plays, for all his comedies were taken from the Greek New Comedy. He did invent a new type of play which was not borrowed from Greece: the historical drama, or, in Latin, the *fabula praetexta*. The name came from the toga with a purple border called the *toga praetexta* worn by Roman magistrates, because the dramas dealt with figures of the Roman past. After Naevius, historical drama had a very modest success. Some plays dealt with the early history of Rome—Ennius wrote a *Rape of the Sabine Women*—and others with the victories of generals who were still alive or only recently dead. Ennius had a nephew, Pacuvius, born in 220 B.C.E., who arrived in Rome as a young man and made a name for himself both as a poet and a painter. His forte was tragedy on Greek subjects—*fabulae cothurnatae*, so-called from the special elevated boots called *cothurni* which tragic actors wore. We know the titles of thirty tragedies that he wrote, but none survive. The same fate awaited the plays of a more significant tragedian, Accius, who overlapped Pacuvius in 130 B.C.E. when each of them produced a drama: Pacuvius was eighty years old and at the end of his career, and Accius, aged thirty, was making his debut. With Accius, the popularity of the *fabula cothurnata* reached its height, and in later years, Romans looked back on the second half of the second century B.C.E. as the Golden Age of Tragedy. Only fragments of the plays survive, however.

**ROMAN COMEDY.** Roman comedy fared better. We have 27 comedies, more or less complete, all adaptations from Greek New Comedy. They are *fabulae palliatae*, that is, dramas with Greek characters who were costumed in a type of Greek cloak (*pallium*) much favored by Greek philosophers. Twenty-one of these comedies are by "Titus Maccius Plautus," about whom there is little reliable information. He supposedly came to Rome from Umbria where he was born, worked for a while in the theater business, tried his hand at trade, lost his money, and had to work at a mill where he used his spare time to write plays. He died in 184 B.C.E. The remaining eight are by Publius Terentius Afer, who was born in Carthage and brought as a boy slave to Rome by a senator who was so taken with the lad that he gave him a good education and freed him. Before he was 25, he produced six plays. He then left Rome for Greece, never to return. Various reports were told about his death, but they agree that he was carrying a large number of new plays in his baggage—translations from the Greek—that were lost with him.

**PLAUTUS.** It is impossible to judge how much Plautus adapted his Greek originals for Roman taste, but his plays ostensibly have Greek settings such as Athens or

Epidamnus. While they could be any city, much of the slapstick must come from the *Atellanae*, the popular Atellan farces. Plautus used the stock characters of the New Comedy but he put his own mark on them. His courtesans are not always sweet and alluring; in the *Truculentus* a ruthless courtesan brings her lovers to ruin. One favorite character type that Plautus developed brilliantly was the clever slave. He also reintroduced song into comedy. There had been songs in Old Comedy but they had fallen by the wayside. Plautus found that the Roman audience liked musical comedy and inserted songs more and more as time went on. The *Boastful Soldier*, which was an early play, has no songs; the *Brothers Menaechmus*, which is later, has five. His dialogue is racy but not dirty, for the Romans were still puritanical, and as the plots of Plautus' comedies unfolded onstage, many Romans must have reflected that such things happened in Greece but never in Rome, and found satisfaction in the sense of moral superiority.

**THE BRAGGART SOLDIER.** The "Braggart Soldier" of the title is a stock character, the mercenary soldier who is all bombast and self-advertisement. In this case, the soldier of the title has the mouth-filling name of Pyrgopolynices. A young Athenian, Pleusicles, is madly in love with a courtesan Philocomasium, but while he is away from Athens on official business, the soldier abducts her to Ephesus. Pleusicles' clever slave, Palaestrio, sets off to tell his master what happened, but he is captured by pirates. Coincidentally, they present him to Pyrgopolynices. Palaestrio gets a letter to Pleusicles summoning him to Ephesus. Pleusicles arrives and lodges at a friend of his father's, who lives next door to the soldier. The clever slave Palaestrio arranges an elaborate hoax to make the soldier believe the wife of a wealthy old gentleman has fallen desperately in love with him. The wife is actually a courtesan who plays the role that Palaestrio has assigned her, and the old man is the friend of Pleusicles' father. The soldier readily gives up Philocomasium for his new love, but he is caught red-handed attempting adultery, given a sound beating, and threatened with castration. The old man relents when Pyrgopolynices swears never to seek revenge for the beating he received.

**THE BROTHERS MENAECHEMUS.** *The Brothers Menaechmus* is a comedy of mistaken identities; it was adapted and elaborated by Shakespeare in his *Comedy of Errors*. Identical twins were born to a Sicilian merchant from Syracuse. One twin, Menaechmus, was kidnapped and his father died of grief. Thereupon the grandfather of the remaining twin renamed him Menaechmus to commemorate his lost brother. Thus we have Menaech-

mus I and Menaechmus II, identical siblings. Menaechmus I, the boy who had been kidnapped, was taken to Epidamnus by his abductor, who, it turned out, had no son, and so he adopted Menaechmus I and made him heir to his enormous fortune. When the play opens, Menaechmus II has come to Epidamnus in search of his twin; this is the sixth year he has been searching. Menaechmus I is having an affair with a courtesan, Erotium. Erotium mistakes Menaechmus II for Menaechmus I, and Menaechmus II goes along with the error; he has lunch with Erotium and enjoys her favors. The deception results in all manner of confusion so that when Menaechmus I returns to the stage he encounters a jealous wife, an irritated mistress, and a father-in-law who thinks he's insane. He escapes being dragged off to a doctor, a fate worse than death, by the intervention of Menaechmus II's slave. Finally the two Menaechmuses meet and sort things out. The drama comes with an assortment of stock characters: a parasite, an alluring courtesan, and a silly doctor. It is Plautus' only comedy of errors, and when Shakespeare adapted it, he doubled the scope for mistaken identities by having not one set of identical twins but two.

**TERENCE.** All six plays that Terence wrote have survived, which is a remarkable tribute to his staying power through the Middle Ages. His comedies did not have the popular appeal that Plautus' plays did, for they lacked his "comic power" as one ancient critic said. They were, however, well-constructed, polished dramas written in the sort of Latin that one could hold up to schoolboys as a model. His first play, the *Woman of Andros* (*Andria*) produced in 166 B.C.E., was based on two of Menander's plays, and uses stock characters with originality: there is the typical lovesick young man, but he wants to marry a young woman of good family, not a courtesan. The strict fathers are presented with sympathy, and the clever slave is more than a mere trickster. The plot is as follows: Simo has betrothed his son Pamphilus to Philumena, daughter of Chremes. But Pamphilus loves Glycerium, an orphan, whereas his friend Charinus wants to marry Philumena. The two fathers negotiate; the clever slave Davus orchestrates the action and everything is resolved when Glycerium turns out to be Chremes' daughter and also to have borne a child to Pamphilus. Pamphilus marries Glycerium and Charinus marries Philumena. The year after the *Woman of Andros*, Terence produced his *Mother-in-Law* but it failed at its first production. Then came the *Self-Punisher* and the *Eunuch* and in the same year as the *Eunuch*, the *Phormio*. His last play was the *Adelphi* (*The Brothers*) which many critics consider his best. In that play, there are two sets

of brothers. One set is elderly with contrasting characters: Micio who lives in Athens and is easy-going, and Demea, a farmer outside Athens who is frugal. Micio has no son of his own and adopts one of Demea's two sons. Thus we have a second set of brothers: one brought up virtuously by his father and the other indulgently by his adoptive father who is also his uncle. The plot centers about the attempt of Micio's adoptive son to kidnap a harp-playing girl for his virtuous brother. The plot is resolved when Demea is converted to a more indulgent attitude, his son keeps his harpist, and Micio's adoptive son gets married.

**THEATER AFTER TERENCE.** The accidents of survival make it appear that dramatic genius dried up after Terence. In fact, theater continued to be popular. While Terence was writing comedies that were purely Greek in everything except the language, other playwrights were putting Roman characters on stage. These were called *fabulae togatae*, that is, dramas in togas, in contrast to the *fabulae palliatae* where the characters wore Greek fashions. Their success was modest. Crowds were more attracted to mime and Atellan farce.

## LATIN POETRY BEFORE THE AUGUSTAN AGE

**LATIN EPIC POETRY.** The Latin epic begins in 240 B.C.E. with Livius Andronicus, a Greek from Tarentum, modern Taranto on the south coast of Italy, which had been founded as the Greek colony of Taras and fell into Roman hands after Rome's war with Pyrrhus. Andronicus was brought to Rome as a slave and was acquired

by a member of one of Rome's great Roman families, the Livii, who freed him because he tutored his owner's children so well. He continued to teach once he was a freedman and desired to develop a teaching model similar to that of the Greeks. Greek children learned from the Greek epic poet Homer, but Rome had nothing similar and so Andronicus translated one of Homer's most famous works, the *Odyssey*, into Latin, using the only rhythm native to Rome, the Saturnian verse. He became a professional poet and playwright, writing a hymn to the gods to win their favor during Rome's war with Hannibal. In recognition of his craft, Rome allowed him to found a guild of writers and actors with its headquarters in the temple of Minerva on the Aventine Hill. But he was best remembered for his translation of the *Odyssey* which was still a vital part of Roman education when the Augustan poet Horace was a boy in the mid-first century B.C.E.

**NAEVIUS AND ENNIUS.** The next step in the development of the Latin epic was taken by Gnaeus Naevius. He fought in Rome's first war against Carthage, which ended in 241 B.C.E., and he wrote a history of it in poetry. Like Andronicus, he used the Saturnian meter. His work is lost, but we do know that he traced the enmity of Rome and Carthage to their foundations, and brought in the story of Dido and Aeneas, as Vergil was to do later in his epic, the *Aeneid*. With Quintus Ennius, (239–169 B.C.E.) the Latin epic took a giant step forward. He came from a town in Calabria, and he knew Oscan, the language of the Samnites, as well as Latin and Greek, and he produced adaptations of Greek dramas for the Roman stage. His great work was his *Annales*, a poem on the history of Rome from the beginning. Unlike Naevius, he adapted the meter of Homer, the dactylic hexameter, to his verse. It was an important step as all later writers of Latin epic would follow his example and use hexameter verse.

**TITUS LUCRETIVUS CARUS.** Lucretius (94–55 B.C.E.) stands apart as one of the finest didactic (from the Greek *didaskhein*, "to teach") poets who ever wrote in any language. The early Greek Presocratic (before Socrates) philosophers had written in poetry, but poetry had given way to prose as a medium for philosophy even before Plato popularized the dialogue form. Didactic poetry was revived in Alexandria, but none of the poets working in the cultural hothouse surrounding the Alexandrian Library ever reached the height that Lucretius did. He was a convert to Epicureanism, which taught that all things are made up of atoms and void and that when human beings die, their atoms dissolve and there is no afterlife. Epicureanism did not deny that the gods existed, but it

*a PRIMARY SOURCE document***LUCRETIUS AND THE ATOMIC THEORY**

**INTRODUCTION:** Lucretius (c. 94–55 B.C.E.), a Roman poet, attempted to explain the atomic theory of the universe expounded by the Greek philosophers Democritus and Leucippus in his great poem *De Rerum Natura* (On the Nature of Things). The theory argued that since all matter is made of atoms and void, death is simply a dissolution of atoms, and no one need fear it. In the following passage he begins his explanation of creation with the principle that nothing can be created out of nothing. The translation into prose gives little hint of Lucretius' poetic genius, but it is a clear exposition of his ideas.

This dread and darkness of the mind cannot be dispelled by the sunbeams, the shining shafts of day, but only by an understanding of the outward form and inner workings of nature. In tackling this theme, our starting-point will be this principle: *Nothing can ever be created by divine power out of nothing.* The reason why all mortals are so gripped by fear is that they see all sorts of

things happening on the earth and in the sky with no discernible cause, and these they attribute to the will of a god. Accordingly, when we have seen that nothing can be created out of nothing, we shall then have a clearer picture of the path ahead, the problem of how things are created and occasioned without the aid of the gods.

First then, if things were made out of nothing, any species could spring from any source and nothing would require seed. Men could arise from the sea and scaly fish from the earth, and birds could be hatched out of the sky. Cattle and other domestic animals and every kind of wild beast, multiplying indiscriminately, would occupy cultivated and wastelands alike. The same fruits would not grow constantly on the same trees, but they would keep changing: any tree might bear any fruit. If each species were not composed of its own generative bodies, why should each be born always of the same kind of mother?

**SOURCE:** Lucretius, "Matter and Space," in *On the Nature of the Universe*. Trans. R. E. Latham (Harmondsworth, England: Penguin Classics, 1951): 31–32.

relegated them to a region far removed from life on earth. The advantage of Epicureanism was that it removed all fear of death, or so Lucretius believed. Lucretius deserves honorable mention among the philosophers, but he also should be recognized as a great poet, for he wrote with verve and skill, and great passion for his subject. He describes matter and void, and the shapes and movements of the atoms in void, he explains how life and sensation came to exist and plants and animals evolved more or less by chance and then reproduced, and what the gods were, for they were also atoms and void, and he ends with a powerful description of a plague epidemic which breaks off suddenly; clearly the poem is unfinished and must have been published after Lucretius' death.

**CATULLUS.** Thanks to the fortunate discovery of a manuscript in the early fourteenth century, we have 116 poems of Gaius Valerius Catullus of varying lengths, and they reveal a poet of genius. He belonged to a new wave of poets in the first half of the first century B.C.E. who looked to writers in Alexandria for their inspiration. They followed in the footsteps of an unconventional poet named Laevius who, in the 90s B.C.E., wrote love poetry expressing personal feelings. The orator Cicero, who disdained them, called them the *neoterici* (the newer writers or "the new wave"), and the name has stuck; modern critics call them the "neoterics." Catullus is the only one whose work has survived. His poems express his pas-

sionate love for a woman he called Lesbia and the emotional rollercoaster he endured as his love turned bitter. Shed of her alias, Lesbia was actually Clodia, a brilliant woman who was the sister of a political firebrand in Rome, Publius Clodius, and Catullus can only have been a minor figure in the group of influential powerbrokers she gathered about her. But Catullus wrote more than love poetry. Taking his cues from Callimachus and the Alexandrians, he tried his hand at an *epyllion*, or short epic, and he translated one of Callimachus' most famous poems, the *Lock of Berenice*. Sappho also influenced him; he translated a poem of hers imitating the Sapphic stanza. But it is his lyrics expressing his ill-fated love for Lesbia that have made him famous.

## LATIN PROSE WRITERS BEFORE THE AUGUSTAN AGE

**WRITERS BEFORE CICERO.** Roman historical traditions shaped the Roman people; from early times, the *pontifex maximus* (high priest) of Rome kept a record on a whitewashed board of the magistrates for each year and any notable events. The first true historian of Rome, Fabius Pictor, wrote in Greek rather than Latin. His history, written during the desperate war with Hannibal the Carthaginian, was intended to encourage pro-Roman sympathies in Greece. Marcus Porcius Cato (234–149 B.C.E.) was the first author and statesman who made a point of using Latin in his writing. He was a considerable orator, and in his old age he wrote a history titled the *Origines* on the origins not only of Rome but neighboring towns as well. All that survives of his writing is a treatise on agriculture that leaves the impression that he was a hard-boiled but pious farmer. After him, there is no prose author of note until Cicero and Julius Caesar in the middle decades of the first century B.C.E.

**MARCUS TULLIUS CICERO.** The facts of Cicero's life can be given briefly. He was born in 106 B.C.E. in the small town of Arpinum (modern Arpino). At age sixteen he was attached to a well-known barrister of the day, Quintus Mucius Scaevola, to win his *entrée* into the Roman legal industry. At eighteen he began his compulsory military service. He served under the father of Julius Caesar's rival, Pompey, which he always thought gave him a special link with Pompey. For the next few years he studied rhetoric and philosophy in Rome and made his court debut in 81 B.C.E. This was the period of Sulla's dictatorship, and Cicero made himself a marked man by successfully defending a man who had incurred the enmity of one of Sulla's minions, Chrysogonus. Cicero thought it prudent to retire to Greece for further study following this case and only returned to Rome after Sulla's death in 78 B.C.E. His first great triumph in court was in 70 B.C.E. when he impeached Gaius Verres for his corrupt governorship of Sicily. Verres went into voluntary exile before he was sentenced, and the Sicilian provincials who were his victims got no restitution. To win the case, Cicero had defeated the best lawyer of the day, Hortensius, and his reputation was made. He rose to be consul in 63 B.C.E. even though he was a "new man"—that is, no one in his family had been consul before—and during his year in office, he suppressed the conspiracy of Catiline and put the conspirators to death without trial, which was illegal. For that he was exiled in 58 B.C.E. and was allowed to return only after he made it clear that he would not make waves for

the political triumvirate of Pompey, Crassus, and Julius Caesar who were manipulating politics behind the scenes at this time. When Caesar started the civil war in 49 B.C.E. by crossing the Rubicon River which marked the boundary between his province of Cisalpine Gaul and Italy, Cicero, after some hesitation, joined the senatorial group led by Pompey, who were Caesar's enemies. After the defeat of Pompey's army during the next year at the battle of Pharsalus, Cicero returned to Italy. He was not one of the conspirators who murdered Caesar on the Ides of March (15 March) 44 B.C.E., but there is little doubt that he approved, and in the immediate aftermath, he tried to arouse the senate to suppress Mark Antony's efforts to take over. He thought—wrongly—that he could use Julius Caesar's grandnephew Octavian, whom Caesar had adopted in his will, against Mark Antony, and then discard him when he was no longer necessary. Events turned out otherwise; Octavian joined Antony and another of Caesar's officers, Lepidus, in a second triumvirate of power brokers, and when this second triumvirate drew up its list of enemies to be proscribed in November, 43 B.C.E., Antony insisted that Cicero be included. He was killed by Antony's troops and his head nailed to the rostra, or speaker's platform in the Roman Forum where Cicero had often spoken.

**CICERO'S LETTERS.** The sheer bulk of Cicero's works is impressive. He bequeathed to posterity private letters, public speeches—some delivered in the law courts, others in the senate or before a public assembly—treatises on rhetoric, and dialogues on philosophy that had an enormous influence even though he was not, by any means, an original philosopher. His letters were written to his friends and family members, including his younger brother Quintus and his close friend and confidante, Titus Pomponius Atticus, a wealthy businessman and financier who stayed out of politics and survived the civil wars. The letters reveal the private Cicero, who differed from his public persona. Lawyers at this time in ancient Rome did not charge their clients fees, for the pretence was maintained that lawyers were above such considerations. They did, however, expect gifts and legacies from their clients, and Cicero's income was such that he could maintain a large number of country villas, although his lifestyle was not particularly extravagant for men of his class by the standards of the day. Cicero's letters give a rare glimpse of the private life of a Roman statesman as the Roman republic slid into civil war.

**CICERO'S SPEECHES.** Of Cicero's orations delivered in the Roman senate or public forums, his most famous are his four speeches against Catiline and his *Philippics*,

speeches attacking Mark Antony, of which the first was delivered in the senate on 2 September, 44 B.C.E. and the second—his most famous—actually published as a pamphlet though it was in the form of a speech. The Catilinarian orations were delivered in the year of Cicero's consulship, 63 B.C.E. How serious a threat Catiline was to constitutional government is a matter for dispute—certainly Cicero exaggerated. Cicero's speeches delivered in the law courts throw a lurid light on Roman public life. His *Verrine Orations* against the corrupt governor of Sicily, Verres, who was tried in 70 B.C.E., were published after the case; they had not actually been delivered in court, for Verres went into voluntary exile first. Another great speech on behalf of a thuggish gang leader, Milo, in 52 B.C.E. was not delivered in court either. Cicero lost the case, but made up for it by publishing the version he would have given, but failed to do so because he was unnerved by Pompey's soldiers ringing the court. Other speeches give splendid vignettes of Roman life. One, "In Defense of Cluentius," is a murder case in an Italian town. Another, "In Defense of Caelius" throws a sidelight on Catullus' love affair with Lesbia, for Caelius was an ex-lover of Clodia, who seems to have been the Lesbia of Catullus in real-life. Caelius had had an affair with Clodia, and when he abandoned her, she charged him with an attempt to poison her. Cicero's defense of Caelius gives him a chance to dwell on the *demi-monde* of Rome, and Clodia's private life in particular.

#### RHETORICAL AND PHILOSOPHICAL TREATISES.

Cicero was an eclectic philosopher who wrote philosophic dialogues during a period of his life when the alliance of the power brokers Caesar, Pompey, and Crassus, known as the First Triumvirate, sidelined him from politics. Of his works on rhetoric, his *Brutus* is interesting for its discussion of the development of oratory in Greece and Rome, which leads up to a description of his own development. Cicero followed it with his *Orator*, which makes the case that the true orator must be a master of all styles: the simple, the somewhat florid, and the grand. Cicero is a major source for modern knowledge of oratory in the Roman republic.

**OTHER NOTABLE WRITERS OF PROSE.** Gaius Julius Caesar is better known as a world conqueror, but he was also an author. His claim to fame in the latter arena is his *Commentaries on the Gallic War* and *Civil War*. His Latin style is unlike any other writer's, except for his imitators. He was writing a "commentary," not a "history" of his conquest of Gaul and the civil war that followed it; a "commentary" purported to be a first draft which would later be fitted out with literary adornments. Cae-

Cicero, profile portrait, engraving. PUBLIC DOMAIN.

sar was writing for propaganda purposes, but he reads like a good war correspondent. His bias is apparent but not blatantly so. One of his officers, Aulus Hirtius, added an eighth book to the *Gallic War* and continued Caesar's *Civil War* with a work in a style that copies Caesar's, the *Alexandrine War*. It is the source for the affair between the young Cleopatra of Egypt and Julius Caesar. Another supporter of Caesar with a more eloquent style was Sallust (Gaius Sallustius Crispus) who wrote a *History*, now lost, monographs on the Conspiracy of Catiline in 63 B.C.E., and the war with Jugurtha in north Africa at the end of the second century B.C.E. which was won by Marius, Caesar's uncle by marriage. In the second of these, Marius comes off very well. In his monograph on Catiline's Conspiracy, Cicero's role pales beside those of Julius Caesar and Cato the Younger. Cicero is portrayed as a decent but lightweight politician, but Cato represents the severe righteousness of an extreme right-wing statesman while Caesar has the makings of a beneficent ruler. Finally, there was an extraordinarily productive writer, Marcus Terentius Varro, of whose many works only one survives complete: a dialogue on buying and running a farm. Another writer worthy of mention is Cornelius Nepos, whose *Book about Excellent Leaders of Foreign*

*Peoples*—22 of them, all Greeks except for two Carthaginians and one Persian—was written in straightforward but rather dull Latin prose.

## THE GOLDEN AGE OF LATIN LITERATURE UNDER AUGUSTUS

**NEW CLIMATE OF OPINION.** The civil war—which started when Julius Caesar crossed the Rubicon River in 49 B.C.E. and ended when Caesar’s heir, Octavian, defeated Mark Antony and Cleopatra at the Battle of Actium in 31 B.C.E.—ended the era of literature of the late republic and started the Augustan Age. The poet Horace fought as a staff officer (tribune) in the army of Brutus and Cassius, but he was no diehard defender of the Roman republic. He returned to Italy after the defeat of Brutus and Cassius at Philippi in 42 B.C.E., and made his peace with the new regime. The poet Tibullus personally had no taste for war, as he tells us in two poems which celebrate the victories of his patron Messala, and Propertius preferred to write about the love of his life whom he called Cynthia—her real name was Hostia and she was a beautiful courtesan—but since he belonged to the circle of writers who were supported by Augustus’ unofficial minister of propaganda, Maecenas, he was called upon to eulogize Augustus’ exploits and excused himself as gracefully as he could. Vergil, the greatest of the Augustan writers, had no hankering for the old Roman republic, having seen first-hand how it misruled the provinces, for he was born in one. Ovid was born the year after Julius Caesar was murdered and never knew the free-wheeling days of the republic when writers could write what they pleased, but he learned that an author under the principate—as Augustus’ regime was called—failed at his peril to respect certain limits to his freedom. When Ovid was about fifty years old, Augustus exiled

him to Tomis on the Black Sea in modern Rumania. Augustus’ successor, Tiberius, did not recall him and he died there. The reasons for his exile are obscure, but one of them may have been a playful poem he wrote titled *The Art of Love* which is a witty poetic instruction manual on how to seduce women.

**VERGIL’S ECLOGUES.** A group of minor poems have survived which have been considered Vergil’s early works, and one of them, the *Culex* (*The Gnat*) is an epyllion worthy of Vergil. The poem describes how a shepherd is wakened from a nap by a mosquito, which he kills only to discover that a venomous snake is about to strike him; the mosquito had sacrificed its life to warn him in time. Some scholars accept the *Culex* as Vergilian, but the earliest works that are certainly written by him are his *Bucolics* (Poems of the Countryside), otherwise known as his *Eclogues* (Select Poems). There are ten of them, and two—the first and the ninth—have been thought to be autobiographic, for they deal with the land confiscations after the Battle of Philippi, when Octavian expropriated land in the region of Cremona and Mantua to settle demobilized soldiers. Vergil’s family estate was expropriated and the first *Eclogue* tells how a freedman, Tityrus, had his little farm restored to him. There are problems with this interpretation, and it is more probable that Vergil’s intent in both his first and ninth *Eclogues* was to make known the disruption and injustice caused by the land expropriations. The fourth poem, the so-called “Messianic” *Eclogue* hails the expected birth of a child who will usher in a new age. The identity of this child has been much disputed, and later Christian commentators interpreted the poem as a prophecy of Christ’s birth. It could be a child expected by Octavian; when *Eclogue* Four was written in 40 B.C.E. he was still married to his second wife Scribonia by whom he had his only child, a daughter Julia. But if so, the child whose birth Vergil foretold was never born. In the *Eclogues*, the influence of Theocritus is clear, but it was Vergil who invented Arcadia—not the Arcadia in central Greece but an imaginary Arcadia where shepherds and cowherds sang and loved and lived a life far removed from the turmoil of the city. In the literary tradition of Europe, it was Vergil, not Theocritus, who invented pastoral poetry.

**THE GEORGICS.** The *Georgics* (On Land Cultivation) is a didactic poem written at the behest of Maecenas who gathered about him a cluster of writers and tried to harness their talents for the benefit of Octavian. Restoring agriculture in Italy after civil war was a vital concern, and though the *Georgics* is the most polished verse that Vergil ever produced, it is propaganda. It also brought didactic poetry to a new height. The subject of

the first book is the crops and the signs for good and bad weather. The second discusses vineyards and olive orchards, the third stockbreeding, the last beekeeping. Vergil worked on the poem for seven years and somehow manages to make plain passages about plowing, planting, and beekeeping interesting.

**ROME'S NATIONAL EPIC.** Augustus wanted a heroic poem, an epic that could be compared without apology to the Greek poet Homer, whose *Iliad* and *Odyssey* overshadowed the works of Roman poets. Of the prominent Roman poets of the day, only Vergil answered the call, producing the *Aeneid*. It has been justly admired from its own time to the present day. Even while it was being written, the poet Propertius wrote that “something greater than the *Iliad* is being created”—a favorable review even before the publication date. It soon became the national epic of Rome, the Latin answer to Homer. It tells the story of the Trojan hero Aeneas, who escaped from the sack of Troy and arrived in Italy, bringing with him his household gods and winning a space in Latium for himself and his descendants. The Romans were familiar with the myth. Aeneas' son Ascanius founded Alba Longa, the royal houses of which spawned Romulus, founder of Rome. Old Roman families called themselves “Trojan-born,” which was the equivalent of claiming ancestors that came over on the *Mayflower*. Julius Caesar's family, the Iulii, made the claim, and the emperor Augustus was Caesar's great-nephew and his adoptive son. Julian tradition told that Aeneas had a son, Iulus, who was the first ascendant of the family. Vergil identifies Iulus with Ascanius by claiming that Iulus was Ascanius' other name. Thus Augustus was a descendant of Aeneas, and the story of Aeneas shed a glow of legitimacy over the emperor and his dynasty. Aeneas' struggle to establish his Trojans in Latium paralleled Augustus' struggle to bring peace and prosperity to the empire after the generation of civil war that destroyed the old Roman republic.

**THE AENEID.** For the first half of the *Aeneid*, Vergil took Homer's *Odyssey* as his model and the *Iliad* for the second half, purposely inviting comparisons. For instance, the character of Aeneas is a warrior from the Trojan War who must endure a long and troubled journey following the end of the war, much like the character of Odysseus from the *Odyssey*. Unlike Odysseus, however, Aeneas is actually fleeing his home, having fought on the side of the Trojans. With a ship full of survivors, including his son and his father, he flees Troy for Italy, where it is his destiny to found Rome. The reality of his destiny does not procure for him an easy passage, however; a tempest tosses Aeneas' little fleet up on the shores

Mosaic c. 3rd century C.E., “Vergil writing the *Aeneid*, inspired by two muses,” in the Bardo Museum in Tunis, Tunisia. Clio, the muse of storytelling, holding a manuscript, is on Vergil's left, and Melpomene, the muse of tragedy, holding a mask, is on the right. © ROGER WOOD/CORBIS.

of Carthage, which has just been founded by queen Dido. Dido welcomes Aeneas and his Trojans and gives them a royal banquet, which parallels Odysseus' landing on the shore of Phaeacia and his welcome by the Phaeacian king and queen. As with the banquet scene in the *Odyssey*, Vergil related what had happened previous to the Trojans' landing at Carthage as a “flashback” sequence in which Aeneas relates to the Carthaginians the fall of Troy, including the famous story of how the Greeks finally penetrated the city walls. The Greeks had built a large wooden horse, left it outside the city gates, and then pretended to depart for home. The Trojans were told by a Greek pretending to be an escaped slave that the horse was a gift from the gods and if they took it within the city walls, their city would never be taken. Tricked by his story, the Trojans did indeed take the horse into their city, not knowing that contained in its hollow belly was a group of Greek soldiers waiting for nightfall to open the gates for the Greek forces outside. That night the Greek forces came out of hiding and sacked the city. So famous is this tale that the “Trojan Horse” has become an enduring symbol for trickery and duplicity. The Trojans fought with the courage of despair, but when resistance proved futile, Aeneas followed the orders of the gods to leave. The story of how he hoisted his crippled father Anchises on to his shoulder and escaped from Troy was already famous in Rome.

**VERGIL'S PROCLAMATION OF ROME'S MISSION**

**INTRODUCTION:** Literature in ancient Rome often served the purpose of the state as propaganda. In 30 B.C.E., the Roman poet Vergil began his epic work *The Aeneid* in response to the emperor Augustus' call for a poem to glorify his regime that could be compared without embarrassment with the works of the Greek poet Homer: the *Iliad* and the *Odyssey*. Using those texts as models, Vergil related the story of the founding of Rome, using the Trojan hero Aeneas as its legendary founder. Although still unfinished at the time of Vergil's death in 19 B.C.E., the work became Rome's national epic, glorifying the Roman Empire's establishment by the "blood, sweat and tears" of Rome's ancestors. In Book 6 of *The Aeneid*, Vergil relates the story of the descent of Aeneas into the Underworld where he meets the ghost of his father Anchises who shows him the souls of Romans yet to be born. As Anchises concludes this pageant of Rome's history, he proclaims the unique mission of the Roman Empire in the following lines.

Others, I do not doubt it, will beat bronze into figures that breathe more softly. Others will draw living likenesses out of marble. Others will plead cases better or describe with their rod the courses of the stars across the sky and predict their risings. Your task, Roman, and do not forget it, will be to govern the peoples of the world with your empire. These will be your arts—and to impose a settled pattern upon peace, to pardon the defeated and war down the proud.

Aeneas got away safely with his father, his little son Ascanius, and his household gods, but his wife Creusa was lost. Aeneas returned to Troy to seek her, but her ghost told him to be on his way—a new home awaited him in Italy. Like Odysseus, Aeneas endured hardship and loss during his journey by sea; he lost his father in Sicily, and a storm blew them onto the shore of Carthage in Africa. As with Odysseus and the Phaeacians, Dido and her people are moved by the sad tale of Aeneas and the Trojans, and the two peoples appear prepared to settle down together. Dido and Aeneas begin an affair, but the gods perceive the romance as a threat to Aeneas' destiny and order him to leave Carthage for Italy; the plot develop-

ment closely resembles the gods' ordering of the nymph Calypso to release her lover, Odysseus, so he can return home. Neither of these powerful female characters wanted to let go of their lovers, and Dido stages a dramatic suicide at Aeneas' departure by building a funeral pyre for herself out of Aeneas' discarded possessions and killing herself in its fires. Dido's death is evidence of a Roman belief that romantic love was a poison which disrupted betrothals and family alliances; in Rome, marriage was a business deal worked out by the parents of the bride and groom, and among well-born Romans it involved property. Love induced irrational behavior and led to unsuitable marriages. Aeneas' rejection of his lover is also evidence of the Roman emphasis on duty over emotional ties; Aeneas is devoted to duty—the usual epithet that Vergil applies to him is *pius* which means more than its English derivative "pious." It means god-fearing, dutiful, and even compassionate.

**DESTINY IN ITALY.** While Aeneas did not lose nearly as many fellow travelers as Odysseus, he is forced to leave behind the women of his party in Sicily after the travel-weary women set fire to the ships in an attempt to prevent their leaving the island. Thus the Trojan settlers in Italy will be men only, which means that they will have to find Italian women for their mates. Aeneas is aware that their settlement in Italy will necessitate another war similar to the Trojan War, but he sees it as his destiny to be on the winning side this time when he visits the Underworld and sees the ghosts of the future builders of Rome. The last six books describe the fight in Italy between the native Rutulians and the immigrant Trojans, and Vergil switches his narrative model to the *Iliad*. Aeneas arrives at the future site of Rome, and there meets King Latinus who has been told by an oracle to marry his daughter Lavinia to someone who is not a native of the country. Although the king is amenable to Lavinia's marriage to Aeneas, the queen, Amata, is not; she favors the prince of the Rutulians, Turnus, and the rivalry between Turnus and Aeneas sparks a war between the two peoples. After much bloodshed, the war is decided by hand-to-hand combat between the two suitors in which Aeneas kills Turnus.

**ASSESSMENT OF A GREAT POEM.** Vergil's *Aeneid* became the national epic of the Roman Empire. The poet drew from various literary influences for his creation, particularly Homer. Vergil also drew upon the *Argonautica* of the Hellenistic poet Apollonius of Rhodes. Vergil's Dido owes something to Apollonius' Medea. Vergil was conversant with Alexandrian poetry; his *Eclogues* draw their inspiration from Theocritus and the *Aeneid* also draws inspiration from Alexandria even

though its model was Homer. Finally there was Ennius, Rome's first epic poet to use the dactylic hexameter from whom Vergil borrowed heavily for his knowledge of primitive Italy. The *Aeneid* no doubt celebrates the Roman Empire, Augustus' contribution to it, and the courage and self-sacrificing toil of Rome's founders. Yet he also pities the people trampled underfoot by Rome's growth to power. Turnus and Dido both engage our sympathies, whereas Aeneas can be remarkably brutal, and his epithet *pius* (dutiful) is a trifle chilling. In the end, it is clear that the Trojans will be assimilated. Aeneas has brought his gods from Troy and plans them to be the gods of Rome, but the god Jupiter makes it clear that he will decide what gods the Romans will worship. Aeneas, who is an Asian immigrant, will start the historical process that results in the Roman Empire, but he will lose his native culture, and his descendants will be purely Italian.

**HORACE.** Quintus Horatius Flaccus was the son of an ex-slave who saw to it that his son received a good education in Rome and then managed to send him to Athens. These were the heady days after Julius Caesar's assassination, and Horace was caught up in the enthusiasm among the Romans studying in Athens for the republican cause and joined the army raised by Marcus Brutus, the assassin of Julius Caesar. The defeat of Brutus and Cassius at Philippi understandably quenched his enthusiasm, so he returned to Italy, got a low-paying clerical post in the government, and began writing. Some of his *Epodes*, belong to this period. They got their name from their meter which the Greek lyric poet Archilochus had invented, for almost all of them have a long line followed by a shorter one, for which the technical name was an *epoide* (after-song). Sometime before the Battle of Actium he was introduced to Octavian's minister in charge of molding public opinion, Maecenas, and his poverty-stricken days came to an end. It was Maecenas who suggested that he put together a collection of his *Epodes*. About 35 B.C.E. he brought out a collection of satires, or as he titled them, *sermones* which can be translated not inaccurately as "chitchat." He was also experimenting with something new: an attempt to use the meters of the Lesbian poets Alcaeus and Sappho. Although the poet Catullus had tried his hand at the Sapphic stanza, Horace could claim to be original because his subject matter was his own. The first three books of his *Odes*—or as he called them, his *carmina* (songs)—took seven years to compose, and they were published about 23 B.C.E. He followed them up with his *Epistles*, so called because they purport to be versified letters to various recipients. He addressed one to his farm man-

ager,' for Maecenas had given him a farm in Sabine country not far from Rome. Horace advised his manager to be content with what he had. The emperor Augustus, who liked Horace and wrote him frequently, urged him to write more in praise of the imperial house, and in response he added a fourth book to his *Odes* and also produced a long hymn for the Secular Games of 17 B.C.E. The Games were not "secular" in the modern sense, for the word comes from the Latin *saeculum*, meaning "century," so "Centennial Celebrations" might be a better way of describing the festivities of that year. The hymn is called the *Carmen Saeculare* and it is not Horace at his best. Horace wrote another long poem which is famous: the third book of his *Epistles* which is taken up entirely with his *Ars Poetica* (The Art of Poetry). It is a nice example of didactic poetry but its content is not original, for Horace followed a treatise written by a Hellenistic author, Neoptolemus of Parion.

**PROPERTIUS, TIBULLUS, AND SULPICIA.** Propertius, Tibullus, and Sulpicia all wrote love poems addressed to specific individuals whom they claim as objects of their devotion. Propertius addressed his poems to Cynthia and Tibullus to Delia. Sulpicia was a woman and the lover whom she addressed is a man, but otherwise she follows the conventions of this genre of poetry. Propertius belonged to Maecenas' circle, but Tibullus had another patron, Messalla. Both wrote in elegiac couplets that had been used for centuries in Greek literature and brought into Latin in the Augustan age. The pioneer of the genre was a friend of Vergil, Gaius Cornelius Gallus, who wrote four books of elegies to a mime actress whom he calls Lycoris; in real life, her name was Cytheris and she had a number of lovers, including Mark Antony. Gallus became prefect of Egypt, where he proved too independent for Augustus' regime; the Roman senate tried and condemned him, and he committed suicide. His political disgrace eclipsed his poetry. Tibullus left two books of elegies. In the first he addresses Delia, and in the second, a woman he called Nemesis. In Messalla's circle there was also a poetess, Sulpicia, probably Messalla's niece, who wrote six short poems addressed to a man whom she calls Cerinthus. They are little gems of frank passion. A more productive poet than either of these was Sextus Propertius, whose love was a woman he calls Cynthia. Maecenas noticed his little book of 22 elegies titled *Cynthia* and took him into his circle. Like the other poets in Maecenas' stable, Propertius was urged to help popularize the principate (the constitutional settlement of Augustus), but his heart was really with love poetry. Propertius is the most interesting of these writers of love elegies if we take the vicissitudes of his love-affair at face

*a PRIMARY SOURCE document***HORACE ON PATRIOTISM**

**INTRODUCTION:** Horace (65–8 B.C.E.) owed the comfortable life that he led to his patron, Maecenas, whose gifts to him included a small estate outside Rome—his “Sabine Farm” made famous by his poetry. But Maecenas was a friend and close advisor of the emperor Augustus, and in return for his generosity Maecenas—and Augustus, too—expected Horace to support the aims of the empire, one of which was to rekindle patriotism and morality among the Romans. This excerpt is from one of Horace’s *Odes* written to please his patron. Some phrases from it are famous, such as *dulce et decorum est pro patria mori* (“Sweet and fitting it is to die for your fatherland” or, as the translation printed below expresses it, “The glorious and the decent way of dying is for one’s country”), which has been inscribed on countless cenotaphs for the war dead. Equally famous is the metaphor that concludes the poem, that Vengeance or Punishment, though she be lame, seldom gives up her pursuit of a man.

value. But we must not be too quick to infer autobiographical details from their poetry, for they were writing within well-defined conventions. Sincerity was not considered a virtue in Latin poetry, and when a poet claims to be dying of love, he may be expressing only a conventional emotion that was demanded by his art form. Sulpicia’s poetry differs only in one way: usually women were the object of male desire in elegiac love poetry, but Sulpicia presents herself as a woman who desires a partner as much as any man does.

**OVID.** Ovid was truly a man of letters. Sophisticated and technically brilliant, he wrote poetry effortlessly. Although not wealthy, he was sufficiently well-to-do to dispense with a patron and he remained outside the circles of Maecenas and Messalla. He began as an elegiac poet of love. His collection known as the *Amores* (Love Affairs) follows the examples of Tibullus and Propertius, for they tell of romantic encounters, but whereas the loves of those two writers probably existed, Ovid’s lover, Corinna, probably did not exist outside literature. While

he was writing the *Amores* he was working on a more ambitious work, the *Heroides* (Heroines), letters in verse by women of mythology addressed to their husbands or lovers. Among others, he imagines Dido writing to Aeneas, Ariadne writing Theseus from Naxos where he had abandoned her, and Medea writing Jason after she has learned of his plans to jilt her and marry the king of Corinth’s daughter. Ovid then turned to didactic poetry, but his subject was not a respectable one like agriculture. Ovid wrote the *Art of Love* in three books, the first two instructing men in the art of seduction and the third showing women who planned to be courtesans how to make the most profit from their husbands. He followed this up with a fourth book, the *Remedium Amoris*, on how to fall out of love. Ovid’s greatest work is undoubtedly his *Metamorphoses* (Changes of Shape). No one believed in the ancient legends anymore, but they were still subject matter for literature, and Ovid decided to string them together on the common theme of changes of shape. He retells myths that told how heroes and heroines changed their shapes, like Actaeon who was

changed into a stag, or Alkyone who was changed into the halcyon bird. The resulting epic is a tapestry of myth, told with wit and all the tricks that an author versed in rhetoric could muster. Then came his exile. Augustus relegated him to Tomis, modern Costanza in Rumania, for reasons unknown. He burned his *Metamorphoses*, but fortunately copies were already in circulation and so it survived, though unfinished. Exile did not break Ovid, though he never saw his beloved Rome again. He wrote five books of *Tristia* (Poems of Sorrow)—the first book was complete before he reached Tomis. He continued these with his *Letters from Pontus*, “Pontus” was the name for the Black Sea. He wrote *Ibis*, an attack on an imaginary figure which was probably written as a psychological release, and a poem on the fish in the Black Sea. The major work of his exile was the *Fasti*, a versified Roman calendar of religious festivals. Ovid finished the first six months of the year and may have hoped that his interest in Roman religion would soften Augustus’ heart. If that was his intent, he must have been disappointed in the result. Ovid died in exile.

**LIVY.** The Augustan age had one prose writer of distinction, Titus Livius, known in English by the name Livy, who wrote a history of Rome from its foundation to his own day in 142 books. He was the type of historian who wrote to edify his readers, and the characters of his history were either heroes or villains. The most wholesome outcome of knowing history, he told his readers, was to have examples of every type of conduct so that a person could choose models to imitate with foreknowledge of what the results of their choices would be. He was not a careful researcher, but he had historians to consult who have been lost long ago, and that gives his work real value for the historian of the Roman republic. His history extends to the Roman triumph over the last king of Macedon, Perseus, in 167 B.C.E. His style is smooth and his characterization vivid, but his panorama of the Roman past is not an example of historical accuracy.

## LATIN LITERATURE OF THE SILVER AGE

**WRITERS BEFORE THE DEATH OF NERO.** The name “Silver Age Latin” as applied to the literature that follows the “Golden Age” under Augustus reflects the judgement of generations of scholars. Writers of the Silver Age valued rhetorical skill and literary ornaments, and produced a style that was quite unlike ordinary human speech. Contemporary writers in Greek moved in the other direction; they were Atticists, that is, they revived the style and even the dialect of the best classical authors of Greece. Their example did not rub off on their Latin counterparts. Still, the sheer bulk of their writing is impressive. One poet, Marcus Manilius, wrote a didactic poem in five books on astrology. Calpurnius Siculus wrote pastoral poetry that was heavily dependent on Vergil’s *Eclogues*. An ex-soldier, Velleius Paterculus, who served under the future emperor Tiberius, wrote a history of Rome in two books, and when he comes to his own period, he is a good historical source. Valerius Maximus collected nine books of sayings and anecdotes under the title *Notable Doings and Sayings*, and Phaedrus versified Aesop’s fable.

**SENECA.** Lucius Annaeus Seneca’s family came from Roman Spain, and his father was a rhetorician known as Seneca the Elder to distinguish him from his son. The reputation of the elder Seneca stems from a collection written in his old age of anecdotes about rhetoricians he had known. The younger Seneca is known for his philosophic treatises—he was a Stoic who failed to practice

what he preached—four prose works—one of which is a funny but cruel essay on the distaste with which the gods received the dead emperor Claudius when he entered their company after being decreed divine by the Roman senate—and nine tragedies. The tragedies were based on Greek originals except for the *Thyestes*, which told how the father of Agamemnon and Menelaus, Atreus, fed Thyestes his own children. The work allowed Seneca to give free rein to his love for blood and gore. He reworked Euripides' *Medea* and made Medea into a bloodthirsty witch. His *Phaedra* reworks Euripides' *Hippolytus* and gives Phaedra nymphomaniac tendencies and makes Hippolytus a woman-hater. It is generally agreed that these plays were intended for public readings before select audiences, not for production in large theaters for the masses, whose taste was for interpretative dancing and mimes. Seneca's plays appealed only to the educated elite who were familiar with the Golden Age of tragedy in Athens of the fifth century B.C.E.

**COLUMELLA.** Lucius Junius Columella, like Seneca, came from Spain, but his interests were very different. After a career in the Roman army, he acquired an estate in Latium outside Rome, and devoted himself to agriculture. His *De Re Rustica* (On Husbandry) is a treatise on scientific farming. It gives a picture of the countryside of central Italy in his own day, with its growing number of country houses for wealthy Romans, and its absentee landowners. His cure for the decline of farming in Italy was hard work, personal supervision, and mastery of the science of agriculture.

**GAIUS PETRONIUS.** The novel as a literary form was becoming popular in Greece in the early imperial period, and Petronius chose to use it for what he called the *Saturae*—the “Mixed Bag” of writing. It is now known as the *Satyricon*. It is picaresque novel (relating to the adventures of rovers) but instead of the hero and heroine of the Greek novels who have a series of wild adventures as they roved from place to place, Petronius has a rascal named Encolpius and a cheeky boy named Giton. Only fragments remain, but one sizeable portion, describing a banquet given by a wealthy ex-slave named Trimalchio, is a masterpiece. The banquet was an orgy of feeding, and Trimalchio takes vulgarity to astonishing heights. Petronius was a favorite of the emperor Nero and invented revels for that pleasure-loving emperor until court intrigue destroyed him and he committed suicide with elegance and irony, as befitted a man of his talents.

**MARCUS ANNAEUS LUCANUS.** The fame of Lucan, who was Seneca the Younger's nephew, rests on one work: his epic poem on the civil war between Caesar and the senatorial party led by Pompey. Its name, the

*Pharsalia*, comes from the decisive battle fought in Greece at Pharsalus, modern Farsala in Thessaly, where Pompey's army was defeated. Lucan's style is somewhat artificial but he is a smooth versifier. His sympathies were with Pompey and the republican form of government that Pompey defended. All of this fitted the popularized Stoic philosopher of the day that looked back with nostalgia at the republic which died in the civil war. Lucan died young. He was implicated in a plot against Nero, and died by bleeding to death, reciting some of his own verses on death by bleeding as he breathed his last.

**PERSIUS.** Little is known about Aulus Persius Flaccus, except that he left a collection of six satires and died young. The first was on the decay of literary taste, the second on the vanity of riches, the third on idleness, the fourth on self-knowledge, the fifth on true liberty, and the sixth on how to use wealth properly. His poetry is crammed with allusions to contemporary life. His fourth satire, for instance, urges a popular statesman named Alcibiades to examine his soul and pay no attention to public adulation. There was an Alcibiades who was an Athenian politician of the fifth century B.C.E., but perhaps the “Alcibiades” whom Persius has in mind is the emperor Nero. Persius' style is not easy to read. He is not for the beginning Latin student. But his small output reveals an interesting talent.

**THE SILVER AGE AFTER THE EMPEROR NERO.** Whatever the emperor Nero's faults may have been, he was an aesthete who was sensitive to culture, and his death in 68 C.E. did not improve the lot of the literary artist. The Flavian dynasty—the emperors Vespasian, Titus, and Domitian who replaced the Julio-Claudian clan to which the emperors from Augustus to Nero belonged—was from Sabine peasant stock. The Flavians were sensitive about their lack of background, and Domitian in particular was a menacing presence who inspired fear. With Nerva, Trajan, Hadrian, Antoninus Pius, and Marcus Aurelius (who died in 180 B.C.E.) there was greater freedom, but there was a comfortable mediocrity about the age, and it was not until the fourth century C.E. that there was a renewed outburst of literary talent. Still, the period did not lack for writers. Silius Italicus was one such figure; his primary position was as an informer under Nero, passing on information about potential enemies of the regime, although he later cleaned up his reputation by earning praise for his administration of the province of Asia. He wrote an epic titled the *Punica* on Rome's wars with Carthage, which were called the “Punic Wars” after the Latin word for Carthaginian: *Poenus*. The meters are correct but as poetry it is second-rate. He likes to put his learning on display, and the result is more tire-

some than impressive. Papinius Statius who wrote under Domitian whom he was careful to flatter, left five books of *Silvae*—miscellaneous poems on various subjects—and two epics, the second unfinished. The first epic was *Thebaid* and covered the legends of Thebes: how Oedipus killed his father, how his sons fought over the throne and killed each other, and how Creon succeeded to the throne. The poem reflects the taste of the day for romanticism through the inclusion of slaughter, exaggerated passions, and high-flown sentiment. The second epic, the *Achilleis* retells the myth of how Achilles' mother Thetis tried to save her son from being conscripted to fight in the Trojan War by dressing him as a woman and hiding him among girls at the court of the king of Scyros. Statius wrote 1127 lines on this subject, but he died before he could write more. Valerius Flaccus wrote an epic on the legend of Jason and the Golden Fleece, taking as his model the *Argonautica* of Apollonius of Rhodes. Quintilian, the son and grandson of rhetoricians, is known for his *Education of an Orator*. His perfect orator was Cicero, and he concluded that all developments since Cicero's day had brought oratory downhill. Martial was a master of the epigram: the short poem that ends with a sharp, stinging quip. He took his subjects from contemporary life, throwing an interesting sidelight on it. Suetonius, secretary to the emperor Hadrian, wrote biographies in straightforward Latin, and one collection has survived entire: his *Lives of the Twelve Caesars* from Julius Caesar to Domitian. A little later than Suetonius, another author wrote the only novel in either Greek or Latin worthy of comparison with Petronius' *Satyricon*: Apuleius, whose tale, *Metamorphosis*, better known as *The Golden Ass*, tells how the hero Lucius dabbled in magic and managed to transform himself into a donkey. We have another work of Apuleius, too, for he married a wealthy widow and her relatives brought him to trial on a charge of winning her affections by magic. Apuleius' *Apology* is the speech he gave in his own defense before a court in Sabratha, in modern Libya. Of all the authors belonging to these somewhat tarnished last years of the Silver Age, there are three that should detain us: Juvenal, Pliny the Younger, and the historian Tacitus, for they were first-rate practitioners of their genre of literature.

**JUVENAL.** Juvenal was a bitter man. Life in Rome had not treated him well, to judge from his poetry, and after the emperor Domitian died and the pall of fear lifted, Juvenal wrote satires—sixteen of them—attacking the wickedness of contemporary life. He disliked women, all immigrants from the east—especially Jews, with Greeks a close second—avarice, the miserly rich, and the horrors of living in the shoddily built apartment houses

of Rome. He attacked scoundrels by name, though he only picked on already-dead scoundrels to avoid retribution. He is the source of the aphorism that the Roman mob cared only about bread and circuses. He accepted the dictum of the Stoic philosophers that all transgressions were equal and hence he indicted the emperor Nero both for murdering his mother and for writing bad poetry as if they were sins of equal magnitude. He was himself a good poet who wrote vigorous hexameter lines.

**PLINY THE YOUNGER.** The reputation of Gaius Plinius Caecilius Secundus—the full name of Pliny the Younger—might have been overwhelmed by that of his uncle, Pliny the Elder, an encyclopedia writer who died in the eruption of Mt. Vesuvius in 79 C.E., except that the only surviving work of the elder Pliny is his *Natural History*, which is a mine of information but not casual reading. Pliny the Younger is known for his collection of pleasant letters written, ostensibly, to various contemporaries, including the historian Tacitus to whom he addressed an eyewitness account of the eruption of Vesuvius. The last book of his collected letters is correspondence between him and the emperor Trajan, for Trajan sent Pliny to the province of Bithynia in Asia Minor about 110 C.E. to correct maladministration there. Among the matters for consultation with Trajan was a cell of Christians whom he found. Pliny wanted to know the legal status of Christianity and Trajan replied that it was outlawed, though he warned against any witch hunt. For historians of Christianity, this is an important morsel of evidence; it defines the attitude of the Roman state towards Christianity in the second century C.E.

**TACITUS.** Cornelius Tacitus wrote five works: a dialogue on orators, evidently his first; a biography of his father-in-law, Agricola; an essay on Germany, the *Germania*; and his two greatest works, his *Histories* and his *Annals*. The first is a discussion of orators of the past, giving top marks to Cicero. Agricola governed Roman Britain under Domitian and hence Tacitus' biography adds significantly to knowledge about Britain in the years after its conquest under the emperor Claudius. The *Histories* begin with the turbulence after Nero's death when there were four emperors in the year 68 C.E., and it breaks off two years later. The rest is lost. The *Annals* also survives in mutilated condition; Tacitus begins with the emperor Tiberius, but the reign of Caligula is lost. Even so, Tacitus' account of Claudius and Nero is splendid. Tacitus knew firsthand the misery of Rome under the tyrant Domitian and when he describes these early emperors, he sees them as forerunners of Domitian. His powers of description were superb, and he is the last great Latin historian until the fourth century C.E. when

Ammianus Marcellinus takes Tacitus as his model and produces a history which compares well with any other in Latin, though Ammianus was a Greek and presumably Latin was his second language.

### GREEK LITERATURE OF THE IMPERIAL AGE

**CHANGED CONDITIONS.** When Queen Cleopatra of Egypt committed suicide in 30 B.C.E., the last independent Hellenistic monarchy disappeared and all the eastern Mediterranean was under Roman rule. In place of the Hellenistic kings there were Roman governors whose language of administration was Latin. Yet Roman rule was light. On the local level, cities governed the people. Every Roman province contained a number of cities, some of them very old, some dating back to a foundation by a Hellenistic king or even Alexander the Great himself. Alexandria in Egypt was not the only city that Alexander founded; the Middle East was dotted with cities with the name "Alexandria" which claimed Alexander as founder. The Roman governor made his headquarters in the most important city in his province, and he was chiefly interested in law and order, and seeing to it that taxes were paid; but within limits, the cities were left to govern themselves. The governors cultivated the local elites and kept the loyalty of the well-to-do property owners, who were glad of the protection of an empire that safeguarded their economic interests, but at the same time they looked back with pride at the Golden Age of Greece and its great literary achievements. The literature of Greece under the Roman Empire reflected this vision: pride in the past, and support for the Roman Empire, or at least acquiescence to it. Rome would not tolerate anything that smacked of sedition.

**CLASSICISM.** The taste of the new imperial age ushered in by the emperor Augustus was classical. That is,

it looked back to the classical period of Greece (480–330 B.C.E.) for its models. The taste is reflected both in the visual arts of the Roman Empire and the literary taste. Dionysius of Halicarnassus, a Greek teacher of rhetoric who settled in Rome about 30 B.C.E., expressed the same view in the various treatises on literary style which he produced; his *On Ancient Orators* defends the Athenian or "Attic" style of oratory exemplified by Demosthenes and rejects the ornate "Asiatic" style which replaced the Attic style in the Hellenistic period. We find the same taste for the past in the essays of two important essayists of the period, Plutarch and Lucian.

**PLUTARCH.** Plutarch (c. 40–c. 120 C.E.) is best known for his *Parallel Lives*: paired biographical essays of Greeks and Romans where Plutarch puts the life of a famous Greek side-by-side with a Roman whose career was in some ways similar, and follows each pair with a comparison. As well as his *Parallel Lives* we have a great collection of essays grouped under the title *Moralia*—"Moral Essays" where the adjective "moral" means "based on general observation of people." Their subjects range far and wide: religion, music, philosophy, superstition (which Plutarch hated), love, and divine justice. He was typical of Greeks who were happy to cooperate with their Roman rulers, but were still proud Greeks. Lucian, (c. 117–after 180 C.E.), born in Samosata, now the village of Samsat in Syria, tried a legal career before turning to lecturing, travelling widely over the empire giving public lectures. When he was about forty, he settled in Athens and wrote satirical essays which laughed at the lives and beliefs of conventional Greeks and Romans. Then, as old age began to close in on him, he accepted a job on the staff of the governor of Egypt, thereby joining the "Establishment" that had been the butt of his humor. His favorite literary forms were dialogues and epistles; the first was borrowed from the theater and also from the dialogues of Plato, and the epistle pretended to be a letter addressed to someone: thus his essay on a charlatan, Alexander of Abonoteichos, takes the form of a letter addressed to one Celsus. Alexander invented a religion centered on a god named Glycon who was incarnate in a large, tame snake that was fitted with an artificial head with a speaking tube so that the snake could give prophecies and answer questions, rather like the Wizard of Oz. Lucian ends his epistle with the hope that it may help the general reader by shattering his illusions and confirming any sensible ideas he might have.

**LUCIAN.** Lucian was educated under a system heavily influenced by a literary movement known as the "Second Sophistic." It taught that an author should model his content and style on the best Greek authors of the

past, and the most obvious way to do this was to use many quotations and allusions to these authors. It also placed great value on rhetorical exercises, and the chief “Sophists” of the movement were orators who gave declamations, often before large audiences that thronged to hear them perform in theaters or music halls (called “odeons”) or other public buildings. The movement got its designation “Second Sophistic” from its memorialist, Philostratus, who belonged to a literary family on the island of Lemnos. Philostratus gave the literary renaissance that he chronicled in his *Lives of the Sophists* the name “Second Sophistic.” Philostratus’ “Sophists” were polished, cultivated orators who were to be distinguished from the sophists of the classical period in the fifth and fourth centuries B.C.E. They were men like Dio of Prusa, nicknamed *Chrysostomos* (“Golden-Mouthed”) who lived about 40–110 C.E., Aelius Aristides (117–189 B.C.E.), and Maximus of Tyre (c. 125–185 C.E.). Their repertory of speeches celebrated both the power and the beneficence of Rome, and at the same time the glorious past of Greece. Nowadays their sociological content is more interesting than their literary excellence. Aelius Aristides, for instance, wrote a panegyric in praise of Rome that shared its power with the ruling classes among the subject peoples that it ruled by granting them Roman citizenship as a reward for cooperation. Aristides gives us a window into the psychology of Greece under Roman rule.

**THE NOVEL.** Writing romantic novels did not begin with the “Second Sophistic” but this was the period of its great development. In fact, Dio of Prusa included a novella in one of his orations. The other novels we have are *Chaereas and Callirhoe* by Chariton, *An Ephesian Tale* by Xenophon, *Leucippe and Clitophon* by Achilles Tatius, *Daphnis and Chloe* by Longus, and the *Aethiopica* of Heliodorus. The authors are only names to us. The plots are full of voyages and adventures with pirates, shipwrecks, and premature burials, and the characters live in a world where everything is governed by chance, but apart from that, they show considerable variation. Chariton’s romance, which could date as early as the first century B.C.E. is a historical novel; Chariton places it after the Athenian expedition to Sicily (415–434 B.C.E.) which took place in the Peloponnesian War and ended in disaster at Syracuse. His heroine Callirhoe is the daughter of Hermocrates, the Syracusan leader of the resistance against Athens. *Daphnis and Chloe* is the story of a shepherd, Daphnis, and his love, Chloe, who, like characters in a Greek New Comedy, turn out to be children of well-to-do parents. There are religious overtones to these novels. Xenophon’s *Ephesian Tale* celebrates the cult of Artemis of Ephesus and Heliodorus celebrates the

cult of the Sun-God, known in Rome as *Sol Invictus*. In this respect they resemble Apuleius’ Latin novel known as *The Golden Ass* which is a better novel than any of them. It need not surprise us that some of the Christian apocryphal gospels as well as stories of Christian saints borrow features from the novel.

**THE ACCEPTANCE OF ROMAN RULE.** The underlying theme of the historians who wrote in Greek was acceptance of Roman rule, and recognition of the benefits that it brought to its subjects. The same Dionysius of Halicarnassus who wrote *On Ancient Orators* also wrote a history of early Rome titled *Roman Antiquities* which covered the period from Rome’s beginnings to where Polybius began his history with Rome’s first war with Carthage (265–241 B.C.E.). His aim was to celebrate Rome’s empire and also to prove a special relationship between Greece and Rome by proving that Rome’s origin was Greek. Flavius Josephus (37–100 C.E.), a Jew who took part in the rebellion of Judaea against Rome that broke out in 66 C.E. but went over to the Roman side in 67 C.E., wrote the history of the revolt in his *Jewish War*, a work in seven books written in the tradition of the great classical historians Herodotus and Thucydides. His aims in writing, he tells the reader, were to remind the victors in the war of the valor of the men they conquered, and also to console the Jews who were vanquished and urge them to reflect on their failed revolt. Josephus wrote one other major work, his *Antiquities of the Jews* on Jewish history, as well as a tract titled *Against Apion* which is a reply to an anti-Semitic tract written by someone called Apion who is otherwise unknown. Josephus accepted Roman rule, but he remained proud of his Jewish heritage. The Egyptian Apion, who was born at the end of the first century C.E. emphasized the benefits of Roman rule in his Roman history. He was not an original researcher—he was a civil servant dabbling in history—but his organization was an effort at a new approach. He wrote a history of Rome’s conquests, people by people and region by region. He did not completely abandon the annalistic technique whereby the historian presents the pageant of the past year by year, but he made an effort to deal with Rome’s wars of conquest as separate military operations.

**ARRIAN.** Arrian, or Flavius Arrianus, to give him his full name, was a governor of Cappadocia in Asia Minor under the emperor Hadrian (117–138 C.E.) where he defeated an invasion by an Iranian tribe known as the Alans in 134 C.E. He was a disciple of the philosopher Epictetus, and like Xenophon with Socrates, he preserved his teachings. His major work that survives is his *Anabasis* which borrows its title from Xenophon’s *Anaba-*

sis ("The March Up Country"), but Arrian's "March" is the story of Alexander the Great's conquest of the Persian Empire (334–323 B.C.E.). He based his history on the memoir written by Ptolemy, Alexander's general who became king of Egypt and founded the Ptolemaic dynasty that ended with the suicide of Cleopatra in 30 B.C.E., supplementing Ptolemy when necessary with the memoir of Aristobulus who had been a Greek technician with Alexander's army. Arrian's account is a sober narrative, and a valuable source for the military campaign of Alexander, for the historians contemporary with him have survived only in fragments.

**CASSIUS DIO.** Cassius Dio deserves special notice, for he is an important source for Roman history. He was born in Iznik in modern Turkey, ancient Nicaea, the son of a consul, in 163 or 164 C.E., and he himself would become a consul and a provincial governor under the emperor Septimius Severus (193–211 C.E.). He started to write in the reign of Caracalla (211–217 C.E.), one of the most odious emperors of Rome. His history, starting with Rome's beginning and continuing to 229 B.C.E. was a tremendous work that took ten years to prepare and twelve to write. Part of it has survived, and for the missing portions, we have digests written by later writers in the Byzantine period. For the reign of Augustus, the first emperor of Rome (27 B.C.E.–14 C.E.), the account of Cassius Dio is the fullest that we have.

**THE CHRISTIAN WRITERS.** Although still in its infancy in the first century C.E., Christianity began to produce its own literature almost as soon as its founder, Jesus, was crucified in 33 C.E. The earliest writings were letters exchanged between the disciples of Jesus and converts that were later compiled as the New Testament of the Bible. As the persecution of the Christian church intensified, other writings commemorated martyrdoms. One of the earliest examples is a group of seven letters composed by Bishop Ignatius of Antioch who, in his old age, was taken to Rome to be put to death sometime in the reign of the emperor Trajan (98–117 C.E.). Guarded by ten Roman soldiers, whom he describes in one letter as "ten leopards," he travelled across modern Turkey to Smyrna (modern Izmir), where he composed letters to the Christian communities nearby, and from there he proceeded to the Hellespont where he embarked on a ship for Rome. The custodian of Ignatius' letters was the bishop of Smyrna, Polycarp, who was burned to death at the age of 86 in the arena at Smyrna in 156 C.E.; the story of his martyrdom survives in Greek, Latin, Syriac, and Coptic versions. Apologies, that is, defenses of the Christian faith appear in the second century C.E.; one of the first, notable for its conciliatory tone, was by Justin

the Martyr, who was born in Shechem (modern Nablus in Israel). His apologies are lucid explanations of Christianity for the non-Christian; his *First Apology*, written about 150 C.E. is addressed to the emperor Antoninus Pius, and his *Dialogue with Trypho* reports a discussion with a Jewish rabbi which ends on a note of mutual tolerance and respect. By the third century C.E. Christian theology was borrowing from the Greek philosophers. The most brilliant theologian of the period was Origen (185–254 C.E.), who learned philosophy in Alexandria where a fellow pupil was Plotinus, the founder of Neo-Platonism, the mystical interpretation of Plato which was to be the last great school of pagan philosophy. After teaching for a period in Alexandria, Origen moved to Caesarea in Palestine where he produced, among other works, the first critical edition of the Old Testament. During the brief but violent persecution of the Christians under the emperor Decius (249–251 C.E.), Origen was tortured, and never recovered from the ordeal. Later Christian churchmen decided that Origen had married Greek philosophy a little too closely with Christianity, and judged him heretical. The same fate befell the greatest of the Latin theologians, Tertullian, who was born in Carthage in North Africa about 155 C.E., converted to Christianity about age forty, and then abandoned Catholicism for the heresy of Montanism, which was founded by a Christian in Phrygia (in western Turkey) who claimed to have a new revelation vouchsafed him by the Holy Spirit. Tertullian wrote over thirty treatises on all aspects of life, from women's fashions to sports in the arena. But the great age of Latin theology came in the fourth and fifth centuries C.E., after the empire became Christian, with men such as St. Augustine and St. Jerome.

# SIGNIFICANT PEOPLE

*in Literature*

---

## AESCHYLUS

c. 525 B.C.E.—c. 456 B.C.E.

*Poet*

**EARLY YEARS.** The tragic poet Aeschylus was born in Eleusis—now a suburb of Athens—in 525 or 524 B.C.E. and died at Gela in Sicily 68 years later. The dates of his life place him squarely in the formative period of the golden age of Greek classical culture. When he was born, Athens was ruled by a tyrant named Hippias, but following Hippias' exile in 510 B.C.E., Athens opted for a constitutional government in which political power was vested in a popular assembly where all citizens could vote. Aeschylus' formative period therefore coincided with Athens' development as a democracy. Aeschylus presented his first tragedies in the seventieth Olympiad—that is, the period between the seventieth and seventy-first Olympic Games, which puts the date between 499 and 496 B.C.E. In 490 B.C.E. Aeschylus fought at Marathon where the Athenians defeated a Persian expeditionary force that landed there, and he lost a brother in the battle. Ten years later, Aeschylus was in the thick of the naval battle off the island of Salamis where the allied Greeks defeated the Persian fleet. These experiences with the Persians in battle inspired his production of *The Persians* in 472 B.C.E. as the second of a trilogy of tragedies; the first was titled *Phineus* and the third *Glaucus Potnieus*. There was no apparent connection between the three dramas, and the satyr play which was the last play in Aeschylus' production—*Prometheus the Firebearer*—must have been a burlesque of the myth that told how Prometheus gave fire to mankind. *The Persians* differed from the other plays by Aeschylus produced on the same day because its subject was taken from contemporary history, and it was a patriotic tribute to the courage of Athens.

**AESCHYLUS AND SICILY.** A few years after Salamis, Aeschylus left Athens for Sicily, where the tyrant of Syracuse, Hiero, had founded a new city, Aetna, and wanted Aeschylus to celebrate the foundation with a drama. Aeschylus' play, *The Women of Aetna*, does not seem to have been a regular tragedy so much as a pageant honoring the new city; a couple surviving scraps of papyrus provide an inkling of what it was like. Aeschylus was

back in Athens again in 468 B.C.E. when he took part in the tragic contest and was defeated by a new tragic poet, Sophocles, who made his debut this year. The following year Aeschylus won with a trilogy on the tragic figure of Oedipus, who was fated to kill his father and marry his mother. One of these tragedies survives: the *Seven Against Thebes*, which chronicles the conflict between Oedipus' sons. In 458 B.C.E. he produced his masterpiece, the *Oresteia*, the only complete trilogy to survive, consisting of three tragedies: the *Agamemnon*, the *Libation-Bearers*, and the *Furies*. Shortly afterwards, he left Athens again for Sicily for reasons unknown. He may have been out of sympathy with some of the political developments in Athens. In any case, he died at Gela in Sicily around 456 B.C.E. According to legend, Aeschylus died when an eagle flying overhead mistook his bald head for a rock and dropped a tortoise on him to break the shell. The story is not quite credible but it supplies a piquant ending for a great tragedian. The epitaph on his monument at Gela which, according to tradition, he wrote himself, mentioned with pride that he fought in the battle of Marathon against the Persians, but omits any reference to his success as tragic poet.

## CATO

234 B.C.E.—149 B.C.E.

*Historian*

**POLITICS.** Cato was the author of the first surviving Latin prose work, and the first Roman historian to write a history of Rome in Latin. He was born at Tusculum near modern Frascati in the hills around Rome in 234 B.C.E., and spent his early years on a small farm in the country where he worked in the fields alongside the farm laborers. At seventeen, he joined the Roman army and served in the long war against the Carthaginian Hannibal which Rome did not win until 202 B.C.E. He settled in Rome about 208 B.C.E. and began his political career four years later, reaching the coveted post of consul in 195

B.C.E. He remained in many ways a small-town Italian, loyal to his native customs and shocked at the “philhellenism”—passion and imitation of everything Greek—that infected the circle centered around Scipio Africanus, the conqueror of Hannibal, and his brother Lucius Scipio. The Scipionic circle admired Greek culture and wanted to introduce it into Rome. In Cato’s eyes, the Greek way of life meant abandoning the frugality, self-discipline, and honesty that made up the Roman ideal. In 187 B.C.E. Cato managed to destroy Scipio Africanus’ political career and won election as censor in 184 B.C.E. He continued to dominate Roman politics until his death three years before the final destruction of Carthage, which Cato advocated strenuously in his last years.

**CATO’S WRITINGS.** What survives of Cato’s writing is an essay *On Agriculture* which sets forth precepts for good farming. Cato was a man who feared the gods, but he was hard-fisted and unsentimental. For instance, he advised getting rid of old slaves who could no longer do their share of work. This is the oldest surviving Latin prose. Cato also wrote a history of Rome, the *Origines*, which he began writing about 172 B.C.E. It dealt not only with the early history of Rome but also with the origins of neighboring Italian towns—hence its title “Origins.” Earlier Romans wrote histories of Rome, beginning with Fabius Pictor who wrote his history in Greek for Greek readers, but Cato was the first to write in Latin. He was also famous in his day as an orator. There is some irony to the fact that it was Cato who brought the epic poet Ennius to Rome where he became a prime mover in introducing Greek culture, and in fact, Cato in his old age, did start to study Greek himself.

## THUCYDIDES

c. 460 B.C.E.–c. 400 B.C.E.

*Historian*

**ONE OF GREECE’S GREATEST HISTORIANS.** Thucydides, who wrote a history of the Peloponnesian War between the two power blocs led by Athens and by Sparta (431–404 B.C.E.), is considered by most scholars to be the greatest historian that Greece produced, though some would give first place to his earlier contemporary, Herodotus. Yet we are not well-informed about his life.

What we know about him comes from the sparse autobiographical scraps he includes in his *History* and a brief, unreliable *Life* written by someone called Marcellinus. From these sources we can infer a birthdate and date of his death, which was probably sudden and unexpected, for his *History* breaks off in mid-sentence in the winter of 411 B.C.E. He belonged to the upper crust in Athens, and his family had an interest in a mine in Thrace which brought him a regular income. When plague smote Athens in 430 B.C.E. he took ill, but recovered and used the experience to write a clinical description of the disease. In 424 B.C.E., he was elected one of the ten generals whom the Athenians chose each year, and thanks in part to his failure of leadership, the strategic city of Amphipolis in northern Greece fell to Sparta. He was exiled from Athens for his nonsuccess, and remained in exile until the war between Athens and Sparta ended. Though his exile removed him from Athens, it gave him a better opportunity to collect information from the rest of Greece. His standards for source evaluation were high—if he did not witness an event himself, he sought reliable eyewitnesses. He lived to see the end of the war, but he left his work unfinished, and parts of it unrevised. The circumstances of his death are unknown. He was, however, buried in the family vault of the Athenian statesman Cimon who was Pericles’ conservative rival at the start of Pericles’ career. Despite his familial association with the anti-Periclean camp, he became a supporter of Pericles in his mature years because he admired his ability to hold the radical elements of the Athenian democracy in check.

**WROTE ON THE PELOPONNESIAN WAR.** Thucydides states in the introduction to his *History* that he realized at the start of the Peloponnesian War that it would be the greatest war that Greece had ever known, surpassing the Trojan War and the war against Persia. Both the adversaries were at the height of their power, and before the war ended, it involved both Sicily and Persia. Yet the war was to prove that unexpected events could upset the best plans. The plague that smote Athens in 430 B.C.E. sapped her strength. The great Athenian leader, Pericles, took ill, and though he survived the immediate onset of the plague, he died of its aftereffects in 429 B.C.E. Thucydides recognized his death as a turning point in Athens’ fortunes, for none of the politicians who followed him enjoyed the broad measure of support that he did. In fact, there is a subtle anti-democratic bias in Thucydides’ *History*; he clearly doubted the ability of a government to conduct war wisely when an assembly of all the citizens made the decisions, as was the case in Athens. Yet he admired the indomitable spirit of Athens.

After the Athenians suffered a disastrous loss of their entire expeditionary force in Sicily in 413 B.C.E. in their campaign to conquer Syracuse (modern Siracusa), they still fought on, and might still have won if Persia had not supplied Sparta with the funds to build a fleet. Thucydides clearly intended to finish the story, but his *History* ends abruptly in 411 B.C.E. Various reasons have been suggested to explain why the *History* is incomplete, but the most likely one is that he died suddenly. Someone took the unfinished work and published it after Thucydides' death. It is a profound study of war and the effect of the stress of war upon civil society. There are also overtones of tragedy to it. Like a protagonist (chief player) in a Greek tragedy, the Athenian democracy entered the war, overconfident, and was brought low by a number of ill-considered moves. Yet the workings of fate also lurked behind the defeat of Athens. Not even the best-laid plans could have foreseen the plague and the death of Pericles.

#### VERGIL

70 B.C.E.–19 B.C.E.

*Poet*

**THE MAKING OF THE POET.** Vergil was born in 70 B.C.E. at Andes, probably modern Pietole, in the valley of the River Po in northern Italy. Vergil was born a provincial, for at the time of his birth, the Po Valley was still the province of Cisalpine Gaul (that is, Gaul south of the Alps) which included the whole region as far south as the Rubicon River. Roman citizenship was extended to Vergil's native region only in 49 B.C.E. Seven years later, Cisalpine Gaul was incorporated into Italy. His father was a small landowner who made money by beekeeping, and was able to send his son to Cremona, then to Milan and finally Rome to learn rhetoric and train as a lawyer, but he appeared only once in court and decided that it was not for him. Instead he went to Naples

and joined a school of philosophy run by the Epicurean, Siro. He may already have been writing poetry, for there is a group of poems—fourteen of them short and five longer works—attributed to him from this time period, but modern students of Vergil doubt that he was the author.

**THE ECGLOGUES AND THE GEORGICS.** In 42 B.C.E., disaster struck Vergil's family. Troops were demobilized after Caesar's assassins were defeated at the Battle of Philippi and in order to find land for settling them, farms in the Po Valley were confiscated, among them the landholdings of Vergil's family. They may have been restored, however, since the first of Vergil's pastoral poems known as the *Eclogues*, a conversation between the shepherds Meliboeus and Tityrus—speaking, perhaps for Vergil himself—refers to a restoration. Vergil's didactic poem on the art of husbandry, the *Georgics*—the title comes from the Greek word for farming—was written between 36 and 29 B.C.E. in honor of Vergil's patron and friend, Maecenas, but it loses no opportunity to praise the emperor Augustus. Vergil, who had been born a provincial, felt no nostalgia for the old Roman republic which had misgoverned the Roman provinces and he appreciated the achievement of Augustus who sought to establish law, order, and good government in Italy and the empire.

**THE AENEID.** Augustus wanted an epic in praise of himself, and Vergil undertook the task. He chose the Trojan hero Aeneas as his subject, for the Julian family to which Augustus belonged claimed Aeneas as its forebear. Vergil spent the last ten years of his life writing the *Aeneid*. In 19 B.C.E. he set out for Greece, intending to spend three years traveling in Greece and Asia and completing the *Aeneid*, and to immerse himself in philosophy for the remainder of his life. But in Athens he met the emperor Augustus and was persuaded to return to Italy with him. He fell ill on the journey and was brought back to Italy only to die in Brundisium (modern Brindisi), the favorite harbor for ships crossing the Adriatic Sea from Greece. Vergil had asked his literary executors Varius and Tucca to burn his unfinished *Aeneid* but Augustus ordered them to ignore this instruction and instead to publish the poem in its unfinished state. In places, the poem shows some lack of finish, but time has vindicated Augustus' command. The *Aeneid* became the national epic of the Roman Empire. The character of Aeneas, a Trojan warrior who fought against the Greeks in the legendary Trojan War, escapes from Troy after it is sacked; he endures many hardships in a journey which eventually takes him to pre-Roman Italy, where he lays the foundation for the future greatness of Rome. The

fact that Vergil highlights Aeneas' "foreignness" in the work is curious; he began writing the *Aeneid* only a year after the Battle of Actium, portrayed in Augustus' propaganda as a victory of Italian values over the effete east, represented by Cleopatra. Yet Aeneas is an Asian himself, and the epic ends with his pitiless slaying of Turnus, the leader of the Italian resistance to his invasion. Yet the final settlement, which is approved by Jupiter, ordains that the Asian Trojans will be assimilated. They will give up their language and adopt Latin, and even the gods of Rome will bear Jupiter's mark of approval. They will not be Trojan gods. Aeneas and his Trojan followers do not found a new Troy in Italy. Instead they set an example of assimilation to the idea of Rome for the various nationalities that will later make up the Roman citizen body.

## DOCUMENTARY SOURCES *in Literature*

Aeschylus, *Oresteia* (525–456 B.C.E.)—The *Oresteia* is made up of three tragic plays: the *Agamemnon*, the *Choephoroe* and the *Eumenides*. It is the only complete trilogy of Greek tragedies to survive from antiquity, and its theme is vengeance and counter-vengeance concerning a blood feud within the family of Agamemnon.

Alcaeus of Lesbos (c. 620–after 580 B.C.E.)—Alcaeus was a lyric poet who wrote songs generally for solo performance: drinking-songs, hymns to the gods, love lyrics, and poems on contemporary politics. Only fragments of his works survive.

Apollonius Rhodius, *The Argonautica* (c. 260–247 B.C.E.)—This work is an epic poem on the story of Jason and his quest for the Golden Fleece, written in a period when long epics were out of style.

Aristophanes, *The Clouds* (423 B.C.E.)—Written in the "Old Comedy" style of playwriting, *The Clouds* avoids the political themes of other Athenian plays and instead satirizes Socrates and the education that he offered the Athenian youth.

Cornelius Tacitus, *Histories* (after 96 C.E., *Annals* (after 115 C.E.))—The *Histories* and the *Annals* together, when complete, covered the history of the first century C.E. from the perspective of a Roman who thought that liberty had perished along with the republic which Julius Caesar overthrew.

Demosthenes, *On the Crown* (330 B.C.E.)—This speech was delivered in a court of law as Demosthenes' defense of his anti-Macedonian political policies of the previous 25 years. Written down and published, it is considered to be the masterpiece of the greatest Athenian orator of the fourth century B.C.E.

Euripides, *Medea* (431 B.C.E.)—This tragic play is famous for its psychological insight in its portrayal of a woman who has suffered wrong.

Herodotus of Halicarnassus, *The Histories* (c. 425 B.C.E.)—This work of history, covering the rise of the Persian Empire and its clash with Greece in 480–479 B.C.E., earned Herodotus the title "Father of History."

Hesiod, *Works and Days* (c. 700 B.C.E.)—Hesiod's *Works and Days* gives insight into the life of a small farmer in early Greece.

Homer, the *Iliad* (c. 700 B.C.E.)—This epic centering on an incident in the Trojan War represents the culmination of the epic oral tradition in Greece. Also attributed to Homer was the *Odyssey*, the tale of how the hero Odysseus returned home after the Trojan War.

Petronius Arbitrator, *Satyricon* (c. 60–65 B.C.E.)—An elegant voluptuary at the emperor Nero's court, Petronius wrote a long novel which is unique in Latin literature—nothing like it exists in Greek literature—which recounts the adventures of three young rascals in southern Italy. Fragments survive, including a long description of a feast given by a rich freedman, Trimalchio.

Pindar, *Epinician Odes* ("Victory Odes") (518–438 B.C.E.)—These lyric poems, written to commemorate athletic victories at the Olympian, Pythian, Nemean or Isthmian Games, are the only ones to have survived complete from the many Pindar wrote.

Publius Vergilius Maro, *Aeneid* (30–19 B.C.E.)—Generally considered Rome's greatest poet, Vergil's masterpiece is the *Aeneid*, which tells the story of how the Trojan

hero Aeneas escaped from Troy, landed in Italy, and founded the royal line that would eventually produce Romulus and Remus, the founders of Rome.

Quintus Ennius, *The Annals* (c. 170 B.C.E.)—Playwright, satirist and epic poet, Ennius introduced the Greek meter used by Homer, the dactylic hexameter into Latin in his epic, *Annals* which told the history of Rome in verse up to 171 B.C.E., the year before his death.

Quintus Horatius Flaccus (Horace), *Epodes* (41–31 B.C.E.)—Sappho was the head of a *thiasos* (sisterhood) which honored Aphrodite and the nine Muses. One complete poem and fragments of others now survive of the seven books of her collected poems.

Sophocles, *Oedipus the King* (c. 429–425 B.C.E.)—This tragic play was considered by Aristotle to be a model Greek tragedy.

Thucydides, *History of the Peloponnesian War* (c. 400 B.C.E.)—This clinical account of the war between the Athenian Empire and the Spartan coalition (431–404 B.C.E.) broke off in mid-sentence in the year 411, probably interrupted by Thucydides' death.

Titus Livius, *History of Rome from its Foundation* (c. 28 B.C.E.–17 C.E.)—Livy's *History*, composed in 142 books, is a monumental work covering the rise of Rome from its foundation to 9 B.C.E. when the emperor Augustus' stepson, Drusus, died. Only thirty-five books have survived.

Titus Lucretius Carus, *The Nature of Things* (65–55 B.C.E.)—This unfinished epic poem expounded the theory that the universe is made up of atoms and void, and therefore men and women do not need to fear death, for it is only a dissolution of the atoms that make up the human body and soul.

## IMPORTANT EVENTS in Music

- c. 2800 B.C.E. –c. 1100 B.C.E. During the Aegean Bronze Age, musicians and musical instruments are depicted in frescoes, on vases and seal stones, and in sculpture. Fragments of lyres, pipes, percussion instruments, and triton horns survive from this period.
- c. 2200 B.C.E. Figurines from the Cycladic Islands depict Bronze-Age Aegean musicians holding the frame harp, the *aulos* (reed pipe), and the *syrix* (pan-pipe).
- c. 1490 B.C.E. A Bronze-Age painted sarcophagus from Ayia Triada, Crete, illustrates musicians playing the *phorminx* (lyre) and *aulos* during a ritual sacrifice.
- c. 1100 B.C.E. A miniature bronze votive *kithara* (lyre) from the Sanctuary of Apollo at Amyklai (near Sparta) is the earliest representation of the type that would become popular in the classical period (480–323 B.C.E.).
- c. 800 B.C.E. –c. 700 B.C.E. During the Early Archaic Period, the Homeric epics *Iliad* and *Odyssey*, the Homeric Hymns, and the poet Hesiod describe musicians, instruments, and musical contexts. Phemios and Demodokos, two of Homer's *aoidoi* (professional bards), perform at the palaces of Odysseus and the Phaiakians in the *Odyssey*.
- c. 750 B.C.E. –c. 550 B.C.E. Greeks colonize southern Italy and eastern Sicily; musicians, poets, and composers bring Greek musical culture to Syracuse and other cities in Magna Graecia.
- c. 676 B.C.E. –c. 673 B.C.E. Music schools are established in Sparta by Terpander of Lesbos and Thaletas of Gortyn.
- The virtuoso composer and *kitharode* Terpander wins the musical competition at the first Karneia festival of Apollo and four successive victories at the Pythian Games.
- c. 654 B.C.E. –c. 611 B.C.E. Lyric poet Alcman lives in Sparta and composes his *Partheneia* (“Maiden’s Dance”).
- The island of Lesbos becomes a second music center.
- c. 628 B.C.E. –c. 625 B.C.E. Arion of Lesbos teaches the Corinthian choirs to perform the dithyramb (male choral dance), which he invented. The tragic chorus is said to have developed from his type of dithyramb.
- c. 612 B.C.E. The most famous female poet, Sappho, is born on Lesbos. At her hometown of Mytilene she composes lyrical songs, usually monodies and choral dances, and is the leader of a circle of girls and young women; the *barbitos* (a low-pitched lyre) and other instruments accompany the music.
- c. 632 B.C.E. –c. 556 B.C.E. The composer Stesichorus (born Teisias) sets up the first tragic chorus and is known for his use of the *Harmateios nomos* (“Chariot melody”) and the *Nomos of Athena* in the Phrygian mode, which tells the story of the birth of Athena in full armor from the head of Zeus.
- c. 625 B.C.E. –c. 585 B.C.E. The dithyramb (male choral dance) is invented by kitharode Arion of Lesbos during the time of the tyrant Periander at Corinth.
- c. 600 B.C.E. –c. 500 B.C.E. Tyrants reform festivals, and attract talented musicians to their cities: at Corinth, Periander supports Arion, who creates the dithyramb; at Sicyon, Cleisthenes ends performances of rhapsodes and paves the way for classical tragedy; and Pisistratus institutes the festival of the City Dionysia in Athens,

- a central feature of which are dithyrambic, tragic, and comic contests.
- Thespis produces the first tragedy in Athens by adding a speaker to interact with the chorus.
- Under Hipparchus, Pisistratus' son, the poets Anacreon, Lasus of Hermione, and Simonides flourish. Hipparchus develops the rhapsodes' competition at the Great Panathenaea into an organized serial performance of the entire *Iliad* and *Odyssey*.
- 586 B.C.E. New contests for *aulodes* and *auletes* are added at the Pythian Games. The *aulode* Echembrotus of Arcadia wins a bronze tripod cauldron.
- The *aulete* (piper) Sakadas of Argos wins a prize at the music contest at the Pythian Games. He will win prizes at the next two Games, and become known for his *Pythikos nomos* ("Pythian Composition") in which he interprets the defeat of the serpent Pytho by Apollo at Delphi.
- Argos becomes a center of musical excellence.
- 574 B.C.E. Pythocritus of Sicyon wins six Pythian victories on the aulos.  
–554 B.C.E.
- c. 560 B.C.E. The philosopher, mathematician, and scientist Pythagoras is born. He later founds a school at Croton where he and his followers study acoustical and musical phenomena.
- 566 B.C.E. The Panathenaea festival at Athens is reorganized on a grander scale and includes music competitions for rhapsodes, kitharodes, aulodes, and auletes.
- 558 B.C.E. Unaccompanied kithara-playing is added to the Pythian music competition. Age-laus of Tegea is the first victor.
- c. 520 B.C.E. The east-Greek poet Anacreon's presence in Athens prompts a series of vase-paintings that depict Ionian influence
- in Athenian music. In one image a singer holds a *barbitos* (an Ionian-style lyre) with Anacreon's name on it.
- 518 B.C.E. The poet Pindar, the most celebrated of all lyric poets of ancient Greece, is born near Thebes in Boeotia (d. 438). He is most famous for his epinikian odes composed for victors at the four athletic games: Pythian, Nemean, Isthmian, and Olympic.
- c. 508 B.C.E. Lasus introduces the dithyrambic competition in Athens.
- c. 500 B.C.E. Democratic Athens is the center of all intellectual and cultural activity in Greece. In this city, tragedians Aeschylus, Phrynichus, Sophocles, Euripides, and Agathon produce their dramas in the theater of Dionysus during the City Dionysia; comic playwright Aristophanes lampoons Athenian politics and culture; and poets Lasus, Simonides, Bacchylides, Pindar, Melanippides, Timotheus, Philoxenus, and Cinesias compose dithyrambs for Athenian choruses and so-called "New Music."
- 478 B.C.E. Hieron, tyrant of Syracuse in Sicily, makes his city a haven for artists, poets, and musicians from all over Greece. His hospitality toward Pindar is so appreciated that the poet composes a eulogy for him.  
–467 B.C.E.
- c. 475 B.C.E. The first concert hall in the Western world—the Odeion—is commissioned by the Athenian statesman Themistocles for musical contests held during the Great Panathenaea. It stands in the Athenian marketplace.
- 474 B.C.E. Hieron defeats the Etruscans at Cumae and begins his rule at Syracuse, during which time he entertains Aeschylus, Pindar, and other Greek artists and musicians.
- c. 470 B.C.E. The Etruscans build the so-called "Tomb of the Leopards" and "Tomb of the Triclinium" in Tarquinia, northern Italy, and paint the walls with a

- funerary banquet scene featuring men and women dancing to the music of the *aulos* (reed pipe) and a six-stringed *chelys* (tortoise-shell) lyre.
- c. 450 B.C.E. Several different forms of harp begin to appear in Athenian vase-paintings, although it was a familiar instrument to Anacreon before this time.
- c. 435 B.C.E. The noted dithyrambist Philoxenus of Cythera is born. His most famous work will be the *Cyclops* (also called *Polyphemus and Galatea*).
- 443 B.C.E. Damon, one of the greatest intellects of his time, publishes an essay in which he argues that musical modes and rhythms are intimately connected with ethical qualities, and the state should concern itself with the regulation of music and music education. His ideas influence Plato's and Aristotle's attitudes regarding the *ethos* of music in their discussion of music education.
- c. 430 B.C.E.
- c. 427 B.C.E. The philosopher Plato is born. He will discuss the character and role of music in many of his works, most notably in the *Timaeus*, *Republic*, and *Laws*.
- c. 420 B.C.E. The musician Timotheus of Miletus beats his teacher, the eminent Phrynis, in a music competition. Several hundred lines of his kitharodic composition *Persians* survive, along with an epilogue containing prayers to Apollo and a manifesto praising his own talent and originality.
- 416 B.C.E. The tragedian and composer Agathon wins first place in the dramatic contest at the Lenaea in Athens. He is later satirized by Aristophanes in his *Thesmophoriazousae* but treated with much affection in Plato's *Symposium*.
- 410 B.C.E. The witty kitharist Stratoniceus of Athens is active, along with a host of other virtuoso performers whose showmanship captivates audiences, including Chrysgonus, hired to pipe the rowing stroke for the naval general Alcibiades' crew;
- the aulete Pronomus of Thebes, shown on a vase (in the Museo Nazionale in Naples) playing before a crowd of actors, wearing an ornate robe and a garland on his head; and Antigeneidas, another aulete from Thebes, described by the writer Apuleius as a "honey-sweet melodizer of every word and a practiced player of every mode" (*Flor.* 4).
- 402 B.C.E. Kitharodes, the most popular with the crowds, win the largest prizes at major competitions; the list of prizes includes: a gold crown weighing 85 drachmas, a crown worth 1,000 silver drachmas, and 500 drachmas in cash; other kitharode prizes are worth 700, 600, 400, and 300 drachmas, respectively. There are two prizes for aulodes (300 and 100 drachmas) and three for kitharists.
- c. 400 B.C.E. Alexander the Great's five-day wedding celebration in Susa features entertainment by a rhapsode, three psilokitharists, two kitharodes, two aulodes, five auletes (who played the Terpandrian *Pythikos nomos*) and then accompanied choruses, three tragic and three comic actors, and a harpist.
- c. 300 B.C.E.
- 392 B.C.E. Aristophanes produces his last surviving comedies *Ecclesiazusae* (Women in the Assembly) and *Plutus* (Wealth), in which the part of the chorus has been much reduced and is no longer written by the playwright; instead of choral lyrics, the word "KHOROU" ("interlude by chorus") appears. Solo song and piping continue as central musical elements in the play.
- 388 B.C.E.
- 343 B.C.E. Aristotle discusses the character and purpose of music in his *Politics* and *Problems*. The music theorist Aristoxenus becomes one of his prize pupils.
- c. 333 B.C.E. Aristoxenus is a pupil of Aristotle in Athens and writes many books and essays, the most influential of which are the *Harmonika stoikheia* (Harmonic Elements) and *Rhythmika stoikheia* (Rhythmic Elements).

- 319 B.C.E. The boy's chorus of the Cecropid tribe wins the dithyramb contest at the Great Dionysia in Athens with a rendition of Timotheus' composition *Elpenor*.
- 316 B.C.E. *Dyskolos* (Grouch), the one complete surviving play of comic writer Menander, is produced; it features four choral interludes indicated by the word "KHOROU" between the five acts. At line 879 a stage direction "the aulos-player plays" and a change in rhythm indicates additional musical content.
- 311 B.C.E. Roman censor Appius Claudius Caecus deprives the Etruscan artists' guild (*collegium*) the right to dine at the public expense in the Temple of Jupiter after performing at the religious festivals; they protest by marching out of Rome to Tibur (eighteen miles away), and eventually win back their free dinners.
- c. 300 B.C.E. New dramatic and musical competitions are added to the Nemean and Isthmian Games.
- c. 200 B.C.E. Kitharode Nicocles of Tarentum records his victories at the Pythian and Isthmian Games, Great Panathenaea, the Lenaea (in a dithyramb), the Hecatombaia, the Helieia, and royal festivals in Macedonia and Alexandria.
- Artists come together in several cities in Greece, Alexandria, and Sicily to form professional organizations known as *technitai Dionysou* (Artists of Dionysus), which formed guilds (*koina*, or later *synodoi*). They provide musicians, composers, conductors, and teachers for religious festivals and secular events.
- 290 B.C.E. The *technitai* ("artists guild") forms in –280 Athens to produce shows in various cities. The rival Isthmian-Nemean guild is established in the north-east Peloponnese; both establish relations with Delphi.
- c. 270 B.C.E. Ktesibios of Alexandria invents the pneumatic pump and the water-organ (Greek *hydraulis*).
- 235 B.C.E. A major artists' guild appears in Teos, which serves Ionia and the Hellespont.
- 211 B.C.E. The Isthmian-Nemean guild is invited to participate in several festivals, including the festival of the Muses at Thespieae, at Thebes, on the island of Delos, and around the Peloponnese.
- 205 B.C.E. Kitharode Pylades of Megalopolis performs Timotheus' *Persians* at the Nemean Games.
- c. 200 B.C.E. New music is performed alongside –c. 100 B.C.E. revivals of old standards and selections from fifth-century tragic poets, especially Euripides.
- c. 194 B.C.E. Satyrus of Samos, a famous aulete, wins the prize, and gives an encore performance selected from Euripides' tragedy *Bacchae*.
- 191 B.C.E. Plautus produces his comedy *Pseudolus* (The Cheat), which, like many of his other plays, integrates polymetric *cantica* (solo songs) accompanied by different types of *tibiae* (reed pipe) and instrumental pipe music into the plot, along with musical interludes between scenes.
- 170 B.C.E. Meneceles, an envoy from Teos, –150 B.C.E. performs works of Timotheus and Polyidus at Knossos and Priansos, Crete.
- 163 B.C.E. Terence produces his comedy *Heautontimoroumenos* (The Self-Tormentor), the structure of which depends completely on musical accompaniment by a *tibicen* (reed player).
- 127 B.C.E. Members of the Athenian guild participate in the Pythaid religious pilgrimage from Athens to Delphi. The group consists of epic and dramatic poets, rhapsodes, actors, instrumentalists, singers, and, in 127, a large choir to sing the paean to Apollo; the notated music of the paeans composed for this occasion by kitharist Limenius and singer Athenaeus is inscribed on the wall of the Treasury of the Athenians.

- 118 B.C.E. The Delphians honor two musicians from Arcadia who trained boys' choruses to perform bits from the "old poets."
- 90 B.C.E. A Cretan organist named Antipatros awes his audience at Delphi; he is awarded prizes at the Pythian Games and earns civic honors for himself and his descendants.
- c. 27 B.C.E. The Roman architect Vitruvius dies. In Book Five of his work *De architectura* he discusses acoustics in relation to the design of the theater auditorium, and translates the works of Greek music theorist Aristoxenus into Latin, explaining the system of *harmonia* (tetrachord system) to his Roman readers.
- 26 B.C.E. Vergil composes his epic for Augustus, the *Aeneid*, in which he describes a type of Phrygian *aulos* and other musical instruments and contexts.
- 19 B.C.E.
- 22 B.C.E. Pylas of Cilicia introduces pantomime in Rome, which consists of re-creations in performance by solo dancers of scenes from myth and history; musical accompaniment is provided by a chorus and orchestra of pipes, lyres, and percussion instruments.
- 17 B.C.E. The Latin poet Horace's *Carmen Saeculare* is performed by a choir of 27 girls and 27 boys; commissioned by the emperor Augustus for Rome's Centennial Games, it is the only known poem of Horace's to have been set to music.
- 54 C.E. Nero, a seventeen-year old art enthusiast who sings, acts, and plays the *kithara* and the organ, becomes emperor of Rome.
- 79 C.E. Vesuvius erupts and buries Pompeii and Herculaneum, preserving a number of frescoes with musical scenes.
- c. 100 C.E. The Roman orator Quintilian dies. In his work *Institutio oratoria*, he discusses music as part of his instructions on how to properly train an orator.
- 117 C.E. Hadrian becomes emperor of Rome after the death of Trajan. A very cultured man who was heavily influenced by Greek ideals, he employed a Cretan *kitharode* named Mesomedes to compose hymns; several fragments with musical notation survive in medieval manuscripts.
- c. 127 C.E. Astronomer and mathematician Claudius Ptolemy is writing in Alexandria. Among his many books is the *Harmonika*, a systematic treatment of the mathematical theory of harmony.
- 148 C.E.
- c. 200 C.E. Gladiators fight to the accompaniment of an organist, trumpeters, and hornblowers. The organ also is used in religious festivals.
- c. 300 C.E.
- c. 250 C.E. Two important music theorists are publishing their works: Aristides Quintilianus, *De musica* (Greek title *peri mousikes*); and Gaudentius, *Harmonica introductio* (Greek *Harmonike eisagoge*).
- c. 350 C.E.
- c. 300 C.E. Alypius, a younger contemporary of Aristides Quintilianus, compiles his *Introductio musica*, which contains the most complete record of the notational symbols.
- 384 C.E. The emperor Carinus organizes a concert in Rome with a hundred trumpet players, a hundred horn players, and two hundred *tibicens* (reed-pipe players).
- 387 C.E. Augustine, Latin philosopher and distinguished church father, writes *De musica*, in which he discusses meter and versification. Ten years later he ponders the ethics of music in church in his autobiographical *Confessions* (397–400), asking whether the worshipper should be moved by the singing, or the song itself.
- 389 C.E.

## OVERVIEW of Music

**THE ROOT OF WESTERN MUSIC.** The modern word “music,” and indeed most of the terms and concepts associated with music—melody, harmony, symphony, orchestra, chorus, ode, hymn, paean, and rhythm, for example—are Greek. Western music is rooted in the Greek concept of *mousike technē*, “the craft of the Muses.” The term *mousike* referred to poetry and dance as well as music, thus all three are linked in Greek culture. Although the Greeks themselves were influenced by Near Eastern, Anatolian, and Egyptian musical traditions, it is the poets, philosophers, and theorists of Greece whose musical writings had the most profound influence on later cultures; the Romans followed the lead of the Greeks, as did the early Christians.

**VITAL PART OF ANCIENT LIFE.** Art and archaeological evidence, literature, theoretical writings, and a few surviving fragments of musical compositions all demonstrate that music was a vital part of public, private, sacred, and secular life in ancient Greece and Rome. Choral dance and song, theatrical and solo performance, and musical competitions filled the calendar year. Ordinary men and women sang as they performed their everyday chores of weaving, making wine, or harvesting grain; professional bards and virtuosos performed for a living to small groups at parties as well as to large audiences at festivals. Music was, however, not solely for entertainment. Because of its connection with the gods, especially the Muses—goddesses who, according to the Archaic Greek poets Homer and Hesiod, legitimize and validate the truth of myths—music itself was considered divine; it played a central role in Greek and Roman religion, which can best be described as polytheistic, employing a combination of myth (sacred storytelling) and ceremonial rituals. Music was an integral part of all important ceremonial rites of passage in Greek and Roman culture: birth, coming of age, wedding, death, and funeral.

**EARLY DEVELOPMENT.** Music was already very much a part of social and religious life in prehistoric

Greece. As early as the third millennium B.C.E., musicians playing instruments such as the harp, the *aulos* (double-reed pipe), and the *syrinx* (a type of flute) are depicted in art, most notably marble and ivory figurines found in graves. By the second millennium, the so-called Mycenaean Period, many of the instruments that were popular later in Greek and Roman history—the *phorminx* (lyre), *sistrum* (rattle), and *triton* (trumpet)—had already made their appearance. Singers and musical instruments again appear in the two most important poems of the eighth century B.C.E., Homer’s *Iliad* and *Odyssey*. These heroic epics provided the musical link between the Mycenaean and the Archaic period of Greece, for the professional bards described in the poems still sung to the accompaniment of the *phorminx*. A century later, the lyric poets Terpander and Archilochus sung Homeric poetry to a more elaborate lyre—the *kithara*—and other solo performers—the *rhapsodoi*—recited the poems at festivals without any musical accompaniment at all.

**MUSIC EDUCATION.** Music education came to be considered by the Greek and Roman writers as essential for civilized people as mathematics and athletics. The earliest music schools are said to have been established in the town of Sparta in southern Greece sometime between the eighth and seventh centuries B.C.E. by the musicians Terpander of Lesbos, Thaletas of Gortyn, and Sacadas of Argos. Terpander, perhaps the most famous *kitharode* (kithara-player), organized and won the first major music competition in Sparta; he is one of the earliest known musical masters, credited also with adding strings to the *kithara*, composing, and perfecting composition and performance techniques for a variety of instruments. He is also said to have invented the categories of *nomoi* (tunes, melodies, laws, customs) used by poets to classify types of songs in a singer’s repertory and to refer to specific melodic compositions, either for a particular instrument (kitharodic), a composer (the Terpanorean), or even a deity. The word *nomos* was originally used to refer to unique melodies or types of tunes attached to a particular region or village; each *nomos* thus maintained unique characteristics.

**CENTERS FOR MUSIC.** Between the seventh to the sixth centuries B.C.E., the island of Lesbos, near the coast of ancient Asia Minor (now Turkey), became another center of music and poetry in Greece. The poets from Lesbos, most notably Alcaeus and Sappho, were influenced by melodic forms from Lydia and Phrygia in the East, and their musical compositions had an Eastern flavor. Together with the *dithyramb*, a ritual choral dance in honor of Dionysus, solo virtuoso playing and

accompaniment to song or recitation was occurring with ever-increasing popularity. By the fifth century B.C.E., the democratic city of Athens was the most powerful *polis* (city-state) in Greece, and had become the center of Greek intellectual and cultural life. During the classical period (480–323 B.C.E.) in Greek history, competitions formed a part of the Olympian, Nemean, Pythian (at Delphi), and Isthmian (near Corinth) festivals, and poets, including the renowned poet Pindar, composed *epinikia* for the victors—elaborate lyric poems of praise—to be sung by a chorus with musical accompaniment. The playwrights Aeschylus, Sophocles, and Euripides produced their dramas, or *tragoidia* (tragedies), in the amphitheater of Dionysus at the foot of the Acropolis as part of the City Festival of Dionysus. Music, especially choral dance and song, played a central role in the tradition of Greek theater, which included not only tragedy, but also comedy and “satyr plays” (satire); indeed the words for “tragedy” and “comedy”—*tragoidos* and *komoidos*—both contain the word for “song,” *oidos*.

**INNOVATIONS.** New types of musical genres and innovations continued to emerge in the fourth and third centuries B.C.E. Especially popular were performances by solo virtuosos—*rhapsodoi* and *tragodoi*—who sang or recited Homeric epic, lyric, or dramatic poetry, often to the musical accompaniment of a band. Perhaps the most important contribution to music in the late third century was the invention of the *hydraulis* (water-organ) by the engineer Ktesibios. Originally designed as a mechanical water pump, the *hydraulis* became a popular musical instrument in Rome and later in the Christian church. The modern pipe organ derives from this early mechanical hydraulic machine.

**ROMAN MUSIC.** The Romans, ever practical, were not very original when it came to music. Aside from some indigenous Etruscan ritual songs and musical instruments, the Romans generally looked to the Greeks for instruction and inspiration. It is safe to say that once Greece becomes part of the Roman Empire in the third century B.C.E., it becomes difficult to distinguish Greek from Roman musical expression. Roman musical instruments, such as the popular *tibia* (a version of the Greek *aulos*), the *fistula* (pan-pipe), and even the true flute, were variations on Greek instrument types. The Greek *kithara* remained the most popular instrument in Rome, and was enlarged in size. As in Greece, military music played a central role in Roman life. A wide variety of wind instruments blared in marching bands: *kerata* (cow horns), *salpinges* (ivory or bronze trumpets), *cornu* (circular horn), and *tuba* (brass tuba). Although the Romans adopted, and then adapted, Greek forms of

epic, lyric, tragedy, and comedy, very little is known about the role that music played in their versions. The comedies of Plautus and Terence in the second century B.C.E. featured a spoken, rather than sung version of the Greek chorus, and included the *canticum*, a scene enacted in sing-song manner to the accompaniment of the tibia. Mime and pantomime were invented and added to the repertoire in the Roman Period, around the first century B.C.E., and the Roman architect and engineer Vitruvius improved the acoustics in theaters with his theory of sound waves.

**MUSIC AND PHILOSOPHY.** In Greek and Roman religion, the myths of heroes and gods not only featured music and musical competitions, but also explained the origin of certain melodies, rhythms, and instruments. The Greeks and Romans believed that music had an effect on moral behavior, and writings from the time period demonstrate a concern that certain types of music might lead young people down the wrong path. The gods Apollo and Dionysus (Roman Bacchus) represented complementary aspects of the human psyche, and thus were especially important in the philosophy of music education. Early Greek philosophers and theorists—especially Damon, Plato, and Aristotle—carefully examined the aesthetic, ethical, and moral qualities of different types of melodies and rhythms. The mathematician Pythagoras (c. 560–470 B.C.E.), who also studied melodies and rhythms, is said to have invented what is now called “acoustic theory” in teaching that the same numerical laws that governed the universe also governed music and, by extension, the soul.

**MUSIC COMPOSITION.** There are countless references to music, musicians, and musical forms in Greek and Roman literature and art. Between 23 and 51 actual notated musical compositions survive, depending on the definition of “composition.” They exist on papyrus, on stone, and in manuscripts. Many are fragmentary, and most date from the relatively late periods between the third century B.C.E. and the fourth century C.E. The texts include hymns and paens to divinities, lines of poetry and drama, and choral song. It is difficult, but not impossible, to read these compositions. Sometime in the fifth century B.C.E., the Greeks developed the science of acoustic theory, the tetrachord scale system, and musical terminology, which served as the foundations for the composition, performance, and the study of music in later periods. Although very little of what modern scholars would call “music theory” proper has survived, a few theoretical works assist in interpreting the surviving fragments. These theoretical treatises and handbooks span a period of about 800 years, from the earliest—Aristox-

enus (c. 375–320 B.C.E.)—to the latest—Alypius (c. 450 C.E.). These works explain and describe musical systems, genres of melody, tunings, *tonoi* (scales), and rhythm, and discuss various philosophical problems in music, such as ethics, and the proper use of music in education. The application of these in composition and performance may be unclear, but the surviving ancient theoretical corpus (especially the Aristoxenian tradition) does a remarkable job of constructing discrete categories for dissecting the phenomena of music, categories still used to some extent in modern musical analysis.

**MUSICAL NOTATION.** Ancient Greek and Roman music was composed and transmitted aurally, without the need for writing, but a standard alphabetic form of musical notation was in limited use by the mid-third century B.C.E. In the surviving musical examples, these notation symbols are placed over the words of the song, probably to indicate the melody, but sometimes they are interspersed between passages of text, to indicate a passage for instruments. There are also a few notated passages without any text. Most of the modern knowledge about notation is found in the tables of Alypius, a music theorist of the late fourth or fifth century C.E. who wrote down the names of all the notes and notation symbols for the two-octave scale, or “Greater Perfect System” in fifteen *tonoi* (“keys”). Notation was clearly used by professionals only. Music was primarily an oral tradition even into the latest periods, passed on from grandparent to child, master to pupil. In the same way that Gregorian Chant was derived from an oral tradition, and remained primarily that through the medieval period, Greek and Roman music thrived for centuries without the aid of written notation or theory.

**CONNECTION TO POETRY.** Ancient Greek music was primarily monophonic—melody without harmony or counterpoint. By the seventh century B.C.E., composers such as Archilochus were employing heterophony (instrumental or singer embellishment), modulation, mixed rhythms, and combining text with music. It is probable that music was improvised, not thoroughly composed. The Greeks used the word *melos* for a simple “song,” either vocal or instrumental, while the Romans used *carmina*; in its “perfect form,” the *teleion melos*, ancient Greek and Roman music was always associated with poetry and dancing. The melody and rhythm of the music was intimately connected with the rhythm of the poetic meter.

**UNDERSTANDING MUSIC FROM SURVIVING EVIDENCE.** Taken together, the theoretical writings, literary and artistic representation, and archaeological evidence

provide a reliable, if imperfect, understanding of music in Greek and Roman life. Musicologists have used the tables of Alypius and other theorists to transcribe surviving compositions into Western notation; ethnographers and acoustic scientists have reconstructed instruments based on surviving artifacts, descriptions in literature, and images in art; and recordings have been made of surviving compositions using these instruments, all in an attempt to recreate the sound of Greek and Roman music.

## TOPICS in Music

---

### MUSICAL INSTRUMENTS

**THE VOICE.** The human voice was the first and the most central of musical instruments in Greek and Roman life. Ordinary people sang while they plowed fields, harvested grain, worked wool, made wine, and tended children. There were drinking songs, hymns to the gods and heroes, laments, and wedding songs. Victors at the athletic games were awarded a song of praise; paeans rallied troops for battle. Singers competed for prizes in solo and choral song. One of the earliest depictions of singing is found on a Bronze-Age black steatite vase from Crete, dating to the second millennium B.C.E.: a group of three singers, heads thrown back and mouths open in song, march together with a group of harvesters; a *sistrum* (shaker) player keeps the beat. The first surviving reference to singing in literature comes from the *Odyssey* where the goddess Circe sang in a sweet voice as she worked at her loom. Singers were commonly portrayed on Greek vase-paintings from the sixth century B.C.E.; some paintings represent the sound emitting from the mouth in the form of little “o’s.” Epic lyric poetry was sung or recited, often to the accompaniment of musical instruments, and the few examples of surviving written music show that the poetry that would be sung was important enough to be written down even if the piece was for a solo instrument. Language itself glorified the voice as an important instrument as well. In his work *De Anima*, the philosopher Aristotle distinguished *phone* (“voice”) from *psophos* (“sound”) by noting that only animals with souls have a true voice. The Greek adjective *ligys*, or *ligyros*, was most often applied to the voice when it was tuneful, clean, and pure, like a nightingale.

**STRINGS.** Chordophones (stringed instruments) were the most basic and arguably the most important of

Drawing of a figure playing the lyre. CREATED BY CECILY EVANS. THE GALE GROUP.

the musical instruments in ancient Greece. They included four types of lyre, a variety of harps, psalteria (zithers), and, after the fourth century B.C.E., a lute-like instrument called the *pandouros*. The Romans preferred the wind instruments, but the lyre appeared in Etruscan art and continued to be popular with soloists throughout the Roman period. Ancient scholars and lexicographers, such as Pollux and Athenaeus (second century C.E.), listed and discussed the different types of lyres and harps, providing important information about their construction, tuning, and usage. In music education, Plato, Aristotle, and the later music theorists advocated the use of simple, traditional tunes on the lyre.

**THE LYRE.** Musicians used the lyre to accompany the singing of sacred hymns, as well as epic and lyric poetry, and it became the preferred instrument of solo virtuoso performers. People of all ages played the lyre for their own personal pleasure, in musical contests, at ritual ceremonies such as weddings and funerals, and at parties and festivals. In Greek myth the lyre was asso-

ciated with the Muses, Hermes, Apollo, Dionysus, and Orpheus. According to the *Homeric Hymn to Hermes*, the god Hermes fashioned the first lyre from the shell of a *chelys* (tortoise). Archaeology shows that the earliest lyres appeared in ancient Palestine and Sumeria in the third millennium B.C.E., and most likely entered Greece through trade with the Mycenaean during the Bronze Age. Earliest depictions of the Greek lyre in action come from Mycenaean Greek settlements of the second millennium, where archaeologists have found painted frescoes and sculptures depicting lyre players and women's circle dances. Lyre-players appear on Mycenaean engraved rings and seals. The Greek word for "lyre"—*lura*—refers to the family of chordophones with strings of equal length. There are four main types of lyre: the *chelys*, *barbitos*, *phorminx*, and *kithara*, each having its own particular shape, size, tuning, and social function. Basic construction consisted of a soundbox (tortoise shell or wood), to which arms and a crossbar were attached; gut strings were attached by a knot to the chordotonon (a small board on the bottom of the sound-box), passed over the bridge, and were attached to the crossbar at the top of the instrument. The number of strings varied from five to nine, with seven being the norm from the Archaic Period onward. The player could stand, sit, or walk while strumming or plucking the strings with a bone plectrum (pick). A lyre-strap helped the musician to hold the instrument in place against the chest.

**TYPES OF LYRES.** The *chelys* and the *barbitos* were small and lightweight; their bowl-shaped soundboxes did not amplify sound with much volume. They were played by amateur musicians, used for music lessons, and were preferred by the lyric poets such as Sappho for smaller, indoor group performances. Although the ancients attribute the invention of the *barbitos* to the Greek musician and poet Terpander, it is not a Greek word and most likely came to Greece from Asia Minor. The most accomplished musicians desired bigger wooden-soundbox lyres: the *phorminx* and the *kithara*. There are numerous literary and artistic references to these being more professional instruments. In Homer's *Odyssey*, two *aidoi* (professional bards) named Demodokos and Phemios perform songs of the epic cycle to the accompaniment of the *phorminx* before an audience eager to applaud "that song which is the latest to circulate among men." In the *Iliad*, the Achaean fighter Achilles sat in his tent singing "the glory of heroes" as he strummed a beautiful *phorminx* "made by an artist, with a silver bridge and a clear lovely tone" (9.185–188). Vase paintings often showed the *phorminx* with a decorative eye

on the soundbox, a feature that always distinguished it from its close relative, the kithara. In the classical period (480–323 B.C.E.), the phorminx came to be associated primarily with the cult worship of Dionysus, and the kithara was increasingly the preferred instrument for competition and virtuoso performance; it could be paired with the *aulos* (double-reed pipe) in ensemble playing. Its large wooden soundbox gave the kithara a powerful sound that made it suitable for playing outdoors, for example, during the Panathenaia (national festival of Athena) in Athens; two *kitharodes* (kithara-players), dressed in fancy costumes, are depicted marching in the Panathenaic procession on the frieze of the Parthenon temple.

**KITHARODES.** The names of several famous Greek kitharodes are known. Terpander was one of the earliest and best-known composers and performers on the instrument in the Archaic Period, while Philoxenus of Kythera and Timotheus of Miletus were the most famous in the classical period (480–323 B.C.E.). Timo-

theus claimed to have invented “eleven-stroke meters and rhythms”; this may mean that he added strings in order to embellish the melody of a song with intricate rhythmic ornamentation. Fame had its downside, however; great kitharodes were sometimes lampooned in Athenian comedies. Two famous kitharodes in Greek myth are Orpheus and Thamyris, both from Thrace. Orpheus was said to have charmed even the rocks with his playing, and Thamyris boasted that he played better than the Muses. Both died violently, but were compensated with cult worship after death. Orpheus gained the gift of prophecy, while a special type of kithara was named after Thamyris.

**THE HARP.** The harp, an instrument that was used by the Sumerians and the Egyptians in the fourth millennium B.C.E., first appeared in the Greek world during the Bronze Age about a thousand years later; a number of marble figurines from tombs in the Cycladic Islands represent the triangular harp in the arms of seated male musicians; no strings are indicated in the

statues, but a contemporary seal impression shows four. Later versions had twenty to forty strings, and were thus called “many-stringed” instruments. Harps varied in size, and appear in three basic shapes: arched, triangular, and C-shaped. Among the many names for the instrument are: *pektis*, *trigonon*, *psalterion*, *magadis*, and *sambyke*. The harp falls into the category of a psalter because it was normally played with the fingers of both hands without the aid of a plectrum (pick). The frame was of wood, and a soundbox was located at the base. Strings of unequal length were stretched from the base to the top of the harp, following the curve of the frame, and tuning pegs were either located on the base or at the top, depending on the type of harp. The Bronze-Age Greek harper figurines were all male, but by the fifth century B.C.E. harps—especially the trigonon, sambyke, pektis, and magadis—were most often described as women’s instruments; they were shown in vase-paintings as being played exclusively by women, generally in the context of a wedding or a *symposium* (men’s drinking party) together in ensemble with the aulos and the chelys. Since it was associated primarily with the feminine, and especially sensual or erotic entertainment, Plato did not consider the harp to be

an appropriate instrument for educational purposes. Professional women harpists—known as *psaltriaí* or *sambykai*—scandalized conservative Romans when they first played there.

**THE LUTE.** There was limited use for the lute in Greece and Rome, although the instrument was known in Mesopotamia as early as the third millennium B.C.E., and in Egypt soon thereafter. The name *pandouros* (“lute”) may derive from the Sumerian *pan-tur* (“little bow”). In both Egypt and the Mediterranean, the lute was another instrument primarily played by women. It is not known in Greece before the Alexandrian Period of the mid-fourth century B.C.E., when the *pandouros* appears in the arms of a group of female terracotta figurines. The instrument is also held by one of the Muses in a well-known pedestal relief sculpture on a temple to the goddess Leto built in the same century. The fourth-century comic poet Anaxilas alludes to a lute in his play *The Lyre-Maker*. It is possible that the instrument, which resembles a small guitar or a banjo, came into Greece

Greek Cycladic marble figure of a harpist from 2500 B.C.E. THE ART ARCHIVE/NATIONAL ARCHEOLOGICAL MUSEUM ATHENS/DAGLI ORTI.

during Alexander the Great's military campaigns in Persia. Constructed of wood, the pandourous consisted of a pear or triangular-shaped soundbox from which projected a fretted neck of varying length. A cord around the shoulders served as a lute-strap. Gut strings were stretched from the bottom of the soundbox to the tuning pegs on the head. The players could either sit or stand, and strummed with their right hand while fretting with their left. The number of strings varied from one to four. The theorist Pollux included the pandourous with the *trichordos* ("three-stringed") lyres, and it is likely that this very simple chordophone was also used by the Pythagoreans for acoustic research.

**WINDS.** The wind instruments—reeds, pipes, horns, and flutes—were important in ancient Greek and Roman music from the earliest periods, especially the double-reed instrument known as the *aulos*. In fact, the *aulos* appears more often in vase paintings and fresco art than any other instrument, despite the opinion of Plato and Aristotle that the instrument was not appropriate for education. Wind instruments were used in a variety of contexts: *salpinges* ("brass trumpets") and *kerata*

Drawing of a figure playing the harp. CREATED BY CECILY EVANS. THE GALE GROUP.

("horns") accompanied military processions as well as public spectacle. The Roman cavalry thundered to the sound of the *lituus* ("trumpet"); brass ensembles featured the *cornu* ("horn") and the *bucina* ("tuba"). Triton-shells were used as trumpets (or, perhaps, megaphones) by ordinary people and children; they were often imitated in stone or faience. The *aulos* was used to accompany small and large groups of singers during religious festivals, banquets, and parties, and could be played while dancing. The *aulos* was essential during the ecstatic cult worship of the gods Dionysus (Roman Bacchus) and Cybele; it is often shown being played by satyrs and silenes (oversexed woodland creatures associated with the ecstatic cult of Dionysus), and Aristotle commented that the *aulos* could arouse wild and dangerous passion. Pan-pipes (Greek *syringes*, Roman *fistula*) were played by shepherds and herdsmen. Along with iconographical and literary evidence, a good number of actual wind instruments have been recovered by archaeologists, so that scholars have a good idea of how many of them were manufactured, tuned, and played.

**THE AULOS.** The aulos was not a flute, but a single- or double-reed instrument, comparable to the oboe. Thinner than an oboe and often much longer, the aulos was usually played in pairs, one held in each hand. It commonly consisted of five parts: the *glotta* (mouth-piece), in which a reed of varying materials was housed; a three-part resonator consisting of two bulb- or oval-shaped resonators called the *holmos* and the *hupholmion*; the *bombyx* (main resonator), constructed in sections; and the *trupemata* (finger-holes). The pipe could be made of reed, ivory, bone, wood, or metal, and could be straight or have a curved bell. In vase-paintings from the sixth century B.C.E., the instrument was frequently shown strapped to the musician's face with a *phorbeia* ("halter"). The aulos (plural, *auloi*) was carried in a *sybene* ("bag"), and the reeds in a *glottokomeion* ("reed-carrier"), when not in use. In the classical period (480–323 B.C.E.) the aulos normally had five finger-holes, with one located on the bottom of the pipe for the thumb. In later Greek and Roman auloi, the holes could be covered by rotatable bands. The theorist Aristoxenus listed five sizes of auloi from highest to lowest in pitch: *parthenikoi* ("for girls," soprano), *paidikoi* ("for boys," treble), *kitharisterioi* ("for lyre-players," tenor), *teleioi* ("complete," baritone), and *hyperteleioi* ("more complete," bass).

**ORIGINS OF THE AULOS.** The writer Pollux noted a number of so-called "ethnic species" of auloi coming from Phrygia, Libya, Egypt, Thebes, and Scythia, each with its own peculiarities. The Greeks desired to claim the aulos as their own instrument and not a foreign import, thus some myths credit Athena with creating the aulos, or its music, while other stories say that a virtuoso player named Pronomos of Thebes (late fifth century B.C.E.) invented the two-pipe arrangement. In fact, the aulos was played in pairs in Mesopotamia, Babylonia, and Egypt from the third–second millennia B.C.E. and is attested in early Bronze-Age Aegean art. The earliest example of an *aulete* (aulos-player) in Greece is a marble figurine from the Cycladic island of Keros (c. 2200 B.C.E.). Myth and history are intertwined regarding the invention of the aulos. Two Greek myths, often re-told well into the fifth century B.C.E., credit the Phrygian satyr Marsyas or the goddess Athena with inventing the instrument. Pollux places the origin of the aulos in Phrygia, noting that there was a Phrygian type of aulos, the *elymos aulos*, used in the celebration of the Phrygian goddess Cybele. Plutarch (first century C.E.) related a famous and often illustrated Greek myth of the Phrygian satyr Marsyas, whose father Hyagnis was said to have invented both the aulos and the first tune for it: "The Great

Mother's aulos tune" (a reference to the goddess Cybele). Hyagnis taught the tune to his impish son, who in turn taught a certain real-life musician named Olympos. Pindar (fifth century B.C.E.) claimed in his twelfth *Pythian* ode that Athena created the *pamphonon melos* ("all-sounding song") of the aulos "in order to imitate the shrieking cry of the Gorgon." In his *De cohibenda ira*, Plutarch gives another account of the story in which Marsyas, watching Athena play the aulos, ridiculed the way her cheeks puffed out when she blew notes; the goddess, mortified, threw the instrument away. Marsyas then invented the *phorbeia* ("cheek-halter") to control the movement of the mouth and cheek. In yet another version, Athena, displeased with the aulos, passed the instrument on to Apollo.

**THE AULOS IN PERFORMANCE.** Numerous artistic and literary references show the aulos being used. On the famous painted Bronze-Age sarcophagus from Ayia Triada from Crete (c. 1490 B.C.E.), a male aulete plays during the occasion of an animal sacrifice; a phorminx player performs on the opposite side. Auloi are again paired with the phorminx in the *Odyssey* on Achilles' shield, accompanying dancing at a wedding. The aulos was often played in ensemble with lyres and harps. It accompanied the *dithyramb* (choral dance) and most other types of choral and lyric performance. Deemed appropriate for both happy and sad occasions, the aulos was played at funerals. Auloi were the instruments that accompanied dancing and singing during the Eastern ecstatic worship of Dionysus, Cybele, and Orpheus. Prostitute women auletes entertained men at drinking-parties, and the instrument is often depicted in erotic scenes on vase-paintings.

**THE SOUND OF THE AULOS.** There were three basic modal systems, or scales, associated with the aulos: Dorian, Lydian, and Phrygian, but several dozen types were categorized by pitch range. Accomplished auletes could play an impressive array of scales and pitches by employing techniques such as half-holing, cross-fingering, and over-blowing; by playing two auloi at once, the aulete could combine scales. Different tones and timbres were also accomplished by adjusting the tonguing of the reed and embouchure (lip position) on the mouthpiece. Different writers described the sound of the aulos as screeching, buzzing, sweet-breathed, pure-toned, wailing, enticing, orgiastic, and lamenting. Plato and Aristotle considered complex melodies employing more than one mode or scale to be disruptive to the soul; Plato banned the aulos from his ideal city in the *Republic* because it was a "pan-harmonic" instrument.

**THE ROMAN TIBIA.** The Roman *tibia* (plural *tibiae*) was a pipe of reed or bone, equivalent to the Greek au-

los. The Roman writer Varro said the same thing about the tibia as the Greek philosophers did about the aulos: its tones were complex, and could have an ecstatic affect on the soul. As in Greece, the reed pipe was played during the worship of deities such as Cybele, Bacchus (Greek Dionysus), and Isis, all of whom are connected with fertility, fecundity, and rebirth. The tibia was also used to accompany different kinds of solo theatrical performance, such as mime, pantomime, and farce, often in ensemble with lyres and percussion. Solo *tibicen* (“tibia-players”) would introduce tragedies, and according to Cicero, the audience could often identify a drama by the first few notes. The tibia is ubiquitous in Roman mosaics and paintings depicting scenes from Roman comedy. Tibicen would play instrumental pieces or accompany songs between the acts. The tibia was indispensable in the comedies of Terence and Plautus as the accompaniment to certain polymetric scenes of dialogue called *cantica*; the playwrights would direct the tibia to play, or to be silent, depending on the desired effect in the scene, and the tibicen would engage sometimes in the action. Stage directions in the comedies of Terence indicate which type of tibia were required: *tibiae pares* (“pipes of equal length”), *tibiae impares* (“pipes of unequal length,” probably an octave difference), and *tibiae sarranae* (“Phoenician tibiae”). The tibia musician who composed for Terence may have also served as musical director.

**THE FLUTE AND PAN-PIPE.** The aulos has often been translated as “flute,” but this is incorrect. The true flute has no reed, and is played by blowing transversely across the blow-hole while holding the instrument horizontally to the side. Most types of auloi were reed instruments played in pairs and held in front of the musician, like an oboe or bassoon. One type of aulos, however, might have been played like the modern flute: the *plagiaulos* (Greek) or *obliqua tibia* (Latin). Like the other auloi, the *plagiaulos* was not Greek in origin, but came from Lydia, Phrygia, or, according to Pollux and Athenaeus (late second century C.E.), Libya. The flute is rare, and does not appear in Greece before the third century B.C.E. Two surviving *plagiauloi* are housed in the British Museum; both feature a small bust of a bacchante (worshipper of Bacchus) on one end. Both the *plagiaulos* and the *syrinx* (“pan-pipes”) were pastoral instruments, played by shepherds and herdsmen for simple enjoyment. There are more artistic and literary references to the *syrinx* than there are to the flute. While there are no surviving Bronze-Age examples of the *syrinx*, it is depicted in the *Iliad* (eighth century B.C.E.) on the shield of Achilles, in the hands of happy shepherds. The so-called “François Vase” (circa 575 B.C.E.) features a Muse

#### A PIPERS' STRIKE IN ANCIENT ROME

**INTRODUCTION:** The *tibicines* were musicians in Rome who played the *tibia*, originally a pipe made of bone with three or four finger-holes; as time went on, it became a double-pipe reed instrument like the Greek *aulos*. The guild of tibicines held a festival every year on the Ides of June (15 June) when they wore masks and fancy dress—sometimes women's clothing. The festival commemorated a strike of the tibicines in 311 B.C.E., which is described in the following passage of Livy. The story shows how important a role that the guild of pipe-players had in Roman sacrificial rites.

I should have omitted an episode of the same year as being scarcely worth mentioning did it not seem to concern religious duties. The pipe-players (*tibicines*) were angry at having been forbidden by the last censors to hold their feast in the temple of Jupiter, according to ancient custom, and marched off to Tibur in a body, with the result that there was no one in the city to play the pipes at sacrifices. The Senate was seized with pious misgivings about the incident, and sent delegates to Tibur to request the citizens to do their best to return the men to Rome. The Tiburtines courteously promised to do so and first summoned the pipers to their senate-house and urged them to return to Rome. Then, when they found that persuasion achieved nothing, they dealt with the men by a ruse nicely in tune with their nature. On a public holiday various citizens invited parties of pipers to their homes on the pretext of celebrating the feast with music, and sent them to sleep by plying them with wine, for which men of their kind are generally greedy. In that condition they dumped them, heavily asleep, in cart and carried them off to Rome. The carts were left in the Forum and the pipers knew nothing until daylight surprised them there, still very drunk. The people quickly gathered round them and prevailed on them to stay. They were given permission on three days a year to roam the city in fancy dress, making music and enjoying the license which is now customary, and those of them who played pipes at sacrifices had their right to hold a feast in the temple restored.

playing the syrinx at the mythical wedding of Peleus and Thetis, but the instrument is most widely associated with pastoral poetry of the third century B.C.E. Although Plato bans the aulos from his ideal state in *The Republic*, he allows herdsmen in the country to have their simple *syringes*. In Greek myth, the god Hermes is credited with inventing the syrinx; it is the instrument commonly associated with Hermes' son, Pan, god of shepherds—hence the term “pan-pipe.” Later writers suggest other origins, including Pollux who associates it with the Celts and unnamed “islanders in the ocean.” The term *syrinx* (Latin *fistula*) was used to designate both a single-pipe whistle and also a group of five to seven equal-length pipes, tied together, and plugged with wax at graduated intervals to form a scale. The musician holds the instrument upright beneath the mouth and blows across the pipes as one would a bottle. Later versions include a rank of different-length pipes tied together, or pipes with holes bored into them to effect the desired pitch.

**THE ORGAN.** The idea behind the syrinx—that scales could be created by blowing air across the opening of pipes—was expanded by Greek engineers in Egypt during the Hellenistic Period (fourth century B.C.E.). Athenaeus, writing in the late second century C.E., cred-

its an Alexandrian mechanic named Ktesibios with the invention of the *hydraulis* (“water organ”), which used a hydraulic pump to create a continuous supply of air to ranks of pipes. The Roman architect Vitruvius (late first century B.C.E.) later described how “stops” were used to close off air from entire rows of pipes in order to alter the pitch. Hero of Alexandria, an engineer writing 100 years later, explained in detail how the hydraulic machine of Ktesibios worked in his book *Pneumatika*. A complex mechanical organ, the *hydraulis* was not commonly played, but there is an inscription from the sanctuary of Apollo at Delphi that praises the *hydraulist* Antipatros for winning a musical competition in 90 B.C.E.

**THE TRUMPET.** Several different types of horns were played by the Greeks and Romans. The ivory or more often bronze *salpinx* (“trumpet”) was primarily a battle instrument, used to send signals; it also appeared in ritual and ceremonial contexts, especially in the Roman period, where it was called a *tuba* and often made of brass or iron. The blast of the trumpet was used to

Roman water organ found at Aquincum, Hungary. COURTESY OF THE AQUINCUMI MUZEUM.

call people to assembly and start races. Most writers claim the salpinx to be of Etruscan (Italian) origin, but the instrument is comparable to both Mesopotamian and Egyptian trumpets. It consisted of a long, thin, tube, which could be straight or curved, with a funnel or orchid-shaped bell at the end. The *glotta* (“mouthpiece”) was made of bone. In his *De Musica*, the Roman theorist Aristides Quintilianus (third–fourth century C.E.) described the salpinx as a “warlike and terrifying instrument” that the Roman army employed to move troops by playing “codes through music.” Human and divine *salpinges* (players of the salpinx) were frequently depicted in vase paintings; on a fifth-century B.C.E. cup by the painter Epiktetos, a saytr holds a salpinx in one hand, a shield in his right, and plays while running; a *phorbeia* (“halter,” also used by dancing auletes) holds the mouthpiece to his lips.

**HORNS.** Animal and sea-shell horns were commonly used throughout the Mediterranean and the Near East

from the earliest periods. In Greek myth, triton and conch shell horns were the instruments played by sea deities such as Nereids and Tritons. The *keras* (“cow-horn”), often baked to produce a clearer tone, was used together with the much louder salpinx to signal troops in battle. In Rome, military horns and trumpets, including the tuba, *bucina* (shaped like a bull-horn), and the circular *cornu* were featured in concerts given by large choral groups and orchestras.

**PERCUSSION.** Percussion instruments included the *sistrum* (“rattle”), *krotala* (“castanets”), *kumbala* (“finger-cymbals”), *tympanon* (“drum”), *kymbalon* (“cymbal”), and the *kroupalon* (Latin *scabellum*), a wooden or metal tap worn on a shoe used to keep time. The *rhombos* (“bull-roarer”) could be classified as either a percussion or a wind instrument. It consisted of a piece of wood attached to a string, which made a rumbling sound when whirled above the head. Sistra—metal or clay-and-wood rattles—were popular in Egypt and throughout the Mediterranean. They appeared in Bronze-Age art of the second millennium B.C.E., and many actual sistra survive—over twenty were found at Pompeii. Evidence shows that percussion instruments—notably large, one-sided drums (*rhoptra* and *tympana*) and perhaps clappers—were used by the Parthians, ancient people of Iran and Afghanistan, to terrify the enemy in battle. In Greece and Rome, percussion instruments were rather used predominately by women to accent rhythm of dance and poetic meter in the cult worship of Dionysus, Cybele, Pan, and Aphrodite, deities associated with fertility, fecundity, and sexuality. Women devotees of Dionysus, called *maenads*, are frequently depicted in vase-paintings dancing while striking small hand-held tympana with their palms. In his comedy *Lysistrata*, the fifth-century B.C.E. playwright Aristophanes suggested that women playing the tympana during the worship of Pan and Aphrodite could create quite a ruckus. Women also played the *krotala*, a pair of bar-shaped wooden or metal clappers, hinged at one end, and played with each hand, like castanets; a commonly depicted duet includes a female *krotala*-player and a male aulete, both dancing wildly. *Krotala* are also depicted as being played by satyrs, over-sexed mythical creatures associated with Dionysus. *Kumbala* (finger-cymbals) are also associated principally with female worshippers of Dionysus. These are small, round clappers made of wood, shell, or clay, which produced a higher tone than *krotala*. Many examples can be found in museums. A pair of *kumbala* from the fifth or fourth century B.C.E. in the British Museum is inscribed with the owner’s name. The *sistrum* (rattle or shaker) was also a woman’s instrument. A ladder-shaped

#### MUSIC IN GREEK LIFE

**INTEGRATED INTO EVERY PART OF SOCIETY.** Music was undeniably prevalent in all parts of Greek society. It was featured prominently in weddings, funerals, and other social events, during military campaigns, and most notably during festivals. Music was appropriate for all situations, whether they were family or community events. Once a musical performance had begun, it was common for neighbors, friends, and even strangers passing by to take part in some of the activities that included music. Music was also the central entertainment at *symposia*, private drinking parties held after dinner in the men's area of the house. Almost all types of these musical events have been preserved, either in the artwork or literature that has survived from the era, giving clues to modern scholars about the scope of music in Greek life.

**EPIC POETRY.** One of the earliest examples of music being performed in public was when it accompanied the performance of epic poetry. The eighth-century

A mosaic showing dancers from a villa found in Argos, Greece, 4th–5th century C.E. The woman plays the cymbals. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM ARGOS/DAGLI ORTI.

B.C.E. Homeric epics *Iliad* and *Odyssey* are the earliest written examples of myths performed in poetic form; they represent a tradition reaching back at least to the second millennium B.C.E. Originally sung to the accompaniment of the *phorminx* (lyre), the Homeric epic was composed in stichic form, meaning that many lines were repeated in the same meter. In the case of Homeric epic, this meter was dactylic hexameter, which consisted of a combination of the dactyl (– U U) and spondee (– –). The melody was simple and conservative. In antiquity the transmission of epic poetry was accomplished through oral rather than written means; the poet trained his pupil, and they traveled from city to city, singing in music competitions and at the homes of patrons, always tailoring their performance to their audience.

**PERFORMANCE OF EPIC POETRY.** The epics themselves include many references to their own performance

style: Demodokos and Phemios, two *ainoidoi* (professional bards), sing and play selections of epic poetry before large audiences at banquets in the royal courts of kings Odysseus and Nestor. In the *Odyssey* Book Two, Odysseus' son Telemachus praises Phemios for delivering the “newest song to circulate.” Amateur musicians would also attempt a few lines of epic, as the poem illustrates: the Achaean warrior Achilles, on a break from battle, plays his phorminx and sings “the glorious deeds of fighting heroes” for his friend Patroclus in Book Nine of the *Iliad*. From the sixth century forward, epic poetry was performed by *rhapsodes*, professional bards who recited selections of Homeric poetry at music competitions during religious celebrations, such as the Epidaurus festival of Asclepius, the god of healing who appeared as a mortal doctor in the *Iliad*. In Athens, during the Great Panathenaea held every four years in honor of Athena,

*a PRIMARY SOURCE document***ODYSSEUS PRAISES SONG**

**INTRODUCTION:** The earliest literary allusions to music are found in the *Iliad* and *The Odyssey*, the eighth century B.C.E. Archaic epic poems attributed to Homer. The subject of these poems—the Trojan War and its aftermath—refer back to a much earlier time: the Aegean Bronze Age (Mycenean Period) of the second millennium, when *aidoi* (bards) entertained at the courts of ancient princes with songs of heroes, accompanied by the *phorminx* (a type of lyre). In this excerpt from *The Odyssey* Book Nine, the hero Odysseus praises as “the crown of life” the good food and songs of the bard Demodokos, provided for his pleasure by his host, Alcinous, king of Phaiacia.

**SOURCE:** Homer, *The Odyssey*. Trans. Robert Fagles (New York: Penguin, 1997): 211.

groups of rhapsodes were organized to perform the complete *Iliad* and *Odyssey*.

**MUSIC IN THE MILITARY.** Another early use for music was its necessity on the battlefield. The *aulete* (piper) was an essential timekeeper for rowers on Greek warships and for soldiers on the march. Bards and musicians entertained sailors and infantrymen while on campaign, keeping their spirits up. Marching songs were played on the *salpinx* (“trumpet”), which was also used to signal and direct troop movement in battle. The paean was sung during battle to rally troops, as the playwright Aeschylus wrote in his tragedy *The Persians*: “O Children of Greece, come! Free the fatherland, free your chil-

dren, your wives, the shrines of your ancestral gods, the tombs of your ancestors! Now the struggle is for all!” The Spartans, noted for their military prowess, used several different types of marching song and rhythms which, according to Plutarch in his *Instituta Laconica*, made the soldiers brave and fearless of death. The seventh-century B.C.E. poet Tyrtaeus used one of the marching meters known as the *embateria* when he urged the Spartan troops to march on, shield and spear in hand, with no thought for their lives, sparing no one.

**EPINIKIAN POETRY.** Athletic contests were held every four years during the Olympian, Pythian (at Delphi), Nemean, and Isthmian Funeral Games, during which music was often heard and was often used as a prize of sorts. Modern Olympic games descended from such celebratory festivals, which featured many of the same events, including boxing, running, wrestling, horse racing, and pentathlon. Athletes from all over Greece would participate, and the victor of a competition was rewarded with prizes. After the competition, a grand homecoming celebration was held for the winners, and an elaborate poem, known as the *epinikion*, would be composed and performed especially for the individual. The poet, who was paid handsomely, extolled the victor and his family, and contextualized his accomplishment by comparing his effort to the struggle of a mythic hero or god. The poem could be performed again on the anniversary of a victory. Epinikia were composed for choral performance and, as the poems themselves reflect, were enhanced with dance accompanied by the *phorminx* (lyre) or *aulos* (reed). The best-preserved epinikian poems of the late sixth–early fifth centuries B.C.E. are those of Pindar, from Boeotia. Four books of Pindar’s epinikia—one for each of the major Games—survive; many can be assigned to specific festivals and victors. Pindar’s first Pythian Ode was composed for a certain Hieron of Aetna, winner of the chariot race in 470 B.C.E. Pindar also wrote poems for war heroes and musicians; his twelfth Pythian Ode, written for Midas of Acragas on the occasion of back-to-back victories on the aulos, contains a reference to the invention of a “many-headed” melody for the aulos by the goddess Athena. Pindar was well respected in antiquity for his brilliant use of imagery and metaphor, lyric meter, and musicality. Dionysius of Halicarnassus, a first-century B.C.E. theorist, praised Pindar’s “archaic and austere” beauty, and the range of his modal systems.

**PUBLIC FESTIVALS.** Much like the Olympics, music was used in numerous other festivals, and many festivals had musical competitions that replaced the athletic competitions that were familiar to Olympians. The ear-

liest evidence that music was part of public festivals in Greek life comes from the Bronze-Age settlement of Ayia Triada on the island of Crete (c. 1490 B.C.E.); a fresco and a stone sarcophagus depict musicians playing the phorminx and the aulos during a procession and a ritual sacrifice. Public festivals in honor of the gods filled the Greek calendar, and each region of Greece had its own particular ceremonial traditions; these came at yearly or longer intervals, and could last from one to seven days. Choral and solo songs, dance, and poetry were central parts of all festival events. The three main features of public religious festivals were the procession, the animal sacrifice, and the feast. The *prosodion* (“processional hymn”) was sung to the accompaniment of the aulos while people paraded to altars and temples; when they arrived at their destination, the *prosodion* was sung to the *kithara* (type of lyre). Larger, more important celebrations, such as the City Dionysia and the Great Panathenaea at Athens, the Pythian festival at Delphi, and the Karneia at Sparta, included dramatic, poetic, and/or musical competitions.

**CHORAL SONG.** The festival procession generally included the *dithyramb*, a male choral dance with musical accompaniment, *hymnoi* (“hymns”), and the *paean* (a song of exhortation sung and shouted by men and boys in unison). Originally associated with the ecstatic worship of Dionysus, the god of “altered consciousness,” the dithyramb was passionate and tumultuous, a revelry that celebrated masculine sexual power and fecundity. The seventh-century B.C.E. poet Archilochus proclaimed that he knew how to lead the dithyramb, the beautiful song of lord Dionysus, when infused with wine. Later, the dithyramb became institutionalized, and the City Dionysia in Athens featured organized performances by close to two dozen dithyrambic choruses of fifty men and boys each; dressed in costume, often crowned with ivy, they sang and danced under the direction of the *khoregos* (teacher, or leader of the chorus) to the accompaniment of the aulos. The names of a number of *khoregoi* (dithyrambic poets) and *auletes* (double-reed players) were inscribed on monuments. Pindar, Simonides, and Bacchylides, poets of the early fifth century B.C.E., were famous composers of dithyrambic choral song; the historian Herodotus named Arion as the person who first categorized the dithyrambs in Corinth, and after the fifth century B.C.E., Timotheus of Miletus and Philoxenus were credited with adding more complex rhythms and melodies to the dithyramb through modulation and modification of the aulos.

**HYMNS.** Often during the beginning and end of festivals, *hymnoi* were sung as a sign of thanks for prosper-

ity. *Hymnoi* (“hymns”) were songs of praise to gods. These could be brief accolades to gods during a procession or short introductions to paeans or epic poems. Hymns were composed by the lyric poets Archilochus, Alcaeus, Sappho, Pindar, and Bacchylides in the sixth–fifth centuries B.C.E., but the earliest hymns were part of an oral tradition. The Homeric Hymns—so named because they were composed in the same meter, dactylic hexameter, as the epic poems of Homer—were a literary genre performed by professional bards during a religious festival. These were long, elaborate, and detailed biographies of divinities that explained the particular god’s origin, sphere of influence in society, and sites of worship. Thirty-three are preserved. The Homeric Hymn to Hermes includes a description of how the god invented the first lyre out of a *chelys* (“tortoise shell”). Aphrodite’s Hymn relates how the goddess fell in love with the mortal hero Anchises, and bore his son—the Trojan prince Aeneas—whose descendents would later found Rome. One of the longest and most elaborate of the Homeric Hymns is the Hymn to Demeter, the goddess of grain and agriculture. Her hymn describes how Demeter’s daughter, Kore, came to be known as Persephone, the wife of Hades, god of the Underworld; the story in the hymn contains many symbols and cryptic references to the popular mystery cult of Demeter, which was held in a large sanctuary in the town of Eleusis, near Athens.

**THE PAEAN.** The paean, a versatile form of song that could be sung on a variety of public and private occasions, was especially important during the festivals of the gods Apollo and Artemis, twin children of Leto. Many paeans were composed by musicians and poets to honor Apollo as the Oracle of Delphi. Two were inscribed on the wall of the Treasury of the Athenians at Delphi, complete with musical notation. Dating to the second century B.C.E., the 33 preserved lines of the first paean praise the glory of Apollo with sacrifice and music of the *kithara* (lyre) and the *lotus* (a type of reed pipe), and relates the myth of how Apollo became the prophet of Delphi by slaying Python, the serpent who guarded the prophetic tripod. Paeans also served as a holy song performed by soloists or choruses during the Panathenaea, a great festival of Athena held every four years in Athens; the Hyakinthia at Sparta; and other festivals honoring the major divinities. They could also function as a prayer of deliverance or thanksgiving.

**GIRLS’ CHORAL SONGS.** Men were not the only ones to perform at festivals. Girls received training in choral music and dance from a young age; before the seventh century B.C.E., this was the only “formal” edu-

*a PRIMARY SOURCE document***THE INVENTION OF THE LYRE**

**INTRODUCTION:** The anonymous “Homeric Hymns,” devotional songs in honor of a divinity, were performed as preludes to the recitation or singing of the Homeric epics, usually as part of a contest during a religious festival. “Hymn to the God Hermes” describes the birth of this trickster god, and relates several of his many powers and accomplishments; his first feat soon after birth is to invent the lyre from a tortoise-shell (*chelys*); he then sings a song while striking the lyre with a plectron, improvising “such as young men do at the time of feasts when they taught and mock each other” (presumably in musical competitions). The chelys-lyre must have been introduced into Greece during the Bronze Age; it is depicted in art from the second millennium B.C.E.

**SOURCE:** Homer, *The Homeric Hymn to Hermes*, in *The Homeric Hymns*. Trans. Apostolos N. Athanassakis (Baltimore: Johns Hopkins University Press, 1976): 31–32.

cation open to girls. From the fifth century onwards, vase-paintings show women teaching girls to dance or play an instrument. Many vase-paintings depict girls and young women dressed in long, modest costumes, holding hands while dancing together in a line or a circle. Choruses of girls and women performed at family occasions such as weddings, but were also a feature of public festivals. Many famous poets, including Pindar, Simonides, and Bacchylides, composed *partheneia* (“maiden’s choral dances”) for public performance. In one of the best preserved of the *partheneia*, composed by seventh-century B.C.E. Spartan poet Alcman, two girls are singled out as the most charming and lovely leaders of ten girls dancing to honor the Dawn Goddess. Choruses of young women joined men in singing paean and dancing on the Acropolis all night at the beginning of the Panathenaea. At Thebes, girls danced at night during the worship of the Mother of the Gods.

**MUSIC COMPETITIONS.** Four major Funeral Games—multi-day festivals held to commemorate a region’s ancestral king—provided opportunities for athletes as well as musicians to compete for prizes. From

the end of the eighth century B.C.E. musicians arrived from all over the Mediterranean to participate in festival contests. Instrumental competitions were instituted in the first quarter of the sixth century; competitors included instrumentalists on the concert lyre (*kitharists*) and the double-reed pipe (*auletes*); poets, who performed to accompaniment (*kitharodes* and *aulodes*); and the *rhapsode*, a professional bard who performed selections from the *Iliad*, the *Odyssey*, and other epic poetry, introduced by a hymn. Vase-paintings depict these competitors standing on a small stage before a judge.

**THE VICTORS.** In his poem *Works and Days*, Hesiod, a shepherd-poet roughly contemporary with Homer (c. 700 B.C.E.), described how he won a tripod with handles, which he dedicated to the Muses, for his performance of a hymn at the Games of Amphidamas in Chalcis (654–652 B.C.E.). The names of many winners are known, some of them women: a kitharode named Polygnota of Thebes won a crown and 500 drachmas for her performance during the Pythian Games, according to a second-century B.C.E. inscription from Delphi. Two among the male victors stand out: Terpander of Lesbos

An engraving copied from a Greek red-figure vase shows a musical competition. A standing woman tunes her lyre, and a seated woman plays the double aulos. THE ART ARCHIVE/BIBLIOTHÈQUE DES ARTS DÉCORATIFS PARIS/DAGLI ORTI.

and Timotheus of Miletos. Terpander was a celebrated musician of the early Archaic Period (seventh century B.C.E.), and was maligned in a comedy by Phercrates for singing too many notes. It is said that while Terpander increased the number of strings on the kithara to seven, Timotheus added four more; an anecdote relates that Timotheus was exiled from Sparta for using too many strings on his kithara during the music competition at the Karnean Festival there.

**GREEK THEATER.** The festival of the Great Dionysia, held in Athens in March, was the most important dramatic competition in Greece. Instituted in the mid-sixth century B.C.E. by Peisistratus, the festival lasted five days and featured three tragedies, three satyr plays, five comedies, and two dithyrambs. The Dionysia honored the god Dionysus as *Eleutherios* (“The Liberator”), and the plays were performed in the large, open-air theater dedicated to the god at the foot of the Acropolis. Here, tragedians, of whom the most famous are Aeschylus, Sophocles, and Euripides, and comic playwrights—Aristophanes is the best known—produced their spectacular and timeless productions before thou-

sands of spectators; adaptations and revivals of these plays continue to be staged today. The tragedies were serious re-enactments of well-known myths, such as the murder of Agamemnon, commander of the Achaean forces at Troy, by his deceitful wife Clytemnestra, or the downfall of the Theban hero Oedipus, who unwittingly killed his father and married his mother. The playwright was free, within reason, to interpret these myths through plot and action, which combined spoken dialogue between two to three actors, and choral song. All the parts were played by men or boys. The earliest surviving tragedy, produced by Aeschylus in 472 B.C.E., is unique in not drawing its plot from a myth; it treats an historical event: the bloody sea battle that had occurred at Salamis only eight years before between the Greek and Persian fleets.

**THE CHORUS.** The most important musical element of Greek tragedy and comedy was the chorus. Aristotle, in the *Poetics*, states that tragedy evolved from the *dithyramb*, the young men’s choral dance originally performed in honor of Dionysus. He adds that the tragic chorus employed melody, rhythm, and meter in combi-

An aulos player backstage with Greek actors, from a Roman mosaic. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM NAPLES/DAGLI ORTI.

nations composed by the tragedian, who also choreographed and trained the chorus. Each playwright entering the competition was assigned a chorus of twelve to fifteen teenage boys, and a *khoregos* (“chorus-leader”). The boys were citizens of Athens, until the fourth century B.C.E., when professional singer-dancers were chosen. Aristotle explained that choral performance consisted of three basic parts: the *parados* (entrance song); the *stasimon*, sung while standing in the orchestra (literally “dancing place”); and the *kommos*, an antiphonal lament exchanged between the chorus and the actors. Musical accompaniment was provided by an *aulete*, a player of the double-reed pipe. In the classical period (480–323 B.C.E.), the chorus was assigned a character role; they played the part of elder statesmen, old men, slave-women, sailors, even supernatural beings, and shared in the action of the plot. Their function was to provide background for the story, interpret the action of the plot for the audience, and provide

a moralizing element. Like the actors, the choral members wore masks, and their musical performance was enhanced by the use of dance and gesture.

**MUSIC IN COMEDY.** In the fifth century B.C.E. “Old Comedy” of Aristophanes, the chorus was 24 in number—twice the size of the tragic chorus. The group played the part of humans, but also birds, frogs, clouds, and other whimsical characters whose primary purpose was to entertain. Vase-painters illustrated the fantastic costumes of these choruses. Contemporary popular music, such as love songs, were part of the repertory, sung and danced to the accompaniment of the *aulete*. Several of Aristophanes’ comedies featured a *parabasis*, during which the chorus would step forward and address the audience directly, speaking on behalf of the playwright. A musical celebration, often comic, marked the end of many comedies. Aristophanes’ play *Wasps* ended

with a type of ribald can-can danced by men, called the *kordax*. In his last surviving comedies, produced at the beginning of the fourth century, the role of the chorus was reduced. The poetry of the choral odes apparently were no longer written by the poet and included in the text; the word *KHOROU* (“Choral Song”) was simply written in near the end of the play or between acts to indicate the performance of a song that was not necessarily connected with the story of the play. Aristotle referred negatively to the use of such interludes, which he called *embolima*. In the “New Comedy” of the fourth century—of which only one entire play, Menander’s *Dyskolos*, survives—no choral odes were written; instead, the word “KHOROU” occurs between the acts. The play itself, like the tragedies and comedies before it, does refer to music and the performances of the aulete, which confirms that music was always part of Greek theater in one form or another.

#### MUSICAL INNOVATIONS OF THE PLAYWRIGHTS.

Thanks to a comedy by Aristophanes called *Frogs*, it is possible to know a bit about how the poetry and music of the great tragedians of the fifth century B.C.E. was perceived by other artists. In the late fifth century, when *Frogs* was produced, the great playwrights Aeschylus, Sophocles, and Euripides were all deceased; in the play, the god Dionysus goes to the Underworld to fetch the best of the three back to earth. A contest is arranged, during which Aeschylus and Euripides ridicule each other’s language, meter, and music. Euripides labels Aeschylus as repetitive and monotonous, while Aeschylus charges Euripides with employing the base songs of prostitutes, foreign music, laments, and dance-hall music. Aeschylus boasts that his musical style fits his lofty, heroic subject matter; Euripides brags that his realism makes the audience think. In the end of the play, Aeschylus wins the contest, but leaves his Underworld throne to Sophocles, whom Aristophanes chose not to mock (perhaps because he had only just died). In his comedy *Peace*, Aristophanes praised the songs of Sophocles, which contained a variety of modes and more complex rhythms than those of Aeschylus.

**THE “MODERN” PLAYWRIGHTS.** The most innovative poets of the classical tragedians were Euripides and Agathon. The music of Euripides was so popular abroad that it was said to have saved the lives of some Athenian sailors and prisoners of war: Plutarch related that when the Athenian forces were defeated at Syracuse by the Sicilians, their captors freed anyone who could sing any songs of Euripides. Unlike their predecessors, Euripides and Agathon employed the chromatic genus of scale, which resulted in more notes and a wider range.

#### *a PRIMARY SOURCE document*

#### SAVED FOR THE SAKE OF EURIPIDES’ HYMNS

**INTRODUCTION:** One source for the popularity of Euripides’ plays is an anecdote related by Plutarch (second century C.E.) in his biography of the Athenian commander Nicias, who had led a fateful military expedition against the city of Syracuse, Sicily, between 415–413 B.C.E. The Athenians were defeated by the Syracusans in 413; Nicias was killed, and the Athenian prisoners were held in a stone quarry; some of them survived, Plutarch said, by entertaining their Sicilian captors with snatches of Euripides.

**SOURCE:** *Plutarch’s Lives*. Vol. III. Trans. Bernadette Perrin (Cambridge, Mass.: Harvard University Press, 1967): 307, 309.

Although other playwrights sometimes used women’s ritual laments in their choral odes, no one made better use of this genre of song than Euripides. Almost every one of his plays contains a lament, considered to be one of the most powerful and effective of the performance genres. It is telling that of all the music composed by the major playwrights, only Euripides’ survives, on two scraps of papyrus dating from the early third century B.C.E. The first comes from his play *Orestes*, originally

*a PRIMARY SOURCE document*

**ORESTES**

**INTRODUCTION:** One of the most famous of a group of musical fragments found written on mummy papyri is the so-called Vienna G 2315, which contains seven lines of a choral ode from the tragedy *Orestes* by Euripides. The myth of Orestes—the Argive prince who murdered his mother Clytemnestra to avenge the death of his father, King Agamemnon, whom Clytemnestra and her lover Aegisthus had killed—belonged to the Homeric tradition and was retold in several tragedies. The surviving fragment captures lines 338–344 of an ode sung by the chorus in the role of Argive maidens, who have seen Orestes, covered in his

mother’s blood, driven mad by the Furies, divine avengers of matricide. The chorus describes the horror of the murder and its aftermath. If this piece represents the actual music composed by Euripides over 100 years prior to the date of the papyrus (still an open question), it is among the earliest authentic examples of ancient Greek music. The center lines of text only are preserved; both vocal and instrumental notation are present, as well as rhythmic and time signs that reveal an expressive dochmiac beat (UUU–U–). The notes indicate the enharmonic or chromatic Lydian scale, mixed with one diatonic. If this fragment does not represent the actual music of Euripides, it is very much in his style: ancient writers remarked on Euripides’ use of the chromatic genera of scale, his varied textual rhythms, reduplication of syllables, and repetition of words for emotional effect, all of which are present in the fragment.

CREATED BY GGS INFORMATION SERVICES. GALE.

produced at the Great Dionysia in 408 B.C.E., and the second from *Iphigenia at Aulis*. Despite the fragmentary condition of the examples, it is possible to recognize Euripides’ style: the use of chromatic lines, alteration of poetic meter, and reduplication of syllables. Agathon, the youngest of the playwrights, won his first competition in 416 B.C.E. when Euripides was sixty; he is credited with introducing new dithyrambic modes and the performance choral music that was not connected to the subject of the tragedy. The music of both Agathon and Euripides was influenced by “modern” tendencies to-

ward multiple notes, complex scales, and modulation, their melodic complexity described as *anatretos* (“bored-through like an ant-hill”). The choral poet Melanippides of Melos, writing at the end of the fifth century, was considered a pioneer of “modern” music in his use of many-noted *anabolai*, instrumental preludes to a dithyrambic performance. By the fourth century, the *embolima* (“interlude”) replaced the traditional choral ode in tragedy, as it did in comedy. The tragedian would no longer write his own choral odes as an integral part of the plot and action.

**COMPETITIONS AFTER THE CLASSICAL PERIOD.**

Agathon was, for all points and purposes, the last of the great classical tragedians. From the fourth century forward, solo arias and “star performances” became the most popular, and the *tragodos*, a virtuoso performer, would sing and mime new material or selections from the great tragedies of the fifth century to instrumental accompaniment. Musical compositions were now being written down for professional use, and a few texts have survived (two of them being perhaps the fragments of Euripides mentioned above). More musical competitions were

added to existing festivals, and the number of festivals increased, as inscriptions attest. In 279 B.C.E. a new festival called the *Soteria* was established at Delphi, in gratitude to Apollo “The Savior” for his divine help in defeating the Galatians, who had attacked Apollo’s sanctuary there. Royal festivals were now held in Macedonia, northern Greece, and Alexandria, in Egypt. Professional guilds, established at the beginning of the fourth century B.C.E., were now sending their musicians, poets, and actors from all over Greece to these competitions. The rise of the virtuoso singer and instrumen-

**PLATO ON MUSICAL INNOVATION**

**INTRODUCTION:** In Plato's *Republic* Book Three, Socrates argues that certain types of *harmonia* (system of scales) and rhythms are more appropriate than others for lyric poetry and song; too much "sweet, soft, and plaintive tunes" will corrupt the soul and make men weak. He also warns against innovations in music that are "counter to the established order"; simple melodies and tunes are best for the purposes of moral education.

**SOURCE:** Plato, *The Republic*. Trans. G. M. A. Grube (Indianapolis, Ind.: Hackett, 1992): 87, 89.

talist was alarming to more than a few people. In the *Republic* and the *Laws*, Plato argued that the sound of complex rhythms and melodies are harmful to the soul, in the way that "new" musical styles over the years like jazz, rock, and most recently, hip-hop and rap music have been considered a threat to social harmony and stability. Plato and other writers complained that music with "too many notes" was vulgar and/or womanish.

**WEDDINGS.** While music was often used at very large social events, it was also used for smaller, personal purposes as well. A popular subject for painters, poets, and playwrights, the wedding was a time for paeans, choral song and dance, women's ululation, and music of the lyre and the pipe. The wedding procession of the bride to the groom's house was an occasion for grand

merrymaking. One of the earliest descriptions of a wedding march appears as a scene on Achilles' new shield in *Iliad* Book Eighteen; the bride is carried on a mule-drawn wagon through the town by torchlight while young men whirl and dance to the aulos and the phorminx, and the *hymenaeum* ("wedding song") rings loud. The *hymenaeum* was sung during the wedding proper; it was strophic, and often contained a refrain calling upon the god of marriage: "Hymen, Hymenaei!" The song wished the couple harmony, prosperity, and love. Another wedding song, the *epithalamion*, was performed by a group of unmarried men and women at the door of the wedding chamber. This bittersweet song signaled the transition from child to adult, virgin to married person. Some of the same themes and metaphors featured in the epithalamion—marriage as a journey, the danger of separation from parents—also appeared in funerary laments. In one of her many poignant wedding songs, Sappho of Lesbos wrote a dialogue between the bride and her virginity:

**Bride:** Maidenhood, maidenhood, where have you gone and left me?

**Maidenhood:** No more will I come back to you, no more will I come back.

**FUNERALS.** Funerary scenes depicted on vases from the ninth century B.C.E. forward indicate that large, public funerals were expected for important people, and music was an important element. For nine days mourning took place privately, in the house, but on the tenth day the public burial would occur. Whenever the body was conveyed to or from the house, the mourners followed the bier, displaying their grief by weeping, tearing their hair, scratching their faces, and rending their clothes. The most important public funeral rite was the lament, performed over the body by kinswomen and professional mourners. The two terms commonly used in literary texts for "ritual lament"—*threnos* and *goos*—both represented vocalizations that combined inarticulate cries with swaying movements and antiphonal poetic song, often described in tragedy and poetry as "un-lyred" and "un-danced" hymns, in reference to their sobriety. Vase-paintings show auletes performing at funerals, and later writers such as Josephus and Cicero refer to the hiring of up to ten professional auletes for large funerals. The *goos* may have been a more private, informal and extempore lament. In Homeric epic the word *threnos* was used for the formal laments by goddesses for dead heroes; it could also refer to the lament of professional mourners. In Athenian tragedy, the *threnos* was delivered during the *kommos*, an antiphonal song of lament between the actors and the chorus. The earliest literary lament occurs

**GRAVE STELE OF SEIKILOS**

**INTRODUCTION:** A grave stele (tombstone) dating to the second century C.E. was unearthed in Tralleis, Turkey, during the building of a railway sometime in the late 1800s. The artifact was first published by Sir William Ramsay in 1883, but the public was largely unaware of the object until it was purchased by the National Museum in Copenhagen, and made public in a 1967 lecture by J. Raasted. It is now on display in the National Museum in Copenhagen. The column is inscribed with thirteen lines of Greek text, in-

cluding an epitaph and an epigram with musical notation. After the little song, the owner signed his name "Seikilos, Son of Euter." The last line, "He lives," may indicate that Seikilos made the monument during his lifetime. Musical notation, in the diatonic lastian *tonos* (scale) according to the tables of Alypius, is inscribed over the words to the epigram: one note for each syllable, with the exception of a few words that carry a short melisma of two or three notes over a syllable. The meter of the song is iambic dimeter, and rhythmical marks present above the vocal notation clarify the duration of notes. The well-balanced melody confirms patterns of composition described later by theorists Cleonides and Aristides Quintilianus.

**Seikilos Funeral Epitaph**

CREATED BY GGS INFORMATION SERVICES. GALE.

in Book Twenty-Four of the *Iliad*, when the Trojan prince Hector is mourned by three kinswomen: his mother Hecuba, wife Andromache, and sister-in-law Helen. No music or dancing is indicated, but the poetry of the laments is very powerful in using the discourse of grief to praise and to blame. So effective were laments in raising the level of emotion in the crowd that the sixth-century B.C.E. Athenian lawgiver Solon banned women's public performance of the threnos, and many fifth-century B.C.E. texts indicate that the practice of women's laments was perceived as politically threatening. Plato was adamantly opposed to women's public laments, calling them irrational feminine expressions of grief; in the *Laws*, he states that the ideal lawgiver would prohibit public outcries at funeral processions. In later periods, an epigram—a simple, often plaintive or melancholy verse—might be inscribed on the tombstone. The only surviving funerary epigram with musical notation was found inscribed on the grave monument of a certain Seikilos, dating to the first century C.E.

**THE SYMPOSIUM.** The *symposion* (literally a “drinking together”) was an important social gathering for Athenian aristocrats from the fifth century B.C.E. forward. The party took place in the men's quarter of a private home; the wife and children remained upstairs. The guests, reclining on couches, ate, drank diluted wine out of large cups, conversed about silly or even serious matters, played games, and caroused. The entertainment was often provided by professional actors or singers and *hetairai*, high-class prostitutes who could sing, dance, and play the aulos. The guests themselves might play the lyre and sing their own renditions of well-studied lyric and elegiac poets of a century before: Alcaeus, Anacron, Stesichorus, Archilochus, and Theognis, to name but a few. *Skolia* (“drinking songs”) were satirical ditties, freely constructed, sung under the influence of wine by any guest who was handed a myrtle branch in turn. The skolia of the poet Anacreon were quite popular; he was considered one of the best of the Ionian (East-Greek) poets of the late sixth century. Athenaeus, in his *Deipnosophistae* (second–third century C.E.), listed 25 skolia and discussed their style. The symposium was a popular subject for vase-painters, who filled their scenes with fantasy mixed with reality. In his *Symposium*, Plato staged a philosophic dialogue during a drinking party. In an unlikely scenario, the characters decided not to drink wine to excess and to let the piper go home so that they could have a serious philosophical discussion on the “Nature of Love.” It might have been a boring night, had Socrates' friend Alcibiades not crashed the party and brought some raucous merriment to the evening.

## MUSIC EDUCATION

**METHODS OF TRAINING.** Formal music education is known in Athens from the beginning of the fifth century B.C.E. Before this, people interested in learning to sing or play an instrument could study informally under someone else, or even teach themselves. A professional bard would train a talented pupil in return for lodging, food, and clothes. Repertoire and technique were passed down orally and by rote; it is unlikely that there was any tradition of teaching pupils how to read music. The large choral groups, which performed at public festivals, did require organized training by a chorus-leader (*khoregos*), who may also have taught participants to read the poetry. From the seventh to sixth centuries B.C.E., there were active music centers at Sparta, where Alcman composed his *partheneia* (girls' choral dances), and on the island of Lesbos, where Sappho set up choruses for girls. In Sparta, part of a young boy's military training included learning how to dance and sing paeans while wearing armor.

**SCHOOLS.** Instruction in music and letters generally took place in the teacher's home, but professional music schools were established in the late eighth to seventh centuries B.C.E. by Terpander and Thaletas at Sparta. After the fourth century B.C.E., professional training was offered by a Guild or Academy school, where students from all over the Greek world would study choral and instrumental composition. Girls and boys both received an education, and some girls became professional musicians. Many vase-paintings from Athens depict a typical day in school, which included music, letters, mathematics, and physical education. A famous cup, painted by Douris in the early fifth century, illustrates this in particularly fine detail: a *kitharistes*

A red-figure kylix in Berlin by the Douris painter showing a music school. 5th century B.C.E. ART RESOURCE.

(“lyre-teacher”) is facing his student; both hold the *chelys* (tortoise-shell lyre). Other lyres hang on the wall above their heads. To their right, a seated *grammatistes* (“grammar-teacher”) holds a scroll with verse written on it, which his pupil recites while standing stiffly at attention. A bearded *paidagogos*, a slave in charge of the boys, watches the lessons. On the other side of the cup, one student prepares to sing while his teacher plays the *aulos* (double-reed pipe); nearby, another teacher writes on a wax tablet for his pupil.

**THE EFFECT OF MUSIC.** Greek philosophers, theorists, and even the poets themselves generally agreed that music had a profound effect on a person’s character, and for that reason the types of music taught in school should be carefully chosen. As a rule, simple traditional styles were preferred by educators—complex, foreign (not Greek), styles were not. The lyre, associated with Apollo and Orpheus, was favored over the pipe, which accompanied wild ecstatic worship of Dionysus. Homeric poetry or selections of tragic choral odes were preferable to other genres of songs. Pythagoras, a mathematician of the late sixth–early fifth centuries B.C.E., believed that sounds and rhythms, which are ordered by numbers, exemplified and corresponded to the harmony

of the cosmos. This is further explained through the Greek word for music theory, *harmonics*, which contains the Indo-European root *-ar*, meaning “to join, fit together, be in synchrony.” According to Pythagoras, the consonances of a fourth, fifth, and octave were models of harmony. His inquiries into the science of sound and relative numbers began what would later be known as “acoustic theory.”

**ETHOS.** The music teacher Damon, building on the ideas of Pythagoras a generation later, taught that each musical genre had its own character, or *ethos*, which affects human thought and behavior. For boys, rhythms and melodic forms should be chosen for their masculine qualities; girls should learn music that taught modesty and restraint. The chromatic genera of scales were considered effeminate, while the enharmonic promoted courage and manliness. Damon’s focus on the ethical qualities of music in turn influenced those who followed, including Plato, Aristotle, and the Roman writer Varo. All of these writers exhibit a conservative desire to label, categorize, select, and even censor certain types of melodic forms. In the *Laws* and *Republic*, Plato considered only two *harmoniai* (modal scales) acceptable for the purposes of education: the Dorian and Phrygian. Aristotle was a bit more lenient, admitting that all types of music have

their place, even the baser sorts. Not all philosophers adhered to the doctrine of *ethos*; the Stoic and Epicurean philosophers of the third–second centuries B.C.E., for example, attacked the notion that music had any permanent effect on the soul. Philodemus, an Epicurean, wrote a treatise entitled *On Music* in which he argued that poetry had power, but music itself was simply pleasurable. Despite those who would contradict the Pythagorean notion that music was linked to cosmic harmony and therefore had the ability to influence the soul, the idea would not go away. After the first century C.E. the doctrine of *ethos* was adopted and adapted by Ptolemy and Aristides Quintilianus (third–fourth century C.E.), who supported earlier arguments that traditional, rational, masculine melodic forms must be used for education, but others could be used for different purposes.

**GUILDS.** Professional guilds of artists and musicians, known as the *Dionysou Technitai* (Artisans of Dionysus), were created in Athens and in Teos (north-west Asia Minor, now Turkey) by the beginning of the third century B.C.E. In his *Deipnosophistae*, the lexicographer Athenaeus included solo instrumentalists such as kitharists and auletes, as well as poets, actors, singers, and composers as members of guilds operating under a group of officers headed by a priest of Dionysus. They provided performers, directors, and composers for any occasion, and handled payment contracts. In this way, the *Dionysou Technitai* was comparable to a musician's union. Such guilds also functioned as schools offering training in singing, musical instrument instruction, and lessons in the writing of rhythm and melody. The guild schools may have kept a library of written compositions, but none have survived.

## MUSIC IN ROMAN LIFE

**PRODUCT OF MANY INFLUENCES.** The surviving evidence indicates that Roman musical culture was not unique and new, but rather a product of many external

influences, most notably Etruscan and Greek. Long before Latin became the official language, and Rome the seat of a great empire, there were native peoples in Italy who spoke their own—as yet undeciphered—languages and, no doubt, enjoyed their own musical traditions; virtually nothing is known about them. The Greeks interacted with many of these cultures and exerted a profound influence. Imported Greek pottery, some of which dates as early as 1000 B.C.E., has been found by archaeologists in the northern regions of Etruria, Latium, and Umbria, along the Tiber River in central Italy, and in Campania in the south. During the course of the eighth century B.C.E., Greeks emigrated in large numbers to southern Italy and Sicily, where they founded permanent colonies. Greek musicians, composers, actors, and poets who had been living and working in Italy eventually found their way to Rome, where their musical ideas, traditions, and practices were accepted by most, if not all the citizens. The native Italian traditions were not completely supplanted by the Greek, but they are not well understood; only a few fragments of early Latin *carmina* (songs, poems) from Rome and Latium survive; these were monodic or choral, and included ritual song (e.g. *Carmen Fratrum*), epic-historical poetry (*Carmen convivialia*)—which were accompanied by the *tibia* (the Latin version of the Greek *aulos*)—triumphal songs (*carmina triumphalia*), and funeral laments (*neniae*). The Romans enjoyed musical concerts, solo performances, and theatrical productions that were, for the most part, versions of Greek or native Italian genres. With few exceptions, the Romans adopted Etruscan, Near Eastern, and Greek lyres, double-reed pipes, and percussion instruments. In fact, after Rome conquered Greece and brought the entire country into the empire in the second half of the second century B.C.E., the pervasive Hellenizing (Greek) presence provoked some heavy criticism from Latin writers and even lawmakers; Juvenal and Cicero both condemned the excessive Hellenizing of Roman culture, and Roman censors issued edicts limiting the performances of Greek virtuosi and the use of Greek instruments.

**THE ETRUSCAN HERITAGE.** The Etruscans were a people who dominated the area of Etruria and Latium in northern Italy before Rome emerged as the central power. Archaeologists have discovered a large number of imported Greek vases in Etruscan tombs, proving that they had a thriving trade with the Greeks from at least the fifth century B.C.E., perhaps earlier. The fresco art in some of the tombs also indicates Greek influence. One grave, the so-called Tomb of the Leopards in Tarquinia, contains a fresco depicting two musicians. One plays the *tibia* (double-reed pipe) known in Greece as the *aulos*;

the other plays a lyre that resembles the Greek *chelys* (tortoise-shell lyre). Even after Roman rule was firmly established, the Etruscans had much influence on Roman religious practices and the music involved. Many, if not most, of the state musicians hired to play for Roman religious and other state festivals were Etruscans who belonged to a *collegium* (“artist guild”) in Rome.

**ETRUSCAN INSTRUMENTS.** The Etruscans played instruments that were comparable to Greek versions, but also others which seem to be unique to them, and they paired instruments that were not played together in Greece. In a relief on a bronze Etruscan *situla* (“bucket”) dating to the late sixth century B.C.E. a musician playing an unusual m-shaped harp (or lyre) is paired with a player of the *fistula* (“pan-pipes”); the two musicians, both wearing wide-brimmed hats, sit facing each other in a formal concert pose. In Greece, the pan-pipe (*syrix*) was rather a pastoral instrument used primarily by shepherds or for outdoor revels. If an illustration on an Etruscan cinerary urn dating to the late second century B.C.E. can be trusted, the Etruscan *obliqua tibia* was a pipe that may have been played more like a flute than an oboe, comparable to the mysterious Greek *plagiaulos*. The player in the scene on the urn seems to hold the tibia horizontally out to his right like a modern flautist; the placement of his lips transversely across the mouthpiece on the top of the pipe and his cross-fingering of the holes suggests that the instrument was more like a flute than a reed. This type of pipe was shown in Roman art well past the third century C.E. Curved horns used by the Etruscans and later adopted by the Romans include the *lituus*, *bucina*, and *cornu*, and were more comparable to the Greek *tuba*, a straight trumpet, than the Greek *salpinx*. Both the *salpinx* and the *tuba* were referred to as “Etruscan” by Greek and Latin writers, but the Greek *salpinx* was almost exclusively a military instrument, whereas the Etruscans and Romans also played their trumpets and horns in concerts, sometimes in ensemble with the *tibia* (“pipe”) and *kithara* (“lyre”).

**GREEK INFLUENCE.** The Greek influence in Italy did not begin with the Etruscans in the north, but in the south, as early as the late eighth century B.C.E., when large numbers of Dorian Greeks moving west from the Peloponnese colonized southern Italy and eastern Sicily. Many Italian and Sicilian Greeks became very wealthy in their new land, especially those living in the Sicilian city of Syracuse. Unlike Athens, which by the fifth century B.C.E. had established a democracy, the political system of Syracuse was a type of monarchy called a “tyranny.” These tyrants took power by force, but once established, they could be very generous to the Greek ar-

tisans, musicians, and poets whom they admired; the fifth-century B.C.E. Greek poet Pindar and playwright Aeschylus were among those who received lavish hospitality at the court of the tyrant Hieron in Syracuse. The largest cities in Italy and Sicily boasted open-air theaters comparable to the most majestic amphitheaters in Greece (such as Epidauros). Greek influence on Roman culture became more evident after the First Punic War, during the course of the third century B.C.E., when contact between the Roman people and the Greeks in southern Italy increased. Musical instruments that were popular in Greece—pipes, lyres, horns, rattles—were also played in Rome, albeit in different forms and combinations. The Romans imitated Greek literary and dramatic forms; they adopted and adapted Greek architecture. Wealthy Latins hired Greek teachers and doctors. Greek gods and heroes of myth received Latin names, but were worshipped in comparable ways. By the time the Roman army took Corinth in 146 B.C.E. and brought the whole country of Greece into their empire, the Roman people had already long been captured by Greek culture.

**ROMAN THEATER.** As in Greece, dramatic dance and song in ancient Italy were central to the various rites and rituals performed to appease or praise the gods. Many early dances were improvised, and accompanied by the tibia—the most popular wind instrument for dancers in both Italy and Greece. The Latin historian Livy related that in 364 B.C.E. Etruscan *ludiones* (“pantomimists”) were called upon to save Rome from a plague by dancing to a special melody played by a *tibicen* (“piper”). The Romans adapted this Etruscan dance and added a rhythmically varied song; the new compositions were called *saturnae* (satire). Scenes on vases from Apulia, a region on the coast of southern Italy, show that a popular form of entertainment in the Greek colonies in Italy after the mid-fourth century B.C.E. was the travelling troupe of tragic jesters called *phlyakes*, who performed satires and burlesque on a portable stage, with music provided by an *aulete* (“piper”). The Romans adopted Greek forms of epic, lyric, tragedy, and comedy, and music continued to play an important role, although very little is known about its melodies or characteristics. No musical compositions from Roman theater survive. In the third century, Roman theatrical productions favored revivals of fifth- and fourth-century B.C.E. Greek playwrights, especially Euripides, Aristophanes, and New Comedy writers Menander and Philemon; the first writer/composer with a Roman name—Livius Andronicus—was actually a Greek slave brought from Tarentum to Rome and later freed. His Latin successors included the playwrights Ennius, Plautus, Terence, and others, who flourished into the second

century B.C.E. These Roman writers translated Greek original plays into Latin, and enjoyed a good deal of poetic license, changing names, mixing scenes, and rearranging the plots in a technique known as *contaminatio*; they also sometimes turned spoken dialogue from the Greek original into song.

**ROMAN COMEDY.** The comedies of Plautus (250–184 B.C.E.) and Terence (a generation later) were among the most popular in Rome at least until the end of the first century B.C.E. Their plays, like those of their Greek predecessors Menander and Aristophanes, were full of ribald and often obscene humor. Male actors played all the parts—even the “girlfriends” in the bawdy love stories. Roman comedy featured the *canticum*, a scene enacted in sing-song manner to the accompaniment of the tibia which would alternate with the *deverbia* (recited portions). Choral song, which was so central to Greek tragedy, probably played less of a role in Roman theater; the orchestra space, used by the chorus in Greek theater as the dancing place, served as an area for reserved seating in Rome. Solo virtuosity was highly prized in Rome, and the tibicen often introduced a tragic or comic performance with an easily recognizable tune composed specifically for that show. The tibicen also interacted with the actors and the audience during a performance. Production data has survived that lists the names of actors, dates of production, and the name of the festivals, along with some information about the original music composed for the plays. Different kinds of tibia were assigned to each actor in a comedy: “equal pipes” were designated for the “Girl from Andros,” while the character of “Phormio” required “unequal pipes” (possibly an octave apart).

**OTHER THEATRICAL FORMS.** After Terence and his generation of playwrights, comedy and tragedy became less prominent in Rome, but a new theater of Pompeii was opened in 55 B.C.E., and the old plays were performed during the Funeral Games for Julius Caesar after his assassination in 44 B.C.E. Mime and pantomime, developed from Etruscan forms, were popular in the Roman repertoire around the first century B.C.E.; the mime was a re-enactment of real or mythical stories performed using speech, dance, and movement, sometimes with the accompaniment of the tibia. Pantomimes might include choral and orchestral music using a variety of instruments: tibiae and other types of pipes, kitharae (lyres), cymbals, and a percussion instrument played with the foot called the *scabella*. Solo comic and tragic actors—*comoeni* and *tragoedi*—were in big demand; the comic Roscius and dramatic actor Aesopus were celebrities in Rome. Suetonius, the biographer of the first twelve Ro-

man emperors, related that the cruel and perverted emperor Nero was, ironically, an accomplished *kitharode* who also performed in costume, on stage, along with the professional actors.

**LATIN POETRY.** While the verses of the famous first-century B.C.E. Latin poets Catullus and Horace contain many allusions to music and the musical instruments of the Greek poets, there is no evidence to suggest that Latin lyric was actually performed to the accompaniment of the lyre, as Greek lyric poetry was. Horace did compose a publicly performed poem in Sapphic meter for chorus, to be sung by two groups of 27 girls and boys. Commissioned by the emperor Augustus for the Centennial Games in 17 B.C.E., no evidence for the music survives. The Latin poet Vergil, working under the patronage of the emperor Augustus, composed the Roman national epic the *Aeneid* using the same meter as Homer—dactylic hexameter—and employing the themes of the *Iliad* and *Odyssey*, yet this poem was not sung, nor was it performed to the accompaniment of the lyre, as Homeric epic had been in the Archaic Period.

**ROMAN FEMALE POETS AND MUSICIANS.** With few exceptions, there were no Latin female poets comparable to Sappho or Nossis of Greece. Male poets, such as Propertius and Ovid, mentioned the names of Roman female writers in their works, but the actual poems of only one Latin woman—Sulpicia (31 B.C.E.–14 C.E.)—survive. Six of Sulpicia’s elegies exist, totalling only forty lines. She was probably the niece of her patron, Marcus Valerius Messalla Corvinus, a historian who also supported other elegiac poets, including Ovid and Tibullus. Although Sulpicia used to good effect the stylistics common during the reign of Augustus—couplets, alliteration, and assonance—she did not allude to music in her poetry, and her poems were meant to be recited, not sung. Some Roman women studied music seriously from an early age, and made a name for themselves as professional dancers, singers, and *kitharists* (lyre-players); girls as young as nine or ten might perform in public, as Phoebe Vocontia did, in Rome. According to her tombstone (imperial period), Phoebe was an *emboliaria*, a performer during the interludes in the theater. “Learned in all the arts,” she died at age twelve. Another inscription on a tomb dating to the imperial period reads: “To the gods of the dead. Gaius Cornelius Neritus made this for himself and for Auxesis the kitharist, the best wife.” Female performers were paid a living wage for their craft. A papyrus from Philadelphia in Egypt dating to 206 C.E. records that a castanet-dancer by the name of Isidora was offered the following payment for a six-day wedding-gig at a gentleman’s home: thirty-six drachmas per day, four

artabas of grain, and twenty double loaves of bread. In addition, the writer offered to keep all her cloaks and gold jewelry safe, and to provide two donkeys for her round-trip journey. According to Roman law, the social status of actors and actresses was low, although female actresses were admired nonetheless. The actress Bassilla, called "the tenth Muse" by her admirers, "won fame in many towns and cities for her various accomplishments in plays, mimes, choruses, and dances," according to her third-century C.E. epitaph from the theater at Aquileia.

**MUSIC AND THE EMPERORS.** A rich and diverse musical climate existed in Rome during the imperial period; talented actors, instrumentalists, singers, and dancers poured into the city from all corners of the empire, including Egypt, Syria, and Spain. The emperors enjoyed musical entertainment while they dined, and many were fine musicians themselves. Theatrical performances in the amphitheaters were well-attended throughout the imperial period. During the time of Nero, the mechanical *syrinx* (water-organ) gained in popularity. This early pipe organ, said to have been invented in the third century B.C.E. by Ktesibios in Alexandria, Egypt, was loud; it was designed for use in Roman am-

**DOMITIAN AND THE FESTIVAL FOR CAPITOLINE JUPITER**

**INTRODUCTION:** According to the biographer Suetonius, Domitian, son of the emperor Vespasian, began his reign in 81 c.e. by promoting festivals and religious celebrations; he also erected many public buildings, including the Colosseum, where he staged spectacles; he may have been popular with the people, but the senate grew to despise him, and he was assassinated in 96 c.e.

Domitian presented many extravagant entertainments in the Colosseum and the Circus ... In honour of Capitoline Jupiter he founded a festival of music, horsemanship, and gymnastics, to be held every five years, and awarded far more prizes than is customary nowadays. The festival included Latin and Greek public-speaking contests, competitions for choral singing to the lyre and for lyre-playing alone, besides the usual solo singing to lyre accompaniment. ... When presiding at these functions he wore buskins, a purple Greek robe, and a gold crown engraved with the images of Jupiter, Juno, and Minerva.

phitheaters, where it could be heard in the back rows. A mosaic from a Roman villa in Germany dating to the third century C.E., shows a pipe-organ with about 29 pipes set upon an altar-shaped wooden base. Despite a lack of detail in the illustration, it appears that the instrument could have played a complete two-octave scale in several different keys. Nero, who spoke Greek and learned to play the kithara from a Greek virtuoso named Terpnos, instituted and participated in musical competitions. The emperor Vespasian hired Terpnos, another kitharode named Diodorus, and the tragoedus Apollinaris to perform at the reopening of the theater of Marcellus. Hadrian, a talented musician, was the patron of the Cretan kitharode Mesomedes; fourteen or fifteen poems by Mesomedes survive, several with musical notation. Large concert performances by choral groups and orchestras were a feature of both secular occasions and religious festivals. Horns such as the tuba, lituus, bucina, and cornu—normally used in the military—were played in ensembles. Rome was host to a number of foreign religious cults; the music associated with these contained

Roman cornu, a curved trumpet. PHOTOGRAPH BY HECTOR WILLIAMS. © HECTOR WILLIAMS.

foreign melodies. During the worship of Cybele and Bacchus, music of the Phrygian *elymoi* (reed pipes of unequal length, one of which featured a curved bell at the end) joined with melodies and dances from Egypt.

**MILITARY MUSIC.** As in Greece, military music played a central role in Roman life. A wide variety of wind instruments blared in marching bands and were used for signalling military maneuvers in battle: *kerata* (cow horns), the *salpinx* and *lituus* (ivory or bronze trumpets), *cornu* (circular horn), and *tuba* (brass tuba). The Etruscans employed these horns as early as the fourth century B.C.E., and they remained popular for more than 500 years—well into the late imperial period (fourth century C.E.). A bonafide *lituus* was found by archaeologists in the town of Caera (modern Cervetri) not too far from Rome. It consists of a 63 inch-long tube with no keys or valves; it would have been blown a bit like a bugle but had a lower tone. The *bucina* and *cornu*, originally cow horns but the latter crafted of bronze or other lightweight metal, curved around the player like a modern sousaphone. The *tuba*, a straight trumpet with a flared bell, had a higher and more striking tone than the *lituus*. Horns such as these, which were used by the Greeks ex-

clusively as military instruments, were also played in concerts, at weddings, and in funeral processions by the Etruscans and Romans.

