During 1955–1956, Gaza and the Sinai Peninsula served as bases for numerous terrorist attacks against Israel. In September 1955, Egyptian prime minister Gamal Abdel Nasser ordered the closure of the Straits of Tiran, an international waterway, effectively blockading Israel’s port at Eilat. Israel regarded the blockade as an act of war. At the same time, Britain and France had grown increasingly frustrated with Nasser. The French resented Nasser’s support of Algerian nationalists, who were engaged in a war of independence from France, and the British opposed his nationalization of the Suez Canal on 26 July 1956. Thus Israeli, British, and French interests converged in the Suez-Sinai campaign. Their joint plan was divided into two distinct military operations, one led by the Israelis and the other by the British and French, and had the primary goal of deposing Nasser. Israel, ostensibly acting alone, launched its invasion of the Sinai on October 29. The Israelis, led by General Moshe Dayan, combined airborne and armored assaults to seize the Suez Canal by 31 October and to gain control of most of the Sinai by 3 November. As planned, the British and French then demanded that both Israel and Egypt pull back from the Suez Canal. When Nasser, as predicted, refused to withdraw, the British and French began a three-day air assault on 31 October, destroying the Egyptian air force on the ground. Within two days, British and French airborne troops had secured the canal. Militarily, the campaign was a success; politically, it was a disaster. U.S. president Dwight D. Eisenhower, preoccupied with the upcoming presidential election and Soviet repression in Hungary, opposed the Israeli-British-French collusion. On 2 November, the United Nations passed a U.S.-sponsored resolution calling for the immediate cessation of hostilities and the withdrawal of all foreign forces from Egyptian territory. France and Britain withdrew in humiliation, but Israel remained in the Sinai until March 1957. Nasser regained control of the Suez Canal and convinced the UN to dispatch a United Nations Emergency Force (UNEF) to the Sinai as a buffer between Israel and Egypt. The UNEF also prevented any further blockade of the Straits of Tiran. The Suez-Sinai campaign bolstered Israel’s military reputation, enhanced Egypt’s political influence in the Third World, and demonstrated that Britain and France were no longer world powers.

1967, Six-Day War

Tensions between Israel and its Arab neighbors significantly increased during 1966–1967. Israel’s borders saw repeated

Arab terrorist attacks and Syrian military activity. Throughout May, Nasser called for the destruction of Israel, and on 16 May demanded the withdrawal from the Sinai of the UNEF, which cravenly left three days later. On 22 May, Egypt closed the Straits of Tiran to Israeli shipping. Three days later, Egypt, Iraq, Jordan, Kuwait, Lebanon, Saudi Arabia, and Syria mobilized 547,000 troops, 2,504 tanks, and 957 aircraft along the Israeli border. Threatened by terrorist attacks, anti-Israel rhetoric, the closure of the Straits, and hostile troops on its borders, the Israelis launched their preemptive attack on 5 June 1967. On the first day, the Israeli Air Force, flying French Mirage fighter-bombers, attacked Arab airfields, destroyed the bulk of its enemies’ aircraft on the ground. The IDF then struck into the West Bank and the Sinai. Lacking air cover, the Jordanian and Egyptian armies quickly retreated. On 7 June, the IDF seized the West Bank (Judea and Samaria), previously controlled by Jordan, and captured east Jerusalem. Suffering 5,000 casualties, King Hussein of Jordan agreed to a cease-fire that same day. In the Sinai, the IDF quickly raced across the Sinai and inflicted perhaps as many as 12,000 casualties upon the Egyptians. Nasser agreed to a cease-fire on 9 June. With Jordan and Egypt defeated, Israel turned its armor and aircraft against Syria. The Israelis, after only 27 hours, entered Kuneitra and captured the Golan Heights, inflicting more than 1,000 Syrian casualties.

The UN negotiated a cease-fire between Syria and Israel on 10 June. Israeli air power was crucial to the destruction of the Arab armies in the war. Israel gained control of the Sinai Peninsula, the West Bank with all of Jerusalem, and the Golan Heights. Israel suffered the loss of 766 soldiers, compared with over 18,000 Arab casualties during the war.

1973, Yom Kippur War

In an attempt to regain the territories lost in 1967, Egypt and Syria launched a surprise attack against Israel, on 6 October 1973, the Jewish Day of Atonement (Yom Kippur). Poor political and military intelligence and an easy contempt for Arab military ability caused Israel to discount Arab frustration with the results of the Six-Day War and also misinterpreted Arab mobilization for the attack as annual military maneuvers. The Israelis finally realized the threat eight hours before the attack, but Israeli prime minister Golda Meir ruled out a preemptive strike for fear of being perceived as the aggressor. When fighting began at 2:00 p.m., the Israelis had not yet fully mobilized and were outnumbered 12 to 1. Backed by \$3.5 billion worth of aid from the Soviet Union, the Egyptians opened with an air and artillery assault into the Sinai, and the Syrians followed soon after with a thrust into the Golan Heights, taking Mount Hermon. Initial Arab gains were impressive, but the Israelis stopped the

Egyptians by 8 June, the Syrians by 11 June, and captured the Suez Canal on 18 October. Initially reluctant to offer assistance, the U.S. then funded Israel with \$2.2 billion worth of aid, which proved vital to Israel's war effort. The Organization of Petroleum Exporting Countries (OPEC), because of U.S. support for Israel, imposed an oil embargo upon the U.S. that lasted until 1974. Despite the active involvement of the U.S. and the USSR, the risk of superpower confrontation was never a serious possibility, and both powers brokered a cease-fire between the Israelis and the Syrians and Egyptians. Israel's military reputation declined as a result of the war; the nation had suffered 3,000 killed and 8,000 wounded, compared with 8,500 Egyptians and Syrians killed and 20,000 Syrians wounded.

But this conflict yielded two positive consequences. Egyptian president Anwar as-Sadat could now treat with the Israelis as a military equal for peace and recognition of the state of Israel. American president Jimmy Carter brokered the agreements in 1977, and both shared Nobel Peace Prizes for their work. But Sadat was assassinated by Muslim extremists five years later. The end of the war also saw the emergence of the Israeli peace movement.

1982, Lebanon and Beyond

Between 1978 and 1982, the Palestinian Liberation Organization (PLO), using Lebanon as a base for terrorist attacks, created instability along Israel's border. In early 1982, Maronite Christians in Lebanon and the Israelis began discussing a joint punitive war against PLO targets in Lebanon. Using the attempted assassination of the Israeli ambassador to the United Kingdom as a pretext, Israeli defense minister Ariel Sharon devised an invasion plan of Lebanon with three goals: the elimination of the PLO in Lebanon; the creation of a stable Maronite government in Lebanon; and the expelling of Syria from Lebanon. On 6 June 1982, IDF armor struck into Lebanon, attacking the PLO along the coast toward Beirut and Syrian forces near the Bekaa Valley. The IDF linked up with Maronite Christian forces outside Beirut on 8 June, but the Maronites were unwilling to attack the PLO in west Beirut. Fighting alone, the Israelis besieged west Beirut on 1 July. The Israelis led air, artillery, and naval bombardments against PLO positions in west Beirut until 6 August, when the PLO agreed to a U.S.-sponsored withdrawal agreement. Fighting elsewhere in Lebanon continued until 21 August. On 16 September, members of the Lebanese Christian Kataib militia massacred between 700 and 2,000 Palestinians at the Sabra and Shatila refugee camps. The IDF claimed to be unaware of the massacre going on about them. On 28 September, the IDF pulled out of west Beirut. Although a military success, the Israelis achieved only one of their three goals, the elimination of the PLO in Lebanon. The Syrian

military remained in Lebanon and the Maronites were unable to maintain a stable government friendly to Israel. The IDF withdrew from Lebanon altogether in 1985 but left a buffer zone maintained by Lebanese-Christian police north of its border until May 1999. Although this was the last overt Arab-Israeli conflict to date, cross-border raids, Israeli air strikes, and nearly continuous unrest between Palestinians and Israelis have kept the area in turmoil.

The Israelis were victorious in their Arab wars because they knew that, for them, defeat was not an option. (More than one Arab leader of the time criticized Adolf Hitler for not killing more Jews.) The Arabs knew, conversely, that they could be defeated in a particular war and come back to fight another day. Israeli society, with its many highly educated and technically skilled citizens and, usually, facing annihilation, fostered innovation and careers open to all talents, just what was needed in the fast-moving, combined-arms Middle East conflicts. The impoverished, authoritarian, underdeveloped Arab societies, with their formulaic, hierarchical militaries, at least until 1973, could hardly compete.

Issus, Battle of (November 333 B.C.E.)

The second victory of the Macedonian king Alexander III the Great over the Persian king Darius III that took place on the eastern coastline of the gulf of Iskanderun in southern Turkey. The battlefield was divided by a river called the Pinarus.

After Alexander had marched through Asia Minor, he followed the Syrian coastline southwards. The Persian army occupied a position north of the Macedonian army, blocking the road to the rear. Alexander immediately turned to meet Darius in battle, the Macedonians deploying south of the Pinarus, the Persians to the north.

Alexander's army consisted of 26,000 infantry and 5,300 cavalry. He positioned his heavy infantry in the center, with a

small force of cavalry on the left. The right wing consisted of the guard infantry and the bulk of the cavalry, including Alexander at the head of his guard-heavy cavalry, and light troops.

We know that the Persian army greatly outnumbered Alexander's, but it is impossible to assess its exact numbers. It contained a sizable cavalry force, a large contingent of Greek mercenaries, probably some 30,000 strong, and a large number of Asiatic infantry. Having reinforced the riverbank with battlements, the Persians took position on the riverbank with the Greeks in the center, some 30,000 Persian infantry on each wing, and an unknown number of local troops in the rear. The cavalry formed the right wing, closing the gap between the main battle line and the sea.

Alexander opened the battle by crossing the river and charging the Persian left, routing the Persian infantry. The Persian king fled immediately, though the Greek mercenaries had put severe pressure upon the Macedonian center, which was driven back into the river. However, as Alexander turned with his guard troops upon the Greek mercenaries from rear and flank, the Persian army was routed and broke, suffering heavy losses. The Macedonian losses numbered 450 dead and 4,500 wounded.

Italian Colonial Wars (1882–1936)

The Italian quest for prestige. Though it would seem that the pursuit of an overseas empire would be a low priority for the newly unified Italian state, with its lack of internal integration, serious border disputes with Austria, and a general paucity of resources, Rome still sought this objective in competition with the other major powers of the nineteenth century. The objectives being international prestige, potential markets, and an outlet for Italy's excess population that would still be under Rome's political control. A particular impetus for Italian expansion was the resonance of the very name Rome with *empire*.

While allowed by the British government to gain a

foothold in what is now Somalia, Italian efforts to create a protectorate over the Ethiopian Empire failed. Despite losing to feudal levies at Dogali in 1887, Rome signed the treaty of Wichale with Emperor Menelik II in 1889. The emperor believed he had signed a treaty recognizing his sovereignty. The Italian government felt they had cleverly bound the Ethiopians with an admission of overlordship. When Menelik came to understand the true meaning of the treaty, he repudiated the document in 1893 and went to war.

The climax of this campaign was the disastrous Battle of Adowa in 1896, though the Italians were also fought to a standstill at Amba Alagi (1895) and Macalle (1896). Essentially, the Italo-Ethiopian conflict had become a proxy fight between London and Paris over control of the Sudan, with the result that the Ethiopian military, while essentially a feudal horde, had access to modern French and Russian weapons. When added to the raw numbers and traditional warrior ferocity of Menelik's army, the result was a crushing Italian defeat. Rome was unable even to mount a retaliatory campaign to exact revenge for the worst humiliation ever visited by a traditional state on a modern Western army.

The second major effort by the Italians came in North Africa, as the Agadir Incident encouraged Rome to try to turn its area of influence in Cyrenica and Tripolitania (modern Libya) into a formal colony, mostly from fear of French aggrandizement. This move led to the Italo-Turco War (1910–1911), which, although a war between organized armies, was mostly about securing colonial possessions in compensation for other governments' gains.

Once the Turks had stepped back from their confrontation with the Italians, mostly to deal with the Balkan War, Rome found itself locked into a long-running guerrilla war with the Senussi, a culture of desert nomads with no intention of compromising their traditions for the sake of Rome's economic and political aspirations. With encouragement from Turkey and Germany, the Senussi (under their emir Idris) were able to fight the Italians to a standstill; by 1919 Rome was forced to grant the nomads autonomy.

These were circumstances that Benito Mussolini was not prepared to tolerate upon his accession to power, though it was not obvious that he would be interested in pursuing a formal empire. As a former socialist, Mussolini was nominally an anti-imperialist. There was also the more cynical consideration of whether adopting such a pose would better serve the ends of the new regime. In the end, Mussolini was further concerned with achieving victories for his regime so as to solidify his domestic power, in addition to the usual Italian colonial goals.

Mussolini assigned Emilio De Bono the task of bringing the Senussi to heel, thus beginning a campaign that lasted into the early 1930s. De Bono was chosen because he was the

most eminent soldier to join the Fascist cause, and his success would reflect glory on the Blackshirt movement, but his lack of progress led to his replacement by the regular army generals Pietro Badoglio and Rodolfo Graziani.

Their strategy was the traditional anti-insurrection method of concentrating the noncombatant population in secured camps so as to separate them from the active fighters, there being no more than 1,000 active guerrillas at any one time. The anti-insurgency campaign was carried out with all of the expected Fascist brutality and much of the social and economic infrastructure of Libya's traditional peoples was destroyed; it was estimated that by 1932 some 100,000 persons had died in Cyrenica alone, roughly half the population of that region.

It was probably inevitable that Mussolini would revisit the question of exacting revenge from Ethiopia for the debacle of 1896, the rationale given to the Italian population. Though Rome had been able to exert more influence over Addis Ababa, Haile Selassie had continued to try to play off the major European powers against each other so as to maintain the sovereignty of his state. Believing himself to have a free hand from London and Paris, Mussolini began his second colonial war much as he had his campaign in North Africa, by dispatching De Bono with a large force of Blackshirt militia to march on the Ethiopian capital so as to monopolize all the glory for his regime.

As before, a larger than expected force (some 800,000 men were mobilized) under professional officers was required to bring the formal campaign to a conclusion, a campaign that nauseated the democracies with its use of chemical weapons, indiscriminately spread by air. Much of the war became desultory after the Ethiopian regular army was defeated.

However, formal military conquest did not lead to a pacified region and the Italians found themselves contending with a constant level of insurrection, a matter not helped by the fragmentary control that the Ethiopian central government had exerted over the country. Neither sanguinary violence nor relative benevolence was able to solidify the Italian position before the country's defeat at the hands of the British in 1941 and the total loss of empire. The entire Italian adventure in imperialism brings to mind the supposed quotation of Chancellor Otto von Bismarck, "The Italians have strong appetites but weak teeth."

Italian Wars of Unification (1848–1870)

Series of wars that resulted in the unification of Italy. The unification of Italy, or Risorgimento, was achieved in several wars fought between 1848 and 1870 by the various states that comprised the Italian peninsula. With French support these states fought against Austria and the pope. By 1870 Italian patriotism created a unified Italy under the Royal House of Savoy.

The unification wars stemmed from the inadequate 1814–1815 Congress of Vienna settlements that restored the status quo of the pre-Napoleonic era. The various states had different monarchs who aimed to increase their power. Unification also was spurred by the liberal ideas of Giuseppe Mazzini (1805–1872), Vincenzo Gioberti (1801–1852), Massimo d'Azeglio (1798–1866), and Giuseppe Garibaldi (1807–1882), who had stirred revolutionary agitation throughout Italy since the 1830s. Revolts in Parma, Romagna, Umbria, and the Marches were harshly put down by the Austrians.

Yet Camillo Benso di Cavour (1810–1861), Piedmont's prime minister from 1852 to 1859, was the chief architect of Italian unification. Piedmont king Charles Albert (1798–1849) had agreed to a constitutional monarchy in February 1848, but the first battle for unification occurred at Custoza on 23–25 July 1848. There the Austrians, under their master tactician Field Marshal Joseph Radetsky, defeated the Italians. The Austrians also outmaneuvered them at the 23 March 1849 Battle of Novara. These humiliating defeats led King Charles Albert to abdicate in favor of his son Victor Emmanuel II (1820–1878).

Pope Pius IX (1792–1878), elected in 1846, exacerbated the situation. He had initially seemed liberal with his welcome refreshing reforms. However, his proclamation on 20 April 1848 that Italians should not fight another Catholic country earned him great enmity from his compatriots and resulted in rioting. The pope's temporal powers were abolished on 9 February 1849; he fled from Rome on 29 November 1849. He was returned to Rome under French protection on 12 April 1850. French troops occupied Rome as a protective force until 1870.

Cavour cleverly persuaded French emperor Napoleon III to join Piedmont and Sardinia in July 1858. Success finally

came when the combined French-Piedmontese army attacked the Austrian army on 20 May at Montebello. The Piedmontese won again on 30–31 May at Palestro. Then this combined army of 59,100 soldiers and 91 artillery pieces defeated the 58,000 troops and 176 pieces of the Austrians at the Battle of Magenta on 4 July 1859, where some 6,000 died.

The same forces defeated the Austrians at the Battle of Solferino on 24 June 1859, which resulted in 14,000 Austrians either killed or wounded with 8,000 missing or prisoners. The victors lost 15,000 killed or wounded and 2,000 missing or prisoners. The victory led to most of Lombardy being annexed to Sardinia-Piedmont. The horrific slaughter and bloodshed severely stretched the medical capabilities of both camps. Henry Dunant (1828–1910) succored the wounded for three days and nights and subsequently established the International Red Cross. Napoleon then signed an armistice with Emperor Franz-Joseph at Villafranca, allowing Austria to retain Venice, which annoyed Cavour, who resigned.

Cavour returned to power in January 1860 and secretly agreed to turn Nice and Savoy over to Napoleon. The remnants of the Papal States, except for Rome itself, were occupied. The Piedmontese Parliament proclaimed Victor Emanuel II king of Italy. Rome was to be the future capital of the Italian nation.

Although Cavour was forced to cede Nice and Savoy to France, a plebiscite held on 15 April 1860 resulted in Parma, Tuscany, Romagna, and Modena voting to join Piedmont.

On 6 February 1860, Victor Emmanuel annexed Umbria and the Marches. In 1860, Garibaldi invaded Sicily and defeated the Neapolitans at Calatafimi on 15 May 1860. He seized Palermo and Naples in a plebiscite, again resulting in a decision to join Italy. Victor Emmanuel not only defeated the pope's army at Castelfidardo on 18 September and Ancona on 30 September, but he also confiscated all of the papal possessions outside Rome. Although Italy lost several battles (including a second loss at Custoza), it was rewarded with Venetia in 1866 as a reward for Italian aid to Prussia against Austria. Finally, on 20 September 1870, with the guardian French troops being withdrawn to fight the Prussians in the Franco-Prussian War, Victor Emmanuel seized Rome and made it Italy's capital city, thereby ending the Italian wars of unification.

Italo-Turkish War (1911–1912)

Italy's preoccupation with national unification in the mid- to late nineteenth century meant that it invariably fell behind other European countries in the quest for overseas colonies. Imperial aspirations thus became inextricably linked with national pride, and the government focused upon nearby North Africa for territorial gains. Italian immigrants and merchants began arriving in Libya in 1880 and within two decades constituted the most numerous foreigners in that Turkish colony. The Ottoman Empire being in decline, on 29 September 1911 Italy suddenly declared war on the Turks, alleging mistreatment of its nationals in Libya. A force of 50,000 men was then dispatched overseas, which caught the Ottoman garrison completely unprepared. By October Italian forces under General Carlo Caneva were in complete control of Tripoli and Tobruk and had carved out several enclaves along the coast. Turkish resistance was either weak or ineffective. However, strong resentment and resistance from the Muslim population culminated in the Battle of Tripoli, 23–26 October 1911, where Turkish-leaning Senussi tribesman tried and failed to recapture the capital after heavy casualties. Italian losses had also been considerable and they were dissuaded from pushing further inland. Despite the Italians' enjoying every advantage in terms of modern weaponry, an embarrassing stalemate ensued.

As events in Libya unfolded, the Italians also dispatched naval forces to harass the Ottoman coast. In April 1912 Italian warships bombarded the Dardanelles while other forces seized the Dodecanese Islands and Rhodes. It was not until July 1912 that Caneva led his forces away from the coast, and several pitched encounters were waged, but the Italians finally emerged victorious. Furthermore, because events in the Balkans began spinning rapidly out of control, the Sublime Porte entered negotiations to cease hostilities altogether. The Italo-Turkish War was finally concluded by the Treaty of Ouchy, signed 15 October 1912, whereby Italy gained Libya, Rhodes, and the Dodecanese Islands. Ottoman losses amounted to 14,000 men, while the Italians, better armed and equipped, lost half that tally. It was hardly a glori-

ous triumph for the Italians, and the conflict may prove of interest more for the fact that it was the first to employ aerial reconnaissance, aerial bombardment, and armored vehicles.

Ivan III (1440–1505)

Ruler who laid the foundation of the modern Russian state, expanded and recovered much of Russia's western "historical lands," and shook off Mongol, or Tartar, rule. Ivan was born in Moscow on 22 January 1440. During his long reign, he gathered, absorbed, and incorporated into the Muscovite state most of the Russian independent principalities and free cities through conquest, diplomacy, annexation, or voluntary surrender. He transformed the small and often contested role of the principality of Moscow into the political center of a unified Russian state.

Ivan's most important achievement was the ending of Mongol rule over the Russian people. Friction between Moscow and the Mongol khans of the Golden Horde came to a head when the Russian and Mongol armies met on the opposite banks of the Ugra River in 1480. For more than two months neither army attacked the other. The Mongols suddenly withdrew their troops without a battle. In this rather inglorious manner Ivan ended Mongol domination.

Ivan's next major objective was the recovery of the ancient territories of Kievan Russia from Lithuania. In 1500, Ivan's army invaded Lithuania, and during the next three years, his forces captured much of Russia's western lands and saved Kiev and Smolensk.

Ivan's successes and victories over Lithuania brought Russia into direct contact with Europe, whose sovereigns viewed him now as a powerful and independent ruler. To augment his authority, he added the title of Sovereign of All Russia to that of czar.

Ivan died in Moscow on 27 October 1505, leaving a much expanded and more powerful country than when he had ascended to power.

Ivan IV ("the Terrible") (1530–1584)

Complex and violent monarch who strove to create a powerful national monarchy and to expand Muscovite territory beyond the Ural Mountains. Ivan was born in Moscow on 25 August 1530. He was orphaned at the age of eight and a group of aristocrats (boyars) assumed control of the regency. His childhood was marred by acts of violence and murders, often in his presence, leaving a deep psychological trauma on his personal life and character. It was perhaps this violent experience that contributed to his vindictive and brutal conduct, earning him the epithet "the Terrible."

Ivan was crowned Czar of Moscow and All Russia in 1547. During the first years of his reign he introduced a series of administrative reforms. He organized a new force of infantrymen (*streltsy*), the first Russian soldiers to carry firearms. With this new army, he invaded the Mongol, or Tartar, khanates of Kazan and Astrakhan to the east and south-east of Russia and annexed them to the Muscovite state in the 1550s.

But the most important military event during Ivan's reign was the Livonian War—an abortive attempt to gain an outlet to the Baltic. In 1558, Ivan opened hostilities against the Livonian Knights, who had ruled Livonia (Estonia) since the thirteenth century, and captured much of its territory. But in 1561, Sweden, Lithuania, and Poland entered the war, defeated the Russian army, and forced Ivan to give up all of his gains along the Baltic.

In 1581 the exploration of western Siberia began. By 1583, the entire region came under Russian control, thus opening the road to further expansion into Siberia.

On 18 March 1584, in the midst of a chess game, Ivan suddenly collapsed and died in Moscow.

Ivry, Battle of (14 March 1590)

The decisive battle that ended the Wars of Religion in France. Henry de Navarre became king after the murder of Henry III in 1589; only the Catholic League supported by Spain dared to challenge him. Henry tried to take Paris but was repulsed by the rebels led by the Duc de Mayenne. He decided then to besiege the town of Dreux, 40 miles west of Paris. Mayenne, with the help of Spanish veteran troops, attacked the royal/Huguenot army.

The king's army was made of French loyal subjects but also of German *reiters* and Protestant Swiss. His 11,000 soldiers had to face more than 15,000 Catholics, including elite cavalry from Spanish Flanders and German Protestant mercenaries.

After some skirmishing, the two armies faced each other on a plain without any terrain features. They deployed like pawns on a chessboard. The royal army had its left wing slightly forward and the right wing some way back as a reserve. Mayenne, confident in his superior number, disposed his troops in a crescent around the royals. Henry IV gave his troops a rallying point: three pear trees he could see behind Mayenne's lines. At 12 P.M., the royal artillery fired nine volleys into the crowding Catholics before Mayenne ordered his German cavalry to charge. The Protestants advanced but refused to fire on their coreligionists and instead they rode at full speed through the waiting Catholic infantry. The infuriated Spanish cavalry charged home on the royal artillery. Henry, leading his gendarmes, stopped this dangerous move; the fight was now a tangle of intermingled cavalry. The royal reserve took the opportunity to charge into the fray, after seeing that all the Catholics had fired their pistols and had no more powder. The Spanish survivors left the battlefield around 1 P.M. The king, following them, led the pursuit to the pear trees and then turned his cavalry toward the three large blocks of Catholic infantry. After a few volleys of artillery, he offered them to surrender. As Mayenne fled the battlefield, they asked for mercy. More than 4,000 were taken prisoners; all the German *landsknechts* were slaughtered by the royal Swiss.

The battle was over by 2 P.M. The Catholics had lost their field army and had to rely more than ever on the Spanish troops. It would take four more years before Mayenne and the Catholic League chose to rally Henry IV.

Marines raising the American flag on Mount Suribachi, Iwo Jima, 1945.
(Library of Congress)

Iwo Jima, Battle of (19 February–15 March 1945)

One of the bloodiest battles of World War II in the Pacific. In order to provide American warplanes with an airfield only 600 miles from Japan and to shorten the attack route toward the Japanese home islands, the United States planned an invasion of Iwo Jima for February 1945. Iwo Jima, only 8 square miles in area, was defended by 21,000 soldiers who were literally dug into the island. The Japanese commander, General Kuribayashi, was determined to inflict maximum casualties on the American forces by fighting to the last man. His soldiers used Iwo's soft volcanic ash and extensive caves to build an effective network of underground tunnels, fortifications, and concrete pillboxes, and from these well-entrenched positions the Japanese prolonged the battle and exacted high American losses.

After a three-day naval bombardment rather than the 10 days originally requested by the marines, the main American assault led by the 4th and 5th Marine Divisions started on 19 February 1945. Although 30,000 U.S. soldiers were ashore by the end of the first day, the volcanic sand made mobility difficult. With the beach crowded with marines and equipment, the Japanese opened fire and inflicted heavy

losses, and even marine veterans commented on the ferocity and violence of the first days. Moving to the south, one regiment of marines captured Mount Suribachi in the face of withering Japanese fire and decided to raise the American flag in order to increase the morale of the marines below and naval vessels offshore. The image of the flag raising, captured by war photographer Joe Rosenthal, provided one of the most famous images of World War II. Despite this symbolic victory, the battle raged for 30 more days, with reinforcements from the 3d Marines joining the 4th and 5th divisions driving north against difficult terrain and the Japanese tunnels throughout the island. The United States employed heavy firepower from the air and from artillery, grenades, mortars, and tanks with flame throwers and slowly began to move northward across the island. The carnage on both sides can be seen in the nickname the “Meat Grinder” for Japanese defensive positions in the reinforced hills. Finally the Japanese defenders were isolated in the northern corner and destroyed.

While nearly the entire Japanese force of 21,000 was killed, the Americans suffered 26,000 casualties, including

more than 6,000 killed, an average of more than 700 dead for every square mile on the island and the first time that American casualties exceeded those of the Japanese. In the end, 27 marines were awarded the Medal of Honor. General Holland Smith praised General Kuribayashi’s toughness and tenacity, while Admiral Chester Nimitz proclaimed: “Among the Americans who served on Iwo Island, uncommon valor was a common virtue.”

J

Jackson, Andrew (1767–1845)

American field commander, politician, and seventh president, the first to be elected from the frontier. Jackson was born on 15 March 1767 in Waxhaw, South Carolina, the youngest of three sons of recent Scots-Irish immigrants. Because his father and namesake died before his birth, his mother, Elizabeth, moved the family into the home of her brother-in-law, James Crawford. Jackson received only rudimentary schooling.

When the British invaded the Carolinas in 1780, Jackson's eldest brother, Hugh, volunteered for the militia and was soon killed. After Colonel Banastre Tarleton defeated the militia near Waxhaw in May, Elizabeth, Andrew, and his brother Robert helped care for the American wounded. The brothers volunteered for the mounted militia and fought at Hanging Rock, South Carolina, on 1 August. After several months as guerrillas in the backwoods, they were captured early in 1781. Both received saber cuts for refusing to polish a British officer's boots. As prisoners of war in Camden, South Carolina, they contracted smallpox. Elizabeth negotiated their exchange but Robert died on the way home. After she nursed Andrew back to health, she nursed American prisoners on British ships in Charleston harbor, where she died of typhus. These incidents prompted Jackson's lifelong hatred of the British.

In 1786 Jackson began to practice law in Martinsville, North Carolina. Eager for the rough life, he moved to Tennessee in 1788 and became a prosecuting attorney for Nashville in 1789. He married Rachel Donelson Robards in 1791, both of whom believed in good faith that her divorce from Lewis Robards was final. Discovering later that she was not legally divorced until 1793, they remarried in 1794. These circumstances dogged Jackson the rest of his life and led to his fighting many duels to defend his wife's honor. In a duel with Charles Dickinson on 30 May 1806, he took a bullet in

the chest, then deliberately aimed and "killed his man." Jackson carried his bullet to the grave.

Through Rachel's family's money and his own shrewd land deals, Jackson quickly became a wealthy man with a large plantation. He served in the U.S. House of Representatives from 1796 to 1797, in the U.S. Senate from 1797 to 1798, and on the Tennessee Supreme Court from 1798 to 1804. After 1802 he was a major general of the Tennessee State Militia. He volunteered his troops for service as soon as the War of 1812 began. Ordered to Natchez, Mississippi, to prepare to invade Florida, he earned the nickname "Old Hickory" by being tough enough to maintain discipline after Congress canceled the invasion. He did not see action until after the Fort Mims massacre on 30 August 1813. His victories at Talladega, Alabama, on 9 November and Horseshoe Bend on 27 March 1814 won him a commission as a major general in the regular army on 28 May.

Using Mobile, Alabama, as a base, he captured Pensacola, Florida, on 7 November and thoroughly defeated the British at New Orleans on 8 January 1815. Now a national hero, he commanded the Southern Division, headquartered in Nashville. From 1817 to 1819 he fought the Seminoles in Spanish Florida, hanging two British subjects as spies in April 1818 and capturing Pensacola again in May, nearly provoking war with both Britain and Spain. He resigned his commission and served briefly as the first governor of Florida Territory in 1821, then was a U.S. Senator from 1823 to 1825. After losing a controversial four-way presidential election in 1824, he won by landslides in 1828 and 1832. Throughout his presidency, he vigorously supported westward expansion and the forcible appropriation of Indian lands. It would be difficult to imagine anyone at the time who more exemplified the virtues and vices of mid-nineteenth-century Americans.

Jackson, Thomas “Stonewall” (1824–1863)

Confederate commander-hero and General Robert E. Lee's irreplaceable “right arm.” Born on 21 January 1824 in Clarksburg, Virginia, and orphaned at seven, he was raised by an uncle. Despite a poor formal education, he was appointed to the U.S. Military Academy. Through determination, he improved his academic standing steadily, graduating in 1846 in the upper third of his class.

In the Mexican War Jackson served with distinction as an artilleryist during General Winfield Scott's campaign to Mexico City. Jackson saw action at Veracruz, Cerro Gordo, Churubusco, and Chapultepec, twice earning brevet promotions. In 1851, Jackson resigned his commission for a position as a professor of artillery and natural philosophy at the Virginia Military Institute.

At the outbreak of the American Civil War, Jackson was commissioned a brigadier under General Joseph E. Johnston in the Confederate States Army. At First Bull Run, his steadiness anchored the Confederate line at the crucial moment, buying time for the tide of battle to turn. The nickname “Stonewall” was thereafter applied to both Jackson and his heroic brigade. Jackson was subsequently promoted to major general.

Commanding his own small army, Jackson received the task of preventing several Union armies from converging on Richmond. His subsequent “Valley Campaign” was masterful and is still studied today in war colleges around the world. Striking at first one then another of the disjointed Union formations, Jackson tied down superior forces under generals Nathaniel Banks, Irvin McDowell, and John C. Frémont, while General Lee dealt with the main Union advance on Richmond.

After a string of minor but timely victories, Jackson's troops made a key contribution to Confederate victory at

Second Bull Run. Though Antietam was a strategic loss, Jackson's role in the invasion of Maryland had been laudable, earning him a promotion to lieutenant general and corps command in Lee's Army of Northern Virginia. In late 1862, at Fredericksburg, Jackson held down the vulnerable flank before executing an explosive counterattack. During Chancellorsville in May 1863, Jackson received a mortal wound from the fire of his own troops, died from his wounds on 10 May 1863 at Guiney's Station, and was buried in Lexington. Jackson's loss left an almost inconsolable General Lee without his most trusted and reliable lieutenant. It would be difficult to imagine a worse blow to the Confederacy.

Jacobite Rebellions (1689–1746)

Uprisings that attempted to restore the Stuart Dynasty, and the last land battles on English and Scottish soil. Following the Revolution of 1688—which had been sparked by the birth of a son and potentially Catholic heir to James II of Great Britain, and the successful invasion of William of Orange, the king's Protestant son-in-law, who assumed the throne with his wife, Mary—James fled to France with his wife and son. For the next 57 years, Jacobitism, the support for the exiled branch of the Stuart family, would be a major tool of European foreign policy and spark four armed uprisings and numerous plots in England, Scotland, and Ireland.

Returning to Ireland in March 1689 with a contingent of French officers sent by Louis XIV, James began to muster an Irish army. Meanwhile, in Scotland, John Graham, Viscount Dundee, had also raised a Jacobite army and, after a successful series of raids, had defeated government forces at Killiecrankie. Although defeated at Dunkeld, Dundee's army, gaining support among the Highland Scots, fought on. In Scotland, the government was forced to an expensive policy of fort building and slow harassment of the clans, while in Ireland, the government fought using mercenaries hired

Charles Edward Stuart (also known as Bonnie Prince Charlie) departs Scotland in 1746, five months after the disastrous Jacobite defeat at the Battle of Culloden. (Library of Congress)

from Europe to augment English forces. William of Orange defeated James on 1 July 1690 at the Battle of the Boyne, although French naval support allowed the Jacobites to continue fighting until government reinforcement arrived and captured Limerick and Galway. With the Jacobites defeated, William turned his resources to fighting France until the treaty of Ryswick in 1697.

The next Jacobite rising occurred in 1715, following an abortive invasion scare in 1708. The Earl of Mar, unhappy with his prospects under the new king, George I, raised the banner of James II's son, James ("the Old Pretender"), in the highlands, expecting significant French assistance. A corresponding English rising, centered on northern Catholics, failed to accomplish much and was defeated and captured at Preston in November 1715. Mar, meanwhile, fought an indecisive battle at Sheriffmuir on 13 November against the Duke of Argyll. When James Stuart arrived in December, without French aid, the rebellion was fading, and most of the leaders had fled to France by February 1716.

In 1719, with Britain and Spain on hostile terms because of Spain's invasion of Sicily, Cardinal Alberoni, prime minister to Philip V of Spain, lent his support to a Jacobite invasion of Scotland. Again mustering highlanders to augment 250

Spanish regulars, the Jacobites, under the command of the earl Marischal and marquis of Tullibardine, quarreled among themselves and were caught at the pass of Glenshiel by government forces. The Scots fled, leaving the Spanish as prisoners of war until ransomed by their own government.

The final Jacobite campaign, "The '45," was first sponsored as a French diversion meant to draw British troops out of the War of the Austrian Succession. A 1744 invasion, to be led by the Marshal de Saxe, fell through after a great storm not only destroyed stockpiled supplies but disrupted the French fleet sent to gain control of the English Channel. Not to be dissuaded, the Stuart claimant, Charles Edward Stuart ("the Young Pretender" or "Bonnie Prince Charlie"), prepared an invasion on his own, borrowing money and counting on a mass uprising upon his arrival in Scotland. Again due to poor weather, the Jacobites arrived with only half the planned men and supplies. (Many began to mutter that "God is a Protestant!") The Jacobites did muster a number of highlanders, captured Edinburgh Castle, and defeated the local government forces at Prestonpans, before marching south into England with an army of about 4,500. The Jacobite army turned back at Derby, now convinced that there was no support in England or substantial French aid on the

way, abandoning a strike at London in favor of a retreat back to Scotland.

Pursued by two Hanoverian armies under the Duke of Cumberland and George Wade, they collected a trickle of smuggled French supplies and, after successfully holding off the government troops at Falkirk, went to ground over the winter of 1745/6. Charles Edward Stuart, emerging from a fit of petulance over the retreat from Derby, insisted on a conventional action rather than continued evasion and in April 1746 met Cumberland at Culloden, where the Jacobites were decisively defeated.

Fleeing, Charles Edward Stuart dismissed the survivors of his army who had rallied after the battle and made his way in secret through the Highlands before reaching France. Ruthlessly punished by the government for their participation, the Scots, disenchanted by Jacobitism, abandoned the Stuarts to romantic nostalgia and the Jacobite threat ceased to exist.

Jan III Sobieski (1629–1696)

Polish military commander, savior of Vienna. Heir to three of Poland's wealthiest landowning families, Jan Sobieski received a cosmopolitan education and as a young man traveled western Europe on the Grand Tour. In 1648, he joined the Polish army, beginning his career with the suppression of the rebellion of Hetman Chmielnicki and his Cossacks. In protest against King John Casimir, Sobieski briefly served under Charles X of Sweden in his 1655 invasion of Poland but changed sides the following year to drive out the invader. With court patronage, Sobieski rose quickly to field hetman, then grand hetman of the Polish forces while conducting successful campaigns against the Tartars and Cossacks in the Ukraine.

In 1672, the Ottoman Empire, whose border was only 40 miles from Crakow, invaded Polish territory and Sobieski took the field against the invaders, annihilating an entire Ottoman army at the Battle of Chocim, on the Dnieper River, in 1673, only days after the death of King Michael Piast.

This victory, and Sobieski's reputation, won him the elective monarchy of Poland. Still at war with the Ottomans, he

defended the fortresses of Lwow and Trembowla and reached a truce with the sultan in September 1676. This truce gave him breathing space to improve the army, increase the mobility of artillery, enlarge the dragoons, and reduce reliance on pikemen. However, still operating within the semifederal politics of Poland, he was unable to centralize fiscal planning or logistical supply.

Sobieski's planned pro-French foreign policy crumbled against the realities of Poland's relationship with the Habsburg emperor and their mutual enmity to the Ottomans; and he willingly answered the appeal of Leopold II for troops to relieve Vienna from Ottoman siege. Acting as commander in chief of a 75,000-man relief force of Lithuanians, Poles, and Germans, Sobieski, particularly skillful in his transport of artillery into the Vienna Woods and the construction of a pontoon bridge across the Danube, defeated Kara Mustafa at Kahlenberg and saved Vienna. Unfortunately, attempts to follow this victory with repeated campaigns in Moldavia between 1687 and 1691 failed and drained Polish resources. Suffering repeated heart attacks after 1691 and forced to deal with the rising power of Prussia and the increasing intransigence of Lithuania, Sobieski died in 1696.

Janissaries

An elite corps of the Ottoman Empire and perhaps the first standing army in Europe. It helped conquer the Byzantine Empire, Egypt, and much of the Balkans, eventually becoming the praetorian element in Ottoman palace intrigues until brutally suppressed in 1826.

The Janissaries, from the Turkish *yeni cheri* (new troops), were formed in 1330 as a bodyguard under the personal command of Sultan Orkhan. They were reformed as a military corps by Sultan Murad I in 1365, using captives from the Byzantine city of Adrianople (Eridne, Turkey). Originally recruits consisted of 1,000 men drawn from the fifth part (*besinci*) of the human booty, which, according to Ottoman law, belonged to the sultan. Replacements of Christian prisoners of war forced to accept Islam or Christian volunteers who later converted to Islam proved insufficient for meeting the demands of the growing corps, and captive Christian

Engraving of Janissaries and Spahis, 17th century. (Chris Hellier/Corbis)

children were recruited beginning in the second half of the fourteenth century. This too proved insufficient and Sultan Selim I imposed the *devsirme*, or forced levy of children, on subject Christian populations in the Balkans. The Janissaries numbered 16,000 by 1520 and 37,000 by 1609. Christians were recruited because Janissaries became slaves of the sultan, and the enslavement of Muslims is forbidden by the Koran. However, once recruited and enslaved, a Janissary was converted to Islam.

The Janissary corps consisted of cavalry, infantry, artillery, and sailors. They often were armed with firearms, taking part in all the major battles and wars of the Ottoman Empire for more than half a millennium, including the capture of Constantinople in 1453, the conquest of Egypt in 1517, the Battle of Mohács in 1526, and the siege of Vienna in 1683. The Janissaries' failure to suppress the Greek revolt in 1820, and their own numerous mutinies and stiff resistance to military reforms led Sultan Mahmud II ruthlessly to suppress the corps after its attempted revolt on 14–15 June 1826.

Japanese Civil Wars (1450–1550)

The period from 1450 to 1550 in Japan known as the Epoch of the Warring Country, or Sengoku Period, that marked a time of continual civil war and unrest. It also marked the decline of central power and the rise of samurai and daimyo (who as great provincial lords were also samurai). Daimyo and their loyal retainers, samurai, battled other daimyo to take advantage of perceived weaknesses or to gain control over economically important areas. The older order, the powerful families in Kyoto, the land stewards, and so on, began to disappear and power diffused throughout the country to the new class of daimyo.

For many years, Japan was controlled by a series of families operating at the capital, Kyoto, who employed stewards throughout the country. While the emperor was weak, power was centralized among these families. The Onin War and the ensuing century of civil wars ended their control outside Kyoto and ushered in a new era that eventually would lead to the consolidation of power behind a new elite.

In addition to the level of destruction, there was the beginning of a new order, or a reorder. Daimyo sought to control their holdings and tried to categorize the quality of agricultural land and manufacturing production in towns. They engaged in *sword hunts* to disarm the peasantry and also sought to elevate the status of samurai, the only warriors allowed to wear the two swords, one long and one short. Samurai were encouraged to settle in fortified castle towns and leave the countryside, and thus the daimyo sought to increase economic production to expand their sources of wealth.

There were other issues, to be sure. The daimyo to the south and west benefited from trade with China and, toward the end of the Sengoku Period, contact with the West; daimyo received valuable goods from China for trade and received more accurate calendars, improved medical knowledge, and guns and gunpowder from the Portuguese, Spanish, and later Dutch traders. The fighting of samurai to samurai with swords, reflecting many years of training and fierce discipline, began to give way to fighting with muskets and cannon and favored those daimyo with greater economic resources or the good fortune to consider converting to Christianity. The samurai perfected the tea ceremony and looked to Buddhism to balance the carnage of continual fighting.