## WOMEN IN ANCIENT MUSIC

**WOMEN IN SOCIETY.** Ancient Greece and Rome were patriarchal societies; men dominated the social and

political sphere. Women's lives were bound to the men in their families and to a system of government that denied women an equal voice in public life. The general rule that women should neither be seen nor heard was enforced into the Christian era and beyond. Most of what is known about Greek and Roman women in music comes not from the women themselves, but from the men who wrote about them, and the male artists who depicted them in vase- and wall-painting. Only if a woman gained enough of a reputation (good or bad) to warrant attention was her name made known. The family was considered the most important unit in ancient Greece and Rome, and women were the center of family life; they played an important role in family religion, and presided over all rites of passage from birth to death. The ceremonies connected with these rites gave women an opportunity to sing, dance, and play music in public. Women also participated in the large state religious festivals, and some became professional poets and musicians. Despite the scant evidence for women writers, poets, and musicians, there is enough to indicate that women did make names for themselves in music, while amateurs enjoyed playing for their own pleasure.

**PARTICIPATION.** In the Greek Bronze Age, Greek women must have sang and probably played instruments, but they are not represented doing so. Mycenaean art of the second millennium B.C.E. depicts only men playing the *phorminx* ("lyre") and the *aulos* ("double-reed pipe"). As a rule, men and women led separate lives in ancient Greece and Rome. Women normally stayed close to home and tended to domestic affairs, while the men spent time working at their profession or in the public gathering places of the city. Even the private homes were divided into male and female spaces. A vase from a grave in Italy shows a group of women dancing and playing a variety of instruments for each other in the privacy of their quarters. They also entertained each other and listened to music while working wool, baking bread, or nursing children. *Hetairai*, often highly educated and musically trained prostitute-musicians, entertained men at *symposia* (drinking parties). Some religious rites and ceremonies were open only to women, especially those connected with fertility, and evidence shows that both Greek and Roman women sang and played musical instruments during these rites.

**INSTRUMENTS FOR WOMEN.** Although both men and women could be professional musicians, certain instruments were thought to be more appropriate for one gender or the other. Since men marched in military parades and moved about more freely in public generally, the horns and the larger lyres were appropriate to them.

**JUST ONE OF THE GIRLS**

**INTRODUCTION:** In his *Life of Caesar*, the writer Plutarch (second century C.E.) related a humorous story in which a young man named Clodius tried to sneak into the women's sacred rite of the *Bona Dea* (Good Goddess—associated with Dionysus) by dressing as a female lyre-player.

Rome, 62 B.C.E.: Publius Clodius was in love with Julius Caesar's wife Pompeia, but a close watch was kept on the women's apartment, and Aurelia, Caesar's mother, made it difficult for the lovers to meet. During the festival of the 'Good Goddess', it is customary for the men to leave the house; the wife takes over and decorates for the festival. Most of the rites are celebrated at night, and with great amounts of festivity in the revels and music as well. The evening when Pompeia was celebrating this ritual, Clodius snuck into the house dressed like a young woman lyre-player. As he was walking around he met one of Aurelia's attendants, who asked him to play with her, as one woman might with another. When he refused, she dragged him before the others, asked who he was, and where he came from. His voice gave him away, and Aurelia, calling a halt to the rites, had Clodius thrown out of the house. Clodius was duly indicted by the senate for sacrilege, but later acquitted. Caesar immediately divorced Pompeia, saying that a wife of his "must be above suspicion."

**SOURCE:** Plutarch, *Life of Caesar*, in *Women's Life in Greece and Rome: A Sourcebook in Translation*. Eds. M. Lefkowitz and M. Fant (Baltimore, Md.: Johns Hopkins University Press, 1982): 292–293.

Women and girls played the smaller lyres, the harp, and the *aulos* (reed pipe). The wife of Ktesibios, the inventor of the organ, may have given concerts on it. *Hetairai* were hired to play the *aulos* and *chelys* (a type of lyre) at men's drinking parties, while *psaltriaai* (literally "pluckers") played the harp at parties for women; certain melodies and instruments, such as the *aulos*, lute, and *chelys*, were associated with erotic love. The *barbitos* (another type of lyre), the *pektis* (a type of harp), and the Lydian harp were popular instruments for women, and after the fourth century B.C.E., the lute-like *trichordos* or *pandouros* appeared in the arms of women. The *tympanos* (drum), *kymbala* (cymbals), and other percussion instruments were most often played by female worshippers

of Dionysus, the Great Mother, and other deities connected to fertility and fecundity.

**FEMALE POETS.** It was the job of the *pythia*, priestess of Apollo at the Oracle in Delphi, to interpret the divine prophecy of Apollo for the pilgrim, and she did so by chanting the god's words in hexameter verse. While this chanting is not proper poetry, it is one indicator that women had a powerful poetic voice in ancient Greece, even though Homer's professional bards were men, not women. Between the sixth and the third centuries B.C.E., however, some of the most famous female poets and musicians make their entrance. None came from Athens, perhaps because women's lives were much more restricted there than in other places. All were highly educated and well-to-do. Sappho, born around 612 B.C.E. on the island of Lesbos, is the most famous of a group of women poets whose work survives: Korinna, Erinna, Nossis, and Anyte. Sappho's poetry was autobiographical, personal, and often erotic. She wrote passionately about the power of Aphrodite, the Muses, and the Graces. She was an innovative poet, setting the rhythms of her native Aeolic dialect of Greek to new melodies; her form of lyric monody (solo singing), which has been called by scholars the "Sapphic stanza," was meant to be sung to musical accompaniment. Sappho is depicted in vase-painting holding the *barbitos*, and she mentions lyre and harp-playing in her poetry. In addition to monody, Sappho also wrote compositions for choral performance. Fragments of her *partheneia* (maiden-songs) and *epithalamia* (wedding-songs) survive, albeit without musical notation. Her choral works were performed by separate groups of dancing young men and women. Admired not only by her contemporary male poets, but generations of poets coming after, Sappho was a vivid portrayer of women's emotions:

Once again that loosener of limbs, Love,  
bittersweet and inescapable, crawling thing,  
seizes me.

Very little is known about the other Greek women poets and only small fragments of their poems survive. The traveler Pausanias (second century C.E.) reported that Korinna of Boeotia beat Pindar—a very important male lyric poet of the fifth century B.C.E.—more than once in poetry competitions. Praxilla, another fifth-century poet, was famous for her *solia* ("drinking-songs"). Of Roman women poets almost nothing is known, despite the fact that in Rome women's social status was better than in Greece. Sulpicia (first century B.C.E.) was the only Latin female poet whose work survives to any degree, because it was included in a book of poems by Tibullus, a male friend.

**TYPES OF MUSIC FOR WOMEN.** In his *Republic* and *Laws*, the philosopher Plato prescribed different melodies and rhythms to men and women according to the nature of each gender. Specifically, men should make "masculine" music, and women, music that is "orderly and moderate." Plato and Aristotle wrote that both girls and boys should be taught *mousike*, the broad term for "music" that included song, dance, and instrument playing. Plato recommended three years of training on the lyre beginning at age thirteen. These philosophers insisted that there were two types of women musicians: respectable and shameful. In the fourth century B.C.E., education was more available to women than it had been in earlier times, and now a sharp distinction was made between the unsavory *hetairai* (prostitute-musicians) and other female musicians who had been taught by reputable music teachers from a very young age and were paid to perform concert music during public festivals. An inscription from 186 B.C.E. recognized Polygnota, a Theban, for her *kithara* performance and recitations during the Pythian Games in honor of the god Apollo at Delphi. It notes that she received a crown and 500 drachmas in payment. Roman female musicians also performed during religious festivals. In Rome and many parts of the Roman Empire, female musicians, singers, and dancers performed every November during the three-day festival of the goddess Isis, who had a temple in Rome despite being an Egyptian deity. The performance involved actors playing the parts of Isis and Nephthys in the mystery plays celebrating the death and resurrection of Osiris. In Roman Egypt, female entertainers were paid quite handsomely. A third-century C.E. papyrus from Philadelphia in Egypt contains a letter in which the services of three castanet-dancers were requested, presumably for a wedding feast. Payment was set at 36 drachmas per day, plus four artabas of grain and twenty double loaves of bread.

**WOMEN'S RITUAL LAMENTS.** In ancient Greece, women generally did not have a public platform in which to express their opinions and sentiments. Ritual lamentation—public mourning for the dead during a funeral—provided women a protected medium to address publicly issues of social importance. Ritual laments were performed by an inner circle of women close to the body of the deceased, and combined weeping and wailing with poetic song and stylized movement. During a ritual lament, women were free to say whatever they felt, no matter how explosive or threatening; in the epic poem the *Aeneid* by the Roman poet Vergil, the mother of a dead soldier criticizes the war so vehemently in her lament that the men are ordered to drag her away be-

*a PRIMARY SOURCE document***HELEN'S RITUAL LAMENT**

**INTRODUCTION:** The musically gifted tragic playwright Euripides was especially attracted to women's melodic forms, most notably the ritual lament. In his play *Helen*, produced in 412 B.C.E., Euripides captured vividly the power of the musicality of the lament form, with its antiphonal response ("songs to answer songs"), its melancholic sound ("lyre-less elegy"), and the combination of weeping with song ("choirs to sing with my wailings").

**SOURCE:** Euripides, *Helen*, in *Greek Musical Writings I: The Musician and His Art*. Ed. Andrew Barker (Cambridge: Cambridge University Press, 1984): 67–68.

fore she disheartens the troops. There were three categories of laments: the *threnos*, the *goos*, and the *kommos*. The *threnos* was a composed dirge performed, for example, by goddesses in Homeric epic and formal laments of a female chorus in Greek drama. The *goos*, a more frequent term, referred to the improvised discordant weeping performed by kinswomen and close friends of the deceased. The *kommos* was specific to tragedy. Aristotle in his *Poetics* defined the *kommos* as an antiphonal song of lament between an actor and the female chorus, which was one of the most visually compelling exhibitions of

physical and psychological pain. In Greek tragedy, ritual laments were often called "lyre-less" or "undanced" to illustrate their harsh discordance and lack of joy. Euripides, an accomplished composer and playwright of the fifth century B.C.E., often wrote laments into his plays. In his musical tragedy *Helen*, the queen of Sparta laments her role in the destruction of Troy, wishing that the Sirens could accompany her mourning with the Libyan harp, the syrinx, with lyres, and with tears of their own to match her own "suffering for suffering, care for care, antiphonal chorus to match" the lament (164–166). The so-called Berlin Papyrus (second or third century C.E.) preserves a notated fragment of a dramatic vocal lament on the death of the hero Ajax that appears to be set at the register of the female voice. Traditionally in Greek and Roman theater men played all the roles, but this fragment suggests that a female singer, perhaps playing the role of Ajax's grieving wife Tecmessa, performed the lament. The Dorian mode, the same melodic system used by the lyric poets, in love songs, and in paeans, was commonly used for formal laments.

**MUSIC THEORY**

**OVERVIEW OF SOURCES.** The study of ancient Greek and Roman music depends on a wide variety of sources: iconographic, literary, and archaeological. Musical scenes, depicted in vase-paintings and frescos, in sculptural decoration and figurines, and on coins and gems, provide one piece of the puzzle. An iconographic

*a PRIMARY SOURCE document***CRITICIZING THE HARMONIKOI**

**INTRODUCTION:** Aristoxenus criticized earlier authors, whom he called *Harmonikoi* (Harmonicists), for paying too much attention to mathematical ratios in their determination of scales and intervals; he argued that these should be judged by sense-perception. The trained ear, he claimed, detects the unique functional quality of sounds; in his view, the dynamic context of music must be judged empirically, not by measuring sizes of intervals or naming notes.

The essence and order of harmony depend not upon any of the properties of instruments ... neither the *auloi* nor any other instrument will supply a foundation for the principles of harmony. There is a certain marvellous order which belongs to the nature of harmony in general; in this order every instrument, to the best of its ability, participates under the direction of that faculty of sense-perception on which they, as well as everything else in music, finally depend. To suppose, because one sees day by day the finger-holes the same and the strings at the same tension, that one will find in these harmony with its permanence and eternally immutable order—this is sheer folly. For as there is no harmony in the strings save that which the cunning of the hand confers upon them, so is there none in the finger-holes save what has been introduced by the same agency. That no instrument is self-tuned, and that the harmonizing of it is the prerogative of the sense-perception is obvious, and requires no proof.

**SOURCE:** Aristoxenus, *The Harmonics of Aristoxenus*. Trans. H. S. Macran (Oxford: Clarendon, 1902): 187–198. Reprinted in *Source Readings in Music History: Antiquity and the Middle Ages*. Ed. Oliver Strunk (New York: W. W. Norton, 1965): 31–32.

image may show the placement of a musician's hands or mouth on an instrument, and the number of strings on a lyre, or holes in a pipe; the relative size of an instrument and the material used to construct it may, in some cases, be reasonably determined by examining an image; a guess—but no more than that—can then be made regarding pitch, tone, and volume. Images may show which instruments are played in ensemble, by whom, and on what occasion. Ancient poets, historians, lexicographers, philosophers, and theorists—most of them Greek—add much more to modern understanding of the scientific principles of music and the role that mu-

sic played in society and culture. The archaeological discovery of actual musical compositions, carved into stone or written on papyrus manuscripts, and bonafide musical instruments recovered from excavated settlements and graves can confirm or contradict what has been deduced from written and iconographical sources. Finally, comparative studies of the musical traditions of other cultures that either influenced or were influenced by Greece and Rome have contributed much to the overall understanding of ancient Greek and Roman music.

**WRITTEN SOURCES.** The earliest written sources on music are descriptions of musical instruments, performances, and musical forms in the epics of Homer (eighth century B.C.E.); in the poetry of Sappho, Alcaeus, Alcman, Pindar, and others (seventh–fifth centuries B.C.E.); and in Athenian tragedy and comedy composed during the fifth century B.C.E. by Aeschylus, Sophocles, Euripides, and Aristophanes. Historians, mythographers, and scholars writing after the fifth century ascribed the invention of musical instruments and melodic forms to divinities or to innovative musicians, composers, and singers. During the late sixth–early fourth centuries, the philosophical schools of Pythagoras, Plato, and Aristotle were established; they influenced all later scientific and theoretical thought about music. The best application of Aristotelian science to music is the work of Aristoxenus. Born in Calabria, Italy, around 370 B.C.E., Aristoxenus studied in Athens with the Pythagorean school and was the star pupil of Aristotle. Aristoxenus is said to have written 453 essays on various subjects, but the majority of his writing has survived only in bits and pieces quoted by other authors. Two substantial theoretical works on music by Aristoxenus—*Harmonika* and *Rhythmika*—highly influenced later theorists. The mathematical approach to harmony of the Pythagoreans is best preserved in a fourth-century B.C.E. anonymous treatise sometimes (erroneously) attributed to Euclid, known as the *Sectio canonis* (“Division of the Kanon”). The title referred to the Pythagorean method of using a *kanon* (“ruler”) to mathematically measure pitches of notes based on string length. The Alexandrian astronomer Claudius Ptolemy supported this approach to acoustics in his *Harmonika*. In the first century C.E., the Roman architect Vitruvius contributed to acoustical science by applying the principle of sound waves to the design of a theater auditorium. Vitruvius translated the *Harmonika* of Aristoxenus into Latin, apologizing to his readers for the lack of Latin equivalents for many of the Greek technical terms used in music theory. Much information about musical life is also found in many non-theoretical works: Athenaeus of Crete (c. 200 C.E.) wrote a dialogue on the Greek *sym-*

*posium* called the *Deipnosophistai*, in which he named, described, and defined 25 *skolia* (drinking songs), along with their performance techniques; his contemporary, a lexicographer named Pollux, compiled technical terms, discussed the species of *aulos* (reed pipe) and types of horn (especially the *salpinx*), and described the Greek theater and structure of comedy in his lexicon, the *Onomasticon*.

**ARISTOXENUS AND HIS FOLLOWERS.** The *Harmonika* and *Rhythmika* of Aristoxenus were two of the most influential treatises on music. Especially important were his discussions and explanations of intervals, tetrachords, and the systems of *harmoniai*. He identified elements of melody and the three genera of tetrachord: diatonic, enharmonic, and chromatic. A number of important philosophical, theoretical, and historical works composed between the second and the fifth centuries C.E. restate and expand on the work of Aristoxenus, including Cleonides' *Harmonica introductio*, Ps.-Plutarch's *De musica*, Gaudentius' *Harmonika*, Alypius' *Introductio musica*, and Aristides Quintilianus' *De musica*. These works provide valuable explanations of the Greek musical system, including notation, melody, rhythm, scales, modulation, consonance and dissonance, and scientific problems of acoustics. Later, during the Byzantine Period (tenth–twelfth centuries C.E.), material on music based on the earlier work of Aristoxenus and Aristides was transmitted in manuscripts. One important such collection is the so-called *Anonymus Bellermanni*, published by F. Bellermann in 1841 C.E., which contains the sole surviving description of rhythmic notation.

**SCALE AND TUNING.** As early as the seventh century B.C.E. accomplished *kitharodes* and *aulodes* (musicians who sing while playing their instruments) were teaching others to play and sing; they must have developed a vocabulary of terms to explain technique, and demonstrated techniques on their instruments. Their students learned by imitation and practice. From the fifth century B.C.E. to the fourth century C.E. (and even later), the Greeks used the term *harmonikoi* to designate the teachers, scientists, and philosophers whom they considered knowledgeable about music theory; the study of the basic building blocks of music (notes, intervals, scales, genera, *tonoi*, modulation, melodic patterns) was known as “Harmonics.” The word *harmonia* was originally used in Homeric poetry to mean “joint, connection,” so the modern word “harmony” is literally a “fitting together” of notes. The earliest use of *harmonia* as a specific musical term occurs in a poetic fragment of Lasus of Hermione, an innovative *kitharode* (a singer-lyre-player) working as a professional composer in Athens in the late sixth–early fifth centuries B.C.E. The line reads: “I sing of Demeter

### ARISTOTLE ON MUSIC

**INTRODUCTION:** In Books VII and VIII of the *Politics* Aristotle considered the construction of the ideal state with special focus on education and the arts. He argued Plato's notion that music is more than amusement; it affects the soul. Since young people (and mankind, generally) are encouraged to imitate what they see and hear, the character and quality of all melodies and musical styles must be carefully examined before they are selected for educational purposes.

There is the natural distinction between the modes, which cause different reactions in the hearers, who are not all moved in the same way with respect to each. For example, men are inclined to be mournful and solemn when they listen to that which is called Mixo-Lydian; but they are in a more relaxed frame of mind when they listen to others, for example the looser modes. A particularly equable feeling, midway between these, is produced, I think, only by the Dorian mode, while the Phrygian puts men into a frenzy of excitement.

...Music has indeed the power to induce a certain character of soul, and if it can do that, then clearly it must be applied to education, and the young must be educated in it.

**SOURCE:** Aristotle, *The Politics*. Trans. T. A. Sinclair (Harmondsworth, England: Penguin, 1981): 466.

and of Kore, wife of Klymenos, intoning the sweet hymn on the low-roaring Aeolian *harmonia*.” By the time of Lasus, a *harmonia* came to represent an entire complex, including text, rhythm and meter, tuning, scale, and melody, associated with a specific geographical region: Aeolian, Phrygian, Dorian, Lydian, Ionian.

**CHARACTER OF HARMONIAI.** The precise nature of the regional (or tribal) *harmonia* is not known. Plato, in the *Republic*, defines the character of two varieties of the Lydian *harmonia* as “mournful,” the Ionian and Lydian generally as “good for drinking parties,” the Dorian as “manly,” and the Phrygian as “inspiring enthusiasm.” In the *Politics*, Aristotle—who was sometimes at odds with his teacher Plato on the character of the various *harmoniai*—agreed that the Dorian was the “most grave, and most suitable for education”; he described the Lydian as “suitable for young children,” but was of the opinion

**ALYPIAN NOTATION TABLES**

**INTRODUCTION:** The musical notation used for the fifteen transposition scales, or *tonoi* (literally “position of the voice”), are preserved in the notational tables included by the theorist Alypius in his *Introductio musicae* (fourth–fifth cen-

tury C.E.). It was his intention to represent the fifteen *tonoi* extending over the range of three octaves and a tone, complete with vocal and instrumental notation in each of the three genera of scale: diatonic, chromatic, and enharmonic. In the composite table below, the ethnic names of the *tonoi* are listed along the left side, in low and high forms. At the top, are the names of the notes, and their tetrachord position. The musical staff represents the conventional approximation of the pitches in each scale.

that the Phrygian harmonia, played on the aulos during the ecstatic worship of Dionysus, was too emotional for use in school. Certain harmonia, such as the so-called “tense Lydian,” were more suitable for women, while the

“slack” Ionian and Lydian were softer and easier to sing. The Greek poets sometimes expressed a preference for one or the other of the harmonia. The fifth-century poet Pindar praised the Dorian as being the most dignified, and

used the Lydian in several of his *epinikian* odes (praising athletes). Composers of the *dithyramb* (choral dance), such as Alcman, employed the Phrygian. The Mixolydian and Dorian were used in tragedy. Perhaps the clearest de-

finition of the harmoniai is to be found in the third–fourth century C.E. work *De musica*, by theorist Aristides Quintilianus. He listed the notes of six *harmoniai*, adding that there were other tetrachordal divisions

used by “the most ancient people” (likely referring to the fifth century B.C.E.): ‘Tense’ Lydian and Ionian (spanning less than an octave); Phrygian, Lydian, and Mixolydian (spanning an octave); and Dorian (spanning an octave and a tone). He explained that each of these harmoniai had its own particular set of intervallic relationships, forming the so-called “Octave Species.”

**THE PERFECT SYSTEMS.** The tetrachord—four contiguous notes forming a perfect fourth—was the basic

building block of the ancient Greek musical scale. A connected series of conjunct or disjunct tetrachords formed the so-called *systema teleion* (“perfect system”), first mentioned by Aristoxenus, but defined and explained in the handbooks of Aristides Quintilianus, Cleonides, and other theorists. A conjunct tetrachord is formed when the last note of one tetrachord coincides with the first note of the next; disjunction occurs when two tetrachords are separated by the interval of a tone. Two conjunct tetrachords constitute the *heptachordon* (seven-note system).

Since a fourth plus a tone equalled a fifth, a pair of disjunct tetrachords was, in effect, a fourth and a fifth, making up an octave. A pair of conjunct tetrachords, with an additional tone at either top or bottom, likewise made up an octave (a fourth plus a fifth, or vice versa). The steps within the tetrachords were all either larger or smaller than a tone. The names of the eight notes of the octave refer to the seven strings on the lyre, plus one—the lowest—added later: *hypate* (“the principal”) was the farthest from the player’s body, *parhypate* (“next to *hypate*”), *lichanos* (“touched by the index finger”), *mese* (the “middle”), *paramese* (“next to *mese*”), *trite* (the “third” from the highest), *paranete* (“next to *nete*”), and *nete* (the “last”).

#### THE GREATER AND LESSER PERFECT SYSTEMS.

Two “perfect systems” were described by the theorists. According to Aristides, the *systema teleion elatton* (“lesser perfect system”) consisted of three conjunct tetrachords plus the *proslambanomenos*, an “added lowest tone” before the *hypate*. Four conjunct tetrachords separated by a tone of disjunction, plus the *proslambanomenos*, constituted the *systema teleion meizon* (“greater perfect system”). Played together in succession, the two perfect systems were called the *systema teleion ametabolon* (“perfect immutable system”). Despite a number of theoretical treatises and handbooks that describe and explain the theory of these systems, their application in performance and the sound of the music resulting from their use remains unclear.

**TRANSPOSITION KEYS.** Aristoxenus used the terms *tonoi* to refer to “positions of the voice.” Later, Cleonides defined *tonos* or *tropos* as note, an interval, a position of the voice, and pitch. Difficulties arise because writers did not always distinguish *tonos* from *harmonia*; Aristoxenus said that the *harmonikoi* were already associating the “octave-species” with the *harmoniai*, and Ptolemy applied the term *tonoi* to the “octave species,” which were explained as “transposition keys” used to solve the problem of different vocal ranges in choral groups. Cleonides attributed thirteen *tonoi* to Aristoxenus; Aristides Quintilianus observed that the “younger theorists” added two additional *tonoi*, for a total of fifteen, which were preserved in the notational tables of Alypius. The *tonoi* were manifested in three genera: diatonic, chromatic, and enharmonic; each *tonos* began on a pitch that was a semitone apart from the next, and was built using a series of tetrachords (four contiguous notes forming a perfect fourth). The five middle *tonoi* carried the same regional names as the *harmoniai*: Lydian, Aeolian, Phrygian, Iastian, and Dorian. The highest five *tonoi* carried the prefix *hyper* (e.g. Hyperlydian), the five lower, *hypo* (e.g. Hypodorian).

**METER AND RHYTHM.** In English, meter (or accentuation) is determined by the stress placed on a syllable. In the tongue-twister “Péter piper picked a péck of pickled péppers” correct pronunciation requires that the stress be placed on the first syllable of every word; this stress dictates the rhythm of the line, and any deviation would ruin the beat. Ancient Greek meter was not based on stress, but on pitch; a rise in the musical pitch of the voice determined the meter. Ancient scholars devised a system of written accents to explain the pronunciation: the *oxytone* (“acute”) accent signified the raising of a pitch, the *barytone* (“grave”) marked a lowered or canceled pitch (used exclusively at the end of a word), and the *perispomenon* (“circumflex”) indicated a combination of up and down pitches on one syllable. The metrical patterns of Greek and Latin song and speech were based on long and short syllables. The ancient metricians explained that the value of one long syllable (–) equaled two shorts (U U). In many poetic meters these two quantities were interchangeable. Aristotle, Aristoxenus, and other writers on rhythm assigned proportional ratios of long and short syllables to each unit (called a “foot”): – U U (dactyl) = 1:1; – – (spondee) = 1:1; U – (iambus) = 1:2; – U U U (paeon) = 2:3; and so forth. The 2:1 ratio predominated, and variations were few. Time was kept by tapping the foot: “up” or “lift” was denoted by the word *arsis*, while “down” or “step” was called *thesis*. Each measure (or “foot”) of poetry was divided into “up” and “down” segments. Ancient songwriters were bound to the metrical types available to them, and until the middle of the fifth century, the meter simply dictated the rhythm of the verse. From the time of Timotheus of Miletus (c. 450–360 B.C.E.) was the elegiac couplet, a stanza composed of a dactylic hexameter followed by – UU – UU – | – UU – UU – ||. Iambic (U –) was generally combined into the so-called metron U – U – seen in many variants. A common pattern was the iambic trimeter U – U – U – U – U – U –; the first iambic formed the thesis (down-beat), and the second, the arsis (up-beat). Many variations on this rhythm existed, and it was popular in spoken verse as well as lyric poetry, tragedy, and comedy. If the first two note-values of the metron were transposed (– UU–), a so-called choriamb was created. The opposite of iambic is the “tripping” rhythm trochaic (– U – U) which, when played in sequence, always ended its metron with a rest (– U – X). The paeonic rhythms (– U– or – UUU or UUUUU)—also called Cretic—played in quintuple time, were used in serious hymns and war chants, as well as light music of dances; they were favored by certain lyric poets and tragedians. The comic playwright Aristophanes frequently employed the paeonic, which could be alternated

with trochaic meters. Among the fragments of ancient Greek musical compositions that survive, two Delphic paeans dating to the second century B.C.E. reveal extensive musical notation almost entirely in paeonic rhythm. The latest extant example of the use of paeonic rhythm is a poem by the composer Mesomedes (patronized by the emperor Hadrian), which shows three new ways of combining the longs and shorts. Thus, the paeonic rhythm evolved from two variants in the seventh century B.C.E. to seven by the second century C.E. The five-syllable Dochmiac (U– – U–) was a diverse and irregular patterned rhythm, and may have been a combination of iambic, anapestic, and paeonic forms. There is no evidence of its use before the fifth century, but it was popular in tragedy, especially in highly charged scenes in Euripides' plays, where it comprised long strings of many short notes in succession. The Ionic rhythm (UU— UU—), first used by the lyric poets Sappho and Alcaeus of Lesbos in the sixth century B.C.E., continued to be popular in all song genres from the tragic chorus to hymns and love songs. Many variations of this rhythm were possible. The so-called Aeolic meter was commonly used by Sappho and Alcaeus, and by other poets between the sixth–fourth centuries B.C.E. This rhythm is characterized by the coexistence of single and paired short notes beginning with a free or undefined series of shorts or longs: the most common was ××– U U – U –.

**MELODY.** A thorough treatment by Aristoxenus on melody has not survived, but in his *Harmonika*, he made a distinction between the melody of speech and that of music; melodic speech was based on word-accents, while musical melody moved by definite intervals of greater pitch variation. Very early traditional vocal melodies were simple, constrained by the pattern of long and short syllables in the meter of the verse, and the small number of strings on the lyre or holes in the pipe. Modulation (moving from one key to another) and heterophony (when strings of the lyre sound one melody while the singer sings another) were not commonly practiced. This began to change in the seventh century B.C.E., when poets, such as Archilochus, introduced the combination of differing genera of rhythms, the mixture of spoken text with instrumental accompaniment and singing, and an instrumental accompaniment that did not follow the melodic line in unison. By the middle of the fifth century B.C.E., virtuoso composers and performers expanded and modified their instruments and performance techniques: more strings were added to the lyre, vocal range widened, and use of the chromatic genus of scale added more notes. Melodic ornamentation and melisma (two or more notes sung to a single syllable) occurred on important words

(like the names of mythical gods or heroes), and words of songs no longer matched the melody note-for-note. In the *Laws*, Plato criticized both melodic and rhythmic heterophony as too complex and unsettling to be used in music education. Some Latin writers, such as Cicero, also maligned the melodic complexity of “modern” music, and pined for the old, simple tunes of yore. Nevertheless, the florid style continued to be popular throughout the Roman period, as musical compositions preserved on papyri from the second and third centuries C.E. attest.

**FORM OF MELODY.** Aristides Quintilianus wrote that before a lyre-player began a song, he would select a register of the voice, decide upon the structure of the scale, the genus, and the key, and consider the style of melody. Two terms were used for “melody, song, composition” in Greek: *melos* and *nomos*. The Greeks defined *melos* simply as “tune,” but more completely as an art form that comprised notes, melody, rhythm, and text. The term *nomos* (law, custom) was used by poets generally to label a type of song or melodic composition—from the song of birds to the songs in a musician's repertoire. Professional musicians and theorists used the term *nomos* more narrowly to identify: (1) a specific melody used for an occasion (e.g. a sacrifice or a funeral); (2) a composition for the kithara (lyre) or aulos (reed pipe); (3) a song for a divinity; (4) a type of ethnic song or melody (e.g. Aeolian); (5) a song named for a composer (e.g. Terpandran); or, (6) a class of song-types, such as lullaby, choral song, etc. The oldest *nomos*, the so-called *kitharodikos*, was a solo song for the lyre-player, said to have been invented by Terpander in the seventh century B.C.E. One of the more famous was the instrumental *nomos Pythikos* (“Pythic Composition”) composed for the aulos in the early sixth century, either by Timosthenes or Sacadas; the first-century C.E. writer Strabo described this piece as a *melos* which narrated the mythic battle between Apollo and the serpent Python in five distinct parts, or movements. The composition itself does not survive, but according to Strabo it was performed by an orchestra of winds and lyres, each movement employing a different type of melody and rhythm to illustrate the story through music.

**ACOUSTICS.** The science of acoustics began in the late sixth century B.C.E. with Pythagoras and his followers. They developed mathematical theories about the laws and principles governing the universe, and extended those to music and the concept of the soul. The primary interests of the Pythagoreans were metaphysical and cosmological, but they were intrigued by the problem of defining musical pitch and the relationship between intervals, which they tried to gauge using a monochord—a single string stretched over a board—and other devices.

The Pythagoreans held that there was a mathematical relationship between lengths of vibrating string and harmonious sounds, which could be measured using a ruler. According to ancient theorists, the first to apply mathematical principles to musical sound were Hippasus of Metapontum, a Pythagorean, or his contemporary, Lasus of Hermione, a virtuoso kitharode, instructor of dithyrambic choruses, and theorist. They were said to have discovered the 2:1 ratio between two sounds at the interval of the octave, 3:2 between interval of the fifth, and 4:3 between the interval of a fourth; Hippasus demonstrated this phenomenon using bronze discs of equal diameter, but different thicknesses, while Lasus, filling vessels with different amounts of liquid, struck them. The consonances of a fourth, fifth, and octave became models of *harmonia*, the “fitting together” of two sounds. A contemporary of Plato, the eminent Pythagorean mathematician Archytas (most of whose own work is lost), noted that a sound can only be produced by an impact of two bodies in motion. Sound, he said, was always created this way, but it was not always audible. He explained that the differences of pitch between sounds depended on the force and speed of the impact. Archytas divided the tetrachord system into harmonic ratios in an attempt to determine which numbers are concordant and why. Another work that is reminiscent of Archytas’ acoustic theory, but goes further, is a short anonymous treatise called the *Sectio canonis* (“Division of the Monochord”), sometimes erroneously attributed to Euclid. The author of this treatise adds to Archytas’ idea that force and speed determine pitch by supposing that some movements are more closely packed, causing notes of higher pitch, while other notes are more widely spaced, creating notes of lower pitch. The quantification of pitch is perhaps the most advanced of the Pythagorean contributions to acoustic theory. No school of thought on acoustics was beyond criticism, however. Aristotle’s pupil Aristoxenus (fourth century B.C.E.), whose interest in music was more philosophical than scientific, claimed that mathematical calculation of the relationship between sounds and the measure of intervals was not sufficient to explain musical phenomena or to indicate the characteristics of musical composition. He emphasized in his *Harmonika* that in order to understand music, the listener needs ear, intellect, and memory; for him, sense perception was vital to judging dynamic musical phenomena. Claudius Ptolemy (second century C.E.), who clearly inclined towards Pythagorean mathematics in his explanations, examined critically both the Pythagorean and Aristoxenian definitions of tuning systems, sound, pitch, and consonance in his *Harmonika*, noting the strengths and weaknesses of each ap-

proach. One of antiquity’s finest astronomers, Ptolemy took a scientific approach to the study of music, and held—as did the Pythagoreans—that the principles of harmonic order were mathematical. The Romans, who were ambitious construction engineers, were aided by the application of Greek acoustic theory in the design of their theater auditoria. Vitruvius, a late first-century B.C.E. Roman architect who translated the work of the Greek theorists into Latin, showed an impressive understanding of acoustics when he described a system of resonators that would improve the sound quality in the small and large theater auditorium. He also discussed the importance of using the right materials: wooden structures resonated sound waves more readily than marble or concrete, which did not vibrate in sympathy; he therefore recommended that bronze jars be added to stone-built auditoria to improve the acoustics.

**MUSICAL NOTATION.** The system of musical notation that was standard for professional use by the mid-third century B.C.E. and seen in all the extant compositions from the earliest (third century B.C.E.) to the latest (third century C.E.) is best represented in the tables of Alypius (fourth–fifth centuries C.E.). He originally mapped each of the fifteen *tonoi* (transposition keys or modes) over three octaves and a tone and in three genera—diatonic, chromatic, and enharmonic—showing the separate and distinct alphabetic symbols used for vocal (*leksis*) and instrumental (*krousis*) music. The enharmonic tables are incomplete, and essentially duplicate the chromatic symbols. Vocal notation employed the 24 letters of the standard Ionic Greek alphabet, with some letters altered and inverted. In the fragments the notation always appears above the text. Instrumental notation matched or was derived from letters in sixth–fifth century B.C.E. local Greek scripts, and appears to have been in use before vocal notation. Some rhythmic values were defined using additional signs; the sole surviving description of rhythmic notation, found in the Byzantine *Anonymus Bellermanni* treatise, includes five types of signs: duration, ligation, articulation, division, and rest. Aristoxenus mentioned the existence of musical and metrical notation in his *Harmonika*, but scoffs at its use. He remarked that simply having the ability to notate a meter or melody did not prove a person’s ability to understand its nature. Aristoxenus insisted that notation could not be the goal of harmonic science, and evidence shows that the tradition of music in ancient Greece and Rome remained oral, not written, regardless of the existence of a notational system.

**THE MUSICAL DOCUMENTS.** Music in ancient Greece and Rome was an oral tradition; songs, melodies,

and even complex compositions were learned by ear. Aristoxenus believed that notation was unimportant, and went so far as to dismiss it as useless for the understanding of music. Although a system of notation was well-established by the third century B.C.E., it was used only by a handful of professionals for a very long time; the Roman orator Quintilian (first century C.E.) omitted notation from his list of recommended readings for music education. Yet, a number of notated compositions survive in medieval manuscripts, papyri, and in stone inscriptions. Although a few pieces were already known and transcribed in the sixteenth century, most of the surviving music was not known or studied prior to the nineteenth century. Today, a respectable corpus of approximately sixty genuine fragments has so far been compiled; newly discovered notated pieces are being published on a regular basis. In the most recent century, a number of papyri have been recovered from mummy cartonnage dating to the Ptolemaic period in Egypt (third–second century B.C.E.) that contain snatches of notated music. The extant collection of fragments, which date from the fifth century B.C.E. to the fourth century C.E., is conveniently transcribed and explained (but not translated) in the *Documents of Ancient Greek Music*, edited by Egert Pöhlmann and Martin L. West. The corpus contains four fragments from the classical period (480–323 B.C.E.), fifteen of the late classical to early Hellenistic periods, three Late Hellenistic inscriptions from sanctuaries, and 39 fragments from the Roman period.

**TYPES OF DOCUMENTS.** Numerous different types of documents exist that show modern scholars different facets of the musical world. From the fifth century B.C.E., examples include a broken clay knee-guard for sewing, located in the Eleusis Museum, which was decorated with a painting of Amazons, one of whom was blowing a trumpet (Greek letters were painted between her body and the trumpet to imitate the sound of the trumpet-call.); remarks on the melody of Euripides, with an example from his tragedy *Orestes*, in the work *De compositione verborum* by Dionysius of Halicarnassus; and two papyrus fragments with notated music of Euripides' *Orestes* and *Iphigeneia in Aulis*. Late fifth century–third century B.C.E. compositions include fragments on papyri of unknown tragedy, and a hexameter hymn inscribed in stone discovered in the precinct of the healing god Asclepius at Epidauros. Examples from the second century B.C.E. include two substantial paeans (to Athenaïos and Limenios), inscribed on the south outer wall to the Athenian Treasury at Delphi, and the so-called “Hymn to the Carian god Sinuri” in two block fragments, published in 1945 C.E., but now missing. The last, and largest, group of extant musical documents comes from the Roman period: the grave stele of

Seikilos; several compositions by the emperor Hadrian's court musician Mesomedes of Crete; six Lydian instrumental pieces; a number of excerpts from tragedies and other hymns or paeans, lyric, and instrumental pieces of unknown origin; a selection from Menander's comedy *Perikeiromene* with some curious notation; and a Christian hymn to the Trinity, written around the end of the third century C.E. on the back of a list of grain deliveries from the first half of the century. Two examples of notated music provide a general idea of the type of fragments available for study in the collection: seven lines from the tragedy *Orestes* by Euripides (presented on a papyrus of the third century B.C.E.); and an epigram on the grave stele of Seikilos (second century C.E.).

## SIGNIFICANT PEOPLE *in Music*

---

### ARISTOXENUS

c. 370 B.C.E.–c. 304 B.C.E.

*Philosopher*  
*Music theorist*

**MOST IMPORTANT FIGURE IN MUSIC THEORY.**  
Known in antiquity as *o mousikos* (“the Musician”), Aris-

toxenus was born in Calabria, at Tarentum, Italy, around 370 B.C.E., and died in Athens around 304 B.C.E. He was the son of Mnesias, a musician from Tarentum, and studied music first with his father, and later with Lamprus of Erythrai in Mantinea, and the Pythagorean philosopher Xenophilus of Chalkis. Finally, he came to the Lyceum in Athens, and became a star pupil of Aristotle. According to the Byzantine lexicographer Suda, Aristoxenus was expecting to be named Aristotle's successor at the Lyceum, and was angry when his colleague Theophrastus was chosen instead. A prolific writer, Aristoxenus was said to have produced 453 essays and books on music, philosophy, history, and education. Unfortunately, nearly all of his works are lost, though some useful fragments are preserved in Plutarch, Athenaeus, and others.

**THEORIES.** Details of Aristoxenus' theoretical explanations of intervals, tetrachords, and the *sustema* (systems) of scales are found in the later works of Cleonides, Aristides Quintilianus, Gaudentius, and Bacchius. The Roman architect Vitruvius translated his works into Latin. The two most substantial and influential of Aristoxenus' books on music are *Harmonika stoikheia* (Harmonic Elements) and *Rhythmika stoikheia* (Elements of Rhythm). His explanation of *tonoi* (keys) influenced all later thought; he taught that all melodic scales are constructed of tetrachords (four contiguous notes forming a perfect fourth), which are either conjunct or disjunct, and if disjunct separated by a tone. His primary interest was to account for every kind of modulation, which he determined constituted a note, interval, or tetrachord common to two keys. He regarded the fourth and the fifth, not the octave, as the primary intervallic or scalar components of music and music theory.

## PINDAR

c. 518 B.C.E.–c. 443 B.C.E.

*Poet*

**COMPOSER OF VICTORY ODES.** The poet Pindar was born in Thebes around 518 B.C.E., but traveled widely and was well-connected; he was hosted by, and wrote a

number of poems for, Hieron, tyrant of Syracuse, in Sicily, whom he considered a champion of Greek civilization. He was also friendly with various aristocratic families on the island of Aigina, near Athens, and wrote eleven odes for Aiginetan athletic victors. Roughly contemporary with the tragedian Aeschylus, Pindar was a prolific poet; he composed choral odes, hymns, paean, dithyrambs, processions, *partheneia* (maiden-songs), laments, and more, all intended for public performance; only his *epinikian*, or victory, odes have survived almost intact. These odes commemorated the victory of competitors in the four major athletic games held regularly in Greece: the Olympian, at Pisa in Elis, sacred to Zeus; the Pythian, at Pytho (Delphi), sacred to Apollo; the Isthmian, at the Isthmus of Corinth, sacred to Poseidon; and the Nemean, at Nemea in the Peloponnese, sacred to Zeus. These festivals are also known as Funeral Games, because each celebrates the life of a mythological hero considered by the locals of the region as their ancient king.

**FORM OF THE ODES.** When a victory was won, the winner (or his family, or a wealthy friend) commissioned Pindar to write an ode to be performed for the winner by a chorus of men or boys, trained to sing and dance, some time after the event. The contract stipulated that certain details about the victor be included; thus the odes often include specific allusions to the winner, his family, and his ancestors. Certain particulars must be included: the victor's name, type of competition and place with some allusion to the divinity associated with that area, and one or more myths of heroes that elevated the victor to heroic status himself. Despite the required elements, many passages in Pindar's poems seem personal and moralizing. The poetic structure consisted of triads of two identical stanzas, called "strophe" and "antistrophe." A few odes, called "monostrophic," contain no triads, but a series of identical stanzas. The poems were not always sung by the whole chorus; solo parts could be performed by chorus leaders, accompanied by the *kithara* and *phorminx* (types of lyres) and the *auloi* (reed pipes). Though the melodies are lost, Pindar often referred to his own music in his poems, mentioning specific melodies and modes by name; in his only surviving ode written for a victorious musician—Pythian Twelve—Pindar credits Athena with the invention of the composition played by the victor, Midas, on the *aulos*. He employed a wide variety of complex meters, which give a sense of his rhythms. He praised his art frequently in his poems, referring to his hymns as "honey-voiced," his odes as "a mix of pale honey with milk, and a liquid shining is on the mixture, a draught of song blown on Aeolian *auloi*."

**CLAUDIUS PTOLEMY**

c. 108 C.E.–c. 165 C.E.

*Mathematician*  
*Music theorist*  
*Astronomer*

**CRITIQUED CURRENT THEORIES.** The *Harmonika* of Claudius Ptolemy is considered to be second only to Aristoxenus in importance to the understanding of Greek music theory. A well-respected geographer, astronomer, and mathematician, Ptolemy was born at Pelusium, Egypt, around 108 C.E., and died near Alexandria around 165 C.E. The lexicographer Suda says that he lived during the reign of the emperor Marcus Aurelius (161–180 C.E.); he worked in the cities Canopus and Alexandria, writing many scientific books; he is one of the founders of the field of astronomy. In the three books of the *Harmonika*, Ptolemy employed Pythagorean mathematical concepts in his explanation of tuning systems, sound, pitch, and consonance, but he carefully critiqued both the Pythagorean and Aristoxenian definitions, noting the strengths and weaknesses of each approach. He agreed with the Aristoxenian principle that the purpose of keys is to bring the different segments of the “Greater Perfect System” (different species of octave, each with its own particular character) into the most comfortable vocal register. He regarded the pitches forming the interval of an octave as homophones, and therefore functionally identical.

**DEVELOPED OWN THEORIES.** In Book II, Ptolemy developed his own theory of the *tonoi* (keys or scales), restructuring them to demonstrate his belief that the only perfect scale was one that contained all the species of the basic consonances. Thus, for Ptolemy, the octave was not a perfect scale, as “previous scholars” had asserted. Ptolemy’s book is full of impressive theoretical details (he must have had access to the great library at Alexandria); yet, the metaphysical view of music, expounded

by both the Pythagoreans and the followers of Aristotle, is evident; the book’s overall design treats music as a model for higher universal order and understanding.

---

**PYTHAGORAS**

c. 580 B.C.E.–c. 500 B.C.E.

*Philosopher*  
*Scientist*  
*Mathematician*

**STUDIED MATHEMATICS, SCIENCE, AND PHILOSOPHY.** Pythagoras, son of Mnesarchus, was born in Samos in the mid-sixth century B.C.E., and was said to have died as a refugee in Metapontum, Italy. One of the most influential figures in Greek intellectual history, Pythagoras was both a philosopher of religion and a scientist, yet very little is known about the man himself; there are no written records. It is therefore impossible to tell how much of the Pythagorean tradition in mathematics, music, and science can be traced back to the man himself and his early followers, called Pythagoreans. As a philosopher, Pythagoras is said to have introduced the “doctrine of transmigration of souls”; as a mathematician, Pythagoras is credited with, among other discoveries, the “Pythagorean Theorem” in geometry.

**DISCOVERED MUSICAL CONSONANCES.** He also discovered the musical consonances, represented by the mathematical ratios of 2:1, 3:2, and 4:3 (the octave, perfect fifth, and perfect fourth). According to Pythagoras, the consonances of a fourth, fifth, and octave were models of *harmonia* (harmony); sounds and rhythms, which were ordered by numbers, exemplified and corresponded to the fitting-together (harmony) of the cosmos. Thus, the ratios, which were displayed in the *tetractys* (an equilateral triangle composed of ten dots), carried religious, as well as scientific, significance for early followers. The scientific application of Pythagorean mathematics appears early, in the *Sectio Canonis* (Division of the Canon), dating to fourth–third century B.C.E., and the acoustic notions of the Pythagoreans—that the same numerical laws that governed the universe also governed music and, by

extension, the soul—profoundly influenced Plato, Aristotle, and the later Greek and Latin music theorists. The treatment of Pythagorean theories of consonance and harmonics in the *Manuale harmonices* of Nicomachus (fl. 100–150 C.E.) and the *Harmonika* of Claudius Ptolemy (fl. 127–148 C.E.) represents the persistence of the Pythagorean tradition in later Greek music theory.

## SAPPHO

c. 625 B.C.E.–c. 570 B.C.E.

*Lyric poet*

**LEADER IN MUSIC FOR YOUNG WOMEN.** Sappho was one of the most important lyric poets of the Archaic Period (sixth century B.C.E.). Little is known about her life, and only a small portion of her large output of work survives. She was born at Mytilene (or Eresus) on the island of Lesbos around 625 B.C.E. The ancient historian Strabo said that she was a contemporary of Alcaeus, another well-respected poet from Lesbos; a vase-painting, dating to about 480, depicts the two poets standing together, both holding the *barbitos* (low-pitched lyre) in their hands. The names of Sappho's family are known; she was married to wealthy Cercolas of Andros, and had a daughter, Cleis. Her family may have led a dangerously active political life, because Sappho mentioned exile in one of her poems, and a marble inscription reported that she spent her exile in Sicily sometime between 604–596. Over the centuries Sappho has been described as a school leader, chorus organizer, and a leader of a *thiasos* (a group of young women devoted to Aphrodite and the Muses), but the evidence for these occupations is scant. The most important information about Sappho comes from her poetry. She wrote choral poetry as well as monodic songs, and *epithalamia* (“wedding songs”). The subject of her poetry was young women; she wrote for them, and about them, in often erotic style, describing women's desires, passions, loves, and anguish. Like many other lyric poets, Sappho composed choruses for young girls, *parthenoi*,

and most likely trained her chorus and accompanied them on the lyre during their public performance. Her work was considered so valuable that the Alexandrians made collection of her poems in nine books, which survived through most of the Hellenistic and Roman periods; parts were still directly known in Byzantium in the twelfth century C.E. In the books, her poems are arranged by meter. She composed in dactylic pentameter, hexameter, mixed meter, and a type of meter that is named for her: the Sapphic stanza. The fragments of her poems reveal language that is witty, passionate, and melodious; “Fragment One,” Sappho's only complete poem, was admired by Dionysius of Halicarnassus for her melodic use of vowels and consonants, sense of euphony, and charm. Other readers emphasized the atmosphere of magic and incantation, the exotic settings, and the musicality of her lyrics.

## DOCUMENTARY SOURCES *in Music*

- Alypius, *Introductio musica* (Introduction to Music; fourth–fifth century C.E.)—This treatise on music theory, in three books, contains interesting material not found elsewhere, some of which may go back to the school of Damon. Based partly on Aristoxenus, and influenced by the Pythagoreans and Neo-Platonists, it contains some unique rhythmic and harmonic doctrines.
- Aristotle, *Politics, Poetics, and Problems* (c. 384–322 B.C.E.)—In these philosophical works, Aristotle analyzes the role of music in a civilized community, including the nature and function of different musical and poetic

forms and the production, perception, and properties of sound.

Aristoxenus, *Harmonika stoikheia* (Harmonic Elements); 375/360–320 B.C.E.)—This treatise was one of the most influential theoretical works on music in antiquity, known only today through a series of fragments and excerpts. It focused on the tetrachord system, *tonoi* (scales), and intervals, and formed the basis for the later technical “Aristoxenian” theorists.

Athenaeus, *Deipnosophistae* (The Learned Banquet; c. 192 C.E.)—The only extant work of this author describes, in fifteen books, the variety of the symposium (banquet) form, and includes a classification of drinking songs (*skolia*), and other types of musical entertainment.

Augustine, *De musica* (On Music; 387–389 C.E.)—In this work, the early Christian theologian follows the Pythagorean and Platonic traditions in applying the theory of ratios to verses of Latin poetry to argue that numbers and ratios allow the mind to transcend the sensual reality of sound, and rise to a knowledge of rational truth.

Bacchius Geron, *Eisagoge tekhnēs mousikēs* (Introduction to the Art of Music; third–fourth century C.E.)—This small but complex Aristoxenian handbook on music presents theory through a series of simple questions and answers.

Cleonides, *Eisagoge harmonike* (Introduction to Harmonics; second century C.E.)—This is the clearest and most concise summary of the technical details of Aristoxenus’ *Harmonika*.

Nicomachus of Gerasa, *Harmonikon enkhiridion* (Manual of Harmonics; fl. 100–150 C.E.)—This Pythagorean ap-

proach to harmonic theory uses material drawn from Aristoxenus and attempts to link the foundations of musical harmony to the principles of the universe. It is the only handbook of harmonics to have survived complete from the period between the *Sectio Canonis* and Ptolemy.

Plato, *Republic*, *Laws*, and *Timaeus* (c. 429–347 B.C.E.)—In these philosophical dialogues, Plato discusses the character (*ethos*) of music, and its role in moral education; he also deals with the Pythagorean analysis of musical structures, and the mathematical science of harmonics.

Plutarch [Pseudo], *De musica* (On Music; c. 50–120 C.E.)—Attributed to Plutarch, but generally agreed not to be written by him (hence, *pseudo*), this work, stylistically modeled on Plato’s *Symposium*, is a useful compilation of writings on music from the fourth and fifth centuries B.C.E., notably the writings of Plato, Aristotle, and Aristoxenus.

Claudius Ptolemy, *Harmonika* (Harmonics; fl. 127–148 C.E.)—This treatise is one of the most valuable systematic treatments of the mathematical theory of harmony, in three books; it includes a critical review and analysis of the Pythagorean and Aristoxenian theoretical models.

*Sectio Canonis* (Division of the Canon; fourth–third century B.C.E.)—This anonymous treatise, once erroneously attributed to Euclid, applies Pythagorean mathematics to many musical topics.

Theon of Smyrna, *ton kata to mathematikon kbresimon eis ten Platonos anagnosin* (On Mathematics Useful for the Understanding of Plato; fl. 115–140 C.E.)—This one surviving treatise is a type of Platonic handbook in three major sections: on arithmetic, on music, and on astronomy, which provides a summary of the Pythagorean and neo-Platonic harmonic theory.

## IMPORTANT EVENTS *in Philosophy*

- 585 B.C.E. Greek natural philosophy begins with Thales of Miletus who held that water was the underlying substance of everything in the world.
- c. 546 B.C.E. Anaximander of Miletus (born 610 B.C.E.) writes the first Greek treatise in prose, setting forth his view that the origin of all things was the “Boundless” or the “Infinite” which he considered divine. He also speculates that the underlying substance of everything is air which becomes fire when rarefied and earth when condensed.
- 545 B.C.E. Greek philosopher Xenophanes of Colophon goes into exile and eventually settles in Elea, modern Velia, in southern Italy. He is the precursor of the Eleatic school of philosophy.
- 532 B.C.E. Polycrates becomes tyrant (dictator) of Samos; to escape his tyranny, Pythagoras leaves Samos and emigrates to Croton in southern Italy where he founds a society that is both a scientific school and a religious community.
- c. 515 B.C.E. Parmenides of Elea, a rigorous logician who argued that the real universe is without beginning or end, is born.
- c. 500 B.C.E. Heraclitus of Ephesus envisions the universe as a conflict of opposites which an eternal Justice holds in check. He develops a theory that Eternal Fire gave rise to all things.
- c. 493 B.C.E. Empedocles of Acragas in Sicily who  
–c. 433 B.C.E. lives in this period posits a universe in
- the shape of a sphere within which are four “roots,” or elements: fire, air, water, and earth. He believes that Love brings these elements together in an unending cycle in order to create, whereas Strife drives them apart in order to destroy.
- c. 490 B.C.E. Zeno of Elea, a pupil and friend of Parmenides, is born. He will become famous for the riddles he uses to refute the theories of opponents of the Eleatic School, as the followers of Parmenides are called.
- c. 480 B.C.E. Anaxagoras of Clazomenae comes to Athens where he remains for thirty years. He is the first philosopher to reside in Athens, beginning a long philosophical tradition in the city.
- c. 460 B.C.E. Democritus of Abdera, who lives in this period, puts forward the Atomic Theory which he adopts from his lesser-known master, Leucippus of Miletus.
- c. 370 B.C.E.
- 427 B.C.E. The philosopher Plato is born in Athens.
- c. 400 B.C.E. Diogenes of Sinope, also known as the “dog” (*kyon*), is born. He will become the founder of the Cynic sect.
- 399 B.C.E. Socrates is condemned to death on a charge of impiety by a court in Athens.
- 388 B.C.E. Plato meets the Pythagorean philosopher Archytas, ruler of Tarentum, and Dioynysius I, the tyrant of Syracuse. He also befriends Dionysius’ brother-in-law, Dion.
- 387 B.C.E.
- c. 386 B.C.E. Plato founds the Academy in Athens where he is to teach for the rest of his life.
- 367 B.C.E. Dionysius I dies, and his successor, Dion, invites Plato to Syracuse to instruct the young Dionysius II in philosophy and the art of ruling.
- 366 B.C.E. Plato is an uneasy guest of Dionysius  
–365 B.C.E. II, who exiles Dion and allows Plato to leave only after he promises to return.

- 361 B.C.E. Plato yields to a pressing invitation from Dionysius II to return to Syracuse, but Dionysius' interest in philosophy proves a passing fancy and after a year he allows Plato to return home.
- 357 B.C.E. Dion, whom Dionysius II had driven into exile, returns with an armed force, ousts Dionysius II, and takes control of the government of Syracuse.
- 354 B.C.E. Dion is assassinated. Dion's friends appeal to Plato and in response he writes his "Seventh Letter," advising them on how to frame a new constitution for Syracuse.
- 347 B.C.E. Plato dies and his nephew Speusippus succeeds him as head of the Academy.
- Aristotle leaves the Academy, perhaps out of disappointment that he did not succeed Plato, and goes to live at Assos in the Troad (the region around Troy) under the protection of Hermias of Atarneus who had taken advantage of the weakness of the Persian Empire to carve out a little independent kingdom for himself.
- 345 B.C.E. Hermias is captured and killed by the Persians. Aristotle leaves Assos for Mytilene on Lesbos where he carries on research in biology.
- 342 B.C.E. Aristotle undertakes the education of Alexander, the son and heir of Philip II, king of Macedon.
- 335 B.C.E. Aristotle returns to Athens, where he leases buildings outside the city and founds his school, the Lyceum.
- c. 325 B.C.E. Diogenes of Sinope, the founder of the Cynic School, dies and is succeeded by Crates as the chief Cynic.
- 323 B.C.E. Alexander the Great dies in Babylon, and when news of his death reaches Athens, there is a violent outbreak of anti-Macedonian sentiment. Aristotle whose friendship with Alexander, his former pupil, is well known, finds himself under attack.
- 322 B.C.E. Aristotle leaves Athens for Chalcis on the island of Euboea to escape a charge of impiety that is brought against him, and he dies there in the fall of the year. He leaves his papers to Theophrastus who succeeds him as head of the Lyceum.
- c. 317 B.C.E. Zeno of Citium in Cyprus comes to Athens and attaches himself to the Cynic philosopher Crates, Diogenes' successor.
- 306 B.C.E. Epicurus moves to Athens and buys a house and a garden, where he founds a school known as the *kepos* (the "Garden"); he lives there for the rest of his life and expounds Epicurean doctrine.
- 301 B.C.E. Zeno of Citium begins to give lectures at the *stoa poikile* (Painted Stoa) in Athens, thus founding the school of philosophy known as Stoicism.
- c. 269 B.C.E. The Academy founded by Plato enters a new phase, the "New Academy," under Arcesilaus, who interprets Platonism as scepticism and argues that since true knowledge is impossible, the best course is to suspend judgement.
- c. 144 B.C.E. The Stoic philosopher Panaetius comes to Rome and joins the circle of Roman *philhellenes* (lovers of all things Greek) gathered about Publius Scipio Aemilianus. He introduces the philosophy of Stoicism into Rome where it becomes the philosophy of choice for the Roman upper classes.
- 129 B.C.E. Panaetius becomes the head of the Stoa in Athens, initiating the development of the school known as the "Middle Stoa."
- 54 B.C.E. Marcus Tullius Cicero in Rome produces his *De Republica* (On the State), which proposes a constitution for a well-governed state.

- 52 B.C.E. Cicero starts to write his *De Legibus* (On the Laws), in which he discusses the Stoic idea of divinely sanctioned law based on reason.
- 45 B.C.E. Cicero begins to produce a series of books on philosophy, covering subjects such as perception, immortality, the problem of pain, the possibility of divination, determinism and the concrete application of moral principles.
- c. 5 B.C.E. Lucius Annaeus Seneca, author of several philosophic dialogues including the incomplete *De vita beata* (On the Happy Life) which expounds the Stoic theory of happiness, is born.
- c. 55 C.E. The Stoic philosopher Epictetus is born. His *Discourses* and *Enchiridion* (Handbook) will be two of the primary sources for information on Stoicism in modern times due to the fact that most other Stoic writings did not survive.
- 161 C.E. Roman emperor Marcus Aurelius ascends to power. His work, the *Meditations*, is the last great surviving statement of Stoic philosophy.
- 204 C.E. Plotinus, founder of Neoplatonism, is born in Egypt.
- c. 250 C.E. The Neoplatonic philosopher Iamblichus is born. He will subordinate philosophy into theurgy (“god-working”), which sought to connect the philosopher with divine power by oracles, magic, and mysticism.
- 270 C.E. Plotinus, who is suffering from a disfiguring disease which is probably leprosy, dies in Rome.
- 412 C.E. Proclus, who will become *diadochos* (head and Plato’s successor) of the Neoplatonic Academy in Athens, is born. The school will develop a pagan theology based on the philosophy of Plotinus and Plato under Proclus’ leadership.
- 529 C.E. The emperor Justinian closes down the Neoplatonic Academy in Athens as part of his policy of suppressing paganism.

## OVERVIEW of Philosophy

**SCANT EVIDENCE.** Greek philosophy has survived only in tantalizing fragments. The works of only one philosopher, Plato, have survived in their entirety. Much of Aristotle has been lost, and the scientific and philosophic treatises that have survived were not written for publication. Socrates who lived in Athens in the fifth century B.C.E., wrote nothing, although he gave Greek philosophy a new direction. Modern knowledge of him is dependent on two very different disciples, Plato and Xenophon, and a burlesque of his teachings by the comic poet, Aristophanes. The works of the philosophers before Socrates, the so-called “Presocratics” who speculated about the nature of the universe, are all lost. They are known by reputation, and by fragments of what they wrote, which are mostly quotations by later writers. One late writer in particular, Diogenes Laertius, wrote a work that is indispensable to modern knowledge of ancient Greek philosophy: *A History of Philosophy, or on the Lives, Opinions and Maxims of Famous Philosophers*, dating to the third century C.E. This work, plus the surviving fragments from the actual writings, provide enough information to recreate the thought of these Greek thinkers with some confidence and to demonstrate their importance. They began the long progression of speculation and philosophic thought that was continued in medieval and modern Europe as well as the world of Islam, and has now become the dominant intellectual tradition everywhere. In reconstructing the thought-world of the Greek philosophers, however, there is a strong temptation to “fill in the blanks” in such a way as to render their ideas too modern. Ancient criticism of the conventional Greek religion, for instance, should not be interpreted in such a way as to suggest that the author was irreligious or an atheist. They belonged to the background of their own day, and this was particularly true when they approached favorite subjects of speculation, such as the nature of the ideal state, and the character and education of the ideal ruler. Yet the contribution of Greek thought has been enormous: in the history of science it made the first steps towards the modern scien-

tific method, and in the fields of ethics and politics it is the underpinning of modern speculation.

**THE BEGINNINGS IN IONIA.** Greek philosophy began with speculation in the region of Ionia about the nature of the physical world. Miletus, located on the south-west coastline of modern Turkey, was the most important of the Ionian cities and it was there that Thales—an engineer, astronomer, mathematician, and a statesman, as well as a natural philosopher—had the intuition that a single substance underlay everything in the world that can be perceived with the senses. His hypothesis was that this substance was water. His disciple, Anaximander, suggested instead that it was something that he called the *apeiron*—the “Infinite” (or “Indefinite”)—a substance without boundaries. His follower, Anaximenes, in turn suggested that the underlying substance was *aer* (air), but with substance and weight. There was no place for traditional Greek religion in the theories of these Milesian thinkers, though it would be inaccurate to call them atheists. There is no denying, however, that their ideas challenged traditional religion with its anthropomorphic gods such as Zeus and his wife Hera, because they pinpointed natural causes for the physical world. A poet named Xenophanes from Colophon, a city neighboring Miletus asserted that the gods of the poets Homer and Hesiod were unsatisfactory as explanations of how creation happened. There is, he asserted, one supreme deity who never moves but who knows all and controls everything without effort by his thought.

**THE PROBLEM OF CHANGE.** Heraclitus of Ephesus, who was prominent around 500 B.C.E., continued in the footsteps of the Milesians. His underlying substance was not water or air, but fire. All things in the world, he argued, come into being in exchange for fire, in the same way as one buys goods in exchange for gold coin. The cause of movement in the world is the conflict of opposites that is controlled by eternal Justice. Conflict, therefore, is a creative force by which everything is constantly changing. The result of this constant state of impermanence is the only knowledge that matters—in fact, the only knowledge that is possible—is self-knowledge. Wisdom consists of comprehending the *logos*, by which Heraclitus seems to mean the rationale that underlies nature.

**THE RUTHLESS LOGIC OF PARMENIDES.** The Milesians and their followers all assumed that the universe was made of matter. Matter was the stuff from which everything was made. Thales’ hypothesis was that this stuff was water, and Anaximenes suggested a substance like air, but whatever it was, it had weight and substance. Even the fire of Heraclitus was matter. It

remained for Parmenides to point out the logical consequences of this assumption. Parmenides, who lived in the Greek colony of Elea (modern Velia) in southern Italy in the first half of the fifth century B.C.E., argued that everything is matter. He believed there could be no movement in the universe, for an object that moves must have empty space into which it can move, and there was no empty space. “What exists,” he pointed out, is all matter, and “what does not exist” is nothing. There is no such thing as “nothing” so space containing nothing cannot exist. Parmenides founded the Eleatic School on this theory, and argued that the perceived movement in the universe was a deception of human senses. According to Parmenides, no true knowledge can be gained from sensory perception.

**THE ATOMIC THEORY.** The challenge of Parmenides never received a completely satisfactory answer. One philosopher, Empedocles, argued that there were four elements—air, earth, fire, and water—that moved through each other through pores like the holes in sponges, always impelled by the alternating forces of Desire and Hate, that is, attraction and repulsion. But two thinkers developed another hypothesis that sounds almost modern. Leucippus and his follower Democritus argued that the universe was made up of atoms and void. The atoms were tiny particles of matter, like our molecules, which moved about in a void like the specks of dust (or “motes”) that can be seen moving in a sunbeam. Atoms had a skin like velcro, and so when they collided, they stuck together, thus forming the objects that we see about us. Trees, animals, even people, were all made of tightly packed atoms. Yet the atomic theory could remain only an hypothesis. There was no way of proving it, and “void,” which was nothingness, continued to seem illogical to many philosophers.

**THE SOPHISTS.** The Sophists mark a new departure in Greek philosophy. They were itinerant teachers who appeared upon the scene to meet a demand for higher education. Education had been an aristocratic preserve in archaic Greece—a young man of good family learned the rudiments of reading and writing. He learned and sometimes memorized the poems of the epic poet Homer, and might also learn how to play the lyre and perhaps some basic arithmetic. In the fifth century B.C.E. this education expanded to include speech making, particularly before the law courts and public assemblies. The itinerant teachers claimed to be able to impart that type of knowledge, and the art of “sophistry” came to be centered in Athens. Although none of the early Sophists were from that city, most of them spent some time there and gave lectures for which they charged fees. In their

teachings and speeches, the Sophists turned philosophy from an examination of the workings of the physical universe to issues of ethics and behavior, including the nature of goodness and justice.

**SOCRATES.** The Sophists provided the intellectual matrix which produced Socrates in Athens in the fifth century B.C.E. Socrates was born in Athens; his father was a stonecutter and his mother a midwife. He was sufficiently well-to-do, allowing him to fight in the Athenian army as a *hoplite*—a heavily-armed infantryman who had to have the wherewithal to supply his own armor. He was at first attracted to the theories of Anaxagoras, a philosopher who continued in the Milesian tradition, arguing that the source of creation was *Nous* (“Mind” or “Intelligence”), but Socrates soon found Anaxagoras’ theories unsatisfying because they could not be applied to everyday life. Socrates turned to ethical questions. He could be seen almost everyday in the public places in Athens, walking barefoot and conversing with people he encountered. He accosted Athenians who thought they knew how to define what was right or wrong, and cross-examined them. The conversations ended often with Socrates’ interlocutor discomfited and annoyed. Yet Socrates attracted large numbers of followers who appreciated his sharp mind. Sometimes they were only ambitious young men who wanted to improve their skill at argument, but among them were genuine disciples, and much of modern knowledge about Socrates comes from two of them: Plato and Xenophon. Xenophon was a voluminous writer who wrote a memoir on Socrates called the *Memorabilia* which provides valuable information about Socrates’ everyday life. Plato was a great philosopher in his own right, and in his many works Socrates acted as the spokesman for Plato’s ideas.

**PLATO.** Socrates was put to death in 399 B.C.E. on charges of atheism and corrupting the young, and after his execution, many of his disciples—Plato among them—left Athens for the safety of the neighboring state of Megara. Plato did not stay there long. He traveled, did a couple stints of service in the Athenian army, and wrote his early dialogues. In 390 B.C.E. he visited southern Italy and then Sicily, where he met the powerful tyrant of Syracuse, Dionysius I, who soon tired of him and sent him back to Athens. Once there, he founded a school on the outskirts of Athens in a park sacred to the hero Academus, from whom the “Academy” got its name. It was intended as a school for statesmen, for Plato was deeply concerned about good government where true justice can exist, and his best-known work is his *Republic*, an ideal utopia where government is in the hands of “Guardians” who are trained in philosophy. On

Plato's death, his nephew Speusippus assumed the headship of the Academy, and it continued to be an intellectual force, though it wandered from Plato's teachings as time went on and became skeptical about the possibility of men acquiring true knowledge. Among the students at the Academy was a young man from Macedonia, Aristotle, who studied there for twenty years. He left when Plato died, and did not return to Athens until 335 B.C.E. During his absence from Athens, he lived for a period at the court of the Philip II, king of Macedonia, and he tutored Philip's son, Alexander, who would a few years later change the course of Greek history by conquering the Persian Empire and pushing his victorious army as far as India. Philip was assassinated in 336 B.C.E.; Alexander became king in his stead, and Aristotle returned to Athens to found the Lyceum.

**THE LYCEUM.** The Lyceum was a research institute, a product of Aristotle's wide-ranging mind. His interests included everything from the dialogues he wrote while a student at the Academy to his groundbreaking treatise on animals—a product of his biology research conducted after his departure from Athens. In the Lyceum he gave lectures, both to his students and to the public, and his surviving works seem to have been notes that he used to prepare his lectures. Those most admired nowadays are his *Ethics* and his *Metaphysics*. In the latter he analyzes the theories of the philosophers who came before him, and he is an important source for modern knowledge of the Presocratics. As much as Aristotle admired Plato, he disagreed fundamentally with him, particularly on the question of perception. Aristotle believed that the senses could provide reliable information about the world.

**EPICUREANS.** After Alexander the Great's conquests, two great philosophers settled in Athens and attracted students. One was Epicurus, who bought a house with a garden in which he formed a community with his students, both male and female. The aim of the Epicureans was happiness—not sensuous enjoyment, but a happiness based on contentment with one's situation. The watchword of the Epicureans was *lathe biosas*, which means "Live without attracting notice," and the "Garden," as Epicurus' school was called, was a retreat from the vicissitudes of life. Fear of death was banished, for Epicurus borrowed the atomic theory and used it to show that the body and soul were both made of atoms which would dissolve upon death. There was no afterlife and hence no reason to fear any tortures in the Underworld.

**STOICISM.** Stoicism was the philosophical belief that combined the philosophies of the Cynics—those who valued all things natural—and the Academics—those

who saw wisdom and knowledge as the key to a perfect society. Stoicism heavily favored the natural world, wanting to enjoy all the things that life had to offer, but believed that this natural world must be tempered by a rational mind. The Stoics believed that institutions such as government, religion, and law were unnecessary if everyone in a society could reach complete rationality (which the Stoics believed should be the goal of every society). Stoicism's founder, Zeno of Citium, lectured in the *stoa poikile* (Painted Stoa) which stood at the southern edge of the marketplace of Athens, and it was from this spot that Stoicism derived its name. In the second century B.C.E. Stoicism became the dominant philosophy of the Hellenistic world and the Roman Empire. In 144 B.C.E. the Stoic Panaetius came to Rome and joined the Scipionic circle, a group of Roman philhellenes who gathered about the statesman Scipio Aemilianus. These Roman aristocrats became enamored of Stoic doctrines, and Stoicism became the philosophy of choice of the Roman elite. The last great surviving Stoic work is the *Meditations* of Marcus Aurelius, the philosopher-emperor who died in 180 C.E.

**CICERO.** The Romans never took philosophy very seriously. Young men might have dabbled in it as part of their education, but once they entered the workaday world, they turned to more practical matters. Typical was Seneca the Younger (c. 3 B.C.E.–65 C.E., the emperor Nero's tutor whom Nero forced to commit suicide when he outgrew his tutelage; on his essays he advocated the precepts of Stoicism and in his own life followed none of them. Still, Rome produced one exceptional student of philosophy: Marcus Tullius Cicero. Cicero (106–42 B.C.E.) was a man of many talents. He was a lawyer and a statesman as well as an accomplished orator, the greatest that Rome produced. He often wrote on political science and rhetoric, and also tried his hand at poetry, but was not as successful. Near the end of his life, beginning in March of 45 B.C.E., he produced a remarkable series of books on various aspects of philosophy. These included works on immortality, perception, Stoic logic, the problem of pain, the possibility of divination, and others. He wrote partly for self-comfort, for his beloved daughter Tullia had just died. He was not an original philosopher, and he tended to pick and choose his philosophies—that is to say, he was an eclectic. If he had any preference, it was for the Sceptics, who denied the possibility of knowledge, though Cicero leaned towards the branch of Scepticism that allowed likelihood, meaning that there were likely or probable truths. Yet most of all, Cicero shows the attitude of a well-read Roman towards philosophy. It was a personal thing, a comfort in time of stress.

**THE NEOPLATONISTS.** The last progeny of Greek philosophy was the Neoplatonic School, founded by an Egyptian, Plotinus, who moved to Rome in the middle of the third century C.E. His starting point was Plato, who had written in his *Republic* of what he called the “Good.” For Plotinus, the “Good” was the “One,” and between the “One” and the world of material objects there were three levels of reality: the world-intelligence, the world-soul, and nature. With Plotinus, philosophy began to move into the field of theology, and his followers went even further. Neoplatonism rejuvenated the Academy in Athens that claimed to go back to Plato’s Academy, and in this Neoplatonic Academy, pagan philosophy made its last stand. It was closed down by imperial decree in 529 C.E.

### BEGINNINGS OF GREEK PHILOSOPHY

**MILETUS.** Greek philosophy began in a city-state on the coast of south-west Turkey: Miletus, which claimed that it was founded by a city on Crete called Milatos—probably Mallia on the north coast of Crete—in the Minoan period. If so, the Minoan foundation did not survive the catastrophe that overtook the Bronze Age civilization about 1200 B.C.E., and Miletus was refounded by Ionian Greeks during the age of migrations in the eleventh century B.C.E. The city prospered, and civic life was as turbulent as it was in most city-states in the Early Archaic Period of the seventh and early sixth centuries B.C.E. Around 600 B.C.E., Miletus’ independence was threatened by her neighbor, the Lydian Empire. The city of Lydia was ruled by a strongman—a “tyrant” as the Greeks called such men—named Thrasylbulus, and he led the resistance to Alyattes, king of Lydia, who harried the Milesians for eleven years. In the end Alyattes made peace and alliance with them but soon had to turn his attention to his eastern frontier where he faced the aggressive empire of the Medes who had destroyed the Assyrian Empire with some help from Babylon and were now expanding into Asia Minor. In 585 or 584 B.C.E., the Lydian and Median armies met at the frontier of Lydia, the Halys River which flows into the Black Sea. Just as they were on the verge of battle, there was an eclipse of the sun. A young man from Miletus, Thales, who was there among the Milesian allies supporting Alyattes, was said to have foretold the eclipse. Modern scholars find this story hard to believe, but it is clear that this man

would be the founder of Greek natural philosophy—that is, speculation about nature and the natural causes of what occurs in the cosmos.

**THALES, ANAXIMANDER, AND ANAXIMENES.** Thales believed that everything in the world is made of matter which might take various forms, be it solid, liquid or gas. The one matter that he knew could appear in all these forms was water. If heat was applied to ice, it became water, and heat applied to water produced steam that in turn could condense and return to water. Thales’ disciple Anaximander carried Thales’ speculation a step further. He suggested that the substance underlying all natural phenomena was not water but rather something that he called the *apeiron*—the “Infinite” (or “Indefinite”)—matter that had no boundary. He argued that the world was a cylinder with a flat top that provided men with living space. It floated freely in space, equally distant from all things, and thus without any need of support. Anaximander’s thoughts were daring and almost modern, but his follower Anaximenes abandoned his concept of the *apeiron* and suggested instead that the primary substance of the universe was *aer*—the Greek word for “air.” It is clear that Anaximenes’ *aer* is more than mere “air,” however. Rather, it is a kind of mist out of which denser substances are formed by condensation, much as felt can be made from wool by the process of felting. For Anaximenes, *aer* was a material substance. Unlike the *apeiron* of Anaximander, it could be defined, and later natural philosophers who argued that the universe was constructed of matter looked back on Anaximenes as the last great thinker of the Milesian School who brought the speculation that Thales began to its natural conclusion.

### PYTHAGORAS AND THE PYTHAGOREANS

**THE LIFE OF PYTHAGORAS.** Pythagoras, perhaps best known for his theorem on triangle angles and

lengths, left behind him a great reputation as not only a mathematician, but also as a philosopher and cult figure. Yet he is an indistinct personality, veiled in the shadows of legends that grew up around him. He was born on the island of Samos off the coast of modern Turkey in the first half of the sixth century B.C.E. and he was the son of an engraver of gemstones. In 532 B.C.E. a Samian named Polycrates seized control of the government of Samos and established himself as a tyrant. Polycrates maintained a splendid court and ruled like a pirate king, living on the fringe of the Persian Empire which would eventually, around 517 B.C.E., overthrow him, but during his heyday no cargo ship in the southern Aegean Sea was safe from his marauding warships. Pythagoras, it is reported, left Samos to escape Polycrates' dissolute court, and emigrated to southern Italy, to the Greek city of Croton, modern Croton. The Greeks had founded a number of colonies in the region: not only Croton, but also Sybaris, Locri, Metapontum, and Rhegium. These colonies battled each other for the rich farmland of the area; when Pythagoras reached Croton, it had just suffered a defeat at the hands of its smaller neighbor, Locri. The rich Crotoniates, humiliated by their defeat, were ready for Pythagoras' austere teachings. He gathered about him a brotherhood of Pythagoreans who were both scientists and mystics with secret doctrines and curious taboos; Pythagoreans wore white clothes to worship the gods and avoided eating beans, to name only two of the taboos that governed their lives. The Pythagorean circle soon dominated the aristocratic ruling class in Croton. The Pythagorean brotherhood became a force in the politics of the Greek cities in southern Italy until there was a violent reaction against their high-handed oligarchic rule that aroused strong resentment. Pythagoreans were massacred, and Pythagoras himself had to flee. He went to neighboring Metapontum where he died in exile. Pythagoreans remained active in southern Italy, continuing their scientific inquiries. It was a Pythagorean in the first half of the fourth century B.C.E., Archytas of Tarentum, who was recognized in the Greek world as the founder of mechanics, the branch of physics that deals with motion.

#### THE RELIGIOUS TEACHINGS OF PYTHAGORAS.

Pythagoras introduced a new vision of the fate of human beings after death: the doctrine of metempsychosis, or the transmigration of the soul from one body to another. The traditional religion of the Greeks which is reflected in the *Iliad* and *Odyssey* of Homer taught that humans differed from the gods in that human life was short, whereas the gods never died. Pythagoras taught that the soul was reborn after death and went through

#### ARISTOTLE ON THE PYTHAGOREANS

**INTRODUCTION:** Aristotle in his *Metaphysics* gives a summary of the doctrines of the philosophers who were active before his time. When he reaches the Pythagoreans, he emphasizes their fascination with mathematics, which seemed to hold the key to the secrets of the universe. He describes their researches as follows.

**SOURCE:** Aristotle, *Metaphysics, Books I-IX*. Book I. Trans. Hugh Tredennick (Cambridge, Mass.: Harvard University Press, 1996): 33.

a cycle of rebirths until it attained the immortality that hitherto only the gods enjoyed. The details of Pythagoras' original doctrine cannot be recovered now, for later philosophers added their own insights. The question of whether there was a set number of rebirths that the soul had to experience before it reached a blessed state was answered by the poet Pindar, for instance, who wrote that if a soul avoided injustice for three lives, it would attain a marvelous existence in the Isles of the Blessed. Philosophers differed on whether the transmigrating soul was the same soul that governed a person's sentience and activity during his lifetime; Plato thought it was, but the philosopher Empedocles thought that it was not the *psyche* (soul) that transmigrated but the *daimon* (spirit). The

doctrine of transmigration that Pythagoras taught his followers pioneered a new field of speculation about life after death. Not everyone was impressed. Pythagoras' contemporary, the poet and philosopher Xenophanes, mocked the doctrine with a story in which Pythagoras urges a man to stop beating his dog, recognizing in the dog's yelps of pain the soul of a dead friend.

**THE COSMOLOGY OF PYTHAGORAS.** Pythagoras' theory of the nature of the universe—his cosmology—was influenced by the Milesian philosophers, Anaximander and Anaximenes. Anaximander's "Infinite" and Anaximenes' "Limitless Air" corresponded to what Pythagoras called the "Dark," which is cold, dense, without light, and without boundaries. Yet "Light" also exists, the opposite of the limitless "Dark," and it has form and thus it has limits, for without limits, matter is by definition formless. Portions of the limitless "Dark" are attracted to the "Light" where they receive form and limit. The Pythagoreans conceived of the "Light" as a living, breathing thing, and from the portions of the "Dark" which "Light" breathes in, the celestial bodies are formed. The celestial bodies numbered ten, and they revolved from east to west around a central fire. The sun reflects light from the central fire and thus provides Earth with light and warmth. Thus the cosmos consists of the central fire, Earth, the moon, the sun, Mercury, Venus, Mars, Jupiter, Saturn, and counter-earth which seems to serve no other purpose than to make the number of heavenly bodies total ten, which the Pythagoreans considered a sacred number. At the very limit of the cosmos were the fixed stars. Except for these fixed stars, the heavenly bodies moved around the central fire, and since moving objects can produce sound, Pythagoras assumed that *harmonia* existed in the universe. *Harmonia* was the word for the octave-system of music he developed according to mathematical ratios. Hence, arose the Pythagorean theory of the "music of the spheres," though it is not at all certain that Pythagoras himself thought of the heavenly bodies as spheres.

**THE NEOPYTHAGOREANS.** Pythagoras came to be regarded as the archetypal philosopher by the end of the fourth century B.C.E., and the followers of Plato and Aristotle absorbed many of his ideas. But his reputation was such that there appeared forged documents attributed to him from the third century B.C.E. onwards, and their numbers grew in the first century B.C.E. when a sect which modern scholars call the "Neopythagoreans" was founded. Neopythagorean doctrine owes more to Plato than Pythagoras. The Neopythagoreans built up a cult around Pythagoras so that he became a legendary semi-divine sage whom the pagans in the Christian era

put forward as a rival for Christ. It is not always easy to separate the Neopythagorean sage from the semi-legendary but nonetheless historical figure of Pythagoras.

#### XENOPHANES, HERACLITUS, AND PARMENIDES

**XENOPHANES OF COLOPHON.** Xenophanes was one of the first philosophers to promote monotheism in Greece, and was the founder of Eleatic philosophy—the belief that above everything in the world there is an unchanging, everlasting "One." He did not define this "One" in his own writings, but many of his later followers, such as Plato and Aristotle, would attempt to steer this concept towards a belief in one God, contrary to the Greek belief of many different gods. Xenophanes was a native of Colophon, a city on the western fringe of Asia Minor, which he left when it was conquered by Persia about 546 B.C.E. He would spend the rest of his life traveling the Greek world. He had a close connection with Elea, modern Velia in southwest Italy, which was founded by Ionian Greeks fleeing the Persian conquest. Xenophanes was an accomplished writer whose influence was immense in the intellectual world of the western Greeks, among the Greek cities in Sicily and southern Italy. He criticized Homer and Hesiod for their portrayal of the gods. They were wrong, Xenophanes asserted, to show the gods in human form with human

*a PRIMARY SOURCE document***HERACLITUS THE MISANTHROPE**

**INTRODUCTION:** Heraclitus of Ephesus, famous as the site of the great Temple of Artemis which was considered one of the “Seven Wonders of the Ancient World,” was famous for his disdain of the masses and his cryptic utterances about the nature of the universe. He was a descendant of Androcles, the founder of Ephesus and as such inherited the title *basileus* (king), which denoted a civic priesthood rather than a political office, but he rejected it. Diogenes Laertius, writing in the third century c.e., preserves stories about him which illustrate his contempt for his fellow Ephesians as well as the thinkers and the poets—including Homer—who were his predecessors or his contemporaries.

Heraclitus was possessed of a haughty and arrogant character, as is clear from his writings, where he says, “Great learning does not make for intelligence; if it did, it would have instructed Hesiod, and Pythagoras, and likewise Xenophanes and Hecataeus. For the only piece of real wisdom is to know the *logos* (the intelligence that sustains human laws) which will by itself govern everything on every occasion. He used to say, too, that Homer ought to be expelled from the contest (for wisdom) and Archilochus as well. He also used to say, “It is more necessary to extinguish arrogance than to put out fire.” Another of his sayings was, “People should defend their law as much as their city walls.” He also upbraided the Eph-

esians for having banished his companion, Hermodorus, saying, “The Ephesians deserve to have all their young men put to death and those who are adolescents exiled from the city, for they have banished Hermodorus, the best man among them, saying, ‘Let no one of us be outstanding, and if there be such a person, let him go to another city and another person.’”

When he was requested to make laws for the Ephesians, he refused, because the city was already immersed in a thoroughly bad constitution. He withdrew to the temple of Artemis with his children and began to play dice, and when the Ephesians all flocked around him, he said, “You wretches! What are you gaping at? Isn’t better to do this than to meddle in public affairs in your company?”

Finally he became a complete misanthrope, and spent his time roaming the mountainsides, living off plants and grasses, and as a result, he developed dropsy (a build-up of fluid in the cells of the body). So he returned to the city and asked the doctors a riddle: could they produce a dry season after wet weather? But they did not understand him, and so he shut himself up in a cow stable, and covered himself with manure, hoping to make the excess of fluid evaporate from him by the warmth this produced. But this treatment did him no good, and he died, having lived for seventy years.

**SOURCE:** Diogenes Laertius, “Heraclitus of Ephesus,” in *The Lives and Opinions of Eminent Philosophers*. Trans. C. D. Yonge (London: Henry G. Bohn, 1853): 376–377.

faults, though it was natural to do so; oxen and lions, if they had hands, would draw their gods as oxen and lions. Xenophanes taught instead that there was a single supreme divine being who, without moving, controlled the universe through his intellect. Xenophanes had a gift for observation that not all Greek intellectuals shared. He found seashells and fossilized sea-creatures in rocks and inferred that there was once a time when the sea covered the land, and hence the earth must have been subject to periods of flooding and drying out. He may even have written a treatise on the subject.

**THE ETERNAL FIRE OF HERACLITUS.** Heraclitus of Ephesus was inspired by Xenophanes’ idea of an everlasting unchanging “One,” but like many philosophers of his time did not think this “One” was a being or a person, but was instead a basic material that was transformed in some way into other kinds of material. Thales of Miletus had pinpointed water as that basic material and Anaximenes had thought it was air; Heraclitus chose fire. Fire, he claimed, was an infinite mass which was

eternal—no divine power created it—and it was kindled and extinguished according to fixed measures. The kindling and quenching of fire maintained the world order. Heraclitus came to this conclusion after observing how flames, flickering in constant motion, transformed wood into ashes and smoke, and yet the fire maintained its own identity as fire. Once it was quenched, it could be rekindled. Like fire, Heraclitus’ universe was subject to constant change. Everything was in constant motion. One famous saying of Heraclitus was that a person cannot step twice into the same river, for new water is constantly being carried past him by the flow of the stream, and hence the river is never entirely the same from one minute to the next. Yet, like fire, the river itself continues to exist.

**THE UNITY OF OPPOSITES.** Heraclitus’ teachings were notoriously obscure, but he was identified in the ancient world with a number of doctrines. One doctrine maintained that the world was in a state of continual flux; his saying, “Everything flows,” made the universe

akin to a moving stream. He also believed in the unity of opposites: things that seem to be opposites are actually aspects of the same thing. This unity is demonstrated in the seeming opposites of “heat” and “cold” which are interdependent: “cold” is the absence of “heat.” Once the continual flux that never ceases in the world removes “heat,” we have “cold.” “What is cool becomes warm and what is warm becomes cool,” Heraclitus wrote. So the young and the old are aspects of the same, and so are the living and the dead, for the one becomes the other. One of Heraclitus’ axioms reads, “The road up and the road down are the same”—meaning there is a single road with two-way traffic. It is the tension between opposites that allows living things to exist, just as the string of a lyre will sound the correct note when it is placed under the right degree of tension by drawing it in opposite directions. This interaction of opposites, which Heraclitus identified as strife, is a creative force, and this belief probably explains one strange assertion of his: “War is the father of all and king of all.” Everything is created and passes away through strife between opposing forces. The world is a mass of conflicting tensions but, at the same time, these contrary forces are bound together by a strict unity. The strife between them results in a sort of balance which Heraclitus identified as justice, and justice maintains order—hence Heraclitus asserted that the sun would keep its allotted course in the heavens, for otherwise the Furies, the agents of Justice, would punish it. The unity of opposites is the central feature of the *logos* that Heraclitus proclaimed.

**THE LOGOS.** Many of Heraclitus’s views on the *logos* are attributed to his study of Xenophanes. *Logos* is a word with many meanings. It means “word”—not “word” in the strictly grammatical sense, but rather “word” as a vehicle expressing thought, and so it comes to mean the thought itself. It is the wisdom of the mind expressed in speech. For Heraclitus, the word *logos* seems to have expressed the Intelligence that directs the manifold changes in the world. It was both willing and unwilling to be called Zeus, according to one of Heraclitus’ cryptic utterances. The *logos* that Heraclitus proclaimed would continue to haunt philosophy and theology as well. In the early Christian era, some thinkers considered Heraclitus a Christian before his time because of his emphasis on *logos*, a Christian synonym for Jesus Christ derived from the opening verse of the Gospel of St. John: “In the Beginning was the *Logos* (the Word) and the *Logos* was with God and the *Logos* was God.” In the Roman period, the Stoic philosophers embraced Heraclitus because his doctrine of eternal fire that was alternatively kindled and quenched seemed to fit their

belief that the world passed through cycles, each of which ended in fiery destruction. Yet Heraclitus was neither a proto-Stoic nor a proto-Christian, though his eccentric lifestyle and his oracular utterances mark him out as almost as much a religious teacher as a natural scientist.

**PARMENIDES OF ELEA.** While Xenophanes and Heraclitus furthered the idea of the everlasting element that underlies all things, it was Parmenides, born in Elea about 515 B.C.E., who brought the line of speculation that began with Thales and Anaximander to its logical conclusion. All the Ionian philosophers who speculated about nature took for granted that there was a primary substance such as water, air, or fire that could take different forms. They left no place for nothingness. The Greeks had no symbol for “zero.” “Nothing” was something that could not be defined or expressed; the opposite of “that which exists” is “that which does not exist.” Parmenides pointed out the consequences of this line of thought. In the first place, “that which exists” cannot have been created for if it were, it would have to be created out of either something or nothing. Nothing does not exist and so “that which exists” cannot not have been created out of it. Nor can it have been created out of something, for the only “something” is “that which exists.” Nor can anything else besides “what exists” be created, for there is no empty space where such creation could take place. Parmenides refuted all accounts of creation with a simple principle that could not be contradicted: “Out of nothing there is nothing created.”

**THE UNIVERSE OF PARMENIDES.** Thus for Parmenides “that which exists” is matter that is continuous and indivisible, and therefore the universe must be a continuous, indivisible *plenum*, that is, a space filled with matter. The plenum cannot move, for if it did, it would have to move into empty space—a vacuum, the opposite of a plenum—and empty space is “nothingness,” which does not exist. The plenum must be finite, with definite boundaries, and spherical, for matter cannot have direction, and that can be true only in a sphere. Within the plenum there can be no movement, for if an object moves, then there must be some empty space into which it can move, and there is no empty space. So the evidence of our eyes that tells us that things in the world that we see *do* move must be an illusion. The messages that our senses send to our brain about the nature of the world must be wrong. The alternative would be to believe that the underlying assumption of all the philosophers from Thales to Heraclitus—that the world of the senses was made from some basic matter such as water, air, or even the “boundless” of Anaximander—had to be wrong.

**ZENO'S RIDDLES.** Zeno, born around 495 B.C.E. was a favorite of Parmenides, and he made it his business to drive home the logical conclusion of the Eleatic school of philosophy that motion was a mere illusion. The paradoxes by which he drove home the logic of the Eleatics were famous. One was the paradox of the arrow that is shot from a bow. The arrow must either be moving in the place where it is or where it is not, and it cannot be moving in the place where it is, or it would not be there. Nor can it be moving in a place where it is not, for it is not there. Therefore the moving arrow is stationary. To put it another way, the apparent motion of the arrow is like a moving picture, which is actually a succession of still pictures that are fed rapidly through a projector and produce the illusion of motion. In fact, at every point in its trajectory, the arrow is actually at rest and what is at rest at every point is not moving. Zeno used this deduction as proof that Parmenides was right: there is no motion. The Greek philosophers had no solution to this paradox, and the modern world had to wait until Sir Isaac Newton discovered differential calculus before Zeno's error could be discovered. Another famous paradox proposed by Zeno was that of Achilles, a legendary Greek hero, and the Tortoise. Achilles and a tortoise run a race, and the tortoise has a head start. Achilles cannot overtake the tortoise, for when he reaches the point where the tortoise started, it has already moved on to further point, and when Achilles reaches that point, the tortoise has already moved further on, and so on through an infinite series which has no end. There is no final term to this infinite series and so Achilles can never pass through the final term. Yet here, Zeno's logic ultimately proved itself faulty, for it is a fair question to ask why, if there is no final term, does Achilles need to pass through it? It cannot be necessary for Achilles to pass through a non-existent final term to overtake the tortoise. Yet the relentless logic of the Eleatic philosophers was hard to counter.

**MELISSUS OF SAMOS.** One of the major flaws in the universe of Parmenides was the idea of a plenum with a finite boundary. If there was nothing whatsoever beyond the boundary, what happened if a person went to the outer edge of the universe, kicked a hole through its skin, and thrust his foot into nothingness, which does not exist? Melissus of Samos, who lived in the mid-fifth century B.C.E. and was the last member of the Eleatic School, attempted an answer. He defended the basic doctrine of the Eleatics, but proposed a plenum without a finite boundary, so that the universe was infinite. So no one could kick a hole through the boundary of the universe, for there was no boundary. Yet there was still no place

for movement. Melissus had to deny that the senses could yield us true knowledge, for the intelligence that our eyes report to our brains indicates that there are bodies in motion in the world about us. The Eleatics denied real existence to the "phenomena"—that is, to the objects that appear to us as actual—and any thinker who wanted to save the phenomena had to devise an argument that countered their uncompromising logic.

## EMPEDOCLES, ANAXAGORAS, AND THE ATOMISTS

**THE IDEA OF FOUR ELEMENTS.** Empedocles attempted to find an escape from the logical conclusions of the Eleatic philosophers. Born in the early fifth century B.C.E. in Sicily, Empedocles took on many roles before becoming a philosopher. For a short time he was a politician, and then he turned his attention to educating people on the topics of medicine and religion. When he embarked on his own study of philosophy, he held two very important views. First, he abandoned the accepted belief that all philosophers had held since Thales: that all matter was derived from a single underlying substance. Instead he theorized that the world, as it is known, is due to the mixing and separation of four elements: earth, air,

fire, and water, which Empedocles called “roots.” Second, he accounted for the blending and the separation of the elements by theorizing the existence of two different forces that blend and separate called Love and Strife—attraction and repulsion. The first caused the elements to blend together and created the physical world, whereas Strife forced the elements apart and caused destruction.

**LOVE AND STRIFE.** Empedocles compared the blending of the elements to what a painter does when he mixes his basic colors: by combining his colors, he produces new tints. So in the universe, which Empedocles, like Parmenides, imagined as a sphere, the elements are mixed together by the attractive force of Love in their proper ratios to form concrete objects; human bones, for instance, were two parts water, four parts fire, and two parts earth. This blending of the elements results in genesis and growth in the world of the senses, whereas the separation of the elements results in death, destruction, and decay. Strife is on the outside of the sphere but in due time it penetrates it, driving Love towards the center of the sphere. Gradually the four elements separate from each other. Death and decay occurs. Then the opposite process begins: Love, which has been driven into the center of the sphere, begins to expand, driving out Strife. This never-ending cycle is like the flux and reflux of blood from the heart, or the action of breathing air into the lungs and then expelling it. All the objects that can be seen are unstable compounds. Blending the elements brings about genesis and the creation of new things, and the dissolution of the mixture of elements brings about their decay.

**THE PROBLEM OF MOTION.** Empedocles still had to explain how this blending of the elements took place. The process implies movement, and Empedocles accepted Parmenides’ concept of a sphere as a plenum in which there was no movement for lack of space in which to move. Empedocles explained that there were “pores” in the elements that allowed them to move together and coalesce. The Greek for “pores” is *poroi*, passageways, like the holes in a sponge. These “pores” provided passageways so that the elements could move into each other and create unstable compounds, and then move apart and destroy them as the endless cycle of cosmic change.

**ANAXAGORAS OF CLAZOMENAE.** Anaxagoras, a contemporary of Empedocles, took up Empedocles’ theory of blending elements and completed it by describing what caused motion in these elements. Anaxagoras, born in Clazomenae in the early fifth century B.C.E., was a man of privilege from a wealthy background. He gave up a good deal of his possessions and lands to study sci-

ence and philosophy, to the point that he left Clazomenae after 470 B.C.E. and settled in Athens. He stayed there for some forty years until he was driven into exile on a charge of impiety. Much like Empedocles, Anaxagoras asserted that the Greeks were wrong to speak of genesis and destruction; instead they should call genesis a “blending together,” and destruction “decomposition.” Empedocles spoke of “elements” whereas Anaxagoras spoke of “seeds.” His “seeds,” however, were not the same as Empedocles’ “roots.” Rather, they were themselves compounds, each with a fixed shape, color, and taste, and each containing a fixed number of *dynameis*—the word means “powers” or “capabilities.” The ration of *dynameis* within each seed is a fixed amount, and they tend to exist in pair of opposites, such as hot *dynameis* coupled with cold ones, heavy with light ones, and moist with dry ones. A stone is made up of seeds with more heavy *dynameis* than light ones and more dry than moist ones—hence its solidity. Every seed has a portion of everything within it, no matter how minutely it may be divided.

**THE POWER OF “MIND.”** Anaxagoras realized that his theory of “seeds” was incomplete. He still needed a source of motion that allowed this blending and uncoupling of the “seeds.” Anaxagoras, however went a step beyond Empedocles and created a force called the *Nous* (Mind), which served as the source of knowledge for the human intelligence. It was not an incorporeal force, however, but a kind of unmixed fluid that did not have portions of other things in it. It coupled the “seeds” and uncoupled them by setting them in rotation. That is, “Mind” established a kind of vortex which began in the center of the “seed” and then spread further and further, evidently somewhat like the ripples that a stone thrown into a tranquil lake produces on the surface of the water. Anaxagoras did not expand further on his concept of the *Nous*, and this left future philosophers dissatisfied with the theory. Although initially attracted to Anaxagoras’ philosophy in his youth, Socrates complained that Anaxagoras thought of “Mind” simply as a mechanical device to get motion started in his universe, and once that was done, he had no further use for it.

## THE ATOMIC THEORY

### ESCAPING THE LOGIC OF THE ELEATIC SCHOOL.

Both Empedocles and Anaxagoras attempted to evade the ruthless logic of Parmenides and the Eleatic School of philosophers who argued that there are two opposites, “that which exists,” which is matter, and “that which does not exist,” which obviously does not exist. Since the world is composed of matter which does exist, it fills all the available space. Thus there can be no motion, for motion implies that there is empty space into which an object in motion can move, and there is no empty space. Parmenides’ follower, Zeno, proved to his own satisfaction that an arrow in flight only appears to move. In actuality, at any given point in its apparent flight, it is at rest. To escape from this logic, someone had to produce a theory to prove that empty space was not the same thing as the Eleatic’s “that which does not exist.” The philosopher who provided the necessary leap of imagination to get over this Eleatic idea was Leucippus of Miletus, the same city that fathered Thales, Anaximander, and Anaximenes who had started the long tradition of Greek speculation about the nature of the universe. Unlike his predecessors, he is a shadowy figure, overshadowed by his more famous follower Democritus to such an extent that some Greeks even denied his existence. He was recognized, however, by such philosopher greats as Aristotle, who headed the school known as the Lyceum in Athens of the fourth century B.C.E., and his successor Theophrastus. Both men referred to Leucippus as the author of a work on the atomic theory titled the *Great World System*, although other philosophers—notably Epicurus (342–271 B.C.E.) and his followers—attributed this theory to Leucippus’ pupil, Democritus of Abdera. Although Democritus was a prolific writer, none of his works survive to the present day.

### THE ATOMS OF LEUCIPPUS AND DEMOCRITUS.

Leucippus and Democritus conceived of particles of matter called “atoms” which moved through space like the flecks of dust that can be seen moving in a sunbeam. Some were large, some small, and some might be smooth and round and others might have an irregular shape. The

atoms moved through void. Parmenides had argued that the universe was a plenum filled with matter, and there was nothing else, but Leucippus and Democritus argued that the opposite of a plenum—a vacuum—also existed. Each atom, however, which was so small as to be invisible, was itself a plenum, and could not be split. Atoms were *atoma somata* (bodies that cannot be divided). The atoms were perpetually spinning, like the “seeds” of Anaxagoras, and as they collided some stuck together while others were forced apart. Small, perfect atoms gravitated towards the outside of the universe and formed the dome of the sky, whereas heavier atoms gravitated towards the center and formed earth. The concept of weight and its opposite, lightness, was something the Greeks did not understand, for the force of gravity had not yet been defined. Leucippus explained that weight resulted from the size of the atoms and their combinations, but neither he nor Democritus seemed to have thought weight very important and they never committed the error that Aristotle made later, of arguing for the existence of absolute weight. Epicurus later assigned different weights to the atoms, and argued that the heavier atoms moved at a different speed than the lighter ones. For Leucippus and Democritus, weight was a relative thing and the atoms moved at random. But they collided, and from their collisions they formed the groups of atoms that make up every object in this world, including human beings. The atomists saw an analogy in the letters of the alphabet. Each letter is a separate symbol with its own form, but when arranged together in various ways they form words. So the various arrangements of the atoms form different objects in the same way as the different arrangements of letters make different words. It was taken for granted that the atoms would always keep moving unless something intervened to make them stop.

**THE PROBLEM OF THE SOUL.** The atomic theory of Leucippus and Democritus assumed that the soul, too, was made up of atoms and void. Soul atoms were round and very mobile, and the atomists argued that there was also a fiery quality about them. Fire-atoms exist in the universe, but had no influence on how material things move; men breathed them into their bodies, at which point they formed an aggregate of fiery atoms known as the soul, and on death, it dissolved. This theory hearkened back to the old Greek belief that the soul—the *psyche*—was the breath of life which departed from the body at death. According to the atomic theory, the soul that is composed of atoms leaves the body when the last breath is drawn and returns to mingle with the fire-atoms of the universe. There is no place in this theory for any

belief in the immortality of the soul. Yet the soul that is within every living person endows him with his intellect and his senses and even governs the motion of his limbs. The senses allow humans to see, hear, and taste, for objects project images of themselves as emanations, and these are received by the soul. Animals apparently did not have souls of this sort, though they, too, breathed in air and exhaled it, and in fact, the concept of the soul according to the atomic theory seems to involve a good deal of inconsistency.

**DEMOCRITUS THE MORALIST.** Democritus wrote on a remarkable number of subjects, including mathematics, and among them was a theory of ethics which he fitted to his atomic philosophy. One treatise titled *On Cheerfulness* began with a warning against restless activity. Freedom from disturbance, he wrote, is what brings about human happiness. Cheerfulness is the ultimate good and it is a state in which the soul lives tranquilly, without being disturbed by any fear or superstition. Here we find a new conception of life for a person, not as a part of a social order such as a city, but rather as an individual. Human happiness was the sum total of all feelings that give pleasure—not just vulgar pleasures, though Democritus did not rule them out, but also pleasures in the beautiful. His thoughts about the gods are difficult to discern; one surviving fragment of his writings refers to them as providers to mankind of all that is good, and another fragment mentions them as images that approach human beings to impart knowledge of the future and of the divine. On morals, he was no relativist. As far as he was concerned, there was one standard of morality for everyone:

The same things are good and true for all mankind,  
but some men take delight in some things and others  
in others.

## THE SOPHISTS

**A SHIFT IN EMPHASIS.** The scientific philosophers, from Thales to Democritus, had done their best to understand the nature of the world with remarkable achievement. The intuition of Leucippus and Democritus—that the universe was created of atoms and void—was a remarkable one, but the Greeks lacked the scientific equipment to make it anything more than an hypothesis. In the classical period (480–323 B.C.E.), philosophy sought new areas of speculation. In Athens, Socrates was a pivotal figure, so much so that the natural philosophers, from Thales to Democritus, are lumped together under the label, "Presocratics." Yet the way for Socrates was prepared by a group of thinkers and teachers called Sophists. The Greek word *sophistes*, from which the word "sophist" is derived, means a "master of one's craft," and it has a secondary meaning of "one who is expert in practical wisdom." Experts in classical Greece always suffered from a degree of prejudice—the American slang word "egghead" is a good translation of *sophistes*. But it was not until the fourth century B.C.E. that the word "sophist" carried distinct overtones of disdain, and Socrates' disciple, the philosopher Plato, must bear much of the responsibility for that development. Plato was at pains to show that Socrates was not a Sophist, though some of his contemporaries clearly thought that he was. Socrates had disciples, but Plato claimed that he never charged tuition fees whereas the Sophists did.

**THE DEMAND FOR HIGHER EDUCATION.** The Sophists appeared at a time when the old aristocratic prejudices of archaic Greece were breaking down all over the Greek world. The age of the Sophists seems to have begun outside Athens, and it gave rise to a cadre of international experts who, like the lyric poets in archaic Greece, roved from city to city in search of students willing to pay the tuition fees they charged. In the aristocratic thought-world of archaic Greece, *arete*, a word which combines the meanings of "virtue" and "valor," was an innate quality. So far as there was an educational program, it consisted of poetry—particularly the poems of Homer—music, training in arms, and following the examples of one's elders. This sort of education was incomplete in classical Greece, however, where individuals needed to be skilled in presenting cases in court; in the public assemblies, competence in public speaking paid dividends. The Sophists claimed to be able to teach the skills necessary for success. They asserted that they could make their disciples proficient in rhetoric and the verbal skills to make a weak case appear stronger than it really was. From teaching men how to be good at something like rhetoric, the claim to teach men goodness it-

self required no great leap of the imagination. One of the learned men who approached these broader questions was Protagoras, the first Sophist to charge tuition fees, who came from Abdera in northern Greece not far from the border with modern Turkey. He was an itinerant teacher who spent most of his life traveling; he visited Sicily and he came to Athens at least twice. During one of these times in Athens he was threatened by a conservative Athenian named Pythodorus with a charge of impiety, and he made a timely departure. His books were publicly burned, but Protagoras' reputation outside Athens no doubt resulted in the survival of copies of his books elsewhere in the Greek world.

**THE TEACHINGS OF PROTAGORAS.** Conservative pious Athenians had good reason to be shocked by Protagoras' books, which he presented during public readings. An early work titled *On the Gods*, which was his first book to be read in public, began with the memorable sentence:

Of the gods, I can know nothing, neither that they are nor that they are not, nor how they are shaped if at all. Many things prevent such knowledge—the uncertainty of the question and the shortness of human life.

With these few words, Protagoras turned his back on the gods to whom the Greeks sacrificed all over the Greek world, though it cannot be said for certain that he was an out-and-out atheist. His outline for the proper education of a politician was laid out in a book titled *Truth, or Refutations* which began with a sentence that became famous as the summary of his philosophy:

Man [or "a man"] is the measure of all things, of things that are, that they are, and of things that are not, that they are not.

In the context of its time, this passage may have been a protest against the Eleatic school of philosophy, particularly Parmenides, who argued that existence as men perceive it is not at all what it actually is. Protagoras' rejoinder to the Eleatics was that as things exist *for me*, that is what they are for me, and as they exist for you, that is what they are for you. In other words, each person has a right to trust his own senses. Yet there is little doubt that Protagoras carried over this relativist view into judgments of value as well. The inference was that there was no such thing as absolute justice or absolute goodness; rather they were matters of personal judgment. Thus Protagoras held that one could argue equally well for or against any proposition; whether or not the proposition had some merit was of no consequence since all opinions were equally true. Some opinions, however, could be better than others even if they were not more

*a PRIMARY SOURCE document*

**PROTAGORAS: THE FIRST PROFESSIONAL TEACHER**

**INTRODUCTION:** Protagoras of Abdera (circa 485–circa 415 B.C.E.) was the first professional sophist to offer instruction for a fee, and he died a wealthy man. He was clearly a man of recognized integrity who was generally respected, for when Athens founded the colony of Thurii on the Gulf of Taranto in Italy in 444 B.C.E., the Athenian statesman Pericles appointed him to draw up a code of laws for the new foundation. He upheld a doctrine of relativism—the sentence that introduced a work of his, “Man is the measure of all things” was famous and was taken to mean that every person has his own criterion for what is good and true. Thus truth existed in the eye of the beholder and everything could be true for in the opinion of someone. The following selections comes from the *Lives* of the ancient philosophers, a compilation by Diogenes Laertius who probably lived in the first half of the third century C.E.

Protagoras was the first person to declare that in every subject for debate, there were two sides which were the exact opposite of each other, and he used to use this debating procedure in his arguments, being the first person to do so. He started a book of his with this introductory sentence:

Man is the measure of all things, of the existence of things that are and the non-existence of things that are not.

He used to say, too, that the soul was merely sensory perception, as Plato says in the *Theaetetus*, and that everything was true. Also, he introduces another of his treatises this way:

Concerning the gods, I cannot know for certain if they exist or if they do not. For there are many things that prevent one from knowing, especially the uncertainty of the subject and the shortness of human life.

Because of this sentence that began his treatise, he was banished by the Athenians, who burned his books in the market-place.

**SOURCE:** Diogenes Laertius, “The Life of Protagoras,” in *The Lives and Opinions of Eminent Philosophers*. Trans. C. D. Yonge (London: Henry Bohn, 1853): 397–398. Text modified by James Allan Evans.

true; that, at least, is what Plato suggested in his dialogue, the *Theaetetus*, as Protagoras' meaning, and it is very close to that of a modern pragmatist.

**GORGAS OF LEONTINI.** Like Protagoras, Gorgias of Leontini found the conclusions of the Eleatic philosophers impossible to accept. But unlike Protagoras, whose reaction was to affirm that it was right for every person to decide for himself what was true, Gorgias maintained that there was no truth at all. Gorgias was from the Sicilian city of Leontini and he came to Athens in 427 B.C.E. as an envoy for his native city. His skill at public speaking made a great impression on the Athenian public. He introduced Athens to methods of persuasion that had been developed in Sicily, and his influence on Athenian literature and prose style was enormous. During his time in Athens he studied and presented his own brand of philosophy. One of his works *On Nature, or What Does Not Exist*, attempted to show that there is nothing; even if there is something, we cannot know it, and even if we could know it, we cannot communicate our knowledge to anyone else. This sort of nihilism would seem to lead to the conclusion that there is no right or wrong, but Gorgias did not go so far. Others did, however; in the first book of Plato's *Republic*, an Athenian named Thrasymachus maintains that there is no "Right" at all, and what we call "Right" is only what is advantageous for the more powerful person who can force weaker persons to accept it as lawful and binding simply because he is more powerful. Thrasymachus was a teacher of rhetoric in Athens when Gorgias visited Athens, and though the *Republic* of Plato was written more than a generation later, Plato probably reported accurately the conclusions that some of Gorgias' disciples drew from his teachings.

**PRODICUS OF CEOS AND HIPPIAS OF ELIS.** Prodicus was a contemporary with Democritus and Gorgias, and was a disciple of Protagoras. Originally from Iulis on the island of Ceos, he was a popular public servant who eventually was sent to Athens as an ambassador. After a time, he also took up the study of philosophy and soon had opened his own school of Rhetoric. By the late fifth century B.C.E., he was giving expensive lecture-courses which seem to have emphasized linguistics. His particular specialization was the exact meaning of synonyms. His studies in religion focused on the personalization of natural objects as the creation for the need for organized religion, that man needed to understand how nature related to him personally and not how he worked in conjunction with nature. This defied many of the ideas that man was the center of the universe and that all things were created by the gods to serve man. Many

of these ideas were noted in his most famous work *The Choice of Heracles*, a work that is no longer available but is often cited by later philosophers. Prodicus was put to death for his ideas on religion and was accused of corrupting the youth of Athens. Another contemporary Sophist was Hippias, who belonged to a school of teachers that believed that the educated man was master of everything. Once he visited the Olympic Games wearing a purple cloak, and boasted that he made everything he wore, including the ring on his finger. He dabbled in all the recognized branches of learning—grammar, rhetoric, geometry, mathematics, and music—and he also tried his hand at literature: epic poetry, tragedy, chronicles, and so on. He made profitable lecture tours, traveling from city to city; in one of the Platonic dialogues he boasts to Socrates that he had just given a very successful series of lectures in Sparta, where his subject was genealogies, which was one of the few categories of learning that were to Spartan taste. One of his works was a list of the victors at the Olympic Games, starting in 776 B.C.E. Hippias' work is lost but it served as one source for a later list drawn up in the early third century C.E., and it is the basis for the chronology of archaic Greece.

#### SOCRATES

**CONSTRUCTING SOCRATES.** Often called the "father of philosophy," Socrates (470–399 B.C.E.) is known to modern readers only through the written works of other philosophers and historians. It is unclear whether Socrates himself ever wrote down any of his philosoph-

ical views, but it is certain that any of his works that were created have since been lost. Fortunately, a good deal was written about Socrates both before and after his death. The main source of the philosophical viewpoints of Socrates comes from his disciple Plato, who first recorded the dialogues of Socrates and later used the persona of Socrates in his writing to promote his own philosophy. Three of Plato's most famous dialogues—the *Apology*, the *Crito* and the *Phaedo*—recreate Socrates' last days before he was put to death on charges of impiety and corrupting the young. All three works focus on different areas of philosophy: the *Phaedo* discuss death, life, and the morality of suicide; the *Apology* constructs a defense of philosophy in general and an attack on the Sophists' way of thinking; and the *Crito* focuses on justice and issues of good versus evil even in the face of injustice. In Plato's earlier dialogues, such as the *Apology* and the *Euthyphro*, Socrates appears as a personality in his own right, but in later works, such as the *Republic*—Plato's dialogue that has had the greatest influence of anything he wrote—Socrates has become a spokesman for Plato's own philosophy. Yet the personality of Socrates recognized by modern scholars as most authentic is Socrates as portrayed by Plato. Numerous other accounts of Socrates—such as the comical character Socrates in Aristophanes' play *Clouds* and the day-to-day advisor that appears in the works of the historian Xenophon—survive, yet these accounts are considered to be minor sources in comparison to Plato.

**THE IDENTITY OF SOCRATES.** Socrates was probably born in Athens in the spring of 468 B.C.E., and he lived there all his life. He was reportedly the son of a stonemason and a midwife, and he had three sons of his own—two of whom were still small children at the time of his death. His wife Xanthippe was famously ill-tempered; stories about Socrates, recorded in the works of Xenophon, include episodes of public fights between the two which often included acts of violence. (Despite the marital discord, Plato's dialogue the *Phaedo* describes a tearful Xanthippe leaving Socrates' prison cell the day before his death in 399 B.C.E., indicating the presence of genuine feelings between the two.) Socrates was a contemporary of the Sophists, and talked and argued with many of them, but the Sophists were itinerant teachers who charged tuition fees, whereas Socrates never left Athens and did not charge his disciples tuition. He originally was attracted to the doctrine of Anaxagoras, and tradition made him a pupil of Anaxagoras' disciple, Archelaus, who kept a school in Athens; after Archelaus left Athens, Socrates probably took over as headmaster of the school. For the last twenty or 25 years of his life,

Marble bust of Socrates. © GIANNI DAGLI ORTI/CORBIS. REPRODUCED BY PERMISSION.

he was a familiar figure on the Athenian scene, always barefoot, discussing and debating the important questions of philosophy.

**SOCRATES' MISSION.** Socrates' mission in life was to expose the lack of wisdom in the world, a purpose that had its origins in a statement by the oracle of Apollo at Delphi that there was no one wiser than Socrates. According to Plato's *Apology* Socrates did not believe the oracle, for he did not consider himself wise, so he began a quest to prove that the oracle was wrong. He encountered a man with a reputation for wisdom—Socrates did not name him—and after questioning him, he concluded that though many people, including the man himself, considered him wise, he really was not. He then examined another man who was considered wise, with the same result. He tried the politicians, then the poets and finally the skilled craftsmen, and concluded that though they might possess expertise in their own area, they were not truly wise, though they thought they were. These investigations did not make Socrates popular, as he readily admitted. Finally Socrates concluded that what the oracle meant was that he was not wise, for real wisdom belonged to God, but that he recognized his lack of wisdom and this self-recognition was what impressed the oracle. So Socrates made it his mission to seek out persons who thought they were wise and to prove to them

*a PRIMARY SOURCE document***SOCRATES RECRUITS XENOPHON**

**INTRODUCTION:** Philosophers in ancient Greece attracted disciples who desired to learn their ideas. Such was the popularity of some philosophers that they established schools to facilitate the teaching of their students, sometimes charging fees for their educational services. According to ancient sources, the eminent philosopher Socrates did not charge tuition fees to his disciples, although he did actively recruit promising young men. The following excerpt from *History of Philosophy, or On the Lives, Opinions and Apophthegms of Famous Philosophers* by Diogenes Laertius, who wrote in the first half of the third century C.E., provides a glimpse into the recruitment of Xenophon by Socrates as one of his disciples.

Xenophon, son of Gryllus, was an Athenian citizen and came from the "deme" (borough) of Erchia. He was a man of great decency, and handsome beyond anyone's imagination.

The story goes that Socrates encountered him in a narrow lane, and put his stick across it, barring him from getting past, and he asked him where men might find a market where foodstuffs necessary for life were sold. When Xenophon replied, Socrates asked him again where men could find goodness and virtue. Xenophon did not know, and so Socrates said, "Follow me, then, and find out." So from that time on, Xenophon became a disciple of Socrates.

Xenophon was the first person who took down dialogues as they occurred, and made them available to the public, calling them *Memorabilia*. He was also the first man to write a history of philosophers.

that they were not. It was a mission that made him many enemies.

**WHAT DID SOCRATES BELIEVE?** With the exception of the comic poet Aristophanes who mocked Socrates in his comedy, the *Clouds*, produced in 423 B.C.E., all the authors who wrote about Socrates did so after his death, and if he had any clear and coherent body of doctrine, we can discern it only dimly now. He was a traditionalist in religion insofar as he held that gods do exist and promote the welfare of mortals, and that they communicate their wishes by oracles, dreams, and other

similar methods. On the other hand, he thought that all conventional beliefs needed rigorous examination, and hence he was a severe critic of Greek religion as it was practiced in the Athens that he knew. He claimed to possess a kind of inner self—a *daimonion* (spirit)—which guided him and warned him at times against an action he was contemplating, but nowhere do we have any explanation of what this *daimonion* was. He was a master of dialectic—that is, the art of investigating or debating the truth of general opinions—and his great contributions to dialectic were definition and inductive logic. He held that before any opinion can be debated, it has to be carefully defined so that there is a basis for argument. Then the argument can proceed by induction—that is, drawing general conclusions from particular facts or examples—and thus the definition can be tested and examined. Socrates was a masterful critic of irrational thought, but his philosophy is less clear since Plato used him as a mouthpiece for his own thought. It is impossible to distinguish between the philosophies of Socrates and Plato in Plato's writings. In Plato's *Seventh Letter*, so-called because it is the seventh in a collection of thirteen letters attributed to him, he calls Socrates the wisest and most just man of his day, but the historical Socrates emerges from the mists of the past as a great personality and a master of rational argument rather than as the teacher of a philosophical system.

**SOCRATES AS A REBEL.** Socrates was a magnet for the bright, well-to-do young men of Athens who honed their debating techniques by matching their wits with his own. Some of these pupils used the skills they learned in ways that Socrates did not intend, however, and it led to serious charges against the philosopher. It cannot be denied that Socrates taught his Athenian disciples to question the basis of the democratic constitution of Athens. The underlying assumption of democracy as it was practiced in Athens was not that all men were born equal, but that every man was capable of performing the functions that public office required, provided that he was honest. It was not necessary to have professional training to hold a government post. Hence citizens were chosen by lot to hold important public offices; the chief exceptions were the ten generals who commanded the army and navy, who were elected each year. Socrates was fond of pointing out that a person would go to a cobbler skilled at shoemaking to have his shoes made, or to a doctor trained in medicine if he was ill, but if he wanted someone to hold high office in the state, he chose a man on the street. Socrates' logic was sound enough, but its inevitable conclusion was that cities should be governed by officials with training in government. That principle lay behind the work for which his disciple Plato is best

known, the *Republic*, which outlines an ideal constitution for a state where those that govern are trained in the art of governing. The same theme lay behind most of the speculation about the art of government in the ancient world after Socrates. Among philosophers, democracy had, at best, lukewarm defenders. It can be argued that Socrates was the intellectual great-grandfather of the totalitarian governments of the twentieth century, but it was the unintended consequence of his teaching.

**THE EXECUTION OF SOCRATES.** In 399 B.C.E., Socrates was brought to trial on a charge of heresy—not believing in the gods in which the other Greeks believed—and of corrupting the young. These charges against Socrates were less about morality and more likely the result of a political upheaval in Athens following Athens' defeat in the Peloponnesian War five years earlier. Socrates was known to associate with men who had seized power after the war and launched a reign of terror on Athens before the democratic process could be reinstated. Socrates was also a good friend of Alcibiades, a politician who many blamed for the loss of the Peloponnesian war. Socrates was arrested and tried before 501 jurymen and, like all Athenians arraigned before the lawcourts, he was given the opportunity to speak in his own defense; no defendant could hire a lawyer to speak for him. Socrates' defense is the basis of Plato's *Apology*, which may be an accurate reconstruction of what Socrates actually did say, for Plato witnessed the trial. Though Plato portrays Socrates as speaking eloquently and convincingly to the jury, he was found guilty and sentenced to death. He was confined to the state prison until the day came for him to drink the hemlock-juice, a poison made from a weed of the carrot family that the Athenians used to execute malefactors. His last words were a reminder to his friends that he owed the sacrifice of a rooster to Asclepius, the god of healing, implying, perhaps, that death was a cure for life.

**THE INFLUENCE OF SOCRATES.** Many of Greece's famous philosophers had their roots in Socrates. Antisthenes (c. 455–360 B.C.E.), considered the founder of the Cynic sect, was a devoted follower, and he in turn influenced Diogenes of Sinope, the most famous of the Cynics. Antisthenes taught that happiness was based on virtue, and virtue is based on knowledge and consequently can be taught. Aristippus of Cyrene, famous for his love of luxury, was a companion of Socrates. He was considered the forefather of the Cyrenaic school of philosophy that taught that the pleasures of the senses were the chief end of life. The Cyrenaics were to influence the Epicureans, one of the important schools of thought

**SOCRATES' DOMESTIC LIFE**

**INTRODUCTION:** Although revered as one of the greatest Greek philosophers, Socrates had a tempestuous domestic life with his wife Xanthippe, by whom he had a son named Lamprocles. Xanthippe seems to have found Socrates an exasperating husband, and she did not hesitate to voice her frustration with Socrates in public or to attack him physically. In the passage below, Diogenes Laertius, writing in the early third century C.E., describes scenes from Socrates' domestic life.

Socrates once said to Xanthippe, who scolded him and then threw a pot of water over him, "Didn't I say that Xanthippe was thundering just now, and there would soon be a downpour?"

When Alcibiades said to him, "Xanthippe's shrewish moods are intolerable!", he replied, "Yet I'm used to it, just as I would be if I were always hearing the screech of a pulley—and you yourself put up with the noise of geese honking." "Yes," replied Alcibiades, "but they bring me eggs and goslings." "Well, yes, so they do," replied Socrates, "and Xanthippe brings me children."

Once when Xanthippe assaulted him in the market-place and ripped off his cloak, his friends urged him to ward her off with his fists. "Yes, by Zeus," said he, "and while we are pummeling each other, you can all cry out, "Good jab, Socrates! Nice blow, Xanthippe!"

He used to say that a man should live with a recalcitrant woman in the same way as men handle violent-tempered horses, and when they have mastered them, managing every other sort of horse is effortless. "Thus," he said, "after managing Xanthippe, I will find it a simple matter to live with any other woman."

in the Greek world after Alexander the Great. Euclides of Megara, another of Socrates' pupils, established a school of philosophy in Megara on the Isthmus of Corinth, between Athens and Corinth, where he tried to combine the teaching of Socrates on ethics with the doctrine of Parmenides on the nature of the universe. Greatest of all Socrates' pupils, however, was Plato whose

works had a lasting influence on the intellectual traditions of the world.

## PLATO

**SOCRATES' DISCIPLE.** Plato (429–347 B.C.E.) was not yet thirty years old when Socrates was put to death in 399 B.C.E., and though the date of their first meeting is unknown, Socrates must already have been a middle-aged man when the two first became acquainted. The meeting of the two changed Plato's life. He belonged to a distinguished Athenian family, and he was educated in music and gymnastics like other youths of his class. According to one tradition, he was a budding poet in his youth and had already written some tragedies, but he burned them all after he met Socrates. In the *Seventh Letter*, which he wrote in his old age, he reflected on the hopes of his youth. He planned to enter public life, and had an opportunity to do so in the immediate aftermath of the Peloponnesian War when a cadre of reformers overthrew the democratic constitution and took control. They were led by thirty men with absolute powers, some of them Plato's relatives—the leader of the "Thirty," Critias, was his mother's cousin—and they invited him to join them. Plato was at first favorably impressed: he

was young, and imagined that these reformers would establish a just state, but instead, they rapidly earned the title of the "Thirty Tyrants" by which they are known in the history books, and Plato soon realized that the democratic constitution which they had overthrown had been a very precious thing. One action in particular appalled him: the "Thirty Tyrants" tried to implicate Socrates in their crimes, but he refused and risked his life by doing so. When the "Thirty Tyrants" were overthrown, the restored democracy acted with restraint—Plato gave it credit for that—but "certain powerful persons" brought Socrates to trial on a charge of impiety. He was found guilty and put to death, and in the aftermath, many of Socrates' acquaintances, Plato among them, feared reprisals and fled from Athens to Eucleides in neighboring Megara. Plato did not stay there long. He served in the Athenian army in 395 and 394 B.C.E. and the rest of the time he spent traveling and writing. Giving dates to Plato's dialogues is no easy task, but it is generally agreed that his early dialogues belong to this period.

**PLATO'S TRIP TO SICILY.** It was probably in 388 B.C.E. that he visited southern Italy first, and then Sicily. In southern Italy he met the Pythagorean philosopher Archytas who had been elected ruler of Tarentum, modern Taranto. Thanks to Archytas, there was a revival of Pythagoreanism in southern Italy, and he made a deep impression on Plato. The two men became friends. From southern Italy Plato went to Syracuse in Sicily where Dionysius the Elder was at the height of his power. Dionysius had enjoyed a brilliant career; at the age of 25, he had been elected general of Syracuse with full authority at a time when Carthage seemed on the verge of conquering the whole island, and he had driven back the Carthaginians and made Syracuse one of the leading cities in the Greek world. Yet by the time Plato reached Syracuse, the brilliant young savior of Greek Sicily had become a tyrant, and Plato's portrayal of the typical tyrant found in his *Republic* owes a great deal to his experience with Dionysius. Dionysius had Plato removed by ship and put ashore on the island of Aegina that was at war with Athens at the time, and Plato might have been sold as a prisoner of war except that a friend from Cyrene ransomed him. During Plato's sojourn in Syracuse, he met Dionysius' brother-in-law, Dion, and was deeply impressed by him. In Dion, Plato recognized a man of similar ideals, and he believed he could be a potential ruler of an ideal state.

**THE FOUNDING OF THE ACADEMY.** Upon Plato's return to Athens, he founded his school known as the "Academy" because it occupied a park a half an hour's

walk outside the Dipylon, one of the city gates which was sacred to the guardian spirit Academus. There, under the sacred olive trees, Plato rented a gymnasium in which he started to teach, but he soon bought a parcel of land nearby which was given the name “Academy.” Little is known about the actual teaching in the Academy, but there seems to have been a regular curriculum for the students who enrolled, and mathematics was an important part of it. One anecdote held that over the Academy’s main gate was a sign that read: “No one shall enter who knows no geometry.” The Academy was a magnet for the intelligentsia of Greece, among them pioneers in mathematics, the most important of whom was Eudoxus of Cnidus who arrived in 367 B.C.E. at the age of 23 and stayed to attend Plato’s lectures. Aristotle arrived at the Academy at the age of seventeen and remained there for twenty years. It should always be remembered that the dialogues of Plato do not give us the full picture of Plato’s thought. Some aspects he transmitted orally and never committed to writing, and among these subjects were his last words on the so-called “Theory of Forms.” Thanks to the witness of Aristotle, we know that before he died, Plato lectured on one important aspect of Creation: how the ideal Forms were originally generated by the “One,” which was a divine entity, or, put simply, God. He never committed this to writing, for he did not completely trust writing as a satisfactory mode of communication.

**PLATO RETURNS TO SICILY.** In 367 B.C.E., the tyrant of Syracuse, Dionysius the Elder, died and was succeeded by his son, Dionysius II. His father had allowed him no experience in politics, but he was a talented young man, eager to learn, and it seemed to his uncle Dion that here was an opportunity to apply Plato’s political ideas to Syracuse. He wrote Plato, inviting him urgently to come, and in 366 B.C.E. Plato arrived to a gratifying welcome. The atmosphere soon changed, however, as court intrigues aroused Dionysius’ suspicions of Dion, and he sent him into exile. He did not allow Plato to leave until 365 B.C.E. and then only after a promise from Plato to return. Four years later, he did return, urged by Dion, who hoped that Plato could persuade Dionysius to recall him, but this time things turned out worse than before, and Plato got permission to leave Syracuse only thanks to the intervention of his friend Archytas of Tarentum. Dion now prepared for war. In 357 B.C.E., he captured Syracuse, forced Dionysius out and ruled for four years himself. Well-meaning though he was, he was tactless and authoritarian, and in 354, he was assassinated by a former supporter. Dion’s friends now appealed to Plato again, and Plato replied with two

Plato shown as a typical philosopher. THE LIBRARY OF CONGRESS.

letters, the *Seventh* and *Eighth* in a collection of thirteen that are attributed to Plato. These two are thought to be genuine, though suspicion hangs over the other eleven. Plato died at the age of 81, some seven years after Dion.

**PLATO’S WRITINGS.** All Plato’s works (apart from the letters) are written as dialogues where he himself does not appear. The one possible exception is his last work, the *Laws*, where one of the interlocutors is an anonymous Athenian, who is almost certainly Plato himself. The result is that there is an elusive quality to Plato’s thought, as if he was attempting to establish a mode of thinking as much as a systematic philosophy, and that is particularly true of his early dialogues. During his time as Socrates’ disciple, he focused on issues of virtue and morality, and the importance of education and training, which interested Socrates himself in his last years. That seems clear from the dialogues that Plato produced in the aftermath of Socrates’ death, which was the catalyst that prompted him to write. Then, having recovered from the immediate shock of Socrates’ execution, Plato began to turn his attention to questions of law and government, writing his most famous text, the *Republic*, in response to his distaste for the sort of governments that he saw in contemporary

Roman mosaic of the 1st century C.E. called the “School of Philosophy” because it shows various famous philosophers in discussion. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM NAPLES/DAGLI ORTI.

Greece. He also wrote on metaphysics, epistemology, and ethics during his study of philosophy, but it was the nature of the just society, governed according to the principles of philosophy, that continued to occupy him. His last work, left unfinished at his death in 347 B.C.E., was the *Laws* in which the topic returns to that of the *Republic*: the constitution of a truly just state.

**THE EARLY PERIOD.** The exact order in which Plato wrote his works is not known, and assigning dates is impossible, but the dialogues can be divided into three periods: early, middle, and late. The early writings deal mainly with the teachings of Socrates in the form of dialogues. The “dialogue” seems to have been a literary form that Plato invented, borrowing it from the theater, and he used it effectively to demolish preconceived notions. One of Socrates’ main concerns is *arete*, the word that is always translated as “virtue,” even though there is no word in English that is an exact translation: *arete* means “courage” and “excellence” quite as much as “moral virtue.” The main doctrine that Socrates puts forward in almost all of the early dialogues is that this virtue is knowledge, and thus it can be taught. He does not say what knowledge is, but he does assert that no one willingly does wrong, and hence wrongdoing is a mark of ignorance. In a typical dialogue of this early period, Socrates poses a question in the form, “What is X?” For instance, what is justice? When he is offered

various examples of justice, he replies that he does not want examples, he wants to know what justice is, in and of itself. Since such questions typically cannot be answered in a satisfactory way the dialogues tend to conclude on a negative note. It is not until the dialogues of Plato’s middle period—where Socrates becomes a mouthpiece for Plato’s own thought—that an attempt is made to provide positive doctrine.

**THE DIALOGUES OF THE MIDDLE PERIOD.** The dialogues of the middle period include works like the *Phaedo*, the *Symposium*, and Plato’s greatest work, the *Republic*, which describes a utopia ruled by right principles. In these works Plato’s philosophy began to provide definite answers to the philosophical questions his master had pessimistically concluded were unanswerable. It is in these dialogues of Plato’s middle period that the “Theory of Forms” is elaborated, most explicitly in the *Republic* and the *Phaedo*. In textbooks, the “Theory of Forms” is sometimes called the “Theory of Ideas” which is misleading, for the “Ideas” are not ideas in the modern sense; rather the word simply transliterates the Greek *idea* which means “form.” Plato argued that these “Forms” are not mere intellectual concepts; they have an existence of their own. They are changeless and divine and among them, the form of the “Good” has a unique status. They exist separate from the things of the visible world that are imperfect copies of them, and knowledge of the “Forms” is therefore true knowledge and not mere opinion, which is fallible and changeable and easily influenced by persuasion. Thus true knowledge can exist. This is Plato’s answer to Protagoras’ dictum, “Man is the measure of all things,” which taught that all things are relative. At the same time, his logic led him to the conclusion that the “Forms” are true reality; what we see in the visible world about us is only the appearance of reality.

**THE FLAWS IN THE “THEORY OF FORMS.”** There were many bright students at the Academy, and they must have made Plato aware that his “Theory of Forms” was anything but watertight. The dialogue titled the *Parmenides* tests the theory. We cannot assign a date to it, but it is a later work, written some years after the *Republic* and the *Phaedo*, and it is a remarkable example of self-criticism. Plato imagines his half-brother Antiphon recalling a conversation that the young Socrates had once had with Parmenides and his follower Zeno. Plato pictures Parmenides, the founder of the Eleatic school of philosophy, as an old man when this imaginary conversation took place, but his logic was as ruthless as ever. Socrates expounds the theory that there are ideal “Forms” of justice, beauty, and goodness, which belonged to the

## PLATO'S Theory of Forms

### The Dilemma of Knowledge

The “Theory of Forms” (in Greek *ideai*—hence the Theory of Forms is sometimes referred to as the “Theory of Ideas”) was Plato’s attempt to understand how knowledge exists. Heraclitus had claimed that the world was constantly changing. Everything is impermanent and hence it is impossible to know anything, since all things change even while one thinks about them. Parmenides had given another explanation: he taught that *what is* must be eternal and changeless and only *what is* can be known. The conclusion of both schools of thought was that the evidence of the senses was not reliable. Yet Plato’s intuition told him that knowledge was possible. Socrates had been sure of it, for the world without the possibility of knowledge made only nonsense. The “Theory of Forms” was a way out of this dilemma and whether it was a conception of Socrates or one which Plato himself conceived, we cannot know. In the *Phaedo*, the dialogue which Plato sets in the prison where Socrates was awaiting death, Socrates, in his final hours before he drank the hemlock, discoursed on the immortality of the soul, and he refers to the “Theory of Forms” as an hypothesis with which his disciples were familiar. However the *Phaedo* was written long after Socrates’ death, and probably Plato was attributing a theory of his own to his master.

### Knowledge of the Forms

How does one recognize that a chair is a chair, even though many kinds of chairs exist? It is because the chairs

which we see all partake of the ideal form of a chair which our souls recognize. How can we recognize Goodness? It is because an ideal form of “Goodness” exists which our souls recognize. These ideal forms are not mere conceptions. Plato would argue that they really did exist in an invisible world, the world from which the soul came and where it will return after it leaves the body at death. A soul knew the ideal chair before it was imprisoned in the body, and when a person sees a chair, he remembers the ideal form of the chair, and knows the chair in the visible world because it comprehends that it partakes of the form in the invisible world. Thus knowledge is a process of recollection.

### The Forms as Causes

In the *Phaedo*, Plato explains that what makes an object beautiful is because of the presence in it, or the association with it of absolute Beauty—the form of Beauty that exists in the invisible world. Therefore it is the form of Beauty that makes things in the visible world beautiful, and therefore the Forms are the causes of existence. They make objects be what they are. Aristotle was to object that even if we assume that Forms exist, things which partake of these Forms cannot come into being unless there is something to impart motion. In fact, Aristotle could not accept Plato’s view that Forms existed outside of the visible world. For him, form and the visible object that partook of the form could not be separated from each other. All substances consist of two parts, matter and form, Aristotle insisted. You cannot chop up a bronze statue into two parts, its bronze and its shape.

realm of true existence, though he is not prepared to assert that there are “Forms” of mud and dirt; he cannot say that absolutely everything has a “Form.” Yet he defends the core of his theory: great things are great because they partake of the Form of Greatness, and beautiful things partake of the Form of Beauty, and so on. Parmenides objects. Does the beautiful object that we see partake of *all* the Form of Beauty or just part of it? If it partakes of only part of it, then the “Form” must be divisible, and if all of it, then the “Form” must be in many places at once. How does the object we see partake of a Form? If a beautiful object partakes of the Form of Beauty, then the object and the Form are similar and we must posit another Form that embraces the beautiful object and the Form of Beauty. Socrates suggests that the Forms are only thoughts or concepts, but Parmenides replies that concepts must be of something. There can be no concepts of nothing. Yet we cannot know the

Forms, which are absolute, for our knowledge is not absolute, and if God’s knowledge is absolute, then He cannot know us. The *Parmenides* concludes on an unsatisfactory note. Socrates does not abandon his “Theory of Forms” but Parmenides tells him that he needs more training in philosophy. Parmenides’ objections are not always cogent, but the dialogue bearing his name seems to show that Plato knew what the weaknesses were in his hypothesis. For Plato, the Forms were timeless entities, which—since they are timeless—cannot have been created. At the Creation, God could create the world of appearances, but he could not create the timeless Forms, for they already existed. Both Plato and Parmenides could agree that the world that we see about us is the world of appearances, not reality. Yet it is fair to ask why, if an appearance really does appear, it is not part of reality? For if appearances do *not really* appear, why bother about them? As Aristotle was to realize, Plato’s distinction

between the Forms—which are real—and appearances—which are not—was a stumbling block.

**THE REPUBLIC.** Plato wrote three dialogues on ideal constitutions: the *Republic*, the *Statesman*, and the *Laws*, his last work which he left unrevised. It is the *Republic* which is justly considered his greatest work, though its influence on the world of politics has not been entirely wholesome. The *Republic* has helped to form the intellectual background for many non-democratic governments, both communist and fascist. To understand Plato's notions of government, it is important to consider the actual types of government that a Greek such as Plato encountered in his contemporary world. Plato lists them in the eighth book of the *Republic*: Timarchy, Oligarchy, Democracy, and Tyranny. Timarchy (*timokratēia*) was a state where the ruling principle was love of honor. Plato used the example of Sparta, which had a constitution unique on mainland Greece. Plato admired the Spartan constitution, though he recognized some of its faults. The Spartan elite—the so-called “Spartiates”—were a military aristocracy who lived off a peasant population. Known as “helots,” these serfs worked the land for their Spartiate masters, giving them half their produce. They were kept in subjection by brutal methods; Sparta had a secret police to root out any disaffection, and each year the Spartan magistrates formally declared war on the helots so that killing one of them was not murder but an act of war. The Spartiates themselves were a military caste that trained from early youth to excel in warfare. The Spartans were courageous and disciplined, and Plato admired them for it. Yet he also considered them to be slow-witted, greedy, and brutal to the underclasses. The word “oligarchy” comes from the Greek words *oligoi* (few) and *arche* (rule), meaning to rule by a minority. In archaic Greece the minority had been aristocrats—that is, men of good family—but in Plato's time, the minority that controlled oligarchic governments was the wealthy. Plato distrusted the profit-motive and the influence of private wealth in politics. Plato used Athens as an example of a democratic government. Athens in Plato's day may have had as many as 300,000 residents, including men, women, slaves, and resident aliens who had little hope of acquiring citizenship, but the right to vote was restricted to male citizens. Sovereign power was vested in an assembly which was required to meet at least ten times a year, though meetings were often more frequent. At these assemblies any male citizen who attended could vote, but only a small minority did since attendance was difficult for citizens living in country villages. Plato had little respect for the system. The salient feature of democracy was liberty; individuals could do or say what they pleased, which gave

society an attractive variety, but ultimately this freedom worked against social cohesion. When social cohesion failed, society disintegrated into class warfare between the rich and the poor. Finally there was tyranny, which was the personal rule of a dictator. A tyrant needed a private army for self-protection and had to eliminate all possible rivals. A tyrant, Plato argued, was essentially a criminal.

**THE SOLUTION OF THE REPUBLIC.** Having found fatal flaws in each of the existing governmental systems, Plato proposed his ideal constitution. According to Plato's system of government, the lawgiver whose task it was to establish this utopia set up three groups or classes. The first class, composed of “Guardians,” was in charge of ruling and would have to be carefully educated and pass exacting tests before being accepted as Guardians. Once this class was selected by the lawgiver, it perpetuated itself by heredity, though occasionally an unsatisfactory son of a Guardian would have to be degraded. The next class was the “Auxiliaries” who carried out the duties of the military, police, and executive offices under orders from the Guardians. The third class was composed of the craftsmen, traders, and the like. Plato believed that men fitted to be shoemakers or carpenters should stick to their own trades and leave the ruling positions to those who had been specially trained for the task. To ensure that the Guardians carried out the lawgiver's intentions, they had to be carefully fitted for their duties by education in cultural pursuits and physical training. Plato recommended that the poems of Homer and Hesiod be banned due to the fact that their portrayal of the gods was often not edifying. He also believed that their writings made their readers fear death, which could undermine the Guardians' ability to die a fearless death in battle. Plato believed strongly in the power of the written word to influence behavior, and so suggested that the young should not read stories where the wicked are happy, or good men unhappy; he felt the poets to be too subversive, and recommended that they be banished. The other arts were not free of Plato's censorship either, however, as he outlawed any music that was too sorrowful or too joyous. Other recommendations for an ideal state included a balanced economic state in which the Guardians would be neither rich nor poor. They would live in simple houses on simple food, as if in an army camp, and they would hold their property in common. Plato argued that girls and boys should have the same education, and advocated complete equality of the sexes. Plato's advocacy of a strong state is most apparent in his structure of marriage and the family. He believed that marriages should be arranged for the good of the State by lot, although the rulers would actually

*a PRIMARY SOURCE document***THE POSITION OF WOMEN IN PLATO'S IDEAL STATE**

**INTRODUCTION:** In Plato's last work, *The Laws*, left unrevised at his death, Plato imagined three elderly gentlemen, a Cretan named Cleinias, a Spartan named Megillus, and an Athenian stranger—in effect, Plato himself—discussing the foundation of a new city on Crete. They turn to a practical discussion of what the laws and constitution of this new city should be. The Athenian eventually brings up the place of women. In Athens, women had no voice in government and no role in public life. The situation was somewhat different in Sparta and Crete, though nowhere was anything approaching equality of the sexes found. Plato's remarks, quoted below, are less than flattering to women, but they show recognition that women make up half of humanity and cannot be ignored and left outside the laws in an ideal society. It was a beginning, and in the Hellenistic period, beginning a couple generations after Plato's death, we find women taking a more active role in public life. The context of the excerpt below is this: the three gentlemen have decided that their new city shall have communal meals for male citizens, as was the case in Sparta, but the Athenian has an additional point to make about the position of women.

The blessings that a state enjoys are in direct proportion to the degree of law and order to be found in it, and the effects of good regulations in some fields are usually vitiated to the extent that things are controlled either incompetently or not at all in others. The point is relevant to the subject at hand. Thanks to some providential necessity, Cleinias and Megillus, you have a splendid and—as I was saying—astonishing institution: communal meals for men. But it is entirely wrong of you to have omitted from your legal code any provision for your women, so that the practice of communal meals for them has never got underway. On the contrary, half the human race, the female sex, the half which in any case is inclined to be secretive and crafty, because of its weakness—has been left to its own devices because of the misguided indulgence of the legislator. Because you neglected this sex, you gradually lost control of a great many things which would be in a far better state today if they had been regulated by law. You see, leaving women to do what they like is not just to lose *half* the battle (as it may seem); a woman's natural potential for virtue is inferior to a man's, so she's proportionately a greater danger, perhaps even twice as great.

**SOURCE:** Plato, *The Laws*. Trans. Trevor J. Saunders (London: Penguin, 1988): 262–263.

manipulate the lots in such a way as to ensure that the best sires beget the most children. The State would then remove the children from their parents at birth and, if healthy, they would be reared by the State so that no one could know the identities of his or her biological parents. Plato believed that this system would foster a community in which children regarded all their elders as their fathers and mothers. To make it all work, Plato was not averse to the state propagating certain falsehoods—“Noble Lies,” as Plato called them—of which the most important was that God created three species of men: the men of gold, fitted to be Guardians; the men of silver, fit to be soldiers; and the common man of bronze and iron, fit for manual toil. Thus the bulwark of Plato's utopia was a lethal mixture of religious propaganda and political science, but in Plato's view, the result would be “justice,” for everyone would have his proper slot in the political structure, and be satisfied with it.

**PLATO'S LAST WORDS ON THE IDEAL STATE.** Plato returned twice to the question of ideal government. In the *Statesman*, he repeated the view that government is a job for experts. He believed that the best government is rule by an expert, like the ideal lawgiver who laid out the constitution in his *Republic*, but if no such expert

could be found, then a law-abiding monarchy was the best alternative. In his last work, the *Laws*, Plato once again considered the question of what sort of government would rule a city best. It is a remarkably detailed work which shows that Plato's thought had evolved a good deal since he produced the *Republic*. For one thing, he placed much higher value now on the rule of law. He believed that complete obedience to the laws solves the problems of political strife. Another change is evident in that philosophy had been a vitally necessary ingredient in the *Republic*, but in the *Laws* philosophy yields pride of place to religion. Plato went so far as to suggest that atheists in the ideal state of the *Laws* should be converted or killed. This seems to represent a remarkable change of heart in Plato's old age.

**THE IMMORTALITY OF THE SOUL.** In the *Apology*, which is Plato's earliest dialogue, he muses on what happens after death. Plato determines that it will either be a dreamless sleep from which there is no awakening, or the soul will migrate to another place where one can meet with the great men of the past, such as Orpheus and Hesiod and Homer. Death is not to be feared. In the *Phaedo*, Plato imagines Socrates speaking to his friends on the last day of his life, and explaining what

happens at death. The soul separates from the body that has prevented it from acquiring true knowledge due to the body's constant interruptions and distractions from man's quest for Truth. Once the soul is free of the body, it can gain direct knowledge of all that is pure and uncontaminated, that is, the Truth. Thus like a man who chooses to follow a wife or children whom he loves into the next world in the hope of seeing them there, the true philosopher will gladly make the journey into the next world to discover Truth. The final book of the *Republic* ends with a vision of life after death: the so-called "Myth of Er." According to the myth, Er was apparently killed in battle, but ten days later, while he was on the funeral pyre, he revived and told an amazing tale. His soul had left his body and gone on a long journey. It had seen the righteous separated from the unrighteous who were condemned to punishment. The souls of the righteous then drew lots for the lives that they would live in their next life, and having made their choices, they traversed the desert plain of Amnesia and camped in the evening on the banks of Lethe, the stream of Forgetfulness. All were required to drink its water, and those who were imprudent drank too much and forgot everything. Er, however, was not allowed to drink, and his soul rejoined his body still remembering what it had seen. The *Phaedo* shows the soul anxious to leave behind the encumbering body to attain the Truth, and the "Myth of Er" tells how it must transmigrate from one life to another before it can attain the Truth. Taken together, they present a picture of the immortal soul seeking to escape from the world of appearances, represented by the body, and reach the realm of real Goodness and Truth.

**PLATO'S UNIVERSE.** The *Timaeus*, one of Plato's last dialogues, was also one of his most influential during the medieval period, partly because the first 53 chapters were available in a Latin translation during the European "Dark Ages" and partly because it presents theology rather than philosophy and thus conformed to the mindset of the medieval world. Plato's construction of the universe rests on his basic premise that there are two orders of reality: that of true existence or "Being," inhabited by the "Forms"; and that of apparent reality, the world of "Becoming," the created world inhabited by the transient things perceived by our senses. The *Timaeus* describes how the world of "Becoming" came into existence, through the character of Timaeus, a Pythagorean philosopher from southern Italy. In the dialogue, Timaeus describes the creation of the world as being similar to the creation of a model by a craftsman. Just as the craftsman works with a model, so the Creator, who is a divine craftsman, created the world of "Becoming" using as his models the Forms that belong to the world of

"Being." His material was composed of the four elements—earth, air, fire, and water—though later in the dialogue we learn that the Creator had found his material as a confused mass in the so-called "Receptacle of Being" and reduced it to form the geometrical shapes of the four elements. The universe itself was a geometrical construction: the planets move in rings around the earth. This concept of planetary movement proved influential to men of science centuries later. In the second century C.E. Claudius Ptolemaeus of Alexandria, better known as Ptolemy, refined the system using trigonometry. Then in the sixteenth century C.E., Nicolaus Copernicus (1473–1543) showed that the earth moved around the sun, but he retained the circles of the planets that Plato described. Then Johann Kepler (1571–1630) showed that the planets moved in ellipses, and Sir Isaac Newton (1642–1727) showed that they were not regular ellipses, and Plato's concept of a universe constructed according to the principles of geometry perished at last. The *Timaeus* survives as an interesting monument in the history of science but nothing more.

#### ARISTOTLE

**IMPORTANCE.** Aristotle (384–322 B.C.E.) was a philosopher whose achievement has been fundamental to the subsequent development of Western philosophy.

No field of knowledge was beyond his purview, and for 2,000 years, his influence on European thought was supreme. It eventually became a straitjacket; from the start of the seventeenth century C.E., almost every new direction in the humanities and science had to start by overthrowing some Aristotelean doctrine, for after Aristotle, Europe never produced even his approximate equal until the Renaissance. Hence Aristotle's philosophy ultimately became unchallenged doctrine and his writings remained "holy writ" for a thousand years. That was not Aristotle's fault, however, but the fault of his disciples in the medieval period. In his own day, he set philosophy in a new direction. He learned from Plato, but he tempered Plato with common sense. He emphasized research and observation, and although he never developed the modern scientific experiment, he was groping in that direction. Politics was one of his interests, but he did not waste his time on utopias; rather he examined governments that actually existed in the Mediterranean world and analyzed how they functioned. His reality was not divided into "Being" and "Becoming" as Plato's was, the first of which was real and the second only apparently real. Instead the two realities were fused and thus one could gain knowledge by observation, for what one observed was real. This was a necessary step before philosophers could develop anything similar to the modern scientific method.

**STUDENT OF PLATO.** The acquisition of knowledge by observation may have been something that Aristotle learned from his father, who was the court physician of Amyntas II, king of Macedon, for by now, the medical fraternity had developed observation into a fine art in order to diagnose diseases. Physicians belonging to the medical fraternity of the Asclepiadae regularly taught their sons dissections, but Aristotle probably missed this training, for both his parents died while he was quite young. When he was about seventeen years old, he joined Plato's Academy. He spent almost twenty years there, but though he never ceased to show affection and respect for Plato, he became less and less comfortable with Plato's philosophy. Plato as he grew older placed increasing emphasis on mathematics and the trend continued at the Academy following his death. Aristotle, who must have suffered some natural disappointment at being passed over for the headship of the Academy, decided to leave it to conduct research in biology at Assos in the region of Troy. Following some time spent in Lesbos, he accepted the invitation—with a suitably generous salary attached—from King Philip II of Macedon to tutor his son, Alexander, who was fourteen years old. Alexander was under his tutelage for two years. Like Plato, Aristotle believed that there could be no good gov-

Modern engraving of the philosopher Aristotle. THE LIBRARY OF CONGRESS.

ernment until kings were philosophers or philosophers kings. Then in 336 B.C.E., Philip of Macedon was assassinated, and Alexander embarked on a series of military campaigns that would change the course of history in the Greek world. About a year later, Aristotle returned to Athens after an absence of about thirteen years and founded a school, the Lyceum.

**ARISTOTLE'S WRITINGS.** Approximately two-thirds of all of Aristotle's writings are lost. During his twenty years at Plato's Academy before Plato's death, Aristotle wrote dialogues, borrowing the literary form from Plato, and they were much admired in the ancient world. None have survived but it is possible to ascertain the subject matter of some of them. He wrote on rhetoric, the art of public speaking, where Aristotle probably pointed out the importance of logic. Although Aristotle had written a dialogue during his Academy days accepting Plato's views on the soul—that is, that it existed before birth and, after birth, it could recall the ideal forms from its previous life—his dialogue *On Philosophy*, most likely written after Aristotle left the Academy, dealt with the progress of mankind and indicated that Aristotle was already unhappy with Plato's Theory of Forms. Aristotle

also wrote collections of historical or scientific information, sometimes done in collaboration with students, or perhaps even done by students as assignments. One example from this group has survived: an essay on the Athenian constitution, a copy of which was unearthed in Egypt in 1890, copied on to the back of a tax register of the Roman period. One group of writings which did survive is composed of treatises which were never prepared for publication, possibly Aristotle's lecture notes. They show an enormous range of subjects, indicating that nothing was too great or small to arouse his interest.

**THE ORGANIZATION OF KNOWLEDGE.** Aristotle had an orderly mind and classified all knowledge into three categories: the productive, the practical, and the theoretical. Productive sciences have to do with making things, and their practitioners include engineers, farmers, artists, and the like. Practical sciences are concerned with how men act in various situations. They are the subject of Aristotle's treatises titled *Ethics* and *Politics*. Theoretical knowledge has as its goal the discovery of truth. This category includes theology, mathematics, and natural science with their various subdivisions.

**ARISTOTLE ON CAUSE.** In modern thinking, the causes of something that comes into existence are the factors—both the components and the agents—that are responsible for the thing being what it is. Aristotle's "cause" had a wider meaning; it can be translated as the "dimensions of reality." Aristotle looked at an object and asked "Why? How? What for? What's its material?", which broadened the philosophical discussion that began with the Milesian philosophers back in the sixth century B.C.E. That group concerned themselves only with the material. The underlying substance of the universe was water, according to Thales, and air, according to Anaximenes. Later the Pythagoreans concerned themselves with "why?"—that is, what is the pattern that makes a thing what it is? Aristotle took the discussion a step further in pointing out that "how?" is also important: who made the object what it is, and what for?, i.e. what was the purpose in making the object. Thus everything has four causes. There is the material cause: the stuff from which it is made. For that Aristotle had to find a new term, and the term he used was *hyle* which means "wood," but Aristotle used it for substance in general. There is the formal cause, which is the pattern. There is the efficient cause: the maker of the thing, whether it is a living thing like a dog or a person, or something inert like a table. The fourth cause is the final cause, which answers the question "what

for?" What is the purpose for which a thing is made? Let us take a chest of drawers as an example. The material cause is the wood from which it is made. The efficient cause is the carpenter who made it, and the formal cause is the pattern that the carpenter followed. Then there is the question "what for?"—the teleological question. The purpose of the chest of drawers is to store clothes. Apply the same logic to Bowser, the family dog. The material cause is the flesh from which Bowser is made. The formal cause is not a blueprint; rather it is a species, the sort of thing we find in nature. Bowser is classified by biologists as a dog. Then there is the efficient cause: Bowser was not manufactured, rather he was generated by parents of the same species as himself. Finally there is the teleological question. Aristotle believed that everything, even the stars, had a goal that, in theory at least, could be discovered. Bowser has an inner nature what directs him to grow from a puppy into a mature dog that will become a family pet. That is Bowser's goal. Aristotle applied these principles even to the universe where he asserted that the final cause is what he calls the "prime mover"—not a mechanical force, but an object of desire. It is "God," but though Aristotle often calls his prime mover "God" it is not really a religious God. It is a divine force that exercises a continual attraction for everything in the universe, and this magnetism of the "prime mover" is the reason for the movement that we can see of the constellations in the night sky. They continually seek the final perfection of the "prime mover" that will allow them to rest, and they will never attain it. Aristotle's "prime mover" is closer to "Mother Nature" than it is to any god of religion, whether pagan or non-pagan.

**ARISTOTLE THE LOGICIAN.** Aristotle was proud of his logic; in fact, he claimed to have produced a complete, perfect logic. Essentially he began with a proposition, which is a statement that is either true or false. If it is true, it refers either to a universal truth or a particular one, and similarly, if it is false, it must point either to a particular falsehood or a universal untruth. For instance, the sentence "All mammals are viviparous" is a general proposition. It means that all mammals reproduce through live births. Since Aristotle himself used letters instead of things to express propositions, we can express the sentence as "All X are Y." There are four types of these simple propositions: the universal affirmative ("All X are Y"), the universal negative ("All X are not Y"), the particular affirmative ("Some X are Y"), and the particular negative ("Some X are not Y"). These four types of propositions can be further subdivided into three modes: that X is always Y, that X is of necessity Y, and that X is possibly Y. Once a proposition is proven true,

## ARISTOTLE as a Biologist

Much of the research which went into Aristotle's two monumental scientific works, the *Dissections* and the *History of Animals*, was done in the nearly thirteen years between the time he left Athens after Plato's death and his return. The *Dissections* has not survived. Its subject was the internal structure of animals, and may have consisted largely of diagrams. The *History of Animals* did survive, however, and is a pioneering study of animals, of their appearance, their methods of reproduction, their behavior, and habitat. It covers all living creatures from sheep and goats, to tortoises and crocodiles, octopods and oysters, and, of course, human beings. To modern researchers, Aristotle sometimes seems naive and pedantic. Modern biological textbooks do not bother to point

out that humans have necks between their heads and their torsos, but Aristotle felt that if he was to be thorough that fact should be noted. His description of the European bison gives good grounds for suspicion that he had never seen one. He claims that when it was hunted, it defended itself kicking and discharging its excrement over a distance of eight yards and the excrement was so corrosive that it could burn the hair off the hunting hounds. Aristotle's observations are inexact—he did not usually measure or weigh his specimens, though there seems to have been some exceptions—and he did not discover the experimental method that is the basic procedure of modern science. He used second-hand information: for instance, he asked beekeepers about bees and fishers about fish, and for human anatomy, he relied on the expertise of the Greek medical profession. Yet research in biology was in its infancy, and Aristotle deserves respect as a pioneer.

it is possible to make a deduction using a form of argument called a "syllogism," from the Greek *sullogismos*. A syllogism is an argument whereby, if certain things are assumed as true, then something different from what is assumed can be deduced. An example would be, "All humans are mortal. John Doe is a human. Therefore John Doe is a mortal." The argument proceeds from a general proposition that is accepted as true, to a particular conclusion. Aristotle thought that he had discovered the key to deductive inference. Later philosophers developed Aristotle's logic into a separate field of its own, which it never was for Aristotle, and for better or worse, it became one of his most important legacies to our intellectual tradition.

**ARISTOTLE'S ACHIEVEMENT.** Before Aristotle, Greek philosophy had developed a profound distrust of the evidence of our senses. Parmenides and the Eleatic School were an extreme example. They held that the world perceived through the senses was not the real world. Heraclitus argued that constant change took place in the world. Plato held that the things seen in the visible world were only imperfect copies of ideal "Forms" in an invisible world. Aristotle's study of biology, however, must have quickly demonstrated to him that if a person was to acquire knowledge about plants and animals, he would have to trust his senses. If he was to do research, he would have to observe, and study the observations of others. There is a certain common sense about Aristotle's teachings. Aristotle continued to believe in the unity of knowledge, yet after him, re-

searchers tended to specialize. Theophrastus, who succeeded him as head of the Lyceum, was a notable botanist. Aristoxenus, one of the most brilliant researchers at the Lyceum, wrote on music. Aristotle's Lyceum was the forebear of modern institutes for research and advanced study.

## THE STOICS

**SCANT HISTORICAL RECORD.** In the six centuries between the death of Alexander the Great in 323 B.C.E. and the emperor Constantine (312–337 C.E.) the dominant philosophy that commanded the allegiance of thinking people was Stoicism—named for the *Stoa Poikile* (Painted Stoa) where Zeno of Citium first taught the philosophy. The early development of this philosophy was not preserved in written texts until about 100 C.E., when a disciple of the Stoic philosopher Epictetus, Arrian, wrote a memoir of his master’s conversations with his students and published them as *Discourses*. Arrian was a Roman official and a soldier with literary tastes, and a man of his position may have had a slave trained in shorthand who could take notes while Epictetus and his students conversed. After Epictetus, the *Meditations* of the emperor Marcus Aurelius is the last expression of Stoic philosophy. The blanks in the historical record on Stoicism must be filled with second-hand reports of the earlier Stoics, the most important of these being the *Lives of the Eminent Philosophers* written by Diogenes Laertius. Without Diogenes’ biography of Zeno of Citium, the founder of the Stoic school, and his successors Cleanthes and Chrysippus, it would be impossible to chart the beginnings of this school.

**THE COSMOPOLITAN NATURE OF STOICISM.** Diogenes the Cynic used to say that he was a *polites* (citizen) of the *kosmos* (world) which created the word “cosmopolitan.” Philosophy was outgrowing the intellectual world of the *polis* (city-state) and the checklist of the native cities of the great Stoics proves the point. The founders of the School did not come from Athens, the seat of Greek philosophy. Zeno was a Hellenized Syrian who came from Citium, a city in Cyprus. His successor as head of the school was Cleanthes who came from Assos in the Troad, the region of northwest Asia Minor in the vicinity of Troy. He had been a boxer in his earlier career and when he came to Athens, he worked as a gardener while he attended the lectures at the *Stoa Poikile*. Chrysippus (c. 280–207 B.C.E.), the third head of the Stoic School, came either from Soli or from nearby Tarsus, both in the region of Asia Minor known as Cilicia. The next head of the school was Zeno from Tarsus; after him came Diogenes of Babylon followed by Antipater of Tarsus. After Antipater of Tarsus, Stoicism underwent a revision by the next successor, Panaetius of Rhodes, and a period of history in the philosophy known as the “Middle Stoa” began. This included a change from the rigid practices of the philosophy to a strong focus on humanism and social practice. Because of the revision, many of the prominent figures in Rome converted to

Marble bust of Zeno of Citium (335–263 B.C.E.), the founder of the Stoic school of philosophy. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM VENICE/DAGLI ORTI.

Stoicism. Panaetius’s writings would influence Cato the younger, the stubborn defender of the Roman republic against Julius Caesar; Marcus Brutus, who was one of Caesar’s assassins; and Cicero, Caesar’s contemporary, who was an eclectic philosopher, picking and choosing his doctrines from several schools. Cicero favored the scepticism of the Academy, but he also ascribed to some of the teachings of Stoicism. Finally in its last phase, Stoicism became the doctrine of the Roman upper classes under the empire, and in the first century C.E. the Roman aristocrats who were martyred for their resistance to the growing autocracy of the emperors all professed Stoicism.

**STOIC PHYSICS.** Zeno, the founder of Stoicism, divided knowledge into three divisions: natural philosophy, ethics, and logic. Stoic physical doctrine rejected the atomic theory of the Epicureans. “Nothing that is incorporeal exists” was the fundamental principle of Stoic physics, and hence there was no place for void. For the Stoics, matter was continuous and empty space did not exist within the finite universe, but only outside it. Everything, even the soul and God himself, was material. In determining what this material was, the Stoics

*a PRIMARY SOURCE document***MARCUS AURELIUS ON THE SOUL**

**INTRODUCTION:** Marcus Aurelius, Roman emperor from 161 to 180 C.E. succeeded Antoninus Pius (138–161 C.E.) whose reign had been long and peaceful. Marcus Aurelius' reign made up for it. He faced a revolt in the east by one of his generals, Avidius Cassius, which he survived. The empire was attacked by plague, probably smallpox although that is uncertain. But most unnerving of all, in 169 C.E. tribes known as the Marcomanni and the Quadi invaded across the Danube frontier of the empire and penetrated as far as northern Italy. Italy had known two centuries of peace, and the invasion was a shattering experience. Marcus Aurelius, who had had little experience in warfare, took command of the army and drove the invaders back. His little book, *Marcus Aurelius to Himself* which is usually known as the *Meditations*, was written on the battlefield, when Marcus, no longer a young man and suffering from tuberculosis, campaigned against the Marcomanni and the Quadi. The translation from which the passage excerpted below is taken is from a classic work by George Long, who dedicated his first edition of the *Meditations* to Robert E. Lee, Confederate commander in the American Civil War, whom Long regarded as another Marcus Aurelius. In the following passage, Marcus expounds the Stoic doctrine of the soul, which is part of the divine *logos* which permeates the world, and understands that all things pass away and are renewed in another cycle of history which will repeat what has happened before.

These are the properties of the rational soul: it sees itself, analyses itself, and makes itself such as it chooses, the fruit which it bears it enjoys itself—for the fruit of plants and that of animals which corresponds to fruits others enjoy—it obtains its own end, wherever the limit of life may be fixed. Not as in a dance and in a play and in such like things, where the whole action is incomplete, if anything cuts it short; but in every part, and wherever it may be stopped, it makes what has been set before it full and complete, so that it can say, I have what is my own. And further it traverses the whole universe, and the surrounding vacuum, and surveys its form, and it extends itself into the infinity of time, and embraces and comprehends the periodic renovation of all things, and it comprehends that those who come after us will see nothing new, nor have those before us have seen anything more, but in a manner, he who is forty years old, if he has any understanding at all, has seen by virtue of the uniformity that prevails all things which have been and all that will be. This, too, is the property of the rational soul, love of one's neighbor, and truth and modesty, and to value nothing more than itself, which is also the property of Law. Thus then, right reason differs not at all from the reason of justice.

**SOURCE:** Marcus Aurelius, *Meditations of Marcus Aurelius*. Book 11, Sec. 1. Trans. George Long (Chicago: Henry Regnery, 1956).

looked back to Heraclitus and argued that it was Fire. Fire was the *logos*, the divine reason. *Logos* pervades the universe as honey pervades a honeycomb, and the human soul was a portion of this *logos*. The primal fire which is the *logos* is God, and hence the soul proceeds into the body from God. Periodically the whole world turns to fire and there is a great conflagration that is not so much a destruction of the world as its apotheosis (elevation to divine status), for the world that is consumed by fire has become united with God. Then the fire goes out, and history begins a new cycle, repeating itself in exactly the same way as it unfolded before. History repeats itself in endless cycles.

**THE THEORY OF KNOWLEDGE.** According to Stoic doctrine, all knowledge reaches the mind through the senses. This view was in stark opposition to Plato's doctrine, that the senses were the source of illusion and error. There was no place for Plato's Theory of Forms in Stoic logic. For the Stoics, concepts have no reality outside the consciousness. They are merely ideas that the mind forms from the evidence with which the senses

have supplied it. Virtue is based on knowledge, but to possess knowledge, the conceptions of the mind must mesh with reality, and so the wise man is one who has an accurate grasp of the real world. The Stoics believed it was possible to accurately grasp the real world, and they tried to show how the mind can acquire conceptions that are based on reality.

**THE VIRTUOUS LIFE.** "Live in harmony with nature" was the watchword of the Stoics, that is, nature in a broad sense. The guiding principle of nature is the *logos*—that is, reason—which the Stoics identified with God. It manifests itself in both fate or divine necessity, and divine providence. Virtue consists of living in harmony with the guiding principle of nature—that is, the *logos*—and to be virtuous is the only good; the only evil is not to be virtuous. The Stoics, with some exceptions, admitted that a wise man might choose to avoid illness or death or seek self-preservation if he could do so and still act virtuously. Nonetheless, pain and discomfort should not affect his happiness, nor, for that matter, should their opposites, pleasure and good health. The

wise man will be indifferent to such things. Pleasure and favor will not influence him, and so he will be completely just. Nor will he consider pain and death evils, and so he will be absolutely courageous.

**PERSONAL CONDUCT.** Zeno defined emotion as an irrational movement of the soul, and so freedom from emotion is the mark of a wise man. A wise man is indifferent equally to fame and obscurity, and so he is devoid of conceit. Good men are not meddlesome; they decline to take any action that is outside the path of duty. Good men may drink wine, but they will refrain from drinking so much as to become intoxicated. The Stoics held that all sins were equal, for every falsehood is false, not more or less false than any other. If one man is a hundred miles from Rome and another man only five miles distant, they are both equally not in Rome. Good men are by nature sociable, and so they will not live in solitude. There should be no Stoic hermits. Finally, if a wise man has a good reason for it, he will commit suicide, or “make an exit” as the Stoics called it, either for the sake of his country or his friends, or because he is suffering great pain of incurable disease. Death as a Stoic was greatly admired in Rome where Cato the Younger became the paradigm of a Stoic martyr. Julius Caesar crossed the Rubicon River in 49 B.C.E. and drove the forces of the defenders of the republic—most of them upper-class Romans—out of Italy and defeated them at Pharsalia in northern Greece. Cato the Younger, an obstinate defender of republican ideals as he interpreted them, managed to rally the republican forces in north Africa, and in 46 B.C.E. Julius Caesar defeated them at Thapsus. Cato heard the news of the defeat at Utica near Carthage and committed suicide, refusing to survive the Roman republic. His suicide won him an acclaim which he had not enjoyed in his political career, for he was an unpleasant man and utterly uncompromising in politics. He became Cato Uticensis (Cato of Utica) who “made an exit” at Utica and thus became a martyr for republican freedom both in ancient Rome and in modern Europe. Seneca the Younger (c. 3 B.C.E.–65 C.E.), the emperor Nero’s discarded tutor, made an equally edifying exit. He was accused, justly or unjustly, of being party to a conspiracy to murder Nero and put a new emperor on the throne. Nero decided that Seneca must die, and Seneca committed suicide. He was given no time to make a will, and so he told his family that he left them something far better than earthly wealth: the example of a virtuous life, and then, opening his veins, dictated his last words to his secretary as his life ebbed away. During his lifetime, Seneca had shown a remarkable

appetite for earthly wealth, but he died as a Stoic philosopher should.

## OTHER PHILOSOPHIES IN THE HELLENISTIC WORLD

**PHILOSOPHY IN A CHANGED WORLD.** Alexander the Great died in Babylon in 323 B.C.E., having radically changed the Greek world through a series of conquests that unified Greece and brought Persia into the Hellenistic world. The word “Hellenistic” comes from the Greek *hellenizein* which means “to speak Greek,” and with the Greek language, to acquire a smattering of Greek culture. The Hellenistic world embraced regions that had been foreign to the Greeks of the classical period in the fifth century B.C.E. and it is significant that non-Greeks developed the dominant philosophy of the Hellenistic world and the Roman world after it: Stoicism. While the pre-Socratic philosophers had focused on abstract questions on the nature of goodness and aspects of society, the burning questions on the minds of the philosophers in this day and age focused more on how an individual should live in a world that had changed so dramatically within a generation and the achievement of personal happiness.

*a PRIMARY SOURCE document***DIOGENES LAERTIUS ON THE SCHOLARCH ARCESILAUS**

**INTRODUCTION:** About 265 B.C.E. Arcesilaus became scholarch or head of the Academy which Plato had founded. He brought new life to the Academy. There was some disagreement among later historians of philosophy in the ancient world about whether he could be called the founder of the “New Academy” or if he was the founder of the “Middle Academy” and his successor as scholarch, Carneades, was the founder of the “New” or “Third Academy.” There was no doubt, however, that when Arcesilaus became scholarch, it marked a new stage in the development of the Academy. Arcesilaus employed scepticism—the view that true knowledge was impossible for humans to attain—as a weapon against the Stoics and Carneades continued the quarrel with the Stoics, particularly with their theological doctrines. Diogenes Laertius, writing in the early third century C.E. includes a life of Arcesilaus on his *Lives of the Eminent Philosophers*, and from it we learn some anecdotes about him.

Since he [Arcesilaus] suspended judgment on every question, he never, as it is reported, wrote so much as a single book. Yet others say that he was once observed detecting correcting some passages in a work of his; and

some assert that he published it. Others deny it, however, and claim that he threw it into the fire.

He appears to have been a great admirer of Plato and possessed all his writings. He also, according to some authorities, had a very high opinion of Pyrrho, [the sceptic philosopher]. ...

He was exceedingly fond of employing axioms, very concise in his diction, and when speaking he laid emphasis on each separate word. ...

He was so free from vanity that he used to counsel his students to transfer to other teachers, and once when a young man from Chios was dissatisfied with his Academy but preferred the school of Hieronymus, whom I have already mentioned, he himself took him and introduced him to that philosopher, advising him to continue to conduct himself regularly. There is a very witty saying of his recorded. When someone asked him once why people left other schools to join the Epicureans, but no one left the Epicureans to join other sects, he replied, “People sometimes make eunuchs out of men, but no one can ever make a man out of a eunuch.”

**SOURCE:** Diogenes, “Arcesilaus,” in *The Lives and Opinions of Eminent Philosophers*. Book 4, Sec.7–8, 10, 18. Trans C. D. Yonge (London: Henry G. Bohn, 1853).

**THE ACADEMY AND THE LYCEUM.** Plato’s Academy continued in this new era, though its reputation declined. Plato’s nephew Speusippus became head after Plato’s death, and he adhered to Plato’s doctrines although he did not emulate Plato’s temperament. He had a reputation as a man of violent passions; once, in a rage, he threw a puppy down a well. Xenocrates next took on the role of headmaster, and although he wrote an enormous number of works, none of them survived. In fact, none of the writings of Plato’s successors survived. About 265 B.C.E. Arcesilaus, a pupil of Theophrastus, Aristotle’s successor as head of the Lyceum, became head of the Academy, or *scholarch*, as the head was called, and began a new era: the so-called “New Academy,” which became an opponent of Stoicism. The Stoics claimed that there was a kind of sense-perception that was convincing and irresistible, and that these senses conveyed truth. Arcesilaus retorted that wrong perceptions could be as convincing as right ones—it all depended on the circumstances—and from that argument, he went on to deny the possibility of any knowledge. The Academy became somewhat less dogmatic as time went on. Yet Arcesilaus’ legacy was to make the Academy a center for logical scepticism.

**SCEPTICS.** Thanks to Arcesilaus, scepticism began to exercise considerable influence on Greek philosophy, but he was not the founder of the school. It was Pyrrho of Elis (c. 360–c. 270 B.C.E.) who taught that the aim of life was a serene mind, which can only be achieved if we understand our relation to the nature of things. But since we cannot know the nature of things, we should not trouble ourselves about matters we cannot understand. This doctrine is sometimes called “Pyrrhonism.” It holds that we should refrain from making positive or negative judgments, and by maintaining a balance between “yes” and “no” in our judgment we can create balance in our soul.

**THE CYNICS.** The Cynics liked to claim descent from Antisthenes, who was one of Socrates’ disciples, for that gave them a connection with the great master of classical philosophy, but the term “cynic” (doglike) was first applied to Diogenes of Sinope as a comment on the anti-social life he chose to live. He held that actions based on natural instincts and impulses could not be unnatural, and hence he refused to be bound by an social conventions. He believed a man should be free to say and do whatever he wanted—even to have

*a PRIMARY SOURCE document***DIOGENES THE CYNIC**

**INTRODUCTION:** Diogenes was famous for his wit and sharp, often tactless, remarks. When Alexander the Great stood beside him and said, "I am Alexander, the Great King," Diogenes replied, "I am Diogenes the dog." When he was asked why he was called a dog, he answered that it was because he fawned on those who gave him something and barked at those who gave him nothing, and bit them into the bargain. Diogenes Laertius recounts a great number of stories about Diogenes, not all of which can be true, but they illustrate the sort of man he was.

Plato defined man in this way: "Man is a two-footed, featherless animal," and he was greatly praised for his definition. However Diogenes plucked a rooster, and brought it into the Academy and said, "This is Plato's

man." For that reason this addition was made to the definition, "with broad, flat fingernails." A man once asked him what was the proper time for supper, and he replied, "If you are a rich man, whenever you please. If you are a poor man, whenever you can." ...

When Plato was lecturing on his Theory of Forms" and using the nouns "tableness" (for the ideal form of a table) and "cupness" (for the ideal form of a cup), Diogenes interrupted, "I, Plato, see a table and a cup, but I see no table or cupness." Plato replied, "That is natural enough, for you have eyes with which to contemplate a table and a cup, but you have no intellect with which to see tableness and cupness."

**SOURCE:** Diogenes, "Diogenes," in *The Lives and Opinions of Eminent Philosophers*. Book 6, Sec. 6. Trans C. D. Yonge (London: Henry G. Bohn, 1853).

sexual intercourse in public, if a natural impulse drove him in that direction. Antisthenes pointed to self-denial as the chief principle of a philosophic life, but Diogenes carried self-denial and the simple life to extremes. Legend has it that one day he saw a child drinking water by cupping it in his hands and raising them to his mouth, whereupon he threw away his own cup, saying that the child had outdone him in austerity. He was a street person—that is, he made his home on the streets, sleeping in porticoes and anywhere he could find shelter—and at one point, he made his home in a large storage jar called a *pitthos*. Wealth and high rank did not impress him. There is a famous story, told by Plutarch in his *Life of Alexander the Great*, that Alexander came to visit him and found him basking in the sun. He asked if he could do anything for him. Diogenes asked him simply to stand aside, for he was blocking the sun. The story is probably apocryphal, but it does illustrate how little the Cynics were impressed by great men. One of Diogenes' early disciples was Crates of Thebes who was once the teacher of Zeno of Citium, the founder of the Stoic school of philosophy. Crates gave up a large fortune to follow the life of a beggar and a preacher, and though he was an ugly man, he won the heart of his pupil Hipparchia; she also gave up everything to marry him. Crates glorified his beggar's wallet, but that was precisely the weakness of the sect: they lived off others, thus saving their souls by using others who were too busy to save their own. Cynicism faded out gradually in the second and first centuries B.C.E., but in the first century C.E., it revived

for reasons unknown. In the reign of the emperor Vespasian (69–79 B.C.E.) and his successors, there were swarms of Cynic philosophers in Rome and in the eastern provinces of the empire. Among the upper classes in Rome, resistance to the autocracy of the emperors was associated with Stoicism, but among the middle classes, it was voiced by the Cynics who always claimed the right to speak freely and frankly. They championed the principle that it was the duty of an ideal monarch to care for the welfare of his subjects; he should be like an idealized Hercules who used his great power for the good of his people, and they were fond of pointing out how far the actual conduct of the Roman emperors was from their ideal. The imperial government frequently lost patience with them and drove them from Rome.

**THE CYRENAICS.** The Cyrenaics were a short-lived school that was founded in Cyrene in north Africa by Aristippus, who was once a disciple of Socrates. They taught that the chief end of life was sensual pleasure. This philosophy was built on the belief that the mind feels two emotions, pleasure and pain; while the first is the primary goal of all living things, the latter is what every creature avoids. Pleasure for the Cyrenaics, however, was not merely the absence of pain or discomfort; rather it consisted of a number of particular pleasures, past, present and future: memories of past pleasures, enjoyment of the pleasures of the present, and anticipation of pleasure in the future. Aristippus, who is supposedly the founder of the school (though some scholars have doubted it), was a teacher of rhetoric in Athens who was famous for his pursuit of luxury. He

spent some time at the court of the tyrant of Syracuse in Sicily, Dionysius I, attracted there by the good food and the comfortable living. The chief importance of the Cyrenaics is that they influenced Epicureanism, which also taught that hedonism was the chief end of life, although the Epicureans were suspicious of the pleasures of the senses and sought pleasure by avoiding what might cause pain. The Cyrenaic school came to an end about 275 B.C.E.

## EPICURUS

**FOUNDER OF EPICUREANISM.** The English word “epicure,” meaning a person who loves good food and drink, is taken from Epicurus and the Epicureans. It is a singular distortion, for the Epicureans believed that man should restrict his desires to those that spring from the natural appetites—gourmet food and fine wines not being among them. Epicurus (341–270 B.C.E.) was a hedonist in that he believed that the proper goal of all activity was pleasure, but he had an austere definition of it, in that his definition of pleasure was simply the absence of discomfort or pain. The Epicurean ate to rid himself of the discomfort of hunger and no more. According to this philosophy, he should guard himself against anguish at the death of a close friend by having no close friends. Insatiable desire for wealth, power, and fame can never be satisfied, and so they should be avoided. Epicurus himself, the founder of the Epicurean School, was born in Samos, but his parents were Athenian citizens and he himself was educated in Athens. While there, he studied under the tutelage of a disciple of Democritus and learned Democritus’ atomic theory that he would later incorporate into his own philosophy. He taught philosophy at Mytilene on the island of Lesbos and in Lampsacus in northern Greece before returning to Athens, and it must have been in this period that he developed his view that pleasure was the chief end of life. It was not the avid pursuit of pleasure, but there was a fine line separating the Epicureans from the Cyrenaics, and the modern dictionary definition of “Epicurean” as a person who is fond of sensuous pleasure may be wrong but it is not entirely unjustified.

**THE GARDEN.** About 306 B.C.E. Epicurus moved to Athens and there bought a house with a garden as quarters for a school which he founded. There he was joined by his disciples who formed a community of philosophers in the “Garden,” the name of his school. The disciples included women, for Epicurus was the first philosopher to admit women into an organized school. His community was known as a *thiasos* (company); it describes a band of persons such as worshipers of Dionysus who parade through the streets singing and dancing, but it also means a religious brotherhood. In his *thiasos*, Epicurus enjoyed a kind of adulation that approached worship. His birthday was celebrated as a festival. He was a voluminous writer, but all his major works are lost. Fortunately, Diogenes Laertius, writing in the early third century C.E., quotes four works by him: three of them letters to disciples and one, titled the *Chief Doctrines*, which is a collection of proverbs on ethical subjects, meant, evidently, to be committed to memory. Modern

Modern engraving of the Athenian philosopher Epicurus. THE LIBRARY OF CONGRESS.

knowledge of Epicureanism expanded in 1888 with the discovery of another collection of proverbs in the Vatican Library.

**ATOMS AND VOID.** Epicurus adapted the atomic theory of Democritus to the purposes of his philosophy. He actually cared very little about the theory itself but he needed a metaphysical background for his ethical doctrine, which taught that pleasure and avoidance of pain were the chief ends of life. He started from two simple points. First, nothing is created from nothing. That was an old principle of Greek philosophy, and it follows that the stuff from which the universe is made has always existed and will never pass away. The universe must also be infinite, for if it had a boundary, it would be possible to reach this boundary and puncture it. A dozen men thrusting their fists through the boundary of the universe could create a new boundary, and this process could be continued endlessly. Second, there are bodies in motion, as our eyes tell us that there is, for Epicurus was willing to trust the senses, and since there is motion, there must be empty space, that is, void, into which they

can move. Thus the existence of atoms and void could be taken as proved, and since the universe is infinite, the number of atoms must also be infinite.

**CREATION.** Epicurus explained the process of creation of objects as occurring when these atoms collided. He thought that the atoms had weight and were constantly falling. They could not fall at the same speed along parallel trajectories, however, or they would not naturally collide. So Epicurus taught that as the atoms fell, they would, purely at random, swerve to one side or the other. The swerve explained the collisions of atoms, which stuck together when they collided—they seem to have had velcro-like appendages—and group of atoms formed the objects that we see, both living and inert. The random nature of the swerve preserved free will in the universe, but it also left a great deal to chance. When an object passes away, the atoms disintegrate. Thus when an animal dies or a tree is cut down, the atoms that compose it will return to the infinite collection of atoms that move forever in a downward motion through the universe. Everything, including man, is atoms and void. Aristotle had claimed that everything that was created in nature had a purpose, or a “final cause.” Epicurus could not accept that. Yet he had to accept the fact that the creative process in nature seemed to follow patterns: men and women, for instance, are not put together at random; they have heads, arms, and legs positioned where they should be on their bodies. Dogs all seem to belong to one species. To explain that phenomenon, Epicurus developed a rudimentary theory of evolution: in the remote past, the atoms did form human being and animals at random, so that once upon a time the world was inhabited by some odd and curious creatures, and a dog might have the claws of a cat, and a man might have the lower body of a horse, like the mythical centaurs. But by trial and error, nature discovered the creatures most able to survive in the competition for life, and these formed patterns of creation. This was a “survival-of-the-fittest” argument, a precursor of Charles Darwin’s evolutionary theory.

**THE GODS.** The Epicureans denied divine providence, but they did not discard the gods. To be sure, Epicurus had mechanistic explanations for natural phenomena such as thunder, rainbows, and earthquakes, and he argued against the belief that there was some caring, benevolent deity that watched over the world. The manifold suffering in the world was proof of the falsity of any such notion. But the Epicurean system did leave space for the gods. They were blessed, happy beings who lived in a never-never land, the *intermundia*, to use the Latin term for it, which means the “space between the

*a PRIMARY SOURCE document***THE MAXIMS OF EPICURUS**

**INTRODUCTION:** Diogenes Laertius ends his biography of Epicurus with four authentic documents, three of them letters to disciples in which, among other things, he presents purely mechanistic explanations for various natural occurrences. For example, earthquakes may be the result of wind penetrating the interior of the earth or it may be caused by the earth itself being bombarded by particles from the outside, and since earth's own atoms are in constant motion, it is prone to general vibration. In any case, earthquakes were not caused by the will of the gods. The last document is a set of Epicurus's maxims to guide a person seeking a happy life. Ten of them are quoted below.

What is happy and imperishable suffers no trouble itself, nor does it cause trouble to anything. So it is not subject to feelings either of anger or of partiality, for these feelings exist only in what is weak.

Death is nothing to us, for that which is dissolved has no feeling whatsoever, and that which has no feeling means nothing to us.

A person cannot have a pleasant life unless he lives prudently, honorably and justly, nor can he live prudently, honorably and justly without a pleasant life. A person cannot possibly have a pleasant life unless he happens to live prudently, honorably and justly.

No pleasure is intrinsically bad, but what causes pleasure is accompanied by many things that disturb pleasure.

Vast power and great wealth may, up to a certain point, grant us security as far as individual men are concerned, but the security of men as a whole depends on the tranquility of their souls and their freedom from ambition.

Of all the things that wisdom provides for the happiness of a whole life, the most important by far is acquiring friends.

Natural justice is an agreement among men about what actions are suitable. Its aim is to prevent men from injuring one another, or to be injured.

Justice has no independent existence: it results from mutual contracts, and we find it in force wherever there is a mutual agreement to guard against doing injury or sustaining it.

Injustice is not intrinsically bad: people regard it as evil only because it is accompanied by the fear that they will not escape the officials who are appointed to punish evil actions.

The happiest men are those who have reached the point where they have nothing to fear from those who surround them.

**SOURCE:** Diogenes, "Epicurus," *The Lives of the Eminent Philosophers*. Book 10, Sec. 31. Trans. C. D. Yonge (London: Henry G. Bohn, 1853).

worlds." They lived happy lives in a perpetual state of *ataraxia* (tranquillity). They did not worry about the wretchedness of human society, which could only disturb their tranquillity. They were ethical ideals, for they had achieved the *ataraxia* which was the aim of the Epicurean philosopher. There was no need to fear their wrath.