Toward the end of the period (for which there really is no exact date), several groupings of daimyo began to emerge

who gathered great power. In time, three great daimyo arose—Oda Nobunaga, Toyotomi Hideyoshi, and Tokugawa Ieyasu—who eventually unified the country, made peace among the contending factions, tried to close the country to foreign influences, and took Japan into a period of 250-plus years of isolation and yet great change.

Japanese Colonial Wars (1874–1945)

Japan's 60-year period of seeking to establish a colonial empire for economic exploitation and to gain equality of a sort with the major European powers. The Meiji Restoration oligarchs had their differences, and one was over an early invasion of Korea as a prelude to expansion on the Asian continent. Realizing that Japan was still too weak, the leaders instead decided to bring the Ryukyu Islands firmly under Japanese control. The people of the Ryukyus were related to the Japanese and were controlled by the former daimyo of Satsuma but had long-established tributary relations with China. In 1872, the new government in Tokyo claimed control and, acting on behalf of the islanders, sent a punitive expedition to Taiwan to avenge the murder of some islanders by Taiwanese aborigines. This campaign took until 1874. The Chinese government in Beijing paid an indemnity, implying a recognition of Tokyo's new territory in the Ryukyus.

The next target, not unnaturally, was Korea. In 1875, the Japanese demonstrated several of the Western-built ships in their new navy off Korean waters and in 1876 gained the Treaty of Kanghwa, opening the former Hermit Kingdom to Japanese trade and claiming Korean independence (from China). Japanese interest in Korea eventually led to the Sino-Japanese War of 1894–1895, pitting the small modern army and navy of Japan against the larger but seriously outdated military forces of China; the Japanese won easily but saw the fruits of their victory—a leasehold over the Kwantung Peninsula—taken away in the Triple Intervention. But Japan did gain control over Taiwan and the nearby Pescadores Islands, reflecting Japan's increasing economic interest along China's coast. In 1902, the Anglo-Japanese Alliance brought

British recognition of Japan's interest in Korea “in a peculiar degree politically as well as commercially and industrially.”

Japan faced few difficulties in its occupation of Taiwan. The effort to develop Taiwan economically and to bring it within the emerging Japanese system really began in 1898. Japanese authorities suppressed bandits and established order; they also raised health standards, improved diets, and provided widespread basic education for all Taiwanese. However, to advance beyond basic education required Japanese language ability and a willingness to accept Japanese cultural norms. While the Japanese did tighten controls in the mid-1930s, they never faced any real threats of rebellion until the end of the Pacific War.

The stage was set for the Russo-Japanese War of 1904–1905. When the exhausted combatants agreed to the invitation by U.S. president Theodore Roosevelt for peace negotiations, the resulting Treaty of Portsmouth recognized Japan's “paramount interest” in Korea, implied that the Russians would vacate Manchuria (thereby leaving it available for Japanese exploitation), and turned over to Japan the Russian leasehold on the Kwantung Peninsula, ownership of the South Manchurian Railway, and the southern half of Sakhalin Island.

The Koreans did not accept the end to independence easily. Korea had a long history, perhaps longer than Japan's, and Koreans were proud of their past; they did not move easily into Japan's Inner Empire and give up their sense of nationhood. When Japan declared Korea a protectorate in 1907 the Koreans responded with more than 1,400 armed attacks and outbreaks of violence between 1908 and 1910, and a Korean patriot in late 1909 assassinated a key Japanese oligarch, Ito Hirobumi, who had appointed himself resident general in Korea. Japan exploited Korea's economy more than Taiwan's, and the result was a declining standard of living for many Koreans; the lack of political freedoms, omnipresent Japanese control, and economic deprivations combined to spark the great Mansei revolt in March 1919; more than a million demonstrators protested for Korean independence as the world was negotiating the Versailles Peace Treaty in France. In turn, the Japanese moved to convert the well-ordered system of Korean schooling into Japanese-intensive education and to control Korean life ever more tightly. But between a strongly developed sense of Korean nationalism, the continuing influence of American Christian missionaries, and the growing influence of Marxism, especially of the Chinese Communist variety, Koreans were most uneasy subjects in the Japanese empire.

World War I increased the growing Japanese colonial empire. In addition to Korea, the Ryukyus, the Pescadores, Taiwan, and also interests in southern Manchuria, Japan sided with the Allies (based on its treaty with Great Britain) and as

a consequence gained at the Versailles peace negotiations. Japan received German concessions in the Pacific—a series of island chains—and German holdings in China, especially Kiaozhou Bay and the port of Qingtao in Shandong. (No one inquired of the Chinese as to these transferrals of what was originally their territory.)

The East Asian world was somewhat fluid during the 1920s, but in September 1931 the Japanese Kwantung Army used the Mukden Incident as an excuse to seize control over Manchuria the next year and then gradually to expand, first into that part of China outside the Great Wall and then by the mid-1930s to significant parts of North China inside the Great Wall. In December 1941 the Pacific War began in earnest and within months the Japanese had acquired a large colonial empire for its Greater East Asia Co-Prosperity Sphere; many Asian nationalists admired Japan's early victories over European nations and the United States. In fact, Japan declared the "independence" of a number of former Asian colonies that they had conquered, including Malaya, Burma, and the Philippines. But nationalists increasingly resented the substitution of Japanese colonial administration for that of Europe or the United States. In August 1945, Japan's surrender to the Allies ended World War II and Japan's overseas empire.

Japanese Invasion of Korea (1592–1598)

The Japanese invasions of Korea describe two campaigns launched against Korea by Toyotomi Hideyoshi (1537–1598), the warlord and hegemon of Japan. Though the Japanese enjoyed initial success on land, Japan's inability to maintain control of the seas, continuous harassment by Korean guerrilla forces, the intervention of Ming Chinese forces, and ultimately, the death of Hideyoshi doomed the invasion to failure.

After gaining control over Japan in the last quarter of the sixteenth century, Hideyoshi turned his sights toward the conquest of China. This had as much to do with a need to occupy Japan's warrior class as with Hideyoshi's own gran-

diose visions. Such a continental invasion (just as with the Mongol invasions of Japan in the thirteenth century) necessitated the active cooperation of Korea, the closest mainland coast to the Japanese archipelago. Korea refused to collude with Hideyoshi, for geopolitical reality as well as Confucian principles required Korea's loyalty to China. In 1591 Hideyoshi ordered the invasion of Korea as a preliminary to the proposed China conquest.

Hideyoshi delegated leadership to a handful of loyal generals under the command of the Christian Konishi Yukinaga. In spring 1592 a vanguard Japanese force of over 50,000 embarked for the Korean city of Pusan. Though the Korean court had made some preparations for the attack, having received alarming reports of Japanese preparations, the Korean armies were eminently ill prepared to deal with the invasion. After landing with overwhelming force at Pusan the Japanese forces advanced in three prongs northward, making quick progress toward the Korean capital of Seoul. King Sonjo (r. 1567–1608) fled with his royal entourage to the more northern city of Pyongyang. In late spring 1592 Japanese forces captured and burned Seoul. Soon thereafter reinforcements arrived from China via Manchuria, and the land conflict was pushed to stalemate, with Chinese and Korean troops holding around Pyongyang and the Japanese barricaded in and around Seoul.

Meanwhile, Korean guerrilla armies and the navy under admiral Yi Sun-shin (1545–1598) harried Japanese troops and supply lines. Yi defeated the Japanese fleet at Pusan in late 1592, seriously hampering Japan's ability to procure reinforcements and supplies. Konishi agreed to armistice talks, and by 1594 the Japanese had completed their withdrawal from Korea.

Hideyoshi ordered a second invasion in 1597. Once again Hideyoshi chose Konishi to lead the attack. As before, the Japanese armies, numbering almost 150,000, met with initial success, defeating a Chinese army near Ulsan in early 1598. In late 1597, however, the Korean Admiral Yi Sun-shin had again inflicted a heavy blow on the Japanese fleet in the Battle of Myongnyang Straits. The sudden death of Hideyoshi in late 1598 brought the second invasion to an abrupt conclusion.

The invasion inflicted serious damage to the Korean landscape, and the famines and epidemics that resulted were harbingers of popular unrest to come. The cultural damage inflicted by the invaders on temples, official structures, and artifacts was also severe. The expenses and losses suffered during the invasions by China's Ming Dynasty (1368–1644) contributed to that dynasty's overthrow by the Qing (1644–1911) less than 50 years later.

Japanese Military, Twentieth Century

The first modern Asian military power. Combining Prussian military theory and traditional warrior values, the Imperial Japanese military had two prime missions: defense of the home islands against Western powers and the unification of the local polities under the new central government. The first campaign of the new Japanese military was the suppression of the Satsuma revolt (1877–1878).

Having defeated the traditional horde fielded by China (1894–1895) and a Russian military in decline (1904–1905), the roots of ultimate Japanese military failure were nonetheless planted during World War I. Lacking direct experience of the fighting in Europe, there was no experience of the traumatic challenges of these campaigns to force the reassessment of received wisdom, the exception being Germany's vulnerability to economic blockade. The ultimate response was conversion of the informal zone of influence in China into a formal empire, leading to the Manchurian Incident (1931) and Japan's political isolation from the liberal West.

Besides deteriorating economic and geopolitical circumstances, the failings of the Meiji constitution were a factor. Active-duty officers held the positions of army and navy ministers and had open access to the emperor. Being a free agent under this system, the military could pull down any given cabinet and arrogated increasing political influence for themselves, culminating with General Hideki Tojo becoming prime minister in October 1941.

Another factor leading to the drive for military political supremacy were political cliques in the army itself, as the so-called Imperial Way and Control factions strove for predominance. The Imperial Way desired the demise of the liberal order of the 1920s and the imposition of direct imperial rule. Meanwhile, the Control faction sought to suppress the political extremists and build up the modern capabilities of the army, in expectation of a coming war with the Soviet Union. By the end of 1936, the Control faction had brought to heel its rival, but the unifying factor for the army remained the drive for a secure economic base on the Asian

mainland, particularly as massive resources were poured into the Manchurian and northern Korean industrial base.

As all-out war with China opened in 1937, Japan finally had to face its limitations. Despite the imperial forces' many advantages, the Chinese were still able to muster superior numbers and inflict sobering losses. Further, the Japanese defeat by the Soviet army at Nomonhan taught a direct lesson as to how war had changed in the wake of World War I.

As a result, Tokyo signed a nonaggression pact with Moscow and cultivated a new interest in the Western colonial interests in Southeast Asia, a course of action that brought strategic congruence with the imperial navy.

In choosing war with the West rather than the USSR, Prime Minister Tojo and the army general staff allowed themselves few doubts, in that they believed it was better to lose than not to try. They also hoped that victory would buy the time to create the resources needed to fight the larger war.

Their belief had always been that a well-led and motivated force would be able to overcome either the mass army of a traditional state or the small constabulary armies of the Western colonial powers. In reality, the Japanese military lacked the resources to go up against the modern mass army of a determined state for any length of time, a lesson that could have been learned as early as 1905.

By 1943, every Japanese liability was being ruthlessly exposed. The veneer of modernity created by aircraft and light arms disguised that many structural basics were lacking in the composition of the force. Relative poverty had put an emphasis on doing more with less, but it also inculcated an indifference to questions of intelligence, logistics, and signals.

There were also basic failures to adjust to modern circumstances at the psychological level, as officers continued to consider themselves a social caste and cultivated a theatrical style of leadership. Failing to master the skills of modern military professionals, Japanese staff schools taught advanced infantry tactics instead of preparing Japanese officers to think in operational-level terms. The final result would be an empty force reduced to claiming that superior spirit would defeat the Allies in 1945.

The demise of a Japanese military system was a short-lived development, though. In spite of the new Japanese constitution forswearing war, the North Korean invasion of 1950 forced the creation of the Japanese "Self-Defense" Force.

Starting with the so-called National Police Reserve—created at the direction of General MacArthur's headquarters to replace the American occupation troops deployed to fight in Korea—American officers and Japanese enlisted personnel were formed into new units. Besides the steady infusion of Japanese company and field-grade officers from the former imperial army, the sign that the new force was more than an

Japanese soldiers in action, 1942. (Library of Congress)

emergency extemporization was the creation of the Japanese Defense Academy in 1953. The JDA was an all-services institution designed both to overcome the factionalism of the prewar military and to inculcate a respect for civilian authority and the rule of law in the new officers.

Despite frequent domestic criticism as to its role, the Japanese Self-Defense Force has functioned as a component of the Japanese-American security agreement. Mostly existing to deny an enemy an easy target, it represented a return to the original function of the first modern Japanese military.

Japanese Wars of Unification (1550–1615)

The years from about 1550, with the introduction into Japan of Western firearms, to the siege of Osaka Castle in 1615 by the forces of the shogun Ieyasu Tokugawa, were the final act in an extended period of armed struggle in Japan, going back to the early fifteenth century. It was during these approximately 75 years that three military leaders would

emerge to forge a unified Japan: Nobunaga Oda (1534–1582), Toyotomi Hideyoshi (1536–1598), and Ieyasu Tokugawa (1542–1616). It would end with the victory of Ieyasu and the unchallenged hegemony of the Tokugawa Shogunate he established and usher in a period of unprecedented centralized power in Japan.

The year 1549 saw the beginning of regular contact between foreign, which is to say Catholic, missionaries and the Japanese. The Japanese reaction to Western Christianity aside, it was the Western introduction of firearms, in the form of the arquebus and cannon, that was to prove revolutionary and instrumental in reshaping the Japanese political landscape. By 1560 they were being used in battle, and it was the richer and more powerful local lords, or daimyo, who could afford them who would benefit most.

The Ashikaga Shogunate (1338–1573) had from its establishment proved lacking in central authority. Its founder Ashikaga Takauji was but one among a group of powerful military leaders vying for control. Indeed, the Ashikaga government ruled through a system of delegating authority in the provinces to constabularies, usually powerful military leaders loyal to the Ashikaga, who in return for their formal recognition of Ashikaga supremacy were granted almost total control over provincial domains. The central authority of the Ashikaga house, already delicate, was further weakened in the fifteenth century by civil wars between varying claimants to the shogunate. The Onin War (1467–1477) ushered in a period of more vigorous and ruthless warfare between local military leaders, who with Ashikaga weakness had begun to consolidate their individual power and private loyalties and to expand territorially. These local military leaders were for the most part no longer related to the officially sanctioned constabulary of the earlier Ashikaga. They were local military men who had risen to the top by dint of their ruthlessness, cunning, and military abilities. By the late fifteenth century the Ashikaga shoguns were reduced to insignificant bystanders in a contest between these powerful and autonomous local military lords, or daimyo. This so-called Period of Warring States (*Sengoku jidai*), from approximately 1467 to 1568, may have been fought into a stalemate, but the introduction of Western firearms proved decisive.

In 1568 a young man named Nobunaga Oda, then the heir to a daimyo around Kyoto, seized Kyoto, the capital of the Ashikaga, eventually overthrowing the last Ashikaga shogun in 1573 (an act in itself that garnished little attention, such had the Ashikaga fortunes fallen). In a close working alliance with another regional daimyo, Ieyasu Tokugawa, Oda set about consolidating the central region of Japan under his control. This meant eliminating many of the powerful Bud-

dhist sects that had come to play prominent political roles through their alliances with rival families. In a battle with the Takeda clan of central Honshu in 1575 (Nagashino), Oda became the first military leader to rely primarily on muskets in battle, soundly defeating his foe. Oda's assassination at the hands of one of his own vassals in 1582 put a premature end to his efforts at reunification.

Oda typifies the type of man who could rise to prominence in the chaos of the Warring States period. He owed much of his success to the sheer will of his ambition and the ruthless means he was prepared to employ to augment and preserve his power. Such were the characteristics of his successor as well.

One of Oda's most able generals was Toyotomi Hideyoshi, a man who had risen from the most humble origins as a peasant's son. It was while fighting the forces of the Mori family in western Honshu for Oda that he heard of his master's assassination. Hurrying back to Kyoto, Hideyoshi quickly eliminated his rivals (including Oda's own son) to establish himself as successor. Gaining recognition as Oda's successor within Oda's coalition of daimyo, Hideyoshi then set about expanding his territorial control. His most powerful rival was perhaps Ieyasu Tokugawa, established in central Honshu. But in 1584, after an indecisive battle, Tokugawa had opted to swear fealty to Hideyoshi. Through marriages the Hideyoshi and Tokugawa clans were brought closer together and in 1590 Tokugawa aided Hideyoshi in his campaigns against the Hojo clan in the Kanto region around Edo (modern Tokyo). In return for his support, with the defeat of the Hojo Tokugawa was granted an immense swath of their former domains, transferring Tokugawa's power base north to Edo.

By 1590 Hideyoshi had succeeded in subduing, through battle or otherwise, all the rival daimyo. Though he was now in the position to name himself shogun, Hideyoshi deferred, perhaps recognizing the aristocratic pedigree that position had customarily held. Rather, he satisfied himself with the titles of regent (*kampaku*) in 1585 and then chancellor (*dajo daijin*) in 1586. Hideyoshi's domestic policies went far in establishing central authority. To quell disturbances in the countryside, he issued orders forbidding peasants from leaving the land, and he had their weapons confiscated. To eliminate daimyo rivalry, he forbade alliances between them without his approval, whether marital, military, or political. Seeing Western Christianity as a potential threat to central authority, in 1587 he ordered all foreign missionaries out of Japan. Though only sporadically enforced under Hideyoshi, this would later become strict policy under Tokugawa.

When Hideyoshi died in 1598 he left only an infant son, Hideyori, as heir. To govern, Hideyoshi had arranged for a

coregency of five powerful daimyo to rule during Hideyori's minority. The most powerful of these daimyo-regents was Tokugawa. When it became clear that Tokugawa was acting as nominal ruler above the other coregents a coalition soon rose up against him, led by one of Hideyoshi's former vassals Ishida Mitsunari (1560–1600). Gathering a coalition of other daimyo around him, primarily from the western regions of Japan, Mitsunari eventually met the forces of Tokugawa at the battle of Sekigahara in central Honshu in 1600. Tokugawa's victory secured his position as hegemon. In 1603 Tokugawa named himself shogun, establishing the Tokugawa Shogunate (1603–1868) based at the Tokugawa capital of Edo. A final rally by the forces still loyal to Hideyoshi, who had lost at Sekigahara, occurred in 1614, briefly threatening the young Tokugawa government. When thousands of masterless samurai rallied to the side of the young Hideyori, now ensconced in the family castle at Osaka, Tokugawa sent a large force against them, eventually overcoming the castle defenses in 1615, putting an end to the Hideyori threat.

The establishment of the Tokugawa government was to usher in a period of unprecedented peace and central authority that would last until well into the nineteenth century. Tokugawa went to great lengths to further the power of the Tokugawa government by expanding and augmenting the domestic policies of Hideyoshi. The Tokugawa systematically eliminated those daimyo who were thought untrustworthy by confiscating their holdings. An "alternate attendance system" (*sankinkotai*), whereby the daimyo were forced to reside part of the year at Edo and to leave family members there permanently as hostages, further ensured daimyo loyalty. Oaths of loyalty were also administered to all daimyo, in which they pledged to aid the shogun in times of trouble. As before, the daimyo were forbidden from concluding alliances, or even from building castles or bridges, without the express consent of the shogunal government. And the threat from abroad, which in many ways had ushered in the unification of Japan, was eliminated when Japan began to seal itself off from the outside from 1635. All foreign contact was soon reduced to the small island of Deshima in Nagasaki harbor.

Java War (1825–1830)

The last instance of armed resistance to the Dutch colonial regime by the aristocrats of Java and an inspiration to future generations of Indonesian nationalists who celebrated it as a patriotic struggle uniting noble and commoner alike. Essentially a guerrilla conflict, villagers of central Java accounted for most of the 200,000 casualties due to combat, disease, and starvation (the island's total population in 1830 was around 7 million).

The British occupation of Java during 1811–1816 caused great unrest, particularly in the old, semiautonomous kingdoms of central Java, Yogyakarta, and Surakarta. Conditions were not improved by Dutch attempts to reassert their weakened authority after the British returned the East Indies to them in 1816. Their governor-general passed a decree, highly unpopular with the nobles, that prohibited them from leasing their land to European and Chinese planters. Rebellion broke out in July 1825. Its leader was the charismatic Pangeran Dipanagara (1785–1855), eldest son of the Yogyakarta sultan who had been promised, then denied, the throne.

Dipanagara united in himself diverse strands of Javanese culture: Islam (the theme of holy war against the Dutch infidels), Javanese mysticism (he meditated in sacred caves and claimed the Goddess of the Southern Ocean came to him in a vision), and the royal traditions of the Mataram Dynasty, which had fought against, then been subjugated by, the Dutch in the seventeenth and eighteenth centuries. Common people as well as nobles were attracted to these appeals, and the Dutch found themselves hard-pressed to reimpose control, especially in Yogyakarta.

By implementing the *bentengstelsel* (fortress system), the Dutch matched the speed and flexibility of Dipanagara's guerrillas through the construction of a network of fortified points linked by roads, where they posted mobile columns. These could strike quickly, before local resistance organized. By 1827–1828, the course of the war turned against Dipanagara. He was imprisoned by the Dutch while conducting negotiations with them in March 1830 and exiled to the eastern island of Sulawesi.

The Java War taught the Dutch the need for brutal, grass-roots policing of the villages and the wisdom of co-opting the old nobility. Many central Java aristocrats, including the ruler of Surakarta, chose to back the Dutch against the rebels. After 1830, they evolved into a parasitic class who prospered while Javanese farmers were ground down by Holland's increasingly harsh policies of economic exploitation.

Javanese Wars of Succession (1685–1755)

Three wars that increased the dominance of the Dutch East India Company. The Dutch, through the power of the Vereenigde Oost-Indische (VOC, Dutch East India Company), intruded on the affairs of Javanese rulers in the East Indies.

The first war began in 1685 with the organization of a rebellion against the Dutch by a former VOC soldier, Surapati (or Untung), a former slave and outlaw. His followers killed officials who had rebelled against the authority of the central Javanese kingdom of Mataram. The grateful king of Mataram, Susuhunan Amangkurat II (1677–1703), granted Surapati refuge. Upon Amangkurat II's death in 1703 the Dutch supported a rival claimant to the throne, Amangkurat's uncle Pakubuwono (1704–1719). Surapati eventually claimed kingship over the northeastern part of Java. War continued until Surapati died in 1706 of battle wounds. Susuhunan Amangkurat III (1703–1708) surrendered all of his possessions, became a prisoner of war, and was exiled to Ceylon.

The second war erupted when Susuhunan Pakubuwono I died in 1719. The claims of numerous princes instigated war. The Dutch again intervened and gave support to whoever upheld their endeavors. Four years of fighting led to all the rival claimants and Surapati's descendants being captured by VOC forces and sent into exile. The Dutch extended their control in Java.

During the third war Mataram became a vassal of the Dutch East India Company. Susuhunan Pakubuwono III (1749–1788) received Dutch military support against two challengers. In 1751 the Dutch were seriously defeated and lost their commander. The 13 February 1755 Gianti Agreement, agreed upon by one challenger, split Mataram in two. The eastern region of Pakubuwono had its capital at Surakarta with Susuhunan Pakubuwono III as king. The western region made Yogyakarta its capital with Sultan Hamengkubuwono I (1749–1792) as its ruler. The VOC retained control over the northern provinces. Ultimately, the VOC militarily expanded its power to gain commercial supremacy over the region.

Jayavarman VII (r. 1181–c. 1220)

One of the greatest kings of Cambodia's Angkor period (802–1431). Jayavarman VII is best known today for his construction of the temple city of Angkor Thom, the mysterious Bayon temple decorated with huge, enigmatic faces of the Bodhisattva Avalokitesvara, and the temple-monastery of Ta Prohm, dedicated to his mother. He is also remembered as a fervent patron of Mahayana Buddhism who broke with Angkor's Hindu traditions of aloof, godlike kingship and devoted himself to good works in order to relieve the suffering of his subjects. For their benefit, he built hundreds of hospitals, rest houses, and roads.

To his contemporaries, however, Jayavarman VII was probably best known as a military leader. In the late twelfth century, the Angkor empire was one of the strongest states in mainland Southeast Asia but was vulnerable to the aggression of its eastern neighbor, the coastal state of Champa (located in what is now central Vietnam). In 1177, a Cham naval expedition sailing up the Mekong and Tonle Sap Rivers to the Tonle Sap (Great Lake) captured the Cambodian capital (near the modern town of Siem Reap), putting the Cambodian king to death and carrying away huge amounts of booty and slaves. During 1178–1181, Jayavarman drove the Chams out of his homeland, becoming king in 1181, and invaded Champa in 1190, making it a province of the Angkor Empire in 1203–1220. His realm also encompassed much of modern Laos, the northern Malay Peninsula, and the Menam Valley in Thailand.

Bas-reliefs in the Bayon temple depict Cambodian and Cham armies fighting on land and water and grim vignettes such as Cambodian soldiers displaying the severed heads of their enemies, artistic testimony to the savagery of war.

Jena and Auerstädt (13–14 October 1806)

Decisive simultaneous French victories that cleared Napoleon's way to Berlin. After Napoleon created the Confederation of the Rhine on 12 July 1806 to bring the German states under French control, and after Emperor Francis II dissolved the Holy Roman Empire on 6 August, only Prussia,

some Saxon states, and Russia continued to resist Napoleon. In October Napoleon deployed 148,500 French against 111,500 Prussians and Saxons under King Frederick William III in the Saale Valley, Thuringia, Germany.

On 13 October François Joseph Lefebvre's 15,000 Imperial Guard infantry occupied Jena and Napoleon inspected the town. Jean Baptiste Jules Bernadotte's I Corps, with 20,000 men, was just south of Naumburg. Louis-Nicolas Davout's III Corps, with 26,000, was at Kösen, between Naumburg and Auerstädt. Nicolas-Jean de Dieu Soult's 18,000 in IV Corps were evenly divided between Jena and Eisenberg. Jean Lannes's V Corps had 20,500 a mile north of Jena. Michel Ney, southeast of Jena, sent 4,500 of his VI Corps to Jena and the remaining 15,000 to Roda. Pierre François Charles Augereau, southeast of Jena with 16,500, separated his VII Corps into thirds, northwest toward Jena, east-southeast toward the Saale, and west toward Magdala. Joachim Murat split his cavalry reserves, 6,000 east of Bernadotte, 7,000 southeast of Ney.

Karl William Ferdinand, Duke of Brunswick, led 63,500 Prussians east toward Auerstädt. Friedrich Ludwig Hohenlohe, commanding 35,000 Saxons and Prussians northwest of Jena, just beyond Lannes, deployed southwest and northeast. Ernst Friedrich Wilhelm Philipp von Rüchel kept 13,000 infantry in reserve at Weimar.

In the midmorning of 14 October, Brunswick and Davout engaged frontally halfway between Auerstädt and Kösen. Brunswick failed to exploit his superior numbers. Davout used artillery, then seized an opportunity to sweep one division around to crush Brunswick's right. Brunswick was mortally wounded. Soon the French were able to create the classic pincer attack, routing the Prussians back through Auerstädt and southwest.

Meanwhile, Bernadotte and his portion of Murat's cavalry hurried southwest to check Hohenlohe's left flank. Lannes held the center while Soult attacked Hohenlohe's left and Augereau his right. Murat made random assaults. Napoleon took full advantage of the various skills of his generals to deploy his troops in diverse, flexible formations to confuse and entrap the Germans. Hohenlohe's conservative tactics could not counter these swift maneuvers. Soult and Lannes had routed their enemy by midafternoon. Augereau mastered first Hohenlohe's Saxons, then Rüchel's reinforcements.

The French lost 6,000 at Jena and 7,100 at Auerstädt. German casualties were 12,000 killed or wounded and 15,000 taken prisoner at Jena, 10,000 killed or wounded and 3,000 taken prisoner at Auerstädt, plus 20,000 more taken prisoner within the week.

Jericho, Siege of (1400? B.C.E.)

One of the oldest cities, and probably the most ancient walled settlement on earth, made famous by the biblical account of its siege and destruction. Emerging from their years of wandering in the Sinai, the tribes of Israel needed to establish a beachhead west of the Jordan River to facilitate their invasion and conquest of Canaanite territory. The most obvious site was Jericho. From this oasis, they could advance into the Judean hills. Men sent ahead to gather intelligence and reconnoiter the city stopped at the inn run by Rahab "the harlot" and learned that the people of Jericho were demoralized by the news of the Israelites' defeat of two Amorite kings.

Joshua, given supreme command by the leaders of the tribes, crossed the Jordan River with the help of a minor earthquake, which temporarily dammed the river, a phenomenon seen as recently as 1927. Although the biblical story attributes the fall of Jericho to the walls actually falling because of the blasts from Joshua's trumpet, the real story may be far simpler and militarily plausible. Encamped around the city, whose walls may have been damaged in the earthquake or in poor repair, the Israelite army in full battle dress marched around the city every day for six days, parading the Ark of the Covenant before their troops. This provoked the response of the city's defenders, who, by the seventh day, tired of the false alarms and relaxed their vigilant defense. Joshua led the troops in assaulting the walls, leading to the surrender of the city. Immediately settling the area with trustworthy tribesmen and their families, Joshua had secured a base for supply and further operations as he moved into the second stage of his conquest.

Jerusalem, Siege of (Palestine) (1099)

On 7 June 1099, the members of the First Crusade encamped before the walls of Jerusalem, the future capital of the Latin Kingdom of Jerusalem. After years of hardship they had reached their goal, although to enter the city the crusaders had to defeat the Fatamid governor, Iftikhar al-Dawla, and his garrison of Arab and Sudanese troops. To prevent treachery, Iftikhar al-Dawla sent the Christian population outside the city.

Due to Jerusalem's immense size, the crusaders could not invest it completely. They also faced a shortage of water and food. The Fatamid garrison, on the other hand, though numerous and well armed, could not man the entire wall. They hoped for the arrival of a relief army from Egypt.

On 13 June 1099, the crusaders attempted an assault. This quickly overran the outer walls, but due to insufficient siege weapons and ladders to continue the assault, they retreated. In order to build siege engines the crusaders endured skirmishes while securing lumber from as far away as Lebanon. Morale also declined as news of the approach of a Fatamid army circulated in their camp.

Raymond of Toulouse and the other leaders realized that time was short. With approximately 14,000 soldiers, they assaulted Jerusalem in the middle of the night on 13 July 1099. On 15 July 1099, the crusaders seized a portion of the wall. The crusaders stormed the city through this breach. Iftikhar al-Dawla realized he had lost Jerusalem and surrendered to Raymond. The rest of the Muslim and Jewish population was massacred, even those who took refuge in mosques and synagogues.

Despite petty jealousies throughout the leadership of the crusade, the capture of Jerusalem culminated in the establishment of the Kingdom of Jerusalem, which lasted as a Latin presence in the Holy Land for almost 200 years.

Jewish Revolts (66–135)

Two major Jewish rebellions against the Romans.

66–73 Revolt (the Zealots Revolt)

Upon arriving as Roman procurator of Judea in 64, Gessius Florus immediately encountered political crises. In Caesarea Maritima, the major Roman seaport of Judea, Florus angered Jews by siding with Greeks during intercommunal rioting. In Jerusalem, he angered Jews by seizing the payment of a large fine from the Temple treasury because Jewish payment of taxes was in arrears. When rioting erupted there, Florus's reprisals were brutal. In order to defuse talk of rebellion, King Agrippa II, the Jewish puppet ruler of Judea, argued that subordination to Rome was no shame and warned that no foreign power, particularly Parthia, would intervene on behalf of the Jews. Indeed, King Vologases I of Parthia agreed to a pact of friendship with Rome in 66. And, despite widespread opposition to Roman rule, the Jews were not united.

Eleazar ben Ananias, guardian of the Temple, prohibited sacrifices by foreigners. This was, in effect, an act of rebellion because it rudely ended the daily sacrifices on behalf of Rome and the emperor. Eleazar then seized control of the Temple, the Lower City, and the Upper City. Soon Jewish forces led by Menachem ben Judas captured the Dead Sea fortress of Masada from a small Roman garrison. By September 66, the Romans had been pushed from most areas of Judea. Cestius Gallus, the Syrian governor, marched a legion and 6,000 auxiliaries into Judea and pacified the Galilee in October. He then marched on Jerusalem but was repulsed and harassed into a humiliating retreat through the area of Beit-Horon around Jerusalem. The Jews' early successes were impressive but short-lived. The Jewish rebels in Jerusalem soon became overconfident and divisive. Eleazar sanctioned the murder of Menachem, and Eleazar himself was soon deposed and sent to command a small force in Idumaea.

In the spring of 67, Emperor Nero dispatched Titus Flavius Vespasianus (Vespasian) to Judea with two legions. Joined by a third legion commanded by his son, Titus, Vespasian now commanded a force of 60,000 and laid siege to Jotapata in the Galilee. After 47 days, the Jewish commander Yosef ben Mattitias (Josephus) surrendered, becoming the Romans' official historian. Instead of advancing directly upon Jerusalem, Vespasian cautiously spent the next three years suppressing revolt in cities like Tiberias, Gischala, and Gamala. Vespasian could afford delay, because violent disunity was destroying Jews in Jerusalem as effectively as Rome's legions. Vespasian returned to Italy in order to become emperor, following Nero's assassination, and left Titus in command of the Judean legions. Titus marched on

Jerusalem in the spring of 70 and captured the Temple in early August. (The Jewish fast day on the Ninth of Av laments this catastrophe.) Roman victory was inevitable despite the resistance of Eleazar ben Ya'ir at the fortress of Masada. Flavius Silva led a siege of three years, which finally captured the fortress in 73, whereupon the defenders committed suicide. In June 71, Titus held a triumph in Rome, where the Arch of Titus was erected next to the Forum to commemorate his victory.

The 132–135 Revolt (Bar Kochba's Revolt)

After the Roman Emperor Hadrian (Publius Aelius Hadrianus) banned circumcision and changed the name of Jerusalem to Aelia Capitolina (named after Hadrian himself), Judea rebelled against Roman rule. The Second Jewish Revolt was well planned in secret and ably led by a messianic figure named Shimon bar Kosiva (later bar Kochba). In the fall of 132, bar Kochba seized Jerusalem from its small garrison, expelled Tineius Rufus, Judea's consular governor, and struck coins in commemoration of the victory. Although the exact course of the rebellion is obscure, it appears that bar Kochba's forces used guerrilla tactics rather than engage

the Romans in open field combat. The Jews enjoyed a number of early successes. In 133, Hadrian sent eight legions, commanded by the able Sextus Julius Severus, who employed a strategy of attrition against the Jews. Unable to draw bar Kochba into open combat, Severus surrounded strongholds and starved out the rebels. Despite this strategy, the Romans suffered significant losses. For example, almost an entire legion was killed with poisoned wine, and many thousands more were killed by the Jews' guerrilla attacks. In the spring of 135, after a two-year-long siege, the Romans captured the fortress of Betar, the last refuge of bar Kochba, who was killed in the battle. As punishment for the rebellion, the Romans changed the name of Judea to Palestine and expelled most of the Jews into the diaspora, into what amounted to an exile of over 1,800 years.

Portrait of Joan of Arc. (Library of Congress)

Joan of Arc (Jeanne d'Arc) (1412–1430)

Patron saint of soldiers and probably most famous female military commander in history. Jeanne d'Arc was probably born on 6 January 1412 in Domremy, Champagne, France. At age 12, she claimed to hear voices and have visions informing her of her mission to restore the dauphin, Charles Valois, later Charles VII, to the French throne and rid the country of English occupation and their Burgundian allies. In February 1429, she met with the dauphin and his commander, Robert de Baudricourt, and somehow convinced them of her mandate.

Dressed in male garb and examined by clergy, Joan was awarded the rank of captain and given command of a small army at Blois. She led her army to the besieged city of Orleans in May. A few days after her arrival, while her army marched to the city by a northern route, citizens armed themselves and took the weakest of 10 Norman/English blockhouses by coup de main. On 7–8 May 1429, she led her troops on a series of successful sorties against the enemy, causing them to retreat. While other advisers wanted to attack Normandy, she made the decision to march upon Rheims.

In the Loire campaign, beginning with the fall of Jargeau on 10 June, she mastered the use and placement of artillery.

At the Battle of Patay, on 18 June, the French defeated the Norman/English under Sir John Fastolfe and Lord Talbot, with 1,800 English soldiers lost. Retreating to Paris, French forces had a clear road to Rheims. On 16 July, Charles entered the city and was crowned king the next day.

In the spring of 1430, Joan was captured by Burgundians at Compiègne, near Paris, in a failed sortie. Sold to the English, she was put on trial by the ecclesiastical court at Rouen. On 30 May 1431, she was burned at the stake in the marketplace after being convicted of heresy and witchcraft. Canonized in 1920, her moral importance to the French during the Hundred Years War has been stressed by historians, but her abilities as a military commander have often been overlooked. Nonetheless, Joan of Arc became almost immediately after her death a symbol, a veritable icon, of the spirit of France.

Jodl, Alfred (1890–1946)

Hitler's most important military adviser during World War II. Born 10 May 1890 at Würzburg (Bavaria), Jodl married Irma von Bullion (d. 1943) in 1913 and Luise von Benda in 1944 but had no children. He entered military service at the age of 13 and was promoted to lieutenant in 1912. He took part in World War I and joined Reichswehr in 1919, held several commands, and was promoted to general major in 1939.

Called back to Berlin he took over Wehrmachtführungsstab, the operation staff within Wehrmacht High Command (OKW). Nominally subordinated to Wilhelm Keitel as chief of OKW, he worked largely on his own, having permanent access to Hitler. After the invasion of Russia (June 1941) Jodl's staff was responsible for every theater of war except the eastern front. His duty was to prepare reports on strategic questions, to participate in the daily briefings (more than 5,000 during the war), and to transmit Hitler's directives. Working very hard, he hardly left the führer's headquarters to visit the front. Frictions with Hitler culminated in autumn 1942, but Jodl held his job. No successor was at hand and Hitler valued Jodl's competence, diligence, and admiration for him. He was promoted to general colonel in January 1944.

On 22 April 1945 Jodl left Berlin and joined Grand Admiral Karl Dönitz's staff in northern Germany. His final duty was to sign the German surrender at Reims, 7 May 1945.

Soviet demands led to his arraignment at the Nuremberg trial of the major German/Nazi leaders. Confronted with numerous criminal orders bearing his signature, he argued that as a German officer he had to obey Hitler's directives. The court did not believe that he, staying in daily contact with the dictator, could have failed to notice events and orders bearing on war crimes. Found guilty, he was hanged on 16 October 1946.

Questions as to whether Jodl deserved the death penalty arose among the Nuremberg judges and are still current among historians.

Joffre, Joseph Jacques Césaire (1852–1931)

French marshal. Born on 12 January 1852, at Rivesaltes, Joseph Joffre interrupted his studies at the École Polytechnique to serve in the 1870–1871 Franco-Prussian War. He resumed his studies after the war and on graduation was stationed in the Far East and Madagascar. He led an expedition to Timbuktu (Africa) in 1893 and served as a fortifications specialist in Madagascar during 1900–1905. He joined the Supreme War Council in 1910 and became chief of the general staff and commander in chief designate the next year.

At the outbreak of World War I, Joffre's War Plan XVII, intended to secure Alsace-Lorraine, failed to anticipate the main German deployment through Belgium because he was convinced the Germans would not use their reserves on the front lines. Following the defeat of the French offensive and the development of the German threat to the north, he skillfully redeployed his assets and conducted a fighting retreat to the Marne.

Joffre orchestrated the Battle of the Marne, 5–11 September 1914. It ended in a German withdrawal and was the high point of his career. Joffre's major offensives of 1915 and 1916, including Champagne, Somme, and Artois, were failures. He justified these as serving to convince Italy to join the Entente and to take pressure off Russia.

Joffre fell under severe criticism, especially when the February 1916 German offensive at Verdun caught him by surprise and with French defenses unready. He was also blamed

for the Romanian disaster later that year. Removed as commander of French forces on the western front in December 1916, he was made marshal of France and named technical adviser to the government. Joffre then headed the French military mission to the United States in 1917, retiring after the war. He died in Paris on 3 January 1931.

John I Tzimisces (924–976)

Byzantine general and emperor. Tzimisces began his career as an officer in the Byzantine forces commanded by his uncle, Nicephorus Phocas. In 956, he served as strategus of Mesopotamia, with little success. In 958, he led a raid into southern Armenia, and in 962 he accompanied his uncle in a very successful invasion of Syria. In 963, he encouraged Phocas to stage a coup against Joseph Bringas, an official in the court of the recently deceased Romanus II Porphyrogenitus. As a result of this coup, Nicephorus married the empress Theophano, widow of Romanus, and became coemperor with her two minor children.

Tzimisces was rewarded with the title Domestic of the Scholae, essentially commander of the Byzantine army in Anatolia. He held this position for less than two years before being dismissed and replaced with another nephew of the emperor, Peter Phocas the Eunuch, who was deemed to pose no danger to the regime.

In December 969 Tzimisces entered into a conspiracy to murder Nicephorus, having been encouraged in this by the empress Theophano. The conspiracy succeeded, and Tzimisces took part personally in the murder of his uncle. Crowned coemperor, Tzimisces exiled all of the members of the Phocas clan, except for Peter the Eunuch, whose services he retained. Tzimisces also sent the empress Theophano to a convent.

Shortly thereafter, Rus forces under Svyatoslav, Prince of Kiev, invaded Bulgaria, took Preslav, and captured the Bulgarian royal family. A further Rus advance, into Byzantine territory, was defeated by imperial troops sent by Tzimisces and commanded by Bardas Sclerus. It is possible that some sort of treaty was agreed to at this time between the empire and

the Rus. Although Tzimisces was preparing a further expedition against the Rus in 970, he was diverted from his purpose by a further revolt of the Phocas clan, which he suppressed.

In spring 971, Tzimisces was finally ready to attack the Rus. He found the passes into Bulgaria unguarded. The Byzantine forces moved quickly to Preslav, where they destroyed most of the Rus army. A siege of Preslav allowed Tzimisces to capture the Bulgar royal family, whom he imprisoned in Constantinople. The Byzantines then discovered that Svyatoslav had gone to Dristra, which the Byzantines besieged until 24 June, when the remaining Rus were captured after an attempt to break out of the town. Svyatoslav and his followers were released and, for the most part, were massacred by the Petchenegs while attempting to return home.

Tzimisces was thus free to turn his attention back to the Arab frontier. An expedition to Baghdad was contemplated in 972 or 973 but never launched. In 974, Byzantine forces marched through Armenia, securing that kingdom as a client state and a recruiting ground. In 975, the emperor marched into Syria, Lebanon, and Palestine, taking Homs, Damascus, Beirut, Sidon, Tiberias, and Nazareth. Pockets of opposition forced Tzimisces to turn back and prevented him from capturing Jerusalem. At the end of the campaign, the emperor fell ill and returned to Constantinople, dying on 10 January 976, shortly after his arrival.

Tzimisces recovered territory lost to the Byzantines and revitalized the army. At the same time, his failure to leave an heir, his suppression of the Phocas family, and his promotion of other families to supplant the Phocas clan created factions within the army, which would shortly cause a civil war over the succession.