**GAINING KNOWLEDGE.** Epicurus' atomic theory explained vision. Every object, he argued, threw off *eidola* (images), which were actually thin films of atoms which traveled through the air to our eyes. An image that struck the eyes affected the soul-atoms there, which transmitted the image to the mind. The whole process was to be understood in terms of the movement of atoms that are arranged and rearranged into patterns. All sensations were true, but Epicurus admitted that some images could be distorted. A favorite example was an oar partly in and partly out of the water that appears to be bent. Epicurus explained the distortion by claiming that the atoms of the *eidola* emitted by the oar collided with

other atoms on their way to the eye, and thus transmitted a distorted image to the eye which in turn transmitted it to the mind. The mind, however, which is made up of very small atoms, can sort things out. The mind stores concepts—Epicurus refers to them as pre-suppositions—of what objects such as oars look like, which it has gained from experience. If a person makes the mistake of believing that the oar really is bent, it is because that person assumed too soon that the image that has reached the eyes is accurate. It follows that a person can accept the evidence received by the eyes so long as the objects that are seen are clearly visible. Senses can provide a person with accurate information.

**THE FEAR OF DEATH.** The aim of life was pleasure—the satisfaction of desires—though Epicurus never went as far as the Cyrenaics who held that sensual pleasure was the aim of life. Fear of death was one thing that could disturb the life of *ataraxia*, and yet there was no reason for such fear. Death was a dissolution of the atoms. The mind, which was also made up of atoms, did

not survive death. There was no need to fear tortures in the Underworld, or any of the travails that, according to myth, the souls of men suffered in the House of Hades. Epicurus and his followers assumed that it was the life after death that men feared, and by eliminating the afterlife, they removed a source of stress. They did not address the fact that what many persons fear is the act of dying itself.

**EPICUREANISM IN ROME.** The philosophy that appealed to the Roman upper classes was Stoicism, not Epicureanism. Rome did produce one enthusiast for Epicurus' philosophy, however: Titus Lucretius Carus, about who little is known. He probably lived from 94–55 B.C.E. He produced one long poem, divided into six books, the *De Rerum Natura* (On the Nature of Things), which is a splendid exposition of the physical theories of Epicurus. He explains the atomic theory of Epicurus, and in his third book, he applies it to the human soul, which is mortal. In fact the third book ends with a hymn to the mortality of the soul and the foolishness of humans who fear death. The poem was left unfinished. The Roman statesman, orator, and philosopher Cicero knew it, for he refers to it in a letter dated to 54 B.C.E., which he sent to his brother Quintus in terms that would lead us to believe that both his brother and himself had read it. Cicero himself leaned towards the scepticism which Arcesilaus had preached in the New Academy in Athens. It is also true that a center of Epicurean study developed in the region of Naples in the first century B.C.E.; a house excavated in the city of Herculaneum, which had been destroyed in 79 C.E. by the eruption of Mt. Vesuvius, contained charred rolls of papyrus apparently containing Epicurean works, most of them by the Epicurean philosopher Philodemus of Gadara (c. 110–c. 40 B.C.E.) who had a villa at Herculaneum. Now known as the Villa of the Papyri, the house must have been a gathering place for Epicureans in the early first century C.E. after Philodemus' death.

## NEOPLATONISM

**HISTORY.** Neoplatonism is the modern name for the philosophy taught by Plotinus who came to Rome shortly after 234 C.E. and opened a school there. Plotinus' pupil, Porphyry, who published Plotinus' works after his death, was largely responsible for publicizing his philosophy and incidentally, antagonizing Christian leaders who were both attracted to and repelled by Plotinus' teachings. Porphyry in turn had a pupil named Iamblichus who founded a school in Syria. Iamblichus' works are all lost, but his philosophic ideas lived on in Athens, where Plato's old Academy was revitalized by Neoplatonism. The Neoplatonic Academy, which regarded itself as a direct descendant of the Academy that Plato founded, became a center for Neoplatonic doctrine until the emperor Justinian closed the school in 529 C.E., a move which marks the end of pagan philosophy. Thus Neoplatonism is the last product of the Greek philosophic tradition which went back to the Milesian philosophers in archaic Greece.

**REMEMBERING PLATO.** The philosophy of Plotinus harked back to Plato, though not to all of his writings. Plotinus paid no attention to Plato's early dialogues, choosing to draw from the dialogues of Plato's middle and late periods. Plato in his *Republic* referred to the "Being beyond Being" which is the Idea of the Good. The "Being beyond Being" re-emerges in Plotinus' conception of the "One," which is the principle of all being, and hence "beyond Being." It is infinite and, as such, it has no attributes. It simply transcends any description or knowledge. But while the goal of Plato's philosophy was the achievement of knowledge of the divine being, Plotinus went a step further and posited that the goal should be an actual union with the divine being. For Plotinus, the "One" is all things and yet none of them. It is formless, but it possesses a kind of true beauty, for it is the power that produces all that is beautiful. The "One" produces offspring, and its greatest offspring, second only to itself, is Intellect. Soul has the same relation to Intellect as Intellect has to the "One." It is the source of all that lives and, as such, it must be immortal. Soul is the principle of motion. Capable of moving itself, it is the cause of movement in the world, and it is the source of life for all bodies that have souls within them. Soul, therefore, rules nature. So between the "One" and the material world there are three descending grades of reality: "Intelligence," that is, the *nous* (world-mind); the *psyche* (world-soul); and *physis* (nature).

**THE DESIRE OF THE SOUL.** The soul's desire is to attain union with the "One," and to do that, it must itself become simple and formless. The soul must discard all awareness of intelligible realities. The union of the Soul with the "One" cannot be described. It is like the return of a wanderer to his native land. To attain this union, a person must free his soul from all outward things and turn completely within himself, rid his mind even of ideal forms and forget himself and thus come within sight of the "One." The Soul loves God and wants to be one with him. This was not a philosophy for a person who took an active role in public life. Plato had founded his Academy as a school of future statesmen, but the world had changed since the fourth century B.C.E., and Plotinus' philosophers withdrew and sought salvation in contemplation.

**THE FINAL DEVELOPMENT.** Porphyry's pupil, Iamblichus (c. 250–c. 325 C.E.), after studies in Rome, returned home to Syria and founded his own school there. His ideas survive, though most of his writings do not, and what is remarkable about them is that he explicitly subordinated philosophy to *theurgy*, the art of communicating with God by oracles, mysticism and magic. Iamblichus imported a great many religious ideas from the East, particularly from Egypt, into Neoplatonism. In the fifth century C.E. the Neoplatonic Academy acquired new life under a *scholarch* (headmaster) named Proclus (412–484 C.E.). Proclus was born in Constantinople and came to Athens as a young man to study philosophy. He stayed to become the head of the Academy. Professors taught in their homes—the park-like setting where Plato himself had taught had long since disappeared—and the remains of Proclus' house have been discovered. It was below the Acropolis, where Proclus had a good view of the Parthenon, the temple of Athena. When the gold-and-ivory cult statue of Athena was removed from the Parthenon, Proclus had a dream in which Athena appeared to him and told him that now she was ousted from her temple, she would have to make her home with him. Proclus enjoyed Athena's favor, it was said. He and his disciples were also devotees of the Sun God, to whom they offered daily prayers. Life in the Neoplatonic Academy was almost that of a pagan monastery. In 529 C.E., the emperor Justinian closed it down, and the long tradition came to an end.

## SIGNIFICANT PEOPLE *in Philosophy*

---

### ARISTOTLE

384 B.C.E.–322 B.C.E.

*Philosopher*  
*Teacher*  
*Biologist*

**EARLY DEVELOPMENT.** Aristotle was born in 384 B.C.E. in Stagira, Chalcidice, the projection of land that forms the eastern edge of the Thermaic Gulf in the northern Aegean Sea. His father Nicomachus was the court physician of King Amyntas II, the father of Philip II of Macedon who would eventually make Macedon the dominant power in Greece. Aristotle may have spent part of his boyhood at the Macedonian court at Pella, and acquired his interest in physical science in his father's surgery. At age seventeen, he travelled to Athens and entered Plato's Academy where he remained until Plato's death in 348 or 347 B.C.E., first as a student, then as a teacher and research associate. When Plato died, Aristotle left Athens, perhaps because he was disappointed at not being named Plato's successor as head of the Academy. In any case, the new head, Speusippus, represented the trend of later Platonic thought to make philosophy into a branch of mathematics, for which Aristotle had no sympathy. Aristotle went to the court of Hermias, a former student at the Academy who extended his hospitality to a small circle of philosophers, and Aristotle married his niece. Hermeias was a eunuch and a tyrant who ruled Atarneus and Assos in the Troad (the region around ancient Troy), on the fringe of the Persian

Empire; in 341 B.C.E. he was betrayed to the Persians who captured him, tortured him and put him to death. In his memory, Aristotle wrote a hymn to virtue. The execution of Hermias may account for Aristotle's prejudice against the Persians which is apparent in his treatise, the *Politics*.

**FOUNDED THE LYCEUM.** Aristotle himself moved to Lesbos, and it is during his stay at Assos and Lesbos that he did much of his research into the natural sciences which laid the foundation for the modern study of biology. Then about 343 B.C.E. Philip II of Macedon asked him to come to Pella as tutor to his son Alexander. The appointment ended when Philip appointed Alexander regent in 340, and Aristotle probably went back to Stagira. The year after Philip's death in 336 B.C.E., Aristotle returned to Athens and leased some buildings—as a non-citizen he could not buy property—and founded a school where he gave lectures and collected books and artifacts to illustrate his lectures, especially his lectures on zoology. The school was in a grove sacred to Apollo Lyceus and the Muses, and it took the name, the Lyceum, from Apollo Lyceus. The buildings which Aristotle rented there included a courtyard with a colonnade called a *peripatos* where Aristotle loved to walk with his students, and from it, the Aristoteleans got the name “Peripatetics” by which they were known in later centuries. There Aristotle built a library and a museum; Alexander the Great is supposed to have given him a grant of 800 talents—a enormous sum by the standards of the day—to fund the collection and ordered information to be sent to him about any new species discovered in the course of his conquests. When Alexander died in 323 B.C.E. Athens was swept up in a wave of anti-Macedonian feeling, and Aristotle's close connections with Macedon put him in danger. He prudently withdrew to Chalcis on the island of Euboea where his family had an estate, and he died there less than a year later.

**RESEARCH LOST.** Much of Aristotle's work is lost. As a young research associate at Plato's Academy, he wrote a number of dialogues that were much admired for their style, but none survive. He also produced memoranda and collections of materials for treatises. At the Lyceum, he organized large-scale research; he assigned his students the task of producing research essays on the constitutions of 158 Greek states and of these one survives: a papyrus found in Egypt at the end of the nineteenth century contains most of the *Athenaion Politeia* (The Constitution of Athens), which is probably one of these research essays. Aristotle's surviving works include the scientific and philosophic treatises, perhaps about one-third of his total output.

**DIVERGED FROM PLATO** Aristotle began as a student of Plato but he soon diverged from his master. He could not accept Plato's Theory of Forms, which held that physical objects in the world such as chairs, horses, and men are imitations of perfect realities which exist separate from the human sphere, and among these perfect realities were abstractions such as pure Goodness and pure Beauty. For Aristotle, these “Forms” did not exist apart from the substances from which they were formed. He pointed out that if the substances did not exist, the Forms could not exist. Thus a horse is recognizable, for instance, because a number of horses exist and their characteristics are known. This is true of all species, whether plants or animals or even types of government, and thus by collecting data about them, and classifying them, real knowledge can be acquired. Aristotle would have said that a political scientist who wanted to acquire skill in the art of governing should not formulate constitutions for imaginary utopias, but rather should imagine the actual constitutions of states in the Mediterranean world.

**ACHIEVEMENT IN DEDUCTIVE LOGIC.** One of Aristotle's major achievements was in the field of deductive logic—the process of reasoning from a premise to a logical conclusion, or from a known principle to one that is unknown. Aristotle no doubt spent a great deal of thought perfecting his logic, and he was proud of the results, but for him it was always a means to an end, and the end was a solution to the old problem: how can anyone know anything for certain? Aristotle always regarded his logic as a tool that he might use to separate wrong arguments from sound ones. His logic was taken up with enthusiasm by the medieval philosophers who used it to make rigorously accurate deductions from one or more first principles that were taken as self-evidently true. The problem with this method of reasoning was that the first principle really must be true; otherwise the deduction would be wrong. However, Aristotle, unlike the medieval philosophers that came centuries after him, did not himself accept first principles as true without examining them carefully.

**THE LYCEUM AFTER HIS DEATH.** After Aristotle died in 322 B.C.E., Theophrastus became the head of the Lyceum and it flourished under his leadership. Theophrastus himself carried on research in botany; Eudemus of Rhodes wrote on the researches into science, including arithmetic, geometry and theology; and the brilliant researcher Aristoxenus wrote on music—parts of his works on harmonics and rhythm have survived. After Theophrastus' death, a series of lesser philosophers became heads, or “scholarchs,” as they were called, but the Lyceum was increasingly overshadowed by rival

schools. It probably ceased to exist after the sack of Athens by the Roman general Sulla in 86 B.C.E. Although the school did not survive, Aristotle's influence did, particularly after the publication of an edition of his works by Andronicus of Rhodes in 40 B.C.E.

### EPICETETUS

c. 55 C.E.–c. 135 C.E.

*Philosopher*  
*Teacher*

**SOURCE OF STOICISM.** Given the small number of surviving writing by the early Stoics, the works of Epictetus take on a particular importance as a major source of modern knowledge of Stoicism. He wrote nothing himself, but he was fortunate enough to have as a student Flavius Arrianus, or Arrian as he is usually known. Arrian was a Roman citizen who served as governor of the province of Cappadocia in Asia Minor under the emperor Hadrian (117–135 C.E.). He transcribed the *Discourses* of Epictetus, which seem to have been conversations between Epictetus and his students after the formal lectures were over for the day. It is hard to believe that they are an actual stenographic record of what Epictetus said, though it is not impossible, for a man of standing such as Arrian might well have had at his disposal a slave trained in shorthand. There is one shred of evidence that would indicate that the *Discourses* do represent the actual words of Epictetus; another work of Arrian—a history of Alexander the Great—differs markedly in literary style from that of Epictetus' *Discourses*, indicating that two different authors are responsible.

**FROM SLAVE TO PHILOSOPHER.** Epictetus was born in Hierapolis (modern Pamukkale in Turkey) and as a boy he went to Rome as a slave where he was purchased by a secretary of the emperor Nero named Epaphroditus. Epaphroditus was himself an ex-slave who had gained his freedom and rose through the ranks of the imperial civil service until he became the official in charge of receiving petitions for his master, the emperor Nero. There were stories told that he treated Epictetus cruelly; he did, however, allow him to attend the lec-

tures of the Stoic philosopher Musonius Rufus. During his mid-twenties, shortly after the suicide of Nero in 68 C.E., Epictetus was manumitted, thereby becoming a freedman. It was then that Epictetus began his own lecturing and philosophizing, much of it focusing on the Stoic philosophy. About 89 C.E. the emperor Domitian expelled the philosophers from Rome, including Epictetus who migrated to Nicopolis in north-west Greece, an area that attracted many upper-class Romans including Arrian. Although there were originally eight books of Epictetus' *Discourses*, only four survived to record the philosopher's thoughts for posterity. A manual of personal conduct for the adherent to Stoic doctrine, the *Enchiridion*, also survived, giving readers a synopsis of the key themes of Epictetus' teaching.

### EPICURUS

341 B.C.E.–270 B.C.E.

*Philosopher*

**EPICURUS' LIFE.** Epicurus was born in Samos in 341 B.C.E., but his father and mother were both Athenian citizens so he suffered none of the disadvantages of resident aliens in Athens who could not, for instance, own property in Athens. Epicurus fulfilled his military service in Athens just after the death of Alexander the Great in 323 B.C.E. and then rejoined his family who had by then settled in the city of Colophon, an Ionian city in Asia Minor. It was there he probably learned about the theory of atoms and void proposed by Leucippus and Democritus. At age 32, he moved to the city of Mytilene on the island of Lesbos, where he set up a school and began his career as a teacher; from Mytilene he moved to Lampsacus on the Hellespont, where he also set up a school and began to acquire pupils and loyal friends. The intellectual center of the Greek world was in Athens, however, so he moved there in 306 B.C.E. He purchased a house with a garden, where he set up a school known as "The Garden." Apart from some visits to Asia Minor, he remained in Athens until his death.

**EPICUREAN PHILOSOPHY.** For many Greeks, the Garden provided an escape. The expanded world that resulted from Alexander the Great's conquests had

become a bewildering place. Epicurus' students retired to his Garden where they attempted to live a life of *ataraxia*: freedom from stress and worry. Though the adjective "epicurean" has come to mean "fond of sensuous pleasure," Epicurus himself and his followers were not epicurean in that sense. They were abstemious: a small cup of light wine was enough for a day, otherwise Epicurus taught that happiness was the aim of his ethical system, and happiness meant pleasure. Pleasure was the one true good, but not the sensual pleasure of the Cyrenaic School with which the Epicureans were sometimes confused by their enemies. Rather it was intellectual pleasure, and freedom from stress, desire, need, and, above all, pain.

**EPICURUS' DEATH AND LEGACY.** As it turned out, Epicurus' death was exceedingly agonizing, and he bore the pain with fortitude. He suffered from a kidney stone, and he failed to pass it in his urine. After some two weeks of excruciating pain, he had a warm bath prepared for him in a bronze tub, asked for a cup of pure wine and drank it, and stepped into the tub. As he rested there, he urged his friends to remember his teachings, and so he died. Unlike the Stoics, the Epicureans never influenced the world to any great extent, but on the other hand, Epicurean teachings did not die out despite being much reviled, particularly by the Christians who disagreed with the Epicurean position that the cosmos was the result of accident and there was no divine plan.

## PLATO

427 B.C.E.–347 B.C.E.

### *Philosopher*

**DISTINGUISHED FAMILY.** Plato, one of Greece's most famous philosophers, was born in Athens in 427 B.C.E. to an old distinguished family. His father, Ariston, was a conservative man of property and established family lineage, and his mother, Perictione, counted among her ancestors Solon, the Athenian statesman who reformed the government in 594 B.C.E. and gave it what

conservatives called the "ancestral constitution" of Athens. Plato himself claimed in two of his dialogues that the tale of Atlantis, a lost continent submerged beneath the sea, was passed down to his family from Solon, who learned it in Egypt. Ariston passed away while Plato was still a child, and his mother married a close friend of Pericles, Athens' powerful statesman. Thus, Plato had close connections to the powerful elite of Athens even as a young child.

**DISCIPLE OF SOCRATES.** Despite his political connections, Plato's most influential relationship was no doubt the one he shared with the philosopher Socrates. Plato must have been quite young when he met Socrates and it was the turning point of his life. Engrossed by Socrates' relentless pursuit of ethical questions, Plato became Socrates' most famous disciple, and it is through Plato's writings that most of the modern knowledge about Socrates is derived. Not everyone was so enamored of Socrates, however; the philosopher's penchant for confronting the citizens of Athens with their own foolishness had earned him many enemies, and the hostility he aroused contributed to his condemnation and death penalty on charges of impiety and corrupting the young in 399 B.C.E. For Plato, Socrates' condemnation resulted in his disillusionment with politics as he saw them practiced in the Greek world. He became convinced that the only cure for bad government lay in philosophy, and there could be no good government until true philosophers gained political power, or politicians become true philosophers. He himself explained how he came to this conclusion in his personal testament expressed in the *Seventh Letter*, which he wrote in his old age, and this belief permeates his most famous work, the *Republic*, as well as his last work, the *Laws*, left unrevised at his death in 347 B.C.E.

**PLATO'S TRAVELS.** Plato traveled widely for about a decade after Socrates' death. He visited southern Italy in the year 388 B.C.E. where he encountered the Pythagoreans; at Tarentum a Pythagorean philosopher and distinguished mathematician, Archytas, had been elected governor and provided an example of a philosopher in power. Plato's fascination with mathematics owed something to Archytas' influence. From Italy, he went to the court of the tyrant Dionysius I in Sicily, and got to know Dionysius' brother-in-law, who was excited by Plato's political ideas. But Plato offended Dionysius somehow and returned to Athens. There he set up the Academy about 386 B.C.E. where he taught for the rest of his life, except for two brief periods (in 367 B.C.E. and again in 361 B.C.E.) when he returned to Sicily to train Dionysius I's successor, Dionysius II.

**PLATO'S ACADEMY.** The aim of the Academy was to train statesmen. Many members of the Academy took an active part in the political life of the Greek states. The Academy was not the first such institution in Athens, but it does have a claim as the first university in Europe. When the Roman general Sulla sacked Athens in 88 B.C.E., the Academy was a casualty, and there is no evidence of activity in the Academy in the centuries that followed. Individual Platonists, however, held classes in their houses and Athens retained a reputation as a center of philosophy. In the fifth century C.E., however, the Academy was refounded as a center for Neoplatonism, which mixed mysticism with Platonic philosophy, and this Neoplatonic Academy claimed direct descent from Plato's Academy, a claim that was clearly bogus. Yet it became paganism's last intellectual stronghold, and in 529 B.C.E., the emperor Justinian closed it down as part of his campaign against the remnants of paganism.

## PLOTINUS

c. 205 C.E.–270 C.E.

*Philosopher*

**STUDIED FOR MANY YEARS.** The philosopher Plotinus is best known as the founder of Neoplatonism—the study, interpretation, and progression of the work of the Greek philosopher Plato. Plotinus, like many philosophers who studied Plato, was not born in Greece, but in Lycopolis, Egypt, around 205 C.E. Not much is known about his early life other than he had an early thirst for knowledge that prompted him to leave Egypt in his twenties in order to learn more. At the age of 28 he returned to Egypt, this time to Alexandria, in search of a contemporary philosopher by the name of Ammonius Saccas. He attended lectures given by Saccas and eventually became a personal student of the philosopher. It was Saccas that introduced Plotinus to Plato, as well as to Persian and Indian philosophy, both of which would heavily influence his later interpretations of Plato. After eleven years as a student of Saccas, he felt the need to travel again, and his newfound love of Asian philos-

ophy led him to join up with a Roman military expedition to Persia in 243. Unfortunately, Plotinus never made it to Persia, for the leader of the expedition, Roman emperor Gordian III, was lynched by his own troops and the expedition was abandoned. It took Plotinus two years to return from the expedition, and his next recorded appearance was in Rome in 245. By this time Plotinus was forty years old, and was ready to embark on his philosophical career.

**LECTURED IN ROME.** Plotinus's first lectures did not relate to Plato directly but instead focused on the teachings of his old mentor Ammonius. According to a biography written by Plotinus's student Porphyry, Plotinus spoke all over Rome about Eastern philosophies in relation to Plato's work, but did not put down on paper any of his theories or interpretations for close to ten years. However, by 263, Plotinus had moved on to the direct study and interpretation of Plato's work and had written 21 treatises on philosophical issues. These writings, along with 33 other treatises which he would write over the last seven years of his life, would make up his most famous compilation of work, the *Enneads*. The 54 treatises in the *Enneads* cover a wide variety of subjects and were later arranged by Porphyry in the following order: *Ennead* I dealt with issues of ethics; *Enneads* II and III looked into natural philosophy and cosmology; *Ennead* IV delved heavily into psychology; *Ennead* V concerned itself with epistemological issues, especially those of the intellect; and *Ennead* VI covered a variety of topics from numbers to the issue of a higher being above the intellect. These writings are not so much musings on these topics as they are responses to questions that Plotinus received during his lectures about different areas of Plato's philosophy.

**SUFFERED AILMENT IN LATER YEARS.** During his later years, Plotinus also heavily studied the works of Aristotle, another pupil of Plato. While most of Plotinus's written work is original, many of his lectures and many of the positions from which he starts his writings were taken directly from Aristotle's interpretation of Plato's work. By 268, Plotinus had retired from lecturing and his writing also seemed to stop completely. This has been attributed to an ailment he suffered, possibly leprosy, which disfigured him. It is unclear whether it was this ailment or simply old age that caused Plotinus's death in 270 at the age of 66. His final words that were reported were, "Try to bring back the God within you to the Divine in the universe." The *Enneads* which Porphyry edited were published thirty years after his death, and they are the main surviving work that produced Neoplatonism centuries later.

**THALES**

c. 625 B.C.E.—c. 547 B.C.E.

*Philosopher*

*Mathematician*

*Astronomer*

**THE FOUNDER OF GREEK PHILOSOPHY.** The Greeks looked upon Thales as the founder of Greek philosophy and the first man to attempt to provide a scientific explanation for the origin of the world. He was born in Miletus on the south-west coast of Asia Minor around 625 B.C.E. and in his youth he was an avid traveler. As Hieronymus of Rhodes indicates in his report, Thales measured the pyramids by their shadow, having observed the time when a person's shadow is equal to the person's height. It wasn't long after his trip to Egypt that Thales went to Greece to further his study of geometry. It was in Greece that he began to lecture on natural sciences and philosophy and he founded one of the first Greek schools of philosophy the Ionian School, also called the Milesian school.

**LEGEND OF ECLIPSE PREDICTION.** Thales was said to have predicted an eclipse of the sun which has traditionally been dated to 585 or 584 B.C.E. and if this report is true, it would provide the one certain date in his life. Whether he actually predicted the eclipse or not is a matter of dispute. At one time scholars believed that he used astronomical observations borrowed from Babylon to make his prediction, but it is now known that at this time, the Babylonians had no theory for predicting solar eclipses that Thales could have used. Moreover, the story goes that the eclipse that Thales predicted took place just as the Medes and the Lydians were about to fight a battle at the Halys River in Asia Minor, and the Milesians were present as allies of Lydia. The eclipse caused the Medes and Lydians to break off the battle. The story implies that the eclipse took place during daylight hours, and there was no solar eclipse at a suitable hour in 585 or 584 B.C.E., though on 21 September 582, there was a partial eclipse, three-quarters total at 10 and this may have

been the eclipse which Thales was said to have foretold. Clearly Thales' prediction was a legend, but it is evidence of his reputation as an astronomer was among the Greeks.

**ANECDOTES ABOUT THALES.** There were a number of similar stories told of Thales' activities as engineer, mathematician, and astronomer, as well as a philosopher. When his critics derided his wisdom as impractical, he used his astronomical knowledge to predict a superabundant crop of olives, and made a fortune by cornering the market in olive presses. Another story which presented him as an absent-minded intellectual told that while he was stargazing, he fell into a well, and a servant girl who found him laughed at him because he failed to notice what was at his feet as he examined the heavens. He discovered that two triangles were equal if two angles and one side were equal and he evidently used this theorem to measure the distance of ships out at sea. He was credited with a book on navigation titled the *Nautical Star Guide*, but it is doubtful if he was the author of this work. Most scholars think that Thales wrote nothing.

**CONTRIBUTION TO NATURAL PHILOSOPHY.** Thales argued that the material constituent of all things is water. The earth, he claimed, floats on water, and he used this theory to explain why earthquakes occurred. He rejected the explanation that they took place when a god such as Poseidon shook the earth. It is possible that he derived his theory from Near Eastern mythological explanations of creation, for Babylonian descriptions of the world order spoke of the "waters under the earth." Yet Thales' doctrine did not turn to supernatural or mystical explanations in order to understand natural phenomena. Instead of elaborating stories of how the universe came into existence, as Hesiod did in his *Theogony* which proposed a theological explanation for how the world arose from chaos, Thales posed a new question—"What is the universe?—and his answer was a theory based on observation of the real world. As such he paved the way for the development of modern natural science.

**HELPED CROESUS DURING WAR WITH PERSIA.** When Thales was an old man, the Lydian kingdom, then ruled by Croesus, whose wealth was proverbial, was threatened by a new enemy, Cyrus, king of Persia, who had overthrown the last king of the Medes in 550 B.C.E. Croesus, whose sister had married the last king of the Medes, wondered if he should attack Persia before it grew too strong, and he consulted the oracle of Apollo at Delphi. The oracle gave the ambiguous answer, "If Croesus crosses the Halys River, a great em-

pire will fall.” Croesus imagined the prophecy was favorable and launched an attack, not realizing that his empire was the one destined to fall. Thales accompanied him, and another legend told that he helped the Lydians cross the Halys River by diverting part of the stream into another channel. Croesus was defeated, and in 547 or 546 B.C.E. his capital of Sardis fell to Cyrus. The Ionian cities that had been subject to Croesus wondered what to do, and Thales proposed that they should form a federal state and present a united front to Persia. But Cyrus split the Ionian resistance by offering Miletus a favorable alliance and leaving the conquest of the rest of Ionia to one of his generals. Following this event, Thales passed from the historical records until his death around 547 B.C.E.

## ZENO OF CITIUM

335 B.C.E.–263 B.C.E.

### *Philosopher*

**EARLY YEARS** Like many people in Citiium, Zeno was most likely Phoenician, a sect of Middle Eastern people who were known for their sea trading. Zeno himself was a merchant in his younger years, traveling often to numerous ports around the Mediterranean Sea. Over the years Zeno began to gather philosophical books from Athens, Greece (both from his own travels and from his father’s travels as a merchant), and by his mid-twenties he sold what cargo he had left and settled permanently in Athens.

**BEGAN TEACHING AT THE PAINTED STOA.** Zeno was influenced heavily in his early philosophical education by two very different schools of thought. He often attended lectures by Polemon, a follower of the Academics, who were considered very traditional philosophers and used Plato’s teachings as their core beliefs. He also was known to follow the teachings of Crates the Cynic, a well-known teacher of Cynicism. Cynicism was the exact opposite of the Academic philosophy, rejecting all

conventions of society and instead pointing towards a life focused on nature and base needs. By the time Zeno began his own lecturing around 300 B.C.E., he had begun to combine these two schools of thought into a new philosophy. Zeno, like many other philosophy teachers at the time, taught in public locations that were accessible to any person who might wander by. It was well known that Zeno’s favorite place to teach was in front of the “Stoa Poikile” (Painted Stoa), a central colonnade on the north side of the agora in Athens. Zeno became so well known for lecturing on philosophy in this spot that his new brand of philosophy was soon named Stoicism. Over time Zeno began to develop a large following that included Antigonus Gonatas, the king of Macedonia who would come to Athens often just to hear Zeno teach. While Zeno was invited numerous times to become the royal philosopher in Macedonia, he declined, not wanting to leave Athens, the seat of philosophy during his lifetime.

**STOICISM.** Zeno’s philosophical core beliefs grew out of the idea of corruption and rationalism. In his most famous and controversial work, the *Republic*, Zeno chastised society and other philosophies for needing to set up binding institutions such as government, law, and religion. In the *Republic* Zeno first breaks down society by all of its ills, and then reconstructs it by describing a new form of society. In this society, members rely completely on rational thinking as a way of life. In this “Utopian” view of the world, there is no need for any sort of government, economic system, nor institutions such as religion. Instead the rational thinking human would only do what is best not only for himself or herself, but for the society at large. This line of thinking allowed Zeno to promote many “radical” ideas for his time period such as equality between the sexes, homosexuality, and shared responsibility for successes and failures. While many of Zeno’s followers saw the possibility of a world where only moral and ethical choices were made, many of Zeno’s contemporaries saw Stoicism as the path toward moral depravity. The philosophy was rejected not only by the Academics, but also by the Cynics who felt that it did not give in completely to all of the natural ways of the world (for much of what Zeno outlined in the *Republic* was an orderly society where no one was offended by actions because all actions were deemed right or wrong by rationalism).

**LIVED A SIMPLE LIFE.** While most of Zeno’s time was spent teaching at the Stoa, he was well known throughout Athens as a person who was of high class and who was highly connected, an unusual status for someone who was not born an Athenian. He was also

perceived as one who enjoyed simple but expensive things. It was well known that he was not a heavy drinker, often turning down invitations to symposia (traditional Greek drinking parties), but that he always drank a little wine of the best stock when taking his meals. He ate loaves of bread with only the freshest honey and could often be found lounging in the sun eating freshly picked green figs. According to the works of some of his later followers, such as Diogenes Laertius, who wrote a biography on Zeno, Zeno was the perfect example of Stoicism; he used his rational mind to enjoy only the best of those things that nature could provide. Unfortunately, Laertius's writing is one of the few records that scholars have of Zeno and his own writings. There are no known surviving copies of the *Republic* nor of any of Zeno's other supposed philosophical writings. Much has been taken from later Stoic writing by followers of Zeno, but it is often difficult to attribute what was originally part of Zeno's Stoicism and what was added later by other philosophers. While Zeno was a student and teacher of rational thinking, he committed suicide, something his own teachings would have looked at as irrational, at the age of 72 after injuring himself severely in a fall.

## DOCUMENTARY SOURCES *in Philosophy*

- Aristotle, *Metaphysics* (335 B.C.E.)—This work contains an examination of earlier philosophers as well as Aristotle's own account of how the universe was created.
- Diogenes Laertius, *Lives of the Eminent Philosophers* (early third century C.E.)—This collection of biographies of the Greek philosophers is one of the major sources for modern knowledge of ancient philosophy.
- Epictetus, *Discourses* (100 C.E.)—This record of the exchanges between the Stoic philosopher Epictetus and his students is one of the few sources available on Stoicism.
- Marcus Aurelius, *The Meditations* (c. 175 C.E.)—This last great statement of Stoic philosophy was written by the emperor Marcus Aurelius as he campaigned on the German frontier against the Quadi and the Marcomanni in the 170s.
- Plato, *The Republic* (c. 429–347 B.C.E.)—Plato's most famous work is one of the best surviving studies of ancient Greek government systems. It also succinctly captures Plato's philosophical views on the flaws of government and the necessity of philosophy.
- Plotinus, *The Enneads* (c. 290 C.E.)—This collection of Plotinus' writings, edited and published by Plotinus' pupil Porphyry about twenty years after Plotinus' death in 270 C.E., is the most complete expression of Neoplatonic views.
- Titus Lucretius Carus, *The Nature of Things* (65–55 B.C.E.)—The Roman philosopher expounded the Epicurean atomic theory in this long poem comprising six books.

## IMPORTANT EVENTS

### *in Religion*

- c. 3500 B.C.E. Greece passes through the Bronze Age; –c. 1100 B.C.E. bronze, an alloy of copper and tin, is used for weapons, tools, and cooking utensils.
- c. 3500 B.C.E. On Crete, now in the Pre-Palatial Period, family tombs are built with adjoining dancing floors, suggesting that dancing is part of the funeral rites.
- Gods are worshipped in sacred caves.
- c. 1950 B.C.E. Greek-speaking migrants invade Greece, displacing earlier peoples known in Greek tradition as the “Leleges” and the “Pelasgoi.” The pre-Greek language is unknown but Greek place-names ending in *-inthos* and *-sos* or *-ttos*, such as *Korinthos* (Corinth), or *Knossos* (Cnossus), are thought to belong to this pre-Greek language.
- c. 1900 B.C.E. On Crete during what is known as the Proto-Palatial or “Old Palace Period,” “peak sanctuaries” are built on mountain tops, and human burials are made in great jars called *pithoi*, though Pre-Palatial tombs also continue to be used.
- 1700 B.C.E. The palaces on Crete are destroyed, probably by an earthquake.
- c. 1700 B.C.E. This is the Neo-Palatial or New Palace –c. 1450 B.C.E. period, when the palaces are rebuilt, all of them constructed around rectangular central courts which had a ceremonial function. Seven palace sites have been identified thus far, as well as five other sites with mansions like small palaces but lacking the central court.
- c. 1600 B.C.E. On mainland Greece, a dynasty at Mycenae buries its dead in “shaft graves” with costly gifts of gold and amber, and bronze weapons.
- c. 1500 B.C.E. “Tholos” tombs resembling old–c. 1200 B.C.E. fashioned beehives, roofed with a false vault without a keystone, are constructed in many regions of mainland Greece, the best of them at Mycenae. Princes build palaces not only at Mycenae but also Thebes, Pylos overlooking the Bay of Navarino, Tiryns, Volos and elsewhere.
- c. 1450 B.C.E. The palaces on Crete are destroyed by fire, and are rebuilt only at Knossos.
- c. 1450 B.C.E. In the “Post-Palatial Period,” the Knossos palace is reinhabited, and modern archaeologists will later find in its ruins clay tablets written in “Linear B”—an early form of Greek—which reveal the names of gods worshipped by the classical Greeks.
- c. 1350 B.C.E. There is destruction at Knossos, but the palace continues to be at least partially in use for another two and a half centuries.
- c. 1200 B.C.E. The palace at Pylos on mainland Greece is burned, apparently by raiders, and the “Linear B” tablets discovered in 1939 in its ruins show that the gods of classical Greece—with the exception of Aphrodite—are known in the Mycenaean world.
- c. 1150 B.C.E. The citadel at Mycenae falls to invaders who are part of a general folk migration that causes widespread destruction in the eastern Mediterranean. The *wanaktes*, or semi-divine kings who lived in the palaces at Mycenae and at other Bronze Age sites, disappear, and their role as intermediaries between gods and mortals ceases.
- 776 B.C.E. The first recorded Olympic Games festival is held at Olympia in honor of Zeus Olympios.

- c. 770 B.C.E. The period of Greek colonial expansion begins with a settlement on the island of Ischia near Naples, and for the next two and a half centuries Greek states sponsor colonies along the Mediterranean and Black Sea coasts, and export their religion to these new cities.
- c. 725 B.C.E. The epic poem *Iliad* is put into writing, followed by the *Odyssey* not much later. The Homeric concept of the gods becomes dominant.
- c. 715 B.C.E. The legendary King Numa draws up the Roman religious calendar and establishes an order of Vestal Virgins, the priestesses of Vesta, the Roman goddess of the hearth.
- c. 700 B.C.E. Hesiod writes the *Theogony*, which recounts the generations of the gods, and the *Works and Days*, which describes the Five Ages of Man: the ages of gold, silver, bronze, the age of heroes, and finally the age of iron.
- c. 700 B.C.E. The normal type of Greek temple, usually raised on a three-stepped platform with gable roof, replaces earlier, primitive structures.
- c. 625 B.C.E. An Etruscan ruling family from Tarquinii takes over Rome and introduces the Etruscan divine triad, *Tinia*, *Uni* and *Menrva*, which supersedes the earlier Italic triad of Mars, Jupiter, and Quirinus.
- c. 600 B.C.E. At Olympia, a temple is built to Hera and Zeus using wood for the columns and mud brick for the walls. It is the earliest temple to have left substantial remains.
- 590 B.C.E. The “First Sacred War” results in the destruction of Delphi’s neighbor, Krisa, which had sought to annex Delphi, and Delphi becomes a small independent state deriving its income and its importance from Apollo’s oracle.
- 582 B.C.E. The Pythian Games are organized at Delphi, and athletic, musical and poetry contests are held every four years in honor of Apollo.
- 566 B.C.E. In Athens, the old annual Panathenaea festival in honor of Athena *Polias* is reorganized so that a Great Panathenaea is held every fourth year which is open to competitors from all Greece. In other years, the annual Panathenaea continues as the “Lesser Panathenaea.”
- c. 560 B.C.E. On the acropolis of Athens, the earliest temple is built on the site later occupied by the Parthenon. It is dedicated to Athena *Polias*, the “Guardian of the City,” and houses the ancient wooden cult statue of the goddess.
- 548 B.C.E. The temple of Apollo at Delphi burns down and is rebuilt over the next forty years with subscriptions from across Greece.
- 546 B.C.E. Peisistratus, dictator of Athens, purifies Delos by removing all graves within sight of the sanctuary of Artemis and Apollo.
- c. 530 B.C.E. In Italy, the Etruscans—whose earlier sanctuaries had been caves, lakes, or mountaintops—begin to build temples with wide porches intended, possibly, as places to stand and observe the heavens for portents, that is, signs such as the flight of birds in a particular quarter of the sky that might signal some future happening.
- 509 B.C.E. In Rome, the temple of Jupiter *Optimus Maximus* on the Capitoline Hill is dedicated.
- 480 B.C.E. The Persians invade central Greece, destroying the temples, including those in Athens. Delphi is spared.
- 479 B.C.E.
- 399 B.C.E. Socrates is sentenced to death in Athens on a charge of introducing strange gods and corrupting the youth.
- 324 B.C.E. A decree of Alexander the Great is proclaimed at the Olympic Games,

- demanding that the Greek states recognize him as a god.
- c. 317 B.C.E. Zeno of Citium on Cyprus comes to Athens and founds the Stoic school of philosophy, important not only for its philosophical doctrines but for its theology and cosmology.
- 306 B.C.E. In Athens, Epicurus founds the Epicurean school of philosophy which teaches that all beings are made up of atoms and void, including the gods, who live a blessed life in the space between the worlds (the *intermundia*) and are indifferent to mankind.
- 290 B.C.E. Ptolemy I, *Soter* (the Savior), one of  
-285 B.C.E. Alexander the Great's generals who had carved out a kingdom for himself in Egypt after Alexander's death, introduces divine worship for the dead Alexander.
- 283 B.C.E. Ptolemy I *Soter* dies and his son and successor Ptolemy II proclaims him a god.
- 279 B.C.E. On the death of Ptolemy I's widow, the two are proclaimed "Savior Gods" and a religious festival, the *Ptolemaika*, is established to honor them.
- c. 272 B.C.E. King Ptolemy II of Egypt proclaims himself and his queen Arsinoe, who is also his sister, the "Brother-Sister Loving Gods."
- 205 B.C.E. The Romans, distressed at their failure to defeat Hannibal, consult the Sibylline Books and are instructed to introduce the religious cult of Cybele, the Great Mother, from Asia Minor into Rome.
- 186 B.C.E. The Roman Senate decrees that the rites of Bacchus (Dionysus) be suppressed in Rome and in Italy.
- 100 B.C.E. The worship of the Egyptian goddess  
-90 B.C.E. Isis is introduced into Italy.
- 44 B.C.E. Julius Caesar is assassinated on the Ides of March (15 March) and is deified by decree of the senate.
- 12 B.C.E. The emperor Augustus becomes *pontifex maximus* (high priest) of Rome, and all succeeding emperors until Gratian (367–383 C.E.) continue to hold this priesthood.
- 64 C.E. The emperor Nero persecutes the Christians in an attempt to divert blame from himself for a fire which had burned two-thirds of the city of Rome.
- 66 C.E. In Judaea, a revolt rages against Rome,  
-72 C.E. led by the Zealots, a Jewish nationalist party, and when Jerusalem is captured in 70, the Jewish Temple is burned, possibly by accident.
- 132 C.E. The Jewish nationalist leader, Simon Bar-Kochba, leads a revolt in Judaea, and once it is suppressed, Jews are banned from Jerusalem and its immediate vicinity.
- 312 C.E. Constantine wins control of the western Roman Empire by defeating his rival Maxentius in a battle at the Milvian Bridge outside the walls of Rome, and is converted to Christianity.
- 324 C.E. Constantine wins control of all the Roman Empire and founds a new capital, Constantinople, on the site of the Greek city of Byzantium.
- 341 C.E. The emperor Constantius II bans pagan sacrifices, a repetition of a ban issued by his father Constantine I.
- 391 C.E. Visiting temples or paying them reverence is prohibited, and sacrifices are banned again.

## OVERVIEW of Religion

**THE MEANING OF RELIGION.** There is no word in the vocabulary of ancient Greek for the modern word “religion.” Latin, the language of ancient Rome, does have a term for it, from which the English word “religion” is derived, but the Latin *religio* does not have quite the same meaning. For the Romans, “religio” meant “the fear of the gods” or “reverence for the divine,” and its secondary meaning was “scruples of conscience.” These facts are important to remember in the study of ancient Greek and Roman religion. Greco-Roman religion did not demand acceptance of a creed or theological dogma. What the gods expected of their worshippers was homage, awe, and even fear. Religion, in the broadest sense of the term, was a factor in the cultures of ancient Greece and Rome as far back as one can delve into their prehistory, and its aim, as much as can be discerned, was always to control the great crises of human life: birth, death, and the circumstances that influenced them such as war, pestilence, and famine.

**PRIMITIVE RELIGION.** It is difficult, if not impossible, to comprehend the mind of primitive human beings, who were dependent on hunting, fishing, and gathering wild fruits and seeds. It is apparent, however, that they were aware that their own well-being was intimately connected with the abundance of the wild beasts that supplied them with meat, and they attempted to control the hunt through religion. One of the earliest deities modern scholars recognize in the Greek world was a goddess called the “Mistress of the Wild Animals,” the *Potnia Theron*, who is depicted as a woman, fully clothed, and flanked on either side by wild beasts which she seems to be protecting. In classical Greece, the *Potnia Theron* was Artemis, a virgin goddess who presided over the hunt as well as pregnancy and childbirth. Her earliest precursor was a prehistoric goddess belonging to the Old Stone Age, stretching back into the last Ice Age when a glacier stretched down over northern Europe, and humans lived by hunting and gathering. Once men and women began to domesticate animals and cultivate the

wild grasses which were the ancestors of our barley and wheat, they became even more aware of an environment that was beyond human control. Life began to revolve around an agricultural cycle, with sowing and harvesting seasons, a rutting season when rams bred ewes, and another season when the young lambs were born. Abundant crops depended upon rainfall at the right season of the year and so these humans began to concern themselves with rudimentary theological questions to control these factors. What deities controlled the rain, or presided over the grape harvest? Could their favor be won? How could they be made to notice an ordinary mortal who sought their help? Giving the gods worship that pleased them demanded knowledge of ritual. The Greeks were not as great sticklers for correct ritual formulas as the Romans, who believed that if a mistake was made in the ritual of a sacrifice, the sacrifice had to be begun again. Still, for the Greeks, too, a correct approach to the gods was necessary if their favor was to be won.

**THE PRIESTS.** Neither in Greece nor Rome was there any special class of priests. This is in marked contrast to Egypt and the Near East. Priests in Egypt were professionals who shaved their heads and wore white linen, and ancient Israel had a priestly tribe known as the Levites. The priests in Greece and Rome, however, were ordinary citizens. A Roman who officiated as a priest at an altar wore his toga, a gown made of a single piece of cloth which was considered the everyday dress of a Roman citizen in peacetime. The only difference was that the Roman priest pulled up the cowl of his toga so that his head was covered as he sacrificed, whereas the Greeks, in contrast, sacrificed bareheaded. There might be priesthoods that were hereditary within certain families. In Athens, for instance, the priestess of Athena *Poliias* (Athena who protects the city) had to belong to the House of the Eteoboutadai, and in the sacred mysteries celebrated at Eleusis, now a suburb of modern Athens, the families of the Eumolpidai and the Kerykes had an hereditary right to certain priesthoods. Most priests in Athens, however, were appointed annually and sometimes they were even chosen by lot. Customs differed from city to city; in some places, priesthoods were sold to the highest bidder. But nowhere was there a priestly class set apart from the ordinary citizens.

**THE HOLY DAYS.** No day was set aside each week for worship, as Shabbat is for Jews, Friday for Moslems, and Sunday for Christians. Congregations never gathered for services inside Greek or Roman temples. Instead, worshippers celebrated religious festivals: the feast days of the gods. In Athens the principal festivals numbered 32—some celebrated every month, others only

annually—but if the monthly and the annual festivals are combined, they total 120 festival days every year. No other Greek state, to the knowledge of modern-day scholars, had as many, but everywhere, festivals were important. There would be sacrifices at festivals, and sometimes athletic competitions; in two of the festivals in Athens there were dramatic performances of tragedies and comedies. Festivals were also a time for feasting, for the sacrificial animals were eaten by the worshippers. Only the inedible parts were burned on the altars as offerings to the gods.

**THE LIMITS OF TOLERANCE.** To modern eyes, Greco-Roman religion seems disorganized. Yet the disorganization had one virtue. Since there were so many gods and goddesses, and no fixed theology, the Greeks and Romans lacked any concept of orthodoxy. It follows that there could be no heresy, for if the Greeks and Romans had no idea of what correct belief was, how could a worshiper deviate from it? Yet religion was embedded in society and the Greeks and Romans would not have understood the modern concept of division between church and state. They had no dogma, but they believed in maintaining the traditional beliefs, taboos, and rituals that their ancestors had accepted. Impiety was a crime, and if men who committed impious deeds such as robbing temples or slaying suppliants who sought refuge at the altars of the gods were not punished by their fellow men, then the gods would see to it that they paid a penalty. Out-and-out atheism was not acceptable. If anyone denied the existence of the gods, that person could endanger the whole society, for the gods would be angered by the atheist's blasphemy and seek vengeance, which could take the form of an earthquake or plague. The atheist's neighbors would also suffer, innocent though they might be. Thus it was unsafe to tolerate atheism. The world of the Greeks and Romans was tolerant if compared to medieval or early modern Europe, but their tolerance was not based on principle and there were limits to it.

**THE LONGEVITY OF GRECO-ROMAN PAGANISM.** The history of Greek and Roman paganism spanned a period of more than two thousand years, from its beginnings in the prehistoric period to the fourth century C.E. when the Greco-Roman world abandoned it. For the Minoan period on Crete, and the Mycenaean Age on the mainland, scholars are dependent on mythology and the evidence of archaeology, but it is clear that these Bronze Age civilizations were the matrix of Greek religion. In the "Dark Ages" that followed them, central authority collapsed, and taking its place were several hundred little independent or semi-independent com-

munities—*poleis* or "city-states," as they are referred to—each with its own religious traditions. It was in them that the religion of classical Greece developed. Memories of the Mycenaean age shaped Greek mythology, which told stories of gods mingling with men, even appearing on earth to fight beside mortal warriors, and the bards who performed at festivals or in the banquet halls of great aristocrats articulated religious concepts as they retold the traditional myths. They could not help doing so, for the gods were embedded in Greek mythology. The Greek poets, particularly Homer who was popular all over Greece, shaped popular belief in a family of gods who controlled the forces with which mortals had to contend. Their headquarters was on Mt. Olympus where they had a good view of the world beneath.

**THE DOMINANCE OF THE OLYMPIANS.** The Olympians maintained their grip on Greek hearts and minds throughout the sixth and fifth centuries B.C.E. Some intellectuals grew skeptical as time wore on, however. In Athens, Socrates pointed out that the Olympian gods could hardly be seen as role models. Anyone who looked for a connection between ethics and religion turned aside from the Olympians with disgust. Yet the majority of Greeks in the classical period lived in rural villages and the speculations of philosophers did not reach them. Temples continued to be built and religious festivals drew crowds as great as ever. The classical period of Greek history came to an end with Alexander the Great's conquests, and in the Hellenistic age that followed religious attitudes changed.

**RELIGION IN THE HELLENISTIC AGE.** One reason for the change was that Greeks emigrated in great numbers to the new kingdoms which Alexander the Great's generals carved out for themselves from Alexander's conquests, and they came in contact with foreign gods and religious cults that were even more ancient than their own. For another, the Hellenistic kings declared themselves divine and expected worship—and there was some logic to their self-proclaimed divinity, since gods were venerated for their power to do their worshippers good or evil, and certainly kings had that power. Then, too, the Hellenistic period was the great age of the philosophic schools, and there was no clear division between religion and philosophy. One philosopher, Epicurus, taught that the gods were made up of atoms and void, and cared nothing for mankind. Last but not least, there was the coming of Rome.

**THE ROMAN ENCOUNTER WITH GREEK RELIGION.** The Roman Empire began with a small, Latin-

## TOPICS *in Religion*

speaking city on the Tiber River in Italy, and the first tutors of the Romans in religious matters were Rome's powerful neighbors, the Etruscans. The Etruscans brought to Rome the great divine triad of Jupiter, Juno, and Minerva whose temple on the Capitoline Hill became the focal point of Roman religion. Then the Romans encountered Greek beliefs and fell under their influence. Jupiter was identified with Zeus, Juno with Hera, and Minerva with Athena. More foreign contacts followed: as Rome's empire expanded, the Romans encountered a multitude of foreign gods from the east, whose cults immigrated to Italy. Rome's conquests brought a flood of slaves into Italy, and their gods came with them.

**THE ROMAN REACTION.** There was a reaction to this dilution of Roman theology. Augustus, the first Roman emperor, attempted to emphasize Italian religious traditions. He made himself master of the Roman world by defeating Mark Antony and Cleopatra, queen of Egypt, and his propagandists presented this war as a struggle against effete orientalism. He took over the office of high priest of Rome, as did his successors, and on his death, he was proclaimed a god. Yet for the most part, Rome remained tolerant of other religions. Judaism was accepted, and even accorded special rights, though the Roman could not understand Jewish monotheism. Christianity, however, the Romans could not accept. They considered it atheist and anti-Roman, and they outlawed it. The persecution of Christians were sporadic and served only to create a Christian tradition of martyrdom. Rather than hindering conversion to Christianity, the persecutions aided in the dissemination of the faith.

**THE END OF PAGANISM.** It is customary to speak of the failure of paganism as if the gods lost their grip on the hearts and minds of the people, but paganism did not die a natural death. Christianity had the advantage of a well-organized clergy and a highly-developed theology which usurped the place which philosophy once held in the pagan world. After the conversion of Constantine, the first Christian emperor, in 312 C.E. the church not only became wealthy, but the state took over the task of crushing paganism. The state suppressed pagan sacrifices, which was a severe blow, for sacrifices were central to pagan festivals. By the end of the fourth century C.E. paganism was facing defeat, but it still persisted for more than a hundred years; an appropriate end-date to Greco-Roman paganism would probably be the year 529 C.E. when the emperor Justinian closed the Neoplatonic Academy in Athens which was paganism's last intellectual stronghold.

---

### THE RELIGION OF MINOAN CRETE DURING THE BRONZE AGE

**EARLY EVIDENCE.** The earliest Greek agriculturists are found in the north; at Nea Nikomedeia, north-west of Thessaloniki, there was a settlement of farmers as early as 6500 B.C.E. But it is further south, on Crete and on the Cyclades, the archipelago in the Aegean Sea grouped around the island of Delos, that one can find the first signs of civilization—a society complete with political structure, distinctive art forms, and religious rites. Islanders in the Cyclades were forging daggers and spearheads of copper by 2750 B.C.E. The white island marble provided the raw material for a distinctive Cycladic sculpture that was geometric with flat planes, almost two-dimensional. One favorite subject was a harpist sitting on a chair and playing his instrument, perhaps for the dead in the afterlife. The most common subject is a nude woman with her arms folded over her stomach. She is probably a deity, very likely a goddess whose concern was pregnancy and childbirth.

**THE PREPALATIAL PERIOD ON CRETE.** Crete follows a different pattern, even though there was interaction with the Cyclades islands. Bronze, an alloy of copper and tin, appears in Crete about 2700 B.C.E. probably introduced by immigrants from Asia Minor, where tin was mined. The immigrants were not numerous and quickly intermarried with the native Cretans. By 2500 B.C.E. monumental tombs appear, first in the fertile Mesarà plain in the southern part of central Crete where five of them have been found, circular in shape with entrances facing east. How they were roofed is uncertain for none have been found intact, but it is clear that they were burial places for entire clans over several generations. Paved dancing floors laid out next to the tombs indicate that these were places where the community gathered for religious rites; dancing in burial grounds renewed the will to live, and affirmed family solidarity in the face of death.

**SACRED CAVES IN THE PREPALATIAL PERIOD**  
There is another clue to contemporary religious belief: sacred caves which were places of worship. On the hill above Amnisos on the north coast of Crete is a cave sacred to Eileithyia, the goddess of childbirth, which received worshippers as early as the New Stone Age, and continued in use until the Roman period. The earliest dedications that the pilgrims left behind were idols with

## CHRONOLOGY of the Bronze Age

Our knowledge of the religion of the prehistoric Bronze Age in Greece is dependent on archaeological excavations which have taken place within the last century and a half. The pioneer was Heinrich Schliemann, an amateur archaeologist from Germany who, in 1870, discovered the site of Troy that was made famous by the legend of the Trojan War. Four years later, he revealed the rich remains of an ancient kingdom at Mycenae. The Bronze Age civilization on mainland Greece that is now known from investigations at many archeological sites is called "Mycenaean" after Schliemann's discovery at Mycenae. Archaeologists now prefer the label "Helladic," since it is evident that Mycenaean culture was widespread in "Hellas," that is, Greece.

In 1899, the British archaeologist Sir Arthur Evans began excavating at Knossos on the island of Crete and found the foundations of a great sprawling structure which he believed was the legendary Palace of Minos

where a king of Crete named Minos kept the Minotaur, a monster that was half-man, half-bull. Evans labeled this civilization "Minoan" after Minos, and he worked out a chronology for its development. He divided it into three phases: Early, Middle and Late Minoan, each of which is subdivided into three sub-phases denoted by Roman numerals. These divisions suit the site of Knossos well enough, but they are an awkward fit for the other palaces that have since been found on the island, and an easier sequence of periods has been worked out by the Greek archaeologist Nicholas Platon. It begins with the Pre-Palatial period before any palaces were built, corresponding to Early Minoan and Middle Minoan I (3500–1900 B.C.E.), then the Proto-Palatial period (Middle Minoan IB–Middle Minoan II—1900–1700 B.C.E.), then the Neo-Palatial Period (Middle Minoan III–Late Minoan I—1700–1450 B.C.E.), and finally Postpalatial.

All dates in prehistory that are based on archeological finds are approximate and some will no doubt be revised in the future. Platon's chronological system, however, gives a better development sequence than the old labels of Early, Middle, and Late Minoan.

large hips and plump buttocks, handmade pottery, and stone or bone tools. Eileithyia is a goddess known in the classical period, when she is closely associated with the Olympian goddess Artemis, and the fact that her cult persisted here is a remarkable example of continuity. Two other cave sanctuaries on Crete were important enough to survive as cult sites long after the Minoan civilization came to an end. One, in the mountains south of Malia, was—according to one tradition—the cave of Dicte where Zeus was born. His father, the Titan Cronus, learned from an oracle that his son would overthrow the rule of the Titans, and so he swallowed the infants which his wife, Rhea, bore, until at last she managed to give birth to Zeus deep in the cave of Dicte. A roughly-built altar, set against the cave wall, was found in the upper part of the cave, and it was within a sacred precinct which is marked off by a barrier. The Minoan worshipers who climbed up to this cave left offerings behind to win divine favor, for bronze weapons were found embedded in the stalactites of the cave, and other votives were discovered in a pool which is at the lowest point of the cave. The other cave is situated on Mt. Ida, and it is also connected with the infant Zeus, who was supposedly brought there and suckled by the nymph Amalthea who took the form of a goat. Around his cradle danced young warriors called *Kouretes*, leaping high into the air and beating their shields to drive away the

evil spirits who might betray the child-god's presence. The cave was used from the end of the New Stone Age, but it seems to have reached the height of its importance as a cult center in the Early Palace period. The latest offerings were terracotta lamps left there in Roman times. Roman visitors—tourists, perhaps, motivated by a mixture of curiosity and piety—were still climbing up to this cave after Crete had become a province of the Roman Empire.

**THE AWAKENING OF CIVILIZATION.** Quite suddenly, about 1900 B.C.E., palaces were built at a number of sites on the island. The first to be discovered was at Knossos about three and a half miles south of Heraklion, the capital of present-day Crete, where the British archaeologist Sir Arthur Evans began to excavate in 1899. Within three years he had uncovered a great sprawling building with a maze of rooms which he called the "Palace of Minos" after the legendary King Minos who lived at Knossos, according to Greek myth. He labeled the civilization that he had found "Minoan." Since then, similar "palaces" have been unearthed at six other sites on Crete: Phaistos directly south of Knossos, Malia along the northern coast, Gournia overlooking the Bay of Pseira, Galatas near Khania to the west of the island, and to the east, Petras and Kato Zakros. All were built around central courts roughly twice as long as they are

wide. At other sites archaeologists have found the remains of great mansions, but they lack the central courts which seem to be the characteristic mark of a palace. Palaces imply kings, perhaps priest-kings, and the legend of King Minos shows that the Greek storytellers of a later age believed that a king once ruled at Knossos, where there was the largest palace on Crete and the only one that continued to be inhabited after the others were deserted. Except in the last phase of the Knossos palace's existence, however, there is no archaeological evidence that kings inhabited these palaces. They seem to have had two main functions. One was the storage of food-stuffs, the other was religious ritual.

**PEAK SANCTUARIES.** The sudden appearance of these palaces on Crete postdates—though only by a brief period—a new religious development. At the very end of the Prepalatial period, “peak sanctuaries” appear, built on mountain tops. One example that can be easily visited is on Mount Juktas above the modern town of Arkhanes, where remains of a sprawling Minoan mansion—though without a central court—have been found. Just below the summit of Mount Juktas, a stepped altar was built across a natural cleft in the rock. There were two construction phases, the first dating to the Old Palace period, and the second to the New Palace period. The offerings and the remains of sacrifices found there show that worshipers frequented this shrine from before the palaces were built until after 1100 B.C.E. The only physical evidence that shows what peak sanctuaries looked like is a *rhyton*, that is a vessel for pouring ritual libations, decorated with a low relief of a peak sanctuary. The facade was divided into three sections. There was a great central gateway adorned with multiple spirals, and on either side, smaller wings, their eaves embellished with “horns of consecration”—stylized bulls’ horns with some religious significance. The temple is shown built over a cleft in the rock, and—if allowances are made for the artist’s ignorance of perspective—it rises above two altars decorated with more “horns of consecration.” On the roof of the temple rest some *agrimi*, the Cretan wild goats which still survive on the island in limited numbers. They may be sacrificial victims, quietly awaiting their fate. The temple is situated on a rocky mountain top which the artist has indicated by a schematic sketch.

**THE ORIENTAL CONNECTION.** Peak sanctuaries have a connection to the Near East. The Canaanite gods, like the gods of Mt. Olympus worshipped by the classical Greeks, lived on mountain peaks. Texts found at the Canaanite site of Ugarit, modern Ras Shamra near the Mediterranean coast of Syria, tell of the storm god Baal

going up the “Northern Mountain” to attend the assembly of the gods. Canaanite hilltop altars were the “high places” mentioned in the Old Testament, where the Canaanites propitiated Baal, who sent the rain and ruled the thunder and lightning. This is not to say that the Minoans worshipped Canaanite gods, but the evidence for Canaanite influence is strong. For instance, a statuette of a woman, probably a priestess, handling snakes was found at Knossos, a reminder of the Canaanite goddess Asherah, the Lady of the Serpent and Mother of the gods and all creatures. Though mountaintop gods were worshipped in Canaan, no peak sanctuary like those found on Crete has been found in the Levant except at one site in northern Israel where a hilltop shrine with a stepped altar has been discovered. It dates to the nineteenth century B.C.E. that is, the early Old Palace period on Crete. Later research may turn up more evidence for parallels between Canaan and Crete but for the time being caution must be taken: the Minoans were not Canaanites.

**THE ROLE OF THE PALACES.** Evidence for the religious rites that went on in the palaces is almost entirely dependent on archaeology. At Knossos, clay tablets with writing in “Linear B” have been unearthed, dating perhaps as early as 1450 B.C.E. though many scholars date them later. “Linear B” was deciphered by Michael Ventris in 1952 and shown to be an early form of Greek. “Linear B” has been found at a number of Bronze Age sites in mainland Greece, but on Crete, it has been found only at Knossos. It was preceded on Crete by an earlier linear script that is labeled “Linear A,” and it has been found not only at Knossos but at other places on the island as well; a particularly large cache was discovered at the site known as *Hagia Triada* (Holy Trinity), so-called from a church nearby, for its ancient name is unknown. “Linear A” has not been deciphered, nor has the hieroglyphic script that was used on Crete before “Linear A” became common. Therefore, the clues these documents might provide as to what early Minoan religion was like are inaccessible. The study of pre-Greek words that have survived as place names or the names of gods, however, has provided a few tantalizing clues. For instance, a goddess with the pre-Greek name of Britomartis survived into the classical period; she is probably the same goddess as Aphaia, who had a temple on the island of Aigina, a short boat ride south from Piraeus, the port of Athens. Britomartis seems to have been a Minoan word meaning “sweet virgin.”

**THE DOUBLE-AX.** The archaeological evidence—wall-paintings, statuettes, votive offerings—raises as many questions as it answers. Double-axes have a religious

significance of some sort, for scholars find them in connection with shrines that they seem to mark as holy places. They come in various sizes, made of bronze, bone, or ivory. Some are highly ornate. They seem to be symbols of power, but they are never associated with a male figure. It is always a woman—probably a goddess—who wields the ax, swinging it above her head with two raised arms. The axes can have had no practical purpose, for their blades are too thin and fragile to chop wood or even slit the throat of a sacrificial animal. In Asia Minor double-axes are found symbolizing thunder-bolts, but they are associated with a male god, and it would be hard to show a connection between them and the Minoan double-ax. Yet the double-ax has left behind one tantalizing folk-memory: there is a rarely-used word in classical Greek, *labrys* meaning a “battle-ax” or a “double-ax,” which seems to be connected with the word *labyrinthos*, a building with a maze of corridors from which it was almost impossible to extricate oneself. The myth of King Minos of Crete told that he built a *labyrinthos* to house a monster called the Minotaur, which was half-man, half-bull. Greek words ending in *-inthos* betray a non-Greek origin, and it is tempting to believe that the “labyrinth” of the Minos-myth was the sprawling palace at Knossos with its multitude of rooms and winding hallways, and that *labyrinthos* means something like the “House of the Double-Ax.”

**THE LONG-HORNED BULLS.** The word “Minotaur” means simply the “bull of Minos,” and whatever the monster may have been, it is clear that long-horned bulls had a special place in Minoan religious rites. Terracotta figurines of bulls were left as votive offerings in holy places. *Rhytons*, which are vessels for pouring libations, were frequently made in the shape of bulls’ heads. Stylized bull horns, called “horns of consecration” are found in sacred contexts and have some unexplained religious significance. One fresco from Knossos depicts a bull charging with a flying gallop, both front and rear legs extended to show that the beast is traveling at speed, and toreadors, both male and female, are shown vaulting over his back. This kind of bull-fight, if that is what it was, is too risky to be mere sport. The toreadors are pitting their skill and athleticism against the power and speed of the bull, and those that lost the contest—as some must have done—would perish, impaled on the bull’s horns, sacrificing their lives for the good of the community. The toreadors represented the strength and courage of the youthful hero who faces death unflinchingly, for he knows that the passing years will soon slow his reflexes, and someday he will fail to leap clear of the bull’s deadly charge.

**SHRINES.** Two miniature frescos which depict religious ceremonies were found in fragments just west of the north entrance hallway of the Knossos palace, where they had probably fallen from an upper floor. One shows a scene set in the countryside, where a fence surrounds a precinct with a sacred tree and a small building, possibly a shrine. It is probably a holy space consecrated to a matriarchal goddess, for Minoan gold rings often have engravings of a goddess seated under a tree or in front of a shrine, receiving worshippers. The second fresco shows a scene in the central court of the palace. Against one wall there is the familiar Minoan shrine with tripartite facade, and double axes attached to it. A crowd has gathered there to watch a ceremony that included dancing. From this it is possible to infer that the central courts of the palaces were places where crowds gathered for religious ceremonies.

**WHAT THE MYTHS TELL US.** Greek mythology connected Minoan Crete with the cycle of myths which centered around the Athenian hero, Theseus, a prince of Athens. Each year the king of Crete, Minos, required Athens to send him twelve adolescent boys and twelve young girls to be fed to the Minotaur who lived in the labyrinth at Knossos. Theseus volunteered as one of the youths destined for this sacrifice, but once he reached Knossos, he won the heart of Minos’ daughter, Ariadne, who provided him with a sword to defend himself, and a spool of woolen thread to mark his path when he entered the labyrinth so that he could retrace his footsteps. Theseus slew the Minotaur, escaped from the labyrinth and fled Crete, taking with him Ariadne, whom he soon abandoned. The youths destined as food for the Minotaur sounds like an indistinct memory of a cannibalistic rite, and students of Greek religion often wonder if there is any evidence of cannibalism or human sacrifice on Crete. Sir Arthur Evans did, in fact, discover a cache of children’s bones in the palace of Minos at Knossos that showed what looked like knife marks, which might be evidence of cannibalism, and at a Minoan shrine discovered in 1979 at Anemóspilia near Phourni, an altar was found in one of the rooms with the bones of a young man still on it. Two other skeletons were found nearby. The shrine was destroyed by the great earthquake which brought the Old Palace Period on Crete to an end, and the excavators concluded that the youth on the altar had been sacrificed just before the earthquake, perhaps in an effort to avert it.

**THE MINOTAUR.** The figure of the Minotaur also has possible connections to Minoan religion. He sounds like a therioanthropic god, that is, a god that is half-man, half-beast, and therioanthropic figures do appear on Mi-

noan seals used to make impressions on clay. Another possibility is that the Minotaur was really the priest-king of Knossos, who wore a bull's head mask as part of the sacrificial ritual. Masks made from real bull skulls have been unearthed in sanctuaries on Cyprus, and terracotta figurines wearing such masks have also been found. It seems likely that the myth of Theseus and the Minotaur reflects a dim recollection of human sacrifice to a god that was half-man, half-bull, since there is sound evidence that human sacrifices did take place. The evidence for cannibalism, on the other hand, is shaky.

**THE EVIDENCE FOR GREEK GODS.** In the last phase of habitation in the palace at Knossos—but not elsewhere—clay tablets with “Linear B” writing were found, which indicates that there, at least, Greek-speaking invaders took over. “Linear B” has yielded the names of all the Olympian gods which are most familiar in classical Greek literature, except for Aphrodite, the goddess of love-making. One “Linear B” tablet from Knossos assigns an offering of honey to the Cave of Eilytheia at Amnisos, showing that the Greek-speaking immigrants adopted this ancient shrine. Another “Linear B” tablet from Knossos mentions the *Potnia*, that is, the Mistress, of the Labyrinth. But what does the tablet mean by the word “labyrinth”? Can it mean the same as the English word “labyrinth”? Or does it mean something like the “Holy House of the Double-Ax”?

**THE SINGULARITY OF CRETAN RELIGION.** Long after the Greek-speakers had taken over Crete, Cretan religion retained some unique features that marked it as different from the rest of Greece. The god Zeus, the king of the Olympian gods, was immortal in the rest of Greece. But the Cretans believed not only that their Zeus was born in the Cave of Dicte, but also that he died and was reborn. The Cretan Zeus seems to have been the result of a merger of the Olympian Zeus of the Greeks with an earlier vegetation god, who died and was reborn with the changes of the seasons. The importance of bulls in Minoan religious life may also be reflected in the fact that the Zeus of the Greeks was also associated with the bull, as was his brother, Poseidon, the god of the sea. On Crete, the religion of the Olympian gods overlaid an earlier religion, which seems to have had Asian and perhaps also some Egyptian connections.

## THE EARLY GREEKS ON MAINLAND GREECE

**THE DISCOVERY OF THE MYCENAEANS.** On the mainland, our study of religion has more guideposts than in Minoan Crete, for classical Greece inherited a wealth of mythology which told of a Greek Bronze Age society where Mycenae was the dominant kingdom, and the other kings owed a sort of allegiance to the high king of Mycenae. This was Greece's age of heroes, which continued to haunt the imaginations of the Greeks and inspire their poets. There is another reason, too, why the label “Mycenaean” is attached to this prehistoric civilization. Mycenae was the site that revealed it to the modern world in 1874, when the pioneer German archaeologist, Heinrich Schliemann, fresh from his discovery of ancient Troy four years earlier, started excavating inside the main gate of the Mycenaean citadel, and uncovered a circle of graves with rich burials. Archaeologists have discovered many more Bronze Age sites in Greece since then, but the term “Mycenaean” is still applied to the whole civilization.

**THE MYCENAEAN GOLDEN AGE.** The great age of Mycenaean civilization was between 1400 B.C.E. and 1200 B.C.E., after the Minoan civilization had fallen victim to some sort of disaster, and only the palace at Knossos continued to be inhabited. These last inhabitants of the Knossos palace wrote in the same “Linear B” script that the Mycenaean used, which was deciphered in 1952 and shown to be an early form of Greek. Hence there is good reason to think that Greek-speaking Mycenaean took over the Knossos palace in its final years. There is good archaeological evidence to show that the Mycenaean Greeks ranged far and wide. They carried on trade with Sicily, Italy, and even Sardinia in the west, and with the Levant in the east, until they fell victim to a general upheaval in the eastern Mediterranean that took place about 1200 B.C.E. and left evidence of folk migration and violent destruction throughout the region.

**THE MYCENAEAN TEMPLE.** It was once thought that the Mycenaean built no temples and religious life was centered in their palaces, which Mycenaean barons built in imitation of the palaces on Crete. This was not the case, however. A temple has been recently discovered at Mycenae that is connected to the palace on the

acropolis by a processional way leading down to a building that was clearly used for religious rites. In front of the entrance was an altar and a table for offerings—limestone blocks with dowel-holes for table-legs are all that survive, but the interpretation is likely. Near it was a circular enclosure filled with ash. This forecourt gives on to two rooms, one of which, the front room, has a great horseshoe-shaped altar made of clay, and beside it was a stone block, possibly intended for slaughtering sacrificial victims. A stairway from the forecourt leads down to a second courtyard where there is a round altar with the remains of many sacrifices, and next to it is a subterranean building that has been called the “House of Idols.” The idols, up to sixty centimeters—almost two feet—tall, are both male and female, and some have painted mask-like features that grimace horribly. They are hollowed underneath so that poles could be fitted to them for carrying in procession. Close to the “House of Idols” was another house, so-called the “House of the Frescoes” from the fresco in the main room showing two goddesses—or perhaps a god and a goddess—on either side of a column, and a woman, either a priestess or a goddess, holding ears of grain. This complex was clearly a place of worship, but it is unlike any classical Greek temple.

**THE EVIDENCE OF THE “LINEAR B” TABLETS.** The “Linear B” tablets found at Mycenaean sites reveal that all the Olympian gods that the later Greeks worshipped were known in the Mycenaean world, except for Aphrodite who seems not yet to have reached Greece. At Pylos, where the largest cache of “Linear B” tablets was found, Poseidon, the god of the sea, seems to have been more important than Zeus. In addition there is a goddess whose name is the feminine form of “Poseidon”—a “Mrs. Poseidon.” Similarly for Zeus: there is a goddess named *Diwija* who is “Mrs. Zeus,” and these goddesses had their own places of worship. Men played a greater role in religious rites than they did in Minoan Crete, where priestesses dominated. But at Pylos, a *ijereu* is mentioned frequently; in classical Greek the word is *hiereus* and it designates a man who holds an official position as a priest.

**THE END OF THE MYCENAEAN KINGS.** Raiders destroyed Pylos about 1200 B.C.E. and the other Mycenaean palaces did not last much longer. The kings who ruled in these palaces disappeared with them. The word for “king” was *wanax*. In classical Greek, which loses the *w*-sound, the word becomes *anax* and it is used to address a god, not a mortal king whose title was *basileus*. That fact may suggest that there were god-kings in the Mycenaean world, but there is no good evidence to sup-

port that theory. The Mycenaean *wanax* prayed to the gods in a spirit of give-and-take: he made offerings to the gods and expected the gods to be grateful and show their gratitude by keeping the kingdom from harm. He was an intermediary between the gods and mortal men, and in that sense, he was semi-divine. In the end, this religious system failed to protect this culture. The little Mycenaean realms fell victim to raiders who came, plundered and burned, and then left—there is no evidence for new immigration immediately on the heels of raiders—and the shock to the religious mentality of the age must have been as great as the trauma that the political structure suffered.

## THE DARK AGES

**THE BEGINNINGS OF THE POLIS.** In the Dark Ages that followed the end of the Mycenaean world, Greece sank back into illiteracy. “Linear B” writing had been only a tool for keeping records in the little bureaucracies in the Mycenaean palaces, and once the palaces were destroyed, and records were no longer kept, “Linear B” died out. Central authority collapsed, and once stability reappeared in the Greek world, some 700 little independent states called *poleis* (translated rather inadequately as “city-states”) are found—each a little urban center with a market, surrounded by its territory where the citizens had their farms and pastures. The urban center was the seat of government and the market was intended both for commerce and as a gathering-place for the citizens to discuss matters of common concern. Since life in the “Dark Ages” was insecure, the preferred site for an urban center was around an acropolis—the word means simply “high city,” or “city on a mount”—which was a defensible hill, able to provide a place of refuge. Of the hundreds of *poleis*, modern scholars are familiar with only a few of the largest, such as Athens, Sparta, Corinth, and Thebes, and these were not the most typical. They revered the same pantheon of gods; yet each

*a PRIMARY SOURCE document***THE FESTIVAL OF APOLLO AND ARTEMIS**

**INTRODUCTION:** The “Homeric Hymns” were composed by the *Homeridai*, a guild of *rhapsodes* (bards who recited poetry in the epic tradition, sometimes composed by themselves) who performed at religious festivals. The festival of Apollo and Artemis at Delos was celebrated by the Ionians; there were twelve cities founded by Ionian Greeks on the coastline of Asia Minor and the Dodecanese islands, including such famous places as Miletus, Ephesus, Chios, and Samos. The following excerpt comes from a Homeric Hymn that celebrates the festival at Delos. The bard gives us his “signature” at the end of the hymn: he is a blind man living in Chios, which led some Greeks to speculate that the bard was Homer himself, who, according to legend, was blind.

Phoebus [Apollo], you get your greatest pleasure from Delos, where the Ionians in their long robes gather with their children and their esteemed wives; and they commemorate you and delight you with their boxing, dancing and song whenever they hold their competitions. Anyone who chances on a gathering of the Ionians would say they were a deathless people who do not grow old; for he would see how graceful they all are, and he would rejoice in his heart as he watched the men and the well-girdled women and their fast ships and their many pos-

sessions. Besides, there is a great marvel here whose glory will never perish: the Delian maidens, the servants of the Far-shooter. For they sing praises to Apollo first, and then Leto and Artemis the shooter of arrows, and then they recall the men and women of old, and sing songs about them, enchanting the tribes of men. They know how to represent the voices of all men, and the beat of their music. One would say those men themselves were speaking, so realistic is their lovely song.

But come, Apollo and Artemis, give your blessing; and [maidens] farewell to all of you. Remember me in times to come, when a stranger from among the men who haunt the earth, who has seen and suffered much, comes and asks: “Who do you think, girls, is the sweetest of the singers who frequent you here? Who delights you most?” With one voice, all you who stand about me, give him answer: “The blind man who lives in rocky Chios; all his songs are the best and will be, too, in time to come.” And I shall carry your fame with me as I go about the world, visiting the well-sited cities of humankind. And they will be persuaded, for it is the truth. For my part, I shall not cease hymning Apollo of the silver bow, the son of fair-tressed Leto.

**SOURCE:** Homer, “The Delian Festival,” in *The Penguin Book of Greek Verse* (Harmondsworth, Middlesex, England: Penguin Books, 1971): 120–122. Translated by James Allan Evans.

had its own favorites, and sometimes even its own versions of the myths about their favorite gods. Moreover, within the *poleis*, there were great families; Corinth, for instance, was dominated by one extended family called the Bacchiadae, who elected one of their members king. Elsewhere there were various family alliances called *phratries*, each of which might have its own patron god. What gave the religion of the “Dark Ages” whatever unity it had was the common memory of the Mycenaean world and the mythology that arose from it.

**THE IMPORTANCE OF ORAL TRADITION.** The oral culture of the Greek world remained lively. Oral bards sang their poems at religious festivals or in the banqueting halls of the great aristocratic families, and they related stories of a time when gods walked the earth and fought beside their favored warriors on the battlefield. It was the poets who gave shape to the Greek ideas about their gods. They imagined deities in human form, though in the standard epithets that were applied to them there seems to be a folk memory of an early time when some of them were theriomorphic gods. Athena was called “owl-eyed” and her special bird was the owl,

which may recall an early, primitive belief that the owl incorporated her spirit. An owl gliding to its perch on silent wings, for example, was Athena manifesting herself. Hera was called “ox-eyed,” perhaps for the same reason. The gods’ association with animal totems aside, the poets made their gods in the likeness of man, and they thought of them as a divine version of an aristocratic clan, whose members had all the human failings. There was this important difference: the gods were immortal. They were safe from the fear of death, and thus they could afford to be more irresponsible than mere humans.

**THE IMPORTANCE OF HOMER.** Two poets in particular can be singled out for their role in shaping religious concepts. The first is Homer, whom legend said was a blind poet who composed the two epic poems, the *Iliad* and the *Odyssey*, as well as the *Homeric Hymns* which were sung at religious festivals. Whether a poet named Homer ever existed or not is much debated, but it is the least consequential of the many questions which this body of literature raises. What is important is that the Greeks at a later time looked back on these poems as the literature that gave shape to their concept of the

gods. Both the *Iliad* and the *Odyssey* take their subject matter from the most famous myth that Greece inherited from the Mycenaean world: the story of the siege of Troy. According to the myth, a Trojan prince, Paris, also known as Alexander, abducted Helen, the beautiful wife of the king of Sparta, Menelaus. A Greek coalition led by Menelaus' brother, Agamemnon, king of Mycenae, sailed to Troy in pursuit of Helen and captured the city after a ten-year siege. Archaeology shows that a city on the site of Troy did stand siege and was destroyed at about the date that the Greeks assigned to the Trojan War, and so the Trojan War-myth must have a kernel of truth to it. But the oral bards who performed in the halls of warrior aristocrats in the "Dark Ages" developed a Trojan myth that mingled the human realm with the divine. Homer, who may have been the poet who first put the *Iliad* and the *Odyssey* into writing, belonged to this bardic tradition. His tales of the gods helped form the Greek conception of them as immortal beings that are powerful but not omnipotent, and capable of doing mortals good or evil according to their whims of the moment. They answered a human's prayers if they were well disposed. They had their favorites, they carried grudges, and they loved to receive honors. When they appeared to humans in divine epiphanies, they were always tall, handsome, and sweet smelling. They were super-human, but they were also unreliable creatures and not to be trusted. They had both the vices and virtues of mortal men, but since they could not die, their lives were untouched by tragedy as were the lives of humans.

**THE CONTRIBUTION OF HESIOD.** The other poet who helped shape the Greek religious beliefs was Hesiod, author of the *Theogony* which is a creation myth, and the *Works and Days* which describes a farmer's life and sets it in a world where the relationship with the divine element was important. The fifth-century historian Herodotus—the first European author to write history that was more than a chronicle of facts—relates that it was Homer and Hesiod who described the gods for the Greeks and gave them all their appropriate titles, functions, and powers, and he suggested the poets lived sometime before 800 B.C.E. That date may not be far wrong, for some scholars think that by that time the Greeks had already learned to write again, having borrowed their alphabet from the Phoenicians. Once the texts of Homer and Hesiod were written down, they gave whatever standard form there was to Greek religion.

**OTHER WRITERS.** The gods of Homer were never canonical, and later writers were free to develop their own concepts that fitted the intellectual currents of the day. Greek story-tellers presented gods that were envi-

ous divine powers, and the tragic poets—the greatest of whom were Aeschylus, Sophocles and Euripides—took up the theme: the standard subject matter of tragedy was a human who became too great or too lucky, and aroused the jealousy of the gods who struck him down. Greek philosophers freely criticized the conduct of the Homeric gods and even began to point out in the fifth century B.C.E. that there was no way of demonstrating the actual existence of the gods or, if they did exist, what they looked like. Yet worship of the gods was deeply embedded in Greek society. It was sustained by ancient custom, and the Greeks revered the way of life that their ancestors had bequeathed to them.

## THE GODS OF OLYMPUS

**THE DIVINE BEINGS OF GREECE.** If a modern observer could tour the cities and villages of ancient Greece, he would be astonished at the multitude of gods and goddesses that the Greeks worshipped. They would include some gods whom he recognized, such as Zeus, the king of the gods, or Athena, whose ruined temple in Athens, the Parthenon, has appeared in countless tourist brochures. But many of them would be unfamiliar. There were woodland nymphs, female spirits of nature who might kidnap mortals whom they fancied. There were river gods who could cause floods if they were angered. A god called Pan, half man and half goat, lived in the woods, and could instill irrational terror in men or beasts, which was called 'panic' after him. To make matters more confusing, sometimes the Greeks referred to "Pan" in the plural, as if he was free of the mortal constraints of singular and plural. If the observer went to the little island of Aegina which is a short distance south from Athens, he might see a well-preserved temple built in the early fifth century B.C.E. that was dedicated to a goddess named Aphaea. She is possibly the

*a PRIMARY SOURCE document***A GUIDEBOOK TO GREECE IN THE SECOND CENTURY C.E.**

**INTRODUCTION:** Pausanias traveled through south and central Greece in the second century C.E. and wrote an account of his travels. His work does not seem to have been widely read in his own time, but it did survive to give us a picture of Greece when it was a province of the Roman Empire. Depopulation was emptying the countryside and yet every square mile had holy springs, sacred precincts, shrines, temples—sometimes ruined—or tombs associated with the religion, mythology, and early history of Greece. This excerpt is from his description of Laconia (or Lacedaemon—both names were used), which was the territory of Sparta just as Attica was the territory of the city of Athens. Therapne, the place first mentioned in the excerpt, was where Menelaus and his wife Helen of Troy were supposedly buried.

The spring at Therapne called Messeis is something I myself have seen. Other Laconians have maintained the modern Polydeucia rather than the spring at Therapne is the ancient Messeis; the Polydeucia is on the right of the road to Therapne, both the spring itself and Polydeuces' sanctuary.

Not far from Therapne is what they call the *Phoibaion* with a shrine to the Dioscuri (Castor and Polydeuces) inside it; this is where the fully-grown boys sacrifice to the war-god. Not far away is a sanctuary of Poseidon called the "Earth-holder." If you go on beyond it towards Taygetos you come to a place called "Grinding-ground"; they say that Myles the son of Lelex who first invented the mill-stone ground with it in this grinding-ground. They have a shrine here to Taygetes' son, the divine hero Lacedaemon. From here if you cross the river Phellia and go to Amyclae straight towards the sea, you come to where the Laconian city of Pharis used to be, but if you turn off to the right from the river Phellia, your road will take you to Mount Taygetos. In the plain is the sacred enclosure of Messapean Zeus; they say it got this title from a man who was the god's priest. From here as you come away from Taygetos you come to a place where the city of Bryseai once stood. A temple of Dionysus still survives there with a statue in the open air; only women are allowed to see the statue inside the temple; and all the ceremonies of sacrifice are performed in secret by women.

Minoan goddess called Britomartis, surviving on Aegina with a changed name. Her temple was in the countryside, high on a hill in the center of the island, and there the islanders gathered for her festivals to pray, offer sacrifices, and enjoy the festivities of a "holy day."

**THE DEMIGODS.** To add to the modern observer's bewilderment, there were the demigods or "half-gods." They were the heroes, and they played a role similar to Christian saints. They were mortals, many—but not all—of whom belonged to the Age of Heroes. What made them demigods was that they won great renown in their lifetimes, and hence received worship after death, for their power did not perish along with their mortal bodies. No temples were built for them, but they did have shrines where worshipers could venerate them with prayers and sacrifice. They did not dwell with the Olympian gods; instead they subsisted with the ghosts of the dead in the Underworld. If they were heroes of mythology, they might be the sons of gods, or more rarely, of goddesses. Great families boasted of pedigrees which went back to a demigod who might have divine ancestry, and the sacrifices they offered their semi-divine ancestor reinforced family solidarity. Our visitor might even have found some heroes that were nameless: if they

ever had names, they were lost in the mists of time. One clan in Athens offered yearly sacrifice to a demigod known simply as the "hero beside the salt-pans."

**THE GREAT MAN AS HERO.** Some of these heroes were historical figures who lived within the time-frame of mortal men. They were men who had once wielded power and used it to perform memorable deeds. If a person founded a colony in Italy or the Ukraine, for example, the colony he founded would honor him after his death as a *Heros Ktistes*, that is, the "founder hero." He would often be buried in the marketplace, where a shrine would be built for him, and sacrifices offered. Great gods were no longer born in historical times, but new heroes could always be created; all that was needed was a resolution passed by a city, clan, or religious group to give a deceased person heroic honors.

**THE LOGIC OF PAGAN WORSHIP.** Although the gods and heroes of the Greeks, and their cults may seem like a chaotic hodgepodge to the modern observer, there was an underlying logic to Greek worship. Gods and heroes were powerful supernatural beings whom men feared and supplicated to win their favor and avert evils, such as shipwreck, earthquake, or the drought that parched the crops. Gods had sacred places which they

*a PRIMARY SOURCE document***THE PESSIMISM OF THE OLYMPIAN RELIGION**

**INTRODUCTION:** The gods did what they wanted to do, and humans were helpless before them. Fate likewise dogged the footsteps of every man as an inescapable force. The following excerpt is a deeply pessimistic expression of an enduring religious belief among the classical Greeks that humans were playthings of the gods. Even if man were lucky enough to avoid angering the gods, old age or disease was sure to finish him off. The passage quoted below was written by Simonides of Amorgos, a little-known poet who probably lived in the seventh century B.C.E.

**SOURCE:** Simonides of Amorgos, "The Vanity of Human Wishes," in *Greek Lyrics*. 2d ed. Trans. Richmond Lattimore (Chicago: University of Chicago Press, 1960): 11–12.

particularly liked, and if a worshipper wanted his prayer to be heard he would be wise to go to a place that was dear to the god whose favor he was seeking and there make his prayer or sacrifice. Gods did not always hear prayers, for they had their own lives to lead and had neither time nor inclination to listen to all the mortals beseeching their help. But if a suppliant went to a precinct sacred to a god, where there might be a temple housing his image, then the chances were good that the god would pay attention. Gods could not ignore their images, for the image captured a god's likeness, and with it, a share of the divine potency.

**DIVINE POLITICS.** The worshipper also had to remember that gods and goddesses had special interests—like cabinet ministers who preside over government departments—and it was important to address the correct department. The goddess Hera took an interest in women in childbirth, Hephaestus was a patron of blacksmiths, and Poseidon controlled the sea and the terrifying earthquakes. Prayers and sacrifices were most effective when they were directed to the right god, for however much a god might favor a suppliant, he would hesitate to trespass upon another god's department.

**GREEK THEOLOGY.** The Greeks had no equivalent of the Bible, the Torah, or the Koran to give coherence to their religion. So far as they had any formal theology at all, they owed it to their poets, particularly the epic poets Homer and Hesiod, who produced the earliest surviving Greek literature. Almost everything that has been written about Homer is subject to controversy, including his very existence, but there can be no doubt that the Homeric poems shaped Greek conceptions of their gods and goddesses. In his *Iliad*, Homer presents them as a large extended family dwelling on Mount Olympus, the highest mountain in Greece, from which they viewed the world below like spectators at a football game. They were immortal: they could not die and did not grow old; they had no need to worry about disease, famine, or the other ills that beset mankind; they had *ichor* rather than blood in their veins; and their food was ambrosia. Beyond these distinctions, they lived lives similar to the lives of earth-bound humans. They had the same family disputes and felt the same passions. They were not, however, bound by the same social constraints as human beings; if a mortal man had dared to rape women with the same licentiousness as the gods, the brothers or male relatives of the victims would have hunted him down. Gods were powerful but not omnipotent; even Zeus, the most powerful of them all, could not change the decrees of Fate. Twelve members of the Olympian family were dominant. Homer knew of more than twelve gods on Mt. Olympus, but twelve great gods formed a sort of inner circle, and that number was never to increase. After Homer, twelve remained the canonical number. Later Greeks added Dionysus, the god of wine, and dropped Hestia, the goddess of the hearth, thus maintaining the number twelve.

**HESIOD'S GENERATIONS OF THE GODS.** Hesiod's contribution was the myth of the creation of the world out of chaos, and the birth of the gods, which he described in his *Theogony*. The main components of the myth were borrowed from the Near East. As more and more clay tablets from the ancient Near East are deci-

phered, it has become increasingly clear that Greek religious ideas owe a great debt to the East. We know now that Hesiod's *Theogony* adapts a story that is found first among the Hurrians, a people in northern Mesopotamia, who passed it on to the Greeks via the Hittites in Asia Minor, and the Phoenicians in what is now Lebanon. Hesiod's tale relates that the great gods of Olympus were preceded by three earlier generations. First there was Chaos, and out of it, *Ouranos* (Heaven) and *Gaia* (Earth) were formed. Ouranos, who was male, covered Gaia, and from their union came the generation of the Titans. The rule of the Titans ended when Cronus, the youngest of the children of Ouranos and Gaia, attacked his father, castrated him, and thrust him up into the sky. Ouranos has been separated from Gaia by the atmosphere of the world above ever since. Cronus, fearing that his offspring would overthrow him in turn, swallowed the infants whom his wife Rhea bore. His children were immortal, and so did not die, but as long as they were imprisoned in Cronus' stomach, they could do their father no harm. Rhea grew angry at the fate of her children, however, and instead of giving Cronus her last child, Zeus, to devour, she handed him a stone wrapped in swaddling clothes, and Cronus swallowed it instead. Zeus was brought up secretly on Crete in a cave high on Mt. Ida. Once he was fully grown, he forced Cronus to regurgitate his brothers and sisters, and after terrible battles—first with the Titans and then with a race of Giants and other monsters—he established the rule of the Twelve Olympians. Yet just as the Titans were overthrown, the Twelve Olympians in their turn might suffer the same doom. The gods were always wary of rivals.

**THE TWELVE OLYMPIANS.** The circle of the twelve great gods of Mt. Olympus consisted of Zeus, the king of the gods, his siblings—Hera, Poseidon, Hestia, and Demeter—and his children—Pallas Athena, Apollo and Artemis, Aphrodite, Ares, Hephaestus, and Hermes. Dionysus was added to the Twelve later, and Hestia dropped. One member of Zeus' family was not included: Hades, the dark lord of the Underworld. He was Zeus' brother, but he lived in a sunless realm, ruling over the weightless ghosts of the dead.

**ZEUS, THE SKY-GOD.** Zeus, the king of the gods, was the god of the sky and the weather. He sent the rain that made the crops grow. Homer called him the "cloud-gatherer," for when the clouds gathered in the sky and lightning flashed the Greeks imagined that they were seeing a manifestation of Zeus' power. He was by far the strongest of the gods, stronger than all the others, who dared not revolt against his rule, much as they might grumble about it. His favorite creature was the eagle, the

most lordly of birds, and his preferred weapon of war was the thunderbolt, which was his exclusive property. Other gods had their preferred weapons as well: Poseidon the trident, Apollo the bow and arrow, and Hephaestus fire, but none of these were as terrible as the thunderbolt. Zeus' enemies, the Titans and the Giants, were utterly overwhelmed by it when he hurled it against them, and mere mortals were powerless in the face of it. The lightning that flashed across the sky was Zeus revealing himself, and wherever it struck the earth, a sanctuary would be set up to "Zeus Descending," for there Zeus had touched the earth and left his mark.

**THE PROMISCUOUS GOD.** Zeus had a wife, Hera, but he was not a faithful husband. He was a god of extraordinary sexual prowess, for he was a fertility god. It was he who made the earth fruitful and saw to it that the seasons came and went in due order. Greek mythology had many tales about his scandalous escapades. He seduced an extraordinary number of both goddesses and mortal women, and his seductions rarely involved mutual consent. One myth related that he saw Leda, the mother of Helen of Troy, taking a bath in a pool and transformed himself into a swan in order to rape her. Another myth related Zeus' seduction of Danaë, who had been imprisoned by her father in a bronze chamber after an oracle told him that a son born to his daughter would kill him. While the chamber had barred mortal men access to Danaë, Zeus worked around this barrier by transforming himself into a shower of gold that penetrated the bronze chamber, and thus he sired her son who did, eventually, kill her father, as the oracle foretold. Zeus was also the father of Heracles, the strongman of Greek legends, and the tale of how he impregnated Heracles' mother Alcmena is an example both of craftiness and a lack of conventional morality. Zeus disguised himself as Amphitryon and slept with his wife, Alcmena, while Amphitryon was away at war. Then, shortly afterwards, the real Amphitryon returned and slept with his wife, who was surprised at his ardor, for she believed that they had slept together only a short while before. From the coupling of Zeus and Alcmena, Heracles was born, while his twin, Iphitus, was fathered by Amphitryon.

**ZEUS, THE SIRE OF GODS.** It is not surprising, therefore, that Zeus had a great many offspring, both mortal and immortal. He sired both Apollo and Artemis by the Titaness, Leto. He begot Hermes by Maia, one of the Pleiades, the seven daughters of the Titan Atlas, whom Zeus set as a constellation among the stars. He fathered Dionysus by a mortal woman, Semele, the daughter of Cadmus, king of Thebes. His sister Demeter bore him

Persephone, the queen of the Underworld whom Hades took as his partner. Hera's children by him were Ares, the god of war, and, according to some accounts, Hera and Zeus were father and mother of Hephaestus, the god of smiths and craftsmen. Zeus deserved his title as father of gods and men. Even those gods who were not sired by him addressed him as "Father," and rose to their feet when he came into their presence.

**THE JUSTICE OF ZEUS.** Zeus was a god of impartial judgment. He was the guardian of conventional morality among mankind even if he did not set an example of it himself. As time went on, he became connected with the principle of justice. Justice, wrote Hesiod, was a daughter of Zeus who reported all deceit and perfidy to him. Yet powerful though Zeus was, he never tried to overturn the decrees of Fate, for he knew that to challenge Fate would be unwise. Every mortal person had his *moira* (portion of life), marked off by boundaries which even Zeus did not transgress, for respect for limits was the basis of ethical behavior. The most distressing of these limits was death, which no mortal could evade. A myth described how a mortal named Sisyphus tried to cheat death and overstep his *moira*, and the judgment of Zeus was severe. In the Underworld Sisyphus was condemned forever to roll a heavy stone to the top of a steep hill, only to be overcome by exhaustion as he neared the top so that the stone rolled back down the hill and he had to start again.

**ZEUS, THE PANHELLENIC GOD.** Zeus was a god whom all the Greeks revered. One of his epithets was *Panhellenios*, which means "god of all the Hellenes," for the Greeks in their own language called themselves "Hellenes." Zeus had no city that he favored above all others. His most famous festival was the Olympic Games that were held every four years at his greatest sanctuary, Olympia, situated in south-west Greece within boundaries of Elis, but in the countryside, away from the urban center of the state. It was a panhellenic festival. Athletes from all over the Greek world gathered there every four years to participate in the contests, and while the games were being held, there was a universal truce: states at war with each other ceased hostilities until the games were finished. All Greeks were welcome to compete, but non-Greeks were not eligible. A victor won only a wreath made of the wild olive for his prize, but the honor and glory that he received in his home city was enormous.

**HERA THE MISTRESS: QUEEN OF THE GODS.** Zeus' wife was Hera, whose name means "mistress." She was the queen of the gods, and she had two city-states she especially loved. One was Argos, south of Corinth, where

she had a sanctuary so venerable that one of her most common titles was "Argive Hera." It was built, not in the urban center of Argos, but some distance away in the countryside. Her other favorite place was the island of Samos where a temple was built for her as early as 800 B.C.E. In fact, she seems to have been one of the first, if not the first, of the Greek deities to have temple buildings erected for her cult. At Olympia, for instance, before the great temple of Zeus was built, a temple was erected for her, and it was so ancient that the walls were made of mud brick and the columns were originally hewn out of wood with stone replacements as the wood columns rotted.

**THE JEALOUS WIFE.** Hera was a goddess of weddings and a patron of married women. She looked after the recurrent cycle of pregnancy and birth—and often infant death—which Greek women experienced. Hera's own marriage with Zeus was no model of connubial bliss, for she saw through the deceptions and infidelities of her randy husband. She reacted with jealousy and anger, and since she could not curb Zeus, she pursued his paramours with unrelenting rage. When the Titaness, Leto, was in labor with Apollo and Artemis—both sired by Zeus—Hera prevented Eileithyia, goddess of childbirth, from going to assist Leto, and consequently Leto's labor lasted nine days. The other gods eventually took pity and offered Eileithyia a great bribe to attend the birth without Hera's knowledge. Her enmity for Heracles, the son of Zeus, was implacable. While he was still an infant, she sent two great serpents to destroy him, but he grabbed them with his fists and strangled them. Once Heracles became a man, Hera deranged his mind, and in a blind rage he killed his wife, Megara, and his children. Another target of Hera's jealousy was Io, a priestess at Hera's sanctuary at Argos who attracted Zeus' lustful eye. Hera persecuted her, first turning her into a heifer and then sending a gadfly that tormented her so much that she fled across the sea to Egypt. In Homer's *Iliad*, Hera plays the role of a quarrelsome partner of Zeus, railing against his infidelity. But she is always careful not to rouse him to violence, for Zeus had no compunction about wife-beating.

**HERA'S CHILDREN.** Hera had children of her own. One was the god of war, Ares, sired by Zeus. The blacksmith god Hephaestus was also Hera's son; one story related that, angered at Zeus' constant infidelities, she bore him miraculously without male sperm. Hera also had two daughters who were not included among the twelve Olympians: Hebe and Eileithyia. Hebe, whose name means "youth and health," was a goddess of healthful well-being. She served as cupbearer of the Olympian

gods until Zeus fell in love with a handsome Trojan boy named Ganymede and snatched him up to Olympus where he usurped Hebe's place as cupbearer. After Heracles was admitted into the company of the gods, Hebe became his wife. Eileithyia, the divine midwife, was an ancient goddess who was worshipped in Minoan Crete, and when she was brought into the Olympian regime, she became Hera's daughter, which must have been a demotion. It demonstrates the disorganization of the Greek religion when Homer speaks of more than one daughter of Hera bearing the name Eileithyia, as if she was a sisterhood of midwives.

**POSEIDON, RULER OF THE SEA.** Poseidon, the god of the sea and earthquake, was the brother of Zeus. Homer refers to a myth that was derived ultimately from an ancient Akkadian epic from Mesopotamia, titled the *Atrahasis*, that after the Olympian gods overthrew the rule of the Titans, the three brothers—Zeus, Poseidon, and Hades—drew lots to decide which portion of the universe each would rule. Hades won the Underworld, Zeus the clouds and the high clear sky, while Poseidon got the sea. The earth, however, was to be common to all three, and whenever Zeus became too autocratic and tried to extend his dominion beyond his proper boundaries, Poseidon complained, though he knew better than to revolt. He ruled the tempests, and sailors and fishermen feared him. If his anger was roused against an unlucky mariner, he was relentless, as the hero Odysseus discovered as he made his voyage home from Troy. Poseidon lived in an underwater palace with his wife, Amphitrite, the daughter of Ocean, and their children were the Tritons, sea monsters with fishtails that could make venturing on the sea dangerous. At the same time, he was the Earth Shaker, the Lord of the Earthquake who could smash rocks with a single blow of his trident. When earthquakes struck, the Greeks would invoke Poseidon and sing his paean, which was a hymn giving thanks for deliverance from evil. He had no city which he could call his own—though he did contest Athens with Athena and lost narrowly—but he did have one famous sanctuary at the Isthmus of Corinth, where every two years the Isthmian Games were held in his honor.

**PALLAS ATHENA, PATRON OF ATHENS.** Athena, or Pallas Athena, was the patron deity of Athens, so much so that when an Athenian referred simply to “the goddess,” it was Athena whom he meant. The derivation of her second name, “Pallas,” is uncertain, but mythology had at least two tales that explained it. One told that Pallas was a Giant, and in the battle between the gods and the Giants Athena killed and flayed him and covered her own body with his skin for protection. An alternative tale

related that Pallas was a goddess who was Athena's playmate when they were both young. They were both skilled warriors, and once when they were sparring, Pallas was about to strike Athena when Zeus intervened and thrust his shield in front of her. Startled, Pallas was thrown off her guard, and Athena's next blow accidentally killed her. Athena mourned her death and took her name. This tale belongs to a common type of myth where one god slays another, sometimes by accident and then assumes his name, and these myths are generally interpreted to mean that the killer god has taken over his victim's cult and co-opted his worshippers. If this interpretation of Pallas' death is right, it may mean that Athena co-opted the cult of an earlier warrior goddess who did not belong to the charmed circle of the Olympians, and the name “Pallas Athena” reflects the merger.

**A GODDESS OF INTELLIGENCE, RESOURCEFULNESS AND WARFARE.** Athena was the daughter of Zeus and Metis. The word *metis* means simply “wisdom” or “cunning,” but in the myth of Athena's birth Metis is a female divinity. While Metis was pregnant, Zeus learned that her son was destined by fate to overthrow his father. Hoping to eliminate this threat, he swallowed Metis with her unborn child. Thus Zeus literally incorporated wisdom in his own body. One day he had a splitting headache, and called on Hephaestus to help. Hephaestus cured the migraine by taking an ax and splitting Zeus' head open. Out stepped the warrior goddess, Athena, in full armor. She was a goddess of battle, and Greek art always depicted her wearing a helmet. She delighted in the clamor of combat. When she favored a soldier, she stood beside him in the fight and gave him courage. In particular she loved a warrior who was not merely strong and brave, but intelligent and crafty as well. The hero Odysseus was a special favorite of hers, for on his long journey home after the destruction of Troy, he survived by his wits, whereas all his men perished. Her shield was called an aegis, and whenever she raised it in battle, it struck panic into her enemies. In art her aegis is shown sometimes as a shield, sometimes as a short cloak; whichever it was, it had in its center the head of a Gorgon, a fearsome monster-woman with snakes instead of hair fringing her head, and a face that was believed to turn those who looked on it into stone. The Gorgon's head was an apotropaic device, that is, a symbol supposed to ward off the evil eye.

**A GODDESS OF DOMESTIC CRAFTS.** Athena was a goddess of domestic crafts as well as warfare. She was a patron of the spinners and weavers of wool, and she was proud of her skill and jealous of rivals. There is a myth that tells how she punished a mortal woman named

Apollo, life-size painted terracotta acroterium figure from the ridgepole of an Etruscan temple, c. 510 B.C.E., found at Veii, Italy. © ARCHIVO ICONOGRAFICO, S.A./CORBIS. REPRODUCED BY PERMISSION.

Arachne who boasted she could weave a better fabric than Athena. Athena challenged her to a contest, and when Arachne lost, Athena turned her into a spider and let her weave her webs to her heart's content. She was also a patron of carpenters and skilled workmen, and it was she who gave Greece the olive tree: not the wild olive but the domesticated olive which yields olive oil, one of the staples of the Greek diet.

**THE VIRGIN GUARDIAN OF ATHENS.** Athena was a virgin—in Greek, a *parthenos*—and in her city of Athens, her great temple which still overlooks the city is called the Parthenon, the Virgin's Temple. Athens was a city she loved, and she won it after a contest with Poseidon, who coveted it for himself. A mark can still be seen on the rock of the Acropolis, the Athenian citadel, which Poseidon supposedly made when he struck it with his trident and created a salt-water well as a gift to Athens. When Athena planted an olive tree beside the well as her gift, Poseidon challenged her to a fight, but

Zeus intervened and set up a court to arbitrate the quarrel. By a majority of one, the court decided that Athena had given Athens the better gift, and Athens became her city. The Athenians continued to reverence the mark on their Acropolis that Poseidon made, however, and never built over it. Instead they left it open to the sky. When the temple known as the Erechtheion was erected and its north porch stretched out over the mark, they left a hole in the pavement of the porch so that the mark was left uncovered, and in the porch roof directly above it a small area was left unroofed. In fact, the mark was probably caused by lightning striking the earth.

**ERECHTHEUS AND ATHENA.** Athena became the stepmother of the ancestral king of Athens, Erechtheus, who was one of the divinities worshipped in the Erechtheion. How Athena, a virgin goddess, became a stepmother was explained by an ancient myth. Hephaestus desired Athena and once tried to rape her. Athena easily fought him off, and all Hephaestus managed to do was to ejaculate semen on to her thigh. In disgust, Athena wiped it off with a piece of wool (Greek *erion*) and hurled it to the ground. When the semen fell on Mother Earth, she conceived and gave birth to Erechtheus. Athena pitied the infant and, taking him up, reared him in her temple. Homer refers to the story in his *Iliad*. Athens, he reports, was the realm of Erechtheus whom Athena settled in her temple, and there the Athenians worshipped him with sacrifices of bulls and goats.

**APOLLO, GOD OF PESTILENCE.** Apollo, the “Far-Darter” was the master of the bow and arrow, and hence his epithet, the “Far-Darter,” which means that the shafts from his bow travelled a great distance. Yet though he was an archer god, he was not a patron of hunters; his sister Artemis filled that role. Apollo's arrows were not for killing wild beasts; instead they brought disease. The first book of the *Iliad* presents a vivid picture of him striding down from Mt. Olympus to the Greek camp outside Troy, with the arrows in his quiver rattling as he walked. When he reached the Greek ships, he knelt on one knee, drew back his bowstring and aimed his shafts into the Greek camp. First the dogs and the beasts of burden died of the pestilence; then men perished, and the smoke rose from their funeral pyres day and night.

**HOLY PLACES.** Apollo's chief sanctuaries were at Delos and at Delphi. Delos is a small, waterless Greek island in the center of the archipelago in the Aegean Sea known as the Cyclades. Greek myth related that Delos alone dared offer a haven to Apollo's mother, Leto, who was driven from place to place by Hera's anger, and she gave birth to Apollo and his sister Artemis as she stood clutching a palm tree for support. Thus Delos became a

holy island, sacred to both Apollo and Artemis. Delphi in central Greece, however, was the greatest center of Apollo's cult. Apollo's oracle there had a reputation for truth which was perhaps undeserved, for when questions were put to it, the replies were famous for their ambiguity. Yet it was thought that if one was clever enough to interpret the real meaning of an oracle, it would prove to be a truthful prophecy. It was no fault of Apollo if his responses were misunderstood. As time went on and the Greeks became more skeptical, belief in oracles faded, but Apollo's sanctuary at Delphi remained a sacred place, and it was filled with rich dedications made over the years by his worshippers.

**THE PYTHIAN GAMES.** Delphi was also the site of the Pythian Games, which were held every four years, and were second only to the Olympian Games in prestige. They included music and poetry competitions as well as athletic contests, for Apollo was a patron of music and poetry as well as athletics. His favorite instrument was the lyre, a stringed instrument with a hollow shell or box to amplify the sound. First prize at the Pythian Games was a laurel wreath, and the laurel, for which the Greek word is *daphne*, had a close association with Apollo, which was explained by a myth. Daphne was the lovely young daughter of a river god, with whom Apollo fell in love. She fled from him, however, and just as he was about to catch her, she prayed for help and was turned into the tree that bears her name. Thus the laurel became a tree that Apollo particularly loved, for it was the maiden he desired and lost.

**APOLLO'S COMBAT WITH THE DRAGON PYTHO.** Apollo won Delphi for himself by fighting and killing the creature that occupied it before him. Before Apollo arrived, Delphi was a hallowed place belonging to a dragon known as Pytho. Apollo fought the dragon and slew it, leaving the carcass to rot (Greek *python*). Murder, however, was an evil deed that made the murderer unclean in the sight of gods and men. Spilling blood left Apollo polluted, and before he could return to the society of the gods, he had to be cleansed of the pollution. He was banished to northern Greece, to a valley near the foot of Mt. Olympus known as the Vale of Tempe, and there he had to undergo a ritual that purified him and allowed his return. To commemorate his combat with the dragon, there was a religious rite called the *Strepteria* that was held at Delphi every eight years. A youth was led to a hut called Pytho's palace, which was built near Apollo's temple. The hut was set on fire, and the youth departed, apparently for exile at Tempe, and then he made his return in a procession along a sacred pathway known as the Pythian Way. The youth impersonated Apollo, who was always shown in art as a well-proportioned,

muscular young man wearing his hair unshorn, like a Greek youth who had not yet reached adulthood. As for the dragon Pytho, his sanctuary which Apollo made his own became the most important oracular shrine in Greece, and the title of the priestess who uttered the sacred oracles, the Pythia, recalled Pytho's name.

**ARTEMIS, PATRONESS OF WILD BEASTS.** Artemis, like her brother Apollo, was born on the island of Delos, and had a temple there which predated Apollo's. Artemis' temple was in the center of the sanctuary, whereas the Apollo temple was off to one side; the positioning of the temples has led students of religion to suspect that Artemis was an early, primitive deity on Delos whom Apollo joined only later, in spite of the myth which related that they were twins. Her cult seems to fit a primordial era, when people survived by killing the beasts of the forest, and were anxious not only that their hunts should be successful, but that the creatures they hunted should increase and multiply, and thus provide them with more prey. In Homer's *Iliad*, Artemis is called the "Mistress of the Animals," the overseer of wild beasts. She was a goddess of hunters and hunting who killed the animals and birds of the forests, mountainsides, and marshes—she was sometimes called "Artemis *Limnatis*" or "Artemis of the Marshes"—and at the same time, she was concerned for their welfare. The endless cycle whereby living creatures were born and killed, or killed in order to survive and reproduce, fell under her authority.

**THE GODDESS OF GIRLS BEFORE MARRIAGE.** Like Athena, Artemis was a virgin, but whereas Athena was asexual, Artemis' virginity was connected with the purity of young girls before they are married. Her followers were the nymphs, and the word "nymph" could refer equally to a divinity of a stream or spring, or a young girl approaching marriage. Everywhere in Greece it was the custom for girls of marriageable age to dance and sing in choruses at festivals in honor of Artemis, and this was one place where young men could become acquainted with unmarried girls. There was a darker side to Artemis, however. Girls who failed to remain pure for whatever reason encountered her wrath. The nymph Kallisto, whom Artemis loved, was raped by Zeus and bore him a son, Arcas. Artemis in her anger turned Kallisto into a bear, and her own son Arcas hunted her down and killed her. In addition to overseeing the purity of unmarried girls, Artemis also presided over the birthing pangs of women. She could be a ruthless midwife, unlike Eileithyia who looked after the actual delivery of the infant from the mother's womb. Eileithyia was a gentle nurse whereas Artemis' interest was the reproduction of the species, and she made decisions involving the life and

death of pregnant mothers. In the *Iliad*, Hera rounds on Artemis at one point and exclaims angrily, "Zeus made you a lion against women, and lets you destroy women in their labor." It was Artemis who determined whether or not a woman would survive childbirth.

#### APHRODITE, GODDESS OF SEXUAL DESIRE.

Aphrodite, the goddess of love and beauty, was worshipped all over Greece, but her most famous temples were at Corinth in Greece and on the island of Cyprus, at Paphos and at Amathus. In Homer's *Iliad*, she was the daughter of Zeus and a deity named Dione, whose name means "the goddess Zeus," or "Mrs. Zeus," so to speak. At an ancient oracle of Zeus at Dodona in north-west Greece, Dione was still recognized as Zeus' wife in classical times, long after Hera had replaced her elsewhere in the Greek imagination. The *Theogony* of Hesiod relates another tale, however. It tells that when Cronus cut off the genitals of his father Heaven, he tossed them into the sea and where they fell, the water foamed and frothed, until Aphrodite arose from the foam (Greek *aphros*), stark naked. She then floated on a scallop shell to Cythera, a favorite island of hers, though later she was thought to prefer Paphos on Cyprus. She was a late arrival among the gods of Greece, and her origins were Eastern. Her counterparts in Mesopotamia were the goddess Innana in ancient Sumer, and in Babylon, Ishtar. The Canaanite goddess Astarte who was worshipped in ancient Syria was Aphrodite in a different guise. Like these Eastern goddesses, Aphrodite presided over sexual desire, and prostitution was practiced at her temples. At Corinth in Greece she had a famous temple that housed prostitutes. While most myths about the couplings of gods and humans invariably involve male gods raping women, Aphrodite was one of the few to reverse the pattern. Aphrodite in disguise seduced a handsome young Trojan named Anchises, and became pregnant with Aeneas, whom the Romans would regard as their founder.

**THE MYTH OF APHRODITE AND ADONIS.** Like her Eastern counterparts, Aphrodite was coupled in mythology with a handsome young lover, who died young and descended into the Underworld. The youthful lover in Aphrodite's case was Adonis, and the myth of Aphrodite and Adonis is an adaptation of the tale of Astarte and Tammuz that was popular in ancient Syria. Both Tammuz and Adonis were young men who were loved by goddesses, and they died in the flower of their youth. Adonis, the story goes, was killed by a boar while he was hunting, and descended to the realm of the Dead. When Aphrodite tried to retrieve him, she found that Persephone, the queen of the Underworld, admired his beauty

too much to release him. Zeus settled the dispute by decreeing that Adonis should spend half the year with Aphrodite, and half with Persephone. Thus he was a fertility god, whose death and resurrection marked the changing seasons of the agricultural year. In the fall, when Adonis descended into the Underworld, the seed was put into the ground and died, and then when the spring sun brought warmth to the earth, it quickened to new life and produced the harvest for the coming year.

**HERMES THE DECEIVER.** Hermes, the deceiver god, was the son of Zeus and Maia, the daughter of the Titan Atlas, and no sooner was he born than he showed his craftiness. On the first day of his life, he invented the lyre, stole cattle belonging to his brother Apollo, then lied when Apollo charged him with the theft, and it took the intervention of Zeus to reconcile the two. Hermes was not only a god of tricksters and thieves, but also the patron of merchants, for any purchaser of goods in Greece or Rome was wise to heed the caution, *caveat emptor*: "Let the buyer beware!"

**THE DIVINE COURIER.** Hermes' chief function in the pantheon of Homeric gods was as the divine courier who carried the messages of Zeus, and he often appears in art dressed like a traveler, wearing a broad-brimmed hat and stout sandals sometimes equipped with wings, and in his hand he carries a herald's staff. This staff was a rod of olivewood twined with two serpents, and it symbolized the sanctity of a herald, for it was a sacrilege to kill a herald. Hermes was also the god who guided the ghosts of the dead to the Underworld, and when this was his mission, he bore a magic wand that is not to be confused with the herald's staff. With it he herded the insubstantial shades to the River Styx where Charon ferried them across. Thus one of his epithets was *Psychopompos*, marshal of the souls of the dead.

**THE GOD OF BOUNDARIES.** Hermes was also a god of boundaries. In fact, guarding boundaries may have been his earliest function, for the word *herma* means a heap of stones piled up to mark a boundary. The heap of stones developed into a square pillar, and about 520 B.C.E. these stone pillars were introduced into Athens to mark midway points between the Athenian *agora*, or marketplace, and the many villages of Attica. As time went on, they came into general usage to mark off neighborhoods. The herm was an oblong shaft about five feet high, with the image of a bearded head on top, projections at the shoulders like two-by-fours, and a phallus half-way down the shaft. Herms were sacred. Anyone who mutilated them committed a sacrilege, and could be tried for it in a court of law. Hermes had one son, Pan, the god of the woods who was half-man, half-goat.

Both Hermes and Pan were connected with Arcadia, the wild mountainous area in the central Peloponnesos, and the identity of Pan's mother was lost in the mists of time, if it was ever known.

**DEMETER, GODDESS OF THE RIPE GRAIN.** Demeter, the sister of Zeus, was the personification of the ripened grain that was reaped at harvest time. The ancient Greeks themselves interpreted her name to mean "Mother Earth," but though the last two syllables of her name, *meter*, do mean "mother," modern linguists point out that the first syllable cannot mean "earth." Yet her connection with the grain harvest is clear. Mythology assigned her a son, Plutos, whose name means wealth, and the wealth of Plutos was the grain stored in the granaries.

**DEMETER AND KORE** Demeter was intimately connected with a goddess who was known simply as Kore, which is the Greek word for "girl," and the relationship between Demeter and "the girl" is so close that they were sometimes known simply as the "Two Goddesses." Kore did have a proper name, however. She was Persephone, daughter of Demeter and Zeus, and the wife of Hades, the king of the Underworld. According to the myth, Persephone was playing one day with other young girls of her age in a meadow near Enna in Sicily; when she stooped to pluck a flower, the earth opened and Hades arose in his chariot, seized her, and carried her off to his realm of darkness. Demeter heard her daughter's cry but did not see what had happened. She set out to look for her, traveling over land and sea, lighting her way with torches. When she reached Eleusis, which is nowadays a suburb of Athens, she paused to rest, and while she was sitting sadly outside the palace at Eleusis, the daughters of the king told her jokes and succeeded in making her laugh. To reward them, she founded the Eleusinian Mysteries at Eleusis that the Athenians celebrated every year. Still mourning the loss of her child, she would not allow the crops to grow until she found her daughter, and the whole race of men would have perished of hunger except that Zeus intervened. It was decided that Kore would spend half the year in the world of the Dead as queen of the Underworld, and half the year in the world above. While she was in the Underworld, the land lay barren, and when she returned to the land of the living, the crops grew and ripened. The death and rebirth of Kore, or Persephone, as she was known in her personification as queen of the Dead, marked the change of seasons from the barrenness of winter to the spring with its new growth.

**THE CULT'S ORIGINS.** It has been often noted that the death and rebirth of Kore does not quite fit the cy-

cle of Greek agriculture, for Greek farmers planted their grain in the autumn; it sprouted and grew over the winter except for a brief period when the temperature fell to the freezing point, and the harvest ripened in late May or June. The barren season was therefore not winter but the hot, dry summer. The cult of Demeter and Kore seems to point to an early period of Greek prehistory, before the Greeks migrated into present-day Greece and were still living in a more northerly latitude. Central Europe has a cycle of seasons which fits the story of Kore better, for there the winter is the barren season, and the summer the time when the fields yield their harvests.

**THE GOD DIONYSUS: THE OUTSIDER.** Dionysus stands apart from the other Olympian gods. He seems to be an outsider, and at one time, scholars believed that he was a non-Greek god who was a relatively recent immigrant to Greece. Evidence from the Linear B clay tablets of Mycenaean Greece does contain the name of Dionysus, however. The tablets on which his name appears come from Pylos, overlooking the Bay of Navarino in southwest Greece, and from Khania in western Crete, and they date from 1250–1200 B.C.E. They give no inkling as to what Dionysiac worship was like in the Bronze Age, except that the one from Khania mentions offerings of honey to Zeus and to Dionysus. There is no mention of wine, with which Dionysus was particularly associated in the historical period.

**THE GOD OF INTOXICATION AND ECSTASY.** Dionysus was a god of wine and inebriation, but he had other associations which set him apart from other gods. His worship included ecstasy and ritual madness. That aspect of his cult in particular marked him as the opposite of Apollo, who appears as the god of self-control and self-knowledge. Apollo's favorite musical instrument was the lyre or *kithara*, a stringed instrument which was the ancestor of the guitar. The instrument of choice for Dionysus was the *aulos*, which was a reed instrument, the ancestor of the oboe, and it had a dominant, vibrant timbre much like modern bagpipes that appealed to deep-seated human emotions. The *skirl* (a shrill sound) of the *aulos* accompanied the chorus in theatrical productions, which were within the province of Dionysus, and the masks which were worn by actors on the stage became symbols of the Dionysiac cult. In art, they became a standard Dionysiac motif. Yet he was primarily a god of wine, which was supposed to have been his invention. When Dionysus is depicted on Greek vases, wine is his constant companion. He is often shown holding a grapevine in one hand, and a cup or some other vessel for wine in the other. Art historians have noticed that while Dionysus is often shown receiving wine, or

*a PRIMARY SOURCE document***A PARODY OF A MYTH**

**INTRODUCTION:** The satirical essayist Lucian of Samosata, now the village of Samsat in Syria, belongs to the second century C.E., the period which Edward Gibbon, in his classic history, *The Decline and Fall of the Roman Empire*, calls the happiest period in the history of mankind. It was also a period when people took a great interest in new religions, and the old stories about the gods which were told by Homer and Hesiod were no longer taken seriously. Lucian was a failed lawyer who turned to the composition of satirical essays. In his new career, he won fame and, to a small degree, fortune as an author. Much of his writing makes fun of philosophy and religion, and in this excerpt he spoofs the myth of the god Dionysus' birth. According to the myth, Zeus saved his unborn son, Dionysus, from the flames that consumed the infant's mother Semele, and kept him sewn into his thigh until he was ready for birth. In this satirical dialogue, the god Poseidon drops by Zeus' palace for a visit and is told by Hermes the gatekeeper that Zeus cannot see him. In trying to discern the reason why Zeus will not see him, Poseidon first guesses that Zeus is in the middle of a sexual liaison, perhaps with his wife Hera, or a young man named Ganymede. Hermes informs him that he is wrong on both counts; Zeus is, in fact, not feeling well after giving birth to his own son.

**Hermes:** He mustn't be disturbed, I tell you. You've chosen a very awkward moment—you simply can't see him just now.

**Poseidon:** Why, is he in bed with Hera?

**Hermes:** No, it's something quite different.

**Poseidon:** Oh, I see what you mean. He's got Ganymede in there.

**Hermes:** No, it's not that either. The fact is, he's feeling rather unwell.

**Poseidon:** Why, Hermes, what a terrible thing! What's the matter with him?

**Hermes:** Well, I hardly like to tell you.

**Poseidon:** Oh, come on. I'm your uncle—you can tell me.

**Hermes:** All right then—he's just had a baby.

**Poseidon:** Had a baby? Him? Whoever by? Do you mean to say he's been a hermaphrodite all these years without our realizing? But there wasn't any sign of pregnancy—his stomach looked quite normal.

**Hermes:** You're quite right. That wasn't where he had it.

**Poseidon:** Oh, I see. He produced it like Athena, out of his head. It's a very prolific organ.

**Hermes:** No, he's been carrying this child of Semele's in his thigh.

**Poseidon:** What a splendid chap he is! He can produce babies from every part of his anatomy! But who, exactly, is Semele?

**Hermes:** A girl from Thebes, one of Cadmus' daughters. Zeus had an affair with her and got her in the family way.

**Poseidon:** What? And then had the baby instead of her?

**SOURCE:** Lucian, "Zeus Is Indisposed," in *Satirical Sketches*. Trans. Paul Turner (Harmondsworth, England: Penguin, 1961): 51–52.

pouring a libation of sacrificial wine, he is never shown actually drinking the wine. That may be only artistic convention, however, since intoxication had a central role in the worship of Dionysus.

**THE FRENZY OF DIONYSIAC WORSHIP.** Intoxication was a means to a state of rapture in which Dionysus' votaries, or worshipers, surrendered themselves utterly to his power and merged their identity with his. His most common cult name was *Bakchos*, which is a Lydian word—the Lydians were neighbors of the Greeks in Asia Minor—and when his worship penetrated Italy, he was commonly known by his cult name. His female devotees were called *Bakchai* (in Latin, *bacchantes*) or alternatively, maenads or *thyiades*. The Romans identified Dionysus, whom they called Bacchus, with an Italian god of fertility and wine called *Liber* (the Liberated/Lib-

erating One), who had a festival every March called the *Liberalia*. In Greek art Dionysus is often surrounded by a swarm of devotees who dance with utter abandon. What made his cult unique among the Olympians was the mass ecstasy and the frenzied exaltation that accompanied it. No other god threw aside the restraints of civilized society with such abandon.

**BIRTH AND UPBRINGING.** Dionysus' mother was Semele, daughter of the founder-king of Thebes, Cadmus. Zeus loved her, and then, when she was six months pregnant, he was tricked by Hera into destroying her. Resentful as ever at Zeus' philandering, Hera visited Semele disguised as an old woman and persuaded the naive young girl to ask her lover to show himself to her in his heavenly regalia. So Semele prevailed upon Zeus to take an oath by the River Styx to grant her whatever

she requested, and when he assented, she asked to see him garbed as the king of the gods. Zeus tried to dissuade her, but even gods dared not break oaths sworn by the Styx, and since Semele insisted, Zeus appeared before her carrying his thunderbolt. The lightning consumed her with its flame, but Zeus snatched the premature infant from Semele's womb, and Dionysus completed his gestation sewn up in Zeus' thigh until he was ready to be born again, which explains Dionysus' epithet, "Twice-born." Then Hermes carried him off to a faraway place called Nysa where maenads attended to him until he grew to manhood. Later mythographers elaborated this period of Dionysus' youth, telling a story of how he wandered as far east as India, but eventually returned to Greece, accompanied by a retinue of maenads and satyrs.

**DIONYSIAC RITES.** Dionysus' rites were called *orgia*: "orgies." The term could be used for any secret rites or mysteries, but its most usual meaning is the rite of Dionysus. In a Dionysiac *orgia*, women abandoned their homes and roamed over the mountainsides, dancing, swinging about torches and *thyrsoi*, which were light sticks of reed with large pine cones fixed on top and wreathed in fresh ivy. In their madness they might seize an animal or even a child, tear it apart, and eat it. How much of this is myth and how much is based on actuality is hard to say. One of Dionysus' epithets was *omophagos*, an adjective meaning "eating raw flesh," and in vase paintings Dionysus and his maenads are shown tearing apart animals with their bare hands and eating them raw. The last play written by the tragic poet Euripides, the *Bacchae* describes a characteristic Dionysiac experience in the words of a herdsman, who witnessed it. He and other herdsmen were pasturing their cattle on the mountain slopes and saw three groups of maenads, who had been dancing together, now sleeping quietly on the ground. On hearing the herd of cattle, they awoke, let down their hair, and wreathed their head with ivy and oak leaves. Then they began a wild dance and fell upon the cattle, tearing them limb from limb, and having had their fill of that, they swooped downhill on two villages which they plundered, snatching children from their houses. The villagers resisted, but the maenads hurled their *thyrsoi* at them and resistance was useless. They then returned to where they had started their wild rampage, their passion spent.

**THE ORGIA IN GREECE.** The rites described in the *Bacchae* were based on reality, for every two years a number of Greek cities held *orgia*. Athens was an exception, but maenads from Athens went to Delphi to celebrate the orgies there. They took place in mid-winter when it

Detail of a wall painting from the Villa of the Mysteries, Pompeii, showing initiation into a religion of Dionysus. On the left, a girl, naked to the waist, is being lashed by a winged figure not shown in this photo, and on the right, the girl is performing a wild dance. PUBLIC DOMAIN.

was believed that Apollo left Delphi, and for three months the shrine belonged to Dionysus. Thebes, between Athens and Delphi, was the center of maenadism from which professional maenads were exported to other cities to organize the biennial orgies. Athens did not celebrate Dionysiac orgies, but she had five festivals that were dedicated chiefly to him. In two of these—the Lenaeon festival in January and the City Dionysia in March—tragedies and comedies were presented. Another festival, the three-day long Anthesteria, was a time for merrymaking. The new wine was broached on the first day; the second was a day of competitive drinking, and on the third, the spirits of the dead were free to return above ground and wander among the living, for Dionysus was also connected to death and the afterlife. At the end of the day, the shades were dismissed with the ritual cry, "Get out, ghosts, the Anthesteria is over!"

**WELCOME AND RESISTANCE.** The spread of Dionysus' worship into Greece met resistance: Homer in the *Iliad* recalls that the herdsman Lycurgus drove the maenads pell-mell down the slope of Mt. Nysa with his ox goad, and as punishment, Zeus struck him blind. King Pentheus of Thebes, where Dionysus was born, tried to suppress his worship when Dionysus returned there, but

could not prevent the Theban women from swarming off into the mountains and surrendering to mass ecstasy. There are various other myths of resistance to the coming of Dionysus as well, and this has led scholars to think that he was a late immigrant to Greece. Many ancient Greeks speculated that Dionysus came from Thrace in northern Greece, and it is true that Macedonian and Thracian women were particularly devoted to his *orgia*. The alternative view was that Dionysus came from Phrygia in Asia Minor. The two views are not necessarily incompatible, for the Thracians and the Phrygians were related. There was also the suspicion, even before Dionysus' name appeared on Linear B tablets, that he might have a Cretan origin. His wife was Ariadne, the daughter of King Minos, who fled from Crete with Theseus after she helped him escape the Minotaur, and then was abandoned by him on the island of Naxos, where Dionysus came and rescued her. It is generally thought that Ariadne was a Minoan goddess, and now that there is evidence that Dionysus was known on Bronze Age Crete, there may be some significance to the union of the two. By Ariadne Dionysus had a son, Oenopion, who is sometimes shown as his attendant, pouring wine for him.

**THE ROMANS ENCOUNTER BACCHUS.** In 186 B.C.E. news came to the Roman senate that the rites of Dionysus, the Bacchanalia (so called after Dionysus' cult name), were being celebrated in Italy. It was reported that devotees of the rites met at night and took part in a ritual that included not only hard drinking but all kinds of sexual depravity. It was the social and political aspect of the Bacchanalia that disturbed the senate. They appeared to be a breeding ground for conspiracy. The senate issued a decree offering a reward for the arrest of any member of the Bacchus cult or even for the denunciation of anyone. It was reported that over 7,000 men and women were involved. Similar decrees went out to the Italian towns ordering the suppression of the cult. Bacchic sanctuaries were destroyed, and Bacchic ceremonies were outlawed in Rome and Italy. The Roman authorities were generally tolerant of foreign religions, but this is an instance of how fiercely they could react if they discerned a threat to the social order.

**HEPHAESTUS, THE BLACKSMITH GOD.** Hephaestus, the god of metal workers and craftsmen, was the son of Hera, but two stories provide two versions regarding the identity of his father. According to one, he was Zeus. According to the other, Hera, who was enraged at Zeus' infidelities, gave birth to Hephaestus by herself, without being inseminated by a male. He had a non-Greek name, and his favorite island was Lemnos; both facts arouse scholarly curiosity, for on Lemnos there was a non-Greek

people living as late as the sixth century B.C.E. He was deformed, with an immensely powerful torso and arms, and crippled legs, and it has been often pointed out that in early communities a lame man would turn to a specialized trade such as metal working, for his deformity barred him from the occupations of physically fit men, such as farming and fighting as a warrior. Hera wasted no motherly love on him, and a myth told how he took his revenge: he made her a splendid throne, which trapped her when she sat on it and held her until Dionysus reconciled him with his mother. A story that accounted for his deformity described how Zeus threw him out of Olympus when he tried to stop Zeus from beating his mother. He landed on the island of Lemnos and would have died, except that the Sintians who inhabited the island nursed him back to life. Another story related that Hera was so disgusted at his appearance that she threw him out of Olympus. Homer in the *Iliad* treats Hephaestus almost as a comic figure with his crippled legs and heavily-muscled torso, a powerful man hobbling about like a child learning to walk. The Greeks admired the well-proportioned masculine figure of the athlete or the warrior, and the ungainly physique assigned to Hephaestus by their mythology shows how little the Greeks esteemed their craftsmen. He did have a temple in Athens which he shared with Athena, and it still stands largely intact in the old blacksmiths' quarter overlooking the marketplace of the ancient city. It was built in the middle of the fifth century B.C.E., and it is the best preserved of all the ancient temples in Greece. Athena, like Hephaestus, was a patron of craftsmen. Except in Athens, there is little evidence for his worship. Yet the products of his smithy were universally admired as marvelous examples of the metal worker's craft. His inventions even included robots. He was also famously ugly, and there was more than a touch of mockery to the fact that his wife was Aphrodite. The goddess of love and beauty was paired with the only ugly Olympian.

**ARES, THE HATEFUL GOD OF WAR.** Ares, the son of Hera and Zeus, was the personification of battle. He was conceived as a warrior in full armor, and his attendants who harnessed his horses to his war chariot were named *Phobos* and *Deimos*, meaning "Fear" and "Terror." He represented war as a destructive force that spreads fire and rapine. He was an unpopular god; in Homer's *Iliad*, Zeus calls him the most hated of all the Olympians, and, for all his love of battle, he was not a markedly successful warrior. For instance, in the Trojan War where Ares championed the Trojans and Athena the Greeks, the two divinities once met in battle. Ares threw his spear at Athena who parried it, and then Athena hurled a stone at Ares and laid him low. That

was a typical example of the prowess of Ares. He represented everything that was odious in war, but the glory of victory did not belong to him. Victory, for which the Greek word was *niké* was reserved for Athena. On the south-west bastion of the Athenian Acropolis there still stands a small, exquisite temple dedicated to Athena *Niké*: Athena who brings victory. Ares did have one admirer; Aphrodite much preferred him to her crippled husband, Hephaestus.

**THE GODDESS OF THE HEARTH.** Hestia, who is found in early lists of the Twelve Olympians instead of Dionysus, was the goddess of the hearth. Every private house had a hearth, and so did the *prytaneion*, or town hall, of every city-state. The hearth was a sacred place, and any suppliant who sat there could claim the protection of his host. If the host rejected the suppliant on his hearth, he would offend Hestia's brother, Zeus. The sacred fire of Hestia continually burned in the *prytaneion* of every city, representing the vital essence of the community. Whenever a band of colonists set out to found a new city, they took with them a firebrand from Hestia's altar in their mother city, and with its flame, lit the fire of Hestia in the newly founded colony. She had no love affairs. She remained a virgin, and she was the mildest and most loved of all the Olympians.

**CONSTITUENTS OF PANHELLENISM.** The Olympian deities owed their preeminence to the Greek poets, and it was reinforced by the great panhellenic festivals, such as the Olympian Games which were open to all Greeks but not to foreigners. The Greeks had no political unity, but the worship of the Olympians gave them a common denominator. The Greek city-states fought innumerable wars; yet when the Olympic Games were held in honor of Zeus, there was a truce that all Greeks observed. Wars ceased until the Games were finished. Apollo's oracle at Delphi served a similar function, particularly after 590 B.C.E., when Delphi became a small independent state with the care of Apollo's cult its sole reason for existence. The oracle received visitors from all over the Greek world and answered their queries with cryptic utterances believed to be inspired by Apollo. Foreigners could consult Delphi as well, but it was as a holy place for all Greece that Delphi rose to preeminence.

## OTHER GODS BEYOND THE TWELVE

**TOO MANY TO COUNT.** In addition to the twelve most important gods, there were innumerable other gods in Greek mythology. Any list made of them would be very long and still be incomplete. Some were old deities whom the poets passed over as uninteresting, though they still attracted worshippers. Eileithyia, whose worship on Crete went back to the Stone Age, was still indispensable. Sea gods belonged to the periphery of Greek religion, though they also were very ancient. One of them, the Old Man of the Sea, is known under various names: Proteus, Phorkys, Nereus, or *Glaukos*, meaning "blue-green," the color of the sea. Anyone wanting his cooperation had to overpower him, which was difficult, for he could change from one form to another at the blink of an eye. Only Heracles, the strongman of mythology, had the muscular strength to capture him and then hold on to him.

**THETIS, MOTHER OF ACHILLES.** Thetis was a sea goddess, and her attendants were mermaids called Nereides, who were the daughters of the Old Man of the Sea. She had a sanctuary in Thessaly which the tragic poet Euripides made the setting of his drama *Andromache*. Myth relates that both Zeus and Poseidon desired Thetis, but when they learned from Prometheus that her son would be stronger than his father, they saw to it that she married a mortal, Peleus. She bore him a son, Achilles, whom she tried to make immortal by burning away his mortal element, but Peleus interrupted the ritual and she left him in a rage and returned to the sea. Another story relates that she tried to make Achilles invulnerable by lowering him into a magic well, but since she held him by one heel as she immersed him, the water could not cover that part of his body, and it remained unprotected. Achilles died from an arrow wound in his heel, and this

story gave rise to the modern phrase “Achilles’ heel” to describe an area of vulnerability.

**THE GOD PAN.** Pan was an ancient god of fertility who was not completely anthropomorphic. He was half-man, half-goat, and his homeland was Arcadia, a mountainous region in the central Peloponnesos. He was worshipped in sacred caves, one of which has been found in Athens under the Acropolis. The finds from this cave show that Pan was worshiped there in Mycenaean times and then, after a long period of neglect, worship began again after 490 B.C.E. In that year, the Athenians defeated the Persians at the Battle of Marathon, and they believed that Pan helped them. Thereafter, the Athenians held an annual sacrifice and a torch-race in his honor.

**THE SPIRITS OF RIVERS, MOUNTAINS, AND TREES.** Rivers were gods, and they could take part in human life. The river god Achelous was Heracles’ rival for Deianira, Heracles’ last wife, and Heracles had to wrestle with him to win her. In the countryside and sometimes even the cities there were the nymphs who associated with Pan, and were like the fairies of European folklore. They embodied the divine essences of the mountains, woods, trees, and waters where they lived. The nymphs of the woods were the Alseides, the Napaeae, and the Dryades. The Hamadryades were tree-nymphs—the life spirit of the trees—and when a tree died, its Hamadryas died with it. The water nymphs were Naiads, Potameids, Creneids, and Hydriads. Like Pan, they were often worshipped in caves. They were usually kindly sprites who patronized springs of sweet water and danced with Artemis on the mountainsides, but they could be dangerous. When the nymphs fell in love with Hylas, a handsome boy whom Heracles loved, they dragged him down into a spring as he fetched water there, and he drowned. It was dangerous to be loved by a nymph.

**CASTOR AND POLYDEUCES.** The twin gods, Castor—the famous horseman—and his brother Polydeuces—equally famous as a boxer—were called the Dioscuri, or *Dios kouroi* in Greek, which means “the youths of Zeus,” and there is a “Homeric Hymn” which hails them as the “sons of Zeus.” Greek mythology had various versions of the Dioscuri-myth: the *Iliad* explains that they did not take part in the Trojan War because they were already dead, whereas the *Odyssey* explains that they are living and dead men on alternate days. This refers to a myth in which Polydeuces was the immortal son of Zeus who loved his mortal brother, Castor, so much that he agreed to share his immortality. Thus they spent alternate days alive and dead. Sparta was their homeland, where they were worshipped with a cult im-

age consisting of two upright pieces of wood connected by two crossbeams. They represented the spirits of the young warriors who rode horses into battle, for though Castor was a more famous horseman than his brother, both were known as “riders on white steeds.” Under the name of “Castor and Pollux” or sometimes simply the “Castores,” their cult spread very early to Rome, where the Theoxenia festival was held every year on the Ides of July (15 July) in their honor, and the Roman cavalry performed a ceremonial parade. The parade supposedly commemorated the Battle of Lake Regillus in the early days of the Roman republic when it defeated an effort to restore the Etruscan kings, and Castor and Pollux aided the Romans. They had a temple in the Roman Forum near the spring of Juturna where the two gods were seen watering their horses after the battle.

**THE MYSTERIOUS “MISTRESS.”** Near Lykosoura in Arcadia a goddess called simply “The Mistress” had a temple which she shared with Demeter. There is some indication that “The Mistress” was reared by one of the Titans, but little else is known about her. She is reminiscent of the title *Potnia* meaning “Mistress” found in the Mycenaean “Linear B” tablets, often in phrases such as the “Mistress of Horses” or the “Mistress of Wild Beasts.” A goddess named *Potnia* without any further qualification was an important deity in Mycenaean Pylos. The name of Zeus’ wife, Hera, is thought to mean “mistress”: a powerful female deity whom the poets transformed into Zeus’ shrewish wife, shoving aside Zeus’ first wife, the colorless Dione.

**NEMESIS.** At Rhamnous outside Athens there was a temple to a puzzling deity called Nemesis. There was a myth that Zeus tried to rape her, and she turned herself into various non-human forms to escape him, particularly into various kinds of fish. The word *nemesis* means wrath aroused by any unjust deed, or righteous indignation. The goddess Nemesis presided over retribution, and her adversary was *hubris*, an act of arrogant violence. She preserved the social order by visiting retribution on those who would destroy it.

**ASCLEPIUS, GOD OF HEALING.** Asclepius, whose famous healing shrine at Epidaurus in the Peloponnesos attracted the sick from all over Greece, is a reminder of how blurred the distinction could become between a hero, who was mortal and descended to the Underworld when he died, and a god, who belonged to the world above. Homer in the *Iliad* referred to Asclepius as a “blameless physician” who was already dead at the time of the Trojan War, where his two sons served in the Greek camp as doctors. Yet at Epidaurus a temple was built for him which housed a cult statue made of gold

and ivory, and to the south of the temple was his great altar where sacrifices were made to him as a god. His festival at Epidaurus, held every four years, required a theater that could hold 14,000 spectators. It is now the best-preserved ancient theater in Greece.

**THE BIRTH OF ASCLEPIUS.** Ancient authors had no doubt that Asclepius' father was the god Apollo, but they differed on his mother. The most common version of the myth relates that Apollo impregnated Coronis, the daughter of Phlegyas in Thessaly. Thus Asclepius was of Thessalian origin, and the Asclepiads—Asclepius' priests on the island of Cos whose most famous member was the doctor Hippocrates who is still known for the "Hippocratic Oath"—maintained that Asclepius was born in Trikka, in Thessaly. Epidaurus, however, also claimed to be his birthplace. That version of the myth maintained that Coronis was unfaithful and slept with another man while she was pregnant with Asclepius, and a crow brought the news to Apollo. Apollo wrathfully cursed the crow, turning its color from white to black, and then he slew Coronis. As she lay on the funeral pyre, he snatched the infant Asclepius from her womb and gave it to the centaur Chiron to rear, who taught him the arts of healing. He grew up to be so skilled a doctor that he restored a dead man to life, and for that Zeus killed him with a thunderbolt, for restoring the gift of life was a prerogative of the gods. In fact, only Zeus could do it, and he refrained from the deed. Thus Asclepius went down into the Underworld to live with the heroes. As his cult expanded, the myth was adjusted accordingly. Zeus, it was said, brought Asclepius into the circle of Olympus and made him a god. Thus he could receive sacrifice as a god and not merely the sort of offerings that were made to the *chthonic* deities, or the earth-bound heroes as they were called, for the Greek word for earth was *chthon*.

**SPREAD OF THE HEALING CULT.** The cult of Asclepius grew increasingly popular. In Pergamum, a Hellenistic kingdom in Asia Minor that was carved out of Alexander the Great's conquests, there was an immense shrine to Asclepius a short distance out of the city, and it included a theater that could seat 3,500. The Romans, who called him Aesculapius, brought him from Epidaurus to Rome after a plague in 293 B.C.E. Instructed by an oracle in the Sibylline Books, they brought a sacred snake incarnating the god to Rome, and as the ship bearing the snake up the Tiber River to Rome reached the island known today as the *Isola Tiberina*, it slithered ashore. A temple for Aesculapius was built there and to this day there is a hospital on this island, named after the physician apostle, St. Bartholemew. Early Christians

found Aesculapius a difficult pagan god to extirpate, and at the *Isola Tiberina* their solution was to Christianize his sanctuary by substituting St. Bartholemew for him.

## THE UNDERWORLD AND ITS INHABITANTS

**GODS OF THE UNDERWORLD.** The Underworld was the House of Hades, the world of the dead, ruled by Zeus' brother, Hades. The name "Hades" means the "Unseen One," and one of Hades' most prized possessions was his "Cap of Darkness" which made him invisible. The Greeks did not typically worship him; only at one place in Greece did he have a temple. In Elis there was a temple to Hades that was open only once a year, and only the priest was allowed to enter. In the land of the Thesprotians in northwest Greece, there was an oracle of the dead, sacred to Hades and Persephone, which is probably where Odysseus made his descent into the Underworld. By and large, the Greeks preferred not to talk about Hades.

**PERSEPHONE AND HECATE.** Hades' wife was Persephone, queen of the Underworld and the daughter of Demeter, and her close companion was Hecate, goddess of the witches. In the magical spells, sorcerer's rituals, and hymns that have survived from the Greco-Roman world, Hecate is one of the deities most often invoked. Her most common epithet was *phosphoros*, that is, "Bringer of Light," and she is sometimes shown bearing two torches. For the Romans, she was identical with Persephone, Selene the Moon Goddess, and Diana, and a witch might invoke any one of them with her magical formulas. The Romans called her by the epithet *Trivia*, for she preferred a place where three roads met for her place of worship. Before Hecate was demoted to an underworld goddess of the witches, she was an ancient, beneficent goddess whom Hesiod in his *Theogony* invokes with a hymn of praise. The Hecate of the *Theogony* was a Titaness, sister of Apollo's mother Leto. She was

a kindly goddess, favored by Zeus, and a patron of fishers and horsemen, and a friend of shepherds and herdsmen. When Hesiod wrote, Hecate was still a deity who had many devotees, particularly in the region of Greece known as Boeotia, which was Hesiod's homeland. Her development into a goddess of witches came later.

**GEOGRAPHY OF THE UNDERWORLD.** The Underworld was the abode of the souls of the dead, and it was a dismal place. Homer's *Odyssey* relates that Odysseus encountered the shade of Achilles there, who told him that he would rather be alive and the slave of a landless man than king of all the dead in the Underworld. In Hesiod's *Theogony*, the Underworld was Tartarus, the prison of the Titans who were overthrown by Zeus. Hades and Persephone had a palace there that was guarded by a fearsome watchdog that wagged its tail in welcome for all who entered, but would not let anyone exit. The river of the Underworld was the Styx, a stream dreaded even by the gods, for if a god swore an oath by the Styx, and then broke it, he would lie in a coma for a year and, once he recovered, would be shunned by the other gods for nine more years. Only in the tenth year could he rejoin their councils.

**PLATO'S "MYTH OF ER."** The geography of the Underworld developed further when Plato concluded his best-known dialogue, *The Republic*, with a parable called "The Myth of Er." The story related the experience of a warrior named Er, who recovered from near-death and told a strange story of his experience. His soul left his body and journeyed to a place where there were two chasms into the earth and, above them, two chasms in the sky. Between them sat judges who commanded the souls of the just to take the right-hand chasm in the sky, and the unjust to take the left-hand chasm into the earth. Some, who had been evil beyond redemption in their lives, were too wicked for even the left-hand chasm, and they were hurled into Tartarus. Those that ascended the path through the right-hand chasm reached a meadow where they saw the Three Fates, the daughters of Necessity, whose names were Lachesis, Clotho, and Atropos. There the souls of the dead chose lots for the new lives they would live. The soul of Agamemnon, who had commanded the Greek alliance that destroyed Troy, chose to be an eagle. Odysseus' soul, however, chose to be an ordinary man who would live an uneventful life. These souls then made their way to the River Lethe, where they had to drink its water that brought forgetfulness. Those that drank too much forgot everything; those that drank no more than required continued to remember something of their pasts. Then, after they had drunk, a great earthquake swept up the souls to their rebirth.

**THE UNDERWORLD OF VERGIL.** The Roman poet Vergil, who wrote the national epic of the Roman Empire known as the *Aeneid* in the first century B.C.E., put his stamp on the popular conception of the Underworld. Vergil combined ideas inherited from Greco-Roman tradition to present an idea of the Underworld that would haunt the imagination of the European literary tradition. The hero Aeneas was guided by the Cumaean Sibyl whose cave can still be seen at Cumae near Naples in Italy. He passed Disease, Hunger, and Poverty, and other scourges of mankind at the entrance gate, and War, Perverted Pleasures, and the Furies on the threshold. From there the road led to the river Acheron where the ferryman who ferried the souls across—a fierce old boatman named Charon—would accept only those souls whose bodies had been buried. The souls of those whose bones had not been properly laid to rest had to wander for a hundred years before they were allowed to cross Acheron, which was an alternative name for the Styx in Vergil's *Aeneid*. Aeneas was not dead, but he carried a talisman—a Golden Bough that he had broken off a magic tree—and Charon recognized it as a permit to cross, and ferried Aeneas and the Sibyl over the terrible river. As Aeneas disembarked on the opposite shore, the three-headed watchdog Cerberus lunged at him, but the Sibyl gave him a drugged honey-cake and he was soon asleep. Then he entered the region where the dead were judged by a court over which Minos presided, for Minos, the mythical king of Crete, had become a judge in the Underworld. There Aeneas saw the souls of children who had died young, and persons condemned on false charges, and the souls of those who had committed suicide. Finally he reached the place inhabited by dead warriors where he met the heroes who had perished at Troy. On his left was Tartarus with its triple wall, surrounded by a torrent of flame called the Phlegethon, and from it came fearful cries of anguish. The Sibyl explained that this was the abyss where the Titans lay imprisoned, and where great sinners were punished. Tartarus was Hell.

**THE ELYSIAN FIELDS.** Aeneas and the Sibyl pressed on until they came to a region of woodland and meadow where the souls of the righteous dwelled, enjoying athletic games or dancing to the music of the lyre played by the great musician, Orpheus himself. These were the Elysian Fields, reserved for those who lived just lives. There Aeneas met the ghost of his father Anchises, who was walking among the souls that were waiting to be reborn. Anchises greeted his son with joy. Aeneas expressed amazement at seeing souls buzzing about like bees in a meadow, and Anchises explained the phenomenon by saying that these were the souls that were owed a second

body by Fate. They would drink the water of Lethe and be reborn. Then, with a splendid literary flourish, Vergil imagines Anchises pointing out the builders of the Roman Empire who were still to be born, until he reaches his own patron, the emperor Augustus.

**THE TITANS: PRISONERS IN THE UNDERWORLD.** Hesiod's *Theogony* relates that the Titans were the offspring of Ouranos and Gaia, that is, Heaven and Earth, whose rule was overthrown by Zeus. After a terrible battle, they were imprisoned in Tartarus. The usual explanation is that the Titans were pre-Olympian gods who ruled before the Greeks arrived in Greece, and the battle between the Titans and the Olympians reflects in some way a half-forgotten struggle between the early inhabitants of the north-eastern Mediterranean region and the Greek immigrants. The Titans might have a Near Eastern origin. It has often been noted that one of them was named Iapetos, which reminds us of the name of one of Noah's sons, Japheth. But Iapetos had no connection with a flood, even though the Greeks—like the Hebrews—had a flood legend and perhaps both flood legends derived ultimately from the same source.

**THE CONQUEST OF THE TITANS.** Most of the Titans were consigned to Tartarus after their defeat by Zeus, where the laments of the damned could be heard day and night, as Vergil described them in his *Aeneid*. But legend related that some Titans fought with the Olympians rather than against them, and thus survived. Moreover, Cronus, the lord of the Titans, continued to receive worship. There was a festival called the "Kronia" held in his honor at various places in Greece. In Athens it was held in Hekatombaion, the first month of the Athenian calendar which began about mid-July. It was a harvest festival, a kind of harvest-home holiday when masters and slaves feasted together. The social norms of the class system were abandoned briefly, and everyone was equal. Among the Romans, Cronus was equated with Saturn, and his festival, the Saturnalia, was held during the Christian Christmas season. There was a Roman legend, reported in Vergil's *Aeneid*, that when Zeus overthrew Cronus, the defeated god fled to Italy. There he brought civilization to the natives, and his rule was remembered as a Golden Age that was ended by the arrival of new immigrants known as the Ausonians and the Sicilians. The Romans recognized Saturn as a Greek import, for whenever a priest made a sacrifice to him, he left his head uncovered in the Greek manner, whereas priests sacrificing to Roman deities covered their heads. The Saturnalia was a merry festival. Slaves were given temporary freedom to do what they liked. Presents were exchanged, particularly wax candles, or dolls or images

made of pottery. A mock king, or "Lord of Misrule," might be chosen to preside over the merriment. For a brief period, the social order was overturned.

**THE SATURNALIA AS NEW YEAR'S FESTIVAL.** Once Christianity became the official religion of the Roman Empire, many of the Saturnalia customs were transferred to the New Year's Day festivities. The old Titan Cronus himself had a curious afterlife. Greek art depicted him with a pruning hook, for he was a god of the harvests. But the pronunciation of his name "Cronus" is very close to the Greek word for "time," which is *khronos*. So the old Titan became Father Time, his pruning-hook became a scythe, and he reappears in the iconography of the Western New Year's Day holiday as Father Time who is ushered out at midnight on the last day of December by the child who represents the New Year.

**THE TITAN PROMETHEUS.** The Titan Iapetos sired four sons: Atlas whom Zeus sentenced to bear the weight of the sky on his shoulders; Menoitios whom Zeus consigned to the Underworld for his arrogance; and two Titans who complemented each other, Prometheus, who always planned in advance, and Epimetheus who was the exact opposite. Students of folklore recognize Prometheus as a familiar figure: a trickster who could outwit gods and men. A deception that Prometheus played on the gods explained the Greek custom of burning the inedible parts of their sacrificial animals on the altars, and feasting on the more appetizing cuts themselves. A question once arose between the gods and mortals about which portions of the sacrificial animals each should get as their due. Prometheus butchered the sacrificial ox and divided it into two portions. In one portion he put the steaks and prime ribs, but he hid them in the stomach of the ox so that they looked unappetizing. In the other he put the bones, but he camouflaged them so that they seemed the better portion. Then he asked Zeus to choose, and Zeus chose the bones. Hesiod, who tells the story, explained that Zeus allowed himself to be tricked, for it would not do for an omniscient Zeus to be deceived. Yet Zeus was angry. In revenge he denied humans fire. But Prometheus, taking pity on mankind, stole fire from Zeus' altar on Olympus and soon Zeus was outraged to see smoke arising from human habitations. He chained Prometheus to a cliff-side, and sent an eagle every day to devour his liver. Because Prometheus' liver was immortal like the rest of his body, it grew back every night, and Prometheus' agony continued until Heracles released him from his chains.

**THE CREATION OF HUMAN BEINGS.** It was Prometheus who created humans. Using his skill as a

master craftsman, he fashioned human beings out of clay, and the Latin poet Horace added that he used bits and pieces of other animals as well. The Greeks added other creation myths, including the myth of the “Five Ages of Man” which Hesiod relates in his *Works and Days*. In that myth, Zeus created five races of mankind, and the fifth race were humans of the present day. Another myth told that Mother Earth gave birth to men and women. After the flood killed the entire human race except for Deucalion and his wife Pyrrha, Zeus granted them one wish. Deucalion asked that the human race might live again, and Zeus told them to throw stones over their heads. The stones Deucalion threw became men; those that Pyrrha threw became women.

**THE ORPHICS AND THEIR CREATION MYTH.** A sect known as the “Orphics” had another theogony, sharply different from Hesiod’s. The patron hero of the Orphics was the great musician Orpheus, whose wife Eurydice died of a snakebite. He descended into the Underworld to bring her back to life, charming his way past Cerberus, the watchdog of the Underworld, by playing music. Hades himself was so delighted that he allowed Eurydice to follow her husband to the world above, but on one condition: Orpheus was not to look back until they left the Underworld. But as he neared the exit of the Underworld, he could restrain himself no longer. He looked back and saw Eurydice, escorted by Hermes. She smiled at her husband and turned back to the Underworld, guided by Hermes. This death and near-resurrection myth attracted a cult following of converts who lived what they called the “Orphic life.” Their creation myth told that in the beginning, there was a primordial power, either Time or Night. Out of it came an egg, which gave birth to *Phanes* (the Shining One). Phanes gave birth to *Ouranos* (Heaven) and *Gaia* (Earth), who reproduced by the sexual union. Their coition created Cronus and Rhea who copulated and produced the generation of Zeus, and so on by a repetition of murder and sexual acts until the cycle of violence arrived at the race of men. Mortals who opted for the pure Orphic life should refrain from all killing, including animal sacrifice, and attain reconciliation with the gods by a pure life. Hesiod’s creation myth had described progress from chaos to the present-day Age of Iron which was unpleasant but relatively orderly. The Orphic myth described a process of human degeneration.

## HEROES AND DEMIGODS

**THE AGE OF THE HEROES.** The myth of the “Five Ages of Man” in Hesiod’s *The Works and Days* was borrowed from the mythology of the Middle East. The Middle Eastern version, however, told of only four ages: a blessed Golden Age, followed by a lesser Silver Age which was in turn followed by a Bronze Age, and finally the age of the present day, the Age of Iron. The Greek adaptation inserted a fifth age between the Age of Bronze and the Age of Iron: the age of the heroes and of heroines. These were the men and women who peopled Greek mythology and lived within a mythological time frame. Some were warriors—such as Odysseus, Agamemnon, and Menelaus, who fought at Troy in the Trojan War—or movers-and-shakers of the mythic past, such as Helen of Troy. Theseus, who was the special hero of Athens, killed the Minotaur at Knossos on Crete, and then became king of Athens. He performed heroic deeds that rivalled the famous Twelve Labors of Heracles. Heracles, the superman of mythology, performed not only his Twelve Labors—incredible feats of strength done in penance for killing his family in a fit of insanity—but he was credited with various other deeds as well which only a man of incredible strength and virility could perform. The Dorian Greeks who settled in the Peloponnesos after the collapse of the Mycenaean kingdoms considered him their ancestor and called themselves *Herakleidai* or “offspring of Heracles.” The kings of the Spartans, who were Dorians *par excellence*, had pedigrees that went back to Heracles.

**SEMI-DIVINE.** The heroes were not gods, though they might be called *hemitheoi* meaning “half-gods” or demigods. After death, they lived in the Underworld, not on Mt. Olympus, and as a general rule, no temples were built to heroes. Instead, the hero’s tomb became a *heroon* or “hero-shrine,” where the heroes were worshipped as if they were chthonian powers, that is, spirits of the earth, the nether world. Sacrificial animals with black hides were sacrificed to them after daylight had faded, at night or in the evening. The blood from the sacrificial victims was poured into a trench so that it would trickle down into the earth and feed the spirit, or shade, of the hero. A god would have a sacrifice made

to him on a high altar (*bomos*), whereas a hero had an *eskhara*, which was a low, round altar though—as is frequently the case in Greco-Roman religious practices—there were exceptions to the rule. Heroes were generally tied to a specific locality, for most of them had only one tomb. They were usually barely known outside the region where they were worshipped. Only the great international heroes such as Heracles, Theseus, Perseus, Jason and Medea, and the heroes of the Trojan War were famous all across Greece, and that was because there were innumerable myths told about them. Every storyteller felt free to embellish the old tales about them, and more than one place might claim to possess their bones. Heracles in particular had myths connecting him with localities all over the Mediterranean world, but he was a super-hero. Most heroes were hometown men, and their cults have puzzled historians of religion. There have been efforts to explain them as half-forgotten gods—“faded gods” is the term used, with the implication that gods can grow dim with time, rather like a slow-motion “fade-out” in a movie—or old vegetation gods, or simply men or women of the past who were remarkable for their great deeds, rather like Christian saints. One common explanation was that when a great man died, offerings were made at his tomb which developed over the course of time into a *heroon*. Thus a *heroon* on the site of a Mycenaean tomb showed that the memory of the Mycenaean warrior buried there lasted into the classical period. Archaeological evidence refutes this idea, however. The hero-shrines date from the eighth century B.C.E. Between about 750 B.C.E. and 700 B.C.E., tombs from the Mycenaean era which were discovered—probably accidentally in most cases—were given new importance as the burial places of heroes, and offerings were made there. The Greeks of the eighth century B.C.E. probably had no idea who the original occupants of these tombs were any more than scholars of the twenty-first century do, but they did know that their local hero should have had a burial somewhere in the vicinity of the Mycenaean tomb. So to whom else could the tomb belong? The logic was irrefutable. Thus a prehistoric tomb belonging to persons unknown, but suitably ancient, could become the site of a hero cult.

**HERO CULTS AND THE RISE OF THE POLIS.** The eighth century B.C.E. was the period when the *poleis* or city-states of Greece were developing and marking out their territories, and the hero-cults which arose at the same time were connected with this development. A legitimate *polis* had a hero, or perhaps more than one. The bones of a hero served to preserve and sanction a *polis* in much the same way as the relics of a saint might pre-

serve a community in the Christian Middle Ages. The Greek historian Herodotus, whose *Histories* was published about 425 B.C.E., told how Sparta, which had been fighting the *polis* of Tegea in Arcadia for many years without success, consulted the oracle at Delphi and was told to bring home the bones of Orestes, the son of King Agamemnon, who commanded the Greek coalition in the Trojan War. When the Spartans asked where the bones of Orestes lay, the reply was that they were where two winds were blowing and iron smote iron. The Spartans were baffled and may not have been able to solve the riddle except that one day, a Spartan, taking advantage of a lull in the hostilities, visited a smithy in Tegea. The blacksmith there told him that when he was digging a well in his courtyard, he came across a huge coffin with a corpse inside. The great size of the bones showed that they belonged to the Age of Heroes, so the smith reburied them. His Spartan visitor reasoned that these must be the mortal remains of Orestes, for the two winds were the smith’s bellows and the iron that smote iron was the smith’s hammer striking his anvil. The Spartans tricked the smith into selling his courtyard and found the bones, and once these presumed relics of Orestes were in Sparta, she thereafter always had the better of her enemies until finally she managed to dominate the Peloponnesos.

**THESEUS AND ATHENIAN POLITICS.** The hero Theseus served Athens in a similar way. In his old age Theseus was banished from Athens, and went to the island of Skyros in the northern Aegean Sea. There the king of Skyros murdered him. About 475 B.C.E., the Athenian general Cimon, who was a shrewd politician as well as a good military officer, was campaigning in the area and on Skyros he unearthed huge bones. A cynic might suggest that they were dinosaur fossils and that Cimon did not find them entirely by accident. But their size seemed to prove that they belonged to the Age of Heroes, and it was easy to arrive at the conclusion that they had to belong to Theseus. Cimon carried them back to Athens, and his pious deed brought him more acclaim than any of the many victories he won. A *heroon* was built for Theseus in the marketplace of Athens. A festival was established for him, and the makers of myth—poets and dramatists—developed him into the founder-hero of the Athenian city-state and the patron of democracy.

**THE HERO IN HISTORICAL TIME.** Not all heroes belonged to the Heroic Age. Some were historical figures. Beginning in the mid-eighth century B.C.E., and for the next two and a half centuries, the Greeks planted colonies in the western Mediterranean region, and in the north Aegean and Black Sea area. Careful planning

usually went into the planting of colonies in new and often strange lands. An *oikistes*—the word has been Anglicized as “oecist”—was appointed to head the colonial expedition. The oecist saw to it that a new home far away from the homeland of his colonists was established in an orderly fashion for them. When he died, a *heroon* would be built for him in the marketplace of the new city he had founded and sacrifices would be offered to his remains. Other great men might also be revered as heroes. At Olympia, where the Olympic Games were held, a *heroon* was built for King Philip II of Macedon, the father of Alexander the Great. The cult of heroes made it easy for the Greeks to believe that kings possessed a kind of divinity, and thus it need not surprise us to find divine kings who received worship in the Greek world after Alexander the Great’s death. Within a couple generations of his death, the Hellenistic kings who had carved kingdoms for themselves out of Alexander’s conquests, declared, first, the founders of their realms divine, and then themselves, too. From these divine kingships of the East, the idea passed to Rome. The Roman senate decreed that Julius Caesar became *divus* (divine) after he was assassinated in 44 B.C.E., as was the first emperor, *Imperator* Caesar Augustus, to give him his official name. Although the worship of dead emperors was an accepted practice, the worship of a living emperor met resistance within Rome itself; neither Augustus nor his successor Tiberius liked the idea, for Roman customs had no place for deified kings, and both Augustus and Tiberius were conservative in matters of religion. Yet outside Rome, the acceptance of living emperors as gods encountered little resistance and soon the cult of the emperors, living and dead, became an important instrument for legitimizing imperial rule.

**NAMELESS DIVINE FORCES.** The Greeks recognized another category of divine force as well which had the power to interfere in human affairs. These were the *daimones*—in singular form *daimon*—who were not worshipped with offerings as the heroes were. The English word “demon” comes from *daimon*, but while the Western concept of demons generally refers to unpleasant supernatural forces, the Greek *daimones* might be either malevolent or benign. They governed the impulses that moved men to action, or perhaps inaction. In the Hellenistic world after Alexander the Great, the *daimones* were often regarded as guardian spirits that looked after mortal men. They existed on the periphery of religious practices. They had no festivals or organized cults.

**DEIFIED ABSTRACTIONS.** Perhaps the logic which the Greeks applied to nameless forces called *daimones* also applied to personifications of abstract entities such

as “Peace,” “Wealth,” or “Luck.” In the fourth century B.C.E., the sculptor Kephisodotos made a statue for Athens of *Eirene* (“Peace”) holding the infant “Wealth” in her arms. He treated *Eirene* as a goddess, the personification of the spirit of peace. The boundary between an abstract entity and a divinity was easy to cross. Thus it is clear that “Luck” or “Fortune”—in Greek, *tyche*—was treated as a goddess. In the Hellenistic world, when faith in the power of the Olympian deities grew more problematic, *tyche* became a popular goddess in whom cities might put their faith, and they erected statues showing her as a woman wearing a model of a city’s fortification walls as her crown. In a society where “Fortune” seemed to play an increasingly important role, it was important for a city to cherish its *tyche*. If “Fortune” was in a good mood, she might forget to be blind, and bestow good luck on her city.

## HERACLES, THE SUPER-HERO

**A HERO WHO BECAME A GOD.** Heroes belonged to the Underworld, and probably the earliest myths about Heracles consigned him there, too, after his death, for in most of Greece, the cult of Heracles was a hero-cult. But as the poets elaborated the Heracles-myth, it developed a happier ending. He was taken up to Mt. Olympus where he reconciled with his bitter enemy, Hera, and married her daughter, Hebe. In fact, the name “Heracles” means “The Glory of Hera,” or “Glory through Hera,” which seems to indicate that Hera was his patron. His name is at odds with the myth that portrayed him as a victim of Hera’s jealousy because he was a son of Zeus by a mortal woman, Alcmena. Yet only at one place in Greece was Heracles worshipped as a god: on the island of Thasos, where he had a sanctuary; he received sacrifices both as a god, on a high altar, and on a low altar as a hero.

**HERACLES’ BIRTH.** Heracles’ mother, Alcmena, was the wife of Amphytrion, who traveled to Thebes with his wife after killing his father-in-law, Electryon, the ruler

of Mycenae. During a time when Amphitryon's military duties took him from Thebes, Zeus assumed Amphitryon's likeness and slept with the lovely Alcmena. Later the same night, Amphitryon arrived home and slept with Alcmena, too, who was amazed at his ardor since she thought he had slept with her only a few hours earlier. Alcmena gave birth to twins: Iphicles, who was Amphitryon's son, and Heracles, who was sired by Zeus.

**HERA'S JEALOUSY.** Hera was bitterly jealous. While Alcmena was in labor, Zeus prophesied that the next descendant of the hero Perseus to be born would rule Mycenae. Alcmena was the granddaughter of Perseus, the founder of the Perseid royal house of Mycenae. Hera heard the prophecy and delayed Heracles' birth. Alcmena remained in labor so long that Perseus' grandson, Eurystheus, was born first and consequently Heracles became Eurystheus' subject. Hera continued her persecution by sending two great serpents to destroy Heracles in his cradle, but he throttled them. Even after he grew up and married Megara, daughter of Creon, king of Thebes, Hera visited him with a fit of madness, and he killed Megara and their three sons. When he recovered his sanity, he consulted the Delphic oracle to learn what he should do to expiate his crime. He was told to submit himself to Eurystheus, king of Mycenae, who would assign him twelve labors. The number "twelve" is the canonical number, but there are variant accounts which assign him ten and have a somewhat different list of exploits.

**THE FIRST SIX LABORS.** The first labor was to slay a lion that terrorized Nemea. No weapon could pierce its hide, so Heracles strangled it, flayed it, and henceforth wore the skin himself. He then slew the Hydra, a many-headed reptile that lived in the swampland at Lerna. Next he captured a wild boar at Erymanthus and brought it back on his shoulders to Eurystheus, who was terrified at the sight of it. He then captured the Hind of Keryneia, and next killed the fierce birds that infested Stymphalus. The sixth labor was the cleansing of the stables of Augeas, who owned many cattle but had never cleaned their stables. Heracles flushed out the manure by diverting a local river through them.

**THE LAST LABORS.** Unlike the first group of labors which were all confined to the northern Peloponnesos, the next six took Heracles further afield. His seventh labor was to capture a wild bull from Crete. Heracles brought it back to Eurystheus and then let it go to continue its depredations. His eighth was to capture the man-eating horses of Diomedes, the king of the Thracian Bistones. Next he was assigned the task of bringing back the sash of Hippolyte, the queen of the Amazons, because

Eurystheus' daughter wanted it. The Amazons were warrior women, and though Hippolyte was quite willing to give Heracles her sash when she learned what his errand was, Hera stirred up trouble and there was a bloody battle between Heracles and the Amazons before he got the sash. The last three labors are variants of the theme of a mortal conquering death. The tenth was to capture the red cattle of Geryon, a triple-bodied monster who had a watchdog with two heads and lived beyond the western reaches of the Mediterranean. It was while he was performing this task that he passed through the Strait of Gibraltar and set up pillars on both sides of it, called the "Pillars of Heracles." There were various stories of how he made his way back to Greece with Geryon's cattle. One related that he spent a night on the site of Rome, where a local monster named Cacus tried to steal the cattle. Another told that the cattle stampeded and led Heracles into what is now the Ukraine, where he slept with a monster-woman and sired the Scythian people. Still another related that he borrowed the vessel of Helios, the Sun God, that Helios used every night after he set in the west to voyage underground back to the east where he would rise next. The eleventh labor took Heracles to the Underworld where he captured Cerberus, the three-headed watchdog of Hades. The final labor took him to the far west, to the world's end, where there grew a tree with golden apples that was guarded by a dragon in a garden belonging to the daughters of Hesperus. Heracles got them and brought them back to Eurystheus.

**MORE CRIMES.** The violence of Heracles is a recurrent theme. Having completed his labors, he committed another crime by murdering his half-brother Iphitus in another fit of madness. This crime was more than fratricide; it breached the laws of hospitality, for Iphitus was Heracles' guest when Heracles hurled him down from the walls of Tiryns. The pollution that resulted from this double crime caused him to contract a terrible disease, and he went to Delphi to ask for a cure. When the Pythia refused to prophesy for him, Heracles, in a rage, seized the tripod on which she sat and would have run off with it except that Apollo himself pursued him and wrestled with him for the tripod. The contest between god and hero ended with Zeus separating them by a thunderbolt. The oracle did speak at this point, and told Heracles that he must work as a slave for three years if he wanted to be purified.

**FURTHER EXPLOITS.** Thus Heracles served as a slave of Queen Omphale of the Lydians for three years and performed various exploits for her. After his three-year stint was complete, Heracles, now cured of his disease, had a number of other adventures, including the capture

of Troy and setting Priam, who was still a young man, on the Trojan throne. Heracles' last wife was Deianira, and to win her he had to wrestle with the river-god Achelous. While he was traveling home with his new wife, he reached a river where Nessos, a centaur (half-horse and half-man), carried people across for a fee. Heracles himself crossed without help, but he allowed Nessos to carry Deianira. As Nessos emerged from the river, he tried to rape her, but her screams reached Heracles, who shot Nessos with an arrow. As the centaur lay dying, he whispered to Deianira that she could make a love-potion by taking the sperm he had ejaculated and mixing it with blood from his wound. Deianira followed his instructions. The potion would prove to be Heracles' undoing.

**HERACLES' DEATH.** Heracles' career of war and homicide ended not on the battlefield but as the result of his wife's insecurity. The king of Oechalia, Eurytus, had offered his daughter, Iole, to whoever could defeat him and his sons at archery. Heracles won, but Eurytus refused to give him Iole because he remembered the fate of Heracles's first wife, Megara, whom Heracles had killed in a fit of insanity. Heracles nursed a grudge against Eurytus because of the broken promise, and he attacked Oechalia, killed Eurytus and his sons, and took Iole by force. He then sent a herald home to bring him a brightly-colored tunic to wear as he offered sacrifice before wedding Iole. When Deianira learned about Iole, she feared that she was losing Heracles' love, and so she smeared the love potion on the tunic. Heracles put it on, and as soon as it grew warm with the heat of his body, it burned into his flesh. He was brought home to Trachis in agony. When Deianira saw his suffering, she hanged herself. Heracles then instructed his elder son by Deianira, Hyllus, to marry Iole when he reached manhood, and he himself went to Mt. Oeta in Trachis where he had a funeral pyre built and climbed on it. Mt. Oeta is one of the earliest places in Greece where there is archaeological evidence of a cult of Heracles, and so if the story of Heracles' death is a later addition to the myth, as some have argued, it is an early addition. Poets and storytellers would later add the detail that, as the pyre burned, there was a clap of thunder, and as a cloud enveloped Heracles he was snatched up to Mt. Olympus.

**HERACLES IN ITALY.** The myth of Heracles came to Italy very early. He was popular among the Etruscans. In Rome, he received sacrifice at the *Ara Maxima* (The Greatest Altar) near the Cattle Market in Rome, and significantly, the sacrifice was "according to Greek rite," that is the priest left his head uncovered as he performed it. The Romans themselves found the rites of Heracles,

whom they called Hercules, difficult to explain. Why was it a Greek rite? Why, too, were women barred from approaching Hercules' altar? There was a legend that before Rome was founded, there was a settlement of Greek colonists on the site, led by a king named Evander, and the worship of Hercules went back to his time. Like many Roman religious rituals, the forms of the rite remained unchanged over the centuries, but the reasons for them were forgotten.

**THE SUFFERING HERO.** One unexpected development of the Heracles-myth was its use as a paradigm of a great man who suffers for the good of mankind. The rationale was that he spent the best years of his life performing labors that rid Greece of monsters, or pushed back the boundaries of the known world. In the period after Alexander the Great when great Hellenistic kingdoms emerged in the lands Alexander had conquered, Heracles became a model king who labored during his life to make the world a better place and was rewarded with divine honors after his death. Under the Roman Empire, the myth continued to have its uses. In 285 C.E., the emperor Diocletian made much-needed reforms, among them taking a junior colleague as emperor. As director of the empire, he called himself "Iovius" after Jupiter, the Roman Zeus, and his junior colleague became "Herculius," who used his power in the service of his subjects. The myth lives on in comic-book heroes such as Superman and Spiderman: men who use their enormous strength to rid society of evils and make the world a better place.

## DISCOVERING THE WILL OF THE GODS: ORACLES AND DIVINATION

**THE IMPORTANCE OF SEERS.** It was vitally important not to offend the gods, but how could mortal men know what the gods wanted them to do, or learn what fate had in store for them? The gods might vouchsafe a sign that could be taken as an omen, good or bad. Reading divine signs and omens correctly required skill and

learning, and there were seers in ancient Greece who specialized in the art. It was important to watch the phases of the moon, and the meaning of an eclipse could test the limits of a seer's skill. There were seers that belonged to clans of hereditary soothsayers who could trace their ancestry back to some legendary vaticinator, or prophet, whose knowledge came from the gods, particularly Apollo who was the most important god of oracles. There was one such clan at Olympia, the Iamidae, or "Descendants of Iamus." Iamus was a son of Apollo and became a prophet because Apollo directed him to do so. The Iamidae continued to live at Olympia until well into the third century C.E.

**COMMUNICATION BY DREAMS.** A god might communicate by dreams. Dreams were a favorite method of Asclepius, the healing god. Patients who came to his sanctuary at Epidaurus slept in the hospice, and as they slept, the great harmless snakes that embodied the god's spirit would slither around and over them, and a dream would visit them and tell them what treatments the god prescribed. Asclepius' sanctuary was full of votive offerings by patients who left terracotta models of the parts of their body that had been healed, and the sick continued to seek Asclepius' help well into the Christian era.

**TAKING THE AUSPICES IN GREECE.** When sacrifices were made, the entrails of the sacrificial victim were examined carefully, with special attention given to the liver. Any abnormalities were noted, and their meaning interpreted by a seer skilled in the craft of haruspicy, that is, the art of interpreting signs and omens in entrails. Ill omens were taken seriously, as is illustrated by a story from Greek history. In 479 B.C.E., the Greeks were about to fight a battle against the Persians at Plataea, a little city-state that neighbored Athens. The Persians were advancing against the Spartan contingent and inflicting severe casualties with their barrage of arrows. The Spartans made the customary sacrifices before battle, but the auspices were not favorable. The Spartans waited, even though the Persian arrows took a deadly toll. The priests continued to slaughter sacrificial victims, but as long as the omens remained unfavorable the Spartans waited. At last the Spartan commander, Pausanias, turned his eyes towards a temple of Hera by the battlefield and in a loud voice prayed to her to save the Greeks from defeat. At that moment, the sacrifices yielded a favorable omen, the Spartans advanced against the Persians and, after a hard struggle, they won a complete victory.

**AUGURIES IN ROME.** Among the Romans, auguries and auspices—which were for practical purposes the same—were a fine art. The Roman augurs, who were Rome's official diviners, formed a committee called a *col-*

*legium* which originally had three members but increased gradually to sixteen. Their duty was to observe signs, such as the flight of birds, and interpret them. They received reports of any unusual events, such the birth of a two-headed calf. On the Capitoline Hill the eating habits of a group of sacred chickens were open to interpretation by the augurs: if they refused to eat at all, that meant an ill-omened day. Roman armies on campaign took with them sacred chickens whose eating habits were carefully watched. It was a very good sign if they ate so as to drop a little food from their beaks. While it is not possible to know how seriously all the Romans took these signs, it is clear that they observed ritual meticulously. One story from their wars with Carthage seemed to prove that it was foolhardy to ignore auguries. In the First Carthaginian War, which cost Rome heavy casualties, a Roman fleet was about to engage a Carthaginian squadron when the sacred chickens aboard the Roman flagship would not eat. In disgust, the commander kicked them overboard, saying, "If you won't eat, then drink!" and joined battle. The Romans lost. The moral was that it was wise to pay attention to auguries. Auspices—from the Latin *auspicium* meaning "omen"—had some importance in the public life of early Rome. Certain magistrates were given the "Right of Auspices," and they played a role in elections or inauguration into office. The auspices would be taken for a governor who was going off to a province to administer it—that is, a magistrate with the "Right of Auspices" would examine the omens and interpret them. As the Roman Empire grew older, the practice fell by the wayside.

**THE ORACLE OF ZEUS AT DODONA.** The word "oracle" is used in two senses: it can be the place or the shrine where a god made his will known, or it can be the god's message itself. There were a number of famous oracles in the Greek world. The oldest was an oracle of Zeus and Dione at Dodona in northwest Greece. The cult center there was an oak tree growing in a sacred precinct or *temenos* surrounded by a low wall. Only in the fourth century B.C.E. was a simple stone temple built, and although later embellishments were added to the site, including a fine stone theater, Dodona remained a small place. A person who wanted to consult the oracle wrote a question on a lead tablet and submitted it. The priests then evidently divined the will of Zeus by interpreting the rustle of the oak leaves belonging to the sacred tree. Some lead tablets with questions written on them have survived, and to judge from them, many who consulted Zeus presented queries of the sort that a "Personal Advice" columnist in a newspaper might receive today.

**THE ORACLE OF APOLLO AT DELPHI.** The oracular god *par excellence* was Apollo who had several

Ruins of the temple of Apollo at Delphi, Greece, which housed the Delphic oracle. COURTESY OF JAMES ALLAN EVANS.

renowned oracles, the most famous of which was at Delphi. There was a legend that a shepherd at Delphi noticed that if his flock approached a chasm in the rock, they began to leap about in a frenzy. He approached the chasm himself and found himself possessed by the spirit of prophecy. The Delphians, on learning of this phenomenon, chose a woman called the Pythia to prophesy for them all, and placed her on a tripod over the chasm. She fell into a trance-like state and uttered cryptic words. There was a real-life Pythia, a woman over fifty years old, who dressed as a young virgin to accentuate her purity. She gave her prophecies on only one day a month, except for the three winter months when it was believed that Apollo left Delphi and the god Dionysus took up residence instead. Originally, in fact, the Pythia gave oracles only one day each year, on Apollo's birthday, but the demand was such that she had to become more accessible. When the Pythia was not giving oracles, a consultant could get a reply to his query by drawing lots, and the method worked well enough, particularly if the answer that was needed was simply "yes" or "no." A mixture of black and white beans was placed in the bowl of Apollo's tripod. The Pythia would pick a bean at ran-

dom, and its color would give the answer. This was a cheap and easy way of consulting the oracle, and most private consultations seem to have been of this sort.

**ORACLES FROM THE PYTHIA.** On the appointed day when the Pythia herself was to give oracles, she washed herself at the Castalian spring which still flows at Delphi and purified herself in the smoke from laurel leaves and barley. She then went to the Temple of Apollo where the Delphian priests sacrificed a goat. The goat was expected to shiver before the sacrifice, thus indicating Apollo's willingness to use the Pythia as his medium. If the goat failed to shiver, the priests would sprinkle it with cold water and if it still did not shiver, they would accept the unfavorable omen and cancel the proceedings. If the sacrifice was successful, the Pythia would enter the temple and take her seat on a tripod—the tripod, which was a kettle with three legs used for boiling stews, was a sacred ritual vessel, used in sacrifices. She went into a trance and the answers she gave to the queries put to her were in a strange, unintelligible language that the priests interpreted. Most of the oracles that have been reported in literature were in polished hexameters, the meter used

by the epic poets. The oracles that are considered most genuine, however, are in prose.

**INTERPRETATION.** The oracles were renowned for their ambiguity. Croesus, king of Lydia, whose memory survives in the saying “as rich as Croesus,” asked the Pythia if he should attack the empire of Persia that was a threat on Lydia’s eastern border. The oracle told him that if he attacked, a great empire would fall. Assuming that the oracle meant the Persian Empire, Croesus attacked, and discovered too late that the empire destined to be overthrown was his own. Yet the Delphic oracle could give fairly straightforward advice as well. Before a city-state sent out a colony, it consulted Delphi and often got good advice. The fact is that Delphi was a communications center, for it received visitors from all over the Greek world and beyond, and got reports from them. The priests at Delphi were well-informed, more so than most people in Greece in the days before modern methods of communication.

**THE ORACLE OF THE “WOODEN WALL.”** The most famous Delphic oracle, and the longest to survive, is the response which the Pythia gave the Athenians when they consulted her on the eve of the Persian War. The Persian king, Xerxes, invaded Greece in 480 B.C.E. with an enormous army, and as the Athenians anxiously awaited the onslaught, they sent messengers to Delphi for an oracle. These envoys performed the preliminary

rites, then entered the temple and squatted or sat before Pythia’s tripod. Immediately the Pythia uttered a prophecy, which the priests relayed in good dactylic hexameters—the meter used by the epic poets—and its meaning was clear. Resistance to Persia was hopeless. The Athenians were dismayed, but a Delphian—probably a priest—advised them to approach the Pythia again, this time as suppliants carrying an olive branch. Two consultations on the same day were generally not allowed; however the Athenian messengers entered the temple again and asked for a more comforting prophecy, saying that otherwise they would remain in the temple until they were dead. The second oracle was hardly more cheerful than the first, but it held out a ray of hope. It said that Zeus had yielded to Athena’s prayers to this extent: the Wooden Wall would save the Athenians, and it concluded by invoking the island of Salamis that would destroy the offspring of women either in the fall or the spring. When this second oracle was brought back to Athens, there was a great debate about its meaning. The *khresmologoi*—men skilled at expounding oracles—argued that it prophesied a defeat at Salamis. The politician Themistocles argued for a happier meaning by claiming that the Wooden Wall was the Athenian fleet, and the oracle’s reference to Salamis presaged a victory there, for it called the island “Divine Salamis.” As it turned out, the allied Greek navy did defeat the Persian

fleet at Salamis, which proved Themistocles right. Both Themistocles and Delphi gained prestige. Modern students of the ancient world are more cynical about Delphi's clairvoyance, suspecting that Delphi was really ready to collaborate with the Persians and made use of its prophetic reputation to weaken Greek resistance.

**SIBYLS.** At Delphi, there was a rock that was always left in its natural state as if surrounded by a taboo, and it was known as the Rock of the Sibyl. While there was no Sibyl at Delphi in the historical period, a legend told that Delphi was the seat of an oracle prior to Apollo's appropriation of the site for his own oracle. The earlier oracle was a Sibyl who sat on this rock and prophesied. The legend of the wandering of the Sibyl is a curious one. As time went on, the number of Sibyls multiplied. First there was only one, then two, then more until the legend knew ten Sibyls. They were all prophetesses, who uttered prophecies in states of ecstasy. A famous sibyl lived at Cumae on the Italian coast near Naples, where the Greeks founded a colony about 750 B.C.E. The cave of the Cumaean Sibyl, cut into the living rock, is still to be seen there. Vergil, in his *Aeneid*, related that his hero Aeneas visited the Sibyl when he landed in Italy at Cumae. There was also a legend that the Cumaean Sibyl once sold a collection of her prophecies to an early king of Rome, Tarquin the Elder. Whatever the truth of the tale, Rome did have a collection of oracles called the Sibylline Books, written in Greek, which were consulted only on order of the Roman Senate. The books were lost when the Roman Capitol was burned in 83 B.C.E. during a period of civil war, but a new collection was put together to replace them and it still existed in the fourth century C.E. when they were consulted for the last time. Oracles lost their prestige as time went on and popular opinion became more cynical. Delphi was still consulted in the period of the Roman Empire, but no longer on questions of much importance. The last Delphic oracle that is recorded was given to an emissary of the last pagan emperor Julian (361–363 C.E.). It said,

Tell the king, the cunningly-built hall has fallen in the dust, Phoebus (Apollo) no longer has a hut, a prophetic laurel, or a speaking stream. Even the talkative water has ceased to exist.