John II Comnenus (1088–1143)

Byzantine emperor, son of Alexius I Comnenus. John II succeeded to the throne upon the death of his father in 1118. He was initially forced to deal with efforts by his mother, sister, and brother-in-law to overthrow him, but by 1119 he felt secure enough to cancel the trading privileges of Venice in Byzantium, which provoked a war, and to attack Turkish strongholds in the Meander valley.

John II's campaigns against the Turks in 1119 and 1120 proved successful. He recaptured Laodicea and Sozopolis and separated the Turkish sultanate of Iconium from the Turkish settlements in Caria. A Pecheneg and Cuman invasion in 1121 forced John to divert his attention from the Anatolian Turks. He negotiated with the invaders in 1121 and in 1122 launched a surprise attack upon the nomads. He defeated the Petchenegs and Cumans, enlisting some, while enslaving others. The war with Venice proved less fortunate, as the Venetians quickly overran several Aegean islands. John, having disbanded the Byzantine navy as a cost-saving measure, settled the dispute with the restoration of Venetian trading privileges.

In the autumn of 1127, the Hungarian king, Istvan II, attacked the Byzantine Empire, which had given refuge to a rival claimant to the Hungarian throne. The Hungarians sacked Belgrade, Nish, Sardica, and Philippopolis (Plovdiv) before being forced to withdraw. In 1128, John attacked the Hungarians and defeated them at Sirmium. Nevertheless, the Hungarians reinvaded Byzantine territory and incited a rebellion among the Serbians of Raska. John defeated the Serb rebellion and was able to negotiate a peace with the Hungarians upon the death of the offending claimant.

In 1130, John began a series of campaigns against the Turks. The first campaign ended suddenly, when John's brother, Issac, defected to the Turks. A campaign in 1132 was more successful, with the Byzantine forces ravaging considerable territory. In 1135, John captured the fortresses of Castamon and Gangra. John then turned his attention to forcing the crusader principality of Antioch into vassalage, which he accomplished in 1137. An attempt to seize Aleppo in 1138 failed.

From 1139 to 1141, John recovered the Black Sea coast of Anatolia, from Sinope to Trebizond, for the empire but made little progress in reconquering the interior of Anatolia. In 1142, the emperor forced the count of Edessa to swear homage to him and made further demands upon the principality of Antioch. Before John could settle affairs with Antioch in 1143, though, he died, allegedly from cutting himself with a poisoned arrow while hunting.

John Comnenus continued the policy of his father in improving the army. He also developed a stronghold at Lopadium, to better defend Anatolia. At the same time, he demobilized the Byzantine navy, leaving the empire dependent upon the goodwill of the Genoese and Venetian governments. John also failed to evict the Turks from Central Anatolia, which, though poor, was a region crucial for the defense of the Anatolian frontier. This failure left the borders of the empire nearly impossible to defend.

Johnston, Albert Sidney (1803–1862)

Confederate field commander whose death in battle on 6 April 1862 was a devastating loss to the Confederacy. A. S. Johnston was born in Washington, Kentucky, on 2 February 1803. After graduating from the U.S. Military Academy at West Point in 1826, he fought in the Black Hawk War of 1832. He resigned from the U.S. Army in 1834, moved to Texas, and enlisted as a private in Sam Houston's army in 1836. By January 1837 he was commander in chief of the Texas army, and from 1838 to 1840 he served as secretary of war for the Republic of Texas.

As brevet colonel of the 1st Texas Volunteer Rifles, he fought under Zachary Taylor in the Mexican-American War, distinguishing himself at Monterrey. He became a U.S. Army paymaster with the regular rank of major in 1849 and regular colonel of the Second Cavalry in 1855. As brevet brigadier general, he led a successful expedition against the Mormons in 1857 and was named commander of the Department of the Pacific in 1860.

Johnston resigned his commission in April 1861 and traveled by way of Texas to Richmond, Virginia, where Jefferson Davis made him a full general on 30 August and gave him command of all Confederate forces in the west. He ranked second among the five original Confederate generals, behind only Samuel Cooper, and first among field commanders, ahead of Robert E. Lee, Joseph Johnston, and P. T. Beauregard.

Outnumbered from the start, he raised the Army of the Mississippi to face Ulysses S. Grant in Kentucky and Tennessee. He retreated from Kentucky after George B. Crittenden lost to Don Carlos Buell and George H. Thomas at Mill Springs on 19 January 1862 and deeper into Tennessee after the fall of Fort Henry on 6 February and Fort Donelson on 16 February. With forces and supplies gathered at Corinth, Mississippi, and reinforced by Beauregard, he took the offensive against Grant in April. Hit in the hip the afternoon of the first day at Shiloh, he bled to death before surgeons could reach him.

Johnston, Joseph Eggleston (1807–1891)

Extraordinarily skillful Confederate field commander whose effectiveness was limited throughout the Civil War by his quarrels with President Jefferson Davis. Johnston was born in Prince Edward County, Virginia, on 3 February 1807. Assigned to artillery after graduating from the United States Military Academy at West Point in 1829, he fought in the Seminole Wars, the Mexican-American War under Winfield Scott, and the Utah War. Brevetted colonel and wounded at Cerro Gordo, he earned an excellent reputation. He was a brigadier general and U.S. Army quartermaster when he resigned to join the Confederacy on 22 April 1861. With Stonewall Jackson at Harpers Ferry, he organized Virginia volunteers into the Army of the Shenandoah.

The five original Confederate generals were, in order of seniority, Samuel Cooper, A. S. Johnston, Robert E. Lee, J. E. Johnston, and P. T. Beauregard. At First Bull Run, Beauregard served under J. E. Johnston, but they commanded as equals to defeat Irvin McDowell. Johnston was wounded at Fair Oaks on 31 May 1862. Commanding the Department of the West after 4 December, he opposed Ulysses S. Grant around Vicksburg in May 1863, losing his base at Jackson, Mississippi, on 14 May.

In a brilliant defensive campaign, Johnston defeated William Tecumseh Sherman at Kenesaw Mountain on 27 June 1864 but could not prevent Sherman's larger and better equipped force from entering Atlanta. Davis, unreasonably disappointed that Johnston could not hold Sherman, replaced Johnston with John Bell Hood on 18 July. Hood's command was a complete disaster, and Lee had Davis recall Johnston on 25 February 1865. Severely outnumbered but undaunted, he lost to Sherman at Bentonville, North Car-

olina, on 19–21 March and surrendered to him at Durham Station, North Carolina, on 26 April.

After the war, Johnston was a paragon of reconciliation with the North. A Democrat, he represented Virginia in Congress from 1879 to 1881 and was President Grover Cleveland's railroad commissioner from 1887 to 1891. He died on 21 March 1891 of pneumonia, caught while acting as pallbearer at Sherman's funeral in Washington, D.C.

Jomini, Antoine Henri, Baron de (1779–1869)

Military thinker and writer. Born Payerne, Swiss canton of Vaud, Jomini, son of town mayor. Banker in Basle (1796) and Paris (1798, 1801), becoming major in French-sponsored Swiss army in the Swiss Revolution (1800). Obtaining a French army staff position under Marshal Michel Ney (1800–1802) and serving as an aide-de-camp to Ney (1803), he wrote the first of his renowned works, *Traité des grandes opérations militaires* (1801–1804), published in 1805. On Ney's staff during the Austerlitz campaign (1805) he served at Ulm (October) and Austerlitz (December). Napoleon (who had read Jomini's book) appointed him a colonel on his staff for the Auerstädt campaign (1806–1807). Jomini then served at Jena (October 1806) and Eylau (February 1807). He was created a baron (1807) and was appointed chief of staff in Ney's corps in the Peninsular War (1808–1811), becoming brigadier general (1810) and director of the pioneering French General Staff's historical section (1811). In the Russian campaign (1812) he was governor of

Vilno and Smolensk but rejoined Ney for the battles of Lützen and Bautzen (1813).

Jomini failed to achieve further promotion, possibly because of his disconcerting tendency to resign posts on impulse, but also likely because he was jealously disliked by Berthier, Napoleon's imperial chief of staff, who had him arrested for a minor misdemeanor in 1813.

Jomini responded by defecting to the Russian army, gaining the rank of lieutenant general, and serving as an aide-de-camp to Czar Aleksandr I (1813–1814) during the War of Liberation, although he refused to enter Paris with allies in 1814.

Living between Russia and Brussels, Jomini wrote more books, serving as military tutor to the Russian Grand Dukes Michael and Nicholas (1816–1826), becoming the latter's aide-de-camp and general in chief on his ascension as Czar Nicholas I (1825), and fighting at the Siege of Varna during the Turkish War (1828–1829). He then played a major role in establishing the Russian Nikolaevskii General Staff Academy in 1832. Four years later he published his most influential work, *Précis de l'art de guerre*. He remained an adviser to Nicholas I, fulfilling this role in the Crimean War (1853–1856). He then retired to Passy, near Chamonix in 1859, dying there 10 years later.

Although Jomini lacked a formal military education and never commanded in battle, his theories, along with those of Karl von Clausewitz, formed the basis of modern military thought. His contributions were more quickly utilized than those of Clausewitz, strongly influencing European and American military leaders alike. Jomini's conclusions rested on his knowledge of the wars of Frederick the Great, French Revolutionary Wars, eighteenth-century military theoretical study, and his personal Napoleonic Wars experience.

Far from proclaiming Napoleon an original commander, Jomini explained his rise and fall through his adherence to or straying from historic military principles, which Jomini reduced to several simple codified laws, which supposedly explained the "art" of warfare.

His greatest contribution was his identifying of the fundamental principle of war as the concentration of the mass of troops against an enemy's weak point, thus allowing breakthrough and victory. Maneuver was vital, positioning the attacking force in the most advantageous position; concealment, surprise, and intelligence—gathering essential information to determine the best point to strike and when. Jomini stressed enveloping one or both enemy flanks (if numbers allowed) and recommended cutting enemy supply lines and communications. Fronts should be kept small, allowing swift maneuver to any weak point, with feints used to break up enemy forces. Commanders must strike decisively to forestall enemy countermaneuvers. Internal operational

lines were preferable, as these allow swift movement and concentration of troops, whereas external lines split the force, creating the potential for defeat. These principles allow coordination of offensive actions, leading to total victory. Viewing the battlefield as a mathematical square, territory was the important factor for victory, not destruction of the enemy army. Jomini abhorred total war on the Napoleonic scale; eighteenth-century warfare was his ideal.

Limiting his writings to commanding armies in the field, always recommending limited wars along pre-Napoleonic dimensions, preventing large-scale endless bloodshed to retain status quo, Jomini was a prisoner of his times and experiences. Much of his writing was overtaken by industrialization and technology, but his basic principles remain valid.

Joseph the Younger, Chief

(Hinmaton Yalatkít, Heinmot) (1840–1900)

Aboriginal American chief and military leader. Joseph was born Hin-mah-too-yah-lat-kekht, or Thunder Rolling Down the Mountain, in the Willowa Valley in northeast Oregon in 1840. His father, who also had the Christian name Joseph, was leader of the Nez Percé, a tribe that had peaceably coexisted with the United States and had willingly settled on a reservation in Idaho. In 1863, the federal government renegotiated its treaty with the tribe and reduced the size of the reservation by 90 percent, seizing 6 million acres. The Nez Percé refused to honor this agreement because the new location of the reservation was difficult to survive in and they wanted to stay on their traditional homelands. Thunder Rolling Down the Mountain became chief in 1871 when his father died and took up the name Joseph. In 1877, Joseph was given an ultimatum by General Oliver Otis Howard to return to the boundaries of the new reservation or risk military consequences. Resisting, Joseph moved his followers

Painted portrait of Chief Joseph, Nez Percé chief. (Library of Congress)

slowly to their new home. Before reaching their destination, a small band of young warriors killed some settlers in anger.

Joseph and 700 of his followers decided to flee to the safety of Canada. He was able to elude and foil the army on several occasions for more than three months and cover more than 1,600 miles using rearguard tactics, skirmish lines, and field fortifications. But while camping near the Chinook on September 30, the army surprised the Nez Percé. After five days of fierce fighting and the loss of three chiefs, more than 30 warriors and a number of women, children, and horses, Joseph decided to surrender. The government dispersed the remaining Nez Percé to several different reservations. Joseph died on the Colville Reservation in Washington State in 1900.

Josephus, Flavius (c. 37–c. 100)

Jewish historian and military leader who chronicled the fall of Jerusalem during the First Jewish Revolt. Born the child of aristocrats in Jerusalem circa 37, as a young man he was a member of the Pharisees, a sect that wanted religious freedom but did not necessarily desire independence from Roman rule. In 64, Josephus traveled to Rome on a diplomatic mission and was awed by the seemingly invincible strength of the empire. In 66 Judea revolted against Rome, and despite his misgivings, Josephus became a military leader in the Galilee. Though sometimes portrayed as a collaborator, he withstood a Roman army led by future emperor Vespasian for 47 days at the fortress of Jotapata before being forced to surrender. As a prisoner, he curried favor with Vespasian and regained his freedom in 69. Convinced the Romans were too powerful to be resisted, he served with the Roman army during the siege of Jerusalem in 70 and thus was seen as a traitor by the Judeans. His attempts to act as a neutral arbiter failed. After Jerusalem fell and the revolt was put down, Josephus retired to Rome to write. He is remembered mainly for his histories of the revolts entitled *History of the Jewish War*, and for a history of the Jewish people, *The Antiquities of the Jews*.

Joubert, Petrus Jacobus (“Piet”) (1831–1900)

Charismatic Boer leader against the British. Joubert was born on the family farm near Prince Albert, South Africa, on 20 January 1831. His parents took him on the Great Trek to Natal when he was six. Settling later in Transvaal, he was always a farmer at heart, with a kindly, diplomatic nature, but was also successful in law, business, and politics. He was a popular civilian leader with almost no military experience when he was elected commandant general at the start of the First Boer War in December 1880. He defeated General Sir George Pomeroy Colley at Laing’s Nek on 28 January 1881, Ingogo on 8 February, and Majuba Hill on 27 February, thus liberating Transvaal and becoming a national military hero. He nonetheless lost four presidential elections to Paul Kruger in the 1880s and 1890s but at the same time remained in power to enlarge and improve the Boer army, especially the artillery. He brought in the famous 155 mm

“Long Tom” siege gun from Schneider-Creusot and the 120 mm rapid-fire howitzer from Krupp.

When the Second Boer War erupted in October 1899, Joubert defeated the British again at Laing’s Nek on 12 October, at Talana on 15 October, Elandsplaagte on 21 October, and Nicholson’s Nek and Modderspruit on 30 October. Having forced the British to retreat into Ladysmith, he began the siege of that town on 2 November. Joubert’s victories were mostly due to British mistakes, which offset Joubert’s short-sighted preparations, overly defensive tactics, and natural aversion to violence.

The gentle Joubert was especially ineffective while besieging Ladysmith; his main concern was to make peace. Disabled on 23 November by a fall from his horse, he resigned his commission and was replaced as commandant general by Louis Botha on 25 November. He fell ill and died on 27 March 1900 in Pretoria.

Julian (Flavius Claudius Julianus “The Apostate”) (332–363)

An outstanding military leader of the later Roman Empire. Flavius Claudius Julianus was born at Constantinople in 332, a relative of Emperor Constantine the Great. He survived a massacre of his family by political rivals and spent most of his early youth in exile. At the age of 20 he secretly renounced Christianity and embraced both paganism and Hellenic philosophies. In 356 Julian was regarded as safe enough for public service, so his cousin, Emperor Constantius II, appointed him caesar of Gaul.

Gaul was then besieged by German tribes, who swarmed across the Rhine River in large numbers. Despite his lack of formal military training, Julian rebuffed the Alamanni in several small encounters, and in August 357 his 13,000 Romans soundly defeated 30,000 warriors at Strasbourg and

subsequently drove the Franks from Gaul. For the first time in many years, Roman military authority was reasserted along the Rhine frontier. Julian also effectively overhauled provincial administration, lowered taxes, and won the affection of his troops.

Constantius II, fearing a potential rival, ordered Julian to transfer the best parts of his army to the east for a war against Persia. The troops refused and proclaimed Julian emperor. Constantius II died of a fever as both men’s armies advanced toward Constantinople, and Julian was proclaimed emperor in December 361. He was nicknamed “the Apostate” by later Church historians for officially embracing paganism and shunning Christianity, although he never initiated any persecution.

Over the next year, the Romans made feverish preparations for a showdown against the Persian Empire under Shapur II. Julian led 65,000 well-trained men through Mesopotamia and across the Tigris River. Supplied by a large fleet of warships accompanying him downstream, Julian easily defeated Shapur II in several sharp engagements and at length stood before the winter capital at Ctesiphon. He then waited for reinforcements from Armenia that were not forthcoming. Julian commenced a fighting withdrawal northward, defeating the Persians in several battles. In a minor skirmish on 26 June 363, he was mortally wounded. His successor, Jovian, concluded a peace accord by ceding considerable Roman territory to Persia.

Justinian I (482–565)

Ruler of the eastern Roman Empire, sought to restore the unity of the Roman Mediterranean through military, diplomatic, religious, economic, and cultural initiatives that instead created Byzantium. When Justinian became emperor in 527, he inherited a strategic orientation founded on four principles: (1) keeping Constantinople, the capital, impregnable; (2) guarding against the Persian Empire to the east, Byzantium’s primary military threat; (3) managing the ill-organized German kingdoms of western Europe, and the Maghrib as a “second front”; and (4) supervising the north-

A mosaic from San Vitale, Ravenna, depicting "Justinian the Great."
(Library of Congress)

ern frontier created by the Danube River and the Balkans, that unstable territory between Constantinople and the river. Instead, he resolved to alter this approach permanently by reclaiming the lost provinces of the west.

A diplomatic quarrel led Justinian into an unwanted war with Persia in 530, but a new shah, Khusrauw, ended the hostilities in 532. Justinian used peace with Persia to launch an invasion of the Vandal kingdom of Carthage. Belisarius, the Byzantine general, made unexpectedly quick work of the Vandals, and in 533 the lands of Libya and Tunisia became Byzantine provinces. Consolidating his hold in Africa, a crisis in the Ostrogothic state of Italy offered Justinian another

opportunity. In 535, backed by the navy, Belisarius invaded Sicily, crossed into Italy, and entered Rome in December 536. Although the Ostrogoth king Vitigis besieged Rome for over a year, the eternal city held, and he withdrew to his capital of Ravenna. Three years later, Vitigis surrendered the city to Belisarius.

Despite these successes, Justinian's fortunes reversed dramatically in the 540s. Shah Khusrauw, prompted by Arab and Armenian allies and fearing that the balance of power was tipping against Persia, stormed through Syria and sacked Antioch. Five years of inconclusive invasion and counter-invasion followed. While Persia preoccupied Justinian, wandering Slavic, Bulgarian, and Germanic peoples began to infiltrate the Balkans. In addition, Totila, a new Goth ruler, recaptured most of Italy and in 549 took Rome.

In 552, Justinian dispatched General Narses to Italy with 30,000 men, including Lombard mercenaries. Narses crushed Totila at Busta Gallorum, occupied Rome, and permanently ended Gothic power in Italy. He also sent his general Solomon to seize a slice of coastal Spain as a weight against the Visigothic kings there. In the Balkans, the crisis continued unabated as Zabregan, chief of the Kutrigurs, raided with virtual impunity, and even threatened Constantinople in 557. Lacking local resources, Justinian simply bribed Zabregan to leave, and then bribed another barbarian king to make war on the Kutrigur. Byzantium adopted this bribe and divide tactic repeatedly to manage barbarian threats in the Balkans. It could backfire. In 562, for example, impervious to payoffs, the Huns sacked the city of Anastasiopolis.

Justinian's successors soon lost Spain and, within a few centuries, Italy and most of his other acquisitions. Historians continue to debate whether his military legacy to Byzantium was one of short-lived grandeur or debilitating over-extension.

K

Kadesh, Battle of (1274 B.C.E.)

The Hittite and Egyptian empires clashed for control of the Levant at Kadesh in the largest, best-documented Bronze Age battle. In 1275–1274 B.C.E. Egyptian pharaoh Rameses II (“the Great”) invaded the Levant, sending his Na’arm division along the coast while he led the Amun, Ra, Ptah, and Seth divisions inland. Egyptian forces included 20,000 Nubian and Egyptian infantry, Libyan mercenaries, and Egyptian chariots. The Hittite king, Muwatallis, responded with 35,000 allies and 2,500 chariots. Egyptian forces utilized bows and light chariots while Hittites were known for iron weapons and heavy chariots.

At Kadesh, Muwatallis set a trap, using spies to suggest that the Hittite army was still far to the north. Rameses fell for the ruse and raced ahead with the Amun division to seize Kadesh. At this time, the Hittites emerged from behind Kadesh, crossed the Orontes River and hit the Ra division squarely on its right flank. The Ra division broke and fled toward the Amun division. Fortunately, the Egyptian Na’arm division arrived just in time to stop a rout.

Rameses rallied the fast-moving Egyptian forces and rolled back the Hittites with swift chariot attacks. The Hittites were in danger of being crushed between the northerly Na’arm, Amun, and Ra divisions and the southerly Ptah and Seth divisions. Muwatallis decided to withdraw east across the Orontes River and occupy Kadesh. With no siege equipment Rameses could not take Kadesh. Both sides eventually agreed to a peace treaty (each loudly proclaiming victory), with Rameses marrying a Hittite princess.

Kamenev, Sergei Sergeevich (1881–1936)

Czarist officer, Red Army commander in chief, military theoretician. Born in Kiev, son of a military engineer, Kamenev graduated from the Aleksandrovskii Military Academy (1900), joining the 165th Lutskii Regiment; he graduated from the General Staff Academy in 1907.

In World War I, Kamenev was a semi-adjutant in the Operational Department, First Army, 30th Poltavskii Infantry Regiment; a commander of a rifle corps; and a chief of staff. He emerged a colonel.

After the October Revolution, he sided with the Bolsheviks, was elected chief of staff, XV Rifle Corps, then Third Army, before demobilization.

During the Russian Civil War, Kamenev was a Red Army volunteer; a military head of the Nevel’skii District, western screens (April 1918); and Smolensk District military commander (August).

From September 1918 to July 1919, he was eastern front commander and oversaw the counteroffensive against Kolchak (April–July), taking the north and central Urals. But he was stripped of command in July by Trotsky after strategic disagreements with Vacietis, who wished the eastern front to dig in, allowing troop transfers southward to face Denikin. Eastern front commanders’ complaints persuaded Lenin to reinstate Kamenev.

Sponsored by Stalin, Kamenev replaced Vacietis (Trotsky’s candidate) as Red Army commander in chief (July 1919–April 1924). He oversaw the Red Army campaigns that defeated Kolchak (July–December 1919), Denikin (August 1919–April 1920), and Wrangel (April–November 1920), but

was partially to blame for the defeat in Soviet-Polish War (April–October 1920). He failed to coordinate or control the western (Tukhachevskii) and southwestern (Egorov) fronts' advances into Poland, allowing the Polish counteroffensive at Warsaw (August 1920). He then oversaw the clearing of anti-Soviet forces in Ukraine, Belorussia (Makhno, Bulak-Balakhovich), and Turkestan (Basmachi).

Kamenev supported Frunze's military doctrinal ideas and became the principal tactics lecturer at the Red Army Military Academy; inspector, Red Army (April 1924); chief of staff (March 1925); head, Main Administration (November 1925), CEC member.

As deputy peoples commissar, Naval, Military Affairs, deputy chairman RVS USSR (May 1927), Kamenev finally joined the Communist Party in 1930. He was appointed head of administration, Red Army anti-air defense, then a member of the Military Soviet Under-Defense Commissariat (June 1934). He also found time to lead Arctic exploration efforts. Kamenev wrote military works assessing civil war operations, changing conditions, and modern warfare developments.

Kamenev died, supposedly of heart failure, in Moscow when Stalin's purges of the military had gathered strength. He was branded a conspirator in the Tukhachevskii Plot (1937) but was later rehabilitated in the post-Stalin era. (Note: S. S. Kamenev should not be confused with L. Kamenev, the party leader executed by Stalin in the same year that S. S. Kamenev supposedly died of a heart attack.)

Kandahar (31 August–1 September 1880)

Final battle of the Second Anglo-Afghan War (1878–1880), the decisive British victory that made a hero of Frederick Sleigh Roberts. In the context of the so-called Great Game or

Tournament of Shadows between Russia and Great Britain throughout most of the nineteenth century for control of southern Asia, Britain kept close watch on the northwest Indian frontier. Afghanistan was an important buffer state, and Britain sought to extend its influence there, despite the Afghans' dangerously intense and implacable hatred of all foreigners.

Roberts won the battle at Charasiah on 6 October 1879; occupied the capital, Kabul, on 12 October; deposed Amir Yaqub Khan; and ruled Afghanistan by strict martial law for the next eight months. In June 1880 Yaqub Khan's younger brother, Ayub Khan, began a jihad, or holy war, against the British occupation. At Maiwand on 27 July, 10,000 Afghans under Ayub Khan ambushed a British and Indian brigade of 2,500 under George Reynolds Scott Burrows, inflicting 40 percent casualties while suffering only 25 percent of their own. Ayub Khan then besieged the garrison of 4,000 under James Primrose at Kandahar.

Roberts immediately mobilized 10,000 men, mostly Indians, and marched them across 313 miles of treacherous mountain paths and burning deserts in just 23 days to relieve Primrose. Roberts's logistical and psychological genius ensured the success of this march and earned him an honored place in military history. Arriving north of Kandahar on 31 August, he attacked Ayub Khan's camp near Baba Wali Pass the next day and overwhelmed him, thus ending the war. The British and Indians lost 40 killed, but more than 600 Afghans died.

Satisfied with both the military and political outcome, the British withdrew from Afghanistan in April 1881. The new emir, Abdul Rahman Khan, Yaqub Khan's nephew, then ruled Afghanistan as a neutral state.

Kangxi (K'ang-his) (1662–1722)

Reign name of a Chinese Manchu emperor born with the name Hsüan-yeh. He survived smallpox as a youth and

ruled the Manchu Empire for 60 years. His reign flourished in all respects, but in the realm of military affairs, Kangxi demonstrated particular acumen.

The completion of the conquest of China marked Kangxi's greatest accomplishment. Several Chinese generals had assisted the Manchu in their conquest of China; three of these renegade generals had established quasi-independent states known as the Three Feudatories. From 1673 to 1681, Kangxi's armies battled the Three Feudatories until he achieved victory. The complete domination of China came when Kangxi's army finally seized Taiwan from the heirs of Koxinga (Zheng Chenggong) in 1683.

Kangxi also expanded the empire into inner Asia. Freed from the threat of civil war and rebellion with the defeat of the Three Feudatories, Kangxi turned to meet the threat of the Russians and the Oirat Mongols. Russian Cossacks had made inroads on the Manchu northern frontier and even exacted tribute from his subjects. After destroying the Russian outpost of Albazin, Kangxi offered a peace treaty to the Russians at Nerchinsk in 1689. Thus, Kangxi could now bring the full weight of his military against the Oirats, without fear that the Czar would ally with them. The Oirats threatened to control all of Mongolia, Xinjiang, and part of Kazakhstan. The Khalkha Mongols, of modern Mongolia, turned to Kangxi and offered their submission in return for protection from the Oirats. Kangxi consented at the treaty of Dolon Nur in 1696. At the battle of Jao Modo, Kangxi defeated Galdan Khan, ruler of the Oirats. With this victory, Kangxi secured Mongolia and extended his influence into Xinjiang.

Kars, Battle of (16 November 1877)

One of the battles of the Russo-Turkish War (1877–1878), resulting in a Russian victory and the aggrandizement of Russian territory in the Caucasus. In support of Balkan rebellions against Ottoman rule, Russian czar Alexander II declared war on 24 April 1877. Russian forces were divided into two main armies: Danube and Caucasus.

The Russian army of the Caucasus was commanded by Grand Duke Michael and numbered 60,000, with a reserve

force of approximately 50,000. It was divided into four operational groups: Kobulety, Akhalsykh, Aleksandropol, Erevan. Their mission was to overcome the Turkish fortresses of Batumi, Arduhan, Kars, Bayazid, and Erzerum. Opposing Turkish forces were divided into two groups: 60,000 commanded by Mukhtiar Pasha and an army of 40,000 near Erzerum.

By the end of April, Michael's forces had occupied Bayazid. By mid-May, Russian forces had seized Ardahan and were besieging Kars. However, by the end of August, Turkish counterattacks lifted the siege of Kars.

Kars was a stone citadel upon a gorge, composed of 12 detached forts for a defensive line of 17 kilometers. Mukhtiar Pasha's army was encircled and destroyed by a two-prong Russian pincer in October. However, Khalil Pasha refused to surrender Kars and his force of 25,000 men.

The Russians divided their 50,000 troops into seven detachments, two of which were diversionary. Kars was captured on 16 November. The main fort (Kamli) was seized by three Russian detachments. The Turks lost 70,000 men and 17,805 were taken prisoner. The number of Russians killed and wounded was 2,270.

Adrianople/Edirne was captured on 20 January 1878, and the war was concluded by armistice on 31 January, with Russian forces outside Constantinople.

Kars remained part of the Russian Empire until the Treaty of Brest-Litovsk in March 1918 returned it to Turkey.

Kasserine Pass (14–23 February 1943)

A gap in Tunisia's western Dorsal mountains where American troops met defeat in their first major engagement with the Germans in World War II. The two-mile-wide pass, situated between two 4,000-foot mountains, was considered the gateway to Tunis, a city the Allies hoped to capture in early 1943. To prevent the capture of Tunis, and with the hope of splitting Allied forces in two and reaching the north coast of Tunisia, German commander Erwin Rommel launched an armored offensive against thinly held Allied lines near the pass. Because they misinterpreted ULTRA intelligence, the

Allies had made the mistake of placing most of their reserves too far north, leaving the troops guarding the pass extremely vulnerable to the German attack.

On 19 February Rommel's 10th Panzer Division, along with Italian armor and infantry, attacked northwestward and forced a breakthrough in the American lines. The inexperienced American troops gave way too easily, leaving behind many of their weapons and much of their heavy equipment. More than 1,000 were killed and many hundreds taken prisoner. The American commander on the scene, the blowhard General Lloyd Fredendall, proved inadequate to the crisis created by Rommel's attack. After the battle he would be relieved in favor of Lieutenant George S. Patton.

Instead of continuing westward to exploit his breakthrough, Rommel was ordered to turn north toward the port of Le Kef. In so doing his spearheads ran into the teeth of the Allied reserves, who fought the Germans to a standstill amid heavy rains. In the process the tide of battle turned and the pass was recaptured on 24 February. Kasserine Pass served as a hard-learned lesson to the United States Army as to the kind of training, toughness, command, and coordination necessary to defeat the Germans in World War II. Rommel himself warned the German military against making too much of their easy victory; the Americans would learn, he asserted, and more quickly than their allies.

Kearny, Philip (1814–1862)

Internationally renowned cavalry officer and Union general. Philip Kearny was born into a wealthy family in New York City on 1 June 1814. His uncle was the famous soldier Stephen Watts Kearny. Philip attended Columbia University in 1833, graduating in 1837 with a law degree. He soon accepted a commission in the 1st Dragoons. In 1839 he was sent to Europe to study cavalry tactics. After attending the French cavalry academy, he served as a volunteer in Algiers with the Chasseurs d'Afrique, seeing action across North Africa and building a wide reputation as a fearless tactician.

Returning to the United States in 1840, he served in administrative billets until he secured a position on the staff of

General Winfield Scott. Kearny commanded a cavalry company during the Mexican-American War. In engagements at Contreras, Churubusco, and Mexico City, he increased his reputation but lost his left arm. In 1851 he resigned his commission and traveled widely and in 1859 rejoined the chasseurs to participate in the Italian war. At Solferino, his charge essentially won the day and earned him the cross of the French Legion of Honor, the first American so honored.

Upon the outbreak of the American Civil War, Kearny offered his services to the Union. As a brigadier with the New Jersey Volunteers in the Army of the Potomac, he saw action at Williamsburg and Seven Pines during the Peninsular campaign. In May 1862, at Second Bull Run, his troops turned back the assault by General Thomas "Stonewall" Jackson's troops. Nearby, at Chantilly, on 1 September, he mistakenly rode into rebel lines and was shot down. The Confederates graciously returned his body for burial. At the time of his death, Kearny was considered perhaps the bravest man in an era of brave soldiers.

Kearny, Stephen Watts (1794–1848)

American commander. Kearny was born on 30 August 1794 in Newark, New Jersey, into a wealthy family. He served as an ensign in the New York State Militia while he attended Columbia College in New York City. At the outbreak of the War of 1812 Kearny entered the United States Army and was commissioned a second lieutenant. At the Battle of Queenston Heights Kearny was wounded and captured.

Kearny spent most of the next 35 years serving in the American West, where he took part in many exploration expeditions. In 1836 Colonel Kearny succeeded to the command of a dragoon regiment. In 1837 he wrote a manual for the dragoons, earning him the nickname "Father of the Cavalry." Upon the declaration of war against Mexico in May 1846 he was appointed commander of the Army of the West and given orders to secure New Mexico and California. He entered Santa Fe in August and, acting as military governor, established a government. In September Kearny marched on California. Having received word that Commodore Richard Stockton had pacified California, Kearny brought only 110 dragoons. Upon arrival, however, he discovered that the Cali-

Field Marshal Wilhelm Keitel (right) standing in an open car in a victory parade in Bucharest, upon the return of the Romanian troops from Odessa, 1941. (Library of Congress)

fornians had reestablished themselves. Kearny led his weary men into action and obtained a costly victory at the Battle at San Pascual on 6 December 1846. By January he had secured California for the United States. A dispute between Kearny and Stockton developed over who should govern California. When the authorities in Washington, D.C., sustained Kearny, he had Stockton's choice of governor, Lieutenant Colonel John C. Frémont, arrested for insubordination.

In the spring of 1848 Kearny was ordered to Mexico, where he served as military governor of Veracruz, and later Mexico City, where he contracted yellow fever and took ill. He died 31 October 1848 in St. Louis, Missouri.

Keitel, Wilhelm (1882–1946)

Hitler's chief of Wehrmacht High Command (OKW). Keitel was born 22 September 1882 at Helmscherode near Hannover and joined the Prussian army in 1901, becoming a lieutenant the following year. He married Lisa Fontaine in 1909 and had six children.

Keitel fought during World War I and entered the postwar Reichswehr as a captain in 1919. From 1925 on he held administrative positions within the then-camouflaged general staff responsible for organizational matters and plans for rebuilding a strong army. As a general major he led the armed forces department within the War Ministry from 1935.

After the dismissal of War Minister Werner von Blomberg and Army Commander Werner von Fritsch in February 1938, Hitler made himself Wehrmacht's supreme commander and created OKW under Keitel as his personal staff. Keitel was without executive power toward the army, navy, or air force because Hitler kept command authority to himself, using Keitel as a high-ranking secretary. Because of his weak position and submissiveness toward Hitler, Keitel, promoted to field marshal on 19 July 1940, was called Lakeitel (lackey)

by those who knew him. He occasionally disputed matters with the dictator, but Hitler kept the busy and experienced field marshal in office and Keitel progressively abandoned any critical attitude. Without prestige among the officer corps but backed by Hitler, Keitel was allowed to sign orders in Hitler's name ("Der Führer—by authority Keitel"), among them the infamous commissar order and many other criminal directives.

Little research exists about his activities in wartime industry and domestic activities as member of the Reich Defense Council. Leaving operational matters to Jodl he participated in many conferences on coordinating warfare, negotiated with German allies, and held important administrative functions, which indicates that his position as near-war minister is still underestimated.

Keitel left Berlin a week before Hitler's suicide but returned to sign the surrender to the Soviets, 9 May 1945. He was found guilty of war crimes at Nuremberg and hanged 16 October 1946.

Kellogg-Briand Pact (27 August 1928)

A multinational treaty actually outlawing war. The Kellogg-Briand Pact grew out of two trends that dominated diplomacy in the 1920s. First, the French search for security, and second, the intense desire in the United States for peace in isolation after World War I.

Aristide Briand, the French foreign minister, sought to protect France through a series of treaties known as the Locarno agreements. After solidifying alliances with potential enemies of Germany, he looked to secure improved Franco-American relations, chilled by America's insistence on collecting war debts for World War I. But Briand hoped at least to sign a pact with the United States that proposed to ban war as an instrument of national policy. United States secretary of state Frank Kellogg feared that France was attempting to draw the United States into a negative alliance and preventing the United States from ever declaring war against France, no matter the circumstances. War with France seemed highly unlikely, but such a treaty might prevent the United States from retaliating against French interference with American flagships trading with Germany during a time of war.

Briand communicated his plan directly to the American

people in April 1927, ignoring the usual diplomatic channels and infuriating President Calvin Coolidge. Moreover, the wily Frenchman met with leaders of the peace movement in the United States in an effort to encourage them to spur on their reluctant government. The trans-Atlantic flight of Charles Lindbergh in May 1927 seemed to draw the two nations closer.

Throughout the fall of 1927 Kellogg stalled negotiations as he considered options to outmaneuver Briand. In November he proposed that the treaty should be multilateral, with an invitation extended to all nations to sign the agreement. Although Kellogg at first hoped this would scuttle talk of a concept he considered foolish, he later became convinced of its practicality and its rewards (a possible Nobel Prize) for himself. Unable to counter Kellogg's move, Briand assented. On 27 August 1928, 15 nations signed the agreement. Within five years, a total of 64 countries signed the treaty to renounce war as an instrument of national policy.

The treaty failed to include any enforcement mechanisms or even of any method to judge if a nation did in fact use war as an instrument of foreign policy. There was no mention of such issues as defense or alliances. Despite these shortcomings, the Kellogg-Briand Pact was, in fact, the legal basis for bringing Germany to account at the Nuremberg tribunal following the end of World War II.

Kesselring, Albert (1885–1960)

German field marshal most famous for his defense of Italy, 1943–1944. Born at Marktstett, near Bayreuth, 30 November 1885, Kesselring enlisted in the 2nd Bavarian Foot Artillery in 1904. During World War I he served in artillery staff positions on the western front, becoming a general staff officer in late 1917, then was assigned to a division on the eastern front. Promoted to colonel in 1930, and having already proved his ability as an administrator, he was transferred to the Air Ministry in 1933, promoted to general major in 1936, and became the air force chief of staff in the same year.

During the Polish campaign, Kesselring commanded the First Air Fleet and succeeded in breaking the defenses in Warsaw. He also played an important role in the French campaign in 1940 as the commander of the Second Air Fleet,

supporting the actions of Army Group B. In the first three months of Operation BARBAROSSA (invasion of the Soviet Union) Kesselring commanded the air fleet assigned to Army Group Center but was transferred to Italy in November 1941, becoming commander in chief south, nominally the direct superior of Rommel. On 21 November 1943 he became commander in chief of Army Group C, the commander of German forces in Italy. He conducted defensive operations against the Allies skillfully until he suffered a severe road accident in October 1944. After returning to Italy for a few weeks, Kesselring became commander in chief west on 9 March 1945.

In February 1947 Kesselring was charged with the shooting of civilians in Italy in March 1944 and sentenced to death, subsequently reprieved, then released on 23 October 1952 on the grounds of ill health. Kesselring died on 16 July 1960 at Bad Nauheim.

Kett's Rebellion (1549)

In 1548, agrarian disturbances, spurred by rising inflation, enclosure of common lands, and debasement of the coinage, began to break out all over England. Most were handled firmly but leniently by the local authorities, urged by Protector Somerset, regent for Edward VI, to address grievances and disperse the rebels without using force, especially because English troops were involved in fighting Scotland. Unfortunately, by 1549, Norfolk was involved in a serious uprising that no threats of forfeitures or martial law could stop. Norfolk was without a great noble family the people respected and obeyed after the purges of the Tudors' Plantagenet relatives, and its citizens had little respect for their unpopular bishop, William Ruge. The ensuing rebellion centered on Robert Kett, a 57-year-old gentleman landowner, who assumed leadership of the angry mob of yeomen that had come to tear down his own fences and kill his sheep.

Kett led the increasingly large group to march on Norwich, where it camped outside the city, on Mousehead Heath, en route tearing down fences and destroying the hated dovecotes of landlords, whom they took as hostages and used as a human shield as they marched. On July 22, the rebels attacked the walled city with help from disaffected city dwellers and broke in through one of the gates, seizing

all of the arsenal before retreating back to the heath, where Kett had set up an elaborate administration, with clerks, legal courts, and a provisioning system. Kett and his men issued a declaration to the crown, "Twenty-Nine Demands," most of which called for the preservation of traditional, conservative rights against recently corrupt practices of enclosure and economic repression.

The government first sent William Parr, Marquis of Northampton, who allowed himself to be trapped inside the city of Norwich, attacked, and forced to retreat, then John Dudley, Duke of Northumberland, who arrived on 24 August and took possession of the city. Dudley declared that he would stay there to the last man in his army, which included Italian mercenaries. Kett, who had sent out agents to try to enlarge the rebellion by contacting other agrarian rebels engaged in minor revolts nearby, failed to rally more men, and also failed to repeat his previous success of attacking Norwich, once Dudley was inside. Street fighting quickly fizzled, and Kett was forced to engage the Crown's army in an open field battle northeast of the city, where the professional soldiers decimated the rebels, killing perhaps 3,000 of them in battle and executing a number of men identified as ring-leaders, before offering a pardon to those who surrendered.

Kett himself, and his brother, William, were captured and taken to the Tower, where they were tried for treason. Returned to Norwich for execution, they died on 9 December 1550. Ironically, the rebellion brought about the collapse of the government of Protector Somerset, who was sympathetic to the grievances of the rebels, and led to the rise of Robert Dudley, the Duke of Northumberland.

Khalid ibn al-Walid (d. 642)

Primary Arab general during the first phase of the Arab conquests. Khalid fought against the Prophet Muhammad at the Battle of Uhud but later converted to Islam in 627 (or 629; historians are unsure). Khalid took part in the conquest of Mecca in 629, and then led several other expeditions.

After the death of the Prophet in 632, Abu Bakr sent Khalid on several missions to quell rebellion. As Khalid demonstrated exceptional prowess, he was placed in charge

of an army to invade Iraq. In Iraq, Khalid conquered several locations before leading his army into Syria, by crossing the desert, although there is disagreement in sources as to whether Khalid went first to Syria, and then marched to Iraq to take the strategic location of Dumat al-Djandal before returning to Syria. Once in Syria, Khalid assisted the Arab armies already fighting the Byzantines there.

Eventually, Khalid's army returned to Iraq to resume its duties there, but Khalid himself remained in Syria. Khalid's success by this time was enormous and he eventually gained the sobriquet of Sayf Allah, or the Sword of God, although later sources refer to him with the less prestigious title of Sayf Rasul Allah, or the Sword of the Messenger of God (that is, of Muhammad).

Khalid rose to be the commander of the armies in Syria, but after the death of Caliph Abu Bakr in 634, his fortunes declined momentarily. Caliph 'Umar ibn al-Khattab demoted Khalid from his position, although he was not removed from Syria. He continued to lead troops in northern Syria as a lieutenant of Abu 'Ubayda. Khalid led numerous raids on the Byzantine border until his death in 642. There is some speculation that Khalid was assassinated by the future Caliph Mu'awiya, who envied Khalid's status.