## WORSHIPPING THE GODS: SACRIFICES AND TEMPLES

**TEMPLES.** Gods were worshipped at holy places, precincts that were cut off from the surrounding region by a clear, well-defined boundary that was marked by boundary-stones. The Greek word for such a precinct was *temenos*, which is connected with the word that means "to cut." The most important structure in the *temenos* was the altar where sacrifice was made. Then in the eighth century B.C.E., the Greeks began to build houses for their gods and goddesses, and the familiar Greek temple made its appearance. The basic temple was a single rectangular room with a porch in front. It was a *megaron*, which was the name for the main room of an early Greek house with a hearth in its center, a hole in the roof to allow the smoke to escape, and in front of it a porch with a roof supported by a couple pillars. Later the Greeks elaborated the design by surrounding the *megaron* with a row of columns. Yet the temple remained a simple dwelling-place that housed the image of the god or goddess. The indispensable component for a sanctuary was not the temple, but the altar. Inside the sanctuary was the cult statue or statues, if the temple sheltered more than one god. Sheltering the god and protecting the property dedicated to him was the temple's prime purpose, for worshippers left votive offerings in the temples which ranged from painted wooden panels which were within the price range of a humble worshipper to offerings of gold or ivory. Few of these have survived: the wooden dedications have decayed and the dedications of gold and ivory were stolen long ago. Many terracotta votives have survived, however, for crockery is not subject to decay. At any healing shrine, archaeologists find models of legs, arms, women's breasts, or male testicles that were dedicated to the god, probably as thank offerings for healing a particular part of the human anatomy. The interior of a temple must sometimes have resembled an old curiosity shop. The votives might overflow the temple and be stored in separate buildings in the temple precinct called "treasuries," for the Greek word for treasury—*thesauros*—also meant "storehouse" or sometimes "granary." Sometimes the priests might houseclean by removing old dedications and giving them decent burial. When the stadium at Olympia was excavated, the excavators found many votive offerings of helmets, shields, and other pieces of armor that had been carefully buried in the embankments on either side of the track. The temple, evidently, had run out of space for them.

**CULT STATUES.** Some cult statues were magnificent. The statue made of gold and ivory which the sculptor

*a PRIMARY SOURCE document***SOCRATES ON PRAYER AND SACRIFICE**

**INTRODUCTION:** In Plato's dialogue titled *Euthyphro*, Plato imagines a conversation between his teacher Socrates and Euthyphro. While Euthyphro may or may not have been a real person, Plato presents him as a conventionally pious person who unfortunately models his own behavior on that of the gods; Euthyphro is prosecuting his own father for manslaughter and justifying his action with the example of Zeus, who put his father Cronus in chains for swallowing his children. Socrates and Euthyphro get into a conversation about the definition of true piety. Euthyphro attempts to define piety as what is dear to the gods, and Socrates shows by his relentless questioning that the definition is not so simple. The quotation below on the purpose of sacrifice comes from near the end of the dialogue, which concludes with Socrates and Euthyphro agreeing that they must discuss the matter again another day.

**Socrates:** Doesn't sacrifice consist of making presents to the gods, and prayer in making requests to them?

**Euthyphro:** Yes, indeed, Socrates.

**Socrates:** So on this view piety would be the science of asking and giving?

**Euthyphro:** You grasp my meaning perfectly, Socrates.

**Socrates:** You see, my friend, I am a passionate admirer of your wisdom and keep my attention fixed upon it, so that no word of yours will fall to the ground. But tell me, what is this form of service to the gods? Do you hold that it consists in asking from them and giving to them?

**Euthyphro:** Yes, I do.

**Socrates:** Then would not the right procedure in asking them be to ask for what we need from them?

**Euthyphro:** What else could it be?

**Socrates:** And similarly would not the right procedure in giving be to present them in return with what they actually need from us? Because surely it would be an incompetent use of presents to give a person things for which he has no need.

**Euthyphro:** Quite true, Socrates.

**Socrates:** So piety would seem, Euthyphro, to be a sort of art of commerce between gods and men.

**Euthyphro:** Yes, if you like it better to describe it so.

**Socrates:** I don't like it any better unless it is really true. But tell me, what benefit do the gods really get from the gifts they receive from us? What they give is obvious to anyone, for we have nothing good that they don't give us; but what benefit do they get from what they receive from us? Is our commerce with them so much to our advantage that we receive all our good things from them, while they receive none from us?

**Euthyphro:** But do you really imagine, Socrates, that the gods derive benefit from the things that they receive from us?

**Socrates:** Well, if not, whatever can these gifts of ours to the gods be, Euthyphro?

**Euthyphro:** Why, honor and esteem and—as I was saying just now—gratitude; what else do you suppose?

**Socrates:** So piety is what is gratifying to the gods, but not beneficial or dear to them?

**Euthyphro:** In my opinion it is supremely dear to them.

**Socrates:** Then apparently piety is once more what is dear to the gods.

**SOURCE:** Plato, *The Last Days of Socrates*. Trans. Hugh Tredennick (Harmondsworth, England: Penguin Books, 1969): 39–40.

Phidias made for the temple of Zeus at Olympia was a masterpiece, and after he completed it, he made an equally famous gold-and-ivory statue of Athena Parthenos for the Parthenon in Athens. Yet the most sacred image of Athena was not the gold-and-ivory image in the Parthenon, but an ancient olivewood statue of Athena *Polias* housed in the Erechtheion beside the Parthenon. Every four years, at the Great Panathenaea festival, the women of Athens gave this image a new saffron-dyed dress that they had woven. Wooden statues of this sort, known as *xoana*, were thought to have a divine origin. They were primitive im-

ages, roughly carved; in some cases a *xoanon* was not much more than a wooden post.

**TEMPLE SITES.** The temple sites were often determined by the preference of the god for a particular location. The preferred sites for temples sacred to Athena and Zeus were in the urban area: Athena on the acropolis and Zeus in the marketplace. Apollo had temples in the marketplace, too, but also sometimes by the seaside. Demeter's sanctuaries are often on a hillside near the city. Hera, Poseidon, and Dionysus preferred the countryside, and Artemis liked woods and marshy areas.

Wherever sanctuaries were sited, they were sacred places where violent acts were not permitted. Temples offered asylum to fugitives, and anyone who dragged a suppliant from a hallowed *temenos* would bring pollution upon himself and arouse the wrath of the gods.

**FESTIVALS.** The year was marked by religious festivals in honor of the various gods. They were holy days, important for both the cultural and the religious life of the community. Dancing, musical contests, athletic games, prayers, hymns, and processions all had a place in them. Greek worshippers did not kneel to pray or utter silent prayers. Instead, they stood and, raising their hands, invoked the god in a loud voice. A hymn was a form of prayer that was chanted: the worshipper addressed the god under his various names, recited his great deeds, and ended with a petition. Processions were parades that often took up the first day of the festivals. Religious custom dictated what the festival procession would be like and what route it would take. If the sanctuary of the god whose festival was being celebrated was outside the city, the worshippers would parade along the country road to the site. In one of Hera's favorite cities, the *polis* of Argos where the Hera sanctuary was several miles outside the city center, the priestess was carried there by ox-cart which apparently led a parade of worshippers.

**SACRIFICE.** The most important part of the festival was the sacrifice. Cattle were the most valued sacrificial victims, but the most common ones were sheep and goats, which were more within the price range of a middle-income Greek. Pigs were sacrificed to Demeter and Dionysus, dogs to Ares and Hekate, birds to Aphrodite, and cocks to Asclepius. A sacrifice to a god or goddess was made on an elevated altar called a *bomos* in front of the temple, and a sacrifice to a hero was made on a low, round altar called an *eschara*, but rules in Greek religion were rarely left unbroken. Sometimes a hero might have a high altar, but the blood from a victim sacrificed to a hero should still trickle down into the earth where it would nourish the bloodless ghost of the dead. Gods on Mt. Olympus needed no such nourishment. A priest or priestess officiated at the sacrifice. Generally, male deities had priests and female deities had priestesses, but one cannot count on consistency. Generally the inedible parts of the sacrificial animal were burned as offerings to the god, and the rest was eaten, or even sometimes sold in the market. The exception was the "holocaust," a sacrifice where the victim was totally consumed by sacrificial flames. The roster of festivals in Athens shows that only one month passed without massive slaughtering of beasts for sacrifice. There must have been many days when the city smelled

Wall painting from tablinum in the House of Livia on the Palatine Hill at Rome showing a Roman domestic sacrifice. End of 1st century B.C.E. PUBLIC DOMAIN.

like an abattoir, and resounded with the noises of the community drinking wine, eating meat, and making merry. For low-income Greeks, festival days might be the only times they ate meat.

**THE WEALTH OF TEMPLES.** Temples had an economic function which should not be overlooked. Sacrifices honored the gods, but they were also occasions for the distribution of food. Temples might also have to shelter asylum-seekers, sometimes in great numbers, whom it had to support. Archaeological excavations reveal that many temples had subsidiary buildings used for accommodation and cooking. Temples also served as depositories. Athens kept its state treasury in the back room of the Parthenon, and when she organized her archives, they were kept in the temple of the Mother of the Gods in the marketplace. Excavations of a temple at Selinunte in Sicily have yielded many clay seals used to seal documents written on papyrus. The papyrus has decayed, but the clay seals remain as mute evidence of the records that were once stored there. In Rome, a citizen might deposit his last will and testament in the Temple of Vesta where it was in the care of the Vestal Virgins. The god whose image was housed in the temple extended his protection over whatever was within his shrine. Some temples were wealthy and possessed large estates which they rented to leaseholders. They had other sources of income as well. An army that was victorious in battle would give the gods a small portion of the booty called "first fruits."

The Roman Forum, showing the foundations of the House of the Vestal Virgins in the foreground and beyond it, the round temple of Vesta. Rome, Italy. PHOTOGRAPH BY HECTOR WILLIAMS. © HECTOR WILLIAMS.

During the brief period in the fifth century B.C.E. when Athens ruled an empire, she consecrated one-sixtieth of the tribute that she received from the member states of her empire as “first fruits” to the goddess Athena. Temples made loans and functioned as a kind of reserve bank. Religious faith changed as time went on in the Greco-Roman world, but religious festivals continued to draw crowds. Mute evidence of their numbers is to be found in the theaters that were built at popular shrines for visitors to witness the drama of the ancient rituals. At Delphi, the theater overlooks the great temple of Apollo. Even at the lonely oracle of Zeus at Dodona there was a theater built, and it is the largest structure on the site. Faith in the Olympian gods was declining when these theaters were built but they still drew visitors and pilgrims. Religion also served to redistribute wealth. There was no income tax in the ancient world, and, in fact, the well-to-do resented paying any taxes at all. But while wealthy citizens did not like taxes, they were quite willing to make donations to the community. Rich citizens paid the bills for the great religious festivals, and the honor they received repaid their generosity. Thus Greco-Roman religion served an important economic function that cannot be overlooked.

## THE RELIGION OF EARLY ROME

**BACKGROUND.** The Romans honored the religion of their ancestors, whom they referred to as “the greater ones”—in Latin, the *maiores*. While the Greeks and all peoples in the ancient world also honored their ancestors’ religions, the Romans were excessively conservative.

They believed in superhuman divine beings as far back as surviving Roman history records exist, but at the same time, the Italian countryside that the Romans knew always remained the home of a multitude of little deities without human form. A grove of trees would be home to a god, as would a river or a stream or a spring. There was a host of small gods in charge of sowing the crops: the *deus Occitor* who looked after the harrowing, *deus Sterculinius* who looked after spreading manure on the fields, *Sarritor* who looked after hoeing, and *Messor* who looked after reaping, to name only a few of them. The priest of Ceres, the goddess of production, would invoke them all when he made sacrifice. Some of these unseen spirits were malevolent. Every 25 April, the *Robigalia* was held at a grove outside Rome to appease *Robigo*, who was the god—or goddess, for the Romans were not sure of *Robigo's* gender—of grain rust, the fungus which plagued the farmers' crops. The guts of a dog were burned on *Robigo's* altar and he was invited to stay away.

**KEEPING THE GOOD WILL OF A SPIRIT.** Suppose a landowner had a wooded area on his farm and wanted to thin the trees. Cato the Elder, the earliest Latin writer to produce a treatise on agriculture, instructs his readers first to sacrifice a pig, and then to repeat this prayer:

Whether you who hold this grove sacred are a god or goddess, as it is proper to make you the sacrifice of a pig as a propitiative offering for disturbing this hallowed place, and hence, for these reasons whether I or someone designated by me carried out the sacrifice, provided that it be performed correctly, for this reason in sacrificing this pig, I pray in good faith that you be kindly and benevolent to me, my home, my family, and my children. For these reasons, accept the honor of the sacrifice of this pig as a propitiative offering.

It was not a sin to cut down trees. Roman religion was not greatly concerned with sin. Instead, the Romans regarded gods and goddesses as beings with rights and prerogatives, and one of them was the right not to be disturbed. If they were disturbed, they had to be propitiated. The prayer that Cato prescribed to appease the god of a grove that was about to be violated by a woodman's ax sounds like a legal proposition, and in a way, it was. Roman prayer always offered the god a bargain. If the god granted a petition, then the petitioner would do the god a service in return.

**GODS OF THE HOUSEHOLD.** Every Roman house had its guardian gods. The *Penates* were gods of the pantry, but they came to symbolize the household. The outer door of the house, the *ianua*, was in the care of the god Janus. Little guardian gods called *Lares* were re-

The lararium in a house at Pompeii, Italy. The painting on the back wall shows the "Genius" of the household. © MIMMO JODICE/CORBIS.

sponsible for the security and well-being of the household. A house would have a little shrine to its *Lar*—or its *Lares*, if there was more than one, as there often were—called the *lararium*. Once the Romans began to think of their gods in human forms, the *Lares* would be depicted as dancing figures wearing short tunics and carrying vessels for libations and saucers for offerings of salted meal. There were also *Lares* that protected a neighborhood, called the *Lares Compitales* and *Lares* that protected the whole city of Rome called the *Lares Publici* or the *Lares Praestites*, for the city was, in a sense, an extended family. There was a religious festival called the *Laralia*, held for the *Lares* on the first of May each year.

**ANIMISM.** Religion that recognizes formless supernatural spirits living in trees and rocks and streams is known as animism. The word derives from the Latin *anima*, meaning "soul," and animism assigns every stream or tree a soul or divine spirit, endowed with a right not to be disturbed without its consent. The Romans called this divine spirit a *numen*, a word with the basic meaning of nodding assent, and then by association it came to mean the divinity that nods assent or sometimes refuses it. At one time, scholars thought that at first Roman religion was purely animist, only later becoming more sophisticated as they came into contact with their neighbors—particularly the Greeks—and learned to make images of their gods in human forms. In fact, the Romans made images as far back as their earliest images

exist. Nonetheless, in primitive Italy there was a good deal of animistic belief. Animism explains, for instance, one ritual in early Rome that took place whenever the Romans embarked on a war. Before a general led his army out of the city, he first went to the Regia, which housed shields and spears sacred to Mars. He shook a sacred spear with the cry, “Mars, awake!” The *numen* of Mars, the spirit of war, was clearly somehow within the spear, and a good shaking roused it from its slumber. If a spear was seen to tremble of its own accord, that was a bad sign. It meant that the *numen* was apprehensive.

**JANUS.** The god of doors and gateways was Janus, and since to enter a house or a city, one must pass through a gate or door, Janus became a god of beginnings. Whenever a prayer was addressed to a list of gods, his name was mentioned first. There was a freestanding gateway in the Roman Forum, the “twin gate of Janus,” which was opened to release the magic forces of battle whenever the Romans were at war, which they frequently were. The gateway represented Janus, but once the Romans began to portray their gods in human form, the symbol of Janus became a man with a double-faced head: one face looking forward and the other backwards. The first month of the year was named after him, and his festival was on New Year’s Day.

## THE RELIGION OF THE ROMAN REPUBLIC

**THE EARLY BEGINNINGS.** Early Roman history and Roman mythology are so intertwined that it is impossible to separate the two. Legend described how Rome’s first king, a son of Mars named Romulus, founded Rome in 753 B.C.E. He first asked the gods for divine approval, then laid out the sacred boundary—the so-called *pomerium* of his city—and built Rome’s first temple to Jupiter *Feretrius*, that is, Jupiter the Striker, who smote Rome’s enemies. Romulus’ settlement was on one

of Rome’s Seven Hills, the Palatine, and archaeologists have found early cuttings in the bedrock there that were left by a prehistoric settlement. Romulus himself may be fictitious, but the habitation on the Palatine Hill was not. The Romans evolved a legend long after Rome was established that told how it was founded. Its mother city was Alba Longa, a Latin town which was founded generations earlier by the son of the Trojan hero, Aeneas, who escaped from the destruction of Troy and came to Italy. Romulus and his twin brother, Remus, had a wicked great-uncle who had usurped the rule of Alba Longa from their grandfather, and, recognizing the two infants as a threat, he set them adrift on the Tiber River when it was in flood, fully expecting never to see them again. Their cradle floated ashore at the future site of Rome, however, and a she-wolf that had lost her whelps suckled them. A herdsman named Faustulus, who was the woodland god Faunus under a thin disguise, also cared for them until they developed into two husky young men. Upon reaching adulthood, they first disposed of their wicked great-uncle and restored their grandfather to the throne; they then journeyed to the Seven Hills of Rome to found a city. Remus was soon eliminated. He was killed either by Romulus himself or by one of his followers. Then Romulus attracted new settlers by offering asylum to men who were fleeing their native lands for some reason. He remedied the dearth of women by stealing them from a Sabine settlement on the Quirinal, another of Rome’s Seven Hills. The Sabines, an Italic people on the fringes of Latium whose relations with the early Latins were more often hostile than not, were incensed by the abductions, but instead of fighting to the death, they united with the Romans to form a single community. Thus Rome from the beginning was a multicultural community, and archaeology lends credence to this theory, for the earliest burials found in the Roman Forum were both inhumation and cremation instead of either one type or the other, which one would expect if the population were homogeneous. Moreover, the union between the Romans and the Sabines may not have been a coalition of equals, for Romulus’ successor was a Sabine, Numa Pompilius. Romulus himself vanished—snatched into Heaven, according to one legend, murdered according to another—and he was assimilated to the god Quirinus, a Sabine god who seems to have been the Sabine counterpart of Mars.

**QUIRINUS.** Quirinus is a colorless god. There were no myths told about him. He did have a festival that was held every 17 February, and *Quirites*, meaning the “Quirinus’ people,” was sometimes used as a synonym

## THE Etruscans

Ancient Etruria was a little more than half the size of modern Tuscany in Italy, which takes its name from the Etruscans. On the west, its boundary was the Tyrrhenian Sea; on the south and south-east, it was the Tiber River; and on the north, the Arno River which flows through modern Florence. Most of the modern knowledge of the Etruscans comes from their tombs, which suggest that they were excessively religious with a gloomy view of the afterlife. Paintings, particularly from tombs of a later date when Etruscan power was declining, show terrifying demons which the dead would presumably encounter in the afterlife, and Etruscan ossuaries (depositories for the bones of the dead) often have relief carvings showing the dead person, with face veiled, being escorted by a demon carrying a long-handled hammer, his face twisted into a wolfish grimace. The tombs show that the Etruscans spared no expense on funerals, and paintings from the heyday of Etruscan power show a people who loved banqueting, dancing, horse racing, and athletic contests. Women and men mingled freely, unlike in Rome where patriarchal power separated the two sexes.

In ancient Greece and Rome, it was generally believed that the Etruscans were immigrants from Asia Minor who arrived in Italy during the so-called “Dark Ages” (1100–800 B.C.E.), and there is a kernel of truth to this, for a people speaking a similar language lived on the island of Lemnos in the north Aegean Sea until near the end of the sixth century B.C.E. We find the cult of the Trojan hero Aeneas in Etruria, and the theory that the Etruscans were refugee Trojans has attracted some scholars, but it cannot be proved. They spoke an unknown language, but they wrote it using the Greek alphabet. They were also among the best customers for Greece’s exports. The great majority of Greek vases that are in modern museums outside Greece itself came from Etruscan tombs.

Rome came under Etruscan domination in 625–600 B.C.E., and the largest Etruscan temple that was ever built was the Temple of Jupiter on the Capitoline Hill in Rome. Etruscan influence on early Rome is hard to measure. The Etruscans possessed sacred books on augury and divination, and Rome considered Etruria a source of knowledge in occult skills. As Rome’s power grew, Etruria’s faded, but Etruscan augury still commanded respect even into the Christian era.

for “the Roman people.” He was a member of Rome’s ancient triad of gods that consisted of *Diespiter* (Jupiter), meaning “the father god”; Mars, Jupiter’s son; and Quirinus, who was the son of Mars, since Rome’s founding myth told that Romulus’ father was Mars. Rome’s first emperor, *Imperator* Caesar Augustus (27 B.C.E.–14 C.E.), thought of taking the name “Romulus” as appropriate for his new status, and he rebuilt the temple of Quirinus in Rome. Romulus’ fratricide was not forgotten, however, and Quirinus, the deified Romulus, was left in obscurity.

**NUMA’S CALENDAR.** Roman legend claimed King Numa as the founder figure of Roman religion. He gave Rome its twelve-month calendar to replace the ten-month calendar that began with March, the month of Mars, which Romulus’ city had borrowed from Alba Longa. Numa’s calendar fixed the dates for the religious festivals. Numa’s successors are shadowy figures, but then Rome fell under Etruscan domination. The last three kings to rule Rome—Tarquin the Elder, Servius Tullius, and Tarquin the Proud—were Etruscans, and very likely historical figures.

**THE ETRUSCANS.** Roman legend veiled the uncomfortable fact that the Etruscan takeover was a con-

quest with a story that the first Tarquin left Tarquinii where he suffered discrimination because he was the son of a Greek, and came to Rome where he became a respected citizen and was chosen king by a popular vote. Tradition also told that Tarquin’s name in Tarquinii was Lucumo, and in Etruscan cities, the *lucumo* was the chief magistrate. Tarquin, whose name was the Latinized form of a common Etruscan name, *tarcna*, probably came to Rome as a conqueror. With the Etruscans came their triad of gods—*Tinia* (the “Sky-Father”), *Uni*, and *Menrva*—who became Jupiter, Juno and Minerva. The Romans already had a divine triad of gods—Mars, Jupiter, and Quirinus—who were by no means forgotten. The new triad, however, took pride of place, and on the Capitoline Hill there arose a great temple with a grand portico to house them. This was the greatest temple in the whole Etruscan world, and it remained the largest temple in Rome until the fall of the Roman Republic. It had three rooms for its three divinities, but in the middle shrine, clothed in an embroidered tunic and a toga, sat a terracotta statue made by the Etruscan sculptor, Vulca of Veii. It portrayed Jupiter *Optimus Maximus*, that is, “Jupiter, the best and greatest god” who now absorbed the attributes of *Tinia*, the “Sky-Father.” In fact, the Romans sometimes invoked him simply as

*caelum*, meaning “sky.” The traditional date for its dedication was 509 B.C.E. A year before, the last Etruscan king had been expelled from Rome.

**ETRUSCAN LEGACIES.** The Romans owed two other rites to the Etruscans. One was the art of augury: how to divine the future by observing the flight of birds or examining the viscera of sacrificial animals. The Etruscans were experts at reading omens from the size, shape, color, and markings of the vital organs, particularly the liver and the gallbladder. One tool of the augur’s craft has been found at Piacenza in Italy. It is a model liver made of bronze that is divided into forty sections labeled with the names of gods. There were Etruscan textbooks: Books on Lightning, Books on Ritual, Books on Fate, Books of the *Haruspices* (Soothsayers) on interpreting signs and portents, and Books on Animal Gods. Lightning was a significant foretoken. In which of the sixteen divisions of the heavens was it seen? The Etruscan Books on Lightning would have an answer. *Tinia* threw three kinds of thunderbolt, and eight other gods threw one kind each. If the omens were bad, what sort of expiation would avert disaster? Consulting the Books of Haruspices would be in order. The Romans were apt pupils, though they never took the occult sciences of the Etruscans quite as seriously as the Etruscans did themselves. The other Etruscan legacy was the Roman triumph. How much of the ritual was Etruscan is not known, but as time went on, the triumph developed into a parade where a victorious general entered Rome in a chariot and proceeded through the Roman Forum to the temple of Jupiter on the Capitoline Hill. Before him were paraded his prisoners and the spoils of his campaign. He wore the regalia of Jupiter Optimus Maximus, and his face was painted red. Behind him in his chariot stood a servant who repeated, “Remember that you are a man!” The triumph was an honor that generals in the Roman republic sought eagerly, and after the fall of the republic, it was reserved for emperors.

**THE INFLUENCE OF THE GREEKS.** Greek influence arrived early to Rome. A legend related that before Romulus founded his city, there was a Greek colony on the site of Rome. There were flourishing Greek cities in Sicily and southern Italy, and Rome was soon in contact. The result was that Rome’s gods became identified with Greek gods. Mars and the Greek Ares were both war gods so they were equated even though they had little else in common. Aphrodite was identified with the Roman Venus, Artemis with Diana, Athena with Minerva, Hera with Juno, and Zeus with Jupiter. Hestia was Vesta and the Titan Kronos became Saturn. Apollo remained Apollo, and stayed on the sidelines until the em-

Arch of Trajan, detail showing Hercules, Minerva, Bacchus, Jupiter, Ceres, Juno, and Mercury, Benevento, Italy, 114–117 C.E. ALINARI-ART REFERENCE/ART RESOURCE, NY. REPRODUCED BY PERMISSION.

peror Augustus endorsed his cult and built a great temple for Apollo on the Palatine Hill. Dionysus was known by his alternative Greek name, Bacchus, which does not appear in Greek usage before the fifth century B.C.E., and his festivities were called the Bacchanalia. Heracles became Hercules, and his worship was an early import from Greece. Sacrifices made to him at the *Ara Maxima* (the Greatest Altar) in Rome were according to the Greek rite: that is, the priest officiated with head uncovered, and not with head covered as was the Roman custom. These Greek immigrant gods brought their myths with them. Latin literature began when an ex-slave, Livius Andronicus, who was probably a Greek, produced Latin tragedies and comedies in Rome, based on Greek models and using Greek myths for subject matter. He also translated Homer’s *Odyssey* into rough-and-ready Latin verse. Hera became Juno, Zeus Jupiter, and Athena Minerva, and the Romans were told titillating stories about their gods that were revelations. The Romans learned from Homer that Venus was married to Vulcan and had an affair with Mars. The discovery must have come as a shock to many of them.

**THE PREMINENCE OF GREECE.** By the end of the third century B.C.E. there was a circle of Roman nobles who were so influenced by Greek culture that they

*a PRIMARY SOURCE document***THE TABOOS SURROUNDING THE FLAMEN DIALIS AND HIS WIFE**

**INTRODUCTION:** The word *flamen* seems to mean something like “priest” or “sacrificer,” and there were fifteen of them, of whom the *flamines* for Jupiter, Mars, and Quirinus were the most important. They had to observe various taboos, and this excerpt from Aulus Gellius’ *Attic Nights*, part of which is quoted below, reports the taboos that the Flamen Dialis (the priest of Jupiter) and his wife had to observe. It was not always easy to find candidates for the office. Julius Caesar considered it in his youth but thought better of it. Aulus Gellius, a Roman lawyer and litterateur who lived in the second century C.E., wrote a collection of table talk in twenty books titled the *Noctes Atticae*, which report a great assortment of information that he has gleaned from his reading. In this case, his source is Rome’s first historian, Fabius Pictor, who lived in the last quarter of the third century B.C.E., and Gellius recalls—evidently from memory—what he has read.

These are the taboos that I recall from my reading. There is a religious ban against the Flamen Dialis riding a horse. Similarly there is a ban against his viewing the Ro-

man people armed and in battle order outside the city boundary of Rome. For that reason, the Flamen Dialis was elected consul very seldom, for the consuls are entrusted with high command in war. Likewise it is never lawful for him to swear an oath by Jupiter, and it is also unlawful for him to wear a ring, unless it is pierced and without a gem. It is not lawful for fire to be removed from the *Flaminia*, that is, the home of the Flamen Dialis, unless it is being taken to be used in sacrifice. If a prisoner in fetters enters the house, he must be released, and the fetters must be pulled up through the *impluvium*, [the opening in the roof above the main room of a Roman house, called the *atrium*] to the roof, and from there be dropped down on to the street. The cone-shaped cap he wears must have no knot on it, nor can there be a knot on his belt or on any other part of his clothing. If anyone who is being taken off to be flogged falls at his feet as a suppliant, it is a sin to flog him on that day. Only a free-born man may cut the hair of the Flamen Dialis. Custom requires the Flamen neither to touch nor even utter the name of a female goat, or raw meat, ivy or beans.

**SOURCE:** Aulus Gellius, *Attic Nights*. 10.15. Translated by James Allan Evans.

preferred to speak Greek at home rather than Latin. Greek art was prized, and when Rome’s empire expanded into the Greek world, the Romans found plenty of it to plunder. They also wanted copies of Greek sculpture for their houses and gardens, and Greece developed an export trade in replicas to meet the demand. Most of the masterpieces of Greek sculpture are known to us now through Roman copies, which were actually copies made by Greek craftsmen for the Roman trade. In the religious imagination of Rome, Roman gods began to look like their Greek counterparts. Modern cultural historians might consider this a degeneration of Roman culture, but it is unlikely that the Romans saw it that way. Roman culture changed constantly as a result of borrowing from a circle of contacts which expanded as Rome’s imperial dominion grew, and many Romans thought the process strengthened rather than weakened Latin traditions. Not all Romans were so accepting of Greek culture, however. There was a reaction, and one figure associated with the reaction was the first Roman author to produce a work in Latin prose, Marcus Porcius Cato (234–149 B.C.E.). He authored the first history of Rome in the Latin language. It has not survived, but his treatise *On Agriculture* has, and it pays special attention to the traditional rites of the farmers who tilled the Italian countryside. Greek

culture might capture the imaginations of upper-class Romans, but ritual remained intensely conservative.

**THE WORSHIP OF THE ROMAN GODS**

**THE PRIESTHOODS.** One remarkable feature of Roman religion was that the priests—who were all males except for the Vestal Virgins—were organized into a number of *collegia* and other small priestly groups, each with a special function to perform. There were four major *collegia*, a word usually inaccurately translated as “colleges,” for they were actually clubs or associations. First there were the fifteen pontiffs, headed by the chief priest or *pontifex maximus* who was chosen by his colleagues in the early Roman republic. From the third

*a PRIMARY SOURCE document***THE LUPERCALIA FESTIVAL**

**INTRODUCTION:** The Lupercalia was a pagan festival celebrating Rome's legendary twin founders, Romulus and Remus. The name "Lupercalia" must be connected with the Latin word *lupus*, meaning "wolf," and suggests that this was at one time a primitive rite intended to keep flocks and herds safe from wolf packs. Whatever its origins, the festival became associated with the arrival of the legendary twin infants Romulus and Remus to Rome after their cradle—set adrift on the Tiber River by their wicked uncle—ran aground at the future site of the city. Almost two centuries after the emperor Constantine adopted Christianity as the religion of the Roman Empire, this pagan festival was still being celebrated. Every 15 February, people swept clean their houses and then went out to watch the Luperci run around the boundary of the city, starting at the Lupercal, the cave below the western corner of the Palatine Hill where a she-wolf supposedly suckled Romulus and Remus in their infancy. The festival began with the sacrifice of a goat (or goats) and a dog in the Lupercal, and then the Luperci—young men wearing only loin cloths—ran carrying strips of goathide from the sacrificial victims with which they lashed out at anyone in their way. Women often deliberately placed themselves within reach of the lash in the belief that a touch

from it aided in fertility, pregnancy, and childbirth. The Roman poet Ovid described the Lupercalia in his unfinished work, the *Fasti*, which was a poetic commentary on the Roman calendar of festivals. In the excerpt below, he described the discovery of Romulus and Remus by the she-wolf.

The cradle drifts to a dark wood and gradually,  
As the river languishes, grounds in mud.  
There was a tree: traces remain, and what is now called  
The Ruminal fig was Romulus fig.  
A whelped she-wolf (marvel!) came to the abandoned  
twins.  
Who'd believe the boys weren't hurt by the beast?  
Far from hurting, she even helps. A she-wolf suckles  
Those whom kindred hands were braced to kill.  
She stopped, her tail caresses the delicate babes,  
And she shapes the two bodies with her tongue.  
You could tell they were sons of Mars. They suck the  
teats  
Fearlessly, and feed on milk unmeant for them.  
The wolf named the place, and the place the Luperci;  
The nurse was well rewarded for her milk.

century B.C.E., however, a pontiff would be elected by the Roman people and held office for life. The emperor Augustus became a pontiff early in his career, and as soon as the incumbent *pontifex maximus* died in 12 B.C.E., he took over the post. The college of pontiffs also included the *flamines* (priests), the *rex sacrorum* (the king of sacred rites), and the six Vestal Virgins. There were twelve minor *flamines* and three important ones: the *Flamen Dialis*, the *Flamen Martialis*, and the *Quirinalis*, that is, the priests of Jupiter, Mars, and Quirinus, the ancient divine triad of Rome. The *flamines* were surrounded by various taboos; the *Flamen Dialis*, for instance, could not be away from his own bed for more than two consecutive nights. Anyone hoping for military renown avoided the office, for no *Flamen Dialis* could lead an army on campaign. For a long period in the first century B.C.E., the office was vacant. The *rex sacrorum* took over the *sacral* duties of Rome's ancient kings—that is, their functions as priests of the state. Presumably, before the last king, Tarquin the Proud, was driven from Rome in 510 B.C.E., he headed the college of priests, and a "king of sacred rites" took over his sacerdotal functions. The presidency of the college, however, went to the *pontifex maximus*, and as a republican

gesture the "king of sacred rites" was barred from all political offices. The second major college was the fifteen augurs who supervised all rituals concerned with the auspices. The third college had the mouth-filling name *quindecimviri sacris faciundis*, meaning "the fifteen-man committee for doing sacred things." Whenever the Roman senate felt that Rome's collection of oracles known as the Sibylline Books should be consulted, it was this group of priests who carried out the consultation. Finally there was a college that looked after one of the most characteristic institutions of later Rome, the *ludi* or the Games which were days filled with competitions and amusements for the public. They began with processions when the images of the gods were paraded through the streets; then there would be the shows: horse racing, to which there was later added animal fights and theater productions held in the presence of the gods, whose images would be seated among the spectators. These priests, called *epulones*, were not the business managers of the *ludi*; those were usually politicians on their way up the political ladder. Despite the political nature of the Games, the religious aspects of the Games were very important, and in 196 B.C.E. a three-man college of *epulones* was established to look after

*a PRIMARY SOURCE document***THE REFORMS OF NUMA POMPILIUS**

**INTRODUCTION:** After the death of Rome's founder, Romulus, the question of a successor arose, and the people elected Numa Pompilius from the Sabine town of Cures to rule over them. Numa was known as a man of peace who established Roman religion. Roman legend attributed to him the ancient rituals of Roman religion. The following excerpt is from Livy's history of Rome, which was written in the reign of the emperor Augustus; he thus was describing reforms that took place some seven centuries before his own time.

[Numa's] first act was to divide the year into twelve lunar months; and because twelve lunar months come a few days short of a full solar year, he inserted intercalary months, so that every twenty years the cycle should be completed, the days coming round again to correspond with the position of the sun from which they had started. Secondly, he fixed what came to be known as "lawful" and "unlawful" days—days, that is, when public business might, or might not, be transacted—as he foresaw that it would be convenient to have certain specified times when no measures should be brought before the people. Next he turned his attention to the appointment of priests; most of the religious ceremonies, especially those which are now in the hands of the Flamen Dialis, or the priest of Jupiter, he was in the habit of presiding over himself, but he foresaw that in a martial community like Rome, future kings were likely to resemble Romulus rather than himself and to be often, in consequence, away from home on active service, and for that reason appointed a Priest of Jupiter on a permanent basis, marking the importance of the office by the grant of special robes and the use of the royal curule chair. This step ensured that the religious duties attached to the royal office should never be allowed to lapse. At the same time two other priesthoods, to Mars and Quirinus, were created.

He further appointed virgin priestesses for the service of Vesta, a cult which originated in Alba and was therefore not foreign to Numa who brought it to Rome. The priestesses were paid out of public funds to enable them to devote their whole time to the temple service, and were invested with special sanctity by the imposition of various observances of which the chief was virginity. The twelve Salii, or Leaping Priests, in the service of Mars Gradivus, were also introduced by Numa; they were given the uniform of an embroidered tunic and bronze breastplate, and their special duty was to carry the *ancilia* or sacred shields, one of which was fabled to have fallen from heaven, as they moved through the city chanting their hymns to the triple beat of their ritual dance.

Numa's next act was to appoint as pontifex the senator Numa Marcius, son of Marcus. He gave him full written instructions for all religious observances, specifying for the various sacrifices the place, the time, and the nature of the victim, and how money was to be raised to meet the cost. He also gave the pontifex the right of decision in all other matters connected with both public and private observances, so that ordinary people might have someone to consult if they needed advice, and to prevent the confusion which might result from neglect of natural religious rites or the adoption of foreign ones. It was the further duty of the pontifex to teach the proper forms for the burial of the dead and the propitiation of the spirits of the departed, and to establish what portents manifested by lightning or other visible signs were to be recognized and acted upon. To elicit information on this subject from a divine source, Numa consecrated on the Aventine an altar to Jupiter Elicius, whom he consulted by augury as to what signs from heaven it should be proper to regard.

them. In the first century B.C.E. their number was raised to seven. The *epulones* also looked after an odd ritual called a *lectisternium*, which the Roman senate decreed when menacing portents indicated that the gods should be appeased. The images of the gods were placed on the streets lying on pillows, and food of all kinds was set before them. Once fed, and presumably happy, the gods were returned to their sanctuaries. Actually, the *epulones* ate the food. Not for nothing did the word *epulones* mean "guests at a banquet." There were other priestly groups, too. The *fetial* priests looked after foreign relations. They determined that Rome's wars were "just

wars," and a fetial priest would perform a ritual before the Roman army crossed into the enemy's territory to make sure that the gods recognized that justice was on the Roman side. The *haruspices* specialized in the Etruscan lore of interpreting prodigies. Two ancient groups were connected with festivals: the *Salii*, priests of Mars who put on archaic armor with conical caps and shields shaped like the figure eight, and danced at various places in the city during the festivals of Mars in March and October; and the "Luperci," the runners in the Lupercalia festival. Finally there were the Arval Brethren, an ancient but obscure college during the Roman republic

that cared for the cult of an equally obscure goddess known as the Dea Dia. The emperor Augustus joined the Arval Brethren and adapted the college to the purposes of the imperial cult. The revived college inscribed its records on stone, and fragments of these inscriptions have survived, running from 21 B.C.E. to 304 C.E., with the result that historians are better informed about the Arval Brethren than any other college.

**FESTIVALS.** The dates of the great festivals were set out in the ritual calendar, which was first drawn up by the legendary King Numa, the successor of Romulus. Copies, inscribed on stone, survive, but almost all date from the reign of Emperor Augustus, and if Numa's calendar ever existed, it had undergone changes over time. Every month except September had festivals. Some lost their original meaning and acquired a new one. The shepherds' festival in April for the protection of their flocks known as the Parilia became a birthday festival for Rome. There were festivals for the dead—the Parentalia every February and the Lemuria in May—which were essentially family festivals. The Saturnalia in December was also a family festival, though it started with sacrifices at the temple of Saturn; the feasting when masters and slaves exchanged roles, and presents were given, all took place inside the household.

**EMPEROR WORSHIP.** Once Rome acquired divine emperors, the worship of the emperor was grafted on to the traditional religion. Temples to the emperors, living and dead, soon became the most prominent temples in Rome and in other great cities of the empire as well. The emperors not only became the high priests of Rome, but, as gods, they received sacrifices. In most of the provinces of the empire, a provincial assembly for the celebration of the imperial cult would meet every year in the chief city. It would hold a festival in honor of the emperor and it would discuss provincial business. If a governor was corrupt, for instance, it could arrange for him to be prosecuted in Rome. The cult of the emperors was not standardized, but it did provide a focus for provincial loyalty as well as a channel for complaints from the provinces to reach Rome.

**JEWISH RESISTANCE.** The Jews resisted the idea of making sacrifices to the emperors, and the civil authorities made an exception, though the emperor Caligula (37–41 B.C.E.) nearly provoked an uprising in Judaea by insisting that his image be placed in the Temple in Jerusalem. Caligula's assassination averted the crisis. The Jews were willing to offer prayers in their synagogues on the emperor's behalf, though they would not offer prayers to him. The Christians, however, were stubborn in their refusal to either pray to the emperor or for him.

## IMMIGRANT RELIGIONS: THE ARRIVAL OF NEW CULTS FROM THE EAST

**MULTICULTURAL ROME.** By the first century C.E., Rome had a population of nearly a million people. It was huge by the standards even of the early modern world: in seventeenth-century Europe, only London, Paris, and Constantinople had populations above 400,000. It was also a magnet for immigrants from the empire, which by the mid-century stretched from Britain to the Middle East. Many came as slaves, who were then freed and as freedmen became Roman citizens. They brought their religious beliefs with them.

**MAGIC.** Along with the new cults there was an upsurge of interest in magic and astrology. The attraction of magic was that it purported to give mortals some control over life and death and the powers of the Underworld. The magician, with his handbooks of magic spells, gave the impression that he could make things work in a world where nothing seemed to work the way it once did. The authorities found it frightening. A *defixio*—an enchantment against an enemy, often only a thin leaflet of lead with a curse scratched on it, then folded, pierced with a nail and buried at a strategic location—could harness supernatural forces to do damage. What is striking about the enchantments that have survived is the range of divinities. All the Olympian gods appear, but as capricious, demonic powers. Apollo, the Olympian most often invoked, became a sun god. Babylonia, Egypt, and Judaea also contributed deities. Osiris and Isis from

*a PRIMARY SOURCE document***THE IMPORTANCE OF MAGIC**

**INTRODUCTION:** Magic was an important element of Greek and Roman religion. Greek mythology provides some information about it. For example, the Telchines who lived on the island of Rhodes were semi-divine little people like the gnomes of Europe and the leprechauns of Ireland, who were not only skilled metal-workers but also powerful magicians who had the Evil Eye. They hated the Olympian gods, and they cast spells on mortals. The Idaean Dactyls were also dwarfs who were wizards connected with Mt. Ida on Crete, though other traditions placed them in Phrygia. Magic, including astrology, was feared, and the Roman authorities tried to suppress it. Magic books that gave recipes for spells were burned, but some survived, and the sands of Egypt have yielded a large corpus of magical papyri. The document printed below is a spell for invisibility. The words that are in italics are written in Old Coptic, the language of the native Egyptians in the later Roman Empire. The rest of the doc-

ument is in Greek. Where "NN" appears, the man casting the spell should insert his own name.

**SOURCE:** *The Greek Magical Papyri in Translation, Including the Demotic Spells*. Ed. Hans Dieter Betz (Chicago: The University of Chicago Press, 1986): 9.

Egypt rubbed shoulders in the Underworld with Hermes and Aphrodite as did a god called Iao, who is the Jewish Yahweh. In the surviving enchantments, Iao is the god most often invoked. Part of magic's attraction was a wish to control destiny in a changing world, and to understand the life after death. While the worshippers of these gods were often immigrants who remained loyal to their ancestral religions, these new cults also made converts. Some Romans converted to several of them since, except for Judaism and Christianity, they were not exclusive.

**CULT OF ISIS.** The goddess Isis was an import from Egypt. In Egyptian myth she was the sister-wife of Osiris, who was slain by the evil god Seth and cut into many pieces so that he could not be mummified and enter the afterlife. Isis searched for the pieces and found them all but one. The secret of where it was hidden was revealed only when Isis' son, Horus, whom the Greeks called Harpocrates, forced Seth to reveal it. Then, at last, Osiris could be resurrected. In the afterlife, as Osorapis, he became the head of the panel of judges who judged the dead. When the Greeks came to Egypt, they identified Osiris as their god, Dionysus. The best-preserved temple of Isis in Italy is in Pompeii, which had just been rebuilt after it was destroyed by an earthquake in 62 C.E. and had not been in use long before all Pompeii was overwhelmed by the eruption of Mt. Vesuvius in 79 C.E. The temple at Pompeii had cells for her priests and a cistern for the Nile water; Isis

was attended by Egyptian priests who shaved their heads and wore white linen garments, and her rituals used sacred water from the Nile river. The processions that marked her festivals were elaborate productions, with dances, penitent worshippers, and music. When the navigation season opened each spring, and the grain transports began to bring their cargoes from Egypt to Italy, Isis gave the ships her blessing in a festival called the *Ploiaphesia*.

**CULT OF SERAPIS.** The god Serapis was often coupled with Isis. His cult seems to have developed out of the cult of Osorapis, but it was encouraged by the Ptolemaic kings of Egypt who may have thought he would bridge the gulf between the religions of the Greeks and their Egyptian subjects. The great temple of Serapis at Alexandria was one of the wonders of the ancient world. Isis in Egyptian mythology was the mother of Horus, the hawk-headed god, but among the Greeks and Romans, Horus became Harpocrates, who is shown as a chubby infant with his hand in his mouth, and Serapis became his father. He is often shown being suckled by Isis and when Egypt was Christianized in the fourth century C.E., the Virgin Mary and the infant Jesus took over the iconography of Isis and Harpocrates.

**MITHRAISM.** Mithraism was an offshoot of Zoroastrianism, the national religion of Persia. Mithras was one of the angels in the forces of Ahura-Mazda, the god of light, in his battle with Ahriman, the god of evil. No

evidence of Mithraism has been found in ancient Iran, and possibly it was within the Roman Empire that Mithraism developed as a separate cult. Its ritual was secret and confined to men, and modern historians are ill informed about it, except that candidates for initiation underwent a series of ordeals. Initiates met in small oblong chapels with benches along the side-walls and, at the end, a painting or sculpture showing Mithras slaying a bull, for one duty that Mithras undertook was to capture and kill a mysterious bull. Mithraism was a militant religion with a special appeal for Roman soldiers. *Sol Invictus* was a natural associate of Mithras, for *Sol Invictus* was the “Invincible Sun,” and Mithras was a god of light. In the third century *Sol Invictus* almost became Rome’s national religion, for the emperor Aurelian (270–275 B.C.E.) was a devotee and built a great temple in Rome to *Sol Invictus*, which was dedicated on 25 December, the Sun’s supposed birthday.

**OTHER CULTS.** There were other new cults as well. One that arrived early was the cult of Attis and the “Great Mother,” Cybele. The Roman senate imported the cult towards the end of the third century B.C.E. and established a religious festival for it called the Megalensia. The rites of the Great Mother celebrated the death and resurrection of Attis, and they involved ecstatic rituals performed by priests called *galli* who had castrated themselves. The cult was kept under strict control in Rome for more than 200 years, but once it was allowed freedom, it began to win converts. One of

the rites attached to it was the *taurobolium* which appeared in Rome in the mid-second century C.E. and from there spread through the Western Empire, becoming particularly popular in Gaul. The recipient would climb down into a ditch and be bathed by the blood of a bull—or alternatively a ram—that was slaughtered above him.

**JUDAISM.** Among the immigrant religions was Judaism. There was already a Jewish community in Rome in the early first century B.C.E. and their numbers increased after the Roman general Pompey extended Rome’s dominion into the eastern Mediterranean and returned home in 63 B.C.E. with a vast quantity of booty and slaves, among them Jews. Julius Caesar gave the Jews certain privileges, such as the right not to be summoned to court on Shabbat, and Judaism became a *religio licita*, that is, a “licensed religion,” a cult that could claim protection under Roman law. There were soon synagogues in the major cities of the empire, and they attracted Gentile (non-Jew) attention. Persons called “God-fearers” were Gentiles with a sympathetic interest in Judaism who might come to synagogues to hear a good speaker and were made welcome. Some became converts, but that involved circumcision, which could be a dangerous procedure for an adult male before modern hygiene. The general Roman attitude to Judaism was ambivalent: Jews were considered clever in the art of healing the sick and

*a PRIMARY SOURCE document***AN EPIPHANY OF ISIS**

**INTRODUCTION:** Lucius Apuleius lived in the second century C.E. as part of a wealthy family at Madaura in Africa. His *Metamorphoses*—better known under the title *The Golden Ass*—is the only Latin novel that survives in its entirety. It tells the story of one Lucius whose curiosity about black magic led to his being transformed accidentally into a donkey, and as a donkey he undergoes a number of adventures. The novel reads like a light-hearted romp until the conclusion, when Lucius has a vision of the goddess Isis as he lies on the beach at Cenchreae, the port of Corinth. Isis restores Lucius to human form and he becomes a devotee. At the end of the story, Lucius shaves his head and becomes a priest of Isis. The following excerpt describes Isis as she rises from the sea.

I had scarcely closed my eyes before the apparition of a woman began to rise from the middle of the sea with so lovely a face that the gods themselves would have fallen down in adoration of it. First the head, then the whole shining body gradually emerged and stood before me poised on the surface of the waves. Yes, I will try to describe this transcendent vision, for though human speech is poor and limited, the Goddess herself will perhaps inspire me with poetic imagery sufficient to convey some slight inkling of what I saw.

Her long thick hair fell in tapering ringlets on her lovely neck, and was crowned with an intricate chaplet in which was woven every kind of flower. Just above her

brow shone a round disc, like a mirror, or like the bright face of the moon, which told me who she was. Vipers rising from the left-hand and right-hand partings of her hair supported this disc, with ears of corn bristling beside them. Her many-colored robe was of finest linen; part was glistening white, part crocus-yellow, part glowing red and along the entire hem a woven border of flowers and fruit clung swaying in the breeze. But what caught and held my eye more than anything else was the deep black luster of her mantle. She wore it slung across her body from the right hip to the left shoulder, where it was caught in a knot resembling the boss of a shield; but part of it hung in innumerable folds, the tasselled fringe quivering. It was embroidered with glittering stars on the hem and everywhere else, and in the middle beamed a full and fiery moon.

In her right hand she held a bronze rattle, of the sort used to frighten away the God of the Sirocco; its narrow rim was curved like a sword-belt and three little rods, which sounded shrilly when she shook the handle, passed horizontally through it. A boat-shaped gold dish hung from her left hand, and along the upper-surface of the handle writhed an asp with puffed throat and head raised ready to strike. On her divine feet were slippers of palm leaves, the emblem of victory.

also in magic, but their denial of all other gods except their own seemed unduly exclusive. Still, Judaism was one of the new religions which took an important place in Rome in the imperial period.

**COMMONALITIES.** All these cults had one thing in common: they accepted individuals as initiates and made them part of a special group. Most of them imparted some transcendental knowledge to their converts as part of their initiation, and for that reason they are commonly called "mystery religions." They did not all promise resurrection after death, but they did borrow from each other, and as time went on, they all developed an eschatology—that is, doctrines about the afterlife—of one sort or another. The greatest attraction seems to have been that, in a world that was increasingly chaotic—particularly in the third century B.C.E. when order broke down and the Roman Empire seemed unable to cope with new invaders that crossed its borders—these cults imparted a sense of belonging to a circle of like-minded persons.

## THE RISE OF CHRISTIANITY

**CHRISTIANITY AS A JEWISH SECT.** Christianity began with a group of Jews who followed the teachings of Jesus, a Jewish carpenter who attracted many followers during his three-year ministry which began in 30 C.E. Jesus' teachings regarding the Jewish law and his claim to be the "messiah" (the savior of the people) long-awaited by the Jews threatened the Jewish religious leaders, who managed to have him crucified by the Roman authorities in 33 C.E. on charges of heresy. Although the religion initially faltered after Jesus' death, reports that Jesus had risen from the dead bolstered the fledgling church in spite of its continued persecution by the Jewish religious leaders. The years following Jesus' crucifixion saw an increase in the number of "Christians"—so-called because they followed Jesus "the Christ." The religion was not without its growing pains, however. According to the *Acts of the Apostles* and the *Epistles* of St. Paul, there soon arose a division of opinion among the followers of Jesus. On the one hand, there was a conservative group centered in Jerusalem, led by James, the brother of Jesus. They clung to the Jewish law of Moses and insisted that all Gentile converts should be circumcised. The other group centered on Paul, a Jew of the diaspora, that is, the Jewish communities living outside Judaea. He had not known Jesus personally, but he had been converted to the new religion that he believed that Jesus had preached, and he was full of zeal. He wanted to reach out to the Gentiles, and he considered the dietary restrictions of Mosaic law and circumcision unimportant. Probably Paul and his followers would have lost the quarrel, except that a Jewish revolt intervened. A sect of Jewish nationalists in Judaea called the Zealots rose in rebellion in the final years of the emperor Nero's reign. The suppression of the revolt was delayed by Nero's dethronement and a year of civil war before Vespasian took over as emperor in 69 C.E.; the next year, Jerusalem was taken by an army led by Vespasian's son, Titus. The Temple was destroyed and its treasures taken to Rome as booty. The Jewish priesthood that had presided over the sacrifices at the Temple no longer had a center for their rituals. The future of Judaism lay with the synagogues and their rabbis, and a rabbinical school that was established at Yavna—later moved to Tiberias—in Judaea was actually encouraged by the Roman authorities. Judaism developed into a religion of the Talmud, which was the collection of writings that constituted Jewish civil and religious law. The Jewish-Christian community in Jerusalem that had opposed Paul had not supported the revolt, but still it was

a casualty. It was dispersed, and many of its leaders were probably killed. Others fled, particularly to Alexandria.

**PERSECUTION.** The future of Christianity lay with the followers of Paul's teachings. They had not supported the Jewish revolt, and their lack of support was not forgotten. Christianity had spread rapidly, partly because Christian preachers were welcome in the synagogues of the Diaspora. That welcome began to grow thin, however, and by the reign of Nero (54–68 C.E.), the Roman authorities began to recognize the Christians as a sect separate from the Jews, and an unpopular one at that. In 64 C.E. more than two-thirds of Rome was destroyed in a great fire. Nero needed a scapegoat, and the Christians were unpopular; in some quarters they were blamed for setting the fire. In fact, many Christians at this point in history expected an imminent Second Coming of the risen Christ and may have imagined that the fire that consumed Rome was the opening scene in the destruction of an evil empire. The Christians suffered their first state persecution at this time, but there were more to follow. The persecutions were sporadic until the middle of the third century C.E. when the empire made a systematic attempt to wipe out Christianity. The emperor Decius (249–252 C.E.) faced a Gothic invasion, the first of many that the empire would suffer. The gods seemed to be angry with Rome, and Decius insisted that everyone sacrifice to them and present certificates to that effect. Had Decius lived longer, he would have done Christianity serious damage, but he was killed in battle, and the persecution slowed. At the beginning of the fourth century C.E. there was another determined persecution, but by then Christianity was too powerful to be wiped out.

**THE ROMAN ATTITUDE TOWARD THE CHRISTIANS.** In 111 C.E., a Roman named Pliny was governor of the province of Bithynia in Asia Minor, and encountered a cell of Christians. He wrote to the emperor Trajan to report how he had handled the case, and his letter has survived. As far as Pliny could ascertain, all the Christians did was to meet before dawn on a fixed day to chant verses antiphonally in honor of Christ "as if to a god" and to bind themselves by an oath, in Latin, a *sacramentum*. Then they would disperse and meet later to eat. Despite these innocuous proceedings, Pliny demanded that all of them make a little sacrifice before the emperor's image, and those that refused be put to death. Pliny sought of Trajan the legal basis for punishing the Christians, asking if Christianity was a crime *per se*, or whether it was the actions of Christians that were recognized as crimes by Roman law. Trajan's answer was brief. He approved of Pliny's actions. As for Pliny's question, the reply was simple. Christianity was a crime *per*

*a PRIMARY SOURCE document***THE TRIAL OF THE SCILLITAN MARTYRS**

**INTRODUCTION:** “The Acts of the Scillitan Martyrs” is a transcript of the trial of a group of Christians from the city of Scillium in the province of Africa Proconsularis, the capital of which was Carthage. Saturninus, the proconsul—that is, the former consul who was acting as governor of the province—presided. The date was the year when Calusian and Praesens held the consulship, 180 C.E. This was a time when the Roman government had outlawed the relatively new religion of Christianity because its followers did not recognize other religions, including the cult of emperor worship. Christians were given the opportunity to renounce their faith in court; those who did not do so were put to death.

On July 17, when Calusian and Praesens were consuls, the latter for the second time, Speratus, Nartzalus, Cittinus, Donata, Secunda and Vestia were arraigned at Carthage in the court.

**Saturninus, the proconsul:** If you come to your senses, you will gain the pardon of our Lord the emperor.

**Speratus:** We have never hurt anyone. We have never committed any crime. We have never libeled anyone. But when we were mistreated, we showed our thanks, because we reverence our own emperor.

**Saturninus, the proconsul:** We Romans are also a religious people. Our religion is very simple: we swear by the *genius* of our Lord the emperor and pray for his well-being. That is what you also ought to do.

**Speratus:** If you would only listen to me quietly, I would explain to you the mystery of simple belief.

**Saturninus:** If you are going to deride our sacred ceremonies, I shall not listen to you. Swear, instead, by the *genius* of our Lord the emperor.

**Speratus:** I do not recognize the kingdom of this world. Rather I serve the God whom no one has seen nor can see. I have committed no theft. I pay taxes on everything I buy. And this because I recognize my Lord, the king of kings, and emperor of all mankind.

**Saturninus, the proconsul, then said to the others:**  
“Cease to adhere to this belief.”

**Speratus:** Any doctrine that teaches that we should commit murder or bear false witness—that would be evil.

**Saturninus, the proconsul: [speaking to the others]**  
Take no part in this business—it is madness.

**Cittinus:** The only one we fear is the Lord our God in Heaven.

**Donata:** Respect Caesar as Caesar, but fear God.

**Vestia:** I am a Christian.

**Secunda:** I want to be none other than what I am.

**Saturninus, the proconsul, to Speratus:** Will you persist in remaining a Christian?

**Speratus:** I am a Christian. (And all the rest agreed with him.)

**Saturninus, the proconsul:** Would you like some time to think this over?

**Speratus:** Where our duty is so clear there is nothing to think over.

**Saturninus, the proconsul:** What do you have as the documents in your case?

**Speratus:** The sacred writings, and the epistles of a saint named Paul.

**Saturninus, the proconsul:** You may have a thirty-day reprieve to think this over.

**Speratus again said:** I am a Christian. (And all the others were of the same mind.)

**Saturninus, the proconsul, then read out the sentence from his tablets:** Whereas Speratus, Nartzalus, Cittinus, Donata, Vestia, Secunda, and the others, have admitted that they live in accordance with the religious rites of the Christians, and whereas they have persevered in their stubbornness even when given the opportunity to return to the Roman religion, it is hereby decreed that they should die by the sword.

**Speratus:** Thank God!

**Nartzalus:** Today we shall be martyrs in heaven—thank God!

**SOURCE:** “The Acts of the Scillitan Martyrs,” in *The Fathers of the Primitive Church*. Ed. Herbert A. Musurillo (Toronto: The New American Library of Canada, 1966): 150–152.

*se.* This decision to outlaw Christianity as a religion made it markedly different from Judaism, which suffered from Roman disdain but was always a legal religion. Christianity was considered dangerous for several reasons. For

one thing, the Roman authorities saw Christianity as a secret society, and secret societies made them nervous. The empire was always afraid of subversion. For another, it is clear from early Christian writings that the Chris-

tians regarded the empire as evil. They looked forward to its final destruction and the Last Judgement. Then, too, there was misunderstanding at fault. There were rumors of horrific Christian rituals including cannibalism, and the liturgy of the Eucharist that professes to offer the body and blood of Christ to Christian worshippers must have nourished this misconception. Finally, unlike the ancient religion of Judaism, Christianity was a new sect, and it was founded by a man who had been crucified by the Romans on a charge of high treason. The Romans had reason to be apprehensive.

**THE RETREAT OF PAGANISM.** Rome's change of attitude towards Christianity began with the conversion of the emperor Constantine to Christianity in 312 C.E. In 313 C.E. he persuaded his co-ruler Licinius, who ruled the eastern portion of the empire, that freedom of religion should be extended to all. Licinius was not a Christian, but he wanted to maintain good relations with Constantine. The proportion of the empire that was Christian at the time of his conversion is a matter of conjecture, but it is generally agreed that it was a minority and perhaps a small minority at that. As Constantine began to favor the Christian church, however, new converts flocked to it. Constantine allowed pagans freedom of religion, but he banned sacrifices and thereby inflicted great damage on the pagan cults, for sacrifices were vitally important for them. He also helped himself to the wealth of the pagan temples. Constantine's new gold and silver coinage that helped stabilize the runaway inflation of earlier reigns used bullion from the pagan temples. The laws recorded in the Roman law codes mark paganism's retreat. Rome's machinery for enforcing its laws was always weak. There was no public prosecutor, and thus when a law appears in the law code, it should not be assumed that it was universally obeyed. If the law is repeated a number of times over a period of years, it can be assumed that there was widespread evasion. The ban on pagan sacrifice is a case in point. It was repeated again and again.

**CHANGEOVER TO CHRISTIANITY.** The changeover from a pagan to a Christian empire took up most of the fourth century C.E. On the coins that Constantine minted, three-quarters of the symbols shown belong not to Christianity but to *Sol Invictus*, the "Unconquerable Sun." Constantine, like his predecessors since the emperor Augustus, was *pontifex maximus*, that is high priest of Rome, and his successors continued to hold the post until Gratian (367–383 C.E.). The imperial cult did not die a sudden death. When Constantine received a request from a town in Italy to erect a temple to him, he gave permission, provided that they did not offer him sacrifices. In 356 Constantine's son, Constantius II, or-

### THE ILLEGALITY OF CHRISTIANITY

**INTRODUCTION:** Pliny the Younger was a Roman litterateur and a gentleman of the governing class who was sent by the emperor Trajan to the province of Bithynia (in northwest Asia Minor) which had been misruled by its senatorial governors and needed someone to remedy the situation. Pliny arrived in Bithynia in 111 C.E. and died there two years later. Pliny's policy towards the early Christian church was harsh in accordance with Rome's suspicious attitude towards these radical believers who neither adhered to Roman pagan gods nor worshipped the emperor. He gave those persons admitting Christianity three chances to deny it, and if they persisted in their avowal, he ordered them executed. If they were Roman citizens, they had a right to a trial at Rome, and Pliny entered them on the list of persons to be sent to Rome to have their cases judged there. His efforts to elicit information about the Christian sect, however, revealed nothing that might endanger the state. Christianity seemed merely to be a "degenerate sort of cult carried to extravagant lengths." Therefore Pliny consulted the emperor Trajan to discover what course of action he should take regarding the Christian church and he received the following reply.

You have followed the right course of procedure, my dear Pliny, in your examination of the cases of persons charged with being Christians, for it is impossible to lay down a general rule to a fixed formula. These people are not to be hunted out; if they are brought before you and the charge against them is proved, they must be punished, but in the case of anyone who denies that he is a Christian, and makes it clear that he is not by offering prayers to our gods, he is to be pardoned as a result of his repentance however suspect his past conduct may be. But pamphlets circulated anonymously must play no part in any accusation. They create the worst sort of precedent and are quite out of keeping with the spirit of our age.

**SOURCE:** Pliny, *The Letters of the Younger Pliny*. Trans. Betty Radice (London, England: Penguin Books, 1969): 295.

dered all temples closed, but in 371 the emperor Valentinian ruled that everyone should be free to worship as he wished. The exceptions were astrologers, magicians, and Manichaeans—the last a sect on the fringes of Christianity which actually had its roots in Zoroastrianism, the national religion of Persia before the rise of Islam,

the doctrines of which envisaged an ongoing struggle in this world between the forces of Good and the dark forces of Evil. In 381, sacrifices were forbidden again, and again in 391 and 392, and in one of those years an event took place that dismayed the pagans who still clung to the old religion: the great temple of Serapis in Alexandria was destroyed by a Christian mob. The pagans expected the god to show his anger by refusing to let the Nile flood and water the fertile fields of Egypt, but the Nile flooded as usual. The pagans were disheartened at the impotence of their god. This was an example of a Christian tactic against paganism which had dramatic effect—demonstrating that the old gods could be flouted without fear of divine punishment.

## SIGNIFICANT PEOPLE *in Religion*

---

### CONSTANTINE

286 C.E.–337 C.E.

*Emperor*

*Convert to Christianity*

**LEGITIMIZED CHRISTIANITY.** Constantine I's long reign brought about a profound change between the Roman state and the Christian church. From being a persecuted sect, Christianity became the privileged religion of the Roman Empire. Constantine was, at first, a

pagan, and worshipped *Sol Invictus*, that is, the "Invincible Sun." His sudden conversion to Christianity on the eve of the Battle of the Milvian Bridge in 312 C.E. does not seem to have resulted in a clean and immediate break with the Invincible Sun religion, but there can be no doubt that the conversion was genuine. He donated the Lateran Palace to the pope almost immediately after he made himself master of Rome. In 313 C.E. he met the eastern emperor, Licinius, in Milan and together they promulgated a decree ordering tolerance for all religions. Constantine soon made it clear, however, that paganism was out of favor. He probably banned pagan sacrifices; although a decree stating such that can be attributed to Constantine has not survived, one from his son, Constantius II, who banned sacrifices and referred to his ban as a repetition of his father's decree still exists. Sacrifice was at the heart of paganism, and by banning sacrifice Constantine struck the pagan cults a mortal blow.

**CONSTANTINOPLE.** In 324 C.E. Constantine united the eastern and western halves of the Roman Empire by overthrowing the eastern emperor, Licinius. He followed up his victory by founding a new capital at Byzantium on the Bosphorus, the strait between the Sea of Marmora and the Black Sea. It was to be a New Rome, free from the pagan traditions and monuments of the old Rome on the Tiber River. It rapidly became known as the "City of Constantine," that is, "Constantinople." It would become the capital of the Byzantine Empire.

**THE ROLE OF A CHRISTIAN EMPEROR.** Emperors before Constantine had held the office of *pontifex maximus*, that is, high priest of Jupiter, Best and Greatest God, and they had also been gods themselves, receiving sacrifices in their temples. Constantine continued to hold the office of *pontifex maximus*, and he did not fully break with the custom of emperor worship; shortly after he conquered Italy he received a request from an Italian town to build a temple to him, and he consented, stipulating only that no sacrifices should be made to him. He eventually redefined the position of the emperor as the "friend" of the *Logos* of the Christian God, that is, the Divine Reason, rather than a god himself. He was God's vicar, that is, his representative on earth. Moreover, as God's vicar, the emperor was involved in defining orthodoxy and repressing heresy. In 325 C.E. he convened the first ecumenical council of the church at Nicaea to resolve the problem of the Arian heresy which held that Christ was a human being, and he was instrumental in formulating the Nicene Creed which set forth church dogma on the nature of Christ.

**BAPTISM AND DEATH.** In 337 C.E. Constantine died as he was planning a campaign against Persia. The end

seems to have come quickly; there was no lengthy illness. He was baptized virtually on his deathbed. It has sometimes been argued that this deathbed baptism shows that Constantine's adherence to Christianity was never strong, but deathbed baptisms were normal at this time, for it was believed that baptism wiped away sin; hence baptisms late in life allowed a sinner to enter Heaven with a spotless record. All the emperors after Constantine were Christian, save one: Julian the Apostate (361–363 C.E.), and his attempt to restore paganism was a failure.

#### HOMER

c. 8th century B.C.E.—c. early 7th century B.C.E.

##### Poet

**ILIAD AND ODYSSEY.** The long epic poems, the *Iliad* and the *Odyssey* stand at the beginning of Greek literature, and the Greeks generally attributed them to a poet named Homer. Nothing can be said for certain about his identity. The years of his life are much disputed; guesses range from the time of the Trojan War, which was generally placed around 1200 B.C.E., up to 500 years after the Trojan War or about 700 B.C.E., which is a date most modern scholars can accept as the approximate period when he lived. It is generally agreed that he lived near the end of a bardic tradition, when oral poets who were generally illiterate performed at festivals or banquets. Yet at some point, the *Iliad* and the *Odyssey* took their present form and were written down, and it is at least possible that Homer was the poet responsible for producing the written text.

**DEVELOPMENT OF RELIGION.** Whoever Homer was, his importance to the development of Greek religion was enormous. The *Iliad* and *Odyssey* defined the gods and goddesses and gave them their attributes. The *Iliad* placed them on Mt. Olympus; the *Odyssey* was a little more vague about the exact location of their dwelling, but in both epics, the gods and goddesses lived high above the earth and looked down on mortals with

detached interest. They represented no ethical ideal, but they were powerful and easily offended.

**PERFORMANCE OF EPICS.** The text of Homer was preserved by a company of bards called the *Homeridai* or “Sons of Homer,” which did not necessarily imply that they were Homer’s descendants, but rather professionals who continued to work in the Homeric tradition. Their responsibility was to recite the portions of the *Iliad* and *Odyssey* at festivals or public gatherings, accompanied by the lyre. Sometimes, before starting his performance, the bard would recite a prelude of his own composition, and some of these have survived as the so-called Homeric Hymns. These hymns are literary creations and not to be confused with the hymns that might be sung to a god as part of the sacrificial ritual, which invoked the god under his various names, recited his deeds, and ended with a prayer. The headquarters of the *Homeridai* was on the island of Chios, off the west coast of Asia Minor, and the author of one Homeric Hymn refers to himself as a blind poet from Chios. It was probably this little autobiographical detail that gave rise to the tradition that Homer himself was a blind poet from Chios.

**HOMER AS EDUCATOR.** The Greeks recognized Homer as the educator of all Greece. His poems were accepted everywhere as classics, and the education of a young Greek would include the memorization of long sections of the epics. We hear of Greeks who could recite all the *Iliad* and *Odyssey* by heart, for they had committed them to memory at school and could still recall them when they became adults. The Olympian gods as Homer represented them became accepted all over Greece, and gave Greek religion whatever unity it had. Moreover, Homer gave Greece a heroic ideal. The Achilles of Homer’s *Iliad* became the splendid model of the heroic warrior who chose honor and valor over a long but uneventful life. If Homer provided the Greeks with an ethical paradigm, it was not the gods but the brave Achilles who died young but left behind him renown and glory.

## NUMA POMPILIUS

715 B.C.E.–673 B.C.E.

*Second king of Rome*  
*Founder of Roman religion*

**THE CALENDAR OF NUMA.** Numa Pompilius may never have existed, but the Romans looked back to him as the founder of their religion. According to Roman myth, Numa became the second king of Rome after Romulus was snatched up to Heaven to become the god Quirinus, or according to another version, murdered by the senators. He was credited with reforming the ritual calendar of Rome and establishing the priesthoods and the cult of Vesta. Before Numa, Rome had used a calendar of ten months, beginning with March, which it took over from Alba Longa, Romulus' native town in Latium. Numa drew up a lunar calendar of twelve months, with extra days inserted by the pontiffs to keep it congruent with the solar year. He fixed days which were lawful for business (*fasti*) and unlawful (*nefasti*), and he set the days for religious festivals.

**THE ROMAN RITUAL CALENDAR.** Numa's calendar may be mythical, but the Romans did have a ritual calendar. Broken inscriptions from Rome and vicinity have preserved fragments of more than forty copies of it. None are exactly the same, but all have roughly the same forty festivals marked in capital letters. While the person who drew up the calendar may not have been Numa, at least the calendar which the Romans thought was Numa's probably did exist.

**THE CULT OF VESTA.** Numa can hardly have founded the cult of Vesta. Her worship parallels the cult of Hestia in the Greek cities, and Roman legend remembered that Alba Longa also had a cult of Vesta. Vesta had a temple of her own in Rome, and she was attended by six Vestal Virgins, the only priestesses in the Roman priestly establishment. The priestesses of Vesta may show that Vesta's cult dates back to a time before Roman society became rigidly patriarchal. The remains of the Temple of Vesta in the Roman Forum and the House of the Vestal Virgins beside it can still be seen. Archaeologists have found votive offerings which were deposited in the forum temple as early as 575 B.C.E., and remains found in the House of the Vestals are even earlier. While these dates indicate that the cult of Vesta began *after* the death of Numa, Numa could have organized the cult of Vesta first in his own house, with his own unmarried daughters as Vesta's attendants. Only later did the Vesta cult move to its own temple after the Roman Forum was drained, and the number of Vestal

priestesses became six. They had to remain virgins for the thirty-year term of their priesthood, and a Vestal who lost her virginity would be buried alive.

**NUMA'S OTHER CONTRIBUTIONS.** Numa was also credited with creating the *Flamen Dialis*, the priest of Jupiter, to take over some of his own ritual duties. He also created priests for Mars and Quirinus. He was also credited with building the Regia in the Roman Forum, which housed the armor sacred to Mars: one shield was said to have dropped from Heaven. The Regia was later the official headquarters of the *pontifex maximus*, or high priest of Rome, and in spite of the fact that the word "Regia" can be translated as "royal palace," it seems never to have been a residence. The first structure built on the site of the Regia was an open-air sanctuary. Another legend about Numa made him a disciple of the Greek philosopher Pythagoras of Samos, who had a group of followers in the Greek settlement of Croton on the Gulf of Taranto in Italy, and then in Metapontum after they were expelled from Croton. Chronology, however, gets in the way of the legend. Pythagoras emigrated from Samos to Croton about 530 B.C.E., long after Numa died.

## ST. PAUL

64 C.E.

*Christian missionary*

### BACKGROUND.

Meanwhile Saul was still breathing murderous threats against the disciples of the Lord. He went to the High Priest and applied for letters to the synagogues of Damascus authorizing him to arrest anyone he found, men or women, who followed the new way, and bring them to Jerusalem. While he was still on the road and nearing Damascus, suddenly a great light flashed from the sky all around him. He fell to the ground and heard a voice saying, "Saul, Saul, why do you persecute me?" "Tell me, Lord, who you are." The voice answered, "I am Jesus, whom you are persecuting."

Thus the *Acts of the Apostles* introduces us to Paul at the turning-point of his life: a sudden conversion which

transformed him from a Pharisee (a Jewish teacher of the law) into one of the major figures in the early Christian church.

**PAUL THE PERSECUTOR.** The future apostle was born in the Hellenistic city of Tarsus in modern Turkey. His father was a citizen of Rome, so he inherited the special status conferred on Rome's citizens, retaining both a Roman name, "Paulus," and a Hebrew name, "Saul." In addition to holding a privileged status in Roman society, Saul was part of the elite tribe of the Jews, the tribe of Benjamin, and was steeped in both Jewish culture and religion. Saul's schooling at Tarsus taught him a smattering of the Greek authors, but for the final stages of his education, his family must have moved to Jerusalem and placed him under the guidance of Gamaliel, the foremost rabbi of the first century C.E. Under Gamaliel, Saul trained to be a Pharisee, an elite teacher of Jewish law. He was also a tent-maker by trade.

**PERSECUTION OF CHRISTIANS.** Saul was extremely zealous in his religious vocation, and viewed the Christians as heretics for claiming that Jesus was the Son of God. The *Book of Acts* in the Bible records Saul's first known participation in the persecution of Christians: at the stoning of Stephen, a deacon of the Christian church, Saul is described as looking on in approval and holding the coats of Stephen's killers. Stephen's stoning apparently began a significant campaign by the temple priesthood to suppress Christianity, and Saul was at the forefront of the persecution, traveling to various cities and even making house-to-house searches for Christians to arrest. At the time of his vision of Jesus, he was on the road to Damascus with letters to the synagogues there from the high priest of the Temple, authorizing him to arrest any Jews he found neglecting the Law of Moses and accepting Jesus as the Messiah, in order to bring them to trial in Jerusalem.

**CONVERSION.** Saul's experience with Jesus described in the passage above convinced him that Jesus truly was the Son of God. The vision, however, had left him blind, and he had to be led to Damascus by his companions who had neither seen nor heard the vision Saul experienced. A second vision assured him that he would be healed of his blindness by a Christian named Ananias, who did indeed pray for Saul to be healed at the behest of a vision he had received. Ananias proved to be an important contact with the Christian church for Saul; he was able to convince a suspicious Damascus church that Saul's conversion was genuine, and Saul, now called "Paul," was accepted into their midst. Saul began to apply his knowledge of the Jewish holy text to prove that

Jesus was the promised Messiah, and quickly became one of the most prominent preachers in the early church.

**CHURCH LEADER.** Paul embarked on an ambitious series of missionary campaigns, and was responsible for planting many churches in various cities. From Damascus he traveled to the Nabataean Kingdom of Arabia to make converts among the Arabs, and also went on a 14-year sojourn to Syria and Cilicia, preaching wherever he went. His letters to the churches he fostered compose a significant portion of the New Testament of the Bible, and his expositions of Christian theology in those letters are the basis for the modern church. So prominent was Paul in the church that he was considered to be an "apostle," even though that title was typically reserved for the members of Jesus' original twelve disciples. As a leader, Paul was a central figure in the theological debates that arose within the church; in particular, he advocated for the inclusion of Gentiles (non-Jews) into the church without forcing them to adhere to Jewish rites such as circumcision and the abstention from eating "unclean" foods. Paul argued that the church's continued fixation on Jewish law made them no different from those who did not believe Jesus was the messiah, and that they should be focusing on Jesus' teachings rather than the rites and laws of Jewish holy texts.

**BREAK WITH JEWISH CHRISTIANS.** Paul's position regarding the Gentile Christians eventually caused a permanent breach with some of the Jewish members of the church. Hard-line Jews, led by the apostle James (the brother of Jesus), pressured more moderate Jews like the apostle Peter to demand that Gentile converts adhere to Jewish law. When Peter sided with them, Paul publicly debated the issue with him and accused him of hypocrisy. The result was a break between Paul and the Jewish-Christian missionaries. Paul continued his mission work, and his travels took him through Asia Minor and across Europe, where he founded a church at Philippi in Macedonia and another in Thessaloniki. He visited Athens, Corinth, and Ephesus. Paul's message was not always well received in the cities he visited, and he was just as likely to be arrested, beaten, or threatened with death as he was to make converts.

**PERSECUTION OF PAUL.** Paul's troubles began when some Jews from Asia Minor recognized Paul in the Temple and incited the crowd to seize him. Roman troops intervened, saving his life, but they kept Paul under arrest. Paul was allowed to address the crowd in Hebrew, but this led to new riots, and Paul was taken into protective custody. At this point, fearing he might be flogged, Paul invoked his privilege as a Roman citizen, which protected him from flogging. Paul tried and failed

to defend himself before the Sanhedrin (the Jewish legal body), and Roman troops once again had to intervene. Some Jewish fanatics conspired to murder Paul, but Paul's nephew warned the Roman authorities and they removed him to Caesarea where he was kept under guard. There the Roman procurator of Judaea, Felix, kept Paul for two years without making a decision about him. When Felix's successor, Porcius Festus, arrived, the Jewish leaders renewed their case against Paul and asked Festus to transfer him to Jerusalem. Paul suspected that they were planning an ambush on the way and appealed to Caesar. The appeal saved Paul from possible murder, but it also meant that he had to present his case directly to Caesar.

**DEATH AND AFTERMATH.** Paul had a great deal of freedom in Rome. A soldier accompanied him, but he had his own lodging, and he contacted the Jewish community. He persuaded some as to the rightness of his ideas, but others remained skeptical. He probably died around 64 C.E. and so it is possible that he fell victim to the emperor Nero's persecution of the Christians in that year, though there is no independent evidence of that. If so, he died just before the event that would defeat his Jewish Christian opponents. In 70 C.E. the Romans, led by the future emperor Titus, destroyed the Temple in Jerusalem. The Jewish Christian church in Jerusalem was a casualty of this catastrophe, as was the Temple priesthood and the Sadducees who had dominated the priestly offices. The break between Judaism and Christianity was complete, and before the end of the century, relations between the two showed signs of hostility.

### SOCRATES

469 B.C.E.–399 B.C.E.

*Philosopher*  
*Teacher*

**IMPORTANCE TO GREEK RELIGION.** Socrates is more important for his contribution to philosophy than religion. Nonetheless, he was important as a catalyst in Athenian intellectual life of the fifth century B.C.E., and the questioning of conventional attitudes which he helped to

initiate spilled over into religious thought. In 399 B.C.E. he was tried before a popular jury of 501 jurymen on a charge of not recognizing the gods whom the state recognized, introducing other new gods, and corrupting the young. There are two surviving accounts of his *Apology*, that is, his speech in his own defense: one by his disciple Plato and a second by another of his followers, Xenophon. They are quite different and neither has a great claim to accuracy. It is not clear what new gods Socrates introduced, and his accusers seem to have concentrated on the charge that Socrates corrupted the young.

**QUESTIONED CONVENTIONAL VIEWS.** It is true that Socrates questioned conventional views of Greek religion. In one of Plato's early dialogues, the *Euthyphro*, Socrates demonstrated that the Olympian gods could not be taken as models of morality or virtue. He himself, however, was scrupulous in his religious observances. His final words before his death were a reminder that he owed a cock to the god Asclepius. Apparently he had promised to sacrifice a cock at the temple of Asclepius on the south slope of the Athenian Acropolis, and he wanted his vow carried out.

**THE TRIAL OF SOCRATES.** Socrates was convicted at his trial by a vote of 281 out of 501 jurymen. His prosecutors suggested the death penalty, and Socrates then had a chance to suggest an alternative punishment. Socrates at first suggested facetiously that he be given meals at state expense for the rest of his life, but, at the urging of his friends, he suggested a modest fine. The jury was clearly annoyed by Socrates' attitude and opted for the death penalty by a greater majority than had found him guilty in the first place.

## DOCUMENTARY SOURCES *in Religion*

Apuleius, *Metamorphoses* (c. 160 C.E.)—The only complete Latin novel that survives, the *Metamorphoses* better known by its popular title *The Golden Ass*, tells the story of how Lucius, who is too interested in black

magic for his own good, is inadvertently changed into a donkey. It ends with an autobiographical account of how Lucius was transformed by the goddess Isis into a man again who stands for Apuleius himself, and is initiated into the cult of Isis who had saved him.

Cato the Elder (Marcus Porcius Cato “Censorius”), *De Agri Cultura* (“On Agriculture”; c. 160 B.C.E.)—Cato’s handbook on how to farm for profit contains a great deal of information about Roman religion and superstition as well as the sacrificial rites which a farmer must know to keep the favor of the gods.

Cicero (Marcus Tullius Cicero), *De Natura Deorum* (c. 43 B.C.E.)—Cicero expounds the view of the gods held respectively by the Epicureans, Stoics and Academics (Platonists) and the work is followed by two appendices, the *On Divination* or “How to Interpret Portents” in two books and *On Fate* which shows the difference between determinism and fatalism.

Delphi, *Oracle of Apollo*—Delphi, on the slopes of Mt. Parnassus in central Greece, was the most famous oracular site in the Greek and Roman world. There the priestess of Apollo known as the Pythia, sitting on a tripod in the temple at Delphi, received questions on one day every month except for the three months of winter, and answered them with replies that were famous for their ambiguity.

Dodona, *Oracle of Zeus*—At Dodona in north-west Greece was an ancient oracle of Zeus, reputedly the oldest oracle in the Greek world, which was closed down only in 392 C.E. According to one account, the oracle spoke in the rustling of leaves on a sacred oak tree.

Hesiod, *Theogony* (c. 700 B.C.E.)—The *Theogony* attributed to Hesiod is a description of how the gods of Greece came into being. In the beginning there is Chaos, Heaven, which is male, and Earth which is female, separate from it; from their union is born the generation of the Titans and from the union of the Titans Cronus and Rhea is born the generation of the Olympian gods.

Homer, *The Iliad* (c. 700 B.C.E.)—Homer’s epic poetry describes the Olympian gods and created the Greek concepts of what the gods were like, how they lived and what their relations were with mankind.

Marcus Minucius Felix, *Octavius* (c. 200 C.E.)—A dialogue written in Latin between a pagan, Caecilius, and a Christian, Octavius, with Minucius acting a referee. Though the dialogue ends with Caecilius becoming a Christian, he presents the case for paganism well and describes the wild rumors about the Christians that

were current among pagans, for instance that in their initiation ceremonies the initiate was made to kill a baby unintentionally and then everyone drank the baby’s blood.

Ovid (Publius Ovidius Naso), *Fasti* (8–17 C.E.)—The *Fasti* is a poetical calendar of the Roman year which records festivals and religious rites for each month. It is an unfinished work, covering only the first six months of the year.

Pausanias, *Description of Greece* (c. 150 C.E.)—Pausanias’ travel guide, based on his own journeys through Greece, pays especial attention to Greek religious sites such as Delphi and Olympia and fleshes out his account with descriptions of worship, superstitious customs, mythology and the like.

Pliny the Younger (Gaius Plinius Caecilius Secundus), *Epistulae* (“Letters”; 61 or 62–c. 114 C.E.)—Pliny’s letters are small essays on current events and provide a valuable commentary on the history and society of Rome in the late first and early second centuries C.E. Two letters written towards the end of his life, one by Pliny himself addressed to the emperor Trajan, and the other Trajan’s reply, deal with a cell of Christians which Pliny has discovered in the province of Bithynia which he is governing, and they show that the imperial authorities regarded Christianity at this time as an outlaw religion.

St. Augustine, *De civitate Dei contra paganos* (“Against the Pagans: The City of God”; 413–426 C.E.)—St. Augustine’s most careful refutation of pagan thought, this work urges Christians to look beyond the turmoil of the Roman world and fix their gaze on the City of God instead of the City of Rome. The work was written in the aftermath of the sack of Rome by the Visigoths in 410 C.E.

St. Luke (?), *Acts of the Apostles* (c. 100 C.E.)—The *Acts of the Apostles*, addressed to someone named Theophilus who was presumably a Roman official, and written by someone familiar with the travel diary of St. Luke which may be incorporated into the latter part of the narrative, describes the spread of Christianity from the crucifixion until thirty-two years later, when St. Paul has been under house arrest in Rome for two years, but is nonetheless free to preach and receive visitors.

Villa of the Mysteries: Pompeii (first century B.C.E.)—This suburban villa outside the walls of Pompeii, which began as a farmhouse in the third century B.C.E., developed into a luxurious villa and then declined to a farmhouse before its destruction in 79 C.E., has a wall painting along three sides of a front room, done in the first century B.C.E. which depicts the initiation of a woman into the mysteries of the god Dionysus.

## IMPORTANT EVENTS in Theater

- c. 750 B.C.E. Homer composes the *Iliad* and *Odyssey* orally.
- c. 600 B.C.E. The form of the tragic chorus and the first satyr verses are introduced in Athens.
- 566 B.C.E. Tragedies are first staged at the newly established City Dionysia in Athens.
- c. 534 B.C.E. Thespis, the legendary actor who first stepped out of the chorus to sing alone, produces the first tragedy.
- 508 B.C.E. The Athenians establish a democratic constitution under Cleisthenes. The freedom of speech and personal rights the citizens gain under this new political system allows for the development of the intensely critical tragedies and Aristophanic political satire.
- c. 502 B.C.E. The Athenians begin keeping records of victories at dramatic festivals.
- 490 B.C.E. The wars between Greece and Persia begin. The playwright Aeschylus fights at Marathon.
- c. 486 B.C.E. Competitions for comedies are added at the City Dionysia.
- 484 B.C.E. The playwright Aeschylus wins his first victory at a dramatic festival.
- 472 B.C.E. Aeschylus produces a trilogy of plays containing *Persians*, the only extant tragedy not based on Greek mythology.
- 468 B.C.E. The playwright Sophocles enters a dramatic festival competition for the first time and wins the dramatic prize, beating Aeschylus.
- 467 B.C.E. Aeschylus produces his trilogy containing *Seven Against Thebes*.
- c. 463 B.C.E. Aeschylus produces the trilogy containing *Suppliants*.
- c. 459 B.C.E. Mynniskos, an actor in Aeschylean tragedy, comes to prominence.
- c. 450 B.C.E.
- 458 B.C.E. Aeschylus produces the *Orestia* trilogy containing *Agamemnon*, *Libation Bearers*, and *Eumenides*, and wins first prize at a dramatic festival competition.
- 456 B.C.E. Aeschylus dies in Sicily.
- 455 B.C.E. The playwright Euripides enters a dramatic competition for the first time.
- c. 449 B.C.E. Competitions for tragic actors are established at the City Dionysia.
- c. 442 B.C.E. Euripides wins a dramatic competition for the first time.
- c. 441 B.C.E. The playwright Sophocles produces the trilogies containing *Ajax* and *Women of Trachis*.
- 441 B.C.E. Sophocles produces the trilogy containing *Antigone*.
- 438 B.C.E. Euripides produces the trilogy containing *Alecestis*.
- c. 435 B.C.E. Theatrical competitions, including contests for both tragic and comic actors, may have been introduced at the Lenaia festival.
- c. 430 B.C.E.
- 431 B.C.E. The Peloponnesian War breaks out between Athens and Sparta. The war and the plague that followed its outbreak become subject material for several plays.
- Euripides produces the trilogy containing *Medea*.
- c. 430 B.C.E. Sophocles produces the trilogy containing *Oedipus the King*.

- Euripides produces the trilogy containing *The Children of Heracles*.
- 428 B.C.E. The philosopher Plato is born.
- Euripides produces the trilogy containing *Hippolytus* and wins first prize.
- 427 B.C.E. The playwright Aristophanes submits a comedy in competition for the first time at age eighteen.
- c. 426 B.C.E. Euripides produces the trilogy containing *Andromache*.
- c. 425 B.C.E. Aristophanes presents *Acharnians* for the first time.
- c. 424 B.C.E. Euripides produces the trilogy containing *Hecuba*.
- Aristophanes produces *Knights*.
- 423 B.C.E. Aristophanes produces *Clouds*.
- c. 422 B.C.E. Euripides produces the trilogy containing *Suppliant Women*.
- Aristophanes produces *Wasps*.
- 421 B.C.E. Aristophanes produces *Peace*.
- c. 420 B.C.E. The tragic actors Hegelochos and Calpides are prominent.
- c. 418 B.C.E. Euripides produces the trilogies containing *Ion* and *Phoenician Women*.
- c. 417 B.C.E. Euripides produces the trilogies containing *Electra* and *Madness of Heracles*.
- 416 B.C.E. The tragic playwright and actor Agathon wins first place at the City Dionysia, according to Plato's *Symposium*, the account of a party in honor of the playwright's victory.
- c. 415 B.C.E. Euripides produces the trilogy containing *Trojan Women*.
- c. 414 B.C.E. Euripides produces the trilogy containing *Iphigenia among the Taurians*.
- Aristophanes produces *Birds*.
- 411 B.C.E. Aristophanes produces *Lysistrata* and *The Festival Goers*.
- c. 409 B.C.E. Sophocles produces the trilogy containing *Philoctetes*.
- c. 408 B.C.E. Euripides produces the trilogy containing *Orestes*.
- c. 407 B.C.E. Sophocles writes *Oedipus at Colonus*, produced posthumously in 401 B.C.E.
- c. 406 B.C.E. Euripides dies at court of King Archelaus of Macedon. Sophocles honors him by dressing his chorus in mourning before the Dionysia.
- 405 B.C.E. Sophocles dies and is honored as a hero.
- The Euripidian trilogy containing *Iphigenia at Aulis* and *Bacchae* is produced posthumously and wins first prize.
- Aristophanes produces *Frogs*.
- c. 392 B.C.E. Aristophanes produces *Women in the Assembly*.
- c. 386 B.C.E. "Old Comedy" is listed as a category in the City Dionysia for the first time.
- 384 B.C.E. The philosopher Aristotle is born in Thessalonica. His *Poetics* defines and extensively discusses Greek tragedy.
- 382 B.C.E. Aristophanes produces *Wealth*.
- c. 380 B.C.E. "Middle Comedy" is prevalent in many dramatic competitions.
- c. 350 B.C.E. Tragic actors Neoptolemus, Aristodemus, and Theodorus are prominent.
- c. 330 B.C.E. Aristotle writes his *Poetics*, which defines and discusses Greek tragedy.
- c. 321 B.C.E. "New Comedy" begins in Athens.
- 316 B.C.E. Menander produces *The Grouch*, his only complete extant play.
- c. 310 B.C.E. Comic actor Parmenon becomes prominent.

- c. 300 B.C.E. The Artists of Dionysus, a performers' union and "religious" guild with its own priest, whose members were exempt from paying taxes and military service, is active.
- The poet Rhinthon of Tarentum, a Greek colony in southern Italy, composes scripts for *phlyax* plays, popular in the western Greek colonies.
- 291 B.C.E. Comic playwright Menander dies.
- c. 264 B.C.E. The first gladiatorial show is performed in Rome.
- c. 240 B.C.E. Livius Andronicus translates one Greek tragedy and one Greek comedy for performance at the Roman Games.
- 236 B.C.E. Naevius, a Roman playwright and poet, produces his first play.
- c. 230 B.C.E. Comic playwright Titus Maccius Plautus flourishes in Rome.
- c. 220 B.C.E. Pacuvius, a Roman tragic playwright and painter, is born in Brundisium, Calabria, in the "heel" of Italy.
- 207 B.C.E. A Roman theatrical union is formed called the College of Scribes and Actors.
- c. 204 B.C.E. Livius Andronicus dies.
- 195 B.C.E. The playwright Aristophanes of Byzantium becomes the head of the library at Alexandria, Egypt.
- c. 173 B.C.E. The first annual performance of mime  
-c. 172 B.C.E. occurs at the Roman festival Floralia.
- Roman actors Antipatros and Agathodorus perform at Delphi.
- c. 170 B.C.E. Accius, a Roman tragic playwright, is born in Pisaurum, Umbria, in central Italy.
- c. 166 B.C.E. Comic playwright Terence is active in  
-c. 160 B.C.E. Rome.
- c. 100 B.C.E. Roman actors Roscius and Claudius  
-c. 50 B.C.E. Aesopus are prominent.
- 69 B.C.E. The comic actor Roscius is defended in court by Cicero on a charge of fraud.
- 55 B.C.E. Pompey dedicates the first permanent, stone theater in Rome.
- 22 B.C.E. The actors Pylades and Bathyllus introduce pantomime at Rome.
- c. 4 B.C.E. Seneca the Younger, philosopher and  
-c. 65 C.E. tragic playwright, serves in the court of Nero, who eventually forces him to commit suicide.
- 60 C.E. Nero puts on the first "Neronian Games."
- 65 C.E. Nero himself performs in the second Neronian Games.
- c. 80 C.E. Mime and pantomime performers form their own artistic union, the Parasites of Apollo.

## OVERVIEW of Theater

**MYTHOLOGICAL ORIGINS.** According to mythology, the theater in ancient Greece sprang from rituals that both honored and appeased the god Dionysus. Dionysus first taught the precious skill of viticulture, the cultivation of grapes for winemaking, to a man named Icarius. Icarius wore goatskins in honor of the god, who had been disguised as a goat in childhood to protect him from the wrath of Hera, queen of the gods. After Icarius served his newly made wine to some shepherds, they became ill from overindulgence and, believing that Icarius had poisoned them, killed him. In order to atone for their crime, they, too, donned the skins of goats and danced and sang around the fire to honor Dionysus and his pupil. From these songs and dances grew rituals of public performance, or so myth would have it. Human beings are fascinated by storytelling and the reenactments of human experience, and most likely always have been. That the Greeks developed this kind of myth about the origins of their theater tells us much about them. For the ancient Greeks, theater was more than entertainment, although it was that, too. It was a didactic institution that sought to analyze social and political change, human relationships, the existence of the divine, and the meaning of life in its deepest sense. For the fifth-century B.C.E. Athenian, drama was an educational and a religious experience as well as entertainment for the ancient Greeks.

**AGE OF THE EPIC.** The word “theater” derives from an ancient Greek verb that means “to see.” But formal staged drama was not the first mode of public performance developed and enjoyed by the Greeks. After the great civilizations of the Minoans and Mycenaeans fell under mysterious but violent circumstances, and before Greece once again produced written literature, architecture, and art, there was a period of several hundred years now called the “Dark Ages.” From the mists of these shadowy years arose a great poet, Homer, who wrote “epic” poetry—long, cadenced poems about great heroes and their struggles to retain their humanity in the face

of warfare, loss, and isolation. These tales of the men who fought in the greatest war in human legend, the Trojan War, were composed orally and were memorized and presented by traveling bards called *rhapsodes* (“reciters of poetry”), who punctuated their performances with the beat of their long staffs. The stories of the Trojan War so captivated the ancient Greeks that they produced dozens of prequels and sequels and tangential episodes to fill in the gaps of and offer alternatives to the Homeric versions of the tales. These legends became the bulk of the material that tragedians later used as the basis for their dramas. Within the Homeric sagas, the poet tells us of the performance of “*paean*s” or songs of celebration and thanksgiving to the gods, especially Apollo.

**COMPETITIONS.** In cities and villages all over ancient Greece, large groups of men and boys formed choruses to perform the “dithyramb,” an ecstatic song and dance to honor Dionysus that sprang from those first frenzied attempts of the shepherds to conciliate the angry god. Legend tells that a man named Thespis was the first to step out of the choral group to speak with his own voice, and thereby “invented” the individual actor in a staged drama. These dithyrambic choruses were also included in the structure of tragedy as it developed and became the heart of Greek drama. In the late sixth century B.C.E., the Athenians founded a democratic government and formalized the performance of tragedy by establishing theatrical festivals. During these festivals, religious processions and rituals blended with the day-long performances of dithyrambs, tragedies, satyr plays, and in later years, comedies, which were in themselves religious expressions. Classical drama combined spoken dialogue with monodies (odes for one voice), choral songs, and dances, which were accompanied by music. Competition was at the center of these festivals: playwrights submitted three tragedies (sometimes a trilogy organized and connected by a theme, sometimes not) followed by a light-hearted “satyr” play, a farcical stage show featuring the lecherous half-man/half-animal creatures who were the constant companions of Dionysus. The staging of these tragedies was undertaken by a *choregos*—a rich citizen who underwrote the cost of the production and oversaw auditions, rehearsals, and the equipage of the troupe. Three playwrights out of the dozens who were actively writing drama were chosen to perform their plays and were awarded first, second, and third prizes. Comic playwrights submitted one play for competition with their peers. Judges were selected from among the Athenian citizenry—adult males whose parents were both native Athenians. Actors in both tragedy and comedy wore masks, long robes, and elevated shoes in order to be seen and heard by the large crowds in the theater. There is

evidence that all classes of people attended performances at these dramatic festivals: citizen men and women, foreigners, slaves, and children. The philosopher Aristotle in the fourth century B.C.E. sought to codify tragedy in his *Poetics* according to his own experience and opinions of the theater.

**COMEDY VERSUS TRAGEDY.** Aeschylus is the earliest playwright whose works still survive. He served in the Athenian military and fought against the Persians during the early years of the fifth century B.C.E. when they sought to conquer Greece. His military experience heavily influenced his earliest extant tragedy, *The Persians*, the only surviving tragedy to use historical rather than mythological events for its plot. Aeschylus and most later tragedians like Sophocles and Euripides chose to dramatize the well-known tales from Greek mythology as a way of expressing their insights on such topics as the possibility of justice in a harsh world, the importance of honor, and the differences between divine and human law. Unlike the tragedies, the first comic plays are now categorized in a genre modern scholars call “Old Comedy.” Comic playwrights like Aristophanes opted to stage political and social circumstances of the day and often portrayed famous people, like Socrates and the politician Cleon, in their uproarious and bawdy comedies (mostly in unflattering ways). Women were often featured as protagonists in both tragedy and comedy, despite the fact that in society, women were permitted very little freedom and would not usually have had much experience with public life. Male actors portrayed all the roles on the traditional stage, just as they did in Shakespeare’s time.

**THE GOLDEN AGE.** The fifth century B.C.E., often known as the “Golden Age” of classical Athens, was bookended by two major wars. At the beginning of the century, the allied Greek forces fought off the invading Persians, and in the last thirty years of the century, the Athenians fought a drawn-out and devastating war with the Spartans, known as the Peloponnesian War. The Spartans were ultimately victorious in this war and annexed the democracy that the Athenians had enjoyed for over a century. This event signalled the end of Athenian ascendancy in the Mediterranean, and with it came a shift in the content of the theater. No longer possessed of such great freedom of speech, the comic playwrights abandoned their topical plays, which were often critical of the government and public figures. Instead, Aristophanes and the playwrights of the fourth century B.C.E., such as Menander, created gentle family-oriented comedies that featured stock roles: the grumpy father, the dissolute son, the dispossessed and vulnerable young girl, the nagging wife, and the nosy neighbor. These plays

were known as part of the style of “Middle Comedy.” Although these plays also had a political message to deliver, it was conveyed by much more subtle means. The production of new tragedies slowed down considerably. A canon of tragic plays was established, and frequent revivals of fifth century B.C.E. dramas were popular.

**RISE OF ROMAN THEATER.** As Rome began to build slowly toward world dominance in the third and second centuries B.C.E., native Italic forms of literature and drama, like the Atellan farces and religious poetry, were supplemented by literature and drama influenced by the Greeks, who had had colonies in southern Italy for hundreds of years. The Romans were superior in military force and imperial ambition, but were in awe of the Greeks’ achievements in architecture, art, poetry, dance, and theater, and they unashamedly copied the Greeks. Poets like Naevius wrote tragedies about Roman legend and myth, but these were not nearly as popular as the comedies adapted from the Hellenistic playwrights by Plautus and Terence. While these comic plays retained the ostensibly Greek settings and many of the more familiar stock characters of “Middle Comedy” (400–200 B.C.E.), the “New Comedy” of Plautus and Terence enlivened the dated dramas of the previous century or two with purely Roman expressions, situations, and humor. Plautus was among the most popular and successful playwrights in history, and his plays continued to be revived and performed for hundreds of years after his death. Under the empire established by Augustus in 27 B.C.E., theater in various forms continued to flourish. The poet Ovid, who was exiled in eight C.E., is known to have written tragedies on classical themes, but unfortunately none of these survive. The emperor Nero fancied himself an actor and often appeared on stage in revivals and newer drama. Seneca, a Stoic philosopher and confidante of Nero, also wrote tragedies using some of the most lurid and disturbing classical myths. Today we cannot know whether Senecan drama was intended to be performed on the stage or merely to be read aloud as entertainment (and perhaps edification) in the royal court. Other forms of theater, like mime and pantomime shows, remained popular throughout the Roman Empire. More extreme forms of public spectacle, like gladiatorial combats, wild beast fights, dangerous chariot races, and executions grew ever more lavish and gruesome.

**LEGACY.** The theater of the ancient Greeks and Romans has continued to enthrall the Western world. It influenced the development of new art forms like opera, which combines dramatic storytelling with grand music and dance. The architecture and brilliant acoustics of ancient theaters shape the way many modern theaters are

designed. The themes of ancient Greek tragedy—like the struggle for power in the family and in the outside world, the harshness of unjust laws, the search for meaning amidst catastrophe, and the soaring heroism of the human spirit—remain as pertinent and powerful today as they ever were.

## TOPICS *in Theater*

---

### ORIGINS OF GREEK THEATER

**PERFORMANCE CULTURE.** The ancient Greeks had a love of pageantry and formalized ritual that permeated their entire society. The poet Homer composed long ballads orally, narratives of great warriors and great human themes. Wandering *rhapsodes* (“reciters of poetry”) memorized these poems and performed them for audiences at banquets and festivals that were public performances in and of themselves. Religious rituals involving all aspects of what we now call drama were performed publicly as well: weddings, funerals, celebrations to honor the gods, and victories in performative competitions of all kinds. Most of the formal elements of theater—people acting out specific roles, appropriate costumes, a set order of events, as well as audience expectation and participation—already existed in the religious rituals the Greeks had been performing for hundreds of years. For the Greeks, performance was an integral part of all aspects of their life. Athenian democracy involved the entire adult male population, and at several meetings a month on the Pnyx, a hill standing opposite the Acropolis of the city, these men performed speeches in front of thousands to persuade or to inflame. To distill the origins of the “theater” from such a culture of performance is impossible, but at the same time it is easy to see how an art form that focused specifically on the performance of all Athenian customs, laws, rituals, government, and religion attained such heights. This art form was theater.

**MYTHOLOGICAL ORIGINS.** The theater festivals celebrated by the Athenians in the city and rural folk in outlying areas of Attica were all dedicated to the god Dionysus. One of the earliest performers in tragedy was said to have complained that the City Dionysia had nothing to do with Dionysus. In fact, it seems especially appropriate for formal rituals of performance to be dedicated to the mysterious god of wine, fertility, and agricultural growth. Though the name “Dionysus” can be

found in the earliest written form of ancient Greek, Linear B, there is a sense throughout the stories of this god in classical mythology that he was an outsider, a foreigner, essentially “un-Greek” in some fundamental way. Dionysus is related to gods from the Near East and Egypt, such as Osiris, but his presence in the Greek pantheon is no intrusion. While Apollo represented qualities the Athenians prized most—such as rational thought, ordered musical and poetic composition, and civic justice—the Greeks were also aware that human nature is two-fold. For every rational thought, there is an irrational desire. For every beautifully composed paean or song on the lyre, there is a wild and unformed song of pure, raw human emotion. In the Homeric Hymn to Dionysus, the god displays his unpredictable nature and demonstrates how he creates “enthusiasm,” literally “the inspiration of the god,” in his followers. The women who worship him, known as *maenads*, or “mad women,” gave themselves up completely to the intoxicating power of the god, power that could bring ease and comfort from life’s suffering but also brought the consequences of inhibition. An individual could become another person entirely through Dionysiac worship—a person could behave and “act” as another character. The half-man, half-animal creatures known as satyrs represent human nature at its most basic and uncivilized: the satyr lives to satisfy his primal urges for sex, wine, and food and has no thought for others. Thus the Athenians produced dramas written and staged according to ancient and well-defined guidelines, but expressive of the most terrifying aspects of the uncivilized human psyche: lust, betrayal, rage, incest, excruciating desire. The audiences who experienced these dramas were meant to undergo a *catharsis*, a cleansing of the soul. The very process of theatrical production was an essential ritual of life for the Athenians because it demonstrated the reintegration of the savage elements of human nature, represented by Dionysus and his retinue, with the civilized and ordered society defined by the tragic form.

**HISTORICAL CONTEXT.** The mighty thalassocracy, or “sea power,” of the Minoans, based on Crete, gave way to the Mycenaeans on the Greek mainland in the mid-seventeenth century B.C.E. The Mycenaeans, whose name comes from the city of Mycenae, built huge palace complexes on the Greek mainland with thick protective walls and ruled through possession of land rather than number of ships. This civilization, from which monumental architecture, magnificent tombs filled with valuable grave gifts, and written documents remain, was wiped out by some kind of catastrophic event around 1100 B.C.E. Greece then entered a period in which there was a widespread deterioration of material culture and

no new cultural production at all. Beginning in the ninth and eighth centuries B.C.E., there was a migration from the mainland of Greece to lands in Asia Minor, the islands in the Mediterranean, and Sicily and the southern parts of Italy. During this period of regrowth, poets and artists once again began to create, including the poet known to modern scholars as Homer, who composed two massive epic poems about the Trojan War, which he presented as a cosmic event from Mycenaean times. Other poets composed hymns to various gods in Homeric style. As the Greeks began to trade with merchants from around the Mediterranean, they came into contact with the Phoenicians, a literate Semitic people with a functional system of writing. The Greeks began to adapt this Phoenician alphabet to the Greek language, and literacy spread once more, this time from outlying areas into the mainland. The Greeks began to write down songs previously transmitted orally, and they developed games and competitions, more occasions for the production of art and poetry. The various poetic genres took shape: epic, wedding songs, dirges, choral odes, and poetry for victorious athletes, musicians, and performers. In the sixth century B.C.E., under the rule of Pisistratus, the Athenians began to develop the democratic civilization that modern governments admire and emulate. To celebrate their monumental achievements both in conquest and in culture, they established dramatic festivals and began a building program to demonstrate their supremacy to the world. Although they were almost constantly embroiled in warfare during the century of their greatest accomplishments, they used the strife and suffering that war brings to strengthen their patriotism and their artistic expression, until their patriotism turned to megalomania and their attempts to bring peace inspired instead greed and merciless colonialism.

**THE DEVELOPMENT OF THE DITHYRAMB.** The first performers of songs in praise of Dionysus were said to have been his closest followers, the satyrs. The satyrs played pipes, and the maenads banged on timbrels (tambourine-like drums) in the production of Dionysiac music. Unlike the sober and ordered melodies dedicated to the god Apollo, Dionysiac songs expressed the emotional need to be free from social constraints and conscious rationality. From these earliest musical and verbal expressions of divine ecstasy (literally “a standing outside of oneself”) inspired by Dionysus arose a form of lyric poetry called the *dithyramb*. This word is not Greek and is of unknown origin, but the poetic form became the primary way for a chorus composed of fifty men and boys to praise Dionysus. Arion of Corinth is credited with the development of the dithyramb as an established poetic genre in the seventh century B.C.E., and a poet named

Lasus brought it to Athens. The Athenians embraced it and began including it as part of their dramatic competitions in 509 B.C.E. According to Aristotle in his *Poetics* (fourth century B.C.E.), a poet named Thespis was part of a chorus performing a dithyramb when he decided to step out in front of the chorus and speak lines of his own, thereby “inventing” the actor and the form of tragedy as a whole. In English, a “thespian” is an actor on the stage. Thespis was commonly held as the winner of the first dramatic competition at the City Dionysia around 534 B.C.E. The word “tragedy” is derived from two Greek words meaning “goat-song,” another reference to the earliest forms of Dionysian worship. The goat was sacred to Dionysus because he had been disguised as a goat when he was a child to protect him from the jealous anger of his stepmother Hera. The dithyramb thus became the center of Greek tragedy, which was built upon the foundation of a chorus who sang and danced in between solo songs (monodies) and exchanges of dialogue between characters on the stage.

## FESTIVALS AND THEATERS

**THE FRAGMENTS OF THEATRICAL CREATION.** Athens was not the only place where plays were written or performed, but after the establishment of the City Dionysia, where formal competitions of drama were held beginning in the late sixth century B.C.E., it was the center of dramatic production. Unfortunately, only a tiny portion of the theatrical output of this time survived. The names Choerilus, Pratinas, and Phrynichus, the first tragic playwright to include female characters in his dramas, in addition to Thespis as predecessors of Aeschylus are known, but all of their works are lost. Of the eighty or ninety plays Aeschylus wrote, only six survive. (The authorship of a possible seventh, the *Prometheus Bound*, is hotly contested; it has been attributed to Aeschylus but also to his son Euphorion, another tragedian.) Sophocles, in his remarkably productive career, wrote some 130 plays, of which only seven are accessible to modern readers. Ion of Chios and Achaëus of Eretria

*a PRIMARY SOURCE document***THE QUEEN IS THE KING**

**INTRODUCTION:** Aeschylus' *Oresteia*, "The Orestes Saga," is the only extant dramatic trilogy remaining from antiquity. It was the venerable tragedian's last production before his death in 458 B.C.E. The satyr play, a farcical and lewd lampoon called *Proteus* which accompanied the trilogy, is lost, however. In these three majestic and powerful dramas, the curse on the house of Atreus, which began with the child-murder and cannibalism of their ancestor Pelops, is finally ended by the young Orestes, the troubled son of Agamemnon and Clytemnestra. Queen Clytemnestra, with her lover, her husband's cousin Aigisthus, has been ruling Argos while Agamemnon was away at the Trojan War, and she is not willing to become submissive to Agamemnon's power again after his return. She is also furious that Agamemnon sacrificed their daughter and came home with a slave-woman, Cassandra, in tow. In this speech, at the end of the first play of the trilogy, *Agamemnon*, Clytemnestra gloats over the dead bodies of Agamemnon and Cassandra, both of whom she has murdered with her "man-slaying axe." In this passage, the extraordinary imagery and the denseness of Aeschylus' rich poetic voice are on stunning display.

**Clytemnestra:** Since I said many things before to suit my own needs, I am not ashamed now to say just the opposite. For how could one person, planning hateful things for hated enemies who only seemed to be loved ones, build a fence around the nets of suffering so high that no one could jump over it? I had been thinking for a long time about this match to settle an old grudge, and it was a long time coming, but in time it finally came: I stand here where I struck them down, over the deeds I accomplished. In

this way I did it, and I will not deny any of it— my husband did not escape nor did he ward off his doom. I threw a boundless net, like a net used to catch fish, around him, a dreadful mass of a garment. I struck him two times, and with two cries his limbs fell lax, and while he lay there in a heap, I struck him a third time as an offering to Zeus of the Underworld, the redeemer of the dead. And as he fell he released his spirit. Then he breathed out a sharp clot of blood and he sprayed me with a dark mist of bloody dew as I rejoiced just as much as the growing grain rejoices in the god-given sparkling rain when the buds are sprouting. That's the way things are, you elders of the Argives, so rejoice, if you would rejoice. I myself exult in my triumph! If it were appropriate to pour libations over the body, then these things would have been done justly, more than justly. Agamemnon filled the drinking cup of this house with so many curses and evils that he drank it dry when he came home.

**Chorus:** We are horror-struck at your tongue, at your harsh mouth, that glories like that over your husband!

**Clytemnestra:** You are treating me like I am some dim-witted woman! My heart has no fear, and I am speaking to those who know it well. Whether you want to praise me for what I did or censure me, it's all the same to me. Here is Agamemnon, my husband, a corpse, the act of this right hand, the act of a just craftsman. And that's the way it is.

**SOURCE:** Aeschylus, *Agamemnon*, in *Aeschyli Septem Quae Supersunt Tragoedias*. Ed. Denys Page (Oxford: Clarendon Press, 1972): lines 1372–1406. Translated by Lisa Rengo George.

were his contemporaries. Euripides, the youngest of the three great tragedians whose works have survived, produced 92 plays, but only 19 of these made it to modern times. The titles of several other tragedies are known and some fragments from them exist. The names of other playwrights are also known, such as Critias, Plato's uncle and the leader of the notorious "Thirty Tyrants" who controlled Athens briefly after the Peloponnesian War, and Agathon, the host and one of the central figures of Plato's *Symposium*, whose victory at the Lenaia in 416 B.C.E. was the reason for the party.

**DRAMATIC FESTIVALS.** The most important theatrical festivals in Attica during the sixth and fifth centuries B.C.E. were the City or Great Dionysia, the Rural Dionysia, and the Lenaia. The Great Dionysia was held

every year in the month of Elaphebolion, corresponding to March in the modern calendar. Pisistratus either founded or expanded the City Dionysia around 536 B.C.E. by introducing the cult of Dionysus of Eleutherae to the celebration. The Rural Dionysia took place in the month of Poseidon (December), and the Lenaia in the month of Gamelion, or January (in Ionian Greece, the month was known as Lenaion). A special archon (an elected Athenian official) oversaw all aspects of dramatic production at the Dionysia. This archon selected the three tragedians who would present a trilogy of tragedies, not necessarily connected by theme, along with a satyr play, a light-hearted farcical drama, during the days of competition. There were five days allotted for dramatic and choral competition except during the Peloponnesian War, when it

was cut back to three days. On the first three days, a tragic trilogy and satyr play were performed, followed by a comedy (beginning in 486 B.C.E.). On the final two days, choral dithyrambs were followed by a comedy. In his *Laws*, Plato suggests that the playwrights read portions of their dramas to the archon who based his choice on these mini-performances. The archon was also responsible for lining up a *choregos* for each production. The *choregos* was a wealthy Athenian citizen who paid for the outfitting and rehearsal of the chorus—the *polis* or city-state of Athens supported the dramatic poets and the leading actors. Playwrights were known to act in their own dramas—Sophocles is said to have stopped acting when his voice became too weak—but as the festivals developed, professional actors were hired. Later, in 449 B.C.E., competitions were held for actors as well as dramatists. Before the theatrical productions proper began, a *proagon* or “pre-contest” was held in which the playwrights appeared with the casts of their plays to explain the sources and themes of their dramas. In a time before theatrical placards or programs, it would have been most useful to have some guidance along these lines from the playwright himself. Athens was divided into ten *phylai* or tribes, and one man was chosen as a judge from each one of the ten. The ivy wreath be-

stowed upon the first-prize winner signified the admiration and adulation of the entire Athenian populace.

#### THE ENACTMENT OF THE DIONYSIAC FESTIVAL.

The City Dionysia began with a lengthy procession that reenacted the original journey of Dionysus from Eleutherae to Athens. The Athenians maintained an image of Dionysus within the ancient temple precinct of the god on the south slope of the Acropolis, where a permanent theater was constructed under Pisistratus in the sixth century B.C.E. A few days before the festival procession, this image was taken to a temple of Dionysus outside the city, and during the opening festivities, the Athenians carried it by torchlight back to its rightful home. The *choregoi* marched in fancy costume along with citizens who carried large phalluses, which signified the agricultural aspects of the god’s character, to the temple precinct. There the ten generals, elected officials of the city, performed sacrifices and libations. Following the *proagon*, the five days of competition began.

**THE STRUCTURE OF THEATRICAL SPACE.** The space for performance and the manner of performance were well-defined by the time tragedy reached its peak in Athens in the fifth century B.C.E. The structure of the Greek theater actually influenced the way actors per-

formed the dramas. Originally, the performance space was probably little more than a flat semi-circular area where the chorus performed the dithyramb, next to a sloping hillside where spectators could sit with an unobstructed view of the show. The flat area for choral performance was called the *orchestra*, which derives from a Greek word for “dance” rather than the production of music. At the back of the orchestral space stood an altar to Dionysus, for whom the dithyramb was sung. On either side of the orchestra was a path, called a *parodos*. Both spectators and actors used these entranceways to enter and exit the theatrical space. As first one and then two and more actors were added, the *skene*, meaning simply “tent,” was added on a small platform behind the orchestra. This simple hut served as a dressing and waiting room for the actors as well as the primary stage setting of the drama, whether a palace, temple, cave, or tomb was required. The *skene* soon transformed into a permanent building with a number of doors, which would

open into the performance space. The *skene* could be painted to convey more vividly the location of the drama. Inside the *skene* was housed an important piece of equipment called the *ekkyklema*, a platform on runners that could be rolled out of the *skene* at critical moments, such as when the display of dead or dying characters murdered off stage was necessary. A crane-like device, called the *mechane*, was employed to display gods in the heavens or humans hovering above the stage, as when Medea makes her escape in Helios' chariot at the end of Euripides' *Medea*. The Latin phrase *deus ex machina*, literally “god from the machine,” refers to the appearance of a god via the *mechane* who offers a divine solution to the human entanglements in the drama. Seating was erected in the hollowed out hillside for up to some 15,000 spectators at the Theater of Dionysus, with wooden benches for the common folk and specially reserved stone chairs for important officials. The acoustics of such an arrangement are excellent, and some of Greece's best pre-

served ancient theaters, such as the one at Epidaurus south of Athens, remain in use for modern performances. All theatrical performances took place in daylight, beginning at dawn and running until dusk. The thousands of theater-goers would have been perfectly visible to their neighbors, and would have had to eat, drink, talk to each other, and move around during the lengthy shows. This level of audience visibility would have created a much different atmosphere than the typically hushed and darkened theater in which modern viewers commonly watch dramatic spectacles.

**ELEMENTS OF PERFORMANCE.** Because the structure of the Greek theater remained static, acting style conformed to the theatrical space and exploited its most attractive features. All actors were male, and some men and boys seem to have specialized in performing female roles although most would have had to play roles of both genders. Because there were only two and sometimes three actors, each would have had to take multiple roles. This was more easily accomplished by the use of theatrical masks and costumes that covered the body completely. The mask had a wig attached to it and a large opening at the mouth, perhaps to amplify the voice. The actors also wore a common lace-up boot called a

*cothurnos*, to which high platforms were added in the Hellenistic period to provide greater visibility. Thus, acting style could not be subtle. No facial expressions or small gestures could be seen by the audience, and stage whispers or low voices would not have been heard. It must also be remembered that ancient theater was more like opera than a modern stage play, since the chorus and actors sang many of their parts, accompanied by dance, and even spoken dialogue was constructed in complex poetic rhythms called "meters" that influenced the method of delivery. Actors employed large gestures that became iconic. An actor's skills were expressed by the emotive qualities of his voice, and his rhetorical techniques, the same ones orators used in the government assembly and public forums. The plots of most tragedies were taken from the stories now known as "mythology." In fact, Plato in his *Republic* called Homer "the first tragic poet," not only because his subject matter was revisited in tragedy but because of the many dramatic interactions between major characters in the epic. Only a few plays that are known were not based on myth—Aeschylus' *Persians*, reflecting his experiences in the Persian War and produced in 472 B.C.E., is one of them.

## TYPES OF GREEK DRAMA

**TRAGEDY TAKES SHAPE.** During the sixth century B.C.E., as Greece awoke from the dark years of illiteracy and cultural deterioration, tragedy as a dramatic form began to take shape. In a performance space that consisted of a central location, known as the *skene* ("tent"), a half-circle called the "orchestra" in front for the chorus, and entrances on either side, tragic drama was first performed. In *Poetics* Aristotle describes how Thespis added an actor to the chorus who would deliver a prologue relating the content of the play and speeches separate from the choral songs. Aeschylus is said to have added a second actor, thereby allowing an exchange of dialogue between two characters, despite the fact that in

some of his surviving plays, the main actor, or “protagonist,” still speaks primarily to the chorus. Aeschylus’ younger contemporary, Sophocles, added a third actor and painted scenery and expanded the chorus from twelve men to fifteen. The movement of the tragic form can thus be seen as the growth of choral song and dance to a series of choral songs relating to spoken interludes of dialogic narration of a story delivered by two or even three actors. The Greek word for actor is *hypocrites*, meaning “interpreter” or “responder,” which suggests that the actor’s earliest role may have been to explicate the cryptic and elusive odes performed by the chorus. In its fully developed form, tragedy followed a generic form. There were two basic styles of communication in a tragedy: the choral ode in poetic meter with musical accompaniment; and spoken dialogue, also in meter, but without music. An actor could perform a solo song, or monody, set to music. Exchanges between an actor and the chorus were also written in special meters. A tragedy usually began with a prologue, spoken by one or two actors, which described the setting and the circumstances of the play. The chorus then entered, singing and dancing, and it remained in the orchestra for the entire drama. Then a series of “episodes,” sometimes culminating in a central *agon*, or debate between irrevocably opposed sides, followed. The chorus divided the episodes with songs called *stasima* (the plural of *stasimon*, meaning “standing in one place”). Sometimes the choral songs were obscure and had only the most arcane connections to the plot of the play, but at other times the chorus sang plaintively about the troubles that swirled around them or rejoiced, ironically, in the peace and happiness that can be foreseen, but which will not materialize. After the last *stasimon* came the *exodus* or final scene and exit, during which the action of the drama was summed up or its results were delineated. Some standard features of tragedy, which appear in some but not all of surviving tragedies, and sometimes in altered forms, are as follows: a chorus of powerless individuals (the elderly, foreigners, women, even slaves); violent action that takes place offstage and is described in detail by a hurried minor character, perhaps a messenger or household member; and a number of silent supernumeraries on stage, such as heralds, guards, servants, children, and other non-speaking roles as necessary.

**TRAGIC PLOTS.** Most tragedies drew on a fund of shared lore that bound Greek-speaking peoples together. We refer to these stories as “myths” and “legends.” Stories of the creation of the cosmos and the battles for control of it; the Olympian gods and the formation of their cults; the many children of the gods, both mortal and

immortal; and their numerous tales of daring and adventure, love and conquest, great journeys, the Trojan war and its aftermath all resurfaced in tragedy as settings for the great fifth century B.C.E. tragedians to dramatize the problems facing their city and the eternal questions of human life. The heroes of mythology were called upon to face danger and repel threats by dint of physical force and mental acuity: they literally voyaged to the ends of the earth and even into the Underworld itself to face down monsters and restore order to their society. In comparison, the heroes of tragedy must still confront danger and take perilous journeys, but these are often represented by the internal struggles of the hero as he or she ruthlessly seeks the truth and determines to find answers. The tragic hero, like the hero of myth, takes the ills of his or her society, often represented by the family unit, upon himself and works tirelessly to bring resolution. Human beings must face the horrors of life: the cruelty of divine will; the greed, lust, and brutality of human interaction; the desire for revenge or power; and the senseless suffering people undergo and inflict on each other. In most tragedies, a terrible deed or event is the catalyst, and we watch as the characters face ultimate catastrophe or, in attempting to thwart it, create new misfortune for themselves. Tragedies did not depend on suspense, since audiences knew well the plots of the stories treated by the playwrights. The excitement and power of the tragedy lay instead in the manner in which the story unfolded, the language employed, and the inevitable realizations of the characters. The Athenian audience would also have felt very deeply the associations the playwright drew between the adversity of the noble family on the stage and their own pressing issues. When Sophocles’ audience was presented with the specter of the plague threatening Thebes at the beginning of *Oedipus the King*, they would have shuddered in acknowledgment, since a horrendous plague struck Athens at the beginning of the Peloponnesian War, during the time period this tragedy would have been performed. Matters of individual rights, tyranny, the possibility of justice, and the right way to live were the subjects treated by Athens’ philosophers, politicians, and historians as well as their playwrights. For the ancient Greeks, divisions of genre were not that strict: tragedy was meant to educate, to pose difficult questions, and to offer potential solutions as well as to entertain.

**THE SATYR PLAY.** After an audience at the Great Dionysia had experienced several hours of the intense performance of tragedies, they were eased back into daily reality by means of a “satyr play,” a coarse and farcical play that followed the formula of tragedy. The same play-

### THE OEDIPUS COMPLEX

**INTRODUCTION:** Sophocles presented the trilogy that contained *Oedipus the King* in 430 B.C.E. when Athens was in the throes of a devastating plague. In the second year of the Peloponnesian War against Sparta, all the residents of rural Attica around the city of Athens were forced to abandon their homes and farms and to crowd into the city. The poor sanitation allowed this plague to spread quickly and thousands died. It is no coincidence, therefore, that Sophocles presents the ancient city of Thebes in his play as overwhelmed by plague as well. Many scholars consider *Oedipus the King* to be nearly perfect in its structure, its dramatic irony, and its presentation of the tragic hero, whose very strengths—his relentless pursuit of truth and justice, his strength of will, and his refusal to compromise—bring about his tragic downfall. Oedipus was left to die on a hillside as a baby because of a prophecy that foretold he would kill his father and marry his mother. In this scene, Oedipus confronts the servant who rescued him and the messenger who raised him, and finally realizes the awful truth: *he* is the cause of the plague—his father’s murderer and his mother’s husband!

**Messenger:** Come on now, do you recognize a certain child you gave me to raise as my own son?

**Servant:** What? Why are you asking about that?

**Messenger:** This man here is the one, friend, who was a young child then.

**Servant:** May ruin destroy you! Why won’t you be quiet?

**Oedipus:** Ah, don’t rebuke him, old man, since your words need to be upbraided more than his do.

**Servant:** What am I doing wrong, best of masters?

**Oedipus:** You are not acknowledging the child, the one he inquires about.

**Servant:** He doesn’t know what he’s talking about. He’s on the wrong track.

**Oedipus:** If you won’t talk as a favor, then you will talk while in pain!

**Servant:** Please, by the gods, don’t hurt an old man like me.

**Oedipus:** Will someone pull his arms behind his back?

**Servant:** Oh no, don’t! What do you want to find out?

**Oedipus:** Did you give the child to this man who is asking questions?

**Servant:** Yes, I did. I wish I had died on that very day.

**Oedipus:** You will get there unless you tell the truth.

**Servant:** Things will be much worse if I do talk.

**Oedipus:** It seems that this man is looking for a delay.

**Servant:** Not, I, sir, I just said that I gave him the child a long time ago.

**Oedipus:** Where did you get this child? In your household or from somewhere else?

**Servant:** It didn’t belong to me—I got it from someone else.

**Oedipus:** From which one of these citizens and from what household?

**Servant:** Oh by the gods, master, please don’t ask me any more.

**Oedipus:** You will die if I have to ask you this again!

**Servant:** He was one of the household of Laius.

**Oedipus:** A slave, or a relative of his?

**Servant:** Ah! I am about to say a dreadful thing!

**Oedipus:** And I’m about to hear something dreadful. But it must be heard.

**Servant:** He was said to be Laius’ child. Really, Jocasta inside could tell best what the situation is.

**Oedipus:** Did she give him to you?

**Servant:** Yes, my lord.

**Oedipus:** Why?

**Servant:** So I could kill him.

**Oedipus:** The wretched woman who bore him?

**Servant:** She was afraid of the evil prophecy.

**Oedipus:** What prophecy?

**Servant:** That the child would kill his own father.

**Oedipus:** How did you happen to give him to this old man?

**Servant:** I pitied the baby, master, and I thought he would carry him away to another land, where he himself was from. But he saved him for the worst fate. If you are the man he’s talking about, you were born cursed.

**Oedipus:** AH! Oh my god! Everything is clear now! O light of day, I am looking at you now for the last time!

wright who produced the tragic trilogy also produced this satyr drama, which may have echoed some of the themes raised in his tragedies. Aristotle believed that satyr drama was the genesis of tragedy, although others think that satyric drama arose as a separate theatrical form. The playwright Pratinas, a predecessor of Aeschylus, turned this ancient cult performance consisting of a group of satyrs who sang and danced in honor of their patron into a dramatic form, with a chorus comprised of actors dressed as men with horse ears and tails led by Silenus, the chief satyr. In the fourth century B.C.E., artists began to represent satyrs as half-goats rather than half-horses. The standard costume for the actors in a satyr play would have been quite obscene from a modern perspective: over a typical bodysuit, they wore short, rough pants with a very large and erect penis attached in front and a horsetail attached behind. Masks portrayed the “ugly” facial features of the uncivilized man-beast: balding, rounded foreheads with snub noses, pointy ears, and black hair and beards. Silenus, as their leader, wore a similar mask with older features and white hair. Although Pratinas wrote over thirty satyr plays, none survive. There are very few examples of this genre: Euripides’ *Cyclops*, essentially the same story Homer tells in the *Odyssey* about Odysseus’ encounter with the Cyclops Polyphemus (with the addition of a chorus of satyrs), is the only complete satyr play to survive. Fragments from Aeschylus’ *Net-Men* and Sophocles’ *Trackers* also survive.

**ORIGINS OF GREEK COMEDY.** In ancient Greece, a *komos* was a drunken parade of carousing revelers who staggered through the streets of their town dancing and singing bawdy and insulting songs. The same form can be seen in the Dionysiac processions that began the theatrical festivals. This familiar kind of inebriated group behavior gradually took shape as a genuine dramatic form, which followed many of the elements of the tragic genre: a chorus, a limited number of speaking parts for actors, the same theatrical structure, and the same modes of production. Comedy, however, as a latecomer to the dramatic competitions, had several unique characteristics as well. The level of invective and insult in comedy is related to the similarly-themed poetics of authors like Hipponax and Archilochus, who flourished during the seventh and sixth centuries B.C.E. during the diaspora from the mainland, as well as to the types of verbally abusive songs sung at the Eleusinian Mysteries, the secretive cult worship of the goddess Demeter, centered at Eleusis, a town south of Athens. Comedy was introduced to the City Dionysia around 487 B.C.E. and was performed after the tragic trilogy and the satyr play. At this time a comic poet named Magnes was on the rise, and for some time he alone remained prominent in the genre,

winning a total of eleven first prizes at the City Dionysia. Magnes was particularly well known for the wonderful musical accompaniments to his plays as well as for his imitations of barnyard animals. In the middle of the century, other comedic poets began to gain prominence: Cratinus, held to be a great drinker; Crates, whom Aristotle said invented actual plots for his comedies rather than producing a series of caricatures; Pherecrates; and Eupolis. Aristophanes is the only comic playwright whose works have survived. Modern scholars know more than 32 titles of his plays, and eleven of them have survived along with some fragments. It is clear from the writings of Aristotle and other historians that playwrights did not write in both the comic and tragic genre.

**THE STRUCTURE OF OLD COMEDY.** Modern scholars must rely on the plays of Aristophanes to determine the structure of ancient Greek comedy also known as “Old Comedy”—those plays written and produced between the mid-sixth century and late fifth century B.C.E. Most of Aristophanes’ plays begin with a prologue spoken by an actor or the playwright himself. In the prologue the author could air grievances, talk about his audience or the government, and describe the circumstances of the comedy to follow. Next the 24-man comic chorus—rather than the twelve- or fifteen-man tragic chorus—entered singing and dancing, often dressed in wild and fantastical costumes. The chorus introduced the audience to the comedy proper and outlined the setting for the play. The chorus usually took sides, either for or against the hero of the play. The *agon*, as in a tragedy, was the centerpiece of the play, in which the two opposing sides argued for their cases, with additions by the chorus. The first speaker in the debate was almost always the loser. The word *parabasis* means “a stepping aside,” and was the time in the play when the chorus, after the actors had exited the stage, held the theatrical space alone and, performing a special song and dance unconnected to the rest of the plot, addressed the audience directly. After this, a series of scenes called “episodes” took place, which illustrated the results of the central debate. Finally, the play ended with a rowdy celebration of marriage or reconciliation.

**FREEDOM OF SPEECH AND OBSCENITY IN OLD COMEDY.** Just as the masks worn by comic actors were grotesquely exaggerated, and their costumes were excessively padded with comically enlarged genitalia, so also were the types of humor, both physical and verbal, garish and vulgar. Athenian democracy guaranteed liberty to its citizens (adult males only), which included freedom of speech (*parrhesia* in ancient Greek). This freedom to speak one’s mind, whether in a public assembly or in a private

*a PRIMARY SOURCE document***ARISTOTLE'S LECTURE NOTES**

**INTRODUCTION:** Aristotle most likely wrote down his analytical work *Poetics* sometime in the 340s B.C.E.—at any rate, he apparently used this work as notes for teaching in his own school, the Lyceum, which he founded in 335 B.C.E. This collection of “lecture notes” is a unique set of writings; the earliest extant work that treats poetic writing as an art and employs a distinct set of theory and criticism in its analysis. Aristotle set out to define the genres of poetry; in essence, to propose “laws” about its structure and purpose. Poetry was of paramount significance in ancient Greek culture, and who better to tackle it scientifically than the great pupil of Plato and teacher of Alexander the Great? Aristotle may sometimes seem hostile to drama, but his observations have influenced the way all scholars since his time have seen, read, and examined the ancient art of stagecraft. In *Poetics* V–IX, Aristotle describes the origins of comedy and tragedy, and lays out his theory that a successful tragedy must have a beginning, middle, and end in the course of a single day. In addition, he discusses types of plots and other integral elements of ancient epic and drama.

gathering, naturally applied to Athenian playwrights as well. Therefore, the comic poets like Aristophanes were perfectly free to criticize or mock any aspect of their city-state: public figures, wars, laws, treaties, citizens' rights, intellectual movements—all could be, and frequently were, treated in satiric form on the comic stage. Even the gods and religious rituals could be parodied, though Aristophanes never presents the gods with serious skepticism. Excretive humor and obscenity were rampant in Old Comedy as well. Aristophanic comedy is all-inclusive and included elements that every level of the *demos* (the citizen population) could enjoy, from highest political satire to the most juvenile jokes about flatulence and bodily functions.

**ROLE OF WOMEN.** In ancient Greece, wealthy women led lives that would be considered restrictive by modern standards. It is likely that women in poorer families had more freedom, but unfortunately there is not much information about the lives of the poor. The vast majority of evidence about the lives of women in antiquity comes from sources, objects, and monuments created by men, from a male perspective. Young girls of noble heritage were educated mostly at home, in the arts of housekeeping, weaving, and food preparation and preservation. Young women remained in their fathers' households until their marriage, usually at the age of fourteen or so. Married women must have spent con-

*a PRIMARY SOURCE document***SPEAKING ILL OF THE DEAD**

**INTRODUCTION:** The Athenian demagogue Cleon, who ruled Athens for six years after the death of Pericles during the Peloponnesian War, was one of the comic playwright Aristophanes' worst enemies. Aristophanes criticized Cleon in his first play, *Babylonians*, for his brutal decision to kill all the adult males on Mytilene after Athens conquered that island in 427 B.C.E. Cleon responded by attempting unsuccessfully to prosecute Aristophanes for treason. Aristophanes continued to mock Cleon, even after the ruler's death in 422 B.C.E. In his play *Peace* (421 B.C.E.), the Athenians are awaiting a peace treaty with the Spartans. The comic hero Trygaeus, who is starving because of the food shortage in Athens during the war, decides to emulate the mythological hero Bellerophon, who rode the winged horse Pegasus. Instead of a fantastical horse, however, Trygaeus uses a fattened dung-beetle for his journey to Mt. Olympus. When he arrives at Zeus' palace, Hermes informs him that the gods have moved out because of the war, and that War himself is in charge and has imprisoned Peace in a cave. The following excerpt highlights the metatheatrical aspects of Aristophanes' comedies. "Metatheater" involves the display of knowledge by the actors during a performance that they are in fact merely performing a play with an audience.

**SOURCE:** Aristophanes, *Peace*, in *The Context of Ancient Drama*. Eds. Eric Csapo and William J. Slater (Ann Arbor: University of Michigan Press, 1994): 182.

siderable amounts of time in the *oikos* or private family space, and lived in special secluded areas. This does not mean that women were never permitted to go about in public: women were active participants in religious rituals, and they undoubtedly visited friends and family, shopped for food and household necessities, and attended public events. But women did not have public lives as men did. Therefore, it is somewhat surprising that female characters are featured so prominently in Greek tragedy and occupy center stage in some of Aristophanes' comedies. In order to understand this, it must be remembered that the creative setting of the theater was itself sacred space, within the temple precinct of Dionysus, and the performances reflected and commented upon Greek culture by artistically depicting events that could occur in real life. Tragedies borrowed their subject matter from mythology and utilized the family unit, at least in part, as a microcosm for the functioning city-state. Since women were central to family life, they could represent certain values on stage that women in society may not have been allowed to articulate. For instance, Antigone in Sophocles' play of the

same name represents a strict religious view and upholds the duties of individual families rather than the laws of the state, in direct opposition to her uncle Creon, the male head not only of her own family but also of the state itself. In Euripides' play, *Medea*, a foreigner and suspected witch, eloquently expresses the hardship she has suffered at the hands of Jason, a Greek hero, and even gets away with multiple murders, including the killing of her own children. On the comic stage, the line between fantasy and reality is blurred, sometimes even non-existent. The requirements of the stage necessitated that all female roles be played by male actors. Aristophanes enjoyed playing with this convention by having male characters disguise themselves as women, as in the *Women at the Thesmophoria*, and by having female characters, already being played by men, disguise themselves as men to attend a political gathering in *Assembly-Goers*. Just as in tragedy, women were an accepted part of the *polis*, and could express political and social discontent through their behavior. In *Lysistrata*, the women of Athens and Sparta, in despair about the length of the Peloponnesian War and the absence of the menfolk, de-

*a PRIMARY SOURCE document***MEDEA, SERIAL KILLER**

**INTRODUCTION:** The life of Euripides, the youngest of the three greatest Athenian tragedians, spanned most of the fifth century B.C.E., a period of unequalled cultural production in literature, drama, art and architecture, and politics. Euripides was often accused of focusing on marginalized characters—women, foreigners, slaves—in his tragedies, to the exclusion of the noble people tragedy was supposed to portray as didactic examples to the Athenian people. But as a result of this, we can see Athenian attitudes and cultural problems of concern to the democracy, such as in his masterpiece, *Medea*. The story was part of mythology: the hero Jason must capture the Golden Fleece from the distant kingdom of Colchis on the Black Sea in order to regain his rightful kingship in Iolcos. In Colchis, the beautiful daughter of the king, Medea, is charmed by Aphrodite into falling in love with the dashing young hero, and she assists him in his quest. In some versions, she murders her own younger brother and chops his body into pieces, which she throws overboard as the Argonauts make their escape from Colchis. In this play, Euripides seems to ask the question, “What would happen to Medea, a spooky foreign woman, supposedly possessed of eerie magical powers, once she returned with her Greek husband to Greece?” During the fifth century in Athens, no Athenian citizen was allowed to marry a foreigner—if he did so, the marriage was not considered legal in Athens. In the following scene, the end of the play, Medea has killed the king of Corinth and his daughter, to whom Jason was betrothed, as well as her own children with Jason, as revenge for being cast out unceremoniously from Jason’s life. Medea is speaking to Jason from the chariot of the Sun, provided for her escape, with the dead bodies of her children on board.

**Jason:** But may the Fury (a horrid female monster who pursues people who kill family members) and murderous Justice destroy you because of what you did to the children!

**Medea:** (gloating savagely) Which god or divine being will hear you, you oath-breaker and liar?

**Jason:** Oh my god, you disgusting child-murderer!

**Medea:** Go home and bury your “legal wife” [i.e. the king’s daughter].

**Jason:** I’m going, deprived of both my children.

**Medea:** Don’t grieve yet—wait until you’re old.

**Jason:** O dearest children!

**Medea:** Dearest to their mother, not to you!

**Jason:** And you murdered them!

**Medea:** I did it to hurt you.

**Jason:** Ah, the pain! Oh wretched me, I long to kiss the soft mouths of my children!

**Medea:** *Now* you speak to them, *now* you show them affection—not so long ago you pushed them away.

**Jason:** In the name of the gods, allow me to touch just once more the gentle faces of my sons.

**Medea:** No! Your plea is cast on the wind!

**Jason:** O Zeus, do you hear these things, how I am driven away, how much I suffer at the hands of this horrible child-killing lioness? But no matter what, as much as it is possible and I am able, I will grieve for these things and I will call on the gods, making the divinities my witnesses, that after slaughtering my children, you are preventing me from touching their skin, and from giving their bodies a proper burial, bodies which I, their father, should never have had to see destroyed by you.

**Chorus:** Zeus, master of many gods on Olympus, the gods bring to pass many things unexpectedly! Justice was not done, but instead a god found the means of the unjust! In this way, this situation has been resolved.

**SOURCE:** Euripides, *Medea*, in *Euripidis Fabulae*. Ed. Gilbert Murray (Oxford: Clarendon Press, 1902): lines 1386–1425. Translated by Lisa Rengo George.

clare a sex strike in order to hasten a resolution to the conflict. The fantastical element of comedy can make allowances for such an event as a metaphor for the Athenians’ dissatisfaction with their political leadership.

**MIDDLE COMEDY.** After the Peloponnesian War ended in 404 B.C.E., the zenith of Athenian creativity passed as well. As first the Spartans and then the Macedonians gained ascendancy, Athens continued its cultural production but on a lesser scale. A canon of tragedies was

established and revivals of these plays were performed, but no new tragedies were written. As Athenian democracy faded, so did its civic freedoms, and the comic poets were compelled to tone down the overtly political content in their plays. This period defined the transition from “Old” Comedy to “Middle” Comedy, a term possibly coined by Aristophanes of Byzantium, the librarian at Alexandria, to describe the comedies created between 404 and 321 B.C.E. Some scholars have seen the beginnings of Middle

*a PRIMARY SOURCE document***MURDER AND THE COMIC EVOLUTION**

**INTRODUCTION:** Platonius was a late Hellenistic writer who, in his work *On the Differences of the Comedies*, set out to explain the evolution of ancient Greek comedy from “Old” to “Middle” to “New” by relying on the questionable theory that the Athenian general Alcibiades had murdered the comic poet Eupolis because of slander, and thereby created the widespread threat of prosecution among poets. Platonius aimed at explicating the particular differences during the three periods—the evolution from the political toward the domestic, the decline in caustic satire, and the loss of the chorus. Platonius owes a debt in his explanation to Aristotle’s *Nichomachean Ethics*.

**SOURCE:** Platonius, *On the Differences of the Comedies*, in *The Context of Ancient Drama*. Eds. Eric Csapo and William J. Slater (Ann Arbor: University of Michigan Press, 1994): 172–173.

Comedy in the romantic tragedies of Euripides, like *Ion* and *Helen*, and in the later comedies of Aristophanes, including the *Assembly-Goers* and *Wealth*. The material becomes less inherently political and much more broadly-based. The role of the chorus is diminished substantially; the *parabasis* is completely absent, and only occasional songs meant for the chorus are indicated. Most of the names of authors and fragments of so-called Middle Comedy that survive come from the work of one author: the *Educated Dinner-Party*, written by Athenaeus

around 200 C.E., and no complete examples of Middle Comedy exist after Aristophanes. Hence assumptions must be made about the content of Middle Comedy based on the comments of ancient scholars and the titles and fragmentary remains, but even these extrapolations are telling. Although the political subject matter may be less explicit and the obscenity and scatological humor less evident, there still seems to have been a wider range of plot-types in Middle Comedy than there came to be in the last stage of ancient comedy known as “New” Comedy. Play-

wrights still wrote political plays parodying public officials and intellectuals like Plato and the Pythagoreans. Mythological lampoons were still popular, especially when figures from mythology were placed in more contemporary settings. The riotous celebratory feasts featured at the end of many Old Comedy plays are found in Middle and New Comedy as well, and the theme of *anagnorisis* (“recognition”) figured prominently in many Middle comedies. This type of “recognition” plot often involved a child separated from his or her parents at birth (sometimes by exposure), who is later recognized by the real parents by means of tokens, specific knowledge, or the child’s name. Contemporary mores, characteristics, and manners were also satirized, according to some of the references to figures like the “criticizer,” “lyre-player,” “shoemaker,” and the “lover of Thebes.” Plays about daily family life (romantic entanglements, debts, conflicts between generations) as well as more alarming themes (such as scam artists, illegitimate children, and rapes) were popular in the New Comedy of Greece and later Rome; they are also recognizable in Middle Comedy, as were stock figures like the sycophant, the prostitute and the pimp, the crabby cook, the boastful soldier, grumpy old men, and amorous young men. Athenaeus mentions nearly sixty playwrights and over 800 plays belonging to the period of Middle Comedy; some of the most well-known authors were Alexis, Eubulus, and Anaxandrides.

**NEW COMEDY.** The period of “New” Comedy began in the fourth century B.C.E. but its peak was in the mid-third century B.C.E. The names of more than eighty playwrights who were writing in the late fourth and third centuries B.C.E. and an assortment of fragments survive, but many of them are unidentifiable. The best-known names of this era are Menander, Diphilus, Philemon, Posidippus, and Apollodorus. Although much of their work was lost during the Byzantine era (seventh–eighth centuries C.E.) because their Greek was considered inferior, in twentieth-century excavations in Egypt, archaeologists uncovered several significant fragments, and one nearly complete play of Menander, to whom the Roman playwrights Plautus and Terence were indebted for many of their “adapted” plots. Plautus also named Diphilus and Philemon as sources for some of his plays. The themes of New Comedy are recognizable from Middle Comedy: the plots focus on family life and its daily complications, and include many of the stock characters that were fixed by the playwrights of Middle Comedy. The chorus, whose role was already diminishing in Middle Comedy, was reduced to providing musical intervals between the five acts of the play. New Comedy was originally written and performed in Athens, and its focus is the law and mores of Athens, particularly in regards to citizenship and marriage

laws. One could not become a naturalized Athenian citizen: both parents had to be proven Athenian citizens in order to pass the privileges and duties of citizenship on to their children. New Comedy often addressed social problems like casual rape and resultant pregnancy, children separated from their parents and lost, and love between citizens and “foreigners,” all of which ultimately arrived at the question of legal marriage. Lost children and victimized young women had to be revealed as real Athenian citizens by means of the “recognition” plot, possession of mementos, and other devices, in order to resolve the plot happily with a celebration of marriage. The topics treated in the comedies had broad enough appeal, however, that the plays were popular all over the Greek world despite their Athenian focus. In addition to plots about love, New Comedy treated fundamental social conflicts—between parents and children, rich and poor, neighbors, and city and rural folks. Menander was especially aware of problems of bigotry, misunderstanding, and lack of tolerance, as can be seen from the subjects found in surviving fragments. New Comedy remained popular for hundreds of years, as Plautus and Terence continued the tradition in their plays, which borrowed the Athenian plots but translated them into Roman plays.

## THE BEGINNING OF ROMAN THEATER

**GREEK INFLUENCES.** The period between the death of Alexander the Great of Macedon (323 B.C.E.) and the beginnings of the Roman Empire (31 B.C.E.) is known to scholars as the Hellenistic era. Even though Athens had undergone a major political downfall, its cultural production remained steady, and its influence on first the Etruscans, from the region of Etruria in northern Italy, and later the Romans is incalculable. The Greeks continued to be highly invested in theater and its performance. Around 300 B.C.E., an actor's union, called the Artists of Dionysus, was established throughout Greece and other Hellenistic sovereignties, a sign of the continuing attraction of the presentation of Greek tragic and comic drama. This powerful guild functioned as a religious organization that was politically independent, with its own priests and sanctuaries (of the god Dionysus) as well as their own elected officials. This was the last era that actors would enjoy such privilege and protection, since performers of all kinds were eventually disenfranchised under Roman law. The Greeks had colonies in southern Italy and Sicily since Homer's time, and they built many permanent performance spaces based on Greek prototypes. Syracuse on Sicily had a theater dating from the fifth century B.C.E., and many other archaeological remains have been excavated throughout the area of colonization. Acting troupes toured the region often, and revivals of ancient plays by authors like Euripides and Aristophanes were popular. In the western colonies, another tradition developed as well: the *phlyax* play, a farcical genre in which tales from myth and everyday life were performed on a special type of stage, with grotesque masks and obscenely padded costumes recalling those worn in Old Comedy, and perhaps involving extemporization and lewd action. A number of vases from this region and era survive depicting the performance of *phlyakes*, and it is from these that most of the modern knowledge about the genre comes. Beginning in the third century B.C.E., a poet named Rhinthon from Tarentum began to write *phlyax* plays as well. The stage consisted of a raised wooden platform covered by a roof and decorated with painted scenery, altars, porches, and other elements necessary for the depiction of the play. It is quite likely that the Romans were influenced far more by these bawdy farces than they were by the performances of "high" drama like tragedy and Old Comedy, but both kinds of theater were well established in Italy.

**ETRUSCAN INFLUENCES.** The Etruscans, an indigenous people from the north of Italy who had power over Rome until the late sixth century B.C.E., seem to have been aware of Greek drama to a greater extent than the

early Romans were. There is much artistic evidence for Etruscan shows, since various performers like musicians, dancers, actors wearing masks, and tumblers, as well as audiences, are found in wall paintings. Etruscan vases from the late sixth century B.C.E. depict performers dressed as satyrs, leading scholars to posit that satyr drama, which was developing in Athens during this period, was the form of theater that most affected the Etruscans, since the satyr play combined coarse farce with a religious element. The Roman historian Livy (59 B.C.E.–17 C.E.) reported that the Etruscans were the first to introduce enacted performance to the Romans in the mid-fourth century B.C.E. Livy, however, was obsessed with identifying "firsts" in Roman history, as evidenced even by the title of his work, *From the Foundation of the City*, and as a result may have exaggerated a bit. The satyr play would probably have appealed to the Romans more than other types of formal drama due to native rituals relating to the harvest that included satirical and vulgar jokes, songs and dances, and good-natured abuse and mockery. Whether the Etruscans were truly the first to introduce acted shows to the Romans or not, their influence was prevalent not only in the lively arts but also in the way the Romans structured their society and government.

**ITALIAN INFLUENCES.** Existing primary sources for early forms of Italian performance are the historian Livy and the Augustan poet Horace (65–8 B.C.E.). Horace traced the development of "Fescennine" poetry to early harvest or wedding celebrations involving sacrifices, libations, and an exchange of playful insults, which Horace says degenerated into cruelty and abusive slander (it was a common lament in Latin letters that society had deteriorated since the innocent days of the early Republic). The term "Fescennine" may derive from the Etruscan town of Fescenna, apparently a place known for these verses, or from the Latin word *fascinum*, having to do with the phallus. This agricultural ritual recalls the legendary origins of Greek drama from lascivious songs and dances, and parades of phallic representations, in honor of Dionysus. Fescennine verses may have developed into an early kind of dramatic performance involving improvisation, rude humor, and rustic music. There was another type of farcical performance already developing in the region of Atella, Campania, called the *Atellanae* or "Atellan farces." The peoples of this region spoke Oscan, an Italic language, and so Latin speakers were unable to understand any of the dialogue in these lampoons, although the mimetic gestures of the actors would have been clear enough. In fact, most Atellan farce lacked extensive dialogue anyway, and relied more on crude physical comedy and charade. The character types

depended on a dominant emotion or quality like anger or stupidity or appetite for food or sex, and stock types carried the same names in every farce: Pappus the old man; Bucco the boaster; Maccus the buffoon. Scholars have suggested the famous Roman comedian Titus Maccus or Maccius Plautus took his familial (middle) name from this last character. The Romans also had a performance tradition of the *satira*, a mixture of genres and content, the precise nature of which remained a mystery even to ancient scholars. One ancient commentator derived the name *satira* from “satyr,” and described the genre as a musical medley written for the pipes and involving the same kind of shameless dialogue and stage action as Greek satyr plays. The Romans derived their own genre of “satire” from this term, and perhaps from the performative tradition as well. Hence, there were a multitude of dramatic influences for the development of the Roman theater, and these influences shed light on why the Romans may have preferred comedy and “light” musical drama such as mime and pantomime to “heavier” dramatic genres, like tragedy and politically driven satire.

## ROMAN THEATERS, PLAYWRIGHTS, AND ACTORS

**STRUCTURE OF THE ROMAN THEATER.** The Romans did not construct a permanent theater until Pompey sponsored one in 55 B.C.E. Instead, as the Roman architect, engineer, and writer Vitruvius (last half of first century B.C.E.) described, the Romans built temporary wooden structures as performance spaces, and continued to do so even after the advent of permanent theaters. There may have been several political reasons for this. Conservatives argued that theater promoted immoral behavior and fought to prevent the building of permanent structures. As class divisions and personal sponsorship of occasions for performance arose, such as the annual *Ludi Romani* (“Roman Games”), circuses and other spectacles, and funeral celebrations for the wealthy and notable, the building of provisional theater spaces allowed for luxury seating and elaborate decorative elements.

There was also a fear of seditious behavior, again due to the growing divide between the aristocracy and the *plebs* or common people, and permanent theaters provided a made-to-order space for public assemblies and mass communication. As needed for festivals and other celebrations, theaters could be erected in public spaces like the Forum, the Campus Martius, or the Circus. These wooden edifices affected the development of the Roman theater as much as the theatrical influences of the Greeks, Etruscans, and early Roman displays and rituals. The ephemeral nature of these wooden theaters allowed the Romans to modify the buildings as needed rather than blindly follow the Greek and Hellenistic models, resulting in a performance space that diverged in distinct ways from its Greek predecessors. Theaters in *Magna Graecia* and on Sicily seem to have followed models from Greece, as might be expected: built into a hillside for ready-made tiered seating, for the most part with a raised stage, an orchestra dividing the acting platform from the spectators, and side entrances. There were also the *phlyax* stages depicted on painted vases—elevated and covered platforms with scenery and accouterments added as needed for individual plays. No remains of the temporary wooden theaters survive, but based on the stage directions implicit in the comedies of Plautus and Terence as well as Pompeian wall paintings and references to the stage in other works, modern scholars can postulate what these Roman performance spaces might have looked like. There was a raised stage with a roofed structure at the rear and usually a public byway running in the front of the stage building. No space for a chorus was necessary. This building could be adapted to suit specific plays, with an altar in front to serve as a temple, or rocks in front of a cave, or a separation between two citizens’ homes. The stage building probably had at least three doors and an off-stage back alley to allow for unseen action and to accommodate the frenetic entrances and exits required in a chaotic comedy. Roman audiences included all strata of society, from aristocrats in special and secluded seats to common folk and slaves. Some playwrights lamented the short attention spans of their spectators, who could easily lose interest in a performance if sidetracked by a high-energy display of physical skill or combat.

**ACTING TROUPES.** Even though Roman theaters were not permanent until 55 B.C.E. actors were amassed into solid unions and groups by the late third century, something that did not occur until late in the history of Greek theater. In 207 B.C.E., Livius Andronicus—who produced the first plays adapted from Greek originals at the *Ludi Romani* in 240 B.C.E.—oversaw the

Roman theater at Hierapolis in Turkey, built in 2nd century c.e. and restored by the emperor Septimius Severus (193–211 c.e.) and again by Constantius II (337–361 c.e.). COURTESY OF JAMES ALLAN EVANS.

establishment of the first performers' union in Rome, called the *Collegium Scribarum Histriorumque*, or the Association of Theatrical Authors and Actors. This union was probably modeled closely on the "Artists of Dionysus," the theatrical association formed in Greece in the third century B.C.E., which was treated as a religious organization exempt from political or military service. This Roman union was associated with the goddess Minerva (Athena in the Greek pantheon), whose temple on the Aventine Hill housed their headquarters. It seems that early on in Roman theatrical history, actors and writers of drama may have had a certain amount of respectability in society that was lost altogether later on. The legal status of actors has been a subject of much debate among scholars. They may have been slaves owned by the company manager, foreigners, freedmen, or even freeborn Romans. At any rate, in the later Republic and Roman Empire, all stage performers, along with gladiators and workers in the sex industry, were deprived of civil rights and designated by the term *infamia*, which indicated legal disenfranchisement. The Romans may have had a *choragus* who supported an acting troupe, much like the *choregia* system in fifth-century B.C.E. Athens (the dif-

ferent spelling comes from the Doric-dialect spoken in the Greek colonies of southern Italy). The magistrates who organized the Roman Games and other opportunities for performance may also have assumed financial responsibilities for some of the dramatic shows held at the annual festival. Many troupes had a *dominus gregis* or "company manager," an actor-director who staged the dramas in conjunction with the playwright himself. Lucius Ambivius Turpio acted in and directed many of the Roman comic playwright Terence's plays in the 160s B.C.E. In the Greek tradition, Roman actors on the formal stage of tragedy and comedy were probably all male, and wore masks and costumes suitable for their roles. The obscene costumes of Old Comedy were long gone, however.

**FAMOUS ROMAN ACTORS.** Although the Romans did not hold full-fledged dramatic competitions as in Greece, there is some evidence that individual actors may have participated in contests with prizes. One of the most famous actors in the first century B.C.E. was Quintus Roscius Gallus. Roscius was born to an equestrian family in Latium and was a close friend of Cicero, who de-

Roman stone relief of actors wearing masks from Sabrata (in modern day Libya), post 4th-century B.C.E. THE ART ARCHIVE.

fended Roscius in court on a charge of business fraud around 69 B.C.E. It seems that women were allowed to perform in mimes, and various other productions, such as pantomime, private parties, and festivals. Some famous mime actresses are known, like Lycoris, the stage name of Volumnia Cytheris, who was the mistress of some of Rome's most prominent citizens in the first century B.C.E. Toward the end of the Roman Empire, women were known to perform in revivals of Roman comedy as well as in mimes and other skits, sometimes wearing scandalously scanty clothes. Theodora, a sixth-century C.E. mime actress in the eastern Roman Empire,

was described as an especially outrageous and lewd woman by her contemporary Procopius in his *Secret History*. She was raised by theater folk, became a prostitute early in her life (it was a common conceit that mime actresses were also prostitutes), and was something like a modern-day "performance artist"; she paraded through the streets of Constantinople wearing see-through clothing and allowed birds to eat seeds nestled between her thighs. When she married the emperor Justinian in 525 C.E. and became empress of the Eastern Empire, it caused a terrific scandal.

Mosaic of Roman theatrical masks from the Villa of Hadrian at Tivoli, outside Rome. 2nd century C.E. THE ART ARCHIVE/MUSEO CAPITOLINO ROME/DAGLI ORTI.

**PLAUTUS AND TERENCE.** Even though playwrights often took a backseat to actors and other spectacles that occurred in Roman theaters, two Roman playwrights that were known throughout the Roman Empire were Plautus and Terence. Titus Maccius Plautus, a comic playwright perhaps originally from Umbria, was the first to make Greek New Comedy a truly Roman genre. His career stretched from the late third to the early second centuries B.C.E., but his legacy and popularity lasted much longer. Playwrights after Plautus' time could ensure the success of a comedy by attaching the name of Plautus to it, and eventually the number of plays attributed to him grew to more than 130 titles. In the first century B.C.E. the Roman scholar Varro limited that number to 21, and most of these still survive. Plautus freely admitted to borrowing titles, plots, and character-types from his Greek New Comedy predecessors, particularly from Diphilus, Philemon, and Menander, but

he gleefully modified these plays to suit his Roman audience. Plautus referred to his method of adaptation from Greek originals as *vortere barbare* ("to turn into another language"), but the adverb *barbare* also has the connotation of "barbarically, inelegantly, roughly." Plautus took the themes of New Comedy—concerns about marriage, family, citizenship, and disputes—and turned them upside down, relying on the influence of Atellan farce and bawdy harvest rituals as much as on his Greek forerunners. Whereas many Greek New Comedies seem to have ended with a marriage, Plautus overwhelmingly preferred to end with a wild debauch, often in the house of a prostitute. Young men, with the help of their cunning slaves, regularly thwarted their mean-spirited parents and ended up not with the proper and respectable young female citizens, but instead with the prostitutes they have been patronizing. Those who had authority in Roman society or those who exploited the weak—such

*a PRIMARY SOURCE document***SASSY SISTERS**

**INTRODUCTION:** Titus Maccius Plautus was Rome's favorite comic playwright. He flourished during the late third and early second centuries B.C.E. in Rome, though he may originally have come from Umbria. Plautus freely adapted plots from his Greek New Comedy predecessors for his Roman revels, but since there is very little extant of Greek New Comedy, it is not often that we can compare Plautus' riotous shows with those of his models. In his play *Two Sisters Named Bacchis*, however, we actually have a significant portion of the Menandrian original, called *Double Dealer*, which allows us to make an educated guess about the changes Plautus may have included in his adaptation. Plautus amplifies the roles of the marginalized—the female prostitutes and the clever slave—and employs the double-plot technique, often seen in Terence, in this madcap play. The comedy is about two sisters, both prostitutes, who are trying to avoid extended service to a pompous soldier, while a clever slave named Chrysalus (“Goldie”) schemes to assist his young master in his relationship with one of the Bacchis sisters while at the same time trying to forestall his old master's lust for the same girl. In this scene, one of the young men tries to resist the wiles of Bacchis I, but at last gives in to her charms. In this scene we can see something of Plautus' love of alliteration, puns, and double entendre (many do not translate from Latin).

**Pistoclerus:** I'm more afraid of your allure than of being lured to the bed itself. You are an evil creature. A lurking lair is not appropriate for this young man, woman. ... Why am I, a young man, afraid, you ask? To enter into a wrestling arena of this sort, where one sweats into debts? Where I should take up debt instead of a discus, disgrace instead of a race?

**Bacchis I:** You talk beautifully!

**Pistoclerus:** Where I would take up a turtledove instead of a sword [both slang words for penis], and where someone would put a drinking cup in my hand instead of a boxing glove, a ladies' chamber pot instead of a helmet, a braided wreath instead of military decorations, dice instead of a spear, a soft cloak instead of a breastplate, where I'd be given a bed instead of a horse, and would lie down with a whore instead of a shield? Get away from me, away!

**Bacchis I:** You are much too rough.

**Pistoclerus:** I am to myself.

**Bacchis I:** So make yourself super-soft. ... Go on then. By Pollux I don't care, except for your sake. He [the blowhard soldier] will certainly carry her [Bacchis II] off; you don't have to be with me, if it's not what you want.

**Pistoclerus:** Am I nothing at all, then, can't I control myself?

**Bacchis I:** What is it you're afraid of?

**Pistoclerus:** It's nothing, just nonsense. Woman, I put myself in your power. I am yours, command me.

**Bacchis I:** You're sweet. Now, this is what I want you to do.

**SOURCE:** Plautus, *Bacchides*, in *T. Macci Plauti Comoediae*. Ed. W. M. Lindsay (Oxford: Clarendon Press, 1903): lines 55–56; 65–73; 91–93. Translated by Lisa Rengo George.

as fathers, money-lenders, and pimps—were the villains, while the underdogs—those who held little power or social status such as the young man still under his father's control, the slave, and the prostitute—were empowered and made comic heroes. Plautus frequently employed many themes that can be traced back to Old and Middle Comedy, such as “recognition” dramas, amatory misadventures, and long-lost children. Plautus' “comedies in Greek dress” could lampoon Roman mores and present a reversal of social structure because they were part of a festival atmosphere, and the fact that they were ostensibly set in Greece (despite the use of purely Roman legal and idiomatic language) helped to displace any sense of Roman impropriety. Plautus' brand of comic chaos remained unflinchingly popular for hundreds of years. Even Shakespeare used one of Plautus' comedies

of recognition, *The Twin Brothers Named Menaechmus*, as the source for his *Comedy of Errors* and inspired the Broadway musical and film *A Funny Thing Happened on the Way to the Forum*. Terence, on the other hand, did not aim for such mass appeal, nor did he receive it. A former slave from Africa, Terence rose socially to enter the elite “Scipionic Circle,” as the friends and clients of Scipio Africanus (c. 185–129 B.C.E.) were called. The Scipio family was fond of Greek culture, and they stood in opposition to conservatives like Cato the Elder, who promoted traditional Roman values and perceived Hellenism as a bad influence. Terence adapted four of his six plays (all of which survive) from Menander, and overtly adhered much more closely to the form and language of his originals than Plautus did. Terence, too, was aiming to please an audience of elite philhellenes and in

that he may have succeeded, but he certainly failed to please the masses as Plautus did. He complains bitterly in some of his prologues that his Roman audiences were frequently distracted by displays of spectacle, such as gladiatorial fights and acrobats. Terence was also criticized for *contaminatio*—combining plot elements and characters from more than one play to create something new. The tensions surrounding Terentian drama reflect the contemporary concerns about the possible infestation of Greek culture and its ability to defile Roman purity during a time when Rome had just vanquished Greece and was inundated with Greek art and culture. Terence’s tendency to celebrate and honor his Greek originals as works of art in their own right made him less admired than his older contemporary Plautus. Nevertheless, Terence’s talent was considerable: his language is fluid and elegant and his philosophical interest in the human condition lends a global appeal to his plays.

#### OTHER TYPES OF ROMAN THEATER

**MIME AND PANTOMIME.** Mime was a genre of theatrical performance lying outside the formal boundaries of tragedy and comedy. It originated in Greece, where it probably began as the informal performance of imitative gestures, impressions, dances, and songs. Mime actors did not wear masks or shoes, and performed mimetically, as the name of the genre implies, improvising the expression of simple but ribald plots from mythology or daily events through gestures, dance, and facial expressions, accompanied by music. In Greece, mime performers were included in the same class as acrobats, much lower socially than the state-sponsored actors, directors, and producers of tragedy, comedy, and the dithyramb. In Rome, performances of mime were at first connected to the *Floralia*, a raucous and bawdy festival for the goddess Flora, which was established in the late third century B.C.E. Flora was a goddess of bloom-

4th-century C.E. mosaic depicting gladiators in an amphitheater scene. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM MADRID/DAGLI ORTI.

ing plants and was thought to be suspiciously Greek by conservative Roman traditionalists. The *Floralia* was patronized by prostitutes: in fact, *mima* or “mime actress” was a euphemism for a prostitute, and women in mimes often displayed their bodies provocatively. Sulla, the Roman dictator in the early part of the first century B.C.E., elevated the status of mime by socializing with mime performers. Mime eventually became a literary genre in the first century B.C.E., written by such authors as Laberius and Publius Syrus, a former slave who was freed because of his talent in the genre of mime. Historical sources relate that Julius Caesar asked Publius Syrus to compete in the Roman Games of 46 B.C.E., and he challenged his fellow producers of mime to a contest of improvisation, of which Caesar declared him the winner. Roman mime was known for its inclusion of proverbial expressions and pithy moral teachings (despite its reputation for indecency), which were excerpted and collected by Seneca the Elder, among others. This genre reached its peak of popularity in the last years of the Roman Republic, but continued to be enjoyed throughout the remainder of the Roman Empire. A connected genre, “pantomime,” meaning “one who mimes everything,” became popular in the Roman Empire. It was brought to Rome from the Hellenistic east in 22 B.C.E. by the actors Pylades, who was said to have a more dramatic tragic style, and Bathyllus, who preferred comic themes. A single, silent performer who wore a mask and loose clothing to permit free movement, accompanied by mu-

*a PRIMARY SOURCE document***THE YAWNING ACTOR**

**INTRODUCTION:** Lucian was a prolific author, critic, satirist, and essayist in the second century C.E. The influences of Attic Comedy, Plato and Cynical philosophy are apparent in his many writings. In *On Dancing*, written around 150 C.E., Lucian defends the genre of pantomime at the expense of traditional drama, and in the process provides us with a fascinatingly detailed (albeit biased) description of the tragic theater of his day. Lucian gives us the impression that for him, at least, old-fashioned and traditional dramas were out of style, and the freer and more balletic genre of pantomime outstripped tragedy and comedy in popularity.

**SOURCE:** Lucian, *On Dancing*, in *The Context of Ancient Drama*. Eds. Eric Csapo and William J. Slater (Ann Arbor: University of Michigan Press, 1994): 182.

sicians and singers, acted out pantomime, and sometimes an actor spoke while the pantomime described the action physically. Prominent authors like Lucian (39–65 C.E.), an epic poet, wrote lyrics for pantomime, and because of its greater demands on the performer, was deemed to be of higher status than mime. Pantomime remained fashionable in both the Roman and Eastern Roman empires well into the sixth century C.E.

**GLADIATORIAL GAMES AND OTHER SPECTACLES.**

Scholars posit that fights between armed opponents at Etruscan funerals were the origin of the Roman gladiatorial combats, dating from the third century B.C.E. Whatever the source, the gladiator became a truly Roman figure, who could earn wealth, admiration from the ladies, and even freedom if successful in the amphitheater. Candidates for Roman office often funded gladiatorial contests as they did performances of other Roman entertainments, like theater, mime, and acrobatic shows, in order to gain popularity among the masses and win votes. Their original connection to funerals was superseded quickly by the desire of politicians and officials to appease the often rowdy and fickle Roman population. Gladiators probably fought in the Roman Forum before permanent amphitheaters were constructed beginning in the early Roman Empire. The most famous amphitheater in Rome is the Colosseum, whose remains still stand. The building of this massive and complex structure was undertaken during the reign of Emperor Vespasian and finished up under Titus in 80 C.E. The amphitheater has

an extensive basement with waiting areas for gladiators, criminals about to be executed, and others unlucky enough to be sent out to face danger and death in the arena, as well as holding pens for wild animals, like lions and tigers, for beast-fights and brutal executions of criminals, slaves, and other undesirables. There were many amphitheaters all over the Roman Empire, as the Romans eagerly exported their favorite entertainments to the furthest reaches of their colonies. As the Roman lust for larger and more elaborate spectacles grew, officials sponsored contests featuring thousands of gladiators and victims. There were four types of gladiator. The Thracian used a round shield and curved dagger. Both the Samnite—dressed to resemble a warrior from the Oscan town of Samnium—and the *murmillio*—identifiable by a fish on his crest—were armed with a long shield, helmet with a visor, and sword. The *retiarius* (“net-man”) had little body armor and relied on agility and speed with his net and trident. Most gladiators were slaves, prisoners of war, or criminals who were pressed into service. Free citizens could also sell themselves to a keeper of a gladiatorial team. The combats were often gruesome affairs, resulting in amputated limbs, horrendous wounds, and death. Not all Romans relished these bloody exhibitions: the great Roman statesman Cicero bemoaned the popularity of these brutal entertainments. The poet Juvenal (first–second century C.E.) was disgusted when a dog ran past with a human hand in its mouth after a night of gladiatorial combats. Other types of popular public

*a PRIMARY SOURCE document***AN UNHOLY FEAST**

**INTRODUCTION:** Lucius Annaeus Seneca the Younger most likely composed his tragedies while serving as an adviser to Nero in the mid-first century C.E. Seneca's tragedies are a puzzle to modern scholars: when exactly were they written, and for what purpose? Are they meant to teach Stoic principles, despite their grotesque violence, or were they merely meant to entertain the callous court of a maniacal emperor? At any rate, they are the only extant Roman tragedies and as such provide us with a glimpse of the continuing tradition of the tragic genre. In his play *Thyestes*, Seneca retells the gory tale of the sons of Pelops, Thyestes and Atreus, who are doomed to repeat the gruesome familial pattern of cannibalism and revenge. Thyestes has seduced his brother's wife, and in a horrible act of vengeance Atreus has killed his nephews and cooked them to serve to his brother in an ironic "reconciliation" banquet for his brother.

**Thyestes (after finishing his grim meal and discovering its source):** This is what shamed the gods, this drove the day against its dawn. Wretched me, what noises shall I make, what laments? What words will be enough for me? I recognize the severed heads, the hands cut off, the feet ripped from broken legs! This is what the ravenous father could not gulp down. My sons' guts are rolling around inside me, and my crime concealed in my stomach struggles without a way out and searches madly for an escape. Brother, give me your sword that is clotted with my own blood. With its blade, the path to freedom may be provided for my children. You refuse to

give me the sword? Then may my chest echo, beaten by resounding blows! Hold back your hand, you miserable son of a bitch—let's show mercy to the ghosts of the dead. Who in the world has ever seen such a horrible crime? What Heniochian [a notoriously savage nation] who lives on a jagged cliff of Mt. Caucasus, what Procrustes [an unusually sadistic fellow], who causes fear among the Cecropians? Look at me, a father who crushes his sons, and is in turn crushed by them. Is there no limit to evil?

**Atreus:** There ought to be a limit to evil when you do evil, but not when you repay it. Even this [gesturing at the bloody body parts of the children] is not enough for me. I should have poured their hot blood right from their wounds down your throat, so that you could drink their gore while they were still alive! My words of rage were lost in my rush. I stabbed them with a deep thrust of my blade, I slaughtered them at the altars, I placated the sacred hearth with their blood as an offering. I carved up their lifeless corpses and I tore them to pieces, immersing some parts in boiling pots: others I set to drip over slow fires. I tore off their limbs and muscles while they were still breathing, and I watched their livers pierced on a thin spit, still quivering, and I myself fed the flames. Their father could have done all these things better—my pain has fallen for no purpose. He ripped apart his sons with an unholy mouth, without knowing it, and without them knowing it!

spectacle, most involving a high level of risk, were wild-beast hunts, executions, chariot-racing, athletic competitions, military triumphal processions, numerous religious holidays and festivals, and religious rituals.

**NERO AND SENECA.** One era of the Roman Empire deserves special mention here. When Nero became emperor in 54 C.E. he introduced a new level of interest in the performing arts. He had been tutored by Seneca the Elder and fancied himself as a talented artist, author, musician, and actor. He developed his own version of Greek games called "The Neronia," instituted in 60 C.E., and he himself performed in the second year of the games. Nero often traveled to Greece to perform in games and to give recitals of music and drama. His refusal to heed the traditional laws of Rome, which forbade members of the upper classes to perform on the public stage, out-

raged many Romans. Seneca, son of Seneca the Elder, became one of Nero's advisers. He had been a senator and held other political offices, but was renowned for his skills as a public speaker and author. He amassed a great fortune while serving under Nero, but his position in the emperor's court also meant that he had to accept the emperor's unsavory and cruel methods, including several assassinations, while at the same time espousing moral values. His works are comprised of several philosophical and didactic treatises, a book on natural science, a comedy parodying the emperor Claudius, and nine tragedies based on Greek mythology. These plays were modeled explicitly on Greek tragedies: they were written in tragic meters and in episodic form, and they included choral songs and dances. His style has often been called "Euripidean" since he explored the psychology of his characters, portrayed individuals as blameless victims

of fate or the gods, and focused on some of the most gruesome and shocking events portrayed in myth. At the same time, his treatment of themes and characters is so exaggerated it may have been intended as parody. Scholars have argued for centuries about whether Senecan drama was meant to be staged or only recited in private performances or public acting contests. Some have pointed out that the plays would have been impossible to stage realistically, since they portrayed murders, funeral pyres, animal sacrifices, and other scenes of ferocious violence—events that always took place off stage and were only described during the course of a Greek tragedy. Others have argued that the unstageable events could have been performed mimetically, or that the dramas were not intended to be staged as a whole, since many individual scenes are performable. Still others have suggested that Seneca wrote these gory dramas only to be read as an evening's entertainment at court or to provide "set pieces" for Nero and others to perform at recitals or in contests. Not surprisingly, Seneca's plays featured beautifully written speeches with fine rhetorical turns, extensive descriptive passages, moralizing and pithy epigrams, or short sayings. Senecan drama had great influence on theater in the Renaissance and in Tudor and Jacobean England.

## SIGNIFICANT PEOPLE *in Theater*

---

### ARISTOPHANES

c. 445 B.C.E.–c. 385 B.C.E.

*Comic playwright*

**FAMOUS COMEDIAN.** Unfortunately, there are very few details about the life of Aristophanes other than the fact that he was born around 445 B.C.E. He began writ-

ing for the comic stage as a very young man, and submitted his first play, *Banqueters*, to the competition at the City Dionysia in 427 B.C.E. when he was only eighteen years old. The titles of 54 of his comedies are known, but unfortunately only eleven of those plays exist today. In fact, Aristophanes is the only Greek comic playwright of the fifth century B.C.E. whose works have survived even in part from this time period. Yet through literary sources, it is clear that Aristophanes was not the only comedic playwright at the time; his most famous contemporaries were Eupolis and Cratinus. Yet Aristophanes' inventive use of language and his inimitable poetic style won the admiration not only of the Athenian public (except the outraged officials) but, later, of Plato. Aristophanes is one of the guests at Plato's fictional *Symposium* and gives a memorable speech about the origins of love.

**WORKS.** Of the surviving plays of Aristophanes it is known that three won first prizes at the City Dionysia. Yet he won many other awards for his plays as well. His known plays include: *Acharnians* (first prize at the Lenaia, 425 B.C.E.); *Clouds* (last place at the City Dionysia, in 423 B.C.E., later revised); *Birds* (second prize at the City Dionysia, 414 B.C.E.); *Lysistrata* and *The Festival Goers* (the first at the Lenaia, the second at the City Dionysia, 411 B.C.E.); *Frogs* (first prize at the Lenaia, 405 B.C.E.); and *Women in the Assembly* (perhaps 392 B.C.E.). Aristophanes was often threatened with prosecution by the statesman Cleon, whom he mocked frequently in his comedies. Comedy in fifth century B.C.E. Athens was quite different from what comedy is to modern audiences. Comedies were topical satires that derided important political and intellectual movements and figures of the day. Famous targets included Cleon, a rich politician and successor of Pericles; Euripides, the famous tragedian; and Socrates, already infamous as a philosopher and teacher, who is identified with the Sophists (itinerant professors of philosophy and rhetoric) whom Aristophanes despised. Even the gods could appear on stage in ridiculous settings. Though he was an intellectual himself, Aristophanes was not averse to including extremely crude (and crowd-pleasing) humor in his plays, which abound in sexual and scatological references. Aristophanes employed outrageous costumes and scenery in some of his fantasies, such as *Birds*, in which actors dressed as animals, wore padded costumes with genitalia protruding from beneath short tunics, and grotesque masks in a fictional utopia called "Cloud Cuckoo Land." Many of the heroes of his plays are common people who want solutions to problems in their

daily lives and who are mystified by the machinations of politicians and diplomats.

**SHIFTED TO MIDDLE COMEDY.** There was a shift in Aristophanes' comic sensibilities as the political climate changed due to the Peloponnesian Wars with Sparta (431–404 B.C.E.). His early plays followed a rigid dramatic structure involving a strong chorus crucial to the action that gradually loosened as the playwright defined his own style. After Athens lost the war to Sparta, however, his plays lost their topicality and became less specific to Athens, and the chorus—formerly of prime importance—became largely extraneous to the plot. These plays are now designated as “Middle Comedy,” as opposed to the “Old Comedy” defined by his earlier style, and influenced fourth and third century B.C.E. Greek playwrights like Menander, and later the Romans Plautus and Terence.

## EURIPIDES

c. 480s B.C.E.–c. 405 B.C.E.

### *Tragic playwright*

**GIVING VOICE TO THE UNHEARD.** There are more than twice as many surviving plays of Euripides than of either Aeschylus or Sophocles (eighteen as compared with six or seven apiece of the others). There is also a parodic portrayal of the playwright in Aristophanes' *Frogs* and a fanciful biography of him written in the third century B.C.E. which relied on details from the playwright's own works as well as various other spurious sources. Even so, it is difficult to discern the facts of the playwright's life, and ultimately there is as little known about him as about most famous people from antiquity. Euripides was born to a wealthy family in the Athenian deme of Phyla, though there were stories that he came from modest origins as well, most likely because he often portrayed humble people in his plays. The tale that he isolated himself

in a cave at Salamis to write his plays probably more reflects his lack of interest in politics or public life than an actual physical isolation. He first competed at the City Dionysia in 455 B.C.E. He won fewer first prizes—only four—than did Aeschylus or Sophocles during his career, but the story that he fled Athens for Macedon in disgust at his lack of popularity is undoubtedly false. Nevertheless, he did die at the court of King Archelaus of Macedon in approximately 406 B.C.E.; the story has it that he was torn to pieces by the king's guard dogs, which echoes his propensity in tragedies to include unusually violent deaths for his characters, such as the demise of King Pentheus in *Bacchantes*, who is ripped apart by a raving band of maenads led by his own mother. Euripides had three sons, one of whom, also named Euripides, may have produced some of his tragedies after his death

**WORKS.** Eighteen of Euripides' plays survive. (A nineteenth, the *Rhesus*, is of doubtful authorship.) The plays securely attributed to Euripides include: *Medea* (last place in 431 B.C.E.); *Electra* (417 B.C.E.); *Trojan Women* (second prize in 415 B.C.E.); *Bacchantes* and *Iphigenia at Aulis* (first-prize winners produced together posthumously in 405 B.C.E.); and a satyr play, *Cyclops* (date unknown). In addition, there are substantial fragments of eleven others, including *Oedipus*, *Cretans*, and *Archelaus*, written for his patron in Macdeon. Euripidean drama focuses on individual characters and their personal circumstances, the paradoxical nature of human life and its vicissitudes, and the internal struggle that the tragic hero undergoes. As a consequence, the structure of his plays sometimes follows a predetermined plot to its foreseeable, if regrettable, outcome; at other times, his plays swerve as unpredictably as his characters do. Euripides featured characters who commit the most extreme acts humans are capable of—incest, rape, betrayal, murder—and allowed them to stand up for themselves. He sometimes drew criticism for portraying women who defended roles that were contrary to Athenian values, like Agave in *The Bacchantes*, who glories in her newfound bloodlust, and Medea in the play that bears her name. He often added startling innovations to familiar stories from myth. Some of his tragedies, like *Ion*, include elements more familiar to Middle and New Comedy: a son born out of wedlock is eventually recognized and reunited with his parents with the help of the gods. The amazing variety of Euripidean plots, from the very bleak *Trojan Women*, portraying women who must face a future as the sexual slaves of the men who killed their families, to the almost light-hearted *Helen*, which chronicles the awkward reunion of Helen and Menelaus after the Trojan War, ultimately de-

fies categorization. Euripides was criticized in his own time for portraying ordinary people as they were instead of noble denizens of a tragic past, but he often seems like the most “modern” playwright. His plays were among the most popular in later revivals.

### LIVIVS ANDRONICUS

c. 280 B.C.E.–c. 204 B.C.E.

*Playwright*  
*Translator*

**THE ORIGINATOR OF LATIN POETRY.** Little is known about the early life of Livius Andronicus, who was born around 280 B.C.E. He likely came to Rome as a teacher of Greek and Latin sometime in the mid-third century B.C.E. in the household of one Livius Salinator, from whom he took the family name “Livius” after being freed. His exact region of origin is not known, though his last name “Andronicus” sounds Greek, and he may have been born in the Greek colony of Tarentum in southern Italy. This area was known to the early Romans as *Magna Graecia* or “Greater Greece,” because it, as well as the island of Sicily, had been colonized by the Greeks since at least the eighth century B.C.E. He is credited as the first to create Latin poetry when he began translating Homer’s *Odyssey* into Latin using a native Italic poetic meter. He also began producing plays for and acting on the Roman stage, influenced by the Greek theater in southern Italy, Greek-influenced Etruscan performances, and the early native forms of spectacle, like the Fescennine verses at harvest times, the Atellan farces of the Oscans in Campania, and the Italians’ love of music, dance, and religious ritual.

**WROTE IN BOTH GENRES.** His first production took place in 240 B.C.E., during an especially grand celebration of the annual Roman Games to celebrate Rome’s victory over Carthage in the First Punic War (264–241 B.C.E.). Unlike Greek playwrights, who wrote in only one genre, Livius Andronicus wrote both

tragedies and comedies in the Greek style, of which seven titles and fewer than seventy fragments have survived. His tragedies often centered around the events of the Trojan War, such as *Achilles*, *Aegisthus*, *Ajax with a Whip*, *The Trojan Horse*, and *Hermione*, but he wrote on other mythological stories as well, including *Andromeda*, *Danae*, and *Tereus*. One of the few comedies that survived to modern times is entitled *The Little Sword*. In 207 B.C.E., he received state honors for his work, the first time that the Romans honored literary achievement. In that same year, the professional actors’ and scribes’ union (the *collegium scribarum histrionumque*) was officially recognized, and space was provided for them in a temple on the Aventine Hill. Under the influence of Livius, and due to the popularity of his plays, the old Roman *saturae* (sketches accompanied by music that were originally performed) gradually became a purely literary genre in favor of the Greek-inspired drama Livius brought to his adopted city.

### LYCORIS

c. 70 B.C.E.–Late 1st century B.C.E.

*Mime actress*  
*Prostitute*

**MIME AND MISTRESS.** “Lycoris” was the pseudonym of Volumnia Cytheris, a freed slave, perhaps originally a Greek, who became a famous mime performer and prostitute. Lycoris was the mistress of some of Rome’s most famous men in the Republican era: Cornelius Gallus, poet and colleague of Catullus and first prefect of Egypt; Brutus, a well-known conspirator in the assassination of Julius Caesar in 44 B.C.E.; and Marcus Antonius, lover of Cleopatra and the unsuccessful opponent of Augustus in the war for control of Rome in 31 B.C.E. She is mentioned in the poetry of Ovid, Vergil, and the fragments of Gallus’s works, and unflatteringly in Cicero’s letters. It is commonly believed that

Roman actors on the “legitimate” stage were all male, and that respectable women were forbidden to act on the stage, but women were permitted to perform in the less reputable genre of mime and pantomime. All performers of Roman theater and spectacle were legally *infamis* (“disreputable”), and Lycoris, a woman, former slave, and a foreigner as well, lived on the margins of society even though she had connections to powerful political figures. There is no mention of Lycoris after the early 40s B.C.E.

## MENANDER

342 B.C.E.–c. 292 B.C.E.

*Comic playwright*

**THE MASTER OF NEW COMEDY.** Menander was born in 342 B.C.E., a native Athenian who may have had family connections to the Greek theater of which he became such an integral part. Some sources relay that he was the nephew of the well-known Middle Comedy playwright Alexis, none of whose works survive. Ancient references also tell that Menander studied with the philosopher Theophrastus, Aristotle’s successor as the head of the Peripatetic school of philosophy at Athens. He served in the military with Epicurus, another philosopher whose doctrine, Epicureanism, involved the pursuit of wisdom and happiness by relying on human perception rather than religious belief. These associations may account for much of the philosophical content of Menander’s plays. Nearly 100 titles of plays are attributed to Menander, but very little of his writing survives today. Most of the manuscripts of his plays were lost during the seventh and eighth centuries C.E. because the Byzantines thought their style of Greek was substandard compared to that of the fifth-century B.C.E. dramatists. Fortunately, several substantial portions, including a few plays more or less in their entirety, were discovered during twentieth century C.E. excavations in Egypt. More of Menander’s works may have survived because he was a master of the genre of New Comedy: his plots, which focused on family life and its daily complications, displayed gentle comic flare, timeless social commentary, and impeccable timing. The

plays had such widespread appeal, in fact, that the Roman playwrights Plautus and Terence frequently “borrowed” from him in creating their own comedies.

**WORKS.** A nearly complete manuscript of *The Grouch* exists, which was first performed in 317 B.C.E. and won first prize at the City Dionysia in Athens. Large portions and fragments of varying size and quality have survived as well. *The Grouch*, which in many ways seems to be a typical New Comedy, features a misanthropic old man named Knemon who, after his wife leaves him, withdraws with his daughter to an isolated farm outside Athens. The god Pan announces that he wants to help Knemon’s daughter by setting up a marriage between her and Sostratos, the son of a wealthy farmer. After a series of comic mix-ups and mishaps that focus on the lovestruck Sostratos’ attempts to prove himself worthy to the crabby Knemon, Knemon realizes the benefits of living in society, accepts Sostratos as his son-in-law, and reunites with his wife. Although Menander and his colleagues had a political agenda invested in the laws of Athens, it was much less obvious than their predecessors. Their plays are far less topical and specific to Athens than those of their predecessors in Old and Middle Comedy. Menander in particular seems to have been especially sensitive to widespread social problems and family issues like rape, illegitimate children, citizenship and marriage, prejudice, and intolerance. Menander was an especially adroit playwright, who was aware of dramatic nuance and who used the genre and versification of New Comedy to explore human psychology, political concerns, and societal dilemmas. The Roman playwrights Plautus and Terence openly acknowledged their debt to Menander and other Greek New Comic playwrights in the prologues and plots of their “adapted” plays. Menander drowned while he was swimming in the Piraeus, Athens’ harbor, around 292 B.C.E.