Khalkin-Gol (Battle of Nomonhan, May–September 1939)

A series of border battles between Soviet and Japanese forces, resulting in Japan's defeat. In the summer of 1939, the Japanese Kwantung Army in Manchuria fought several battles against Soviet forces in Siberia over the exact border along the Khalkin-Gol River at a town named Nomonhan. There were several stages to the fighting.

First, Soviet troops occupied the disputed territory to a depth of about 12 miles to the east in May 1939.

Second, the Japanese attacked with a reinforced division and were initially successful. They had expected to fight Mongolian troops and were surprised at the appearance of

regular Soviet Red Army forces. After the initial success in driving the Soviets out of disputed territory, Japanese troops crossed into Mongolia, where despite reinforcements of artillery and tanks, they were stopped.

Third, Soviet forces, now commanded by General Georgy K. Zhukov, drove back the badly outnumbered Japanese across the border and back to Nomonhan. Zhukov threw 65,000 troops against 28,000 Japanese and soon pushed them 20 miles into Manchuria.

Finally, before the Japanese Kwantung Army commander could employ the three divisions he had concentrated for a counterattack, the Japanese high command took control from the nearly autonomous Kwantung Army and called a halt to the fighting in mid-September 1939.

The Japanese learned little from the Soviet attack. Supposedly, the Japanese experience in fighting the Soviets and the situation of the European empires in Southeast Asia after the German victories in the West in the spring of 1940 caused the Japanese to look south to expand into the resource-rich southern Asia-Pacific region and hence to consider a preemptive strike against the American Pacific Fleet in its anchorage at Pearl Harbor, Honolulu, Hawaii.

Khambula (29 March 1879)

The turning point of the Anglo-Zulu War, breaking the morale of the Zulu army. Colonel Evelyn Wood's number 4 (left) column of 2,086 officers and men maintained an active presence in northwestern Zululand after the other invading British columns were thrown onto the defensive by defeat at Isandlwana. Wood's fortified position at Khambula consisted of a wagon laager, connected to an earthwork redoubt and a smaller cattle laager. At midday on 29 March the Zulu army of about 20,000 men, under the command of Chief Mnyamana kaNgqengelele, halted four miles south-east of the camp. Aware of the danger of attacking entrenched positions, King Cetshwayo had instructed Mnyamana to draw the British into the open by threatening their line of supply. But Mnyamana was overborne by the younger warriors, who insisted on a direct assault.

The Zulu army deployed with the intention of enveloping Khambula, but at 1:30 P.M. the right horn began an unsupported advance from the north, drawn on by mounted troops sent forward by Wood, and was repulsed. The Zulu were consequently unable to complete their envelopment of the camp, whose northern and western salients remained unthreatened, thus enabling the British to concentrate against the main Zulu attack, which unfolded at 2:15 P.M. from the south.

The Zulu drove the British from the cattle laager and threatened the main laager. Several British companies then sortied and drove the Zulu back at bayonet point, and by 3:00 P.M. the Zulu had abandoned their assault from the south. Over the next two hours they renewed the attack, first from the east, and then from the northeast. At about 5:00 P.M., when the Zulu attack slackened off, British infantry sortied once more, supported by the mounted troops. The exhausted Zulu were unable to rally, and their retirement turned into a rout. The mounted troops relentlessly pursued them eastwards until night fell.

The British lost 29 killed, the Zulu more than 1,000. The fighting spirit of the Zulu army never recovered from this crushing defeat, and the Zulu had lost the initiative in the war.

Kharkov (12–28 May 1942)

World War II battle on eastern front, catastrophic defeat for Red Army. The second largest city in Ukraine, Kharkov fell to German forces 24 October 1941, four months into Hitler's invasion of the Soviet Union. Seven months later, in May 1942, Kharkov became the site of a major defeat for the Red Army.

The so-called Second Battle of Kharkov (12–28 May 1942) developed when Marshal S. K. Timoshenko's Southwestern Front, supported by Marshal R. Ia. Malinovsky's

Southern Front, undertook an offensive to recapture the city and destroy the German forces deployed in its defense. Attempting a pincer operation, Soviet Twenty-eighth, Twenty-first, and Thirty-eighth Armies attacked from Volchansk in the northeast, while Soviet Sixth and Bobkin Army Group struck from the Izyum Bulge in the southeast.

Both arms of the Soviet pincer made substantial advances until 16 May. However, Timoshenko's failure to commit armored forces fast enough allowed the Germans to blunt the Soviet drives and mount a counterstrike. Code-named Operation FREDERICUS, the German counteroffensive of 17–18 May saw the southern prong of the Soviet offensive encircled by General Friedrich Paulus's Sixth Army, attacking from the north, and General Ewald von Kleist's Army Group (Fourth Panzer and Seventeenth Army), attacking from the south.

Although a few Soviet units managed to escape, the Second Battle of Kharkov cost the Red Army an estimated 277,000 men, 4,900 guns and mortars, and 652 tanks.

Khartoum, Siege of (13 March 1884–26 January 1885)

Evacuation, defense, and massacre in the First Mahdist War. In the early 1880s the Sudan was ruled by Egypt, which was itself a puppet state of Great Britain and nominally part of the Ottoman Empire. Native Sudanese resented foreign domination and grumbled for home rule. Sudanese nationalist/theocratic uprisings led by the Mahdi, a charismatic Nubian Sufi fundamentalist mystic, began in 1881. British prime minister William Gladstone tried to remain aloof from what he perceived as an internal Egyptian affair, but the British became embarrassed by their inability to safeguard Egypt's control of the Sudan. The khedive of Egypt pleaded unsuccessfully for British support.

Finally bowing to public pressure in January 1884, Gladstone reluctantly sent a popular hero, Charles George "Chinese" Gordon, to the Sudan with orders first to evacuate Egyptian troops from Khartoum, then, if possible, regroup

and retaliate against the Mahdi. Gordon left London on 18 January, arrived in Khartoum on 18 February, judged immediately that transport was insufficient for a well-managed withdrawal of troops, and set about to evacuate women, children, the sick, and the disabled. Gordon had evacuated only about 2,000 of these civilians when the Mahdi besieged Khartoum on 13 March. Gordon's garrison was about 8,000 men. Besides an unknown number of Mahdist troops, Gordon estimated that two-thirds of Khartoum's native population of 40,000 was against him.

Gladstone, annoyed at Gordon's apparent insubordination, did not authorize relief until October, then sent a rescue force under Garnet Joseph Wolseley. Advance British gunboats under Lord Charles Beresford arrived on 28 January 1885, two days too late, as Mahdists had already breached the walls and killed the entire garrison. Wolseley withdrew, leaving the Mahdi free to govern. The Mahdi proclaimed an Islamic state from the Red Sea to central Africa with its capital at Omdurman but died of natural causes in June. Gladstone's weak handling of the Sudan crisis contributed to his replacement as prime minister by the marquis of Salisbury on 23 June; many Britons blamed him personally for Gordon's death and Khartoum's fall.

Khe Sanh, Siege of (21 January–8 April 1968)

A major siege operation against a U.S. Marine combat base. At the time the siege of Khe Sanh, an isolated marine base along Route 9 in extreme northern South Vietnam, caused some to recall the French debacle at Dien Bien Phu in 1954. President Lyndon Johnson emphasized to the chairman of the Joint Chiefs of Staff, Earle Wheeler, "I don't want any damn Dinbinfoo," and Johnson received assurances that, unlike the French, the United States could sustain the marines.

Unlike the French, the marines held the hills surrounding

their base camp and prepared for the attack. The North Vietnamese set up positions around the marines' perimeter, moved in thousands of troops, and engaged in classic siege measures. To upset North Vietnamese plans, U.S. air power saturated the area: B-52 bombers, marine and naval aviators, and army long-range artillery dropped more than 100,000 tons of bombs and shells on suspected enemy positions. Finally, in early April, the U.S. 1st Cavalry Division moved up Route 9 and linked up with the marines on 8 April, ending the siege. Later, to some bitter reaction, Khe Sanh was abandoned.

However, there will always be a question as to the goals of the North Vietnamese. Was this a decoy, to draw U.S. attention away from the cities and the coast immediately prior to the Tet Offensive? Was it simply a probe to test American resolve? Or was it preparation for a cross-parallel invasion to follow up a supposedly successful Tet Offensive and popular, antigovernment uprising in the South? The answers remain, to this day, unclear.

Khmer-Cham Wars (1050–1203)

A series of wars between the Khmer Empire and a resurgent Champa state for control of Indochina. In Southeast Asia, Hindu and Buddhist kingdoms from India and China had developed into independent polities centered around ethnic groups such as the Annam in north Vietnam, the Cham in central Vietnam, the Khmer in Cambodia, and the Tai in Siam. These polities had thrown off the yoke of Chinese and Indian overlordship and then turned on each other. The Khmer-Cham Wars, Khmer-Thai Wars, Vietnamese-Cham Wars, and the Vietnamese-Khmer Wars all stemmed from this struggle to control Southeast Asia and the rich trade that flowed between China and India.

The first Khmer-Cham War (1050–1051) involved revolts in Khmer territories. The Cham king Jaya Paramesvarman and his son Yavuraja then invaded the northern Khmer territory of Sambhupura while supporting a revolt in the Khmer south. Khmer generals suppressed the revolt and crushed Cham forces in the north.

The second Khmer-Cham War (1144–1150) followed the Vietnamese-Khmer War of 1123–1136. The Khmer king Suryavarman II controlled modern Cambodia and Laos but sought all of Vietnam by allying with Champa and invading Annam. Instead, a Cham-Annam alliance formed and opposed the Khmers. Khmer armies invaded Cham and captured its capital of Vijaya. Cham forces still held out under Harivarman I at Chaklyang and destroyed Khmer and Vijayan armies in two Phanrang Valley battles. Champa troops then marched north, captured Vijaya, and defeated the Khmer forces at Mahisa. A final Khmer force sent by Suryavarman II was also crushed.

The third Khmer-Cham War of 1167–1190 saw the Cham king Jaya Indravarman IV invade the weakened Khmer Empire using cavalry and naval forces, instead of the traditionally slow elephants and water buffalo. These concepts, learned from the Chinese, led to startling initial victories over the Khmers. In 1177 Cham naval forces sailed up the Tonle Sap (great lake) of the Khmer and destroyed the Khmer capital at Angkor (Yasodharapura).

Cham now threatened to overrun Southeast Asia but a wealthy Thai-Khmer alliance under the Khmer Jayavarman VII arose against it. Both sides became dependent on China for naval aid and horses, with most going to the wealthy Khmer Empire. An 1181 sea victory over Champa allowed the rebuilding of Angkor Thom, north of the original Khmer capital. Champa was invaded in 1190 and its capital at Vijayana sacked.

The fourth Khmer-Cham War of 1191–1203 saw Champa rebel against Khmer rule. Two Khmer armies were defeated, but the Khmer king Jayavarman VII used Cham traitors to regain control of the Champa throne. The renewed Khmer Empire remained dominant in Southeast Asia until Thai-Cham forces sacked Angkor-Thom after a seven-month siege in 1430 and destroyed vital irrigation systems in 1444, signaling the end of the mighty Khmer Empire.

Kiev (16–26 September 1941)

The greatest single military victory in modern history, and the worst defeat in Soviet military history. On 16 September 1941, 680,000 Soviet troops of General M. P. Kirpanov's

Southwestern Front suffered encirclement in the Kiev pocket (130 miles in width and depth) when the German Second Panzer Group, commanded by General Heinz Guderian, advancing from Smolensk in the north, linked up with the German First Panzer Group, commanded by General Ewald von Kleist, advancing from Kremenchug in the south at Lokhvitza (125 miles east of Kiev). For the next 10 days, six trapped Soviet armies, the entire strength of the southwestern front, struggled to break out, while German forces, their movements coordinated by Field Marshal Gerd von Rundstedt, commander of Army Group South, fought to reduce the pocket.

Although 15,000 Soviet troops ultimately escaped, Kirpanov's armies lacked sufficient power to achieve a large-scale breakout against a numerically superior enemy who also enjoyed command of the skies. Kiev itself fell 20 September, and six days later the last Soviet resistance inside the pocket ended. Four entire Soviet armies were destroyed, and two others severely emasculated. German statistics revealed that the Battle of Kiev cost the Soviets 665,000 prisoners, 3,018 guns, and 418 antitank guns. General Kirpanos himself was killed attempting to break out of the pocket.

The annihilation of the Soviet Southwestern Front opened the door for Army Group South to capture central and eastern Ukraine and most of the Crimea in the last months of 1941.

And yet Hitler's diversion of additional German forces to the Kiev encirclement delayed the drive on what should have been the ultimate goal of the German invasion—Moscow. By the time German forces finally approached the Soviet capital in early December, it was winter and too late. Germany had won a great operational victory at Kiev but had lost any chance of destroying the Soviet union.

Killiecrankie (27 July 1689)

A major defeat of the British at the hands of the Highland Scots, and the last true Scottish battle. The overthrow of James II by the English Parliament and the subsequent ascension to the throne by William III and Mary II led to an

uprising by Scottish clans supporting the Stuart claim. In 1689, John Graham of Claverhouse, Viscount Dundee, unfurled the Stuart standard in the Highlands. He quickly raised an army of 1,800 soldiers, including men from the various clans, along with 500 Irish mercenaries. Dundee marched his force to secure Blair Castle (Atholl), an important strategic site in the Grampian Highlands near Perth.

To suppress this revolt, General Hugh Mackay marched north with a force of approximately 3,500 royalist troops. Mackay's force consisted mostly of Lowland Scots, many of whom were recent recruits. The most direct route to Blair Castle was to traverse the Pass of Killiecrankie, a narrow rugged area that was easily defensible. Furthermore, Dundee knew this was the likely avenue of march and moved his army to defend the pass. On 27 July, the advance guard of the royalist army entered the pass and found it undefended. Here Mackay made a critical error. Instead of quickly moving his entire force through the pass, he ordered his men to take up positions in the nearby grain fields to allow the artillery and baggage train to traverse the steep hills. This allowed Dundee to consolidate his forces on the battlefield. Mackay could have ordered an assault on the enemy, but lacking intelligence about the size of his opponent, he organized his units in defensive positions. He divided each battalion into two units, three men deep with intervals between each group. Mackay unlimbered his three artillery pieces and began a harassing fire on the Jacobites.

Dundee arranged his smaller army by clans with large intervals between units. He also shifted his line toward the enemy's right flank to prevent his own flank from being enveloped. At 7 P.M., the weight of the royalist cannon fire prompted Dundee to order an assault. The Highlanders launched a fierce charge, with each man bent forward to provide a smaller target, using his shields to protect the upper body. Mackay's troops fired three volleys at the advancing Jacobites, with little effect because each unit fired by platoon, instead of withholding fire for a concentrated volley. Some units did not fire at all. This allowed the Highlanders to fall upon Mackay's unnerved troops with broadswords and pole-axes before they could insert their socket bayonets. Hundreds were hacked down and the royalist infantry broke into rout. The entire force would have been destroyed had Dundee not been killed at the moment of victory and the Jacobites stopped to plunder the royalist baggage train. After suffering nearly 2,000 casualties, the remnants of Mackay's army retreated to Perth. Jacobite losses were approximately 500 men.

Killiecrankie is touted as the last of the true Scottish battles, as most of the participants were Scots. It was a tactical masterpiece by Dundee, but his death prevented the Jacobites from exploiting the victory. Colonel Cannon, Dundee's

successor, was repulsed by the royalists at Dunkeld and the uprising soon lost momentum.

Kim Il-sung (1912–1994)

Founding leader of the Democratic People's Republic of (North) Korea. Kim Il-sung was born in 1912 near Pyongyang in Japanese-occupied Korea and began his revolutionary career in 1929 when he was jailed for student activism. The next year he received the *nom de guerre* of Kim Il-sung—a famous former revolutionary—and for the next decade probably fought with Chinese guerrillas in Manchuria. In 1939, he likely reentered Korea to fight the Japanese occupiers and two years later he retreated into the Soviet Union. Little is known of his time in the USSR; there is no firm evidence to support the rumor that he fought at Stalingrad.

At the end of World War II, in September 1945, Soviet authorities brought Kim back to Korea and later presented him as the leader of the Soviet-imposed regime north of the thirty-eighth parallel. There probably was a struggle for power between Kim, an expatriate, and local Korean communists. In 1948 the Soviets established the Democratic People's Republic of Korea with Kim as its leader and set up the Korean People's Army. By the next year, American intelligence experts were expecting warfare across the parallel in the near future.

That attack began on 25 June 1950, and North Korean troops seemingly overwhelmed the South Korean defenders. Eventually, U.S. air power inhibited North Korean supply lines and General Walton Walker held the Pusan perimeter; on 15 September General Douglas MacArthur launched the Inchon offensive and North Korea nearly collapsed. Had the Chinese not intervened, Kim would have lost everything; presumably in the aftermath of Chinese intervention, he owed the Chinese a huge debt of gratitude, which probably was difficult for a committed though Communist Korean nationalist.

Kim retained power after the armistice with the United Nations forces defending South Korea and served as general secretary of the party as well as chairman of the party's mil-

itary commission and president of the Democratic People's Republic of Korea (DPRK). He increasingly almost deified himself in a cult of personality that seemed to out-Stalin Stalin. To the consternation of the more credulous DPRK citizens, he died on 8 July 1994.

Kim Yu-sin (595–673)

General and statesman of the Silla Kingdom (c. 200–905), one of the primary architects of Silla's unification of the Korean peninsula in 668. Kim Yu-sin was born in an aristocratic family in 595, at a time of increasing rivalry between Korea's three dominant kingdoms—Paekche in the southwest, Koguryo in the north, and Silla in the southeast—and was brought up in the strict military and Buddhist discipline common to the youths of the Silla nobility. Later legends relate how he was visited by a mountain spirit that predicted his eventual defeat of Silla's rivals.

For almost two centuries before Kim's birth, the three Korean kingdoms had fought an ever-shifting, three-way struggle for territorial expansion. By the early seventh century, the issue had become one of peninsular hegemony. After Silla secured an alliance with the Tang Dynasty (618–907) to overcome both Koguryo and Paekche, Kim Yu-sin led Silla forces in 661 in a combined Silla-Tang attack upon Paekche that culminated in that kingdom's utter defeat. The defeat of Koguryo, again through a Silla-Tang alliance, soon followed in 668, but Kim Yu-sin would die before witnessing the final Silla unification. This came in 676 with Silla's defeat of its erstwhile ally and would-be overlord, Tang China. Regardless, Kim Yu-sin is viewed as the father of Korean unification, and legends have continued to be built around him since his death. His tomb can still be seen in the historic city of Kyongju, the former capital of the Silla Kingdom.

Kimberley, Siege of (14 October 1899–15 February 1900)

Unsuccessful siege in the Second Boer War. The diamond-mining frontier town of Kimberley was a key British outpost in the Cape Colony of South Africa in the late nineteenth century. Just days after the onset of hostilities, 4,000 Boers under Cornelius J. Weasels invested 600 British regulars and 4,000 local police and militia inside the town on 14–15 October 1899. The British command was uneasily divided between Lieutenant Colonel Robert G. Kekewich and a domineering civilian, Cecil John Rhodes, the founder of De Beers Consolidated Mines and a former prime minister of the Cape Colony, who usurped Kekewich's authority at every turn and generally harassed his efforts to run an efficient military operation. The Boers never attacked Kimberley, but surrounded it, cut communication, and tried to starve the garrison and inhabitants into submission. There was sporadic artillery fire from both sides. On 4 November Weasels issued a written ultimatum to surrender, which Kekewich immediately rejected.

In mid-November British commander in chief Redvers Buller ordered Lord Paul Sanford Methuen to reopen the railroad to Kimberley and rescue the garrison. Boer leaders Jacobus Hercules De La Rey and Jacobus Prinsloo were more than a match for Methuen's unimaginative tactics at Belmont on 23 November, Graspan on 25 November, and the Modder River on 28 November. Methuen's frontal assault withered against small arms fire from Piet Cronjé's skillfully entrenched Boer positions at Magersfontein on 11 December. Thus the first significant British effort to break the siege failed.

In January 1900 the new British commander in chief, Frederick Sleigh Roberts, demoted Methuen and ordered John French to relieve Kimberley. French led an exhausted division of cavalry into the town on 15 February. Only 21 inside the town had died from enemy action, but more than 1,500 had expired from disease. With the siege of Kimberley lifted, Roberts was able to defeat Cronjé at nearby Paardeberg on 27 February.

King Philip's War (1675–1676)

Proportionally in terms of population, both aboriginal and settler, the most devastating war in American history. The conflict basically erupted over differing concepts of land ownership. Indians viewed land as a shared environment; however, the English perspective was based on boundaries and exclusive ownership. The Plymouth settlement had expanded rapidly to almost 50,000 colonists by the mid-1670s. This development combined with religious zeal to threaten

the stability of Indian culture, leading to resentment and eventually violence.

In the midst of this tension Philip assumed leadership as sachem of the Wampanoag in 1662. Philip sought to demonstrate leadership through shows of force. However he was coerced into surrendering all weapons and recognizing English sovereignty.

When Christian Indian John Sassamon was found murdered, the colonists accused and executed three Wampanoags. Philip's perceived weakness led stronger and younger warriors to seek direct conflict with the colonists. The Wampanoag began to ambush settlers in outlying areas while using the swamps for protection. They destroyed 12 towns, including Deerfield, Massachusetts, and killed thousands of settlers. Other tribes, such as the Narraganset and Nipmuc, joined with the Wampanoag to attack settlements across New England.

The colonists soon raised armies adapted to wilderness warfare that destroyed Indian crops, captured their families, and offered protection for those who rejected Philip's leadership.

The Narraganset Indians were decisively defeated during the Great Swamp Fight of December 1675, in which colonists overran a defensive stockade and killed more than 600 Indian warriors and their families. The colonists' superior

English troops taking King Philip's fort at South Kingston, Rhode Island, December 1675. (Library of Congress)

numbers and firepower, combined with Indian allies from the Iroquois tribes, spelled doom for Philip's efforts. Philip was killed during an ambush in August 1676 and his head put on display in Plymouth.

The war effectively ended with Philip's death, but not the violence as the colonists sought to exterminate or enslave the Indians. The death of almost 5,000 Indians from war, starvation, and disease destroyed the tribal societies of New England and removed barriers to further white settlement. The English paid a heavy price as well, with half their towns damaged and thousands of colonists killed during the merciless and brutal struggle. Most significantly, King Philip's War reflected a pattern of cultural conflict that would repeat itself over the next 200 years.

King's Mountain (7 October 1780)

A small but sanguinary conflict between civilians on both sides of the American Revolution. British Major Patrick Ferguson commanded approximately 1,000 loyalist troops moving through the western Carolinas guarding the left flank of Charles Lord Cornwallis's advance. On 7 October 1780, along the South Carolina/North Carolina border, Ferguson and his men occupied heavily wooded King's Mountain, about 60 feet above the surrounding plain. The plateau was about 600 yards long and varied in width from 70 feet to 120 feet; Major Ferguson assumed it was too steep to be scaled. In fact, he felt sufficiently safe to ask Lord Cornwallis for reinforcements to reach out and secure the backcountry.

Patriot forces from the surrounding Appalachian Mountains, aroused by Ferguson's threats against them if they did not submit to the Crown, arrived at the mountain, tied up their horses, and moved through the woods. These militiamen also sought revenge for an earlier battle (and massacre) at Waxhaws Creek.

At this point, the weakness of the loyalist position became clear. The thick woods prevented the kind of advance by column and deployment into line that was the basis of late-eighteenth-century European warfare; meanwhile, to defeat the patriots, the loyalists had to attack them. Loyalist

units sought to descend the plateau and come down the hill-sides to attack the patriots. Exposed to sharpshooters hiding in the trees and brush, the loyalists suffered many casualties; Ferguson, easily recognizable in a red hunting shirt, was wounded several times and died.

Soon thereafter the British surrendered, and several of the worst offenders in the hanging of captured patriot militiamen were themselves hanged after brief courts-martial. Fearing that Cornwallis would seek revenge, most of the patriot militia went home, never really to appear again in the conflict, but they did set the stage for the ensuing victory at the Cowpens, the skillful retreat to the Dan River, the key battle at Guilford Court House, and Cornwallis's decision to abandon the Carolinas and retreat to Virginia—and Yorktown.

Kinsale, Siege of (1601)

The climactic action of the Nine Years' War in Ireland. Hugh O'Neill, Earl of Tyrone, who had been in rebellion since 1595, had long awaited Spanish aid, but the arrival of Don Juan Aguila's 3,500 men at Kinsale on 22 September 1601 presented problems for both sides. Kinsale was in southwestern Ireland, while O'Neill's main forces were in Ulster, so joining the Spanish required a march across the island. Meanwhile, Charles Blount, Lord Mountjoy, the English lord deputy, faced the logistical problem of moving his own forces, including his siege train, from Dublin. Mountjoy successfully concentrated 7,000 men outside Kinsale, and English control of the sea allowed delivery of heavy guns and supplies needed to initiate a siege. However, Mountjoy's troops were poorly supplied, and as the siege continued through November, sickness began to reduce his numbers.

O'Neill also experienced difficulty moving his army in that season. His advanced guard, commanded by Hugh O'Donnell, arrived near Kinsale in November, but O'Neill did not arrive until December. With 6,000 men, his plan was to blockade Mountjoy's besieging forces until disease and hunger forced their withdrawal. O'Donnell and Spanish representatives, however, insisted on a relief attempt. This operation was mounted on 24 December. The English had the ad-

vantage in the ensuing set piece battle, and their cavalry routed O'Neill's advanced guard as it passed through a bog. Its retreat threw the army into disorder, and a charge by Mountjoy's reserves drove the Irish from the field with more than 1,200 casualties. During the action Aguila made no move to break out of Kinsale, and O'Neill's defeat left him with no hope of relief. The Spanish surrendered on 2 January 1602.

Kitchener, Horatio Herbert (1850–1916)

British field commander, staff officer, and politician. The son of a career army officer, Kitchener was born in County Kerry, Ireland, on 24 June 1850. After graduating from the Royal Military Academy in Woolwich, he was commissioned in the Royal Engineers in January 1871 and saw action as a volunteer on the French side in the Franco-Prussian War. After extensive service as a British military surveyor and intelligence officer around the eastern Mediterranean, he was assigned to cavalry in Cairo, Egypt, in 1882, and was Sir Garnet Wolseley's intelligence officer from October 1884 to March 1885 during the futile expedition to rescue "Chinese" Gordon.

As governor of British Red Sea Territories after 1886, Kitchener faced significant Mahdist resistance. He was wounded and defeated by Mahdist leader Osman Digna at Suakin on 17 January 1888. While still a colonel in the British army, he became sirdar, or commander in chief, of the Egyptian army in 1892. After training this army in modern methods for four years, he invaded the Sudan to avenge Gordon, winning at Dongola on 21 September 1896, Abu Hamed on 7 August 1897, Atbara River on 7 April 1898, and Omdurman on 2 September. He drove Jean-Baptiste Marchand's French army from Fashoda, Sudan, on 18 September 1898.

In the Second Boer War, Kitchener was assigned to Frederick Sleigh Roberts as chief of staff on 18 December 1899. His tactics defeated Piet Cronjé at Paardeberg on 18–27 February 1900, frustrated Boer guerrillas, and resulted in the capture of Bloemfontein on 13 March, Johannesburg on 31 May, and Pretoria on 5 June. He replaced Roberts as com-

Horatio Herbert Kitchener. (Library of Congress)

mander in chief of British forces in South Africa on 29 November. Continuing his offensive against guerrillas, he invented the concentration camp, in which he imprisoned guerrillas, their families, and their supporters.

Appointed secretary of war in July 1914, Kitchener, almost uniquely, foresaw a long war against Germany and urged massive British mobilization. But he was among those lost when HMS *Hampshire* struck a German mine near the Orkneys and sank on 5 June 1916.

Kléber, Jean-Baptiste (1753–1800)

One of the most capable field commanders of the French Revolutionary and early Napoleonic wars. Kléber was born in Strasbourg on 9 March 1753. He served in the imperial army (1777–1785). Influenced by French revolutionary ideas, he joined the national guard at Belfort and rose to lieutenant colonel in a volunteer battalion. His aggressive defense of Mainz earned him a promotion to brigadier general (17 August 1793). He fought the Vendean rebels, and his achievements, especially at Cholet, earned him a battlefield promotion to division general (17 October). He captured Le Mans in December.

As a division commander Kléber played a crucial role at Charleroi (25 June 1794). At Fleurus (26 June) his left wing drove the Austrians into retreat. He captured Maestricht (4 November) and participated in the invasion of the Rhineland. But in spite of a series of victories Kléber, perhaps feeling inadequately rewarded, resigned all active field command on 21 December 1796.

Kléber by now had earned a reputation for great concern for his men's welfare. He was known for great tactical flexibility. He employed both line and column formations but preferred columns for attack.

Kléber returned to active service in 1798. Seriously wounded leading an attack at Alexandria, Egypt (21 July 1798), he also fought in Syria, distinguishing himself in the capture of El Arish (20 February 1799) and at Gaza, Jaffa, and Acre. At Mount Tabor (16 April) his troops held off the main Turkish army until relief arrived. He commanded the rear guard on the retreat into Egypt. Kléber, who had opposed the Egyptian campaign, now advocated a French evacuation. Ironically Napoleon appointed him to command the French forces left in Egypt.

On 24 January 1800 Kléber signed the Armistice of El Arish, providing for a French evacuation. The British disavowed it. With growing enemy opposition, Kléber audaciously resumed hostilities. He defeated the Turks at Heliopolis (20 March) and reconquered Cairo (25 April) and lower Egypt. On 14 June 1800 a Muslim nationalist assassinated Kléber in Cairo. His remains were returned to France in 1801.

Knox, Henry (1750–1806)

Continental army officer and secretary of war. At the beginning of the American Revolution, Knox constructed American defenses near Boston. Impressed by Knox's work and his knowledge of artillery, General George Washington commissioned him colonel of the Continental Artillery Regiment. Knox remained a trusted adviser to Washington throughout the war.

During the winter of 1775–1776, Knox directed the transfer of British ordnance captured at Fort Ticonderoga to Boston, which compelled the British to abandon the city. He participated in almost every major battle of the northern campaigns and Yorktown, rising in rank to major general. In 1783, Knox founded the Society of Cincinnati.

As secretary of war (1785–1794), he battled persistent distrust of standing armies yet organized Anthony Wayne's successful Indian campaign, reestablished the U.S. Navy, and secured congressional support for the Uniform Militia Act of 1792. In 1798, Knox was appointed major general in the Provisional Army in anticipation of war with France but refused to serve under Alexander Hamilton, his subordinate during the American Revolution.

Koguryo (attributed 37 B.C.E.–668 C.E.)

Northernmost of three kingdoms dominating the Korean peninsula. Although the oldest extant in Korean history, the *Samguk sagi* (*History of the Three Kingdoms*, 1145), dates the foundation of Koguryo to 37 B.C.E., there is no evidence for its existence prior to the first century C.E. At that time it emerged in the mountainous region now separating North Korea from China, expanding at the expense of lowland groups.

Following the fall of the Han (206 B.C.E.–220 C.E.), the various small states of northeast China entered a period of

intensive competition. Koguryo's power was briefly eclipsed by that of the state of Wei (225–265), which overran its capital in 244, but it soon recovered. In the late fourth century, primarily under the inspired leadership of young king Kwanggaet'o (r. 391–413), a series of successful military campaigns brought Koguryo hegemony over a good part of Manchuria and northern Korea. Early in the fifth century, Koguryo moved its capital south to modern Pyongyang in North Korea, leaving it better positioned for competition with other Korean states.

The next 250 years were ones of growing competition between Koguryo and the other two major states on the peninsula, Paekche and Silla. In 668, Koguryo was conquered by the southern state of Silla, then in alliance with Tang (618–906) China. Although Silla was able to incorporate Koguryo territories as far as the Yalu River (separating modern North Korea from China), Koguryo possessions beyond permanently passed from Korean control with Koguryo's defeat.

Because of its positioning, Koguryo faced frequent and formidable military threats from nomadic tribes and other groups living in Manchuria, and from more centralized Chinese dynasties, Sui (587–618) and Tang in particular. For this reason it gained a reputation for martial spirit and strength of arms. Koguryo is often lauded by modern Koreans for its heroic defense of the peninsula from would-be foreign conquerors.

Kokoda Trail (1942)

The first substantial land defeat of Japanese forces in World War II. In early 1942 the Japanese were consolidating the southern boundaries of their Southern Economic Zone along a line through Timor, western New Guinea, Rabaul, and Micronesia, when Australian and U.S. air forces com-

menced an aggressive bombing campaign from Australia and Port Moresby in New Guinea. In response, the Japanese commenced operations to capture the whole of New Guinea. The first attempt was turned back during the Battle of the Coral Sea in May 1942.

On 22 July 1942 the Japanese landed a 2,000-man advance unit of General Horii's South Seas Force at Buna on the north coast of New Guinea with orders to commence an overland assault on Port Moresby. Their route was to be a walking track leading over 10,000-foot-high passes in the Owen Stanley Mountains—the Kokoda Trail.

A component of the Australian 39th Militia Battalion made an orderly fighting withdrawal without slowing the Japanese. By 21 August, 13,500 Japanese troops had been committed and had captured the town of Kokoda near the summit of the Owen Stanley Mountains. The Australian 53d battalion was ordered northwards up the Kokoda Trail to reinforce the 39th and was followed by the 21st brigade, which reached Isumura at the southern side of the summit on 23 August.

Conditions were horrific. All supplies, including dismantled artillery and mortars, had to be carried by hand. The muddy, narrow trail crossed a series of very steep valleys, up to 3,000 feet deep, as it climbed either side of the mountains. The Japanese were now two full brigades in strength and continued to push the Australians, who had been reinforced by elements of the 25th brigade, back in fierce and continuous fighting. By 16 September they reached Imita Ridge, only 26 miles from Port Moresby. However, because of the situation at Guadalcanal, Japanese Imperial Army Headquarters ordered a withdrawal on 20 September, and with all supplies exhausted, the retreat commenced. It rapidly degenerated into a rout for the Japanese, and starvation, total breakdown in discipline, killing of sick and wounded, and cannibalism were evident. However, savage firefights did still occur frequently. Of 14,500 Japanese troops committed, only 5,000 survived to reach Buna by mid-November 1942.

"Aleksandr Vasilyevich Kolchak, supreme ruler of all Russian government." Poster, 1918. (Library of Congress)

Kolchak, Aleksandr Vasil'evich (1874–1920)

Russian admiral, polar explorer, White Civil War leader. Born in St. Petersburg, son of a naval officer, Kolchak graduated from St. Petersburg Naval Academy (1894) and served in the Pacific and Indian Oceans, becoming a naval lieutenant in 1899. A specialist in oceanography and hydrology, he completed two Arctic exploratory trips (1900–1904) and was prestigiously awarded for his published results (1909).

With the outbreak of the Russo-Japanese War (1904–1905) he rejoined the navy, commanding a destroyer, and was decorated for mine-laying work and sinking an enemy cruiser. Forced ashore by ill health, he commanded a naval battery during the siege of Port Arthur, was captured, but repatriated in 1906.

A founder of the Naval General Staff, he served in this, becoming chief of the organization section for the Baltic Fleet, pressing for naval modernization and reforms. Between postings, he organized and planned another Arctic expedition to chart the northern Siberian coast.

During World War I he enjoyed a distinguished active

service: Baltic Fleet (1914–1916) and commander of the Black Sea Fleet (July 1916–July 1917). Becoming vice admiral in August 1916, he won further decorations for mine-laying and naval defense work.

After the February Revolution, he supported the provisional government but resigned in June 1917 with his command disintegrating. Traveling to America via London, he made links with the American and British navies, joining the latter in December 1917 after the Bolshevik Revolution. In Japan December 1917–April 1918 and July–September 1918, he also served General Horvath in Harbin. Coveted as an anti-Bolshevik figurehead after his impressive military career and foreign connections, he was summoned back to Russia and installed as supreme ruler of Russia after the Omsk coup in November 1918.

During the Russian Civil War, Kolchak established a military dictatorship, but his initial support deteriorated amidst political corruption, repression, and misuse of Allied aid to create vast discontented partisan networks in his rear, which came to favor the Red Army. Kolchak launched an initially successful offensive, taking Perm (December 1918), but was pushed back by Red eastern front counteroffensives (April–December 1919). His capital, Omsk, fell on 14 November; he resigned on 4 January 1920 as supreme ruler of Russia, naming Denikin as his successor.

Fleeing eastwards, he was captured by Czechs and handed over to social revolutionaries in Irkutsk. Tried by a hastily assembled Communist revolutionary tribunal, he was executed on 7 February.

Konev, Ivan Stepanovich (1897–1973)

Soviet military commander marshal of the Soviet Union (1944). Of peasant origins, from northern Dvina Province,

Konev joined the Russian army (1916), saw little action, but emerged an NCO. A Bolshevik supporter, he returned home after the October Revolution, becoming Nikol'sk District military commissar. He ended the Russian Civil War as an armored-train political commissar, serving in the east against Kolchak, Semenov, and Japanese forces until 1922, and in suppression of the Kronstadt Revolt (March 1921).

He graduated from Frunze Military Academy staff training courses (1926, 1934) and somehow survived Stalin's purges to gain rapid promotion. He commanded 57th Special Corps in Mongolia (1937) and Second Separate Red Banner Army in the Far Eastern, Transbaikal, and Northern Caucasus Military Districts.

After mixed fortunes, Konev emerged as one of the most original, capable Soviet World War II commanders. As Nineteenth Army commander, he counterattacked at Smolensk to delay the Germans, but as Western Front commander in September 1941, he was partly responsible for the Viazma-Briansk encirclement, wherein 500,000 Russians were taken prisoner. Escaping trial for this, he was given the Kalinin Front, counterattacking with Zhukov in December to halt Operation BARBAROSSA before Moscow.

He commanded the Western Front from August 1942, Northwestern Front from March 1943, the Steppe (later 2d Ukrainian) Front from June 1943, and the 1st Ukrainian Front (May 1944–May 1945), playing a leading role in Soviet Operations at Kursk, Korsun'-Cherkassy, Vistula-Oder, Berlin, and Prague.

Postwar, Konev served as Soviet commander in Austria (1945–1946), chief inspector of the Soviet Army (1950–1951), commander in chief of Soviet Land Forces and deputy minister for war (1946–1950, 1955–1956), and Carpathian Military District commander (1951–1955). Benefiting under Khrushchev at Zhukov's expense, Konev became first deputy minister for defense and commander in chief of Warsaw Pact forces (1956–1960). He commanded Soviet forces in suppressing the 1956 Hungarian uprising and in Germany during the construction of the Berlin Wall, all actions which Stalin would have approved.

Konev remained an adviser in retirement, wrote his memoirs, and died of cancer in Moscow.

Kongo, Kingdom of the (14th–17th Centuries)

An ally of Portugal, adopting European military technology, but eventually undone by internal conflict, marauding neighbors, and the intrigues of foreign slave traders. The Kingdom of the Kongo arose in the 1300s along the mouth of the Congo River in western central Africa. The ruler, the Mani-Kongo, functioned as an absolute monarch, supervisor of an intricate administrative organization, and a semidivine religious authority in an intricate system that extended from the capital through all cities, provinces, and villages. An agrarian people, the Bakongo people were also active in mining, smelting, and in woven raffia products. Advised by a council of landed nobles, the king used trade, tribute, and occasional demonstrations of force to ensure peace with neighboring peoples.

In 1483, a Portuguese vessel arrived at the mouth of the Congo River and began a long and complex relationship with Kongo. By 1506, the Mani-Kongo, many nobles, and ordinary people had converted to Catholicism. King Afonso I (1509–1543) used the church, Portuguese mercenaries and advisers, and trade revenues to centralize his power. He mixed traditional Kongolese light infantry, shield-bearing "heavy" infantry, and Portuguese mercenaries armed with pikes and arquebus rifles. He campaigned against his neighbors, the kingdoms of the Angola, Banguela, and Nziki as well as more rustic peoples like the Mbundu, the Teke, and the Jaga. To support these efforts, Afonso engaged in slave trading with Portuguese merchants, operating out of São Tomé and other offshore islands. The demand for slaves generated a pervasive, pernicious, and hugely profitable commerce that neither the Portuguese authorities nor Afonso could control. Slavers relentlessly thwarted all Afonso's work by allying with other kingdoms, funding slaver gangs and rebellious nobles, and draining resources from the monarchy.

Future kings had to balance their dependency on Portugal for arms, assistance, and trade with the intrigues of Portuguese merchants, slave dealers, and mercenaries to promote rivalries, wars, and instability throughout the region. In 1569, for example, King Alvaro confronted a massive invasion by the Jaga. The Jaga sacked the capital at São Salvador, nearly drove Alvaro to the coast, and sent thousands of captives to the eager slavers at São Tomé. Lisbon came to Alvaro's rescue in 1571 and drove the Jaga out. Shortly thereafter, Portugal established another great enslavement center

south of Kongo at Luanda in Angola territory. Thus, relations between Kongo and Portugal would remain active, but the slave trade also ensured that these relations would be brittle and unstable.

In the 1640s, Dutch efforts to seize Angola encouraged the Kongo kings to reduce Portugal's influence. In 1665, a boundary dispute led to war between the Kongo and Portuguese forces protecting Angola. At the Battle of Mbwila, the Kongo army shattered on the Portuguese formations and King Antonio died of a bullet wound. The Kongo fragmented into warring components.

In 1670, another Portuguese force from Luanda tried to place a candidate on Kongo's throne, only to be annihilated at the Battle of Colombo by troops from Nsoyo Province. São Salvador was destroyed and abandoned in 1678. The Kongo knew no peace until 1709, when Pedro IV finally emerged as the victor.

Pedro's Kongo was not the Kongo envisioned by Afonso 200 years before. Decentralized, unstable, plagued by rebel nobles and outside incursions, the proliferation of firearms in the eighteenth century only sharpened the turbulence. The Kongo had, in effect, imploded.

Königgrätz, Battle of (1866)

Battle that secured Prussian dominance of central Europe for Otto von Bismarck. The battle began in the morning of 3 July 1866 with a Prussian enveloping attempt, but the maneuver failed when two Prussian armies failed to connect and a third failed to advance because of ground fog. Prussia was forced to engage all its reserves, while Austria did not even have to commit its cavalry. When the Prussian Second Army finally arrived on the Austro-Saxon flank in the late afternoon, they forced an Austrian retreat. Some 250,000 Prussians had defeated a comparable number of Austrians and Saxons, ending the Seven Weeks' War. The Austrians had lost 45,000 casualties and 20,000 captured, while Prussian forces sustained only 10,000 casualties. Vienna lay open to Prussian attack, forcing Austria to sue for peace.

Prussian soldiers had several important advantages in the battle. First, their breech-loading needle-guns (so-called because of their long firing pins) were far superior rifles to the Austrian muzzle-loaders. The Austrian rifle had better

range and accuracy, but men lying down and presenting a smaller target could use the Prussian gun.

Second, the superior organization and planning of the Prussian army, led by the general staff under Helmuth Karl von Moltke, quickly recovered from the mistakes of the morning and saved the day.

Finally, the Prussians moved large numbers of forces rapidly using the extensive Prussian railroad system. In contrast, Austrian movements were clumsy and slow. The Prussians saved their troops for battle rather than losing them to fatigue on march and earned an element of surprise.

The battle, which took place near the Czech town of Sadowa, was the largest European battle until 1914.