**GNAEUS NAEVIUS**

c. 270 B.C.E.–c. 200 B.C.E.

*Playwright**Translator*

**FIRST ROMAN PLAYWRIGHT.** Naevius was most likely born in Rome around 280 B.C.E., despite a later reference to his possible Campanian origins. His family name is known from historical records as a plebeian rather than noble name and he was certainly a Roman citizen, not a freedman like his contemporary Livius Andronicus. He served in the Roman army during the first Punic War (264–241 B.C.E.) and began writing for the stage afterward, with his first production in Rome in 235 B.C.E. He did not act in his own plays like Livius, but he did originate a uniquely Roman form of drama: the *fabula praetexta*, historical tragedies about Roman subjects rather than Greek mythology. One, called *Clastidium*, recounted a Roman victory in that city in 222 B.C.E.; another, *Romulus*, told the story of Rome's legendary founder. He also wrote comedies, based on Greek originals (called *fabula palliata* after the Greek *pallium*, or outer garment) and Roman originals (*togata* after Roman clothing). In a style that harked back to Greek Old Comedy and very much contrary to New Comic practice, Naevius often attacked famous Romans, like Scipio Africanus and the noble Caecilius Metellus family. He was even jailed for a time because of his assaults on the upper class, which Plautus alludes to in one of his comedies. He may have been best known for his epic poem "The Punic War," the first real Roman epic in native Italic meter. This sweeping national poem, which went back to Rome's connection to the Trojan Aeneas, was a powerful influence on later writers of Roman epic like Ennius and Vergil. Naevius' younger contemporaries Pacuvius and Accius continued to write in the genres Naevius established or developed, but Roman tragedy as a dramatic form did not endure past Naevius' time. Plautus and Terence carried on writing comedies "in Greek dress," and in the first century C.E., Seneca wrote tragedies based on or inspired by Greek originals.

**NERO**

37 C.E.–c. 68 C.E.

*Roman emperor**Performer*

**A TROUBLED EMPEROR IN A TROUBLED TIME.** Nero was born Lucius Domitius Ahenobarbus in December 37 C.E. to Agrippina the Younger and G. Domitius Ahenobarbus. His mother was the daughter of Germanicus Julius Caesar, grandson of the emperor Augustus and brother of the emperor Claudius. His father was a cruel and much vilified former soldier who swindled and killed for fun. His family was banished by the emperor Caligula in 39 C.E., and his father died soon afterward. When Claudius became emperor in 41 C.E., he restored Agrippina's civil rights and her estates, which had been confiscated by Caligula. Seneca the Elder, an historian and orator, tutored the young Nero. His uncle Claudius adopted him in 50 C.E., making him heir to the throne. Agrippina murdered Claudius in 54 C.E., and Nero became emperor. His dominating mother held the empire's reins at first, but gradually the impressionable Nero fell under the influence of his advisers, and she was removed from the emperor's palace in 55 C.E. Nero murdered his mother in 59 C.E. Never very stable, he allowed his advisers to run the government while he slid into debauchery, excess, and madness. He was married three times, and had numerous affairs with both men and women, and, according to some rumors, even his mother.

**PUBLIC PERFORMANCES.** Nero adored spectacle and the arts, and spent a lot of time in Greece, the cradle of culture for the Romans, where he regularly competed in games. He once staged a triumph for himself, but instead of displaying the spoils of conquered nations, he was preceded by a display of the trophies and proclamations of his victories in singing and lyre playing in Greek. He fancied himself as a gifted author and performer on the stage, and often compelled the citizenry to listen to him declaim and sing excerpts from drama for hours in locked theaters. Citizens were said to have faked serious illness in order to be carried out of the theater. In 60 C.E. he established the Neronia, contests modeled on Greek games in which noblemen vied in declamation and music. He underwent grueling rituals to strengthen himself for performing in public, such as lying with heavy weights on his chest, purges and

extreme diets, and drinking a concoction made of dried boar's feces to repair sore muscles. He surrounded himself with flatterers who encouraged his delusions. The famous fire in 64 C.E., in which Nero was famed to have "fiddled while Rome burned," serves as an example of the extent of his megalomania and the urban turmoil in Rome during his reign. He was so serious about himself as one of the world's most talented performers that the writer Suetonius relays that his dying words were "I die as such a great artist."

### TITUS MACCIUS PLAUTUS

c. 250 B.C.E.—c. 184 B.C.E.

*Comic playwright*

**FROM SLAVE TO KING OF COMEDY.** Because Plautus was the most popular playwright in Roman history, there are many biographical details about him from many sources. It is ultimately impossible to determine which are true, or even partly true, and which are wholly false. In any case, the stories about Plautus bestow on him a colorful life, with a dramatic rise from slavery to comic sovereign. It is said that he was born in Sarsina, Umbria, around 250 B.C.E., and was a native speaker of his regional Italic language, Umbrian. "Plotus" is the Umbrian spelling of his *cognomen*, or last name, which may have meant "flat-footed" or "big-eared," both perfect for a comedian. This name would have been Romanized as "Plautus." "Plautus" also connotes "applause" (the modern English word comes from a Latin root), and therefore is a clever last name for a famous playwright, whose livelihood depended on his popularity with his audience. His gentilician or family name, Maccius or Maccus (the manuscripts are unclear), was very probably made up as a joke on the Roman nobility with prestigious family names like Julius and Claudius. There was a typical character named "Maccus," a clown, in the native Italic dramatic genre known as Atellan farce. Though Plautus was born a free citizen, his popular biography told that he was a slave who had been a performer in

Atellan farce and mime, and who then came to Rome as a freedman and rose to greatness on the comic stage.

**LIBRARY OF WORK.** In the second century B.C.E. over 130 titles of plays were attributed to Plautus. Certainly he was a prolific author, but part of this overwhelming number of attributions may be a result of his name itself: any play said to be written by the great Plautus would certainly have attracted more audience members. At the end of the century, the Library of Alexandria began to collect manuscripts and put together reliable editions of the best known authors, and in the first century, one of the foremost scholars in Rome, Varro, made what he considered a definitive list of 21 plays that could accurately be called Plautine. These plays are the ones that have been recognized by modern scholars, mostly complete with some fragmentation. The chronology of the plays is uncertain and has been a source of scholarly debate for hundreds of years. Because New Comedy focused on general social situations and avoided most topical references, allusions to historical events are few and often hard to assess. The titles of Plautus' best-known plays are as follows: *Casina*, the name of a household maidservant (c. 186 B.C.E.); *The Twin Sisters Named Bacchis*; *The Twin Brothers Named Menaechmus*; *The Boastful Soldier*; and *Pseudolus*, the clever slave of the play (c. 191 B.C.E.).

**THEMES AND STYLES.** From these plays, much can be garnered about Plautine style, characterization, and staging. Plautus often presented as his comic heroes not members of the nobility or figures of authority but the lowliest and least powerful elements of society: slaves, foreigners, prostitutes, young men without resources. Since Plautus unabashedly "adapted" plots from his Greek New Comedy predecessors, many of the same characters that were established in that genre can be seen: the grouchy old man, the nagging wife, the nosy neighbor, the shrewd prostitute, the dissolute son, the victimized young woman. Plautus made these characters his own, however, by changing them from Greek comic stereotypes to real denizens of Rome, who used Roman idioms and legal terms and thought like Romans. In this way, Plautus could satirize aspects of his own ultra-conservative society by presenting all his characters as "Greek," thereby absolving them of their debauched morals and behavior, and allowing his Roman audience to enjoy the reversal of heroic status. One scholar has compared the comedies of Plautus to the celebration of the Saturnalia, a festival in which masters and servants changed places for the day. Plautus' Latin is the only example of literary Latin in the late third and early second centuries B.C.E. His latinity is deceptively fluid and id-

iomatic; it is also highly stylized, uses a great number of anachronisms and other oddities, and follows a complicated metrical schema. Plautus' play *Twin Brothers Named Menaechmus* was the basis for Shakespeare's *A Comedy of Errors*.

### QUINTUS ROSCIUS GALLUS

c. 120 B.C.E.–c. 62 B.C.E.

*Actor*

**ROME'S MOST FAMOUS ACTOR.** Quintus Roscius Gallus was one of the most famous actors in ancient Rome. In fact, his name continued to be used to describe a brilliant actor until the nineteenth century C.E.—as modern critics might use “an Olivier” to designate an especially gifted actor. His *cognomen* (“last name”) Gallus usually denoted someone who was a freedman (the son of a former slave), but Roscius was born to a prosperous family in Latium, what is now the area south of Rome. Most of the biographical information about him comes from the great Roman statesman Cicero, who defended Roscius in court on a charge of business fraud in 69 B.C.E. or thereabouts. He was extremely handsome with a slight squint, and was especially renowned for his *venustas* (“grace of movement”). He may have tutored Cicero in the art of elocution when Cicero was a young student, but he was aristocratic enough to be part of the inner circle of Sulla, the Roman dictator, who made him a knight in 81 B.C.E. Roscius preferred acting in comedies to tragedies, perhaps because comic roles required more physicality, but he was known for his tragic performances as well. As the great actor grew older, he slowed down his movements and was renowned for his “old man” voice.

### SENECA THE YOUNGER

c. 4 B.C.E.–65 C.E.

*Statesman*

*Author*

**TUTOR TO NERO.** Lucius Annaeus Seneca, the “Younger,” was born in the Roman colony of Spain just before the turn of the first millennium. His father, Seneca the “Elder,” was a famous orator who wrote treatises on rhetoric for his sons, which were later used as school texts. Seneca the Younger was born around 4 B.C.E. and educated in Rome from an early age. He pursued a political career as a young man and, in addition to being a lawyer, held the offices of quaestor and praetor before becoming a senator. When Nero became emperor in 54 C.E., Seneca became one of his most influential political advisers, and thanks largely to him and another adviser, Burrus, the Roman state proceeded smoothly for the next eight years. As Nero's behavior became more erratic and violent, Seneca was increasingly compelled to overlook the emperor's barbarity until, after Burrus died in 62 C.E., he was allowed to retire from court. He set out to write works of philosophy, but was incriminated in a political conspiracy and was forced to kill himself in 65 C.E.

**WORKS.** Seneca wrote prolifically and his corpus included works on morals, philosophy, and ethics in addition to poetry and drama. He became known in particular for the tragedies in Greek style he composed in the first century C.E., such as *Medea*, *Phaedra*, and *Thyestes*. Seneca was indebted to the great Greek tragedians Aeschylus, Sophocles, and Euripides for the treatment of his subject matter and in some elements of his style, but overall Senecan tragedy is a unique amalgam of moralizing, gore, and hyperbolic rhetoric. Seneca's rhetorical training is apparent in the frequent, impassioned speeches of his characters, and his focus is on the power of language rather than of actions. Some have suggested that Seneca taught Stoicism through his tragedies, since many of them feature the destructive power of unrestrained emotion, a Stoic precept. This is unlikely, however, since evil often triumphs over rationality in his plays in a distinctly un-Stoic manner. His tragedies are richly drawn with extraordinarily vivid characters. His plays are filled with suspense, madness, and horror, which kept them in the theatrical limelight far past Seneca's own time. It is un-

clear whether Seneca intended for his tragedies to be staged completely or whether he wrote them for other purposes. Seneca had a widespread influence on authors of the Italian Renaissance and Jacobean England.

### SOPHOCLES

c. 496 B.C.E.—c. 405 B.C.E.

*Tragic playwright*

**ROLE IN GOVERNMENT AND RELIGION.** In his play *Oedipus at Colonus*, Athens' most prize-winning tragic playwright paid tribute to his native village Colonus, just outside of Athens, where he was born sometime around 496 B.C.E. He was the son of Sophilus and had connections to the most important political figures of his day, from Cimon until his ostracism in 461 B.C.E. and Pericles afterward. Sophocles served as a treasurer of Athens and as a *strategos* or general, one of the highest elected offices in the state, though his contemporary Ion of Chios reported that he had no particular talent at politics. He was also called upon to serve as a state adviser after the catastrophic Athenian defeat at Syracuse in 413 B.C.E. Ancient sources report that he was a cult priest and worshipper of Asclepius, the son of Apollo and healer, and after his death he was honored with his own hero cult under the name "Dexion."

**WORKS.** His career as a tragic poet was long and impressive. He is credited with three important theatrical innovations: the addition of a third actor, painting of the *skene*, and the increase of the chorus from twelve men to fifteen. He is said to have written over 120 plays, with twenty first-place prizes and no last-place showings in any dramatic competition. He competed for the first time in 468 B.C.E., perhaps against Aeschylus, and won. His last competition was in 406 B.C.E., when he dressed his chorus in mourning for the death of Euripides during the introduction to his trilogy at that year's celebration of the Dionysia. Of his many titles, only seven plays remain, and the dates for most are uncertain. His most famous plays and their probable dates are: *Antigone* (c. 441 B.C.E.);

*Oedipus the King* (between c. 436–426 B.C.E.); and *Oedipus at Colonus* (won first prize posthumously in 401 B.C.E.). He is renowned for his three Theban plays about the fortunes of Oedipus and Thebes, but those dramas were not written together in one single trilogy; rather, they were produced in trilogies over the course of forty years.

**THEMES.** Sophoclean heroes can be characterized by an arrogant inflexibility that must be broken before the truth—another vital element to Sophoclean drama—can be found. The characters in Sophocles' plays are also haunted by their responsibilities to the dead: the character Oedipus must uncover the murderer of the former king of Thebes; Antigone must bury her dead brother against the edict of her uncle; Ajax is tortured by his failure to possess the dead Achilles' weapons. Part of Sophocles' particular dramatic flair revolved around his use of a talismanic item or action: the solving of the Sphinx' riddle, the bow of Philoctetes, Deianeira's magic potion. Sophocles is also renowned for his use of the theme of dramatic recognition, his characters' exquisitely well-timed entrances and exits, and the naturalistic language he intersperses with high-flown and abstract poetic flourishes. Some of the greatest actors of later periods, such as Polus and Theodorus, often appeared in Sophocles' plays, which were regularly revived. Sophocles died at about age ninety around 405 B.C.E., the same year his younger contemporary Euripides died.

### TERENCE

c. 193 B.C.E.—c. 159 B.C.E.

*Comic playwright*

**HELLENIST AND HUMANIST.** The Roman biographer and historian Suetonius in the first century C.E. wrote the life of Terence, and some of that biography was preserved by Aelius Donatus, a medieval commentator on the playwright's work. Even so, as with all ancient biography, it is impossible to determine the

authenticity of all the details. He was born in Carthage around 193 B.C.E., which accounts for his *cognomen* (last name) “Afer,” meaning “African.” He may have come to Rome as the slave of one Terentius Lucanus, from whom he took his family name, Terence. Despite his humble and unpromising entrée into Rome, he became closely associated with the house of Scipio, one of Rome’s premier families. Some contemporaries suggested that Scipio Aemilianus or Gaius Laelius, two members of that elite circle, composed Terence’s plays themselves. The playwright refutes these and other allegations in the prologues to his six plays. At any rate, the Scipionic circle held wide influence culturally; they were philhellenes, or lovers of all things Greek, and with their Greek conquests they brought also a renewed passion for Greek art, drama, and culture. This trend is illustrated by Terence’s corpus. Like fellow playwright Plautus, Terence used the plots and titles of Greek New Comedies for his comedic drama, relying on Menander for four of his six plays. He followed his precursors more closely than Plautus did, but his talents were distinctly different from his forerunner in Roman comedy. All six of his plays survive and include: *Mother-in-Law*, *Eunuch*, and *Brothers*. This last play was commissioned for the funeral of Lucius Aemilius Paulus, the father of Scipio Aemilianus, in 160 B.C.E. While Plautus aimed and succeeded at entertaining the Roman masses in vast numbers, Terence’s more tightly constructed and less riotous plays seem to be geared toward a more sophisticated group of theatergoers, people who recognized the constraints of the genre and sought something beyond its boundaries. Terence adhered strictly to the generic conventions, but used them to express a new interest in humanism and the personal. A famous line from *Self-Torturer* states that “I am human, and I don’t think anything human is foreign to me.” Terence also celebrated the artistic achievement of Greece and followed his models more closely in order to showcase his predecessors’ talents. Using primarily Menander as a model, he wrote plays in refined Latin on the Menandrian themes of the importance of friendship, the resolution of family conflicts that reflected social issues, and the making of good citizens. He also offered some important innovations to the structure of theater: Terence used a double-plot structure and strove for on-stage realism, more suspense and less irony, and the universal quality of gentle humor found in Greek New Comedy. In one of his most exciting plays, *Eunuch*, a young man who lusts for an innocent young woman (the slave of a prostitute) poses as a eunuch to gain access to her chamber, while in another plot, a soldier is in love with this same prostitute and competes with another client for her attention. In the end, the slave-girl

is found to be the daughter of a citizen and so can be legally married to her rapist, which passed as a happy ending in New Comedy. Terence’s humanism was not necessarily popular with the public, however, as the playwright himself relays in prologues that make no attempt to be integrated into the plays themselves. At the first performance of *Mother-in-Law* in 165 B.C.E., Terence’s audience was distracted by an acrobatic display; at a second performance in 160 B.C.E., they left in droves to watch gladiators fighting. At a third production later that same year, his audience, or most of it, finally stayed until the end of the play. Terence died at a very young age, either 24 or 34, while on a voyage to Greece. Dying while journeying to the cultural center of the world was especially poetic—the same story is also told of Vergil’s death in 19 B.C.E.

## DOCUMENTARY SOURCES in Theater

- Aeschylus, *Oresteia* (458 B.C.E.), and other tragedies—This trilogy is the only surviving trilogy from the fifth century B.C.E.
- Aristophanes, *Acharnians* (c. 425 B.C.E.)—Aristophanes’ first play introduced the comedic genius of the young playwright. The plot of this Old Comedy revolves around a simple man who defies the Athenian government and makes a separate peace with the Spartans during the Peloponnesian War.
- Aristotle, *Poetics* (c. 340 B.C.E.)—Aristotle’s treatise is the first to treat poetic composition of all kinds as art, making Aristotle the first literary critic and theorist.
- Cicero (Marcus Tullius), *In Defense of Roscius the Comic Actor* (c. 69 B.C.E.)—In this speech, Cicero defends the comic actor Roscius against a charge of fraud and in

the process reveals important information about the profession of acting in the first century B.C.E.

Euripides, *Medea* (431 B.C.E.)—One of the more famous of Euripides' plays, *Medea* highlights the playwright's penchant for depicting society's victims—women, outcasts, the abused—and his ability to explore the interiority of characters in a new way. In this play, Medea—a foreigner, outsider, woman, and witch—is allowed to wreak vengeance on her callous Greek husband Jason, and is rescued in the end by a *deus ex machina*.

Homer, *Iliad* and *Odyssey* (c. 750 B.C.E.)—Homer's epics were the source of Greek dramatic form and much of its subject matter.

Livy (Titus Livius), *From the Foundations of the City* (c. 25 B.C.E.)—This complete history of Rome (not surviving in its entirety) from its founding in the eighth century to 9 B.C.E. in 142 books includes many anecdotes about Roman theater from its beginning until the beginning of the empire.

Ovid (Publius Naso), *Metamorphoses* (c. 5 C.E.)—This extremely creative and playful Roman “anti-epic” focuses on the many transformations that take place in Greek mythology, and is one of the most valuable sources of ancient myth.

Plautus (Titus Maccius), *Pseudolus* (c. 191 B.C.E.)—The comedies of Rome's most popular playwright gleefully borrow plots and settings from Greek New Comedy but turn the material into brilliant and purely Roman plays. Plautus' *Pseudolus* is representative in many ways of his values; the eponymous clever slave outwits his master and assists his young master's quest for love, with no thought of his own gain.

Seneca (Lucius Annaeus) The Younger, *Thyestes* (c. 60 C.E.)—Seneca's work, heavily indebted to the Athenian tragic playwrights, are the only extant attempts from Rome to create new tragedies since the days of Naevius, Accius and Pacuvius in the third and second centuries B.C.E. In *Thyestes*, Seneca displays all of his prodigious rhetorical talent as well as his fondness for the grotesque, as Atreus, the title character's brother, serves up a stew made from Thyestes' own children as revenge for his brother's adultery with his wife.

Sophocles, *Oedipus the King* (c. 430 B.C.E.)—Sophocles is most famous for three of his plays about the Oedipus story, and his extant tragedies feature strong but stubborn heroes whose greatest qualities often ironically bring about their downfalls. Sophocles' most famous tragic hero, Oedipus, tries desperately to outwit Fate and avoid killing his father and marrying his own mother, while ironically moving inexorably toward the fulfillment of the oracle that prophesied his downfall. This play is often considered one of the most perfect examples of a Greek tragedy, in its characterizations, structure, language, and ultimate moral lesson.

Terence (Publius Afer), *Eunuch* (c. 160 B.C.E.)—This sophisticated playwright's comedies paid tribute to the artistry of Greek New Comedy during a time when a conservative movement fought to eradicate Hellenistic influences from Rome culture. In this play, he uses his trademark double-plot structure to demonstrate how a personal catastrophe, like rape, can in the end be resolved and can even lead to civic justice and order.

Vitruvius, *On Architecture* (first century B.C.E.)—The only architectural work to survive from ancient Rome, it provides modern readers with valuable information about Roman engineering, building practices, and theater design.

## IMPORTANT EVENTS *in Visual Arts*

- c. 3000 B.C.E. Early Cycladic art develops in the Cyclades archipelago, the islands that circle Delos and neighboring islands, excluding Crete.
- c. 2000 B.C.E.
- c. 3000 B.C.E. Pottery is handmade during the Prepalatial period on Crete, before the development of the Minoan civilization.
- c. 1950 B.C.E.
- 2600 B.C.E. Fine handmade vases with mottled decoration, called “Vasiliki-Ware” from the place of their discovery, appear on Crete. They appear to imitate vessels made from stone found in Egypt.
- 2400 B.C.E.
- 2500 B.C.E. On the Cyclades Islands, this period known as Early Cycladic II is the heyday of Cycladic sculptors, who produce magnificent abstract figures. Most of them are schematic representations of women, but there are also abstractions of seated harpists, standing pipers playing pipes, and warriors.
- 2200 B.C.E.
- c. 2000 B.C.E. The period known as “Middle Helladic” begins in mainland Greece, corresponding to the Middle Minoan Period on Crete. Wheel-made pottery appears, though on the mainland it does not yet become widespread.
- c. 1950 B.C.E. A new type of pottery, grey “Minyan Ware,” appears on mainland Greece. Minyan Ware has a burnished surface and is decorated with geometric designs either incised on the surface before the pot is fired, or applied in a flat dark color on a pale slip.
- 1950 B.C.E. During the Proto-Palatial or Old Palace
- 1700 B.C.E. period in Minoan Crete, pottery is made using the potter’s wheel.
- c. 1650 B.C.E. Minoan artists are at work in Avaris (modern Tell el Dab’a), the capital of the Hyksos kings in Egypt, producing frescoes in a palace which predates the eruption of the Thira volcano.
- 1628 B.C.E. The volcano on Thira, the southernmost of the Cyclades Islands, erupts. Volcanic ash buries the Minoan settlement at Akrotiri, preserving wall paintings that will be discovered almost intact in modern times.
- c. 1600 B.C.E. Towards the end of the Middle Helladic period on the mainland, gray Minyan ware is superseded by pottery with polychrome geometric designs, owing their inspiration to Crete and perhaps the Cyclades Islands.
- 1550 B.C.E. A new style of pottery emerges on Crete, with patterns favoring spirals and depictions of plants.
- 1500 B.C.E.
- 1500 B.C.E. The “Marine Style” of pottery appears on Crete, with designs of fish, octopods, and argonauts. This is the last Minoan style before the catastrophe of 1450 B.C.E.
- 1450 B.C.E. During the Post-Palatial period, there appears a style of pottery known as “Palace Style” which lacks the spontaneity of the earlier “Marine Style.”
- 1350 B.C.E.
- 1400 B.C.E. In this period, designated “Late Helladic IIIA and B,” Mycenaean pottery is exported far and wide over the Mediterranean area to Sicily, Italy, Egypt, and Asia Minor.
- 1200 B.C.E.
- c. 1200 B.C.E. In the Late Helladic IIIC period after the collapse of the Mycenaean palaces, the so-called “Granary Style” pottery appears, decorated with a few wavy lines and festoons on the belly and neck of the vase. This style will develop into the Protogeometric style.
- 1100 B.C.E.
- c. 1050 B.C.E. Early Geometric (Protogeometric) vases appear—vases painted with geometric

- designs such as circles, spirals, and concentric rings.
- c. 900 B.C.E. In the fully-developed Geometric period, geometric designs spread over the vases that the potters produce and a new repertory of patterns appears.
- c. 700 B.C.E.
- 700 B.C.E. The influence of Asian art is at its height, so much so that art historians have dubbed this the “Orientalizing Period.”
- 600 B.C.E.
- Monumental architecture and sculpture revives.
- 700 B.C.E. Athenian potters have by now adopted the black-figure technique showing figures in silhouette, which had already been practiced in Corinth for a century.
- c. 675 B.C.E. The earliest Greek style of sculpture, the so-called Daedalic style, appears.
- c. 650 B.C.E.
- The Nikandre statue, an over life-sized statue of a woman in Daedalic style, is dedicated to Artemis at Delos by Nikandre of Naxos about this time.
- c. 650 B.C.E. Corinthian pottery dominates the export market in Italy and Sicily.
- c. 550 B.C.E.
- c. 650 B.C.E. The first Daedalic-style *kouros* statues appear. The style depicts nude male figures standing stiffly with one foot thrust forward like contemporary Egyptian statues.
- 620 B.C.E. The so-called Sunium *kouros* is carved for the temple of Poseidon at Sunium. The ten-foot tall statue is the best-preserved of several over life-sized *kouroi* found there.
- 580 B.C.E.
- c. 550 B.C.E. Athenian pottery begins to dominate the export market in Sicily and Italy, displacing Corinthian pottery.
- c. 530 B.C.E. Athenian potters begin to produce vases in red-figure style.
- c. 480 B.C.E. The Greek sculptor Myron produces his masterpieces during these years.
- 445 B.C.E.
- 478 B.C.E. To commemorate a victory in the chariot races in the Pythian Games of either this year or four years later in 474 by Polyzeus, tyrant of Gela in Sicily, the bronze charioteer now in the Delphi Museum was erected as part of a chariot group.
- 465 B.C.E. The Athenian sculptor Phidias is working on his great bronze statue of Athena Promachos, later known as Athena Promachos, which stood over nine meters (30 feet) on the Acropolis of Athens.
- 456 B.C.E.
- c. 452 B.C.E. The earliest work of the sculptor Polyclitus of Argos dates to this time.
- 447 B.C.E. Phidias is working on his statue of Athena made of gold and ivory which stands 12.7 meters (41.67 feet) high in the Parthenon on the Athenian Acropolis.
- 438 B.C.E.
- c. 437 B.C.E. Phidias goes to Olympia to work on the gold-and-ivory cult statue of Zeus for the Temple of Zeus.
- 405 B.C.E. The Spartans defeat the Athenians at Aegospotami in northern Greece, destroying the Athenian fleet. The Spartan memorial that Polyclitus of Argos designed for this victory is the last known work of Polyclitus.
- 372 B.C.E. The sculptor Lysippus of Sicyon makes his first statue that can be dated for a victor in the Olympic Games of this year.
- c. 364 B.C.E. Praxiteles sculpts the first female nude, the *Aphrodite of Cnidus*.
- 323 B.C.E. In the Early Hellenistic Period of Greek sculpture, sculptors continue with the traditions of late classical sculpture as exemplified by Lysippus and Praxiteles.
- c. 240 B.C.E.
- 280 B.C.E. A bronze portrait statue of Demosthenes by Polyeuctus, which is erected in the marketplace of Athens a generation after the orator’s death, portrays him realistically, without any attempt at idealism.

- 272 B.C.E. The Romans capture Taras, Roman Tarentum on the south coast of Italy, and take some of its art as plunder, thus introducing Romans to Greek masterpieces.
- 240 B.C.E. In the “High Hellenistic Period,” a  
–c. 150 B.C.E. “Baroque” style of sculpture is developed which is full of violent motion and physical energy.
- 211 B.C.E. The Roman general Marcellus, having captured Syracuse in Sicily the previous year, takes Greek works of art to Rome as spoils, thereby starting a craze for Greek sculpture and painting in Rome.
- c. 190 B.C.E. The *Nike* of Samothrace, a sculpture now in the Louvre in Paris, showing a Winged Victory alighting on the prow of a warship, is erected at Samothrace, an island in the northern Aegean Sea.
- c. 175 B.C.E. The Great Altar of Zeus, the most famous ensemble of High Hellenistic “Baroque,” is erected in Pergamum, modern Bergama in Turkey.
- 168 B.C.E. Aemilius Paullus, having defeated the last king of Macedon, Perseus, takes a huge number of statues and paintings to display at his triumph in Rome.
- c. 150 B.C.E. In the Late Hellenistic Period sculptors  
–31 B.C.E. return to the styles of the classical period.
- 150 B.C.E. The sculptor Alexandros of Antioch-  
–125 B.C.E. on-the-Meander River sculpts the *Venus di Milo*, a statue of Aphrodite holding the apple which Paris had awarded her as a beauty prize, which according to myth was the cause of the Trojan War.
- 146 B.C.E. Lucius Mummius sacks Corinth and ships cartloads of major and minor arts to Rome.
- 133 B.C.E. The last king of Pergamum, Attalus III, dies, and leaves his kingdom to Rome in his will. Pergamum ceases to be a Greek artistic center but Pergamene traditions continue on Rhodes.
- 9 B.C.E. The Altar of Peace is dedicated in Rome.
- 64 C.E. A great fire in Rome ruins half the city, and the emperor Nero seizes the opportunity to build his extravagant “Golden House” in the center of the city that was cleared of buildings by the fire.
- 79 C.E. The eruption of the volcano of Mt. Vesuvius overwhelms Pompeii, Herculaneum, Stabiae, and Oplontis, thus preserving houses and public buildings along with wall paintings and statuary.
- 81 C.E. The emperor Titus dies and after his death, the Arch of Titus is erected in Rome by his successor, Domitian, to commemorate the victories of Vespasian and Titus in the Judaeen War which ended with the sack of Jerusalem.
- 113 C.E. The Column of Trajan in Rome, carved in less than four years by an unknown master sculptor and his workshop, is dedicated in Rome to commemorate the emperor Trajan’s conquest of Dacia (modern Rumania).
- 129 C.E. Antinous, a youth who was a favorite of the emperor Hadrian, is drowned in the Nile River, and Hadrian expresses his grief by deifying Antinous and erecting statues of him which represent a last flowering of the classical male nude as an artistic type.
- 180 C.E. The Column of Marcus Aurelius is  
–196 C.E. built in Rome with marble from quarries at Luni to commemorate his campaigns of 168–176 C.E.
- 203 C.E. The Arch of Septimius Severus is erected in the Roman Forum, spanning the “Sacred Way” at the foot of the Capitoline Hill. The arch commemorates the victories of Severus and his sons Caracalla and Geta over the Parthians (195 C.E.) and the Osroeni (197 C.E.).
- 305 C.E. The Arch of Galerius is erected in Salonika in northern Greece to celebrate

- the victory of Galerius over the Persians. Reliefs show scenes of the campaign: one shows Diocletian, Augustus of the East, and Galerius, his Caesar, offering sacrifice, and another shows the surrender of an eastern town.
- 315 C.E. The Arch of Constantine is erected in Rome to commemorate his victory over Maxentius at the Milvian Bridge in 311 C.E. It is decorated with sculptural fragments from earlier monuments.
- 330 C.E. The emperor Constantine dedicates his “New Rome,” Constantinople, which is to be the capital of a Christian empire. Large numbers of works of art are taken from Greece to adorn the new capital, including Phidias’ “Athena Promachos” and his “Zeus” from the Temple of Zeus at Olympia.
- c. 390 C.E. The emperor Theodosius I erects an Egyptian obelisk originally from the temple of Amon at Karnak in the Hippodrome at Constantinople, and has a base made for it decorated with reliefs, one of which shows Theodosius surrounded by his court. Figures are all frontal and of equal height, except for the taller figure of the emperor in the center.
- c. 425 C.E. The so-called Mausoleum of Galla Placidia is built at Ravenna in Italy, and its interior is decorated with a rich group of early Christian mosaics, including one showing Christ as the Good Shepherd in the lunette above the entrance, still done in the three-dimensional, naturalistic style of the classical tradition.
- 504 C.E. The Church of Sant’ Apollinare Nuovo is dedicated in Ravenna, with mosaics that move away from the naturalistic style of the classical tradition and use gold as the background color.

## OVERVIEW *of Visual Arts*

**PERIODS OF DEVELOPMENT.** The history of ancient Greek art falls neatly into five periods. It begins in the prehistoric Bronze Age, when a civilization flourished on the island of Crete in the second millennium B.C.E., which has the modern label “Minoan.” Its artistic traditions were carried on in mainland Greece via the Mycenaean civilization. This civilization flourished until 1200 B.C.E., when it fell victim to raiders and new migrants into Greece, thereby entering a “Dark Age” (1150–700 B.C.E.). Archaeology is gradually making this period less dark, however, for the ceramics of this age continue to shed light on the development of artistic tradition. By the ninth century B.C.E. a new period of Greek art emerged known as “Geometric” after the geometric designs such as triangles, circles, and spirals that decorate the pottery. “Geometric” developed by natural stages into the Early Archaic Period (700–550 B.C.E.), when the first sculptured human figures appear. The Late Archaic Period (550–480 B.C.E.) is the great age of Athenian vase-painting, when pottery from Athenian workshops found buyers all over the Mediterranean world. Then, in the classical period (480–330 B.C.E.) Athens set the standard for the visual arts of Greece. Alexander the Great’s conquest of the Persian Empire ushered in the next period, the Hellenistic Age (330–30 B.C.E.), which takes its name from the Greek word *hellenizein*, meaning “to adopt Greek culture and language.” It was an era in the ancient world when Greek culture spread over the eastern Mediterranean region, submerging other, more ancient cultures in Egypt and the Near East. The centers of culture moved from Greece itself to new cities such as Alexandria in Egypt and Antioch in Syria and many others scattered throughout Asia Minor and the Near East. Egypt, the last Hellenistic kingdom, fell to Rome in 30 B.C.E. and what followed was the period of Roman imperial art, though in the eastern Mediterranean the traditions of the Hellenistic Age lived on until late antiquity (284–632 C.E.).

**THE MINOAN AND MYCENAEAN WORLD.** The art of the Minoans is known solely through archaeological finds, beginning with the excavation of the so-called “Palace of Minos” at Knossos in Crete by British archaeologists in 1900 C.E. The finds at Knossos were rapidly supplemented by finds made by Italian excavators at Phaistos in the south-central region of the island, and by the French at Mallia close to the north coast. At all these sites, sprawling palaces were discovered, built around central courtyards, and the rooms decorated with frescoes provided a glimpse of Minoan artistic tradition. These palaces began to be built about 2000–1900 B.C.E.; they were destroyed by some disaster, probably a great earthquake, about 1700 B.C.E. and then overtaken by another disaster about 1450 B.C.E., after which only the palace at Knossos was reinhabited. The best-preserved examples of Minoan wall painting were discovered at Akrotiri on the volcanic island of Thira, where an eruption in 1628 B.C.E. buried the outpost. On mainland Greece, a prehistoric civilization also flourished, called Mycenaean after the earliest site excavated, Mycenae, where a sprawling, poorly preserved palace was discovered. The Mycenaeans carried on the traditions of Minoan art despite differences of culture in other areas, such as language.

**THE GEOMETRIC AGE.** The Mycenaean civilization began to decline around 1200 B.C.E. when raiders began to invade the area. Over the course of the next century, they overran the rule of the Mycenaean kings and destroyed the palaces. By 1000 B.C.E., some stability had returned to the Greek world, and in the city-states which took the place of the old Mycenaean palace-based monarchies a new type of art emerged that art historians label “geometric.” Athens provides the best evidence for the development of geometric art, for in the Kerameikos cemetery there, in the potters’ quarter of the ancient city, a continuous series of burials have been excavated, from the end of the Mycenaean civilization down to the classical period. About 1000 B.C.E., vase painters in Athens ceased to imitate Mycenaean prototypes and turned to abstract patterns. They decorated the necks, shoulders, and bases of their vases with continuous bands and concentric circles. Athens seems to have taken the lead, but the new style spread rapidly throughout Greece and the islands. As the style developed from Early Geometric (Protogeometric) to mature Geometric, the early simplicity disappeared, and painters covered the whole surface of their vases with geometric forms: triangles, diamond-shaped figures, squares, checker-board patterns, and the so-called “Greek key” pattern, a continuous square-cornered meander. By the eighth century B.C.E., animal figures appear, to be fol-

lowed by human figures not much later. The vase paintings began to show scenes; the most common are scenes of funerals, for many of the greatest surviving vases were intended as monuments for the graves of wealthy men. They held food and drink offerings for the dead and some had holes pierced in the bottom so that drink offerings could flow down into the earth and feed the corpse buried beneath. Then about 700 B.C.E. artistic patterns borrowed from the East appeared: lions, panthers, sphinxes, and griffins. This “orientalizing style” began on Cyprus, and developed in the Greek cities of Asia Minor which came into contact with the art of the Assyrian Empire through the mediation of the Syrians, Phoenicians, and Lydians. The Greeks borrowed the Assyrian way of portraying the human body, as well as the Assyrian technique and style, but their themes were Greek, taken from Greek legends. In 668 B.C.E. Assyria conquered Egypt, but she failed to hold it. By 650 B.C.E., Egypt was in revolt, and Greek mercenaries were helping rebel leader Psammetichos. Greeks visited Egypt as soldiers and traders, and what they saw was a revelation. Egypt would teach Greece the potential of free-standing sculpture.

**SCULPTURE.** Sculptors began to experiment with free-standing human figures in the middle of the seventh century B.C.E. Males are nude, women fully clothed, and both face the onlooker like the Egyptian statues which served as the inspiration for the Greek craftsmen. But by the end of the Archaic Period, sculptors learned how to model the muscles of the body and to show figures that were no longer strictly frontal. The names of famous classical sculptors survived, including Myron, Phidias, and Polyclitus, but their masterpieces did not. Art historians are dependent on Roman copies of these works. Wealthy Romans were passionate collectors of Greek art, and in Greece an industry developed for manufacturing copies for the Roman market. Yet it is rare that a statue has survived with its original color, for statues were painted; in addition to coloring the eyes, lips, and hair, painters decorated the clothing of female statues with bright patterns. The white marble statues displayed in museums have drained Greek art of its color. Even so, marble sculpture has fared better than bronze statues of ancient Greece. Most of them were melted down in the Middle Ages for their metal. Underwater finds, however, have brought a number of bronze masterpieces to light; the best of them is a splendid, life-size figure of Zeus hurling a thunderbolt which is now in the National Museum of Greece in Athens.

**GREEK PAINTING.** The evidence for early Greek painting for the archaic and classical periods comes

mostly from Greek vases. In the mid-sixth century B.C.E. Athenian potters developed a style known as “black-figure” because the figures were shown in black glaze, with details etched with a pointed instrument, while the background was left the natural burnt sienna color of the Athenian clay. Some artists signed their vases with their names, but many are anonymous. “Black-figure” gave way in the last quarter of the sixth century B.C.E. to “red-figure,” where the background is in black glaze and the figures are the natural color of the clay. These vases provide only a tantalizing glimpse of the painters’ art in Greece. Ancient authors wrote descriptions of lost paintings and the names of the great fifth-century B.C.E. painters such as Polygnotus, considered the first great painter; or Zeuxis, famous for his realism; or Apelles in the next century who was the favorite painter of Alexander the Great. Macedonian tombs, which are underground chambers with walls decorated with murals, give some idea of what painting was like in the fourth and third centuries B.C.E.; since the great painter Apelles of Epehesus was active in Macedon in his early years, the murals may reflect his influence. In the Roman period, the cities destroyed by the eruption of Mt. Vesuvius in 79 C.E.—Pompeii, Herculaneum, Oplontis, and Stabiae—had wall-paintings and mosaics, some of which probably tried to reproduce the great masterpieces. One house in Pompeii, the House of the Dancing Faun, has a splendid mosaic showing Alexander the Great defeating King Darius III of Persia at the Battle of Issus in 333 B.C.E. It reproduces some ancient masterpiece, and there have been attempts to conjecture who the artist was—perhaps Philoxenus of Eretria, or a woman artist, Helena from Egypt, both of whom painted a “Battle of Issus.” The Christian churches of the fifth and sixth centuries C.E. also preserve mosaics which continue the traditions of ancient painting.

**THE HELLENISTIC AGE.** New centers of Greek art appeared in the period after Alexander the Great unified Greece and conquered the Persians and Egyptians. Greece itself, particularly Athens, remained a center of art in the expanded Hellenistic world, although other centers developed. In the early Hellenistic period, sculptors carried on the artistic traditions of the fourth century B.C.E. Following the example of Praxiteles, they portrayed female nudes in seductive poses, and following Lysippus’ example, they showed male nudes as active figures. Then, from the mid-third century B.C.E., the Hellenistic Age developed a taste for the baroque. One notable center for the baroque style was Pergamum (modern Bergama in north-west Turkey), where the Great Altar of Zeus, erected about 175 B.C.E., was

adorned with a frieze showing the familiar subject of the Battle of Gods and Giants, where the combatants are in violent motion, with muscles taut and straining. Draperies swirl, figures writhe in anguish. As the eastern Mediterranean slipped under Roman domination, Hellenistic taste returned to its classical roots, though the baroque school continued to flourish at Rhodes which produced a masterpiece dating to the early first century C.E.: a statue group showing the Trojan priest Laocoon and his sons struggling with the two serpents that came out of the sea and attacked them when Laocoon urged his countrymen not to bring the Trojan Horse within the walls of Troy. The statue group illustrates an incident in Rome's national epic, the *Aeneid*, which describes the death of Laocoon in vivid detail.

**ROMAN IMPERIAL ART.** The Roman Empire preferred to take its models from the classical period, not the Hellenistic world. Roman emperors, for instance, were shown with the muscular, well-developed bodies of the male nudes sculpted by Polyclitus, who was famous for his athletes who were more powerfully built than the nudes of the Athenian sculptor Myron in the fifth century B.C.E. or Praxiteles in the following century. The emperors wear Roman armor with breastplates that emphasize the musculature of their chests, but beneath their armor, we see the proportions prescribed by Polyclitus. Roman portraits are a distinctive breed. Greece had produced portraits since the fifth century B.C.E. and sought to combine realism with idealism. The Roman taste for portraits was simply realistic, often brutally so. That is particularly true of those portraits that date to the republican period, before 30 B.C.E. In the first and second centuries C.E. Roman artists looked to classical Greece for inspiration and portraits show a tendency to idealize, though the individuality of the subject is always all-important. Imperial portraits in the late third century C.E. are again brutally realistic, but as we edge into the fourth century the spirit of imperial portraiture changes. The emperors are shown as men of power, not of this world. The robes of imperial office, which are rich and ornate, bear the same message. Art of this time period reflect the end of an era, when the pagan world and its culture were dying.

**EARLY CHRISTIAN ART.** The earliest Christian art is found in the catacombs which were great subterranean passage-ways with cubbyholes (*loculi*) placed one above another like shelves for the bodies of the dead. The catacombs in Rome are estimated to run from sixty to ninety miles and they date from the second to the fourth centuries C.E. The paintings found there are rough work which use the designs and techniques of contemporary

pagan work: what is different is the choice of subject. The Christian artists liked subjects from the Jewish scriptures: Jonah and the whale, Adam and Eve, the Sacrifice of Isaac, and Daniel in the lions' den, for instance. When Jesus appears, he is shown either as a youthful teacher or as the Good Shepherd tending his flock and even carrying a lamb. Only after the Roman Empire became Christian in the fourth century C.E. are there depictions of Jesus with a halo, wearing a purple robe. The picture of Christ as a mature, bearded man, which eventually displaced the picture of the youthful Christ, was developed only in the fifth century C.E. Christian subjects also appear on Christian sarcophagi, many of which have survived, for the Christians rejected cremation of the dead; pagans likewise favored burial over cremation in the third century C.E. Sarcophagi had common themes—standard scenes from the life of Christ—for the marble cutters turned them out with the sculptural decoration roughed out, and only after the sarcophagus was purchased would they finish them to the specifications of their customers. One scene from the life of Christ which did not occur in early Christian art, however, was the Crucifixion. It was unknown in Christian art before the fifth century C.E. and remained fairly rare for some time afterwards. The Resurrection, that is Christ's victory over death, engaged the imaginations of the first Christian artists rather than His death itself.

## TOPICS in Visual Arts

---

### POTTERY IN THE BRONZE AGE

**EARLY DEVELOPMENTS.** Pottery first appeared in the Greek peninsula about 6000 B.C.E., introduced, perhaps, by immigrants from the Near East where pottery was made as early as 8000 B.C.E. The first pots were coarse, gray, handmade ware with simple decorations made by scratching linear designs on them, but in the mid-Neolithic period (5000–4000 B.C.E.) there is evidence of potters in southern Greece using slips, or washes of specially-prepared clay painted on the pot before firing in order to produce a lustrous finish. Pottery was still made by hand, as it would continue to be during both the Early Helladic Period (3000–2000 B.C.E.) on mainland Greece, and the Early Minoan Period which corresponds to it on Crete. Yet on Crete, a change took place once the island entered the Early Minoan Period. The quality of pottery on Crete improved. One type of pot-

tery found on Crete during the Early Minoan period hints at connections with Egypt; the “Vasiliki-ware,” so-called from the site of Vasilike on Crete where it was first discovered, apparently imitated vessels made from fine veined stone of the sort found in Egypt. Vasiliki-ware is decorated with patches of paint which is then fired to different shades of red, yellow, and dark brown, producing a mottled effect. Typical shapes are the goblet and a jug with a long spout. By the end of the Early Minoan period (2000 B.C.E.), however, this mottled decoration found on Vasiliki-ware had been abandoned. Contemporary ware on the mainland at the end of Early Helladic is typically plain and dark in color, though pots with patterns have also been found that feature interlocking triangles, winding lines, and chevron. The potter’s wheel also made its appearance on mainland Greece before the end of the Early Helladic Period, though it was not much used there until after 1600 B.C.E. By 2000 B.C.E., when the Middle Minoan period began on Crete and Middle Helladic on the mainland, Crete and mainland Greece apparently went their separate ways.

**THE PROTOPALATIAL PERIOD ON CRETE.** The early years of Middle Helladic on the mainland Greece were marked by a new migration into the Greek peninsula, and it is generally agreed that these new immigrants spoke Greek, and were thus the first wave of Greek-speakers to reach Greece. They brought with them a type of ware which archaeologists call “Minyan Ware,” either gray or beige in color and without decoration. For the next three centuries or more, mainland Greece became a backwater. On Crete, however, the Middle Minoan period ushered in a brilliant age, the Protopalatial or Old Palace Period, when great sprawling palaces were built at a number of sites, chief of them Knossos just south of Iraklion, the capital of modern Crete; Phaistos, due south of Knossos; and Mallia on the northern coast of the island. The potter’s wheel was generally used. Potters in the Old Palace Period threw their clay on the horizontal surface of a disk and molded it with their hands as the disk spun around, turned by the potter’s helper. The result was a more symmetrical pot of a finer texture and the best of these can stand comparison with the best oriental porcelain.

**KAMARES WARE.** The most distinctive pottery of the period is “Kamares Ware” which took its name from a cave sanctuary on the slopes of Mt. Ida near the village of Kamares where the first examples of the style were found in the 1890s. Kamares Ware is egg-shell thin and polychrome, that is, it is decorated with designs in several colors: creamy white and reddish-brown against a black background is the favorite color combination. One

example, from the palace at Phaistos in south-central Crete, shows a large fish and what appears to be a fish-net on the belly of the vase, and beneath it are spirals, concentric circles and wavy lines, perhaps representing the sea. The development of Kamares Ware was interrupted by a catastrophe about 1700 B.C.E. in which the palaces of the Old Palace Period were destroyed. When the palaces were rebuilt, the Kamares-type vases continued to be made, though they lacked the vivacity of the earlier examples.

**VASE-PAINTING IN THE NEOPALATIAL PERIOD.** By 1600 B.C.E. vase-painters began to experiment with designs in dark paint on light backgrounds, the opposite of the Kamares-style where the background was dark. Vase-painters moved towards a new style, with themes taken from nature; a number of vases show illustrations of papyrus plants which the Minoans must have seen in Egypt, for no papyrus grows on Crete. Then, by 1500 B.C.E. the last Minoan pottery style before the great catastrophe of 1450 B.C.E. evolved: the so-called “Marine Style.” In this style, vases were decorated with life-like paintings of sea-creatures: fish, octopods, and the mollusk with octopus-like tentacles known as “argonauts.” There is nothing stiff or ornate about the Marine Style. Fish, dolphins, and cephalopods were depicted as they appear in real life, and the style betrays familiarity with marine life. Then about 1450 B.C.E. catastrophe overwhelmed all the palaces and only the Knossos palace was rebuilt and reinhabited, apparently by Mycenaean Greeks, for their language is Greek. At Knossos in this period, the last pottery style of Bronze-Age Crete emerged: the so-called “Palace Style,” associated with the palace at Knossos. The cheerful spontaneity of the Marine Style disappeared, and was replaced by a style that aimed at grandeur. Formalism replaced naturalism. The taste is Mycenaean, for at Mycenae on the mainland natural motifs were stylized into symmetrical and often heraldic patterns.

**MYCENAEAN VASES.** By the late 1400s B.C.E., Greek-speakers from mainland Greece had probably invaded Crete, and more and more in the later centuries Minoan pottery and the Mycenaean ware from the mainland converged and became standardized. From a technical point of view, Mycenaean vases are often very fine work, with clean shapes and stylized decoration that reuses motifs from Crete. For two centuries after 1400 B.C.E. Mycenaean pottery found markets all over the Mediterranean world. It has been found in Italy, Sicily, Asia Minor, and Egypt. However, with the end of the Mycenaean civilization around 1200 B.C.E., the world became an unsettled place, and the change is reflected

in the pottery. The last styles from the aftermath of the Mycenaean collapse—the period from 1200–1100 B.C.E. which archaeologists call Late Helladic IIIC—belong to the “Close Style” and the “Granary Style,” both modern labels. The Close Style has decoration distributed in close rows of concentric half-circles, triangles, and the like over the body of the vase and sometimes there are motifs of fish and birds. One group that has been found has stylized octopods as decoration. Granary Style got its name because a cache of “Granary Style” vases were found at Mycenae in a store-room for grain inside the “Lion Gate” there, and they can be securely dated. Their decoration is simple: wavy lines and festoons on the belly and neck of the pot. “Granary Style” is recognizably sub-Mycenaean. It is the art of the dying Mycenaean civilization which still influenced potters, though the palaces where the god-kings used to rule had been destroyed and the well-to-do customers who used to buy Mycenaean pottery had vanished. Granary Style or “sub-Mycenaean” developed naturally into the Protogeometric style, whereas the Close Style did not survive the final phase of the Mycenaean world.

## THE EARLY POTTERY OF GREECE

**THE IMPORTANCE OF ATHENS.** Athens was relatively unimportant in the Mycenaean period, but after the collapse of the Mycenaean world, it dominated the Geometric Period that followed. Sites from the century following 1200 B.C.E. show destruction by fire all over Greece and, for that matter, the Aegean world, but Athens

Funeral monument for Dexileos, a 20-year old Athenian cavalryman killed in action at Corinth in 394 B.C.E., from the Kerameikos Cemetery in Athens. COURTESY OF JAMES ALLAN EVANS.

survived. Athenian traditions told that Athens was attacked by the Dorians—a group of Greek people speaking the Dorian dialect—and in the struggle, the last king of Athens, Codrus, sacrificed his life to save the city. Athens and her territory, Attica, remained unconquered and offered a refuge for other dispossessed Greeks. The evidence of Athenian pottery during this period is particularly important, for not only is it the only evidence for the visual arts during the “Dark Ages” that followed Mycenae’s collapse, but it contributes a major body of evidence about the period’s history. In the *Kerameikos* cemetery—that is, the cemetery in the Potters’ Quarter in Athens—there is an unbroken series of burials from the end of the Mycenaean age into the classical period, and the pottery found in these burials allows scholars to document pottery decoration from sub-Mycenaean to Geometric.

**MOVEMENT FROM SUB-MYCENAEAN TO GEOMETRIC.** The sub-Mycenaean pottery from the immediate aftermath of the catastrophe ending the Bronze-Age civilization is similar to the Granary Style found at Mycenae. It bears signs of culture shock, as the potters adjusted to the collapse of the civilization they once knew.

Geometric amphora from Athens, c. 760 B.C.E., showing the “lying-in-state” of the dead. © WOLFGANG KAEHLER/CORBIS.

Simple Mycenaean patterns remembered from the past are repeated as if by rote. By about 1050 B.C.E., however, a new spirit emerged with a generation that never knew the Mycenaean world at first hand. The first stages of a new style of pottery appear which is labelled “Protogeometric” or “Early Geometric.” Vases were made once again on the fast wheel and fired at higher temperatures. The feature that gave the style its name, “Protogeometric,” is the type of decoration that the potters used on their ware: lines, circles, and, as time went on, intricate geometric patterns. Protogeometric artists employed a black background with light-ground stripes around the neck or the belly of the vase, or alternatively, a light background with geometric designs such as concentric circles, wavy lines, or checker-board patterns. The vase painters used compasses to draw concentric half-circles. The technique of producing the fine black gloss from the Bronze Age was not forgotten; it is used to cover more of the surface of the vase.

**GEOMETRIC POTTERY.** About 850 B.C.E., the pottery artists moved into the so-called Middle Geometric

Rhodian oinochoe (wine jug), 7th-century B.C.E., belonging to the “Orientalizing Period.” THE ART ARCHIVE/MUSEE DU LOUVRE PARIS/DAGLI ORTI.

Period with new and more complex geometric designs. Vases have bands of zigzags, triangle-patterns and meander designs that cover the whole surface of the vase. The patterns used by the Middle Geometric artist seem to owe their inspiration to basket weaving. During this period, the most dramatic change occurred with the introduction of figures, first of animals and then suddenly around 770 B.C.E., human figures. The spirit of these new vases is still geometric as the figures are still marshaled in orderly rows. But there is an effort to depict a scene. In one large vase made in Athens about 750 B.C.E., a central band across the belly of the vase shows a woman’s corpse laid out on a bier, and on either side, rows of women with their hands clasped over their heads in a ritual gesture of mourning. The rest of the vase is completely filled with geometric patterns marshaled in concentric circles. This vase, which stands about one and a half meters (five feet) high, was a grave marker, placed on top of a woman’s grave and partially buried. Another vase made in Athens about the same time shows a war galley with rows of oarsmen. A man is about to embark, and as he does, he turns and clasps a woman standing behind him by the wrist. The man is portrayed with a very slender waist and heavily-muscled thighs, and he grasps the woman’s wrist as if he is trying to drag her

with him into the ship. Clearly the vase is telling a story, perhaps from Greek mythology, as one of the first examples of narrative art.

**CORINTHIAN POTTERY.** Vases ornamented with geometric figures were popular among Athenian potters, but this was not the case everywhere in Greece. In Corinth, the potters preferred linear designs coupled with fine craftsmanship, using the local buff-colored clay that is still found there. A new style of vase painting appeared in the early seventh century B.C.E., at the same time as Corinth became a major exporter of pottery to Sicily and Italy: the Corinthian potters began to decorate their vases with figures and motifs that show Eastern influence. The images were more frequently done in outline rather than in silhouette as had been the case in Geometric, but the artists also started to experiment with a new technique they borrowed from metalworking; they made images in solid black paint and drew in details by graving the surface of the paint with a sharp stylus so that the buff clay beneath it became visible. By about 720 B.C.E., this technique developed into the Corinthian black-figure style, with images in solid black, and details engraved with incised lines. Parts of the figures were sometimes highlighted with purplish-red paint. The subjects that the vase paintings depicted were geared to the taste of the market. Battle scenes reflected a time of civil strife in many of the Greek city-states as the old aristocracies which had once dominated the government faced a changed political situation that they would no longer control. There were also many oriental motifs, such as friezes of animals such as wild boars, wild goats, dogs, lions, and griffins, marshaled in rows, that reflected the growing commerce with the Near East. The inspiration was Asian, particularly from Mesopotamia. The Corinthian potters aimed to please their markets, and Corinthian pottery in this period reached Syria, Asia Minor, and Egypt, where the Greeks had a trading center at Naucratis on the Nile Delta. In Sicily and southern Italy, Corinth was the major player in the pottery export market until the middle of the sixth century B.C.E., when products from Athens suddenly became popular. Yet the Corinthian potters did not retreat from the market in Italy and Sicily without a struggle. There is a remarkable *krater*, or mixing-bowl for wine—the Greeks drank their wine mixed with water—found at Cerveteri in Italy north of Rome, which was the old Etruscan city of Caere. It shows how the Corinthian potters tried to adapt their art to counter the new taste for Athenian pottery in the Etruscan market. A tinge of red ochre had been added to the buff Corinthian clay to make it look more like Athenian clay. There is a familiar frieze of animals, lions, and antelopes in black and dark purple. But on the

belly of the vase, the artist attempted a polychrome effect: a married couple is shown setting out on a chariot, with attendants and well-wishers standing around. Men are done in black-figure and a white wash is used for the flesh of women—that is by now conventional—but the horses are also white, and the cloaks of both the men and the women are purple. This is an example of innovative vase painting, but it did not secure the Etruscan market for Corinth.

## THE DOMINANCE OF ATHENS

**EARLY BLACK-FIGURE POTTERY.** In the last quarter of the seventh century B.C.E. the Athenian pottery industry adopted the black-figure technique from Corinth, and perfected it. It would be a mistake to think of Corinth and Athens as the only centers of vase painting, for Sparta produced vases of considerable merit at this time, as did Chalcis on the island of Euboea, the cities of East Greece in Asia Minor, and the Dodecanese Islands. Nonetheless, by 550 B.C.E. Athens overtook its Corinthian rival, and its vases became the dominant imports in the western Mediterranean pottery market. Many of the vase painters who produced the masterpieces of Athenian black-figure ware can be recognized by their individual styles as well as their signatures on their work. The first black-figure artist to have a recognizable style to modern scholars is the “Nessos Painter,” an anonymous artist so named because his best-known vase depicts on its neck Heracles fighting the centaur

Nessos. On the belly of the vase he used a stock scene: the three dread sisters with black wings called the Gorgons, galloping in pursuit of Perseus who had just lopped off the head of one of them, Medusa. Any Greek would recognize the myth; the fact that the Gorgons' quarry, Perseus, is omitted from the scene did not matter. After the "Nessos Painter" the next group of painters with recognizable styles all still betray an artistic debt to the Corinthian pottery industry. Then about 580 B.C.E. an artist signed his name: Sophilos. It appears on four vases, three as the vase painter and one as the potter.

**THE DEVELOPMENT OF VASE DECORATION.** Unlike the early painters who scattered ornaments over the whole surface of the vase, painters in sixth century B.C.E. confined them to definite areas, such as the neck, shoulder, and handles, or they served as frames for figured scenes. Moreover, ornaments were reduced to a limited number of standard motifs, such as the meander pattern, the lotus, palmette, ivy and laurel wreaths, scrolls, tongues, and horizontal bands. The figured scenes showed illustrations from mythology, but as time went on the scenes from everyday life became more popular. Youths are shown exercising, riding, arming for battle, or reclining at banquets and listening to music. Women are shown at household tasks. The figures were at first two-dimensional silhouettes, but after 550 B.C.E. artists experimented with three-quarter views. By 500 B.C.E. three-quarter views were completely mastered; drapery is shown with flowing lines and artists were trying linear perspective. One of the treasures of the Florence Archaeological Museum in Italy is a black-figure masterpiece, called the François Vase after its finder, Alessandro François, who discovered it in 1845 in an Etruscan tomb at Vulci in Italy. It is a volute *krater*—a new shape—signed by the potter Ergotimos and the painter Kleitias. It shows scenes from mythology. In a horizontal band under the rim, Peleus and Meleager face an enormous boar. They are identified by their names, so that the viewer is left in no doubt that this is the Calydonian Boar Hunt. Beneath it are friezes showing other scenes from Greek myth, with the figures carefully labelled. This *krater*, which was used to mix wine, evidently served as a conversation piece whenever its Etruscan owner gave a banquet. With vases such as these, by about the mid-sixth century B.C.E. Athenian potters were driving their Corinthian rivals out of the markets in the western Mediterranean.

**IMPORTANT ARTISTS.** Among those artists working in the mid-sixth century B.C.E. was one who called himself "the Lydian," evidently an immigrant from the kingdom of Lydia in western Asia Minor. There was

another who signed "Amasis," a Greek form of the Egyptian name "Ahmose," whose signature appears on eight surviving vases. His black-figure vases are particularly fine, but even greater than he was Exekias. His great masterpiece is in the Vatican Museum. He signed it "Exekias decorated and made me," indicating he was both a potter and a painter. On one side he showed Castor and Polydeuces welcomed home, on the other Achilles and Ajax playing a board game. Both heroes wear splendidly embroidered cloaks which Exekias drew with exquisite detail. Achilles wears a helmet; Ajax's helmet rests on his shield behind him. Both bend intently over the board, but Ajax bends lower. His shoulders are slumped, whereas Achilles has shoulders squared and back comparatively straight. Through the body language of the figures, Exekias subtly conveys the message that Ajax is losing the game. Another Exekias vase, a *kylix*, or drinking-cup, shows the god Dionysus reclining on a ship, its mast sprouting vines while dolphins surround the boat. The painting illustrates one of Dionysus' adventures in which he was captured by pirates, who failed to reverence the god; because of their impiety a grapevine sprouted from the mast and the sailors leaped overboard in terror, becoming dolphins as they did so.

**THE SELLING OF ATHENIAN VASES.** The majority of Athenian vases in modern museums outside Greece itself come from Etruscan tombs in Italy. For the Etruscans, fine Athenian vases were the equivalent of Wedgwood and Royal Doulton china in modern times. Excavations of Etruscan tombs still yield Athenian vases, but the great age of their collection was the eighteenth century. During that century Etruscan tombs were looted for their antiquities, and the Athenian vases that were found were called "Etruscan urns" because it was thought that they were made in Etruria. One pottery workshop in Athens, belonging to an inventive potter named Nikosthenes, made a distinctive type of *amphora* (an ancient Greek vase with a large oval body, narrow cylindrical neck, and two handles that rise almost to the mouth of the vase) with an angular body and broad, flat handles which was made to appeal to Etruscan taste, for the shape mimics Etruscan *bucchero*-ware: black glaze pottery without decoration which was manufactured in Etruria. Various vase painters worked for Nikosthenes, including "the Lydian." There is a curious pattern to the find-spots of his vases. The Etruscans at Caere (modern Cerveteri) apparently liked his *amphora*-type since almost every surviving example is from there. His other types of pottery come mostly from Vulci. It looks as if Nikosthenes targeted these two particular Etruscan markets.

## THE Potters' Art

Greek vases were an important export of Greece, and they are found all over the Mediterranean world, but particularly in Italy and Sicily, where Corinthian pottery dominated the markets until about 550 B.C.E. when exports from Athens came into vogue. Most of the Greek vases on museums outside Greece itself were discovered in Italy, particularly in Etruscan tombs. Ancient Etruria, which comprised the region of modern Tuscany in Italy, was the homeland of the Etruscans, a mysterious people who spoke a language unrelated to Latin or any Italic dialect, were probably immigrants from Asia Minor who developed a unique civilization that influenced early Rome, and they carried on a lively trade with Greece. Many of our best examples of Athenian black-figure and red-figure pottery were found in Etruscan tombs. Greek vases were the equivalent of Royal Doulton and Meissen china nowadays. On some of them, both the potters who made them and the artists who decorated them signed their names. They took pride in their work.

### The Technique of Making a Vase

Both Corinth and Athens had clay deposits of high quality. The clay of Corinth was buff-colored, whereas the Athenian clay was a burnt sienna. The first step in making a vase, after the clay was dug from its bed, was to levigate it. Levigation is the process of removing natural impurities from the clay, and it was done by mixing the clay with water and letting the impurities sink to the bottom. The process was repeated until the clay was pure enough for pottery-making. Then the clay was kneaded like dough to remove air bubbles and make it flexible. This process is called "wedging" the clay. Then the clay was placed on the potter's wheel, a rotating horizontal disk which the potter's apprentice turned by hand while the

potter pulled the clay into the desired shape with his fingers. The body of the pot, the foot and the spout, if there was one, were all made separately, and the handles were shaped by a different method and attached to the pot. A slip made of liquefied clay was applied to the joints to hold them together.

### The Role of the Vase Painter

Sometimes the potter was also the vase painter, but frequently the painter was a specialist employed by a potter. They might sign their names on the vases that they decorated, which is how we know them, but who they were, and whether they were slave or free we cannot say. Students of Greek vase paintings still use terms such as "black glaze" and "paint," but in fact, the Greek vase painters used neither glaze nor paints. Instead they drew their designs using slips of finely-sifted clay, some of which might contain pigments from metal. Then followed a three-stage firing process. In the first stage, which was the oxidizing phase, the kiln was heated to about 800 degrees Celsius and air was allowed free access. Both the pot and the slip turned red. In the second, reducing phase, the supply of oxygen into the kiln was shut off, and both pot and slip turned black, and the areas covered by the slip became partly vitrified. In the final, reoxidizing phase, oxygen was allowed in again, and the kiln was allowed to cool. The result was that the surface areas of the pot that were covered by the smooth slip, now partly vitrified, remained black whereas the coarser surface areas not covered by the slip absorbed oxygen once again and turned red. If the slip was applied too thinly, there might be a red spot in a black area, and this happened not infrequently. This was the technique used for both black-figure and the later red-figure vases which were produced in Athenian potteries. Corinthian potters were fond of a reddish-purple color, which they got by mixing a little red iron oxide into the slip. White could be produced by a slip of very fine white clay, which was not affected by the reducing process.

**RED-FIGURE POTTERY.** A rival of Nikosthenes was a potter who signed his vases "Andokides," and apparently an anonymous employee in his workshop pioneered red-figure vase painting about 530 B.C.E. If not the first red-figure artist, the Andokides painter was the first to show the potential of the technique. The black-figure technique showed figures in silhouette with details incised in the black glaze with a sharp instrument, while the background was left the natural color of the reddish clay found in Attica (the territory under control of Athens). Red-figure reversed the method: the background was black glaze and the figures were the color of

the red Attic clay, with details painted with a fine brush. Some of the early productions were "bilinguals"—red-figure on one side and black-figure on the other. One "bilingual" *amphora* was painted by the Andokides Painter in red-figure on one side, and by the Lysippides Painter in black-figure on the other. Other painters followed the lead on this new trend, including a painter named "Epiktetos," who worked in the potteries of both Andokides and Nikosthenes, and a group known to modern scholars as the "Pioneers" composed of Euphronios, Phintias, Euthymides, and a few others who seem to have belonged to a close-knit guild of painters.

Red-figure calyx crater, late 6th century B.C.E. © BETTMANN/CORBIS. REPRODUCED BY CORBIS CORPORATION.

By the last years of the sixth century B.C.E., red-figure vases dominated the market, and red-figure ware continued to be made until near the end of the fourth century B.C.E. Black-figure production never disappeared, however. In the Panathenaic Games held each year in Athens, the first prize for the contestants was an amphora filled with olive oil, and the amphora was always decorated in black-figure technique, even long after black-figure had gone out of style.

**THE RED-FIGURE VASE PAINTERS.** Like the black-figure artists, red-figure vase painters are mostly anonymous. Buyers seem to have been interested in the potter's workshop that manufactured the vase more than in the artist who painted it. Euphronios, who was active in the years 520–470 B.C.E. was both a potter and a painter; he signed twelve surviving vases as a potter and six as a painter. In his old age he seems to have concentrated on pottery production and employed other vase painters,

some of them the finest artists of the period. One artist who worked in Euphronios' pottery was Douris, who signed his name on 39 vases that have survived, two of which he also potted. Douris worked in the first half of the fifth century B.C.E., and if the number of his surviving works is any indication, he must have been enormously productive. The survival rate for Greek vases is probably no more than an average 0.5 percent of an artist's work, and if that calculation holds true in the case of Douris, he must have produced some 78,000 vases during his productive life. His specialty was red-figure cups, but he worked in other media as well, including white-ground painting, which was a favorite decoration for *lekythoi*, oil flasks which were buried with the dead.

**WHITE-GROUND VASES.** In the fifth century B.C.E., the Athenian Empire reached the height of its prosperity, and Athenian artists made their mark on the art world. Great artists such as Polygnotus produced narra-

The Daimons Sleep (Hynpos) and Death (Thanatos) carrying the body of a warrior, grave stele behind, detail of an Attic white-ground lekythos attributed to the Thanatos Painter, c. 440 B.C.E. PUBLIC DOMAIN.

tive paintings, and they influenced the vase painters. A new spirit can be detected in the years 475–450 B.C.E.; artists decorated large vases with ambitious combat scenes of, for instance, Greeks fighting Amazons, that are set in hilly landscapes where the artists tried to produce an illusion of depth by placing more distant figures at a higher level than those in the foreground. The great murals that inspired these painters have not survived, but descriptions of these works by ancient authors provide a record of them for modern scholars. Yet the skill of the painter's brushwork can be seen on white-ground vases of the fifth century B.C.E. On these, the artist covered the background with a wash of fine white clay, and then painted his figures on the white surface in the same way as he would paint on a wooden panel. The finish is not as durable as red-figure, and thus it was particularly popular for the oil-flasks that were buried with the dead. The paintings on them are often domestic scenes, but there is a cosmetics jar (a *pyxis*) in the Metropolitan Museum in New York that shows the "Judgment of Paris" in which Paris, the young Trojan prince, is visited by the god Hermes. Greeks, who knew their mythology very well, would have known what was taking place: Hermes was bringing Paris a message that he was to judge which

of the three goddesses—Hera, Athena, and Aphrodite—was the most beautiful. Paris seems youthful and innocent, the picture of naivety, and yet he was about to start the Trojan War.

**THE END OF THE RED-FIGURE PERIOD.** The workshops in the Kerameikos—the potters' quarter of Athens—continued to produce red-figure vases in the fourth century B.C.E., though the disintegration of the Athenian Empire meant that there were no more protected markets, and local potters in Italy and Sicily began to offer serious competition. One place where Athenian pottery still found eager customers, it seems, was in the Ukraine, and one fourth-century fashion in pottery is known as the "Kerch Style" after the city on the Black Sea where numerous fourth-century vases imported from Athens have been found. The vases discovered at Kerch improved on the basic red-figure technique by picking out details in color, especially white, yellow, and gold. Among those who were producing Kerch Style pottery was the last notable red-figure artist in Athens: the so-called Marsyas Painter, who is named for a vase of his in Berlin which depicts the flaying of Marsyas, the satyr who had lost a musical contest with

Apollo. He embellished his vases with gilding, raised relief, and colors such as pink, blue, white, and green. Yet as the Athens-based workshops declined, production of red-figure vases in old Athenian markets in Italy increased. The customers were not only the Greeks who lived in the colonies planted during the great period of colonization from the mid-eight century to the end of the sixth century B.C.E. but also the native Samnite peoples who were now encroaching on the Greek cities, driven by a sharp increase in their population. They, too, liked Greek vases. About 400 B.C.E., the Greek colony of Poseidonia (now Paestum on the western shore of Italy south of Naples) had been taken over by the Samnites who denied the Greek inhabitants the right to use their own language except for one day a year, but nonetheless the pottery workshops of Poseidonia remained active. Two of their vase painters are known, Python and Assteas, who signed their names in Greek. They took the subjects for their paintings from the theater and Greek myth. Some of their scenes taken from the comic theater show performers wearing padded costumes and grotesque masks, acting on a wooden stage. These represent a type of comedy called *phlyax*-plays—the word *phlyax* means a comic parody of Greek tragedy invented by a comedian named Rhinthon. They were evidently very popular in southern Italy, and the vases give a hint of what the plays of the Athenian comic poet Aristophanes may have looked like when they were staged in Athens.

## HELLENISTIC AND ROMAN POTTERY

**MEGARIAN BOWLS AND TERRA SIGILLATA.** During his brief lifetime, the Macedonian king Alexander the Great (356–323 B.C.E.) brought mainland Greece under his control and also conquered Persia and Egypt to form a “Hellenistic” kingdom composed of diverse peoples. Not surprisingly, the pottery from the period after Alexander the Great shows many diverse cultural influences. One type of pottery, however, became enormously popular in the Hellenistic period and, after 30 B.C.E., in Italy. From Italy its popularity spread to Roman Gaul and from there to Germany and Roman Britain. Its precursors were the “Megarian bowls” in Greece, tableware made in molds which seems to have had no particular connection with Megara, a Greek city on the Isthmus of Corinth. No later than the early third century, Athenian potters were producing crockery with relief ornaments which imitated the designs on metal vessels which were too expensive for most people. These so-called “Megarian bowls” were the forerunners of red-gloss *terra sigillata*, also known as “Samian Ware,” though it has no connection with the island of Samos. *Terra sigillata* means “earthenware decorated with figures,” which describes the pottery well, for on the exterior of the dish there are relief designs and figures which are imprinted from the mold. The place where this type of pottery may actually have been invented was the kingdom of Pergamum in Asia Minor, and the date was probably the mid-second century B.C.E. It was perhaps there that the black-ground ware inherited from Athens was modified into bronze or dark red gloss, which was its distinctive color.

**THE POPULARITY OF TERRA SIGILLATA.** Terra sigillata was pottery that could be easily mass-produced: clay was put in a mold, and the interior of the vessel scooped out using a fast wheel, and then the vessel was fired. With its smooth, red glossy surface, it was serviceable tableware and relatively cheap. Yet it was elegant and artistic, for it copied designs from silverware, and it must have appealed to customers for whom silverware was beyond their means. It brought style to the tables of the common man. As the first half of the first century C.E. wore on, production of terra sigillata in Ar-

Arretine ware bowl from Capua, Italy, with reliefs of the seasons. An example of "terra sigillata." THE ART ARCHIVE/BRITISH MUSEUM/HARPER COLLINS PUBLISHERS.

retium in Italy declined as potters migrated to Roman Gaul. The Roman army was also a factor in this "hollowing-out" of pottery manufacture in Italy. The legionary soldiers liked the sort of pottery that they knew in Italy or the Romanized provinces where they were recruited, and exports from Italy to the regions along the Rhine and Danube Rivers, and Roman Britain, where the military units were concentrated, were common. The corps of craftsmen attached to the army who knew how to make bricks and roof tiles for military use would also turn their hands to making pottery in the Roman style.

**THE DECLINE OF TERRA SIGILLATA.** From the end of the first century C.E. the common ware that came into fashion was "Red Slip" pottery, once called "African Red Slip" since the center of production seemed to be in

North Africa. It is now clear that not only Roman Africa but also Asia Minor manufactured and exported Red Slip ware all over the Mediterranean. Land transportation may have been exorbitantly expensive, but transportation by sea, though slow, was very cheap. Yet though Red Slip ware displaced terra sigillata as the common table crockery of the Roman Empire, it shared a common origin and it was recognizably Roman. It continued in use until the seventh century C.E.

## SCULPTURE IN ARCHAIC GREECE

**THE DAEDALIC STYLE.** By the mid-seventh century B.C.E. Greek sculptors were experimenting in free-standing figures, influenced, no doubt, by their discovery of the art and architecture of ancient Egypt earlier in the century. Once the Assyrians were driven out of Egypt, the pharaohs of the Twenty-Sixth Dynasty cultivated close relations with Greece and allowed the Greeks to build a trading station at Naucratis on one of the mouths of the Nile River. The Greeks themselves attributed many of their early efforts at sculpture to the legendary craftsman Daedalus, whose name means “Cunning Worker,” and hence modern art historians apply the label “Daedalic” to the earliest Greek sculptures. An early example comes from the sanctuary of Apollo and Artemis on the island of Delos, and it must be one of the first made. It is made of the white marble from the island of Naxos, which was the stone of choice for early sculptors until the quarries on the neighboring island of Paros were opened. The statue is of a woman wearing a wig and the garment known as the *peplos*, shaped awkwardly from an oblong piece of marble. She faces the onlooker, her arms hanging by her sides. On her skirt there is a verse inscription disclosing that this statue was dedicated to Artemis by Nikandre of Naxos, whose father, brother, and husband are also named. Nikandre’s statue is the first of many. One, a statuette of solid bronze from Apollo’s other great sanctuary at Delphi from the mid-seventh century B.C.E., shows a boy naked except for his wig and a belt at his midriff. He stands stiffly at attention, except that the left leg is slightly forward, the right leg slightly back. Except for the Daedalic wig and the belt, this is the stance of the later *kouroi*, that is, statues of naked youths.

**THE KOUROI.** The word *kouros* (plural: *kouroi*) means “boy” or “youth,” and it is a term that describes the archaic statues of nude youths produced from about 650 B.C.E. until the last quarter of the sixth century and

the early years of the fifth, when they lost their archaic features and became the male nudes of the classical period. Some 200 known examples of *kouroi* survived to modern times, although most of them are badly damaged and in fragments. The *kouroi* began to appear about the mid-seventh century B.C.E. One of the earliest examples, dating to about 600 B.C.E., is the “Metropolitan *Kouros*,” now in the Metropolitan Museum in New York. It is rigidly frontal; the statue has a front, two sides, and a rear—four independent faces that preserve the four sides of the marble block from which it was carved. A comparison between it and an Egyptian statue of a standing male figure reveals the source of the Greek sculptor’s inspiration. The Egyptian figure and the Metropolitan *kouros* have the same proportions. In both, the arms hang at the sides, and the left leg is thrust forward. Yet there are differences: the Egyptian figure wears a skirt held up by a belt whereas the Metropolitan *kouros* is entirely nude; and unlike the Egyptian sculptor, the Greek artist did not try to give the face any individuality. The lips are drawn back at the corners into what has come to be known as the “archaic smile.” Not much later than the Metropolitan *kouros*, about 580 B.C.E., two *kouroi* of Cleobis and Biton were erected at Delphi. According to the historian Herodotus, Cleobis and Biton were the two sons of the priestess of Hera at Argos who dragged their mother’s ox-cart from the city of Argos to the sanctuary of Hera in the countryside. For this act of piety, their mother prayed to the goddess to confer on them whatever reward was best for mortal men. The two youths then lay down to rest after their exertion and never awoke again, proving that, for men, death at the height of their renown is the best reward. The *kouroi* of Cleobis and Biton show them as two sturdy youths with well-developed pectoral muscles, smiling the “archaic smile” and staring with large eyes into the distance. These were two athletic young men who died at their physical peak and the sculptor tried to convey in stone the ideal they represented. They are dwarfed, however, by the contemporary “Sunium *kouros*,” the best preserved of several over life-size *kouroi* found at Sounion, the eastern tip of Attica, where there was a sanctuary of the god of the sea, Poseidon. Over three meters (9.84 feet) high, it stood with its giant companions overlooking the treacherous waters off Cape Sounion, perhaps commemorating men lost at sea. Slightly later, belonging to the second quarter of the sixth century B.C.E., is a *kouros* found at Tenea south of Corinth, a small place whose inhabitants claimed to be captive Trojans whom the Greeks settled there. The sculptor of the Tenean *kouros* had observed the male anatomy carefully; the shoulders, pectorals, stomach muscles, and thighs are well-shaped and well

*a PRIMARY SOURCE document***DAEDALUS THE SKILLFUL CRAFTSMAN**

**INTRODUCTION:** Daedalus, whose name means “skillful worker” (the Greek adjective for “well-wrought” or “intricately made” is *daidalos*) was connected in Greek myth with the legendary king of Crete, Minos. It was said that he built a great labyrinth for Minos as a lair for the Minotaur, a monster that was half-man, half-bull. There was also a tale that Daedalus escaped from Crete by making wings for himself and flying away to Italy or Sicily. There is, however, another set of legends that seem to place Daedalus in the period after the fall of the Bronze Age civilization, and attribute the beginnings of Greek sculpture to him. The Greek traveler, Pausanias, who toured Greece in the second century c.e. and wrote an account of what he saw that has been enormously useful to archeologists, remarked on several works attributed to Daedalus which he encountered. A passage from Pausanias is quoted below. The reference to the relief sculpture in “white stone” (marble), which Daedalus made of the “Dancing Floor” of Ariadne, is a reference to a dancing floor designed by Daedalus that Homer describes in

his epic, the *Iliad*. The passage is quoted in the chapter on “Dance” in this volume.

**SOURCE:** Pausanias, *Pausanias*, Book IX, in *The Art of Greece, 1400-31 B.C.: Sources and Documents*. Ed. J. J. Pollitt (Englewood Cliffs, N.J.: Prentice-Hall, 1965): 7.

coordinated. The pose remains the same: left leg slightly forward, right leg drawn slightly back and arms hanging loosely at the sides. Yet there is a new plasticity to the modelling of the body that signals a leap forward.

**THE KORAI.** The female figures dating to the same period as the kouroi are called *korai* (singular: *kore*). Males are shown nude and women clothed, the convention that will not be breached until the fourth century B.C.E. Sometime in the sixth century, a person whose name was Cheramyas dedicated a *kore* at the great temple of Hera on the island of Samos. The *kore* is now headless, but the body is intact except for the left arm. It is basically a cylindrical figure. A long tunic or *chiton* drapes the body, falling in tiny pleats from the waist to the toes which peep out from under it, and she wears a cloak that once veiled her hair. It falls over her shoulders, covering her right arm completely, and it is drawn diagonally across her breasts. Under her clothes the contours of her body are visible; her breasts are full and her stomach bulges slightly below her belt. Unlike the nude kouroi, the *korai* were clothed, and this required the sculptors to portray garments which were originally painted to reproduce the patterns on the clothes that the *korai* wore—usually a *chiton* and over it a cloak known as a *himation*. The Acropolis of Athens in the late sixth and early fifth centuries must have been full of *kouroi* and *korai* which were dedicated there. In the course of

the Persian Wars, the Persians captured the city in 480, and again in 479 B.C.E., laying the whole area waste and leaving the shattered remains of these statues on the ground. The Athenians buried the decimated statues reverently, and they remained in their graves until archaeologists, clearing the Acropolis in the 1880s, stumbled on an amazing collection of archaic sculpture, including a cache of *korai* from the century before the Persian Wars. They stand, facing forward, left foot thrust slightly forward as if they were dancing. The treatment varies, but in the standard pose the *kore*'s left hand pulls the skirt of her *chiton* across her legs, sometimes so tightly that the legs can be seen beneath it, and over it she wears a *himation*, a wrap that is slung over the right shoulder and hangs diagonally across her bosom and under her left arm. The reason for their burial is unclear, although the statues did commemorate an untimely death on occasion. They were, however, erected all across Greece in the archaic period.

**“RIPE ARCHAIC” SCULPTURE.** “Ripe Archaic” is a convenient label for the style of sculpture from the period dating from about the second quarter of the sixth century to the time of the Persian Wars (490–479 B.C.E.). This is also the period when Greek craftsmen learned how to make hollow bronze statues using the so-called “Lost Wax” technique. In this technique, a model of the figure was made of wax over a clay core, then a

## CASTING

### Bronze Statues by the “Lost Wax” Method

#### The Technical Difficulty

The earliest bronze figures that we have from Greece are small statuettes cast of solid bronze. Bronze in ancient Greece was an alloy of copper and tin and it was expensive. Making a life-size statue in bronze would be costly, to say nothing of its weight. In the sixth century B.C.E., Greek sculptors learned how to cast hollow bronze statues using the “lost wax” method, which they learned from Egypt. Greek authors such as the historian Herodotus in the fifth century B.C.E., Pliny the Elder in the first century C.E., and Pausanias in the second century, whose guidebook to Greece is a mine of information for the archaeologist, attribute the introduction of bronze casting by the “lost wax” process to Rhoikos and Theodoros who worked for the tyrant of Samos, Polycrates, who became tyrant about 540 and died about 522 B.C.E. Whether that is true or not, hollow bronze statues appear around the middle of the sixth century B.C.E.

#### The Technique

First, the sculptor made a clay core. He then inserted metal pins, known as chaplets, into the clay core, covered it with wax and carved it to form a model of his statue. Then he covered his wax model with clay and allowed the clay to become completely dry, thus forming a mold. The next step was to place the mold in a casting pit and heat

it so that the wax melted and ran out, leaving a space between the clay core and the mold. The chaplets which had been inserted into the core held it firm within the clay mold. Next bronze was melted in a furnace constructed alongside the casting pit and poured into the space between the clay core and the mold, using a clay funnel. The bronze was allowed to cool and harden, the mold was broken away—it would probably not be used again—and the bronze statue would emerge. The clay core could then be removed. Or it might not—in 1959, a bronze Apollo, dating to about 525 B.C.E., was found in Piraeus, the port of Athens, which was part of a lost consignment of bronze statues intended for shipment to Rome in the first century B.C.E., and it was cast using the “lost wax” process, but the core had not been removed. Nor had the iron chaplets which held the core in place.

#### Finishing the Statue

Once the statue was removed from its mold, the sculptor would finish it. Most statues were far too large to be cast at the same time. The head, the legs, and the arms were usually cast separately and then were fitted together only after they had emerged from their molds. The Delphic Charioteer in the Museum at Delphi in Greece, which commemorated a victory at the Pythian Games in either 478 or 474 B.C.E., is a case in point. Its skirt, upper torso, both arms and head, as well as the side-curls on the head, were all cast separately. The left arm is now lost and so we can see how it was originally attached. The sculptor then inset the eyes using colored glass, and smoothed off any imperfections. He then oiled and polished his statue, and it was ready to be erected.

mold was made from the wax model; the wax was then melted out and replaced by molten bronze and finally, after the bronze had cooled, the mold was removed. Before the discovery of this technique, large bronze statues could be made only by hammering bronze plates over a wooden core, in the same way as bronze armor continued to be made. Most of the bronze statues of the ancient world disappeared long ago, melted down in many cases for their metal, and so it is easy to forget that all the great sculptors of Greece worked in bronze. Only one bronze *kouros*, dating to about 525 B.C.E., survived, discovered in 1959 in Piraeus, the port city of Athens. It is the exception, however; the *kouroi* and *korai* that still exist are generally of marble. The type changed very little. *Kouroi* and *korai* still face the viewer head-on as if their movements were constrained by the block of marble from which they were sculpted, and they still wear their archaic smiles which make them look a little smug.

Yet the sculptor’s chisel was surer, as the sculptors became more skilled at representing the anatomy of the male body. A *kouros* found intact at Tenea, a village south of Corinth, illustrates what the type was like at the beginning of the “Ripe Archaic” period. The *kouros* still smiles at the viewer with the corners of his lips pulled back in an archaic smile. His arms hang by his sides and his left leg is thrust forward in the familiar pose that was borrowed from Egypt, but his torso is modeled with skill. The sculptor paid close attention to the pectoral and stomach muscles. Yet a comparison between the *kouros* from Tenea with one made a generation later, the Anavysos *kouros*, shows the great strides forward in just a short time. Sometime after 540 B.C.E., at Anavysos in the countryside outside Athens, a *kouros*-statue was erected on the grave of a young man named Kroisos (Croesus) who had died in battle. The Anavysos *kouros* is intact; in fact, some of the original paint on it sur-

Kroisos, kouros figure from Anavysos, full length marble sculpture of nude young man walking, funerary monument/portrait of a young man who died in battle, c. 530 B.C.E. © GIANNI DAGLI ORTI/CORBIS. REPRODUCED BY PERMISSION.

vives. It is not a portrait of *Kroisos*, but it is somehow intended to represent the spirit and life-force of the dead warrior. The lips still smile the “archaic smile,” and the kouros stands, hands hanging at his sides with his left leg still thrust slightly forward and the right leg pulled slightly back. The traditional pose of the kouros-statue is unchanged, yet the spirit is different: the sculptor had observed the musculature of the male body carefully and attempted to reproduce it accurately. Kroisos was evidently a powerfully-built young man, unlike the lithe youth that the *kouros* from Tenea represented, and the sculptor tried to convey an impression of his physical power in the statue that marked his grave.

**THE KORAI IN THE “RIPE ARCHAIC” PERIOD.** The *korai* demanded stone carving that was even more proficient, for these were statues wearing clothing that had

The “Peplos Kore,” a girl wearing the garment known as a “peplos,” found on the Acropolis in Athens with some of its original paint intact, c. 530 B.C.E. THE ART ARCHIVE/ACROPOLIS MUSEUM ATHENS/DAGLI ORTI.

to be recreated in stone. The fashions of the day were elaborate and the garments that the *korai* wear reflect it. The garments were originally brightly painted and on a few of them that have escaped weathering some of the pigment has survived. One of these, dating to 530–515 B.C.E. which is now in the Acropolis Museum in Athens, shows a young woman with an elaborate coiffure and long braids hanging down over her shoulders. She wears a mantle with heavy folds that contrast with the soft, crinkly folds of the tunic (*chiton*) beneath it. The color is well-preserved; the tunic is dark and the mantle has a pattern on a white background and a dark fringe along its edges. Another almost contemporary statue, also in the Acropolis Museum, is the so-called *peplos kore*, so-called because she is wearing a simple *peplos* with an overfold that falls down as far as her waist. Her right arm hangs by her side, and she may have held something in her left hand, though the left forearm is broken off. The simplicity of her dress is more apparent than real for the

Marble statue of a "kore" from the Athenian Acropolis, dressed in an ornate Ionian "chiton" under an Ionian-style "himation," c. 510 B.C.E. THE ART ARCHIVE/ACROPOLIS MUSEUM ATHENS/HARPER COLLINS PUBLISHERS.

fabric was originally brightly patterned. Only a few remnants of the paint survive, but enough to suggest what the statue must have once looked like. Her hair hangs down her back in multiple braids; three are slung over each shoulder. She has a lively face with almond-shaped eyes and pupils picked out in paint.

**SCULPTURE IN RELIEF.** Relief sculpture appeared as decoration for monumental temples about the middle of the seventh century B.C.E., the colonial period of Greece, when various city-states in both mainland Greece and East Greece on the western fringe of Asia Minor sent out colonies to Sicily, Italy, southern France, and the north-east coast of Spain, as well as to the northern Aegean region and the shore of the Black Sea. The earliest Greek temples were one-roomed structures, entered through a porch at one end, with a place for burnt sacrifices in the middle. This style developed into a long narrow room with the entrance-porch at the east end,

and the cult statue facing it at the other end. The earliest examples of cult statues were what the Greeks called *xoana*: primitive statues of wood, hardly more than wooden posts with some human features carved roughly on them. The sacrificial pit was moved to an open-air altar, often outside the east door. The Doric temple evolved from this style in the Peloponnesos, while in East Greece the Ionic temple developed; the first use of relief sculpture decorated both of these temple types. At each end of the temple there was a triangular gable called a "pediment," surrounded by cornices, leaving a recessed triangular space called the "tympanum" in which sculpture could be placed. On Doric temples, a frieze of triglyphs and metopes appeared below the pediment. The *triglyphs* were plaques carved with two vertical channels separated by three moldings, one over each column and one in the space between. The *metopes* were the empty spaces between the triglyphs, and they could be filled with relief sculpture. Some of the earliest examples of metope-sculpture comes from the Greek colonies in Sicily and Italy. One, which comes from a ruined temple at Selinunte (ancient Selinus) in western Sicily shows the hero Perseus cutting off the head of the Gorgon, Medusa, a monster who could turn anyone who looked at her face into stone. The relief tells a story familiar to Greeks, who believed that Perseus was not a mythical hero but a man who actually lived in an earlier era when gods walked the earth; the Gorgon's head was also a well-known terror-symbol that struck fear into men's hearts. Both Perseus who holds his sword at Medusa's throat, and Medusa, whose head is being severed, confront the onlooker, their facial expressions unmoved. From a small mid-sixth-century B.C.E. temple built to Hera at the mouth of the Sele River in Italy comes a remarkable series of 36 metopes, some of which are only roughed out and left incomplete. The finishing of the relief sculptures was evidently done after the metopes were in place, and the builders of this temple never got around to it. Some of the best metopes show the Labors of Heracles or events from the Trojan War.

**SCULPTURE IN AN AGE OF TYRANNY.** The sixth century B.C.E. was a period in Athenian history when Athens moved from aristocratic government to tyranny and finally to democracy, though democracy was not fully in place until the fifth century B.C.E. In 560 B.C.E., Pisistratus, an outsider in Athenian politics who belonged to neither of the main political factions, staged a *coup d'état* and seized power, but he did not last long. The two main factions forgot their bickering long enough to unite against him, and he was expelled. Yet once he was gone, the factions returned to their rivalry, and the leader of the weaker faction made Pisistratus his

Frieze of Perseus Slaying the Gorgon from Temple C in Selinus, Sicily (c. 540 B.C.E.). COURTESY OF JAMES ALLAN EVANS.

ally and brought him back. He was soon driven out again, but he made a third attempt, backed by armed force, and this time it took only one battle to scatter his enemies. He remained tyrant of Athens from 546 to 527 B.C.E., and his son Hippias carried on as tyrant until 510. After the tyrants were gone, the Athenians of a later generation looked back on the tyranny as a time of oppression, although in actuality both Pisistratus and Hippias kept their iron fists well camouflaged in velvet gloves. They allowed the Athenian constitution to function and only manipulated from behind the scenes. Likewise during this time period Athens prospered and new temples arose on the Acropolis. Some of the sculpture that adorned their pediments was found among the debris left when the Persians sacked Athens in 480 B.C.E. One group portrays the three-headed serpent Typhon; the long serpentine coils must have filled the corners of the tympanum, and Typhon's three torsos filled the space under the central peak. His three faces still have blue beards and moustaches, and the lips are curved into

the familiar archaic smile. One other sculpture that belonged to the time when Pisistratus was trying to secure his hold on power is a variation of the *kouros*-type: a statue of a man bearing a calf on his shoulders, and its inscribed base reveals that it was dedicated by Rhonbos. Whoever he was, Rhonbos is almost certainly the man whom the sculpture represents, and he is shown bringing a calf for sacrifice. Over his shoulders, he wears a thin cloak; the paint which once set it off from his naked flesh has long disappeared. His upper body, the muscles of his arms, and the calf slung over his shoulders are realistically modeled, though the modeling of his lower body is more stiff, and his legs are broken off at the knees. His face, which is bearded, smiles the "archaic smile." Rhonbos' statue was erected about 560 B.C.E., the year when Pisistratus first seized power and held it briefly. Perhaps Rhonbos erected this statue to commemorate his thank-offering to Athena for delivering Athens from the tyrant. He did not yet know that the tyrant would return.

Carved metopes from a small mid-6th-century B.C.E. temple of Hera at the mouth of the river Sele in southern Italy, showing exploits of Heracles. COURTESY OF JAMES ALLAN EVANS.

#### SCULPTURE OF THE CLASSICAL PERIOD

**THE EARLY CLASSICAL PERIOD.** About 480 B.C.E., just before the Persians under King Xerxes sacked Athens, someone dedicated a *kouros* (a Greek male nude statue) on the Acropolis which has been labelled the “Critian Boy” because of the resemblance of its head to a statue group by two sculptors, Critias and Nesiotes, erected a few years after the Persian invasion had been defeated. The Critian Boy faces the onlooker like earlier *kouros*, but he stands relaxed, his weight on one leg, his head inclined. His body is skillfully modeled. It is that of an athletic youth aged eighteen or nineteen. There is no vestige left of the “archaic smile,” typical of earlier statues, indicating its stylistic alignment with sculpture from the classical period. The sculptors who produced

The Apoxyomenos (athlete scraping himself after exercise): a Roman copy of a famous bronze statue by Lysippus. ART RESOURCE.

the *kouroi* and *korai* (female versions of the *kouroi*, only clothed) are generally nameless, though one battered *kore* bears the signature of the sculptor Antenor. The preferred medium of the great sculptors of the classical period was bronze, although copies of the sculptures were done in marble for Roman customers. It is these copies which survived antiquity, since most of the bronze statues were melted down for scrap metal during in the Middle Ages. Unfortunately, marble cannot reproduce bronze exactly because it is a heavier, more inflexible medium, and the sculptor working in marble must distribute the weight of his statue evenly or it will not be stable. Therefore, the copies do not reveal the evolution of sculpture in the classical period from the stiffness of the archaic period, a development made possible by the more flexible medium of bronze. The bronze *kouros* found in Piraeus which dates to about 525 B.C.E. is already less stiff than contemporary marble *kouroi*; its head is slightly inclined and its forearms stretch out towards the onlooker. The “Discus-Thrower” of the sculptor My-

“Discobolus” or “Discus-thrower,” a Roman copy of a famous statue by Myron, early 5th century B.C.E. © GIANNI DAGLI/CORBIS. REPRODUCED BY PERMISSION.

ron whose career began just after 480 B.C.E. shows a naked youth in the act of throwing a discus. Though the original is lost, the survival of several Roman copies reveal that the statue is an action figure, a type developed by early classical bronze-workers. It is still two-dimensional; the onlooker can view it from the figure’s right side or from the rear. Other viewpoints are an unsatisfactory jumble of lines. The original in bronze was balanced, though it has been argued that Myron altered the natural stance of a youth about to throw a discus in order to give the statue stability. The copyist, however, introduced a strut to stabilize the figure.

**THE BRONZE ORIGINALS.** While it is fortunate that Myron’s work was preserved in good marble copies of his “Discus-Thrower” and his statue group of Athena and Marsyas, there are no surviving Roman copies of the work of the other two outstanding sculptors of the period, Pythagoras and Calamis, that can be attributed to them with any certainty. Despite the widespread destruction of bronze works during the Middle Ages, some bronze originals of the early classical period did manage to survive. One is the Delphic Charioteer found at Delphi, where it was preserved by a landslide. Of the chariot, horses, and groom that were part of the statue group,

*a PRIMARY SOURCE document***PLINY THE ELDER ON THE SCULPTOR, MYRON**

**INTRODUCTION:** Myron is best known nowadays for his *Diskobolos*, or “Discus-Thrower,” which depicts a young athlete crouching down to throw the discus. The bronze original is lost, but it survives in copies, of which the finest and best-preserved is the so-called Lancelotti *Diskobolos* in the National Museum in Rome. A second statue group survives, portraying the myth of Athena and Marsyas: Athena invented the reed pipe known in Greek as the *aulos*, but threw it away because it distorted her mouth when she played it, and made her look ugly. The satyr Marsyas picked up the pipe that had been discarded and learned to play it. He became so proud of his skill that he challenged Apollo to a musical contest, and when he lost, he was flayed for his impertinence, for gods took offense when they were challenged by lesser beings. In the ancient world, Myron was particularly famous for his statue of a heifer that was so life-like that, according to one report, it aroused the lust of a concupiscent bull. The passage quoted below comes from the *Natural History* of Pliny the Elder, a Roman man of learning who died in the eruption of Mt. Vesuvius in 79 C.E. His *Natural History* touched on the visual arts among other topics, and it is a major source of our knowledge about ancient art. Pliny’s remark that many short verses or epigrams were written in praise of Myron’s heifer is true. The *Greek Anthology*, which is the title given to two collections of ancient Greek poetry made in the Byzantine period, preserves thirty-six epigrams on Myron’s famous heifer.

**SOURCE:** Pliny, *Natural History*, in *The Art of Greece, 1400–31 B.C.: Sources and Documents*. Ed. J. J. Pollitt (Englewood Cliffs, N.J.: Prentice-Hall, 1965): 61–62.

only fragments remain. Another is a bronze statue of Zeus hurling a thunderbolt that is now in the National Museum of Greece in Athens. It was found in the waters off Artemisium at the north tip of the island of Euboea in the Aegean Sea. Zeus strides forward, his right arm raised to hurl the thunderbolt. The sculptor is unknown, but Ageladas of Sicyon, a famous artist who taught both Myron and Phidias, is known to have sculpted a Zeus hurling the thunderbolt. If the Zeus in the National Museum is not his, it may at least have served as the inspiration for it. The sea off southern Italy at Riace Marina also yielded two Greek bronze statues in 1972. They are dated to shortly before 450 B.C.E. Both are nudes and both portray bearded warriors; one has the remains of a shield on his right arm, and the other originally wore a helmet which has mostly disappeared. On the first, the eyes are of ivory and glass paste, the teeth—visible between his parted lips—are inlaid silver. His lips, his nipples, and his eyelashes are of copper, precast and inserted into the mold when the statue was made. The warrior that once had a helmet also has copper for his nipples, lips, and eyelashes, and his one

surviving eye is made of marble and glass paste. Both statues were made by the “lost-wax” technique (in which a mold is made from a wax model over a clay core; then the wax is melted out and replaced by molten bronze) and, when found, they still had their clay cores, though these are now removed. Both are about six and a half feet tall, the helmeted one slightly shorter than the other. Better than any other bronze statues that have survived, these powerfully built warriors provide a clue as to what Greek bronzes in the early classical period must have looked like.

**THE HIGH CLASSICAL PERIOD.** By the middle of the fifth century B.C.E., Greece had fully recovered from the ravages of the war with Persia. After the Persian invasion was repelled, Persia remained a powerful enemy, and the Greek states in Asia and northern Greece still felt threatened. They willingly joined an alliance under Athenian leadership to continue the fight and make sure that Persia could not launch a counter-offensive. The center of the alliance was on the island of Delos, sacred to Apollo and Artemis, and there the treasury of what

was called the “Delian League” was kept, and all members of the alliance contributed to it according to an assessment drawn up by Athens. But more and more the Delian League developed into an Athenian Empire. In 454 B.C.E. the treasury was moved from Delos to Athens, and in mid-century the campaigns which the Delian League had once launched annually against Persian territory came to an end; there may even have been a peace treaty signed at last, though that is a matter of debate. Yet Athens decreed that the yearly tribute to the Delian League treasury should still be paid and used the money not only to maintain the most powerful fleet in Greece, but also to finance a building program in Athens. On the Athenian Acropolis, a splendid temple to the goddess Athena Parthenos was built that was larger than the temple of Zeus at Olympia, and unlike the temple at Olympia which was built of limestone, the Parthenon was built of marble from the Athenian quarries on Mt. Pentele. The architect of the temple was Ictinus, but the artist who oversaw the project and made the great gold-and-ivory statue of Athena to stand inside it was Phidias. It was probably Phidias, too, who drew up the designs for the sculpture that decorated the temple: the sculptures that filled the pediments at the east and west ends, the relief sculptures that filled the metopes, and the frieze that ran around the whole of the cella—inner room of a Greek sanctuary or temple—wall inside the colonnade. An examination of the relief sculpture of the frieze shows that it was done by several hands. The same was probably true of the other sculptures, but much has been lost. In 1687, during one of the wars between the Venetians and the Turks, the Turkish garrison on the Acropolis was being besieged by the Venetians and a Venetian cannon lobbed a shell into the Parthenon. The Turks were using the Parthenon as a powder magazine, and the shell ignited an explosion that blew out the center of the temple. The pedimental sculptures affected by the explosion as well as some undamaged specimens were taken to England in the early nineteenth century before the Greek War of Independence by Lord Elgin, British ambassador to the Ottoman Empire which still ruled Greece. They are now in the British Museum and known as the “Elgin Marbles.” There is no agreement about what the pediments of the Parthenon looked like before the explosion of 1687, for most of the sculpture is lost. The frieze is thought to represent the Panathenaic procession that was part of the festival of the Great Panathenaea, but even that is not completely certain. Also uncertain is what part Phidias played in carving the sculptures that do survive, if any, but at least it can be said with confidence that he was the presiding genius who drew up the designs that other stone carvers executed. Phidias’ activity extended

beyond Athens. In fact, he spent his last years in exile. From Athens he went to Olympia and made the gold-and-ivory statue of Zeus there; Olympia is also the site of the discovery of his workshop and the terracotta molds used to fashion the gold drapery of the statue, which was not pure gold as at Athens but gold inlaid with glass.

**THE ARGIVE STYLE.** Although Athens was the dominant center of art and literature in Greece from the mid-fifth century B.C.E. on, one other center retained its artistic independence: Argos and its neighbor Sicyon. While the Parthenon was being built in Athens, in Argos the workshop of the sculptor Polyclitus was perfecting its own idea of what the proper proportions of a male nude should be. Polyclitus also made statues of deities, and though he was primarily a bronze-caster, he made a chryselephantine statue of Hera for her temple at her holy site in the Argive countryside. Chryselephantine statues (from the Greek *khrysos* meaning “gold” and *elephantinos* meaning “ivory”) were made of gold and ivory: the drapery was made of gold and the flesh of ivory, and the statue was supported on a wooden frame. They were considered the pinnacle of Greek sculpture. Polyclitus,

Poseidon, Apollo, and Artemis (left to right), marble relief sculpture fragment from the Parthenon east frieze, c. 445–438 B.C.E. © GIANNI DAGLI ORTI/CORBIS. REPRODUCED BY PERMISSION.

however, was especially known in the ancient world for his bronze statues of athletes, two of which survive as good Roman copies: the *Doryphoros* or “Spear-bearer,” and the *Diadoumenos*, a youth adjusting his *diadema* or headband. These male nudes form the climax of the long development towards naturalistic form. Both statues portray arrested motion: the Spear-bearer, for instance, is in the midst of a step forward, with all his weight on his right leg and the musculature of his torso responds to the movement of the body. The right hip that supports the Spear-bearer’s weight is slightly raised, and the left hip droops while the left shoulder is tensed and slightly raised to compensate for the weight of the spear that the Spear-bearer holds in his left hand. In these two nudes, Polyclitus achieved a balanced, harmonious, and naturalistic whole. He was particularly interested in proportion; in fact, he wrote a book on the proper proportions of the body titled the *Canon*. Polyclitus’ *Canon* would be recycled in the Roman Empire for imperial statuary.

Statues from this era showed the emperors as military leaders wearing armor, but under the armor their physiques adhered closely to the proportions which Polyclitus set forth.

**WIND-BLOWN DRAPERY.** In the late fifth century B.C.E. sculptors turned their artistic energy to exploiting the wind-blown style of drapery which the sculptors of the Parthenon pediments had developed. Figures were portrayed as having cloaks blown by the wind. The drapery sometimes appears almost transparent as the wind presses it against the body, showing the anatomy underneath. The style stressed both elegance and technical virtuosity. One example of this style was found at Olympia, an original sculpture by the little-known sculptor Paionius of Mende, who carved a figure of *Nike* (the goddess of Victory) for a victory monument dating to about 420 B.C.E., erected by the Messenians at Naupactus to commemorate a defeat they had inflicted on

*a PRIMARY SOURCE document***PHIDIAS' GOLD AND IVORY STATUE OF ZEUS AT OLYMPIA**

**INTRODUCTION:** After Phidias finished his great statue of Athena for the Parthenon in Athens, he went to Elis which had the site of the Olympic Games within its territory, and there he made another great statue of gold and ivory for the new Temple of Zeus. The remains of Phidias' workshop have been discovered at Olympia—among the finds was a cup bearing Phidias' name—and the pottery found in the workshop can be securely dated to the late 430s and 420s B.C.E. This settles an old debate among archaeologists whether Phidias sculpted the statue of Athena Parthenos in Athens before or after he sculpted the statue of Zeus at Olympia. It is clear now that the making of Zeus came second. The passage quoted below comes from the *Geography* of Strabo (64 B.C.E.–circa 21 C.E.). Strabo visited Greece which he describes in books eight to ten of his *Geography*, and in the following excerpt he describes the impression which Phidias' statue of Zeus at Olympia made on him more than four centuries after it was made.

**SOURCE:** Strabo, *Geography*, in *The Art of Greece, 1400–31 B.C.: Sources and Documents*. Ed. J. J. Pollitt (Englewood Cliffs, N.J.: Prentice-Hall, 1965): 73.

the Spartans. Messenia was a region west of Sparta that the Spartans had subjugated in the early archaic period, reducing the Messenians to serfdom; the Messenians who erected this monument had escaped from the Spartan yoke and had been settled on the Gulf of Corinth at Naupactus by Athens. To mark the victory, they erected this victory monument at Olympia where all the Greeks who came to the Olympic Games could see it. The *Nike* of Paionius stood on a high triangular base some 9.14 meters (thirty feet) high before the front end of the Temple of Zeus. To viewers below, it looked as if the *Nike* was alighting on the pillar as the air swirled around her, pressing her *chiton* (tunic) against her body, while her *himation* (outer cloak) billowed out around her. The *himation* is now largely broken away, but it is still possible to appreciate the technical virtuosity which this statue displays. Battered though it is, this is a masterpiece of the “flying drapery style.”

**SCOPAS OF PAROS.** Early fourth-century sculpture retained the artistic conceptions of the fifth. Figures stand with the same easy balance, their facial expressions have the same calm serenity, and the drapery is transparent though it is often combined with heavier, agitated

folds. The fourth century did develop its own style, however, in introducing a more human quality. Poses became more sinuous, drapery was more naturalistic, and a dreamy gentleness appeared in the faces. Three sculptors dominated the period: Scopas of Paros, Praxiteles of Athens, and Lysippus of Sicyon. Of Scopas little remains to form a judgement of his art. He worked on three important monuments of the first half and middle of the fourth century B.C.E.: the temple of Athena Alea at Tegea, the temple of Artemis at Ephesus, and the great Mausoleum of Halicarnassus (modern Bodrum in Turkey). From the pediment of the temple at Tegea, some battered heads survive and they are arresting, with deep-set eyes that gaze upwards and furrowed brows. While they cannot be attributed with certainty to Scopas, he was the architect of the temple and these sculptures must have been approved by him at the very least. The sculptural remains from Halicarnassus and Ephesus add little to modern knowledge of Scopas although Roman copies do exist of one famous free-standing sculpture of Scopas, the so-called *Pothos* (“Yearning”). The statue is of a youth standing with crossed legs, leaning on a pillar, with a goose at his feet. He stands with raised

Copy of the "Doryphorus," or "Spear-bearer" from Greek original by Polyclitus of Argos, found at Pompeii. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM NAPLES/DAGLI ORTI.

head, looking upwards with a melting gaze. The upward gaze seems to have been a mark of Scopas' sculpture.

**PRAXITELES.** The most famous work of Praxiteles was his statue of Aphrodite which he made about 370 B.C.E. for the Dorian city of Cnidus. It was extravagantly admired in its own day for its beauty and its daring, for it showed Aphrodite naked, one hand shielding her pudenda from the onlooker's gaze, and the other resting on a water jar (*loutrophoros*) with a towel draped over it—Aphrodite has been surprised as she was preparing for her bath, it appears. Many Roman copies of the statue have survived. The best example is in the Vatican Museum in Rome but even though it is a competent replica, it gives little idea of the statue's original appearance, when its paint was fresh. At Cnidus it was placed in an open shrine where it could be viewed from all sides. It is the first of a whole series of female figures, some nude, some partially clad, the most famous of which is the *Venus di Milo*, the Aphrodite found on the island of Melos which is now in the Louvre museum in Paris. Praxiteles worked in bronze, but he was at his best working in marble, which he knew how to polish to a finish that

Statue of Hermes carrying the infant Dionysus, by Praxiteles. PHOTOGRAPH BY HECTOR WILLIAMS. © HECTOR WILLIAMS.

represents the softness of female flesh. He was also a master of the tender gaze. A statue by Praxiteles was discovered during the archaeological excavations at Olympia, and though there has been a long debate as to whether it is a genuine Praxiteles or a later but very fine copy, the reasons for rejecting it as genuine are not convincing. This statue shows the god Hermes holding the infant Dionysus. Hermes holds the child with his left arm, and with his right he dangles a bunch of grapes. The right arm is broken, but other depictions of the statue show that Hermes is teasing Dionysus with a bunch of grapes and Dionysus recognizes his special fruit, infant though he is. Hermes' head is particularly fine, and the finish of the marble and the impressionistic method used to portray Hermes' hair are all marks of Praxiteles' style.

**LYSIPPUS.** Lysippus of Sicyon, who was active not long after 370 and was still at work in 312 B.C.E., marked the period of transition to the Hellenistic Age. When he was born, the city-states of Greece were squabbling in the aftermath of the Peloponnesian War that had ended in 404 B.C.E. with the defeat of Athens. When he died,

*a PRIMARY SOURCE document***POLYCLITUS AND THE ARGIVE STYLE**

**INTRODUCTION:** Polyclitus was a native of Argos, and a younger contemporary of Phidias. Thanks to him, the Peloponnesian tradition of sculpture, centered in Argos and its neighbor Sicyon, maintained its artistic independence from Athens in the fifth century B.C.E. when Athens became the cultural leader of Greece and absorbed the other local sculptural traditions. Like both Myron and Phidias, he is supposed to have been a pupil of Ageladas of Argos who was active in the 470s. The period of Polyclitus' activity as a sculptor stretched over the whole of the second half of the fifth century B.C.E. In the excerpt from Pliny the Elder's *Natural History* quoted below, Pliny makes two errors. First, the "Canon" which set out Polyclitus' prescription for the proportions of the male nude figure was not a separate statue. It was the *Doryphoros* or "Spearbearer," a muscular youth carrying a spear over his shoulder. It expressed what Polyclitus thought were the perfect proportions for the young man's body, and he drove home his point with a treatise on the subject titled the "Canon." Second, Polyclitus came from Argos, not Sicyon, but Sicyon, next door to Argos, succeeded Argos as the center for sculpture in the Peloponnesos in the fourth century B.C.E., and Pliny's error is understandable.

When Pliny quotes the opinion of the learned Roman Marcus Terentius Varro (116–27 B.C.E.) that Polyclitus' statues were "square," he probably means that they were squarely-built, which is more or less true.

**SOURCE:** Pliny, *Natural History*, Book XXXIV, in *The Art of Greece, 1400-31 B.C.: Sources and Documents*. Ed. J. J. Pollitt (Englewood Cliffs, N.J.: Prentice-Hall, 1965): 88–89.

the Hellenistic Age had already begun, and Lysippus pioneered the new sculptural style. His workshop in Sicyon produced hundreds of statues—he is supposed to have turned out 1,500 works—but one was particularly famous: his *Apoxyomenos* or "Athlete Scraping Himself," referring to the process by which athletes removed the residue of the olive oil they rubbed on themselves prior to exercise. The *Apoxyomenos* broke with the tradition established by the *Canon* of Polyclitus that the head should be one-eighth the total height of the statue; the head of the *Apoxyomenos* is one-ninth the total height. Nor is the *Apoxyomenos* a "square" statue like Polyclitus' "Spear-bearer." Lysippus' statue constantly draws the viewer's eyes around the figure, for he has given it no clearly defined front, unlike the defined front and back approach of Polyclitus. The *Apoxyomenos* represents a figure in motion, caught in the act of shifting its weight from one leg to the other. Lysippus had absorbed what Polyclitus had to teach him, and moved forward.

**THE FARNESE HERACLES.** Heracles was a subject of interest to Lysippus. Lysippus did a miniature sculpture of the famous Greek hero that was much copied, showing Heracles sitting on a table, somewhat drunk and looking a little flabby. His most famous Heracles-figure, however, is the "Farnese Heracles" in the Naples Museum,

so called because it was once part of the collection belonging to the Farnese family in Rome. It is a marble copy of a bronze original by Lysippus, and the copyist has signed his name: Glycon of Athens. There is reason to suspect that the copy by Glycon gave Heracles a more exaggerated physique than the original to please his Roman customers, for there is a copy of the same statue in the Louvre in Paris where Heracles' muscles are less overwhelming, though he still has the appearance of a body builder. He is shown resting after completing the last of his legendary Twelve Labors: fetching the golden apples from the Garden of the Hesperides. He leans on his club, his gaze tilted down and towards the left. He is weary; his labor has exhausted him, for he is clearly no longer a young man. His face expresses utter fatigue. His right arm is tucked behind his back, and his right hand holds the three golden apples. Like the *Apoxyomenos*, the "Farnese Heracles" prompts the viewer to circle around it, and only upon seeing the apples is it possible to comprehend the cause of Heracles' fatigue. This is a good example of three-dimensional sculpture, a style that Lysippus pioneered.

## THE HELLENISTIC PERIOD

**BACKGROUND.** The Hellenistic period spans the years from the death of Alexander the Great in 323 to 30 B.C.E., when Rome annexed the last independent Hellenistic kingdom, Egypt, which was ruled by a royal dynasty that was descended from one of Alexander's generals, Ptolemy. The year 30 B.C.E. does not mark a sharp break in the artistic tradition. Athens maintained its reputation as a center for the visual arts, but it was now only one of many. The world of the Greek artist expanded enormously. This period of artistic development was ushered in by Alexander's favorite sculptor Lysippus of Sicyon. He was not the first to portray figures in motion, but he was the first to make them fully three-dimensional. Yet there is a rational organization to their composition which Lysippus inherited from the classical age and passed on to his successors. Sculptors were fond of using a "pyramidal design," so-called because a pyramid can be drawn around the figures, enclosing them. Hardly less influential than Lysippus was Praxiteles, whose nude Aphrodite of Cnidus set the style for the female nude, a type which sculptors throughout the Hellenistic period exploited with even more flair and ingenuity than their classical predecessors had lavished on the male nude. Then about 240 B.C.E. a new style burst upon the artistic scene. The impression it conveys is almost baroque—to borrow a label that is applied to the grandly ornate art of southern Europe in the period 1550–1750 C.E. The Hellenistic "baroque" loved struggling figures in violent action, with muscles straining and bulging, and faces contorted with desperate striving or

The Capitoline Venus in the Capitoline Museum in Rome. THE ART ARCHIVE/MUSEO CAPITOLINO ROME/DAGLI ORTI.

bitter anguish. The Roman presence, however, began to exert influence. In 197 B.C.E. Rome defeated Philip V, king of Macedon, and in 167 she dethroned the last king of Macedon, Perseus. By 146, Greece had become the Roman province of Achaea. The creative fire that had informed the visual arts of the Hellenistic period began to burn low following this domination by the Romans. Late Hellenistic sculpture returned to the styles of the classical Greece of the fifth century B.C.E., perhaps an artistic expression of the yearning for Greece's heyday. From the late second century B.C.E. on, a group of sculptors known as "Neo-Attic School" specialized in producing reliefs based on classical designs. Sculptors became increasingly satisfied to recall and imitate the

past. It was safe, unadventurous art, and it was what the market wanted. The baroque style continued into the first century C.E., but it was the taste and preferences of the market that dictated style. The sculptors catered to the tastes of their patrons, who were more and more the Romans, the new masters of the Mediterranean world, and the preference of the Augustan Age (27 B.C.E.–14 C.E.) was for Neo-Attic.

**THE POPULARITY OF THE FEMALE NUDE.** Praxiteles' famous Aphrodite of Cnidus set the style for the female nude and there were many variations on the theme. The subject is always Aphrodite, goddess of love and sexual desire. One variation, by an unknown sculptor, showed her either untying her sandal or putting it on again after taking a swim. Another famous nude, the Capitoline Venus, is simply a variation of the famous Aphrodite of Cnidus by Praxiteles. It exists in more than 100 copies, of which the best is in the Capitoline Museum in Rome. It shows Aphrodite naked; there is a tall water-jug called a *loutrophoros* beside her with a towel draped over it, and so she has presumably just taken a bath. Evidently she has been surprised, for one arm tries to hide her breasts and with her other arm she shields her pudenda. In spite of the enormous popularity of this statue, both the original statue and its creator are lost. One other experiment with the female nude in a different pose became a favorite ornament of the gardens and courtyards of great Roman houses, to judge from the number of Roman copies that have survived. The sculptor of the original, Doidalsas of Bithynia, worked in the mid-third century B.C.E., and the statue for which he is known shows a naked Aphrodite washing herself. She is shown in a crouching position, glancing over her right shoulder. Many copies have turned up in the region of Naples in Italy, which was dotted with villas in the heyday of the Roman Empire.

**THE PARTIALLY-CLOTHED FEMALE NUDE.** Both Praxiteles and Lysippus have a claim to be the first to produce a partially-clothed female nude. In 1651, in France, a statue of Aphrodite, without her arms, was found in an old cistern at Arles. The "Venus of Arles," as she is known, is now in the Louvre with arms restored by order of King Louis XIV. The statue shows Aphrodite with her garment slipping down over her hips far enough to give a glimpse of her groin. Her head turns to the left in a pose similar to the Hermes of Praxiteles found at Olympia, and the creator of this copy's original may have been a work of Praxiteles, too. The claim of Lysippus is based on the Aphrodite of Capua, a Roman copy found in the ruins of the Roman amphitheater in Capua north of Naples and now in the Naples Museum. Praxiteles,

Aphrodite of Cnidus. REUNION DES MUSEES NATIONAUX/ART RESOURCE, NY.

Scopas, and Lysippus have all been suggested as the sculptor of the original, but Lysippus is the favorite. The most famous partially-clothed Aphrodite, however, is the *Venus di Milo*, now in the Louvre. It was found in 1820 on the island of Melos, one of the Cyclades archipelago, by a young French naval officer and a Greek farmer. Her arms are lost, but a hand holding an apple was found as well as the statue base, which identifies the sculptor. The first four letters of his name cannot be read with certainty, for the inscription is mutilated, but he was probably Alexandros of Antioch-on-the-Meander River in Asia Minor, to be distinguished from the more famous Antioch-on-the-Orontes River in Syria. The apple must be the "Apple of Discord" that started the legendary Trojan War. According to the myth, the goddess *Eris* (Discord) had not been invited to the wedding of Peleus and Thetis, the parents of Achilles, and avenged the slight by hurling a golden apple inscribed "For the fairest" among the guests. The goddesses Athena, Hera, and Aphrodite all claimed it, and they entreated the young Trojan prince, Paris, to judge which of them was the most beautiful and therefore the rightful owner of the apple.

Venus de Milo, statue of Aphrodite found on the island of Melos in Greece, c. 100 B.C.E. AP/WIDE WORLD PHOTOS. REPRODUCED BY PERMISSION.

Alexandros' statue portrays Paris' choice, Aphrodite, at the moment of her victory. One lost arm was outstretched and her hand held the apple, and her other hand probably held up her garment which is about to slip off her hips. There is more than a hint of suggestiveness to her pose. Yet the softness of her flesh and the subtle curves of her body have been masterfully rendered, and she is justly famous, though she is not a masterpiece of the classical period of Greek sculpture as art historians proclaimed a century ago. She was probably carved between 150 and 125 B.C.E.

**HIGH HELLENISTIC "BAROQUE."** About 240 B.C.E. sculptors began to portray figures in motion as statues radiated exuberant energy. Men portrayed in violent actions have muscles that ripple and swell. The new style was particularly conducive to the victory monuments that were erected to commemorate some military triumph. The famous Winged Victory of

Samothrace, now in the Louvre in Paris, depicts the goddess Victory at the very moment when she alights on the bow of a ship. She was found in 1863 in the Sanctuary of the Great Gods on Samothrace in the northern Aegean Sea, and she was dedicated probably between 180 and 160 B.C.E. to commemorate a naval victory. The artist sculpted the Victory in the pure white marble from the quarries on the island of Paros, but for the prow of the ship he chose grey marble from Rhodes. The wind swirls round her as she alights, filling her wings like great sails, and blowing back her cloak so that it ripples around her body in great folds. Another military victory was celebrated with the Victory Monument of Attalus of Pergamum. In the first half of the third century B.C.E., Greece was menaced by Gallic invaders, who moved into Asia Minor where they pillaged and marauded, threatening the newly founded principality of Pergamum (modern Bergama in Turkey). Pergamum at first tried to buy them off, but reversed this policy in 241 B.C.E. when Attalus I became ruler of Pergamum. He refused any more payments to the Gauls and when they attacked, defeated them soundly. After the victory he took the title of king and set up a monument to commemorate his triumph. Although the original is long gone, there are some Roman copies. One shows a Gallic warrior in the act of killing himself after his defeat. With his right arm he thrusts his sword into the base of his throat, while with his left he holds the limp body of his wife whom he has already slain. Another shows a Gaul in the throes of death. He has sunk to the ground, but still props himself up with one arm. These tall, hard-muscled Gallic warriors would not be mistaken for Greeks. The sculptors have captured a difference between their nude male bodies and typical Greek physiques. Another monument that Attalus set up to advertise his triumph showed the same taste for the exotic. It showed battles against Gauls, Giants, Amazons, and Persians. Copies of the figures show what they looked like: a Persian lies dead, a Gaul is dying, a wounded Amazon slips from her horse. Attalus had the monument placed on the Athenian Acropolis, for though Athens no longer was a great power, it was still recognized as the cultural heartland of the Greek world.

**THE GREAT ALTAR OF PERGAMUM.** The superlative masterpiece of the baroque style is the frieze on the podium of the Great Altar built at Pergamum, erected about 165 B.C.E., and now partially reconstructed in the Berlin Museum. The frieze portrays the Battle of the Gods and Giants from Greek mythology which told how the supremacy of the Olympian gods was challenged by a race of vast creatures like Tityus whose immense mass covered

Nike (Victory) of Samothrace, showing her landing on the prow of a warship, found at Samothrace, early second century B.C.E.

© PAUL ALMASY/CORBIS.

nine acres when he lay stretched out on the plain, and Enceladus whom all of Mt. Etna was needed to hold down. About one hundred over-life size figures carved in high relief are shown in violent struggle. Muscles strain and bulge, cloaks swirl, faces portray anguish. A dog bites a giant as he sinks to the ground, reminding the viewer of one of the greatest horrors of war, that the dead on the battlefield might be left unburied for dogs to devour. The central part of the west side, which the visitor would see first upon approaching the monument, shows Zeus and Athena in the thick of the fight. Zeus' cloak has slipped from his shoulder, revealing a heavily muscled torso, and on his left, Athena hurls a giant to the ground, his eyes turned heavenwards in mute appeal. The relief gives the general impression of a new, vigorous approach to sculpture, but a closer look reveals reminiscences of the classical past. The mute appeal on the face of the dying giant whom Athena kills is borrowed from Scopas. The relief on the central west side of Zeus and Athena reverses the composition used on the west pediment of the Parthenon, but the derivation is clear. The "Baroque" artists, like the other sculptors of the Hellenistic period, build upon the techniques and traditions of the classical past.

The Laocoon Group, Greek sculpture illustrating an episode from Vergil's *Aeneid*, Book II, Laocoon and his two sons wrestling with snakes. © ARALDO DE LUCA/CORBIS. REPRODUCED BY PERMISSION.

**THE LAOCOON GROUP.** The last king of Pergamum, Attalus III, willed his kingdom to Rome when he died in 133 B.C.E., and Pergamum became the Roman province of Asia, which was a notable example of Roman misrule in the following century. However, the High Hellenistic "Baroque" had another center of excellence: the island of Rhodes, where the style of the Great Altar frieze at Pergamum continued to flourish. The Laocoon Group, now in the Vatican Museum, dates from the early first century C.E. and is a good example of late Rhodian work. It is narrative art, and the story that it relates comes from Vergil's poem, the *Aeneid*, the national epic of the Roman Empire which described how the city of Troy supposedly fell to the Greeks. In the story, the siege of Troy by the Greeks had lasted ten long years, and, unable to penetrate the city walls, the Greeks devised a scheme to trick the Trojans into letting them into the city. They constructed a large wooden horse and hid a group of Greek warriors in its belly. They then left it at the city gates, supposedly as an offering to the gods, and pretended to depart, as if they had given up the siege. The Trojans, thinking that the siege was over at last, decided to bring the horse within the city walls as part of a celebration. The Trojan priest Laocoon was the lone voice

of warning against bringing the horse into the city, rightly fearing that it was a trap set by the Greeks to gain access to Troy. As Laocoon made his case to his fellow Trojans, however, two great serpents emerged from the sea and wound their coils around him and his two sons. The Trojans took Laocoon's horrible death as a token of divine anger, and decided to bring the horse into their city, thus sealing their doom. The statue group shows Laocoon and his sons struggling in vain against the serpents, one of which sinks its fangs into Laocoon's thigh. Laocoon's face expresses anguish and despair. He is losing the struggle and he knows it. One of his sons is already dead; the other is still fighting to disentangle himself. The coils of the serpents bind the three figures together into an artistic whole. The statue group was found above the ruins of the Golden House of Nero in 1506, and among the spectators who witnessed the excavation was the great Michelangelo. Unfortunately we cannot be certain that this statue group is an original rather than a copy. According to the Roman historian Pliny the Elder who described this statue, the original was made by three Rhodian sculptors—Hagesandrus, Polydorus, and Athanadorus—from a single block of marble whereas the existing Laocoon is made of seven or eight pieces fitted together. That would seem to indicate that the “Laocoon Group” in the Vatican Museum is a copy, but Pliny is not infallible, and whether it is a copy or not, it is a masterpiece of the baroque style.

**THE SCULPTURES FROM SPERLONGA.** In 1957, at Sperlonga on the west coast of Italy some sixty miles south of Rome, a cave was found that once belonged to a villa of the emperor Tiberius (14–37 C.E.). What was remarkable about the cave were the statues found there. An inscription was found that gives the names of the sculptors: Hagesandrus, Polydorus, and Athanadorus—the Rhodian sculptors who carved the Laocoon group. The find dates these sculptors firmly in the early first century C.E.; they had previously been dated at least a century earlier. The sculptures show incidents from Homer's *Odyssey*; one group shows the blinding of the Cyclops Polyphemus, another shows the monster Scylla attacking Odysseus' ship. This is theatrical sculpture in the best traditions of High Hellenistic Baroque. The face of Odysseus bears an expression of apprehension mixed with resolve; as a portrayal of feeling it is comparable to Laocoon's face and is utterly different from the calm, unemotional expressions found in the classical sculpture of the fifth century B.C.E. The creative fire of the Hellenistic artistic tradition may have been burning low by the first century C.E., but the finds at Sperlonga show that it could still produce a masterpiece.

**THE LATE HELLENISTIC PERIOD: A RETURN TO ATTIC STYLE.** By the second half of the second century B.C.E., it was clear that there was no hope for Greek independence. In 146 B.C.E., Greece became the Roman province of Achaea. In 133 B.C.E., Pergamum fell under Roman rule. Huge numbers of Greek works of art were taken as spoils of war to Rome, and along with Greece's subjection to Roman rule there seems to be a decline in artistic creativity. Rome provided a market for copies of Greek masterpieces that adorned the houses and country villas of the wealthy classes, and sculptors honed their skills by making replicas. Many Greek sculptors went to Rome to find work, making it increasingly hard to disentangle Greek from Roman sculpture. The lack of development is not due altogether to a failure of inspiration, but rather to the fact that Greek artists, who now saw their world subject to a foreign empire, salvaged their pride by looking backwards to the heyday of Greece. The same feeling can also be detected in the Greek literature of the period. It is these classicizing Greek masters of the Late Hellenistic period who provide the artistic vocabulary for the Rome of the emperor Augustus.

**THE “NEO-ATTIC” IDIOM.** The hallmark of this Late Hellenistic style known as “Neo-Attic” is its recycling of the idioms of the classical period—the century when Athens dominated the artistic world of Greece. It was the poses, the modeling, and the features of Attic (that is, Athenian, for Attica was the territory of Athens) sculpture that made up these idioms. The *Venus di Milo* is a successful example of Neo-Attic style. No single part of her is original, but the sculptor Alexandros combined his various borrowings into a harmonious whole. Much less successful is a statue group of Orestes and Electra that apparently once adorned the Roman meat market in Pozzuoli, ancient Puteoli on the western outskirts of Naples. Orestes is a standard male nude of the fourth century B.C.E., and his sister Electra, standing beside him with an arm over his shoulder, is a standard clothed female figure with transparent drapery of the last quarter of the fifth century B.C.E. It is an uninspired work, which shows how perfunctory “Neo-Attic” style could become when art was treated as mere decoration.

## ROMAN SCULPTURE

**THE ETRUSCAN INFLUENCE.** Roman sculpture has its roots in Etruria, an ancient country north of Rome. According to tradition, the Etruscans were immigrants from Asia Minor who migrated to Italy, perhaps during the general meltdown at the end of the Bronze Age, in the years following 1200 B.C.E. Once they arrived, they established themselves as a ruling class that exploited the resources of one of the richest regions of Italy. Etruria was an important export market for Greek vases, and Greek artisans worked in its cities for Etruscan patrons. One such colony of Greek craftsmen existed in Caere (modern Cerveteri, north of Rome), where there is still a large Etruscan necropolis. The paintings in the Etruscan underground tombs at Tarquinia were probably done by Greek artisans, though the taste is Etruscan. Rome's last three kings were Etruscan; the last of them, Tarquin the Proud, who was expelled in 510 B.C.E., built a great temple for the triad of gods, Jupiter, Minerva, and Juno on the Capitoline Hill in Etruscan style. As a model for all future Roman temples, it stood on a raised podium and was decorated with painted terracotta moldings. The cult statue of Jupiter was made of terracotta by an Etruscan sculptor from Veii named Vulca. A surviving terracotta statue from the school of Vulca was found in the ruins of Veii and now stands in the Villa Giulia museum in Rome. The so-called Apollo of Veii originally looked down from the ridgepole of an Etruscan temple. It has the "archaic smile" of the Greek *kouroi* (nude male statues), but it has little of the quiet serenity of archaic Greek sculpture.

**EARLY SCULPTURE IN ROME.** Etruscan influence continued in Rome after the Etruscan kings were driven

The Apollo of Veii, the head shown in profile of this terracotta Etruscan statue found at Veii. © ARALDO DE LUCA/CORBIS. REPRODUCED BY PERMISSION.

out, and Etruscan sculptors continued to work there. One monument that survived from this early period is a bronze she-wolf of about 500 B.C.E. In the Renaissance period, two infants were added, suckling her teats. The addition clearly identified this wolf with the legendary wolf that suckled Rome's legendary founders, Romulus and Remus, as infants, but it is not clear whether the original statue should be connected with the legend or not. The Etruscan influence on Rome faded, however, as Rome's conquests brought Greece into the empire. A turning point came in 211 B.C.E. while Rome was fighting a desperate war with the Carthaginians who were led by a general of genius, Hannibal. That year the city of Syracuse, which had sided with the Carthaginians, fell to Marcellus, the proconsul commanding the Roman army that was operating in Sicily. Syracuse was a great Greek city filled with works of art, and a share of the art travelled back to Rome as spoils of war. They made a strong impression on the Roman elite, who clamored for more Greek art. In the second century B.C.E., when Rome conquered Greece, there was ample opportunity for more looting. In 146 B.C.E. Rome destroyed Corinth, and the commander, Lucius Mummius, sent shiploads of art works to Rome, saying as he did so that if these cargoes were lost at sea, there were more where they came

from. Yet the number of masterpieces was limited, and so a flourishing industry arose in Greece of copying sculptures in marble for the Roman market. The skill of the copyists varied, and though the sculptors knew how to make exact replicas, it is clear that they sometimes varied the originals. Yet without these Roman copies modern understanding of Greek sculpture would be greatly diminished.

**AUGUSTAN CLASSICISM.** The emperor Augustus (r. 27 B.C.E.–14 C.E.), the heir of Julius Caesar, made himself master of the Roman world only after a hard-fought civil war. First he had to suppress Caesar’s assassins, Brutus and Cassius, who had mustered armies in the east. He destroyed them in a battle fought in 42 B.C.E. at Philippi in northern Greece. Then he had to suppress a more dangerous rival, Mark Antony, defeating him at the Battle of Actium in 31 B.C.E. After finally achieving peace, Augustus was determined to give the empire a capital worthy of its position as mistress of the Mediterranean world. He turned to the art of classical Greece to accomplish this goal. His artists revived the *Canon* of Polyclitus, a classical treatise on the proper proportions

for sculpture, in creating statues of Augustus. Indeed, a comparison between the so-called “Prima Porta” statue of Augustus, found at the villa of his wife Livia a short distance north of Rome, with the *Doryphoros* (Spear-bearer) of Polyclitus reveals some startling similarities. The statues have the same tilt of the head, and the same treatment of the hair. While Augustus has some individual features, such as his high cheekbones and the hint of resolution to his brow, his physique adheres to the proportions which Polyclitus set forth in his *Canon*. The statue is a copy of an original statue of the emperor conceived about 27 B.C.E., the year that the senate conferred on him the title “Augustus,” meaning “the revered one.” The statue of Caesar Augustus is an idealized version of the man as a celebration of his new title. Augustus harnessed the art of Greece for his political purposes. The aesthetic value of the “Prima Porta” Augustus cannot have greatly interested the sculptor who carved it or Augustus’ wife Livia, who was probably the person that commissioned it, for its rear is only roughly finished. Af-

ter all, no one could see it, for the statue was intended to stand against a wall.

**THE ALTAR OF PEACE.** In 9 B.C.E., the Roman senate dedicated the *Ara Pacis* (Altar of Peace) on the *Campus Martius* (Field of Mars) in Rome to commemorate the safe return of Caesar Augustus from his campaigns in Gaul and Spain. It was a modest monument, reproducing the proportions of the Altar of the Twelve Gods which stood in the marketplace of Athens. It was adorned with reliefs, which are the most important features that survive of Augustan sculpture. Some of the reliefs portray the sacrifice that took place at the ceremony of dedication on 30 January 9 B.C.E. The panels on the north and south of the altar show a procession of the imperial family and court; the portraits are sufficiently realistic that most can be identified. On the east and west sides there are panels representing mythological scenes. One shows Aeneas, whom Augustus claimed as an ancestor, making sacrifice. But the most arresting of all is a panel on the outside of the altar enclosure that shows a goddess holding two infants. Various fruits are on her lap, and a child offers her one in his small hand. At her feet a cow rests, and a sheep grazes. The identity of the goddess is unknown. Some scholars believe her to represent

“Peace,” while others claim she is “Mother Earth,” or perhaps Venus, the mother of Aeneas and hence the progenitor of the Julian family. Whatever her identity, she adheres to the artistic traditions of classical Greece. Her *stola*, the proper dress of a Roman matron, clings to her body, revealing her breasts and even her navel underneath. It reproduces the transparent drapery of Greek sculpture of the 420s B.C.E., such as the Flying Victory of Painonius of Mende, except that in the *Ara Pacis* relief there is no wind. Yet the message is clear enough. The goddess, whoever she is, is bringing the fruits of peace, and of law and order, to the Roman Empire. This, proclaims the relief, was the achievement of Caesar Augustus.

**HISTORICAL RELIEFS.** In one category of relief sculpture, the Romans could claim a degree of originality: the relief that narrated an historical event. The Arch of Titus in the Roman Forum commemorates the suppression of the revolt in Judaea that broke out in 66 C.E. Titus, who took over command of the Roman forces in Judaea from his father Vespasian, captured Jerusalem and then returned to Rome with his spoils to celebrate a Roman Triumph. In the triumphal ceremony, the victorious general paraded his captives and his spoils

through the streets of Rome, through the Roman Forum along the “Sacred Way” and up to the temple of Jupiter on the Capitoline Hill where he laid down his command. Inside the arch there are two great panels which portray the triumph: one shows the exhibition of the spoils, which include the seven-branched candlestick from the Temple in Jerusalem, and the other shows Titus himself in his triumphal chariot. There are two other great monuments in Rome that use continuous narration: the columns of Trajan and of Marcus Aurelius. Trajan, emperor from 98–117 C.E., added Dacia (modern Rumania) to the empire, and his column shows the campaigns that he waged to conquer Dacia. The story unfolds in a spiral scroll that runs from the bottom to the top of the column, where there perched a statue of the emperor himself. The episodes run into each other without obvious breaks. The column of Marcus Aurelius (161–180 C.E.) takes its inspiration from the column of Trajan. The “continuous narrative” frieze spirals up the column, but there is less attention to the factual recording of details. The nature of Marcus Aurelius’ campaigns may account for the difference. Trajan’s military operations resulted in an addition to the empire, whereas Mar-

cus Aurelius was fighting to hold back barbarian attacks across the Roman frontier. The emphasis of his relief sculpture is more on the hardships and cruelty of war.

**THE APPEARANCE OF THE FRONTAL POSE.** In the third century C.E., the frontal pose appeared in sculpture as a way of emphasizing the isolation of the emperor. Frontal poses were borrowed from Middle Eastern art; the first examples that we have come from the site of Dura-Europus on the Euphrates River, which was destroyed and abandoned in 257 C.E. Naturalism in sculpture was in full retreat in the third century, and the tendency became more marked in the fourth century. The base of an Egyptian obelisk erected by the emperor Theodosius I (379–395 C.E.) in the Hippodrome at Constantinople is a dramatic illustration of the portrayal of the emperor in the art of late antiquity. Theodosius and the imperial family sit in the imperial loge in the Hippodrome. On either side are senators and court officials. All face the onlooker. Below the imperial loge are various barbarians, recognizable by their dress. They kneel and offer tribute. Even as the empire was growing more ramshackle, the message of Roman sculpture in-

sisted that the emperor was the fount of Roman peace and prosperity.

## GREEK PAINTING

**WALL PAINTING IN THE MINOAN PERIOD.** Greek wall painting has its roots in the prehistoric civilization on the island of Crete during what is known as the Minoan Period. The excavations of Sir Arthur Evans at Knossos on Crete at the start of the twentieth century revealed not only a great, sprawling palace, but they also turned up fragments of wall paintings. Reconstructing them was a painstaking process, but the results can be seen in the Heraklion Museum on Crete. The most impressive of the murals that Evans found was one that showed toreadors leaping over the back of a charging bull. Since then, fragments of frescos have been found at other sites on Crete and some of the Cyclades Islands as well. Also in the early 1900s, a house belonging to a Minoan settler was uncovered on the island of Melos, and among the finds was a naturalistic painting of flying fish. In the 1980s, Austrian archaeologists discovered a palatial complex at Tell el-Daba (ancient Avaris in Egypt), which was the capital of the Hyksos who invaded Egypt in the period between the Middle and the New Kingdom and were driven out by the founder of

"Man Carrying a Vessel in a Procession," Minoan wall painting, c. 1400 B.C.E. © WOLFGANG KAEHLER/CORBIS. REPRODUCED BY PERMISSION.

the New Kingdom, the pharaoh Ahmose. In it were fragments of Minoan mural paintings, including one showing bull-leapers against a background that shows a maze. The most startling finds, however, have emerged since 1967 from Akrotiri on the island of Thera, where a Minoan town was buried by the eruption of the Thera volcano that preserved houses to their second and even their third story. The eruption is dated by scientists to 1628 B.C.E., for it must have spewed enough ash and pumice into the atmosphere to block the rays of the sun, producing abnormally low temperatures for a year or two. By examining tree rings for signs of retarded growth and ice cores from Greenland for layers of peak acidity, the date can be pinpointed with a degree of confidence, even though the pottery found at Akrotiri would indicate a date about a generation later. Akrotiri produced the earliest surviving Minoan paintings, as well as those that are best preserved.

**THREE CLASSES OF MINOAN MURALS.** Minoan wall paintings—known also as frescoes—fall into three major classes, yet due to their often overlapping styles, it is often difficult to establish any direct line of development between the classes. The first class deals with the world of nature. These frescoes show flowers and other plants, animals, birds, and sea creatures. Human figures are usually not present. The second class shows human figures of both men and women, on a large scale. Female figures seem to predominate, and they are dressed in the fashions of the Knossos court, but it is not always clear whether they are priestesses or ordinary women dressed for a festival. The third group is the miniature frescoes that feature small human figures in a landscape or architectural setting. Assigning dates to these frescoes is not easy, and without dates it is hard to trace any development. Obviously the paintings found at Akrotiri must date before the eruption of the volcano that buried the Minoan town, but elsewhere dates are much less approximate. The famous fresco showing a life-size charging bull and toreadors is part

of a stucco relief of charging bulls from the north entrance of the palace at Knossos and is assumed to have been created relatively late in the Minoan period. Yet it is a thoroughly Minoan painting belonging to the second class, even if it belongs to the years shortly before the palace was taken over by Greek-speaking invaders from the Greek mainland.

**THE PAINTINGS FROM AKROTIRI.** The finds at Akrotiri have added immensely to modern knowledge of Minoan painting. Not only are the paintings well preserved, but they are securely dated before the eruption of the Thera volcano, during the New Palace period on Crete. There are examples of all three classes of painting. The world of nature is represented by a mural in a house labelled the “House of the Ladies” which shows papyrus plants. Since papyrus does not grow on Thera or Crete, the presence of the plant in Minoan art indicates Egyptian influence. A fresco from a shrine portraying a garden with stylized rocks and naturalistic lilies is another example. The second class is represented by a mural of two boys boxing, and another of a naked

fisherman holding his catch of fish in both his hands. The Miniature Style is represented by a remarkable fresco of a ship from the so-called “West House” at Akrotiri. It is a frieze about 43 centimeters (seventeen inches) high running around the top of at least three walls of a room. It shows a flotilla of ships being paddled between two ports. It seems to be an example of narrative art, perhaps of a naval campaign, but it is impossible to know for sure.

**MYCENAEAN PAINTING.** On mainland Greece the Mycenaean civilization, a Greek-speaking peoples, flourished between 1600 and 1200 B.C.E. Mycenaean wall painting is a continuation of Minoan painting, but it is not easy to attach dates to the surviving evidence. Recent excavations at Thebes in central Greece, the city of the legendary King Oedipus, have revealed remains of two successive palaces, and in the earlier of the two, archaeologists found fragments of a fresco showing a procession of women dated to the fourteenth century B.C.E. At Mycenae, houses outside the citadel walls yielded fragments of frescoes that might be dated equally early. But nothing on the mainland is as early as the frescoes found on the island of Thera. Most of what has been found dates to the last century of the Mycenaean civilization.

**FAVORITE SUBJECTS.** A procession of women, life-sized and wearing the typical Minoan dress consisting of a tight bodice, bare breasts, and flounced skirt, is one of the most common themes of Mycenaean murals. Each woman bears an offering, and they move from left to right, making their way probably towards a goddess. There are also battle scenes; at Pylos there were enigmatic battle scenes showing duels between Mycenaeans equipped with short swords, daggers, and helmets made from the tusks of boars, and adversaries wearing animal skins knotted over the shoulder. A painted mural at Mycenae showing scenes of battle ran around the four walls of the main room of the Mycenaean palace, the “megaron,” with a hearth in the middle. There were also hunting scenes, including one of a boar hunt from the palace at Tiryns, where the boar is portrayed running in a flying gallop, pursued by hunting dogs that leap on his back. A shield fresco showing figure-eight shields was found at Tiryns, better preserved than the similar figure-eight shield fresco found at Knossos by Sir Arthur Evans. On the whole, the subjects of the paintings seem to reflect a more martial society than on Crete; hunt-scenes and battle-scenes were apparently more attractive. Other murals do indicate the presence of varied interests, however. The Throne Room in the palace at Pylos had a mural of a black man playing a lyre. From a house at Mycenae built after 1400 B.C.E. outside the citadel,

*a PRIMARY SOURCE document***THE "PAINTED STOA" IN ATHENS**

**INTRODUCTION:** The "Painted Stoa" was a colonnade on the south side of the Athenian marketplace which got its name because it displayed on its back wall four paintings, one of the Battle of Oenoë by an unknown artist, and the others by Polygnotus, Micon, and Panainus. The pictures were not painted directly on the wall, but on wooden panels affixed to it, which could be removed. Pausanias, the Greek traveler of the second century C.E., visited Athens and left the following description of them.

---

**SOURCE:** Pausanias, *Pausanias*, Book I, 15, 1, in *The Art of Greece, 1400-31 B.C.: Sources and Documents*. Ed. J. J. Pollitt (Englewood Cliffs, N.J.: Prentice-Hall, 1965): 108.

fresco fragments depict toreadors and bulls. This fresco may have been painted by a Minoan artist who had emigrated from Crete to mainland Greece, and it does not prove that bull-leaping was a sport that was popular in the Mycenaean world, though it does indicate some interest in it. When the Mycenaean palaces fell at the start of the Greek Dark Ages in 1100 B.C.E., the art of fresco painting perished with them.

**THE REVIVAL OF GREEK PAINTING.** Painting revived in the early archaic period of Greece, but except for vase painting the evidence is mostly literary. Only one well-preserved example of painting dating earlier than 600 B.C.E. survived: a terracotta plaque from a temple at Thermon in north-west Greece which portrays the hero Perseus fleeing with the head of the Gorgon, Medusa, under his arm. The Etruscan tomb paintings found in Italy seem to have been done by Greeks for Etruscan customers, however; they are therefore the products of Greek journeymen who traveled to Etruria (modern Tuscany north of Rome) to find work as early as the start of the sixth century B.C.E. A painted wooden votive plaque has been discovered in Greece, at Pitsa near

Corinth, which dates about 530 B.C.E. It shows a family making sacrifice. A man is apparently pouring wine on the altar, and a boy wearing a garland has brought up a sheep to be sacrificed, while two flautists and a lyre-player supply music and two women look on, holding laurel branches in their hands. It is a colorful composition, rather like the polychrome vases which Corinthian potters were producing at the time. The next evidence dates to about 470 B.C.E.: a painted tomb from Poseidonia, a Greek colony in Italy south of Naples, now known as Paestum. It is a small tomb with paintings of banqueters reclining on couches along the sides of the interior, and on the ceiling a picture of a youth diving from a high scaffolding. The painting was not meant for public viewing and it is impossible to interpret its message. In the history of the visual arts, it is important because Greek painting on media other than pottery is exceedingly rare.

**THE GREAT PAINTERS: POLYGNOTUS AND MICON.** For the works of the great Greek painters, modern scholarship must rely on descriptions from ancient authors. The painter who introduced portrayals of per-

sons in three-quarters view was Cimon from Cleonae, which is between Corinth and Argos in Greece. Polygnotus of Thasos, who was brought to Athens by the Athenian general and statesman Cimon who dominated Athenian political life in the late 470s and 460s B.C.E., introduced more innovations. He was the first to paint faces with the mouth open, showing the teeth, and the first to paint women with transparent drapery. He lived in the period when painters were discovering the laws of perspective. The tradition is that painted scenery for productions in the theater was invented by the tragic poet Sophocles, but his older rival Aeschylus was the first to have scenery that had perspective, developed by the painter Agatharchus. Other painters of the period were Micon, who collaborated with Polygnotus, and Panainos, the brother of the great sculptor Phidias. There was one monument where all three of them collaborated: the *Stoa Poikile* (The Painted Colonnade) on the south side of the Athenian marketplace, where the philosopher Zeno, founder of the Stoic School of philosophy, would give his lectures years later. There were four painted panels in the stoa affixed to the back wall. One depicted the Battle of Oenoë between the Athenians and the Spartans that was evidently an important battle although historians are uncertain what it was or why it took place. Another was a painting from mythology showing a battle between the Athenians and the Amazons, warrior women who attacked Athens and were defeated by King Theseus. A third showed a scene from the legendary Trojan War in which the Greek leaders are meeting to decide how to punish Ajax the Less for his rape of the priestess Cassandra. Finally a fourth painting evidently shows a sequence of actions related to the Battle of Marathon where the Athenians defeated the Persians: first the struggle itself, then the flight of the Persians, and finally the Persians trying to embark on their ships to leave. Panainos painted the Battle of Marathon with Micon's collaboration; Micon painted the battle of the Athenians and the Amazons; and Polygnotus' contribution was the painting of the Judgement of Ajax. The greatest masterpiece of Polygnotus, however, was found at Delphi in the *Lesche* or club house of the Cnidiads. One part of it depicted the sack of Troy, and another part the descent of the hero Odysseus into the Underworld. We have a detailed description of it by Pausanias, the Greek traveler of the second century C.E. who toured Greece and wrote a guidebook describing what he saw.

**THE SUCCESSORS OF POLYGNOTUS.** The balancing of light and shade—what modern artists call *chiaroscuro*—was pioneered by a little-known artist Apollodorus of Athens in the late fourth century B.C.E., but the artist who exploited it was Zeuxis in the early third

*a PRIMARY SOURCE document*

### THE BEGINNINGS OF PERSPECTIVE

**INTRODUCTION:** When a modern artist wants to paint in perspective, he draws a horizon line and on the horizon he makes a vanishing point. Then lines that are parallel in real life are drawn so that they intersect at the vanishing point. Greek painters seem first to have discovered the need for something like a vanishing point when they produced painted scenery for theatrical productions. A casual reference in a treatise on architecture and engineering by Vitruvius Pollio, a Roman architect and engineer who worked under the emperor Augustus (27 B.C.E.–14 C.E.), indicates that the first painter to try to show depth by making lines converge on a central point was a craftsman named Agatharcus who produced scenery for the tragedies of Aeschylus (525–456 B.C.E.) in Athens. Democritus and Anaxagoras, who wrote treatises that are lost on perspective, were both philosophers in the fifth century B.C.E.

First there was Agatharcus in Athens who painted scenery for Aeschylus who was producing a tragedy, and wrote a commentary about it. This resulted in Democritus and Anaxagoras writing on the same subject and showing how, once a central point is drawn in a definite location, the sight lines should have a natural relation to the central point and the spread of the visual rays from it, so that painted scenery can portray, by this sleight of hand, a faithful representation of how buildings appear, and though everything is drawn on a vertical flat plane, some parts look as if they have withdrawn into the background and other parts to be positioned in the foreground.

**SOURCE:** Vitruvius, *The Ten Books on Architecture*. Trans. Morris Hicky Morgan (New York: Dover, 1960): 198. Text modified by James Allan Evans.

century B.C.E., who was famous for his illusionist effects. One of his paintings was *The Centaur Family* which shows a female centaur stretched out on the grass, suckling her two infant centaurs, while the male centaur, who is portrayed as a shaggy beast, leans over them laughing. Zeuxis' contemporary, Parrhasius of Ephesus, took a different approach. He was a careful draftsman, the acknowledged master of contour line. He is best known for his picture of Theseus that adorned the Capitol in Rome years after his death. His other works, besides the obscene subjects with which he supposedly amused

An underground Macedonian tomb from Vergina in Greece, identified as Aegae, the ancient capital of Macedon where the Macedonian kings were buried. COURTESY OF JAMES ALLAN EVANS.

himself in his leisure time, are chiefly mythological groups. A picture of the Demos, the personified People of Athens, is among his most famous of these works. In the fourth century B.C.E. Pausias of Sicyon, who was known for the garlands of flowers that he introduced into his murals, also became famous as a master of paintings in the encaustic technique, mixing his pigments in hot wax and applying the wax with a small spatula. He learned the technique from Pamphilus of Sicyon, who was also the teacher of the great Apelles, the favorite painter of Alexander the Great. With Apelles, Greek painting evidently reached its height in the late fourth century B.C.E. One painting of his was particularly famous: it showed the birth of the goddess Aphrodite, rising from the foam of the sea. A similar painting discovered on the wall of a house in Pompeii may have been an attempt to copy Apelles' masterpiece, or at the very least had its inspiration in Apelles' work. Unfortunately, the journeyman wall painter who made the mural did not do a good job.

**MACEDONIAN TOMBS.** The masterpieces of Greek painting are lost, though sometimes archaeologists un-

cover bits of evidence that intrigue the imagination. Macedon, an ancient country in northern Greece, has yielded a number of underground tombs from the fourth and third centuries B.C.E. at various sites, the most famous of which are the royal tombs at Vergina, the ancient capital of Macedon. There a tomb has been identified, rightly or wrongly, as the burial place of Philip II of Macedon, father of Alexander the Great. In one, dating probably to the third century B.C.E. garlands and floral designs are reminiscent of the work of Pausias. Pausias' own works are lost but his influence may be reflected in these tombs.

## ROMAN PAINTING

**THE DESTRUCTION OF POMPEII.** On 24 August 79 C.E., the volcano of Mt. Vesuvius, which was thought to be extinct, reawakened and blew up, spewing a mushroom-shaped cloud into the air to the amazement and terror of the onlookers. The eruption would claim the life of Pliny the Elder who is one of the major sources for information about Greek and Roman art. When the eruption was over, the cities of Pompeii, Herculaneum, Stabiae, and Oplontis had been sealed in ash and lava. Pompeii and Stabiae were covered in easily removable ash and pumice, but Herculaneum, directly beneath the volcano, was covered with mud and lava that hardened as it cooled, making it impossible to remove without pick-axes and pneumatic drills. While the eruption was a terrible tragedy in the ancient world, it was a boon for modern art historians, for the lava preserved the wall decorations of the houses and the mosaics on their floors for modern excavators to discover. While wall-paintings from other sites are only isolated finds, the art from Pompeii and Herculaneum show the changes in Roman taste over three centuries. Even

though Pompeii, a town of some twenty thousand inhabitants, was already past the peak of its prosperity when it was buried under the ash from Mt. Vesuvius, and so did not attract the Roman Empire's best painters, its houses present a vivid record of changing fashions. Towards the end of the nineteenth century, the German scholar August Mau divided the wall paintings of Pompeii into four styles: first, second, third, and fourth, in chronological order. Fourth style was in vogue when the eruption of Mt. Vesuvius abruptly ended the life of the little city.

**FIRST STYLE.** First Style tried to produce in painted stucco the appearance of a wall covered with panels of marble or with blocks of masonry, for which reason it is also sometimes called "Masonry Style." The largest house in Pompeii, the House of the Dancing Faun, which was built in the second century B.C.E., had first-style wall decoration: plaster that faked marble panels, all painted a bright red. Herculaneum has a well-preserved example of this style in a house built in the late second century B.C.E.: the so-called "Samnite House." The plaster is shaped into panels which were painted using the *al fresco* technique in which the pigment is applied to the plaster while it is still damp. The inspiration for the style is the marble-paneled walls in the Hellenistic palaces and public buildings in royal capitals such as Alexandria and Antioch. First Style counterfeits the marble panels in plaster, and since the painter had more colors at his command than did the marble-cutter, the effect of First Style could be more garish than the real thing, an example of which can still be seen in the Pantheon in Rome where the marble panels on the wall are still in place.

**SECOND STYLE.** Second Style came into fashion after 80 B.C.E. though it never pushed First Style completely aside. Second-style painting was illusionist, meaning it tried to create the illusion that the spectator was looking beyond the confines of the wall to a world outside it of gardens and fantastic architecture. One splendid example was found in the villa of Livia, the wife of the emperor Augustus, at Prima Porta just north of Rome. There a vaulted, partly underground room was painted on all sides with a panorama of a garden, complete with trees bearing fruit and birds. With this illusion the walls of the room no longer confine the space. The artist suggests depth to his painting by a kind of atmospheric perspective: the trees and plants in the foreground are painted precisely but as objects recede into the distance, they become increasingly blurred. If the artist working in Second Style wanted to open up the wall and show landscapes beyond it receding into the distance, he had to use perspective to give depth to his

*a PRIMARY SOURCE document***VITRUVIUS ON CONTEMPORARY ROMAN WALL PAINTING**

**INTRODUCTION:** Vitruvius, who wrote a treatise of ten books on architecture in the latter part of the reign of the emperor Augustus (27 B.C.E.–14 C.E.) has some derogatory remarks to make about the wall-painting fashion of his own day, which, from his description, was Third Style. In the passage quoted below, he begins with a reference to First Style or “Masonry Style,” and then progresses to Second Style, which, as he reports, took some of its inspiration from the scenery in theatrical productions. He approves of paintings taken from mythology, and many examples of these have been found in Pompeii. Two of the best examples, however, come not from Pompeii but from a house excavated on the Esquiline Hill, one of the Seven Hills of Rome. It shows landscape scenes taken from Homer’s *Odyssey*, copied, like most such wall paintings, from lost masterpieces. The originals of the wall paintings from the Esquiline would have dated to about 150 B.C.E. Note that Vitruvius, whose language was Latin, refers to Odysseus by his Latin name, “Ulysses.”

The ancients, who introduced well-finished wall surfaces, began by representing different varieties of marble slabs in different positions, and then cornices and blocks of yellow ochre arranged in various ways. Afterwards they made such progress as to represent the forms of buildings, and of columns, and projecting and overhanging pediments; in their open rooms, such as *exedrae*, (rooms or outdoor conversation areas) on account of their size, they depicted the façades of scenes in the tragic, comic, and satyric style; and their walks, on account of the great

length, they decorated with various landscapes, copying the characteristics of particular locations. In these paintings, they show harbors, promontories, seashores, rivers, fountains, straits, temples, groves of trees, mountains, flocks and shepherds. In some places there are also pictures designed in the grand style, with representations of gods or episodes from myths portrayed in detail, or the battles at Troy, or the wanderings of Ulysses, with landscape backgrounds, and other subjects reproduced on similar principles from real life.

But those subjects which were copied from real life that exists around us are scorned in these modern days of bad taste. We have now fresco paintings of monstrosities rather than truthful paintings of tangible things. For instance, reeds are put in the place of columns, fluted accessories with curled leaves and volutes instead of pediments, candelabra supporting representations of shrines, and on top of their pediments numerous tender stalks and volutes growing up from the roots and having human figures seated on them without rhyme nor reason. Sometimes there are stalks with only half-length figures, some have human heads, others the heads of animals.

Such things do not exist and cannot exist, and never have existed. Thus this is the new taste that has caused bad judges of substandard art to prevail over true artistic excellence.

**SOURCE:** Vitruvius, “The Decadence of Fresco Painting,” in *The Ten Books of Architecture*. Trans. Morris Hicky Morgan (New York: Dover, 1969): 210–211. Text modified by James Allan Evans.

painting. Greek scenery designers for the theater had been the first to use perspective in the first half of the fifth century B.C.E., and its general rules were well known. A fine example of Second Style was found in the villa of Publius Fannius Synistor, otherwise unknown, at Boscoreale near Pompeii which dates to the middle of the first century B.C.E. The frescoes were removed from the walls and taken to the Metropolitan Museum in New York shortly after the villa was discovered, and they are part of a reconstructed *cubiculum*, or Roman bedroom, there. The wall paintings create the illusion that the onlooker can walk through the bedroom walls into a cityscape with porticoes, arches, and temples; one view shows a charming *tempietto*, a small, round shrine which seems to be set in a courtyard surrounded by porticos. Roman taste changed a few years after the villa of Publius Fannius Synistor, as evidenced

by the construction of another villa belonging to Agrippa Postumus which was decorated in Third Style about 10 B.C.E.

**THE ELEGANT THIRD STYLE.** As the landscapes of Second Style went out of fashion, they were replaced by mural designs that emphasized the wall instead of dissolving it into a vista beyond. The artist painted his wall in a solid, dark color such as black, and instead of the architectural elements of Second Style, he framed his space with thin, spidery columns holding up insubstantial canopies—architectural forms that never existed in real life. In the middle of his space he composed a picture enclosed within a frame, like a painting hanging on a wall. Or he sometimes substituted a motif borrowed from Egyptian art. Third Style was elegant and exquisite, but it was also oppressive.

**FOURTH STYLE.** Illusionism returned with the Fourth Style, which became popular in Pompeii about 62 C.E., when Pompeii was shaken by an earthquake and houses needing their damaged wall paintings restored no doubt opted for the latest style. The emperor Nero, who was building his *Domus Aurea* (Golden House) in the heart of Rome following the devastation of a great fire that broke out in the summer of 64 C.E., used Fourth Style to decorate the rooms of his extravagant new villa. Walls were painted a creamy white with landscapes appearing as framed pictures in the center of a large subdivision of the white wall. There are also architectural vistas, but they are dream cityscapes: columned facades, sometimes fragments of buildings, none of them belonging to the world of reality. The painters of these architectural follies may have been influenced by the painted scenery that they saw in contemporary theater. Some of the framed paintings show scenes from mythology: one, from Pompeii, now in the Naples Museum, shows Aeneas, wounded in one leg, being tended by Iapyx, master of the healing art, while Venus appears in the background, bringing with her a medicinal herb. The scene comes from the final book of Vergil's epic, the *Aeneid*, and it is evidence that the Romans had illustrated books containing such pictures. The *codex*, or bound book, would not appear until the second century C.E., but the picture of the wounded Aeneas from Pompeii is the sort of illustration that might have been found on a parchment scroll containing the last book of the *Aeneid*.

**THE AFTERMATH.** Campania, the region of Italy around Naples which includes the cities destroyed by the eruption of Mt. Vesuvius, has no examples of wall paintings after 79 C.E. The murals after that date which have survived come from Rome or the imperial provinces, and they show less taste for fantastic ornamentation and an increase in simpler, more realistic designs, done on white, red, or yellow backgrounds. In the Roman province of Britain, a town house of the second century C.E. found at Verulamium (modern St. Albans) yields evidence of a mural with painted panels with two candelabra on a red background, and in the center, a blue dove on a perch. On the ceiling, there were ears of wheat painted in a lattice-work design on a purple background. The third century C.E. had a penchant for scenes on a large scale, most of them illustrations of ancient myths. The third century was a period when the Roman Empire seemed on the verge of disintegration, and yet it was also a time when there were new departures in artistic taste. In the eastern provinces, the retreat from naturalism that we find in medieval art, where two-dimensional figures stare directly at the viewer, was already underway.

**DURA-EUROPOS: A POMPEII OF THE THIRD CENTURY C.E.** In 256 C.E., a Roman garrison town on the Euphrates River in modern Iraq, called Europos by the Greeks and Dura by the Romans, fell to the Persians. The eastern frontier of the Roman Empire had become a dangerous place, for the Persians under a new dynasty, the Sassanids, had overthrown Rome's old foe, the Parthian Empire, in 224 C.E. They were more aggressive than the Parthians had ever been for they dreamed of restoring the Old Persian Empire that Alexander the Great had overthrown. Dura-Europos was discovered during World War I, and in 1931 excavations got underway under the auspices of Yale University. The wall paintings that were found made art historians rethink their notions about the retreat from naturalism in the late Roman Empire that had hitherto been associated with the rise of Christianity. There was a Jewish synagogue with scenes from the Old Testament, dating to about 200 C.E. These came as a surprise, for Judaism took the Second Commandment banning "graven images" very seriously, as did early Christianity, but by the start of the third century C.E., the veto for both religions had broken down. There was a Christian "house church," built about 240 C.E., for before Christianity became a legal religion, Christian congregations met in ordinary houses which were adapted for worship; we know that there were at least forty such "house churches" in Rome by 258 C.E. At one end of the baptistery room in the Dura "house church," set in a vaulted niche, there was a font shaped like a sarcophagus, and on the back wall of the niche was a painting showing Christ as the Good Shepherd, carrying a sheep on his shoulders, and beside him, Adam and Eve. This was clearly an example of wall painting as a mode of instruction: Adam and Eve represented the old Adam who sinned, and Christ, the new Adam, redeemed the victims of original sin. The synagogue paintings were also art serving to instruct, and since they date before the "house church" was built, the Christians probably borrowed the idea of using art for religious education from the Jews. One synagogue painting shows the prophet Samuel anointing David as the future king of Israel while his six older brothers look on. Samuel towers over David and his brothers who are all the same height, though David's status is marked by the purple toga that he wears like a Roman emperor. The figures face the onlooker, fixing him with an intense gaze, and they seem to float in air. This frontality and weightlessness is even more pronounced in the sacrificial scenes that were painted and carved in the Temple of the Palmyrene Gods in Dura. By contrast, the art in the Christian baptistery has not quite abandoned the classical tradition. The "Christ the Good Shepherd"

Greek chapel of the catacomb of Priscilla, an example of early Christian art in Rome, Italy, c. 230–240 C.E. © ARCHIVO ICONOGRAFICO, S.A./CORBIS. REPRODUCED BY PERMISSION.

figure recalls a classical type; among the archaic sculpture found on the Athenian Acropolis there is an example, the dedication of Rhombos showing a man carrying a lamb on his shoulders. The Dura finds make it clear that the features associated with early medieval art—two-dimensional, weightless figures in frontal poses—developed independently of Christianity, and that their inspiration came from the Middle East.

**EARLY CHRISTIAN ART.** Apart from the “house church” at Dura-Europos, examples of early Christian art come from the catacombs: underground cemeteries hewn from the rock-like tunnels for mines. The catacombs were not solely Christian—the Jewish catacombs in Rome antedate the Christian ones—nor are they only in Rome: there are also catacombs in Naples, Syracuse in Sicily, and Alexandria. Christians, like Jews, did not cremate their dead, which was the prevailing custom in the pagan world until the later second century C.E., and the catacombs provided burial places that a Christian of modest means could afford. Most of the catacomb burials are later than 313 C.E. when Christianity was made legal by the so-called “Edict of Milan,” and so the old romantic notion of persecuted Christian believers gathering secretly for worship in the

catacombs must be abandoned. The dead were placed in niches (*loculi*) stacked one above the other like shelves lining the underground galleries, and in various places small rooms (*cubicula*) cut out of the rock served as funerary chapels. The paintings in the *loculi* and particularly in the *cubicula* are our earliest examples of Christian art. The style is similar to contemporary pagan art, though there is a charming naivete about the pictures. They are narrative art but they have an educational purpose: they give instruction in the Christian faith. Christ is usually shown either as a teacher or as the Good Shepherd, caring for his flock of sheep. In the early drawings he is depicted as a young man and beardless; he might pass for a young pagan god. The figure of Christ as a mature man with a full beard developed only later in Constantinople in the fifth century, and perhaps it reflects the impression made by Phidias’ great gold-and-ivory statue of Zeus at Olympia when it was taken to Constantinople after the temple was closed by imperial decree in 391. The catacomb paintings were executed by journeymen painters who worked quickly in poor light, surrounded by decaying corpses, and they are not great art. They borrow heavily from the classical tradition. Yet their general aim was instruction in Christian piety, and though occasionally figures from classical mythology appear if they can be linked in some way with Christian teaching, the subjects are usually stories that convey a message from the Old and New Testaments.

## PORTRAITS

**IDEALISM AND REALISM.** In modern society, photographic equipment makes it easy to capture images of one's self and one's family in portraits, and the ease with which such pictures can be created tends to devalue their significance. The absence of such technology in the Greek and Roman world, however, made the creation of portraits a very important and significant act that was generally done for a motive beyond the capturing of an image. In the sixth century B.C.E., victorious athletes in Greece were commemorated with portrait statues which presented an idealized picture of vigorous youth, though there was a degree of realism as well. Idealism was the hallmark of Greek portraiture because the motive of the portrait artist was not to portray an exact likeness—warts and all—but rather an impression of a real individual as an exemplar of vigor, intellectual power, or heroic virtue or the like. This motivation did not quite hold true for the Romans, however, as portraiture had a practical purpose. A Roman kept *imagines*—images usually of wax—in the atrium or living room of his house as the visible record of his ancestors and of his own social status. They were exact likenesses, and they set the standard for Roman portraiture. Early Roman portraiture can be realistic to the point of homeliness. However, once Rome was ruled by emperors, from the time of Augustus (27 B.C.E.–14 C.E.) onwards, imperial portraiture was used to convey a message of power. Yet the Roman portrait, whether of an emperor or an ordinary citizen, always portrayed an individual with a distinctive appearance, and this taste for realism survived even into the early Byzantine period.

**PORTRAITURE IN CLASSICAL GREECE.** A bust of the Athenian statesman Pericles, the architect of the Athenian Empire, has survived in a Roman copy. The original was a bronze statue by the sculptor Cresilas, erected in Athens after Pericles' death in 429 B.C.E. The

date is important, for there was a prejudice against portraits of living men. The great Phidias who made the gold-and-ivory statue of Athena Parthenos for the Parthenon, smuggled a likeness of Pericles into his design for the shield of Athena and was apparently driven into exile for it. While the original is lost, the marble bust is a good copy and shows an idealized Pericles. Any blemishes he may have had were removed and the helmet he always wore hid his peaked skull. The helmet also marked him as a general, for during his years of power he was elected year after year to the influential Board of Ten Generals. Without the helmet, this portrait of Pericles would pass for the image of a god. Portraits in fifth-century Greece were intended to flatter, although this was not the case in the following century. No original portrait from the fourth century B.C.E. survived, but to judge from Roman copies representing Plato, it seems that the aim of the sculptor was to portray him not so much as an individual as a typical philosopher. Pliny the Elder reported that the Sicyonian school of sculpture experimented with realism and that Lysistratus, the brother of the famous Lysippus of Sicyon, made a likeness from an actual face. Lysistratus was probably the first artist to ask his subject to sit for his portrait so he could sculpt what he saw, whether it was flattering or not. Pliny's evidence has been disbelieved by some art historians, but there is evidence of a greater taste for individualism in portrait sculpture in the Hellenistic world, though it is far from the uncompromising realism found in Egypt and later in Rome.

**PORTRAITURE IN THE HELLENISTIC WORLD.** In the Hellenistic world after Alexander the Great's death in 323 B.C.E., there were two rival traditions in portraiture. One carried on the classical tradition. Like Cresilas's portrait of Pericles, it sought to idealize. Alexander the Great's portraits are a case in point. Alexander had his favorite artists: Lysippus for sculpture, Apelles for painting, and the gem cutter Pyrgoteles for his seal engravings. It is likely that the many sculptures depicting Alexander take their inspiration from portraits that he himself approved. They show Alexander with his head bent slightly to the left, directing his gaze above the spectator as if he were looking into the distance, or perhaps a distant future, and they emphasize Alexander's physical beauty and youth. The portrait is of an individual, but in 324 B.C.E. Alexander demanded that the city-states recognize him officially as a god, and his portraits have a god-like quality about them. About 280 B.C.E. a statue in Athens by the sculptor Polyectus of the orator Demosthenes made no effort to idealize Demosthenes, and art historians have pointed to it as a landmark in the development of realistic portraiture. This asser-

Bust of Homer, showing balding head, full beard and beetling brows which were typical of his portraits. © ARALDO DE LUCA/CORBIS.

tion must be tempered, however, with the reality that the statue was made some forty years after Demosthenes' death by an artist who probably never saw Demosthenes in his lifetime. Even so, he showed Demosthenes as he should have looked, not as he did. The statue of Demosthenes has the body of an old man, slightly stooped, and he clasps his hands nervously in front of him; his face is lined and his expression is sober, almost melancholy, as if he was apprehensive of the future, reflecting, perhaps, Athens' approaching defeat by Macedon.

**PORTRAITS OF THE IMAGINATION.** While it cannot be determined how true to life the portrait of Demosthenes is, it is reasonably certain that portraits were produced in this period which were not true to life at all; they portray real individuals, but they are purely imaginary. This is a period in the history of portrait art when sculptors produced "portraits" of authors who were long-since dead, which could be set up in libraries. Homer's portrait is a case in point. No one knew what Homer actually looked like, but the portrait sculptor started with some preconceived notions: Homer was a dignified old man of genius, and he was blind. The finished portrait fits the conception. Yet what was remark-

able about it is its individualism. This portrait was not simply the portrayal of a poet-type; it depicts an individual, and copies of it are immediately recognizable. Homer's hairline is receding and he wears a fillet or headband which partly disguises it. The lines on his forehead suggest great intellectual power. He wears a full beard, denoting maturity, and his eyes are arresting under his beetling brows. This portrait was an imaginative creation, but it was one that the Greeks could accept as a representation of what Homer actually looked like.

**ROMAN PORTRAITURE.** Romans kept *imagines* (portraits) of their distinguished ancestors in the main rooms of their houses. They were usually made of wax from death-masks of the departed ancestor, and when a Roman died, these *imagines* were carried in the funeral procession so that a Roman was buried in the presence of his ancestors. His genealogy was put on public display, and the longer it was, the better it was for his social and political standing. If any such *imagines* existed in the houses buried by the ash and lava from Mt. Vesuvius in 79 C.E. they were unfortunately melted by the heat. A fourth-style wall painting from a Pompeian house has yielded a wedding portrait, however. It shows a man and a woman, the man holding a scroll and the woman a stylus and a writing tablet known as a *pugillaris*, two small thin wooden boards hinged at one side so that they could be folded over and their inner surfaces covered with a layer of wax on which a message could be written. The scroll, stylus, and *pugillaris* are all stage setting; they are intended to portray the man and wife as an educated couple who read books and wrote letters. The faces of the man and woman are photographic likenesses, done with such startling realism that we could recognize them if we met them on the street. The man transfixes us with his gaze; the woman gazes off to one side with a look of infinite sadness. There must have been many portraits like this in the Roman Empire. From the second and first centuries B.C.E. a number of Roman portraits depict their subjects with uncompromising realism. The wrinkles and other blemishes that come with advancing age are clearly marks of honor. This attitude towards portrait art owes little to Greece. Rather it draws its inspiration from the *imagines* of the ancestors, which Romans kept in their houses. This realistic tradition continued into the first century C.E. and, in fact, never died. Yet by the mid-first century C.E., the completely uncompromising realism of the earlier age was no longer in fashion. Many Romans no longer displayed masks of their ancestors in the atriums. The historian Pliny the Elder makes a grumpy complaint in his *Natural History* about the new custom of decorating rooms with pictures of athletes

from the gymnasium or the arena rather than family portraits. An imposing array of family portraits went along with lengthy genealogies, and the demographic changes in the Roman Empire from the first century C.E. onwards resulted in persons with very short genealogies rising to power and wealth. The portrait artist could pick and choose from the styles of the past, and eclecticism was the vogue.

**THE IMPERIAL PORTRAITS OF AUGUSTUS.** The emperor Augustus (r. 27 B.C.E.–14 C.E.), who restored peace to Italy after a half-century of civil war and political turmoil, was very conscious of the fact that his reign was a new beginning for the Roman Empire. His portraits reflected this new era by seeking inspiration in classical Greece, the age before the Hellenistic monarchies, when the city-states (Sparta excepted) were little republics. He adapted the art of classical Greece to Roman uses. One famous statue of Augustus that was found at the villa of his wife Livia at Prima Porta just north of Rome shows him in full armor, with one arm raised in the gesture of an army commander addressing his troops. The body beneath the armor conforms to the *Canon* of Polyclitus which outlined proportions for sculpture in the classical period. Augustus, who in real life did not have an impressive physique, had his statue conform to the proportions of Polyclitus' *Diadoumenos*, a muscular youth adjusting his headband. The face of the Prima Porta statue is easily recognized because it has the high cheekbones and hairstyle of Augustus. Augustus was shown in two other ways as well. He was portrayed as a priest, wearing a toga with a cowl, for Roman priests covered their heads when they sacrificed to the gods. He was also shown as a youth: a young man who was leading in a new age. Augustus' portraits never aged, nor did those of his wife, Livia, though her hairstyles changed with the fashion. Like the famous portrait of Pericles by Cresilas, the portraits of Augustus showed him as no ordinary man.

**CHANGING FASHIONS.** Portrait styles changed in 69 C.E. with the ascension of Vespasian as the new emperor. He had none of the aristocratic background of the previous dynasty, the Julio-Claudian family that became extinct with the suicide of the emperor Nero in 68 C.E., and though he was sensitive about the peasant origins of his family, known as the Flavians, he was wise enough to know that he should make a clean break with the Julio-Claudians. His portraits therefore returned to the realist tradition of Roman republican portraiture. They show him with receding hairline and the leathery skin of an old soldier who knows what life in the military camps is like. His portraits were numerous; this was a

Bust of Roman woman with hairstyle typical of the Flavian period (69–96 C.E.). THE ART ARCHIVE/MUSEO DELLA CIVILTA ROMANA ROME/DAGLI ORTI.

great age of portraiture when people of all ages, not just old men, had portrait sculptures made. One marble bust of a woman of the Flavian period, which is now in the Capitoline Museum in Rome, should be noted as an example of Flavian style, even if it is not an imperial portrait. The face and the long neck are modelled softly, and the sculptor managed to portray the texture of the skin by the polish of the marble. The woman's coiffure is a mass of tight curls piled up above her forehead. The sculptor used a drill rather than a chisel to sculpt the curls, a trend that became more common as sculptors used the drill more and more, particularly for hair and beards. The surprising element of this particular bust is that the coiffure is, in fact, a wig. It can be lifted off the bust and replaced by another. In an age when hairstyles changed, this was an efficient way of keeping the bust up to date.

**IMPERIAL PORTRAITURE IN TROUBLED TIMES.** With the reign of Marcus Aurelius (161–180 C.E.) the long period of peace that the empire had enjoyed came abruptly to an end. There were grim times ahead, and imperial portraiture conveyed a new message of suffering and sadness. A relief sculpture of Marcus Aurelius

A mummy portrait from the Fayum province, Egypt, c. 200 C.E. Portraits of this type were placed over the face of the mummy. PHOTOGRAPH BY HECTOR WILLIAMS. © HECTOR WILLIAMS.

that once adorned a lost imperial arch shows him bearded after the style of the emperor Hadrian (r. 117–138 C.E.) who had worn a beard to hide scars on his face. Marcus' face is that of a care-worn man. His eyes are incised rather than merely painted, creating a melancholy effect that no doubt was a window to his soul. The sense of sadness is even greater in the portrait of a short-lived emperor, Decius (r. 249–251 C.E.), in the Capitoline Museum in Rome. He is balding and what is left of his hair is clipped short. The sculptor made no effort to flatter. His gaze is fixed upwards, as if he hoped for help from above. If so, the help failed to arrive, for Decius died in a disastrous defeat at the hands of the Goths. After 268 C.E., when the empire began to revive under a succession of emperors from Illyria (modern Croatia and Serbia), first Claudius Gothicus (r. 268–270 C.E.) and then Aurelian (r. 270–275 C.E.), the emperors are shown as men of action with several days' growth of beard. Re-

alism increased to the point of brutality. The emperors are shown as tough and effective rather than handsome.

**THE LOSS OF INDIVIDUALITY.** A great political change occurred at the end of the third century C.E. In 284 C.E. a soldier from Illyria named Diocles was elected emperor by the Roman army. He immediately changed his name to Diocletian and chose a colleague, a fellow soldier named Maximian, to share the imperial office. A few years later, he chose two more junior colleagues, naming them "Caesars." So the empire was ruled by a committee of emperors, two bearing the title "Augustus" with one of them, Diocletian, senior to the other, and two with the title of "Caesar." This tetrarchy (the rule of four men) lasted until 305 C.E., when Diocletian retired and persuaded his colleague, Maximian, to retire as well. At San Marco Cathedral in Venice there is a remarkable group portrait of the tetrarchs that captures the spirit of the new age. It is made of porphyry, a hard reddish granite from Egypt which, because of its dark crimson color, was considered particularly fitting for representing emperors. The tetrarchs are each shown embracing another with one arm; with the other arm each grasps his sword. They have larger, cubical heads on squat, shapeless bodies. This sculpture group represents the tetrarchy as an office rather than a group of individuals. The sculptural form is less important than the message it conveys. The same spirit, too, informs a colossal portrait of the first Christian emperor, Constantine, who united the Roman Empire under his rule in 323 C.E. and founded a new capital, Constantinople, the next year. The portrait, which is in Rome in the *Palazzo dei Conservatori*, is over two and a half meters (8.2 feet) tall, and it is what remains of a seated statue, over nine meters (30 feet) in height, that has a core of brick, a wooden torso covered with bronze, and head and limbs of marble. The face is a mask. Enormous eyes are set into the broad planes of the face. The eyes stare beyond the onlooker as if their gaze is fixed on Heaven where resides the ultimate authority. This is an image of power and Christian faith, and the message that it conveys almost overwhelms the human individualism of the portrait.

**PAINTED PORTRAITS.** Few of the imperial portraits survived to modern times, except for marble sculptures. While portraits were also painted on wood in hot, colored wax, only one such rendering exists today: a portrait of the family of the emperor Septimius Severus (193–211 C.E.). These wooden portraits were sent to the far corners of the empire and set up in public places when a new emperor ascended the throne. The best examples of portraits come from Roman Egypt. They are mummy portraits painted on wooden panels and placed

*a PRIMARY SOURCE document***WOMEN PAINTERS**

**INTRODUCTION:** Two wall-paintings from Pompeii show women artists at work. One shows a woman painting a statue, the other a woman seated at her easel. Most of the ancient painters, men as well as women, are only names to us, and they would not have been known at all except that Pliny the Elder mentions them in his *Natural History*. Pliny garnered his information from earlier sources, and in one of these sources, Marcus Terentius Varro (116–27 B.C.E.), he found a reference to a woman who worked as a portrait painter in Rome, sometimes painting with a brush and sometimes using the encaustic technique. Her name was Iaia, and she came from Cyzicus in north-west Asia Minor. Pliny compares her to Sopolis and Dionysius. We know nothing

of Sopolis; Dionysius was a portrait artist who painted only men.

Iaia, who came from Cyzicus and remained unmarried all her life, worked at Rome when Varro was a young man and she painted portraits on ivory, of women mostly, sometimes using a brush and sometimes a spatula (for applying molten colored wax). She painted a large picture of an old woman which is at Naples, and also she painted a portrait of herself using a mirror. No artist worked more swiftly than she; yet the excellence of her art was such that her paintings sold for far more than those of the most celebrated artists of her day, Sopolis and Dionysius, whose works fill our art galleries.

**SOURCE:** Pliny, *Natural History*. Book 35. Chapter 147. Translated by James Allan Evans.

over the face of the corpse that is then wrapped in long bands of white linen. The portrait painters used the encaustic technique, mixing their pigments with hot wax and then applying them to the smooth surface of the wooden panel. The dry climate of Egypt has preserved the wood and the colors have not faded. The faces show the man or woman in the prime of life. They were probably painted some years before the time of death. There are no side-views or three-quarters views; the pose is always frontal, and the eyes transfix the viewer with a sober, almost melancholy gaze, conveying a sense of spirituality. Their eyes are windows to their souls. Hundreds of these portraits have been found in the Fayum province of Egypt west of the Nile River, and they date mostly from the second and third centuries C.E. They show how portrait painting developed in the Roman Empire in the years following the eruption of Mt. Vesuvius in 79 C.E. It is interesting to compare them with imperial portraits of the same period. The medium is different and these portraits from the Fayum portray ordinary people, not emperors. Yet one can detect a similarity in spirit. Both suggest that the everyday life with its troubles and turmoil is not all there is to life.

**FORERUNNERS OF THE ART OF ILLUMINATION.**

The troubled third century produced another type of portrait: miniatures on glass set against a gold-leaf background. One exquisite example has survived which bears the signature of the artist: Boumeris. He is otherwise unknown. His portrait group shows a mother and two children, a girl and a boy, painted on a glass roundel (a round object) four inches (10.16 centimeters) in diameter. The portrait, dating to about 230 C.E., shows the

mother and her children full-face and unsmiling. Another example, which is unsigned, shows a man painted in a roundel 2.7 inches (6.86 centimeters) in diameter. This is exquisite work, and only the well-to-do could afford portraits such as this one. They are, however, forerunners of the art of illuminating texts and paintings printed on vellum which is one of the glories of art in the Middle Ages.

## MOSAICS

**BEGINNINGS.** The beginnings of Greek mosaic art occurred before the middle of the fourth century B.C.E., and all the early examples are pebble mosaics, in which pebbles of different colors are laid in mortar. In Olynthus, a Greek city on the northern coast of the Aegean Sea, there are some fine pebble mosaics in the dining rooms of private houses which were built in the last quarter of the fifth century B.C.E., though the mosaics may not have been laid at the time of construction. However, in 348 B.C.E., King Philip II of Macedon destroyed Olynthus, so the mosaics cannot be dated later than that. They show scenes taken from mythology; one scene shows Dionysus, the god of wine, riding a chariot pulled by leopards and surrounded by a following of maenads and satyrs. The pebbles used are white and black. White figures are shown against a black background, and art historians have pointed out the similarity to red-figure vase painting in which the figures are red against a black background. From these beginnings, the technique developed rapidly.

**THE PELLA MOSAICS.** Pella, the capital of Macedon which was rebuilt on a grand scale by Alexander the Great's father, Philip, has yielded mosaics that mark the high development of pebble mosaic. In addition to black-and-white patterns, there are now mosaics using colored pebbles, though the range of colors is still limited. The basic pattern of white figures against a dark background remains unchanged, but details are modeled using small pebbles that are packed tightly together, while fine strips of terracotta and lead mark the contour lines with the figures, and there is skillful use of colored pebbles. One mosaic from Pella shows a lion hunt with white pebbles for the body of the lion, grey and pale blue to set off muscles and shadows, brown and yellow for the hair, and strips of lead or terracotta to mark the contour lines. Another mosaic from Pella shows two young hunters, both wearing the cloak known as the *chlamys* but otherwise naked, hunting a stag. The mosaic craftsman used different shades of pebbles for the bodies of the two hunters, and for their hair he used yellow pebbles. The tongue of the stag is shown in red. The craftsman's skill is extraordinary.