Korean War (1950–1953)

Korea had been a part of Japan's Inner Empire until Japan surrendered to end World War II in the Pacific. At the Yalta Conference, Soviet leader Joseph Stalin promised Soviet intervention in the war against Japan soon after the war in Europe ended. Meanwhile, on the night of 10–11 August 1945, two American army colonels, Dean Rusk and Charles Bonesteel, sat down with a map to determine an American zone of occupation to accept the Japanese surrender in Korea; they chose a temporary demarcation line at the thirty-eighth parallel. Thus, the most homogeneous nation on earth was divided as an administrative convenience.

By 1950, the situation had worsened for the U.S. government. The Soviets had isolated their sector and had set about almost immediately to organize life in the north along People's Republic lines. Meanwhile, the southern zone needed continuing American economic assistance, which was difficult in those days of limited foreign aid budgets and many more deserving or perhaps more important countries.

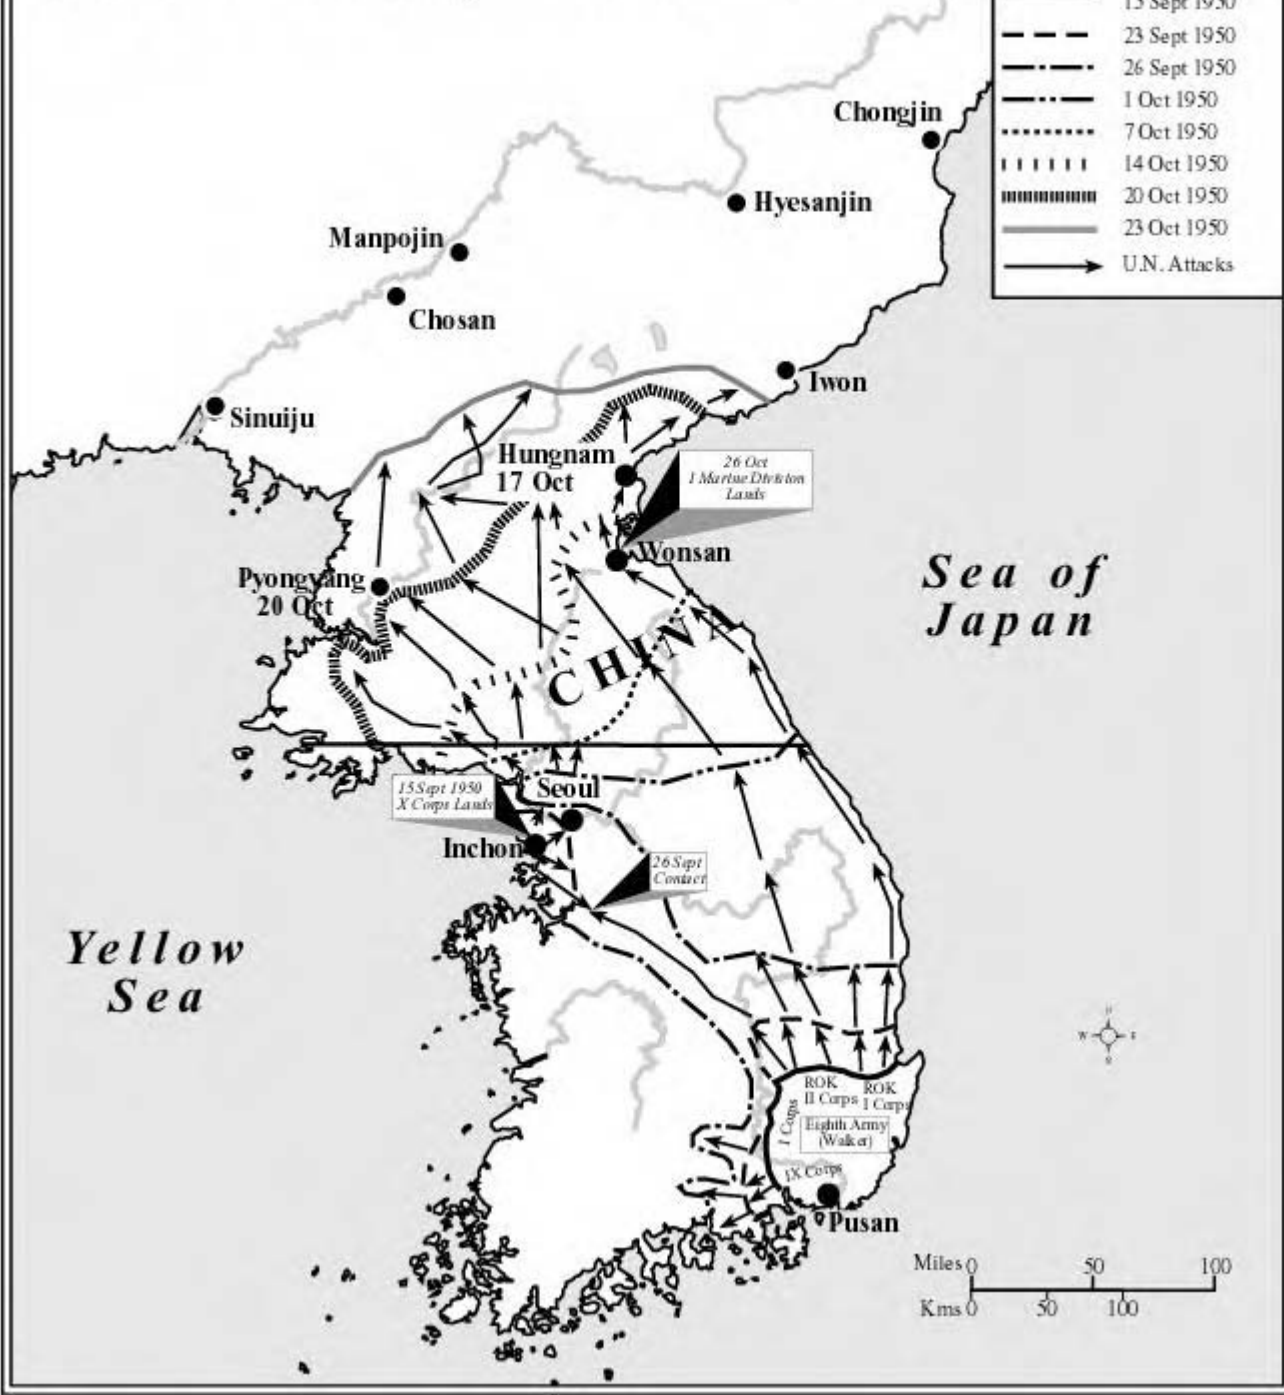

In a notorious speech in January 1950, Secretary of State Dean Acheson outlined the U.S. defense perimeter in the western Pacific and Asia—and explicitly excluded southern Korea. Perhaps the North Korean invasion was inevitable; perhaps the government in Pyongyang assumed American noninterference given Acheson's remarks and America's

nonreaction to the “loss” of China. Regardless, on 25 June 1950, North Korea launched a major invasion of the south.

The Korean War can be seen in five stages. Initially, North Korea’s Korean People’s Army (KPA) unleashed a surprise attack against the lightly armed South on 25 June 1950. The South Korean army was really a constabulary with mostly antiguerrilla warfare, few heavy weapons, and practically no air power. Some of its higher-ranking officers did have military experience—fighting in the Japanese army in World War II. Many North Korean soldiers had experience fighting with the Chinese Communists in World War II or in the long Chinese civil war; more tellingly, they had Soviet T-34 tanks, artillery, and antitank weapons. They easily broke through the defenses at the thirty-eighth parallel and, after pausing for several days to cross the Han River before Seoul, they poured southwards. President Harry Truman committed U.S. forces to resist this aggression, and available infantry units sought to delay the Communist drive down the west side of the peninsula. But the Americans, pulled from their easy Japanese occupation duties, were too few in number, had too little artillery and tanks, and were kept off-balance

by the North Koreans, who were able to move faster and punch harder. By early August the Communists had pinned the South Koreans and their American allies to a small perimeter around Pusan in southeast Korea. But they had a long supply line and the U.S. was committing more ground, sea, and air power to hold the perimeter and to interdict the flow of supplies to the aggressors.

Then came the American counterattack—the second stage. On 15 September 1950 General Douglas MacArthur mounted a surprise amphibious assault deep behind enemy lines at Inchon on the west coast near the capital, Seoul, and UN forces in the Pusan perimeter soon linked with the invasion force, cutting off the bulk of the North Korean army. U.S. Navy and Marine Corps commanders had great doubts about the wisdom of invading Inchon, but events proved that MacArthur was correct to follow the line of least expectation. Within a few weeks, the North Korean army in the south ceased to exist as an organized fighting unit, although many North Korean soldiers escaped north of the thirty-eighth parallel but without their equipment and armaments. After considering the alternatives, including a halt to the

fighting at the thirty-eighth parallel, President Truman gave permission for MacArthur to cross the thirty-eighth parallel and to proceed north to “free” the entire peninsula from Communist control unless UN forces ran into Chinese or Soviet troops operating in Korea. Only South Korean units were to approach the sensitive borders with China and the Soviet Union. But MacArthur in Tokyo and many American

officials in Washington, D.C., discounted warnings from the Chinese Communist leaders in Beijing, relayed through the Indian government, that the Chinese would intervene unless the drive northwards was halted; similarly, U.S. intelligence discounted evidence of hundreds of thousands of Chinese soldiers moving north to Manchuria from the provinces opposite Taiwan and in south China. (Recent evidence suggests

U.S. Marines move forward after effective close-air support flushed out the enemy from their hillside entrenchments on December 26, 1950. (National Archives)

that the Chinese Communist leadership seriously considered intervention in the Korean War from as early as late July 1950.)

Once again, there was a surprise attack—the third stage. In late October, Chinese Communist “volunteers” struck at Republic of Korea (ROK) units that had neared the Yalu River. They bloodied the South Koreans and then seemingly disappeared. MacArthur stubbornly continued to discount the possibility of a major Chinese Communist intervention. Then, in November, the Chinese Communists, who had infiltrated more than 300,000 men, struck hard and suddenly, and broke the United Nations Command (UNC) drive to the Yalu River. As MacArthur noted, “It was an entirely different war.” Within a few weeks, American and ROK troops were retreating south of the thirty-eighth parallel and abandoning Seoul for the second time. The Chinese recognized their limitations in terms of firepower and logistics, and sought to set up positions behind the Americans and South Koreans, and

cut off their expected lines of retreat; this tactic was, at least initially, incredibly disconcerting and hence effective. It was so effective that General MacArthur may have panicked and suggested a retreat back to Pusan or even a withdrawal to Japan. Although there would be media reports of Chinese hordes, the truth was that both sides had approximately equal numbers of troops, and UN forces clearly had more artillery, logistical support, and air power than the Chinese and North Koreans. The Communists were more willing to fight close up and were clearly less reliant on motorized transport and tank and artillery support, and it would take the American infantry time to relearn how to fight hard.

After General Walton Walker was killed in a jeep accident, General Mathew Ridgway was appointed to command the U.S. Eighth Army and later to overall command; he managed to stabilize the lines near the original border marking northern and southern Korea. He understood the limitations of the enemy and designed his strategy to take advantage of

their weaknesses in logistics. He realized that American morale was low, and troops had become too accustomed to motorized transport, artillery support, and air power. He raised their fighting spirit, prepared them better for the changed nature of the conflict, and took advantage of the Chinese dependence on porters carrying supplies from Manchuria to the front lines. He realized the Chinese could not sustain an offensive for more than two weeks without running short of supplies. Operation RIPPER (called Operation KILLER by the press) accepted the initial Communist attack and then, as Communist supplies of ammunition decreased, prepared for a powerful counterattack. By summer 1951, the lines had largely stabilized along the thirty-eighth parallel, a little to the south (on the west)—Line Kansas—and a little more to the north (on the eastern side of the peninsula)—Line Wyoming.

Then came the final phase—not peace, not war—for another two years, during which Dwight Eisenhower became U.S. president and Soviet leader Joseph Stalin died. Suddenly the armistice talks, basically deadlocked for almost two years over the question of the forced repatriation of POWs, moved to closure and the guns fell silent in late July 1953, although the Chinese did threaten along the mostly American sector to the west and engaged in several serious efforts to destroy South Korean army units, perhaps to indicate they were still capable of fighting.

To the rest of the world, Korea was an example of a kind of limited war, fought after 1950 for limited goals. For the troops who fought in Korea, it was an intense conflict, with bloody hand-to-hand combat and incredible artillery duels reminiscent of World War I. And certainly the troops had to be motivated, prepared, supplied, and led as in any previous intense conflict—which was not easy to do, given the limited goals of the fighting.

But the conflict was limited because the major power combatants had other obligations and tasks that prevented them from investing the manpower and logistics of a major war in the Korean peninsula. The United States had to retain enough strength to meet an imagined Soviet threat to Western Europe; the Chinese Communists wanted to remake a society and rebuild a country devastated by years of political decline and corruption, external invasion and exploitation, and war. The Soviet Union was still rebuilding from the devastation of World War II. Thus neither side would invest what it would take to achieve victory in the sense of destroying one's enemy; instead, each side became content to demonstrate that it could resist and make the cost of an advance too great to be worth the expense.

Equally important, neither the United States nor the Soviet Union turned to nuclear weapons to force a decision. Although such weapons appeared to be the ultimate weapon,

fortunately for the world the bombs remained safely away from the front, although there have been unsubstantiated claims that Dwight Eisenhower threatened their use to force the Chinese to hold real negotiations for an armistice after he became president in January 1953.

Kosciuszko, Tadeusz Andrzej Bonawentura (1746–1817)

Polish officer who fought against the British in the American Revolution. Born on 4 February 1746, in Mereczowszczyzna (in present-day Belarus), Kosciuszko was educated in military engineering in Warsaw and in military and civil architecture in Paris. Influenced by French ideas of liberalism, he went to America in 1776 to serve alongside the colonists in the American Revolution. Appointed a colonel of engineers under Major General Horatio Gates, Kosciuszko selected the defensive position that contributed to the American victory at the Battle of Saratoga in 1777. After spending two years directing the construction of fortifications at West Point, New York, he served under Major General Nathanael Greene in South Carolina. In 1783, as a reward for his services, Kosciuszko was granted U.S. citizenship and promoted to brigadier general.

In 1784, Kosciuszko returned to Poland and became a major general in the Polish army. Following the second partition of Poland in 1793, he led a rebellion against Russia and Prussian rule. Proclaimed supreme commander and given dictatorial powers, Kosciuszko defeated the Russians at Raclawice in April 1794 but was defeated in June by a combined Russian and Prussian force. After successfully defending Warsaw against both the Russians and Prussians (July–September 1794), he was defeated and wounded at the Battle of Maciejowice in October, which marked the end of the Polish nation. Kosciuszko was held prisoner in Russia

Engraved portrait of Thaddeus Kosciuszko. (Library of Congress)

until 1796, when he was released on the promise that he never again take up arms against Russia. In 1797 he visited America, where he was awarded a \$15,000 pension and a grant of 500 acres of land in Ohio. After 1798, Kosciuszko lived in France and Switzerland, where he unsuccessfully sought Polish independence, while refusing to break his promise by joining Napoleon's invasion of Russia. He died 15 October 1817, in Solothurn, Switzerland. Kosciuszko's remains were carried to Krakow and were buried among the Polish kings in the Royal crypt of Wawel Cathedral. In accordance with his will, his Ohio property was sold and the money used to establish a school to educate freed African Americans at Newark, New Jersey.

Kosovo, Battles of (20 June 1389, 17 October 1448)

Ottoman Turkish victories in the Balkans. The First Battle of Kosovo was fought on 20 June 1389 as part of the Ottoman Wars of Expansion. King Lazar of Serbia had taken advantage of issues of succession to the sultanate throne caused by the death of Süleyman the Magnificent and by Byzantine intrigues. Lazar formed a Christian coalition army that defeated the Turks at the River Topolica in 1387. In response the Turks, led by Murad I, advanced into Bulgaria, crushing the rebellion there. Murad I then turned his 60,000 Turks to face Lazar's 100,000-man league of Serbs, Bosnians, Bulgars, Poles, and Albanians on the plain of Kosovo (plain of Blackbirds), 60 miles north of Uskub.

Murad's army was composed of Janissaries and *sipahis*. The Janissaries—the name comes from the Turkish for new army (*yeniçeri*)—was an army raised from Christian slave recruits from all over Europe, most of whom were raised by the Turks themselves as foster children. The *sipahis*, developed by Süleyman, were heavy cavalry and proved effective in the battle to come.

The Turks won a hard-fought key victory, but Murad was mortally wounded by a Serbian aristocrat posing as a deserter. Murad's brother, Bayazid, led the Turks to victory by encouraging the 12,000 men under Vuk Brancovic to switch to the Turkish side late in the day when it appeared Lazar's forces had the upper hand. Lazar was captured and beheaded.

The Turks then turned their attention to a siege of Constantinople, having taken almost all other Byzantine territory. Only the arrival of mercenaries looking for payment from the last vestiges of the Byzantine treasury saved the city, albeit temporarily. After the first Battle of Kosovo, the Byzantines had no allies within territories nominally controlled by them. Instead they had to rely upon tenuous tricks to survive, including encouraging pretenders to the sultan's throne.

The Second Battle of Kosovo, 17 October 1448, was much more closely fought than the first. Eighty thousand Hungarians and Wallachians under John Hunyadi constructed trenchworks against a much larger Turkish army. On the 17th, the Christian forces, attempting to relieve Constantinople, surprised the Turks by leaving their trenches and attacking and holding them at bay for the entire day. On the 18th,

the Turks, wily as always, enticed the Wallachians to switch sides, causing the Hungarians to retire from the field.

The Hungarians lost at least 17,000, while the Turks lost perhaps 40,000. The Turks, led by Sultan Muhammed II, “the Conqueror,” could now turn their attentions entirely to the siege and capture of Constantinople, which they finally took in 1453.

Koxinga (Zheng Chenggong) (1662–1722)

Leader of the last effective Ming resistance against the Manchus. Zheng Chenggong, who was half Japanese, is best known by the nickname given him by the Portuguese, Koxinga. This was based upon his honorary title, Guoxing Ye (Gentleman with the Dynastic Surname), which he acquired after being granted the imperial surname, Zhu, by the Ming pretender, the prince of Tang, as a reward for his loyalty.

Koxinga’s military career began soon after the Manchus, founders of the Qing Dynasty (1644–1911), invaded China. As the son of a Ming admiral, Koxinga was quickly thrust into service. At first Ming loyalist forces, who had lost the north and the capital of Beijing to the rapidly advancing Manchus, hoped to make a stand along the Yangtse, but further Manchu advances, and confusion within loyalist ranks, soon made this impossible.

Hoping to repeat the success of the founders Southern Song, who when faced with an invasion by the Jurchen, the ancestors of the Manchus, in the mid-twelfth century adopted a flexible maritime strategy based on the Chinese southeast, Koxinga took to the seas. He and a band of men rallied on Nanao island, in eastern Guangdong. His forces steadily grew, and in 1647 Koxinga led an army unsuccessfully against the city of Quanzhou in Fujian. Although repulsed, Koxinga continued to raid the coast of China with growing success.

In 1650, Koxinga annexed the trading port of Amoy in Fujian and Quemoy, an island guarding its approaches. From these bases, Koxinga became involved in Chinese overseas trade to finance his operations. During this period, although

Koxinga enjoyed success against the Qing armies on land, it was not universal; however he did control the sea, and the entire coastline of China was fair game for his operations.

In 1659, Koxinga attempted a major invasion into the lower Yangtze River valley. He sailed directly to Nanking, sweeping opposition before him, but his army was routed at the gates of the former Ming capital. Koxinga’s overconfidence and lack of military strategy had undermined his efforts. This invasion effectively ended Koxinga’s ability to restore the Ming and reclaim China, although he remained a thorn in the side of the Qing Dynasty.

By 1660, Koxinga was the sole remaining resistance to the Qing armies. In need of a secure food supply, he invaded Taiwan in 1661. Despite stiff resistance from the Dutch, who held the island with Qing consent, Koxinga eventually succeeded. Thereafter, Koxinga established an administration and governed the island, but this was his last adventure, although he did threaten the Spanish governor of the Philippines with invasion. In 1662, Koxinga died of illness. His successors continued to hold Taiwan until 1683, when the island was surrendered to the invading Qing.

Kruger, Paul-Stephanus Johannes Paulus (1825–1904)

South African statesman and military leader. Bush-trained trekboer, soldier, pioneer, farmer, politician, and South African statesman, Kruger took part with his family in the Great Trek from Cape Colony to Transvaal. Strictly reared in Dutch Calvinism, with scant formal education, he was profoundly affected by tribal opposition and his lifelong struggle for independence from the despised British, which he countered with fearlessness and cunning. While a teenager Kruger simultaneously farmed and held military and civil posts. In 1864 he became Transvaal commandant general and worked toward establishing constitutional authority. Lucrative minerals were found in 1868, leading the British to annex Transvaal in 1877.

In 1880 he traveled to England for talks to regain independence but was thwarted, leading Kruger, Piet Joubert, and Martinius Pretorius to oppose a British-inspired federation.

The Transvaal War saw numerous Kruger-led victories, climaxed by the Battle of Majuba Hill (27 February 1881), which restored independence to the Afrikaners at the Pretoria Convention of 1881. Once president in 1883, a position to which he was reelected in 1888, 1893, and 1898, Kruger stringently opposed political equality for *uitlanders* (mostly British and German foreigners) who arrived with the gold rush of Witwatersrand in 1886 and doubly outnumbered Afrikaners.

The Cecil Rhodes–inspired 1895 Jameson Raid to overthrow Kruger's government failed. Kaiser Wilhelm II's telegram congratulating Kruger for the victory was widely interpreted as German support. This struggle led to the Boer War of 1899–1902, which resulted in the 31 May 1902 Peace of Vereeniging, making Transvaal a British crown colony.

During the Second Boer War Kruger did not take to the field, but traveled to Europe to obtain aid. He was unsuccessful and never returned to Transvaal. The “old lion of Transvaal” died in Switzerland in 1904.

Kublai Khan (1215–1294)

Founder of the Mongol-Chinese Yuan Dynasty. Kublai Khan, or in Mongolian, Qubilai-qan, was the second of four sons of Tolui-noyan (c. 1190–1231/32), who was the youngest son of Cinggis-qan (Genghis Khan). Kublai was at first just one of many Mongolian princes holding appanages near China. This changed with the events of 1251 that brought his elder brother, Möngke (Mongke), to the throne. Kublai became his viceroy in northern China and went on to build up an independent power base there that stood him in good stead after Möngke's death in 1259 and the end of a unified Mongolian empire.

Kublai rushed back to north China from Yunnan, where he had been campaigning, convened a *quriltai* of supporters, and had himself elected *qan*. He then set about establishing a regime largely using savvy local advisers he had acquired as Möngke's viceroy.

Kublai's claim as Möngke's successor was challenged by

his younger brother, Arigh Böke (d. 1266). The latter enjoyed wide support and controlled Qaraqorum, the capital. Also an opponent of Kublai and his house from domains in Siberia was Qaidu, representing the line of *qan* Ögödei (Ogadei), excluded from the succession in 1251.

The war with Arigh Böke lasted until 1264 and ended with his rival's defeat, thanks to Kublai's superior resources. The war with Qaidu continued until 1303. At one point it seriously threatened the survival of Kublai's *qanate* (after 1271, Yuan Dynasty). Such central Asian concerns remained critical for Kublai and his house until the end.

Once relatively secure in Mongol China, that is, the north and parts of the southwest, Kublai set about expanding his power. His most important line of advance was due south, into Southern Song domains, definitively conquered by the Mongolian general Bayan in 1276, although the mop-up continued until 1279. Other campaigns were two failed invasions of Japan (1274 and 1281) and successful campaigns in Vietnam, Burma, and across the sea to Java, as, under Kublai, China became a base for a most aggressive sea power for the first time in its history.

Kublai died in 1294, nearly 80. No other ruler of Mongol China ever rose to his stature. Thanks to Marco Polo, Kublai has remained the very symbol of the Oriental potentate. It was his world, by then long lost, that the Portuguese and others went looking for in the fifteenth and sixteenth centuries, marking the beginning of our own era.

Kuropatkin, Aleksey Nikolaevich (1848–1925)

Disastrous Russian commander. Of noble origins, Kuropatkin was born in Pskov Province, graduated from Pskov Military Academy (1866), General Staff Academy (1874), and served in Turkestan (1866–1871, 1875–1877, 1879–1883). He participated in the capture of Samarkand (1868) and Kokand (1876) and was an infantry division chief of staff under General Skobelev in the Russo-Turkish War of 1877–1878. He fought at the third Battle of Plevna (1877) and Senova (1878), participated in the attack on Geok Tepe (1880–1881), and became a major general (1882), serving on the general staff (1883–90). He also published *Deistvia otriadov generala Skobeleva* (1885), on the Balkan and

Russo-Turkish War campaigns, and became head of the Transbaikal District (1890–1898).

His impressive military record and diplomatic experience in the Far East saw him appointed minister for war from 1898 to 1904. Kuropatkin supported expansion into the Far East but failed to negotiate the corruption of czarist court politics to modernize and professionalize the army or keep pace with technological developments. His failure was brutally exposed in the Russo-Japanese War (1904–1905). Kuropatkin's underestimation of Japan, his indecisiveness in planning and in battle as Russian Land Forces commander in chief were similarly revealed. Pressured to relieve Port Arthur, he suffered reverses at Laioyang, Sha-Ho River, and Sandepu before defeat at Muckden saw him demoted to First Army commander.

While a State Duma member Kuropatkin wrote "The Russian Army in the Japanese War" (1909), an attempt to justify his performance.

Kuropatkin's shortcomings in the Russo-Japanese War did not preclude him from commanding a corps and the Fifth Army (1915), and on the northern front (February–July 1916). He also seemed not to have learned much, compiling a similarly poor command in this most disastrous of

czarist wars. He initially doubted the possibility of the Brusilov Breakthrough, then failed to support it, contributing to its loss of impetus.

He was finally removed from military command and appointed Turkestan governor-general, until February 1917. He was arrested in April by the Tashkent Soviet, transferred to Petrograd, but freed by the provisional government. Kuropatkin rejected White overtures to fight in the Civil War. French offers to emigrate probably enabled him to live out his life back in Pskov Province, teaching at a middle school and an agricultural school that he founded.

Kursk, Battle of (1943)

The greatest tank battle in history. After the disastrous loss at Stalingrad in World War II, German army commanders, with Adolf Hitler's enthusiastic approval, planned a massive offensive in 1943. In March, German field marshal Fritz von Manstein had achieved a great victory at Kharkov for Army Group South, leaving a bulge of 100 miles north and south and 75 westward into the German lines of Army Group Central at Kursk. Bad weather and German indecision interfered with von Manstein's plans for a pincer movement to encircle the Soviet army in the salient, allowing the Red Army under General Nikolai Vatutin in the south and General Konstantin Rokossovski in the north time to build defenses and prepare for a large counterattack.

On 10 May, Hitler consented to the plan called Operation ZITADELL. Colonel General Model's Ninth Army, with seven Panzer, two Panazergrenadier, and nine infantry divisions, were to attack from the north and Colonel General Hoth's Fourth Panzer Army, with 10 Panzer, one Panzergrenadier, and seven infantry, would advance from the south—roughly 570,000 men.

Delayed until 4 July, the Germans found themselves confronted by 11 Russian armies (alerted by Allied ULTRA in-

telligence) of 977,000 men. Soviet defenses in the north corner of the salient were particularly dense with 2,200 anti-tank and 2,500,000 antipersonnel mines and 20,000 guns of various kinds.

For the next eight days, the Germans tried to advance in the face of bitter fighting but Soviet artillery knocked out 40 percent of German armor. On 12 July, at the battle of Prokhorovka, 600 German tanks clashed with 850 Soviet tanks. The battle became a war of attrition with both sides calling for reinforcements.

On 13 July, due to the American invasion of Sicily and fears of a landing in Italy, Hitler ordered German units to disengage. Retreating on 17 July, the Nazis left 70,000 dead and 2,950 tanks on the battlefield. The Soviets following the German retreat ordered an immediate counteroffensive. The lack of victory at Kursk by the German army spelled an end to any more major offenses on the Russian front to the end of the war.

Kut-al-Amara (1915–1916)

One of the very few capitulations in British military history. In December 1915, after an unexpected defeat at Ctesiphon on the drive to capture Baghdad from the Turks, British troops fell back to the town of Kut-al-Amara, located on the Tigris River. Lacking the troops to relieve them immediately, the British High Command ordered them to retire further south. The order came too late, as the British force of about 16,000 was now surrounded by the Turks. When General Charles Townsend, in command of the British forces, suggested a breakout, he was told to stay in Kut-al-Amara in order to tie down as many Turkish troops as possible. The Turks immediately ordered a number of failed assaults on the town, with heavy losses on both sides. While the troops in Kut-al-Amara held out, a relief expedition was formed in order to try to break through the British lines. It failed, with the British suffering 23,000 casualties, and the Turks about 10,000. Attempts to resupply by river boat failed, and in April 1916, with food supplies dwindling and threats of epidemics looming, General Townsend asked the Turks for a

six-day armistice in order to discuss surrender. The Turks, wanting to add to the British humiliation at Gallipoli, replied that they would only accept unconditional surrender. On 29 April 1916, British forces surrendered to the Turks. It was one of the largest capitulations for the British army up to that time.

For the British troops who had endured the siege, the worst came after the surrender. The surviving troops, weakened by disease and near starvation, were taken to POW camps under a brutal forced march by the Turks. More than 3,000 perished on the way, or about 2 percent of all those who surrendered. Conditions in the POW camps were little better, and those who survived the inhuman conditions came out of the camps in 1918 as little more than skeletons.

Kutuzov, Prince Mikhail Illarionovich Golenishchev (1745–1813)

Credited for defeating Napoleon's Grande Armée in the Russian campaign. Kutuzov was born in St. Petersburg and enrolled in a military engineering school at age 12. A corporal at age 14, he lost the sight in one eye during the Russo-Turkish War (1768–1774). Kutuzov served six years under the command of Aleksandr Suvorov in the Crimea and was promoted to colonel in 1777 and major general in 1784.

During the War of the Third Coalition, Kutuzov was appointed commander of Austro-Russian forces at Vienna and attempted to link up with General Mack at Ulm. However, the latter was defeated by Napoleon on 19 October 1805, before Kutuzov arrived. Kutuzov avoided Napoleon's pursuit, but Czar Alexander I demanded Kutuzov engage the French. At Austerlitz on 2 December, 90,000 Austro-Russian troops were defeated.

Kutuzov was retired and reappointed as supreme commander in 1811 during the Russo-Turkish War (1806–1812).

After Napoleon's 600,000 Grande Armée invaded Russia and reached Smolensk, Kutuzov was made a prince and appointed supreme commander on 20 August 1812. Kutuzov withdrew Russian forces, ordering the destruction of all unevacuated supplies and lodgings. To further weaken the

French, Kutuzov fought minor engagements. However, Alexander ordered Kutuzov to stand at Borodino on 7 September, where Kutuzov lost 42,000 of his 112,000 troops and withdrew southeast, allowing the remaining 58,000 of 130,000 French forces to enter Moscow. Failing to defeat the Russians and unwilling to winter in a Moscow that had been burned out, Napoleon retreated.

By giving battle at Maloiaroslavets on 24 October, Kutuzov forced Napoleon to retrace the path of the French advance. Kutuzov's troops continuously molested the retreating French, engaging them at Viazma and Krasnoie. The remnants of Napoleon's army narrowly escaped annihilation during the crossing of the Berezina River on 27–28 November.

Kutuzov died while in pursuit of the French, at Bunzlau in Silesia.

L

Ladysmith, Siege of (1899–1900)

Major siege of the second Boer War. The Boer independence movement conflicted with British governance in Natal colony, located on the route around Africa. Ladysmith was strategically sited where the main rail line from coastal Durban divided, providing communications with Transvaal and the Orange Free State. General Piet Cronjé's Boers surrounded Ladysmith, severing the rail line on 2 November 1900. Lieutenant General Sir George White, Victoria Cross, commanded 12,500 British soldiers in this town of 21,300 persons.

Similar to the French at Dien Bien Phu in Vietnam (1953–1954), the British garrison was situated in low ground and dominated by enemy observation and artillery fire from surrounding hills. The Boer's rapid-firing German and French artillery was superior to that of the British, with the exception of the two 4.7-inch naval guns and four long-range 12-pounder guns from the *Powerful*. Although the naval guns were more effective, the navy provided merely 500 rounds of ammunition. The Boer advantage was negated by poor gunnery. Thus, the battle reverted to the centuries-old siege technique of starvation and disease.

Ladysmith, unlike the other major sieges at Kimberly and Mafeking, was noteworthy for the level of sickness and disease. The garrison held sufficient rations for two months, with the perimeter holding one month's forage for the horses and pack animals. Fever cases peaked at 1,314 on 27 January 1900, when eight deaths per day became the average.

Field Marshal Lord Roberts commanded a relief column of 30,000 troops, having replaced General Sir Redvers Bullers, Victoria Cross, following his defeat at Colenso. The lead elements under Lord Dundonald arrived on 28 February 1900, ending the four-month siege.

Lafayette, Marie Joseph Paul Yves Roch Gilbert du Motier, Marquis de (1757–1834)

French field commander and politician and hero of the American Revolution. Lafayette was born to wealth in Chavaniac, Auvergne, France, on 6 September 1757. He joined the infantry in 1771 and the dragoons in 1773 and was promoted to captain in 1774. Inspired by the American cause and intending a job at Britain for the sake of France, Lafayette arrived in America in 1777 with Baron Johann de Kalb and offered his services to the Continental Congress. He was commissioned a major general in the Continental army on 31 July.

Lafayette distinguished himself at Brandywine, where he was wounded, spent the winter at Valley Forge, and excelled at Barren Hill on 18 May 1778, Monmouth on 28 June, and in the Rhode Island campaign of July and August. He returned to France in 1779 to secure more French help for the Americans, was promoted to colonel in the French army, and returned to his command in Virginia in April 1780. He sat as a member of the court-martial that convicted Major John André in September, engaged Benedict Arnold's British forces several times in Virginia in 1781, supported Anthony Wayne at Green Spring, and was an important factor in the defeat of Charles Cornwallis at Yorktown. Upon his return to France in December, he became a major general in the French army.

Lafayette entered French politics in 1787, represented Au-

vergne in the Estates General in 1789, assumed command of the National Guard on 26 July, and tried to mediate among the various revolutionary factions and the crown. Promoted to lieutenant general and briefly in command of the Army of the Center, he was persecuted by the Jacobins and fled to Belgium in 1792. Captured, he was held as a prisoner of war, first by Austria and then by Prussia. After his release on 23 September 1797, he returned to France, avoided Napoleon, and kept a low profile, but he reentered politics during the Hundred Days, helping to ensure Napoleon's second abdication. Thereafter, he served liberalism in France until his death in Paris on 20 May 1834. Lafayette was lionized in the United States, with numerous towns and cities (e.g., Fayetteville, North Carolina and Arkansas; Lafayette, Indiana) and counties named in his honor.

Lake Trasimene, Battle of (2 June 217 B.C.E.)

The second of three disastrous defeats the Romans suffered at the hands of the Carthaginian general Hannibal. The year after his victory at the Trebia River, Hannibal crossed the Apennines into Etruria (Tuscany) with an army of 55,000 men. A Roman army under the command of the consul Flaminius tried to intercept him.

Hannibal directed his army to the northern shore of Lake Trasimene (Lago di Trasimeno), a perfect place for an ambush. The road passed through a narrow valley that was bordered by the lake to the south and by hills to the north. There was only a narrow path westward. An easily defensible hill blocked the eastern side. Because the Romans would come from the west, Hannibal positioned his Spanish troops and his light infantry in the east, on the hill at the end of the valley. Both Hannibal's cavalry and his Celtic troops took a position in hiding along the hills to the north. A large force of Celts was positioned near the western passage.

The Roman force, 30,000 strong, entered the valley in marching order. A dense mist obscured the hills, and the Ro-

mans failed to send out reconnaissance parties. When the entire Roman column had marched into the valley, the Celts attacked the rear end of the column, blocking the retreat. The cavalry charged downhill upon the Roman troops. The Romans were totally surprised.

What followed was more a slaughter than a battle. Thousands were killed on the shore or driven into the lake. Only the Roman vanguard, 6,000 men, succeeded in fighting through the Carthaginian line, though they too were captured the following day. The Roman army was crushed, with 15,000 troops taken prisoner and 15,000 killed, among them the consul himself. Hannibal lost only 1,500 men.

Land Mines

Explosive charges that are usually concealed by their small size or by being buried just under the surface of land; pressure sensors detonate land mines when they are passed over by troops or vehicles. Their primary objective was originally to slow down large-scale troop advancement, but as they evolved, they came to be used in all phases of war, for purposes ranging from tactical defense to strategic offense.

Land mines were first used in World War I, when Germans troops buried live artillery shells and left only their fuses exposed. They were meant to act as a defense against advancing French and British tanks, but these land mines could easily be dug up, removed, and stolen by enemy troops on foot. This practice gave rise to the development of smaller mines, which were placed alongside the bigger mines to prevent them from being moved. Since World War I, technology has made land mines smaller and more destructive.

The two main classes of mines are antitank (AT) and antipersonnel (AP) mines. Antitank mines employ a large amount of explosives, weigh more than 5 kilograms, are detonated by a pressure of more than 120 kilograms, and are used primarily to immobilize tanks. It can be done by either a blast explosion that cuts the vehicle's tracks or a killer explosion that sends a plate through the tank and destroys both the tank and crew. Antipersonnel mines employ a smaller explosive charge and are detonated by pressure of more than 5 kilograms. Antipersonnel mines are intended to

disable or kill personnel. Blast mines cause injury by shattering extremities or otherwise disabling personnel. Fragmentation mines are designed to kill personnel by exploding into the air and producing fragments. Offensively, land mines are used for protection along flanks and to cut off an enemy's withdrawal. Defensively, they are used to slow the advance of an enemy.

Since the end of World War II, antipersonnel land mines have become a lingering threat in many areas of the world, mainly to civilians. The United Nations estimates that there are more than 110 million buried mines left from the numerous wars of the twentieth century in more than 62 countries. Some 20,000 antipersonnel land mines detonate a year, taking with them a limb or the life of a civilian adult or child. The difficulty in avoiding them is that many minefields are uncharted because an accurate track of their location has not been kept. To add to the problem, land mines are mainly used by Third World nations because they are cheap and can be easily dispersed over a large area. Although easy to deploy, the recovery cost of land mines can be upwards of U.S.\$1,000 per mine. There is some hope for the future in mines that can be remotely exploded when no longer required. But these weapons are expensive and so far are mainly used by wealthy nations.

It is only recently that nations have come to acknowledge that the strategic and tactical value of land mines does not outweigh humanitarian concerns. In May 1997, a U.S.-led United Nations resolution won the support of more than 150 countries in calling for a global ban on land mines. The United States was following a different path from that taken in Canada. On 3 December 1997, the Convention on the Prohibition of the Use, Stockpiling, Production, and Transfer of Anti-Personnel Mines and on Their Destruction (informally known as the Ottawa Convention), a Canadian-led initiative, was signed by 122 nations (11 nations subsequently added their signatures) and came into legal force in March 1999. However, two of the top producers and sellers of land mines, Russia and China, have not signed the Ottawa Convention; nor has the United States.

Lannes, Jean, Duke of Montebello (1769–1809)

One of the most audacious field commanders of the French Revolutionary and Napoleonic Wars. Born on 10 April 1769 at Lectours (Gers), Lannes was commissioned on 10 June

1792, earning rapid promotion and the reputation of leading from up front. As a colonel he was the first across the Po River at Piacenza (7 May 1796) and was the first to reach the Austrian positions at Lodi (10 May) in Napoleon's audacious and decisive Italian campaign. This campaign brought him Napoleon's attention and a promotion to brigadier general.

Lannes participated in the capture of Alexandria, Egypt (2 July 1798). He distinguished himself at El-Arish (8–19 February 1799) and at Acre (8 May). Appointed a division general (10 May), Lannes left Egypt with Napoleon (22 August). He provided vital support for Napoleon at the coup of 18 Brumaire, which made Napoleon first consul of France.

Lannes led the advance guard through the Great Saint Bernard Pass (16–21 May 1800) and defeated the Austrians at Montebello (9 June). At Marengo (14 June), his badly outnumbered troops held the Austrians until Louis Desaix arrived. Appointed a marshal (19 May 1804), Lannes helped trap Karl Mack at Ulm (20 October 1805). At Austerlitz (2 December), he blocked Austro-Russian attempts to outflank the French left. Lannes drove the Prussians and Saxons back at Jena (14 October 1806). His decisive command of the center at Friedland brought victory and rewards, including the title Duke of Montebello (15 June 1808).

Sent to Spain, Lannes was victorious at Tudela (23 November 1808) and captured Saragossa (21 February 1809). Napoleon, however, recalled him for the 1809 campaign against Austria. At Ratisbon, when his troops balked at assaulting the walls, Lannes himself shouldered a scaling ladder. His troops took the city (23 April 1809). On 21 May Lannes and André Masséna spearheaded the ill-fated attempt to cross the Danube River. Then Lannes seized and held Essling against overwhelming numbers while the French evacuated. On 22 May, a cannonball shattered his legs, necessitating the amputation of the right leg. Gangrene developed, and Lannes died on 31 May at Ebersdorff, Austria. The first marshal of France to die of battle wounds, Lannes was Napoleon's friend among the marshals and one of his most aggressive commanders.

Laotian Civil War (1954–1973)

Laos declared its independence from France in July 1949 and was finally recognized in 1954. A three-sided conflict immediately erupted, involving royalist, neutralist, and Communist forces. In 1959 General Phoumi led a coup against the indigenous Pathet Lao (Communist) forces of Prince Souphanouvong. The Communists were driven into the bush, but aided and abetted by North Vietnam, China, and the Soviet Union, they retained military viability. Over the next decade and a half, the government alternated between various neutralist and royalist factions, which invariably brought on Pathet Lao offensives exploiting the chaos. By 1965, the Communists were poised to overrun the entire country before the United States intervened with direct air strikes against Pathet Lao positions and the Ho Chi Minh trail. Military advisers were also introduced, along with large-scale recruitment of Meo tribesmen as mercenaries.

For nearly a decade, the political and military situation in Laos revolved around control of the central highland region known as Plain of Jars. A seasonal succession of offensives and counteroffensives by both sides secured and lost this vital area with little diminution of fighting. At length, the Pathet Lao gained the upper hand, thanks to direct intervention by North Vietnamese forces. A cease-fire was agreed to in 1973, but two years later, with the retreat of U.S. forces from Indochina, the Pathet Lao took formal control of the country. Within two years, anti-Communist forces began a low-intensity war against the regime that lasted until 1990 and also involved incursions by neighboring Thai forces. Sporadic fighting lasted until 1991, when a final political accommodation was reached.