**TESSELLATED MOSAICS.** The art of the mosaic did not come into its own until mosaicists began to use bits of marble and stone cut, more or less, into cubes and fitted closely together in a bed of mortar. These small pieces of marble or colored stone were called *tesseras*, and the mosaics made from them were called *opus tessellatum*. Tesseras had a range of colors which pebbles lacked,

and if they were cut into tiny pieces and set together closely enough, the mosaic could give the impression of a painting. This new technique sometimes went by the Latin name of *opus vermiculatum*, and probably began in Alexandria, the capital of the Ptolemaic kingdom of Egypt, but it was embraced enthusiastically by the kingdom of Pergamum. It was the fashion to use *opus vermiculatum* to make what were called *emblemata* (singular: *emblema*)—panels imitating paintings—which the mosaicist could make in his workshop and then insert into the floor of a room, in its center, and surround it with coarser mosaic work. Mosaic artists were not so much creative artists, however, as they were humble craftsmen who executed designs given to them, and ancient literature mentions the name of only one of them: Sosus, who worked at Pergamum. He was known for a famous mosaic that was often imitated. It portrayed a floor with the appearance of being littered with the leavings of a banquet that the banqueters have thrown on it. The central panel, or *emblema*, shows doves sitting on a bowl, drinking from it and preening themselves. The motif was often repeated, with modifications. There are examples of the motif from Pompeii and Herculaneum, and there is a particularly fine example from the emperor Hadrian's villa at Tivoli outside Rome, which is so well done with tiny tesseras that art historians have wondered if it could be Sosus' original. Though ancient literature mentions only one great mosaic artist, some of the mosaics themselves bear signatures. Someone called Gnosis, for instance, signed the pebble mosaic of the stag hunt from Pella. The mosaic craftsmen were proud of their art.

**MOSAICS FOR THE MIDDLE CLASSES.** By the second century B.C.E., mosaic floors were no longer the preserve of princes. They were the decorative flooring of middle-class homes. Evidence for their ubiquity comes from the houses found on the island of Delos in the southern Aegean Sea. For a period between 166 and 69 B.C.E., there was an economic boom on Delos, for Rome had made her a free port, and she rapidly developed as a trading center, particularly for the slave trade. The private houses found there belonged to traders and merchants who settled there during the boom. Mosaics are to be found in every room of these houses, not just in the dining room. This was the sort of mosaic art which the Romans encountered when they came to Greece. In fact, among the merchants living on Delos were a group from Italy, and some of the houses there with elegant mosaics may have belonged to them. When archaeologists excavated Pompeii and Herculaneum, cities buried

Mosaic from the House of the Faun in Pompeii, showing the Battle of Issus between Alexander the Great and Darius III of Persia. Copied from a Hellenistic painting by an unknown artist probably of the third century B.C.E. THE ART ARCHIVE/ARCHAEOLOGICAL MUSEUM NAPLES/DAGLI ORTI.

by the eruption of Mt. Vesuvius in 79 C.E., it is not surprising that they found a rich collection of mosaics.

**THE MOSAICS OF POMPEII.** The House of the Dancing Faun, so called because of a dancing faun in the middle of its atrium or main room, is the largest house in Pompeii, taking up a whole city block. When it was excavated in 1831, it turned out to be a treasure trove of mosaics. Mosaic subjects include a lion, three doves pulling a necklace from a casket that was an adaptation of Sosus' famous mosaic, and a cat attacking a hen. On the floor of a room off the atrium is one of the greatest mosaics to survive. It reproduces a painting of the Battle of Issus where Alexander the Great met the king of Persia, Darius III, for the first time and defeated him. The painting that the mosaicist copied must have been famous, and art historians have made various guesses as to what it was and who executed it. A painter named Philoxenus of Eretria is known to have painted

a "Battle of Issus," and so did a female painter, Helena of Egypt. There have been suggestions, too, that the painter was the great Apelles himself. The painting depicts the moment when Darius flees from the battlefield. Alexander charges from the left, thrusting his long lance towards Darius. Darius is masterfully executed; he turns toward Alexander with panic in his face, while his charioteer lashes the horses. In the middle of the picture, the painter has shown a horse from the rear, which a Persian rider is trying to pull out of the way of the deadly Macedonian charge. The original painting was done with the four-color palette favored by fourth-century artists who created their colors by mixing red, yellow, white and black pigments, but the craftsman who made his mosaic did not have that luxury: he had only tiny tesseras of different colors at his disposal and he had to juxtapose them with infinite care to get the right effect. It is estimated that one and a half million tesseras were used to produce this mosaic. It is likely that this mosaic was

not actually made in Pompeii, but was shipped from somewhere in the eastern Mediterranean in several sections and reassembled in Pompeii. It may have been prefabricated for a Roman customer by a mosaic workshop in the Hellenistic east, but more likely it was a mosaic that had already been laid in the east and was lifted and shipped to Italy in sections where it was reassembled. Probably it came to Italy as plunder from the east. A close examination of the mosaic supports this argument, for it is possible to find mistakes made in reassembling it such as incomplete figures. Mosaics were among the works of art that the Roman armies looted when they operated in Greece in the second and first centuries B.C.E., but not all mosaics from the east came to Italy as spoils of war. Some were made for paying customers in Italy. This was probably true of two mosaics found in Pompeii in the so-called House of Menander, showing scenes from the comedies the playwright Menander. Each is signed by Dioscurides from Samos off the southwest coast of Turkey, and each is set in a marble tray so it could be transported easily.

**MOSAICS IN ROMAN ITALY.** The mosaics of Roman Italy from the latter part of the first century to the third favor silhouette designs. There is an example from Pompeii itself, from the “House of the Tragic Poet,” which has a silhouette mosaic in black and white in the vestibule showing a snarling dog straining at his leash, and the words “CAVE CANEM”—“Beware the dog!”. It is, however, in Ostia Antica (“Old Ostia”) that the best black-and-white mosaics are found. Ostia, situated at the mouth of the Tiber River, was an unsatisfactory port, but the emperor Claudius (r. 41–54 C.E.) attempted to improve it and make it possible for grain ships to unload their cargoes there. His harbor works soon silted up, however, and the commercial buildings and baths in Old Ostia were deserted as business moved to a new port built by the emperor Trajan north of the Tiber river mouth. The “Baths of Neptune” in Ostia still have a well-preserved black-and-white mosaic showing Neptune driving his sea-horses across a floor filled with marine creatures. The figures are distributed freely over the floor; the old Hellenistic practice still found at Pompeii of placing a framed picture, or *emblemata*, in the center of

Lateral view of the colonnaded nave of the Church of S. Apollinare Nuovo with its mosaics, procession of female saints bearing offerings visible along left side, Ravenna, Italy, c. 504 C.E. ALINARI-ART REFERENCE/ART RESOURCE, NY. REPRODUCED BY PERMISSION.

the floor had been abandoned. Mosaics of this black-and-white style remained popular in Italy until the third century when color crept back in.

**THE ROMAN PROVINCES.** The black silhouette mosaics of the sort found in Ostia were never very popular in the western Roman provinces and they were not at all popular in the Roman East, where the traditions of Hellenistic mosaics were strong. The exception was Greece, which had suffered greatly in the civil wars of the first century B.C.E. The market for mosaics collapsed during this time, and mosaic workshops in Greece went out of business. When the market recovered in the second century C.E., the mosaic artists looked to Italy for their inspiration. Elsewhere, the provinces developed their own traditions. Excavations at Antioch, the capital of Roman Syria (modern Antakya in Turkey), in the 1930s revealed a splendid group of mosaics which were unaffected by styles in Italy. The mosaic artists of Anti-

och loved color; the black-and-white mosaics of Italy had no appeal. Scenes from mythology were still as popular as they were in the Hellenistic period when they were used as *emblemata* framed in the center of mosaic floors. The chief difference is that the *emblemata* became larger, so that they took over much of the floor space, and the framing around them became narrower and less important. Roman Africa also developed its own style. Few mosaics have been found in country villas there, though that may be an accident of archaeology, for not many country villa ruins have been explored in Roman Africa. The town houses, however, have yielded an astonishing array of mosaics. Polychrome mosaics were particularly popular. One favorite pattern was the “floral style,” where vine or ivy tendrils and flowers were arranged in geometric patterns. One fine example from El Djem in Tunisia, belonging to the second half of the third century C.E., shows grapevines growing out of urns in each corner and spreading over the whole floor. In the

Mosaic from the Tomb of Galla Placidia, Ravenna, Italy, dating to about 425 C.E., showing the martyrdom of St. Lawrence who was roasted on a gridiron. MAUSOLEUM OF GALLA PLACIDIA AT RAVENNA, ITALY.

center there is a small picture framed in a hexagon which shows old Silenus, the perpetually intoxicated follower of the wine god, Dionysus, sprawled on a couch, playing with children. Another popular type of mosaic shows scenes distributed freely over the surface of the floor as they were in the Italian black-and-white mosaics. From the mid-second century C.E. an increasing number of scenes were taken from the amphitheater. Such scenes show wild-beast hunts where gladiators armed with spears faced savage beasts like leopards and bears, or criminals being thrown to them to be torn apart in the Roman arena. The expense of producing these duels between gladiators and wild beasts was heavy, and the mosaics sometimes commemorate the generosity of wealthy citizens who paid the bill out of their own pockets.

**THE MOSAICS FROM PIAZZA ARMERINA.** One of the most extensive African-style mosaics was found not in Africa but in central Sicily, at Piazza Armerina. The villa at Piazza Armerina is a vast, sprawling structure which seems to be a great hunting lodge built at the end of the third or the beginning of the fourth century C.E.

Some scholars conjecture that it was built for the use of the emperor Maximian, the colleague of Diocletian from 286 to 305 C.E., who retired without enthusiasm when Diocletian did and presumably sought peace and quiet there. The floors are covered with polychrome mosaics in the style of Roman Africa. Experts generally agree that the mosaic craftsmen who made them came from Carthage, on the edge of modern Tunis. Some show the fauna that was fodder for the amphitheaters—including lions, tigers, elephants, and ostriches—being caught and shipped, presumably to Rome, while others depict the amusements in the arenas and the hippodromes. One mosaic shows a chariot race, with the charioteers competing under their colors which indicated their teams: the Reds, Whites, Blues, and Greens. Another mosaic shows scantily-clad girls playing a kind of water polo, for one of the popular spectacles called for the orchestras of theaters to be made water-tight and then filled with water so that girls wearing bikini-type bathing suits could put on a water show.

**WALL MOSAICS.** Sometime about the middle of the first century C.E. Romans began to put mosaics on their walls. The owner of one up-to-date house in Herculaneum, the so-called House of the Neptune and Amphitrite Mosaic, had wall mosaics installed not long before Herculaneum was buried by the eruption of Mt. Vesuvius. In Pompeii, a house owner used mosaic to decorate a small fountain. Mosaics were particularly suitable for areas that were damp, such as ornamental fountains and public baths, where painted plaster would quickly mildew. Most of the wall mosaics of ancient Rome were destroyed when the buildings they once decorated were ruined, and the best wall mosaics belong to Christian churches. There are splendid examples in Ravenna, the last capital of the Western Roman Empire before the last emperor was dethroned in 476 C.E. The little mausoleum of Galla Placidia, the sister of the incapable emperor Honorius (395–423 C.E.) who provided what imperial rule there was for the Roman Empire in the middle of the fifth century, has its interior walls covered with mosaics. One portrays St. Lawrence approaching the hot griddle where he would suffer martyrdom, his flesh roasted while he was still alive, and another, in the lunette above the entrance, shows a popular Christian design: Christ the Good Shepherd looking after his sheep. Christ sits in a naturalistic landscape that extends to a background beneath a blue sky. The mosaic belongs to the classical artistic tradition, which was still strong at Ravenna when the mausoleum was built about 425 C.E. Yet its days were numbered. As the sixth century began, the Church of Sant' Apollinare Nuovo was being built in Ravenna, and its mosaics belong to world of Byzantine art. A mosaic of the "Miracle of the Loaves and Fishes" shows Christ wearing imperial robes, facing the onlooker, dominating the center of the picture while on either side are two disciples. The background is gold, symbolizing the splendor of Heaven. Henceforth gold became the background of choice for mosaics.

**THE LAST OF THE RAVENNA MOSAICS.** At Ravenna, there are two famous mosaics which mark the transition from the artistic traditions of the classical world to the new world of Byzantine art. In the Church of San Vitale, which was dedicated in 547 C.E., there are mosaics on the walls on either side of the chancel, one of which shows the great emperor Justinian and his entourage about to enter the church for the dedication ceremony; on the other wall is the empress Theodora, the ex-actress whom Justinian married, standing in the courtyard of the Church of San Vitale, surrounded by her attendants. The mosaic dates to 547 or shortly before, and was probably made in Constantinople; the next year, in 548 C.E.,

Theodora died of cancer. The figures are in procession, filing into the church, and they are not shown in profile; instead they face the viewer and gaze at him. Theodora's eyes are particularly arresting. Yet the figures are still to some degree three-dimensional and the portraits of the emperor and empress show them as real individuals. The classical tradition in art is fading but its influence is not yet dead.

## SIGNIFICANT PEOPLE *in Visual Arts*

---

### APELLES

c. 370 B.C.E.—Early third century B.C.E.

*Painter*

**GREECE'S GREATEST PAINTER.** Apelles was probably the greatest artist in the Greek world, though all that survives are descriptions of his works. He gained fame as the portrait artist of choice to some of the most powerful men in the ancient world, including Philip of Mace-

don, Alexander the Great, and Ptolemy I in Egypt. He placed great emphasis on precise line drawing, and every day he made a point of practicing it to maintain his skill. He also used a transparent varnish to preserve his paintings. The exact formula of the varnish is not known, but the word that the historian Pliny the Elder used for it was *atramentum* (black lacquer) which indicates that it darkened his colors and probably softened them.

**TRAINING.** Apelles was born either on the island of Cos, or on the Asia Minor mainland at Colophon around 370 B.C.E. He was thus an Ionian Greek and he trained first with Ephorus of Ephesus who belonged to the Ionian School of artists. He then moved to the Greek mainland to study with the celebrated artist Pamphilus, who headed a school at Sicyon, the western neighbor of Corinth. Pamphilus was famous for charging high tuition fees, but his school had some famous alumni, including the sculptor Lysippus, who became Alexander the Great's sculptor of choice. Apelles learned to combine the precision of the Sicyonian style with the elegance that he had learned in Ionia, and about 340 B.C.E., his reputation was such that he was invited to the court of Philip II, king of Macedonia, where he painted portraits and won the admiration of the young Alexander, Philip's son.

**ALEXANDER'S FAVORITE PORTRAIT ARTIST.** Alexander was the subject of Apelles' most famous portraits, and Apelles helped to create the image of Alexander as a superhuman hero, ruler of the inhabited world. Alexander recognized the value of art in creating an image, and he entrusted his representation to only three artists: Apelles, Lysippus, and the engraver Pyrgoteles. The most famous of the portraits was Apelles' depiction of Alexander as the god Zeus holding a thunderbolt, *Alexander as Zeus Keraunophoros*, a painting that aimed to support Alexander's claim to deity. Another painting of Alexander showed him with the Victory Goddess, *Nike*, and another with strong allegorical overtones showed Alexander in a triumphal chariot along with the personification of war, *Polemos*, whose hands are bound. Both these paintings were later taken to Rome where they were displayed in the Forum of Augustus and later repainted so that Alexander's features in the paintings were replaced by those of Augustus himself by order of the emperor Claudius (r. 42–54 C.E.).

**APHRODITE ANADYOMENE.** One of Apelles' most famous works was *Aphrodite Anadyomene* (Aphrodite Arising) which showed Aphrodite arising from the sea where she was born, and wringing her hair. According to one story, the model for the work was Alexander's mistress, with whom Apelles fell in love during a previous portrait sitting. When Alexander discovered Apelles'

feelings, he gave his mistress to Apelles. If the anecdotes from ancient writers about Apelles' relationship with Alexander can be believed, Apelles was able to take liberties with Alexander that others could not. Both Pliny the Elder and Aelian noted instances when Apelles directly insulted Alexander's understanding of art and apparently suffered no consequences for his cheekiness. Apelles also did a self-portrait, the first self-portrait known from the ancient world.

**PAINTER TO THE KINGS.** When Alexander died in 323 B.C.E., Apelles painted portraits of his successors, including Antigonos *Monophthalmus* (One-Eyed), who was blind in one eye. According to a description of this portrait, Apelles painted it in such a way as to show only the good eye, suggesting that he introduced a three-quarters view. Apelles then travelled to Alexandria in Egypt, where he worked in the court of King Ptolemy I. His career nearly came to an abrupt end there when he was implicated in a plot against Ptolemy, but he managed to clear his name and regain the favor of the king. Some scholars suggested that his famous allegorical painting, *Calumny*, described by the second-century C.E. satirist Lucian, was part of Apelles' argument for his innocence. The fifteenth-century Florentine artist Sandro Botticelli (1445–1510) recreated this work from Lucian's description, and it now hangs in the Uffizi Gallery in Florence.

**DEATH.** Apelles died on the island of Cos, while copying his famous *Aphrodite Anadyomene*. The painting was later taken to Rome. While the exact date of his death is unknown, it was probably early in the third century B.C.E.

#### EXEKIAS

c. 570 B.C.E.—After 530 B.C.E.

*Potter*  
*Vase painter*

**KNOWN BY HIS VASES.** The Greek artist Exekias represents black-figure vase painting at its height, a distinction he shares with a contemporary known as the Amasis-painter. Although the time period in which he

flourished places him in Athens during the rule of the tyrant Pisistratus, the only other biographical details about him come from his vases. His signature appears on two vases as both potter and painter, and on eleven others as the potter. Other vases are attributed to him on stylistic grounds and thus a total of about forty of his pieces survive. Exekias' career as a potter seems to have begun before he tried his hand at vase decoration. Scholars guess that he was probably born in the 570s B.C.E., and while the date of his death is unknown he seems not to have been active after 530 B.C.E.

**REMARKABLE SKILL.** Exekias is remarkable for the quality of his draftsmanship and his skill as a potter. He may have invented the type of vase known as the calyx crater, for he decorated the earliest surviving calyx crater. But it is his skill as a vase painter that is most impressive. His masterpiece is a black-figure amphora in the Vatican Museum showing Achilles and Ajax playing a board game, Achilles wearing his helmet and Ajax, bareheaded, bending intently over the board. After Exekias, this scene is repeated by later vase painters about 150 times. It refers to some incident in the Trojan War myth, but it is not mentioned in any of the classical literature that has survived. The Trojan War, however, seems to have been a favorite subject for Exekias. One vase shows Ajax lifting up the corpse of Achilles who has just been slain by the arrow of Paris. Another vase of his shows Ajax committing suicide: all alone he plants a sword upright in the sand and falls on it. Exekias has only one surviving scene from the sack of Troy. It shows Aeneas rescuing his father Anchises; Exekias managed to portray the haggard face of old Anchises with remarkable skill.

**OTHER SUBJECTS.** Exekias was also interested in other subjects. One splendid drinking-cup shows the god Dionysus in a boat that is sprouting a grapevine from its mast, while dolphins swim round about. The myth is well known: pirates kidnapped Dionysus who turned them into dolphins as punishment. Exekias also did a fine black-figure hydria—a small water jar with three handles and a small neck—showing Heracles wrestling with the Nemean lion. Heracles seems to have been a favorite hero in Athens of the sixth century B.C.E., though in the next century, he was supplanted to a large extent by Theseus who was made into an Athenian counterpart of Heracles. Heracles was too intimately connected with the hated Sparta whose kings claimed to be his descendants. Exekias did a scene from the Theseus-myth but the vase is broken and its scene cannot be reconstructed. Another of Exekias' amphoras shows Theseus' two sons, Demophon and Akamas, walking their horses. This, as far as we know, is the first time they appear in Athenian art.

## LYSIPPUS

c. 390 B.C.E.—After 316 B.C.E.

### *Sculptor*

**PRODUCTIVE CAREER.** The sculptor Lysippus was born in Sicyon, a small city-state west of Corinth in Greece near the beginning of the fourth century B.C.E. He was active as early as 370 B.C.E., as an inscription found at Delphi makes clear, and according to another inscription, he made a portrait of King Seleucus, one of Alexander the Great's successors who laid claim to Alexander's conquests in the Near East in 312 B.C.E. He was extraordinarily productive. His workshop turned out literally hundreds of bronze statues. None survive, but a few copies sculpted in marble still exist. The most famous is his *Apoxyomenos* (Scraper) in the Vatican Museum, which portrays a naked athlete scraping himself. Athletes rubbed themselves down with olive oil before exercising and then, after exercise, scraped off the oil and sweat with a scraper called a *strigil*.

**ROYAL SCULPTOR.** It is clear that Lysippus' career was closely associated with the Macedonian royal house. Philip II, king of Macedon who ruled from 359–336 B.C.E., employed him first, and then he became the court sculptor of Alexander the Great (r. 336–323 B.C.E.). It is reported that Alexander would allow only Lysippus to sculpt portraits of him. This may not be literally true, but it was probably Lysippus who was responsible for the portrait-type of Alexander which shows him as if divinely inspired, his eyes looking upwards and his hair windswept. Another favorite subject of his was Heracles, whom the royal house of Macedon claimed as an ancestor. He was greatly praised for two colossal statues of Heracles, both made of bronze. One was a seated figure of Heracles made for the Greek city of Taras, Roman Tarentum (modern Taranto) on the southern coast of Italy, where it once stood on the acropolis. It was taken to Rome in 209 B.C.E. and displayed on the Capitoline Hill. Libanius, an author of the fourth century C.E., described the second as Heracles leaning heavily on his club which was draped with his lions' skin. There are about

25 Roman copies of it: the largest was found in the Baths of Caracalla in Rome and is now in the Naples Museum. The statue of Heracles in Naples bears the signature of a sculptor named Glycon, an Athenian sculptor of the second century C.E. who was a copyist. Another copy in Florence states that it is a work of Lysippus. It probably belongs to Lysippus' old age, for it looks forward to the High Hellenistic period with its taste for statues with superhuman bodies; Heracles is shown resting after his exertions with bulging muscles and stretched tendons.

**CAPTURED MOVEMENT IN SCULPTURE.** Outside Lysippus' house in Sicyon stood a statue that the sculptor made for himself, titled *Kairos* which can mean "due measure" and "proportion" or "opportunity"—the right time to do something. It has been taken as Lysippus' manifesto, just as the "Spear-bearer" of Polyclitus represented Polyclitus' *Canon*, his statement of the proper proportions of the naked male body. The *Kairos* showed that Lysippus had moved far beyond Polyclitus. Modern knowledge of the statue comes from reproductions on reliefs and gems. It showed a youth with wings on his shoulders and his ankles, running on tiptoe, with his one hand balancing a set of scales on the edge of a razor and with the other adjusting the scales. This is an allegorical representation and it refers to the saying taken from the historian Herodotus: "Our affairs are on the razor's edge," meaning, "This is the time for decision, and time will not wait." Lysippus represented rapid motion frozen in bronze. In Lysippus' *Apoxyomenos* too, the muscles of the left leg seem to carry the weight of the body, yet the shoulders and torso swing to the right. Lysippus caught the athlete at the moment when he is shifting his weight from one leg to the other thereby successfully sculpting motion. This innovation in sculpture was further developed in the Hellenistic Age when sculptors depicted subjects frozen in a moment of restless or violent motion.

#### PHIDIAS

c. 490 B.C.E.–c. 417 B.C.E.

*Sculptor*

**THE GREATEST GREEK SCULPTOR.** Phidias was not only the most important sculptor produced by the artis-

tic center of Athens but the most important artist of the fifth century B.C.E. He is responsible for two of the most impressive cult statues produced in Greece—the *Athena Parthenos* and the *Zeus* at Olympia—and, according to ancient sources, was in charge of the creation of the Parthenon, Greece's most recognizable structure. His skill as a sculptor in a number of mediums, including bronze and marble as well as the combination of gold, ivory, and wood used in his chryselephantine statues, made him an extremely versatile artist whose work inspired generations of artists after him. It was largely due to his reputation that Athens became the trendsetter for Greek sculpture. Although none of his works survived to modern times, his art was immortalized in the descriptions of ancient writers, engraved on coins of the day, and copied by lesser artists.

**FIRST MAJOR WORK.** The "Attic Style" which developed in Athens during the period of Phidias' dominance absorbed the other regional styles in Greece with the exception of the Peloponnesos where the city of Argos maintained its reputation in bronze casting and its independent artistic traditions. Phidias himself was a product of the workshops of Argos; according to tradition he had been trained by Hegias and Ageladas, who also trained Myron. His first large commission seems to have been at Delphi, where Athens commissioned a monument to honor its victory over the Persians at the battle of Marathon in 490 B.C.E. The monument dates to some 25 years after the battle, during the political heyday of Cimon, the son of Miltiades who was the architect of the victory at Marathon. Of the sixteen bronze statues on the monument, which included depictions of gods, heroes of Athenian tribes, and Miltiades himself, thirteen were by Phidias.

**EARLY ATHENA STATUES.** Besides his *Athena Parthenos*, Phidias produced several other cult statues of the goddess. He sculpted his *Athena Areia* to celebrate another Greek military victory, although ancient writers disagreed as to which one. The drapery of her clothes was gold-covered while her flesh was crafted in ivory, a composite technique that was a hallmark of his style. Sometime around 450 B.C.E. he sculpted the famous bronze statue of *Athena Polias*, later known as *Athena Promachos* (Athena who fights in the forefront of the battle), which is estimated to have been around seven and a half meters (25 feet) tall. It stood in the Acropolis of Athens where it could be seen by nearby ships. Both of these Athenas are depicted as warriors, and contrast with a more peaceful presentation of the goddess in his bronze of Athena known as the *Athena Lemnia*, produced about the same time. It was probably dedicated by a group of

Athenians who were going to the island of Lemnos as military colonists to secure Athens' hold on the island. A Roman copy of the *Athena Lemnia* was found. Its head—now in Bologna, Italy—and the body—now in Dresden, Germany—fit together to give modern scholars an idea of what the original statue looked like.

**ATHENA PARTHENOS.** While these statues earned Phidias praise, his reputation was built on his creation of the chryselephantine statues *Athena Parthenos* for the Parthenon, and *Zeus* for the Temple of Zeus in Olympia, neither of which survived. A chryselephantine statue (from the Greek *khrysos* meaning “gold” and *elephantinos* meaning “ivory”) is a statue made of gold and ivory: the drapery is made of gold and the flesh of ivory, and the statue is supported on a wooden frame. In 448 B.C.E. Athens decided to build the Parthenon which still stands on the Acropolis of the modern city of Athens. Phidias, who had connections with Pericles, the leading Athenian statesman of the day, was put in charge of the sculpture on the building. Scholars disagree on Phidias' contribution to the project. It is clear from an examination of all the Parthenon marbles that a number of sculptors were at work, but Phidias may have been responsible for the overall design. There is no doubt, however, that the great chryselephantine statue of *Athena Parthenos* that stood inside the temple was by Phidias. She stood more than twelve meters (40 feet) high, and over a ton of gold went into making her clothes. Her robe, however, was made of pieces of gold that could be removed easily and melted down if financial stringency made it necessary. *Athena Parthenos* literally carried a large share of the Athenian treasury on her back.

**ZEUS AT OLYMPIA.** There is some question as to when Phidias worked on his famous *Zeus* at Olympia. Some scholars argued that it was actually completed before he started work on the Parthenon, sometime around 448 B.C.E. There is evidence, however, that Phidias was charged with impiety in Athens sometime around 432 B.C.E., possibly because he included a representation of both himself and Pericles on Athena's cult statue. The resulting trial may have forced Phidias' departure to Elis, where he kept a workshop and created the *Zeus*. The later date is further supported by the style of a piece of black-glaze pottery which reads “I belong to Phidias” on the bottom discovered in the remains of this workshop. At the time of Phidias' arrival to Elis, the temple of Zeus at Olympia had already been built but still lacked a statue. The seated statue Phidias created was even larger than the *Athena Parthenos*, so large, in fact, that one ancient observer noted that were *Zeus* to rise from his seated position, he would unroof the temple.

**UNCERTAIN ENDS.** The fates of Phidias' monumental works are unknown, as is the death of their creator. His statue of *Athena* in the Parthenon was destroyed by fire in the second century C.E., but was restored by the emperor Hadrian. It was removed by imperial decree, probably to Constantinople, in the fifth century C.E. The *Zeus* of Olympia was also taken to Constantinople at which point it disappeared from history.

#### POLYGNOTUS

c. 500 B.C.E.–c. 440 B.C.E.

##### *Painter*

**INNOVATIONS IN PAINTING.** Polygnotus, a Greek painter who introduced several innovations to his craft, was born on the island of Thasos in the northern Aegean Sea although he lived in Athens during the first half of the fifth century B.C.E. He was the son of a painter of Thasos, Aglaophon, and adhered to the familiar pattern of a son following his father's trade. The historian Pliny the Elder, writing in the first century C.E., credited Polygnotus with being the first to paint women with transparent garments revealing the body beneath them, and to show them with multicolored headdresses. He treated the faces and mouths of his human figures in a freer, more naturalistic manner than his predecessors. The famous Greek philosopher Aristotle praised Polygnotus' ability to represent the characters of his human figures. His effort to represent space and depth in his pictures was also an innovation. Polygnotus was not satisfied with placing all his figures in the foreground, on the baseline of the picture, as was typical in pictures of the time. Instead he tried to represent depth in his paintings by placing figures that were more distant on a higher level than that which were nearer to the viewer. There is evidence of similar experiments in red-figure vase painting about the time that Polygnotus was active, indicating his influence on that medium.

**WORKS.** Since none of his paintings survived, knowledge of his works comes entirely from descriptions of them by later writers. The Greek writer Pausanias who wrote an account of his travels in Greece in the second century C.E. mentioned a painting by Polygnotus in the picture gallery in the north wing of the Propylaea, the

monumental entrance to the Athenian Acropolis. He also saw Polygnotus' picture of an episode in the sack of Troy in the *Stoa Poikile* ("Painted Porch") in the Athenian marketplace. It was painted on wooden panels attached to the wall of the porch, the foundations of which have recently been uncovered, and must date soon after 460 B.C.E. His work on the Stoa may have been the reason that Athens conferred citizenship on him in an era when Athens rarely gave aliens such an honor. His most famous works were at Delphi, however, where he did paintings of the Sack of Troy and of the Underworld—that is, the world of the dead—in the *Lesche*, or club house of the Cnidians, built by the city-state of Cnidus sometime between 458 and 447 B.C.E. The foundations of the *Lesche* survive, and Pausanias provided a detailed description of Polygnotus' paintings there.

## PRAXITELES

c. 400 B.C.E.—Before 326 B.C.E.

### *Sculptor*

**LEADING GREEK SCULPTOR.** Praxiteles of Athens was the leading Greek sculptor of the fourth century B.C.E. and introduced several innovations to the medium that significantly influenced Hellenistic sculpture. He more than likely belonged to a family of sculptors; his own sons, Cephisodotus and Timarchus, followed in his footsteps, and the fact that he named his first son Cephisodotus indicates that his own father was also Cephisodotus (given names skipped a generation). Praxiteles' father is likely the Cephisodotus who carved a famous statue of *Eirene* (Peace) and *Ploutos* (Wealth) which was set up in the marketplace in Athens in the 370s, perhaps after 374 B.C.E. when Athens made peace with Sparta. The statue betrays some of the characteristics for which Praxiteles would be famous, including a humanizing of the gods that is a departure from the more formal representations of the gods in the fifth century B.C.E.

*Eirene* is shown as a goddess carrying the infant boy Ploutos on her left arm. Cephisodotus managed to portray the psychological interaction between the goddess and the child: the goddess looks tenderly at him, and he stretches out his hand to her in a gesture of trust. On the immediate level this is a portrayal of a mother and child; only after a moment's thought does the onlooker realize that this is an allegorical sculpture.

**PRAXITELEAN CURVE.** The same tenderness is evident in the one genuine statue of Praxiteles that has survived, his *Hermes and the Infant Dionysus* found in the temple of Hera at Olympia in 1877. While it is unclear whether the statue is the original or a copy, Praxiteles' distinctive style is obvious. Instead of the defined muscles of the previous century's statuary, Praxiteles created statues with softer, more fluid lines, and composed his statues along a languid 'S-curve' that became known as the "Praxitelean curve." His *Apollo Sauroctonus* also illustrates the dreamy quality of Praxiteles' work. The statue of the god Apollo as a young boy has him leaning against a tree trunk, on the verge of killing a lizard with an arrow. Roman copies of the work in both bronze and marble highlight Praxiteles' ability to portray the gods as emotional beings.

**APHRODITE OF CNIDUS.** Praxiteles worked both in bronze and marble, but marble seems to have been his most successful medium. Marble was the material for his most famous statue, the *Aphrodite of Cnidus*, that brought tourists to Cnidus, anxious to view the statue. It was the first statue to show a woman naked, and its appeal was perhaps more erotic than artistic. The goddess is shown as if she was surprised by an intruder while she was bathing. One hand shields her pudenda from view, but there is a slight smile on her lips and a hint of welcome to her expression. The statue was exhibited at Cnidus so that it could be viewed from all angles, and it was the first of many female nudes that Greek sculptors would produce.

**LEGACY.** Altogether seventy works have been associated with Praxiteles, though some may be by members of his workshop. He died sometime before 326 B.C.E., leaving his sons to carry on his style. The Praxitelean school became enormously influential in early Hellenistic sculpture as other sculptors sought to emulate the delicacy of expression and fluid lines he introduced in his works.

## ZEUXIS

Fifth century B.C.E.–Fourth century B.C.E.

*Painter*

**MASTER OF REALIST PAINTING.** The Greek artist Zeuxis was born in the city of Heraclea in southern Italy sometime in the fifth century B.C.E. While still a young man, he travelled to Athens and built his reputation as one of Greece's best realist artists there. His style carried on the artistic innovation known as *skiagraphia* ("shading") developed by the little-known master Apollodorus of Athens. The technique modulated light and shade so as to imitate what the eye sees in nature, thus giving figures the appearance of weight and volume. Apollodorus remarked wryly in an epigram that Zeuxis robbed this artistic technique from his masters and made it his own. Regardless of the originality of his style, Zeuxis indeed was a master of it, and became very wealthy on commissions for his work. He even displayed his wealth at the Olympic Games one year by wearing garments into which his name had been woven with gold thread.

**WORKS.** None of Zeuxis' works survived to modern times, which means all that is known of his art comes from the descriptions of ancient writers. Aristophanes' comedy, the *Acharnians*, produced in 425 B.C.E., has a reference to his famous painting of the god of Love, Eros, wreathed in flowers. Another of his paintings was a renowned work of Zeus on his throne, with the other gods standing by, and another of the infant Heracles strangling the two serpents that Hera sent to kill him. The comic essayist Lucian of Samosata (second century C.E.) described a family of centaurs painted by Zeuxis—an unusual subject for a painting, but in keeping with Zeuxis' penchant for themes beyond the normal fare of gods, heroes, and wars. Lucian remarked that a copy of this work existed in Athens in his time, but the original had been stolen by the Roman general Sulla who sacked Athens in 86 B.C.E. and lost at sea during the journey to Rome. According to a legend, Zeuxis was so skilled at realist painting that birds attempted to eat the grapes he painted. Ever the perfectionist, Zeuxis was apparently disappointed that the boy he had painted with the grapes had not been sufficiently real to scare them off. His monochrome etchings on a white background were also

notable, but what made his reputation was his skill at producing realistic figures in color.

## DOCUMENTARY SOURCES *in Visual Arts*

Anonymous, the "Critian Boy" (c. 480 B.C.E.)—The "Critian Boy" is a *kouros* that was dedicated on the Acropolis of Athens just before the Persian invasion of 480 B.C.E. It was damaged in the sack of Athens and buried after the Athenians recovered their city. The facial expression is sober but the "archaic smile" has disappeared, and the style of the "Critian Boy" dates it to the beginning of the early classical period. It gets its name from the resemblance of its head to the statue group of the "Tyrannicides" sculpted by Critias and Nesiotes in the decade after the Persian sack.

Anonymous, the "Zeus" from Artemisium (c. 470 B.C.E.)—This bronze statue, now in the National Museum of Greece in Athens, was found in the waters off Cape Artemisium, the northern tip of the island of Euboea. It shows Zeus striding forward like the "Tyrannicides" and hurling a thunderbolt. The thunderbolt is lost, and thus it is a matter of debate whether the statue portrays Zeus or Poseidon hurling his trident, but on the whole it seems more likely that it is Zeus. It is a rare survivor of a bronze statue from the early classical period. The sculptor is unknown, but one suggestion is that it was Ageladas, the teacher of the sculptor Myron.

The *Ara Pacis* of Augustus in Rome (9 B.C.E.)—The *Ara Pacis* ("Altar of Peace") is a modest altar similar in size to the "Altar of the Twelve Gods" in the marketplace of Athens. It was reconstructed on the banks of the Tiber shortly before the outbreak of World War II. Its sculpture speaks the language of Augustan propaganda; one famous relief shows "Mother Earth" with the blessings that peace brings: children brought up without fear, flocks and herds that multiply, and bountiful crops from the fields.

Critias and Nesiotes, *The Tyrannicides* (c. 475 B.C.E.)—In 514 B.C.E., Aristogeiton and Harmodius assassinated Hipparchus, the brother of the tyrant of Athens, Hippias, and though Hippias himself was not driven out

until four years later, thanks to the intervention of Sparta, the Athenians preferred to remember Harmodius and Aristogeiton as the heroes who delivered them from tyranny. To commemorate their deed, a statue group by the sculptor Antenor was erected in the Athenian marketplace shortly after Hippias was expelled, but the Persians took it as booty when they captured Athens, and the Athenians commissioned a replacement by Critias and Nesiotes. A good Roman copy was found in the villa of the emperor Hadrian at Tivoli outside Rome. The statue group, which shows the two men striding forward to attack Hipparchus, is a good example of early classical sculpture, comparable to the Zeus hurling a thunderbolt found off Cape Artemisium.

Lysippus, *Apoxyomenos* (c. 325 B.C.E.)—The *Apoxyomenos* or “Athlete Scraping Himself,” marked a break with the sculptural tradition of Polyclitus of Argos. The *Apoxyomenos* is a three-dimensional figure with no clearly defined front or back. It looks forward to the art of the Hellenistic Age.

Myron, *The Discus-Thrower* (c. 455 B.C.E.)—Several Roman copies of *Discus-Thrower* by Myron survive, the best of which is in the Terme Museum in Rome. It shows an athlete in the act of hurling a discus, his head and body turned in a twisted, yet harmonious pose. The original statue was in bronze.

Phidias, *The Athena Parthenos* statue for the Parthenon (c. 440 B.C.E.)—Phidias was the most prominent Athenian artist in the mid-fifth century B.C.E. and his two most famous works in the ancient world were his cult-statues for the temple of Athena Parthenos in Athens and the temple of Zeus at Olympia. He was in charge of making the sculptures for the Parthenon, but how many of the surviving sculptures were carved by him is a matter of debate.

Polyclitus, *Doryphoros* (c. 440 B.C.E.)—Polyclitus’ bronze *Doryphoros*, or “Youth Bearing a Spear,” exemplifies the proportions of the male nude which he set forth in his *Canon*. A good Roman copy was found in the palaestra (gymnasium) at Pompeii, where it was buried by the eruption of Mt. Vesuvius in 79 C.E. The *Doryphoros* is a broad-shouldered youth who rests his weight on his right leg while his left is placed sideways and drawn back. The veins and muscles of his chest, abdomen, and biceps are all portrayed accurately.

Praxiteles, *Hermes with the Infant Dionysus* (c. 350 B.C.E.)—Praxiteles’ *Hermes* was found at Olympia, in the Temple of Hera, where the Greek traveler Pausanias reported that he saw it in the second century C.E. Thus this statue is almost certainly an original by Praxiteles. Praxiteles was also famous for his nude *Aphrodite of Cnidus*, the first female nude which inspired many more, including the famous *Venus di Milo*.

## GLOSSARY

**Abacus:** A flat, square-shaped slab forming the top of a column capital.

**Academy:** The school established by the philosopher Plato about 385 B.C.E. in the park and gymnasium on the outskirts of Athens sacred to the hero Academus, from whom the Academy took its name.

**Acanthus:** A plant known in English as brank-ursine, the leaves of which are used as a decorative motif on Corinthian capitals.

**Acheron:** A river in southern Epirus in north-west Greece which disappears underground at several points. It was therefore thought to flow into the Underworld and hence an Oracle of the Dead was situated on it.

**Acropolis:** The “high place” or citadel of a Greek city—an easily-defensible, fortified hill within the city walls. It was usually the oldest part of the city.

**Adyton:** An inner chamber at the rear of a temple.

**Aegis:** The shield of Zeus which flashes forth amazement and terror. The goddess Athena also has an aegis, which is shown in works of art not as a shield, but as a short cloak covered with scales, fringed at the bottom and with a Gorgoneion set in the center of it.

**Aeolian:** The dialect of Greek spoken by the Greeks of Aeolis. The dialect of Sappho and Alcaeus.

**Aeolis:** The territory of the northernmost group of Greek immigrants who migrated to the west coast of Asia Minor after the fall of the Mycenaean civilization. They

mobbed from Thessaly and Boeotia to settle the region stretching southward from the entrance to the Hellespont, including the island of Lesbos.

**Aer:** Air. The Presocratic philosopher Anaximenes believed that the basic matter of the world was *aer*, a substance more like mist than pure air, that was transformed by expansion or contraction into water, earth and all other natural things.

**Aetiological Myths:** From the Greek word *aitia* meaning “the reason why.” An aetiological myth tells why familiar objects or practices originated.

**Agathos Daimon:** The “Good Spirit” or the “Good Luck” of a household.

**Agoge:** The term used for the strict, militaristic education of Spartiate youths.

**Agora:** The marketplace of a city: both its commercial and administrative center.

**Akroterion:** (plural: *akroteria*) An ornament placed on the peak of the gable of a temple roof, or on the corners of the roof.

**Alexandria:** A port city of Egypt slightly to the west of the Canopic mouth of the Nile River. Here, where there was already an Egyptian village named Rhacotis, Alexander the Great founded a city named after himself on 7 April 331 B.C.E., which would become the capital of the Ptolemaic dynasty that ruled Egypt after Alexander’s death, and one of the great cultural centers of the Hellenistic world.

**Alexandrian Library:** A great library in Alexandria probably founded by King Ptolemy I but greatly extended by Ptolemy II (308–246 B.C.E.). Estimates of the number of scrolls which it held range from 100,000 to 700,000.

**Altar:** A platform where sacrifices were made. If connected with a temple, it was outside the entrance, usually on the east side. In Christian churches, the altar was inside, generally at the east end of the church, and was where the bread and wine were offered and blessed as Jesus' body and blood during the sacrament of the Eucharist.

**Ambo:** The pulpit in a Christian basilica. A basilica would have two of them on either side of the church, one for reading the epistle and the other for reading the Gospel.

**Ambulatio:** A terrace where one might walk for exercise.

**Amnisos:** A Minoan harbour town on the northern shore of Crete, where a Minoan villa known as the "House of the Lilies" has been excavated. The Homeric hero Idomeneus is supposed to have set sail from Amnisos to fight in the Trojan War.

**Amphictyony:** A league of devotees of a religious sanctuary whose duty it was to protect and maintain the cult. The word derives from the Greek *amphiktiones* meaning "those who live in the vicinity." Important amphictyonies, however, like the Delphi amphictyony, had representatives from many parts of Greece.

**Amphidromia:** Literally "a running around." A religious ceremony marking the birth of a child where the father of the house carried the five-day-old infant around the ancestral hearth.

**Amphiprostyle:** With columns at the front and rear of the building, but not along the sides.

**Amphora:** A crockery container, normally two-handled, which was the standard storage pot of the ancient Mediterranean world. A type of amphora with a pointed end was used instead of barrels to transport olive oil, wine and other products. Another type, decorated and with a base, was used to keep wine and olive oil for domestic use, and sometimes an amphora filled with wine or olive oil served as a prize in athletic games—for instance, in the Panathenaic Games in Athens, the prize for the victors was an amphora of olive oil, always decorated in black-figure technique.

**Anax:** *See* Wanax.

**Andron:** A principal room in a Greek house, used as the dining room. It was part of the men's quarters in the house—the literal meaning is "belonging to men."

**Aniconic:** Without human features.

**Anta:** (plural: *antae*) The end of a wall, thickened often to form a pilaster. Columns *in antis* are columns at the end of a building between two antae.

**Anthesteria:** A flower festival (the Greek *anthos* means "flower") held in Athens on the 12th of the month Anthesterion in the Athenian calendar, roughly equivalent to the end of February and the beginning of March. The day before, on the 11th, the wine jars with the new wine were opened, and on the 12th, the wine was ceremonially blessed by the god of wine, Dionysus.

**Antioch-on-the-Orontes:** A city founded by Seleucus I in 300 B.C.E. on the Orontes River in Syria some fifteen miles from the sea. It became one of the capitals of the Seleucid Empire—the other was Seleucia-on-the-Tigris, founded in 312 B.C.E., which displaced Babylon as the major center for trade between east and west.

**Antonine Age:** Strictly speaking, the reigns of the Roman emperors Antoninus Pius (138–161 C.E.), Lucius Verus (161–169 C.E.), and Marcus Aurelius (161–180 C.E.). However the term is sometimes used to embrace the period from 96 to 180 C.E., when reigning emperors adopted their successors, thereby avoiding wars over the succession.

**Aoidos:** Singer, or bard, who performed, accompanied by the lyre, at festivals or private banquets.

**Apeiron:** Matter without any limit. According to the Presocratic philosopher Anaximander, the basic matter of the universe was vast, boundless substance where everything was mixed together, out of which the world as we know it emerged.

**Apotheosis:** The act of making a person into a god; deification.

**Apotropaic:** Designed to frighten away malignant spirits or ward off the evil eye.

**Apse:** The half-vaulted, semi-circular end of a building. A building with an apse at one end is called "apsidal."

**Archaic:** The term applied to the period of Greek culture from about 600 to 480 B.C.E.

**Architrave:** The course of masonry immediately above the column capitals, which supports the superstructure.

**Archon:** The highest public office in archaic Athens to which nine citizens were originally appointed and later chosen by lot from forty elected candidates, and after 487 B.C.E., from five hundred elected candidates.

**Areopagus:** The "Hill of Ares" (or Mars' Hill), a rocky outcropping which is directly opposite the entrance to the

- Athenian acropolis. The ancient Council of the Areopagus, composed of ex-archons, met there.
- Aristocracy:** Rule by the *aristoi*—the “best people.” The class of “best people” was usually defined by birth.
- Arris:** In the Doric order, the sharp ridge where the flutes of the column join.
- Ashlar:** A masonry style where the stones are cut and dressed into rectangular blocks and are laid in regular courses.
- Atrium:** The main room of a Roman house, with an aperture in the center of the roof for light, air and rain called the *compluvium* which had a catch basin directly under it called an *impluvium*. In Late Antiquity, the courtyard in front of a Christian basilica, with a fountain in the center where worshippers could wash, was called an atrium.
- Attic:** (1) The upper story of a Roman building. (2) On a Roman triumphal arch, a slab directly above the archway where an honorific inscription was carved.
- Augur:** In Rome, a member of a “college” or body of priests who predicted the future by observing and interpreting the path of lightning, the flight of birds, the feeding of sacred fowls and any unusual occurrences.
- Augustan Age:** The period when Rome was ruled by the emperor Augustus (27 B.C.E.–14 C.E.).
- Augustus:** A Latin adjective meaning “worthy of esteem and reverence.” In 27 B.C.E., the Roman senate conferred the title “Augustus” on Octavian, the heir of Julius Caesar who had made himself master of the Roman Empire by defeating Mark Antony and Cleopatra at the Battle of Actium (31 B.C.E.), and henceforth the title was born by all emperors.
- Aulos:** Often mistranslated as “flute,” the *aulos* was a reed-instrument which was an early ancestor of the modern oboe which was developed in the seventeenth century C.E. The double *aulos* had two pipes, and to assist the piper’s breath control, he wore a leather band called a *phorbeia* like a halter around his head and over his mouth, with holes just large enough for the pipes to poke through.
- Aurelian Wall of Rome:** The Roman wall, most of which survives to this day, built by the emperors Aurelian (270–275 C.E.) and Probus (276–282 C.E.).
- Auxilia:** Units of the Roman army made up of non-Roman citizens recruited in the provinces of the Roman Empire. On Roman monuments they are shown wearing chain mail or scale armor rather than *lorica segmentata* which seems to have been reserved for the Roman legions made up of Roman citizens. When the auxiliary trooper retired after twenty-five years of service, he would receive Roman citizenship — until 212 C.E. when the emperor Caracalla extended citizenship to almost of the inhabitants of the Roman Empire.
- Balneum:** A private bathroom in a Roman house, or a modest public bath, as distinct from the *thermae*, which were the great public baths, such as the Baths of Caracalla in Rome.
- Barbitos:** A type of lyre with long curved arms, favored by Greek courtesans. Also known as *barbiton*.
- Bard:** A poet, often illiterate, who improvised and recited narrative poetry of his own composition, usually with musical accompaniment.
- Baroque:** Characterized by curved, dynamic, elaborately-carved forms.
- Basileus:** In Homeric times, a local ruler like Odysseus or Menelaus, as distinct from the *wanax* or “high king” who seems to have been divine. In the city-states of Classical Greece, a magistrate with priestly functions was often called a *basileus*—one of the archons of Athens was called the “archon *basileus*.”
- Basilica:** A type of Roman hall built to house law-courts. The building type was adapted first by the Jews for synagogues, and after the conversion of Constantine I to Christianity, the type was used for the earliest Christian churches. A typical early basilical church faces west, with a narthex or oblong vestibule across the front end, and in the interior, a central hall (nave) with aisles on either side and an apse at the end wall.
- Beehive tomb:** A Mycenaean tomb with a false or corbelled vault, resembling an old-style beehive.
- Bema:** A rostrum or platform used by a speaker to address a crowd or preside over a meeting.
- Black-figure Technique:** A technique of decorating pottery whereby the figures were shown in black silhouette with incised detail, and the background was the natural reddish color of the clay.
- Boeotia:** The region in Greece northwest of Attica, where the chief city-state was Thebes.
- Breastplate:** Metal armor worn to protect the chest and midriff of a soldier.
- Breccia:** A composite rock made up of fragments of stone that have been compressed together. Also called “conglomerate” or “pudding stone.”

- Byzantium:** A colony founded at the entrance to the Black Sea by the Greek city-state of Megara in 667 B.C.E. The city was refounded as Constantinople (dedicated in 330 C.E.) but the old name survived and hence the eastern Roman Empire which lasted until 1453 C.E. is known as the “Byzantine Empire.”
- Caldarium:** The “hot room” of a Roman bath-house where hot water was available for bathing.
- Caliga:** A leather shoe, especially the leather boot worn by Roman soldiers.
- Cantica:** A passage in a Roman comedy which the actor sang, accompanied by a piper (*tibicen*).
- Capital:** The spreading element that caps a column, forming a transition between the vertical shaft of the column and the horizontal elements of the architrave.
- Capitolium:** The steep hill and the west side of the Roman Forum where the temple of Jupiter Optimus Maximus was built.
- Cardinal virtues:** The four cardinal virtues as listed in Plato’s *Republic* are Justice, Wisdom or Prudence, Courage, and Self-Control.
- Cardo:** In a Roman town plan, the main north-south road which is bisected by the decumanus.
- Caryatid:** A figure of a woman used in architecture to support the entablature of a building in place of a column.
- Catacombs:** Underground graveyards excavated by Christians and Jews, found particularly at Rome but also in places like Naples and Syracuse where the geology was suitable for tunneling. They consisted of a network of tunnels lined with brackets for depositing the bodies of the dead.
- Cavea:** The seating area of a Greek or Roman theater.
- Causia:** Light-colored, broad-brimmed, felt hat of Macedonian origin worn to shield the wearer from the sun and the rain. In Rome, it was worn by poorer people as protection against the sun.
- Cecrops:** The mythical first king of Athens, often represented with a snake’s tail.
- Cella:** The main room of a Greek temple where the cult statue was housed.
- Centauiromachy:** Battle between the heroes known as the Lapiths and the centaurs, who gate-crashed the wedding of the king of the Lapiths, and tried to rape the women, but were driven out. The west pediment of the Temple of Zeus at Olympia shows a centauromachy.
- Chamber Tomb:** An irregularly shaped underground room used for burial, frequently approached by a corridor or *dromos*.
- Charon:** In Greek mythology, the old ferryman who conveyed the ghosts of the dead across the rivers of the Underworld. Greeks would put a coin in the mouth of a corpse as a fee for Charon.
- Charun:** An Etruscan demon with a fiendish face who carried a long-handled hammer and conducted the souls of the dead to the Underworld.
- Chiaroscuro:** The use of light and shade to give the effects of shape and mass in painting.
- Chimaera:** A mythical monster slain by the hero Bellerophon. It had the head and body of a lion, a snake for a tail, and a goat’s head emerging from its back.
- Chiton:** A lightweight Greek garment made from a single piece of cloth, belted and with a buttoned sleeve. The Doric chiton was thigh or knee-length; the Ionic chiton was more elaborate and reached the ankles.
- Chlamys:** A short cloak fastened at the shoulder.
- Chryselephantine:** A statue constructed of gold and ivory; such statues usually had a wooden core.
- Chthonic:** Meaning “belonging to the earth,” this adjective is applied to the gods of the Underworld.
- Cipollino:** A greyish marble with streaks of white or green favored by Roman builders.
- Cithara:** A large stringed instrument used in concerts, festivals and theaters. It was the ancestor of the guitar.
- City Dionysia:** A festival held each spring in Athens in honor of the god Dionysus, where tragedies and comedies as well as dithyrambs were presented.
- Classical Period:** The period of Greek cultural history from 479 B.C.E. when the Persian Empire’s invasion of Greece was repulsed, to the death of Alexander the Great (323 B.C.E.).
- Cnossos:** The site of the Labyrinth of King Minos of Crete where he kept the legendary Minotaur. In 1900 C.E. Sir Arthur Evans discovered the remains of a great sprawling palace there and revealed the Minoan civilization of Bronze Age Crete.
- Colonnade:** A row of columns supporting an *entablature*.
- Columbarium:** A dovecote. The word was also used for a structure with little compartments built into the wall to receive the ashes of the dead after cremation.

**Concrete:** Roman concrete was made from lime mortar, volcanic sand, water and small stones. It was placed in wooden frames and left to dry with a facing of brick or stone or a marble revetment.

**Conglomerate:** *See Breccia.*

**Contrapposto:** A stance in which the body's weight is supported on one leg, so that a contrast is formed between the tension of one side and the relaxation of the other.

**Corbeling:** A system of supporting courses of masonry or wood by extending successive courses beyond the face of the wall. Thus a "corbeled" or false vault can be constructed by thrusting each course of a circular wall slightly closer to the center until it comes together at the peak.

**Corinthian Order:** A development of the Ionic order of architecture, but with a capital of stylized acanthus leaves.

**Cornice:** Horizontal molded projection above the frieze of a temple. Also called a "geison."

**Cornu:** A Roman bugle, or curved horn.

**Cosmogony:** A myth that accounts for the origin and nature of the world.

**Crepidoma:** The platform on which a Greek temple was built, consisting of the stereobate and the stylobate.

**Crotalum:** A castanet used to accompany dances, to accentuate the rhythm.

**Cubiculum:** A bedroom in a Roman house.

**Cuirass:** Metal armor worn to protect the chest and the back.

**Cyclades:** The southern islands of the Aegean Sea, especially Delos, Paros, Naxos, Siphnos, Melos and Thira, which is the southernmost.

**Cycladic:** The term applied to the prehistoric culture found on the Cyclades Islands, 3000–1550 B.C.E.

**Cyclopean:** Belonging to the mythical primitive giants called Cyclopes. The term is applied to the Bronze Age masonry fortifications made of huge, irregular blocks.

**Dactyl:** A "foot" (a group of syllables forming a metric unit in verse), consisting of one long syllable and two short syllables—the long syllable would be held twice as long as the short syllable, and hence when the verse was sung, the dactyl was the equivalent of a half note followed by two short notes.

**Dactylic Hexameter:** A line of poetry consisting of six dactyls or their equivalent. This was the meter used for

epic poetry, such as the epics of Homer in Greek or Vergil's *Aeneid* in Latin.

**Dado:** The lower part of the wall of a room decorated differently from the upper part, often with colored marble or stucco.

**Daedalic:** From the legendary Minoan craftsman, Daedalus. The term is applied to a type of human figurine appearing about the end of the eighth century B.C.E., and belonging to the Orientalizing Period of Greek art, with the following traits: frontality (they face forward), rigidity, flatness, low brows, triangular faces, big noses and eyes and flat skulls.

**Daimon:** A spirit, or a manifestation of supernatural power. A man might have a good or an evil *daimon* which followed him through his life. Christianity impressed upon the word the meaning of "demon" which is now its common significance.

**Dark Ages:** A term applied nowadays to the period of Greek history (1100–900 B.C.E.) when Greece was illiterate.

**Decumanus:** In a Roman town plan, the main east-west road. The main street was called the "decumanus maximus."

**Delphi:** A small sacred city-state in central Greece north of the Corinthian Gulf, where the oracular shrine of Apollo was located on the slopes of Mt. Parnassus.

**Delphic oracle:** The oracle of Apollo at Delphi, where non-Greeks as well as Greeks could seek advice about the future. *See Oracle.*

**Deme:** A district or township. "Demes" were ancient townships of Attica which were distributed by Cleisthenes, the founder of the Athenian democratic constitution, into ten *phylai* or "tribes" that became the basic political units of Athenian government.

**Demigod:** A hero: a semi-divine person who still possessed some supernatural powers even though his soul (or "shade") was in the Underworld.

**Demiourgos:** The divine being in Plato's dialogue, the *Timaeus*, who creates the world out of pre-existing matter.

**Dentil:** Toothlike projection on an Ionic epistyle.

**Deus ex machina:** A "god (descending) by stage machinery" The term is used for a conclusion of a tangled plot of a tragedy which is resolved by the intervention of a god.

**Diadem:** A headband tied at the back of the head. Constantine I, the first Christian emperor, made a diadem encrusted with pearls the normal imperial head-dress.

- Dialogue:** A discourse consisting of question and answer on a political or philosophical subject. The most important source of the dialogue form was the conversations of Socrates, and the dialogue became the favorite medium of Plato for publishing his philosophic ideas.
- Diazoma:** A walkway dividing the upper tiers of seats from the lower in a Greek theater.
- Didactic literature:** Literature intended to teach or to inform the reader.
- Didascalia:** In Greece: the “teaching” of a play or dithyramb to the chorus that was to perform it by the poet or professional trainer who was employed for the task. The term is also used to refer to all aspects of the production of a play or a dithyramb.
- Didascaliae:** The plural form of “didascalia.” In Greece it was used to refer to the records of performances, including the names of victorious tribes, poets, *choregi*, actors and auletes for each year and of the plays that were staged at the festivals in honor of Dionysus. In Rome, the term is used for the brief remarks that preface the plays of Terence, describing the first performances of the plays, mentioning the composer and the type of music, the Greek originals from which the plays were adapted, the date of the play and so on.
- Dione:** The word means “goddess” and it is the feminine form of “Zeus.” At the oracular site of Dodona, Dione was worshipped as the consort of Zeus, and one version of the myth of Aphrodite’s birth makes her the daughter of Dione. In the canon of the Olympian gods, however, it was Hera rather than Dione who was the wife of Zeus.
- Dionysus:** God of wine and of emotional religion. Greek myth made him the son of Zeus and the mortal Semele, a princess of Thebes.
- Dithyramb:** A type of narrative choral song accompanied by dance, originally associated with Dionysus. Aristotle claimed that tragedy originated with the dithyramb.
- Dodona:** The seat of an ancient oracle of Zeus in the mountains of Epirus in north-west Greece. The center of Zeus’ cult at Dodona was a sacred oak tree and from the rustling of its leaves the will of Zeus was ascertained.
- Dorian:** (1) A dialect of Greek. (2) Greeks who spoke the Dorian dialect, who entered Greece in the so-called Dorian invasion which took place after the collapse of the Mycenaean civilization.
- Doric:** A type of architecture, characterized by fluted columns without bases, and triglyph and metope friezes.
- Dromos:** A passageway leading into a chamber tomb or a *tholos*.
- Echinus:** The lower member of a column capital.
- Eileithyia:** The Greek goddess of childbirth.
- Ekkylema:** In the Greek theater, a low trolley used to bring someone on stage such as a dying man or a corpse of a character who has been slain offstage.
- Ekphrasis:** A literary description of a work of visual art.
- Eleatic School:** The philosophy of the Eleatic School takes its name from Elea, modern Velia in southern Italy. The founder of the school was Parmenides of Elea.
- Elegiac couplet:** A verse in dactylic hexameter followed by a pentameter line (a line of five feet) with a caesura or pause in the middle. Roman poets of the Augustan Age associated elegiac poetry with sorrow, but probably early elegiac in Greece was simply poetry sung to the accompaniment of the *aulos*.
- Eleusinian Limestone:** A black limestone quarried at Eleusis west of Athens, which was used for decorative effect in marble buildings.
- Elis:** The state in the northwest Peloponnesus where Olympia, the site of the Olympic Games, was located.
- Elysium:** Elysium, or the Isles of the Blest, appears in the works of Homer and Hesiod as a place where certain favored heroes who were exempted from death were taken by the gods. It came to be regarded as a region of the Underworld reserved for persons who were righteous in their lifetimes.
- Emmeleia:** The dance associated with Greek tragedy.
- Encaustic:** A technique of painting using hot wax colored with various pigments.
- Entablature:** All parts of a building such as a temple above the columns.
- Entasis:** A cigar-like swelling of columns which is particularly pronounced in buildings of the archaic period, but is no longer found by the Hellenistic period.
- Ephebe:** A boy who has reached puberty, about eighteen to twenty years old.
- Epic:** A long, narrative poem written in dactylic hexameter meter.
- Epigram:** Originally a short verse inscription which the Greeks engraved on tombstones or votive offerings or even signposts. In the Hellenistic period, poets wrote artificial epigrams: short poems on persons long dead, or on famous works of art or on pet animals. The epi-

- gram could also be used as a vehicle for invective. Latin epigrams were occasional poetry that could sometimes be humorous, and sometimes spiteful.
- Epigraphy:** The study of inscriptions.
- Epiphany:** The appearance of a god.
- Epistle:** A letter addressed to someone. As a literary form, the epistle could be used to expound philosophy or theology. The epistle was also used as a form of poetry: for instance, Ovid's *Heroides* is a collection of fictitious love letters written by famous heroines to their absent husbands or lovers.
- Epistyle:** Another term for "architrave."
- Epitaphios:** A funeral eulogy given, according to Athenian custom, at the memorial service held each year for the men who had fallen in battle.
- Epithet:** In epic poetry, an adjective applied to a hero, such as "Achilles, swift of foot." Divine epithets were surnames given to the gods, sometimes indicating some aspect of a god's activity, such as "Zeus, the cloud-gatherer," or in Rome, "Mars *Uitor*," that is, "Mars the Avenger." Sometimes the divine epithets are puzzling, such as "Owl-eyed Athena," or "Apollo *Lykeios*" which might mean "Apollo the Wolf-God" or "Apollo of Lycia" (Lycia was in south-west Asia Minor).
- Epyllion:** A type of narrative poem, popular in the Hellenistic period, where certain episodes, usually not the central ones, are taken from the context of old legends and carefully reshaped, while the remaining themes of the legend are left on the fringes of the narrative.
- Erinyes:** The "Furies." Snaky, winged creatures born of the earth who pursue mortals guilty of matricide and fratricide and drive them mad.
- Eros:** Sexual love or attraction. "Eros" (Latin: "Cupid") was the name of the child-god, son of Aphrodite, the goddess of love, who was depicted as a winged boy with a bow and poisoned arrows, with which he wounded men and women and infected them with sexual passion.
- Etruria:** The western part of central Italy, somewhat larger than modern Tuscany, inhabited by the Etruscans.
- Etruscans:** A people whose language has not yet been deciphered who emigrated from Asia Minor to Italy in the early Iron Age, established a number of cities in Etruria, and for a brief period, dominated early Rome.
- Euripus:** A long narrow fishpond placed in the center of a formal garden surrounded by a colonnade in a Roman villa.
- Exodos:** The "exit." In a Greek tragedy, it is the final section, after the last ode sung by the chorus.
- Fabula palliata:** A dramatic presentation on the Roman stage where the actors portrayed Greeks and wore Greek costumes, for example the plays of Plautus and Terence.
- Fabula togata:** A Roman drama, usually a comedy but sometimes historical, where the actors portrayed Roman citizens and wore togas on stage.
- Familia:** A Roman household, including father, wife, sons and daughters, domestics, slaves and freedmen.
- Fauces:** The entrance hallway into a Roman house.
- Fayyum:** The modern name for a province of Egypt in a depression in the desert west of the Nile which receives water from the Nile through a natural channel called the *Babr Yousef* ("Canal of Joseph"). In the early Ptolemaic period, the agricultural area was extended and many settlers from the Greek world came there.
- Fayyum portraits:** Portraits from Egypt, painted on wood using the encaustic technique, which were placed over the face of a mummy in the Roman imperial period. They are realistic frontal portraits of the dead person who was mummified, and they are considered the artistic forerunners of later Byzantine icons.
- Fibula:** A brooch, or safety-pin.
- Final Cause:** In the philosophy of Aristotle, the purpose or end by which an event, a thing or a process can be explained.
- Flavian Period:** The period of Roman history when the Flavian dynasty ruled, the emperors Vespasian (69–79 C.E.), Titus (79–81 C.E.), and Domitian (81–96 C.E.).
- Flora:** The Roman goddess of flowers.
- Floralia:** The festival of Flora, held on 28 April. The festival had a reputation for licentiousness where mime actresses might appear in the nude.
- Flutes:** Shallow grooves that run vertically along the shaft of a column.
- Foreshortening:** An illusionistic trick that painters use to suggest depth on a flat surface by representing forms as shorter in length than they actually are.
- Forum:** Like the Greek *agora*, the commercial and administrative center of a Roman city.
- Fresco:** A type of wall painting where the paint is applied while the plaster is not yet dry.

**Frieze:** In architecture, a horizontal band with sculptural decoration.

**Frigidarium:** The cold room in a Roman bath where unheated water was available for bathing.

**Fuller:** A tradesman who “fulled” woolen cloth, cleaning it, thickening it and shrinking it with moisture, heat and pressure.

**Gauls:** Celts who migrated across central Europe into France and the British Isles in the sixth century B.C.E.; in Italy, they settled in the Po River valley which became known as Cisalpine Gaul. In 387 B.C.E. they sacked Rome and in 279 B.C.E. they invaded Greece, and from Greece moved to Asia Minor where they eventually settled in Galatia.

**Geison:** A cornice.

**Geometric Style:** A type of pottery decoration that develops from Protogeometric shortly after 900 B.C.E. with various designs such as cross-hatched and wavy-lined lozenges, squares, triangles, the meander motif arranged in concentric bands around the pot. In the eighth century B.C.E. stylized human and animal forms are introduced.

**Geranos:** The so-called “crane dance”—*geranos* is the Greek word for the bird called a “crane” in English—which was danced in chorus lines of young men and women in festivals on the island of Delos.

**Glaze:** Hard, glossy surface finish for pottery.

**Gorgon:** One of three hideous female monsters in mythology, with wings, large fangs and snakes for hair. The most famous of the three was Medusa whose face turned men who looked on it into stone.

**Gorgoneion:** The head of a Gorgon, shown full-face, with protruding tongue, serving as an apotropaic device.

**Greaves:** Armor worn by an infantryman to protect his lower legs.

**Griffin:** A legendary animal with the body of a lion and the wings and head of an eagle.

**Gymnasium:** A place for exercising. The gymnasium might also be a social center and a place for learning and listening to lectures on philosophy.

**Gynaikeion:** The portion of a Greek house which was reserved for women, either at the back of the house or on the second story. Men from outside the family would not normally enter the *gynaikeion*.

**Gypsum:** An easily-worked white or pinkish-buff limestone.

**Hades:** Lord of the Underworld, which was known as the “House of Hades.” He presided over the souls of the Dead and was not counted among the Twelve Olympian Gods.

**Hagia Triada:** Site of a royal villa on Crete dating to the Late Minoan period where a cache of Linear A clay tablets was discovered.

**Haruspices:** Diviners of Etruscan origin who divined the future from portents such as the entrails of sacrificial animals or prodigies or meteorological phenomena such as lightning.

**“Harvester Vase”:** A Minoan vase of black steatite, dating to about 1500 B.C.E., found at the site of Hagia Triada on Crete, about five inches high, showing in relief sculpture a group of harvesters or sowers, singing as they go to work, or as they return from the fields.

**Helladic:** The term used by archaeologists for the civilization of prehistoric Greece, 3000–1100 B.C.E. The Helladic period is divided into “Early Helladic” (3000–2000 B.C.E.), “Middle Helladic” (2000–1550 B.C.E.) and “Late Helladic” (1550–1100 B.C.E.). “Late Helladic” is otherwise known as the “Mycenaean Age.”

**Hellenistic:** The term applied to the period between the death of Alexander the Great and the completion of Rome’s conquest of the eastern Mediterranean with the annexation of Egypt (323–30 B.C.E.), when the Greek language and culture spread across the Near East.

**Helots:** The serfs in Sparta who farmed the estates of their Spartiate overlords and gave them half the produce.

**Herculaneum:** A town with a population of about 2,000 on the Gulf of Naples, which was buried by lava and mud from the eruption of Mt. Vesuvius in 79 C.E.

**Heroon:** The shrine of a hero, a dead man who was considered semi-divine and whose soul in the Underworld received offerings.

**Hexastyle:** A building with six columns along the front, or along the front and the back.

**Himation:** A garment consisting of a large rectangular piece of cloth that was draped over the body. The standard outer garment for Greek men by the sixth century B.C.E. and for women by the fourth century B.C.E.

**Hippodamian:** Belonging to Hippodamus, an architect and town-planner of the fifth century B.C.E.

**Holocaust:** A sacrifice where the victim was completely consumed by fire, as distinguished from the usual sacrifices where only the inedible parts of the sacrificial animal were burnt.

**Hoplite:** A heavily-armed footsoldier wearing helmet, cuirass, and greaves, and equipped with a round shield and spear for thrusting, who fought in a battle-line eight ranks deep. The hoplite was the standard heavy infantryman in Greece from the eighth century to the fourth century B.C.E.

**Horns of Consecration:** Stylized bull's horns, associated with Minoan shrines.

**“House of the Faun”:** The largest house found in Pompeii, taking up a full city block, and dating from the second century B.C.E.

**Hydraulis:** The water-organ, invented by Ctesibius, an engineer in Alexandria in the third century B.C.E., which became popular in Rome as a domestic instrument and in amphitheatres as well because of its loud volume. By the fourth century C.E., organs worked with bellows had also been developed.

**Hydria:** A three-handled jar for holding water.

**Hymettian Marble:** A dark marble quarried at Mt. Hymettus outside Athens.

**Hymn:** Originally a song addressed to a god. However, hymns such as the *Homeric Hymns* were more literary than devotional and related a myth.

**Hypocaust:** Furnace in a Roman bath which not only heated the bath water but also the “caldarium” which had flues under the floor and sometimes in the walls where hot air and smoke from the furnace would be circulated.

**Hypothesis:** A conjecture or a supposition.

**Iconography:** The art of pictorial representation and illustration.

**Inductive Logic:** Inference from a finite number of particular cases to a further case or to a general conclusion. Thus if we know that twelve ducks reproduce by hatching eggs, we may conclude that a thirteenth duck will reproduce in the same way, or even reach the general conclusion that all ducks reproduce by hatching eggs.

**Insula:** Roman tenement house.

**Ionia:** The central part of the western coastline of Asia Minor and the offshore islands, settled by refugees from the Greek mainland displaced by the Dorians after the fall of the Mycenaean civilization.

**Ionic Dialect:** The dialect of Greek spoken in Ionia.

**Ionic Order:** An order of architecture, characterized by columns with bases, flutes on the columns but not with

the sharp arrises we find on Doric columns, capitals with spiral volutes and lacking a triglyph and metope frieze.

**Isthmian Games:** A Greek athletic contest held every two years in honor of Poseidon at his sanctuary at the isthmus of Corinth. The prize was a crown of wild celery.

**Judgement of Paris:** The title given to the event which caused the Trojan War. The goddesses Hera, Athena, and Aphrodite appeared before the young Trojan prince Paris who had been banished from Troy to serve as a shepherd on the hillsides because of a prophecy that he would bring disaster on Troy. Paris was asked to judge which of the three goddess should get the golden apple offered by the old hag “Discord” to the most beautiful. Paris gave the apple to Aphrodite who had promised him the most beautiful woman in the world, Helen, wife of King Menelaus of Sparta, thus earning the hatred of Athena and Hera for Troy.

**Jupiter Optimus Maximus:** Jupiter, the Best and the Greatest. The chief god of Rome whose temple was built in the Capitolium, the steep hill on the west side of the Roman Forum. It was a tripartite temple, that is, with three cellas, with Jupiter occupying the central sanctuary, and on either side, sanctuaries for Minerva and for Juno.

**Kantharos:** A deep drinking-cup with high, vertical handles.

**Keystone:** The voussoir or wedge-shaped stone at the center of an arch at the top, which locks the arch together.

**Kordax:** The dance associated with Greek comedy.

**Kore:** A maiden. The term is applied to the archaic, fully-clothed statues of young women belonging to the archaic period.

**Kotyle:** A deep drinking-cup with small, horizontal handles.

**Kouros:** A youth. The term is applied to the archaic naked male figures found from about 650 B.C.E. to the time of the Persian War (480–479 B.C.E.) which marked graves, or served as dedications to a god.

**Krater:** A large mixing-bowl used to mix wine with water before drinking it.

**Kylix:** A shallow two-handled drinking-cup.

**Lacedaemon:** The southeastern region of the Peloponnesos which belonged to Sparta.

**Laconia:** Another term for “Lacedaemon.”

**Lares:** Roman gods who gave protection against supernatural forces. The *Lar familiaris* (or in the plural, *Lares*

*familiares*) protected the family. There were also *Lares* that protected crossroads (*Lares compitales*).

**Larnax:** A casket or ossuary to hold the bones and other remains of a corpse after it was burned on the funeral pyre.

**Late Antiquity:** The period of the fourth and fifth centuries C.E.

**Latona:** The Roman name for Leto, the mother of Apollo and Diana.

**Legion:** The standard unit of the Roman army. It numbered five thousand foot-soldiers and a mounted body-guard of one hundred and twenty men, if at full strength.

**Lekythos:** (plural: *lekythoi*) A tall flask with a single handle and a narrow neck for holding oil and unguents.

**Lenaea:** A festival in honor of Dionysus celebrated in January where dramatic performances were produced. Originally it seems that comedy was preferred to tragedy. The name comes from *lene*, meaning “maenad.”

**Libation:** An offering to a god before eating or drinking. Before drinking wine, which was a part of a meal, a little of it was poured on the floor as an offering to the *Agathos Daimon* (Good Luck) to establish communion with him.

**Light-Well:** A small courtyard or an open shaft inside a building to let in light and air.

**Linear A:** A form of writing using a syllabic alphabet used in Minoan Crete. The language has not yet been deciphered.

**Linear B:** A form of writing using a syllabic alphabet used in the Mycenaean period for writing Greek.

**Lintel:** A horizontal beam bridging the top of a doorway or window in a wall.

**Lions' Gate:** The main gateway through the thirteenth century B.C.E. fortification wall at Mycenae, which has a relieving triangle above the massive lintel block and in the triangle, a relief sculpture, two lions with their heads missing, standing on an altar with a pillar between them which probably had some religious significance.

**Lituus:** A long-stemmed horn with a hook-shaped bell that was bent backwards. Used for military music in Rome.

**Logographos:** A writer of prose. In the fourth century B.C.E. the word designated a ghostwriter for speeches delivered by someone else.

**Logos:** A rational, logical account or explanation. For Heraclitus, the logos had the broader sense of a rational, ordering principle that remains constant in spite of all the apparent changes in the world.

**Lorica segmentata:** Articulated armor made of iron plates developed in the reign of the emperor Augustus (27 B.C.E.–14 C.E.). It was the body armor of Roman legionary soldiers—auxiliary troops are generally shown wearing chain mail or scale armor.

**Loutrophoros:** A tall vase for holding water.

**Ludi Scaenici:** Theatrical shows in Rome.

**Lupercal:** A grotto on the Palatine Hill in Rome sacred to Lupercus, identified with Pan.

**Lupercalia:** A festival held every February in Rome when *Luperci*, wearing only a girdle around their loins, ran around the city boundaries striking women whom they met in a ceremony supposed to make them fertile.

**Luperci:** Priests of Lupercus, identified with Lycean Pan (Pan the wolf-god) who was thought to keep the flocks and herds safe from wolves. At first these priests were chosen from young herdsmen but later young Romans of high rank might serve as *Luperci*.

**Lustral Basin:** A small, rectangular space generally thought to have a religious purpose, that is accessible from above by a short stairway.

**Lyceum:** The grove just outside Athens, sacred to Apollo Lyceus and the Muses, where Aristotle leased some buildings and founded a school in 335 B.C.E.

**Lyre:** Stringed instrument with a tortoise shell for a sound-box, or with a wooden sound-box shaped like a tortoise shell.

**Lyric poetry:** A term coined by critics in the Hellenistic period for early poetry intended to be sung accompanied by a stringed instrument or by the *aulos*, either separately or in combination. There were two types: choral lyric sung by a choir or solo lyric sung by an individual performer.

**Macellum:** A Roman market building for selling meat.

**Maeander:** A rectilinear, decorative motif that continuously winds backwards and forwards.

**Maecenas:** The wealthy unofficial “Minister of Public Relations and Propaganda” of the emperor Augustus who was the patron of the poets Vergil, Horace and Propertius as well as the pantomime, Bathyllus of Alexandria.

**Maenads:** Female followers of the god Dionysus. In art they are often depicted dancing ecstatically.

- Magna Graecia:** The term (Latin) means “Great Greece,” and it is applied to the Greek settlements in southern Italy, and sometimes it includes Italy as well.
- Mallia:** Site of a Minoan palace on the north coast road of Crete, some twenty-five miles east of Herakleion. The ancient name is unknown.
- Mausoleum of Galla Placidia:** An oratory or place of prayer in Ravenna which, according to tradition which may be wrong, is the mausoleum of Galla Placidia, half-sister of the emperor Honorius and after Honorius’ death, regent on behalf of her son. The interior has some splendid examples of mosaics of the fifth century C.E., including one showing Christ as the Good Shepherd, and another showing the martyrdom of St. Lawrence.
- Megalensia:** A procession and festival held in republican Rome in honor of Cybele the *Magna Mater* (Great Mother), where dramatic presentations were staged.
- Megaron:** The great hall of a Mycenaean palace with a hearth in the center, a vestibule and a porch with columns over the front entrance.
- Mêkhanê:** (in Latin *machina*) Part of the stage machinery of the Greek and Roman stage. The “machine” was a crane used for the entrances of actors playing gods who were lowered from Heaven, or for actors making exits to Heaven.
- Metempsychosis:** The rebirth of the soul in other bodies, a doctrine of the Pythagorean philosophers. Also called “Transmigration of Souls.”
- Metope:** A slab, often blank but sometimes decorated with relief sculptures, between two triglyphs of a Doric frieze.
- Mime:** An imitative performance. Skits in archaic and classical Greece acted out with dialogue and sometimes song and dance presenting short scenes from daily life. In the Hellenistic period, authors such as Theocritus and Herondas wrote literary mimes, intended to be read or for semi-dramatic recitation. In Rome mime troupes produced extempore performances of improbable themes. Actors, who were both men and women, wore no masks. The mimes continued to be popular even after Bathyllus and Pylades introduced the much more elaborate pantomime in the Augustan Age.
- Mimus:** A mime actor. A mime actress was a “mima.”
- Minoan:** The label applied to the culture of prehistoric Crete (3000–1100 B.C.E.), taken from the name of the legendary king Minos of Crete. The Minoan period is subdivided into “Early Minoan” (3000–2000 B.C.E.), “Middle Minoan” (2000–1550 B.C.E.), and “Late Minoan” (1550–1100 B.C.E.).
- Molding:** In architecture, a continuous decorative motif.
- Monodia:** A song sung as a solo.
- Mousike:** “Arts belonging to the Muses,” which include not only music in the modern sense of the word but dancing, poetry and literature in general.
- Muses:** Greek deities of cultural and intellectual pursuits.
- Museum:** A place connected with the arts of the Muses. The most famous Museum in the ancient world was a think-tank in Alexandria founded by Ptolemy, the first king of Egypt, which in its heyday housed about one hundred research scholars, supported by the Ptolemaic kings and later by Roman emperors. It should not be confused with the Alexandrian Library.
- Mycenae:** A Bronze Age citadel dominating the Argive plain in the Peloponnesus. Legend makes it the capital city of King Agamemnon, the commander of the Greek forces who fought in the Trojan War. Heinrich Schliemann’s excavations at Mycenae in the 1870s first revealed the Bronze Age culture of Greece, and the term “Mycenaean” is often used for the civilization of the Late Helladic Period.
- Naos:** The main room of a Greek temple; the *cella*.
- Naxian marble:** A white marble quarried on the island of Naxos in the Aegean Sea.
- Nemean Games:** A Panhellenic athletic contest held at the sanctuary of Zeus of Nemea every two years. The prize was a crown of wild celery.
- Neolithic Age:** The “New Stone Age.” Polished stone and flint are used for tools and weapons.
- Nous:** The divine mind that controls all events and processes in the universe according to the theory of Anaxagoras.
- Numismatics:** The study of coins.
- Obelisk:** A four-sided shaft, tapering towards the top, ending in a pyramidal point, which appeared in Egypt during the period of the Old Kingdom as a symbol of the sun-god Re. A number of Egyptian obelisks were brought to Rome by various emperors and erected there.
- Obol:** An iron spit used for roasting meat over a fire. The obol was also the smallest Greek unit of currency. Six obols equalled a “drachma” (meaning literally a “handful”).
- Obsidian:** Black volcanic glass used in the Neolithic Period to make sharp blades.
- Ode:** A song, often choral. The term was used by the Latin poet Horace for his lyric poems written in meters borrowed from Sappho and Alcaeus.

- Odeum:** From the Greek, *Oideion*. A small theater or roofed hall for musical performances and competitions.
- Oenochoe:** Vase used for pouring liquids, usually wine.
- Oikos:** The household, a concept that included all family members, the husband, wife, and children, as well as slaves, animals and property.
- Oligarchy:** Rule by a select group.
- Olympian Gods:** The original list of the twelve Olympian gods consisted of Zeus, his wife Hera, Athena, Artemis, Apollo, Ares, Aphrodite, Hestia, Hephaestus, Poseidon, Demeter, Hermes and Hestia. Hestia, the goddess of the hearth, was soon displaced by Dionysus. In Latin literature, these gods were given Roman names: Zeus =Jupiter, Hera =Juno, Athena =Minerva, Artemis =Diana, Apollo remained Apollo, Hestia =Vesta, Hephaestus =Vulcan, Poseidon =Neptune, Demeter =Ceres, Hermes =Mercury and Dionysus =Bacchus.
- Olympic Games:** Panhellenic games held every four years, beginning in 776 B.C.E., in honor of Olympian Zeus, at his sanctuary between the rivers Alpheus and Cladeus in the territory of the city-state of Elis in the northwest Peloponnesus. The prizes were crowns of wild olive.
- Omphalos:** A sacred stone at Delphi marking the navel of the earth. Zeus was supposed to have sent two eagles to fly from the two ends of the earth and they met in the middle at Delphi.
- Opisthodomus:** The back porch of a Greek temple.
- Opus caementicium:** Roman masonry of undressed stone laid in concrete.
- Opus incertum:** A concrete wall faced with irregularly-shaped undressed blocks of small stones.
- Opus reticulatum:** A facing of a Roman concrete wall using diamond-shaped stones.
- Opus sectile:** Irregular slabs of colored marble embedded in concrete, used mainly for floors.
- Opus signinum:** Concrete floor with fragments of terracotta, stone or marble pounded into it before the concrete had set.
- Opus spicatum:** Roman brick flooring laid out in a herringbone pattern.
- Oracle:** The response of a god to a question put to him by a worshiper. Depending upon the context, the term might also mean an oracular shrine, or the body of priests that administered the shrine.
- Orchestra:** The level horseshoe-shaped area of the Greek theater between the seats of the auditorium and the stage building.
- Orientalizing Period:** In Greek cultural history, the seventh century B.C.E. when the influence of Asian artistic traditions was particularly strong.
- Orthostate:** An upright slab, higher than the other blocks of masonry, usually placed at the foot of a wall, or a course of masonry of such blocks.
- Oscan:** The Italic dialect spoken by the Sabellian peoples who lived in central and southern Italy.
- Ossuary:** A receptacle for the bones or ashes of the dead.
- Paeon:** A hymn sung particularly to Apollo, but also to Zeus and Poseidon. It might be a hymn of thanksgiving, or it might have a military purpose—the Spartans and other Dorian Greeks sang paeans. Paeans might also be sung at banquets, after the libations were poured and before the feast began.
- Palaeolithic Period:** The “Old Stone Age,” when roughly-shaped, unpolished stone and flint tools and weapons were used.
- Palaestra:** An exercise ground used for wrestling, boxing, ball-games and similar sports.
- Palatine Hill:** A flat-topped hill on the south side of the Roman Forum where the legendary founder of Rome founded his settlement in 753 B.C.E. Later the Roman emperors built their palaces there, with the result that the word *palatium* came to mean “palace.”
- Pallium:** The Latin word for the Greek cloak known as the *himation*.
- Palmette:** A design consisting of leaves arranged like a palm shoot.
- Pan:** A woodland god native to Arcadia in the central Peloponnesus. Pan had a human body as far as the loins and goat’s legs, horns and ears. In Athens he had a cave-shrine under the Acropolis and yearly sacrifices and a torch-race were held in his honor.
- Panathenaea:** An annual festival in Athens honoring Athena. Every four years the Panathenaea was opened to non-Athenians who were allowed to compete in the events—this festival was known as the “Greater Panathenaea.” The prize for victors was always a black-figure amphora filled with olive oil.
- Panhellenic:** Encompassing all of Greece.
- Panta rhei:** A saying attributed to the philosopher Heraclitus, meaning “all things are in flux” or “everything flows.”

It means that the world is in a constant state of change, like the water in a stream driven by the current.

**Parabasis:** The section of an Old Comedy where the chorus comes forward towards the audience and addresses it directly, speaking on behalf of the author.

**Paradox:** An apparently sound argument that leads to an unacceptable conclusion.

**Parian marble:** A pure white marble with flecks of mica quarried on the island of Paros in the Aegean Sea.

**Parodos:** The song which the chorus in a Greek classical drama sang as it made its entry into the orchestra of the theater.

**Parthenia:** Songs sung and danced by young, unmarried girls to the accompaniment of the *aulos*.

**Parthians:** An Iranian people who expanded their power over Mesopotamia and the Near East in the second century B.C.E. at the expense of the Seleucid Empire. The last Parthian king was overthrown in 227 C.E. by the Persians led by the Sassanid family from Persepolis.

**Pediment:** The triangular space formed by the gable at each end of a temple.

**Pedimental Sculptures:** Sculpted figures, carved either free-standing or in relief, which fill the tympanum, that is, the space of the pediment.

**Peloponnesus:** The region of the Greek mainland south of the Isthmus of Corinth.

**Penates:** Roman gods who guarded the family larder or food storehouse.

**Pentelic marble:** White marble from Mt. Pentelikon near Athens. It contains iron oxide and turns the color of honey over time when it is exposed to the air.

**Peplophoros:** (plural: *peplophoroi*) A woman who wore a peplos.

**Peplos:** A woman's garment consisting of a rectangular piece of cloth draped around the body and fastened with brooches at the shoulders.

**Periblema:** Greek clothing, such as the *himation*, designed to be wrapped around the body.

**Perioikoi:** "Those dwelling round about"; people ethnically akin to the Spartiates but not full citizens who lived in separate communities in Laconia with a degree of self-government.

**Peripatetic School:** The Aristotelian school of philosophy. It took its name from the "Peripatos," the covered

walking-place or courtyard which was one of the buildings which Aristotle leased at the Lyceum to found his school.

**Peripteral:** Surrounded by a row of columns.

**Peristyle:** A row of columns surrounding a building such as a temple.

**Petamos:** A man's hat made of felt, with a crown and a broad brim, giving protection from the sun.

**Phaistos:** Site of a Minoan palace in south-central Crete, destroyed about 1500 B.C.E.

**Phlyax:** (1) A type of comic drama with much buffoonery that was popular in south Italy, or (2) an actor who played in a *phlyax* drama.

**Phorminx:** An ancient stringed instrument strummed with a plectrum, which is mentioned in the poems of Homer.

**Pilos:** A felt cap.

**Piscina:** Fish-pool. The term was used for pools in Roman baths or swimming pools in palaestras, or of fish-tanks in private gardens.

**Pithos:** A massive, earthenware jar for storage.

**Plataea:** The little city-state on the southern fringe of Boeotia, on the north edge of Mt. Cithaeron, which maintained its independence from Thebes by becoming an ally of Athens, probably in 519 B.C.E.

**Pnyx:** The place in Athens where the assembly (*ekklesia*) met.

**Polis:** A "city-state," including the chief urban center which was the seat of government, and the agricultural region round about it which the *polis* ruled.

**Politeia:** The constitution of a *polis*.

**Pompeii:** A city with a population of about 20,000, near the Gulf of Naples on the river Sarno, which was buried by ash and debris from the eruption of Mt. Vesuvius in 79 C.E.

**Poros:** Term used in Greek archaeology for "tufa."

**Porphyry:** A hard, fine-grained dark-red or purplish rock quarried in Egypt, favored for portraits of Roman emperors.

**Porticus:** A colonnade; the Latin translation of the Greek "stoa."

**Postern Gate:** A small gate or door at the back of a building or a building complex.

**Pozzolana:** A fine volcanic sand that was used for quick-drying cement. *Pozzolana* cement will set under water and hence is suitable for constructing piers and moles.

**Presocratic:** A label given to the Greek philosophers who generally predated Socrates, who interested themselves in natural philosophy, that is, early science.

**Prime Mover:** God, in the philosophy of Aristotle, seen as the efficient and the final cause of the universe.

**Principate:** The term given to the government instituted by the emperor Augustus who entered into an agreement with the Roman senate in 27 B.C.E. whereby the senate would be responsible for governing those provinces of the empire which were peaceful, while those provinces where significant numbers of troops had to be posted would be ruled by Augustus himself who would appoint legates to govern them.

**Proconnesian Marble:** Marble from Proconnesus in northern Greece, much favored for marble sarcophagi in the later Roman Empire.

**Pronaos:** The front porch of a Greek temple.

**Propylon:** (plural: Propylaea) A monumental entrance to a *temenos*. The plural form is used if there is more than one door.

**Prostas:** A south-facing room off the courtyard of a Greek house that allowed for maximum exposure to the winter sun.

**Prothesis:** Lying in state and ritual mourning of a dead person, commonly depicted on Late Geometric pottery.

**Protogeometric:** A type of pottery dating to c. 1050–900 B.C.E. marked by simple decorations of bands and circles. The shapes of the pots mostly derive from the Mycenaean age.

**Protome:** Three-dimensional representation of the head and forepart of an animal, or head and upper part of a human body, usually as a decoration applied to a wall or other flat surface.

**Province:** The sphere of action of any Roman magistrate possessing *imperium* (the right to command an army) who exercised authority as a representative of Rome. The word came to be associated with Roman overseas possessions whose inhabitants paid tribute to Rome.

**Prytaneion:** The assembly hall of the ruling council of a Greek city-state.

**Pseudo-Dipteral:** In architecture, a building plan with a row of columns on all sides, but with unused space between the colonnade and the wall for a second row of columns.

**Ptolemaic Dynasty:** The royal family, descended from Ptolemy, son of Lagus, one of Alexander the Great's generals, who ruled Egypt until its last representative, Cleopatra VII, was dethroned in 30 B.C.E. and Egypt was annexed by Rome.

**Pylos:** According to Homer, the seat of the Homeric hero Nestor in the north-west Peloponnesus. In 1939, excavators at Ano Englianos above the Bay of Navarino revealed a Mycenaean palace, destroyed suddenly by fire about 1200 B.C.E., which has been called "Nestor's Palace."

**Pyrrhic Dance.** A war dance; the national dance of Sparta. In the Roman period, Pyrrhic dances were sometimes staged as spectacles in theaters and amphitheaters.

**Pyxis:** A cosmetic or jewelry box with a lid.

**Quadriga:** A sculpture of a chariot with two wheels drawn by four horses.

**Quirites:** Originally the citizens of the Sabine town of Cures, but once the Sabines and Romans united into one community the Romans began to call themselves "Romans and Quirites." Eventually the two terms became virtual synonyms.

**Raking cornice:** The slanting cornice at the top of the pediment of a temple, which forms the upper part of the gable. Also called a "raking geison."

**Ravenna:** The court of the western Roman emperors moved from Milan to Ravenna on the north-east coast of Italy at the beginning of the fifth century C.E., in the reign of Honorius (393–423 C.E.). The early Christian churches of the city provide us with our best examples of mosaic art in Late Antiquity.

**Red-Figure Technique:** A method of painting pottery which was the opposite of black-figure technique: the background was black with figures left the color of the clay. Contours and interior details were added with relief lines or dilute slip.

**Register:** In painting, a horizontal band or frieze decorated with ornament or figures.

**Relieving Triangle:** A triangular space left in the masonry above the lintel of a door to take some of the weight off the lintel block.

**Repoussé:** Metalwork decoration in relief, made by beating the metal from behind.

**Revetment:** A wall built to hold back earth. When the term is used in architecture, it means a facing of stone, brick or wood.

- Rhyton:** A drinking-horn, or a ritual pouring vessel sometimes in the shape of an animal head.
- Ridge pole:** The roof beam; the beam across the top of a ridge roof.
- Roman Republican Period:** The term given to the period of Roman history from the expulsion of the Etruscan kings in 510 B.C.E. to the civil war between Julius Caesar and the so-called “republicans” led by Pompey, which ended in 45 B.C.E. with Caesar’s last victory at Munda in Spain.
- Rostra:** The speaker’s platform in the Roman Forum, so called because it was decorated by the rams (*rostra*) of enemy warships captured by the Romans in an early naval battle. In English, the singular form “rostrum” is used to mean a speaker’s platform.
- Rubble:** Rough stone-work.
- Rural Dionysia:** Festivals in honor of Dionysus held in many villages in Attica, where dramatic performances were staged, borrowed, in the classical period, from the City Dionysia or the Lenaea festivals.
- Sabines:** An Italic people who probably spoke Oscan who lived in villages north-east of Rome. Rome derived some of her religious rites from the Sabines.
- Sacred Way:** A processional road leading to a sanctuary. The most famous Sacred Way was the road leading through the Roman Forum to the temple of Jupiter Optimus Maximus on the hill known as the Capitulum.
- Salpinx:** A trumpet used in battle. A salpinx might also be used in some religious ceremonies.
- Sanctuary:** A sacred space defined by a boundary wall, with temple(s), altar(s), stoa(s), treasuries to store sacred objects, and other dependent buildings, where cult activities took place.
- Sarcophagus:** (plural: sarcophagi) A coffin made of stone, terracotta or wood.
- Satura:** *Satura* is translated from the Latin as “satire,” but it is not satire in the English sense of the word. Rather it is a medley, that is, a poem of medium length that deals with a number of subjects often taken from everyday life. The Latin poet Horace claimed the *satura* as the one literary genre that was invented by the Romans.
- Saturnine meter:** The earliest meter used for Latin verse, which may have had an accentual rhythm. It was used by the early Latin poets Livius Andronicus and Naevius.
- Satyrs:** Spirits of wild life from the forests and hills, often shown as attendants of the god Dionysus. At least from the fourth century B.C.E. onwards, satyrs are usually shown as youthful, half-man, half-goat creatures.
- Satyr play:** A play with a chorus of satyrs which a tragic poet staged after the presentation of his tragic trilogy, parodying a tale from Greek mythology.
- Scabellum:** A foot-clapper which pipers used to mark the beat of the dance music that they were playing.
- Seleucid Empire:** The empire founded by one of Alexander the Great’s generals, Seleucus I Nicator, which at his death in 280 B.C.E. stretched from Macedon to Iran. By the peace of Apamea in 188 B.C.E. Rome forced the Seleucid Empire to give up Asia Minor and thereafter the empire went into slow decline.
- Shaft Grave:** A grave for multiple burial, cut as a rectangular shaft in the rock. Two shaft-grave circles have been discovered at Mycenae.
- Sikinnis:** The dance associated with the satyr play.
- Silenus:** (plural: Sileni) Often confused with satyrs. However from the sixth century B.C.E. on, sileni are shown as shaggy, bearded men with horses’ ears and sometimes horses’ tails. Sileni were companions of Dionysus. In satyr plays sileni were treated as drunkards and cowards.
- Sistrum:** A musical instrument used in the cult of the Egyptian goddess Isis. It was a kind of rattle with a metallic sound like castanets.
- Skene:** The literal meaning is a tent, for in the earliest dramatic productions, a tent must have served as the dressing-room. In the developed Greek theater, the *skene* was the “scene-building” where there were dressing-rooms for the actors and storage space for props.
- Skolion:** A drinking-song.
- Skyphos:** A two-handled drinking cup, not as deep as the *kantharos* or *kotyle* but deeper than a *kylix*.
- Slip:** A coat of clay, of a different constitution from the clay of the pot itself, which is applied to cover the surface of the pot before firing. Also used to join together parts of a pot that are fired separately.
- Soffit:** The underside of a lintel, cornice or arch.
- Sophist:** A teacher of rhetoric and philosophy in classical Greece who gave instruction to pupils and charged tuition fees.
- Spartiates:** The warrior class that governed Sparta, educated from youth to be soldiers and supported by helots or serfs who worked their farms and gave them half the produce.

- Spina:** A low wall dividing a circus or hippodrome lengthwise, so that the chariots could race down one side of the racecourse, turn and then race up the other side.
- Stadium:** The Greek *stadion* was 600 Greek feet (184.9 meters or 606.7 feet). This was exactly the length of the single-course foot race in the Olympic Games and thus this was the length of the Olympic stadium or race course. In the Roman period, stadiums acquired stone seats for spectators, though never at Olympia.
- Stasimon:** A “standing song.” Any ode sung by the chorus of a Greek drama after the parodos.
- Steatite:** A soft stone made of compacted talc (magnesium silicate), sometimes called soapstone. In Minoan Crete it was used for carving vessels, such as the “Harvester Vase.”
- Stele:** (plural: stelai) A vertical slab of stone with an inscription and often decorated, the normal use of which was as a grave marker.
- Stereobate:** The lower two steps of the three-stepped foundation of a stone temple.
- Stirrup Jar:** A vessel, normally globular in shape, with a small double handle like a stirrup and a thin spout, common in the Late Bronze Age.
- Stoa:** A long, rectangular colonnaded building of one or two stories found in marketplaces or sanctuaries. In Late Antiquity, the term may designate any building with a colonnade. The term, “The Stoa” was sometimes used to designate the Stoic School of Philosophy because the founder of the Stoic School, Zeno of Citium, lacking the wherewithal to lease a hall for his lectures, gave them in the *Stoa Poikilē* (Painted Stoa) in the Athenian *agora* (marketplace).
- Stoa of Attalus:** A stoa erected on the edge of the Athenian *agora* (marketplace) by King Attalus II of Pergamum (159–138 B.C.E.). It was reconstructed in 1953–1956 on its original foundations by the American School of Classical Studies in Athens and is now used as a museum.
- Stoa Poikilē:** The “Painted Stoa.” A stoa on the north side of the Athenian *agora* erected about 460 B.C.E., which housed paintings by leading artists of the fifth century B.C.E., including Polygnotus and Micon.
- Stola:** Long, female garment worn by Roman married women, reaching from the neck to the ankles.
- Stucco:** Plaster used for coating walls.
- Stylobate:** The uppermost step of the three-stepped platform that formed the foundation of a temple. The columns stood on the stylobate.
- Styx:** One of nine rivers in the Underworld. If the gods took an oath by the River Styx, they feared to break it, for the punishment was terrible.
- Symposium:** An all-male drinking party in Greece where participants sang songs, recited poems and were entertained by musicians and dancers.
- Syncretism:** Identification of one god with another, as of Apollo and the Sun-god, Helios.
- Syracuse:** A Greek colony founded by Corinth on the east coast of Sicily in 734 B.C.E. With its magnificent harbor, Syracuse became the strongest and most prosperous Greek city in Sicily and a center of Greek culture.
- Syrinx:** Panpipes. A group of hollow reeds or pipes bound together and tuned by cutting the pipes to the proper length to produce a fully graduated musical scale. The syrinx was a favorite instrument of shepherds.
- Syssitia:** The dining clubs in Sparta where Spartiates who were club members ate their meals together.
- Tablinum:** A room in a Roman house opening on to the rear of the *atrium*.
- Tanagra:** The chief town of eastern Boeotia with a territory extending to the sea. It is best known for the so-called “Tanagra figurines,” lively little Hellenistic terracotta figures of women and groups from daily life that are found in the graves at Tanagra.
- Tartarus:** The region of the Underworld where the souls of evil persons were subjected to terrible punishment.
- Telamon:** A male figure, used in place of a column, like a caryatid.
- Temenos:** A hallowed segment of land with defined boundaries which was consecrated to a god, where a temple and an altar for sacrifice might be built, though a *temenos* could exist with no structure on it.
- Tepidarium:** The warm room of a Roman bath-house where warm water was available for bathing.
- Terpsichore:** The Muse who presides over dancing.
- Terracotta:** Hard, brown-red earthenware, usually without a glaze, used for pots, statuettes, and ornamental facings on buildings.
- Terra sigillata:** Red-glazed table ware made in molds which imitates metal-ware with embossed decoration. It was the common table ware of the Roman Empire. Also known as “Samian Ware” and “Arretine Ware.”
- Tesserae:** Small pieces of colored marble or glass used for making mosaics.

- Tetrarchy:** The type of imperial government introduced by the emperor Diocletian (284–305 C.E.) where he took a junior emperor, also called an Augustus, and in addition, each Augustus took a junior colleague called a Caesar.
- Tetrastyle:** With four columns at the front, or at the front and back.
- Thalamos:** Women’s quarters of a Greek house.
- Theogony:** The origin of the gods, or the genealogy of the gods, that is, an account of their ancestry.
- Theophany:** A manifestation of a god to man by actually appearing on earth.
- Thermae:** Warm springs or warm baths. In Rome and other cities of the empire, great public buildings known as “Thermae” were constructed which not only served as public baths but also were cultural centers.
- Thesmophoria:** A women’s festival celebrated everywhere in Greece in the autumn, intended to promote the fertility of the grain which had just been sown.
- Tholos:** A circular building, or a Mycenaean “beehive” tomb, circular in plan, roofed with a false vault.
- Thymele:** A place for sacrifice. In the Athenian theater, it was an altar-shaped platform in the middle of the orchestra where the leader of the chorus stood.
- Tibia:** In Rome, originally a pipe made of bone with three or four finger-holes; later a double-pipe reed instrument like the Greek *aulos* with two pipes made of silver, boxwood or ivory. It was a national ritual instrument of the Romans and its playing was intended to drown out any malevolent noises during the Roman sacrificial rites which were rigidly prescribed.
- Tibiae pares:** The Latin name for a double *aulos* with pipes of equal length that were evidently played in unison. Pipes of unequal length were evidently tuned to play in harmony. This was the instrument that provided the music for the plays of Plautus and Terence.
- Tibicines:** Tibia players, whose professional organization was one of the oldest in Rome.
- Tiebeam:** A piece of timber tying together rafters in a roof, or securing masonry in a wall.
- Tiryns:** Site of a Mycenaean citadel close by modern Navplion in Greece, dating to 1400–1200 B.C.E. Legend makes Heracles ruler of Tiryns.
- Toga:** The Roman national dress: an outer garment consisting of a single piece of cloth with one rounded edge which was wrapped around the body.
- Toga candida:** A white toga, made whiter by being rubbed with chalk, which was worn by a candidate for office.
- Toga praetexta:** A toga ornamented with a purple stripe, worn by free-born children, and by Roman magistrates.
- Toga pulla:** A dark-grey toga worn by mourners.
- Toga pura:** An unornamented toga worn by a youth who had laid aside his “toga praetexta” at a coming-of-age ceremony.
- Torsion:** In figural art, the turning or twisting of the human body.
- Trabeated:** A term in architecture for a post-and-beam building—one that depends on horizontal beams and vertical posts.
- Tragedy:** A poetic drama about the vicissitudes of a mythical hero, with an unhappy ending.
- Tragic Trilogy:** A set of three tragedies by a tragic poet that was presented on a single day of a dramatic festival such as the City Dionysia in Athens. The plots of the tragedies need not deal with the same theme.
- Triclinium:** The dining room in a Roman house. In later Roman houses, it becomes the chief reception room.
- Triglyph:** A slab with three grooves carved in it. In the frieze of a Doric temple, a triglyph was placed over each column and another between the columns. The slab between the triglyphs was called a “metope.”
- Trireme:** The standard warship of the late Archaic and Classical periods of Greece. It was a galley with a ram at the bow, which was rowed by about 170 rowers arrayed in three banks of oars on each side.
- Triumphal Arch:** A monumental archway built usually to commemorate a victory.
- Trompe-l’oeil:** A French term for painting so true to life that it seems to be real. Examples of *trompe-l’oeil* painting have been found in Second Style wall painting from Pompeii, where the landscape painting gives the impression that the room opens on to a garden.
- Tuba:** A Roman straight war-trumpet, as distinguished from the *cornu* which was curved. Besides its military use, it was also used in religious festivals, public games, and funerals.
- Tufa:** A porous limestone. It underlies Rome and was ideal for tunneling catacombs.
- Tunica:** A tunic worn by the Romans as an undergarment.

**Tyche:** Chance, or luck. Sometimes “Tyche” is used almost with the meaning of “Providence.”

**Tympanum:** The triangular space formed by the gable at each end of the temple. Also called a “pediment.”

**Verde antico:** A green marble.

**Vergina:** Ancient Aegae, the capital of Macedon before it was moved to Pella in 399 B.C.E. Aegae remained the place where the kings of Macedon were buried, and in 1977 a Greek archeologist discovered there a tomb which he identified as that of Philip II, the father of Alexander the Great.

**Villa:** A country-house, or a farm in the Roman Empire.

**Villa maritima:** A seaside villa.

**Villa of the Papyri:** A suburban villa outside Herculaneum which was overwhelmed by the eruption of Mt. Vesuvius in 79 C.E. It took its name from a cache of carbonized

papyri discovered there when it was excavated in 1752. It is the model for the Getty Museum in San Francisco.

**Volute:** A spiral carving on the face and back of an Ionic capital.

**Vousoir:** A wedge-shaped stone which forms part of an arch. The vousoir at the top of the arch is the keystone.

**Wanax:** A title meaning “lord,” held by the dynasts who ruled from the palaces of the Mycenaean period. The first letter of the name, a *digamma* with the sound “w” became obsolete in classical Greek where the word was spelled *anax*; and the term was applied only to gods, or, in Homer’s *Iliad*, to Agamemnon, high king of Mycenae.

**Xoanon:** Primitive, aniconic statue made of wood, usually an ancient cult statue in a temple.

**Zakros:** Site of a Minoan palace on the eastern shore of Crete, destroyed violently about 1500 B.C.E.

## MEDIA AND ONLINE SOURCES

---

### GENERAL

The Ancient City of Athens (<http://www.indiana.edu/~kglowack/athens/>)—The Ancient City of Athens contains links for the most important sites and monuments, essays, an Internet tour of the city, teaching and learning resources for students and teachers, and related links. Take a “virtual” visit to Athens and see the setting of history, culture, and literature come alive.

Atrium (<http://web.idirect.com/~atrium/>)—Atrium includes “This Day in History,” which provides the Roman date and important events that occurred on any given day; “The Ancient World on Television,” a list of television programs about antiquity on the History Channel, The Learning Channel, PBS, and network series; Archaeology’s Top 100, and many other resources.

Diotima (<http://www.stoa.org/diotima/>)—Diotima, a storehouse of resources for the study of women and gender in the ancient world, fulfills many functions. It contains bibliographies from ancient gender and family courses from institutions across the country as well as bibliographies and research guides to dozens of topics related to the study of men and women, a refereed journal section with essays published by leading scholars, a database for biblical studies, and a catalog of imagery.

Perseus Digital Library (<http://www.perseus.tufts.edu/>)—The Perseus Digital Library provided by Tufts University is a primary source for a wide range of materials, including ancient texts and illustrations of objects and monuments. There are a number of classical sites included with extensive illustrations of the ruins and monuments.

Providence College’s page on Roman Art and Architecture (<http://www.providence.edu/dwc/romaarch.htm>)—This website is a critical list of other websites on Roman architecture with information on their content and comments on their quality and characteristics.

Vroma (<http://www.vroma.org/>)—Vroma, a virtual community for teaching and learning Classics, includes games, photos, and interactive media. The website allows users to become a Roman character and interact with other characters in a virtual Rome circa 150 C.E.

Women’s Life in Greece and Rome (<http://www.stoa.org/diotima/anthology/wlgr/>)—This is the on-line searchable version of *Women’s Life in Greece and Rome. A Source Book in Translation*, edited and translated by Mary R. Lefkowitz and Maureen B. Fant, 2nd. ed. (Baltimore, Md.: 1992). This is a useful compilation of primary sources for the study of women in Ancient Greece and Rome.

---

### ARCHITECTURE AND VISUAL ARTS

The American School at Rome (<http://www.aarome.org/programs/classical.htm>)—This site is useful for the study of Roman art, history, and archaeology.

The American School of Classical Studies at Athens (<http://www.ascsa.edu.gr/>)—This website is a principal resource for research on the art, history, and archaeology of Greece and the Greek world from pre-Hellenic times to the present. Connected to it is the website of the Athenian Agora Excavations (<http://www.agathe.gr/>) that offers an opportunity to visit an excavation in

progress, the work that has been done, as well as the reconstruction of the stoa carried out by the American School in Athens.

Classical Architecture at Loggia (<http://www.loggia.com/designarts/architecture/classical.html>)—This website is a particularly useful site for illustrations of Greek and Roman architecture. Often several views of a building and its situation in a context are included.

The Getty Museum Collections (<http://www.getty.edu/art/collections/bio/a595-1.html>)— This website from the Getty Museum in Los Angeles presents a biography of the Marsyas Painter, the last of the great Athenian vase painters working in the red-figure style. There is also an image of a work attributed to the Marsyas Painter.

The University of Colorado at Colorado Springs page on Greek Art and Architecture (<http://harpy.uccs.edu/greek/greek.html>)—The University of Colorado, Colorado Springs, sponsors this website on Greek architecture and art with many good links to other sites.

---

## FASHION

Illustrated History of the Roman Empire (<http://www.roman-empire.net/society/soc-dress.html>)—The site contains pictures of Roman dress and brief descriptions, including short sections on footwear, hairstyles, and beards.

Metropolitan Museum of Art (<http://www.metmuseum.org/collections/department.asp?dep=13>)—This is a web page sponsored by the Metropolitan Museum in New York. It offers pictures of Greek vases and sculpture to illustrate various types of dress.

Roman Clothing I and II (<http://www.vroma.org/~bmcmanus/clothing.html>)—This site is recommended for its section on fashionable Roman hairstyles and jewelry. There are numerous connections to sites with illustrations.

---

## MUSIC

Ancient Greek and Roman Music, Selected Bibliography (<http://titan.iwu.edu/&thksim;classics/music.html>)— This website contains several citations for further research on Ancient Greek and Roman music.

Ancient Greek Music at the Austrian Academy of Sciences (<http://www.oeaw.ac.at/kal/agm/>)—This site contains all published fragments of Ancient Greek music which contain more than a few scattered notes. All of them are recorded under the use of tunings whose exact ratios

have been transmitted by ancient theoreticians (of the Pythagorean school, most of them cited by Ptolemaios). Instruments and speed are chosen by the author. The exact sound depends on the hard- and software used.

*Music from Ancient Rome, Vol 1. Wind Instruments.* Walter/Ravenstein, Natalia van Maioli, Luce Maioli, et al. (Amiata #1396, 1996)—This CD includes performances of primarily cultic music from Imperial Rome, based on the research of Synaulia and Walter Maioli, performed on reconstructions of ancient pipes, trumpets, and other aerophones. Includes notes.

*Music from Ancient Rome, Vol 2: String Instruments.* Performed by Synaulia (Amiata #1002, 2002)—This CD includes performances of primarily cultic music from Imperial Rome, based on the research of Synaulia and Walter Maioli, performed on reconstructions of ancient lyres. Includes notes.

*Music of Ancient Greece.* Christodoulos Halaris and instrumental ensemble, vocal soloists (Orata, 1994)—This CD includes Pindar's First Pythionic Hymn, a chorus from Euripedes' Orestes, a chant to Apollo, and a hymn to the Holy Trinity (based on ancient Greek musical theory). Includes 80 pp. booklet.

*Music of the Ancient Greeks.* De Organographia—Gayle Neuman, Philip Neuman, William Gavin. (Pandourion Records, PRCD 1001, 1997)—This CD features ancient Greek music from 500 B.C. to 300 A.D. performed on voice and copies of ancient Greek instruments including kithara, lyra, aulos, syrinx, seistrion, tympanon, pandoura, trichordon, photinx, salpinx, kymbala, and others. Full listing of instrumentation and photos of ancient Greek instruments included.

*Musique de la Grèce antique.* Gregorio Paniagua and Atrium Musicae de Madrid (Harmonia Mundia, 1979)—This CD recreates the music for 22 of the extant fragments of ancient Greek music, performed on modern replicas of ancient instruments. Includes detailed liner notes.

*Musiques de l'Antiquité Grecque.* Annie Bélis and the Kérylos ensemble. (K617, 1996)—This CD includes performances of fifteen fragments of ancient Greek music, including four Mesomedes' songs and the Christian Hymn of Oxyrhynchus.

Oxyrhynchus Online (<http://www.csad.ox.ac.uk/POxy/>)— This online publication of the Oxyrhynchus Papyri from the excavations at Oxyrhynchus, Egypt, contains fragments of ancient Greek and Roman literature, music theory, and notated music.

*Sappho de Mytilene.* Angelique Ionatos and Nena Venetsanou (Paris: Tempo, A6168, 1991)—This CD includes poems

of Sappho sung in ancient and modern Greek by two female vocalists. The music is composed by Ionatos, and sounds very Greek (using both ancient and modern instruments). Modern Greek versions are by Nobel laureate Odysseus Elytis. \$18.98 available from Lady-slipper.

The Thesaurus Musicarum Latinarum (TML) (<http://www.music.indiana.edu/tml/start.html>)—The Thesaurus Musicarum Latinarum (TML) is an evolving database of

the entire corpus of Latin music theory written during the Middle Ages and the Renaissance.

The University of Michigan Papyrus Collection (<http://www.lib.umich.edu/pap/>)—This collection contains over 10,000 fragments. The website provides on-line public access to one of the largest collections of papyri in the world and, through the APIS search engine, to other papyrological resources. Musical documents are included in the collection.

## ACKNOWLEDGMENTS

*The editors wish to thank the copyright holders of the excerpted material included in this volume and the permissions managers of many book and magazine publishing companies for assisting us in securing reproduction rights. Following is a list of the copyright holders who have granted us permission to reproduce material in this volume of Arts and Humanities Through the Eras. Every effort has been made to trace copyrights, but if omissions have been made, please let us know.*

## ABOUT THE BOOK

**SEEING HISTORY FROM A DIFFERENT ANGLE.** An education in history involves more than facts concerning the rise and fall of kings, the conquest of lands, and the major battles fought between nations. While these events are pivotal to the study of any time period, the cultural aspects are of equal value in understanding the development of societies. Various forms of literature, the philosophical ideas developed, and even the type of clothes worn in a particular era provide important clues about the values of a society, and when these arts and humanities are studied in conjunction with political and historical events a more complete picture of that society is revealed. This inter-disciplinary approach to studying history is at the heart of the *Arts and Humanities Through the Eras* project. Patterned in its organization after the successful *American Decades*, *American Eras*, and *World Eras* products, this reference work aims to expose the reader to an in-depth perspective on a particular era in history through the study of nine different arts and humanities topics:

- Architecture and Design
- Dance
- Fashion
- Literature
- Music
- Philosophy
- Religion
- Theater
- Visual Arts

Although treated in separate chapters, the connections between these topics are highlighted both in the text and through the use of “See Also” references to give the reader a broad perspective on the culture of the time period. Readers can learn about the impact of religion on literature; explore the close relationships between dance, music, and theater; and see parallel movements in architecture and visual arts. The development of each of these fields is discussed within the context of important historical events so that the reader can see history from a different angle. This angle is unique to this reference work. Most history books about a particular time period only give a passing glance to the arts and humanities in an effort to give the broadest historical treatment possible. Those reference books that do cover the arts and humanities tend to cover only one of them, generally across multiple time periods, making it difficult to draw connections between disciplines and limiting the perspective of the discipline’s impact on a specific era. In *Arts and Humanities Through the Eras* each of the nine disciplines is given substantial treatment in individual chapters, and the focus on one era ensures that the analysis will be thorough.

**AUDIENCE AND ORGANIZATION.** *Arts and Humanities Through the Eras* is designed to meet the needs of both the beginning and the advanced history student. The material is written by subject experts and covers a vast array of concepts and masterworks, yet these concepts are built “from the ground up” so that a reader with little or no background in history can follow them. Technical terms and other definitions appear both in the

text and in the glossary, and the background of historical events is also provided. The organization of the volume facilitates learning at all levels by presenting information in a variety of ways. Each chapter is organized according to the following structure:

- Chronology covering the important events in that discipline during that era
- Brief overview of the development of that discipline at the time
- Topics that highlight the movements, schools of thought, and masterworks that characterize the discipline during that era
- Biographies of significant people in that discipline
- Documentary sources contemporary to the time period

This structure facilitates comparative analysis, both between disciplines and also between volumes of *Arts and Humanities Through the Eras*, each of which covers a different era. In addition, readers can access additional research opportunities by looking at the “Further References” and “Media and Online Sources” that appear at the back of the volume. While every effort was made to include only those online sources that are connected to institutions such as museums and universities, the web-

sites are subject to change and may become obsolete in the future.

**PRIMARY DOCUMENTS AND ILLUSTRATIONS.** In an effort to provide the most in-depth perspective possible, *Arts and Humanities Through the Eras* also includes numerous primary documents from the time period, offering a first-hand account of the culture from the people who lived in it. Letters, poems, essays, epitaphs, and songs are just some of the multitude of document types included in this volume, all of which illuminate some aspect of the discipline being discussed. The text is further enhanced by 150 illustrations, maps, and line drawings that bring a visual dimension to the learning experience.

**CONTACT INFORMATION.** The editors welcome your comments and suggestions for enhancing and improving *Arts and Humanities Through the Eras*. Please mail comments or suggestions to:

## CONTRIBUTORS

**Michael A. Batterman** received his Ph.D. in art history from Northwestern University in 2000. He has spent the last three years on the faculty of the School of Art and Design at Southern Illinois University, Carbondale, and currently resides in Paris. His research has explored the artistic culture of Jewish communities in later medieval Christian Spain and the visual expression of cultural difference. Publications have also dealt with the modern historiography of medieval Jewish artistic production.

**Michael T. Davis** received the Ph.D. in the history of art from the University of Michigan in 1979, and taught at Texas Christian University, East Carolina University, and Princeton University before joining the faculty of Mount Holyoke College in 1982. He has also taught at the University of Michigan and Smith College. A collaborative research fellowship from the National Endowment for the Humanities funded a study of the methods of church plan design in the thirteenth and fourteenth centuries (with Professor Linda Neagley of Rice University). Davis has published studies of Clermont Cathedral and Limoges Cathedral, the papal church of Saint-Urbain in Troyes, the Cathedral of Notre-Dame and the royal palace in Paris. His current research is focused on the architecture of late medieval Paris, and he is preparing a book centering on an early fifteenth-century description of the city.

**Tim J. Davis** has spent the past ten years teaching religion, philosophy, and the humanities in the Columbus, Ohio, area. He holds a full-time position at Columbus State as well as part-time appointments at The Ohio State University and Otterbein College. Tim has earned a Ph.D. in the study of religion, a Master of Arts in medieval church history, as well as the Master of Divinity. His

published books include *St. Bernard of Clairvaux: A Monastic View of Medieval Violence* (McGraw-Hill, 1998), *Readings from the Christian Tradition*, compiled and edited with commentary (Campus Custom Publishing, 2000), and the forthcoming *History of the Abbey of the Genesee*. He has also written various articles on medieval Cistercian monasticism and is currently in the midst of a long-term project involving the assembly and publication of historical information on the Roman Catholic diocese of Youngstown.

**Véronique P. Day** received her Ph.D. in art history from Northwestern University in 1993. She has taught at the University of Iowa, Rhodes College in Memphis, St. Louis Community College, George Mason University, and Southern Illinois University, Carbondale. She is now an independent scholar living in Paris. Her research focuses on the social context of manuscript production in provincial France during the later Middle Ages. Her publications have dealt with the production and careers of particular illuminators from Poitiers, such as the Master of Yvon du Fou, Jehan Gillemer, and the Master of Walters 222.

**Kristen Mossler Figg, Editor**, received the Ph.D. in English at Kent State University in 1989 after completing a Bachelor of Arts in humanities and Master of Arts degrees in both French and English. She is professor of English at Kent State University, Salem Campus, where she directs the Honors program and teaches literature, history of the English language, and composition. Her books include *Jean Froissart: An Anthology of Narrative and Lyric Poetry* (New York: Routledge, 2001); *Trade, Travel, and Exploration in the Middle Ages: An Encyclopedia* (with John B. Friedman, Routledge, 2000); and *The*

*Short Lyric Poems of Jean Froissart: Fixed Forms and the Expression of the Courtly Ideal* (Garland, 1994). Recent articles have focused on genre distinctions in medieval lyrics, the role of animals in medieval society, and the history of Froissart manuscripts. She is past president of the Medieval Association of the Midwest and is currently serving as co-editor of *Publications of the Medieval Association of the Midwest*.

**John Block Friedman, Editor**, received the Ph.D. in English from Michigan State University in 1965. He taught at Connecticut College, Sir George Williams (Concordia) University, and the University of Illinois at Urbana-Champaign where he retired as professor emeritus of English in 1996. He has been a Woodrow Wilson Fellowship holder, a Guggenheim Foundation fellow, and the recipient of an American Council of Learned Societies award, and is on the editorial board of *The Chaucer Review*. He is currently visiting professor of English at Kent State University, Salem. His books include *Orpheus in the Middle Ages* (Harvard, 1970; Rpt. Syracuse University press, 2000); *The Monstrous Races in Medieval Art and Thought* (Harvard, 1981; Rpt. Syracuse University Press, 2000); *John de Foxton's Liber Cosmographiae (1408) An Edition and Codicological Study* (Leiden, Brill, 1988); *Northern English Books, Owners, and Makers* (Syracuse University Press, 1995); *Medieval Iconography: A Research Guide* (New York: Garland, 1998); and ed. with Kristen Figg, *Trade, Travel and Exploration in the Middle Ages: An Encyclopedia* (New York: Routledge, 2000). He has published many articles on medieval literature and iconography, most recently one on the fifteenth-century French illuminator Robinet Testard and his debt to the graphic arts. Currently, he is completing a book entitled *Realistic Observation of Nature and Society 1360–1530* to appear from Syracuse University Press.

**Laura F. Hodges** received the Ph.D. in literature from William Marsh Rice University in 1985, and taught literature and composition at the University of Houston at Clear Lake, California State University at Bakersfield, the University of Maryland's European Division, and the University of Houston in Houston, Texas, before retiring. Her books include *Chaucer and Costume: The Secular Pilgrims in the General Prologue*, Chaucer Studies 26 (D. S. Brewer, 2000); and *Chaucer and Clothing: Clerical and Academic Costume in the General Prologue to the Canterbury Tales*, forthcoming from D. S. Brewer, February 2005. She has published a number of articles specializing in depictions, and their functionality, of arms and armor, costumes, textiles, and cloth-making in medieval literature, as well as articles on John Steinbeck, Sir Thomas Malory, and Henry James. Initially schooled in the field of clothing and textiles, she blends this training with her later degree in literature and continues to research both the history of costume and

costume as it is portrayed in the literary works of the Middle Ages.

**R. James Long** received the Licentiate in Mediaeval Studies from the Pontifical Institute of Mediaeval Studies in Toronto and a Ph.D. from the University of Toronto (1968). Following Fulbright and Canada Council post-doctoral fellowships to work at the Vatican Library, he accepted his current position in the Philosophy Department at Fairfield University. He currently serves as the general editor of the Fishacre edition at the Bavarian Academy of Sciences in Munich and is the incoming president of the Society for Medieval and Renaissance Philosophy. His books include (with Maura O'Carroll) *The Life and Works of Richard Fishacre OP. Prolegomena to the Edition of his Commentary on the 'Sentences', Band 21* (Munich, 1999); and Bartholomaeus Anglicus, *On the Properties of Soul and Body (De proprietatibus rerum libri III et IV)*, ed. (Toronto, 1979), the first edition since 1601 of the most popular of medieval encyclopedias. His many scholarly articles have focused on philosophy and theology at early thirteenth-century Oxford.

**Timothy J. McGee** received the Ph.D. in musicology from the University of Pittsburgh in 1974. He was appointed to the Faculty of Music, University of Toronto, in 1973, where, until his retirement in 2002, he taught music history, directed the Historical Performance Ensembles, and was cross-appointed to the Centre for Medieval Studies. In 1972 he founded the professional early music ensemble The Toronto Consort, and in 1993–94 was visiting professor at the Villa I Tatti in Florence. His areas of research include the history of music in Canada and the performance of music in the Western world before 1800. His books include *The Sound of Medieval Song: Vocal Style and Ornamentation According to the Theorists* (Oxford, 1998); *Medieval Instrumental Dances* (Indiana, 1989); *Medieval and Renaissance Music: A Performer's Guide* (University of Toronto, 1985); and *The Music of Canada* (Norton, 1985). He is currently working on a history of the civic musicians of Florence in the late Middle Ages.

**Edward Peters, Advisor**, received the Ph.D. in medieval studies from Yale University in 1967. He taught at the University of California, San Diego, before moving to the University of Pennsylvania in 1968, where he is the Henry Charles Lea Professor of History and curator of the Lea Library. He has received research fellowships from the American Philosophical Society, the American Council of Learned Societies, and the John Simon Guggenheim Foundation, and he has been a visiting professor twice at Yale University and twice at the Katholieke Universiteit Leuven, in Belgium. Much of his research has focused on the subject of the responses by authorities to heresy and witchcraft, illustrated in the annotated readers *Heresy and Authority in Medieval*

*Europe* (1980) and, with Alan C. Kors, *Witchcraft in Europe, 400–1700: A Documentary History* (2001). He has also published several articles on these subjects. He is currently collaborating with Richard G. Newhauser on *Curiosity and the Limits of Inquiry in the Western Tradition*, as well as an intellectual biography of Henry Charles Lea.

**Lorraine Kochanske Stock** received the Ph.D. in medieval studies from Cornell University in 1975, and has taught English and women's studies at the University of Houston since 1976. Stock served as president of the Southeastern Medieval Association (SEMA) from 2001–2003, and currently she serves as an elected councilor to the Modern Language Association "Division of Middle English Literature excluding Chaucer." She has published widely on medieval drama, Dante, Chaucer, the *Gawain*-poet, Langland, Froissart, Arthurian romance, medieval *translatio*, Robin Hood ballads, and various medieval iconographic figures such

as the Green Man, the Wild Man, and the Celtic Sheelana Gig. Recently she began teaching and writing about twentieth-century cinematic treatments of medieval literature and culture. She is currently completing an interdisciplinary book about late medieval primitivism and the Wild Man figure.

**Carol Symes** received the Ph.D. in history from Harvard University in 1999 and has been on the faculty of the University of Illinois at Urbana-Champaign since 2002. Prior to that, she taught European history at Bennington College, while at the same time pursuing a career as a professional actress. She is the author of numerous articles on the manuscript transmission of medieval plays, and is currently at work on a book devoted to the intersection between theater and public life in thirteenth-century Arras. In 2004, she was the recipient of the Van Courtlandt Elliott prize of the Medieval Academy of America and, in 2003, of the Martin Stevens Award of the Medieval and Renaissance Drama Society.

## ERA OVERVIEW

**DEFINING THE MIDDLE AGES.** Although the traditional term “Middle Ages” suggests that the years between the final fall of the Roman Empire in the sixth century and the full flowering of the Renaissance (literally “rebirth” of Roman and later Greek culture) in the fifteenth century was merely an interval between two great periods of civilization, the history of the arts and humanities in Western Europe during these centuries is, in fact, rich and varied. The era begins with the reign of the Frankish king Charlemagne—who by the time of his death in 814 had, under the auspices of the Latin Christian Church, reunited much of the former Western Roman Empire and joined to it parts of northern Europe that had never been under the rule of Rome. The period ends with the rise of humanism, which by 1450 dominated the art and literature of Italy and was spreading its influence northward. Between these two historical movements the medieval period encompassed major developments in political, economic, and cultural systems, all of which were reflected in the artistic, intellectual, and spiritual movements of the era.

**A PERIOD OF REORGANIZATION.** The emergence of Western Europe as a distinct culture occurred in large part as the result of the administrative division of the Roman Empire into an eastern and a western part in the late fourth century, the cultural and political separation of the two parts in the following centuries, and the migrations of non-Roman settlers and invaders from the east and north. While the strength of the Eastern Empire established by Constantine in his capital of Constantinople (what is now Istanbul, Turkey) allowed for

a continuity of Greek (Byzantine) civilization until the triumph of the Ottoman Turks in 1453, the last ruler of the Western Roman Empire abdicated in 476, leaving the area from what is now Germany and Austria westward to the Atlantic Ocean in disarray. Latin learning was preserved and enriched in monasteries wherever Christianity had been established, with notable examples in Ireland and England, as well as on the Continent. But the lack of a source of centralized political power encouraged vast migrations of non-Roman peoples, including not only the Goths, Visigoths, and Huns who had defeated the Romans, but the Angles, Saxons, and Jutes who settled England in the seventh century, and later the Vikings and their Norman descendants, who continued to raid coastlines and inland regions and establish settlements in both Europe and the New World well into the eleventh century. It was only with the relative stability of the reign of Charlemagne, crowned Emperor in Rome in 800, and the wide cultural and intellectual networks it established and supported that a single dominant influence began to reunify Europe, and the Latin Christian Church became the central focus of Western thought and expression.

**LORDSHIP.** During the period following the establishment of the Carolingian Empire, a new concept of social and political organization began to take hold, creating what is perhaps the most distinctive institutional development of the medieval era. Called “feudalism” in popular terminology, this complex network of interlinked political, economic, and social obligations extended to and involved almost all sectors of the socioeconomic

hierarchy. In practice, both free peasants and “serfs,” the agricultural workforce who tilled the land of medieval estates and manors, owed their physical labor and a large share of the crops they produced to their lord (who might hold a royally-bestowed title like count, duke, or baron), who extended to them his physical and political protection in return for their labor. Knights, the warrior sector of the culture, as the vassals of greater lords owed them homage, usually in the form of military service. In political terms, within the larger hierarchy that was emerging, this meant that dukes and barons were themselves vassals of kings or emperors who, in turn, deferred to the pope, who represented the highest spiritual authority. If the pope asked for military aid from kings or emperors, these monarchs might in turn elicit service from their dukes and barons, who would in turn call upon their vassals from the lower echelons of the aristocratic hierarchy, the knights. These bonds between lords and vassals were never as stable as such a description might suggest, and the term “feudalism” is today widely discredited since there is some argument that it represents a modern, rather than a medieval, formulation of what was really a much more fluid system. But whatever its actual workings, the concept of lordship and obligation, existing side by side with the ongoing traditions of monasticism and the authority of local bishops, established a new kind of balance between secular and spiritual authority.

**CRUSADES AND CULTURAL EXCHANGE.** Even before the system of lordship began developing in the West, the spread of Islam following the death of the prophet Muhammad in 632 had led to both a flowering of Arab culture and a vast expansion of Islamic power throughout the Middle East, across North Africa, and into Spain, Sicily, and southern Italy. In 1095, Pope Urban II made an appeal for the formation of a Christian army to retake Jerusalem (Christianity’s most popular pilgrimage site) from Muslim control, and in response approximately 100,000 soldiers (mostly French) set out on the First Crusade, changing forever the relationship between Western Europe and the rest of the known world. Following the success of the First Crusade, and the resulting increase in trade and travel between the regions, subsequent crusades drew armies from broader geographical areas. The Second Crusade (1147) was led by Emperor Conrad III of Germany and King Louis VII of France, while the Third Crusade (1192) included an English army led by King Richard I (Lionheart), as well as French and German contingents. By the time of the Fourth Crusade (1202–1204), which originated in Venice, the crusade movement had proven to be largely

unsuccessful in achieving its military aims, but contact with the Muslim and Byzantine East, as well as with the Arab culture of Spain, had broadened commercial activity and introduced knowledge and learning that would have far-reaching effects on European culture.

**THE HOLY ROMAN EMPIRE.** Another important development of the twelfth century was the establishment of the Holy Roman Empire as the successor to the series of imperial monarchies that had begun with Charlemagne. After Charlemagne’s death and the division of the empire among his sons, there had been a decline in the power of Carolingian rule, but after the German king Otto I defeated the Magyars in 955 and then established the archbishopric of Magdeburg in 968, the eastern Frankish monarchy strengthened its control over Italy and its alliance with the popes. This relationship, while mutually beneficial in terms of securing territory in central and eastern Europe against Byzantine expansion, led eventually to an ongoing series of conflicts over rights and jurisdictions, particularly with regard to the involvement of non-clerical authorities in the control of ecclesiastical property and appointments (known broadly as the Investiture Controversy or the age of Gregorian reform). In response to challenges from the German emperor Henry IV, the liberty of the church was vigorously asserted by Pope Gregory VII in 1075, leading to a rift between the two leaders and disagreements among the German nobles who chose the succeeding emperors. The internal divisions among the imperial electors were, however, temporarily resolved with the selection in 1152 of Frederick I (Barbarossa) who proceeded to consolidate his authority into what was now for the first time referred to as *sacrum imperium*, a sacred or holy empire emphasizing the divine origin of imperial power. The uneasy balance between the Holy Roman emperors (representing “temporal” or earthly authority) and popes (who along with other ecclesiastics represented “spiritual” authority) over the centuries that followed contributed to a number of controversies and even, at times, military conflicts, that extended throughout northern Europe and in the thirteenth century even to Florence and other Italian cities. Other political pressures eventually led to the relocation of the papacy from Rome to Avignon from 1309 to 1376 (during which time the popes were under the influence of strong French kings, beginning with Philip the Fair) and, with the attempt to move the papacy back to Rome, the election of a series of popes and anti-popes in a period of division known as the Great Schism (1378–1417). The political rancor and abuses apparent during this period ushered in a widespread desire for reform and even a questioning of the value of a strong ecclesiastical hierarchy.

**THE RISE OF INDIVIDUALISM AND THE NEW MIDDLE CLASS.** Along with the challenge to the authority of the papacy came a challenge to the three-tiered manorial structure that had divided human endeavor among those who worked the land, those who fought, and those who prayed. Increasingly, from the thirteenth century onward, the agrarian-based lordship culture was giving way to a more urban culture of tradesmen and artisans offering services for money (a development that gave rise to the first minting since the eighth century of gold coins in Florence and Genoa in 1252) rather than for land tenure. Likewise, the arts of bookmaking and jewelry were coming out of the monasteries and into workshops in towns. Government during this period tended to be increasingly centralized and bureaucratic, especially from the time of Philip Augustus (r. 1180–1223) in France and Henry II (1154–1189) in England. But at the same time the idea of imposing limitations on royal power—as evidenced in the issuing of Magna Carta in England in 1215—points also towards a more modern sense of civil and juridical rights. To meet the needs of the changing social structure, new movements arose within Christianity, including significant numbers of lay religious communities that encouraged greater participation of uncloistered men and women in lives of spiritual activism (sometimes in ways that were judged heretical by the institutional church). Within the Roman Church in the early thirteenth century there emerged mendicant orders of Franciscan and Dominican friars, who turned away from monasticism in favor of a life of interaction that was closely linked both to preaching in urban centers and to teaching in the universities that had been developing there since the late twelfth century. By the fourteenth century, all of these cultural trends were reinforced and hastened by two cataclysmic occurrences that had profound economic and social implications: a series of famines across Europe between 1315 and 1317 and, from 1349 onward, a series of outbreaks of the bubonic plague known as the Black Death, which seems to have been brought to western Europe from central Asia. These two events reduced the population sharply, creating higher wages for those who could work, and mobility across frontiers by people in search of food and jobs. A new class developed in the wake of these disasters, one that could be called a middle class, characterized by well-to-do urban dwellers whose income came from trade and crafts, commerce, banking, and venture capital. At the same time, laborers, no longer tied to the land, began to assert their rights, both in France, in the rebellion known as the Jacquerie, which took place near Paris in 1358, and in England, in the Peasant Rebellion of 1381.

**THE GOTHIC AND AFTERWARD.** The new commercial class of bankers and merchants in Italy and the new middle class of artisans and tradesmen in England, France, Germany, and the Low Countries soon developed their own interests in music, art, and literature, and by the beginning of the fifteenth century, the Western European world that emerged was the result of a long and dynamic process of negotiation between the traditions of the past and the forces of change. The period known as the Middle Ages had certainly encompassed a desire to identify itself with the lost glory of the Roman Empire that preceded it, evident even in the name “Romanesque” as applied to the massive and rounded churches that dominated architectural style before 1150. But it also had been the age of magnificent innovations, captured most visibly in the pointed arches, stained glass windows, and soaring tracery-filled spires of cathedrals like Chartres, Strasbourg, and the Sainte-Chapelle in Paris, built in the thirteenth century as a symbolic reflection of the glory of God and the spiritual power of the Christian Church. Ironically, the word “Gothic”—still used to identify this style of architecture and applied more broadly to refer to the entire culture of the later Middle Ages (roughly 1225 to about 1375)—is not a medieval term at all but a derogatory one coined in the eighteenth century to describe a period that was seen as Germanic and primitive rather than Roman and classical in culture, an era that was considered merely imitative in its literature and regrettably “monkish” and “superstitious” in religion. But a closer look at the arts and humanities of the period reveals a complexity of response that evolved continuously, taking in not only the institutional grandeur that dominated the architectural landscape, but also, increasingly, the personal expression that gained power with the emergence of strong national identities and respect for the individual conscience. By the time of the Hundred Years’ War between France and England (1346–1453), the French and the English had come to see themselves as distinct cultural and political entities in which the Latin learning of the church was being rivaled by secular literature in the vernacular languages and by translations of the most important philosophical and scientific documents. This sense of the importance of the language of the people took on a different meaning in spiritual life with the call for vernacular Bibles, led by John Wyclif, whose preaching was condemned after his death in 1384 but whose followers, the Lollards in England and the Hussites in Bohemia, spread the belief in the right of the individual to read and interpret Scriptures. It is no coincidence that while the new, classically-based movement of humanism was

developing among members of the leisured class in the cities of Italy, one of the final events of the Middle Ages in the north was a transformation of the central document of Christianity, the Bible, from handwritten script to print that used moveable type. The Gutenberg Bible (1453) was at once a product of the new technology of

moveable type, and a means of making accessible to far more people the very text that had dominated medieval culture and influenced its arts and institutions for over six centuries. As such, it is a fitting symbol of the blend of conservatism, adaptation, and innovation that characterized the Middle Ages.

# CHRONOLOGY OF WORLD EVENTS

*By Kristen Mossler Figg*

- 330 Roman Emperor Constantine founds the city of Constantinople (present-day Istanbul, Turkey), which becomes the capital of the Eastern (Byzantine) Empire.
- 476 Romulus Augustus, the last Roman emperor of the West, is deposed by Odoacer, a barbarian chieftain of Italy.
- 622 The Muslim era begins with the Hegira as the Prophet Muhammad flees, with a few adherents, from Mecca to Medina.
- 768 Charlemagne (Charles the Great) begins his reign as king of the Franks.
- 778 Charlemagne's nephew Roland is killed in the battle of Roncevalles in the Pyrenees as Charlemagne's army returns from an unsuccessful campaign in Spain against the Saracens. This event serves as the basis for the most famous heroic poem in French literature.
- 800 Charlemagne is crowned emperor of the West by Pope Leo III in Rome.
- c. 810–c. 820 Vikings begin to settle in the Faroe Islands.
- 814 Al-Ma'mun, the seventh Abbāsīd caliph of the Muslim Empire, establishes the House of Knowledge in Baghdad. Scholars there translate Greek, Syriac, Persian, and Sanskrit works of philosophy, science, and literature, and make discoveries in astronomy, mathematics, and medicine.
- The reign of Emperor Louis the Pious, son of Charlemagne, begins, bringing with it the beginning of the disintegration of the Carolingian empire.
- 837 Byzantine forces begin invasions of the Abbāsīd Muslim Empire.
- 838 Muslim naval forces prepare to lay siege to Constantinople, but their fleet is destroyed in a storm.
- 843 The iconoclastic controversy in Byzantine Christianity comes to an end, and the use of icons is restored.
- The Treaty of Verdun formalizes the division of the Carolingian realm among the three sons of Louis the Pious: Charles the Bald (western section, roughly equivalent to modern France), Louis the German (eastern section), and Lothair (middle section, later called Lotharingia).
- 847 Arabs sack Rome.
- Ruling from Samarra, north of Baghdad, the weakened Abbāsīd caliph al-Mutawakkil

- begins persecutions of Christians, Jews, and unorthodox Muslim Shiites.
- 849 An Arab fleet is defeated off the coast of Italy by the forces of an alliance formed by Pope Leo IV.
- c. 850 Arabs invent the astrolabe, which allows mariners to use celestial navigation to determine latitude.
- c. 860 Viking explorers discover Iceland.
- 866 Japan begins a period of clan dominance known as the Fujiwara period, which lasts until 1160.
- c. 866 The Abbāsīd caliphs begin to lose the eastern provinces of their empire as the Saffarid Dynasty is established in what is now eastern Iran.
- 869 The Saffarid Dynasty expands to include parts of modern-day Afghanistan and Pakistan.
- 870 Al-Kindī dies. He was the first Islamic thinker to try to reconcile Greek philosophy with Muslim beliefs.
- When Lothair II dies, the Treaty of Mersen divides Lotharingia (Burgundy and northern Italy) between Louis the German and Charles the Bald.
- 876 Saffarid troops fail to conquer Baghdad, but in 879 their leader is recognized by the Abbāsīd caliph as governor of the eastern provinces of the Muslim empire.
- 877 Charles the Bald dies, effectively ending the era of Carolingian supremacy on the Continent.
- 878 King Alfred the Great of England (r. 871–899) defeats the Danes in a major battle and ends Viking invasions of England by recognizing an area of northeast England (known as Danelaw) as Danish territory.
- 882 Oleg, Varangian (Viking) ruler of Russia, captures Kiev and makes it his capital.
- 894 The emperor of Japan is convinced that contact with the T'ang Dynasty in China is undesirable because of growing influence from the Near East and breaks off diplomatic relations, ending three centuries of Chinese influence on Japanese culture.
- c. 900 Norse (Viking) explorers settle in Iceland.
- Rulers of the powerful Ghanian kingdom of Africa adopt Islam.
- The lowland cities of the Mayan empire, which comprised a total population of about two million people in present-day Guatemala, Honduras, southern Mexico, Belize, and El Salvador, are abandoned in favor of the highland cities of the Yucatan peninsula.
- 902 The Abbāsīd ruler al-Muqtafi begins his rule, during which he will regain control of Egypt and repulse an attack by the Byzantines.
- 907 The T'ang Dynasty falls in China, ending a golden age of Chinese culture and leading to the break-up of China into separate kingdoms.
- 909 The famous Benedictine monastery of Cluny is founded.
- The Fātimid Dynasty is founded when Al-Mahdī, a member of a family claiming descent from Fatimah, daughter of the Prophet Muhammad, declares himself caliph of Tunis and begins his family's gradual conquest of all of North Africa.
- 910 Following a period of Berber-Arab invasions that had begun in 711, the Muslim Umayyad Dynasty controls all but the northwest corner of Spain.
- 911 French King Charles III the Simple (r. 898–922) concludes an arrangement with Rollo the Dane that allows the Vikings to control the area of northern France known as Normandy (Norman meaning "north man").

- 936 Otto I (the Great) becomes king of Germany (r. 936–983) and begins expeditions to Italy during which he intervenes in Italian and papal affairs, leading eventually to unification of Germany and Italy under his rule.
- 939 Vietnam gains its independence from China.
- 947 The Khitans of northeastern China proclaim the Liao Dynasty, which rules until 1125.
- 950 A French bishop named Gotescalc is among the early pilgrims to travel to the town of Santiago de Compostela, which by the twelfth and thirteenth centuries is visited by hundreds of thousands of pilgrims from all parts of Christendom.
- c. 950 Harold Bluetooth begins his reign as king of Denmark, during which Christianity will be introduced.
- 958 The maritime city of Genoa, Italy, is refounded after being destroyed by Muslim raids from North Africa in 934–935; it emerges in 1099 as a medieval commune ruled by an association of citizens and six neighborhood consuls.
- 960 The newly proclaimed Sung Dynasty begins reunifying China and establishing trade in porcelain and steel.
- 961 Hugh Capet becomes duke of Francia and Aquitaine, with landholdings that make him more powerful than King Lothair I (954–986), allowing him eventually to take the throne as the first king (987–996) in the Capetian Dynasty of France.
- Establishment of German Ottonian rule in northern Italy allows the city of Verona to use its strategic position at the base of Brenner Pass to negotiate for privileges and rights in return for allegiance.
- 962 German ruler Otto I is crowned emperor of the Romans, establishing the Ottonians as the successors to the Carolingians and reestablishing strong ties between Church and State.
- 968 The Fātimids establish themselves in Egypt, founding Cairo, and shifting the center of Islamic culture away from Baghdad. The dynasty lasts until 1171.
- 972 The Chinese begin printing with movable type.
- 975 Al-Aziz becomes caliph of the Fātimid Dynasty, during which he will conquer Syria and extend Fātimid influence from the Atlantic Ocean in the west to the Euphrates River in the east.
- 977 A former Turkish slave in modern-day Afghanistan establishes the Ghaznavid Dynasty, rejecting control by the Muslim Sāmānids and expanding eastward to the border of India.
- c. 980 By this date, Arabs and Persians have settled the east coast of Africa and begin founding major cities, such as Mogadishu (tenth century) and Mombasa (eleventh century), and establishing trade routes for ivory, gold, and slaves from the interior of Africa to India and the Arabian peninsula.
- c. 986 Icelanders led by Erik the Red establish settlements in Greenland and make the first known sighting of the North American continent.
- 992 Subject to the Eastern, rather than the Western, Roman Empire, Venice is granted relief from port taxes by Byzantine emperors, the first of many privileges that will give Venice an advantage over all other traders in the Mediterranean region.
- 997 Stephen I (St. Stephen) begins his reign as king of Hungary, during which he is instrumental in establishing Latin-rite Christianity as the religion of Hungary.
- 998 Under the Great Mahmud of Ghazna, son of the dynasty's founder, the Ghaznavids, now extending into northern India, adopt Sunnite Islam.
- 1000 Christianity is introduced to Iceland.

- c. 1000 Seljuk Turks, originally from Central Asia, become Sunnite Muslims and begin westward expansion.
- Persian scientist and court physician Avicenna writes *The Canon of Medicine*, the best known single book in the history of medicine.
- The Incan civilization begins to develop in the Andean region of South America.
- The West African city-state of Benin, in what is now Nigeria, begins its development into a powerful cultural center renowned for metalwork.
- Navajo and Apache peoples from the far north arrive in the American southwest.
- 1001 The troops of Mahmud of Ghazna (in present-day Afghanistan) begin incursions into India, spreading Islam.
- 1004 An expedition of about 130 people from Greenland land on the North American continent and settle in an area they call Vinland, probably on the Gulf of the St. Lawrence River. Three years later, they abandon the settlement.
- 1014 The Cola Empire of southern India begins expansions that will extend the borders northward and include all of Ceylon and portions of the Malay peninsula.
- 1016 After a renewal of Viking invasions in England, Danish King Cnut (r. 1016–1035) ascends the throne of England, but misgovernance by his heirs results in a return to Anglo-Saxon rule in 1042.
- 1019 Yaroslav begins his reign of Kievan Russia, during which the oldest Russian law code, the “Russian Truth,” is written.
- 1042 The Anglo-Saxon Edward the Confessor becomes king of England following a period of Danish rule, but he dies childless in 1066.
- 1046 Henry III, king of Germany, begins his reign as emperor of the West. The Latin Empire is at its height, extending into Hungary, Poland, and Bohemia.
- c. 1050 Pueblo peoples in the American Southwest begin building cliff houses and other apartment-like dwellings.
- 1054 The schism between the Eastern (Orthodox) and Western (Roman) Christian churches is formalized.
- 1055 Seljuk Turks conquer Baghdad and the Abbāsīd caliph recognizes the Seljuk Toghrīl Beg as Sultan.
- 1056 Henry IV, king of Germany and emperor of the West, begins his reign, during which he struggles with the papacy over lay appointment and investiture of bishops and abbots, resulting in rebellions among those nobles who support the power of the Pope.
- 1061 The Almoravids, a Berber Dynasty, begin their conquest of Morocco and western Algeria.
- 1066 William I of Normandy (William the Conqueror) invades England, defeating the Anglo-Saxon King Harold Godwinson (r. 1066) at the Battle of Hastings and establishing the Anglo-Norman dynasty.
- 1071 At the Battle of Manzikert, the Seljuk Turks seize most of Asia Minor from the Byzantine Empire.
- 1074 Byzantine Emperor Michael II enlists the aid of the Seljuk Turks against his uncle, who is making a claim to the throne, allowing the Seljuks, in return, to establish themselves in Anatolia (the Asian portion of present-day Turkey).
- 1075 Responding to the investiture controversy, the *Dictatus Papae* declares Rome’s supreme authority in all religious matters.
- 1076 The Seljuks take Damascus from the Fātīmids.
- The Almoravids extend their influence into the Ghanian empire of Africa, establishing Islam in the area that is now Mali.
- 1081 Rodrigo Díaz de Vivar, whose exploits won him the title *Mio Cid*, or “My Lord,”

- is banished for the first time as an outlaw by Alfonso VI, king of León, an event that figures in Spain's great heroic poem, *The Poem of the Cid*.
- 1085 Christians reconquer Toledo from the Muslims in Spain.
- 1086 The Domesday survey is undertaken in England by King William I (r. 1066–1087), creating surprisingly accurate records of all landed property for tax purposes.
- 1088 Construction begins on the third abbey church of Cluny (Burgundy), the largest church in Christendom.
- 1089 The Almoravids begin their conquest of Spain.
- c. 1090 A small Shiite minority sect in northern Persia organizes into a secret band of political murderers known as the Assassins (a name derived from the word for hashish); they operate out of a fortress in the mountains, sending out missionaries to convert Sunni Muslims and, if that does not work, dispatching terrorist agents to murder key figures and subvert the power of the Seljuks.
- The last Muslim stronghold in Sicily falls to the Normans, who rule Sicily for the next 100 years.
- 1095 Under threat of invasion by the Seljuks, Byzantine Emperor Alexius I calls on Pope Urban II for assistance.
- 1096 Responding to Alexius's call, Pope Urban II launches the First Crusade to regain the Holy Land from the Muslims.
- 1098 The Cistercian Order is founded in an attempt to reform the abuses of medieval monasticism and return to a purer interpretation of the Benedictine Rule.
- 1099 The Fātimids lose Jerusalem to the Crusaders, who establish Christian kingdoms there and in Edessa, Antioch, and Tripoli.
- c. 1100 Inuits from North America settle in northern Greenland.
- Use of the stirrup, horseshoe, and saddle with cantle has become common in France, making heavy cavalry engaging in mounted shock combat the dominant force in medieval European armies.
- 1106 Henry I of England (r. 1110–1135) gains control of Normandy by defeating his brother, Duke Robert, at Tinchebrai. He is later involved in a struggle with the Church, headed by St. Anselm of Canterbury, over lay investiture.
- 1110 Seljuks invade the Byzantine portion of Anatolia.
- c. 1113 The Order of the Hospitallers, which originated as a brotherhood that served poor or sick pilgrims in the city of Jerusalem, is given a charter from Pope Paschal II establishing them as a unique order to be supervised by their own master and answerable only to the pope.
- 1121 The Seljuks lose southwestern Anatolia to Byzantine forces.
- 1122 The lay investiture controversy is settled through a compromise at the Concordat of Worms.
- 1123 The Juchen conquer the Liao Dynasty in northern China and proclaim the Chin Dynasty.
- 1125 The feud between the Guelphs (supporters of Lothair, Duke of Saxony, of the Welf family) and the Ghibellines (supporters of Frederick of Hohenstaufen, whose family are called the Waiblings) begins after Emperor Henry V dies without a direct heir.
- 1128 The order of the Knights Templar is established to protect pilgrims and settlers in the Holy Land following the ousting of Muslim rulers by Crusaders.
- 1130 Fātimid caliph al-Amir is murdered by the Assassins.
- 1135 The Jewish quarter in Muslim Córdoba, Spain, is sacked, causing some Jewish merchants to move from Islamic into

- Christian areas, where they played a key role in trade in the later Middle Ages.
- 1138 The city of Florence is governed as a commune by a consulate made up mainly of knights and a few merchants who serve for one year and preside over an assembly of the people and a grand council.
- c. 1140 The rebuilding of the Abbey of St-Denis outside of Paris marks the beginning of the Gothic style of architecture.
- 1143 Alfonso I Henriques begins his rule as the first king of Portugal, which had previously been a province of León.
- 1144 Muslims recapture Edessa, leading to the Second Crusade.
- 1147 King Roger II of Sicily forcibly transports Greek and Jewish silk workers from Thebes and Corinth to Palermo in order to improve the quality of fabrics manufactured in his royal workshop.
- 1149 The Second Crusade ends, and European troops leave having accomplished little.
- 1152 After her divorce from King Louis VII of France (r. 1137–1180), Eleanor of Aquitaine marries Henry, count of Anjou and Duke of Normandy, who within two years becomes Henry II of England (r. 1154–1189), shifting the immense territories of Aquitaine from France to England. As both queen of France and queen of England, Eleanor acts as an important patron of the arts.
- 1157 The earliest Italian sumptuary law dealing with clothing is enacted in Genoa, initiating a series of such laws enacted for economic purposes (to enhance trade and reinforce the social hierarchy) but often expressed in moral terms.
- 1160 The Taira Kiyomori establish control of the entire country of Japan.
- The Hanse, an association of German merchants, begin securing transnational trading concessions that, over the next 300 years, make it the most influential socioeconomic phenomenon in northern Europe, facilitating trade in everything from amber, beer, furs, and timber to linens, wines, and woollens.
- 1169 Averroës, an Islamic philosopher in Córdoba, Spain, completes the first of his commentaries on Aristotle.
- Saladin becomes commander of Syrian troops in Egypt, orders the assassination of the Fātimid vizier, and is appointed to replace him.
- 1170 Thomas Becket is assassinated at Canterbury Cathedral in England by four household knights of Henry II (r. 1154–1189) following a clash over royal and ecclesiastical rights.
- 1171 Saladin abolishes the Shiite Fātimid caliphates in Egypt and proclaims himself the ruler of a new Sunnite state, establishing the Ayyubid Dynasty.
- As many as 10,000 Venetians are residing in Constantinople to assist in business negotiations and carry out trade transactions.
- 1174 Saladin begins a twelve-year military and diplomatic campaign to unite the Muslim territories of Egypt, Syria, Palestine, and northern Mesopotamia under his rule.
- 1175 The English monk and scholar Alexander Neckham provides the first European account of sailors using a compass to establish direction on cloudy days.
- 1177 William II of Sicily (d. 1189) convinces German Emperor Frederick I Barbarossa to end his opposition to a Sicilian monarchy held in fee of the papacy.
- 1180 Philip II Augustus (1165–1223) becomes king of France and begins an expansion of domains and influence that establishes France as a leading power in Europe.
- Bruno of Cologne founds the Carthusian Order of hermits in the Alps north of Grenoble, combining the communal (cenobitic) lifestyle with solitary (eremitic) practice.

- 1187 Saladin captures the Christian kingdom of Jerusalem, leading to the Third Crusade.
- 1189 Richard I (Lionheart) begins his ten-year reign of England, which will be spent almost entirely abroad, on crusades and in conflict against Philip Augustus of France.
- 1191 Forces led by Richard Lionheart of England (r. 1189–1199) and Philip II Augustus of France (r. 1180–1223) conquer Acre, in the kingdom of Jerusalem, and slaughter the inhabitants.
- 1192 After Christian forces fail to retake Jerusalem, the Third Crusade ends with a three-year truce. Saladin allows the Crusaders to retain a small strip of coastal land and access to Jerusalem.
- 1198 Pope Innocent III, the last powerful medieval pope, begins a pontificate in which he restores some Italian territories to direct papal control, initiates the Fourth Crusade (1202) and the Albigensian Crusade (1208), and approves the founding of the Franciscan and Dominican orders.
- 1199 King John of England (c. 1167–1216) begins his reign, which is marked by loss of English possessions to France, a dispute with Pope Innocent III over the election of the archbishop of Canterbury, and the granting of Magna Carta (1215).
- c. 1200 The major city-state of Great Zimbabwe is founded in southern Africa by the Shona tribe, who dominate trade in gold, slaves, and ivory between inland areas and the Indian Ocean coast.
- Europeans become aware of the Chinese invention of gunpowder, probably by way of the Mongols who have brought it with them.
- By this date, Paris has become the leading center in Europe for the study of the liberal arts and theology, with an academic community that may have included as many as 4,000 people.
- The Ghanian empire is weakened when it is invaded by desert nomads, making it susceptible to attack, in 1203, by Sumanguru, leader of the Susu kingdom of Kaniaga.
- 1204 At the end of the Fourth Crusade (begun in 1202), Christian knights capture and brutally sack Constantinople. The Crusaders establish a Latin kingdom that controls Constantinople until 1261.
- Philip Augustus of France quadruples the size of his domain by conquering all English land holdings north of the Loire.
- 1206 Chinggis (Genghis) Khan, ruler of the Mongols, convenes a national assembly declaring him supreme ruler and begins military campaigns that lead to the conquest of Tibet, parts of northern China, Manchuria, and Korea.
- 1208 Pope Innocent III (1198–1216) proclaims the Albigensian Crusade against the heretics of southern France, causing a long period of conflict that brings an end to the great cultural flowering of Provence.
- 1209 The Franciscan Order of Friars is founded in Italy by Francis of Assisi.
- 1212 A French boy, Stephen of Cloyes, leads the Children’s Crusade, as a result of which thousands of children who travel to Marseilles are sold into slavery, while many German children traveling eastward die of hunger and disease.
- 1215 The Fourth Lateran Council convenes and implements major reforms for secular clergy.
- The Poor Clares, a Franciscan order for women, is formed.
- Magna Carta (The Great Charter) is issued by King John of England, granting privileges to “all the free men of our realm,” and establishing precedent for such modern practices as due process of the law and trial by jury.
- Chinggis Khan’s army takes Beijing.
- Peter Lombard’s *Books of the Sentences* or *Quattuor libri sententiarum* (1155–1157)—a comprehensive work arranging the

- opinions of the Church Fathers, especially Augustine, into a system with a logical order of development—is legislated into the curriculum of all theology students at the University of Paris, where it remains until the sixteenth century.
- 1216 The Dominican Order of Friars Preachers is founded by the Castilian canon Dominic of Calaruega.
- 1218 The Fifth Crusade, the most carefully planned and multinational of all the Christian expeditions to the Holy Land, begins its siege of Damietta in Egypt, but by 1220 has failed due to postponements in the arrival of reinforcements.
- 1220 Frederick II (1194–1250), king of Sicily and Germany, becomes Holy Roman Emperor and enters a long dispute with the papacy over control of Italy and Rome.
- Mongols under Chinggis Khan conquer Persia and other areas of western Asia, and large numbers of Persians are massacred.
- 1221 Crusaders fail to conquer Cairo and sign an eight-year truce with the Egyptians.
- 1223 Chinggis Khan’s son Jochi defeats the Russians and claims the Russian steppes for himself and his descendants.
- c. 1230–c. 1250 The Ebstorf World Map, measuring 12 feet in diameter, is created in Germany. Based on the writings of Gervase of Tilbury, the map depicts a round earth surrounded by ocean, with over 1200 legends identifying geographical features, cities, monasteries, and curiosities, including monsters at the edges of the earth.
- 1231 Holy Roman Emperor Frederick II issues legislation to rebuild royal authority in Sicily, eventually deporting 20,000 displaced Muslims.
- 1233 Pope Gregory IX establishes the Inquisition for the investigation of the Albigensian Heresy, which is undertaken by members of the Dominican order.
- 1236 Alexander Nevski begins his reign as prince of Novgorod (he is later also prince of Vladimir), during which he gains fame for great victories over the Swedes (1240) and the Teutonic Knights (1242).
- 1240 The Islamic empire of Mali establishes its domination of West Africa, which lasts until 1464.
- 1241 The Mongol army under Ögödei Khan completes the conquest of nearly all Russian cities and princes just before Ögödei’s death.
- Louis IX of France (r. 1226–1270) begins building the Sainte-Chapelle in Paris to house a large collection of relics of Christ he purchased from the emperor of Constantinople.
- 1242 The Mongol threat to Western Europe ends when Batu Khan (nephew of Ögödei) withdraws his troops to Russian territory and establishes the capital of his khanate (the Golden Horde) at Sarai on the lower Volga River, where his descendants continue to rule for the next 250 years.
- 1245 In response to the recent threat of a Mongol invasion, Innocent IV sends John of Plano Carpini, a first-generation Franciscan friar, on a mission to Karakorum, capital city of the Mongols, a trip of 3,000 miles that was accomplished in only 106 days. On his return, John writes an ethnographic study of the Mongols, *Historia Mongalorum*.
- 1249 Oxford University is founded.
- 1250 Mamluks, members of a class of military slaves, seize control of Egypt and Syria from the Ayyubid Dynasty, establishing a dynasty that lasts until the state is conquered by Ottomans in 1517.
- A Guelf army defeats a Ghibelline army outside of Florence, and the Guelfs establish the regime of the *popolo*, allowing upwardly mobile, prosperous, non-nobles (mainly merchants and guildsmen) to hold political office.

- 1252 Genoa and Florence introduce the first regular gold coinage in the west, with the Florentine *florin* soon dominating the coinage of northern Italy.
- 1254 Upon returning in defeat from the Seventh Crusade, Louis IX of France, later canonized as Saint Louis, begins a series of governmental reforms intended to put into practice his notion of the ideal Christian ruler.
- 1258 Mongol invaders under Hülegü (younger brother of Khublai Khan) take Baghdad, massacre the inhabitants, and kill the last Abbāsīd caliph, ending the rule of the Seljuks and establishing Mongol rule in Persia.
- 1260 Muslim Mamluk Turks defeat a small garrison force of Mongols in Palestine, ending the advance of the Mongols, who now control all of the Middle East except Egypt.
- 1271 Khublai Khan declares the Yüan Dynasty in China.
- c. 1273 Thomas Aquinas writes his *Summa Theologica*, a massive statement of the whole of Christian theology that becomes the basis of medieval clerical education.
- 1275 Marco Polo, who left Venice in 1271, arrives at the court of Khublai Khan in Mongolia and lives in his domains for the next seventeen years.
- 1279 Khublai Khan conquers the Sung kingdom in southern China and reunifies all of China under Mongol rule.
- 1281 In response to the actions of Japanese authorities who executed Khublai Khan's envoys in 1276, a large army of Mongols, Chinese, and Koreans invades Japan. The Mongols withdraw after a typhoon destroys many of their ships and drowns thousands of their warriors.
- 1285 Philip IV (the Fair) becomes king of France and expands royal power by dominating both the ecclesiastical and the secular affairs of Western Europe.
- 1289 Osman I begins his reign as the first Ottoman Turkish sultan.
- 1290 The Jews are expelled from England by Edward I (r. 1272–1307).
- 1291 Acre, the last Christian stronghold in the Levant, falls to the Mamluks.
- 1295 The “Model Parliament” of England, called by Edward I (r. 1272–1307), is the first to represent all classes of society.
- 1300 By this date, Venice is exporting its own high-grade silk fabrics to England and Spain, replacing more expensive imported silks from the East.
- 1302 The Ottoman Expansion begins.
- Philip IV (the Fair) of France (1268–1314) calls the first of several assemblies of nobles, clergy, and town representatives to solidify support for his ecclesiastical policies, anticipating the “Estates General” that later become part of French government.
- 1306 Philip IV of France expels the Jews and confiscates their property.
- 1309 The seat of the papacy moves from Rome to Avignon when Clement V (1305–1314), originally from Bordeaux, acquiesces to the will of Philip IV (the Fair) of France.
- 1317 Famine strikes Europe, lowering resistance to disease and disrupting social institutions.
- 1325 Ibn Battuta leaves Tangiers for thirty years of travel in Asia and Africa, providing a major source of information to Western readers.
- Mansa Musa, emperor of Mali, annexes the Songhai kingdom of Gao, and continues his transformation of key African cities into important religious and cultural centers with mosques, libraries, and schools.
- 1326 War begins in Poland against the Teutonic Knights, continuing until 1333, when the Teutonic Knights are victorious.

- c. 1330 The Bubonic Plague, or Black Death, begins killing people in northeastern China and is carried westward by traders, travelers, and nomadic peoples.
- The medieval galley, with the maneuverability of a warship, is widened to provide room for additional rowers and cargo space, and it is soon adopted by Venice and Genoa for shipping their most valuable goods.
- 1335 The Sultanate of Delhi dominates most of the Indian subcontinent.
- 1336 The Ashikaga family (Shoguns) takes control of Japan, ushering in an era of constant warfare accompanied by economic growth.
- 1338 The Hundred Years' War between England and France begins, precipitated by a dispute involving English interests in the Flemish wool trade, though the underlying cause was a disagreement over control of Aquitaine (held by the English) and Normandy (to which the English claimed rights), and Edward III's ongoing assertion of his claim to the French throne.
- 1344 The Canary Islands, located off the African coast in the Atlantic Ocean and once colonized by the Romans, are granted to Castile (Spain) by papal bull after being rediscovered by a Genoese explorer operating for the Portuguese in 1341.
- 1345 Ottoman Turks extend their conquest of Byzantine territory into Europe.
- 1346 Bubonic Plague reaches the Golden Horde, precipitating the disintegration of Mongol rule in Russia.
- Outnumbered English longbowmen defeat mounted French knights at the Battle of Crécy, signaling a shift from chivalric to modern warfare.
- 1349 Bubonic Plague reaches Austria, Hungary, Switzerland, Germany, and the Low Countries.
- 1350 Bubonic Plague reaches Scandinavia and the Baltic lands.
- 1356 At the Battle of Poitiers, the English, under Edward the Black Prince, defeat the French, whose king, John II, is taken prisoner, not to be ransomed until 1360.
- 1358 A peasant revolt in France called the *Jacquerie*, protesting mainly against unfair taxation, is suppressed by the royal army.
- 1360 The Peace of Brétigny ends the first period of the Hundred Years' War when Edward III of England (r. 1327–1377) renounces his claim to the throne of France in exchange for control of Aquitaine, Poitou, and Calais.
- 1368 The Mongol Yüan Dynasty in China is overthrown by the Ming Dynasty, contributing to the closing of the trade routes that have provided silk and spices to Western Europe and leaving remaining trade in the hands of Muslim middlemen.
- 1378 Gian Galeazzo Visconti begins his rule of Milan, during which he will extend his influence over Padua, Verona, and Vicenza, though ultimately failing to control Florence and create a kingdom of northern Italy.
- The Great Schism begins when cardinals opposed to the Italian pope in Rome elect a French pope who rules from Avignon, thus establishing two lines of popes who are supported by various European states according to political affiliations.
- 1380 Charles VI becomes king of France but, because of his insanity, the country is in an almost constant state of civil war, thus opening the door for Henry V of England (r. 1413–1422) to be named regent in 1420.
- 1381 The Peasants' Revolt takes place in England when large numbers of peasants, led by Wat Tyler, march on London to protest a poll tax. The young king Richard II (r. 1377–1399) stops the revolt by promising to meet the crowd's demands, but does not keep his word.
- 1382 The Vulgate Bible is translated into English under the guidance of religious re-

- former John Wyclif, whose teachings, rejecting transubstantiation and supporting vernacular Bibles, are condemned.
- 1396 The Crusade of Nicopolis ends when a European army under Sigismund of Hungary is annihilated by the Ottoman Turks under Bayezid I.
- 1399 Richard II of England is deposed by his cousin Henry Bolingbroke, who is crowned Henry IV (r. 1399–1413).
- 1401 Mongols under Timur (Tamerlane) capture Baghdad, slaughter the inhabitants, and destroy the city.
- 1402 The westward expansion of the Ottoman Turks is halted when the Turks are defeated by invading Mongols under Timur (Tamerlane), who captures Bayezid at the battle of Ankara.
- 1405 Admiral Zheng He of China begins maritime expeditions that visit Champa (Vietnam), Indonesia, and southern India, and eventually round the tip of India, reaching the Persian Gulf and the eastern coast of Africa.
- 1409 The Council of Pisa, called to end the Great Schism, elects a new pope, but when the popes in Rome and Avignon refuse to resign, there are three popes.
- 1415 The Portuguese Expansion begins with the conquest of Morocco and continues with the discovery of the Azores, the circumnavigation of Cape Bojador, and exploration of the western coast of Africa, reaching Gambia by 1446.
- The English win an important battle at Agincourt in the Hundred Years' War.
- 1416 The Czech reformer Jan Hus, a follower of Wyclif's teachings who preached against clerical corruption, is burned as a heretic.
- 1417 The Council of Constance brings to an end the Great Schism (1378) which had created two lines of popes.
- 1420 The Hussite Wars begin in Bohemia, involving both issues of religious reform (the teachings of Jan Hus) and issues of nationalism.
- 1422 Henry V of England (r. 1413–1422) dies, leaving his infant son Henry VI (r. 1422–1461 and 1470–1471) and France's Charles VII as claimants to both the English and the French thrones.
- 1429 Galvanized by the leadership of Joan of Arc at the siege of Orléans and the subsequent coronation of Charles VII (r. 1422–1461), the French begin winning battles, leading to the eventual defeat of the English in the Hundred Years' War in 1453.
- 1431 Joan of Arc is burned at the stake in Rouen, France.
- 1438 The Pragmatic Sanction of Bourges, issued by Charles VII of France, asserts the autonomy of the Church in France against the authority of the Pope.
- Albert II (Hapsburg) becomes emperor of Germany, and, from this time on, the imperial title becomes, in practice, hereditary.
- 1453 The Turks, under Mohammed the Conqueror, breach the walls of Constantinople and capture it, bringing the Byzantine Empire, which has lasted 1,000 years, to an end.
- The expulsion of the English from Aquitaine marks the end of the Hundred Years' War.
- 1455 The Gutenberg Bible is printed in Germany using movable type, effectively ending the predominance of hand-copied manuscripts and making books accessible to ordinary people.

## IMPORTANT EVENTS *in Architecture and Design*

- 754 The Abbey of Saint-Denis is begun; its cruciform (cross-shaped) plan imitates that of St. Peter's in Rome.
- c. 790 Construction begins on the abbey of St. Savior at Fulda; the church includes a transept modeled on that of St. Peter's in Rome.
- Construction begins on Charlemagne's palace at Aachen, which is laid out according to a grid of squares in imitation of Roman methods.
- c. 800 Construction begins on the abbey at Lorsch in Germany. Its gateway evokes the Arch of Constantine in Rome.
- 800 Charlemagne, who began a project of articulating the ideas of power, order, and Christian faith through architecture, is crowned emperor in St. Peter's in Rome by Pope Leo III.
- c. 820 The church of San Prassede in Rome is built under Pope Paschal I in conscious imitation of early Christian basilicas.
- c. 830 An ideal plan of a monastery is drawn and sent to the abbot of Saint-Gall.
- 873 At the abbey of Corvey in Germany construction begins on a "westwork," a monumental entry with an upper chapel reached by lateral stair turrets.
- 962 Otto I is crowned emperor in Rome by Pope John XII, leading to repeated copying of the chapel at Aachen in the design of other structures.
- 1001 Construction begins on the abbey of Saint-Bénigne, Dijon. Its rotunda emulates the Holy Sepulchre in Jerusalem.
- 1010 Construction begins on the abbey of St. Michael's in Hildesheim. Its design elaborates on the cruciform basilica.
- 1012 Construction concludes on a castle at Loches, France, which includes an early example of a "tower keep."
- 1030 Work begins on the imperial cathedral of Speyer in Germany, a church of enormous scale completed around 1060 and vaulted around 1100.
- 1037 Construction begins on an abbey church at Jumièges in Normandy. The design introduces a gallery or upper story above the arcade that opens into the main interior space.
- 1066 England is conquered by the Normans, who will rebuild every cathedral and monastery in the country, obliterating all traces of major Anglo-Saxon architecture.
- c. 1078 The Tower of London ("White Tower") is built for William the Conqueror by Gundulf, bishop of Rochester, to dominate the eastern edge of the city and advertise Norman presence.
- 1078 Construction begins in Spain on the cathedral of Santiago de Compostela, shrine church of St. James, apostle of Jesus.
- c. 1080 Construction begins on the pilgrimage church of Saint-Sernin at Toulouse, demonstrating development of barrel vaulting.
- 1088 Construction begins on the third abbey church of Cluny, the largest in Christendom.
- 1093 Work begins at the cathedral of Durham. The design features one of the first examples of ribbed groin vaults.
- 1099 Westminster Hall, the great hall of the palace of Norman kings of England, is completed. It is so wide that it requires internal supports.

- c. 1135 Construction begins on the west façade block of the abbey church of Saint-Denis (dedicated in 1140), with three portals and the first example of a rose window.
- 1139 Construction begins on the abbey of Fontenay, exemplar of Cistercian architecture during the lifetime of influential churchman Bernard of Clairvaux.
- 1140 Construction begins on the new choir of Saint-Denis (dedicated in 1144) with columns recalling the churches of Rome.
- c. 1145 Construction begins on the choir of the abbey of Saint-Germain-des-Prés in Paris, one of the earliest buildings to use flying buttresses.
- c. 1150 Laon Cathedral is begun. It is an example of four-story elevation in northern French Gothic architecture.
- c. 1155 Construction begins on the cathedral of Paris (Notre-Dame), the interior of which rises to the height of a modern ten-story building.
- 1179 Master mason William of Sens leaves Canterbury Cathedral after being injured in a fall during the rebuilding of the choir after a fire; he is replaced by master mason William the Englishman. Their work changes the direction of English architecture towards lightness and linearity.
- c. 1190 Wells Cathedral's nave is begun, using Gothic forms in independent bits and pieces.
- 1192 Master mason Geoffroy de Noyers begins work on St. Hugh's choir at Lincoln Cathedral and introduces "crazy vaults."
- 1194 A fire destroys the Romanesque cathedral of Chartres and work begins on a new Gothic cathedral, which will be known for the expanse of its windows.
- 1211 Construction begins at Reims Cathedral directed by master mason Jean d'Orbais; it is the first example of bar tracery.
- c. 1220 Construction begins on a new choir at the Cistercian abbey of Rievaulx. The structure will illustrate the achievement of balance through the use of harmonious proportions based on the square.
- 1228 Construction begins on the church of San Francesco, Assisi (completed 1253) by the Franciscans, one of the new orders of mendicant friars. The church combines new French forms with the local Italian tradition of broad interior space decorated with frescoes.
- 1229 Work is started on a Dominican church in Toulouse (completed 1292). It is an example of the double-nave church type.
- 1241 King Louis IX of France begins work on the Sainte-Chapelle (completed 1248) within the royal palace; it includes vertical colonnettes which frame enormous, fifty-foot high stained glass windows.
- c. 1244 Work begins on fortifications for the new city of Aigues-Mortes, which serves as a port of embarkation for a crusade led by Louis IX.
- 1245 Reconstruction of Westminster Abbey choir begins under King Henry III by master mason Henry of Reyns, imitating French *rayonnant* style.
- 1246 Work begins on the Dominican church of Santa Maria Novella in Florence, stressing a return to functional purity.
- 1277 Work begins on the west façade of Strasbourg Cathedral where extravagant expressions of bar tracery completely disguise the load-bearing walls behind.
- 1284 The choir of Beauvais Cathedral, the tallest cathedral (158 feet) in Europe, collapses.
- 1294 The architect Arnolfo di Cambio begins work on the Franciscan church of Santa Croce in Florence. The design of the church illustrates the simplicity of Franciscan aesthetic values.
- 1295 Construction begins on Beaumaris castle (in Anglesey, North Wales), the design of which illustrates elaborate defensive structure.

- c. 1296 The remodeling and expansion of the royal palace in Paris begins under King Philip IV, combining elements of church and military architecture.
- 1305 French queen Jeanne de Navarre founds the College of Navarre in Paris; the construction of college buildings begins in 1309, combining elements of monastic and urban palace architecture.
- 1334 Pope Benedict XII begins construction of a papal palace at Avignon, combining an apparently military exterior with residential and bureaucratic halls; work continues under his successor Clement VI.
- 1344 Work starts on Prague Cathedral under French master mason Matthew of Arras; Peter Parler becomes master mason in 1352.
- 1386 Work starts on the Milan Cathedral; in the 1390s debates raise the question of whether a design based on a square or a triangle would be more beautiful and structurally sound.
- 1394 Architect Henry Yevele and carpenter Hugh Herland begin the remodeling of Westminster Hall and the construction of a hammer-beam ceiling.
- 1434 Pierre Robin designs the parish church of Saint-Maclou in Rouen. His design illustrates the growing importance of architectural drawings.

## OVERVIEW *of Architecture and Design*

**THE IDEAL FACE OF THE SOCIETY.** Change has been a constant of human societies as long as history has been recorded, and the six centuries of the Middle Ages were a period of dynamic transitions and developments in architecture. Europe in 1400 bore little resemblance artistically, economically, politically, or technologically to Europe in 800, although each succeeding generation and century built upon the achievements of its predecessors. As might be expected, architecture offers a complex reflection of the collective concerns of medieval European society, as well as a localized guide to the character and tastes of specific regions or institutions. One twentieth-century French scholar wrote that “architecture is the expression of the very being of societies,” but he was also careful to note that architecture represents the ideal face of that society. These structures were erected not only to serve useful purposes as places of worship or residence, but they were, at the same time, visual arguments that were intended to persuade. These important buildings show clearly who had the power and was able to gather the resources of materials, men, and money necessary for their construction. They also reveal the activities and values that were most highly prized and the issues that were deemed the most urgent. Rather than focusing attention on art museums, corporate skyscrapers, or sports stadiums as is common today, the most extravagant medieval architecture was concentrated on churches, aristocratic palaces, and defensive structures.

**COMBINING ROMAN AND CHRISTIAN HERITAGE.** A rapid sketch of the political and religious landscape of medieval Europe sets the stage for an understanding of medieval architecture, whose beginnings in the late eighth century can be linked to the emergence of a new empire under the leadership of Charlemagne. After the collapse of centralized Roman authority in the fifth century, Europe endured 300 years of political fragmentation and economic decline. Invasions of peoples from western Asia and central Europe, wars, and waves of disease destroyed security, devastated agriculture and commerce,

and emptied urban centers. However, in the later eighth century, the Franks, a Germanic tribe that had settled in what is today France and Germany, began to consolidate their power and expand their territory. To support their claims to rule, they presented themselves as the successors to the Romans, but with one important difference: the Franks were Christian. Their architecture constituted an important part of their persuasive argument, for it looks back for many of its forms to the ancient buildings of Rome and, whenever possible, to those associated with the first Christian emperor, Constantine.

**REGIONAL DIVERSITY AND THE ROMANESQUE.** Within less than a century, the Carolingian Empire—the kingdom of Charlemagne and his successors—began to lose its central authority once again, and although large-scale political units, such as the empire of the Romans, existed or were revived in theory, effective power settled into the hands of local and regional lords. A system usually referred to as “feudalism,” based on hierarchy, land holding, and obligations, arose out of the new political realities. An aristocratic lord gained his wealth from payments (usually in kind) from those who lived on and worked his land. In exchange for his subjects’ oath of loyalty and service, he assumed responsibility for their protection. Although great feudal lords might still owe allegiance to the king—for example, the duke of Normandy, even when he was also king of England, was required to swear homage to the king of France for Normandy—they were, in effect, sovereigns in their own regions. A consequence of this political fragmentation is reflected in the diversity of European architecture in the tenth and, especially, the eleventh centuries, a period called the Romanesque. Patrons and their builders continued to employ Roman forms, but did so in such different and imaginative ways that each region’s architecture assumes a distinctive flavor. Architectural forms such as monastic buildings, pilgrimage churches, or castles can best be discussed through comparison across both time and space. These architectural types, moreover, such as shrine churches, for example, were not confined to a single art historical period, and their appearance was modified continually.

**THE INTERNATIONALIZING OF ARCHITECTURAL FORMS.** To a degree, the rise of international monastic orders countered the centrifugal trend of diversity fostered by a political structure based on lordship. Benedictine monastic architectural planning, based on the cloister (walled space) and an orderly arrangement of buildings, was regulated in the ninth century and followed consistently throughout the Middle Ages. In the twelfth century, the Cistercians—a reforming group within Benedictine

monasticism—spread not only consistent methods of planning, but also church types and an artistic attitude of austerity across Europe. Pilgrimage, promoted with special intensity by the Order of Cluny, another group within Benedictine monasticism, also created avenues and institutional connections for the exchange of ideas and innovations in art and architecture. Although precise documentation is lacking, it is obvious, for example, that the builders of the abbey churches of Toulouse (begun in 1080) and Conques in France (begun around 1060) and the cathedral of Santiago de Compostela in distant northwest Spain (1078) were aware of one another's work.

**CITIES AND TECHNOLOGIES.** The twelfth century was a period of profound change in European society. Modern centralized states began to coalesce as the kings exercised more effective control over their territories and reduced the independence of regional lords. This current culminated around 1300 with the evolution of England and France into nations and the emergence of powerful kingdoms including Aragon and Castile in Spain, and Naples in southern Italy. With improved security, the dramatic increase of agricultural productivity, and the rise of economies based on money gained from surpluses and the increased manufacture of goods, western Europe entered a period of rapid population and urban growth. Paris, for example, experienced roughly a tenfold increase in its population between 1100 and the early fourteenth century, Florence became a metropolis of 100,000 inhabitants, and London and Prague rose to prominence as both royal capitals and artistic centers. It is certainly no accident that a new style of architecture took shape in and around these cities at this time. Gothic architecture, as it later came to be called, first appeared in northern France within royal territory in the mid-twelfth century, and then spread to all areas of Europe. Although the traditional monastic orders remained important sponsors of large-scale building, bishops in their cities assumed greater importance and an affluent laity, whose fortunes were made in commerce and industry, emerged in the thirteenth century as a key source of support for the building efforts of new urban religious communities, notably the convent churches of the Dominican and Franciscan friars. Commercial success, which underscored individual initiative, not only stimulated construction of luxurious residences, but may also have been a factor in the late medieval emphasis on personal piety that was felt architecturally in the demand for spaces for private worship, such as completely outfitted chapels in the home. In addition, the architectural workshop was an important laboratory of new industrial

methods. As the number and scale of building projects increased, techniques of production were devised based on standardized parts, whose fabrication was controlled by drawings. In turn, other industries, such as wool or dye manufacture, offered models of rational organization and efficient labor to the building yard.

**ARCHITECTURE AND UNIVERSITY LEARNING.** Beginning in the twelfth century and continuing into the fourteenth, universities were founded throughout Europe: Oxford and Cambridge in England; Paris, Toulouse, and Montpellier in France; Bologna in Italy; Salamanca in Spain; and Prague in what is now the Czech Republic (in the Middle Ages part of the Holy Roman Empire). In these centers of intellectual activity, new ways of thinking, based on Aristotelian logic and rhetoric, careful observation, and systematic analysis, pushed received ideas toward original conclusions that transformed European culture. The greatest thinker of the thirteenth century, Thomas Aquinas, a Dominican friar, recognized similarities between the scholar and the architect. Just as the architect orders the raw materials of sand and stone and the skills of his craftsmen into an overall scheme, the philosopher assembles and arranges the disciplines of human learning into an edifice of knowledge. Although the connections may be indirect, the mental processes of the master mason, his acquisition of specialized knowledge in his craft, his ability to think problems through to a solution, and his achievement of innovative combinations of forms can be viewed within the framework of these progressive intellectual trends.

**THE ULTIMATE CREATIVITY.** Paralleling the development of church architecture throughout the period were technological and conceptual changes in military and domestic architecture. Castles, for example, had evolved from the purely defensive tower that stood alongside a hall for protection, to the residential “donjon” with living spaces for the overlord, and finally to elaborate palace-like structures within fortified walled cities. It was, however, in church architecture that the ultimate expression of medieval creativity was to be found. Gothic cathedrals, as represented by their soaring spires, innovative flying buttresses, and dazzling stained glass, have often been likened to the skyscrapers of the modern era. Despite the obvious differences, the comparison is nonetheless instructive. The modern office building is driven by economic factors, shaped by zoning regulations, designed by skilled architects and engineers, assembled from steel and glass produced in factories and transported by machines to the construction site, run by electricity, accessed by high-speed elevators, climate-controlled by computers, and represents civic pride or

corporate status. It is at once the product of a long developmental process and the awe-inspiring, original creation of the unique forces and capabilities of twentieth-century society. In a similar light, the late medieval cathedral summarized centuries of architectural experience, but also represented the impact of advanced stone-cutting technology and constant structural innovation, patterns of religious devotion, and prosperity as it embodied the visions of earthly power and other-world splendor of its makers.

## TOPICS *in Architecture and Design*

---

### THE INFLUENCE OF THE CAROLINGIANS

**BUILDING AN IMAGE.** Medieval architecture, in many ways, was defined during the reign of Charlemagne. Not only was the scale of building enterprises unmatched in Europe since the collapse of the Roman Empire four centuries earlier, but Charlemagne also utilized architecture to create the image of his government. In a biography composed around 830, Einhard, the ruler's friend and advisor, wrote that the emperor

set in hand many projects which aimed at making his kingdom more attractive and at increasing public utility. . . . Outstanding among these, one might claim, are the great church of the Holy Mother of God at Aachen, which is really a remarkable construction, and the bridge over the Rhine at Mainz, which is five hundred feet long. . . . More important still was the fact that he commanded the bishops and churchmen, in whose care they were, to restore sacred edifices which had fallen into ruin through their very antiquity, wherever he discovered them throughout the whole of his kingdom.

During the reign of Charlemagne, the emperor's builders strove to articulate the ideas of power, order, and Christian faith through the arrangement of spaces and the abstract vocabulary of architecture—columns, piers, walls, windows, ceilings. Their task was not unlike the one that the new republic of the United States confronted around 1800: how to give meaningful physical form to guiding political principles. And just as Washington, D.C., wages an eloquent argument in its pediments, domes, porticoes, and temple forms that the United States is heir to the democratic tradition of Greece and the might of Rome, Carolingian buildings turned to ancient Roman architecture to embody the vision of an empire guided

by Christian values that would bring unity and peace to a fragmented and conflict-ridden Europe.

**AACHEN AND THE EMULATION OF ROME.** No project reveals Charlemagne's architectural goals for his new empire better than the palace complex Aix-la-Chapelle at Aachen, in what is now Nord Rhein-Westfalen in northwestern Germany. As another of his biographers, Notker Balbulus (the Stammerer), wrote, "He [Charlemagne] conceived the idea of constructing on his native soil and according to his own plan a cathedral which should be finer than the ancient buildings of the Romans." Built during the 790s, Aachen constituted a palace complex that included a monumental gateway, a chapel, and an audience hall in stone supplemented by residential and utilitarian structures in wood. With this set of impressive buildings, Charlemagne established a permanent and symbolic capital that intended to emulate the great imperial cities of Rome and Constantinople. To make his point clear to the populace, he named his palace "The Lateran," a direct reference to the cathedral and palace, built under Constantine, the first Christian emperor, in Rome. The very plan of Aachen, laid out according to a grid of squares, revived Roman methods to embody the ordered regularity that the emperor wished to impose on his vast territories. Further, the long galleries that linked the three stone structures imitated a feature frequently found in Roman palaces.

**ROMAN MODELS.** Moreover, the buildings themselves were based on particular Roman prototypes. The palace's great hall, for example, where Charlemagne received visitors and presided over court ceremonies while enthroned in the semicircular space of an apse (a rounded projection from the end of a building), resembled that erected by Constantine around 310 C.E. at nearby Trier on the central western border of modern-day Germany. The palace chapel—this is Notker's "cathedral"—consisting of an outer sixteen-sided polygon enclosing an octagonal central space, looked to a tradition of centralized court chapels found throughout the Mediterranean world from the fourth century on; but it was especially close in form to Justinian's church of San Vitale in Ravenna in Italy (c. 540–548). Charlemagne himself had passed through Ravenna shortly before construction of Aachen was begun and his direct experience of this beautiful imperial church must have been a decisive factor in its design. Like San Vitale, the interior space at Aachen is disposed on two levels: a chapel, dedicated to the Virgin, occupies the ground floor, while the upper gallery level, sheltering the imperial throne and an altar of the Savior, comprises a second chapel. The sturdy piers, the tiers of arches, the sophisticated combination of vaults, and the

## MEDIEVAL Architecture Terms

**Aisle:** A long open narrow area at the sides of a church used to walk through the structure.

**Altar:** The elevated place in a church where rites are performed.

**Ambulatory:** The passageway around the end of the choir.

**Arcade:** A series of arches supported by piers or columns.

**Apse:** A vaulted semicircular or polygonal recess in the church at the end of the choir.

**Ashlar:** Stone that is faced and squared, often with a chipped or irregular surface.

**Bailey:** The open courtyard in a castle between the outer ring of fortified walls and the keep.

**Battlement:** The low parapet at the top of a fortified wall composed of solid shields of masonry, called merlons, alternating with openings, called crenels.

**Bay:** Any of a number of similar spaces or compartments between the vertical dividing structures of a large interior.

**Capital:** The uppermost portion of a column or pillar, often carved with relief sculpture on several faces.

**Chapel:** A small space for private worship off the aisle of a church.

**Chevron:** A pattern of angled stripes.

**Choir:** The part of a church to the east of the transept, occupied by monks during the singing of offices.

**Clerestory:** A portion of the interior of a church rising above adjacent rooftops and having windows to admit light.

**Column:** A large post-like support holding up an arch or other architectural feature. The tops of columns were often decorated with sculpture.

**Corbel:** A short horizontal bracket of stone or timber projecting from a wall and supporting an architectural element.

**Crenellation:** A battlement (protective wall) with tapered embrasures or squared openings.

**Crypt:** A chamber or vault below the main floor of a church, often used as a burial spot.

**Donjon:** The great tower or keep of a castle, sometimes thought to be the residence of the lord of the castle.

**Façade:** The front of a church, usually imposing and decorated.

**Flying buttress:** A segmental arch transmitting outward and downward thrust to a solid buttress or square column which transforms the force into a vertical one.

**Gallery:** A long narrow area open at each end or at sides and sometimes elevated.

**Groin vault:** The curved line or edge formed by the intersection of two vaults.

**Hammerbeam:** One of a pair of short cantilevered timbers supporting a ceiling arch.

finely cut stonework of the building are unprecedented in earlier medieval architecture and, once again, suggest that the revival of Roman forms was accompanied by a comparable renewal of Roman building technology. Finally, the decoration of ancient columns and capitals, marble imported from Ravenna, bronze railings and doors, and mosaics all invest the chapel with a dazzling and thoroughly Roman aura. As a whole, Aachen sends the message of Charlemagne as the legitimate successor to the authority of Christian imperial rulership in the West. It was the architectural “first act” of a political drama whose conclusion was staged on Christmas Day 800 with the coronation of Charlemagne as emperor in St. Peter’s Basilica in Rome.

**THE BASILICA.** As the words of Einhard, quoted above, imply, the Carolingian era witnessed a surge of church construction. Although centralized plans were often favored for aristocratic chapels, they were not easily adaptable to the needs of churches that required space for large congregations or housed monastic communi-

ties whose liturgy involved processions to altars located throughout the interior. Once again, Carolingian patrons and builders looked back to early Christian Rome for a model that was at once functional—accommodating crowds of worshippers and the processional liturgy of the Mass—as well as historically resonant and symbolically potent. The basilica fit all three requirements. Adapted from large Roman halls that served a variety of functions, including law courts or public assembly, the Christian basilica is characterized by its longitudinal space organized around a central axis and formed by a dominant central area flanked symmetrically by lower aisles. The usual model contained a long hall or nave, an entry portico on the west side, and an apse (usually semicircular in form, but sometimes polygonal or square) in the east, which usually contained the altar area. The entry and altar were almost always on the short sides of the rectangular configuration, with the altar facing the city of Jerusalem. A large open courtyard or atrium, a feature eliminated in the later Middle Ages, and an entry

**Keep:** The multi-storied tower that combined living quarters and defensive features in a medieval castle.

**Keystone:** A wedge-shaped stone at the summit of an arch serving to lock the other stones in place and create structural strength.

**Machicolations:** A projecting gallery at the top of a fortified wall with floor openings through which heavy objects or boiling liquids could be dropped on attackers.

**Moot:** A ditch of some width and depth around a fortified area like a castle serving to repel intruders.

**Motte:** A fortification consisting of a timber tower set atop a conical earth mound. The motte often was surrounded by a ditch and wooden palisade.

**Narthex:** An enclosed passage between the main entrance and the nave of a church.

**Nave:** The main longitudinal area of a church.

**Parapet:** A battlement wall protecting the wall-walk and roof.

**Pier:** A support for the ends of adjacent spans of arches.

**Plate:** A horizontal timber laid flat atop a pier or wall used to attach the ends of rafters.

**Portcullis:** A heavy iron or wooden grill, set in vertical grooves, that can be raised or lowered by chains to protect the entrance to a castle.

**Purlin:** A longitudinal member in a roof frame usually for supporting common rafters between the plate and the ridge.

**Rafter:** The beam, usually angled and joined at the top to a similar beam in the form of an inverted V, which is used to support a roof.

**Rotunda:** A circular high space in a church surmounted by a dome.

**Rubble:** A wall made of different sizes and types of uncut stone.

**Screen:** A wooden or iron structure separating the nave from the choir of a church, sometimes called "rood screen" if it had a large crucifix ornamenting its top.

**Transept:** The transverse part of the rectangular body of the church, usually crossing the nave.

**Triforium:** The wall at the side of the nave, choir, or transept corresponding to the space between the vaulting or ceiling and the roof of an aisle.

**Truss:** A triangle of timbers used to support compression, used in the construction of a roof.

**Vousoir:** A wedge-shaped brick or stone used to form the curved part of an arch or vault.

**Wattle and daub:** A building material consisting of wattle, a light mesh of laths or interwoven twigs, covered with mud, stucco, or brick.

**Westwork:** The monumental western front to a church involving a tower or group of towers and containing an entrance and vestibule below and a chapel above.

vestibule, called a narthex, frequently fronted the body of the basilica. This axial sequence of spaces lent itself naturally to hierarchical divisions, marked by barriers, curtains, screens, and differences in decoration. The nave served as the congregational space while the apse enclosing the altar was reserved for the clergy.

**SYMBOLIC SHAPE AND NUMBER.** In Abbot Fulrad's rebuilding of the abbey of Saint-Denis between around 754 and 775, the Roman inspiration was evident. The church took the shape of a cross through the addition of a transverse space, termed a transept, inserted between the nave and the apse. The transept appeared earlier only at the great martyrs' basilicas of St. Peter's and St. Paul's in Rome, presumably to provide a suitably impressive spatial setting around the tomb of the saint, but once revived, this cruciform plan became common in Christian architecture. Used at Saint-Denis, it served the dual purpose of linking the local saint with the prestige of the apostle Peter and of equating the Frankish kings, many of whom were buried there (including Charlemagne's

father Pepin the Short), with Constantine, the patron of St. Peter's. To judge from its plan, a nearly exact replica of the transept and apse of St. Peter's was also erected over the tomb of St. Boniface, missionary to the Germans, at Fulda in the early ninth century. Another impressive example can be found in the abbey of Saint-Riquier at Centula in northern France, where the cruciform shape of the church combines with an insistent use of three in its plan to emphasize the Trinity. The importance of number in the church's design is characteristic of medieval architecture. Based on a passage in the Wisdom of Solomon, "you have ordered all things in measure and number and weight," Christian theologians from Augustine, writing in the fifth century C.E., on interpreted numbers symbolically. Numbers revealed the underlying harmonies of the universe and their incorporation into the designs and visual rhythms of medieval architecture intended to convey the beauty of divine creation. In all of these basilicas, the references to early Christian Rome served not only as a political symbol,

## TYPES of Churches and Religious Structures

---

**Abbey church:** The church of a monastery under the supervision of an abbot or a convent of nuns under the supervision of an abbess.

**Basilica:** A Roman Catholic church or cathedral given ceremonial privileges by the pope. Christian basilicas were formed out of ancient Roman buildings (originally assembly halls, courts, and exchanges) or built on a similar design.

**Cathedral:** The principal church of an archdiocese or diocese, the regional administrative districts of the Church. The throne—or cathedra—of the archbishop or bishop is located in the cathedral.

**Chapel:** A separate area in a church or home, having its own altar and intended for private worship.

**Cloister:** The enclosed part of a monastery or convent where monks or nuns live and, in some cases, laypeople are not allowed to enter. The term can

also refer to the covered walkway around the interior courtyard of a monastery or college.

**Convent:** The living quarters of nuns or the dwelling of a community of friars.

**Monastery:** The complex of buildings, including an abbey church, in which a group of people, observing religious vows or rules, lives together. A convent often designates a female religious community. A double monastery refers to one that includes both monks and nuns.

**Parish church:** The church of a parish, a small division of the larger diocese. The parish church was the focus of religious activity of the local population, who were ministered to by a rector or sometimes a curate whose living came from the rent provided from the lands of that community.

**Pilgrimage church:** A large church on the major pilgrimage routes, such as the road leading to the shrine of St. James at Compostela. Pilgrimage churches often offered shelter, and provided maps and information about the route.

**Shrine:** An alcove for a tomb, holy relics, or a religious icon in a church.

Tiber River and St. Peter's Basilica, Rome, Italy, early fourth century. JOHN AND LISA MERRILL/CORBIS.

*a PRIMARY SOURCE document***ON THE LITURGY AND RELIQUARIES OF THE ABBEY CHURCH OF SAINT-RIQUIER**

**INTRODUCTION:** During the reign of Charlemagne, the Western Church experienced both a rise in the use of Roman liturgy and an increased interest in the cults of saints. Church architecture responded by providing additional pathways for processions and spaces for the exhibition of relics. This architectural tendency is illustrated at the Abbey Church of the Royal Monastery of Saint-Riquier, near Amiens in northern France, where the abbot was a theologian and court-poet known as Angilbert of Saint-Riquier. Born in the late 750s to one of the families of Frankish aristocracy, Angilbert received his schooling in the entourage of Charlemagne and was closely connected to the emperor's family. In his treatise entitled *De perfectione*, Angilbert provides a narrative account of his personal rebuilding of the abbey and treats the elements of the buildings and treasures of the monastery. The excerpt provided below shows how movement around the church to multiple altars and stations had become an important part of worship. The titles preceding the paragraphs have been added for clarity. They do not appear in the original document.

**The Liturgy**

At all Vespers celebrated in the normal way, when everything has been completed at [the altar of] Saint Richarius, let the brothers proceed by singing psalms up to the holy Passion. When the prayer has been completed, let the choirs be divided into two, of which one proceeds to [the sculpted relief of] the Holy Resurrection, the other to [the sculpted relief of] the Holy Ascension. Then when the prayer has been done, let one choir come to [the altar of] Saint John, the other to Saint Martin. And then afterward [proceeding] through [the altars of] Saint Stephen and Saint Lawrence and the other altars by singing and praying, let them come together at the [altar

of] the Holy Cross... But when Vespers and Matins shall have been sung at [the altar of] the Holy Savior, then let one choir descend to [the sculpted relief of] the Holy Resurrection, the other to [the sculpted relief of] the Holy Ascension, and there, praying, let them just as above process singing to [the altars of] Saint John and Saint Martin; when the prayer has been completed, let them enter here and there through the arches of the middle of the church and let them pray at [the sculpted relief of] the Holy Passion. Thence let them proceed to [the altar of] Saint Richarius, where, when the prayers have been said, they shall divide themselves again just as before and shall come through [the altars of] Saint Stephen and Saint Lawrence, singing and praying, up to [the altar of] the Holy Cross. ...

**The Relics**

These [relics] having been collected ... honorably and fittingly in the name of the Holy Trinity, we have with great diligence prepared a principal reliquary decorated with gold and gems, in which we have placed part of the above-mentioned relics, which we have been eager to place ... under the crypt of the Holy Savior. Moreover, we have taken care to divide the relics of the other saints, which are noted above, into thirteen other smaller reliquaries decorated most handsomely with gold and silver and precious gems, which we merited to collect ... and we have placed them on the beam that we have established on the arch in front of the altar of Saint Richarius [in the apse of the church], so that in every corner in this holy place it will be fitting that the praise of God and the veneration of all of his saints always be adored, worshiped, and venerated.

**SOURCE:** Angilbert of Saint-Riquier, *De perfectione*, in *Faith, Art, and Politics at Saint-Riquier: The Symbolic Vision of Angilbert*. Ed. Susan Rabe (Philadelphia: University of Pennsylvania Press, 1995): 118, 121–122.

but also as a representation of the true Christian faith that Charlemagne and his theologians took as their mission to protect and proclaim.

**INNOVATIONS IN PLANNING.** Carolingian church architecture was more than historical and spiritual nostalgia for early Christian Rome. It enriched its borrowings from the past by contributing a greater complexity to spatial planning. In part, this was a response to the promotion among Charlemagne's ecclesiastical allies of the Roman liturgy, whose worship services featured processions through and around the church. With the rise of the cult of saints as a significant component of

medieval Christian worship, auxiliary spaces were required for the exhibition of relics with pathways providing access to the tomb or shrine. The underground corridor that was excavated in the apse of St. Peter's in Rome around 600 during the reign of Pope Gregory I (the Great) allowing the faithful to circulate around the saint's burial site was copied at Saint-Denis and San Prassede in Rome (c. 820). An elaborate two-story crypt was added outside the choir of the original church of Saint-Germain, Auxerre, in France in the mid-ninth century. Passages, connecting a series of chapels, including a rotunda dedicated to the Virgin Mary, provided circulation around the sixth-century tomb chamber of

Gatehouse from Abbey of Lorsch, Germany, early ninth century. VANNI ARCHIVE/CORBIS.

Saint-Germain as well as space for six new altars. A similar multiplication of chapel spaces was echoed above ground in the 870s at the abbey church of Corvey in Germany, where an axial cruciform chapel and two lateral chapels were linked by a curving aisle that wrapped around the choir. These experimental schemes anticipated the development of the ambulatory (an aisle surrounding the end of the choir) and chapel arrangement of Romanesque and Gothic architecture. A further modification of the standard basilica was the “double-ended” plan, found at Fulda in Germany and in the Plan of Saint-Gall in Switzerland (a series of blueprint-like drawings), where the saint’s shrine and the main altar were placed in apses at opposite ends of the church, a solution that had a long life in German church design.

**PROUD TOWERS.** Proclaiming the majesty of the church, towers represent one of the most daring contributions of medieval architecture, for they existed more for the sake of their visual impact and symbolic resonance than they did to fulfill any functional purpose. Concentrated at the “crossing,” that is, the intersection of the nave and choir of the basilica, towers accented the area of the main altar, the focal point of the church. At Saint-Denis, a 30-foot-high tower rose above the crossing while at Saint-Riquier, a multi-stage polygonal lantern (a tower-like structure admitting light) flanked by two slim stair turrets formed a monumental vertical cluster

Towers of Benedictine monastery, Cluny, France, 12th century. HAMISH PARK/CORBIS.

that contrasted dramatically with the 275-foot length of the body of the church. This embellishment of the crossing, often formed by a central tower with taller towers placed at the ends of the transept, continued through the next major architectural period (the Romanesque), as at the third abbey church of Cluny in France or Tournai Cathedral in Belgium, and then into the culminating period of medieval architecture (the Gothic) at the cathedrals of Laon and Chartres in France, and Milan in Italy, where the towers were likened to the “four evangelists surrounding the throne of God.” Towers appeared most commonly as integral elements of the façades of church buildings. Twin towers are mentioned at the Carolingian Saint-Denis, an arrangement repeated in the reconstruction of the abbey’s new entrance block in the 1130s. However, Carolingian architecture is most notable for its invention of the “westwork,” the monumental entry composed of a dominant central element enclosing an upper chapel reached by lateral stair turrets (that is small towers on each side). Described as a *castel-*

Abbey of Saint-Denis Cathedral, Paris, France, 13th century. THE ART ARCHIVE/DAGLI ORTI.

*lum* (“castle”) or *turris* (“tower”) by contemporary writers, the westwork of churches such as Saint-Riquier and Corvey served as a virtual vertical church for the staging of important religious services. In addition, because the façade block housed the emperor’s throne at Aachen, it has sometimes been interpreted as an imperial architectural form. Roman city gates, it should be remembered, had included towers and upper chambers used in imperial ceremonies. At the Abbey of Lorsch in Germany, a freestanding triple-arch gateway that probably “copied” the Arch of Constantine in Rome coupled with the church’s westwork behind to create a spectacular entry sequence. The tower, like the inventive mix of Roman and medieval forms of Carolingian architecture in general, resonated on multiple levels as it invested the church with the aura of imperial power, triumphal authority, and transcendental spirituality.

## OTTONIAN AND NORMAN ARCHITECTURE

**CAROLINGIAN QUOTATIONS.** Charlemagne’s vision of a Christian Roman Empire dissolved in the later ninth century, bringing an end to a great period of public construction. Central authority, undermined by the division of territory and royal rivalries among Charlemagne’s grandsons, was shattered by the invasions of Vikings in the north, Magyars in the east, and the Muslims around the Mediterranean. Their attacks devastated hundreds of towns, churches, and monasteries. A new kingdom emerged in central Germany in the mid-tenth century that laid claim to the mantle of the Carolingians, and in 962, Otto I was crowned emperor. In the projects generated by the court and its ecclesiastical allies, architecture reinforced Ottonian political pretensions through a deliberate continuation of Carolingian models. The palace chapel at Aachen was copied repeatedly throughout the eleventh and twelfth centuries: in the chapel of St. Nicholas at Nijmegen in the eastern Netherlands, at Bishop Notger’s chapel at Liège in Belgium, and, oddly enough, in nunneries at Essen and S. Maria im Kapitol in Cologne in Germany, and at Ottmarsheim (1049) in eastern France. The interest of these female monastic communities in Charlemagne’s chapel underscored their

Towers and roof of Speyer Cathedral, Germany, 1030. CARMEN REDONDO/CORBIS.

imperial connections, but may have also been suggested by Aachen's dedication to the Virgin Mary and its possession of the relic of her shroud. Westworks appeared in major Ottonian cathedrals and monasteries in Germany, including the cathedrals of Speyer and Worms, and the abbey church of St. Michael's in Hildesheim, suggesting that by this time they were seen as an important component of the imperial architectural image. The cruciform basilica, revived by Carolingians, remained the basis for large-scale church plans. At St. Michael's, Hildesheim, this basic plan was elaborated with a transept and apse at each end of the building with the western choir raised above a crypt whose ambulatory was visible on the exterior.

**SPEYER.** The Cathedral of Speyer in western Germany, started in 1030 during the reign of Emperor Conrad II and vaulted (given its stone ceiling) around 1100, was the pre-eminent structure of the period and illustrates what might be called the progressive historicism—the creating of new architectural forms inspired by historical models—typical of so much of medieval architecture. A glance at the exterior of the cathedral with its massive

westwork and grouped crossing towers certainly recalls Carolingian precedents, such as Saint-Riquier, but the enormous scale of the cross-shaped plan, 435 feet in length, equals that of Roman imperial churches such as St. Peter's in Rome. The interior conjures up a similar Roman spirit. Its combination of rectangular piers and attached columns reproduces the structure of the Colosseum (Rome's massive amphitheater), while the arcade that rises through the entire 90-foot high elevation to frame each window resembles an aqueduct (Rome's system of raised water channels) or, again, the exterior of Constantine's audience hall at Trier in Germany. Visually, the new mix of piers and columns created a system that articulated the building as a series of repeating units that reflected the geometry of the plan. It also produced a more emphatically three-dimensional architecture whose walls were organized in distinct planes. In a similar vein, the exterior was embellished by the disciplined formal rhythms created by niches, decorative arches, and wall arcades framed by columns or pilasters (flattened or rectangular columns). A setting of overwhelming monumentality was created at Speyer to demonstrate the Roman and Carolingian origins of the

Aisle of Speyer Cathedral, Germany, 1030. VANNI ARCHIVE/CORBIS.

power of the German kings who lay buried in the spacious crypt under the choir.

**IMPOSING VERTICALITY IN NORMAN FRENCH ARCHITECTURE.** In a treaty of 911, the Carolingian king Charles the Simple granted the area around Rouen in northwestern France to the Vikings, creating what was to become the duchy of Normandy. Converted to Christianity and expanding their territories, the Normans soon turned to the task of building architecture worthy of a powerful state. The cathedrals and monasteries they erected during the eleventh century reveal a far-flung array of sources drawn from southwestern France, Burgundy, and the Holy Roman Empire in Germany. At the Abbey of Jumièges in France, begun in 1037 and completed in 1066, a pair of tall towers flank a projecting porch with an upper chapel to form an impressive frontispiece that is reminiscent of such Carolingian façade blocks as Saint-Denis or Corvey. The interior of the church emphasizes elegant verticality through the use of tall, attached columns that divide the nave wall into a series of regular units or bays. Even more notable, the elevation now contains three levels: above the arcade, a spacious gallery is introduced with a window zone, called a clerestory, at the top of the wall just below the timber

ceiling. Appearing in Ottonian church designs, but known in early Christian examples from Jerusalem to Trier, the gallery might have accommodated additional altars or been used by pilgrims. Clearly, it invested the church structure with a lordly height that was a symbol of status. Saint-Etienne at Caen in Normandy, founded around 1060 by William the Conqueror, who was also buried in front of the high altar at his death in 1087, exhibits an even more imposing demeanor. The rigorously ordered façade with its three portals and twin towers offered a scheme that would be repeated until the end of the Middle Ages. Like Jumièges, the interior of Caen contains three stories, including a gallery, but here supported exclusively by piers composed of a bundle of shafts set around a cruciform core that are coordinated with the key structural elements of the arcade, aisle vaults, and original wooden ceiling. Its thick walls, honeycombed by passages, resemble the architecture of contemporary Norman castles—the Tower of London, for example—and capture an image of the church as a Christian fortress as well as a symbol of political might.

**NORMAN DOMINATION IN ENGLAND.** Few events so thoroughly remodeled an architectural landscape as the Norman conquest of England in 1066. In the generation

Church of Saint-Etienne, Caen, Normandy, France, under reconstruction. BETTMANN/CORBIS.

following the Battle of Hastings, at which the Norman invaders, led by the future king William I, conquered the Anglo-Saxon king Harold, the Normans rebuilt every major cathedral and monastery in the country, literally obliterating the architecture of the Anglo-Saxons whom they had defeated. Dominating the skylines of English towns, these Norman churches left no doubt as to who was in control. As the twelfth-century historian William of Malmesbury noted in his *Deeds of the English Kings*, “You may see everywhere churches ... [and] monasteries rising in a new style of architecture; and with new

devotion our country flourishes, so that every rich man thinks a day wasted if he does not make it remarkable with some great stroke of generosity.” The ambitions of the new regime were apparent immediately in the projects launched by the conqueror and his ecclesiastical entourage, including Lanfranc, archbishop of Canterbury, and Walkelin, bishop of Winchester. If the recent Norman plans of Rouen Cathedral or Saint-Etienne at Caen guided design at the cathedrals of Canterbury, Durham, or Lincoln, the conscious desire to evoke Rome and rival the architecture of the Continent lies behind

Choir with roof vaulting, stalls, and woodwork of Winchester Cathedral, England, eleventh century. ALAN TOWSE; ECOSCENE/CORBIS.

the pursuit of overwhelming scale, and the selection of majestic forms and materials. By William the Conqueror's death, the kingdom had no fewer than nine churches comparable in scale to St. Peter's. At Winchester, the columns that rise from floor to ceiling, seen in the surviving late eleventh-century transept or in the vaulted choir, parallel the insistent verticality of Speyer Cathedral in Germany and, combined with a huge western entry block, whose outlines have been recovered in archaeological excavations, create an imperial aura based on a mix of Roman, Carolingian, and Ottonian references. In the case of Durham's famous spiral columns, a specific link to St. Peter's is conjured up to reveal the local saint, Cuthbert, as an equal of the apostle. While Durham's architecture draws on Norman features present at Jumièges and Saint-Etienne at Caen, its most significant aspect is its use of pointed arches together with ribbed groin vaults, an innovation that supported the heavy stone roof in a way that was lighter, higher,

and more decorative than the heavy barrel vaults they replaced. Originally planned only over the eastern arm, or choir, of the church, the stone vaults were extended over the entire edifice during the building process. Whatever their structural and aesthetic advantages, they also provided a canopy over sacred space that turns the building into a monumental shrine. This conception of the church as a precious object is reflected at Durham in the lavish decoration of the entire building: the interlacing arches of the aisle walls, the carved patterns on the piers, and the restless chevron (angled stripe) ornament that outlines the arches and ribs.

**A SICILIAN BLEND.** An independent band of Normans established a kingdom in southern Italy and Sicily during the later eleventh century where they formulated an architecture that was an exotic mixture of Byzantine (Eastern Christian, centered in Constantinople or modern Istanbul), Muslim, and Christian Roman traditions. Best represented by the Palatine Chapel in Palermo or

Mismatched ribbed vaulting for transept ceiling in the Chapel of the Nine Altars, Durham Cathedral, England, 1093–1133. ANGELO HORNAK/CORBIS.

the cathedral of Monreale on the Italian island of Sicily, the Norman buildings of Sicily serve as a reminder that architecture is a language of communication whose vocabulary is often tailored to local circumstances. Thus, rather than erasing all signs of the past, the Palatine Chapel, built and decorated by King Roger II between 1132 and 1189, recasts the traditional basilican structure in forms absorbed from the conquered Byzantines and Muslims. The alternating smooth and fluted columns, the dome that rises over the crossing, as well as the glittering gold-ground mosaics are Byzantine in style; the pointed arches and elaborately faceted stalactite ceiling draw upon Muslim architecture. Like the imagery that showcases Christ in Majesty accompanied by the Roman saints Peter and Paul under a ceiling with paintings of constellations, courtly entertainments, and scenes of daily life, the church in its combination of traditional and alien forms comprises a text in which the impact of rival cultures, divine sanction, and the sophisticated refinement of the Norman kingdom and its rulers can be read. The same point is made by Monreale Cathedral, begun in 1174. An arresting play of interlacing pointed arches over the exterior invests the church with an ornamental luxury comparable to the most elaborate Islamic palaces, while the cruciform basilica with classical columns and mosaics seems a deliberate recollection of early Christian models. Far different in appearance from the projects undertaken in France and England, Norman architecture in Sicily underlines the bewildering variety

View of Cathedral, Monreale, Palermo, Sicily, 12th century. ADAM WOOLFITT/CORBIS.

of styles and the creative interplay of sources encountered in the Romanesque period.

## SYMBOLIC

### Architecture: Copying the Church of the Holy Sepulchre

#### Imitation and Connection

Every church, no matter its size, plan, or style, was a symbol—or rather a set of simultaneous symbols—of heaven, Noah’s Ark, or the Body of Christ, as interpreted by theologians. From the beginning of Christian public architecture in the fourth century, builders often identified holy sites by special plans or by dazzling decoration. In the best known and most widely imitated example, the Church of the Holy Sepulchre in Jerusalem, as it was originally built around 325 C.E. during the reign of Constantine, marked Jesus’ tomb with a large circular structure, a type of building associated with commemoration in the Roman world. Religious structures in Western Europe from the ninth through the twelfth centuries frequently copied the Holy Sepulchre to make the experience of Jerusalem, which lay in Muslim hands, more accessible and to encourage devotion to the central beliefs of the faith. Bishop Meinwerk of Paderborn in Germany even sent a representative to the Holy Land to measure the building, but the structure he erected in 1036 was cruciform in shape. Evidently, he (and the many pilgrims who engaged in measurement and even carried back banners cut to symbolic proportions) believed that incorporating selective dimensions and adopting a

centralized plan and common dedication to the Holy Sepulchre were sufficient to establish a compelling connection. Rather than an exacting copy, it was the meaning of the Holy Sepulchre as the place of the Crucifixion that was of paramount importance to the bishop.

#### Symbolic Interpretations

For the Templars, the various versions of the Holy Sepulchre that sprang up in their monastic houses throughout Europe during the twelfth century—for example, at London and Paris—all represented their charge to defend and maintain the sites of the Holy Land. Emphasizing a somewhat different interpretation, in the Baptistery of Pisa of 1153, the quotation of the circular plan, the dimensions, the exotic multicolored masonry, and the steep conical roof of the Holy Sepulchre created a symbolic link between the rite of baptism that would take place there and the death and resurrection of Christ. Shifting the symbolism back to the original idea of commemoration, the monastic church of Saint-Bénigne in Dijon (1001–1018) repeated the rotunda as the setting for the tomb of its saint, and as late as around 1180 another such rotunda was attached to the choir of Canterbury Cathedral, where the cranium of St. Thomas Becket was displayed to the eager eyes of visitors. This imitation of a prestigious model, however flexible its interpretation, was one of the ways by which importance and prestige could be conferred onto a building and the saint whose relics “lived” within.

## GEOMETRY AND PLANNING

**ARCHITECTURE, BEAUTY, AND GEOMETRY.** Modern observers are often filled with awe when they consider the combination of engineering and aesthetic sophistication required to achieve the complex structures that were evolving even in the early Middle Ages. Of the many stages involved in the construction of a medieval

building, the first step, the planning phase, remains the most elusive. This was the moment when thoughts and conversations began to take physical form as architects translated functional requirements and a patron’s vision into structure and space. What strategies did they employ to ensure that an edifice was both stable and beautiful? Geometry provided the means by which masons designed and laid out plans, the common language of communication between craftsman and cleric, and the vehicle by which architectural form could be invested with meaning. Medieval thinkers, such as St. Augustine, followed Vitruvius, a Roman architect who wrote *On Architecture* at the time of Augustus in the late first century B.C.E., by defining beauty as a harmony of parts that arose out of geometrical regularity. Constantly cited by writers from the ninth century on, Vitruvius’s ideas on architectural planning, along with other classical works, were well known in the Middle Ages. In 1321, the monks of the abbey of Saint-Ouen in Rouen wrote, as they planned for the reconstruction of their church, that “we have decided to build in accordance with former

learned treatises” by “industrious and accomplished artisans who are recognized to possess proven and well-known experience in such matters.” Whether or not medieval masons actually read these “treatises,” this document suggests that they were able to put into practice the architectural theories familiar to their scholarly patrons.

**SQUARES, CIRCLES, AND TRIANGLES.** According to Vitruvius, plans of buildings require geometry that “teaches the use of straight lines and the compass.” The designs of most medieval buildings can be understood in terms of skillful combinations of squares, circles, and triangles. An architect might take a “modular” approach based on the repetition of a standard unit, as illustrated by the layout of Charlemagne’s palace at Aachen which used a 12-foot length, organized into larger squares of 84- and 360-feet, or the plan of Saint-Gall that was governed by a grid of 40-foot squares. However, after the fifth century and the collapse of centralized Roman authority, different regions of Europe and even cities within the same region adopted their own standards of measurement that might vary by as much as four inches per foot. The potential for chaos if an architect designed a building according to one foot-length while the craftsmen constructed it using another standard of measure was great. To avoid such problems, builders turned to ratios generated by the manipulation of basic geometric figures as the means of organizing and coordinating the complex of parts and spaces of the church. One of the most common techniques was based on the ratio of the side of a square to its diagonal, that is, one to the square root of two (or mathematically 1: 1.414). For example, imagine that a person laid out a square then drew its diagonal. Then the person swung the diagonal until it lined up with the side of the square. That person has just designed most of the twelfth-century Cistercian abbey of Jerpoint in Ireland: its cloister is a 100-foot square while the nave, created by the diagonal, is 142 feet long. Swinging the diagonal in the other direction establishes the width of the east range of the cloister buildings. A similar square root of two ratios ran through Norwich Cathedral, begun in the late eleventh century, and controlled the relation of width to length of the papal church of Saint-Urbain in Troyes which was begun in 1262.

**OTHER RATIOS.** A second ratio that can be found frequently in medieval architecture is the “golden section” (1: 1.618), easily produced from the diagonal of half a square. Used as far back as ancient Egypt and continued by the Romans in such important Christian structures as Old St. Peter’s in the fourth century, the golden section was applied in the designs of Amiens Cathedral, and again at Saint-Urbain in Troyes and Saint-Ouen in

Rouen. Despite their differences, each plan reveals a golden section ratio between the wide central space and the flanking aisles. Other ratios detected in medieval monuments include the square root of three (1: 1.732), taken from an equilateral triangle and found at the abbey church of Fontenay, and the square root of five (1: 2.236). All of these ratios involve irrational rather than whole numbers and are derived from working directly from the geometrical figures of the plan. These same ratios were projected upwards into the superstructure. The square root of two controls the composition of the elevation at Durham Cathedral. At Milan, arguments broke out during the 1390s over whether the cathedral should be designed on the basis of a square (*ad quadratum*) or a triangle (*ad triangulatum*). Debate raged over which solution would be more beautiful and structurally sound, and advocates of the various solutions supported their positions by citing the Bible as well as Aristotle.

**DRAWING.** The plan of a building could be laid out at full scale on the ground using ropes and stakes to mark its outlines. But as medieval architecture developed in complexity, drawing became an increasingly important tool in the process of design and construction. Few drawings are known before the twelfth century: the famous plan of Saint-Gall, created in the early ninth century, is less a construction blueprint than a conceptual diagram that sets out the scheme of an ideal monastery. As late as 1178 when William of Sens, architect of the new choir at Canterbury Cathedral, was seriously injured after falling from scaffolding, he attempted to supervise construction by having himself carried to the building site on a stretcher. Although William had supplied templates or patterns for architectural details, there apparently were no drawings that could keep the project on course in his absence. Numerous full-scale drawings survive from the thirteenth century onwards. Incised into floors, on walls, or on plaster surfaces, the extant engravings encompass preliminary sketches and finished representations of building parts such as windows, piers, gables, portals, and flying buttresses. They offered the master mason a chance to refine his formal ideas, to evaluate the merits of a design before it was executed, and to check the accuracy of the cutting before stones were mortared into place. Finally, in the Gothic period, drawings on parchment evolved as structures were composed of precisely coordinated networks of shafts and moldings, and intricate and finely scaled vault and window patterns. Drawings not only became indispensable to construction, but they allowed an architect to supervise multiple projects simultaneously. In 1434, Pierre Robin, a Parisian master, was hired to design the parish church of Saint-Maclou

*a PRIMARY SOURCE document***THE CHURCH OF SANTIAGO DE COMPOSTELA**

**INTRODUCTION:** So popular were pilgrimages throughout the Middle Ages that various guidebooks were written to help pilgrims negotiate the voyage and understand the significance of the route and the buildings along the way. Among the most famous of these was the *Liber Sancti Jacobi* (the Book of Saint James), a compilation made between 1139 and 1173 of five books, treating such subjects as the four French roads leading to the major pilgrimage routes, the cities and stations along the way in Spain (treated very negatively), hospices, road maintenance, and rivers to be crossed. The fifth book of the compilation, perhaps written by Aimery Picaud from nearby Poitiers in France, is entitled *The Pilgrim's Guide to Santiago de Compostela*. In the book's eleven chapters, appear a liturgy to serve the cult of Saint James, twenty-two miracles of Saint James, glorification of the cult of Saint James, the story of the legendary Bishop Turpin (who appears as a character in the *Song of Roland*), and three long chapters on relics, reliquaries, peoples, and lands. The section below, describing the cathedral itself, contains details on measurements and proportions.

**The Measurements of the Church**

The basilica of Saint James measures in length fifty-three times a man's stature, that is to say, from the west portal to the altar of the San Salvador [the eastern chapel]; and in width, thirty-nine times, that is to say, from the French [north transept portal] to the south portal. Its elevation on the inside is fourteen times a man's stature. Nobody is really able to tell its length and height on the outside.

The church has nine aisles on the lower level and six on the upper, as well as a head, plainly a major one, in which the altar of the San Salvador is located, a laurel crown, a body, two members, and further eight small heads [chapels] in each of which there is an altar. ...

In the largest nave there are twenty-nine piers, fourteen to the right and as many to the left, and one is on the inside between the two portals against the north, separating the vaulted bays. In the naves of the transepts of this church, that is to say from the French to the south portal, there are twenty-six piers, twelve on the right and as many on the left, as well as two more placed before the doors on the inside, separating the entrance arches and the portals.

In the crown of the church there are eight single columns around the altar of the Blessed James. ...

In this church, in truth, one cannot find a single crack or defect: it is admirably built, large, spacious, luminous, of becoming dimensions, well proportioned in width, length and height, of incredibly marvelous workmanship and even built on two levels as a royal palace.

He who walks through the aisles of the triforium [gallery] above, if he ascended in a sad mood, having seen the superior beauty of this temple, will leave happy and contented.

**Concerning the Towers of the Basilica**

There are nine towers in this church, that is to say, two above the portal of the fountain, two above the south portal, two above the west portal, two above each of the corkscrew staircases, and another, the largest one, above the crossing, in the middle of the basilica. By these and by the many other utmost precious works the basilica of the Blessed James shines in magnificent glory. All of it is built in massive bright and brown stone which is hard as marble. The interior is decorated with various paintings and the exterior is perfectly covered with tiles and lead.

**SOURCE:** *The Pilgrim's Guide to Santiago de Compostela*. Trans. and ed. William Melczar (New York: Italica Press, 1993): 120–121; 126.

in Rouen. He stayed in the city for five months, delivered a complete set of plans, then left the building entirely to local contractors. Although construction at Saint-Maclou lasted for ninety years, Robin's plans were followed scrupulously, and the church displays a remarkable unity despite the participation of many hands. The most lavish drawings of the later Middle Ages, embellished by color washes, might be shown to patrons to confirm the genius of the design, sent to potential donors, or exhibited in public to raise funds for construction. An example of such geometrical drawing occurs in the portfolio of Villard de Honnecourt in the 1230s.

**MAKING AND MEANING.** While medieval architecture was becoming increasingly technological in its methods, it also maintained symbolic and religious significance. The medieval church building was likened by theologians to the Temple of Solomon as well as to the celestial Jerusalem. The Bible describes these sacred edifices in detail, including their dimensions: the temple was 60 cubits long, 20 cubits wide, and 30 cubits high; the heavenly city measured 12,000 *stadia* with a wall of 144 cubits (cubits were measurements of about 17 to 21 inches and *stadia* were about 607 feet). In addition, Christian theology interpreted numbers in symbolic terms. Four was equated with the gospels, five was the

number of divinity, evoking the five wounds of Jesus, and six was the perfect number, according to St. Augustine, because it was both the sum and product of its factors, 1, 2, and 3. Thus although plan designing was a process that involved the mechanical manipulation of geometric shapes by secular craftsmen, it was possible to endow a building with symbolic meaning by basing the design on a resonant module or by encoding a significant number into its geometry. The chapel at Aachen, for example, was based on a twelve-foot module and its total length was 144 feet, both dimensions clearly intended to connect it with the image of heaven. The royal Sainte-Chapelle in Paris quotes the proportions and dimensions of the Palace of Solomon, described in I Kings 7, perhaps as a way to associate the contemporary French monarch with Solomon, the paragon of the wise ruler. And the design of the papal church of Saint-Urbain in Troyes unfolds out of a central square that is 36 feet per side using the square root of two and golden section operations. Six is, of course, a factor of 36, so that the perfect number literally lies at the heart of the plan. Its height, 72 feet, is determined by two of these squares, but is also a factor of the number 144 associated with heaven. In sum, medieval masons used geometry as the practical means to ensure the harmony of their designs while patrons found in number and shape potent symbols that linked the present with the past and connected their earthly projects to divinely inspired models.

## CONSTRUCTION TECHNIQUES

**BUILDING WITH MASONRY.** Throughout the Middle Ages, the most prestigious and durable edifices—castles, churches, and palaces—were built of stone. However, the loss of the Roman formula for concrete (a mixture

of water, lime, and pozzolanic sand akin to modern Portland cement, to which a coarse aggregate of rubble and broken pottery was added) and its replacement in the Middle Ages by a weak lime mortar made complex masonry ceilings difficult to build. Thus, one of the major achievements of medieval architecture was the recovery of the ability to vault monumental interior spaces to dramatic effect. Medieval masons continued many Roman architectural practices, constructing their buildings with rubble (broken, rather than cut stone) walls faced with cut stone blocks or decorative patterns, as seen in the surviving sections of the late-tenth-century cathedral of Beauvais, Notre-Dame-de-la-Basse-Oeuvre. Yet, there were significant variations from region to region in Europe due to available building materials and established traditions. For example, brick was used in southern France and northern Germany as a substitute for the poor-quality local stone. Ancient Roman architectural elements (remnants of columns, carvings, etc.), called *spolia*, were often incorporated into medieval Italian structures because of their handy abundance as well as their evocative connection to the glory of the past, while timber forms inspired designs in Anglo-Saxon stone buildings in England.

**THE LEGACY OF ROME: ARCHES AND VAULTS.** By far the most important legacy from Rome was the arch, which constituted the basis of medieval church architecture. An arch is a curved structural form composed of wedge-shaped stones called *voussoirs*. The uppermost voussoir is the keystone which, when dropped into place, locks the other stones of the entire arch together. Pushing against one another, the stones stay in place, and as long as there is enough material around the arch to resist this outward, pushing force, the arch will remain stable. There were many uses for arches: supported by columns or piers to form an arcade, they span space to create passages; they frame doorways and windows; they act as structural reinforcement; and, in miniature, they decorate walls. Arches were, in turn, the basis of vaults. The continuous barrel vault was constructed by extending an arch across an expanse from pier to pier, creating a ceiling that had a concave or half-cylindrical appearance, as occurs in the main nave space at Saint-Sernin at Toulouse, France. Two barrel vaults intersecting at right angles, the "groins" marking the lines of intersection, formed a groined vault. By focusing supporting forces at the corners of the vault compartment or bay, the groined vault relieved the wall of its structural purpose and made large openings and windows possible. But because the stones of the groins had extremely complex geometric shapes, these vaults were difficult to

Basilica of Saint-Sernin, Toulouse, France, 11th–14th centuries. MARC GARANGER/CORBIS.

build and were used most frequently over smaller spaces that included windows, such as those in the side aisles of Saint-Sernin.

**THE COMING OF GOTHIC ARCHES.** European architecture in the eleventh and early twelfth century, despite its variety, is commonly called “Romanesque” because its massive walls, its rounded arches, the extension of stone vaulting throughout the entire structure, and many of its ornamental forms resemble Roman buildings. Around 1100, new forms appeared that moved away from the heritage of ancient building and began to transform the appearance of architecture. The first major development can be seen in a change in the shape of arches. Builders from the Carolingian to the Romanesque periods employed semicircular arches. To draw one with a compass requires only a single fixed center point to produce an arch whose height is always one-half of its span. However, a different type of arch appeared in Romanesque buildings, such as Durham Cathedral, that became the dominant form in the Gothic period from the twelfth through the fifteenth centuries: the pointed arch. In this case, the intersecting arcs are struck from two centers whose location is fluid. This

creates an arch that not only can be flexibly tailored to fit almost any spatial need but also is more structurally efficient than the semicircular arch. A second breakthrough came with the invention of the ribbed groin vault. This vault had all the advantages of the groin vault, but added ribs—decorative moldings that masked the groin lines. Ribs facilitated construction, first, because they were assembled from identical pieces and, second, because once built, they offered a scaffolding that was filled in by a light stone membrane or web. An example of vaulting appears in the Chapel of the Heiligen-Geist-Hospital in Lübeck, Germany.

**THE FLYING BUTTRESS.** Along with pointed arches and ribbed groin vaults, the flying buttress was introduced as a key structural component in mid-twelfth century buildings such as the Abbey of Saint-Germain-des-Prés and the Cathedral of Notre-Dame, both in Paris, and the Cathedral at Chartres, France. Exposed arches “flying” over the aisles of the church act to brace the wall against the outward thrust of the vault and the wind pressure on the roof and to direct these forces to massive slabs of masonry (buttresses). Flying buttresses, coordinated with ribbed groin vaults and pointed arches,

Vaulting, Chapel of Heiligen-Geist-Hospital, Lübeck, Germany, 13th century. WOLFGANG KAEHLER/CORBIS.

composed a completely new system. Rather than a continuous envelope of heavy supporting walls, as was characteristic of the Romanesque style, the structure now resembled the cage of an Erector set, with the flying buttresses appearing both internally and externally. By exploiting the potential of these new features, Gothic church architecture was able to achieve the impossible: unprecedented height combined with walls that were little more than perforated screens whose openings were filled with vast fields of dazzling stained glass.

**TIMBER.** Most buildings in the Middle Ages—houses, forts, barns, market halls, and even parish churches—were made of timber. Stone construction itself required vast quantities of wood for the temporary scaffolds socketed into walls that served as work platforms in upper levels, for formwork upon which vault stones were laid, and for templates or patterns that guided the cutting of moldings. Cranes and the great wheels that hoisted building materials aloft were made of wood. Timber pilings and lattices were incorporated into the foundations of edifices that rose on marshy ground, a technique still used in the late nineteenth century in Henry Hobson Richardson’s Trinity Church

in Boston. Wooden vaults, imitating the appearance of stone, were erected at York Cathedral in the late thirteenth century, and the fourteenth-century crossing of Ely Cathedral, its stone lantern perched atop a pinwheel of wooden vaults, achieved one of the most spectacular spaces of the age. But, by far, the most significant concern of carpentry was the roof structure.

**ROOFS.** Tall, steeply pitched roofs were more than practical coverings to shed the rain and snow of northern Europe’s inclement weather; they were status symbols. Hrothgar’s magnificent “mead-hall” of Heorot is described in the early (pre-tenth century) Anglo-Saxon poem *Beowulf* as “high-roofed—and gleaming with gold,” and the slate roofs of the palace of the kings of France in Paris struck one fourteenth-century writer as “glistening bright” to the point that “everyone is gladdened by / The very thought of entering.” Churches, too, were crowned by prominent roofs whose beams were likened by a late thirteenth-century bishop, William of Mende, to “the princes and preachers who defend and fortify the unity of the Church,” while the tiles reminded him of “the soldiers and knights who protect the Church against the attacks of enemies of the faith.” Until the

View from the Bell Tower of flying buttresses and stained glass window, Cathedral of Chartres, France, 13th century. ADAM WOOLFITT/CORBIS.

eleventh century, large interior spaces in medieval churches were covered by timber roofs, often open to the space below, devised from a system of members, that included sloping beams called rafters whose ends were connected by horizontal tie beams, to form a triangular truss. Norwegian stave churches, a late example of which is found at Borgund (c. 1250), demonstrate the advanced roofing technology achieved in northern Europe. Trusses, stiffened by curving scissor braces, are supported by tall timber posts or staves to create a bay system that may have influenced the development of a comparably integrated frame in stone architecture.

**STONE VAULTS, TIMBER ROOFS.** With the spread of masonry vaulting in the Romanesque period, carpenters faced a set of problems that tested their ingenuity. The curving crown of the vault that rose into the space of the roof made it impossible to create a structure based on trusses placed every three or four feet as in an unvaulted building, and they were forced to search for solutions that accommodated the vault but did not sacrifice stability against gravity and wind. The number of tie beams was reduced gradually as supplementary rafters

and braces were added to increase the rigidity of the roof frame. In Gothic architecture of the thirteenth and fourteenth centuries, roofing systems evolved in response to the wide spans of the spaces and the reduction of the thickness of the walls. At Notre-Dame in Paris and Reims Cathedral, trusses were organized into bays consisting of main frames, recognizable by their vertical hangers that support a matrix of beams and rafters that alternate with secondary frames without tie beams. More important, plates that ran along the top of the wall and purlins that supported the additional rafters integrated the system longitudinally. Reaching a pitch of about 60 degrees, these steep roofs emphasized the vertical silhouette of the soaring buildings, making them appear even taller.

**THE HALL.** Timber architecture was not simply a question of money, nor was it indicative of social class. At Aachen, where Charlemagne's audience hall and chapel were built of stone, the emperor maintained his domestic quarters in a wooden structure. As medieval literature, from *Beowulf* to *Sir Gawain and the Green Knight* (1360–1370) makes clear, the hall stood at the center of palace life, serving as the stage for aristocratic

Woodwork and roofs of Stavechurch, Borgund, Norway, 1150. ELIO CIOL/CORBIS.

festivities. But it was also the basis of other structures of daily life such as hospitals, colleges, and commercial buildings. In stark contrast to the arched form of churches, halls were fashioned of vertical post and horizontal beam construction that created aisled interior spaces. After around 1200, there was a general shift toward aisleless structures that is represented by the remarkable rebuilding of Westminster Hall in the palace of the kings of England. Completed in 1099 by the Norman ruler William Rufus, who is reported to have “spared no expense to manifest the greatness of his liberality,” the original hall was so wide—around 67 feet—that internal supports were required to carry the ceiling. In the 1390s, Richard II engaged his chief carpenter, Hugh Herland, and master mason, Henry Yevele, to refurbish the hall. Herland’s ingenious hammer-beam roof, supported through the use of short cantilevered timbers, covered the enormous space with a single breathtaking span. The hammer beams, projecting from the wall, actually pull in the sloping rafters to keep them from spreading outward. Combined with the heavy vertical

hammer posts and horizontal collar beam (tie beam) as well as the great arch, they transmit the weight and thrust of the roof to the stone brackets, or corbels, located about halfway up the wall, that had been added by Yevele. Masonry and carpentry collaborate in a structure that is at once logical and elegant. Despite the fact that some 600 tons (the weight of a modern diesel locomotive) of oak were used in the frames, the roof—enriched by open grilles—appears to float on the backs of the angels that decorate the ends of the hammer beams. Finally, it is important to remember that this great roof structure was assembled from material provided by trees grown in forests that were legally protected and carefully managed. Eliminating the floor posts was not simply a matter of artistic choice, but permitted the use of smaller trees that were easier to cut and transport. The study of medieval structures reveals the complex interrelationship between architectural form, building technology, natural resources, and human institutions.

**MONASTIC ARCHITECTURE**

**MONASTIC RULES FOR CLOISTERED LIFE.** From the earliest days of Christianity, there have been men and women who have withdrawn from the world to seek solitude in order to devote themselves to prayer and meditate upon God. For some, this spiritual quest was a solitary endeavor, but in many cases the holy hermit attracted groups of followers who sought to emulate the ascetic lifestyle, and this formation of groups eventually necessitated the development of specialized architecture. Beginning in the fourth century, life in these religious communities was ordered by rules that divided the day into periods of work, prayer, and reading. Basil the Great (c. 330–379) wrote the first set of rules that became the basis of monasticism in the Orthodox church in eastern Mediterranean regions, and this was followed in the West by the Rules of St. Augustine in the late fourth century, and the Rule of St. Benedict, written around 530, which predominated in Europe throughout the Middle Ages. In drawing up the regulations for his

“school for the Lord’s service,” Benedict included directions for all facets of a monk’s life. In 73 chapters, he set an abbot in charge of the monastery, offered guidelines for food, drink, and clothing, addressed sleeping arrangements, prescribed punishments for misbehavior and mistakes in religious services, and detailed the reception of guests. The day was structured by seven offices, beginning in the middle of the night, at which the Psalms were sung, but also included six to eight hours of manual labor and periods of study and reading. Although the Rule did not contain specific architectural directions, its requirements for eating and sleeping in common, the importance of the oratory as the hub of liturgical life, and the mention of kitchens, an infirmary, cellars, and guest quarters assume a complex of structures that would compose a self-sufficient community. As Benedict wrote in chapter 66, “The monastery should, if possible, be so constructed that within it all necessities, such as water, mill, and garden, are contained, and the various crafts are practiced. Then there will be no need for the monks to roam outside, because this is not at all good for their souls.”

**THE PLAN OF SAINT-GALL AND THE CLOISTER.** The Carolingians translated the framework for monastic life envisioned by St. Benedict into architectural form in the ninth century. With the same view toward uniformity that guided the reform of imperial administration, the development of a more legible script for copying the Bible, and the planning of architectural monuments, Charlemagne commanded all monasteries in his realm to adopt the Benedictine Rule and convened assemblies in Aachen in 816–817 to consider policies that directly affected the layout of the proposed structures. At about the same time, a large plan, drawn on five sheets of parchment and measuring about 44 by 30 inches, was sent to the abbot of Saint-Gall, apparently portraying an ideal scheme of what buildings a monastery should contain and how to arrange them. A model built from the plan shows the monastery’s appearance. The multiplex, dominated by the large “double-ended” church, is organized in a series of concentric zones like an onion. Animal pens, industrial buildings employing secular artisans, guest quarters, and the school formed an outer ring. At the heart of the plan lay the cloister, the focus of monastic life. With a fountain at its center, the square courtyard was surrounded by covered and arcaded walkways that provided sheltered circulation between the primary spaces of monastic activity: church, dormitory, refectory (dining hall), cellar, and scriptorium (book production center). Chapter rooms, for general meetings, became standard features in Cistercian abbeys and were always

located in the east gallery of the cloister under the dormitory. They were the most important structure of a monastery, after the church, and served as places where the monks assembled after morning Mass to receive spiritual advice or discipline from the abbot, read chapters of the Rule of St. Benedict, and discuss the internal affairs of the community. Because the new orders of the Franciscan and Dominican friars established themselves in cities during the thirteenth and fourteenth centuries and were not cloistered, they did not need the large cellars, barns, animal pens, and industrial buildings required by monks living in remote rural areas. Further, each Franciscan or Dominican friar lived in his own small cell in the convent—as the houses of friars were called—rather than together in a dormitory. Nevertheless, despite these additions and modifications, the scheme created in the ninth century and represented by the Saint-Gall plan remained the essential template for the cloister for the rest of the Middle Ages.

**THE DILEMMA OF THE MONASTIC CHURCH.** Monastic churches were designed according to the same plans and were assembled from the same architectural forms—columns or piers, arches, masonry vaults or timber ceilings—as other churches. The Rule of Saint Bene-

dict, which all monks followed, left no directions concerning the style or appearance of the church. Thus, there is a noticeable variety in the approaches of the different orders to the physical structure of the church and its decoration, a range of interpretation that reflects a dilemma in the character and purpose of monastic life. On the one hand, monks were constantly urged to embrace humility, to avoid arrogance, to seek moderation, and to be content with poverty in emulation of Christ. On the other hand, the monk spent his life in the task of glorifying God and seeking the vision of his kingdom. And that kingdom, as described in Revelations, chapter 21, was a glittering jeweled structure irradiated by light with streets paved in gold. So what should a monastic church be: a representation of humility and a simple “workshop of prayer,” or an image of heaven and an offering of unsurpassed grandeur to God?

**CLUNY AND THE ROMAN MODEL.** The most important of the monastic churches to represent the argument for opulence was the one begun in 1088 in Cluny. Founded in Burgundy in 910, the abbey of Cluny was not subject to any bishop or secular authority, only to the pope. Other monastic houses, attracted to Cluny’s concept of spiritual improvement through constant

## THE Buildings of the Cloister

One of the most enduring influences of the Carolingian period was the idea that monasteries should have a uniform kind of architecture that was suited to the rules of monastic life. The scheme created in the ninth-century Saint-Gall plan remained the essential template for the cloister for the rest of the Middle Ages. Dominated by a large church on the north side, such a cloister was organized in a series of concentric zones, with such things as stables, pens for oxen and cattle, a mill, a smithy, a tannery, guest quarters, and a school in the outer ring. Outside and to the east might lie orchards, gardens, and fishponds. The abbot's residence, accommodations for distinguished visitors, and the monks' infirmary also lay outside the walls, usually to the east. At the heart of the plan was the cloister itself, the focus of monastic life. With a fountain at its center, the square courtyard was surrounded by covered and arcaded walkways that allowed residents to walk between the primary spaces of monastic activity: church, dormitory, refectory (dining hall), cellar, and scriptorium (book production center). Chapter rooms, for general meetings, became standard features in Cistercian abbeys and were always located in the east gallery of the cloister under the dormitory. The entrance gatehouse and service courts (controlling agricultural and industrial activity) were generally in the west range, as were the refectory and dormitory of the lay brothers, whose princi-

pal responsibilities involved the agricultural or industrial functions of the abbey.

**Cellar:** Space used for storage and located on the ground level of the west range.

**Chapter room:** A room usually located along the east range of the cloister used by the monastic community for daily meetings.

**Day room:** A room in which the monks pursued manual labor within the cloister; sometimes it was used as a scriptorium. The day room was often located next to the chapter room along the east range and below the dormitory.

**Dormitory:** The common sleeping room of the monks. The dormitory was customarily attached directly to the south arm of the church and was located above the chapter room on the east side of the cloister.

**Infirmary:** The building devoted to the care of sick and infirm monks often was situated outside the cloister precinct to the east. With its own cloister and chapel, it formed a monastery in miniature.

**Kitchen:** Conveniently located next to the refectory in the south range buildings.

**Refectory:** The dining hall of the monastery, usually located on the south walk of the cloister.

**Warming room:** A space, often adjacent to the refectory on the south side (under the dormitory in the Saint-Gall plan), where a fire was kept burning during the winter months.

prayer and their resulting splendid liturgy, were reformed by the abbey and brought under its rule so that by around 1100, it controlled about 1,450 monasteries throughout western Europe. Cluny's direct link to Rome and its role as the virtual capital of an international religious empire found expression in one of the most daring and magnificent churches erected during the Middle Ages. Fueled by a donation of 10,000 gold talents from King Alfonso VI of Aragon, the new structure, the third in the history of the abbey, was built between 1088 and about 1130, replacing a mid-tenth-century edifice that had been one of the first fully stone vaulted churches in medieval architecture, but had grown too congested to accommodate the throng of 460 monks who celebrated Mass in the choir. Legend records that a retired monk named Gunzo, who was also a musician, was shown the plan in a dream by saints Peter and Paul. Whether or not this is true, the new design does echo the basilica of St. Peter's in Rome in its inclusion of five aisles that were graded in height and a prominent projecting transept. Further, the inte-

rior walls, which rise to a height of about 100 feet, were embellished by fluted pilasters and the piers crowned by luxurious foliate capitals that emulate the forms of Roman architecture.

**DEPICTIONS OF POWER AND GLORY.** At the same time that it was emulating the design and forms of Rome, Cluny utterly transformed these traditional features by remounting them in an elaborate setting. The 635-foot long plan, the largest in Christendom, included two transepts as well as an ambulatory ringed by a necklace of chapels. Four mighty towers rose above the transepts and two more stood at the western entrance, creating an impressive silhouette. Inside, the elevation was composed of three levels: a tall arcade; a middle zone, or triforium, decorated with cusped arches that resembled Islamic ornament; and a clerestory. Pointed barrel vaults covered the main spaces, while pointed arches were used in the arcade. Given Cluny's extreme height and breadth—the nave vault alone spans 35 feet—this precocious decision to use the pointed arch, which was to become such an

Grounds (with much later buildings) of Abbey at Cluny, France, 910. SANDRO VANNINI/CORBIS.

important component of the Gothic style, was likely based upon structural considerations. Finally, the choir composed an opulently decorated stage where the daily round of monastic offices was sung. Beautifully sculpted capitals topped the tall columns that ringed the apse, depicting figures of the eight tones of plainchant, the four seasons, and the four rivers of paradise, while a monumental painting of Christ in Majesty filled the half dome of the choir above the altar. Taken as a whole, the abbey church of Cluny not only made a compelling statement about the power of the Order but also composed an image of heaven. As the author of the *Life of St. Hugh*, the abbot under whom the new church was built, wrote, “if it were possible for those who dwell in heaven to take pleasure in a house made by human hands, you would say this was the walk of angels.”

**THE CISTERCIANS.** At the very moment that Cluny was nearing completion, Bernard, abbot of Clairvaux, voiced his criticism of contemporary monastic architecture in his famous *Apologia* written around 1125 to his friend, William of Saint-Thierry: “I say nothing of the immense height of your churches, their immoderate length, their superfluous breadth, the costly polishings,

the curious carvings and paintings which attract the worshipper’s attention and impede his devotion. ... But I, as a monk, ask of my brother monks, ‘tell me you paupers, what business has gold in the sanctuary?’” The monastic reformers that settled at Cîteaux in 1098 and created the Cistercian Order sought to return to the letter of the Rule of St. Benedict as they rejected the materialism and sensory overload of Cluny. The architectural simplicity of the order’s churches reflected their spiritual ideals and their search for perfection through silence and interior meditation. Although there was neither a set formula for planning nor a clearly defined style shared among the more than 1,100 houses of the order established from Ireland to Greece and from Spain to Sweden, Cistercian architecture can be identified by a common attitude within the variety of its expression. For example, the abbey of Le Thoronet (second half of the twelfth century) strips away all of the grand forms and decorative flourishes so characteristic of Cluny to achieve a structure where every space and stone is directed to function. In a manner typical of Cistercian architecture, the church is laid out on a straightforward cruciform plan, the choir is reduced to a simple square, and the small chapels that open off the main vessels provide additional

altars for those monks who were ordained priests to celebrate individual masses. The interior uses piers, pointed arches, and a pointed barrel vault similar to those at Cluny, but it contains only a single story. Sculpture is banished, stained glass is absent, and no towers ennoble the exterior. Indeed, the crisp cubic mass of the church can hardly be distinguished from the adjacent dormitory or nearby forge. This renunciation, however, should not be viewed as evidence that Cistercian monks and builders were crude or unsophisticated. Like Shaker architecture in nineteenth-century America, Cistercian structures were endowed with a profound balance (using harmonious proportions based on the square), careful craftsmanship, and consistently up-to-date building technology. As seen in the new choirs of Rievaulx in England (1220s) or Altenberg abbey near Cologne (c. 1255–1280), thirteenth-century projects incorporated ribbed vaults, flying buttresses, and even bar tracery. Yet, despite this architectural evolution, the message of humility endured as the essential expression of Cistercian identity.

**FRANCISCANS AND DOMINICANS.** In the early thirteenth century, a new wave of religious thought stressed engagement in the world rather than withdrawal from it. This change in purpose led to a new type of religious community whose members were called friars (brothers) or mendicants (from the fact that they begged for their sustenance). The friars were not cloistered or closed off from the world, but rather lived in convents, often on the edges of cities. First the Dominicans, founded in 1216, and soon afterwards the Franciscans, whose rule was approved by the pope in 1223, began to settle in the rapidly growing cities of Europe where they preached to the faithful, performed charitable works, and defended the Christian faith from heretical interpretation. Both orders embraced poverty; indeed, each rejected the ownership of property, and their members sustained themselves by begging and the acceptance of donations. Although Francis of Assisi opposed church building of any kind and asked to be buried in the refuse dump of Assisi, his followers erected a splendid church, San Francesco, in his honor. Built between 1228 and 1253 on two levels with a lower, crypt-like church surmounted by a taller upper church, the architecture of San Francesco, Assisi, reveals the clear impact of such “modern” French forms as finely scaled engaged columns, ribbed vaults, and bar tracery that frame stained glass windows. Yet the broad interior space and the insistence on prominent surfaces of wall, decorated with frescoes of the life of St. Francis, adhere to the local Italian traditions.

**HALLS FOR PREACHING.** Perhaps more emblematic of Franciscan attitudes is the church of Santa Croce in

Arcaded Cloisters of Cistercian Abbey of Le Thoronet, France, late twelfth century. GAIL MOONEY/CORBIS.

Florence, begun in 1294 and probably designed by the architect and sculptor Arnolfo di Cambio. Like the Cistercians before them, the Franciscans legislated against architectural extravagance. Statutes of 1260 declared that, “any superfluity in length, width, or height above what is fitting to the requirements of the place [should] be more strictly avoided. . . . Churches shall in no wise be vaulted, save for the presbytery [the choir].” The nave of Santa Croce appears as an updated version of an early Christian church with thin brick walls supported by octagonal columns and covered by a timber roof. The vast barn-like space was perfectly suited to the large crowds that came to hear the friars’ sermons. In a similar vein, Dominican churches were also created as preaching halls. The striking church of the Jacobins (Dominicans) in Toulouse that took shape in a series of building phases between 1229 and 1292 adopts an unusual double-nave scheme that resembles a monastic refectory or hospital: a single file of columns marches down the center of the church to the choir, which is covered by a magnificent star-shaped vault. On the other hand, the Dominican

**A BUILDING ACCOUNT FROM THE CHURCH OF SAINT-BERNARD, PARIS**

**INTRODUCTION:** Saint-Bernard was the church of the College of the Bernardins (Cistercians) in Paris. Pope Benedict XII, who had studied at the college, underwrote the construction of a new church after he was elected pope in 1334. Begun in May 1338, work on Saint-Bernard stopped with the pope's death in April 1342 and remained incomplete. It was demolished during the nineteenth-century urban renewal of the city. The following account offers a detailed record of the materials, methods, and expenses involved in the project, with summaries divided according to the types of materials required.

**The Year of Our Lord 1339**

The payments that follow were made for lumber and large beams and other timbers and are contained in the payments that were necessary for the work of Saint-Bernard made by brother Pons de Madieiras.

**Friday the ninth day of April:**

To Simon Grapeli for 200 timbers for the work of making the arches for the work; per 100 6 £ 10 sous (20 sous = 1 £): 13 £

**Wednesday the fourteenth day of April:**

Item, to Denis le Franc for 260 timbers to make the said arches: 11 £ 10 sous

**Monday the twenty-sixth day of April:**

To Simon Grapeli for 20 beams called joists three toises (the toise, a medieval unit of length, measured six feet) long for the work on the lifting engine: 55 sous

**Monday the seventh day of June:**

To Jean Champion paid for two pieces of timber six toises long. Item for three other timbers called joists for work on the engine: 11 sous

**The Year of Our Lord 1340**

**Saturday the twenty-fourth day of June:**

Item to Jean Champion for two big beams for the work of covering the apse of the church to make the strong arches to support the centering: 45 sous

Item to the said Jean for three large timbers to place across the chapels to make the strong arches; paid for each 2 sous 6 deniers (12 deniers = 1 sous): 7 sous 6 deniers

**Sunday the twentieth day of August:**

To Jean Champion for three big beams each six toises long for the work of placing them above the apse of the church to make the strong arches to place the keystone of the said apse and to make the vault.

**Saturday the eleventh day of November:**

To Jean Polemlang for two beams of three toises in length for the work of making the centering for the flying buttress: 7 sous

Item for fifteen pieces of timber for the work of roofing and to make the roof of the apse of the church, each one three toises long: 50 sous

Item to Jean Champion for forty timbers two and a half toises long. And for twenty-five timbers four toises long to make the roof of the said apse of the church: 100 sous

Item to Jean de Beumon for eight hundred eighty laths for the work of the said roof; paid per one thousand 45 sous: 39 sous 11 deniers

**The Year of Our Lord 1341**

**Saturday the twenty-first day of April:**

To Jean Champion for three beams to make the centering of the aisles ("the little naves"): 11 sous 4 deniers

**Saturday the second day of June:**

To the said Jean (Polemmlang) for five beams to carry the centering of the aisles: 75 sous

Item to Jean Belabocha for four posts for the work of making the centering of the aisles: 11 sous 9 deniers

**Sunday the twenty-sixth day of August:**

To Jean Beumon of the (Place) de Greve for two big beams to place across the large nave to make the strong arches: 10 £

churches of Santa Maria Novella in Florence (begun 1246) or Santa Maria sopra Minerva in Rome (1280) return to a cross-shaped and three-aisled plan with a two-story elevation inspired by Cistercian designs. Once again, their use of current building technology remains restrained. In place of a complex structure composed of

a worldly vocabulary of shafts, moldings, and screens that emphasized visual drama, verticality, and framed fields of imagery, Dominican and Franciscan architecture offered functional purity. Purging virtually every sign of evocative resonance and material luxury, these churches worked to embody the spiritual ideals of humility and

**Saturday the twentieth day of October:**

To Jean Champion for six big beams to place across the large nave for the work of making strong scaffolding; paid for each 100 sous: 30 £

**Sunday the eighteenth day of November:**

Item to the said Jean (Maurelet) for thirty planks to cover the ribs of the quadripartite vaults of the aisles so that it does not rain in: 7 £ 5 sous

Item to Philippot Dupin for three cartloads of thatch to cover the vaults of the aisles; paid for each cartload delivered to Saint-Bernard 13 sous 6 deniers: 40 sous 6 deniers

**Sunday the twenty-third day of December:**

Item for five large pieces of timber for the work of bracing the piers that are in danger of breaking: 13 £

**The year 1339**

In the year 1339 were made the following payments by brother Pons de Madieiras for plaster to make the floors where the drawings necessary for the work were made and to make the webbing of the vaults of the large nave as well as in the chapels and in the aisles ...

In the year 1339 brother Pons de Madieiras made the following payments for ironwork that was necessary for the work of Saint-Bernard:

**Friday the twenty-second day of May:**

Item for 2800 nails for work on the lifting engine; paid per thousand 5 sous: 14 sous

**Saturday the twenty-sixth day of June:**

Item for the cost of 2000 nails for the work on the engine: 8 sous

Item for the cost of 40 big nails for the work on the engine: 2 sous 8 deniers

**Saturday the fourteenth day of August:**

Item to Robert Lengles, blacksmith of the Place Maubert for four hinges for the doors of the church

weighing thirty-two pounds; paid per pound 8 deniers: 21 sous 4 deniers

**The year 1340****Saturday the third day of June:**

Item to Thomas Lengles, blacksmith, for twelve bars of iron for the windows, which weigh 175 pounds; paid per pound 6 deniers: 4 £ 7 sous 6 deniers

**Sunday the twentieth day of August:**

Item for a bar of iron to place in one of the lifting engines that is used to haul the beams up to the apse of the church for the vault and to place the keystone which weighs four pounds: 2 sous

**Saturday the twenty-eighth day of October:**

Item for the cost of 3000 nails for the work of nailing the laths above the apse of the church; paid per thousand 2 sous 8 deniers: 8 sous

Item to P. Lullier for covering the said apse of the church with tiles and for climbing on top of the said apse: 32 sous 8 deniers

**Monday the twenty-fifth day of December:**

To Jean au Louvre for one cartload for the work of hauling the large stones of the round piers and the large cartloads of stone: 60 sous.

**The year 1341****Sunday the twenty-fifth day of February:**

To the said Thomas (Lengles) for three iron anchors that are placed into the piers of the chapels and in the round piers (of the nave). Each of the anchors has a ring which is outside the body of the pier and into the ring one iron tie rod is placed to hold the round piers and weighs one hundred twelve pounds; paid per pound 6 deniers: 56 sous.

## PILGRIMAGE ARCHITECTURE

**SYMBOLIC PLACES.** Because medieval Christians believed that holy places bore the mark of divinity, they were drawn to the sites of important historical and spiritual events, such as those in the Holy Land where

Jesus had lived and died, the tombs of revered saints, or important collections of their relics. To visit these spots—the tomb of Jesus in Jerusalem or the footprints of St. Peter in Rome—not only revealed the truth of the scriptures, but also allowed the Christian worshipper to remember the past through the rituals of the present. In religious journeys or pilgrimages to these special places of spiritual power, relics—the physical remains of bones, skin, hair, and fingernails or objects touched by saints—offered concrete points of contact with Christian martyrs, who, though long dead, provided accessible and inspiring models for behavior. While pilgrimage and the cult of saints and their relics originated in the first centuries of Christian devotion, they became especially important in the Middle Ages. The church, and particularly its monastic orders, fostered pilgrimage as one strategy to refocus the energies of secular society away from destructive fighting toward more peaceful concerns. By 1100, the shrine of Saint James, apostle of Jesus, at Santiago de Compostela in northwestern Spain had become the most popular pilgrimage destination in Western Europe and joined Jerusalem and Rome in importance. Dozens of other churches sheltering the miracle-working

relics of saints—Sainte-Foy at Conques, Saint-Trophime at Arles, Saint-Sernin at Toulouse—rose along the major routes that fanned out through France from the road to Santiago. For local communities, pilgrimage was a lucrative source of income from services provided for the pious travelers and the donations they left behind. Medieval architecture played a critical role in giving form to religious memory and experience, but the cash generated by those encounters with the divine also fueled the burst of building.

**THE AMBULATORY AND CHAPEL PLAN.** As early as the ninth century, the Church of the Holy Sepulchre in Jerusalem, with its circular plan and dome, had been a model for many kinds of religious buildings in Western Europe. Likewise, St. Peter's in Rome was reproduced repeatedly in the Carolingian period to honor saints, and in Italy its T-shaped plan with a transept and apse inspired other designs, such as that of Bari, where the body of St. Nicholas was placed in 1089, as well as nearby Trani, where the cult of a rival St. Nicholas was promoted. During the eleventh century, however, a new and more complex plan came together that skillfully orchestrated spaces around the multiple functions that a shrine church needed to accommodate. Simply put, the cruciform basilica that maintained the association to the venerable martyrs' churches of St. Peter's and St. Paul's in Rome was joined to the kind of ambulatory and chapel arrangement found in crypts arranged around saints' tombs and pioneered in Carolingian churches such as Saint-Germain at Auxerre and Corvey. The breakthrough came when the apse of the body of the church was spatially connected with the ambulatory through an open arcade. As a result, like a modern highway system, the ambulatory allowed pilgrims to circulate around the outer edge of the interior, bypassing the liturgical area of the choir and leaving the clergy undisturbed. Visitors might descend into the crypt where they could peer in through arches or windows at the tomb of the saint, or they might make the circuit of the ambulatory above to glimpse the golden and jeweled reliquary boxes displayed on altars in the main choir and chapels. Five of the major churches along the route to Compostela—Saint-Martin in Tours, Sainte-Foy at Conques, Saint-Martial at Limoges, Saint-Sernin at Toulouse, and Santiago—adopted this plan, each with a nearly identical two-story elevation composed of an arcade with a gallery above and crowned by a barrel vault. Although this design is often called the “pilgrimage roads” type, it is by no means typical of pilgrimage churches in general. To cite but one example, Saint-Front at Périgueux in southwestern France, begun in the late eleventh century, turned to St.

Mark's in Venice for its cross-shaped plan capped by five domes. By quoting St. Mark's, itself based on the sixth-century church of the Holy Apostles in Constantinople, Périgueux advertised its saint's identity as one of the seven apostles of early Christian France.

**CHURCH AS GUIDEBOOK.** In addition to the general plan of a pilgrimage church, other architectural features sometimes served to remind visitors of their purpose and impress upon them the scope of their undertaking. A striking example of this phenomenon is the exterior design of the church of Mary Magdalene (La Madeleine) of Vézelay. This church was originally built as a shrine for the relics of Mary Magdalene; once their authenticity had been confirmed by the pope in 1058, the church became a major destination for pilgrims, both because of its own significance and because it lay at the intersection of the roads leading to Compostela and a major route towards Jerusalem. One of the key features of this church is its tympanum, the huge semi-circular carving above the main portal inside the narthex of the church, which was begun in 1124 and sculpted in a style that resembles the choir capitals in Cluny in 1115. This relief carving, which would be one of the first things every visitor would see because of its location at the main entry to the church, depicts the ascension of Christ combined with the mission of the apostles. In this scene of Christ flanked by the apostles, his power both to condemn and to save mankind is clearly revealed to all who walk into the church. The lintel—the horizontal frieze at the bottom of the semi-circle—contains various peoples, including imagined Ethiopians and monstrous races of men with the heads of dogs believed to live in the remote parts of the world, all illustrating Christ's successes in preaching to and converting non-Christians. Appropriately for a church where the Second Crusade was to be preached, the tympanum showed pilgrims the symbolic liberation of the Holy Land, a subject matter that would be easily recognized by later pilgrims as a sort of prophecy.

**THE DECORATED CHURCH.** Church portals were not the sole focus of figural decoration in the medieval church. Gold-ground mosaics that narrated stories of the lives of Christ or the saints, as seen in the Norman churches of Sicily, sometimes covered wall surfaces. Other churches adorned their walls and even the ceilings with extensive cycles of paintings. In the Romanesque period, the capital, the topmost part of a column or pilaster, became a favorite field for sculptural decoration. Often brightly painted, capitals were most frequently carved with figures of animals and fantastic beasts such as griffins, harpies, or sirens. Their appearance on capitals

Relief carved choir stalls and paneling from church of Saint-Denis, Paris, added in 15th century. THE ART ARCHIVE/BASILIQUE SAINT DENIS PARIS/DAGLI ORTI.

in monastic cloisters prompted Bernard of Clairvaux to condemn them as distractions.

In the cloisters, before the eyes of the brothers while they read what are the filthy apes doing there? The fierce lions? The monstrous centaurs? The creatures part man and part beast? The striped tigers? The fighting soldiers? The hunters blowing horns? You may see many bodies under one head, and conversely many heads under one body? In short, everywhere so plentiful and astonishing a variety of contradictory forms is seen that one would rather read in the marble than in books, and spend the whole day wondering at every single one of them than in meditating on the law of God.

But in addition to this menagerie of imaginative creatures, capitals in such notable churches as La Madeleine in Vézelay or Saint-Lazare at Autun—both in Burgundy, France—were carved with religious and moralizing subjects. As viewers moved through the interior space of the church, they might look on devils tormenting the lustful

or leading misers to hell, the temptation of Christ, or the miracles performed by St. Benedict. Complementing the monumental images of the divine in stone and paint at the portals and in the apse, these capitals offered a vivid reminder to the congregation of the paths that led to heaven or hell.

**CHURCH AS RELIQUARY.** The ambulatory and chapel scheme remained in force during the twelfth century at such magnetic pilgrimage churches as Saint-Denis, Canterbury, and Chartres. The Canterbury itinerary, for example, led from the altar in the north transept where the archbishop Thomas Becket had been murdered, down into the crypt, then up and around the ambulatory to the stations where Becket's relics were displayed, while pilgrims at Saint-Denis circulated around tombs set on the raised stage-like platform of the choir, in a setting enhanced by an innovative use of glass and a more unified sense of space. It was mainly in drawing upon these new possibilities that shrine architecture of

the thirteenth century adopted a radically different language. Rather than looking to the past for plans and references, commemorative structures during this later “Gothic” era increasingly replicated the delicate, brittle effects of contemporary metalwork. The most breathtaking example of this new taste is embodied by the Sainte-Chapelle, built by Louis IX between 1241 and 1248 as the repository for the fabulous horde of relics of Christ he had purchased from the emperor in Constantinople and transferred to his palace in Paris. With the summit of the exterior walls embellished by an intricate filigree of bar tracery (a network of slender ornamental shafts), bristling with ornate pinnacles, and crowned by a diadem of pierced gables, the royal chapel appears as a monumental stone and glass version of a reliquary fashioned of gold, silver, enamel, and precious stones. The building literally assumed the form of its function. While the construction cost of the chapel itself was reported at 40,000 pounds (as a gauge, the annual salary of a master mason would have been about 10 pounds), the king spent 100,000 pounds on the relic containers, and 135,000 pounds for the relics themselves. Thus, the meaning of the building was not created through connections to historical models, but by emulating objects closely associated with the veneration of holy figures and their symbolically resonant precious materials. Similarly, Saint-Urbain at Troyes, built between 1262 and around 1285 to commemorate the birthplace of Pope Urban IV and as a shrine to his patron St. Urban, advertises its memorial character in the fretwork of sharp gables and tracery that encase the exterior. And at Notre-Dame in Paris, the two tiers of ornate gables added between 1300 and 1350 transformed the choir into an otherworldly container for the body of Christ and the relics of the saints.

## A NEW VISION: SAINT-DENIS AND FRENCH CHURCH ARCHITECTURE IN THE TWELFTH CENTURY

**OLD AND NEW AT SAINT-DENIS.** As the history of pilgrimage churches suggests, the reconstruction of the monastery church at Saint-Denis, begun in 1135 under the direction of Suger (1081–1151), abbot of Saint-Denis, initiated a new age of French architecture. Now nearly 400 years old, the original Carolingian church was too small for the many pilgrims who came to visit the relics of the saints and for the monks who needed more altars to accommodate an increasing number of worship services. To alleviate the crowding at the abbey, the first phase of work focused on enlarging the entrance and extending the nave of the eighth-century structure. Although echoing the general form of the old Carolingian west block, Suger's front looked to more recent Norman examples, such as the abbey of Saint-Etienne at Caen, the burial church of William the Conqueror, for a design that included three portals with two soaring towers. Including the first known example of a rose window—a large circular window in the façade of a church, usually decorated with a pattern of radiating tracery that frames stained glass depicting stories from the Bible and the lives of the saints—as well as battlements drawn from military architecture, the twelfth-century façade presented an impressive gateway into the church that was an original blend of old and new, castle and church forms. In the three short accounts that he wrote describing the stages of the construction project and the celebrations upon their completion (held in 1140 for the new west front and in 1144 for the dedication of the choir), Suger declared that his “first thought” was to make sure that the new work harmonized with the old building—believed to have been touched by Jesus himself. To match the interior forms of the eighth-century church, the abbot launched a search for stone to make columns. He considered importing them from Rome, but this proved too expensive and the problems of shipping were too difficult. Finally, a nearby quarry was found where stone for columns could be cut, shaped, and transported by river to Saint-Denis, allowing Suger to realize his architectural plans.

**A RETURN TO COLUMNS.** Columns were rarely seen in Ottonian and Romanesque church architecture; for example, Speyer Cathedral in Germany and Saint-Sernin in Toulouse in France used complex piers to support their tall, heavy structures. As in the Carolingian abbey, the columns of Suger's Saint-Denis were intended to recall the churches of Rome, such as St. Peter's, St. Paul's, or St. John-in-the-Lateran, which had been built

Vaulting and glass of a cathedral as seen by a medieval painter. *Adoration of the Virgin with Mary of Burgundy. Hours of Mary of Burgundy*, by Alexander Bening. Vienna, Austrian State Library MS 1857, folio 14v. Bruges, 1467–1480. BILDARCHIV D. ONB, WIEN.

at the beginning of the age of Christian art and architecture. The columns not only emphasized the prestige of Saint-Denis by imitating famous models, but they also served as reminders that Denis, the saint buried at the abbey who was the first bishop of Paris and the special protector of French kings, had been sent from Rome, so it was thought, by St. Peter. The capitals atop the Saint-Denis columns turned away from the usual figural sculpture of Romanesque architectural decoration and instead adopted baskets of richly carved foliage that emulated the Corinthian order used in ancient Roman and early Christian architecture. This elimination of narrative and animal subjects from capitals was followed throughout northern France in churches influenced by Saint-Denis.

**LIGHT.** At the same time, Suger wanted a church that was filled with light. The choir, he wrote, included a “circular string of chapels, by virtue of which the whole [church] would shine with the wonderful and uninterrupted light of most luminous windows.” Filling the width of the wall, the windows tell stories of biblical

history, such as the birth of Jesus, or illustrate theological ideas. They were composed of richly colored stained glass that made light, interpreted by medieval writers as an image of God and a metaphor for spiritual realities, visible, almost tangible. The intended effect of the jewel-like colors, dominated by deep reds and blues, together with the sacred subjects, was to urge the viewer, in Suger’s words, “onward from the material to the immaterial.” These windows were made by the use of cartoons, large patterns that laid out the stories to be told. Then many pieces of colored glass were cut and fitted together by means of soft flexible channels made of lead (called *comes*), which held the glass in position; these were soldered to each other to create glass fabric that could endure for many centuries. Often the individual stories had written explanations in the glass that were very carefully crafted, though they were so far above the congregation that they can today be read only by means of binoculars.

#### THE ARCHITECTURE OF THE SAINT-DENIS CHOIR.

By demanding columns along with large stained glass windows, Abbot Suger forced his master mason to devise a strikingly original structure that was light, yet could achieve an impressive height. He described how his master mason had laid out the choir through arithmetic and geometry. The builder turned to new architectural techniques as well as new technology—most importantly, of the pointed arch and the ribbed groin vault. Although these forms had appeared in Romanesque buildings, they remained part of a massive, even overpowering structure. However, set on top of slender cylindrical columns and used to frame expansive window openings at Saint-Denis, they produced a completely different effect. First, because the pointed arch was flexible, it could be adjusted to create a uniform ceiling height and a fluid, integrated interior space. Looking through the twelfth-century ambulatory of Saint-Denis, the eye slides past the smooth, rounded columns and moves to the stained glass windows without interruption. (A wonderful rendition of stained glass and vaulting as seen by the contemporary medieval eye appears in a book of hours by the Master of Mary of Burgundy, Alexander Bening, now in Vienna.) Second, the pointed arch combined with the rib vault to direct weight to the corners of each structural compartment or bay in a system that was both architecturally efficient and conducive to maximum spaciousness. This upper-level structure rested on an overall plan that continued the well-established formula of an ambulatory with a series of radiating chapels, seen in Romanesque pilgrimage churches such as Saint-Sernin at Toulouse, but it achieved a new sense of unity. Instead of a collection of separate blocks that appear to be added to one another (at Saint-Sernin, for example, the semi-circular

chapels, the curving ambulatory, and the apse are clearly distinguished from one another), Saint-Denis fused all of the parts of the choir into an integrated composition. The chapels form a continuously undulating exterior wall and, in the interior, their space merges with that of the outer choir aisle or ambulatory.

**A HEAVENLY VISION.** Saint-Denis offered a new vision for church architecture. Upon entering the grand west façade and passing through the narthex with its architecture of stout piers and thick walls, visitors to the abbey found themselves in a building in which solid stone walls appeared to dissolve into surfaces of glass, and vaults were transformed into delicate, hovering canopies that framed broad, open spaces shimmering with colored light. Again, as abbot Suger wrote about the choir in his account “On the Consecration of the Church of Saint-Denis,” “we made good progress—and, in the likeness of things divine, there was established to the joy of the whole earth, Mount Zion.” In other words, the church was built as an image of heaven. The twelfth-century abbey of Saint-Denis, and the Gothic churches that followed it during the next three centuries, captured the aura of the celestial city of Jerusalem that would descend to earth at the end of time, described by St. John in Revelations, chapter 21: “And he (the angel) showed me the holy city of Jerusalem coming down out of heaven from God, having the glory of God, its radiance like a most rare jewel, like a jasper, clear as crystal. The wall was built of jasper, while the city was pure gold, clear as glass. The foundations of the wall of the city were adorned with every jewel. And the twelve gates were twelve pearls, each of the gates made of a single pearl, and the street of the city was pure gold, transparent as glass.”

### IMMEDIATE IMPACT: NOTRE-DAME AND CHARTRES

**NOTRE-DAME.** Saint-Denis had an immediate impact on major church-building projects throughout northern

View of the Cathedral of Notre-Dame, Paris, France, 1163–1250. BILL ROSS/CORBIS.

France. One of the most important appeared in nearby Paris, where the new cathedral of Notre-Dame was begun in the 1150s. The cylindrical columns and other elements in the nave can be recognized immediately as inspired by the architecture of the abbey. But in comparing the two churches, one is struck by the differences. Notre-Dame is enormous. The interior space rises to a height of about 108 feet—the height of a ten-story building. In its original twelfth-century state (remodeled in the thirteenth century and partially restored in the nineteenth) it was composed of four levels: an arcade supported by those monumental columns; a gallery that created a second-story aisle; above that, a series of circular openings in the wall that corresponded to the zone of the pitched roof over the gallery; and, finally, the high windows or clerestory. One views the structure with awe, wondering how such a fragile assemblage of columns, spaghetti-thin colonnettes rising to join with the taut ribs that arc across the vaults, and walls consisting of little more than arched openings can enclose such a vast space. The answer is displayed on the exterior by the cage of flying buttresses that transfer the outward thrust of the walls downward into the ground and thus assure the cathedral’s stability.

**HEIGHT.** Notre-Dame’s monumental scale and the three levels of stained glass windows, in the ground floor aisles, gallery, and clerestory, sought to represent, as at Saint-Denis, the miraculous architecture of heaven. At the same time, the cathedral was more than just a religious symbol. Set in the heart of a rapidly growing city, the

Nave of the Cathedral of Notre-Dame showing stained glass, vaulting and columns, Paris, France, 1163–1250. ADAM WOOLFIT/CORBIS.

great bulk of Notre-Dame towered over the surrounding rooftops and flanking hills to give tangible expression to the prestige of its powerful bishop and clergy. Bishop Maurice de Sully (1120–1196), who spearheaded the construction project, must have aimed to erect the most impressive church in the kingdom of France, outdoing even the new cathedral of his superior, the Archbishop of Sens. This competition among elite churchmen of the time to build larger, higher, and more luxurious churches was critically noted by Peter the Chanter, one of the most powerful members of the Notre-Dame clergy. While he did not mention his cathedral by name, he must have had it in mind when he wrote, “If these builders believed that the world would ever come to an end, no such lofty masses would be reared up to the very sky, nor would such foundations be laid into the abysses of the earth. In that they resemble those giants who built the tower of Babel (men sin even in building churches). Today, on the contrary, the choirs of churches are built higher and higher.”

**CHARTRES.** One of the finest examples of twelfth-century church architecture—and the one preserving the largest collection of Gothic stained glass, with 173 windows—is the cathedral of Notre-Dame at Chartres. A fire in 1134 destroyed the façade of the Romanesque church that was replaced by three new portals, with their renowned sculpture influenced by Suger’s west façade of Saint-Denis, and two towers built between c. 1140 and 1165. A second fire swept through the town on 10 June 1194 devastating the body of the cathedral, but sparing the new west front. The church that rose from the ashes of the 1194 blaze reached 118 feet in height, and was briefly the tallest building in Europe. The cathedral, dedicated like the earlier church to the Virgin, was not only the seat of the bishop that made it the administrative headquarters of a large church territory called a diocese, but it was also a popular pilgrimage destination because it sheltered a prized relic, a tunic or garment believed to have been worn by the Virgin Mary. After the fire in 1194, the bishop and chapter donated part of their large incomes to the new construction and also collected gifts from Christians from as far away as England who wished to honor the Virgin by supporting the rebuilding of her church. Construction proceeded quickly, and in 1221 the clergy moved back into the choir of the nearly completed new edifice.

**SIMPLIFYING THE DESIGN.** Rapid construction was possible not only because of the wealth of the Chartres building fund, but also as a result of the design of the cathedral and developments in building techniques. Unlike the large French churches, including the cathedrals of Paris, Arras, Cambrai, Laon, and Noyon, or the abbey of Saint-Remi at Reims, built between 1150 and 1190, Chartres rejected the four-story interior. A three-level elevation re-appeared at Chartres, composed of an arcade, a dark, narrow passage called a triforium about halfway up the wall, and huge clerestory windows. In many ways, Chartres is a version of Suger’s choir at Saint-Denis, except that it is about twice as high. The master mason may have realized that with flying buttresses providing the necessary structural reinforcement, the gallery, seen at Notre-Dame in Paris, became irrelevant. Eliminating the gallery simplified the design and led to the enlargement of both the arcade and the clerestory, which created two equally tall zones of space and light balanced by the dark horizontal belt of the triforium. Verticality was also emphasized: four slim shafts were added to the arcade columns, which alternate subtly between cylinders and octagons, creating continuous lines that rise from floor to vault and join all of the parts and levels into a unified whole. Further simplification of the design reduced the number of components needed for

the structure, and at Chartres the individual pieces form extremely regular repeating units. Indeed, the piers, triforium, and window patterns are almost identical in each bay. In addition, Chartres used four-part vaults throughout the entire building, in contrast to the six-part vaults seen in Paris, that were at once consistent in their appearance, made from the same limited group of parts, and easier to build. As with a car in a modern automobile plant, Chartres was assembled from a series of mass-produced parts that promoted speedy, efficient construction even though it was part of a trend to construct buildings of ever-increasing size.

**VARIATIONS ON A THEME.** Chartres Cathedral is the most famous example of late twelfth-century developments that established a basic system of construction and a pattern for elite Christian church architecture that continued for the rest of the Middle Ages. To be sure, there were many design variations, such as the Cathedral of Saint-Stephen at Bourges, where tall arcades stressed spatial expansion rather than the vertical concentration of Chartres, but the major monuments of the thirteenth and fourteenth centuries—the cathedrals of Reims, Amiens, Beauvais, and Narbonne in France; Tournai in Belgium; Cologne in Germany; Burgos, León, and Toledo in Spain; as well as cathedrals in Prague and Milan—bear witness to the enduring impact of these architectural ideas. It is also important to think about the architectural process that produced these marvelous structures as a complex recipe that was shaped not only by religious ideas and symbols, but also by considerations of money, by available technology, and by strategies of production. The church may have been an image of heaven, but it was also the product of practical reality.

## THE GOTHIC IN ENGLAND

**SEA CHANGE AT CANTERBURY.** Although Gothic architecture developed in the direction of a highly ra-

tionalized set of forms responding to a combination of religious, technological, and practical conditions, it was never conceived as a rigid formula or an integrated system that obeyed a set of rules. English architecture during the half century from 1175 to 1230 reveals that it is better understood as a kit of parts, including columns, piers, shafts, pointed arches, and ribbed vaults, that could be selectively combined in endless variations. The rebuilding of the choir of Canterbury Cathedral after a fire in 1174 marked the beginning of this change of direction in English architecture. Designed by the French master mason William of Sens (late twelfth century), and completed by William the Englishman, the extraordinarily long east arm includes two transepts and two choirs that accommodated a community of monks as well as the secular clergy of the archbishop and chapter (the canons charged with administration of the church). With its ambulatory and rotunda on the eastern axis, it also provided a splendid theater for the display of the relics of St. Thomas Becket, who had been murdered in the cathedral in 1170. Although it incorporated portions of the old Norman walls into its fabric, Canterbury is thoroughly French in character. In place of the massive walls of the Romanesque period, the choir rose, as at Saint-Denis, in three tiers of light screen walls carried by slender columns and supported on the exterior by flying buttresses. The constantly varying columns that appear in cylindrical and polygonal shapes, as pairs or enriched with additional shafts, enhance the visual complexity of the building. Complemented by the dark marble shafts and moldings that play over the piers and walls, the polished marble columns of the apse, and the incomparable stained glass and wall paintings, the Canterbury choir emphasizes luxurious variety that was a hallmark of medieval definitions of beauty, intended to achieve an almost literal representation of the Heavenly City.

**LINCOLN.** The importance of Canterbury lay not so much in inspiring a series of copies based on French styles, but in directing English architecture toward new effects of lightness and linearity. This is best illustrated at Lincoln Cathedral, where rebuilding that began in 1192 after the collapse of the crossing tower in the original Romanesque church went on through a series of campaigns and eventually resulted, by 1250, in the replacement of the two transepts, St. Hugh's (the western) choir, and the nave—indeed, everything except the west block and towers. Although the Canterbury type of elevation formed the starting point, and a Gothic sensibility is apparent in the adoption of pointed arches, ribbed vaults, and finely scaled shafts and moldings, the

Lincoln design was guided by principles of syncopation and a rich layering of the wall in depth that recalls the powerful three-dimensionality of Norman Romanesque. The dark shafts of the vault are cut off above the level of the arcade and meet the rib at a seemingly arbitrary level in the triforium, effectively severing the relationship between the vault and the piers. Looking upward into the vaults of St. Hugh's choir only aggravates the visual uncertainty. These so-called "crazy vaults" comprising groups of three ribs that converge on two centers at the crown, marked the appearance of *tiercerons*, ribs that arc from the wall to an off-center keystone. By multiplying the number of ribs and introducing two keystones tied by a longitudinal ridge rib, the Lincoln vaults broke down the clear definition of the bay unit and intensified the sense of continuous zigzag movement down the length of the interior space. However, the vaults were not the work of an eccentric architect, but

rather an ingenious solution that permitted an expansion of the windows in the choir to include three broad lights per bay. In this regard, the importance of light and color that shaped twelfth-century developments in northern France as well as Canterbury remain central concerns for the Lincoln master. But rather than pursuing the visual logic of a rigorously integrated structure, the Lincoln builder may have turned to disjunction and multiplicity as the effective means to capture the unearthly architecture of heaven. The vaults of St. Hugh's choir were elaborated into star patterns in the nave in the 1220s and 1230s through the addition of *liernes*, short ribs within the surface of the vault that tie tiercerons together. The tierceron and lierne vault was to be repeated in ever more intricate variations throughout the thirteenth and fourteenth centuries in such buildings as Exeter Cathedral and the Lady Chapel of Ely Cathedral.

### THE MASTER MASON WILLIAM OF SENS AND THE RECONSTRUCTION OF THE CHOIR OF CANTERBURY CATHEDRAL

**INTRODUCTION:** In 1174 there was a great fire at Canterbury Cathedral when sparks from burning cottages nearby ignited the wooden timbers supporting the roof, which were hidden between the sheet lead covering above and the painted ceiling below. By the time the fire was discovered, the burning timbers had fallen down onto the choir and set the wooden seats on fire, sending flames twenty-five feet high that damaged the columns of the structure. So severe was the damage to the church that experts were called in to decide how it might be reconstructed. Gervase of Canterbury, a monk at the Cathedral from 1163 to 1210, describes this process in "Of the Burning and Repair of the Church of Canterbury."

[1174] However, amongst the other workmen, there had come a certain William of Sens, a man active and ready, and as a workman most skilled both in wood and stone. Him, therefore, they [the monks of Canterbury], retained, on account of his lively genius and good reputation, and dismissed the others. And to him, and to the providence of God was the execution of the work committed.

And he, residing many days with the monks and carefully surveying the burnt walls in their upper and lower parts, within and without, did yet for some time conceal what he found necessary to be done, lest the truth should kill them in their present state of pusillanimity.

But he went on preparing all things that were needful for the work. ... And when he found that the monks began to be somewhat comforted, he ventured to confess that the pillars [piers] rent with the fire and all that they supported must be destroyed if the monks wished to have a safe and excellent building. ...

And now he addressed himself to the procuring of stone from beyond [the] sea. He constructed ingenious

machines for loading and unloading ships, and for drawing cement and stones. He delivered molds for shaping the stones to the sculptors who were assembled, and diligently prepared other things of the same kind. The choir thus condemned to destruction was pulled down, and nothing else was done in this year. ...

In that summer [1178] he [William of Sens] erected ten piers, starting from the transept ... five on a side. ... Above these he set ten arches and the vaults. But after two triforia and the upper windows on both sides were completed and he had prepared the machines ... for vaulting the great vault, suddenly the beams broke under his feet, and he fell to the ground, stones and timbers accompanying his fall, from the height of the capitals of the upper vault, that is to say, of fifty feet. Thus sorely bruised by the blows from the beams and stones he was rendered helpless alike to himself and for the work, but no other person than himself was in the least injured. Against the master only was this vengeance of God or spite of the devil directed.

The master, thus hurt, remained in his bed for some time under medical care in expectation of recovering, but was deceived in this hope, for his health amended not. ... But the master reclining in bed commanded all things that should be done in order. Thus the vault between the four main piers was completed; in the keystone of this quadripartite ribbed vault ... the choir and the arms of the transept seem, as it were, to [converge]. ... Two quadripartite ribbed vaults were also constructed on each side before winter. Heavy continuous rains did not permit of more work. With that the fourth year was concluded and the fifth begun. ...

And the master, perceiving that he derived no benefit from the physicians, gave up the work, and crossing the sea, returned to his home in France.

**SOURCE:** Gervase of Canterbury, "Of the Burning and Repair of the Church of Canterbury," in *Gothic Art, 1140–c. 1450*. Ed. Teresa G. Frisch (Englewood Cliffs, N.J.: Prentice-Hall, 1971): 17–19.

**WELLS AS MODERN ARCHITECTURE.** A glance at the interior of the Wells Cathedral nave, begun around 1190, reveals the way in which English architects used Gothic forms as independent bits and pieces. Pointed arches and ribbed vaults do not work together as parts of a unified skeleton, but appear as repeating forms arranged in three distinct horizontal zones stacked on top of one another. Vertical connections are reduced to a fragmentary clasp between the two upper levels, leaving the vault in a tenuous, hovering relationship to the

lateral walls. With its brawny piers and thick walls with passages, Wells might be seen as an old Norman structure dressed in fashionable new Gothic clothes, but its mantle of sharp forms, increased luminosity, and restless linearity demonstrate the creation of an architecture that is divorced from the forms and effects of the classical Roman tradition. The singular west front, at once majestic and delicate, rearranges the French type by shrinking the portals and emphasizing the stout mass of the towers. Row upon row of statue niches evoke the "many

View of the interior of Lincoln Cathedral at the crossing, 13th–14th century. ARCHIVO ICONOGRAFICO, S.A./CORBIS.

rooms in my Father's house" mentioned by Jesus in the Gospel of John (14:2) and created more than 500 places for the residents of heaven, prophets, apostles, kings, martyrs, virgins, bishops, and abbots. Choirs hidden in the singing galleries within the thickness of the west wall would have brought these statues to life during liturgical ceremonies throughout the year. Rather than relying on quotations of models and forms from the past to create meaning, Wells is a fully realized example of the Gothic invention of an architecture of persuasive symbolic

View of the nave of Wells Cathedral, Wells, Somerset, England, 1175–1239. COLIN HOSKINS; CORDAIY PHOTO LIBRARY LTD./CORBIS.

power drawn from a formal repertory that was both completely original and infinitely flexible.

## THE ILLUMINATED CHURCH AND THE RAYONNANT STYLE

**LIGHT, VISION, AND ARCHITECTURE.** There is an intimate relation between architecture and its decoration. Whereas in early Christian and early medieval churches mosaics and paintings on walls had been the primary medium for the presentation of sacred stories, the elimination of solid mural surfaces and the transformation of the Gothic building into a skeletal frame led to the ascendancy of stained glass during the twelfth century. No doubt, the importance of an aesthetic that emphasized light as a metaphor of the Divine and spiritual experience spurred the creation of an architectural system that made a maximum expanse of stained glass possible. A third factor to consider is the rise of interest, during the twelfth century, in vision and optics. Not only were scholars curious about how physical objects and visual phenomena—rocks or rainbows—were seen, but they also explored the nature of what might be called “spiritual vision.” How was it possible to understand St. John when he wrote in Revelations, chapter 21, “Then

I saw a new heaven and a new earth—And I saw the holy city, new Jerusalem, coming down out of heaven from God”? As an explanation, Richard of Saint-Victor (d. 1173), the author of a commentary on Revelations, formulated four categories of vision. The first was the “simple perception of matter”: I see a tree. The second viewed an object’s “outward appearance,” but saw a mystical significance in it: I see a rose that is a symbol of the Virgin Mary. The third level of vision was that of spiritual perception in which one discovered, to quote Richard, “the truth of hidden things by means of forms and figures.” This is the experience described by St. John, who saw heaven in the form of a city. The fourth and highest level was the mystical mode in which the divine was encountered face to face. It is important to keep these notions of vision in mind when thinking about medieval architecture and its figurative decoration. Images, of course, were physical things, but through them Christians gained access to a realm beyond the mundane world. And the architecture of the church composed an elaborate frame for those pictures that could lead the worshipper to that higher, spiritual mode of vision.

## STAINED Glass

### Historical Origins

Stained glass work is a phenomenon of the twelfth century, but one whose history can be traced far earlier. Indeed, the Romans had used glass made of local sand or silica in windows to transmit light and keep out insects and the elements. Decorative glass was used in windows in sacred buildings in the Byzantine Empire, in Syria, and in France (by about the sixth century at Lyon), as well as in Britain in Northumberland during the Anglo-Saxon period. Windows in the Carolingian period used colored glass, but the glass did not represent people or stories and was not painted. Augsburg Cathedral in Germany in about 1130 seems to have had decorative windows with fairly elaborate programs of painting, and Saint-Denis (1135) seems to have been the earliest full program (depicting a series of linked narrative episodes) in France.

### Making Stained Glass

Shortly before the first mention of decorative stained glass windows in churches, detailed instructions for making them appeared in the treatise *On Various Arts* (c. 1100) by the monk Theophilus. He gave instructions for coloring glass, cutting and laying it out in designs on flat worktables, and assembling the pieces in a frame. The glass used in cathedrals and the wealthier parish church windows could be of two types—an older kind known as “potmetal” glass, colored in molten state by the addition of various metal oxides, or a “painted” type, further colored for detailed areas like faces or clothing folds by the addition of paints made of iron filings and pulverized glass suspended in a vehicle of wine or sometimes of urine. This paint could range in color from thick black to light gray, and it created a translucent effect. Once the pattern was achieved, the glass was fired in a kiln, bonding the paint to the surface permanently as a sort of glaze.

### Color and Shapes

Ingeniously, the flat pieces of colored glass had designs traced on them with the tip of a tool like a hot poker, and then cold water was applied, causing the glass to crack exactly along the lines. The shape was further refined by using a holding tool called a *grozer* and a pair of pliers with a nipper-like jaw to crack off tiny pieces of the glass until the desired shape was reached. During the fourteenth

century, a new addition to the glassmaker’s toolbox was a stain made of silver oxide, which gives a range of colors from lemon yellow to bright orange, depending on how long the glass was fired. Thus, the artist could virtually paint on the glass and not have to join so many different colored pieces to obtain the desired design. Typical palettes included green, pink, yellow, blue, and shades of red. When the design was created, the pieces of glass were assembled on the flat glassmaker’s board and held together in a mosaic of irregular shapes given structural strength by lead channels called *comes*. A groove along each edge of the came fit the piece of glass, and the resultant pattern was securely soldered together to form a large sheet that was shaped to fit in the arch of the window, encased in a stiffening iron frame.

### Variations

About 100 years after the general introduction of stained glass, the dark, rich colors—reds and blues—changed to *grisaille*, a type of monochrome silvery gray which admitted more light. Grisaille could be unpainted when used in floral or geometric patterns, but was sometimes painted with foliate motifs, as at Salisbury Cathedral in England. From about 1150 on, grisaille glass in its natural state of green, pink, or clear was especially popular with the Cistercians, who avoided spectacular decoration; eventually grisaille was combined with the regular painted glass in some churches, such as Clermont Cathedral in France. As early as 1080–1100, stained glass was used in windows in York Minster in figurative scenes. Canterbury Cathedral was glazed with figurative windows from about 1180 to 1220. From about 1225, in addition to the scenes of New and Old Testament events and the lives of the saints, heraldic motifs and royal arms began to appear in church windows, often signifying the social status of a donor of the window or benefactor of the church. Patrons or donors sometimes had themselves memorialized in the windows of churches, as in the case of Abbot Suger, shown supplicating the Virgin in a window at Saint-Denis. Guilds who gave windows were often represented with scenes of their members (for example, shoemakers or bakers) pursuing their trades in the lower parts of the windows. Stained glass was carefully placed for best viewing, often in the windows of the end of the transept to give maximum visibility. Aisles had biblical subjects, and rose windows showed cosmological scenes or perhaps depictions of the Apocalypse and Last Judgment, while upper or clerestory windows often had large-scale individual figures, which were easier to interpret from far below.

**RAYONNANT ARCHITECTURE.** The course of Gothic architecture can be described in terms of a series of structural innovations, all leading in the direction of greater

light and visual space. The combination of the pointed arch, ribbed vault, and flying buttresses led to a new type of structure that was no longer an opaque box punctu-

ated by intermittent window openings but rather a cage-like frame. As the size of windows expanded in the twelfth century, glass surfaces were subdivided into manageable sections. In the Chartres clerestory, the two tall pointed lancets with an *oculus* (“circular opening”) are partitioned by flat pieces of stone, or plate tracery, that make them appear to be three holes punched through a solid wall. A new solution was proposed at Reims Cathedral in the 1210s, where the window was designed along the same lines as the other elements of the structure—as a taut network of slender ornamental shafts or mullions called “bar tracery.” This invention had an enormous impact on the appearance of buildings, and, ultimately, on the way architecture was experienced. By the mid-thirteenth century, not only had bar tracery been developed into elaborate window patterns—at Amiens Cathedral, four-part windows decorate the clerestory while six-lancet compositions appear in the choir—but grids of delicate shafts began to spread over the remaining solid walls of the interior and exterior. In the interiors of new projects, including the rebuilding of Saint-Denis, the nave of Strasbourg Cathedral, or the choir of Clermont Cathedral, the networks of tracery were coordinated with piers composed of bundles of thin colonnettes to create an overall architecture of consistently delicate scale. On the exterior, the west façade of Strasbourg Cathedral (1275 fl.) in eastern France presents one of the most extravagant expressions of bar tracery, in which a fantastic fretwork of stone completely disguises the load-bearing walls behind. Gothic architecture between around 1240 and 1380 is often called the “Rayonnant,” taking its name from the radiating spokes of the spectacular rose windows that dominate façades, as in the transepts of Notre-Dame in Paris or the west façade at Strasbourg. Although the Rayonnant is usually discussed as a phase in which architects refined forms to achieve an even greater degree of lightness and elegance, its development was a response to the visual experience of the church interior illuminated by stained glass.

**THE SAINTE-CHAPEL.** In two separate purchases of 1239 and 1241, Louis IX, king of France, acquired the most precious relics in Christendom: objects associated with the Crucifixion of Jesus. After bringing the Crown of Thorns, a large piece of the Cross, nails, the sponge, and the lance to his capital in Paris, he set about erecting an appropriately magnificent chapel to honor them in the heart of his palace. Like Charlemagne’s chapel at Aachen, the Sainte-Chapelle, built between 1241 and 1248, contained two levels. A low, broad chapel on the ground floor, dedicated to the Virgin Mary, provided a base for the tall upper chapel where

Gable and rose window above the center portal of the west façade of Strasbourg Cathedral, Strasbourg, France, 1277. FARRELL GREHAN/CORBIS.

the relics of Christ were displayed and the king and his court worshipped. In this remarkable upper chapel, the architecture is reduced to thin clusters of vertical colonnettes, linked by iron chains that support the vault canopies and frame enormous, fifty-foot high stained glass windows. Its design resembles closely the triforium and clerestory of the nave of Amiens Cathedral, built in the 1220s and 1230s, producing the sensation that the visitor has been lifted up into a zone of space and light. Moreover, the architecture is clearly arranged as scaffolding that provided visual cues for apprehending the different ranks represented by the painting, sculpture, and stained glass. For example, closest to eye level and framed in the quatrefoils (four-lobed ornaments) of the wall arcade are paintings (now badly damaged) of local Parisian saints. Sculpted figures of the twelve apostles then appear attached to the columns, their architectural symbols, and lead the gaze up to the windows that present the entire cycle of divine history from Genesis to the Second Coming. Here the architecture creates distinct

Stained glass windows depicting biblical stories, Sainte-Chapelle, Paris, France, 1240s. ROBERT HOLMES/CORBIS.

patterns for each level. The images of the earthly lives of local saints are framed by arcades organized in three units of two, while the stained glass narratives appear in two- and four-lancet windows. Second, as one moves upward across these architectural thresholds, the medium also changes from the more physical substance of opaque paint and three-dimensional sculpture to the jewel-like light of the windows. Although the architecture of the Sainte-Chapelle did not impose a rigid system that dictated the placement of certain images or media in specific locations, its careful organization and relentless subdivision of surfaces into panels, arcades, and niches on multiple levels created a flexible, but structured framework that measured the stages of devotional experience. A measure of the international impact of the Sainte-Chapelle and the French rayonnant style can be seen in the choir of Aachen Cathedral that was added to Charlemagne's church beginning in 1355. The majestic, solid masonry of Carolingian architecture has been replaced by an armature of shafts and ribs that frame enormous windows. Instead of Roman columns and Corinthian capitals, there

are taut screens of tracery, animated sculpted figures of saints, and glowing panels of stained glass that combine in a building whose meaning no longer resides in historical references, but rather is created through the emulation of the dazzling effects of shrines and the evocation of a heavenly edifice.

**CLERMONT CATHEDRAL.** Clermont Cathedral, located in the modern city of Clermont-Ferrand in central France, may well have been inspired by the Sainte-Chapelle. The bishop of Clermont, Hugues de la Tour, attended the dedication of the royal chapel on 26 April 1248, and within a few months launched a new structure in his own diocese to replace the old Romanesque church. The thirteenth-century master mason, Jean Deschamps, adopted an up-to-date Rayonnant style that appears tailor-made for its role as a monumental picture frame. Looking into the deep chapels from the ambulatory, one first sees a section of bare, solid wall. Then, moving into the chapel, the eye first encounters a blind tracery pattern, and then is pulled to the expanse of luminous glazed walls. The colonnettes, moldings, and ribs that constitute the architectural structure define a sequence of thresholds through which one looks: from a location in the ambulatory into the chapel which only the clergy could enter; from a world of solid matter into a realm of light that presents the stories of sacred and saintly history. The paintings added to the lower wall beautifully articulate this visionary path. In one chapel, an angel leads a procession of canons forward into the presence of the saint, while in another, a canon kneels in devotion as his celestial guide points to the altar and the glass cycle beyond. As one gazes upward into the main space of the choir, the clerestory windows appear to hover above the dark band of the triforium that creates a gateway to the visionary realm above. In the clerestory, the rich color of the narrative windows of the chapels evaporates into the cool light of fields of grisaille glass (decorated monochromatically in shades of gray) in which figurative panels of Old Testament prophets, apostles, and in the axial lancets, the Assumption of the Virgin, float. This switch from full color to grisaille, a style of glazing that became widespread in the second half of the thirteenth century, offers another metaphor for spiritual ascent: from the almost tangible colored light, characteristic of terrestrial perception and appropriate to the subject of saints' lives to the brighter, flashing divine light at the highest level of the church.

**DIFFERENT PATHS.** The Westminster Abbey choir (1245–1272), Cologne Cathedral in Germany (begun 1248), and León Cathedral in Spain (begun around 1254) adopted the Rayonnant style in its entirety along

with stained glass as an essential part of the decoration. While this may reflect the prestige that French art and culture acquired during the reign of Louis IX, these royal churches were not trying to be French. Glazing programs were geared to local saints and rulers, suggesting that French architecture was emulated primarily because of its effective representation of the church as an image of heaven, as well as its ability to organize complex ensembles of pictures. Apart from a handful of clearly French-inspired edifices, European architecture between 1300 and 1500 presents an overwhelming variety. For example, the influential church of Saint-Rombout, Mechelen, in the Brabant region of Belgium was rebuilt after a fire in 1342 in the fashionable rayonnant style with wiry patterns of bar tracery that fill the windows and spread over the walls. But its enormous (unfinished) west tower, begun in 1452 and supervised by the architect Andries Keldermans between 1468 and 1500, looked to such contemporary German designs as Ulm Cathedral as well as the great towers of local secular civic structures. Finally, the choir of the church of St. Lorenz in Nuremberg, built 1439–1477, could hardly be more different from Amiens or Clermont in France. A hall church, a type in which the aisles rise to the same height as the central vessel, capped by an intricate net vault and exhibiting a variety of tracery designs, St. Lorenz offered fluid, indeterminate space in place of clear organization. Nevertheless, the ribbed vaults defined interior spatial compartments and the bar tracery created hierarchies of arches, repeated at different scales in which a worshipper was free to plot his own itinerary through stained glass panels, painted altarpieces, and sculpted keystones. Like the Sainte-Chapelle, St. Lorenz's architecture delineated the thresholds and setting of meditation in which the objects and images encountered as a spatial sequence became the material vehicles for an inward journey.

## THE ARCHITECTURE OF SECURITY AND POWER

**CASTLES.** Although the design of churches was the primary focus of medieval architectural creativity, structures for the daily living and defense of members of the upper level of society also displayed technical ingenuity and an awareness of the importance of image. Just as the monastery assembled different kinds of buildings—church, hall, infirmary, barn—to accommodate all of the activities—prayer, work, eating, sleeping—of the monk's life, the castle fulfilled an equally varied array of functions in the secular world. With the collapse of the centralized authority and administration of the Carolingian Empire in the later ninth century, power was increasingly concentrated in the hands of local lords. Rather than providing a common defense for the towns under his control, the lord built only for his own security. The great circuits of walls and gateways that had protected cities in the past, such as Rome or Constantinople (modern Istanbul), gave way to fortified independent residences. Castles thus developed as multi-purpose structures at once a dwelling, a governmental headquarters, and fortress. But along with these practical duties, castle architecture projected an image of power and security that aimed to impress both the lord's subjects and peers. Rather than pursuing the celestial vision of a "walk of angels" as in religious construction such as at Cluny, it spoke a language of form whose vocabulary was assertive gateways, thick walls, and tall towers. Nevertheless, religious structures drew upon castle features, such as battlements, narrow windows, or towers, to enhance their own image of authority. Building techniques, including the use of precisely cut ashlar masonry and engaged columns, that first appeared in castle construction were soon adopted by church builders, suggesting that despite differences in function and appearance there was an interchange of ideas between the two areas of construction.

**THE KEEP.** Castles appear to have developed from the union of the *motte*, a purely defensive wooden tower set upon a conical earth mound, and the hall. Halls, used for feasts and spectacles, official audiences, rendering

Donjon of the castle at Loches, France. 11th century. THE ART ARCHIVE/DAGLI ORTI.

justice, and administrative business, were complemented by a private chamber for sleeping, a kitchen, and a chapel for worship; these few structures constituted the essential domestic spaces of early castles. Around the year 1000, and apparently beginning in the Loire river valley of France, these separate areas were combined into a single, multi-storied tower called a keep or *donjon* surrounded by a circuit of protective walls that created an inner courtyard or bailey, where stables or industrial buildings were located. At Loches, one of the earliest examples, the ground floor was probably used for storage while the hall on the first floor, with its fireplace and latrines located in the surrounding wall passages, was entered through an attached rectangular building. A staircase within the massive walls climbed to the private chamber and chapel, distinguished by its apse, on the second floor. A spiral stair on the upper level provided access to another private room. A similar design was used at the Tower of London (White Tower), built by William the Conqueror immediately after his conquest

of England in 1066, where the apse of the two-story chapel is visible on the exterior and the great hall was also likely intended to rise through two levels to create a noble festival space. Marked by four towers at the corners of the square block (118 by 107 feet), the enormous tower that dominated the eastern edge of the city ostentatiously advertised the Norman presence and left no doubt as to who was in charge. Even in the fourteenth century at Vincennes to the east of Paris, King Charles V erected a mighty tower in which residential chambers and a chapel were combined with military features that included provisions for the use of new gunpowder weapons.

**WALLS AND DEFENSE.** The defensive character of the tower or keep of a castle is clearly indicated by its sheer and solid walls and the reduction in the size of windows to narrow slits or small openings. As the last inner stronghold of the castle, the architecture of the keep and the castle continually incorporated new fea-

Upper city ramparts of Carcassonne, Aude, France, mid-thirteenth century. ENTZMANN CYRIL/CORBIS SYGMA.

tures designed to repel the advances in weapons and technology of warfare. In Norman castles of the eleventh century, for example, the battlements formed a protective parapet (a wall with both taller areas for defense and openings for deployment of weapons) for the use of defenders. Cantilevering the battlements forward on supporting arches or corbels created machicolations (openings) through which a variety of missiles, rocks, boiling water, pitch, or refuse could be dropped onto attackers below. Inclining or battering the base of the wall then ensured that the volley would bounce or splash onto an enemy unable to flatten himself against the wall. A moat or deep ditch, often filled with water, and one or two rings of walls then surrounded the keep. A fortified gateway and a heavy portcullis (an iron grating that could be lowered from above) further protected access into the castle, which was gained over a drawbridge. Additional towers studded the outer walls of the castle, each floor with narrow slit windows that widened toward the interior, allowing archers within to cover the entire field of fire around the tower. With this description in mind, one might imagine the difficulties of trying to capture Beaumaris castle, built 1295–1323 by King Edward I on

Westminster Palace and Abbey from the air, London, England, begun late eleventh century. LONDON AERIAL PHOTO LIBRARY/CORBIS.

England's western border with Wales. After climbing the steep hill, somehow crossing the bridge and fighting their way through the gate, attackers would find themselves marooned in a courtyard facing another set of walls, another ring of towers. In this case, the inner gateway is not aligned with the outer entry so that troops are forced to change directions and are exposed to fire from a different angle. Each tower formed an independent bastion so that the fortress would have to be taken tower-by-tower and ring-by-ring. Similar ideas of defense were also applied to cities. The thirteenth-century wall systems of the southern French town of Carcassonne offers a particularly well-preserved example of a double ring of walls, fortified gateways, and directional changes, while Aigues-Mortes, begun in the 1240s by Louis IX, joins an intimidating circular keep, the Tour Constance, that protected the port to a towered precinct wall that enclosed the entire city.

**PALACES.** In contrast to castles, palaces were non-fortified residences that were more ceremonial and administrative in character. At Aachen, for example, Charlemagne's palace consisted of a great audience hall and monumental chapel tied together by long galleries in a scheme that emulated Roman luxury villas and imperial palaces. In the ninth century, a poet described Charlemagne's palace at Ingelheim as "a large palace with a hundred columns, with many different entrances, a multitude of quarters, thousands of gates and entrances, innumerable chambers built by the skill of masters and

Papal Palace with military crenellations at Avignon, France, 14th century. ANGELO HORNAK/CORBIS.

craftsmen. Temples dedicated to the Lord rise there, joined with metal, with bronze gates and golden doors. There, God's great deeds and man's illustrious generations can be reread in splendid paintings." Ranges of rooms, a great hall, a banqueting hall with three apses, and a chapel were set around two spacious courtyards, one rectangular, the other semicircular, and connected by porticoes. The lobed hall carried particular architectural importance for it denoted "the house of the lord." Featured in the banqueting structures of the imperial palace of Constantinople, a similar type would have been seen by Charlemagne in the papal palace of the Lateran in Rome. As in church architecture, German emperors of the eleventh century continued Carolingian traditions in palace design, best represented at Goslar (begun around 1050). Unfortified, the palace's regular organization, double-level hall, and towered chapel composed the ideal expression of heritage and magnitude of the ruler's authority. Because of political instability, palaces such as that at Westminster in England all but disappeared from European architecture until around 1300 when the nation-states led by powerful monarchs created a climate in which display superseded defense.

**PARIS AND AVIGNON.** In the 1290s, King Philip IV ("the Fair") of France began to enlarge and transform the motley collection of buildings, ranging from the eleventh-century donjon to the thirteenth-century Sainte-Chapelle, that composed the royal palace in Paris. In the space of about twenty years, his architect, Jean de Cerens, added a huge new hall, the largest in Europe, built a chamber for the Parlement, towers for civil and criminal courts, and offices for the kingdom's financial departments, and remodeled the royal apartments. All of the branches of government were united in the complex, efficiently grouped around a series of courtyards, and linked by long corridors. Statues of Philip and his royal ancestors decorated the main door into the palace and the piers of the festival hall, the Grand'Salle. Although the king seldom resided in his chambers that looked out onto an extensive garden, its walls encompassed the entire machinery of royal administration and justice, made room for commerce in the galleries, and showcased the Sainte-Chapelle as a religious jewel that signified France's divine favor. The high walls and clusters of towers that encircled the palace gave the appearance of strength but, in reality, these features were decorative and symbolic.

*a PRIMARY SOURCE document***ON THE SAINTE-CHAPELLE AND THE ROYAL PALACE IN PARIS**

**INTRODUCTION:** In 1323, Jean of Jandun, a philosophy professor and translator of Aristotle at the University of Paris, wrote his *Treatise in Praise of Paris*, a work in the tradition of the “city encomium,” a genre that had been popular since Carolingian times. In Jean’s case, he was hoping to convey to his readers his own sentiment that “to be Parisian is to be.” The two passages below describe the effect of the ornamentation in the Sainte-Chapelle and the carefully planned arrangement of the various chambers of the Royal Palace, reflecting the author’s sense of how the best examples of architecture are planned to create a perfect harmony between form and function.

**Part II, Chapter II: On the Churches and Principally on Notre-Dame and the Sainte-Chapelle**

In Paris, privileged sanctuary of the Christian religion, beautiful edifices consecrated to God are founded in such great number that there are not many cities among the most powerful in Christianity that can boast of counting so many houses of God.

But the most beautiful of the chapels, the chapel of the King, conveniently located within the walls of the royal residence, is admirable through its strong structure and the indestructible solidity of the materials of which it is made. The carefully chosen colors of its paintings, the precious gilding of its images (statues), the transparency of the windows which shine from all sides, the rich cloths of its altars, the marvelous virtues of its sanctuaries, the exotic ornaments of its reliquaries decorated with sparkling jewels, give to this house of prayer such a degree of beauty that upon entering, one feels transported to heaven and one imagines that one has been ushered into one of the most beautiful chambers of Paradise.

Oh! How salutary are the prayers that ascend from these sanctuaries towards all-powerful God when the inner purity of the faithful corresponds exactly to the outer corporal ornaments of the oratory!

Oh! How gentle are the praises of God the most merciful sung in these tabernacles when the hearts of those who sing are embellished by virtues in harmony with the lovely paintings of the tabernacles.

Oh! How agreeable to God most glorious are the sacrifices prepared on these altars when the life of the priest shines with a brilliance equal to that of the gold of the altars!

**Chapter II: On the Palace of the King in Which Are the Masters of Parlement, the Masters of Requests, and the Royal Notaries**

In this illustrious seat of the French monarchy a splendid palace has been built, a superb testimony to royal magnificence. Its impregnable walls enclose an area vast enough to contain innumerable people. In honor of their glorious memory, statues of all the kings of France who have occupied the throne until this day are reunited in this place; they have such an expressive demeanor that at first glance one would think they are alive. The table of marble, whose uniform surface presents the highest sheen, is placed in the west under the reflected light of the windows in such a way that the banqueters are turned toward the east; it is of such grandeur that if I cited its dimensions without furnishing proof for my statement, I fear that one would not believe me.

The palace of the king was not decorated for indolence and the crude pleasures of the senses, nor raised to flatter the false vanity of vainglory, nor fortified to shelter the perfidious plots of proud tyranny; but it was marvelously adapted to the active, effective, and complete care of our wise monarchs who seek continually to increase the public well-being by their ordinances. In fact, nearly every day, one sees on the raised seats which are placed on the two sides of the room, the men of state, called according to their functions either Masters of Requests or Notaries of the King. All, according to their rank and obeying the orders of the king, work for the prosperity of the republic; it is from them that the generous and honorable favors of grace flow incessantly; it is by them that appeals, weighed with the scales of sincerity, are presented.

In a vast and splendid chamber, entered through a special door in the northern wall of the palace because the difficult negotiations that take place there demand the utmost tranquility and privacy, the skillful, far-sighted men, called the Masters of Parlement, sit on the tribunals. Their infallible knowledge of law and customs permits them to discuss cases with complete maturity and clemency and to hurl the thunder of their final sentences which give joy to the innocent and to the just because they are rendered without regard to persons or presents and in the contemplation of God alone and law. But the criminal and the impious, according to the measure of their evil, are overwhelmed by bitterness and misfortune.

**SOURCE:** Jean of Jandun, *Treatise in Praise of Paris*, in *Paris et ses historiens au XIVe et XVe siècles*. Ed. A. J. V. le Roux de Lincy (Paris: Imprimerie Impériale, 1867). Text modernized by Michael T. Davis.

Jean de Jandun's description of 1323 eloquently captures the character of the royal palace. Rising in the midst of the capital city, its unusual combination of military features, delicate gables and window tracery from church architecture, and a garden embodied the might, the piety, and the prosperity secured for the realm by a wise monarch's good government. Much the same can be said about the palace at Avignon built by the popes in the fourteenth century during their exile from Rome. Begun by Benedict XII in 1334, the original palace with its offices, assembly and banqueting halls, chapel, and residential wing arranged around a central court was not unlike a monastery's plan, perhaps not surprising in light of the fact that Benedict had been a Cistercian monk before his election to the papacy. His successors, Clement VI and Innocent VI, enlarged the papal apartments and added new wings including the west façade with its muscular arches, battlements, archers' slits, battered walls, and machicolations. Who would guess from this forbidding, even ferocious exterior that the palace enclosed an essentially bureaucratic compound and that the pope wielded little effective political power? The towers, like modern office buildings, contained work spaces, libraries, chapels, and apartments; a small garrison could be deployed on the roof platform in case of attack, but the palace was not designed to withstand a determined or prolonged assault.

## THE ARCHITECTURE OF DAILY LIFE

**COLLEGE ARCHITECTURE.** One of the most original architectural contributions of the late Middle Ages was

collegiate architecture. In the wake of the rise of universities throughout Europe in the late twelfth century, colleges were founded as safe and regulated residences for students who, at the beginning of their liberal arts studies, might be as young as thirteen or fourteen. Initially, colleges in Bologna, Cambridge, Paris, or Oxford were simply established in houses donated or purchased by a benefactor. The famous Sorbonne, founded in 1259 for theology students at the university, was initially located in a series of nondescript houses in the Latin Quarter of Paris. However, in the mid-thirteenth century monastic orders, such as the Cistercians and the Cluniacs, arriving in these centers of learning created enclosed compounds that limited contact with the seductions of the secular world. They adapted the cloister to the new educational requirements, reducing the church to a chapel and lodging students in a building that included a refectory with a dormitory above. The College of Navarre in Paris, established by Philip IV's queen, Jeanne de Navarre, in her will of 1304, marked a further step as it forged a new blend of building types for its seventy students from the liberal arts, law, and theology faculties. Part urban palace, part monastery, the college was composed of fine stone residential houses and included a chapel and a library arranged around an interior court. In England, the Oxford and Cambridge colleges of the fourteenth and fifteenth centuries display various combinations of halls, chapel, residential cells, monumental bell towers, and entrance gates built around open quadrangles, a scheme that has been widely imitated in American universities, such as Yale and Michigan.

**THE GUILD HALL.** As Europe made the transition from an economy based on large aristocratic landholdings to a commercial economy with a thriving merchant class, a new kind of architecture emerged to meet the needs of the groups called "guilds." Guilds began as voluntary associations of individuals to control training, membership, prices and quality in a trade or craft, and grew to have social and political significance as the trades gained economic power. These organizations began to own property from donations and bequests, and real estate provided a steady source of income, so they began to construct their own buildings in cities for meetings, celebrations, and political activity. By 1192, the city of Gloucester, in England, had its own guildhall, and as traders came from various countries their guilds erected halls for their members in the cities in which they did business. By the mid-twelfth century, for example, merchants from Cologne had established a guildhall in London. In the great cloth trading city of Ghent in modern Belgium, a variety of different trades such as bakers,

The Tom Tower of Christ Church College, and spires of Magdalen College, and Merton College, Oxford, England, fourteenth century. CHRIS ANDREWS; CHRIS ANDREWS PUBLICATIONS/CORBIS.

brewers, butchers, carpenters, cheesemongers, shoemakers, and coverlet weavers had their own guildhalls. Perhaps the most elaborate of these structures was the Ghent Cloth Hall where members of other trades in the city obtained their materials and women were even allowed to have stalls to sell cloth and related items. Such guildhalls could even politically and economically dominate a city neighborhood. By the early fifteenth century, there were 1,200 craft associations in London alone, and in 1411 a new guildhall was constructed on a site of one dating back to 1128; the borough called “Guildhall,” surrounding the present building, has been the center of London city government since the Middle Ages. The London Guildhall, which is very large, has stained glass windows, echoing a pattern very common in Belgium, where guildhalls consciously imitated Gothic churches. In these barn-like civic structures the steep roofs and large lancet windows created a sense of spaciousness and importance for the crowds doing business just as a Gothic church accommodated and inspired its congregation. The cloth hall at Ypres, built in the thirteenth century, is generally considered the most impressive of secular Gothic buildings. It had sumptuous decorations and elaborate woodwork, as well as huge front steps from which proclamations

could be read. Such buildings expressed not only a belief in the power of commercial enterprise, but a newfound spirit of civic freedom and pride.

**STANDARD PLANS FOR LIVING.** Although non-aristocratic domestic architecture did not go through the number of changes and technical developments that characterized public, religious, and aristocratic architecture, the housing of peasants and working people did reflect an evolution towards multi-room and multi-level architecture. During the earliest period of the Middle Ages, and even as late as 1300, many peasant families lived in single-room buildings called “longhouses,” which they shared with livestock. The bulk of surviving houses, however, had three rooms, usually with a large central room called the “hall” that was heated by an open-hearth fireplace and no real chimney (that is, smoke rose to the rafters and exited through an open hole in the thatched roof). At one end, there would be an entrance passage and service area, screened off to prevent drafts and sometimes subdivided into a pantry and buttery; at the other end of the hall was a private room, which in some plans was on a second or loft level called a *solar*. As more people moved into cities and land became more valuable,

Plan of a medieval English manor showing houses and buildings. THE GRANGER COLLECTION, NEW YORK.

Half timbered house in Noyers-sur-Serein, France, 15th century. © MARC GARANGER/CORBIS.

use of vertical space increased. Plans, materials, and styles varied according to local building traditions, physical context, climate, and wealth, yet houses throughout Europe had certain basic features in common. Surviving medieval houses from the eleventh into the fifteenth century tended to include a shop or commercial space on the ground floor (sometimes open to the street by day and shutterable by night), with the living quarters arranged above in the upper stories. A warehouse or manufacturing area might be located towards the rear. Unlike modern houses with rooms that accommodate specific activities and that allow for ample individual private space, medieval dwellings generally were still composed of a few multipurpose rooms, often grouped around an inner courtyard or light well. Surviving twelfth-century houses in the town of Cluny had one large front room connected by a corridor to a smaller back room per floor.

**REFLECTIONS OF URBAN WEALTH.** Nevertheless, later medieval houses, for example the Palazzo Davanzati in Florence of the mid-fourteenth century, could include sophisticated comforts and lavish decoration. Each of the

three floors that rise above the street-level loggia (open arcade) is composed of a large room that stretches the entire width of the house together with smaller chambers decorated with carved and painted ceilings and wall frescoes. A well shaft ran through the main rooms at every level and lavatories were provided on each floor, reflecting the high standard of living enjoyed by this wealthy merchant family. The crenellations that topped the house, later replaced by an open loggia, were a mark of social distinction. The monumental city halls, the Palazzo Vecchio of Florence (c. 1300) or the Palazzo Pubblico in Siena (c. 1300), are in effect enlarged versions of these grand urban palaces. Decorative detailing of houses, seen in door frames or window moldings, mirrored contemporary and local architectural fashion: twelfth-century houses sport classicizing pilasters, columns, capitals, and semi-circular arches; thirteenth-century dwellings feature pointed arches and traceried lights.

**HALF-TIMBER CONSTRUCTION.** But the most widespread and enduring type of town-house construction was the half-timber frame, built with interlocking beams and a wattle and daub filling. With an appearance that

is familiar today in homes that imitate Tudor architecture, this new type of house featured an exposed frame of hewn timbers notched and pinned together to form a cage-like structure in such a way that the dark vertical and diagonal beams remained flush with the finished surface of the exterior wall. To create the wall itself, the spaces between the timbers were filled with “wattle”—actually a mixture of interwoven twigs and branches—and then sealed with a thick coating of mud and straw, the predecessor of modern stucco or plaster. The upper stories of these three- or four-floor houses (five or six floors in crowded cities like Paris) were corbeled out over the street on projecting brackets, a technique that increased precious interior space. Houses of this type, with their distinctive high-pitched roofs and dormers, later sheathed by clapboards, were transplanted to America in the seventeenth century by the first settlers who continued construction techniques learned in Europe.

## SIGNIFICANT PEOPLE

*in Architecture and Design*

---

### BERNARD OF CLAIRVAUX

c. 1090–1153

*Cistercian abbot*

**A DEFINER OF MONASTIC AUSTERITY.** Born into an aristocratic family in Burgundy, France, Bernard en-

tered the Cistercian monastery of Cîteaux in 1112. In 1115, he founded the monastery of Clairvaux, and by the end of his life, the order had grown into an international monastic organization of prestige and influence. Bernard’s ideas on monastic life and the role of art in the cloister were reflected in the definition of Cistercian architecture. His views, eloquently set out in such tracts as the *Apologia*, offer a radically different attitude than those of traditional Benedictine monasticism or Cluny. Instead of seeing art and beauty as a vehicle for spiritual illumination, Bernard, certainly aware of images’ attractive power, judged them as distractions that hindered the monks’ devotions. He also condemned lavish church building as an arrogant and needless expenditure of money. Churches built in the mid-twelfth century—for example Fontenay or Pontigny—were laid out on a cruciform scheme, often called the “Bernardine plan,” and emptied of images and sculptural flourishes. This plan, along with the restrained height that expressed the ideal of humility, was emulated widely in other Cistercian houses that, in turn, served as important conduits by which French architectural ideas were introduced into other countries. Thus, Bernard’s defense of an architecture of austerity resonated across Europe.

### JEAN DESCHAMPS

Early 13th century–Late 13th century

*Architect*

**A FAMILY OF MASTER BUILDERS.** The inscription of his lost tombstone in the cathedral of Clermont-Ferrand informs modern scholars that Jean Deschamps (“Joannis de Campis”) began construction of the choir of the church in 1248 and was buried alongside his wife, Marie, and their children. Judging from the forms and construction methods employed at Clermont, Deschamps came to that city in the central French province of Auvergne from Paris, for the cathedral’s design can be linked closely to work at Saint-Denis, the Notre-Dame nave chapels, and the Sainte-Chapelle of the 1230s and 1240s. In 1286, a Jean Deschamps was appointed “first master” (“premier maistre”) of the works at Narbonne Cathedral,

an event that offers the tempting possibility to propose that this is the same builder four decades later in the twilight of his career. Despite general similarities with Clermont, Narbonne appears to be the work of a different master, who headed construction until 1295 and left drawings for piers in the floor of one of the choir chapels. Nevertheless, Jean Deschamps of Clermont may have been the eldest member of an extended family of architects that included not only his namesake at Narbonne, but also a Pierre Deschamps, who worked at Clermont and possibly at Rodez in the mid-fourteenth century, and Bertrand Deschamps, master mason of Bordeaux Cathedral around 1320. Familial connections in the craft are common in architecture and are encountered in the late Gothic German “dynasties” of the Parlers, whose members worked at Cologne and Prague or the Roriczers. These ties would also explain the similarities between the southern French cathedrals of Clermont, Limoges, Rodez, Narbonne, and Bordeaux, based on northern French verticality enriched by the linearity characteristic of the rayonnant style.

#### SUGER

1081–1151

*Abbot*  
*Royal advisor*  
*Author*

**AN INFLUENTIAL ABBOT.** Given to the abbey of Saint-Denis as a child, Suger, was, as told by his biographer, “small of body and family; constrained by twofold smallness, he refused in his smallness to be a small man.” Once elevated to the abbacy in 1122, he set about realizing his childhood dream of refurbishing the church, now nearly 400 years old. After reorganizing Saint-Denis’ finances to support the cost of construction, he launched the building campaign in the mid-1130s. Although he was not, as sometimes asserted, the architect of the new church, his travels throughout Europe and France gave him an extraordinarily wide horizon of knowledge of buildings and their decoration. He obviously drew upon his far-flung network of contacts to assemble an international team of masons, sculptors,

glass painters, and goldsmiths in the abbey’s workshops. He was also clearly a “hands-on” patron, riding out into the forest in search of tall trees to provide roof timbers. It was, no doubt, his demands for columns, for large stained glass, for a harmonious union of the old structure with the new, that pushed the master mason to realize the novel combination of architectural elements that produced the spacious, light interior that changed the course of western architecture. In addition to his duties as head of a powerful abbey, advisor to King Louis VI, and regent of France during Louis VII’s absence on Crusade in the late 1140s, Suger authored a life of Louis VI and, most famously, three booklets, *De Administratione* (On what was Done Under his Administration), *De Consecratione* (The Other Little Book on the Consecration of the Church of Saint-Denis), and the *Ordinatio* (Ordinance Enacted in the Year 1140 or in the Year 1141), in which Suger describes the building campaigns, works of art, and dedication ceremonies of his beloved abbey church.

#### WILLIAM OF SENS

Mid-twelfth century–Late twelfth century

*Master mason*  
*Architect*

**THE RIGORS OF DIRECT SUPERVISION.** The sole source of information on William of Sens comes from Gervase of Canterbury’s account of the rebuilding of the choir of Canterbury Cathedral following the ruinous fire of 1174. William’s expertise and reputation recommended him for the job over other masters who had been gathered to assess the rebuilding project. Not only was he a skillful and subtle designer who incorporated sections of the Romanesque walls into his new structure, but he also fabricated the machinery to lift stones and provided the sculptors with templates for shaping stones. Although his name suggests that he was a native of Sens in France, his architecture shows closer connections to northern France and Flanders. The proportions of his three-story elevation, the use of wall passages screened by arcades, the sexpartite vaults, and the preference for decorative colored marble shafts point to his close affin-

ity with recent building projects in Arras, Cambrai, and Laon. William supervised construction until badly injured in a fall from the triforium in 1178. Although he attempted to supervise work from his bed, he simply was not up to the physical rigor of the job, and was forced to leave Canterbury for France. William's forced retirement suggests that in the late twelfth century construction was not guided by an overall set of plan and detail drawings, and that the master mason's on-site presence was still required. As drawings became more frequently and widely used in the thirteenth and fourteenth centuries, architects were able to take on several projects at once, leaving workshops in the hands of assistants and directing by "remote control."

### HENRY YEVELE

c. 1320–1400

*Master mason  
Architect*

**FROM MASTER MASON TO ARCHITECT.** The long and prolific career of Henry Yevele encompasses major works of both secular and religious architecture. In many ways, Yevele functioned like a modern architect, directing a workshop that was responsible for design, construction, and maintenance. First mentioned in London in 1353, he was soon appointed master mason to Edward ("the Black Prince"), prince of Wales and, thereafter, became Edward III's Deviser of Masonry and in charge of all works of the crown. Among his many works, either documented directly or attributed to him on the basis of form and style, are Prince Edward's chantry chapel in Canterbury Cathedral, the Neville screen (1372–1376) in the choir of Durham Cathedral (1376–1379), the nave of Canterbury Cathedral (1377–1403), the nave of Westminster Abbey (1387), and the remodeling of Westminster Hall carried out under Richard II between 1394 and 1399 in collaboration with the carpenter, Hugh Herland. These architectural works are executed in a

refined Perpendicular style in which delicate grids of tracery organized the wall surfaces and spread onto the vaults in elaborate rib patterns. Yevele also designed the tomb of the Black Prince at Canterbury along with the tomb chests of Richard II and his wife Anne of Bohemia, and, probably, that of Edward III at Westminster Abbey. He also served as consultant to the projects of William of Wykeham, bishop of Winchester, such as New College, Oxford.

## DOCUMENTARY SOURCES *in Architecture and Design*

**Aachen Palace Complex (c. 784–796)**—Located in Aix-la-Chapelle in what is now Germany, the Aachen complex was one of fourteen residences of the emperor Charlemagne. Based on specific Roman prototypes, the buildings were intended to convey and legitimize the idea that Charlemagne was the successor to western Christian Roman rule.

**Avignon Palace Complex (c. 1335–1345)**—While Avignon served as the seat of the papacy during the early fourteenth century, this complex was constructed as a grand papal residence with two huge palaces around a large walled courtyard, with defensive towers at either end. From the outside, it remains today a fine specimen of military architecture, while on the inside it is a repository for grand wall paintings.

**Canterbury Cathedral (1100–1175)**—This site was both the seat of the diocese's archbishop—the spiritual center of the English church—and also, after 1170, an important pilgrimage site of the shrine of Thomas Becket. Begun in the Norman style around 1100 on the site of a vanished Anglo-Saxon church, Canterbury has had several devastating fires and periods of reconstruction. Gervase of Canterbury's narrative of one such period of construction beginning in 1175 (in the Gothic style) is perhaps the most complete account of the building of a cathedral extant.

Cluny Abbey Church (1088–1130)—Now ruined but reconstructed in drawings and plans, the monastery of Cluny (Saône-et-Loire) is a complex of buildings begun in 909; the several churches are referred to as Cluny I, II (c. 955–1040) and III. Its great period was the 1080s when the abbey held about 200 monks, leading to the construction of a much more massive church (Cluny III) between 1088 and 1130. It was perhaps the largest church in Europe. Only small portions of the complex survive today.

Durham Cathedral (1093–1133)—Sitting in a military position atop a hill overlooking the virtually unscalable bank of the river Wear, this cathedral, the burial place of Saint Cuthbert, was intended to convey the presence of Norman power. In its mass it recalls the basilicas of Rome and competes with other great cathedrals such as Winchester. It has stone vault work with extremely fine ribbing, molding, and carved chevron decoration.

Loches Castle (eleventh century)—Located in the French department of Indre-en-Loire and intended to control the Roman roads from Tours, Angers, and Orléans, this castle, first built in the sixth century, was many times reconstructed. The eleventh-century *donjon*, or keep, is a particularly fine specimen of a defensive tower also used at several periods as a prison.

Monreale Cathedral (1174)—Located in Palermo, Sicily (Italy), this cathedral was built by the Norman king

Roger of Sicily. Constructed in the Roman basilica style with a Byzantine transept, it combines motifs of east and west in structure and is highly decorated inside and out with massive bronze doors (late 12th century) with biblical scenes in relief, magnificent carved capitals atop the interior columns, and Byzantine and Venetian mosaics of biblical scenes covering the walls.

Sainte-Foy at Conques (1031–1100?) Located in Aveyron, southeastern France, this Romanesque abbey church in the “ambulatory and chapel” plan is one of the most beautiful of pilgrimage churches. It has a magnificent tympanum of Christ at the Last Judgment and many fine sculptural capitals on its columns.

Santiago de Compostela (1075–1128)—Located in Galicia, northern Spain, this Romanesque cathedral is believed to hold the relics of James the Apostle, as well as a supposed piece of the True Cross. A place of pilgrimage for over a thousand years, it has a magnificent portal with three doorways and sculpture representing the Last Judgment. The symbol of the church and of its role as a pilgrimage site is a scallop shell, the emblem of Saint James.

Speyer Cathedral (1030 and late eleventh century)—Located in western Germany, this enormous church is in the basilica style with four towers and two domes. It was the earliest cathedral to have a full gallery.

## IMPORTANT EVENTS *in Dance*

- c. 1190 Troubadour Raimbaut de Vaqueiras composes the *estampie* “Kalenda Maya.” This is the earliest known *estampie* melody.
- 1235 *Roman de la Rose*, a lengthy allegorical poem, is begun by Guillaume de Lorris and completed before 1275 by Jean de Meun. The poem includes several descriptions of courtly dancing.
- c. 1250 A copy of the *Magnus liber organi*, containing sixty sacred round dances, is sent from Paris to Florence, demonstrating the influence of Parisian music.
- The earliest known English instrumental dance is included in Oxford’s Bodleian Library: MS Douce 139, a manuscript from Coventry, England.
- c. 1275 Four dance tenors (that is, melodies that could be used to structure new compositions) are copied into Montpellier, Bibliothèque de l’Ecole de Médecine, MS H 196, one of the largest sources of early motets.
- c. 1280 Eleven instrumental dances are copied into the *Chansonnier du Roi* (Paris, Bibliothèque Nationale MS fr. 844). This is the only known medieval collection of French *estampies* and carols.
- c. 1285 Three English *estampies* are copied into London, British Library, MS Harley 978.
- c. 1300 *De musica*, a music treatise by Johannes Grocheio, includes the earliest detailed descriptions of dances and dance music.
- 1300 *Doctrina de compondre dictatz*, a Catalan treatise on poetry by Jofre Goixà, gives instructions on how to compose a *dansa*.
- 1316 *Le Roman du Comte d’Anjou*, a narrative poem by Jean Maillart, includes a description of a carol.
- c. 1320 Three dances, two of them *estampies*, are copied into London, British Library, MS Additional 28550, known as the *Robertsbridge Codex*.
- 1320 Raimon de Cornet cites the *basse danse* as one of the poetic forms that a jongleur (a court entertainer or minstrel) would learn.
- 1328 A set of rules for composing troubadour poetry, including the dance poem *estampie*, is included in the *Lays d’amors*, by Guillaume Molinier.
- 1337 *The Effects of Good Government*, a fresco by Ambrogio Lorenzetti, painted in the Palazzo Pubblico of Siena, contains a scene with round and line dances.
- 1353 The *Decameron* by Giovanni Boccaccio narrates the fictional activities of ten nobles who travel to the country to escape the Black Death, and includes descriptions of dancing after each day’s events.
- 1365 *The Church Militant*, a fresco by Andrea di Bonaiuto, painted in the Spanish Chapel of Santa Maria Novella in Florence, includes a scene with dancers.
- c. 1380 A single instrumental dance tenor, called *Czaldy Waldy*, is copied into Prague’s Czechoslovakia State Library, MS XVII F9.
- c. 1390 The largest set of medieval Italian instrumental dances is copied into British Library, MS Additional 29987. The manuscript originated near Milan.
- c. 1395 *The Canterbury Tales*, by Geoffrey Chaucer, mentions dancing in several of the tales.
- c. 1400 Over 100 English carols with music are copied into several manuscripts in England.
- Dança general de la Muerte* (Common Dance of Death), a poem of 79 stanzas originating in Spain, describes the dance of death.

- 1400 *Il Sapporitto*, a literary work by Simone Prodenzani containing a number of poems, includes scenes of courtly dancing.
- 1420 Included in a set of frescos painted in the Castello del Buonconsiglio in Trent is a depiction of a processional dance.
- 1430 Three estampies are copied into Faenza, Biblioteca Comunale MS 117 (the *Faenza Codex*).
- 1445 Domenico da Piacenza writes *De la arte di ballare et Danzare* (On the Art of Dancing and Choreography), the earliest known treatise on dancing.
- 1455 Poet, statesman, and humanist Antonio Cornazano writes *Libro dell'arte del danzare* (Book on the Art of Dancing), the second treatise on dancing, and dedicates it to his student, Ippolita Maria Sforza, one of the first ballerinas known by name.
- 1463 Guglielmo Ebreo (also known as Giovanni Ambrosio) writes the earliest version of his dance treatise *De pratica seu arte tripudii* (On the Practice or Art of Dancing). Six later copies also exist.
- 1465 Ippolita Maria Sforza, the earliest known ballerina, dances with Lorenzo de' Medici in Florence as she travels to Naples to meet her bridegroom and become the Duchess of Calabria.
- 1470 The earliest surviving collection of Burgundian basses danses is copied into Brussels Bibliothèque Royale, MS 9085. The repertory is largely retrospective and shows connections to the Court of Burgundy from at least as early as 1420.

## OVERVIEW *of Dance*

**DANCE IN SOCIETY.** Dance was one of the major pastimes during the late Middle Ages. It was the favorite leisure activity of all levels of society from the peasants to the aristocrats and was a part of most celebrations, just as it is in modern times. In the Middle Ages, however, dance could also be found in sacred settings as a part of many church feasts, and there is an entire repertory of sacred dance songs that celebrate these events. This is not to say that dancing was completely approved by the Christian church. Alongside accounts that speak of sacred dance in a positive way, proclamations can also be found that forbid dance: some are aimed at a specific audience (e.g. clerics); others at specific occasions or locations (holy days, churches, churchyards, and cemeteries); and others are a wholesale condemnation of the entire activity as immoral.

**SOURCES OF INFORMATION.** Information about dance in the late Middle Ages is found in a number of sources, although few of them contain sufficient details to allow scholars to reconstruct a clear picture of the activity. Literary accounts are very helpful for placing dancing in a social context, as are iconographic images such as paintings, drawings, and sculptures. To these can be added several types of documentary evidence, including treatises on poetry, since much dancing was done to dance songs whose forms and subject matter are discussed along with those of other kinds of poems. Music treatises also provide some details when they include dance music among the descriptions of musical forms. And finally, the dance music itself, the songs and instrumental pieces that are identified as intended for dancing, add other kinds of information that aid in the understanding of what dance must have been like during those centuries.

**SURVIVING DANCE MUSIC.** The surviving repertory of medieval dance music is relatively small and consists mostly of dance songs. Although it is clear from existing evidence that musical instruments frequently accompanied dance, very little of that repertory was ever written

down. Few instrumentalists could read music; they learned the tunes by ear and passed them on in that manner from generation to generation. The names of some of the favorite tunes come down to us in literature, but few of the melodies are preserved as written music. A large variety of instruments were used in conjunction with dancing; some, such as the bagpipe, are almost exclusively associated with it. In spite of that fact, however, the surviving instrumental dance repertory consists of fewer than fifty compositions.

**DANCE AND POETRY.** It is interesting to note that many of the secular musical forms found in all regions of late medieval Europe bear names indicating that their origins were in dance. Since the music was directly related to the poetry that it set, the names of the musical forms also represent poetic forms. In France, the three most popular secular musical forms were *rondeau* (round dance), *virelai* (twist), and *ballade* (dance). In Italy the *ballata* (dance) was very common; and in England, the round and carol were frequently performed as both music and dance. Throughout the late Middle Ages and well into the Renaissance, these dance types continued to provide the standard formats for secular music, although by the late fifteenth century most of the written compositions with these names were somewhat removed from their dance origins and probably were no longer actually intended for dance. Their very existence, however, suggests the extent to which dance played a central role in the culture of all regions during these centuries.

**STYLES AND VARIATIONS.** Until the late fourteenth century there would seem to have been little difference between the kinds of dances engaged in by the different social classes. There was undoubtedly some difference in style and perhaps in the refinement of the steps due to the kind of clothing worn and the locations where dancing took place, but the existing records show that, for the most part, the dances themselves were very much the same for all levels of society, as were the types of occasions on which dancing took place. Regional differences can be found, having to do with a local or larger regional preference for a particular type of dance, or simply on the level of a local variation in the execution of steps for a dance that was popular in all areas.

**DANCING IN GROUPS.** Most dances were group dances, involving as many participants as wished to join in. They can be thought of as line dances, in which the dancers join hands and follow the leader, often breaking into formations, such as dancing in a circle or forming “under the bridge.” Solo dances were also performed, often allowing demonstrations of impressive athletic ability. Small group dances, involving two or three dancers, were

another part of the tradition, and processional dances usually involved couples holding hands, but all of these dances were related to the line formations; couples never embraced as in later “ballroom” dancing.

**THE BIRTH OF CHOREOGRAPHY.** Sometime in the late fourteenth century, no doubt as a part of the increasing self-consciousness of aristocratic courts, a new form of dance was created in which the individual steps were choreographed and fitted to what might be considered to be a theme or perhaps a mini-drama. That is, there was often a story acted out in the choreography, having to do with the patterns traced by the dancers as well as with their body gestures. There is no record of where or exactly when choreographed dances began, although some evidence does point toward the Burgundian court (centered in modern-day eastern France) of Philip the Bold in the last third of the fourteenth century, an area closely linked after 1350 or so with the county of Flanders, the duchy of Brabant, and the duchy of Hainaut—that is, modern Benelux, Pas-de-Calais, and Nord. By the early fifteenth century, there is evidence that choreographed dancing was widespread in the courts of France, Italy, Spain, and England.

**DANCING MASTERS.** Choreographed dance was a radical change on several levels. It separated these dances from those of the past and created the element of class distinction by introducing a studied and rehearsed element into an activity that formerly was spontaneous. Whereas each of the earlier dances was composed of a single set of steps that were repeated over and over throughout the dance, each of the new choreographed dances contained a specific sequence of several different steps, a sequence it did not share with any other dance, meaning that the steps for each new dance had to be individually memorized. Professional dance teachers not only designed the new choreographies, rehearsed the dancers, and showed them the step sequence, but also taught body movement and leg and hand gestures that would help convey the theme or story of the dance. This type of dance was completely restricted to the noble classes, who could afford to employ the dancing masters. The practice of themed, individually choreographed dances continued to grow through the period of the Renaissance, blossoming into ballet in the seventeenth century.

**CONTINUING TRADITIONS.** At the end of the Middle Ages, dance continued to be an important form of celebration and relaxation for all classes and cultures. The advent of choreographed dances supplemented the more conventional repertory in aristocratic courts, bringing a new dimension to the traditional activity, one that would

## TERMS in Medieval Dance

- Choreographed dance:** A dance having a unique sequence of steps.
- Conventional dance:** A dance consisting of the continuous repetition of a single pattern of steps.
- Monophony:** (mono = one; phony = sound) Music of one part, including not only solo song, but also a single melody performed by more than one person or instrument.
- Polyphony:** (poly = several) Music of more than one part, each musical line having a separate rhythm and melody.
- Tempo:** The speed of the composition.
- Tenor:** A melody borrowed from another composition and used as a basis of a new polyphonic composition. The notes are held as long notes, which explains the use of the word (*tener* = to hold). Music for dance sometimes was written only as a tenor line, requiring the musicians to improvise the accompanying lines.
- Vocal dance:** A dance song—that is, one with words to be sung, as differentiated from an instrumental dance.

continue to flourish throughout the Renaissance and beyond. The dances themselves, both conventional and choreographed, continued to evolve and adjust to political and cultural changes throughout the period. But although our knowledge of dance accelerates from this point forward, thanks to new dance treatises and a growing repertory of written music, for the next several centuries the importance of dance to society as a whole, as well as the general styles and types of dances, remained more or less the way it had been at the end of the Middle Ages.

## TOPICS in Dance

### DANCING IN MEDIEVAL LIFE

**COURT AND COUNTRYSIDE.** Throughout the Carolingian era (eighth to tenth centuries) and the later Middle Ages, dancing was a part of all types of celebrations, both formal and informal. It could involve a solo dancer, couples, or groups of any size, and was accompanied by

Rabardie or Branle, peasant dance, missal from Montierneuf, Robinet Testard, Paris, Bibliothèque nationale MS lat. 873, fol. 21, 1485. THE GRANGER COLLECTION, NEW YORK.

music that was either sung or played on instruments of all types. The dances themselves could be simple or complex, sedate or energetic, and contributed to the social life of every level of society. Dancing filled a variety of needs: it could be a way of expressing happiness, a casual relief from the toils of daily labors, an occasion for amorous flirtation, or a vehicle for displaying elegance and wealth. It took place in castles and manor houses, in town streets and squares, and in neighboring fields. Typical instances of dancing—on joyous occasions outside of churches or churchyards—occurred in a variety of private and public locations and involved a number of different formations and steps, most of which we know from images and descriptions recorded after 1300.

**CONVENTIONAL VERSUS CHOREOGRAPHED DANCE.** Broadly speaking, there are two basic divisions that can be applied to a discussion of medieval dance: conventional dances, in which a single set of steps is repeated over and over until the music stops; and choreographed dances, in which each dance has a unique sequence of steps. The two types are quite different in terms of their origins and purpose, although there are many similarities in steps, social function, and level of importance in the cultural lives of the people of the period. The story of conventional dances begins long before recorded history, continuing to the present day, and

although it is not documented in full detail, there is sufficient evidence to provide a clear outline of the various forms it took and the functions it filled between the ninth and the fifteenth centuries. Choreographed dance, on the other hand, was an invention of the late Middle Ages, and a number of treatises have survived that provide a fairly accurate picture of how it was performed and what it was intended to achieve.

**OCCASIONS FOR DANCING.** Most circumstances in which dancing takes place have not changed much over the centuries. In the Middle Ages, as now, people danced at weddings, on holidays, and at political or cultural gatherings, as well as for simple evening entertainment. There are two occasions in the Middle Ages, however, that would seem to be unusual, both of which involve the church and the clergy: sacred dance, in which life is celebrated, and its opposite, the dance of death. These examples, in particular, demonstrate how widespread dance was as a means of expression in medieval society.

## SACRED AND SYMBOLIC DANCE

**LITURGICAL DANCE.** There is ample evidence from as early as the fourth century that dance was a frequent occurrence in church, serving as a component of liturgical services on special occasions, especially Easter and Christmas. That the tradition continued throughout the Middle Ages is attested to by a twelfth-century description of girls dancing during the Easter celebrations in London and references to thirteenth-century clerics in Gournay (near Rouen, France) dancing as a part of the feasts of the Innocents and of St. Madeline. The troubadour Pierre de Corbiac wrote in his *Tesaur* around the year 1250 that he knew how “to dance the Sanctus and the Agnus and the Cunctipotens,” which refers to three prayers chanted during the celebration of the Mass. In 1313, members of the congregation of St. Bartholomew in Tauste, Spain, were taught by Rabbi Hacén ben Salomo to perform choral dances around the altar. All of this is clear evidence that throughout the period, dancing continued to be associated with sacred occasions, including the celebration of the Mass, and that laymen as well as clerics took part.

**PROHIBITIONS.** At the same time, there are also frequent warnings throughout the period against dance, be-

ginning as early as the late sixth century, when the rather austere English monk, St. Augustine of Canterbury (d. 604), wrote that “it is better to dig and plough on festival days than to dance,” a sentiment echoed a century later by the theologian and English historian the Venerable Bede (673–735). A number of church writings indicate that dancing was frowned upon because it was considered to have pagan as well as erotic overtones. In the first decade of the thirteenth century both the bishop of Paris and the Council of Avignon forbade dancing the carol in processions or during the vigil ceremonies on saints’ days, and in 1325 the General Chapter of the Church in Paris threatened excommunication for clerics who danced on any occasion, with the exception of sacred dancing on Christmas and the feasts of St. Nicholas and St. Catherine. An extremely negative view of dancing is found in the fourteenth-century preacher’s handbook *Fasciculus morum*, which describes a scene in which the devil gathers up his followers by sending one of his daughters to lead a round dance. The same source also connects dancing to gluttony and lechery in the midst of a discussion of the sin of Sloth:

Notice that it is absurd to say that such worldly joy as is generated by dancing and singing and the like on holy day—activities which rouse people rather

Dance of Death, Hartmann Schedel, *Liber cronicarum* (Nuremberg: Wohlgemuth, 1493). HISTORICAL PICTURE ARCHIVE/CORBIS.

to gluttony, lechery, and similar wretched deeds than to the praise of God and his saints—can possibly please God; and yet they think they please him the more they devote themselves to such unwarranted activities.

A legend circulating in England and western France, found in a collection of stories known as *Marvels of the East* (Oxford, Bodleian Library, MS Bodley 614), told the story of seven women dancing in a circle on a Sunday. As a punishment, they were cursed by the priest and turned into stones. A number of megalithic stone circles in Brittany and England have been identified as these women, including the stone circle in Cornwall known as the “Merry Maidens.” In spite of such prohibitions, however, there is ample evidence that dancing on sacred occasions continued throughout the late Middle Ages

and beyond. Documents recording the presence of dance at sacred ceremonies, as well as those forbidding it, can be found into the seventeenth century. The objections to dancing were mostly aimed at clerics taking part in secular dances. The reasons for this strong prohibition included the lascivious nature of the texts of some of the secular dance songs. Also, secular dancing usually involved the participation of women, a temptation seen as best avoided by the celibate clergy.

**SACRED DANCE SONGS.** Although there are no detailed descriptions of what steps may have been danced on these occasions, the music that has survived provides a few clues, which, when matched with the iconography (mostly images from manuscript illuminations), establishes a fairly reliable picture. The largest repertory of sacred dance songs with music can be found at the very

end of a copy of the *Magnus liber organi* (Great Book of Organum), a book that contains music for the liturgy that originated in Paris in the twelfth century, located today in Florence, Italy. The section containing the dance songs has an illumination depicting five men standing in a semicircle. From their garb and the fact that all have been tonsured (that is, they have a shaved patch on the crowns of their heads), it is obvious that they are clerics. Their mouths are open, indicating that they are singing, and they appear to be holding hands, a standard way of symbolizing dance. There are sixty short dance songs in this collection, nearly all of them in a verse and refrain format known as *rondeau*, meaning round (see Round, below). Some of the texts specifically mention dance: “Let the joyful company this day resound in a joyful dance,” and “With a vocal dance this assembly sings.”

**THE DANSE MACABRE.** In sharp contrast to the joyful celebration of church feasts is the dance that was often associated with hysteria of various kinds, a type dating back to ancient times. Stories of wild dancing, often ending in complete exhaustion or even death, are a standard part of the tales and myths of the Middle Ages. The Dance of Death (*Danse Macabre*), one of the more bizarre preoccupations of late medieval literature and iconography, always involves humans and skeletons, and was frequently referred to in sermons as a reminder of mortality. Literary origins of the tradition have been traced back before 1280 in the *Dit des trois morts et des trois vifs* (Story of Three Dead and Three Living) by Baudouin de Condé. Another account, dating from late fourteenth-century Spain, is a poem of 79 stanzas, the *Dança general de la Muerte* (Common Dance of Death), in which Death summons two maidens, Beauty and Pride, and then invites clergy and laymen to dance with them, using their excuses as a forum for social criticism.

**ST. VITUS’S DANCE.** The literary versions of hysterical dancing are nearly all symbolic, but there are also accounts of actual events taking place, sometimes called “St. Vitus’s dance,” described as happening in a church graveyard and associated with a desire to communicate with the dead. These events usually involved large numbers of people and went on for hours or even days. The narratives of such dances usually describe them as spontaneous and uncontrollable, provoked by something akin to mass hysteria. In the mid-fourteenth century in particular, mass hysterical dancing was recorded as a reaction to the Black Death, the plague that resulted in the deaths of nearly one-third of the population of Europe. In modern times St. Vitus’s dance has been identified as Sydenham’s Chorea, a tremor of the nerves and body caused by eating rotten grain containing ergot, a parasitic fungus.

### HYSTERICAL DANCING

**INTRODUCTION:** Gerald of Wales (Giraldus Cambrensis), a twelfth-century writer from Cambria (in Wales), has provided the most detailed surviving account of a medieval hysterical event in his *Journey Through Wales*, which was completed around 1189. As a writer who specialized in “eyewitness” narrations, Gerald, who himself had both Welsh and Norman ancestors, was fascinated not only with the details of nature and geography in the places he visited, but also with unusual variations in manners and customs, as this passage illustrates.

You can see young men or maidens, some in the church itself, some in the churchyard and others in the dance which threads its way round the graves. They sing traditional songs, all of a sudden they collapse on the ground, and then those who, until now, have followed their leader peacefully, as if in a trance, leap in the air as if seized by frenzy. In full view of the crowds they mime with their hands and feet whatever work they have done contrary to the commandment on sabbath days. You can see one man putting his hand to an [imaginary] plough, another, goading on the oxen with a stick, and all as they go singing country airs, to lighten the tedium of their labour. This man is imitating a cobbler at his bench, that man over there is miming a tanner at his work. Here you see a girl pretending that she has a distaff in her hand, drawing out the thread with her hands, stretching it at arm’s length, and then winding it back onto the spindle; another, as she trips along, fits the woof to the warp; a third tosses her shuttle, now this way, now that, from one hand to the other, and with jerky gestures of her tiny tool seems for all the world to be weaving cloth from the thread which she has prepared. When all is over, they enter the church. They are led up to the altar and there, as they make their oblation, you will be surprised to see them awakened from their trance and recover their normal composites.

## CONVENTIONAL DANCE FORMATIONS AND STEPS

**COMMON ELEMENTS.** Dances that require continuous repetition of a small set of steps have a tradition

that precedes written history. Movement to a steady rhythm springs from an essential human desire that includes the need for exercise as well as for self-expression, and it is often associated with mating rituals. From the surviving evidence, we can see that many of the basic dance movements and formations remained more or less unchanged over many centuries. A variety of different formations were employed in dancing, the choice often having to do with the occasion and the space available. The formations, in turn, required different kinds of steps, and each dance was performed to a particular type of musical composition that matched the dance step and its speed. Changes in the dance movements coincided with changes in the phrases of the music. Although our information is incomplete, from the descriptions and the iconography, the following formations and steps seem to have been the most popular.

Dancers, tambourine player, fresco "The Allegory of Good Government," Ambrogio Lorenzetti, Siena, Italy, Palazzo Pubblico, Sala della Pace, east wall, 1338–1340. ARCHIVO ICONOGRAFICO, S.A./CORBIS.

**ROUND DANCES.** The round dance formation, which is associated with the dance of the same name, involves a group of people holding hands in the form of a circle, usually with a leader in the center. The dance steps require the circle to move first in one direction and then the other, reversing its direction at the beginning of each new verse. The leader sings the verses and the entire group joins in the chorus.

**LINE DANCES.** The most popular dance of the period was called a carol; it is the most frequently depicted formation in medieval art and is described in a number of the literary sources. The principle arrangement calls for dancers to join in a line holding hands, fingers, or a scarf, while they move along, often through the streets, following the leader. One French literary source mentions a line dance "nearly a quarter league long" (Philippe de Remi, in *La Manekine*, c. 1270), which may be an exaggeration, but it does suggest that any number of

people could join this kind of formation. A passage from *Le Roman du Comte d'Anjou*, written in 1316 by Jean Maillart, vividly portrays this kind of dance:

Then the napery was taken up, and when they had washed their hands, the carols began. Those ladies who had sweet voices sang loudly; everyone answered them joyfully, anyone who knew how to sing, sang along.

The iconographic and literary descriptions of this dance often indicate that it could break into other formations, including a round or "under the bridge." The mid-fourteenth-century fresco by Andrea di Bonaiuto, in the Spanish Chapel of Santa Maria Novella in Florence, shows both a line dance of three people and a round dance of four. The steps in a line dance vary depending on the direction the line is traveling—forward, to the side, or in one of the other formations described here.

Carol dancers, *Roman de la Rose*, Flemish, 15th century. THE ART ARCHIVE/BRITISH LIBRARY.

**UNDER THE BRIDGE.** This formation involves dancers in pairs with the first of the couples joining their hands to form a bridge while others take their turn first ducking under the bridge and then emerging on the other end to form a part of the bridge, thus providing an endless series. The early fourteenth-century Siena fresco by Ambrogio Lorenzetti, *The Effects of Good Government*, depicts this formation together with the round. In both this painting and that by Bonaiuto (above) there is only a single dance leader (playing a tambourine and singing), which suggests that in the round, in line, and “under the bridge” all were possible variations of a carol.

**PROCESSION.** In many paintings couples are seen moving forward side by side, often holding hands, such as in the “under the bridge” formation, above, or in a more stately procession, such as that in both the *Buonconsiglio* and *Adimari* paintings. It is possible that in the processional-type dances, the steps used are a version of the “simple” and “double” steps employed in the choreographed processional *basse danse* and *bassadanza* (see Choreographed Dances, below). Additional support for this suggestion comes from the Renaissance processional

Stately processional dance. Labor of the Month of June. Fresco, Castello dei Buonconsiglio, Trent, Italy, 1420. SCALA/ART RESOURCE NY.

dance the “Pavan,” which also used those steps. They survive today as the steps of the bridal party during a wedding procession.

**SOLO DANCING.** There are a number of paintings that show a single man or woman dancing while others watch. The gestures of the solo dancer usually indicate a very active, athletic dance, but exactly which of the jumping or twisting dances is being depicted is never stated. The contexts of a large number of the illustrations of solo dancing suggest that they are intended to condemn wild or immoral living. A number of them are found in Psalters and books of hours or sacred manuscripts in conjunction with passages about morality. One illustration, for example, shows a woman of loose morals (skirt up showing legs, arms raised above her head) dancing for a monk who is absurdly trying to play a musical instrument using a *crozier* (a bishop’s staff) as a bow. Depictions such as these must be considered to be symbolic exaggerations rather than typical scenes. On the other hand, there are also pictures of apparently athletic solo dancing in settings that are quite realistic.

Monk plays for dancing woman. Book of Hours, Maastricht, 13th–14th century. LONDON, BRITISH LIBRARY, MS STOWE 17, FOLIO 38.

**OTHER DANCE MOVEMENTS.** Many kinds of steps are mentioned in literature in conjunction with dance—walk, slide, glide, hop, jump, strut, sway, etc.—although it is rarely clear which dance is being referred to. It is possible to connect some, but not all, of these movements with the named dances below, but the information that has survived is insufficient to show how many of these movements would be employed in any particular dance. As literary narrative tells us, even when specific steps are stated, it was always the dancer's prerogative to ornament and personalize a step by spontaneously introducing other movements.

#### POPULAR DANCES

**GENERAL CHARACTERISTICS.** Literary sources, including music treatises, provide the names of several dances and a few descriptions, although some of the

references are so incomplete that little can be deduced from them. Medieval literature includes far more dance names than are described in the treatises, leaving an impression of a society that enjoyed a wide variety of dances, only a few of which are known in any detail. The Catalan treatise written by Jofre Goixà, the *Doctrina de compondre dictatz* (Treatise for Composing Poetry), from about 1300, for example, gives instructions on how one may write a *dansa*, a dance name that is not found elsewhere. According to the treatise, the *dansa* should have three stanzas, a refrain, and one or two envoys ("send-off" stanzas, used for summing up or offering a dedication), the text should be about love, it should have a nice melody, and it is to be sung with an instrumental accompaniment. That description, unfortunately, could apply to nearly all dance songs, and perhaps that is really what is intended: a general characterization of the contents of dance songs rather than instructions for a particular dance called *dansa*.

**SOURCES OF INFORMATION.** The most detailed of the early descriptions are found in the treatise *De musica*, written in Paris around the year 1300 by Johannes de Grocheio. In this work, Grocheio defines both vocal and instrumental dances. By combining Grocheio's statements with poetry treatises and other, less specific

*a PRIMARY SOURCE document***DANCE TERMS FROM DE MUSICA**

**INTRODUCTION:** The following is a list of dance terms from Johannes de Grocheio's *De musica*, written in Paris around the year 1300.

**Sung Dances**

**Refrain:** A refrain is the way all [dance] songs begin and end. They are different in the round, carol, and estampie. In the round they agree in sound and rhyme. In the carol and estampie, however, some agree and some are different.

**Round:** We call round or rotundellus [those songs] that do not have a different melody in the verse and the refrain. It is sung in a slow rhythm ... and is often sung in the West country, for example in Normandy, by young men and women to celebrate festivals and other grand occasions.

**Vocal estampie:** A song called an estampie [stans-tipes] is that in which there is a diversity in its parts in its refrain, not only in the rhyme of the words but also in the melody. ... This type causes the souls of young men and women to concentrate because of its difficulty, and turns them from improper thinking.

**Vocal carol:** A carol [ductia] is a light song, rapid in its rise and fall, which is sung in carol by young men and women. ... This influences the hearts of young men and women and keeps them from vanity and is said to have force against that passion which is called love or eros.

**Instrumental Dances**

**Instrumental carol:** An instrumental carol [ductia] is an untexted piece with appropriate percussion. I say with regular percussion because these beats measure it and the movement of the performer, and excite the souls of men and women to moving ornately according to that art they call dancing.

**Instrumental estampie:** The estampie is also an untexted piece, having a complicated succession of sounds, determined by its verses. ... Because of its complicated nature, it makes the souls of the performer and listener pay close attention. Its form is determined by its [irregular] verses since it is lacking that [regular] beat which is in a carol.

**SOURCE:** Johannes de Grocheio, *Concerning Music (De musica)*. Trans. Albert Seay (Colorado Springs: Colorado College Music Press, 1974): 17–21.

literary references, as well as the evidence of the music itself, it is possible to obtain an idea of some of the dances. The dances described in the rather dry and academic accounts of the treatises take on more human and real presence in Simone Prodenzani's *Il Sapporitto*, and Guillaume de Lorris's *The Romance of the Rose*. These poems capture the spirit of the occasions and supply us with vivid glimpses of a very lively dance culture in which everyone took part. The dance music discussed below provides additional details about the nature and spirit of the dance steps and formations.

**THE ROUND DANCE/RONDEAU.** The round and the carol must have been the two most popular dances in the Middle Ages. They are the two most often mentioned in literature and depicted in manuscripts and paintings. The description by Grocheio tells us that the music has a refrain and that the melody of the refrain is exactly the same as that of the verse. A good example of what he is describing can be seen in the round "with a vocal dance" (*Vocis tripudio*), a sacred dance found in the *Magnus liber organi*, which demonstrates how the text is to be sung and also suggests the kind of dancing that would accompany the song. To perform this song, a soloist (the dance leader) would sing the first phrase, "With a vocal dance," and the rest of the dancers (the chorus) would respond with the half refrain, "This assembly sings," using the same melody. The soloist would then sing the next phrase, "With a vocal dance but with a temperate mind," and the chorus would answer with the full refrain, "This assembly sings of Paschaltide," again using the same melody supplied by the soloist. All of the following verses would proceed in the same way with the soloist singing the new words of each verse, followed by the chorus singing the same half and full refrain. The name of this type of verse and refrain song, *rondeau* (round dance), implies that the dance was done in the formation of a circle, perhaps with the leader actually standing in the center of the circle rather than as a part of it. (For practical reasons of size and perspective, manuscript illuminations would often only suggest the formation, but the raised hands of participants would indicate that they were to be joined in a circle.) The usual steps for this kind of dance are leg over leg to the side, going around in a circle, reversing direction at the beginning of each new verse. As Grocheio explains, this kind of song is sung by young men and women on all festive occasions.

**THE CAROL.** Along with the round, the carol is the other most frequently mentioned and depicted dance from this period. The two dances are closely related in that the round is one of the possible formations for the carol. But unlike most other dance formations, the carol

*a PRIMARY SOURCE document***TWO EVENINGS OF DANCE**

**INTRODUCTION:** These witty poems from *Il Sapporitto*, by Simone Prodenzani (c. 1400), contain the names of a number of dances as well as some detailed descriptions of dance steps not found elsewhere. The poems accompany a narrative about a “bon vivant” named Sollazzo, who is apparently good at dancing, singing, and playing musical instruments. Although fictional, the poems present a fairly accurate picture of music and dance in aristocratic Italian circles during the late Middle Ages.

We come now to the second evening:  
I tell you truly that by the light of the double candles  
they danced a rigoletto rather lightly,  
jumping forward and back and in waves.  
Of those who were seen in the round  
each one arose and danced to “al bicchieri.”  
No dancer had ever been seen  
to make such beautiful moves and turns to the hurdy-  
gurdy,  
with slave-like bends and turns, forward and backward  
jumps,  
some with new halting moves,  
and some made small circles on the point of their feet.  
Some made their bows with head and shoulders,  
while others did it with hands and feet raised  
as if they were sailors or Greeks.

The third evening they danced two by two  
beginning with “ranfo,” and then “l’achinea.”

Here one finds Cagnetto and Monna Mea,  
who would never miss that dance.  
And on the dance floor also was il Vicaro,  
who took Monna Tomea by the hand.  
Nor did there remain either a good woman or a queen  
who did not dance with a man of her status.  
Then came the dance of “La pertusata”  
and after a while came “La palandra”  
and then they did “Donna Innamorata.”  
Never was seen a lark who could sing as well  
as did Solazo play on this wind instrument,  
a performance that was the equal of a piper from Flanders.

With the bagpipe Sollazzo played “La pastorella,”  
then in the evening he played “La picchina,”  
“La forosetta” and then “La campagnina,”  
“A la fonte io l’amai,” and “La Marinella.”  
You would have said “it is fabulous!”  
that he played so well in “La palazina”  
and “La Guiduccia,” also “La montanina,”  
“La casa bassa,” and “La patrona bella.”  
To this last tune they danced in the Roman style  
with the chest extended and raised  
which for the women is more beautiful than the Tuscan  
style.  
Then they formed in a circle to do the rigoletto,  
arm and arm, because it is a country dance.  
All who were there took great pleasure in it.

**SOURCE:** Simone Prodenzani, *Il Sapporitto*, in *Il “Sollazzo”*. Ed. Santorre Debenedetti (Turin: Bocca, 1922). Translation by Timothy J. McGee.

was quite flexible, giving rise to Grocheio’s name for it, *ductia*, meaning “leader’s dance,” signifying that the carol could take on a number of different formations depending on the whim of the leader. It would begin as a line dance for as many as wanted to join, with all the participants holding hands, and could change into round or under-the-bridge formations as the leader wished. According to Grocheio’s description, the steps of a carol were lively and light-hearted, with a relatively quick tempo. He notes that the dance excites the dancers to move ornately, which suggests that a part of the carol dancing tradition included some active improvisation on the part of individual dancers. Grocheio’s rather sober description is augmented by the more fanciful scene depicted in *The Romance of the Rose*, written in the mid-thirteenth century, where we receive a similar impression of light-hearted gaiety with a variety of activities. The surviving repertory, in addition to the surviving English carols, is quite small and consists of three French instru-

mental compositions called *danse* and *danse real*. These pieces all have very short phrases, with light, simple, and lively melodies.

**THE ESTAMPIE.** The *estampie* is mentioned in literature from France and Italy, and Grocheio discusses both a vocal and an instrumental form. The word itself probably derives from the Latin *stante pedes* (stationary feet), referring to the fact that the dance steps remain close to the ground, in contrast to those dances that employ jumps or kicks. Grocheio describes this dance as suitable for people of all ages, which probably means that it is a less energetic dance, as is suggested by the “low” steps, and in contrast to the round and carol that he recommends for “young men and women.” According to the 1328 *Lays d’amors* of Guillaume Molinier, a set of rules for composing troubadour poetry, the *estampie* poem has a text based on love and homage. At the end it can have an envoy stanza that serves as a summary or dedication, or it can possibly repeat the opening or closing couplet.

*a PRIMARY SOURCE document***A ROUND DANCE**

**INTRODUCTION:** This is one of the earliest round dances known. It is found in the Florence copy of the (originally Parisian) *Magnus liber organi*, and is intended to

be performed by monks during a church service. The leader sings lines 1, 3, and 4 of each verse (the new material in each verse), and the entire choir sings lines 2, 5, and 6 (the refrain).

**THE "KALENDA MAYA" ESTAMPIE.** This description is confirmed by all of the existing twenty troubadour estampie poems, and especially by the single example that survives with both text and music, "Kalenda Maya," by the troubadour Raimbaut de Vaqueiras. (There are minor variants in the construction of all of the texts, such as number of stanzas, which suggests that there was some leeway allowed). The text of "Kalenda Maya" is about

both love and homage. It is in five stanzas, with a refrain but without an envoy. From the music of "Kalenda Maya" it can be seen how the individual musical phrases were repeated in pairs, with the refrain at the end of each stanza. This construction suggests that the performance format could have been similar to that of the round, with verses sung by a soloist and a refrain for all to sing. With its dramatic portrayal of a lover who must implore his

*a PRIMARY SOURCE document***A “CHRISTMAS” CAROL**

**INTRODUCTION:** The term *carol* is usually associated in modern times with a Christmas song that sounds much like a hymn, but the repertory of early English carols shows that they were intended for a number of occasions, including Christmas, and were in the verse and refrain format. (The refrain in an English carol is called a burden.) More than 100 English carols with music have survived from around the year 1400, and nearly five times as many without music, some in Latin, some in English, and some in an alternation of Latin and English known as *macaronic* (mixed texts), where the two languages are blended together in the way illustrated by this carol for the feast of the Annunciation (followed by a modern translation).

This worle wondreth of al thyng  
 Howe a maide conceyued a kynge;  
 To yeue vs al therof shewyng,  
 Veni, Redemptor gencium.

Whan Gabriel come with his gretynge  
 To Mary moder, that swete thyng,  
 He graunted and saide with grete lykynge,  
 “Veni, Redemptor gencium.” [3 additional verses]

Above all, this world wonders  
 how a virgin conceived a king,  
 to make that manifest to us.  
 Come, Redeemer of the nations.

When Gabriel came with his greeting  
 to the Mother Mary, that sweet thing,  
 he spoke to her and said with great fondness,  
 “Come, Redeemer of the nations.”

elevated lady to take pity on him, the text of “Kalenda Maya” is typical of courtly love lyrics in the eleventh through the thirteenth centuries.

**REGIONAL VARIATIONS IN THE ESTAMPIE.** In addition to “Kalenda Maya,” the surviving repertory of estampies consists of one additional vocal dance, “Souvent souspire,” which is a new text set to the “Kalenda Maya” music, and 21 instrumental pieces—three from England, eight from France (called *estampie royal*), and ten from Italy (called *istanpitta*), many of which have fanciful titles such as “Chominciamento di gioia” (Beginning of

*a PRIMARY SOURCE document***KALENDA MAYA**

**INTRODUCTION:** "Kalenda Maya," written in 1190 by the troubadour Raimbaut de Vaqueiras, is the earliest known *estampie*. At the end of each verse, a refrain, beginning with the words "And may I be joined," is repeated. The entire refrain is printed here at the end of the first verse.

As suggested by the words "noble and vivacious lady" and "your fair person" in the first verse, this song is a monologue addressed by a lover to his lady; the use of the phrase "Fair Knight" in verse 4 suggests a comparison to the system of feudalism, as was common in courtly love literature.

**SOURCE:** Raimbaut de Vaqueiras, "Kalenda Maya," c. 1190. Trans. Robert Taylor.

**"Kalenda Maya"**

Text in italics is sung by the chorus.

 22 q'a-mors m'a - tra - ia e - ja - ia e.m tra - ia vas vos do - na ve - ra - ia  
 30 e cha - ia de pla - ia .lge - los anz qu.m n'e stra - ia

I. Neither May Day nor the beech tree's leaves nor the song of birds nor gladiolus flowers are pleasing to me, noble and vivacious lady, until I receive a swift messenger from your fair person to tell me of some new pleasure that love brings me; *and may I be joined to you and drawn toward you, perfect lady; and may the jealous one fall stricken before I must leave you.*

II. My sweet beloved, for the sake of God, may the jealous one never laugh at my pain, for his jealousy would be very costly if it were to separate two such lovers; for I would never be joyful again, nor would joy be of any benefit to me without you; I would set out on such a road that no one would ever see me again; on that day would I die, worthy lady, that I lost you. *And may I be joined ...*

III. How shall my lady be lost, or restored to me, if she has not yet been mine? For a man or woman is not a lover just by thinking so. But when a suitor is accepted as a lover, the reputation that he gains is greatly enhanced, and the attractive appearance causes much stir; but I have not held you naked nor conquered you in any other sense; I have only desired you and believed in you, without any further encouragement. *And may I be joined ...*

[continued]

CREATED BY GGS INFORMATION SERVICES. GALE.

**“Kalenda Maya” [CONTINUED]**

Text in italics is sung by the chorus.

IV. I should not likely find pleasure if I should ever be separated from you, Fair Knight, in anger; for my being is not turned toward anyone else, my desire does not draw me to anyone else, for I desire none but you. I know that this would be pleasing to slanderers, my lady, since this is the only thing that would satisfy them. There are those who would be grateful to you if they were to see or feel my suffering, since they admire you and think presumptuously about that which makes the heart sigh. *And may I be joined ...*

V. Lady Beatrice, your worth is so refined by its nature, and it develops and grows beyond that of all other ladies; in my opinion you enhance your dominance with your merit and your admirable speech without fail; you are responsible for initiating praiseworthy actions; you have wisdom, patience, and learning; incontestably, you adorn your worth with benevolence. *And may I be joined ...*

VI. Worthy lady, everyone praises and proclaims your merit which is so pleasing; and whoever would forget you places little value on his life; therefore I worship you, distinguished lady, for I have singled you out as the most pleasing and the best, accomplished in worth, and I have courted you and served you better than Eric did Enide. Lord Engles, I have constructed and completed the estampida. *And may I be joined ...*

CREATED BY GGS INFORMATION SERVICES. GALE.

Joy), and “Tre fontane” (Three Fountains). The music indicates that the estampie did not take on the same character in all of these regions. In the English and French sources the phrases are all quite short, with simple and lively melodies. The Italian estampies, however, have relatively long phrases with more rhapsodic melodies and are more than ten times the length of the English and French dances. Although the phrases in all of the dances are of irregular lengths, which suggests that all estampies had steps that did not require a specific sequence, the differing characters of the melodic lines hint at a lively dance in England and France, and a more subdued one in Italy.

**ADDITIONAL DANCE TYPES**

**NOTA.** The *nota* is an instrumental dance that is neither discussed in any detail nor identified by name in any musical source. It receives a passing reference in Grocheio’s treatise, where he points out that it has formal elements of both the carol and the estampie. Jean Maillart, in his *Le Roman du Comte d’Anjou* of 1316, briefly mentions it in a manner that makes it clear that the *nota* is a distinct dance type: “Some sang pastourelles about Robichon and Amelot, others played on vielles chansons royal and estampies, dances and notas.” Four instrumental dances have been tentatively identified as possible *notas* on the basis of their formal construction; all are in English sources, but nothing at all is known about their formation or steps.

**SALTARELLO.** Although no description survives of the *saltarello* as an independent dance, the name (from the Italian *saltare*, to jump) indicates a very lively dance step, a fact confirmed by the way the *saltarello* step is described in the later bassadanza dance manuals. Only four examples of the medieval *saltarello* are known; all are instrumental and are found in a single Italian manuscript where they are labeled “salterello.” The melodies are lively, with repeated phrases, and the fact that their phrases are of different lengths suggests that the *saltarello* step was relatively simple, something that could be repeated over and over until the music stopped.