Larrey, Dominique Jean (1766–1842)

French military surgeon of the French Revolutionary and Napoleonic eras; renowned for pioneering rapid evacuation and treatment of wounded soldiers. Born at Beaudéan (Hautes-Pyrénées) on 8 July 1766, Larrey studied medicine at Toulouse. While serving with the Army of the Rhine in 1792, Larrey was appalled at the delay in treating the wounded. He helped organize mobile field hospitals, which closely followed the troops. He also recognized that rapid

evacuation of wounded from the battlefield was crucial. Therefore he developed a light, sprung, horse-drawn, two-wheeled cart—the “flying ambulance”—to pick up wounded even under fire. A four-wheeled version to carry more wounded came later. In Egypt in 1798, he designed camel-mounted pannier baskets to transport the wounded.

Larrey served in every Napoleonic campaign after Egypt and was appointed chief surgeon of the Imperial Guard. Skilled in the accepted practice of rapid amputation of any severely injured limb, Larrey unwittingly pioneered the use of antiseptic dressings. He could be quite unorthodox. After the Battle of Aspern and Essling (20–22 May 1809), Larrey ordered the slaughter of horses, including officers’ mounts, to provide broth for the wounded who were stranded without food.

Noted for his boundless energy in treating wounded of all ranks, Larrey distinguished himself by his courage, efficiency, ingenuity, and medical observations and writings. As surgeon general of the Grand Army in Russia in 1812, Larrey labored prodigiously to save the wounded while simultaneously making extensive observations of the effects of cold on them. He served at Waterloo, where the Duke of Wellington, noticing the brave surgeon at work under fire, ordered his gunners not to fire on him.

After Waterloo, Larrey devoted himself to a distinguished career in medicine and wrote many works dealing with military medicine. He died in Paris on 1 August 1842. In his “Testament” (15 April 1821), Napoleon described Larrey as “the most virtuous man” he had known.

Latin Empire–Byzantine Wars (1204–1267)

The Fourth Crusade shattered Byzantium and installed a Latin regime. In 1203, the knights of the Fourth Crusade captured Constantinople and drove out Emperor Alexius III (r. 1195–1203). The following year, after attempting to rule

through several Byzantine puppets, the crusaders again took the city to suppress the anti-Latin regime of Alexius V Ducas Murtzuphlus (r. 1204). This time they thoroughly looted it and destroyed the Byzantine administration. Churches were converted from orthodox to Catholic (Latin) Christianity, and Count Henry of Flanders was crowned as the “Latin” emperor of Constantinople. Henry then parceled out provinces to his vassals, assuming that they could conquer them. Even as he did so, opposition was forming. In 1205, Alexius III’s son-in-law, Theodore Lascaris (r. 1204–1222), created a Byzantine government in exile at Nicaea. The Latins also had to confront rivals in Epirus (present-day Albania and north-western Greece) and in Trebizond, as well as predatory Turks and Bulgarians.

To challenge Lascaris, the Ducas family of Epirus began to expand into the Balkans. In 1216, Count Henry died, and his heir Peter fell in an Epiran ambush. With the Latins in disarray, Theodore Ducas moved in and captured Thessalonica in 1224, a great victory. Meanwhile, Nicaea, now under John Vatatzes (r. 1222–1254), was consolidating its hold on Anatolia after defeating both the Comneni of Trebizond and the Turks. With Ducas now claiming to be emperor of Byzantium, John Vatatzes, John Asen of Bulgaria, and even the Constantinople Latins united against him. In 1230, Ducas decided first to punish the Bulgarians, but John Asen crushed his army at the Battle of Klokotnitsa and annexed half of Ducas’s former conquests.

With the Ducas family in eclipse, Vatatzes and the Bulgarians agreed in 1235 to divide the Balkans and besiege Constantinople together. The siege failed, and by 1237, the alliance had soured. Plagues and Mongol incursions delayed new operations, but circumstances still benefited Vatatzes. The Mongols crushed the Seljuqs, securing Nicaea’s eastern flank. In 1246, Vatatzes invaded an enfeebled Bulgaria, securing a European base. In 1251, Michael II of Epirus invaded Nicaean holdings in Greece. Vatatzes intercepted the Epirans, pulverized their army, and forced Ducas into vassalage. Nicaea was now ascendant.

Vatatzes’ sickly heir, Theodore II (r. 1254–1258), soon confronted a new Ducas plot, an alliance of Serbs, Bulgarians, Peloponnesian Latin knights, and the bellicose Manfred of Sicily. When Theodore II died, he left Nicaea to a child, John Lascaris (r. 1258–1261), and to his grand commander, Michael Paleologus. Paleologus immediately went on the attack. Although he inflicted severe defeats on the coalition, these campaigns were actually holding actions. Nicaea’s real objective was not Epirus but Constantinople. Risking another invasion from Albania, Paleologus concentrated forces against the city in 1260 and took it, ironically, by stealth the next year. Now Emperor Michael VIII (r. 1259–1282), he played divide-and-conquer to force treaties on Bulgarians,

Serbs, Venetians, the Latin knights in Greece, and the Ducas family. The death of Manfred of Sicily temporarily halted the menace from western Europe. By 1267, the “Latin Empire” of Constantinople was officially dead. It had taken the Byzantines over 60 years of convoluted war and diplomacy to overthrow it.

Laupen, Battle of (21 June 1339)

Swiss shock action that defeated mounted heavy cavalry. The Battle of Laupen pitted the Swiss city of Bern against a coalition of Burgundian cities in what boiled down to a land dispute. The city of Bern had aggressively acquired two Burgundian towns, Thurn and Laupen. In 1339, a Burgundian coalition formed to take back the disputed regions. In June 1339, the Burgundians (1,200 mounted knights and an unknown number of infantry auxiliaries) surrounded the town of Laupen, which was defended by 600 Bernese militia. The Swiss from the forest cantons came to the aid of the Bernese. On 21 June, the Bernese and their allies (about 6,000 men) moved to relieve the town.

The Burgundians, led by Count Gerard of Vallangin, intending to crush the Swiss by a strong attack against their left, deployed their horse on the right, with foot soldiers holding the center and left positions. The Swiss formed a staggered line, with the Bernese, armed with the pike, thrust forward onto the crest of a hill. Two other squares of Swiss halberdiers followed behind and were staggered to the left of the Bernese. There they awaited the Burgundian attack. After some minor skirmishing, the Swiss swept forward. Their right and center squares immediately drove into the enemy foot soldiers and dispersed them with great slaughter and panic. They then wheeled to the left to take the knights, who were engaged by the third Swiss square, in their flank. The knights had been launching successive charges against the Swiss with some effect, but they could not break the square, which bristled with halberds. With the field entirely in the hands of the Swiss, the knights were soon surrounded and forced to flee, leaving behind many of their fallen nobility.

Laupen marked the beginning of the end of the unquestioned dominance of the mounted warrior. Laupen was the first victory won by infantry attacking heavy cavalry. For

nearly two hundred years afterward, the Swiss maintained the reputation for fearless and resolute offensive action.

Lawrence, Thomas Edward (T. E.) (1888–1935)

Eccentric British scholar-adventurer, better known as “Lawrence of Arabia,” who helped lead the Arab revolt against Turkey during World War I. Lawrence was born on 15 August 1888 in the Welsh town of Tremadoc. In 1910, he took a degree in modern history at Jesus College, Oxford University, while traveling regularly to the Middle East to study crusader castles. His reputation as an archaeologist

The writer and soldier T. E. Lawrence (“Lawrence of Arabia”) c. 1918. (Hulton/Archive)

and a linguist brought him to the attention of the War Office in 1914.

Lawrence was commissioned and went to work in the War Office’s Geographical Department in London. In December 1914, he went to Cairo to help instigate a revolt on the Arabian peninsula.

In late 1916, Lawrence, now a captain, was part of a British delegation that met with Sharif Hussain of Mecca, whose son Feisal led a small insurgent army in southern Arabia. In November, Lawrence joined Feisal’s army as an adviser and liaison. With British support, the Arab army launched attacks on the vital Hadjis Railroad. Feisal and Lawrence seized the Red Sea ports of Wejh (24 January 1917) and Aqaba (6 July 1917). Lawrence was promoted to major, and the army turned north in support of Edmund Allenby’s offensive in Palestine. The Arabs played an important role in the fighting in 1918, taking Der’aa (27 September 1918) and Damascus (1 October 1918).

An outspoken supporter of Arab nationalism, Lawrence attended the Versailles Conference but was bitterly disappointed by continued Anglo-French influence in the region. Lawrence, now a colonel and uncomfortable with the publicity he received in Britain and the United States, resigned in 1922. He enlisted in the Royal Tank Corps and the Royal Air Force (RAF) under assumed names but was unmasked by the press. In 1926 he published his memoir, *The Seven Pillars of Wisdom*. On 19 May 1935, shortly after leaving the RAF, Lawrence died of injuries sustained in a motorcycle accident.

Laws of War

International laws, enforced sometimes by nations after war and sometimes by commanders in battle, governing both the decision to engage in war and the manner of its conduct, particularly the forms of violence used, the definition of combatants, the treatment of prisoners, and the treatment of neutrals and noncombatants. Throughout recorded military history, there have been limits on the conduct of war. These limits have been often breached, in the same manner that almost all laws are broken, but they have not only persisted but have grown more comprehensive, and whether a nation’s

armies and soldiers comply with them is a hallmark distinguishing that nation's military as professional.

Laws of war arose in ancient Greece from the custom of commanders as well as from the specific treaties concluded among cities. Thucydides recorded a high level of compliance with truces, armistices, alliances, and peace treaties between city-states. Further, commanders honored flags of truce and heralds, truces to bury the dead, conditions of surrender, and the sanctity of triumphant monuments erected to celebrate victory. The rights of neutrals were usually honored, as was the neutrality of religious temples and the right to travel to Olympic games. Soldiers and commanders obeyed these rules for three different reasons: they were defining habits of civilized Greeks, a status they highly valued; they were religious obligations; and they expected reciprocal treatment from their opponents.

Roman conquest was very little constrained by laws, although the army did maintain strict rules for discipline within its ranks, and there were detailed regulations for the treatment of conquered lands and people. Further, Rome concluded many treaties for truces and peace with both allies and opponents that were honored, at least for the time specified in the treaties. The most essential characteristics of the Roman *iustum bellum*, though, were that war be conducted *pium* (according to religious prescriptions) and only after unsatisfied demands had been made of the opponent or a declaration of war had been sent.

Medieval warfare was regulated only by religious doctrine. Christians were constrained in the treatment of opposing Christians, just as Muslims were constrained in their treatment of fellow Muslims. Neither, for instance, could enslave a captured enemy of the same religion. In both cultures, forms of chivalry emerged by the late Middle Ages that specified limits on the forms of battle and the treatment of prisoners, although these rules usually mandated such good treatment only of those with high rank.

Christian scholars from Ambrose and Augustine to Thomas Aquinas, Francisco de Vitoria, and Francisco Suárez argued that only some wars were just and that there was no justification in killing noncombatants. Despite their reflection in the Gratian decretals of canon law, these arguments for just wars were predicated on theology and found little adherence in national legal systems.

The modern law of war is the result of the development of the modern nation-state. Both were foreseen and described in the great text of Dutch scholar Hugo Grotius, *De Jure Belli ac Pacis* (1625), which argued (based in part on the system of Alberico Gentili) for national obligations of rational conduct through law, in peace and in war. Although initially few attempts were made at international agreement or enforcement, custom followed many of Grotius's observations and

edits, such as the use of declarations of war and the honoring of pledges not to destroy surrendered cities.

With the balance of power created by the Treaty of Westphalia in 1648, states were subject to no obligations but those they voluntarily accepted, usually as treaties. There was no enforcement of a breached obligation other than by very powerful states or alliances. This process of "horizontal enforcement" has persisted for 350 years. As armies grew larger with massed men and as weapons became more capable of destruction, the identification of combatants, limitations of weaponry, and treatment of prisoners became more acute problems for all nations, and both internal military culture and international treaties began to set new standards.

The Declaration of Paris (1856) abolished privateering, leaving naval engagements solely to professional combatants and banning all others as pirates. In 1863, President Abraham Lincoln issued General Order No. 100, setting standards for the identity of combatants and treatment of prisoners of war. The first Geneva Convention (1864) set standards for the treatment of enemy wounded by the great states of Europe. Further international conventions, at The Hague in 1899 and 1907 and in Geneva in 1906, 1929, and 1949, refined the law of war as to battlefield conduct and weapons, civilians, prisoners of war, and wounded and sick military personnel. Other conventions banned particular weapons, beginning with the Geneva Protocol on Gas Warfare of 1925.

The Bryan Treaties of 1913 and 1914 and, perhaps most controversially, the Versailles Treaty of 1919 promoted limits on the grounds for commencing war, including requirements for investigation, arbitration, and peaceful settlement of disputes, and the Kellogg-Briand Pact (1928) condemned recourse to war in all cases but self-defense. None of these instruments prevented the horrors of World War II, and at the conclusion of the war, the victorious allies established tribunals at Nuremberg and Tokyo to try individuals accused of war crimes, particularly the new category of crimes against peace, which included planning, initiating, and waging wars of aggression in violation of international treaties and agreements; crimes against humanity, which included exterminations, deportations, and genocide; war crimes, or the violations of the laws of war on the battlefield; and conspiring to commit the criminal acts listed in the first three counts. In Germany, of 22 defendants, 3 were acquitted, 4 imprisoned from 10 to 20 years, 3 imprisoned for life, and 12 sentenced to hang. In Japan, of 25 defendants, 2 were sentenced to prison terms, 16 to life imprisonment, and 7 to hang. The most important change in law from these trials was the Nuremberg principle, holding the individual and not just the state accountable for violations of the laws of war.

With the adoption of the United Nations Charter in 1945, almost all nations of the world committed to the peaceful

settlement of disputes and the renunciation of war except in self-defense. Among the signatory regimes, very effective conventions have been adopted outlawing genocide and crimes against humanity; further limiting the use of weapons of mass destruction, such as nuclear and biological weapons, and certain weapons of particular inhumanity, such as exploding bullets; and further refining standards for the treatment of prisoners and the wounded.

The UN Security Council created the International Criminal Tribunal for the Former Yugoslavia on 25 May 1993 and the International Criminal Tribunal for Rwanda on 8 November 1994. Both ad hoc tribunals are charged with the investigation of war crimes, and both have actively investigated and convicted individuals for violations of the Geneva Convention of 1949; genocide; violations of the laws and customs of war; and crimes against humanity. The specific articles for violations of the laws and customs of war include the use of poisonous weapons or other weapons calculated to cause unnecessary suffering; wanton destruction of civilian areas not justified by military necessity; attack or bombardment of undefended towns; seizing or harming buildings dedicated to religion, charity, education, and the arts and sciences, as well as historic monuments and works of art and science; and plundering public or private property.

The UN Rome conference (opened on 17 July 1998) drafted a treaty establishing an International Criminal Court with global jurisdiction to try individuals accused of crimes similar to those prosecuted by the tribunals for Yugoslavia and Rwanda and whose governments will not try them. The treaty will become effective when 60 states have ratified it; by December 2000, 120 states had signed it, and 25 had ratified it.

Lebanese Civil Wars (1958, 1975–2000)

Two civil wars that have devastated the Lebanese “nation” created by ill-conceived World War II peace settlements. The 1958 civil war was due to pro-Western president Camille Caiman’s (1900–1987) wish to serve a second term, contrary to the constitution, and Lebanese Muslims’ desire for a

stronger pro-Arab relationship. To quell the riots of May 1958, Caiman asked the United States for help, and it responded by sending the Sixth Fleet with 14,000 U.S. troops. On 23 September 1958, Caiman was succeeded by General Fuad Chehab (1902–1973). The U.S. troops withdrew in October 1958.

The Lebanese civil war of 1975 to 2000 focused on the discontent that evolved from the unofficial, inequitable National Pact of 1943. The Maronite Christians governed Lebanon at the expense of the Shiite, Sunni, and Druze sects, which constituted 50 percent of the population by 1975. Disgruntled Palestinian Muslims supported the Palestine Liberation Organization’s (PLO) guerrilla attacks on Israel.

Civil war was sparked on 13 April 1975, when some Christian Phalangists were attacked in a church; they retaliated by killing 27 Palestinian bus passengers. The PLO joined other Muslim groups in raids. Israeli became involved by supplying arms to the Christians. The League of Arab States, led by Syria, sent 30,000 troops to implement a peace plan in 1976. Beirut was divided into political and religious enclaves in 1977, with most groups fighting each other. Israeli troops invaded Lebanon on 14 March 1978 to eliminate PLO bases. Some 6,000 UN peacekeepers replaced the Israelis, who left later that year.

By 1981, Syria had intervened militarily and placed armed forces in Lebanon’s Bekaa Valley, along with Soviet missiles. The Phalangists responded by occupying the area around the Beirut-Damascus highway, which sparked a Syrian offensive. The Israelis attacked the Syrians and bombed some Beirut sectors in retaliation for PLO rocket attacks into northern Israel. A cease-fire was called on 24 July 1981.

In June 1982, the Israelis reinvaded Lebanon, killing 18,000 Lebanese. Israel forced the PLO guerrillas to evacuate Beirut. On 14 September, President-elect Bashir Gemayel (1947–1982), a Phalangist, was assassinated, but he was succeeded by his brother Amin Gemayel (b. 1942). Then 328 Palestinian were killed by Phalangists in Beirut refugee camps from 16 to 18 September. Peace-keeping forces from the United States, the United Kingdom, France, and Italy arrived.

The U.S. Embassy was bombed on 18 April 1983, killing 50 people. Suicide bomb attacks on French and U.S. military headquarters in Beirut led to more than 300 deaths on 23 October 1983 and caused the international forces to withdraw. Israeli forces left the Shuf Mountains, which were then occupied by the Druze, who fought both the Lebanese army and the Christians. PLO Leader Yasir Arafat (1929–) was forced to leave Beirut on 20 December 1983 after some PLO dissidents supported by Syria attacked and besieged his stronghold.

By February 1984, Lebanon was occupied by both Israel

and Syria. Fierce fighting in Beirut between Druze and Shiite militias occurred. The extremist group Hezbollah (Party of God) emerged in 1985. Sheer anarchy reigned when Christian general Michel Aoun (b. 1935) became president in 1988, while Muslim prime minister Selim al Hoss (b. 1930) established a competing government. Their respective militias physically destroyed Beirut.

The League of Arab States drafted the National Reconciliation Charter for Lebanon in 1990, providing greater equality and diminished presidential power. It also called for the withdrawal of the militias and the destruction of the “green line” that bisected Beirut; thus the civil war supposedly ended. However, more attacks and counterattacks continued to plague desolate Lebanon. Nearly 150,000 lives, civilian and military, have been lost in the civil war, and nearly 200,000 people have been wounded.

Lechfeld (10 August 955)

Decisive defeat of Magyar raiders by Otto I. The Magyars, emerging from the steppes of Russia, migrated to the Danube River basin in the ninth century and settled in what is now Hungary. Fighting primarily as horse-archers, they sought to avoid close-quarter action, preferring to encircle their foes and engage them from afar.

As king of Germany, Henry the Fowler (r. 919–936) had transformed the Saxon nobility, hitherto used to fighting as light cavalry, into a disciplined force of armored horsemen. This “military revolution” gave the Ottonian dynasty the edge not only over its rivals in Germany but also over the Magyars. When Henry fought them at the Battle of Riade (933), he reminded his “men of iron” of the need to maintain their line, to use their shields to deflect the first discharge of arrows, and only then to spur their mounts to close contact, but it was left to his son, Otto I the Great, to banish the threat of the Magyars.

The Magyars resumed their attacks in 954 with a major invasion, followed by a second one in 955. Their numbers are unknown, but the chroniclers report that they had never been seen in such force before. Crossing Bavaria, they laid siege to Augsburg. Otto moved rapidly from Saxony, with an

army amounting to some 8,000 horsemen, its various contingents coming from Saxony, Bavaria, Swabia, Franconia, and Bohemia. When Otto approached the Lech River, the Magyars broke camp. While their main body engaged the king, a smaller detachment, outflanking the German host, turned up in the rear of the Swabians and wreaked havoc among them. The Franconians under Conrad the Red, duke of Lotharingia, had to turn so as to face this surprise attack, but when Otto ordered a general charge against the main body of the enemy, everything favored his host. The Magyars, on their smaller mounts and lacking armor, discharged a volley of arrows before they were overtaken and slain, many as they attempted to negotiate the Lech River.

The Germans had suffered heavily—Conrad was killed the moment he lifted his helmet to get some air—but what turned defeat into irreparable disaster for the Magyars was the relentless pursuit of the vanquished by Otto. The remnants of the Magyar army were decimated and its captured leaders executed.

Lee, Henry (“Light Horse Harry”) (1756–1818)

American cavalry commander and politician. Lee was born into a wealthy Virginia family in Prince William County on 29 January 1756. After graduating in 1773 from the College of New Jersey (later Princeton University) he volunteered for Captain Theodorick Bland’s Virginia Cavalry in June 1776. This unit, with Bland as colonel and Lee as captain, was incorporated into the First Continental Dragoons on 31 March 1777 and saw action at Brandywine. Lee blamed Bland’s poor reconnaissance of the northern fords for George Washington’s being outflanked on the right and losing that battle.

Promoted to major on 7 April 1778 by virtue of distinctive service against Banastre Tarleton at Spread Eagle Tavern, Pennsylvania, on 20 January, he drilled his battalion into an effective force and led it to victory at Paulus Hook, New Jersey, on 19 August 1779. Promoted to lieutenant colonel on 6 November 1780, he named his regiment “Lee’s Legion” and reinforced Nathanael Greene in South Carolina on 13 January 1781. Supporting the guerrilla warfare of Francis Marion, the “Swamp Fox,” Lee excelled throughout the Carolinas in 1781 at Georgetown, Haw River, Guilford Court House, Fort Watson, Fort Motte, Fort Granby, Augusta, Ninety-Six, and Eutaw Springs. His raids on Charles Cornwallis’s out-

posts were an important factor in the success of the Continental army's southern strategy.

After the war, Lee held several high political offices, including Virginia state legislator, Virginia governor, and U.S. congressman. In 1794 he commanded troops against the Whiskey Rebellion in western Pennsylvania. In 1799 he eulogized the just-deceased Washington as "First in war, first in peace, and first in the hearts of his countrymen." To recover from injuries he suffered while trying to impede an antiwar riot in Baltimore in July 1812, he retired to the Caribbean in 1813. He died on Cumberland Island, Georgia, on 25 March 1818, during the return voyage to Virginia. His third son was Robert E. Lee, the great Confederate general.

Lee, Robert Edward (1807–1870)

Commander in chief of the Confederate armies in the American Civil War. Lee was born in Stratford, Virginia, on 19 January 1807, the third son of "Light Horse Harry" Lee. Ranking second in the U.S. Military Academy at West Point, class of 1829, and with no demerits, he was commissioned in the engineers and stationed in the southeastern states. Until 1846 he worked on bridges and fortifications in Georgia, Virginia, New York, and Missouri. In the Mexican-American War, he served first under John Ellis Wool and then under Winfield Scott, building bridges and securing important reconnaissance for the Battles of Saltillo, Veracruz, Cerro Gordo, Contreras, Churubusco, and Chapultepec. From 1852 to 1855, he was superintendent of the U.S. Military Academy.

Promoted to lieutenant colonel in the Second Cavalry, Lee served in Texas from 1855 to 1857. In October 1859 he led the expedition to capture John Brown at Harpers Ferry. He served again in Texas until February 1861, when Scott re-

called him to Washington. When the Civil War broke out, both Scott and President Abraham Lincoln tried to persuade him to accept command of the Union armies, but choosing instead to support Virginia, he became major general of Virginia forces on 23 April. Confederate president Jefferson Davis promoted him to full general on 14 June.

Lee's debut as a Confederate field commander at Cheat Mountain, West Virginia, on 12–13 September was a failure caused by the insubordination of his junior officers. Davis reassigned him to the Carolinas and Georgia to oversee coastal defenses but recalled him to Richmond as a military adviser in March 1862. After Joseph E. Johnston was seriously wounded at Fair Oaks on 31 May, Davis ordered Lee to take over Johnston's command and renamed it the Army of Northern Virginia on 1 June. It was Lee's command for the remainder of the war.

Lee's brilliance as a field commander first became apparent in the Seven Days' Battles. Leaving only a small garrison in Richmond, Lee boldly attacked George B. McClellan north of the Chickahominy River. This bloody series of tactical defeats was in fact a strategic victory because it pushed the Union army away from Richmond. After a stunning victory over John Pope at Second Bull Run, Lee invaded Maryland, but McClellan eventually stopped him at Antietam. Lee tried a second invasion of the north after beating Ambrose Burn-

Photographic portrait of Robert E. Lee, 1869. (Library of Congress)

side at Fredericksburg and Joseph Hooker at Chancellorsville. He worsened his losses at Gettysburg on the third day by ordering “Pickett’s Charge,” a massive frontal infantry attack across a three-quarter-mile-wide plain under constant fire from the Union center.

In the wake of Gettysburg, the Army of Northern Virginia could not resume the offensive. Lee made full use of delaying tactics and entrenchments, forcing Ulysses S. Grant to waste huge numbers of Union troops assaulting his positions in the Wilderness, at Petersburg, and before Richmond. Davis named Lee commander in chief on 23 January 1865. In the end, Grant gave Lee generous terms of surrender at Appomattox on 9 April 1865.

Lee spent the rest of his life as a paroled prisoner of war. In October 1865, he became president of the nearly defunct Washington College, now Washington and Lee University in Lexington, Virginia. Unlike most Confederates, he was never able to regain his U.S. citizenship, even though he had opposed slavery before the war and epitomized reconciliation after the war. His greatest gift to his reunited nation, in fact, may have been his strong discouragement of any ideas of continuing the battle by guerrilla warfare, thus sparing the country the agony of prolonged insurgency and counterinsurgency conflict. He died in Lexington on 12 October 1870. A person of seemingly absolute integrity, Lee was revered throughout the South and honored in the North by the time of his death.

LeFebvre, Pierre-François-Joseph, Duke of Danzig (1755–1820)

French marshal. Pierre-François-Joseph LeFebvre was born at Rouffach on 25 October 1755. He enlisted in the Gardes

Pierre-François-Joseph LeFebvre. (Library of Congress)

Françaises in 1773 and rose to the rank of sergeant by 1789. During the French Revolution, he was promoted rapidly and served in the Army of the Moselle. By December 1793, he was promoted to *general de brigade*; in 1794, he was appointed to command a division. From September to December 1797, he served as commander of the Army of the Sambre-et-Meuse after the death of Lazare Hoche. In March 1799, he was appointed to command the S17th Military Division, the district containing Paris. He remained quiet during Napoleon’s coup of 18 Brumaire, thus ensuring its success. During the consulate, he served as president of the Senate.

In May 1804, LeFebvre was made a marshal of the empire. Two years later, he commanded the V Corps and in October 1806 was appointed to command the infantry of the Imperial Guard, which he led at Jena. During the closing months of the campaign against Prussia, he was sent to besiege Danzig, in command of the X Corps. After the siege, lasting from January to May 1807, and the surrender of the city, he was created duke of Danzig.

In 1808, LeFebvre commanded the Fourth Corps in Spain, defeating Spanish armies led by Joaquín Blake and the marquis de la Romana. Recalled to Germany during the 1809 campaign, he commanded the VII Corps, composed mostly of Bavarians. Later, he was appointed to command the Army of the Tyrol, operating against pro-Austrian insurgents. He defeated the insurrection and restored order.

In 1812, LeFebvre again commanded the infantry of the Imperial Guard during the Russian campaign. He was thus present at most of the major battles of that invasion but figured little in the fighting. He did not participate in the 1813 campaign. In the 1814 campaign, he fought at Champaubert, Montmirail, and Monteneau, where, according to the diarist Coignet, he “fought so hard that he foamed at the mouth.” At the end of the 1814 campaign, he was part of the group of marshals, including Michel Ney, MacDonald, and Nicholas-Charles Oudinot, who secured the first abdication from Napoleon, on 6 April 1814.

During the Hundred Days, he played no active role on behalf of the Bonapartists, pleading old age and thus avoiding exile or death. He lived in retirement until his death in 1820.

Leipzig, Battle of (16–19 October 1813)

Decisive victory for the allies over Napoleon, ending his last German campaign. When Austria declared war against France on 12 August 1813, Napoleon had about 443,000 field troops in Germany south of Berlin. Trying to surround him were three separate multinational armies, a total of about 512,000 men under Karl Philipp zu Schwarzenberg in the south, Gebhard Leberecht von Blücher in the east, and Jean Baptiste Jules Bernadotte, crown prince of Sweden, in the north. From a skirmish on 16 August to the great cavalry battle at Liebertwolkwitz on 14 October, they fought many engagements, and both sides suffered enormous losses.

Napoleon's main force on 16 October was deployed in and around the city of Leipzig. Schwarzenberg attacked the southern and eastern outskirts at 8:00 A.M. Meanwhile, Blücher tried to sever Napoleon's communication lines in the west. Inconclusive fighting raged all day. Little happened on 17 October; the crucial day was 18 October. At 9:00 A.M., Schwarzenberg advanced his left in the south and soon was able to send his center against Napoleon's diverted forces in the southeast. Napoleon's situation was precarious by early afternoon. Bernadotte attacked from the northeast and Blücher from the north, completing a three-quarters' circle around Napoleon's entire army, compressing it, and pushing it into the city. Schwarzenberg's final assault of the day came

from the east, dramatically reducing Napoleon's perimeter and inflicting heavy casualties. Napoleon made a defensive stand inside the city on 19 October. The allies commenced urban warfare in the northwest, east, and southeast. Napoleon's main concern was to organize an orderly retreat to France without being cut off. His defeated army escaped through a swamp and over a causeway west of the city.

Leipzig is frequently called the Battle of the Nations because of the great numbers of troops actually engaged: about 300,000 Russians, Prussians, Austrians, Swedes, British, and Germans united against Napoleon's 190,000 French, Italians, Germans, and Poles. Napoleon's losses were about 40,000 and those of allied forces about 54,000. In terms of numbers of troops engaged, Leipzig was the greatest battle of the nineteenth century, eclipsing even the massive engagements of the American Civil War half a century later.

Lend-Lease (1940–1945)

A program devised by President Franklin D. Roosevelt to provide material aid to England (and later the other Allied powers) during World War II. By late 1940, the United Kingdom had run out of gold and cash reserves and thus informed the United States that it would be unable to pay for any more war matériel. In response, President Roosevelt proposed the Lend-Lease Act, which Congress passed in March 1941. Under the act, the president was empowered to sell, transfer, or exchange matériel to any country deemed vital to the defense of the United States. The United States was still neutral, and Roosevelt had to deal with many Americans who took an isolationist view of the war in Europe. To get support for the act, Roosevelt appealed directly to the American people, using a water hose analogy: if your neighbor's house is burning down, you do not worry about selling him the hose, but you give him the hose to deal with the cri-

Russian militia during the Siege of Leningrad c. 1942. (Hulton/Archive)

sis at hand and worry about the cost later. In presenting the idea of Lend-Lease to Congress in January 1941, Roosevelt first conceived of the idea of the Four Freedoms (freedom of speech and expression, freedom of worship, freedom from want, and freedom from fear) that later became part of the Atlantic Charter.

One of the foundations for the Lend-Lease Act was the transfer, in September 1940, of 50 obsolete destroyers to the United Kingdom in exchange for 99-year leases on a number of bases in the Caribbean and Newfoundland. The initial act included \$1 million for aid to the Allies. By the fall of 1941, China and the Soviet Union had been added to the list of recipients. In October 1941, the Office of Lend-Lease Administration was developed to handle the growth of the Lend-Lease program. By 1943, Lend-Lease had been taken over by the State Department. Although the United Kingdom was the first (and main) recipient of Lend-Lease, the program was later expanded to help more than 40 countries. By August 1945, when Lend-Lease was abruptly terminated, more than \$49 billion in aid, ranging from fighter planes to canned

meat, had been extended to Allied nations. The countries of the British Commonwealth received about 63 percent and the Soviet Union about 22 percent. The United States received about \$8 billion in “Reverse Lend-Lease,” in which host countries helped pay for U.S. troops overseas during the war.

Leningrad, Siege of (1941–1944)

Monumental siege during World War II. Leningrad's 900-day ordeal began on 8 July 1941, when the German Fourth Panzer Army severed the city's land contact with the Soviet Union less than three weeks after invading Russia. Hemmed

in by Finnish troops to the north and German forces to the south and west, the 2.5 million inhabitants of Leningrad depended on meager supplies brought across Lake Lagoda from the east. They were not prepared for a siege, the authorities having dismissed calls to stockpile supplies and prepare defenses as “defeatist.”

The “siege” itself was really an extended blockade ordered by Adolf Hitler to annihilate the city. German forces remained within artillery range but were ordered not to accept any form of surrender. They dug in permanently after the diversion of troops for attacks against Moscow in 1941 made offensive schemes impossible, and their Finnish allies, reluctant to cross their pre-1940 border with the Soviet Union, refused to attack from the north.

For the next two and a half years, German artillery and aircraft pounded the city, and the Wehrmacht denied all Soviet attempts to break the blockade. Leningrad’s inhabitants froze to death in the winter, died under the incessant shelling, or starved when no more animals or glue could be found for consumption. More than 850,000 were evacuated in 1942, but at least 1 million are estimated to have died by the time a Soviet offensive relieved the city in January 1944. No city in modern history has suffered such losses without surrendering.

Leo III (c. 675–741)

Founder of the Isaurian dynasty, iconoclast, energetic military leader, and adept strategist. Leo III took power in 717, at a time when Byzantium seemed on the verge of disintegration and conquest. Seven emperors had reigned in two decades of coups, revolts, and murderous attacks by Arabs, Slavs, and Bulgarians (697–717). As Leo deposed the reluctant emperor, Theodosius III, and entered the capital, massive Arab armies converged behind him, determined to bring Constantinople under Islam.

Fortunately, Leo was a wily and experienced commander. His successes in the Caucasus had earned him command of the Anatolian-Syrian frontier. In that office, Leo had courted the Bulgars and Armenians and employed his fluent Arabic. He defended Constantinople against an overwhelming force

in a masterful economy of force strategy, using fire ships, encouraging guerrilla raiding and ambushes by the Slavs and Anatolians, and provoking revolts in the enemy camp. The Umayyad caliph ended the siege in 718, and Leo quickly shifted forces to reclaim control of Sicily and southern Italy.

Although Arab raids into Anatolia continued throughout his reign, Leo had rescued the empire and restored the frontiers. He also reinforced the defense of many cities and updated the law codes of Emperor Justinian, but Leo’s ban on the use of icons in Orthodox Christian worship ignited the iconoclastic struggle. It inflicted decades of internal strife upon Byzantium. His policies also fueled the growing alienation between eastern and western Christendom, when he attempted an invasion of northern Italy in 733.

Lettow-Vorbeck, Paul Emil von (1870–1964)

Successful German guerrilla warfare leader in East Africa during World War I. Paul von Lettow-Vorbeck was trained as an officer at the Military Academy at Potsdam and served in the German expeditionary force that quelled the Boxer Rebellion in China (1899). As a captain in the Schutztruppe (German colonial troops), he saw action against local tribes in German South-West Africa (now Namibia) from 1904 to 1907.

In 1913, Lettow-Vorbeck was placed in command of the German forces in German East Africa (today Tanzania). When World War I broke out, he defeated the invading Allied forces on several occasions, for example, at Tanga harbor (November 1914); Jassini (January 1915); Kilbata (1916); and Narungombe, Mahiwa, and Lukuledi (1917). He led by example and was wounded on three occasions. At most, he commanded only 3,007 white soldiers and 12,100 Askaris (black soldiers). Lettow-Vorbeck succeeded in evading the vastly superior Allied forces (of approximately 150,000 men) commanded by the South African generals Jan Christiaan Smuts (1916) and J. L. van Deventer (1917–1918), both of whom had waged successful guerrilla campaigns against the British during the Boer War (1899–1902) but were incapable of implementing successful antiguerrilla warfare against the Germans. In fact, Lettow-Vorbeck was able to recruit a number of former Boer guerrilla fighters into his ranks, who assisted him in developing guerrilla tactics.

The German command attempted to resupply Lettow-Vorbeck by the only means possible in the face of British control of the seas—by dirigible. A German airship was dispatched from Bulgaria in 1916 and almost reached the guerrilla commander when it had to turn back because of adverse weather. It was the longest unrefueled flight in history until 1986.

In November 1917, Lettow-Vorbeck led his force across the border into Portuguese East Africa (Mozambique), defeated the Allies at Ngomano and Namakurra, and returned to German East Africa by September 1918. In November 1918, shortly before the armistice was signed, he occupied a strong position in Northern Rhodesia (now Zambia), but soon afterward he was ordered by his superiors in Germany to lay down his arms, which he and his remaining 155 white soldiers and 1,156 Askaris did reluctantly.

Lettow-Vorbeck's force contributed a brilliant chapter to the military history of irregular operations. His courageous resistance earned him worldwide fame, and he was honored and respected by both friend and foe. After the war, he became a symbol of inspiration for his humiliated fellow Germans. In 1919 he was promoted to brigadier general but was dismissed from the army in 1920 for taking part in the abortive right-wing Kapp Putsch. He was a member of the Reichstag (German parliament) from 1928 to 1933 and published three books on his war experiences in East Africa, two books on postwar visits to Africa, and his autobiography in 1957. Lettow-Vorbeck was a fervent patriot and strict disciplinarian but had good relations with his subordinates and was compassionate toward captured or wounded enemies. His Askaris called him *Bwana mkubwa ya akili mingi* (the big man who can do everything). His campaigns are still a cornerstone of unconventional warfare studies.

Leuctra, Battle of (371 B.C.E.)

Epaminondas, with a force of approximately 6,000 soldiers, defeated the Spartan army, which numbered about 10,000 men, at Leuctra in 371 B.C.E. Epaminondas arrayed his force

to meet the Spartan right in oblique order, with a reinforced left consisting of a deep column that was 48 ranks deep, compared to the customary eight. He may have protected this column's left flank with a terrain obstacle or with a detachment of the Theban Sacred Band. He held back the forces remaining to his right and assigned them the task of holding in place the numerically superior Spartan left. In standard phalanx warfare, the right flank tended to overlap the enemy's left because soldiers unconsciously inched to the right to find cover for their exposed side from their neighbor's shield. The resulting rightward drift of both sides often resulted in a quarter rotation of the two lines as each right wing bore against the enemy's less steady left. Epaminondas's oblique order allowed an overwhelming concentration to overthrow the enemy's strongest wing while immobilizing the remainder of the enemy force.

The battle opened, typically, with a cavalry skirmish, in which the Thebans had more success than the Spartans. The climax occurred soon after, when Epaminondas led his heavy column against the Spartan line. Following the impact there was considerable fighting, but the Spartan right could not resist the Theban mass. The Spartan center and left, held to their front by the remaining Theban line and the cavalry, took no part in the fight. When Epaminondas completed the destruction of the Spartan right, his column wheeled to the right and advanced on the flank of the remaining Spartan line. In short order, the Spartan line broke and fled, leaving Epaminondas master of the field. Although this new battle tactic had some shortcomings, it changed military tactics in ancient Greece and brought Sparta down from its preeminent military position.

Leuthen, Battle of (5 December 1757)

Major battle of the Seven Years' War (1756–1763) between Prussia and Austria. The Austrian army occupied Silesia as Frederick the Great defeated the Austrian army at Rossbach on 5 November. Prince Charles of Lorraine's army overwhelmed the Prussian detachment guarding the province and captured both Schweidnitz and Breslau. On 2 December, Frederick returned to Silesia and marched toward Breslau with 39,000 troops and 170 guns. He planned to lure the

Austrians into a decisive battle that would end the war. Opposing him were 66,000 men and 210 guns.

The Austrians stood near the small village of Leuthen. Charles and Field Marshal Leopold Daun wanted to entice Frederick into making a frontal assault along their 4.5-mile line and lock his army in a battle of attrition. On the morning of 5 December, Frederick advanced his army directly toward Leuthen and discovered the Austrian left flank exposed and unguarded. He altered his army's angle of advance so that it would be oblique to the Austrian left flank. Feigning an advance against the Austrian main line, Frederick's army redeployed without the Austrians' knowledge. Around noon, Prussian forward units attacked and broke through the Austrian positions, followed by a large-scale cavalry charge that put the Austrian command in chaos. Charles's attempt to shift his front only contributed to a growing panic within the Austrian ranks. At 3:30 P.M., Frederick unleashed a final assault of 40 cavalry squadrons that resulted in a general Austrian retreat but failed to organize a general pursuit to annihilate the remnants of Charles's army.

Leuthen ranks as Frederick's greatest tactical masterpiece. Nearly 6,000 Prussians were killed or wounded. Austria losses included 3,000 dead, 7,000 wounded, 12,000 prisoners, and 130 guns. The battle did not decide the war, but it did reinvigorate Frederick's war effort and ensured the survival of Prussia.

Lewis, Meriwether (1774–1809)

American explorer, leader of the Lewis and Clark expedition. Born near Charlottesville, Virginia, on 18 August 1774, the son of an American Revolutionary War officer, Lewis was an avid outdoorsman. He served during the 1794 Whiskey Rebellion in the Virginia Militia. Later, in the regular army, he served under Captain William Clark in the Chosen Rifle Company. Between 1796 and 1801, Lewis was assigned to the 1st U.S. Infantry Regiment on the Ohio and Tennessee frontier and was promoted to lieutenant in 1798 and captain in 1800. In 1801, Lewis became private secretary to President Thomas Jefferson, an old family friend.

In 1803, the United States acquired a enormous land tract, the Louisiana Purchase, from France, and Jefferson assigned Lewis and his old captain, William Clark, to explore the new territory with Lewis in command. Along with mapping and exploring, Jefferson wanted the team to look into the feasibility of a route to the Pacific Ocean and to bolster U.S. claims to western lands not included in the purchase.

The expedition began on 14 May 1804 from St. Louis, Missouri Territory, with a total of 50 men. The explorers went up the Missouri River to North Dakota, where they spent the winter before continuing across the Rocky Mountains toward Oregon, arriving at the Pacific Ocean in early November 1805. Along the way, they received valuable assistance from American Indians, most notably the Shoshone guide, Sacagawea. They wintered on the coast, waiting for a transport ship that never came.

In March 1806, they began the return journey and were back in St. Louis on 23 September 1806. Hailed as a hero, Lewis was nominated by Jefferson as governor of the Louisiana Territory in 1807. Lewis was a poor administrator and died during a trip from St. Louis to Washington, D.C., in a tavern 70 miles southwest of Nashville, Tennessee, on 11 October 1809. The cause of his death remains a mystery; most modern historians consider it a suicide.

Lexington and Concord (1775)

Traditionally, the first military engagement of the American Revolution. The clashes at Lexington and Concord on 19 April 1775 produced new pressures for independence within the British North American colonies and a new resolve to suppress colonial resistance on the part of the British government.

General Thomas Gage, commander of British forces in Massachusetts, received orders to act decisively against the leaders of colonial American resistance. Gage devised a plan to strike against the colonial militias and ordered 700 troops under Colonel Francis Smith and Major John Pitcairn to seize gunpowder and cannon reportedly hidden at Concord. News of this plan reached leaders of the resistance, including Paul Revere, who subsequently spread word of the planned British raid along the road from Boston to Concord.

Revere's ride brought him through the town of Lexington

Painting of the Battle of Lexington. (Library of Congress)

(and into immortality), where colonial militiamen dedicated to the resistance movement—the Minutemen—turned out in force under Captain John Parker to meet Smith and Pitcairn. On the village square, British and colonial American forces exchanged fire following a shot whose source remains a mystery, leaving 1 British and 18 American casualties.