**MORESCA.** The name *moresca* usually refers to a special dance in which the dancers all blackened their faces in imitation of Moors, and dressed in what were thought to be “Moorish” costumes with bells attached to their legs. (The term *Moors* originally referred to the people

of Morocco, but Europeans often used the word to mean anyone from North Africa.) The dance sometimes depicts a fight between Moors and Christians, a reference to recent Spanish history, and sometimes includes a fool as part of the cast of characters. A *moresca* is recorded as one of the dances performed in 1465 in Siena in honor of the dancer Ippolita Sforza. The cast on that occasion included twelve men and women dressed in “Moorish” costumes and one woman dressed as a nun, all dancing to a song with the text “I don’t want to be a nun.” *Morescas* were often danced during large celebrations such as carnival processions, and by the late fifteenth century they were transformed into theater pieces and inserted into banquets and plays for light relief. The later English “morris dance” is related to the *moresca*. The word *moresca* also had the more general meaning of any unchoreographed or unsophisticated dance.

**RIGOLETTO.** *Rigoletto* is best known as the name of the jester in Giuseppe Verdi’s 1851 opera by that name, which begins at a ball in sixteenth-century Mantua. In Prodenzani’s description, the dance includes forward and backward jumps and some type of “waving” motion. Another bit of information about this dance comes from the text of a mid-fifteenth century *lauda* (sacred song) with the title “Chi vuol ballare a rigoletto”: “Whoever wants to dance the rigoletto, move with the step to the organetto; make your steps to the sweet sound, executing the changes and matching your foot to the tune ... Anyone who has weak legs or arms, do not embarrass yourself to enter in, since it changes briskly from leaps to level steps.” The term *rigoletto* also was used in a looser context where it carried the meaning “wasting time,” as for example, the early fifteenth-century criticism leveled at the executives of the Florentine government who were “dancing the rigoletto” instead of getting down to business. That is, they engaged in much motion but did not get anywhere. Although there is no more detailed description of the rigoletto dance steps, from these vague statements, as well as its use as a political criticism, we could speculate that the forward and backward jumps may not have progressed from the original position, thereby giving the impression of motion that accomplishes little.

**TARANTELLA.** One theory is that the *tarantella* dance receives its name from the tarantula spider, a reference to the rapid leg motion the spider makes in order to mesmerize its victim before killing it. Another possibility is that the name of the dance comes from its place of origin, the city of Taranto in southern Italy. From all accounts it would seem to involve rapid foot and leg motion while the dancer remains in one spot.

When mentioned in accounts during the late Middle Ages it is usually set in southern Italy, and it is sometimes associated with hysterical dancing.

**DANCE PAIRS.** There are a number of references to dances in pairs, generally referred to as dance and after-dance, although few details are ever given. Three musical examples exist, all from late fourteenth-century Italy. In each pair, the first dance has a fanciful name, while the after-dance is given a label: “Lamento di Tristano”/“La Rotta;” “La Manfredina”/“La Rotta della Manfredina;” and “Dança Amorosa”/“Trotto.” Tristan (Tristano) and Manfred are characters in medieval romances, and Amorous Dance (Dança Amorosa) probably also would be recognized at the time as a literary reference. The melodic phrases of these dances resemble those in an *estampie*, and so it is possible to relate these dances to both the Italian *estampie* and the later *bassadanza* repertory that also featured fanciful names (see The *Bassadanza* below). Since the word *rotta* refers to something that moves very quickly and *trotto* means “to trot,” it is likely that both words refer to the fact that the after-dance is quick and lively. All of this agrees with literary and theoretical descriptions that speak of pairs as consisting of a slow, sedate dance followed by a quick one. In all of the Italian examples the melodies of the paired dances are closely related, which associates the idea itself with the most popular Renaissance dance pairs, known as “pavan and galliard,” in which a sedate processional dance is paired with a leaping dance, both based on the same melody. The concept of organizing dances in sets of contrasting tempos and movements became standardized as dance suites in the late Renaissance, and remained the basic organization of most instrumental music until well into the nineteenth century.

**OTHER DANCE NAMES AND MUSIC.** There are many more names of dances found in literary sources, such as *espringale*, *reien*, *hovetantz*, *tresche*, *piva*, and *farandole*. Some of these names appear as particular steps in later dance choreographies (see Origins of Ballet below), but outside of that nothing else is known of their steps, formations, or music. At the same time, there are also a few musical compositions that are identified as dances or thought to be dances, but which do not fit easily into the known descriptions. Some are possibly tenors (basic melodies for choreographed dances) but others simply defy all efforts to identify their types.

## CHOREOGRAPHED DANCING

**THE SHIFT TO A NEW ART FORM.** All of the dances described so far come under the heading “conventional”—that is, they consist of a single set of steps and movements which are to be repeated over and over throughout the length of the dance. Although there were many different types of dances, which resulted in a rich variety of steps and movements, a dancer needed only to learn a single set of steps for any one type; once the basic steps were learned, they could be applied to any and all dances of that type (for example, a saltarello step could be danced to any and all saltarello compositions). This is not to imply that the dancing was static; as the descriptions from “Il saporitto” and *Roman de la Rose* suggest, the dancers were free to add variations, as well as other body motions, to all of the basic steps, bringing an element of creativity to each occasion. All of these conventional dances continued to be practiced throughout the Middle Ages and into the Renaissance, but sometime in the mid- to late fourteenth century a new level of dancing appeared, one that would blossom into a separate art form in the centuries to come: choreographed dance, the direct ancestor of classical ballet. The very concept of choreographed dancing sets it aside from the conventional type in a number of significant ways. On the technical level, it replaces the spontaneous repetitions of a small number of dance steps with a studied and rehearsed individual sequence. Further, rather than simply being a particular kind of dance (a carol, or an estampie, for example) each choreographed dance was unique; it carried its own order of steps that was not shared by any other dance.

**DIFFICULTY AND EXECUTION.** On the social level, choreographed dances separated the nobles from the lower classes. This was a sophisticated artistic elaboration that was restricted to courtly circles where the nobles had the time to rehearse and the funds to employ a dancing master (a choreographer) who designed the dances and instructed the dancers. The choreographed dances were complicated and required serious concentration on the part of the performers, who had to memorize a complex series of steps as well as arm and body motions and floor patterns that were particular to each dance. In addition to mastering all of the motions, the most difficult chore for each dancer was to be able to execute the movements with grace and elegance, and at all times to make the task appear to be effortless. Hours of weekly practice were necessary for the dancers to execute the steps properly and stay physically agile. Much of this was done under the guidance of a dance teacher.

**SOCIAL DISPLAY.** The most notable difference between the choreographed dances and the other repertory, however, was its function. The choreographed dances were not something that everyone in the room performed at once; they were danced by two, three, or, in Italy, up to twelve dancers, depending on the particular dance, while everyone else watched. In reality, therefore, these were performances not far removed from theater. The noble members of the court placed themselves on display in front of their equals, demonstrating their personal grace and elegance. Not the least of the display was the costume, since attention was brought not only to how the dancers moved in the dance, but to their elegant clothes and jewelry, which were chosen to reinforce the image of wealth and taste. (The majority of accounts of dancing from this period, in fact, dwell on what the dancers wore and how elegantly—or inelegantly—they presented themselves, while unfortunately failing to report details of the dance steps.) The courtly choreographed dance, therefore, functioned as a demonstration of social and political power; it was one of the many tools employed by the wealthy and powerful to establish, maintain, and publicize their position.

## DANCING MASTERS

**BURGUNDIAN ORIGINS AND ITALIAN SPLENDOR.** Choreographed dances brought into existence a new type of artistic impresario, the dancing master, who invented the dances and taught them to the members of the court. The earliest known of these worked in Italian courts from the beginning of the fifteenth century, although their manuals show a well-developed set of step protocols and dance behavior that suggests that the idea had begun in the previous century, and possibly not in Italy. The name of one of the Italian choreographed dances, bassadanza, is first seen in its French form *basse danse* in a poem by the Provençal troubadour Raimon de Cornet (c. 1340): “A jongleur would rapidly learn stanzas and many little verses, cansos, and basses danses.” It is clear that by the fifteenth century the *basse danse* was choreographed, but since the name simply means “low dance,” contrasting

*a PRIMARY SOURCE document***A NOBLE OFFER**

**INTRODUCTION:** The following letter, dated 10 April 1469, was written to Lorenzo de' Medici, from Filippus Bussus, a dancing master trying to gain a position with the illustrious noble family. Although there is no evidence that Filippus was successful, the letter gives a picture of how a dancing master would function at a special celebration—arriving more than a week before the festivity, bringing a repertory of dances to teach the nobles, and creating original choreographies for the principal members of the family.

My magnificent and most distinguished and honorable lord:

In the last few days I have learned that your Magnificence is about to take a wife during the upcoming May festivities and that you are preparing a noble and triumphant celebration. This gives me the greatest pleasure for all your consolation and well being. A little before the Carnival I left Lombardy with the children of the Magnificent lord Roberto [da Sanseverino] whom I have taught to dance, and from that area in Lombardy I have brought some elegant, beautiful and dignified balli and bassadanze.

These things are indeed worthy of lords such as yourself and not of just anyone. And I firmly believe that if your Magnificence were to see them performed, you would like them exceedingly and you would wish to learn them since they are so beautiful and delicate. Consequently, I have almost decided to come, if it pleases you, of course, to help honor your festa. And if you would like to learn two or three of these balli and a few bassadanze from me, I would come eight or ten days before the festa to teach them to you with my humble diligence and ability; and in that way it will also be possible to teach your brother Giuliano and your sisters [Bianca, Maria, and Nannina] so that you will be able to acquire honor and fame in this festa of yours by showing that not everyone has them [i.e. the dances], since they are so little known and rare. And thus I beg and pray, press and urge you to accept this unworthy and small offer of mine. There is nothing else to say now except that I recommend myself to Your Magnificence, for whose pleasures I offer my un-failing and ready service.

*Your servant Filippus Bussus of Biandrate*

**SOURCE:** Filippus Bussus, Letter to Lorenzo de' Medici, April 10, 1469. Trans. Timothy J. McGee (Florence: Archivio di Stato, MAP, Filza XXI, No. 90).

its conservative steps with the more flamboyant jumps, hops, and leaps of other dances, there is no way to know whether the history of choreographed dances goes back as early as 1300 or whether the application of specific choreographies to this dance step was developed later. The earliest French collection of basse danse music and choreographies is associated with the court of Burgundy, an area now in eastern France that was once a powerful independent duchy. Although the manuscript itself, a spectacularly beautiful one with silver and gold musical notation on black parchment, dates from approximately 1470, it is clearly a retrospective collection going back at least to the beginning of the century. Given what is known about the splendor of all of the arts at the Burgundian court beginning with the reign of Philip the Bold in 1364, it would not be surprising to learn that the tradition began under his supervision and encouragement.

**CEREMONIES AND CELEBRATIONS.** It is clear that the role of the Italian dancing masters extended far beyond the mere teaching of dance. Often, these men also planned the elaborate ceremonies that accompanied a feast, including the plays, parades, processions, jousts, banquets, wild animal hunts, and games that were a part of the celebrations, as well as the decoration of the city

streets and performance venues. Celebrations of this kind were arranged for engagements, weddings, receptions of important guests, and other special occasions that could provide the powerful noble families with an opportunity to show off their wealth, artistic superiority, and social importance. At the end of one of the later copies of his treatise, Guglielmo Ebreo adds a list of thirty events in which he participated. There is no doubt that this is only a partial account, but it probably contains those occasions that seemed to him most memorable. His comments (not reported in chronological order) provide an interesting glimpse of the nature of festive events in the fifteenth century:

Event 6 [1454]: I was present [in Bologna] at the nuptials of Messer Sante del Bentivoglio, when we accompanied Lady Ginevra [daughter of Alessandro Sforza] and the festivities lasted three days; and I never saw finer repasts or finer refreshments or greater ceremony. And the platters of boiled meat, that is, the capons, were in the form of his coat of arms. And moreover, around the tables there were peacocks whose feathers and spread tails seemed like curtains in that hall.

Event 10 [1450]: I was present when Duke Francesco Sforza made his entry into Milan and

*a PRIMARY SOURCE document***RULES FOR WOMEN IN DANCE**

**INTRODUCTION:** Guglielmo Ebreo's dancing manual, *On the Practice or Art of Dancing*, includes a number of statements about etiquette and proper dress. It also includes this statement about the behavior of women, which provides some interesting evidence of the fifteenth-century attitude toward young women, as well as some details about dancing.

---

**SOURCE:** Guglielmo Ebreo, *On the Practice or Art of Dancing*. Trans. Barbara Sparti (Oxford: Clarendon Press, 1993): 109, 111.

was made Duke. And the jousts and the dancing and the great festivities lasted a month. And I saw two hundred knights dubbed. And I understand Giovanni of Castel Nova and Giovanni Chiapa to say to the lord Messer Alessandro Sforza that ten thousand people sat down to table when the trumpet sounded and all of them were in court.

**LOCAL PATRONAGE.** As a special feature on some of these occasions, the dancing masters invented new choreographies that were directly related to their patrons, naming the dance after a local person or place: Domenico's *balli* (dances in the *ballo* form) called "Belriguardo" and "Belfiore" refer to the Este family residences in Ferrara; those called "Lioncello" and "Marchesana" refer to Marchese Leonello d'Este. These special choreographies would be premiered in front of all of the invited guests, featuring the patrons themselves as the dancers. Some dance teachers, such as Domenico da Piacenza and Antonio Cornazano, were permanent members of the household staff, with duties in addition to dance instruction, while others were hired for particular occasions; the letter from Filippus Bussus to Lorenzo de' Medici shows one such itinerant teacher extolling his own talents while seeking employment in Florence.

**ITALIAN AUTHORS.** Three of the fifteenth-century Italian dancing masters left treatises that include not only specific dance patterns for *bassadanze* and *balli*, but also essays on etiquette, costume, and dance techniques. The earliest of the treatises is from 1445, *De la arte di ballare et Danzare* (On the Art of Dancing and Choreography), by Domenico da Piacenza; the second, *Libro dell'arte del danzare* (Book on the Art of Dancing), from 1455, is by Antonio Cornazano; and the third—the first of seven versions of Guglielmo Ebreo's treatise *De pratica seu arte tripudii* (On the Practice or Art of Dancing)—was written in 1463. We know from various sources, including choreography attributions and statements in the surviving treatises, that there were many other dancing masters in Italy during the fifteenth century, including Giuseppe Ebreo (Guglielmo's brother), Pietro Paolo (Guglielmo's son), Moise Ebreo, and Filippus Bussus. However, their writings have not survived, and little is known of these dancing masters or their lives.

**HUMANISTIC INFLUENCES.** The Italian dance manuals contain more than just instructions for recreating specific dances; they begin with a section of poems, highly complimentary dedicatory material addressed to their patrons, and essays on a number of different topics.

It is clear that the authors were all formally educated, since the subject matter of some of this material is a reflection of the humanist movement, relating dance to philosophy, history, and world thought. On a more practical level, there are also discussions of the basic elements of dance: measure and rhythm, accurate memory, artistic use of the dance area, graceful movement of the body, considerations when wearing long or short gowns and capes, and special instructions to women on the subject of modesty when dancing.

### THE BASSE DANSE AND THE BASSADANZA

**BASSE DANSE.** Each of the choreographed dances—basse danse, bassadanza, and ballo—has a distinct sequence of steps that are appropriate for only that dance, and all of them also have in common a small number of main steps, although they differ in how they are executed. The Burgundian basse danse is an elegant processional dance, consisting of five basic steps that are arranged in a unique sequence for each composition. The steps themselves are not complicated, and all require that the feet stay close to the floor, in keeping with the name *basse* (low). Basse danse steps include the following movements:

**Branle:** A swaying motion with the body turning first to one side and then to the other. Since the partners are holding hands, the first turn is away from each other, the second towards the partner. This is always the first step to follow the *reverence*.

**Double:** Three equal steps forward while raising the body.

**Reprise:** (also called *demarche*) A small step backward with the right foot, followed by placing the left foot behind the right. The right then moves forward again, thus allowing the dancer to end with the right foot in the place where it began.

**Reverence:** A bow, executed with one foot behind the other and the knees bent. It was always the first step in each basse danse.

**Simple:** A single step forward with one foot. This step is always called for in pairs and always begins on the left foot.

This constitutes the complete repertory of steps for all fifteenth-century basses dances. The choreographed versions varied from one another only in the sequence and number of movements. Each basse danse had a specific number of steps that were matched in the music accompanying it by a similar number of units of measure, meaning that the dance and its music were inseparable. Although the descriptions suggest that the steps are not difficult, the exact step sequence for each dance was crucial, and when arm, head, and body motions were added, any one choreographed dance became quite complex, compelling the nobles to spend many hours in dance practice.

**THE BASSADANZA.** The Italian bassadanza is similar to the basse danse in that it too is basically a processional dance, moving at a single steady tempo and organized around a number of relatively simple basic steps. In fact, four of the basic bassadanza steps (called "natural steps") are quite similar to those of the basse danse. The bassadanza and basse danse differ, however, in a number of details of construction and execution, and especially in their tone and the amount of freedom taken by the choreographers and expected of the dancers. Bassadanza and ballo "natural steps" include the following:

**Continenza:** A small step to the side with knees bending, usually executed in pairs. It is somewhat similar to the branle.

**Doppio:** Three equal steps forward, similar to the double.

**Mezza volta:** A half turn, meaning that the dancer ends up facing in the opposite direction. It is sometimes executed by using other steps (one doppio, or two continenze, or two sempii, or two riprese).

**Represa:** A large step to the side with one foot, which is then joined by the other.

**Riverenza:** (two types) The normal bow with one foot behind the other and the knees bent, and *riverenza in terra*, in which the knee of the back leg touches the floor.

**Salto:** A jump with several possible executions: on one foot or two, or from one foot to the other.

**Sempio:** A single step forward, similar to the simple.

**Volta tondo:** A full turn, executed by using the same steps as the mezza volta, but requiring twice as many steps and taking twice as long to execute.

Slide trumpeters. Wedding scene, Master of the Adimari Cassone. Florence, Galleria dell' Accademia, 1460. ARTE & IMMAGINI SRL/CORBIS.

Ornamental steps (sometimes called “accidental steps”) could be interpolated into a performance by the dancers themselves. None of these steps is clearly explained; the descriptions are those suggested by the words themselves:

**Escambiamento:** A change; perhaps performing the motion or step with the other foot.

**Frappamento:** A shaking motion, perhaps meaning the foot.

**Scorsa:** Dragging the foot.

**FORMALITY VERSUS FLAMBOYANCE.** As can be seen by comparing the steps in both dances, the *basse danse*, with its limited number of steps executed in a fairly standard sequence, creates an air of sedate and highly controlled formality and elegance, whereas the *bassadanza*, with its larger repertory of basic steps, numerous variations, and looser tradition of step sequences, results in a far more flamboyant dance. Unlike the two- or three-person formation of the *basse danse*, which is confined to processional movements with a more or less rigid sequence of the basic steps, all of which are low, the *bassadanza* allows as many as eight dancers in formations which can be single file, all dancers abreast, or even circular, and there is far more variety in the sequence of the basic steps. The processional aspect of the dance is interrupted by numerous half-turns and even a jumping step, and the *bassadanza* choreographies include the addition of “accidental” steps to be placed before or after the basic patterns, as well as variations on the basic steps, ornamental movements, and steps borrowed from other dance types. The *bassadanza* is still a very formal dance, but the greater variety of steps and formations, including larger motions such as full- and half-turns, lend a far more theatrical air. The Italian *bassadanza*, therefore, although stemming from the same processional idea as its Burgundian counterpart, was a more extravagant product.

**MATCHING NOTES AND STEPS.** As can be seen in the transcription of a Burgundian *basse danse* called “La Haute Bourgogne” (The High Burgundian), the writ-

ten music for the *bassadanza* and *basse danse*, known as a “tenor,” is expressed only as a series of long notes, each representing one measure of time. The word *tenor*, from the Latin *tenere* (to hold), refers to the fact that the notes were sustained. Each *bassadanza* and *basse danse* has its own music, which contains exactly the correct number of notes to match the choreography. Some of the melodies of these dances are adapted from known songs, although many of them probably were composed specifically for a particular dance choreography. Since there is no change in the pace of the music, it was also possible to compose a new *bassadanza* or *basse danse* to an existing tune; all that was required was that the number of dance steps must correspond with the units of measure in the melody.

**DANCE NOTATION AND INSTRUMENTATION.** Although the music for both low dances looks the same, the way in which the treatises associate the steps with the music differs in that the *bassadanza* steps are described only in prose, whereas the French developed a shorthand in which letters designating the steps are placed beneath the appropriate notes of the dance tune, showing at a glance which steps go with which notes. In performance, the music would be more complex than the single line that was written. In addition to the long notes of the monophonic (single-line) tenor, one or two other parts would be improvised, resulting in a polyphonic (multi-part) composition full of harmony and ornate interweaving melodic lines. Instrumental musicians were quite skilled at this type of improvisation and would easily fill out the harmonies and melodies around the sparse written outline of the tenor. The most common dance ensemble of the period was a trio consisting of a slide trumpet (predecessor of the trombone), and two or three *shawms* (double-reed instruments, similar to the oboe). In performance, one shawm would play the written melody and the other instruments would improvise faster-moving accompaniment parts above and below the

*a PRIMARY SOURCE document***AN EXAMPLE OF DANCE NOTATION**

**INTRODUCTION:** In Italian treatises the dance steps for the *bassadanza* were indicated simply by written descriptions that were provided alongside the music. But the French

developed a kind of shorthand in which letters designating the steps were placed beneath the appropriate notes of the dance tune, showing at a glance which steps were to go with which notes. In the example below, from a dance called “La Haulte Bourgongne” (The High Burgundian), the letters beneath the notes correspond to the five basic steps of the *basse danse*: R=reverence, b=branle, s=simple, and so on.

**“La Haulte Bourgongne” in modern notation**

CREATED BY GGS INFORMATION SERVICES. GALE.

melody. A similar kind of improvised accompaniment would also be added when the music was performed by a single musician playing harp or lute. Other instruments frequently shown in the company of dancers are tambourines, bagpipes, recorders, and fiddles.

**THE BALLO**

**ORIGINS OF BALLET.** The ballo enters more fully into the area of what we would think of as theatrical

dance or ballet. Although the ballo employs the same basic steps as the *bassadanza*, it is quite different in its overall format and in the number of step variations. Instead of being danced at a single steady tempo and measure, as are the *bassadanza* and the *basse danse*, the ballo is made up of an irregular series of up to four different tempos (called *misura*), each having a different kind of rhythmic organization and speed. The tempos, from slowest to fastest, were *bassadanza*, *quaternaria*, *saltarello*, and *piva*. The changes of tempo result in a large variation in the natural steps. For example, a *saltarello doppio*, which involves a small hop as well as a stepping motion, moves quite a bit faster than a *bassadanza doppio* because the *saltarello* tempo itself is faster. There is also, of course, a *quaternaria doppio* and a *piva doppio*, and to complicate matters, some of the choreographies call for the execution of one kind of step variation in a different tempo: a *saltarello doppio*, for example, in a *bassadanza* tempo. The result of the changing tempos and wide variation of steps was a dance form capable of enormous expression. In the hands of the creative Italian dancing masters, such dances were organized into pantomimes and mini-dramas that were highly entertaining. The ballo “Gelosia” (jealousy), for example, involves three couples who flirt with one another while executing a wide variety of dance steps and floor patterns, ending

*a PRIMARY SOURCE document***A FIFTEENTH-CENTURY BALLO**

**INTRODUCTION:** The ballo “Petit Vriens” is a choreographed dance for three dancers by Guglielmo Ebreo, from one

of his dance manuals of the mid-fifteenth century. In performance, a small group of musicians would improvise harmony to this melody.

**“Petit Vriens”**

The image displays the musical notation for the dance 'Petit Vriens'. It consists of four staves of music, each beginning with a treble clef and a common time signature (C). The notation is written in a medieval style, featuring a mix of eighth and sixteenth notes, often beamed together. The melody is presented in a single-line format across the four staves. The first staff contains the first eight measures. The second staff contains measures 9 through 16, with repeat signs (double bar lines with two dots) at the beginning and end of the section. The third staff contains measures 17 through 24, also with repeat signs. The fourth staff contains measures 25 through 32, concluding with a final double bar line. The overall structure suggests a 32-measure piece with repeated sections.

CREATED BY GGS INFORMATION SERVICES. GALE.

with an exchange of partners. It would be difficult to exaggerate the enormous amount of time and effort required to present these dances with the flair and elegance they required. Throughout the sixteenth century, the ballo continued to be one of the favorite forms of entertainment, attracting professional dancers by the beginning of the seventeenth century, and eventually—as the name would suggest—becoming the basis of modern ballet.

**MUSICAL COMPLEXITY.** Ballo musical lines are far more complex than those for the bassadanza and basse danse, each having a unique set of sections that vary in style and meter, as well as in the number of times each section is to be repeated. Because of this, each ballo is inseparable from its music. Similar to the music for the other choreographed dances, in performance the ballo music was filled out by the musicians, who extemporized additional musical lines to what was written. The ballo

music, however, was based on a melody with a variety of rhythms (as opposed to a basse danse and bassadanza sustained-note “tenor”), which required the musicians to fill in only harmonic lines. The instruments used in these performances were the same as for the bassadanza; the two types of dances were usually combined during the elaborate feasts in which they were performed.

**NOVELTY AND TRADITION.** The arrival of choreographed dances brought not only a new repertory and style to the activity of dance, but also a new function in which dance took on unprecedented political and social importance as political leaders used it as a measure of culture, elegance, and taste. The political implications, however, could have been important only to relatively few, meaning that for the majority of those who attended the entertainments of the royal court it was simply a new and sophisticated way to enjoy dancing, though certainly one that required far more preparation than anything

they had previously experienced. Rather than replace the older style of conventional dances, the new form merely augmented the repertory for the nobility, while the conventional dances continued to be performed by all the citizens, including the nobles. The low steps of the new basse danse and bassadanza forms were derived from earlier estampie steps, and the line dances of the earlier centuries continued on as well, acquiring new names and step variants but remaining essentially the same. New dances and styles continued to reflect the ever-changing social and political lives of all Europeans, but regardless of the changes, dancing retained its central place in the recreational activities of late medieval society.

## SIGNIFICANT PEOPLE *in Dance*

---

### ANTONIO CORNAZANO

1430–1484

*Poet*

*Humanist*

*Statesman*

**MASTER OF MANY ARTS.** Because dance was only one of many arts practiced in the courts of late medieval Italy, it is important to recognize that those engaged in it were not necessarily professionals. Indeed, as the concept of the “Renaissance man” developed, what was most admired was an individual’s ability to move easily from one art to another as a cultivated amateur (that is, one who loves a subject but does not make a living from it). Thus, although Antonio Cornazano taught dancing and wrote a dance manual, it would be inaccurate to refer to him as a dancing master. He was not himself a choreographer—his manual contains only choreographies by Domenico da Piacenza—and he was not a professional dancer, as were all the other dancing masters. He is better described as a poet, humanist, and statesman; at his appointment to the household staff of Duke Francesco Sforza, he was described as “counselor, secretary, chamberlain, and teacher of the Duke’s children.” Cornazano was born into one of Piacenza’s leading noble families and, similar to other young men of his status, received

a broad education that included ancient and modern languages, the theory and practice of military arts, and politics. He learned dancing from Domenico, whom he later referred to as “my only teacher and colleague.” In 1454 he entered into service in Milan at the Sforza court where a year later he dedicated the first version of his treatise, *Libro dell’arte del danzare* (Book on the Art of Dancing), to his young student Ippolita Maria Sforza. Following the death of Duke Francesco in 1466, Cornazano moved to Venice where he spent eleven years as military adviser to General Bartolomeo Colleoni, leader of the Venetian military forces.

**INTERRELATED ARTS.** Cornazano was married to Taddea de Varro, a member of an old noble Ferrarese family, and in 1479 he entered the court of Ericole I d’Este in Ferrara, where he spent the remainder of his life. He was noted as an excellent and prolific poet who was also skilled at extemporizing poetry. His writings include *La Sforzeide* in praise of Francesco Sforza, a set of poems divided into 36 chapters, written in the style of Vergil’s epic *The Aeneid*. His works also include *Vita di Nostra Donna* (Life of our Lady), a book of poems on the life of the Virgin Mary, dedicated to Ippolita Maria Sforza; and *Opera bellissima de l’arte militare* (The Most Beautiful Work of Military Art), a treatise on the art of war. Though to us the combination of the “arts of war” and the arts of poetry and dance might seem unusual, this was not the case in fifteenth-century courts, where dance, like poetry and the performance of music, was an activity of great interest to almost everyone and was always included as one of the skills required of a successful courtier.

---

### DOMENICO DA PIACENZA

1390–1477

*Dancing master*

**THE FIRST DANCING MASTER.** Domenico da Piacenza (c. 1390–1477) is the earliest known dancing master. He was born in Piacenza (northern Italy), and worked in the major northern Italian courts, including that of the Sforzas in Milan and the Este in Ferrara. He wrote *De la arte di ballare et Danzare* (On the Art of Dancing and Choreography) in 1445, the earliest surviving dance treatise, and taught a number of Italian dancing masters including the other two authors of dance

treatises, Guglielmo Ebreo (also known as Giovanni Ambrosio) and Antonio Cornazano. On the invitation of Duke Francesco Sforza, Domenico, along with Guglielmo and Antonio, took part in the elaborate celebration for the wedding of Tristano Sforza and Beatrice d'Este in Milan. A year later he was appointed to the Este court in Ferrara where he was listed as "spectabilis miles" (worthy knight). Other sources refer to him as a Knight of the Golden Spur. He remained in Ferrara until his death 21 years later.

**LASTING INFLUENCE.** His treatise was taken as the model by both of his renowned pupils, whose works followed Domenico's format of beginning the treatise with a discussion of dance theory and then providing a set of specific choreographies for balli and bassadanze. It is clear that Domenico was well educated; in his discussion of the aesthetics of dancing he refers to Aristotle. Among his balli are two dance-dramas, "La mercanzia" and "La sobria," which are considered by some dance historians to be the earliest ballets.

### GUGLIELMO EBREO

1420–1484

*Dancing master*  
*Author*

**DANCING MASTER EXTRAORDINAIRE.** Guglielmo Ebreo is the best known dancing master of the fifteenth century, owing to the survival of seven manuscripts containing versions of his dance treatise *De pratica seu arte tripudii* (On The Practice or Art of Dancing), as compared to one copy each of the only other treatises from the fifteenth century written by Domenico da Piacenza and Antonio Cornazano. In the early 1460s, while Guglielmo Ebreo (William the Jew) was in the employ of the Sforza court in Pesaro and was a frequent visitor at the Sforza court in Milan, he decided to convert to Christianity and took the name Ambrosio after St. Ambrose, the patron saint of Milan.

**AN HONORED CAREER.** Guglielmo and his brother Giuseppe (also a dancing master) were born in Pesaro (central Italy), the sons of Moses of Sicily, who for a time was dancing master at that court. Quite a bit is known about Guglielmo's career, thanks to a number of surviving letters he wrote to various courts, and especially to

an autobiographical list that he appended to one of the manuscripts of his dance treatise, describing thirty events in which he took part. His career as a dancing master took him to a number of the finest courts in Italy where he was valued for his ability as a dancer, dance teacher, and choreographer. In addition to the Sforza families in Pesaro and Milan, he served the Montefeltro in Urbino, the Gonzaga in Mantua, King Ferdinand I in Naples, and the Medici in Florence. The esteem in which he was held is attested to by his elevation to Knight of the Golden Spur in Venice in 1469 by the Holy Roman Emperor Frederick III, an honor he shared with Domenico da Piacenza, and one that was bestowed only rarely on artists.

### RAIMBAUT DE VAQUEIRAS

c. 1150–1207

*Troubadour*  
*Poet*  
*Composer*

**A PROLIFIC TROUBADOUR-ADVENTURER.** Raimbaut de Vaqueiras (c. 1150–1207) was a troubadour, poet, and composer. Like many of the people associated with early dance, he did not devote his entire career to this interest, but rather was a member of the court who served a variety of personal, literary, and educational functions. Indeed, his life was primarily one of military and diplomatic service. According to his thirteenth-century biography, he was born the son of a poor knight in Provence, near the castle of Vaqueiras. He entered into the service of the Marquis of Monferrat in northern Italy and became a companion at arms to his son Boniface, remaining there until 1180. In 1189, he moved to Provence in the service of Hugues I des Baux, and in 1192 returned to Monferrat. During a military campaign in 1194, Raimbaut saved Boniface's life and was rewarded with a knighthood. In 1202, when Boniface became the leader of the Fourth Crusade and set off from Venice for the Holy Land, Raimbaut at first returned to Provence, but later rejoined his patron and the crusade in Constantinople. Boniface was killed near Messiole on 1207, and it is probable that Raimbaut died at that time.

**CONTRIBUTION TO MUSIC AND DANCE.** Raimbaut was fluent in several languages, including Occitan (a medieval language spoken in what is now southern France),

Italian, French, Gascon (a dialect of French), and Galician-Portuguese. Scholars attribute 26 poems to Raimbaut, although only seven survive with music. The best known of his works is the estampie “Kalenda Maya,” which he composed in honor of Beatrix, daughter of Boniface, to fit a melody that he had heard played on the *vielle* by two French jongleurs.

### IPPOLITA MARIA SFORZA

1445–1488

*Dancer*

*Duchess*

**A CHILD PRODIGY OF DANCE.** Ippolita Maria Sforza was the daughter of Duke Francesco Sforza of Milan and Bianca Maria Visconti. Her father employed a number of scholars to provide his children with the finest of classical educations, which included Greek, Latin, rhetoric, and the arts. In 1454, Francesco added the humanist poet Antonio Cornazano to his household staff, assigning the instruction of dance as one of his teaching duties. A year later Cornazano dedicated his treatise *Libro dell'arte del danzare* (Book on the Art of Dancing) to his ten-year-old star pupil, Ippolita, making her the earliest known ballerina, that is, a dancer of choreographed dances. The treatise also includes a sonnet by Cornazano, extolling Ippolita's graces in language, echoing Latin mythological poetry. In the spring of that same year, Ippolita was introduced to two of the most famous dancing masters of the century when Domenico da Piacenza and Guglielmo Ebreo were summoned to the Sforza court to work with Cornazano to organize the festivities and dances for the marriage of Tristano Sforza to Beatrice d'Este, a woman widely acclaimed as a dancer. Shortly afterward, in the fall, Ippolita, still only age ten, was promised in marriage by her father to Alfonso of Naples. From that point forward she was usually referred to as the Duchess of Calabria, which would be her title following her marriage ten years later.

**A PERFORMING ARTIST.** Ippolita's renown as a dancer began at the 1455 Sforza wedding, where she participated in a *ballo* with Beatrice. The next recorded notice of her dancing is from 1465, associated with her wedding celebration in Milan, followed by the long journey she took from Milan to Naples for her marriage. She was escorted on the trip by Federigo, the youngest son of King Ferrante of Naples, accompanied by two of her

brothers and a company of more than a thousand, including 600 nobles, soldiers, servants, and courtiers, among them her dancing teacher Antonio Cornazano. All along the journey the entourage stopped at the major cities and courts where she was lavishly entertained; in Florence she danced with Lorenzo de' Medici (age sixteen), whom she had met and danced with at the earlier wedding celebration in her home palace. Next she traveled to Siena, where one of the entertainments presented in her honor included a costumed *moresca* (Moorish dance). When she finally arrived in Naples after three months on the road, a full week was set aside for the wedding festivities, which included lavish balls. Throughout her reign as Duchess of Calabria, Ippolita was renowned for her learning and her support of the arts, including her beloved dance.

## DOCUMENTARY SOURCES *in Dance*

*Bodleian Library: MS Douce 139* (1250)—This manuscript from Coventry, England, now housed in Oxford's Bodleian Library, contains the earliest known English instrumental dance.

*Chansonnier du Roi* (c. 1280)—This collection of eleven instrumental dances, copied into a manuscript now located in Paris (Bibliothèque Nationale fr. 844), is the only medieval collection of French estampies and carols.

Antonio Cornazano, *Libro dell'arte del danzare* or *Book on the Art of Dancing* (1455)—This book, the second known treatise on dancing, was written by poet, statesman, and humanist Antonio Cornazano, who dedicated it to his student, Ippolita Maria Sforza, one of the first ballerinas known by name.

*Dança general de la Muerte* (c. 1400)—This poem of 79 stanzas, originating in Spain, describes the dance of death. The title, translated as *Common Dance of Death*, acknowledges that mortality is a universal experience.

Domenico da Piacenza, *De la arte di ballare et Danzare* or *On the Art of Dancing and Choreography* (1445)—This work by one of the first dancing masters is the earliest known treatise on dancing and the model for those that

followed. It begins with a discussion of dance theory and then provides a set of specific choreographies for balli and bassadanze.

Guglielmo Ebreo (Giovanni Ambrosio), *De pratica seu arte tripudii* or *On the Practice or Art of Dancing* (1463)—Written by the best known dancing master of the fifteenth century, this dance treatise exists in a total of seven manuscript versions, one of which contains a list of thirty important events in which the author participated.

Jofre Goixà, *Doctrina de compondre dictatz* (1300)—This Catalan treatise on poetry gives instructions on how to compose a *dansa*.

Johannes Grocheio, *De musica* (c. 1300)—This music treatise includes the earliest detailed descriptions of both vocal and instrumental dances and dance music.

*Magnus liber organi* (c. 1250)—This book of music for the liturgy (the title means the “Great Book of Organum”) contains at its end the largest repertory of medieval sacred dance songs with music. The sixty short dance songs in this collection, which originated in Paris, are nearly all in a verse and refrain format known as *rondeau*.

Guillaume Molinier, *Lays d’amors* (1328)—This book, which presents a set of rules for composing troubadour poetry, includes a description of the estampie dance poem.

## IMPORTANT EVENTS *in Fashion*

- 800 Charlemagne is crowned emperor of a realm that includes much of modern France, Germany, and Italy, creating the social structures necessary for the development of a system of fashion.
- c. 808 Emperor Charlemagne decrees the first medieval sumptuary law to regulate the price of clothing.
- 1066 The Anglo-Saxons are defeated by the Normans at the Battle of Hastings. William the Conqueror, duke of Normandy, now king of England, introduces Norman dress to the English court.
- 1095 The First Crusade begins, and French warriors travel to Constantinople (the capital of the Christian Byzantine Empire—modern Istanbul, Turkey) to stage a battle for control of the Holy Land, then under Muslim rule. Returning crusaders will popularize Eastern silks in Europe and initiate Byzantine influence in costume.
- c. 1100 “Courtly dress” is first described in literature and public records.
- 1100 The reign of Henry I of England begins, ushering in a period of more luxurious dress style.
- c. 1125 The French priest Fulcher of Chartres comments that Westerners living in the Latin settlements in the Holy Land have become orientalized in their clothing and habits.
- 1135 The reign of King Stephen in England continues the luxurious styles of Henry I’s reign.
- c. 1140 Earliest forms of Gothic architecture are initiated, paralleling in height the longer silhouette in costume.
- c. 1142 Paris becomes a center of learning as universities emerge throughout Europe, leading to the beginnings of academic dress.
- 1147 Bernard of Clairvaux begins preaching the Second Crusade, influencing Emperor Conrad III of the Holy Roman Empire and Louis VII of France to go on crusade. The result is the extension of the Eastern influence on fashion to the German-speaking world.
- c. 1150 Heraldry, a system assigning distinctive coats of arms to identify knights in tournaments, originates in France and influences display of colors and lineage in costume.
- 1154 Henry II, the first king in the royal family of Plantagenets (1154–1485), takes the throne in England. He marries Eleanor of Aquitaine, who continues to influence female fashion until long after her death; their reign initiates a return to the simpler fashions of 1066.
- 1157 The earliest Italian sumptuary law dealing with clothing is enacted in Genoa, initiating a series of such laws conceived for economic purposes (to enhance trade and reinforce the social hierarchy) but often expressed in moral terms.
- 1192 The Third Crusade—consisting of French, English, and German contingents—ends, and Eastern fabrics are again brought back to Europe.
- 1199 The reign of King John in England begins, during which the court revives lavish dress for men while the ladies continue to imitate Queen Eleanor’s simpler fashions.
- 1204 The end of the Fourth Crusade, which originated in Venice, brings another wave of Eastern fabrics to Europe.
- Constantinople falls to the Crusaders, and the Latin Empire is formed. The resulting decline in Byzantine political power corresponds to a decline in Byzantine influence on European fashion.

- 1216 The reign of King Henry III of England begins. The period will be characterized by unpretentious dress, development of merchants' guilds, and the circulation of "trade poems" (realistic poems depicting the lives of peddlers and artisans) about items of costume.
- 1226 Louis IX of France (later St. Louis) becomes king. His piety will influence the court towards unpretentious dress.
- 1272 Edward I becomes king of England. He favors exceptionally simple styles in clothing, and his court adopts his tastes.
- 1290 In an effort to restrain and control indulgence in excessive dress, laws are passed stating that the women of Florence must register their garments and get them officially approved.
- c. 1300 Gothic art and architecture emphasize the beauty of the natural world in decorative details. Parallel ornamentation and natural motifs appear in costume.
- 1346 The English defeat the French at the Battle of Crécy in northern France. The rich costumes taken as spoils of war after this battle enrich even humble attendants of the English knights, allowing for their display of high style.
- 1348 The first wave of bubonic plague spreads throughout Europe. Recurring until 1400, the plague greatly reduces Europe's population, resulting in the concentration of the continent's wealth—including property, money, and clothing—in the surviving population. The newly enriched middle classes are thus able to indulge in fashions previously worn primarily by the nobility.
- c. 1350 "Fashion" emerges as a recognizable social phenomenon at the same time as Gothic architecture (known as "Flamboyant Gothic") reaches its peak of ornamentation, demonstrating a widespread cultural taste for systems of decoration.
- 1356 The English defeat the French at Poitiers and return home with treasure and rich clothing, again providing the means by which the lower and middle classes might dress above their social station.
- 1363 The English Parliament expands earlier fourteenth-century sumptuary laws and establishes price and garment rules for seven social categories so that overspending is discouraged and members of each class are easily distinguished by their costume.
- 1375 The city-state of Aquila in Italy passes a sumptuary law forbidding males to wear very short doublets.
- 1377 The reign of King Richard II of England begins, and his court imitates Richard's preferences for extreme richness in fabric, color, and cut.
- 1380 The reign of King Charles VI of France begins, ushering in brilliant and excessive fashions that are imitated throughout Europe.
- 1385 Marriages are arranged between the children of Philip the Bold, duke of Burgundy, and members of the ruling counties of Hainaut, Holland, and Zeeland, extending Burgundian influence into the Low Countries, an area that will be a center for fashion until the early sixteenth century.
- 1399 Henry IV of England becomes king. His court follows the brilliant and extravagant fashions worn throughout Europe.
- 1413 The reign of King Henry V of England begins, continuing the emphasis on the brilliant and excessive fashions worn throughout Europe.
- 1415 The English defeat the French at Agincourt and bring home the spoils of war, including rich and fashionable clothing.
- 1422 The reign of King Henry VI of England begins, instituting a new fashion silhouette characterized by extreme height.
- 1430 The Statutes of Savoy are instituted by Duke Amadeus VIII, describing a hierarchy of 39 social groups and prescribing appropriate dress for each, disallowing inappropriate items, fabrics, and colors.
- 1461 The reign of King Louis XI of France begins, bringing with it a return to simpler dress styles.

## OVERVIEW *of Fashion*

**FASHION DEFINED.** Fashion, as the term is used in this chapter, refers to a dominant mode in dress in a particular place or time, usually a mode that is established by a perceived social elite or by notable persons. Fashion functions as a social phenomenon, setting standards of dress that periodically change when what once was new and desirable becomes ordinary and then must be supplanted by yet another innovation. Moreover, fashion as a social force possesses its own natural laws. For example, it appears that once innovative fashions move too far from what society perceives as the norm, it rejects these excesses, and a pendulum swing occurs with a return to an older or plainer style. Fashionable clothing must convey the impression of distinction, excellence, originality, and character expressed artistically. And, of course, fashion responds to the availability of new materials, dye stuffs, and technologies. The relative importance of each of these factors, although generally present in some combination, will vary at any given time. Therefore, a fashion system is characterized by constant change. Historians of costume agree that in Europe fashion as a social concept—that is, an ongoing awareness of self-consciously changing styles—began in the Middle Ages. By the middle of the fourteenth century, this system was well enough established to be the subject of ongoing commentary and concern, since the pressure always to be purchasing new and expensive clothing, with its emphasis on the human body, has moral implications. But even before fashion became a major force in society, elements of a fashion system were present in European courts, making it possible to trace the development of fashion as early as the age of Charlemagne in the eighth century.

**SOURCES OF INFORMATION.** Because of the fragility of materials and the socially downward movement of used garments, very little clothing from the early part of the Middle Ages has survived, but the paintings in illuminated manuscripts provide a wide range of examples of what people wore. Because it was common practice

to illustrate even historical texts dealing with biblical or classical subjects with figures wearing “modern” clothing, books as well as the other visual arts (sculptures, reliefs, wall paintings, tapestries) from the ninth to twelfth centuries offer an ongoing record of fashion trends. Literature is also a source of information towards the end of this period, since the newly developing genre of the romance often included detailed descriptions of courtly heroes and heroines (though these, as well as images from the visual arts, must be used carefully since some details are merely conventional). By the thirteenth century, documentary records, including lists of items sold at fairs and expense ledgers from royal households, offer evidence of both the range and cost of clothing, while the trade poems that emerged in the last half of the century provide details of the kinds of costume goods offered by traveling peddlers (known as mercers) to customers at every level of society. One additional source of information is the gradually increasing tradition of recording wills and inventories of belongings, which by the fourteenth century extended to members of every social rank.

**CLASS DISTINCTIONS.** Members of higher and lower social classes have, of course, always dressed somewhat differently from each other. At the beginning of the period discussed here, society was, for the most part, divided between a small ruling class of warriors and a large laboring class that primarily worked the land. In the 800s, for example, when Charlemagne (Charles the Great) established the first European empire (called “Carolingian” after the Latin word for “Charles”) to replace the Roman Empire that had fallen five centuries earlier, laborers throughout Europe wore a similar costume, common to both the newly dominant Germanic tribes and the earlier Celtic tribes they had displaced. This costume, for men, was made up of a short (mid-thigh-length) smock, belted at the waist, worn over leggings in cold weather and supplemented by a short cape, sometimes with a hood. Members of Charlemagne’s court, on the other hand, maintained the simple style allowing vigorous movement necessary for warfare, but adopted some details imitating their Roman predecessors, adding a wool or silken braid to the hems of their tunics, loose bloomer-like “braies” (underpants) that tucked into their leggings, and a large rectangular cloak (which could double as a blanket) fastened at the right shoulder. By the late eleventh century, courtly robes had become long and voluminous in a more extensive imitation of Roman and Byzantine styles.

**ELABORATION OF STYLES.** Eleventh-century England provides an early example of a period that began to exhibit the kinds of changes typical of a fashion system.

The nobles' standard of living rose, cities were established, trade expanded, and craftsmen flourished, catering to the demands of nobles with money to spend. Following the Battle of Hastings in 1066, the victorious Norman nobility acquired the wealth of England. During the period when William I was establishing his rule, styles for both males and females were based on the long tunic and were relatively conservative as to cut and ornamentation. There was a change in taste, however, during the reign of his successor, William II (ruled 1087–1100). Clothes during this period were lavishly cut from luxurious cloth (some of which was brought back from the Holy Land after the First Crusade in 1095–1099), and both men and women adopted a variety of personal decoration. Still, the extravagance during this reign did not involve the creation of new styles so much as it did the exaggeration of known styles. For example, more fabric was used in the tunic; it was made both longer and fuller, resulting in garments with numerous folds and of a length that bunched fabric on the floor. Such tunics represented a considerable economic investment in a period when both cloth and clothing were thought of as commodities of exchange and were used much as money is used today. Across the twelfth, thirteenth, and the first half of the fourteenth centuries, a sporadic but escalating creation of a detailed set of fashions took place and the range of fabrics available expanded (in silks, for example, there were plain, patterned, and figured pieces in twills and other weaves), first brought back from the Christian military expeditions to regain the Holy Land (including the Crusades of 1095, 1146, 1188, and 1202) and later from the resulting expansion of production sites and trade.

**CRAFTSMEN AND GUILDS.** The increasing trade in both fabrics and dyestuffs became more efficient and vigorous in the middle of the thirteenth century as corporations of craftsmen organized in guilds to supervise training of workers, regulate quality, and specialize in production. In Flanders and in Italy, for example, craftsmen transformed bulk wool from England and silk from Sicily and the East into fine fabrics. In Paris, such specialization had, by the last half of the thirteenth century, resulted in groups of artisans that made doublets, others that made bonnets, and still others that produced shoes. Beyond an increase in quality, an additional benefit of specialization was that the craftsmen were skilled enough to create novel variations in garments and decorative design. These specialized artisans—like those in other kinds of guilds—regulated trade during the Middle Ages; scribes, goldsmiths, bow and arrow makers, and so on tended to intermarry within their own groups and live in certain quarters of the city which took their names

from the trade in question. Thus, a person shopping for certain articles of costume would generally find such items in home-based shops in specific neighborhoods, often indicated by a sign showing, for example, a representation of shoes or hats.

**THE AGE OF FASHION.** Fashion historians often credit the development of the doublet as the event which gave birth, around 1350, to an “age of fashion.” The first appearance of this short jacket, which took its name from the padded garment used as soft body armor under metal armor, occurred at a time when the military importance of the armored knight on a horse was declining, being superseded in actual fighting by the efficient and deadly long- and cross-bowmen. In the latter half of the fourteenth and throughout the fifteenth centuries, the knight continued to be designated as a military leader, even as he became less functionally important as provider and warrior. Simultaneously, his presence in the court took on greater significance, and the knight sought to make a more spectacular impression through dress. At this time, the long, full robe employing rich folds of material, now considered appropriate to the upper civic elite class of lawyers, physicians, and merchants, as well as for male members of the aristocracy, was dramatically replaced by a new silhouette. If the previous generations had preferred to hide the body in sedate movement-encumbering robes that denied physicality, the styles of the 1350s—when the aristocrat’s connection to combat was becoming more symbolic than real—emphasized male freedom of movement and sexuality in an hourglass figure. Especially in the 1500s, such new fashions were specifically associated with the courtier class of persons who maintained themselves by various forms of royal and ducal appointments and “preferments.” Two features of this costume are notable: the *pourpoint*, or short doublet showing the legs and buttocks, and the long pointed shoes called *poulaines* supposedly originating in Crakow, Poland. These exaggerated styles, as well as a trend towards tall headdresses that seemed to mimic the perpendicularity of Gothic architecture, were the subject of numerous satires against excesses in court dress.

**SOCIAL AND ECONOMIC FORCES.** In addition to the development of new tastes in the royal courts of Europe, another significant source of fashion change may be found in the increasing affluence of members of the commercial class, which gave them the ability to adopt the styles worn by the nobility. Consequently, the nobility developed yet newer styles to assert their difference from, and superiority to, the commercial elites. This encroachment of the mercantile class upon the clothing styles formerly worn only by the nobility stimulated the

proliferation of sumptuary laws (laws against excess in food, clothing, and celebrations) to regulate dress in terms of income and birth status, with the aim of stabilizing the visual and social distance between the various levels of society, from the aristocracy down to the plowman. An additional factor that contributed significantly, if indirectly, to changes in late fourteenth-century tastes from about 1348 onward was the recurrence of virulent outbreaks of a plague known as the Black Death. The sweeping fatalities from this disease and its later epidemics in the fifteenth century are thought to have eliminated between 35 and 65 percent of Europe's population. Such decimation of the populace does not seem to have halted in any permanent way the overall tendency toward conspicuous consumption, but it is interesting to note that Italian sumptuary laws responded to the mortality caused by the plague by modifying dowry requirements, including those relating to clothing, in a way that would encourage marriages and, of course, repopulation through economic incentives. One additional effect of the plague on ownership of clothing was that survivors of this epidemic inherited the wealth, including valuable garments, of those who were victims, and thus such wealth was concentrated among fewer owners.

**AN ARISTOCRATIC PREROGATIVE.** In the Middle Ages, regardless of the increase of wealth among the commercial class and their imitation of noble dress, the trendsetters in clothing styles remained those at the highest level of society—especially those courtiers in power at the royal courts. A king was expected to maintain a high standard of magnificence not only in the quality of food and entertainment in his court, but also in his and his family's dress. And he was expected to epitomize *largesse* (generosity) in the giving of gifts, especially of cloth and complete garments, to his courtiers—a virtue the courtiers must in turn imitate with their inferiors. Thus, the consumption of fashionable cloth and garments spread from the top to the bottom of society; as fashion filtered down through the different levels of social class, these garments became increasingly “unfashionable.” As a result, from the mid-fourteenth century onward, the pace of spending to create a fashionable appearance accelerated, changes in styles occurred more often, and the search for innovations in apparel eventually resulted in a standard of “precious elegance,” overly refined elaboration of details such as slashed hems that revealed contrasting colors underneath, puffed sleeves (and, later, puffed trunks), or appliqué and embroidery work. Furthermore, the adoption of this standard coincided with a new acceptance of the concept of individuality, as opposed to the former custom of emphasizing

familial or social groups. This change in attitudes included the idea that an individual might express his or her unique personality through costume. Thus, fashion, understood as a pattern of change and differentiation, became an aristocratic pleasure, enjoyed by courtiers in the same way that they enjoyed other artistic works and extravagant entertainments.

**THE ONGOING FASHION PROCESS.** Ultimately, the change from the long flowing costume that completely covered the bodies of men and women alike in the late eleventh century to the short outer clothing assumed by the mid-fourteenth century male and the long fitted gowns with plunging necklines worn by their female contemporaries was a dramatic one. Adoption of the new short costume differentiated a young nobleman from his more conservative elders and emphasized his masculinity. Similarly, lowered necklines displayed female physical beauty. The long styles of earlier centuries persisted in the more conservative ranks of society, reaching their peak of linearity in the fourteenth century and continuing to be fashionable for another hundred years among civil, judicial, and academic professionals. Near the end of the fifteenth century, the masculine style went even further as shoulders broadened, headgear flattened and widened, codpieces (decorative pouches) were added to the crotch area of the wearer's hose, and the toes of shoes became blunt and broad in the so-called “bear paw” shoe style often associated with King François I of France. As previously stated, such periodic reversals are characteristic in a system of fashion.

## TOPICS *in Fashion*

---

### FASHION AND CULTURAL CHANGE

**MEDIEVAL SOCIAL STRUCTURE.** In order to understand the history of Western Europe's costume from 800 to 1450 C.E., it is important to recognize the basic social structures and the dynamic changes that took place during this era. In the years leading up to this period, the fall of the Roman Empire had left much of Europe populated by the Germanic tribal peoples who had invaded from the east, pushing the formerly Romanized Celtic tribes westward, so that the society itself might be characterized by its emphasis on warfare and geographic mobility. Under these conditions, costume tended to vary little between that of the local chiefs or kings and that of their subjects, except by its quality of materials

and decoration. The most stable institution of society was the system of Roman Catholic monasteries where much of the wealth and learning that had arrived with the Romans was concentrated, but these were not yet organized into the numerous orders that would later lead to formalized distinctions in religious costume. It is only with the solidification of the power of the Frankish king Charlemagne and the establishment, in 800, of his empire over an area that includes what is now France, Germany, Italy, and the Low Countries, that medieval society began to stabilize, creating the conditions under which the aristocracy, now spending more time in the royal court than on the battlefield, would wish to distinguish itself by costume. By the eleventh century, a change in the economic and political system had created a hierarchy of lords, elite landholders, and land-working peasants, while in the centuries that followed, increased trade and economic development created a rising class of artisans, merchants, and financiers. At each stage, the impulse to distinguish one class of people from another through clothing became more intense, at the same time that the means of creating distinctive costume—through access to materials, craftsmanship, and wealth—were enhanced. Thus fashion in the Middle Ages reflects the complexity of a particular society in transition, as well as certain processes common to the development of fashion in general.

**THE THREE ESTATES.** Although the period from the twelfth century forward saw a rise in what would now be recognized as a “middle class,” the traditional way of describing medieval society was in terms of the “three estates”: those who fight (the nobility or aristocracy), those who pray (monks, friars, secular clergy, and the ecclesiastical hierarchy), and those who labor (peasants and serfs). There was also an important division between laity and clergy. This sense of how society was organized is basic to any discussion of fashion, since it is to the interests and concerns of the aristocracy that one must always look for the origin of fashion trends. Because the nobility of Europe originated as a warrior class, the males in this society continued to prefer a style of clothing that was designed for vigorous movement both in walking and in riding until the eleventh century. They wore brief garments called tunics that were cut close to the flanks and hips. Belted at the waist, these tunics were made of wool or linen, and were worn over *braies*—a sort of loose bloomer or shapeless trouser-like undergarment for men that was knee-length or slightly longer. The bottoms of the braies were usually tucked into full-length hose or bound close to the leg, and the large cloak worn over top could double as a blanket. This very practical garment reflected the functional role of the

aristocratic male, but at the same time it took on certain decorative elements more characteristic of a system of “style.” During the Carolingian period, the hems of tunics were edged with woolen or silken braid, and the cloak, which was large and square, was fastened at the right shoulder in a style reminiscent of a Roman toga. Both of these touches suggest that costume was being used not only to provide an appropriate garment for work, but also to make a symbolic statement about the relationship between Charlemagne’s new empire and the Roman empire that it replaced. The women in this empire wore longer versions of the male tunic. The clothing of the peasant, which often consisted of only a single smock or long shirt, worn over leggings and under a hooded cape in cold weather, would not be marked by decorative elements, nor, as long as a land-based economic system persisted, would it be subject to periodic change. Likewise, clerical garb for daily wear remained static because it was subject to ecclesiastical regulation and, in keeping with the imagined simplicity of Jesus and his disciples, consisted of the plainest of styles, while church vestments for the celebration of the Mass were determined not by fashion, but by their specific symbolic character.

**THE HISTORICAL PROCESS.** Throughout the Middle Ages, aristocratic costume evolved in a manner characteristic of all fashion change, illustrating the basic principle of periodic shifts and reversals of extremes. The era from the ninth century to the fifteenth saw major changes in social roles, political leadership, economic well-being, foreign influence, and the visual arts, all of which had some direct or indirect influence on styles of clothing. Such influences, however, do not provide the complete explanation for all the shifts that occurred sporadically from the ninth century—when T-shaped styles (cut from a single piece of fabric with a hole for the head, seams down the sides, and sleeves draped over the arms and sewn underneath) and relatively simple fabrics and ornamentation were the norm—to the late fifteenth century when excesses in luxurious, closely fitted, and fanciful dress were commonplace in the upper and middle classes. In this complex historical process, there were periods during which one or more aspects of current dress were carried to such an extreme—for example, the practices of vastly lengthening gowns, widening shoulder proportions, using excessive amounts of fabric in a gown, or tightening a garment to fit the body that had formerly been hidden among folds of fabric—that excesses were followed by a swing or return to conservative, opposite styles in dress. Such reversals in fashion, then, resulted from a variety of factors and contributed to the development of a system of fashion as a powerful force in the

## DEFINITIONS of Medieval Clothing

**Bliaut:** Either a costly fabric, a knight's court tunic, or a lady's court dress. When this term refers to the lady's garment, it signifies a gown of the richest fabrics, banded at neck and wrist edges with strips of embroidery; fur-lined; having a tightly-laced (at the sides) elongated bodice; a full, long skirt; and sleeves of various styles. The sleeves were often sewn on with each wearing, and one pair might be exchanged with another in the course of the day. As a fabric, bliaut meant silk, satin, or velvet imported from the Orient. This cloth was frequently woven with gold thread and embroidered with gems.

**Braies:** Loosely fitted linen thigh- or knee-length underpants worn by men of all classes.

**Corse:** The bodice of a bliaut, or a stiffened garment worn underneath a bodice made of lighter weight fabric. It could be laced tightly to shape the waist and torso.

**Cotehardie:** A short, tightly-fitting jacket-like garment for men popular from around 1333 through the mid-fifteenth century. In its earliest form, it was a tightly-fitting, low-necked garment reaching only to the knee, worn over a shirt, distinguished by a row of buttons that ran from the neckline to the low waistline. When worn by women, the cotehardie was somewhat less fancy. Buttons were optional, and no girdle was worn with it.

**Courtepie:** A short garment worn by men and women over other garments in the fourteenth and fifteenth centuries. The courtepie resembled the surcoat, and in its fifteenth-century version may have been the short houppelande.

**Doublet (pourpoint, gambeson):** A short garment for men with a tight waist and a thickness of padding through the chest; also a garment worn by knights, both as an outer garment (coupled with hose) and as padding under armor.

**Girdle:** A kind of belt introduced into female costumes in the eleventh century to give the female figure a more distinctive outline, but later worn by both men and women. Girdles were usually constructed as twisted cords, sometimes knotted, made from gold or silver wire and dyed wool or silks, and bound with ornamental fasteners or finished off with tassels. Simpler girdles were also constructed from a length of fabric that was decorated with stitching of a contrasting color.

**Gown:** See *Houppelande*.

**Houppelande:** A fourteenth-century garment of variable length that was worn over the doublet and hose. The longest version of this garment was worn for formal occasions and was ground-length or somewhat longer. A short version reached halfway between ankle and knee, and one of an even shorter length hit some inches above the knee. Initial forms of the houppelande had high collars that fanned out, but later collar styles differed. Belts were sometimes worn with houppelandes. Sleeves were funnel shaped, increasingly wide at their ends, and often edged with fancy cut-work ("dagging") and slashed to show fur linings of complementary colors. The short version was named "haincelin" for the jester Haincelin Coq in the court of Charles VI of France. After 1450, the more usual term for this garment was "gown." The houppelande was replaced by the robe later in the fifteenth century.

**Mantle:** A garment worn to protect its wearer from bad weather while serving also to designate high social status and power. Throughout the Middle Ages, variations in style depended on intended usage. In the period from 1066 to 1154, two shapes of mantles had long been in use—the semi-circular and the rectangular. These outer garments were bordered with contrasting colored embroidery interspersed with gold or silver threads. A mantle was often received from an overlord as a valuable gift, then bequeathed from generation to generation; because of its history, this garment increased in social significance through time.

**Paletot:** A short-sleeved, short and loose gown for men, sometimes worn as an over-garment with the doublet.

**Poulaines:** Leather shoes with long pointed toes, sometimes called *crakows*. Both names were associated with Poland where such shoes supposedly originated.

**Pourpoint:** See *Doublet*.

**Robe:** A name applied to many different garments during the Middle Ages, ranging from the long tunic in England (late eleventh century) to a complete outfit of a varying number of layers intended to be worn together, some of them made of silk, some furred (fourteenth century). In the fifteenth century, "robe" indicated a particular kind of gown, worn long for important events and short for ordinary purposes.

**Tunic:** A loose wide-necked garment, usually extending to the hip or knee and gathered with a belt at the waist.

dress of Europe. Regardless of their causes, of course, once the swings had occurred, the movement toward excess in dress would inevitably begin again and build toward another peak. The end of the fifteenth century was one such excessive period in the dress of the nobility and the commercial class that, by this time, also had the money to dress lavishly.

**MEN AND THE AGE OF FASHION.** Although in recent centuries society has been accustomed to thinking of fashion as an area of greater interest to women than to men, during the Middle Ages it was the clothing of men that underwent the most radical transformations. Female aristocratic costume retained a uniform set of basic elements, including a minimum skirt length at the top of the shoes, throughout the entire period; changes in fashion mostly concerned the tightness of fit, exposure of neck, chest, and shoulders, amount of fabric utilized, decorative elements, and the addition of such accessories as sewn-in sleeves, girdles (belts), and headdress. The clothing of men, on the other hand, underwent more profound alterations in garment type and especially length. These alterations reflect the change from an almost exclusively warrior image to a developing role as both warrior and courtier, and, finally, around 1350–1400, to a status in which the former military role was mainly symbolic. This last shift in male fashion, characterized by a major transformation from long to short costume, took place during a period when other economic and social factors encouraged interest in clothing as a reflection of status, and, as a result, led to an accelerated pace of imitation and alteration. Thus, the period from 1350 onward can be identified as The Age of Fashion.

#### PEASANT COSTUME

**IMAGES OF LABOR.** The costume of the nobility is fairly familiar to modern historians thanks to its frequent depiction in manuscript miniatures, wall paintings, and

tomb art. While such evidence is not as available for the more humble costume of peasants, there is still a considerable body of evidence to offer a rather precise idea of a costume which remained fairly fixed from about 800 to about 1375. Such sources include manuscript illumination, textual sources (including literature), and numerous French wills and inventories of garments in the possession of agricultural laborers. Moreover, some details of female agricultural costume were preserved in poems called *pastourelles* (from the French word for “shepherdess”), a type of song popular in both northern and southern France during the thirteenth century. These poems told the story of how a knight passing through a rural area tries to seduce or overpower a pretty shepherdess. Since the knight coming upon a shepherdess guarding her flock often describes her clothing as part of her charm, these poems also serve as a source of information about rustic female dress. A variant of the pastourelle called the *bergerie* (meaning “shepherd” in French) features an aristocratic observer of a group of shepherds in conversation or playing games. Information about their clothing or discussions of clothing sometimes form part of these poems.

**PEASANT WOMEN.** Regardless of class, women’s costume had certain elements in common, although costume for peasants was drab in color and used far coarser materials and less ornamentation than did the clothes of the aristocracy. All classes of women apparently wore a white linen or hemp chemise or underdress with full-length sleeves, fitted at the wrists. There is no evidence that women in the Middle Ages wore underpants under the chemise, though men did. Women seem to have worn hose, though they were only calf or knee high. The chemise’s neckline sometimes plunged to show the tops of the breasts, and its bodice was often laced horizontally or criss-cross. The chemise could be pleated on occasion. Over the chemise peasant women wore a long, tightly fitting dress similar to that worn by upper-class women. This dress was called a *cote* or *cotte*. The word *robe* in the earlier Middle Ages referred to an entire female costume made up of a chemise, a cote, and a cloak-like over-garment called *surcote* (literally, “overcoat”), or sometimes a mantel. For working outside, they wore a kerchief-like head-cover or a cap with a stiff brim and mittens. In some cases the cote was tucked up into the waistband of a white linen or hemp apron to keep its hem clean while the woman engaged in “dirty work.” By the mid-thirteenth century it became fashionable for women to have the cote and a protective outer garment of a matching fabric called *burel*, which is both a coarse wool and a grayish-brown color. In some cases, as noted in death

Male farm worker with seeding apron and woman with sack of seeds. Labor for October, the Playfair Hours, use of Rouen, Victoria and Albert Museum MS L.475–1918, late 15th century. THE ART ARCHIVE/VICTORIA AND ALBERT MUSEUM LONDON/GRAHAM BRANDON.

inventories of possessions of late fourteenth-century Burgundian peasants, the cote is most commonly described as a shade of blue or, next most popular, a shade of red. Against the cold, the rustic woman would often have a cloak or sometimes a hooded surcote; this was apparently a very desirable garment, since in one anonymous thirteenth-century French pastourelle the practical shepherdess tells the narrator that he must give her a “sorcote” before she will make love with him. Somewhat wealthier female peasants wore cloaks trimmed with rabbit or cat fur. In fair weather female agricultural workers wore neither surcote nor cloak. They are often depicted in medieval manuscripts such as the *Très Riches Heures of Jean de Berry* (1415), sowing in the fields while wearing a special apron or overdress with a fold to hold the seed with the simplest of smocks underneath. Rustic women are easily recognizable in medieval manuscript painting by the presence of a large brimmed, rather flat straw hat, very like that worn today by farm workers in Asia.

**MALE AGRICULTURAL COSTUME.** Throughout the period, male peasant clothing was largely similar to the costume that upper-class men had worn in the Carolingian period (eighth to tenth century), when the main concern of the warrior class was to have freedom of movement. Even when male aristocratic costume lengthened, peasant costume remained at the knee or just slightly below. Beginning with the feet, typical male peasant costume consisted of hose of a sturdy white fabric (in good weather) worn inside low patchwork shoes with leather soles and heels. In winter, the peasant wore gaiters or leggings, usually made of canvas or leather, over his hose. His undergarments were the chemise, similar to that worn by women but with long split tails in which he often wrapped any coins he might have, and linen *braies* (underwear). Over the chemise he wore a sleeveless cote, often with double facings—broad strips added on the chest and shoulders for warmth and resistance to wear. This was sometimes called in Old French the *jupeau* or *jupel* and could be made of the coarse

*a PRIMARY SOURCE document***SHEPHERDS' CLOTHING**

**INTRODUCTION:** The only medieval text to describe in some detail the actual dress of shepherds is the treatise by Jean de Brie called *Le Bon Berger*, or *The Good Shepherd*, supposedly written at the command of King Charles V of France in 1373. The practicality of the average agricultural costume described here highlights the functionality of shepherds' clothing, which stands in stark contrast to the "luxury" of courtly attire.

The shepherd ought to wear stockings of a sturdy white cloth or of a camel-hair fabric and some slippers with soles and heels of sturdy leather. In winter, he ought to have, over his hose, gaiters or leggings cut from the leather of old boots, to keep off rain. To last longer, the heels and soles ought to be sewn with a stout hempen thread well waxed ... And the shepherd ought to be able to squat on his heels, under a bush when it is necessary.

The shepherd's chemise and braies ought to be of a thick and sturdy linen fabric called canvas. The garters or suspenders (brayette) holding the hose to the braies ought to be made of cloth about two fingers wide with two round iron buckles. The chemise should be split into two tails, and these ought to be long and shaped like a small handkerchief so that the shepherd can wrap up his coins inside and tie the bag with a simple knot. Over the chemise he should have a coteron or sleeveless mantle of white linen or of gray camel hair [imitation camel or goat hair]; this ought to be double faced over the shoulders as far down as the belt in order to protect his chest and belly from wind and storms and to allow him to walk across the fields more surely behind his sheep, for they are of such a nature that they go willingly against the wind.

Over the mantle the shepherd ought to have a surcote, a garment of white linen or of gray camel hair ending in two square bibs. The one hangs like an apron before and the other behind, protecting from cold both belly and loins. It has sleeves and is large and ample enough so that he can get it on easily without buttons. For it is not suitable to have buttonholes or hooks that can annoy him when he is getting dressed. Rather he ought to enter it directly, as if getting into a sack or like Aaron's tunic. Above the surcote he ought to have a surplice of canvas with sleeves and four buttons. This surplice protects the shepherd from the rain, and sometimes he will have to remove it to wrap up a lamb just born in

the field. Around his surplice he ought to have a girdle of fine strong cord, braided of three strands, with a round iron buckle. From this girdle he can suspend various things. ...

He ought to hang from this girdle a scabbard in old taw or rough-tanned leather or eelskin in which to keep his flail. And he ought to carry a pouch in which to keep his bread and food for his dog. It ought to be of a kind of netting suitably knotted in the fashion of a potter's harness. This pouch ought to be worn on the shepherd's left in order that it not encumber his right side so that he can easily shear, trim, anoint, and bleed his sheep, if need be. And to the pouch ought to be attached a dog leash of about a yard and a half in length which ought to be redoubled back to the pouch. In the middle of the leash he ought to have a piece of leather with a small toggle of wood to attach and unhook his dog and send him easily and quickly against wolves and other annoying animals which wish to seize his sheep. ...

It is proper that the shepherd wear a felt hat, round and very large. On the brim and upper part of the crown fabric ought to be doubled a palm's length or more. This doubling is necessary for two reasons. At first to protect the shepherd from rain and bad weather when he goes against the wind behind his sheep. Secondly, for the profit of the master who owns the sheep. For each time that the shepherd goes to anoint the animals against the scab and he cuts the wool away with his scissors to get to the scabbed spot, he puts the wisps of wool and clippings in the folds and doublings of his hat, in order to return them to the master at the house. For he is obliged to look out for his master's interests in doing his offices as a shepherd. This hat is usefully adapted to a shepherd's life as much to protect him from rain, wind and storm as to cover his head. ...

In winter the shepherd ought to have some mittens to protect his hands from the cold. He ought not to buy them but make them himself whether he knits them with needles in the fashion of a canon's hood from a skein of wool spun by the hand of a shepherdess, or whether he makes them from cloth of several colors to his own taste; when they are made of such motley bits of cloth they are very pretty. When it is not too cold where the shepherd can work with his hands, he ought to hang these mittens from a small ball hooked to his girdle. ...

A SHEPHERD'S FASHION ADVICE TO HIS SON

**INTRODUCTION:** Shepherd costume is often described in a variant form of the pastourelle called the *bergerie*, from the French word for “shepherd.” These poems were popular in the 1360s; one appearing in a collection of lyrics now in the University of Pennsylvania Library (MS Van Pelt 15) is particularly rich in concrete information about male peasant costume. It also shows the same satiric attitude toward excesses in costume applied to the ornate head-dresses of women. In this *bergerie*, a shepherd named Herman, now 100 years old, offers sartorial and moral counsel to his son Robin—a stock name for a shepherd.

“[Make sure] that you wear a white smock, patchwork shoes laced high and fastened with three iron clasps. Beware of short smocks showing your behind and codpiece in tight-gathered drawers when you squat and crouch, and do not wear pointed and windowed shoes.” ...

[The dutiful Robin agrees to do just as Herman commands:]

“Father, I will do your will. No poulaines will be my shoes, causing me to trip as I go. I will not walk about with my stomach belted in tightly nor with my hose attached to my smock, for in kneeling when girded thus, all will rip in several places.”

*Translated from the Middle French  
by John Block Friedman.*

grayish brown wool called *burel* if undyed, or perhaps dyed dark gray-blue with woad, a pigment-producing plant. The *jupeau* could also be made of heavy canvas. For many tasks, the peasant would wear a linen or leather apron over the *cote*. An example of a male laborer with such an apron for seeding occurs in a calendar for a book of hours (daily devotions and prayers) now in the Victoria and Albert Museum, London. The full peasant costume is illustrated in a manuscript miniature from the *Maciejowski Bible* in the Pierpont Morgan Library in New York, which shows a peasant at work in a *cote*, tucked up into his *braies*. On top of his *chemise* and *mantel* against inclement weather was worn the *surcote*, also of white linen or of matching wool with bib-like extensions at front and rear. This was usually cut large and had no buttons. A girdle or belt on which pouches could be hung to hold sharpening stones, sewing implements,

Laborers threshing, with gowns tucked up and braies or under-pants exposed, lower left. *Maciejowski Bible*. © PIERPONT MORGAN LIBRARY 2004. THE PIERPONT MORGAN LIBRARY, NEW YORK. M. 638, F. 12V. PHOTOGRAPHY: DAVID A. LOGGIE.

or, for shepherds, salves or even dog food, completed this outfit. Peasant men usually wore a large round felt hat and fingerless woolen mittens, in contrast to the fancier gloves worn by aristocrats.

**A CHANGE FOR MEN.** By the mid-fourteenth century (1350–1375), members of the working class less frequently spent their lives confined to manors where they labored and began to have increased access to consumer goods. This new freedom translated into fashion as the male costume changed somewhat and began to imitate courtier garb, which had by then become shorter and more tightly fitted. In particular, the *cote* was radically shortened, coming just to the buttocks or slightly below, and the plowmen or urban industrial workers wore hose that were tightly fitted and cut on the bias to give them elasticity. The hose were attached to the hem of the *cote* by laces, sometimes with metal ends called *points*. For vigorous work involving bending, these laces were left unfastened.

## ACADEMIC, CLERICAL, AND RELIGIOUS DRESS

**STANDARDIZING FOR SIMPLICITY.** Similar to peasants, members of the second estate—those who led a life associated with the church—wore costumes that were not nearly as subject to changes of fashion as the costumes of the aristocracy. Clothing worn by those who served the Christian church was intended to symbolize the simplicity of life modeled by Jesus. The ruling that required all men and women in cloistered religious orders—that is, monks and nuns who lived apart from the world—to wear habits was established by a consensus of church officials several centuries after the founding of the Benedictine Order of monks in 529. Canon 27 (a rule regulating dress) was initiated as early as the Fourth Council of Constantinople (869–870) and reaffirmed in the Fourth Lateran Council in 1215. These councils, known as "ecumenical" (that is, intended for creating unity), included cardinals, bishops, and superior abbots throughout the whole Christian world and were convened by the papacy. The influence of these rules extended to university students, a relatively new group in the later Middle Ages, for whom religious costume was adapted according to their stage of education. Another group that imitated the simplicity of the early church in their costume were pilgrims, who were to be found on land and sea throughout Europe and the Middle East as they made their way to sacred shrines for purposes of penance or, sometimes, the simple desire to travel.

**MONASTIC AND SECULAR RELIGIOUS COSTUME.** The founder of each holy order in the Roman Church of the Middle Ages established a Rule under which his

or her members should live, and these rules specified appropriate and uniform clothing that illustrated the religious beliefs of that order and served as its identifying insignia to the public. It was desirable that these members, often withdrawn from the world, should demonstrate this withdrawal by avoiding all display of worldliness, especially in their dress. For example, the Rule of St. Benedict, written for monks and adapted for nuns, specified that only locally produced, inexpensive fabrics might be used for religious dress, and the finished garment was to be without decoration. The standard garments for Benedictine monks included braies, over which was worn a long robe with cowl or hood, a belt or girdle, stockings, and shoes. Similarly, the basic dress of Benedictine nuns was a *cotte* (a black surcoat with wide sleeves or a mantle), a headdress consisting of a white under-veil and black over-veil, and a white wimple (a cloth covering the neck, sides of the face, and some portion of the forehead still worn by some orders of nuns). A *pilch* (a cloak made of skins or fur), and/or a fur-lined mantle were allowed in more severe climates. For secular clergy—that is, parish priests who lived in quarters near their churches—there were, however, no hard-and-fast rules about what to wear when they were not officiating at Mass. They were urged to dress soberly.

**FRIARS.** The four orders of friars (Franciscan, Dominican, Augustinian, and Carmelite) differed from members of cloistered religious orders in that they were not removed from the general society. Friars were out and about in the world, begging for their subsistence, hearing confession, sometimes teaching, and sometimes acting as spiritual advisors to wealthy families. Ordinary peasants' dress was the model for their habits. St. Francis set the standard for his followers to have and wear only one tunic with a rope girdle, one hooded coat, and, if needed, a second unhooded coat, and no shoes. He specified that only the simplest materials might be used to make these garments, and they should be patched with the same kind of fabric. Franciscan friars wore brown hoods, brown loose robes with loose sleeves, cord girdles (belts) with knots showing, and sandals. The brown (or indeterminate gray) associated with Franciscans distinguished them from the Dominicans, who wore black over white (they were thus called the Black Friars), as well as from the black monks (Benedictines) and white monks (Cistercians).

**STUDENT DRESS.** Since universities grew indirectly out of the cathedral schools that first began to be established in the 800s, most students in medieval universities were initially required to take "minor" holy orders, the first step towards becoming priests. Indeed, students

Two priests and a bishop bless beggars. *Chronique de St. Denis*, London, British Library MS Royal 16. G.VI, 1325–1350. © THE BRITISH LIBRARY/TOPHAM-HIP/THE IMAGE WORKS.

were known in English and French as “clerks,” or *clerics*, a word also meaning “cleric.” Thus, in certain ways academic costume developed from secular religious dress in the later Middle Ages. As the universities became more formally structured in the thirteenth century, university officials began to pay attention to academic dress for scholars of all ranks in the system. Bit by bit, a detailed system of dress developed that indicated each gradation from bachelor to doctor in a university career. In the thirteenth century, the basic garment was a dark-colored *vestis talaris*, a long tunic. When styles for men were shortened and the pourpoint or short doublet grew popular among younger men in the fourteenth century, student dress retained the “long robe” of sober color, which reached to the ankles. Over this “long robe” students were expected to wear either a formal full-sleeved cope, or cape, which was briefer than the tunic (*cappa manicata*) or, for normal wear, a larger, sleeveless over-garment, also reaching to the feet, having one slit, mid-front, so that arms and hands could reach out, or having slits on each side (*cappa clausa*). These slightly modified religious habits, both for students and for teachers, survive as the academic dress that is still worn for graduation ceremonies today.

**VIOLATIONS OF DRESS CODES.** The fact that university dress codes—apparently based closely on the disciplinary decrees regarding clerical dress of the Fourth Lateran Council of 1215 held under Pope Innocent III—

were often violated may be inferred from university records where certain items of clothing were periodically and repeatedly forbidden. The wearers of offending garments could be fined or denied privileges. Among the forbidden items were red or green garments (which were considered vain); “secular” shoes (that is, those with cut-out designs); curved or decorative hoods; swords or knives; fancy belts (girdles) enhanced with silver or gold trim; trunkhose, puffed sleeves, red or green hose, or boots that might be seen beneath long garments; and garments that were too short or fitted too tightly to the body (as was increasingly fashionable in late fourteenth-century secular costume). Such attention to color, fabric, and cut showed that the wearer was too worldly and not sufficiently serious for university life. Tailors who made such gowns for academics were subject to imprisonment and non-payment until these tunics were altered to the appropriate dimensions. Certain universities, such as the University of Toulouse, set up systems of dress for scholars of all ranks with economy and seamliness in mind to keep them from spending their fee, book, and subsistence money on clothing. In addition, other rules ensured the plainness of student head coverings: the *pileus*, a close-fitting skullcap; the *biretta*, a square cap with three ridges at the top and sometimes a tuft in the middle; and the hood. Over time, these requirements for plainness gave way to color schemes assigned to each field of study to distinguish one faculty from another and to

Three pilgrim badges, St. Christopher with Christ child in center. 14–15th centuries. © MUSEUM OF LONDON/TOPHAM-HIP/THE IMAGE WORKS.

satisfy the desire for pageantry and display. For example, those who became Masters (achieved a Master's degree) of Civil Law at some time before the late fifteenth century adopted dark blue as the color of their hoods (a practice in color choices retained in the twenty-first century). Similarly, Doctors of Medicine chose red for the color of their robes. The colorful academic hood worn by those who achieve doctoral degrees today is a remnant of this system, as are the black velvet bands sewn to the arms of academic gowns to signify master's or doctoral status.

**CHURCH VESTMENTS.** The particular garments worn by priests when officiating at divine worship and administering the sacraments are called vestments. Because they symbolized the glory of God and the church, such garments could be constructed of costly fabrics, with much ornamentation, and dyed in colors established by long use. When the priest celebrated Mass, he wore six specialized garments: the *amice*, *alb*, girdle, *maniple*, *stole*, and *chasuble*. The *amice* is a handkerchief-like fabric that covers the shoulders; the *alb* is a floor-length white gown with full, long sleeves. The gir-

dle of white tasseled cord belts the *alb* at the waist, while the *maniple* (from the Latin word for "hand") is another handkerchief-like cloth that is worn over the left forearm. The *stole* is a white knee-length scarf around the priest's neck, very much like a modern dress scarf. The *chasuble* is worn over all of these garments. Other vestments were the *dalmatic*, *surplice*, *cope*, and *pallium*. A *surplice* was the garment of the choristers or singers in the choir; it was of white linen and knee length. A bishop wore the *pallium*, a narrow woolen scarf with purple crosses embroidered on it, and a *cope* or *chasuble*-like outer garment. He carried a *crozier* (a staff with a hooked end like a shepherd's crook) and wore a type of pointed headdress called a *mitre*.

**PILGRIM'S COSTUME.** Pilgrims were sometimes members of religious orders and sometimes lay travelers who were engaged in a religious or penitent voyage to a sacred shrine. They wore a distinctive set of garments and accessories and were treated by others as religious persons. This costume distinguished them from other travelers as proper recipients of wayside charity and helped protect them from thieves. Medieval pilgrims

Statue of Saint James the Greater with scrip and wide-brimmed hat with a scallop-shell badge. His staff has broken off. Burgundy, Paris, The Louvre, 15th century. © ADAM WOOLFITT/CORBIS.

carried a walking staff and a *scrip*, or bag, with strap that could be worn across the shoulders for the purpose of transporting the pilgrim's minimal possessions, possibly including a begging bowl, on the journey. Their chief garment was a tunic, normally made of the roughest fabric, sometimes worn or ragged, and a broad-brimmed hat with the brim turned up in the front. Attached to this hat were various insignia in paper, parchment, pewter, or tin that denoted the shrines the pilgrim had visited. The emblem of a scallop shell served as the traditional pilgrim sign of St. James of Compostela. A pilgrim would wear this shell to show that he had made a pilgrimage to the saint's shrine in Spain. For each new pilgrimage the traveler added an appropriate insignia. Thus, someone who made a pilgrimage to Canterbury might return with a badge in the form of a Canterbury cross or one depicting St. Thomas Becket mounted on a horse, while those who came home from Rome displayed Rome's signature pilgrim badge—a *vernicle*, the depiction of Christ's face on a replica of St. Veronica's veil. While on pilgrimage, it was also not uncommon in

the later medieval period to carry a coral rosary (symbolically significant because of the cross-like branching of the original material) in a convenient manner for ready use—over the arm, or suspended from the belt—both for regular prayers and because it was believed that the rosary itself, as well as prayers, protected the pilgrim from possible dangers of the road and from ill health. No shoes are mentioned among these garments and accessories because the greatest piety was demonstrated by going barefoot. Nevertheless, some pilgrims did wear rough sandals or shoes.

**RELIGIOUS VANITY.** In spite of all this regulation, beneficed priests—that is, parish priests who had the income from a specific church and piece of land in a parish—and even monks and friars often dressed as they liked, and sometimes quite sumptuously. Chaucer's Friar in *The Canterbury Tales*, for example, wore a cope which was too short and turned his tippet or hood into a peddler's bag stuffed full of small items to attract the attentions of parish wives. At the Convocation of the Province of Canterbury in England, held in 1460–1461, a complainant alleges that

in modern times a certain abuse has appeared ... that simple priests and other priests over and above their grade and status openly wear their apparel in the manner of doctors or of other worthy men. ... They do not wear their top garments closed but the whole of the front part open, so that their private parts can be seen publicly in the manner of laymen, and many such priests have tight hose and hoods with tippets joined to them and have the collars of their doublets made of scarlet or other bright outlandish dress publicly showing above their gowns or tunics ... to the great scandal of holy orders.

Repeated councils dealt with this problem and addressed numerous details of dress that were forbidden in order that the garments of clerics and laypersons might be visibly different. Later councils even set forth regulations with the aim of distinguishing so-called "simple" priests from those who were elevated in status and/or education.

## ARMOR AND HERALDRY

**COSTUME FOR MILITARY IDENTITY.** Throughout the medieval period, the upper-class male maintained his sense of aristocratic identity in part through wearing the specialized clothing and insignia of military life. This clothing was connected to both military combat itself and the peacetime military exercises known as tournaments, which served not only to provide practice for knights in training but also spectacle for members of the aristocracy. Defensive clothing changed radically during the period from the eighth to the fifteenth centuries, and these changes were largely in response to the evolution of new methods of combat and military organization. While early medieval warriors (before the year 1000) fought in tribes and encountered each other mainly on foot, the development of a system of lordship usually referred to as “feudalism”—based on the idea of an exchange of land for part-time military service as an obligation to an overlord—created a class of mounted soldiers (knights) who were obligated to present themselves, their weapons, and their horses for a certain number of days a year to satisfy the requirements of their contract with the overlord. These knights, known as vassals, formed small troupes accompanied by younger noblemen called squires who acted both militarily as supporters and also as servants. Owing to the cost of their equipment, as well as of the horses for both traveling and combat, only quite wealthy persons could muster such a group and own the armor and weapons that the new style of mounted combat required. The connection between wealth and military costume in this strongly hierarchical social system was further reinforced when decorative elements were added to serve as a way of identifying the individual knight, who was anonymous once clad in his armor. Not only did these decorative elements, in the form of coats of arms, provide a way of distinguishing one knight from another, but they also contributed to the visual stimulation of tournaments and indicated the family lineage that set the aristocrat apart from the other classes.

**LEATHER AND CLOTH.** The military costume of the Germanic peoples, including the Vikings who conducted

Dietmar der Sezzer and another knight with heraldic coat of arms and helmet disguise. Manesse Manuscript, Heidelberg, Universitätsbibliothek, Cod. Pal. Germ 848, 1300. THE GRANGER COLLECTION, NEW YORK.

raids throughout northern Europe well into the eleventh century, was largely like that of the workers on the land. From about the first century C.E. until about 1150, the warrior's costume was short enough to allow for freedom of movement, and used layers of animal skins or padded fabric to protect the wearer from hacking swords and spear thrusts in close quarters. It was not intended to stop projectile weapons, which were not then in common use. Though this defensive costume had bosses (circular metal plates covering critical areas on the body) and fastening pins of iron or precious metals, only the head covering was of solid metal; this helmet was in the form of a pointed cylinder, often surmounted by an ornament such as the boar's head mentioned in the Old English heroic poem *Beowulf*, which details battles and military life in Scandinavia during the seventh to ninth centuries. Some forms of the helmet during the Carolingian period (eighth to tenth centuries) had a protective bar or “nasal” which came over the nose and sometimes flaps which served as cheek protectors.

**CHAIN MAIL AND PLATE ARMOR.** Military costume changed markedly with the rise of lordship in the eleventh century. The knight who served as a vassal to an overlord held a well-defined place in the social hierarchy and soon had a costume intended both to distinguish his social class and to protect him in the new style of combat, in which mounted knights charged at each other with lances in an effort to unhorse their opponents. Once the knight was dismounted, he fought with sword, axe, or mace—weapons requiring a defensive costume that protected against piercing and blows. This costume evolved rather quickly between the eleventh and twelfth centuries and differed in a number of ways from the older Germanic or the even earlier Roman style of military dress. Over the knight's outer robe known as the *bliaut* or later the *cote*, he wore a vest, often called a *gambeson*, made of *cuir bouillée* (leather boiled to make it tough) or of padded linen, a garment often worn alone as soft armor by non-aristocratic warriors. It was slit at the sides and in the middle of the lower portion, which allowed its lower panel to drape protectively over each thigh as the knight sat on a horse. Over this vest was another waist-length garment called the *brogne* or *burney* from German and French words meaning "bright," which was made of many tiny rings of iron linked together like chains into a sort of metal "fabric" that allowed movement. Up to the eighth century or so the early version of this garment had not protected the neck, but a caped hood of mail soon developed, called in Old French a *hauberc*. Some armor historians use the term "hauberc" to refer to the whole mail garment, but *haubergeon* is the correct term. This chain-mail garment could be sleeved or sleeveless, but it came up over the head and neck in a characteristic hood-like fashion and was supplemented by an iron skull-cap-like conical helmet for further protection. At the end of the eleventh century, through contact with the great metal-working centers of Damascus in Syria and Toledo in Spain, French knights obtained the finest quality haubergeons of mail, in which each ring was welded for strength and had sleeve-like extensions to protect the lower arms. Matching chain-mail-covered leather gauntlets (forearm-high gloves) and cloth or leather leggings with chain mail came into use about 1150 and continued to about 1330, completing this relatively light and flexible defensive costume, especially suitable for close hand-to-hand combat. From about 1350 onward, armor responding to the technology of archery developed; now key areas of the haubergeon would be reinforced with plates of iron, flattened cow horn, or boiled leather to protect the wearer from the bolts or shafts of the crossbow, which appeared in France as early as the mid-tenth century, and the long bow, in use by 1290 or so. Gunpowder weapons appeared

around 1350. From 1330 to about 1450, knights attempted to protect the entire body against these projectile weapons by the addition of plates of iron, eventually linked together by leather straps, and cylindrical helmets with eye and breathing holes. But this standing suit of armor, which is so familiar in modern depictions of castles and medieval life, was unwieldy and eventually became mainly ceremonial.

**THE COAT OF ARMS.** On top of chain mail, as early as around 1100, knights began to wear a long thin fabric garment. It could be sleeveless and open under the arms, or it could have short sleeves. Beginning around 1130, this shirt, which buttoned down the front, often had painted or embroidered on it a shield-shaped insignia called a *cote a armer*, or coat of arms, which identified the disguised knight at a distance. This technique apparently developed during the period of the Crusades in imitation of an Islamic custom of painting an image (a blazon) on the knight's shield to identify him to his own troops, who could then recognize and defend him. The cote remained in use until 1410, and its ensign or design contained elements such as bars, stars and stripes, flowers, animals, crosses, and other images that enabled the knowledgeable viewer to know the whole lineage of its wearer. Such insignia were also painted on the outside of the knight's shield where they could easily serve to identify him when his cote might be obscured. In addition to these two forms of insignia, knights also often carried banners, wore scarves around the helmet (again probably in imitation of their Islamic rivals), and decorated their horses with cloth trappings. These markings and patterns soon became hereditary so that a knight bore the insignia, with small identifying changes, that had been worn by his father and grandfather. Since the possibilities for deception existed, heralds—persons knowledgeable in family history—were trained as early as the 1130s to recognize and validate the knight's right to display the coat of arms.

**THE INFLUENCE OF HERALDIC DECORATION.** Over time, displays of arms provided a popular motif for the decoration of civilian costume, as, for example, in the use of the *fleur de lis* (the symbol of the French royal family) as an appliqué on royal robes and dresses. Such designs also began to move from costume to architecture, in the stained glass window of a chapel donated by a certain local family or carved on the façade of a building. The coat of arms might also be inscribed on jewelry (still common on the modern signet ring) or painted on the title page of an illuminated manuscript to indicate ownership. Arms were placed on tombs of knights in churches as early as 1135 where the sculpture

of a knight in lifelike armor, often with his dog at his feet, was displayed atop the tomb chest with armorial shields at the sides of the chest. When members of noble households married, the symbols of the two families were often combined to form a new heraldic device in which the arms are said to be “impaled” or divided down the middle, with those of each family occupying half of the shield. This “impalement” brought the influence of the coat of arms back to fashion as it gave rise to “particolored” costume in which one leg of hose might be red and the other green. With the gradual coming to power of a civic elite through trade or administrative service, a person’s arms could often include elements of the occupation his preeminence was founded on; in the north of England, for example, the family called Bowes, from their original trade as makers of bows and arrows, showed a pattern of bows presented vertically in panels on the shield. Eventually corporate entities such as cities, universities, and even colleges within universities all came to have arms which were displayed on plates, draperies, in stained glass, and the like.

## THE RISE OF COURTLY COSTUME

**COURTLY DRESS AND CHRISTIANITY.** With the relative calm and stability of the empire established under Charlemagne and his Ottonian successors, a renaissance of court costume—that is, costume to be worn at times

when freedom of movement was not required for fighting—arose in the tenth and eleventh centuries. It was characterized by both splendor of fabric and cut and a Roman solemnity or soberness in style. This costume was a reaction to the older pagan Germanic or “Barbarian” dress styles, which were chiefly military and short. This newer courtly costume was considered “Christianized” because it was modeled on the long robes supposedly worn by the Evangelists. It also showed marked Byzantine influence, for costume in the Eastern Christian capital of Constantinople had long been floor length. It appears, then, that long costume in a Roman style was absorbed by the spread of Christianity and became the garb of Christians of both high and middle station, above the peasant class. Thus, when St. Bernard preached the first Crusade in 1095 and complained about the excessively long skirts and rich ornamentation of Western aristocratic costume, he showed that elaboration of cut in the standard long costume was already a fashion element by the end of the eleventh century. Indeed, the fact that so many bishops commented in sermons on this lengthening and ornamenting of long costume indicates that it was the norm for both men and women above the level of the laboring classes and that it was primarily the excessive lengthening and the fashion for dragging trains and rather pointed shoes with curved toes for men and women that was seen as foppery and extravagance by those preaching against the sins of pride and luxury. That people sought to elaborate costume to this degree and that such trends disturbed moralists certainly suggests that a strong desire to imitate the clothing of the elite existed already at the end of the eleventh and through the middle of the twelfth centuries.

**BYZANTINE FOUNDATIONS.** The courtly fashions of the eleventh century made use of silks and patterns of ornamentation that were popular in the Byzantine Empire, the eastern Christian realm centered in Constantinople (now Istanbul, Turkey). The question of when such styles were introduced to the West is, however, complex. It has for many years been believed by costume historians that long and highly ornamented robes and other garments employing silks came from the East only in the aftermath of the First Crusade at the end of the eleventh century. More recent opinion, however, suggests that such garments had been native to the Carolingian empire for several centuries, largely because of continuing trade between the Byzantine Empire and the West, especially trade in silks that entered Europe by way of Venetian merchants. And after the Moorish conquest of much of what is now Spain, silks from Andalusia also moved eastward along trading routes. Probably, then,

Empress Theodora with handmaids and deacons. Mosaic, 6th century. THE ART ARCHIVE/SAN VITALE RAVENNA ITALY/DAGLI ORTI.

the Crusades introduced a variety of highly ornamented fabrics to the West in the luggage of returning warriors and their retinues, rather more than specifically Eastern garments like turbans and slippers. Beginning with the return of crusaders at the end of the First Crusade in 1099 and terminating with the fall of Constantinople in 1204, both male and female bliauts displayed Byzantine influence that included voluminous amounts of fabric arranged in linear drapery (that is, uninterrupted lines extending from the T-shaped shoulder to the floor). An example of these linear styles can be seen in the sixth-century C.E. mosaic of the Empress Theodora on a wall in the Church of San Vitale, Ravenna, Italy. Other elements of this influence were the Byzantine fashions for purple and for broad bands of bead embroidery, giving the fabric a geometric and dotted or studded look. This quality is still seen in modern Greek icon paintings where gold raised dots outline the nimbus or halo of a holy person. Though there is an element of fancy in the idealized descriptions of aristocratic male costume in the thirteenth-century French Arthurian romances, it is not far wrong to believe that Erec in Chrétien de Troyes' romance of that name "wore a tunic of noble patterned

silk that had been made in Constantinople" (56). Some of the bliauts had long fitted sleeves and others fairly wide ones. Accessories included fancy embroidered silk belts and a brooch used as a fastening at the neck.

**TREND TOWARDS LAYERING.** The most elaborate ensemble of garments during the Middle Ages would naturally be that of the royal families and their courtiers. Its distinguishing feature was the addition of multiple layers that signified gradations in status and wealth, both because layering required large amounts of the expensive, exotic fabrics now imported from the East and because it allowed display of multiple patterns, textures, and decorations all at once. One of the best examples of this trend would be in the court clothing of the powerful Normans, who, in addition to having conquered Sicily, had also conquered England in 1066. Writers of contemporary chronicles, such as Ordericus Vitalis (1075–1142) and William of Malmesbury (1095–1143), commented on these Norman warriors, describing them as being "particular" about their clothing but not excessively so. During the reign of William I (William the Conqueror, 1066–1087), the king's clothing of state consisted of a

minimum of five garments (from the skin outward). In addition to his braies (male underpants with wide, loose, and short legs and a draw-string waist), hose (Norman French: *chausses*), and shoes, he wore a white, delicately woven long-sleeved shirt of linen with a neckband and wrists decorated with colored stitching (the *chainse* or later the “chemise”). This shirt might be only one of several undergarments of this type, including another warm silken or woolen one (French: *bliaut*) with elbow-length sleeves that might also have decorative edges. The alternate term for the bliaut was “gonelle” that would later become the English word “gown.” By this period, French names for garments were largely replacing the old Roman (Latin) terms. Next, he wore an undertunic of fine fabric, reaching almost to the ankles, and over this a silken *dalmatic* (originally a loose outer garment with short, wide sleeves and open sides; later the sides were partially closed) with wide sleeves, and hem, neck, and sleeve edges bordered in silk and gold embroidery. Sometimes the silk fabric of this garment exhibited a pattern or design. At his waist, the king wore a narrow belt, embellished with gold and jeweled studs. Over this ensemble, he wore a mantle, shaped either as a semicircle or rectangle (Norman-French: *manteau*), with edges bordered with embroidery and/or gold. Additional garments also have French names, including the *doublet*—which, as its name suggests, was a vest made of two layers of linen, often padded—and a *pelisson* from the word meaning “animal hide”—a sleeveless jacket or vest-like insulating garment. The *jupe* (or gipon or juperel or jupeau) was a corset-like garment often worn over the chainse, which could serve as soft body armor for men because it was quilted. The jupe, which eventually became the modern English “slip,” had lacings down the side.

**PRACTICAL AND DECORATIVE ACCESSORIES.** In this period of developing courtly costume, accessories such as cloaks, shoes, belts, and headdresses served both practical and decorative functions. In the interest of warmth, both men and women in northern climes wore a *chape*, a sort of cloak cut either as a round piece of fabric or as a rectangle, lined or trimmed with fur, and fastened with a cord held in place by the hand. This garment goes back to the Roman *pallium* and shows the long continuity with Roman styles. The legs were not bare, but were protected by hose, which could be brightly colored or even striped as a decorative touch. Presumably women also wore hose but this element is not shown in representations of female costume. Over the hose men and women wore leather shoes, which gradually took on more shape with curved, pointed toes that reflected a slight Eastern influence, a fashion phenomenon

Layered costume, Konrad von Wurzburg dictating to scribe. Manesse Manuscript, Heidelberg Universitätsbibliothek, Cod. Pal. Germ 848, folio 383. c. 1300. H.-J. WISSMAN MINNESANGER IN FRANKEN: RENDEZVOUS MITTELALTERLICHEN SANGERN.

remarked on and criticized at the time. The shoes of various types were made to be open at the top of the foot and closed by long laces, which were wound up around the hose. Headdress for both men and women in the court consisted mainly of circlets made of precious metals, braid, or flowers, though by the thirteenth century both women’s and men’s hair could be pulled back and hidden by a linen cloth called a *coif*. Also during the twelfth and thirteenth centuries, the importance of belts increased as an accent to dress and a mark of affluence, since many of them were studded with jewels or embellished with gold and silver wire. Some served a protective function, for noblemen suspended small weapons from them, thus presenting the image of being armed at all times as a reminder of the aristocrat’s warrior origins.

## EARLY ARISTOCRATIC DRESS FOR WOMEN

**LAYERS.** During the period when court costume was evolving, the clothing of aristocratic women mirrored the men's layered look, although women did not wear braies or underpants. Throughout the entire period treated in this chapter, noblewomen wore a chemise or *camise* (Anglo-Saxon, "smock") next to their bodies. The aristocratic version of the chemise was similar to the one worn by peasant women, but in the late eleventh century this basic undergarment became more elaborate; the neckline was gathered with cords within a decorative band of piping that was secured at the front, later replaced with a button and loop fastening. The wrists of the sleeves were similarly decorated, and the embroidery of both the sleeves and the neckbands was allowed to show when the lady was completely dressed. The fabric at the shoulder and upper arm and just above the wrist area of the sleeves was pleated or gathered to ensure a close fit. Such garments were usually made of linen, but fine fabrics such as wool or silk were also used to make a chemise, a variation which, along with the careful fit-

ting and elaborate decoration, emphasized the aristocratic woman's access to materials and labor, as well as the use of servants to help her with dressing and undressing. While peasant women wore a single dress or *cote* over the chemise, aristocratic female outerwear consisted of a series of gowns. Directly over the chemise was worn a second long garment known as the undergown. It, too, was made of fine fabric, but was more closely fitted than the outer gown and had tight sleeves. The over-gown was long, reaching at least to the floor, although in periods of costume excess, these gowns sometimes dragged on the ground or extended behind the wearer in trains that also required servants to manage during court appearances. In the second half of the eleventh century, women wore gowns arranged with easy folds of fabric encasing the body; both upper and lower portions of these gowns were generously cut. The outer and most formal garment was a mantle, fastened with cords or a brooch (jeweled pin).

**THE SHAPED GOWN.** By the late twelfth century, though both men and women wore several layers of gowns, a definite difference between the male and female silhouette began to appear in representations of these garments in works of art. Women's robes now fitted very tightly at the waist and were made to outline the figure through tight bodices with a row of ornamental buttons, tight sleeves, and the girdle, a wide belt-like accessory that went round the hips several times and then was tied off in front with the ends or tags often elaborated to considerable length, even touching the feet. It was during this period that women's costume was amply represented, and sometimes exaggerated, in the newly fashionable medieval romances—long episodic narrative poems describing the adventures of knights, both amorous and military, and their rescues of women from oppressors. The romances often detailed what women were wearing and described ornamentation, such as the embroidery on belts and coifs or head coverings. The *Romance of the Rose*, in its continuation by Jean de Meun (born c. 1237), also discussed the newest styles and fashions for women. Such works showed women how to *wear* their clothes. They provided instructions on how to make the waist of a gown appear smaller by the way the mantle was held, how to lift the skirts so as to reveal a small foot, and how to swing the hips slightly while walking. Notable among mid-thirteenth-century authorial comments was Jean de Meun's observation that the contemporary woman "through the streets [should] go/ With most seductive motion, not too stiff ... / So nobly sway her shoulders and her hips/ That men no motion could believe more fair" (Robbins, 282). In this period of increased awareness of the female form, the

ease of the older styles disappeared and the waistlines of the gowns themselves were tightened, first by the use of stiffer fabric, and later by means of a laced corset worn under gowns made of more delicate cloth. These robes were called *bliaut*, a term which could refer either to a knight's outer tunic, or a lady's outer dress, both of costly cloth. Sometimes, especially in Middle High German, the term could simply mean rich fabric, such as silk, satin, or velvet imported from the Orient. This cloth was frequently woven with gold thread and embroidered with gems. In its most distinctive use to refer to a woman's garment, *bliaut* signifies a gown of the richest fabrics, banded at neck and wrist edges with strips of embroidery, fur-lined, having a tightly-laced (at the sides) elongated bodice, a full, long skirt, and sleeves of various styles. In this manner the upper body silhouette was redefined.

**GIRDLES, SLEEVES, AND HEADDRESSES.** Typically, female fashions in the Middle Ages changed more in the small detail than in the nature of the garments themselves, since vanity in female costume was considered by preachers to be a dangerous vice. Moreover, the major changes in length that characterized male costume were not adopted by women, who never revealed their legs (though their dresses had trains of varying lengths). Thus, it is to matters of silhouette and accent that women generally turned their attention. Belts, called girdles, were introduced into women's costumes during the century following the Battle of Hastings (1066) and emphasized the fitted styles that gave the female figure more of an outline than in previous centuries. Girdles were constructed as twisted cords, sometimes knotted, made from gold or silver wire and dyed wool or silks. These cords were periodically bound with ornamental brooches or emblematic enameled or jeweled bosses, or convex raised metal engraved or otherwise ornamented and sometimes finished off with tassels. It was customary to pass the doubled decorative cords around the body, to pull the ends through the loop, and to allow them to hang down the front of the gown. Simpler girdles were also constructed from a length of fabric decorated with stitching of a contrasting color. Queen Matilda of England willed one of her two girdles made of gold thread—this one with emblematic ornamentation—to the Abbey of the Holy Trinity to use for hanging a lamp in front of the altar. She left her gold embroidered mantle to this same abbey, to be turned into a cope or religious vestment. By the mid-twelfth century another element of female costume that seems to have been the subject of elaboration was the sleeve. Often sleeves were wide, contributing to the overall bulk of the ensemble, and the cuffs hung so low below the

## CINDERELLA'S Furry Slippers

Among the new fashion trends developing in Europe during the period of William II's reign in England was the mantle. These outer garments, always made of the most luxurious fabrics available—some imported from the Orient—became even more elaborate with the innovative addition of a second layer composed of the most expensive furs, especially ermine, *vair*, and *miniver*, which symbolized the owner's wealth and power. Ermine is a white fur with black spots created by sewing together the gray backs and white bellies of whole squirrels; it was called *vair* in France from the Latin *varius*, meaning "speckled" or "changeable." A closely related aristocratic fur, *minever*, is a "fabric" made only from a squirrel's white belly area or constructed from this belly fur with only an edge of the gray flank fur.

The association of the fur called "*vair*" with aristocratic clothing contributed to one of the most distinctive (and rather odd) details in the modern version of the fairy tale "Cinderella." Apparently the strange "glass slippers" that children have accepted for generations without question were, in the original folk story, slippers made of fur or "*vair*." But when Charles Perrault (1628–1723) wrote the story down for publication, an error was made in transcription, and the word became "*verre*," meaning glass. Thus, one of the most fascinating elements of this popular story was the result of a mistranslation of a medieval fashion term.

wrists that they touched the ground and were knotted to shorten them. These sleeves were sewn onto the costume with each wearing, so that it was possible to have a number of different variations that could be added to a basic costume. Since the color of these removable sleeves often contrasted with the color of the robe, it was possible for a lady to choose for herself a distinctive sleeve that could be given to a suitor as a token to be worn on his helm or used as a pennon, sometimes at tournaments, reflecting in this way a similarity to the coat of arms or blazon that identified individual knights. A final detail of female fashion was the headdress, which for noblewomen from 1066 to 1154 was in the form of a veil made from fine linen or cambric in a variety of shapes; these veils hid the wearer's hair and sometimes also hid the neck with draped fabric. Called by the Normans a *cowrechef*, such a veil might also be worn with an end

flung across the shoulder. A later variation, in the thirteenth century, was the *caul*, a fine linen cap fastened under the chin.

## INTERCULTURAL INFLUENCES AND REGIONAL DISTINCTIONS

**THE ISLAMIC INFLUENCE.** The First Crusade (1095–1099), in which a mostly French Christian army traveled to the Holy Land to recover it from Islamic control, had markedly influenced noble dress by the mid-twelfth century, ushering in a new "Eastern" style. At this time there was already evidence of Byzantine influence in outer tunics. As returning crusaders also brought back ideas of Islamic dress cut and fabrics woven in the Mediterranean area and far East, Islamic influence may be found in European dress at least as early as the first part of the twelfth century. These included cloth specific to the East such as damask, brocade, and muslin—thin fabric of silk and gold from Mosul in what is now Iraq and other very fine and thin gauze-like materials; they tended to replace the heavier, stiffer fabrics and garments of Byzantine cut. Other fabrics of this type were those woven of cotton from Egypt and the cloth called in Old French "camlet," which was believed to be woven with part camel hair in Syria and Asia Minor, the predecessor of modern "camel hair" fabrics for top coats. Eastern silken fabrics, some of which were manufactured in Islamic workshops in Sicily, remained permanently in European costume throughout the Middle Ages. Other features adapted from Islamic dress and merged with customary European styles were the decorative bands on garment edges and top portions of the sleeves, known as *tiraz*. These bands frequently featured embroidered written charac-

ters, often in strange alphabets. Another major change from the old eleventh-century T-shaped garments was the adoption of the dropped shoulder seam in male tunics. In the northern portion of Europe, the long, fuller gown similar to Islamic cut—which had already been accepted in the south—was adopted at the close of the eleventh century by Normans imitating what was called "Saracen" or Islamic dress, understood as quite exotic.

**ENGLAND AND REGIONAL DISTINCTION.** By 1204, the Crusaders had captured Constantinople, ending the cultural dominance of Byzantine and Islamic styles, and in time this Eastern city ceased to be a major influence on the clothing of the European nobility. Dress in Western Europe was then subject to tastes and trends developing within individual national borders; differences in styles now reflected geography. As an island nation, separated from the rest of Europe by the English Channel, England provides early examples of trends in dress that were unique to the local political and economic conditions. Male dress, for example, became more ornate during King John's reign (1199–1216), which was known for its extravagant spending on elaborate clothing, but the women of the court did not follow this trend. Instead their dress retained the styles previously instituted by the highly respected former Queen Eleanor (c. 1170), who preferred simplicity. Henry III's reign, beginning in 1216, ushered in a period of costume featuring unpretentious cut and fabric for both the nobility and moneyed commoners. Indeed, between 1220 and 1270 these plainer garments made it more difficult to distinguish between the nobility and merchants, or between shopkeepers and peasants. Of particular influence in this change from courtly ostentation to simplicity was King Louis IX of France, who reigned from 1226 to 1270. Much revered for his piety during his lifetime, he was canonized as Saint Louis in 1297. Through his marriage to the sister of the English queen Eleanor, his influence spread to both English and French courts, with nobles adopting Louis's preference for simple clothing. At the same time, the flourishing woolen industries in England and the Netherlands and various technological advances (in carding and spinning wool, and in looms) increased fabric production and availability. Woolens began to be dyed in yardage, and blue, green, and brunette (a dark brownish red color from woad and the ground-up shells of a small Eastern beetle) dyes were particularly popular. Twill weaves of an extreme fineness developed along with heavy felt-like wools used in the manufacture of hats. Thus court dress during this period, while simple in style, was renowned for the fine quality of the fabrics. Draped in various ways, long robes that fit easily upon the body without the use of excessive fabric were a distin-

guishing feature of this costume. They created an effect of sobriety and dignity while maintaining a quiet magnificence. Such a style also found favor with King Edward I of England (r. 1272–1307), whose personal humility inspired fashions exhibiting even greater simplicity.

**DESIGNS FROM NATURE IN FRANCE.** Styles in decoration evolved across the centuries as did fashion itself. In the thirteenth century, for example, Gothic art emphasized the beauty of the natural world in its details of flowers and animal life richly distributed throughout the decorative arts of Europe. Cathedrals both inside and out sported carved and sometimes painted friezes showing real and imagined animal and plant forms. And plant and animal life accurately drawn from nature began to appear in the margins and in the bows of letters like O, B, and D in the script of painted manuscripts across Western Europe. This appreciation of beauty found a parallel in the dress of the nobility, in the textures and patterns of fabrics utilized, the silhouettes developed, the patterns of embroidery, and the increasing amounts of additional metallic and jeweled decoration, often in designs representing the beauties of nature. One of the major literary works reflecting the incorporation of natural motifs into fashion is the *Romance of the Rose*, begun by Guillaume de Lorris and completed by Jean de Meun. Guillaume's portion of the poem describes a costume covered in every part with images of geometric shapes (lozenges, escutcheons or small shields), lions, birds, leopards, as well as broom and periwinkle flowers, violets, and other yellow, indigo, or white flowers and rose leaves (ll. 876–98, Robbins, 19). This trend toward naturalistic representation in weaving and embroidery patterns continued into the fourteenth century, by which time it had influenced English fashion as well. The silken band or banner that encircles the hero's helmet in the Middle English romance *Sir Gawain and the Green Knight* (written about 1370) is decorated in such a way that it resembles a border for an illuminated manuscript. It was "embroidered and bound with the finest gems/ on the broad silk fabric/ and over the seams were birds such as parrots painted with periwinkles and turtle doves and true love flowers thickly entwined."

**THE GERMAN DECORATIVE TRADITION.** German aristocratic fashion differed somewhat from that of other European courts because, owing to lengthy civil wars and a series of dukedoms rather than a more centralized governmental structure, Germany did not develop a single court style which could respond to trends elsewhere in Europe. Unlike the French and English decorative traditions, which tended to emphasize designs from nature, the German tradition leaned more heavily towards geo-

metric shapes, a feature still seen in the so-called "hex" patterns of Pennsylvania "Dutch" (that is, German) barns and quilts. Throughout the history of German costume, the outermost garments are characterized by decorative patterns, either in the weave or pattern of the fabric used, or in decorative woven or embroidered bands. Such bands appear at the mid-calf or mid-thigh level on gowns of the Byzantine style or, later in the twelfth century, as a decorative placket extending downward from ornamental circular yokes or collars, usually ending at mid-chest. Customarily two tunics were worn, with the outermost being made of patterned fabric with a lower border and the one underneath being fuller and longer, made of plain linen; the wealthy sometimes wore a third and plainer tunic overall, with an undecorated lower edge. The preference for decorative patterns may be seen in early thirteenth-century German costumes in stained glass windows in Augsburg Cathedral, which feature patterns of *diaper* (repeated diamond shapes), *foliates* (leaf-shapes), and *quatrefoils* (flowers or leaves with four petals) linked by squares and stripes. Such ornamentation increases in flamboyance throughout the thirteenth century, as can be seen in the painted marble or alabaster effigy of Graf Wiprecht von Groitzsch (1230–1240) at the Klosterkirche of Pegau, near Leipzig. In the effigy he wears a red mantle and a blue tunic, both bejeweled, a fur tippet (a stole with hanging ends), and an elaborate girdle at his waist. By the late thirteenth century, some overcoats featured short sleeves with a slit for the arm that allowed the sleeve to hang empty and free of the body, thus showing the arm dressed only in the tunic's tight sleeve. In addition, buttons could be both ornamental and functional along the neck placket and side slits. The German preference for colorful, patterned fabrics continued into the fourteenth and fifteenth centuries.

**THE ITALIAN PENINSULA AND THE MANUFACTURE OF SILK.** As early as the time of the Carolingian Empire, Mediterranean styles and Islamic textiles were arriving in Europe, not only directly, by way of East-West trade routes and the return of Crusaders, but also by way of the Italian peninsula. Sicily, an island off the tip of what is now southern Italy, had been controlled by the Muslims until it was reconquered between 1060 and 1091 by the Norman French, and thus it continued to serve as one of the chief geographical areas of contact with the Islamic world. From an early period, many textiles traveled northward from the island to the Italian city-states and the rest of the continent. This region, moreover, early developed a silk manufacturing industry with imported mulberry worms from China. The development of silk manufacturing in Sicily and also in the city of Lucca—which became known especially for

## WOOL and Other Textiles

### Sources of Raw Materials.

Medieval European costume employed three main materials—wool, linen, and silk—in varying qualities. Silks had been imported from the Near East since the time of imperial Rome, and sericulture—the growing of silk worms—had reached Sicily by the tenth century, though fine silks continued to come from Byzantium through the medieval period. Linen was grown within Europe, and cotton, coming from Egypt by way of Italy after the Crusades (later produced in Swabia in Germany), began to be mixed with linen to create a popular fabric called *fustian* by the thirteenth century. Like linen, wool was a native fiber, and wool constituted one of the most important commodities in European trade. England, particularly in the north and west of the country, exported raw wool to France for the actual production of cloth in the south around Toulouse, though France was also a large raw wool producer, especially in Flanders, Artois, and Picardy. The actual wool merchants, at least up to the thirteenth century, were the Flemings from Ypres, Ghent, and Bruges, in what would today be called Belgium. By the fifteenth century, Spain and Germany overtook England as raw wool suppliers, while England began to excel as an actual manufacturer of woollen cloth and soon outpaced all other nations in the production of fine woollen fabrics for luxury clothing.

### Making Woollen Cloth.

The process by which wool moved from sheep to fine dress or robe was a complex and lengthy one. The English wool brokers sold bulk wool in sacks of 346 pounds to *drapers*, as they were called, who then subcontracted the wool to workers (usually women) who washed, beat, and sorted the wool fibers, often at home in cottage industries, a practice that continued in the northwest of England until the mid-nineteenth century. Sometimes these fibers were dyed blue with a plant called woad, imported from northern Italy, which allowed them better to retain other dye colors, such as reds of varying types (sometimes called “scarlet,” though this term also denoted a type of material), a brownish tone (very common for the garments of agricultural laborers), and, by the late Middle Ages, rich blues and black for upper-class clothing. The next link in the chain was the weaver draper, who again subcontracted

the fibers to combers and carders (who worked on the shorter fibered wools); these persons readied the material for the spinners. The wool then went back to the weaver drapers, who paid off the artisans at so much per pound, and on to wooden looms—often water powered—where clothing fabrics like worsteds and more expensive broadcloths and serges were woven. Wool could also, in its finer grades, be ornamented with silk and even metallic threads and have shapes of other fabric sewn on. Yet another step for some grades of woollen cloth was fulling, which involved shrinking the cloth and the addition of a sort of chalk called fuller’s earth to the fabric to compact and stiffen it. The cloth then went back to the weaver drapers who had the cloth dyed in a mix of pigments and alum from Asia Minor in bolts of a certain length and width (called *ells* in England and *toises* in France) and marketed it to merchant clothiers, where it eventually became clothing in the shops of tailors.

### Competing Textiles.

Though woollen cloth was a staple for outer garments for all levels of society, it was expensive because of the many duties and taxes that were collected as it moved from its place of origin as a raw material (for example, England) to the cloth-making regions (usually France) to the actual merchants (in Flanders) and then to the consumer. For this reason, as well as for comfort, undergarments—the chemise or long smock worn by both men and women—were made of linen, a fiber derived from the flax plant, which grew well in France and Italy. It was very durable and less irritating next to the skin. Silk, on the other hand, was preferable to wool for luxury clothing because it was thin and supple, and it could be woven to create shimmering patterns and highlights. By the 1370s there was a taste for very ornate textiles and many new types of fabric became popular. Some of these had come from the East with the returning Crusaders, such as *samite*, a densely woven silk, and *cendal*, a thinner silk much like the silks used in women’s clothing today. Others were damask, brocade, and velvet, a fabric soon reproduced in Florence. These Eastern fabrics were imitated in France in lower-cost examples by the 1460s. Still, though silks and silk blends offered greater versatility and visual splendor, many medieval wools were quite beautiful, and wool had the added advantage of being durable and having a high insulative factor. In an age when housing lacked central heating, especially in northern Europe, the use of wool and wool blends was important to help keep the wearer warm.

its fabrics made of silk blended with other fibers—combined with the activity of Venetian merchants, who were importing silks from China, to create a strong taste for silk in both men’s and women’s attire at least as early

as the twelfth century. Evidence of Eastern influence from this early period of Sicilian fabric manufacture survives in a piece of silk fabric, now preserved in the Fabric Museum in Lyon, France, which shows what appear to

be peacocks and dragon-tailed animals surrounding a floral medallion of the sort found on oriental carpets. Though the technology had been acquired from the Far East, the designs were increasingly blended to include Mediterranean patterns of all kinds, especially combinations mixing European designs with Muslim motifs. Merchants distributed these fabrics widely throughout Europe, Britain, and Scandinavia.

**THE ITALIAN PENINSULA AS AN EXPORTER OF STYLE.** Not only Eastern fabrics, but also fashion itself sometimes moved from south to north during this period. One method of distribution was through aristocratic marriages, as was the case with King Robert II the Pious (972–1031) and Constance of Arles, who were married in 1005; their union brought Mediterranean (in this case, southern French) styles worn by the bride's courtiers to northern France, and these were important enough to be commented on by writers describing the event. These styles involved fabrics with many pleats, a sort of waffle-like pattern called *goffering* crimped into robes more fitted than usual. Indeed, fashion from Italian city-states and the Mediterranean was distinctive from an early period and was exported to France, the Netherlands, England, and Germany. These exports include both actual garments and drawings brought back by courtiers and diplomats on their travels and also renditions of costume in illuminated manuscripts from Italian workshops. One of the distinctive features of fourteenth-century female costume in Italy was the head-dress and hairstyle, which was arranged in a large ball or "balza" at the back of the head, covered with braided bands of fabric and light gauzes. Men in the late fourteenth century had a rather square profile with wide shoulders accentuated by padding in rolls over the shoulders, with a full-length or thigh-length tunic and most of the weight and value of the garment concentrated in the chest and shoulders through banding, piping, folds, and rolls. One of the most interesting examples of exported Italian fashion was a trend towards black silks, which was developed in Italy to distinguish members of the upper middle classes from true aristocrats, who alone could wear bright colors such as scarlet and blue. Before long, black did not have good social connotations, and the Italians exported their black silk garments and dark furs to go with them to European courts, who found them to be very original and were not attuned to the negative social implications of the color black in Italy. Though black silks were primarily used for male doublets and gowns, women also wore them, and the fashion for damasks, velvets, and brocades of black silk with a mantle or trimming of sable (a very dark fur from the area of what is now Russia) was popular among aristo-

crats in the fifteenth century. Thus, in the fourteenth century a strong taste for black developed throughout Europe among the aristocracy in marked opposition to the taste for bright colors that had prevailed from about 1330 onward. In this, as in other fashions, Italy seems to have been the source of a major trend.

## THE Battle Between Blue, Red, and Black

### The Rise of Black

Clothing colors have long indicated social class, and in the late Middle Ages this was particularly true of the colors blue, red, and black, though it was only during the fifteenth century that black became a competing force against red and blue in bourgeois and aristocratic fashion. Among the most prominent medieval wearers of black were King Charles VI of France (1368–1422), Duke Philip the Good of Burgundy (1396–1467), and King René of Anjou (1409–1480), all of whom dressed in black throughout their adult lives and helped to give the fashion social preeminence. Yet, by an irony of history, their taste for black did not originate with the aristocracy but rather with the upper bourgeoisie in Italy, who in the fourteenth century were forbidden by law to wear garments of “scarlet” or luxurious blues. Although the dull blacks of earlier years had never been an appealing alternative, the medieval dyeing trade was becoming more “industrialized,” allowing artisans to create richer and more luminous hues, including wools of a deeper and more striking black. As parallel technological advances among weavers increased the availability of rich black serges and gabardines, a vigorous trade in black cloth developed to meet the demand. Soon the fashion for black moved from Italy to France, England, Germany, and Spain, and the color became a court fashion, appearing in linens, silks, and woolens as well as in black or very dark furs called sable.

### Luxurious Scarlet

By the mid-fourteenth century, then, black was a competing color with “scarlet,” a term which could refer to several different hues of red as well as to fabrics of various colors but of a generally luxurious appearance, and the dyes used to create them. Authentic scarlet fabric was very expensive to own, as it was created by a special dye called kermes that was laboriously made from the dried shells of a small beetle. Other dyes to make less fancy forms of red involved the use of madder, a plant material common in Western Europe. In either case, however, dyeing fabric red required an additional process with a

chemical called a mordant, literally something “biting” (typically urine, lime, or vinegar) which allowed the red pigment to enter the fibers of the fabric and bond with them. Accordingly, scarlet was a color reserved for royalty and persons of high rank. In Portugal, for example, only members of the royal family were allowed to wear it. Red was also the preferred color of royalty in Italy and Germany.

### Royal Blue

Early blue fabric was first used in the costume of servants and workmen (a use which it still has in France today and which lingers in the American phrase “blue collar”), and it typically denoted low social status. But again technology played a role in changing aristocratic perceptions of the color’s symbolic value. The first blue fabrics were rather pale and lusterless, but as techniques developed for producing blue in more vivid shades (using indigo from India), the color (eventually known as “royal blue”) competed with red, and later black, in status. Blue was associated with the Virgin Mary, considered the religious patron of France, and pictures of her in manuscript painting showing her in blue robes helped to make the color fashionable. Perhaps even more important was the appearance of blue as part of the French royal family’s coat of arms, where a blue ground with gold lilies (*fleurs-de-lis*) became standard from the end of the twelfth century. In scenes from the magnificent manuscript called the *Très Riches Heures* (1416), not only Jean, duke of Berry, but even his horses are draped in blue fabrics with gold *fleurs-de-lis* as the duke and his entourage go out riding. Well before this time, blue had become a color for others to imitate. As the dyers who made red fabric saw their livelihood threatened (for dyers were forbidden by guild regulations to make several colors in one workshop), they responded with propaganda campaigns against the dyers who worked in blue, and actual violence between these “colors” often occurred. Hence, by the mid-fourteenth century—the period when we begin to find the great interest in colors and extravagance of costume developing—there was a true combat between red, black, and blue which was to have important ramifications for the next two centuries of fashion. Of the three colors, only black retains today some elements of its medieval significance, indicating, for example, not only somberness in mourning, but also social respectability and high status as it is worn for formal occasions in tuxedos and formal dresses.

**SPANISH COSTUME.** The area now known as Spain is a particularly interesting case for the development of fashion because of its relative geographic isolation. As a peninsula separated from the rest of Europe by the Pyrenees mountains, with a culture that had long been under Islamic influence, Spain developed some fashion

trends peculiar to the region, though they could be exported. In the early Middle Ages, dress for the Spanish noble class was modeled on that of ancient Rome, but constructed with exotic fabrics derived from the Islamic presence there. Both male and female Spanish costume resembled that of other Europeans in having as its basic

combination a long tunic with tight sleeves worn under a second long tunic with wide sleeves. During the tenth century, however, men wore a mantle with a slit for the left arm, and for their military dress, tunics with striped fabrics. The outer tunic was sometimes sleeveless, and both “keyhole”-shaped neck openings and armholes were decorated with braid. A distinctive cape or mantle, like the surplice a modern Catholic priest would put on to say Mass, was worn over the back and chest, a style adopted by women as well. In the thirteenth century, ladies’ tunics covered their feet, while those for noblemen ended at mid-calf, allowing full visibility of their pointed-toe leather shoes, which were often decorated with gold braid. At this time, noticeable ball-shaped buttons or rosettes ornamented the neck and wrists of the tunics. A distinctively Spanish thirteenth-century fashion trend was the custom of slashing or opening the over-garment under the arms to show the layer below in a contrasting color; lined mantles completed the costume. By the mid-fourteenth century, Spanish nobles had adopted the so-called “short costume” of doublet and hose, worn with long pointed toe shoes, which dominated medieval Europe and Britain from about 1330 onward; it appears that this combination had actually originated in Spain much earlier as a military fashion worn by soldiers in Aragon, after which the concept had taken hold in Naples in Italy, and was later exported from there to France and beyond. The elite retained their semicircular cloak at hip length, decorated with large buttons from neck to breast. In addition to the tighter, shorter fashions, nobles in Spain also continued to wear the two tunics of the older style, but with narrower shoulders, topped with a semicircular flap of fabric reaching to the elbow as a sleeve, and a skirt that gradually flared to the hemline. Though Spanish female costume remained much the same from the early to the late Middle Ages, by the late fifteenth century women did wear a hoop skirt which belled out below the waist through the use of stiffeners, a fashion not yet seen elsewhere. And by the end of the period covered in this chapter, all Spanish garment styles underwent the variety of constant changes in tightness and looseness, and (for men) in lengths of garments and in amount of decoration common in all European courts. Throughout the entire era, cities and regions such as Valencia, Catalonia, Castile, Barcelona, Andalusia, and other places produced fabrics that blended Christian European motifs with Islamic and Far Eastern designs, and Spain retained these patterns long after Moorish control of the country ended in 1492. Catalonian woollens were of the finest quality in the late 1400s and throughout the 1500s, and a thriving silk industry evolved by the late fifteenth century. The peak of such luxury weaving was reached in the production of

silk “cloths of gold.” Hence, Spanish costume was marked by a fondness for richly patterned fabrics and bright colors, such as white, red, pale blue, pink, light violet, and sea green. These were deviations from the older primary colors in use in the rest of Europe (red, yellow, and blue), and even from the secondary colors (orange, green, and violet), and suggested a subtle refinement of taste. A favored fabric design was that of a large pomegranate, woven in both damask and velvet, one example having a background highlighted with metallic thread on which the image appears in cut velvet. Many of these Spanish fabrics reached Europe and the British Isles through merchants, and London livery companies—trade and religious fraternal groups wearing the same costume or “livery” as a sort of insignia—used some of them for palls or coverings for the casket during processions at the funerals of their members.

### THE NEW SILHOUETTE FOR ARISTOCRATIC MEN

**BODIES ON DISPLAY.** The period around 1330 saw the beginning of Italianate influence on both English and French fashion styles. At this time noblemen abandoned their long robes and, for public appearances, wore short doublets or padded jackets that fit close to the body with leg-hugging hose revealing and emphasizing the thighs and buttocks. This new style first vied in popularity with the long robes worn at the beginning of the century, but, by its end, had fully replaced the traditional fashion among younger men, especially those with ties to the most fashionable courts. The shorter

garments were initially knee-length, but rose throughout the century to mid-thigh and then nearly to the waistline. In the form known as a *cotehardie*, its distinguishing features were the row of buttons that ran from the neckline to the low waistline, and the elbow-length sleeves from which a long extension of fabric known as a “tippet” hung down. Some costume historians have seen the shortening and exhibitionism of male costume in this period as a reflection of the new interest in the unclothed, partially clothed, or sexualized body becoming evident in late medieval culture. Though there are no literary or philosophical documents that can be cited to support any general consciousness of such an interest, it is certainly present in a variety of medieval artistic manifestations. The rising interest in naturalism (the focus on natural and organic processes and forms) fostered by the study of Aristotle’s works in the medieval university, the practice of dissecting bodies in late medieval medical education, and the growing respectability of Greek and Roman mythology with its attention to unclad nymphs and demigods as a subject for literary and artistic imitation all played a part in the idea of a

revealed body, especially at the beginning of the fifteenth century. A good example is the medieval revival of the classical myth of Pygmalion, which was depicted frequently in wall paintings, tapestry, poetry, and manuscript illumination. The story in the Tenth Book of Ovid’s *Metamorphoses* recounts how a bachelor artist, Pygmalion, made a beautiful ivory statue of a woman with whom he fell in love. He spent much of his time clothing and ornamenting the carving, bringing it presents, and speaking to it. He prayed to Venus to animate this statue and his wish was granted. Among other important medieval representations of female and male bodies are the naked “Venus rising from the waves” scenes of mythographic treatises like the *Fulgentius Metaforalis* in Rome and the famous Zodiac Man in Jean de Berry’s *Très Riches Heures*. The last is a miniature showing an unclothed young man, parts of whose body are keyed to the constellations and planets that have astrological influence on them. In a culture where monastic moralism discouraged excessive interest in the flesh, such “distant” or mythological miniatures provided acceptable spaces in which the body, safely dehumanized, could be examined.

**PADDING AND LACING.** In the fourteenth century, it was customary for knights to wear “soft armor” under their mail or plate armor; in keeping with the continuing identity of the nobility with their military origins, one form of the new short tunic—called the doublet or *pourpoint* (also called *gambeson*)—came to be padded with various fibers, such as hemp, cotton, or silk, and then quilted. In 1322 the Armourers’ Company in London laid down specifications for this garment: that it be covered in *sendal* (a silken fabric) and that it be padded with only new cloths of silk and *cadar* (a name for cotton, which was a new and exotic material now being imported from Egypt to the West). To eliminate extra fabric that bunched beneath the arm, this close-fitting doublet had inset sleeves, replacing the older garment that had been cut in a T-shape. The outermost layer of these garments was composed of the costliest of fabrics from the thirteenth century onward; they were often embroidered, and they were worn as ordinary dress before and after a nobleman was armed. Thus, as the new short costume came to be worn independent of the armor it originally had supplemented, this military necessity became high fashion for the courtier. Later, doublets came to be laced to increase their tightness as part of the new silhouette for men. In the fifteenth century, the doublet and hose were the premier garments of male attire, and a variety of over-garments were also worn, such as the *paletot* (a short-sleeved, short and loose gown for men).

Poulaines or Polish pointed shoes, London, Museum of London, 1380. BRIDGEMAN ART LIBRARY.

**THE HOUPPELANDE.** Over the ensemble of doublet (pourpoint), hose, and poulaines (shoes with very long pointed toes), nobles wore a long-sleeved, generally high-collared robe-like garment called the *houppelande*. The *houppelande* is sometimes described as a “hybrid garment” because, toward the end of the fourteenth century, it replaced the cote, the surcoat, and mantle that were all parts of the traditional fourteenth-century “robe.” Some historians of costume have felt that the *houppelande* was fostered by the guilds of tailors, who saw a threat to their economic security as the older style of long costume became obsolete except among older men and those needing ceremonial garments, such as jurists. The style that preceded the *houppelande* is well described in the Middle English romance *Sir Gawain and the Green Knight* where the hero wears a “bliaut of blue that reached to the ground/ his surcote fit him well and was softly furred inside/ and its hood that hung from his shoulder/ was adorned with ermine.” In any case, the *houppelande* quickly became very popular. While the formal *houppelande* was quite long and

voluminous, a shorter version, called the *courtepie* or *haincelin*, developed as a popular variation. This more abbreviated garment reached halfway between ankle and knee, and an even shorter version hit some inches above the knee. Such a garment appears in miniatures for the *Tacuinum Sanitatis*, a treatise on health popular at the end of the Middle Ages. Painted about 1390, they show men collecting roses for medicinal use; their *haincelins* illustrate the fashion for “dagged” (also called “cut-work”) sleeve and hem edges, scalloped in fanciful shapes such as those of leaves, points (known as “vandykes”), or the square indentations on castle rooftops and towers called battlements or crenellations. The longer and more formal version of the *houppelande*, which was ground length or even trailing, also appears in these manuscripts. A third version, worn by the figure of the sun personified as a stylish young man from John de Foxton’s *Liber Cosmographiae* (1408), features a high collar that fanned out from the neck and funnel-shaped sleeves that become increasingly wide at the wrist end, billowing out into the shape of medieval bag

## JOAN of Arc and Cross-dressing

More famous than almost any woman of the Middle Ages, Joan of Arc is still well known today as the female warrior who led French troops to victory against the English in the Hundred Years' War. Claiming to have been guided by the divine voices of Saint Margaret and Saint Catherine since the age of thirteen, Joan, at age seventeen, left her home in a village in northwestern France, put on men's clothes to identify herself as a military leader, introduced herself to the yet uncrowned future king of France, and turned the tide in favor of the French at the siege of Orléans in 1429. In the version of the story most people remember, her charismatic presence continued to inspire confidence among the French, leading quickly to Charles VII's coronation; then, at the height of her power, after only a year on the battlefield, she was captured by the Burgundians and turned over to the English to be tried. After a lengthy and brutal Inquisition, during which she became ill and recanted her supposed heresy, then relapsed and was condemned, she was burned at the stake.

While most discussions of Joan over the centuries have focused on the trial's inquiry into the validity of the voices she claimed to be hearing, an equally important issue at the time was her decision to wear male dress, which was seen as an overturning of natural order as defined in the biblical book of Deuteronomy: "The woman shall not wear that which pertaineth unto a man, neither shall a man put on a woman's garment; for all that do so are abomination unto the Lord thy God" (Deut. 22:5). Although there was some precedent among earlier holy women to suggest that she might have been forgiven for wearing men's clothing for practical reasons—either to protect her virginity while she was living among soldiers or to make it easier for her to ride a horse—she never offered any such explanation. Her insistence that she wore such clothing at the command of God and his angels, and her refusal to wear women's clothing even while in prison, suggest that she saw men's attire as part of her identity, a symbol of her calling.

The meaning of her clothing is complicated by the fact that Joan—an illiterate peasant who had never even ridden a horse before leaving home—chose to dress not

as a simple soldier, but as something of a fashionable dandy. Indeed, one of the charges against her was an accusation of idolatry, a worship of herself. The transcript of the trial indicates that she wore "shirt, breeches, doublet, with hose joined together, long and fastened to said doublet by twenty points, long leggings laced on the outside, a short mantle reaching the knee, or thereabouts, a close-cut cap, tight-fitting boots or buskins, long spurs, sword, dagger, breastplate, lance and other arms in the style of a man-at-arms." The description goes on to mention the sumptuousness of her attire, including cloth of gold, furs, and a surcoat open on the sides. Clearly, Joan loved beautiful clothes, perhaps seeing her attire not only as a statement of independence from the restrictions usually put on women, but also as an homage to male heroism and the royal cause she was attempting to support. From the point of view of her inquisitors, however, her short costume connected her with immoral elements of society (as perceived by the ecclesiastical hierarchy) and was a sign of her demonic nature. Her refusal to put on a dress, even when she was promised that she would again be allowed to hear Mass if she gave up her male costume, made her an easy target for charges of witchcraft.

The grandeur of Joan's appearance—supplemented by the acquisition of a fine horse and knightly weapons, all of which she mastered almost immediately—must have contributed substantially to her ability to raise the confidence of the French troops. And when she was rehabilitated at hearings between 1450 and 1456, less than a single generation later, it was this image of her as a warrior, her connection to the reigning king, and her vindication as a leader of a just cause that dominated the proceedings. The fact that she wore male clothing was no longer an issue since now the trial and execution were attributed to the political maneuvering and hatred of the defeated English enemies, sidestepping entirely the question of the validity of her voices and the impropriety of her attire, which was now depicted artistically only as conservative military trappings. Ironically, even when she was canonized as a saint in the early twentieth century, the petitions focused on her marvelous equestrian skills, the supernatural signs at her death, and her loyalty to the church, optimizing her value as a rallying point for French Catholicism in an increasingly secular climate and minimizing the transgressivity of her cross-dressing.

pipes. Belts were also sometimes worn with houpelandes. The garment's elaborate ornamentation included fur, fabric appliqué, and slashes showing the linings of complementary colors. The combination of pouppoint, hose, poulaines, and houpelande peaked as

the ruling fashion at the courts of the English kings Edward III and Richard II in the second half of the fourteenth century. After 1450, the more usual term for the houpelande was "gown," and it was gradually replaced by the robe.

**SHOES WITH POINTED TOES.** Shoes worn with the tight hose of the new silhouette had long, pointed toes. Before 1350 shoes generally conformed to the shape of the foot, reached to the ankles, and had leather lacings, although there were periods when the toe became more pointed, even exaggeratedly so, and then returned to a more natural shape. Following the mid-fourteenth-century fashion shift in masculine dress, shoes were more visible and therefore more important as an element of fashion. *Poulaines*, sometimes called *crackowes*, were a recurring style. These shoes were named after Poland or its capital because they were thought to have originated in the city of Crakow in Poland. Featuring a pointed toe as much as six inches long that had been stuffed with moss, these shoes were an accompaniment to styles that stressed linear proportions. Besides the long toes, shoemakers employed many other decorative techniques appropriate to leather and fabric shoes: embroidery, tooling, paint, dye, cut-out designs, and elaborate buckles. Such highly ornamental shoes were often described in late medieval literature; for example, in Geoffrey Chaucer's *Miller's Tale*, Absolon, the clerk and would-be lover of Alisoun, is a dandy who wears shoes with cut-out designs on his shoes' insteps that Chaucer likens to the panels in a stained-glass window in St. Paul's Cathedral, London.

**HAIR, HOODS, AND HATS.** Around 1400 to 1450 it became very fashionable for French, English, and Spanish men to wear an unusual hairstyle in which the hair was cut very short at the sides and nape of the neck, leaving a bowl-like area at the crown and above the ears. It is possible that this style developed in response to the popularity of the "carcaille" collar, very high and fur edged, which was found on the houppelande and other forms of the gown. Joan of Arc adopted this male hairstyle, and this was presented as evidence of her alleged cross-dressing tendencies at her trial. To accompany the new short costume in the fourteenth century, men wore a hood that covered the head and shoulders and revealed more or less of the face according to how it was rolled back. About the end of the twelfth century, the hood had ceased to be attached to the cloak, acquiring a very brief neck cape and becoming a separate piece of male apparel. In the fourteenth century, the hood became a fashion accessory for men, and a tail or band called the "liripipe" developed long enough to be worn as a scarf around the neck, or decoratively arrayed and tied around the head, or hanging down and secured by the girdle. Alternatively, this hood might be folded and tied so as to form a hat. During the fifteenth century, it was arranged over a wicker hoop or roll to give it shape. It competed in popularity with crowned felt hats and sheared or long-furred beaver hats with brims, a fashion

exported from Flanders or modern Belgium, which were increasing in size and amount of decoration. These hats took a variety of shapes and some had conical tops, were embroidered and covered with ribbons, or sported peacock or ostrich feathers attached by jeweled pins.

## A NEW LOOK FOR WOMEN

**NECKLINES AND UPPER BODY COVERINGS.** The most significant change occurring in feminine styles around the middle of the fourteenth century in France and England was a low neckline revealing shoulders and the upper portions of the breasts. One explanation for this change is geographic since the lowering of women's necklines in dresses with very tightly laced or buttoned bodices, tight-fitting sleeves, and A-line skirts was perhaps at first a climate-related trend from Italy. But with the new interest in the human body and the belief that the body was a potential source of beauty, the style spread rapidly northward to cooler regions by the fourteenth century. Now visible were areas of the body that had formerly been hidden by a higher neckline and a *wimple*, a portion of the headdress that covered the whole of the neck and even part of the chin. The contrast between the newer, barer style for fashionable women and the older more conservative style was strikingly expressed in the Middle English romance *Sir Gawain and the Green*

Female dress showing neck and shoulders. Fresco, Runkelstein Castle, Bolzano, South Tyrol, Italy, 14th century. ERICH LESSING/ART RESOURCE, NY.

*Knight*, where the poet notes of the lady of the house that “her breast and her bright throat were shown bare and gleamed brighter than snow new fallen on hillsides,” in contrast to the witch-like Morgan le Faye who had “a gorger or coverchief over her neck, bound over her black chin with chalk-white veils/ her forehead shrouded in silk.” Such low necklines were a stylistic feature that lasted through the following century. At the same time, for reasons not fully understood, no matter how revealing of the bosom these low necklines were, women’s arms still remained covered by sleeves.

**WOMEN AND THE HOUPPELANDE.** From about 1350 onward, and coinciding with the advent of the new short costume for men, records for expenditures on clothing purchased by various royal courts survive and provide considerable information regarding styles, color, and fabric choices (especially vernacular or non-Latin terms for colors and costume styles), and the particular

court occasions, such as weddings or festivals, for which the items were ordered. Since male fashion seems to have been documented more than female, it is harder to say with certainty exactly what was purchased for women, and costume historians are forced to rely more on manuscript miniatures and other depictions in the decorative arts. Nonetheless, it seems clear that during the period from 1340 to 1485, feminine fashion remained relatively stable, though throughout the fifteenth century women’s necks were decidedly bare, with the exception of a brief period from around 1415 to 1425 when it was fashionable to cover them. In the first quarter of the century, the standard garments for women were the cote and the mantle, with the cotehardie (a sort of vest), the sideless gown or surcoat (adopted from Italy), worn by noblewomen only for the most important court ceremonies. In the second decade of the fourteenth century, the garment formerly reserved for men, the houppelande, with

## TYPES of Medieval Head Coverings

**Almuce:** An elongated, fur-lined hood. Initially worn by the general population, it later became the headdress worn by clerics, especially canons (members of a religious community who lived outside a monastery in “colleges” and were often associated with the daily song rituals in cathedrals).

**Bonnet (English “cap”):** A general French term denoting a small head-covering. This term was used from the early Middle Ages onward.

**Chaperone:** A hood with a lower edge long enough to cover the nape of the neck and upper shoulders, having a circular opening for the face and often a long point, sometimes with a tail or tippet added. In the fifteenth century, the chaperone was often worn in an elaborate curved turban-like arrangement on top of the head, with the tippet wrapped to retain the desired shape.

**Coif:** A small covering for the head, usually of linen, that tied under the chin, resembling a present-day baby bonnet. It was worn beneath other types of headdresses. Dating from the early thirteenth century, it disappeared from men’s fashionable dress by the middle of the fourteenth century, except that it continued to be worn by Sergeants at Law in England even after they became judges. In warmer weather,

nobles often wore other light headgear such as flower wreaths, garlands of peacock feathers, and jeweled circlets.

**Hennin:** Primarily a French headdress of the second half of the fifteenth century, the hennin had a cone-shaped construction with soft veiling attached at the peak that hung behind it in varying lengths, some as long as to the floor. At the time when these were popular, ladies shaved or plucked their foreheads to raise their hairlines, and their tall headdresses emphasized this elongated facial effect.

**Reticulated headdress:** A style in the fourteenth and fifteenth centuries characterized by the enclosure of hair arrangements in a net-like receptacle. The forerunner of this headdress was the *caul* or *crispinette*. Reticulated headdresses were made of gold, silver, or silk nets, sometimes set with jewels at intersections, and fashioned into bags to hold the hair in place.

**Wimple:** A small veil or shawl-like garment worn over the neck and upper chest, usually draped, pleated, or tucked. Attached at the sides of the head either by ties or pins, they were worn sometimes as loose coverings and at other times fitted so as to adhere closely to the neck. Wimples were stylish in the late thirteenth and early fourteenth centuries, but by the second half of the fourteenth century they were primarily conservative garments worn only by nuns, ladies in mourning, and elderly women.

a variety of fanciful sleeve types, was adopted for feminine wear. This garment’s extravagant decoration, with slashings to show contrasting fabric below and cut-out decoration at very full sleeves and hem, was taken over with slight modification by women in the form of full frontal closure and a train. A variation in the style of the sleeves of the houppelande or robe appeared at the middle of the century when a tight sleeve with a cuff covering the knuckles replaced older sleeve types. The female form of the cotehardie was somewhat less fancy than its male counterpart. It was worn over a “kirtle,” a term originally designating a short linen under-garment, later an overgown, and still later, analogous to the French cote, the outer garment also known as a robe or surcote. Buttons were optional, and no girdle was worn with it.

**HENNINS AND HEADDRESSES.** For the whole of the fifteenth century, very fanciful largely vertical headdresses built up on a framework or understructure were in fashion, perhaps because women wanted to participate in the acquisition of ever-changing fashions but were not permitted to make drastic changes to the length

of their dress. Continuing the trend of decorative excess, women’s fifteenth-century headgear included heart-shaped and “reticulated” headdresses—that is, headdresses characterized by the enclosure of hair arrangements in a stiff net-like receptacle that replaced the earlier “snoods,” or bags, to hold the hair in place. The hennin, primarily a French headdress of the fifteenth century, was a cone-shaped construction with soft, often pleated veiling attached by pins at the peak that hung behind it in varying lengths, some as long as to the floor. The origin of the word “hennin” is unknown; it possibly reflects a contemptuous slur meaning “to whinny,” which was flung by passersby at women wearing such headdresses on the streets. Another form of such headdresses was that called “cornes” (horns), in which the headcovering branched out like a crescent moon in two horn-like protuberances. Towards the end of the medieval period, perhaps responding to the same taste for “verticality” that appeared in Gothic architecture (and also in men’s clothing), women plucked or shaved their hairlines to increase their expanse of foreheads—a style

## THE SPREAD OF THE AGE OF FASHION

**DOWNWARD MOVEMENT AND UPWARD PRESSURE.** While at first the development of radically new styles for both aristocratic men and aristocratic women in the mid-fourteenth century probably arose from a combination of intellectual and artistic influences, the increased rate of change and the spread of interest in fashion throughout all levels of society were brought about in large part through a new set of economic and social factors that began to appear around the same time. The significant shift in European styles worn by the fourteenth-century nobility re-instituted class markers in costume that had largely been eliminated in the thirteenth century. Because so many family lines were disrupted by mortality from the bubonic plague, which led to the redistribution of lands and opportunities for the upper bourgeoisie to attain property and power, social status came to be determined in part by the possession of wealth rather than merely by family lineage. The commercial class who survived the plague and became wealthy could afford to imitate the opulent dress of the nobility, and the classes beneath these merchants and citizens, as they were able, followed suit. Likewise, in England, during the Hundred Years' War, the middle and lower classes were able to accomplish such imitation after the English victory over the French at Poitiers (1356) because sumptuous garments flooded the country as a result of booty taken from the defeated French nobility. As the French author Jean Froissart mentions in his *Chronicles of the Hundred Years' War*, from this battle, ransoms were collected for captured French prisoners, dishes made of gold and silver were confiscated, and other treasures were gathered, such as jewels, girdles, and ornaments made of precious metals, and richly furred mantles, all of which the English leader, Edward the Black Prince, shared among his followers. Thus, in the fourteenth century, every time the nobility introduced a new style, there were always immediate imitators whose wearing of the garments took away their appeal and made it necessary for the aristocracy to seek even newer, and often more expensive, fabrics and garments. Some costume historians, for example, have argued that women's headdresses might be used to date costumes with an error factor of only about ten years, presumably because styles in headdresses changed so often and these changes were so well documented that they could be used as dating guidelines. However, this

called "bombé" or "bulged"—and their tall headdresses emphasized this elongated facial effect. A late fifteenth-century panel painting of a young woman with plucked or shaved hairline and a sheer veil and tall headdress from the workshop of Rogier van der Weyden, now in the National Gallery in London, shows this cosmetic and fashion style.

method of dating should be used cautiously since now a given headdress might be worn even when it was out of style by someone not affiliated with the court, or by someone far removed from the centers of style in the major sites of the court or the cities.

**COMPETITION BETWEEN COURTS.** After about 1350 European styles in general were heavily influenced by the French court, and became ever more elaborately ostentatious following the death of France's king Charles V in 1380. In England, earlier in the century, King Edward II's French consort, Queen Isabella (married 1308, died 1358), had influenced fashion similarities between the two courts. The succeeding two kings of England—Edward III and Richard II—were members of the Plantagenet family, whose claims to the French throne (the cause of the Hundred Years' War) no doubt contributed to a desire to compete with the French court in matters of opulence and led to a similarly unrestrained attitude towards expensive dress. Indeed, Richard II was reputed the greatest fashion spendthrift of all of the English monarchs to his day, a habit to which some attributed his eventual downfall. Overall, in the fifteenth century expenditures for clothing continued to increase, and the rapidity of fashion changes and excesses of ornamentation contributed to the brilliance of a growing number of European courts, particularly in Burgundy and in the Burgundian Low Countries at Bruges and Ghent. Until 1440, noblemen and women continued to wear the lavish styles, garments, and ornamentation developed in the late fourteenth century, with only minor variations in design. Beginning in 1440, tunics of fashionable European noblemen reached nearly to the knee, but in the following decade tunics were made much shorter. The fourteenth-century fashion known as the *courtepie* (or short *houppelande*) returned to favor. From then on, short tunics continued to be in fashion into the sixteenth century. In addition, in France and England, Italian styles and those of the court of Burgundy, which also reflected Flemish and German elements, became popular. Germanic influence included the enlarging of sleeves, chest, and shoulders by means of added padding in a manner that some considered a distortion of the human silhouette.

**TALL AND NARROW.** Perhaps due to a combination of social and economic factors, including the end of the Hundred Years' War, fashion took a turn to a radical new form in the middle of the fifteenth century. In England, toward the close of King Henry VI's first reign (1422–1461), fashionable courtiers wore narrow, long robes, with *houppelandes* and *pelicans* again in style. The shoulders were padded, but the skirts were narrow, and these robes were worn as outer garments

Guy Parat presents *The Preservation of Health* to Philip the Good, duke of Burgundy, wearing black "tall" costume. St. Petersburg, Russia, National Library MS Fr.Q.v.v.i.I, folio 2, 1450. ERICH LESSING/ART RESOURCE, NY.

over the short tunics mentioned above, topped by tall hats. The combination produced a silhouette of extreme height. At the same time, ornamental excesses were appearing in all of the other arts of the period, so that the "perpendicular style" in fashion occurred simultaneously with the period when Gothic architecture was reaching its peak of ornamental linear emphasis. In costume this trend toward extremes was best illustrated in the courts of King Charles VI of France (1380–1422) and the dukes of Burgundy, as the nobility wore garments divided into contrasting color areas—such as red and blue, or green and yellow—and the headdresses of both noblemen and ladies grew more varied and exaggerated in shape, especially in height. Indeed, from mid-century forward, women also sought an elongated fashionable look that included a high, plucked hairline, complemented by a swan-like neck, slender shoulders, and skirts that reached to the ground. Breaking the long line of this fashion look was the fashionable lady's posture, in which her stomach protruded beneath her elevated waistline, an effect often increased by padding.

## DRESS CODES AND ANTI-FASHION

**THE ORIGINS OF SUMPTUARY LAW.** Sumptuary laws, named from a Latin word that joins the ideas of magnificence and expense, were enacted across Western Europe during the Middle Ages. Such laws had economic, moral, and social foundations. Economically, they regulated personal spending, with the intention of controlling inflation, discouraging the depletion of state resources for purposes of ostentatious display, and limiting the trade deficits that could occur through the import of luxury goods from faraway places. At the same time they regulated behavior, reinforcing the virtues of modesty and moral seriousness that were often thought to be especially lacking among women and young men. Finally, they performed a social function in clarifying the lines between classes through visual signs, slowing the encroachment of the commercial classes on the privileges of the aristocracy. The earliest such laws in the Middle Ages were those decreed by Charlemagne and by Louis the Debonnaire who ruled the Frankish kingdom after Charlemagne's death in 814. These were, respectively, attempts to control the prices that nobles might pay for their customary garments and attempts to forbid the wearing of silk and ornaments of gold and silver. Later sumptuary laws, with the earliest dated 1157 in Genoa—followed by similar statutes in France, Spain, and the rest of Italy—attempted to regulate economic conditions of a political area such as entire countries and individual city-states. Sometimes their purpose was to restrict trade with an eye to promoting local production at the cost of other states' profits; for example, in England at certain periods citizens were forbidden to purchase imported cloth and could only wear clothing made of locally produced fabric. When royal coffers were getting depleted, governments attempted to regulate traffic in consumable goods and monies spent on ceremonial occasions, such as weddings, funerals, knightly investitures (the "dubbing" ceremony), and birth celebrations. It should come as no surprise that during a period of lavish

Pride in open-sided jacket and hose. Psalter hours of Rome use, Robinet Testard, Poitiers, late 15th century. THE PIERPONT MORGAN LIBRARY, NEW YORK. M. 1001, F. 84.

and luxurious costume in fourteenth-century England, sumptuary laws were initiated there, as they had been previously in other parts of Europe. From time to time, the king and/or his nobles in Parliament attempted to regulate dress by the two standards of income and birth status. Despite their efforts, these laws—passed, sometimes passed then rescinded (1363), or proposed but rejected (as in the case of Richard II)—were never capable of curbing fourteenth-century fashion excesses. Nonetheless, they serve as valuable indicators of the attitudes of certain portions of the nobility toward costume.

**SUMPTUARY LAW AND ITS MORAL IMPLICATIONS.** Not only noble wastefulness, but any excess in dress was the target of sumptuary laws. And sometimes a moral point was made—that excessive consumption of these goods, with clothing specifically mentioned, resulted from the sin of pride. Thus, such practices must be moderated or else such sinfulness would draw upon the community natural disasters such as plague, famine, and war as signs of God's punishments. In many cases, especially in Italy, sumptuary laws were directed at women partic-

*a PRIMARY SOURCE document***A SATIRE ON WOMEN'S HORNED HEADDRESSES**

**INTRODUCTION:** Medieval moralists singled out female headdresses as a special target for attack on the immorality of certain fashions. Not only sermons, but also popular poetry pointed out the dangers of excessive headwear. The male writer of the early fourteenth-century poem reproduced here specifically attacks a style in which women fashioned "horns" of false hair enclosed in a net known as a *crispinette* on both sides of their heads, in this case making the point that women wearing horns were adopting male roles, since horns were a sign of masculinity on animals like bulls and deer. Variations of this style of headdress, with the horns growing longer or taller, survived into the reign of Henry VI (1422–1461 and 1470–1471) and continued to incite satirical comment.

The Bishop of Paris, a theologian  
and a philosopher, observes that  
a woman who puts false hair on her head  
and paints herself to please the world  
is too foolish a hussy. ...

If we do not take care of ourselves  
we shall be slain by these women.  
They wear horns to kill men; they carry great masses  
of other people's hair upon their heads.

Woman began to turn herself to evil  
from the time she caused our first father [Adam]  
to descend into hell.  
Believe me well—

A woman who adorns her head with horns will pay for it;  
if she does not mend her ways. ...

They make themselves horned  
with worked hemp, or flax,  
and counterfeit dumb beasts—  
they who wish to be known as worthy ladies.  
It would be more to their advantage  
to think of their souls; as do  
the worthy women of simple manners,  
who will not display themselves,  
nor show their flesh to attract libertines.  
They [horned ladies] make men much worse—greater fools,  
and greater sinners—by their enticement;  
this foolish behavior entices those who would,  
long ago, have kept out of temptation,  
I do not doubt.

And I believe,  
May God bless me, that a woman  
who decorates herself thus,  
and disfigures herself, and loves  
and values her flesh so much,  
is not much occupied with goodness of heart.  
Even if she were my cousin, or my sister,  
I could only believe that such a one,  
horned, is a foolish woman.

**SOURCE:** Frederick W. Fairholt, ed., *Satirical Songs and Poems on Costume: From the 13th to the 19th Century* (1849; reprint, New York: Johnson Reprint Corp, 1965): 29–39. Text modernized by John Block Friedman.

ularly, the reputed source of all temptation to excess. Indeed, women as temptresses drawing men into sin through pride and lust were a favorite target for medieval moralists. A striking combined attack against prideful exhibition in male and female costume appears in the *Book of the Chevalier de la Tour Landry*, a late medieval French "courtesy book" intended by the author for the moral education of his daughters. The speaker mentions a sermon against pride—preached to a fashionably dressed crowd of men and women—which presents Noah's Flood as an exemplum of destruction caused by bad behavior and then goes on to remark on women in the church who wore "horned" headdress. The preacher compares the women to snails who are displaying their "horns" to men who have come to church in such short costume that they are showing their behinds and their underpants and even their genitals. Thus, each outdid the other in foolish pride, the ones in short clothes and those wearing horns.

**OPPOSITION TO EXTRAVAGANT GARMENTS.** Many of the styles that took hold from the middle of the fourteenth century onward caused especially strong reactions from conservative members of society. Not surprisingly, one of the concerns was the new trend towards emphasis on the body, as expressed both in the men's short styles just mentioned and women's low necklines. The arguments against these styles took a number of forms. In a poem by Eustache Deschamps, for example, dated around 1398, the concern mainly seems to be a matter of jealousy, the complaint from older women that they are put at a disadvantage when young women use corsets to push up their breasts: "Because bosoms are being shown about / In all manner of places, generally, / A desire has arisen in many a person / To have them covered again; / For it makes many a heart suddenly fill with sadness / To see them ... / For the thing that has put them in this situation / Is youth alone: / Round, small, firm ..." (Ballade 1469). The sideless gown also seems

Male “short” costume and doublets seen from the rear. The “Golf” hours, Flemish, Simon Bening, London British Library MS Additional 24098, folio 19v, 1530. © THE BRITISH LIBRARY/HIP-TOPHAM/THE IMAGE WORKS.

to have disturbed moralists: the resulting openings were called “devil’s windows” since it appeared they made women’s bodies accessible. For men, the revealing pourpoint excited a strong backlash across Europe. For example, the Italian city-state of Aquila passed a sumptuary ordinance in 1375 legislating against men who wore very short pourpoints, and the Middle English poem *Brut* (c. 1346) mentions how the “madness and folly of the foreigners” has brought to England a taste for “short clothes.” The well known Middle English satiric poem “Huff A Gallant” remarks on the fashion for “gowns/Too short their knees to hide,” while a similar poem, “Now is England perished,” mocks those with “short gowns.” One Middle English sermon of about 1380 treats several of these points with an added concern about class transgressivity: “Now are the common people afflicted by the sin of pride. For now a wretched knave, who walks behind a plow and a cart, and has no money but serves from year to year for his livelihood, whom once a white

girdle and a russet gown would have served quite well must now have a fancy doublet costing five shillings or even more and over that a costly gown with baggy sleeves hanging down to his knees and pleats under his girdle like those on a bishop’s surplice, and a hood on his head with a thousand little tags on his tippet, and gay hose and shoes as though he were a country squire.” The extravagant cut of the houppelande, though it was not revealing, likewise excited considerable comment at its appearance in the 1360s because it required so much expensive cloth (and often fur and other decorative touches), resulting in a wasteful display of wealth. French chronicler and poet Jean Froissart wrote a pastourelle in which several humble shepherds discuss this garment with awe and a certain ironic lack of understanding of its function as an indicator of social status.

**THE BATTLE OVER SHOES.** As early as 1298, extravagant shoe fashions drew criticism from both monarchs and moralists. An edict issued in France by King Philip the Fair in that year intended to curb excess of fashion among the rising bourgeois by restricting the length of the toes on poulaines. Such shoes were condemned at the Council of Anvers in 1365 and again by royal edict, for King Charles V of France on 9 October 1368 forbade the wearing of poulaines by all classes under a penalty of a fine of twelve florins (a gold coin). An English statute of 1465 decreed a fine of 20 shillings—a very large sum of money at the time—for those with pointed shoe tips over two inches long. As with many shifts in fashion in the later Middle Ages such as the replacement of long with short costume, the taste for poulaines had some significance in the economics of the cordwainers’ (leatherworkers’) guild and the general rise of guild autonomy throughout Europe and the British Isles. According to Gregory’s *Chronicles*, the pope issued a bull in 1468 excommunicating those who made any shoes with pointed toes exceeding two inches in length: “And some men said that they would wear shoes with long pointed toes whether the Pope approved or disapproved, for they said the Pope’s threat of excommunication was not worth a flea. And a short time later, some members of the Cordwainers guild got privy seals to make such shoes and caused trouble for those fellow guildsmen who heeded the papal edict.”

**BACKLASH AGAINST WOMEN’S HENNINS.** The fashion for the tall dunce-cap-like female headdress called the *hennin* or cornet soon drew the attention of social critics. Although this headdress is the one most commonly associated with medieval female costume in the modern consciousness, it was in fact a late phenomenon mainly limited to France, Burgundy, and the Low

*a PRIMARY SOURCE document***SHEPHERDS DISCUSS THE HOUPPELANDE**

**INTRODUCTION:** As a poet in the court of Edward III of England in the late 1360s, the French chronicler Jean Froissart wrote a number of "historical pastourelles," poems using the form and context of traditional songs about aristocratic encounters with shepherdesses, but transformed to comment on current events. In a poem that appears as "Pastourelle 1" in both of the original manuscripts, Froissart imagines an aristocratic narrator who overhears a group of shepherds discussing the houppelande fashion of a nobleman who has just passed by. Quoting the words of the shepherds, the poet simultaneously makes fun of both the shepherds' misunderstanding of what they see and the absurdity of the garment itself, which used a tremendous amount of cloth. In the poem, one shepherd wonders if a single ell of cloth (a measurement equal to about 45 inches) would be enough to make a houppelande for himself, and is promptly informed that he would need nine times that much just to line the garment.

Between Aubrecicourt and Mauny  
Near the road, upon fallow ground,  
The other day I heard shepherds talking  
Around the hour of noon.  
And Levrins Cope-osiere was saying:  
"Gentlemen, yesterday didn't you see  
Men on horseback riding by  
Or hear talk about houppelande cloaks?  
I saw each man wearing one of them,  
And the sight brought me such great joy  
That, ever since, I've done nothing but wish that I  
Could dress in a houppelande."

"A houppelande, dear God, oh my!"  
Thus answered Willemes Louviere,  
"And what can that be, now tell me that!  
I know what a bread sack is, all right,  
A tunic and a traveling pouch,  
Leggings, a needle holder,  
A hare, a collar, a greyhound,  
And I know how to guard sheep well,  
Care for them and get rid of disease;  
But I don't have the slightest idea  
What on earth could make you talk about  
Dressing in a houppelande."

"Listen, and I will tell you:  
It's because it's the latest style,  
For the other day I saw someone wearing one,  
One sleeve in front, another behind;  
I don't know whether such clothes are expensive,  
But they certainly are valuable;  
They are good both summer and winter,  
You can wrap yourself up snugly inside,  
You can put whatever you like in there;  
You could easily hide a wicker basket—  
And that's what makes me think about  
Dressing in a houppelande."

"By my faith," said Ansel D'Aubri,  
"I am sure that some time ago  
Shepherds used to wear cloaks of that kind,  
Except theirs were made of light cloth,  
For I still have the very first one  
That belonged to my grandfather Ogier."  
Then Adins, son of Renier, responded:  
"Ansel, by the body of Saint Omer,  
Please bring it with you tomorrow;  
We will use it to cover our food,  
For I might also decide that I wish to  
Dress in a houppelande."

"Gentlemen," said Aloris d'Oisi,  
"By the faith that I owe Saint Peter,  
I will go to Douai Saturday,  
And buy an entire ell of cloth,  
And I will make the most excellent cloak  
That anyone has ever seen a shepherd wear.  
Will I have enough cloth to have one made  
And have a fourth left over?"  
—"My, no; to line it you will need  
Nine ells of broad Irish cloth."  
—"Alas! It would cost me too much to  
Dress in a houppelande."

Prince, I saw them thinking it over  
And talking among themselves and making plans:  
It would be good to require of all shepherds  
That every one of them should agree to  
Dress in a houppelande.

**SOURCE:** Jean Froissart, "Pastourelle 1," *The Short Lyric Poems of Jean Froissart: Fixed Forms and the Courtly Ideal* (New York and London: Garland, 1994): 108–111. Translated by Kristen M. Figg.

Countries. The hennin could be as much as a yard tall, and it was worn inclined to the rear. On its peak was attached a thin veil, which might be short, so as to flutter in the wind, or long, reaching all the way to the floor. The Carmelite friar Thomas Conecte (died 1433) singled

out hennins in a sermon as among the worst expenditures of women on their fashion. His sermons against gambling and extravagance in clothing were enormously popular in northeast France and what is now Belgium, drawing crowds in the thousands.

## GUILDS AND CONFRATERNITIES

### GROUP IDENTITY AND CONTROLLED COMMERCE.

Guilds and confraternities were an essential phenomenon of life in the early thirteenth and later centuries.

Cloth merchants showing wares. Book of statutes of Siena Drapers Guild, 14th century. THE ART ARCHIVE/MUSEO CIVICO BOLOGNA/DAGLI ORTI.

They played an important role in the development of the cloth trades and in the consequent rise of fashion in all of its social and aesthetic ramifications. For example, although religious confraternities allied to a particular church or shrine were chiefly organized for the purpose of mutual spiritual and social support, they also played a role in the development of fashion. Their rules and charters designated a particular costume to be worn at meetings to identify members and give a feeling of community. Members prayed together and for each other; they provided mutual financial support and comfort in times of illness and death, and they formed and financially supported groups who went on pilgrimages, often wearing the colors and heraldic insignia of the group. The merchant guild was organized in the smaller cities or towns primarily to enforce a monopoly that ensured its membership—craftsmen, traders, and merchants—the control of commerce within the city or town boundaries. They retained economic control within their geograph-

ical area by imposing fees and rules that non-residents and non-members had to add to their cost of doing business within this town or city. These guilds also provided aid to their members who were sick or needed burial, in addition to meeting regularly for ceremonial and social dinners. They, too, required members to be appropriately dressed in the costume that identified the guild. At least as early as 1216 there were a notable number of these merchant guilds controlling, for example, the transportation trades of carters, watermen, and the like.

**STANDARDS OF CRAFTSMANSHIP.** In the larger cities such as London and Paris, however, a different kind of guild—that of artisans—sprang up. There, the numbers of craftsmen were great enough that individual crafts might form a guild of their own, and specialization within a craft provided the opportunity for increasing skills, developing talent, and encouraging innovations in style. Such guild members intermarried and tended to live in

*a PRIMARY SOURCE document***A MERCER HAWKS HIS WARES**

**INTRODUCTION:** A French “trade poem” called “Le Dit du Mercier,” from a manuscript in Paris, Bibliothèque nationale MS fr. 19152, composed between 1270 and 1340, presents the mercer as a speaker, hawking his merchandise and describing some of his sales practices. The text offered here contains only the portions relating to fashion.

Hello to this very fine company.  
 I am a mercer, and carry mercery,  
 which I would sell willingly,  
 for I am in need of pennies.  
 Now, if it pleases you to listen,  
 I can easily describe the goods that I carry,  
 however heavy the weight of it that I bear—  
 I have some charming little girdles,  
 some fine gloves for young girls;  
 I have gloves in both double and single weight thickness.  
 I have good belt buckles  
 and good looking iron chainlets for the belt too—  
 I have wimples saffron tinted and perfumed;  
 I have well sharpened needles  
 and neat little boxes to hide trinkets in—  
 When you see them you will nearly cry out.  
 I have leather purses with nice catches,  
 Indeed, I have too many wares to describe.  
 I have good otter-skin winter cloaks,  
 and ermine and silks  
 and border edging of porpoise.  
 I have trains of fur  
 and nicely worked needle cases. ...

I have braies [male underpants] and lovely garter belts  
 and good saddle bags.  
 I have sewing thimbles  
 and various alms purses  
 of both silk and Spanish leather  
 which I would love to sell.  
 And I have some also of plain linen.  
 I would gladly sell a veil to a Benedictine nun.  
 I have iron buckles for your shoes. ...

and for ladies horn clips for your hair.  
 Buckles for your shoes  
 And even pewter catches for a child’s shoe straps.  
 I have fine laces for felt hats.  
 I have beautiful silver wimple pins,  
 as well as some of pot metal too,  
 that I sell to these fine ladies.  
 I have some pretty head scarves  
 and lovely coifs with laces  
 that I can sell to pretty girls,  
 and a matching silk  
 for hats with bordered brims,  
 and I also have some linen hats for young girls,  
 embroidered with flowers or birds—  
 of a smooth and bright warp and woof—  
 to primp in before their boyfriends,  
 and for peasants some hats of hemp  
 and mittens for their hands.  
 And for monks some purses ...

And knotted laces for surcoats ...

and well-made hose from Bruges ...

the same neighborhoods, which then became identified with those trades. At the same time, the guild developed and maintained standards of craftsmanship and assumed responsibility for punishing any member or apprentice who violated these standards. Like the merchant guilds, artisan guilds also aimed to control commerce, protect it from predatory and innovative non-members or foreigners, and make it work always in their own favor. When towns expanded into cities, these craft guilds supplanted the merchant guilds that had formerly held trade monopolies. Gradually, the number of specialized craft guilds increased. Throughout the Middle Ages, the largest and most powerful of these guilds were those having to do with the cloth trades, but leather crafts were also very important since they supplied shoes, clothes, and belts, as well as other serviceable goods.

**COMMERCIAL PRIDE.** The flavor of these cloth trade guilds and their enterprise is encapsulated in certain “trade poems” of the thirteenth century. For example, the essence of a medieval tailors’ guild is portrayed in the “Song Upon the Tailors,” which emphasizes the importance of tailors to society in a time when those who could afford it always ordered their wardrobes from tailors and those who were less affluent had their garments made at home. This poem, written in Latin and dating from about 1260 to 1270, is extremely useful as a glimpse into attitudes towards clothing from relatively early in the Middle Ages. The poem illustrates the thrifty practice of the remaking of old garments into new ones, and, in a subtle play on the religious concept of transubstantiation, the poet elevates the importance of tailors’ work by likening it to that of divinities (gods)

and combs for the hair—  
I have good Parisian soap  
and nice boxes to keep it in.  
I have catches of both silvered and  
gilded pot metal—and people love those  
which are made of pot metal so much  
that often we mercers use silver colored pot metal  
and call it silver. ...

And I have knives both blunt and pointed  
to make a knight-to-be look chic ...

and ribbons to attach silk-covered gold buttons  
and belts red and green, white and black  
with iron plates—  
that sell very well at fairs. ...

I have many fine collars up to the ears, and napkins  
that rich women wear on their heads on holy feast days,  
and I have much finery for women:  
Everything necessary to the toilette:  
razors to shave the hairline, tweezers, make-up mirrors  
and ear and tooth-picks,  
hair preeners and curling irons,  
shoehorns, combs, and mirrors,  
and rose water with which to cleanse themselves.  
I have cotton with which they rouge,  
and whitening with which they blanch themselves,  
and I have laces for lacing their sleeves ...

I have saffron to spice your food  
which I sell to ladies to tint their collars,  
whole pomegranates (but I think they are expensive).  
But nonetheless I know well how to sell them  
—and get money or payment in kind—  
and very fine belts and deceitful little trumperies. ...

I have catches of pot metal and alloy  
and girdles and beautiful falls to cover the head  
of which I have given three in exchange for one egg!  
(But I don't guarantee that they are new!)  
I have fine muslin to veil your faces ...

and chaplets for the old ones.  
I can tell you the world has mercers  
so that men and women can buy  
all these goods that load me down. ...

Come forward ladies, come here.  
Come forward, Don't avoid me.  
With an egg or a sou or a penny  
come lighten my panniers. ...

Now there is nowhere a man so rich  
who would not better love such a load  
Of mercery were he to have it—  
and if he knew how to safeguard it well—  
But I can get no good from it  
nor could I get any profit with it  
and from nothing I carried  
did I gain enough to eat—  
Therefore will I set down my pack  
I will not meddle any more with it—  
Thus I will go back to the peddlers' tax notice  
at the city gates, and pray you God:  
shelter me in some castle  
and I get some chattel by it.

## SIGNIFICANT PEOPLE in Fashion

---

### THOMAS CONECTE

c. 1390–1433

*Carmelite friar  
Reformer*

**A CARMELITE PREACHER SATIRIST.** Thomas Conecte (or Connect) was born in Rennes, in Brittany in northwestern France in the 1390s. He joined the Carmelite order of friars and by 1428 was a popular preacher in Cambrai, Tournai, and Arras in the area of

Mercer showing wares, Manesse Manuscript, Heidelberg, Universitätsbibliothek, Cod. Pal. Germ 848, fol. 64. MINNESANGER MS., C. 1300, HEIDELBERG UNIVERSITY (PH. MANSELL).

northeastern France bordering on what is now Belgium. Though he denounced gambling, his chief target of criticism was the fashion for very tall and elaborate female headdress. It is said that his sermons—which drew crowds as large as 20,000—were so effective that gamblers destroyed their dice and cards and women their tall headdresses immediately upon hearing his preaching. The famous eighteenth-century English essayist Joseph Addison had heard of, or read of, these sermons and described the women present at them in their tall headdresses “like a forest of cedars with their heads reaching the clouds.” Soon caught up in the reform movement among the Carmelites in the fifteenth century, Conecte’s denunciations of overly “secular” priests earned him the hostility of the ecclesiastical hierarchy of his diocese; he had to flee France to Italy, where he became involved in the reforms of the Carmelite convents at Florence and later at Mantua. By 1432, he made reforming trips to Venice, and finally to Rome, where he attacked the papal curia and the papacy of Eugenius IV for vices. He was condemned by the Inquisition and publicly burned at the stake as a heretic in 1433.

### SONG UPON THE TAILORS

**INTRODUCTION:** The poem “Song Upon the Tailors” appears in a manuscript miscellany originally written at Reading Abbey in England, now in the British Library (MS Harley 978, folio 78). The author was a cleric both learned and witty as he plays on both the Christian concept of transubstantiation (the belief that the elements of the Eucharist actually transform into the body and blood of Christ upon consecration) as well as the gods of ancient Greece and Rome to elevate the importance of tailors’ activity in reworking older clothes for new owners.

Ye are gods: ...

Gods certainly ye are, who can transform  
an old garment into the shape of a new one.

—The cloth, while fresh and new,  
is made either a cape or mantle;  
but, in order of time, first it is a cape,  
after a little space this is transformed into the other:  
thus ye “change bodies.”

When it becomes old, the collar is cut off;  
when deprived of the collar, it is made a mantle:  
thus, in the manner of Proteus, are garments  
changed;

nor is the law of metamorphosis a new discovery.

—With their shape they change their sex; ...

—When, at length, winter returns, many  
engraft immediately upon the cape a capuce;  
then it is squared;  
after being squared it is rounded;  
and so it becomes an almuce.

—If there remain any morsels of the cloth  
or skin which is cut, it does not want a use—:  
of these are made gloves; ...

—This is the general manner [in which]  
they all make one robe out of another,  
English, Germans, French, and Normans,  
with scarcely an exception.

## ELEANOR OF AQUITAINE

1122–1204

*Queen*

**SIMPLICITY AND FINE TASTE.** Eleanor of Aquitaine, wife of two kings and mother of two more, was born in 1122, the daughter of William X of Aquitaine, a large important duchy in southwestern France. At fifteen Eleanor married a relative soon to be King Louis VII (r. 1137–1180) of France but did not bear him male heirs, and he eventually divorced her in 1152 on the grounds of consanguinity (being too closely related). Eleanor remarried; with her new husband, Henry II of England (r. 1154–1189), count of Anjou and duke of Normandy, she had five sons. She brought to this marriage her lands of Aquitaine. In her roles as queen of France and queen of England, Eleanor was an important arbiter of taste, serving as a patron of the arts, rebuilding deteriorated religious houses, and financing the construction of the first church in the “gothic” style. She also supported manuscript illumination and fine book making and has been associated with the rise of courtly poetry, a literary form that focused attention on the beauty of women and their fashions. Though her son King John (r. 1199–1216) presided over a wealthy court that provided ample opportunities for extravagance of dress, Eleanor encouraged a rather plain style among the women of her court, demonstrating the importance of her influence. She died in 1204.

## FRANCIS OF ASSISI

1181–1226

*Founder of the Franciscan Order*

**THE SIMPLE GARB OF THE FRIAR.** Francis of Assisi was born in 1181 and early in life experienced a mystical conversion to a life of poverty, itinerant preaching, and aid to the poor and disenfranchised. Like-minded persons soon gathered to him and by 1209 had formed what was to be the Franciscan Order of Friars or Friars

Minor. Authorized by Pope Innocent III as a group of public preachers, they came together for their first general chapter in 1217. A Rule, that is, a guide to the organization and behavior of the order’s adherents, was created in 1221 and officially approved for the Order of Friars Minor by Pope Honorius III in 1223. The rule stressed qualities that Francis saw in the apostolic form of Christianity illustrated by the lives and deeds of Jesus and his disciples. One element distinguishing the Friars Minor from the other mendicant or “begging” orders like the Dominicans, Augustinians, and Carmelites was Francis’ insistence on absolute personal and corporate poverty. Franciscans were to live by begging or manual labor, reside in simple surroundings, and, most important, own no money or property. This was reemphasized at his death in 1226 in his *Testament*, a last work which again stressed that Franciscan friars were to own nothing, either as individuals or as a group. This issue of extreme apostolic poverty eventually led to divisions within the church, and a bull (the most solemn and weighty form of papal letter) of 1230 by Gregory IX implicitly favored wealth within the church and seemed to allow the order to own some simple property. This position was supported by the faction of “Conventuals” under the leadership of Bonaventure, who, in writing a “life” of Francis, defended the ownership of property such as the highly ornamented priestly garments known as vestments. Against the Conventuals was the Spiritual party, particularly associated with the name of Peter John Olivi (1248–1298) who argued against any type of possession and for an intense apocalyptic spirituality with a focus on the “use” of material goods, such as books, religious ornaments, and clothing, in only the most basic and necessary form. The garb of the Friars Minor, with its simple robe, rope belt, and sandals, was often depicted in medieval art and established a symbolic standard for simplicity of dress.

## PHILIP THE BOLD

1342–1404

*General  
Statesman*

**A MAGNIFICENT DUKE OF BURGUNDY.** Philip, known as the Bold, was the son of King Jean II of France and Bonne of Luxembourg. He was born 17 January 1342 at Pointoise. After his capture at the Battle of Poitiers (1356), he was made duke of Burgundy by his father in 1363. He married Marguerite of Flanders, an heiress of great landed wealth, in 1369. Eventually, through his dynastic power, Philip formed a Burgundian state that controlled not only what is now eastern France, but much of the Netherlands and what is now Belgium. In some ways he became the second most important person in France, after the monarch Charles V. His reign of some twenty years was known for its patronage of the arts, and especially for the lavish use of highly ornamented fabrics such as silks, velvets, and cloth with gold and silver wire embroidery. He also favored striking color combinations in the costumes of his courtiers. Because of his influence, the colors blue and black became especially important in late fourteenth-century costume. As interest in clothing grew, extravagant displays of costume became civic ritual, and often the duke and his courtiers changed clothes several times a day. Philip's court left detailed records of purchases of fabric, gifts, descriptions of clothes, and inventories of garments that for the first time created what would later be a virtual library of information for those wishing to study the history of costume. Much of this extravagant fashion was financed from the tax receipts of France. He died in what is now Belgium in 1404.

## RICHARD II

1367–1399

*King*

**FASHION AND POLITICS.** Richard II, king of England, was born not in England, but in Bordeaux, France, on 6 January 1367. He was the son of the legendary knight Edward the Black Prince, who died without ever becoming king. Thus, Richard succeeded his grandfather, Edward III, whose court was already known for its lavish spending on clothes and jewelry. Both Richard's father and his grandfather loved tournaments, and there is evidence from records of the Royal Wardrobe that they always ordered expensive new clothes for these occasions. Indeed, Edward III did not hesitate to spend large amounts of money on gifts and especially on dresses for the queen. In one case it is recorded that he paid more than £200 for jeweled buttons for his wife, an amount that would have equaled a craftsman's salary for more than ten years. It is not surprising, then, that Richard inherited this taste for fine clothing and that he was eager to keep up with the French fashions then emerging in the celebrated courts of England's chief military rival. From fairly early in his reign, however, Richard was criticized for royal extravagance in a way that his predecessors were not, perhaps in part because he had instituted a series of truces with France that cut off the potential for enrichment that had come from earlier wartime victories. Richard was also in nearly constant conflict with his uncle John of Gaunt and with Gaunt's son Henry Bolingbroke, whom Richard sentenced to a ten-year exile for treason in 1397. When Gaunt died in 1399, Richard made Bolingbroke's exile permanent and confiscated the family fortune—an unpopular decision that was associated publicly with his overspending and his taste for what were seen as decadent foreign styles. Opposition to his authority grew among disgruntled lords; finally charges were made against him in Parliament and he was deposed as monarch, with Bolingbroke taking the throne as Henry IV. Imprisoned far from London, in Pontefract, Yorkshire, Richard died, or was murdered, in 1399.

**FASHION AS SYMBOL.** In many ways, Richard's interest in clothing demonstrates how important fashion had become as a symbol of sophistication. One of his main goals as king was to promote regal ideals and create an image of majesty, a role for which he was well suited physically and intellectually. Handsome and well built, standing six feet in height, he enjoyed such noble pastimes as hunting, observing tournaments, and reading courtly literature. Richard married Anne of Bohemia in 1382, a match that gained him prestige, since she was the daughter of the late emperor Charles IV, but which also contributed to the importation of foreign styles, including the pointed shoes that the French blamed on the Italians and the English blamed on the Flemish. John

Stow's Tudor *Annales* mentions that, since 1382, the points of shoes worn by English courtiers and gallants were of such length that they had to be tied to the knees with silver gilt chains or silk laces. Although Richard was in some ways just continuing a tradition of finery that was already established in the English court, an excess of this kind is a clear example of the sudden acceleration of change that marked the Age of Fashion. Thus, Richard could be said to have done for English costume what his near contemporary, Philip the Bold, Duke of Burgundy (1342–1404), did for fashion in France.

John Stow, *Annales* (London: G. Bishop and T. Adams, 1605).

## DOCUMENTARY SOURCES *in Fashion*

The Bayeux Tapestry (1080s)—This 231-foot-long embroidery on linen features a continuous pictorial narrative relating the story of the Norman conquest of England in 1066. It is an important source of information on

the clothing and arms of the Norman invaders of the eleventh century.

Jean de Brie, *Le Bon Berger* (1379)—This treatise written for King Charles V of France, describing the life and activities of a shepherd, provides detailed information on the costume and appurtenances of shepherds.

“Le Dit du mercier” (thirteenth century)—This thirteenth-century French trade poem found in a manuscript in Paris (Bibliothèque Nationale) presents the mercer—a traveling peddler or salesman who carried his stock with him—as a speaker, hawking his merchandise and describing some of his sales practices. The poem provides information on a variety of inexpensive accessories, such as buckles, combs, hats, and cosmetics that the mercer offers for sale.

*Tacuinum sanitatis* (1370)—This medieval health handbook exists in a number of manuscripts from about 1370 on, showing a variety of rustic and aristocratic costumes, including the houppelande worn by persons manufacturing pharmaceuticals, or commissioning and selling garments.

Robinet Testard, *Merveilles du monde* or *Les secrets de l'histoire naturelle* (1480–1485)—This manuscript, now in the Bibliothèque nationale in Paris, is a work on geography discussing 56 regions of the world. It shows numerous examples of agricultural, as well as aristocratic, costume.

*Très Riches Heures* (1390–1416)—Located in Chantilly, France, in the Musée Condé, this luxuriously illuminated manuscript provides detailed illustrations of both peasant and aristocratic life at the end of the fourteenth century.

## IMPORTANT EVENTS *in Literature*

- 524 Boethius writes the *Consolation of Philosophy*, which will be translated from Latin into every major medieval European language and become highly influential in medieval literature.
- 800 Charlemagne, who encouraged education and literature, is crowned emperor of the Romans and king of the Franks.
- 870 Viking settlers found the colony of Iceland, which will become the major source of medieval Scandinavian literature.
- c. 895 Anglo-Saxon king Alfred, who encourages learning at his court, translates Boethius's *Consolation of Philosophy* from Latin into Anglo-Saxon.
- 948 Egil Skallagrímsson, Scandinavian skaldic poet whose life is celebrated in the Icelandic saga, *Egil's Saga* (1230), writes *Head Ransom* while awaiting execution by King Erik Bloodaxe.
- c. 970 Anglo-Saxon lyric and narrative poems, including "The Wanderer," "The Seafarer," "The Ruin," and "The Wife's Lament," are copied into a manuscript collection later called *Exeter Book*.
- c. 1000 The only surviving manuscript version of the Anglo-Saxon heroic poem *Beowulf* is written down after the poem has circulated through memorization and recitation (known as oral tradition) for several centuries.
- 1095 Pope Urban II calls for the first Crusade, which many *chansons de geste* (heroic poems) helped to propagandize.
- c. 1100 The troubadours in the south of France and the trouvères in the north begin composing lyric poetry in a new style.
- The *Song of Roland*, the most famous example of the French *chanson de geste*, appears in manuscript form after several hundred years of circulating orally as a narrative recited along pilgrimage routes to Compostela.
- 1127 Duke William IX of Aquitaine, first *troubadour* poet and grandfather of Eleanor of Aquitaine, dies.