Pressing his mission, Smith ordered his men to Concord, where they encountered a much larger and more organized force of Minutemen under Colonel James Barrett arranged on the heights above the settlement. Barrett moved his force toward the town center when he learned that British troops had begun to burn houses and goods in their search for the gunpowder. Barrett's colonials met a British detachment at North Bridge on the outskirts of town, leaving a few casualties on both sides. Smith ended his futile search for the gunpowder and determined to withdraw, but the shots and alarm bells had drawn hundreds of new Minutemen from surrounding areas into his return path. Before their arrival back in Boston, the British withstood repeated guerrilla attacks, their retreat almost degenerating into a rout, and engaged a concentrated force at Menotomy, ultimately suffering 273 casualties in the entire operation. As a consequence, the British government reinforced Gage's army with thousands of new troops, while the American resistance movement recruited new adherents with their supposed evidence of British tyranny. Given the wider conflict that ensued, the exchange at Lexington and Concord eventually became known as "the shot heard round the world."

The brave and defiant performance of the citizen-soldiers at Lexington and Concord entered American mythology: the yeoman citizen-soldier, ready to leave his plow in his furrow and shoulder his musket to defend hearth and home. This ideal, given voice by Thomas Jefferson in particular and strengthened by the British heritage of distrust of a standing army and the Roman Republic's "Cincinnatus at the Plow" for the classically literate British American elite, saw to it that the United States as late as 1939 had a standing army about the size of Romania's.

Li Hongzhang (1823–1901)

Chinese imperial politician and military administrator, instrumental in modernizing the military infrastructure of China. Li was born into a Confucian scholarly family on 15 February 1823 in Hefei, Anhui Province, China. In 1844 he became a government official in Beijing under his mentor,

Zeng Guofan. Li's father, Zeng, and in 1847 Li himself both earned the terminal *jinshi* degree in the rigorous Confucian examination system.

Li raised militias to support the Qing Dynasty during the Taiping Rebellion. He was appointed a judge in 1856 and governor of Jiangsu Province in 1862. Militarily, he was both an independent field commander and a member of Zeng's staff. Li's negotiations brought Western personnel and weapons to the Qing side against the Taipings. After the death of Frederick Townsend Ward in 1862, Li held administrative command of the "Ever-Victorious Army," while Charles "Chinese" Gordon commanded this crack unit of foreign mercenaries in the field.

Convinced that China could never compete with the West, either militarily or economically, unless it adopted Western technology, Li dedicated the rest of his life to what he called after 1872 the "Self-Strengthening Movement." Under his leadership, China built railroads, shipyards, arsenals, factories, military academies, technological institutes, and communications systems. He grew increasingly wary of Japan, which was rapidly becoming a military threat to China. Because so few of his colleagues perceived this danger as accurately as he did, he was unable to persuade them to develop fleets or improve standing armies. The result was that Japan humiliated China in the 1894–1895 Sino-Japanese War, ending with the Treaty of Shimonoseki.

Li died on 7 November 1901 in Tianjin, brokenhearted by the Boxer Protocols signed on 12 September. Even though he had foreseen and tried to prevent both the Sino-Japanese War and the Boxer Rebellion, Li was ashamed that foreigners had twice so severely humbled China on his watch.

Li Shihmin (600–649)

Grand strategist, second emperor of the Tang Dynasty (618–907), and son of Tang Dynasty founder Li Yuan. Histo-

rians continue to debate how much Li Shihmin contributed to his father's rise and the precise nature of the coup that forced the latter's abdication in his favor in 626. Clearly he made contributions to the rise of Tang, but they may not have been as great as the historical tradition indicates, and equally clearly, Shihmin was no innocent party in 626.

In 630, Shihmin, later known as Emperor Tai Zong, defeated the eastern Turks and in several great campaigns brought the Tarim Basin and its Silk Road under Tang control. He eventually pushed Chinese power well beyond the Pamirs, its greatest extension in history. He also established a short-lived Chinese protectorate over Tibet and tried to annex Korea, a process completed in 668 by his successor, Emperor Gao Zong (643–683).

To maintain control over China's extended borders, Li Shihmin used permanent garrisons of soldiers who grew their own food and were otherwise self-supporting. He did so because the Tang tax base was still limited, and he wished to reduce the strain on government resources. The practice also drew upon a long northern tradition of similar forces (*fubing*) predating Tang.

Such garrisons tended to become more settled as they established families and grew more and more integrated into the local population over time. Thus they were less available as mobile forces. Mobilizing such local forces for distant campaigns had never been easy in any case. Later, to solve this problem, the Tang had to turn to expensive mercenaries, who often had their own agendas.

Among his many other contributions, Li Shihmin restored local government after years of neglect. He continued the commitment of the Sui Dynasty (581–618) to a bureaucracy based on merit and primarily selected through a written examination system requiring mastery of Confucian philosophy and current topics. The energies of potential opponents were thus directed to passing the examinations and to moving ahead in the bureaucracy rather than to rebellion. Individual emperors (Empress Wu, for example) also used the examination system to recruit "new men," ones not associated with the traditional northern elite. It was largely thanks to Li Shihmin's conquests and the institutions that he established that the Tang Dynasty lasted for nearly another three centuries, in spite of its near collapse in the aftermath of the An Lushan rebellion of 751 and the need for late Tang to reinvent itself.

Liberia (1889–1997)

Founded in 1822 by freed slaves from the United States, the Republic of Liberia quickly became an autocracy in which the freed slaves (Americo-Liberians) held power over the indigenous peoples. This, along with the growing unrest of the 1970s and a faltering economy, sowed the seeds of the Liberian civil war.

In 1980 a group of enlisted soldiers led by Samuel Doe entered the presidential palace and executed President William Tolbert and his ministers. Doe declared himself president; his 9-year rule was marked by corruption, brutality, and nepotism. Doe both showed favor to his own ethnic group, the Krahn, and violently suppressed rival ethnic groups to the north.

In December 1989, Charles Taylor, a former Doe minister, launched an invasion of Liberia with his rebel group, the National Patriotic Front of Liberia (NPFL), from bases in Ivory Coast. Taylor and his soldiers had received training and arms from Libya as well as Burkina Faso. Once the invasion began, the NPFL advanced rapidly, driving the impotent Armed Forces of Liberia (ALF) before it.

Even before the invasion, there were numerous factions vying for power and position within the NPFL. Once the invasion had begun, the warring factions quickly became more hostile. Prince Yourmie Johnson, who split with Taylor and formed the Independent National Patriotic Front (INPFL), was the first of many defectors.

Within seven months, the NPFL was on the outskirts of the capital, Monrovia, and in control of 95 percent of the country. With the international community obviously not willing to intervene, the surrounding West African states initiated a historic first: an all-African peace-keeping force for service in Africa. The Economic Community of West African States (ECOWAS) deployed ECOMOG (the Economic Community Monitoring Group) to Monrovia in early 1990.

The situation in Monrovia quickly became a stalemate and turned into a West African Beirut, with different factions controlling specific areas of the city. Doe was killed in an ambush on his way to peace talks with NPFL, ECOMOG, and INFLP in September 1990. After President Doe's death, the remnants of the AFL (which was mainly Krahn) regrouped under the banner of the United Liberation Movement for Democracy in Liberia (ULIMO).

The situation remained relatively static until elections were held in 1997. These elections, monitored by international observers, drew 90 percent of the 1 million registered Liberians to the ballots. Taylor won the presidency in a landslide and was installed as the president of the State of Liberia, and a measure of stability returned to the wounded nation.

Liddell Hart, Sir Basil Henry (1895–1970)

British defense analyst. An infantry company commander when he was gassed in the Somme offensive, Liddell Hart became deeply involved in the development of infantry tactics in an attempt to restore mobility to the battlefield. His analyses caused senior officers to treat him with great courtesy, and he was unflinchingly proud of the ordinary British soldier, Britain's military leadership, and war aims.

In 1920, he made John Frederick Charles Fuller's acquaintance, and they sharpened each other's insights, writing for a wide audience about armored warfare. Both believed armor would profoundly change the nature of warfare, but Liddell Hart came close to advocating all-tank armies rather than Fuller's combined arms approach. In 1924, Liddell Hart was discharged for medical reasons from the service he loved, and his views of British military leadership deteriorated accordingly. As Adolf Hitler posed an increasing threat to Britain, Liddell Hart became convinced that British involvement in World War I had been a mistake. He therefore changed his policy positions to stress the primacy of the defense and became an appeaser as the Chamberlain government moved toward war.

His reputation shattered by the conquest of France, Liddell Hart lived quietly during World War II. After Germany's defeat, he began interviewing captured German officers, seeking to resurrect his reputation. Eventually, Generals Fritz Bayerlein and Heinz Guderian credited his writings with influencing German *offensive* armored doctrine at a

time when he had stressed the *defensive* potential of armor. In turn, Liddell Hart vouched for the Wehrmacht leadership's blackened honor.

Israeli army commanders, thinking it wise to link the Israeli Defense Forces to the Wehrmacht's efficiency, proclaimed themselves his other best pupils, further enhancing his status. By the time of his death on 29 January 1970, the development of German and Israeli blitzkrieg doctrine was firmly associated with Liddell Hart's interwar writings, in defiance of the historical record.

Light Brigade, Charge of the (25 October 1854)

Near-suicidal British cavalry charge against Russian artillery in the Battle of Balaklava in the Crimean War. The British commander at Balaklava, General Fitzroy James Henry Somerset, Baron Raglan, saw from his headquarters on Sapoune Heights that the Russians on Causeway Heights were removing allied guns from the redoubts they had captured from the Turks that morning. Raglan's perhaps erroneous recollection that his hero, the Duke of Wellington, had never lost a gun roused him to action. He immediately tried to prevent the Russians from adding these guns to their own artillery.

Raglan routinely delegated tactical decisions to his staff and field officers, even when communication among them was poor. He chose to defer to General George Charles Bingham, Third Earl Lucan, nominal commander of the British cavalry, who was then with his troops east of Sapoune at the western end of the North Valley. From that vantage point, Lucan could not see the redoubts.

Raglan dictated the following order to his quartermaster general, Colonel Richard Airey: "Lord Raglan wishes the Cavalry to advance rapidly to the front, follow the Enemy & try to prevent the Enemy carrying away the guns. Troop Horse Artillery may accompany. French Cavalry is on yr left.

Immediate." The obscurity of this order has prompted much controversy among historians over the years, but most of them blame Raglan for the disaster.

Airey's aide-de-camp, Captain Lewis Edward Nolan, galloped the order downhill to Lucan. Nolan attempted to indicate which guns Raglan meant, but Lucan could see only the three main Russian batteries, aimed south from Fedioukine Heights, north from Causeway Heights, and west from the eastern end of the North Valley. Lucan ordered Brigadier General James Thomas Brudenell, Seventh Earl Cardigan, to charge the easternmost battery, about a mile and a quarter away. Cardigan simply obeyed. Disgusted with Lucan, Nolan voluntarily took part in the charge and was among the first to die. Of the 675 cavalymen in the Light Brigade, only about 400 reached the guns, where they avenged their comrades by furiously sabering the Russian cannoners.

"The Charge of the Light Brigade" soon entered legend as a symbol of bravery, perhaps blind bravery, against overwhelming odds. Poet Laureate Alfred Lord Tennyson's poem of the same title even included the line, "Someone had blundered," but the offending words were excised, supposedly at the behest of Queen Victoria.

Lin Biao (1907–1971)

Chinese Communist military leader. Lin Biao was, for many years, a close associate of Mao Zedong and a key figure behind the successful Communist effort to defeat the Nationalists and gain control of China and the more mixed effort to face American intervention in Korea. His downfall under mysterious circumstances only added to his image.

At age 18 years, he entered the famous Whampoa Military Academy in Guangzhou, and soon thereafter he served as a platoon leader and later battalion commander in the famous Northern Expedition in 1927–1928 to "unify" China under Chiang Kai-shek's Nationalist regime. When Chiang turned against the Communists, Lin defected to Mao's forces, and several years later, his corps was the vanguard in the Long March of 1934–1935, the long defeat—yet ulti-

mately victory—as the Communists moved from southeastern to northwestern China.

When the anti-Japanese war (in which the Communists were little more effective than their Nationalist rivals) ended in 1945, Lin took command of Communist forces in Manchuria, and putting Mao's theories into practice, he abandoned the cities, gained the support of peasants, and took control of the countryside. By 1948, the Nationalists had suffered irreversible defeat in the northeast, despite massive American aid, and within a year had lost the battle for China.

In the late 1950s, Lin took over the army. He became a close ally of Mao during the Cultural Revolution of the mid-1960s that threatened to tear China apart. Lin compiled Mao's quotations into the famous book, *Quotations of Chairman Mao*. In 1966, Mao named Lin as his successor.

Then in 1971, it appeared—proof is sketchy—that Lin helped organize a plot against Mao (perhaps in opposition to the latter's opening to the Americans). When discovered, he tried to flee on an airplane to the Soviet Union; his plane supposedly crashed. But the reasons for and exact means of his demise remain shrouded in mystery.

Lincoln, Abraham (1809–1865)

Sixteenth president of the United States and for many the model of how a commander in chief should conduct a war. The American Civil War dominated the Lincoln administration and consumed the president's daily thoughts and actions. Although it can be claimed that the South had better generals, at least at the beginning of the war, Lincoln's leadership was the decisive factor in the North's favor, and historians have often listed Abraham Lincoln as the Union's greatest "asset."

On a practical level, Lincoln made several strategic decisions that altered the course of the war. He visited the army in the field 11 times, spending 42 days with them, and had voluminous correspondence with commanders. He studied military strategy and spent long hours at the War Department telegraph office. In May 1862, he personally issued or-

Detail of a photograph by Alexander Gardner of Abraham Lincoln with General McClellan (facing Lincoln) at Antietam, 1862. (Library of Congress)

ders for the occupation of Norfolk and later tried to organize Union attempts to defeat Stonewall Jackson in the Shenandoah Valley. Fearing for Washington's safety, he transferred the Army of the Potomac from southeast of Richmond to northern Virginia. In September 1863, he later decided to transfer four divisions of that army to Chattanooga under General William Rosecrans after the loss of the Battle of Chickamauga. It was not uncommon for the president to study maps and make suggestions to his generals. Yet Lincoln left most military decisions to his commanders; he was not what a later generation would call a "micromanager." He insisted that commanders act promptly, not move slowly, and take advantage of numeric superiority. Such considerations led him to remove or demote generals such as George McClellan and remain fearlessly loyal in the face of criticism of commanders like Ulysses Grant.

Lincoln's greatest impact on the war was in the political arena, where he was able to promote and sustain northern participation. He strengthened and unified the Republican Party through the use of political and military appointments. He kept many of the border states in the Union and worked with Democrats who opposed emancipation and "subjugation" of the Confederate states. He was also able to dominate the Peace Democrats and their 1864 platform,

The Battle of the Little Bighorn. Painting by C. M. Russell, 1903. (Library of Congress)

which called for an armistice and a negotiated end to the fighting. Lincoln issued directives and urged the passage of laws that harnessed the industrial capacity of the Union for war production, promoted volunteerism, and stifled criticism. His declaration of martial law is perhaps the most controversial aspect of his war leadership. Through speeches, letters, and the Emancipation Proclamation, the president was able to bring a moral clarity and authority to the cause and conduct of the war. The conflict was transformed from one over states' rights and secession to a crusade for freedom and justice. For many, he had come to personify the northern cause, and his passing is often referred to as the last death of the Civil War. Abraham Lincoln was the only American president whose entire administration was conducted in time of war.

Little Bighorn (25–26 June 1876)

Perhaps the most written about and hotly debated battle in U.S. military history. The deeper symbolism and mythology linked to what is popularly known as “Custer’s Last Stand” have often outweighed in the minds of Americans what actually occurred on 25–26 June 1876. Even Americans severely ignorant of their own history know something of “Custer’s Last Stand” and of that other “They Died with Their Boots On” epic—the Alamo.

In December 1875, under the direction of President Ulysses S. Grant, the commissioner of Indian affairs ordered all northern Plains Indians to report to their agencies by 31 January 1876 or be forced to do so by the army. General William Sherman and General Philip Sheridan had planned a winter campaign to break the hostiles, but General George Armstrong Custer had been delayed in reporting to his command because of a conflict with the president. On 17 May, General Alfred Terry, Custer, and the Dakota column left Fort Abraham Lincoln, in a coordinated effort with troops under the command of General George Crook, to round up renegade Sioux and Cheyenne warriors. On 22 June, Terry ordered Colonel John Gibbons and Custer to lead two columns into the valley of Little Bighorn, trapping any Indians found in the valley between them.

The nearly 600 soldiers of Custer's Seventh Cavalry and 35 Crow scouts marched south along Rosebud Creek. On the night of 24 June, from a tall peak in the Wolf Mountains, scouts saw the unmistakable signs of a large village in the Little Bighorn Valley. Believing they would scatter, Custer ordered a forced march to engage them before they could escape. A few miles from the camp, Custer ordered Major Marcus A. Reno to lead three companies directly into the Little Bighorn and attack the southern end of the village. Custer would take the remaining five companies east of the river and attack the village's northern end. Captain Frederick Benteen would take three companies to the south, along the Wolf Mountains, to make sure no one escaped.

Although the exact size of the encampment is debated, it was the largest Indian village ever to congregate on the Plains. On the morning of the 25th, Reno's troops crossed the Little Bighorn River 2 miles south of the village and then advanced on the lodges. Just short of the encampment, Hunkpapa warriors met the oncoming soldiers. Able to hold his position for just 15 minutes, Reno ordered his men to retreat to a grove of cottonwood trees along the river. Feeling surrounded, Reno ordered his command to withdraw to the steep bluffs on the other side of the river. Of his 140 men, Reno had 40 killed, 13 wounded, and 17 stranded in the trees below. Benteen's troops arrived on the scene and dug in with Reno. Custer's companies attacked the village from a broad coulee know as Medicine Tail. As the troopers tried to cross the river, they received heavy fire from warriors. After they were driven back to the bluffs, it is debatable what exactly occurred. Whether they were overwhelmed by Indians led by the warrior Gall or encircled from the rear by Crazy Horse's Oglala, every soldier under Custer's command was killed. Although the exact number of Sioux and Cheyenne who died is unknown, 263 soldiers were killed and 60 wounded (of Reno's men). It is said that for the next four decades, every saloon in the United States had mounted over the bar either a full-length painting of a nude or a depiction of Custer's Last Stand.

Livonian War (1558–1583)

A military conflict initiated by Ivan IV of the Muscovite state against Livonia in an attempt to gain an outlet to the Baltic Sea for trade with the West. Hostilities broke out in January 1558. Ivan invaded Livonia, which the grand master of the Livonian Order of Knights had occupied and ruled since the thirteenth century. His forces seized much of its territory, including the commercial port of Narva (Dorpat).

The Livonian knights, unable to face Ivan's offensive, placed themselves under the protection of the king of Poland. Subsequently, Livonia was partitioned among Poland, Denmark, and Sweden. This development precipitated the war between Lithuania and the Muscovite state. Ivan's army captured several towns, including the fortified city of Polotsk. Faced with complete collapse, Lithuania formed a political union with Poland in 1569, and Stepan Bathory was elected king of the Polish-Lithuanian kingdom. An able military commander, Bathory led his well-trained army against the Russians, defeated them repeatedly, and captured Polotsk and several border towns. His advance was finally halted at Pskov. The Swedes, meanwhile, took advantage of Ivan's unfavorable position, invaded the Baltic, seized Narva, and occupied the entire coast of the Gulf of Finland.

Finally, Ivan appealed to Pope Gregory XIII to mediate the conflict. Hoping to bring Muscovy into the Catholic fold, the pope dispatched the Jesuit Antonio Possevino, who arranged an armistice between Ivan and Bathory in 1582. The following year, Ivan ceded Livonia and Polotsk but kept his former possessions along the Lithuanian border. A year later, he signed a less favorable armistice with Sweden, surrendering most of the Baltic coastline. After 25 years of intermittent warfare, Ivan IV was no closer to gaining a window to the West, and Moscow had to wait another century to achieve this objective.

Lobengula (a.k.a. Lopenule, Nobengulu, or Ulopengule) (c. 1830–1894)

King of the Ndebele (Matabele), in what is today Zimbabwe. At the beginning of the 1840s, Lobengula's father, the Ndebele king Mzilikazi, ordered many of his subjects, including his sons, to be killed in an effort to stamp out possible oppo-

sition. However, Lobengula was hidden by his mother and lived in seclusion for several years.

Consequently, little is known about Lobengula until the death of Mzilikazi in 1868. Two years later, Lobengula was installed as king at the insistence of the witch doctors and *indunas*. However, not all the Ndebele tribes recognized Lobengula as their king, and he took action against his opponents, routing them in battle. In 1881 he moved to the new town he had built for himself at Gibexhegu, later renamed Bulawayo. Aggressive raiding against other tribes was an integral part of Ndebele life, which for several years ensured dominance in his sphere of influence. However, in due course many European hunters, traders, and concession seekers entered Matabeleland and Mashonaland. Against the background of Cecil John Rhodes's plans for British expansion northward from the Cape Colony, Lobengula first signed a treaty with the Boer Transvaal Republic (1887) and then with John Smith Moffat, a British representative (1888).

Also in 1888, Lobengula ceded his country's mineral rights to a group representing Rhodes. Rhodes then formed the British South Africa Company (BSAC), and soon British settlers started to occupy portions of what became known as Southern Rhodesia (now Zimbabwe). Soon clashes between white and black ensued, and the BSAC's forces were ordered to occupy Matabeleland. Lobengula set fire to his capital, Bulawayo, on 3 November 1893, the day before the company's forces arrived. Lobengula fled with several of his regiments, pursued by the company's men. A patrol under Major Allan Wilson caught up with Lobengula's forces on the Shangani River, but all 33 members of the "Shangani Patrol" were killed. Soon after, Lobengula reached Pashu's country, but there he died—of self-administered poison, smallpox, or arthritis. Lobengula was a man of high intelligence, but he lacked the military genius and ruthless cruelty of his father. He was not inclined to be a warrior, but his suspicious nature and the influence of witch doctors and *indunas* led him to commit acts of cruelty.

Lodi (10 May 1796)

A battle fought in northern Italy between the French Army

of Italy, commanded by Napoleon Bonaparte, and an Austrian army commanded by J. P. Beaulieu. Bonaparte opened the first Italian campaign in April 1796 with an attack on the Piedmontese army, commanded by General Colli, and a supporting Austrian force, commanded by Generals Provera and Argentau. The French assault led to several inconclusive actions and the withdrawal of the Piedmontese army.

By 24 April 1796, Bonaparte was threatening the Piedmontese capital, Turin. The king of Piedmont asked for an armistice, which Bonaparte granted. The effective neutralization of the Piedmontese allowed Bonaparte to attempt to trap the main Austrian army, which had been left in a dangerously exposed position southwest of Milan as a result of the Piedmontese negotiations.

The French army, 30,000 strong, thus began a 50-mile forced march in an attempt to seize crossings over the River Adda, including the town of Lodi, in order to trap the Austrian army. Beaulieu, aware of his danger, was in full retreat, and with a vigor unusual for Austrian generals of the period, managed to escape with most of his army across the Adda River, leaving only a 10,000-strong rear guard by the time the French reached Lodi on 10 May.

The Battle of Lodi itself consisted simply of determined French assaults upon a bridge over the River Adda. The first of these failed. The second, however, prevailed, and the French main column, assisted by a body of cavalry that had forded upriver, routed the Austrians. The Austrians lost about 150 men, and 1,700 were taken prisoner. The French lost 350 men.

Despite the relatively small scale of the action, the French victory at Lodi opened the way for the capture of Milan. As a result, the Kingdom of Savoy and the Duchies of Parma and Modena were forced to make peace with the French, and the Kingdom of Piedmont found it expedient to complete peace negotiations with the French. The French were now masters of the northwestern Italian peninsula, and Bonaparte was free to begin efforts to force the Austrians from Mantua, which would culminate in the Battle of Rivoli.

Logistics

Umbrella term for military activities other than strategy and tactics that emerged about two centuries ago. Today it is largely an American usage crystallized in World War II and

encompassing military supply, transportation, medical service, and construction-maintenance.

Historically, there have been three solutions to the problem of supplying an army with the least sacrifice of power, mobility, and range: (1) self-containment, in which the force carries all its supplies, mortgaging power and range to mobility; (2) local supply, a forage system that narrows military activity to growing seasons and fertile areas; and (3) supply from bases, favoring power and range over mobility. Alexander the Great's army marched, self-contained, from Macedonia to India. Napoleon's armies foraged their way across Europe for a dozen years, but his Grand Army starved and froze while retreating from Moscow through country it had already denuded. The arrival of mass armies and greatly increased firepower after the Industrial Revolution, combined with highly developed systems of communication and economic support, brought widespread reliance on supply from bases. Generals continued to be more interested in strategy and tactics than in logistics, however, and thus took less advantage of manpower and munitions than they might have done. In 1870 the Germans used staged, continuous resupply by railroad to support their invasion of France by a mass army and found that even constant forward movement of supply depots was not enough to forestall the necessity of foraging. The long-planned envelopment of Paris by German armies was frustrated in 1914 in part because their plans called for more troops than the road system could bear and in part because rail lines used by the French to bring reinforcements from the Alsace-Lorraine front had not been targeted by German planners.

World War II was a breathtaking exercise in the logistics of total war. The Allies produced seven times as many planes as the Axis powers, five times as many trucks and artillery pieces, and more than four times as many machine guns and tanks. All these and millions of men and women had to be transported to fronts all over the world in the face of enemy resistance. But the inability of the Luftwaffe to resupply the German army trapped at Stalingrad, like the halting of General George Patton's offensive late in 1944, indicated the limits on logistical problem solving in total war. Nonetheless, the United States was able not only to lavishly supply (by the standards of the other belligerents) its own forces but also to provide millions of tons of equipment for the Nationalist Chinese, the Free French, the Soviets, and even the British forces.

At war's end, the advent of nuclear weaponry threatened to make conventional logistics irrelevant, and superpower rivalry raised new problems in the organization, deployment, and supply of mass armies. At the same time, Third World conflicts increasingly demanded rapid deployment of special forces. The United States solved these problems in the post-Vietnam era by elaborating AirLand, mechanized

combined operations that could stop a Soviet offensive in Europe and be adapted to more limited scenarios, such as the deployment of 527,000 personnel and 3,500 aircraft in the Gulf War.

Long Island, Battle of (22 August 1776)

A major defeat of the patriot American forces early in the Revolutionary War. In summer 1776, a huge British fleet with a large army arrived off New York City. The British occupied Staten Island, and the Americans, led by George Washington, defended Long Island along Brooklyn Heights as well as the Battery, Fort Washington, and other places in and around New York City. For seven weeks, the British strengthened their positions.

British general William Howe and 10,000 troops landed on Long Island on 22 August and proceeded to formulate a plan. The American defenders were at best untrained in warfare and inexperienced in battle; at worst, a mob without artillery. While some British and German troops demonstrated in front of the American position, Howe and about half his men marched around and behind the American left flank. They gained complete surprise, General John Sullivan's left wing was crushed, and the men fled. Washington ordered a retreat.

After considering a defense of Long Island at Gowanus Bay and realizing the British fleet could trap him, Washington had his men rowed across the East River to Manhattan, where after a battle at Harlem Heights and some fighting at Fort Lee and Fort Washington, he retreated to White Plains and later across the Hudson to New Jersey. General William Howe and his brother, Admiral Richard Howe, not wanting a repeat of the slaughter at Breed's Hill, pursued rather slowly. Howe also feared exasperating the Americans and hoped for some sort of negotiated reconciliation. Although the brothers Howe may have felt they had demonstrated the Americans' inability to withstand a proper British attack, they also had given Washington time to withdraw and save his army to fight another day.

Longstreet, James (1821–1904)

Confederate field commander in the American Civil War, a skillful subordinate but unsuited for independent command. Longstreet was born in Edgefield District, South Carolina, on 8 January 1821. As a member of the West Point class of 1842, his roommate was William S. Rosecrans. An infantry lieutenant in the Mexican-American War, he won brevets to captain at Churubusco on 20 August 1847 and major at Molino del Rey on 8 September and was severely wounded at Chapultepec on 13 September. Promoted to captain in 1852 and major in 1858, he resigned on 1 June 1861 to join the Confederacy, which commissioned him brigadier general on 17 June.

Longstreet defeated Irvin McDowell's vanguard at Blackburn's Ford, Virginia, on 18 July and distinguished himself at First Bull Run. Promoted to major general on 7 October, he served under Joseph Johnston in the Peninsula campaign, fighting at Yorktown, Williamsburg, Seven Pines, and Fair Oaks. He excelled at Second Bull Run; fought at South Mountain, Maryland; commanded Robert E. Lee's right flank at Antietam; and held Marye's Heights at Fredericksburg. He made lieutenant general on 9 October 1862.

On the way to Gettysburg, Longstreet counseled Lee to maneuver between George Meade's army and Washington, D.C., thus forcing Meade to attack. Nevertheless, Lee attacked, with Longstreet commanding the right. By the third day, Longstreet was so disheartened that he had difficulty bringing himself to convey Lee's order to George Pickett to charge the Union center. Historians analyzing Gettysburg from both tactical and strategic viewpoints usually agree that Longstreet's plans were more reasonable than Lee's.

After Gettysburg, Lee detached Longstreet to Georgia to reinforce Braxton Bragg. Longstreet's arrival in time to command the left on the second day at Chickamauga ensured

the Confederate victory. His siege of Knoxville, however, deprived the South of needed manpower at Chattanooga. Wounded at the Wilderness, he recovered for the final Petersburg and Richmond campaigns and was with Lee at Appomattox.

After the war, Longstreet became a Republican and held several federal offices in the Grant, Hayes, Garfield, Arthur, McKinley, and Theodore Roosevelt administrations. He died in Gainesville, Georgia, on 2 January 1904.

Louis XIV (1638–1715)

King of France and warlord for more than 70 years. In the eyes of a younger generation that had forgotten the former power of Spain, Louis XIV was a vain warmonger and enduring threat to the European balance of power, largely because of a policy directed at the destruction of Spain's power that continued long after Spain had apparently lost its influence on the international stage.

Louis led his armies in his youth but never fought a major battle. In later years, he sometimes assumed personal command at sieges because this form of war permitted him to establish permanent camps where he could carry out his administrative responsibilities. His letters reveal a lively understanding of siege craft, and he certainly had a gift for finding able commanders.

Louis inherited the Thirty Years' War (1618–1648), a long-drawn-out conflict with Spain, and the civil wars of the Fronde. In 1661 he launched the War of Devolution with Spain, only two years after the signing of the Peace of the Pyrenees. A Dutch War (1672–1678) soon followed, in which Franche-Comté fell into his hands. Between 1678 and 1688, Louis used armed force to intimidate his neighbors, annex-

ing Strasbourg and other territory in Germany. This policy shaded into a general European conflict in 1688, the War of the Grand Alliance or War of the League of Augsburg (1688–1697). Primarily defensive in Europe, it ended with significant French gains in the Americas as Britain was driven to unfortunate terms by near-bankruptcy. In the long War of the Spanish Succession (1701–1714), Louis devastated France's economy while establishing a king of his house in Spain (although not in many of Spain's former European territories) and ending the Spanish menace, but in the process he sacrificed his earlier gains in the Americas. He died in 1715, admitting on his deathbed that he had "loved war too much."

Louisbourg, Expedition against (May–June 1758)

Successful British and colonial operation that forced the surrender of the linchpin of the defense of New France. Early in 1757, the new British prime minister, William Pitt, ordered the Earl of Loudoun to seize Louisbourg, a fort on Cape Breton Island guarding the entrance to the Gulf of St. Lawrence. This effort failed miserably. By the time 10 regiments arrived from Ireland to join forces already gathered in Halifax, Nova Scotia, a large French fleet had reached Louisbourg and brought 2,500 reinforcements. Stormy weather halted British operations for the rest of July and August. The British naval commander, Vice Admiral Francis Holbourne, believed offensive action was hopeless, and Loudoun agreed and abandoned the attack and retreated to New York City.

General William Pepperrell at the siege of Louisburg in 1745. (Library of Congress)

The next year, Pitt wisely promoted three junior officers who all would play major roles in the eventual British victory over the French in North America. One of these officers, Jeffrey Amherst, commanded the attack on Louisbourg. A British fleet sailed to Halifax in winter 1758, and reinforcements arrived several months later in early May. On 28 May, the expedition set out. Amherst followed the plan New Englanders had used in their successful attack in 1745. Led by James Wolfe, men landed at Gabarus Bay, west of Louisbourg, and soon established a siege that greatly damaged the town. On 26 July 1758, the governor raised the white flag of surrender.

The loss of Louisbourg imperiled the French colony in Quebec, which depended on seaborne transportation through the Gulf and past the fort to France. Defeat at Louisbourg foreshadowed France's defeat in North America several years later.

Louvois, François-Michel Le Tellier, Marquis de (1639–1691)

The most outstanding military organizer of the seventeenth century. Louvois was the son of one of the most powerful officials of Louis's XIV early reign. In 1655, the senior Le Tellier brought his dissolute teenaged son into the war department to teach him military administration. He emerged as a hard worker, supremely confident in his own ability to be a brilliant administrator. His administrative career is exceptional; as early as 1661 he was working with his father in the foreign affairs council and was appointed state minister in 1672, in charge of military affairs and administration, after his father's retirement. With Louis's backing, Louvois transformed the French army from a feudal semi-independent force to the first modern army. The reform of the financial and tax system gave Louvois the money he needed to increase the king's troops both in quantity and quality.

His first task was to build a centralized army control: he used civilian inspectors as war commissioners or army intendants whose job was to reduce corruption by regular inspections of troops. Officers, whatever their rank of birth or their commission, were responsible for obedience to orders and regulations, which were prescribed by Louvois. Corrupt or insubordinate officers were dismissed. Officers were also expected to be conversant with current military theories and practices. The purchasing of officers' commissions was fought by Louvois. He instituted ranks that were appointed by the king rather than bought: from 1661, lieutenant colonels were promoted solely on merit, the rank of brigadier general (given by the king) opened the way to high command to poorer nobility (Sébastien Le Prestre de Vauban's career is the best example). Louvois's work included the reform of various administrative branches: creating militia for second-line duties, which was the first attempt at a national conscription system; constructing barracks for the troops instead of quartering them in citizens' houses; providing regular pay and a uniform; implementing tighter discipline and a military justice code; and improving standardized weapons.

All these reforms were conducted to improve the soldier's lot and to ensure his loyalty to the king, as well as to heighten morale and corps pride. Louvois supported the first veterans' hospital, Les Invalides. The French army reached the incredible number of 450,000 soldiers by Louvois's death. He had constructed the military tool needed by Louis XIV for his aggressive foreign policy.

Ludendorff, Erich Friedrich Wilhelm (1865–1937)

World War I general and postwar politician. Ludendorff was born on 9 April 1865, near Posen. He entered the army in 1883 and was appointed to the general staff in 1895. On 2 August 1914, he was appointed deputy chief of staff for the Second Army. He saw action on the western front and immediately won fame through his contribution to the capture of Liège. On 22 August 1914, he was appointed chief of staff of the Eighth Army, serving under Paul von Hindenburg. Their spectacular victories over the Russians at Tannenberg and the Masurian Lakes (August–September 1914) made them

the most popular generals in Germany. In November 1914, Ludendorff was made chief of staff of the Supreme Command on the eastern front, again serving under Hindenburg. Convinced that the war could be won on the eastern front, Ludendorff came into increasing conflict over strategy with Erich von Falkenhayn, chief of the general staff. Falkenhayn's dismissal in August 1916 resulted in his replacement by Hindenburg, with Ludendorff serving as first quartermaster general. Ludendorff and Hindenburg were now in charge of German military strategy and increasingly of German domestic policy, a situation that by 1917 had led to the creation of a "silent dictatorship." Domestically, Ludendorff and Hindenburg sought to place the German economy on a total war footing. Militarily, they were responsible for the reintroduction of unrestricted submarine warfare in April 1917 and the annexationist peace treaties imposed on Russia and Romania in 1918. Following victory in the East, Ludendorff oversaw Germany's final attempt to break the stalemate on the western front in 1918. After the war, Ludendorff became active in right-wing politics. He participated in Hitler's failed Beer Hall Putsch in 1923 and served in the Reichstag from 1924 to 1928. Ludendorff died on 20 December 1937 in Bavaria.

Lundy's Lane, Battle of (25–26 June 1814)

The most sanguinary battle of the War of 1812, a draw. The Americans sought to follow up their victory several weeks earlier at Chippewa on the Niagara frontier. General Winfield Scott and about 1,000 troops were in the vanguard, with General Jacob Brown in command of the main unit. Scott was aggressive and unexpectedly encountered a British force of 1,600 to 1,800 troops. Although outnumbered, he believed he had to attack because a retreat might result in panic among his main body of troops.

So, in the early evening of 25 July 1814, Scott ordered an attack uphill against British troops and a gun battery. The attack failed, for British artillery was extremely effective, and Scott had to retreat. As more and more Americans arrived, they once again assumed the offensive as dusk turned into

night. The British too received reinforcements, and the fighting became intense with heavy casualties—more than 850—on each side.

After dark, the Americans began to run out of ammunition, and General Brown ordered them to retreat. The British and Canadians held the field but were too exhausted to give chase as the Americans retreated to Fort Erie. The earlier American victory at Chippewa was undone, and bloody Lundy's Lane ended this last U.S. effort to invade Canada.

The king's subordinates quickly marshaled all available forces and plunged ahead. The battle seesawed as infantry formations pushed with pikes and cavalry repeatedly charged and countercharged. The Swedes finally rallied and swept the imperial forces off the field, capturing by nightfall all their artillery and killing upward of 12,000 men. Swedish losses were about 6,000. Though a technical victory for the Swedes, the loss of their king brought the military balance into equilibrium. The Swedes lost much of the strategic initiative and direction Gustavus provided. The Battle of Nordlingen (1634) completed the shift of fortunes back to the Catholic cause.

Lützen, Battle of (16 November 1632)

The high tide of Swedish strategic dominance under Gustavus Adolphus during the Thirty Years' War. Following the Swedish victory at Breitenfeld in the fall of 1631, the Swedes under Gustavus marched into Bavaria to attack the senior member of the Catholic League. The Hapsburg general Albrecht von Wallenstein skillfully rallied the imperial troops and wore down the Swedish force. After the imperial victory at Nuremberg on 3 September 1632, a series of inconclusive engagements brought the combatants back into Saxony.

The two forces clashed again at Lützen on 16 November 1632. Eighteen thousand Swedes faced 25,000 imperial troops. Wallenstein occupied a strong position with cavalry on the wings, four *tercios* composed of pikemen and musketeers in the center, and artillery emplaced in the center and on the right flank. Additionally, a ditch defended by musketeers extended across his front. The Swedes took up their usual linear formation of two lines with infantry in the center and cavalry-infantry combinations on the wings. Gustavus, commanding his right wing of cavalry, planned to attack Wallenstein's left flank to push him back and away from Lützen. After an intense artillery barrage, Gustavus led his cavalry to penetrate the imperial musketeers and crash into Wallenstein's cavalry. Swedish infantry likewise advanced and captured the imperial artillery in the center. This success was temporary, however. Imperial cavalry charged into the flanks of the Swedish infantry, throwing them back. At this point, Gustavus moved across the field to rally his infantry and personally lead his final charge against the enemy. He died with musket balls in his arm, back, and head.

Luxembourg, François Henri de Montmorency-Bouteville, Duc de Piney (1628–1695)

The most brilliant tactical commander of Louis XIV's early reign. The son of a duelist beheaded in 1627, he was educated at a prince's court and became a close friend of the Great Condé. At the age of 20, he was appointed brigadier general after the Battle of Lens (1648). Being loyal to Condé, he took part in the Wars of the Fronde on the rebels' side. His choice leading him straight to treason against the young king, he commanded Spanish troops during the Battles of Arras and the Dunes (1658). When the peace treaty of the Pyrenees was concluded, he was allowed to return to Paris in poverty. Once again, Condé helped him in finding a rich, noble young lady to marry. He claimed for his wife the restoration of the peerage of Luxembourg and eventually added this title to his own. He became the duke of Luxembourg and had to take legal action to be accepted as such by the king's courtiers.

Luxembourg's fortune had to wait 10 years before Louis XIV again allowed him to command French troops. The Dutch War of 1672–1678 gave him the opportunity to distinguish himself. Commanding the army in 1672 after the king's departure, he won the Battle of Senef with Condé in 1674 and was made marshal of France in July 1675. The victories accumulated in the following years: Valenciennes and Cassel in 1677 and Ypres and Saint Denis in 1678. His cleverness and his composure were the cornerstones of his tactical

skill, but he took a hard line with those who didn't share his views and made numerous personal enemies, including François-Michel Le Tellier, Marquis de Louvois.

In 1679, Luxembourg was deeply involved in the famous poisoning of a king's mistress and spent 14 months in the Bastille jail. After being discharged the following year, he returned to court. The war of the Augsburg League gave him a further opportunity to add new victories to the king's glory: Fleurus in 1690, Leuze in 1691, Steinkeerk in 1692, and Neerwinden in 1693. This last battle crowned him as an outstanding tactical general. After besieging Huy, Luxembourg lured William of Orange from a very strong camp into a less sound position, brought him to battle, and successfully routed the allied army. His death in January 1695 left France without anyone of his quality to take his place. His nickname was "le tapissier de Notre Dame"—Notre Dame's decorator—in token of the dozens of captured standards displayed in that cathedral.

Luxembourg, Siege of (April–June 1684)

Probably the best example of siege warfare in the seventeenth century. During the seventeenth century, sieges were the rule and battle the exception. Fortified cities dominated communication lines and the most fertile parts of land. A field army could not allow harassing garrisons in its rear. Luxembourg was one of the most feared and well-defended fortified towns of this era. The five-stage siege of 1684 is archetypal.

The first stage was in January, when a French army under the Marechal de Créqui isolated Luxembourg from the Spanish main army. Then, a covering force of 20,000 took position between Brussels and Luxembourg to mislead the Spanish commanders. The main army approached Luxembourg with Marechal Sébastien Le Prestre de Vauban as commanding officer. A siege had to be conducted by specialist officers, who sometime overruled superiors, including the king. The besieging army was composed of more than 25,000 soldiers, including 40 royal engineers, and more than 70 guns. The besieged Spanish troops numbered no more than 3,000 under the governor, the prince de Chimay, and the comte de Tille. From 28 April to 8 May, defending lines

were dug a few miles away from the town to protect the besieging troops. Vauban had to use 12,000 workers, forcing unwilling peasants into service. The inner lines were dug by troops under artillery fire.

The fortified town of Luxembourg was protected by high cliffs, a river, and modern fortifications made of a glacis-covered tunnel in front of ditches and bastions protecting the curtain walls. From early May, parallels were dug, and then zigzag trenches were constructed. Meanwhile, sappers had dug explosive mines. The explosion on 27 May was the sign of the assault on this first line by elite troopers. The French took the covered way and had to begin a new siege on the second defense line by a bastion. Hundreds of gabions were made to protect the head of the approaching trench. During the siege operations, the French artillery fired more than 55,000 rounds, night and day. The governor of Luxembourg, not expecting any relieving army and fearing the plunder and massacre that would follow a general assault, asked to surrender on 3 June. Four days later, he left the town with 2,000 survivors. The siege had cost more than 373,000 French livres, less than the million needed to rebuild new fortifications with Vauban as the main architect.

Lyautey, Louis-Hubert-Gonzalve (1854–1934)

French colonial administrator and soldier. Born 17 November 1854 in Nancy, France, Lyautey studied at the Saint-Cyr Military Academy, spent time in a cavalry regiment, and served in Algeria from 1880 to 1882. He served in Indochina under the influential Joseph Simon Gallieni in 1894 and transferred to Madagascar in 1896. After successfully subduing the southern portion of the island, he returned to France to command the 14th Hussars at Alençon (1902–1903). Transferred to Algeria, he commanded the Ain Sefra region and gradually began expanding French territory into Morocco. In 1906, he became commandant of Oran and squelched Moroccan resistance to his expansion, particularly the rebellion of the Beni Snassen in late 1907. Lyautey returned to France and commanded the X Corps at Rennes from December 1910 to March 1912. He returned to Africa as resident general of the protectorate of Morocco in April

1912 and stepped into the middle of a revolt. He managed to reassert French rule and restore order fairly quickly and again was able to increase French holdings.

At the start of World War I, most of his troops left for France, but Lyautey kept a potentially explosive situation in hand by working within existing tribal institutions. From December 1916 to March 1917, he served as minister of war in Paris. Afterward, he assumed his former post in Morocco and successfully defended against a rebel force led by Abd-El Krim at Taza in spring 1925. Lyautey resigned on 5 September of that year, partly as a result of the appointment of Marshal Henri-Philippe Pétain as commander in chief in Morocco. He retired at Thorey, where he died on 21 July 1934.

Lysander (d. 395 B.C.E.)

Spartan commander who combined land and sea strategies to defeat the Athenians in the final phase of the Second Peloponnesian War. In 406 B.C.E., Lysander, with a fleet of 140 ships, engaged the Athenian navy at Lesbos, destroying 30 of its 70 ships. The Athenians, in desperation, melted down the

dedications to the gods, offered freedom to slaves and citizenship to the metics (resident foreigners), and built 150 additional ships. They engaged the Spartan navy at Arginusae, where they won their last naval victory of the war. The following year, Lysander ordered his ships to the Hellespont, where he observed the Athenian fleet. The Athenians attempted to draw the Spartan ships into battle, but Lysander ordered them to wait. Frustrated by the delays and needing fresh supplies, the Athenians anchored their ships and went ashore for provisions. Lysander seized this opportunity to dart across the straits separating the two fleets and captured 160 of the 180 Athenian ships. He then pushed all Athenians living outside Athens back to the city. After an eight-month siege, the people surrendered, and Lysander installed a new oligarchic government of the Thirty. In 403 B.C.E., Lysander put down an Athenian revolt intended to restore democracy.

After the death of the Spartan king Agis II, Lysander pushed the claim of Agis's brother Agesilaus as the rightful heir to the throne. Confident that he could exercise control over Agesilaus because of a personal relationship between the two men, Lysander received an appointment as the head of the board of 30 advisers for the new king. Agesilaus often rejected Lysander's advice, and at the beginning of the Corinthian War in 395 B.C.E., Lysander returned to Greece and was slain in the first battle of the war.

M

MacArthur, Arthur, Jr. (1845–1912)

Prominent U.S. Army commander. Born in Springfield, Massachusetts, on 2 June 1845, Arthur MacArthur Jr. moved with his family to Milwaukee, Wisconsin, in 1849. Following the outbreak of the Civil War, MacArthur attempted to get an appointment to West Point, but when he was unable to do so, his politically influential father, Judge Arthur MacArthur Sr., managed to have him commissioned a second lieutenant and named the adjutant of the 24th Wisconsin Infantry Regiment on 4 August 1862. At the Battle of Missionary Ridge (25 November 1863), he seized the regimental colors at a critical moment and led his regiment to the crest of the ridge. The 24th Wisconsin's colors were the first to be planted on the enemy's breastworks, and for his daring action, MacArthur was awarded the Medal of Honor on 30 June 1890. By the end of the Civil War, MacArthur had been promoted to lieutenant colonel and brevetted to full colonel.

After being mustered out of the volunteers in June 1865, MacArthur was commissioned a first lieutenant in the regular army in February 1866. For the next 30 years, he served on the frontier, eventually being promoted to lieutenant colonel in May 1896. After the outbreak of the Spanish-American War, MacArthur was promoted to brigadier general of volunteers in May 1898 and commanded a brigade during the capture of Manila. Promoted to major general of volunteers in August 1898, he was given command of the U.S. forces in the Philippines, which were fighting against the insurrectionist army of Emilio Aguinaldo. MacArthur was promoted to brigadier general in the regular army in January 1901 and major general in February, which was followed by an appointment as the military governor of the Philippines in May 1901. In September 1906, MacArthur was promoted to lieutenant general and given command of all U.S. Army personnel in the Pacific. Despite being the most senior officer in the U.S. Army, he was passed over for

the position of chief of staff and retired in June 1909. MacArthur died when a blood vessel in his brain burst while he was giving a speech at the 24th Wisconsin's fiftieth reunion in Milwaukee on 5 September 1912.

MacArthur, Douglas (1884–1964)

The most successful and most controversial of any American general. His real and unchallenged accomplishments included the development of modern staff procedures, the foundation for American military expansion in the face of World War II, and the stunning employment of amphibious force in World War II and at Inchon in 1950. Still, his record has been marred by his own arrogance and by his refusal fully to disclose the reasons for many of the high command decisions.

MacArthur was born on 26 January 1880 into a military family. His father was a Civil War hero who was later to serve as the first U.S. governor of the Philippines and who would be rewarded by promotion to lieutenant general, then a rare rank in the American service. His older brother was a Naval Academy graduate who was himself a distinguished officer and whose death at a relatively early age was much lamented by his peers.

As is the case with most complex people, MacArthur was

Douglas MacArthur, after being fired by President Truman, making a speech, 1951. (Library of Congress)

a morass of contradictions. He was not an innate modernizer, but when the need for modernization was proven to him, he demanded it from his subordinates and from the military system. He detested staff work but, in World War I, developed and ran what might have been the finest divisional staff in that war. In World War II, he allowed his own staff to become rather slack at conducting routine chores while he developed elaborate plans on his own that emerged fully hatched and capable of implementation. His faith in the American fighting man—army, navy, Marine Corps, and air force was immense—yet he spent most of his career with the navy, air force, and Marine Corps distrusting him to the point at which he had to challenge them with barbs to achieve his ends. He sought closeness with political leaders but only achieved it either with those whose grip on power was slight, such as Newton Baker or Herbert Hoover, or those who failed fully to understand his capacities, such as Franklin D. Roosevelt. At the same time, he alienated the political leaders who could have worked with him for even greater accomplishments than were to be his due, such as Henry Stimson or Harry Truman. MacArthur's entire life is one of contradiction.

Although MacArthur did not develop the idea, he was the first major U.S. commander to accept the necessity of bypassing Japanese strong points in the Pacific. He was late in comprehending the significance of tactical air power, yet, once convinced, no U.S. commander has ever understood or employed air power to better advantage than did MacArthur. He had been an early advocate of strategic air power, but his advocacy was so shielded that it seemed nonexistent to many of the leaders of the army and air force in the buildup to World War II. In a similar vein, MacArthur alienated the navy, though his relationship with the chief of naval

operations during MacArthur's tenure as army chief of staff marked the high-water level of army-navy relations for almost the first half of the twentieth century.

MacArthur committed few grave errors, but the arrogance of his personality caused him to be blamed with many. MacArthur was held to account by the public for perceived harshness in disbursing the Bonus Marchers in 1932, for laxness in allowing half of his heavy bomber force to be wiped out on the ground when World War II erupted over the Philippines in 1941, for the supposed cowardice of "Dugout Doug" in facing combat, for not recognizing the real threat of Chinese Communist intervention in the Korean War, and for treating the president of the United States in a dismissive and belittling matter. Yet, at the same time, there is far more to each of these tales than these bare outlines, and the complexity of MacArthur's character is matched closely by the intricacies of the crises in his life.

MacArthur was an outstanding field commander and staff officer in World War I. He was an innovative superintendent at the U.S. Military Academy at West Point. He was a successful corps commander and department commander in the Philippines and was noted for the leadership he projected in the military doldrums of the 1920s. He headed the successful U.S. Olympic Team in 1928, arguably the first occasion in which the nation mounted a major effort at these international games. His term as chief of staff was outstanding and lasted longer than that of any other officer in recent times save for George C. Marshall; during his term, MacArthur laid the foundations for the rapid mobilization that the United States was able to mount in the late 1930s and early 1940s and modernized military organizations and structures. He displayed great ability in establishing the Civilian Conservation Corps and established the beginnings of the army-navy cooperation that flourished in the decade after MacArthur ended his term as chief of staff in 1935.

MacArthur, following his withdrawal to Australia from the doomed Philippines, rapidly learned the application of modern warfare and proved a master of combined arms operations, integrating air, land, and sea power into a potent force that enabled those in the Pacific theater to handle immense distances, prepared enemy defenses, and meager resources and still advance from the Stanley Owens Mountains in New Guinea in late 1942 to the invasion of the Philippines barely two years later. His ability to seize the initiative and to combine overwhelming force with only short windows of opportunity marked him as perhaps the best-balanced of American senior commanders during World War II.

MacArthur, after having been designated to command *DOWNFALL*, the invasion of Japan, found himself instead designated to command the Allied occupation of the former enemy and was charged with converting a warlike state to a na-

tion of peace. In this, he was successful beyond all expectation, balancing the demands of competing Allied requirements and often ambiguous guidance from Washington into a sure course of direction that rapidly turned Japan into both a democracy and the first of the economic “Asian Tigers.”

MacArthur’s final command ended in frustration and embarrassment, in some measure caused by his own failure to recognize the changed attitudes in both the United States and Europe toward warfare in Asia. From his initial chagrin at U.S. troops proving themselves to be ill-trained and ill-equipped to the magnificent stroke of CHROMITE (the Inchon Landings)—certainly one of the finest amphibious operations ever mounted—and then to the hectic advance north and the dismal retreat south, MacArthur made this war his, with his frequent appearances at the front and his even more frequent press releases. But the intervention of the Chinese Communists caused MacArthur to become a changed man, negative and complaining, and this attitude, in turn, seems to have led to his refusal to listen more carefully to how the winds were blowing in Washington. At the end, MacArthur was perceived by his superiors as being out of control, a conclusion with some basis in truth but also one tainted with personal envy from some of those involved. In any event, despite MacArthur’s unrivaled seniority—he had been the senior eligible officer for the position of chief of staff in 1930, for instance, and both of his successors, and all of his rivals, had long ago retired—he was relieved of the far eastern command in a botched episode embarrassing to both Washington and Tokyo in April 1951.

MacArthur returned home to vast public accolades, and his address to Congress flooded the media. He was the keynote speaker at the Republican National Convention in 1952, but his political aspirations were blocked by the ready nomination of Dwight D. Eisenhower for the presidency.

MacArthur then moved to New York, where at the instigation of former president Herbert Hoover he lived at the Waldorf-Astoria. His birthday celebrations were events of great interest to the U.S. military community, as his former soldiers, many of them now risen to military power, paid homage to the man they credited with forming their careers. MacArthur did serve as a corporate officer with some success but otherwise avoided the limelight.

Although President Eisenhower declined contact with his former commander, President John F. Kennedy frequently consulted MacArthur as the United States became drawn into the Vietnam conflict, though MacArthur’s analysis was that the United States should avoid military support to the South Vietnamese government, advice unwelcome to Kennedy. MacArthur enjoyed a tumultuous return visit to the Philippines in 1961 and completed his military duties as the graduation speaker at West Point in 1962. He died fol-

lowing a brief illness at Walter Reed Hospital in 1964 and is buried in his mother’s home city of Norfolk, Virginia.

MacArthur was a soldier marred by an arrogant personality and one who failed properly to protect his record by explaining in detail the reasoning behind his actions but nevertheless a soldier first, last, and always.

Maccabees, Revolt of the (168–143 B.C.E.)

The Jewish-dominated region of Judea rebelled against the religious oppression of the Seleucid king, Antiochus IV, and forged an independent nation-state in one of the world’s first successful guerrilla campaigns. For about a century after Alexander the Great had conquered the Persian Empire, the coastal zone southwest of Syria became the pivot point of the rivalry between the Ptolemaic (Egypt-based) and Seleucid (Syria–Asia Minor) successor regimes. By 170 B.C.E., Antiochus III and his sons Seleucus IV and Antiochus IV Epiphanes, rulers of the Seleucid Empire, understood that they would have to confront the expanding influence of Rome. Antiochus IV felt that it was crucial to forge religious unity throughout his dominion, integrating all the various gods with Olympian Zeus at their head. Especially significant was Jewish-dominated Judea, the strategic fulcrum covering southern invasion routes. As a result, he violated the promise of his father Antiochus III to respect the religious autonomy of the Jews. To this end, Antiochus took sides in a power struggle between rival high priests in Jerusalem, as a pretext to intervene openly in Jewish religious matters. This

confrontation culminated when Antiochus Epiphanes occupied Jerusalem. He destroyed the city walls, raided the Temple treasury to fund his dwindling war chest, and decreed the abolition of Jewish separatism. He next converted the temple into a pagan shrine, setting up a fortress opposite, and forbade the hallowed practices of circumcision and Sabbath observance.

In 168 B.C.E., Seleucid troops set up pagan altars in the countryside and, in the village of Modi'in, ordered a lower-ranking priest, Mattathias, to ritually eat pig's flesh. He refused and killed another villager who complied, leading the townsfolk in a massacre of the Greek garrison, thereby starting the revolt. Mattathias withdrew to a concealed and well-guarded training camp for irregular forces in the foothills near Gophna, northwest of modern Ramallah. The training went on for a year prior to conducting operations and included politico-religious indoctrination and the establishment of friendly ties with the populace in key localities, where they established logistical bases, intelligence networks, safe houses, and weapons hoards. The moribund Mattathias designated one of his sons, Judas (who became known as Maccabee, or "the Hammer") to take over for him.

In a series of brilliant guerrilla actions, Judas defeated a succession of Syrian generals. His most renowned victories occurred at Beth Horon Pass (166 B.C.E.), Emmaus (166 B.C.E.), and Beth Zur, in the vicinity of Hebron (165 B.C.E.). His success is attributed to the first recorded instances of successful irregular warfare: hit-and-run night raids, ambushes at defiles, and attacks on rear-echelon units and individuals. After Beth-Zur, Judas captured Jerusalem, liberating the temple, though a Seleucid garrison held out in the citadel.

In 165–164 B.C.E., Judas extended his control over most of Judea, maintaining a close siege of the Syrian troops in the citadel. Since Antiochus was preoccupied with a triumphant campaign in the East, it was left to the Syrian regent Lysias to lead an invasion of Judea to recapture Jerusalem. After defeating the Jews at Beth Zacharia, he had to cut the campaign short to suppress a revolt in Syria in 164 B.C.E..

In 164 B.C.E., Bacchides, in charge of Seleucid forces in Judea, defeated Judas, driving him from Jerusalem. Quickly rebounding from this reverse, Judas took the offensive and, in 160 B.C.E., routed and killed the Syrian general Nicanor at Adasa, close to his earlier victory at Beth Horon. Judas himself was killed in battle by Bacchides at Elasa later that year.

Leadership of the Maccabees passed to Judas's brother, Jonathan, who continued guerrilla campaigns against the Syrians. In 143 B.C.E., Syrian troops, in league with alienated Jews, captured and eventually executed Jonathan at Ptolemais (Acre). Subsequently, the Seleucids recognized another of Judas's brothers, Simon, as king of Judea, establishing the Hasmonean dynasty, which ended with the accession of

Herod the Great, after his marriage to the last Hasmonean queen, Miriam.

Macedonian Wars (215–146 B.C.E.)

A series of wars during which the Romans gained control over Greece and destroyed the Macedonian kingdom.

The First Macedonian War (215–205 B.C.E.)

In 215 B.C.E. the Macedonian king Philip V signed a treaty with the Carthaginian general Hannibal, who had invaded Italy. Thereupon Philip invaded Rome's possessions in Illyria (Albania). Although the Romans succeeded in keeping the important city of Apollonia out of Philip's hands, the war effort in Italy prevented them from intervening until 211 B.C.E., when the Romans allied with the Greek confederacy of Aetolia.

The Romans left land warfare to the Greeks, confining themselves largely to naval support. In the following years, Rome's successes were mainly diplomatic. Several Greek states chose Rome's side. Philip was driven out of Greece by diplomatic means. Then, during a lightning campaign, Philip defeated the Greeks and their Balkan tribal allies, recovered his position in Greece, and attacked Aetolia. The Aetolians sued for peace (206 B.C.E.) after their Spartan allies were defeated by the Achaeans. After an unsuccessful campaign in Illyria, the Romans did so as well. The Peace of Phoenice (205 B.C.E.) left Philip in possession of his conquests in Illyria.

The Second Macedonian War (200–197 B.C.E.)

In 200 B.C.E., war broke out again. The Romans landed in Illyria with two legions and marched inland. They failed to push through into Macedonia but did succeed in coercing several states to join the many Greek states that had already joined them.

In 199 B.C.E., an army of Greek allies raided Thessaly and

southern Macedonia, but during a lightning campaign, Philip succeeded in fighting off both these invaders and Rome's tribal allies on the Balkan frontier. In the following year, Philip took the initiative and moved his army into a strategic position, where he threatened the lines of communication of the Roman army in Illyria. The Romans assaulted Philip's position, a costly but eventually successful campaign. Thereupon Philip retreated into Macedonia. In the meantime, the allies of Rome were successful at sea, and even more Greek states joined the Romans.

Philip advanced into Thessaly but was engaged by the Roman army before he had reached his objective. He was forced to do battle at Cynoscephalae and was defeated. He had to abandon all territories outside Macedonia and respect the independence of all Greek cities. The Romans assumed Macedonia's role of dominant power in Greece.

The Third Macedonian War (171–168 B.C.E.)

The Romans felt threatened in their hegemony when King Perseus, the son of Philip V, again started to acquire influence in Greece. Unscrupulously taking advantage of Perseus's diplomatic advances to avoid hostilities, they brought an army into Illyria and Greece. Perseus reacted with speed and outmaneuvered the Romans in Thessaly, cutting off their line of supplies.

In the meantime, the Romans alienated themselves from the Greeks by their brutality, heavy-handedness, and greed. Perseus, on the contrary, became increasingly popular. Moreover, he was successful, while the Romans suffered from bad discipline and command. Two invasions of Macedonia failed, and Perseus counterattacked, regaining territory and defeating Rome's Balkan tribal allies. During the following winter (169 B.C.E.), he campaigned successfully against the Romans on Macedonia's northwestern frontier and in Greece and Epirus.

In 168 B.C.E., the consul Lucius Aemilius Paullus assumed command of the Roman army. The Romans decided to attack on three fronts: a naval offensive in the Aegean Sea, an offensive from the west from Illyria, and an offensive from Thessaly. After initial Macedonian success, Perseus met the Romans at Pydna. The well-deployed Macedonian phalanx attacked the unprepared Romans, but the Macedonian line became disrupted. The Romans counterattacked and broke the Macedonians. Perseus was captured and brought to Italy. Macedonia was divided into four republics, tributary to Rome.

The Fourth Macedonian War (146 B.C.E.)

The so-called Fourth Macedonian War was in fact an insurrection. The Macedonians had always been very loyal to their royal house, and in 152 B.C.E., a pretender to the throne

named Andriscus aroused the Macedonians into a rebellion to reinstate the royal dynasty. The insurgents initially succeeded in defeating an army consisting of a Roman legion and local militia, though another Roman army soon crushed the revolt.

Maceo y Grajales, Antonio (1845–1896)

Noted black general in the struggle for Cuban independence. Maceo y Grajales was born on 14 June 1845 in Majaguabo, San Luis, to a farming family of free blacks. At the outbreak of the Ten Years' War in 1868, he joined the revolutionary forces and rose to the rank of general. Although the war ended with the Pact of Zanjón, in which Spain promised various social and economic reforms, Maceo was one of a number of Cuban revolutionaries who refused to accept the pact's terms.

By 1880, Maceo was traveling outside Cuba attempting to acquire arms, munitions, and men to return to the battle. Though it would be 1895 before he returned to Cuba to fight, he worked tirelessly for independence. He met with Máximo Gómez and José Martí various times to plan the continued war for independence. During these meetings, Martí would have to mediate at various times because Maceo and Gómez were rivals.

With the renewal of the war, Maceo was wounded more than 200 times. He was emphatically against annexation of Cuba by the United States, a course of action considered by some revolutionaries. But Maceo, appalled by the increasingly restrictive "color line" being drawn in the post-Reconstruction United States, stated that if annexation were attempted, he would be forced to switch allegiance and fight on the Spanish side.

During a fierce battle at San Pedro in Havana province on 7 December 1896, Maceo and his aide, a son of Máximo Gómez, fell in battle.

Machiavelli, Niccolò (1469–1527)

Secretary to the chancellor on diplomatic relations for the Republic of Florence, better known as the first great political philosopher of the Renaissance. Born in Florence, Italy, on 3 May 1469, Machiavelli was the son of a lawyer of modest means who provided his son with a strong background in the humanities. Over his remains stands a monument bearing, in Latin, the phrase, "No eulogy would do justice to so great a name."

In 1512, the Medici family overthrew the republic, and Machiavelli lost his position. He spent his forced retirement reflecting upon events, reading history, and writing political philosophy. It was during this time he wrote *The Prince* (1513), *Discourses on the First Ten Books of Titus Livius* (1513–1517), and *The Art of War* (1520).

In *The Prince*, his most famous work, Machiavelli discusses the political necessity of "vices" over traditional "virtues," the political benefits of deceitfulness and miserliness, and how a prince should prefer being feared to being loved while avoiding being hated by his subjects. The book is a technical manual on how a prince was to grasp and hold power.

Most of Machiavelli's later work focused on his love of republican values. In *Discourses*, he examines the elements of the ancient Roman Republic that led to its success and draws lessons for republican governments. In *The Art of War*, Machiavelli advocates replacing unreliable mercenaries with a patriotic militia imbued with civic virtue and possessing an intense desire to protect their republican rights.

Many of Machiavelli's works, especially *The Prince*, were favorite reading of history's great military minds, such as Frederick the Great, Napoleon, and Clausewitz.

Machine Gun

A rapid-firing small arm, which today means a fully automatic weapon. Muzzle-loading firearms were slow to reload, inaccurate, and effective only at very short ranges. Since their first appearance, those who make and use them have striven to increase the guns' rate of fire and combine great rate of fire with accuracy. Muzzle-loading separate ball and powder prevented any development along these lines. Breech-loading weapons and the complete round (bullet and cartridge in one unit) made machine guns possible. The machine gun is the easiest method of putting heavy fire down quickly on unprotected troops and areas.

One of the earliest successful machine guns was the Gatling (1862), a hand-cranked gun, which had between 6 and 20 rotating barrels. By the end of the nineteenth century, machine guns were fully automatic, in that once the trigger was depressed the gun continued to fire until it either ran out of ammunition or the trigger was released. This effect was achieved by tapping some of the gases used to propel the bullet down the barrel or by using the recoil of the cartridge case to work the mechanism of the gun. Ammunition is fed to the gun from magazines or belts.

The machine gun has a purpose in attack (to suppress the enemy) and in defense (to mow down attackers who do

not use practical anti-machine gun field craft and tactics). Its greatest effect was in World War I, when the machine gun took second place only to artillery in killing and wounding on both sides.

The machine gun is an infantry weapon and can be used for direct or indirect fire. In the direct fire role, the machine gun is a very effective defensive weapon and gives very good fire support for moving troops. In the indirect role, a machine gun or a battery of guns can deny the enemy unprotected movement well behind the forward battle lines.

Light machine guns are weapons carried by the infantry, and every infantry section has one or more light machine guns. Medium machine guns (used mainly in the indirect fire role) are concentrated normally at battalion level, as are heavy machine guns. All armored fighting vehicles carry a machine gun for local support. Machine guns have also been used in aircraft for air warfare and for ground strafing, but these roles have now mainly been taken on by missiles. But even in an age of high-tech electronic warfare, the machine gun, by general agreement, is still a most important weapon in any army's armory.

Mackensen, August von (1849–1945)

German field marshal who achieved a string of spectacular victories on the eastern front in 1914–1916. Born on 6 December 1849 in Leipnitz, near Wittenberg, Mackensen joined the Death's Head Hussars in 1869 as a cadet. Serving in the Franco-Prussian War as a junior officer, he was appointed to the general staff in 1882. Although not from the nobility, he rose rapidly through the ranks and was promoted to cavalry general in 1908.

As commander of XVII Corps on the eastern front in 1914, he suffered defeat at Gumbinnen (20 August) but contributed to victory at Tannenberg and in the first Battle of the Masurian Lakes. As commander of the Ninth Army, he conducted the successful offensive at Lodz (11–21 November). The following year, he succeeded in breaking through the Russian lines at Gorlice-Tarnów as commander of the Austro-German Eleventh Army, his advancing forces taking 120,000 prisoners, destroying the Russian Third Army, and capturing Lemberg and Brest-Litovsk. Promoted to field marshal in recognition of his achievements, he was ordered

to renew the attack on Serbia and captured Belgrade on 9 October 1915 as commander of German, Austro-German, and Bulgarian armies. On 1 September 1916, he launched a successful attack on Romania with combined Bulgarian, Turkish, and German forces, entering Bucharest on 6 December. Mackensen was a modest man, and his battlefield successes have been attributed to his ability to work harmoniously with different chiefs of staff.

During the 1930s, he was used by Adolf Hitler at various public displays to symbolize the continuity of military tradition in the Third Reich. He died on 8 November 1945, at Burghorn, near Celle, having lived just long enough to witness Germany's utter defeat in World War II.

Mactan, Battle of (1521)

An avoidable defeat of Spanish forces led by the Portuguese Fernao de Magalhaes (Ferdinand Magellan). The Battle of Mactan delayed Spain's colonization of the archipelago later named Las Islas Felipinas, or the Philippines.

With Pope Alexander VI's bull (decree) of 1493 and the Treaty of Tordesillas of 1494 (later approved by Pope Julius II), conflict between Catholic Spain and Portugal over prospective colonies in the Western Hemisphere was adjudicated. Spain then sought a direct water route to the Spice Islands in Southeast Asia.

Captain General Magellan commanded three ships sailing from Spain in 1519, intent on reaching the Spice Islands. He sailed from the Atlantic to the Pacific and thence through insular Southeast Asia. Magellan baptized the Muslim Rajah Humabon of Zebu (Cebu), whose gold and ginger attracted him, obtaining a pledge of loyalty to Spain. Although Rajah Lapulapu of Mauthan (Mactan) Island, 2 kilometers east, was refusing to submit, Magellan overconfidently declined military support from Humabon.

Magellan's three galleons anchored at low tide in the northern gulf of Mactan Island early on Sunday morning, 27 April 1521, leaving inland Mactan beyond the firing range of cannons on deck. In lieu of a surprise attack, Magellan sent an envoy on a fruitless mission seeking Lapulapu's obeisance. At daybreak, the Spanish contingent of less than 60

mostly inexperienced volunteers slogged shoreward over reefs. They confronted a crescent formation of 3,000 fighters. Invoking military analogies from Mexico, Magellan injudiciously ordered his forces inland. However, crossbows, muskets, and spears were ineffective against bolos, shields, longer iron-tipped bamboo lances, and poisoned arrows. Squeezed on two sides, the volunteer force retreated—first with discipline and then in disorder. In the hour-long rout, 7 Europeans and 15 Mactan Islanders were killed. Covering his unit's retreat in hand-to-hand fighting, Magellan perished.

Circumnavigating the globe, 18 survivors returned to Spain in 1522. Lapulapu's victory simply delayed Spanish colonization. In 1564, Spain returned to stay for 334 years.

Maczek, Stanislaw (1892–1994)

Polish World War II commander and the last surviving senior Allied general officer of World War II. Born in Szczerzec in Austro-Hungarian-occupied Poland on 31 March 1892, Maczek served in the Austro-Hungarian army during World War I. After active service during the Russo-Polish War of 1919–1921 and as an infantry officer during most of the interwar period, he commanded the 10th Motorized Mounted Rifle Regiment during the Polish campaign of 1939. Though his regiment, which was one of only two tank regiments in the Polish army, particularly distinguished itself against the Germans, it was overwhelmed by the vastly superior quantity and quality of German armor and was forced to seek refuge in Hungary. Promoted to major general, Maczek was reunited with many of his men in France, where he commanded the 10th Polish Mechanized Cavalry Brigade during the French campaign of 1940. Again forced into exile, he and his men eventually found their way to Scotland, where they formed the 1st Polish Armored Division. As part of the First Canadian Army, the 1st Armored fought its way across

northern Europe after the Normandy invasion. During the Battle of the Falaise Gap in August 1944, it was Maczek and the 1st Armored that closed the “pocket” and prevented tens of thousands of German troops from escaping. Promoted to lieutenant general in May 1945, Maczek refused to return to Soviet-dominated Poland after the war and lived out his exile in Scotland. He was promoted to full general by Polish president Lech Walesa in March 1994 and died in Edinburgh on 11 December 1994, the only senior Polish World War II commander to witness the fall of the Soviet Union and of European communism.

Magdeburg, Siege of (1630–1631)

A symbol of the fury of the Thirty Years' War. Magdeburg was the first imperial town (Reichsstadt) to enter an alliance with the Swedish king on 1 August 1630. Thus the town became an enemy of the Habsburg emperor, but it did not become the center of the operations at that time because the main imperial army, commanded by Johann Tserclaes, Graf von Tilly, advanced to Pomerania to fight Gustavus Adolphus. As the Swedish king avoided a battle, Tilly turned his whole army against Magdeburg at the end of March 1631.

Now the siege became part of a war of diversion. Tilly intended to force Gustavus Adolphus to relieve his ally, who himself tried to distract the imperial army by advancing along the Oder River and posing a threat to the Habsburgian provinces of Silesia and even Bohemia. Ignoring this advance, Tilly reinforced his efforts in besieging the town instead, but the Magdeburgians relied on the Swedish promise to relieve the town and did not surrender. After several attempts, a general assault on 20 May 1631 was successful. In the course of fighting, a fire broke out and reduced almost the whole town to ashes, killing not only most of its inhabitants but also many of the invading imperial soldiers.

The question of who started the fire still remains unclear. Undoubtedly, the devastated town was of less worth for Tilly, who failed to gain a logistic stronghold for his campaign against Gustavus Adolphus. To the Swedish king, the fall of

Magdeburg served to damage his reputation as protector of the German Protestants, so massive Protestant propaganda (mostly by broadsheets) put the blame on the victorious Tilly.

Magersfontein, Battle of (11 December 1899)

Second British defeat of “Black Week.” In the opening months of the Boer War, Redvers Buller ordered Lord Paul Sanford Methuen to relieve the beleaguered garrison at Kimberley and remove all noncombatants. Methuen proceeded northward along the Western Railway to safeguard his supply line and to ensure the integrity of his only means of evacuating the civilian population. Anticipating the British strategy, the Boers positioned themselves along the railway. In late November, Methuen’s force defeated the Boers in three successive battles at Belmont, Graspan, and Modder River.

On 10 December, British artillery opened fire upon Boer entrenchments at Magersfontein. Methuen ordered a night march, to be followed by a frontal attack. Despite heavy rain and poor reconnaissance, British troops managed to reach their destination, a few hundred yards from the Boer trenches. Orders to extend, however, came too late. Daybreak caught the advancing infantry in tight formation. Boer firepower left the brigade in a confused mass scrambling for cover. All attempts to reform and renew the advance failed. The British were forced to withdraw by late afternoon.

In 1899, no British soldier had ever come across such an elaborate design of trenches as those constructed at Magersfontein. British artillery failed to disturb them. British casualties approached 1,000; Boer casualties, 275. The failure at Magersfontein, one of three British defeats that week, demonstrated that the British army was not ready for modern warfare and led to major changes in leadership, mobilization, and organization.

Maginot Line

An extensive series of border fortifications that failed France in 1940. At the end of World War I, the dominant school of thought in the French army emphasized the value of a defensive stance in warfare. Based on experience from the early phase of the war, when frontal attacks against machine guns caused massive casualties, and the experience acquired at Verdun, the French general staff favored the option of “digging in” as a means to hold off the enemy while limiting losses. In addition, in the event of surprise attack, a massive fortification would gain the French army some valuable time as it assembled its forces. Throughout the 1920s, the French General Staff argued about what the best defensive attitude was and where to build fortifications. Eventually, the focus fell on the relatively flat area that extended from the Ardennes to Alsace. In this context, politician André Maginot came to oversee the design and construction of a defensive line that bore his name. As war minister from 1922 to 1924 (and again in 1929), he remained involved in the planning as the head of the Parliamentary Armament Committee. In 1927, the basic design was approved, and Paul Painlevé, then minister of war, authorized the call for bids. Private contractors built the Maginot line. The reason for naming it Maginot rather than Painlevé goes back to the level of involvement of the former and his successful lobbying of the French parliament to allocate funds at a time when Germany, prior to Adolf Hitler’s takeover, was not considered an immediate threat to French security. By the time the Maginot line was built, it had cost twice the original estimate, exceeding 6 billion French francs at the time.

The design of the Maginot line posed several challenges to engineers, and no two forts (also known as *ouvrages*) were the same because of terrain and communication constraints. In addition, drainage was a constant worry, and several modifications were required in the 1930s to make the installations livable. Common to all forts were the garrison personnel, ranging from 200 to 1,200 men and divided into infantry, artillery, and engineering sections. The layout followed the same structure everywhere, with living quarters at the bottom of the installation, a railroad that brought supplies to a narrow-gauge network that linked forts, and a diesel-powered generating facility to supply electricity in times of war (in peacetime, the French national power grid

fed the entire Maginot line). Armament was also standard to all installations and involved modern cannons, some specially modified to fit in the forts alone. Construction began in late 1929, and in 1936 the line was first used on the occasion of Hitler's military occupation of the Rhineland. Some installations were added later, but limited funding and waning political will made them no more than perfunctory complements, especially near the English Channel.

Divided into sectors, the Maginot line was placed on war alert on 24 August 1939, nine days ahead of the general mobilization order. However, the state of war was not confirmed until 6 September, and garrison commanders were ordered to fire on the enemy only in case of incursion on French territory. The subsequent "Phony War" lasted until May 1940, when the German army invaded Belgium and circumvented the Maginot line. Germany's striking success encouraged the implementation of Operation ROT (red), whereby the Germans began testing the Maginot line's defenses. Although some sections held up extremely well against 88 mm cannon, turrets and other mobile steel gear were often damaged. The greatest weakness of the line was that even though the heavy cement foundations facing the border were further protected by earth, the rear was not, which made rear assaults easier. Several forts, however, held until the Armistice. Morale all along the line remained excellent by most accounts, and the Maginot cannons ceased firing only on 24 June 1940. Five days later, the men left their quarters and were made prisoners of war, even though they should have, in theory, been allowed to join French troops in the Free (Vichy) zone under the terms of the cease-fire.

German and American troops made sporadic use of the installations until 1944, after which the French army took over and maintained part of the installations for another 20 years. Since then, much of the Maginot line has been auctioned off to civilian businesses, from mushroom farms to dance clubs. The Maginot Line remains as a literal monument to unimaginative military thinking.

Magsaysay, Ramón (1907–1957)

Philippine guerrilla, counterinsurgency leader, and later president. Magsaysay was born into a poor rural family in 1907 in Zambales Province. After a brief career in business, he became a noted guerrilla leader when the Japanese invaded the Philippines in 1941. Later, appointed secretary of national defense, he was faced from the outset with the problem of putting down the Hukbalahap, a peasant guerrilla movement that by 1953 had been penetrated by left-wing cadres. He initiated a three-pronged program. Corrupt and inefficient officers and soldiers were removed; a ground-up development program in Hukbalahap areas was initiated to deny the guerrillas local support, and guerrillas who surrendered were given land grants (land hunger was supposedly the main reason for the Huk revolt) and an amnesty. By 1955, when Magsaysay had been elected president, the Huk rebellion had faded to a small hard-core group of communist cadres. Magsaysay himself died in office on 17 March 1957 in a plane crash.

Portrait of Ramón Magsaysay. (Library of Congress)

Magsaysay's success can be attributed to two main factors. In an environment rife with corruption, he was one of the few seen as uncorrupt. Second, as both secretary of national defense and later as president, he managed to inspire support from line soldiers and civilians by leading from the front, personally supervising operations, and demonstrating concern and an aptitude for leadership.

Magsaysay also oversaw a number of military innovations in his counterinsurgency campaign. Small units with overwhelming firepower were used to track down guerrilla groups. Heightened real-time intelligence identified and tracked guerrilla leaders and groups, as did the extensive use of bribed and "turned" informants from among guerrilla ranks themselves. Psychological warfare was deployed extensively to convince the Huks that they were on the losing side. Many of these tactics were absorbed by the U.S. Army in Vietnam. Magsaysay's death was a disaster for the Philippines, for much of his good work was undone, and persisting Marxist guerrilla war sprang up anew beginning in the 1960s.

Magyars

Seminomadic tribes, originally from western Siberia, that conquered the middle Danube and raided western Europe in the ninth and tenth centuries. The Magyars were the last invading people to establish a permanent presence in central Europe.

After destroying the Moravian state (902) and defeating the Bavarians at Breclavsburg (907), the Magyars established themselves in Pannonia. From this base, they raided neighboring lands, extorting tribute. Their armies, consisting mostly of light cavalry, were highly mobile. Attacking without warning, they quickly plundered the countryside and departed before any defensive force could be organized. If forced to fight, they would harass their enemies with arrows or suddenly retreat, tempting their opponents to break rank and pursue, after which the Magyars would turn to fight them singly. After 937, the Magyars began to range ever farther, across Germany and France and into Italy. The raids finally ended after emperor Otto I defeated the Magyars at

the Lechfeld, near Augsburg (955). In the following centuries, the Magyars settled down in Hungary and adopted western European forms of feudal military organization, including the predominant use of heavy armored cavalry. The light cavalry tradition was partly revived through the settlement of nomadic Cuman tribes in southern Hungary in the thirteenth century, the employment of Serb mercenaries in the fifteenth century, and finally in the evolution of Hungarian *huszar* light cavalry in the sixteenth and seventeenth centuries, which served as the model for the later appearance of hussar units in western European armies.

Mahan, Dennis Hart (1802–1871)

American educator whose theories and insights had a great influence on American military strategists in both the Mexican War and the Civil War. Born in New York City on 2 April 1802, Mahan spent his childhood in Norfolk, Virginia. A gifted student and protégé of Sylvanus Thayer, he graduated from the top of his class at the U.S. Military Academy at West Point in 1824 and was named assistant professor of mathematics in his third year at the institution. A year after graduation, Second Lieutenant Mahan was transferred to the position of assistant professor of engineering. He then went abroad to study public engineering work and military institutions at the Military School of Application for Engineers and Artillerists in Metz, France, and was befriended by the Marquis de Lafayette. Returning to West Point in 1830, he was named professor of engineering and was promoted to chairman of the department two years later. In 1838, he was also named to the position of dean. He committed suicide on 16 September 1871 in Stony Point, New York, when he learned that he was going to be forced into retirement by an overseeing board. He was the father of Alfred Thayer Mahan.

Among Mahan's most important works are *Complete Treatise on Field Fortifications* (1836), *Summary on the Cause of Permanent Fortifications and the Attack and Defense of Permanent Works* (1850), and *An Elementary Course of Military Engineering* (2 vols., 1866–1867). He exposed cadets to the principles of Antoine Henri, Baron de Jomini.

According to student Henry Wager Halleck, Mahan stressed that war should be looked at as both an art and a science; a science as it analyzes general principles and military operations and an art when referring to the practical rules of conducting campaigns, sieges, battles, and so on.

Mahmud of Ghazna (Yamin al-Daula Abu'l-Qasim Mahmud ibn Sebuktigin) (971–1030)

Founder of the medieval Ghaznavid dynasty, his conquests made the Turkish people and the Islamic faith a part of Indian civilization. Sebuktigin, Mahmud's father, held command of Ghazna, a military camp town in eastern Afghanistan. By the time Mahmud reached maturity, Ghazna had become virtually independent of Iran. Quickly proving himself an adept commander, he established himself as emir in 998 after a brief war with his brother Isma'il. At that time, the Samanid government of Iran was crumbling, and in the scramble for the pieces, Mahmud also annexed the northern territories of Khurasan. A rich and desirable province, Mahmud had to return repeatedly to Khurasan to defend his northern frontier from Turkish interlopers like the Kharakhanids.

Mahmud inherited from his father the practice of conducting annual raids into the Indus valley. A strict Sunni Muslim, he believed that these raids not only filled his treasury with loot but also served as jihad against infidel Hindus, Buddhists, and Shiite Muslim cities. Mahmud made his capital a rich center of Islamic culture but also invested large sums into organizing his state and army. He supplemented his Arab, Turkish, and Afghan units with Hindu infantry and elephants. The sultan's wars, wealth, and militancy also magnetized thousands of Turkish plainsmen to his standard.

Mahmud conducted over 17 campaigns in northeastern and central India and jihads against the Shiite Buyid state in central Iran. He imposed a unified Islamic regime over most of the northern Indus valley. In 1024, Mahmud marched across the Thar wastelands and plundered the great Hindu center at Somnath. Under Mahmud, Islam penetrated for the

first time onto the Ganges plains. At his death, the sultan was contemplating the annexation of Iraq and a jihad against the Fatimid Shiites in Syria.

Majorian (Julius Valerius Majorianus) (d. 461)

Emperor of the western Roman Empire from 1 April 457 to 2 August 461. The date of his birth is unknown; he was executed on 7 August 461 at Dertona (Tortona, Italy). After a distinguished early military career, Majorian was appointed *comes domesticorum* (roughly, commander of the imperial bodyguard). In league with the Suevian commander Ricimer, he defeated the western emperor Avitus at Placentia (Piacenza, Italy) on 17 October 456. Subsequently promoted to *magister militum*, Majorian was acclaimed emperor by his troops; formal recognition from the eastern empire came on 1 December 457.

As emperor, Majorian ambitiously sought to strengthen the western empire by reintegrating with it former Roman territories in Gaul and North Africa. In Europe, he campaigned successfully against Huns, Vandals, Goths, and Alamanni and subdued Gallic rebels. In 460 and 461, he launched two expeditions intended to expel the Vandals from Africa but in both cases was defeated, the last before his transports left Nova Carthago (Cartagena, Spain). He initiated tax reforms and was admired greatly by Sidonius Apollinaris, bishop of Lyons, France. In 461, Ricimer, his erstwhile ally, deposed Majorian.

Malayan Emergency (1948–1960)

An insurgency inspired by and modeled on Mao Zedong's success in China. The dates are misleading; emergency restrictions remained in several areas after 1960, and the com-

munists remained in the field in southern Thailand until 1990. Nonetheless, by 1960 communist guerrillas had been reduced to a futile and ineffective existence.

British success in Malaya was largely the result of four factors. Perhaps the most important was the fact that at no stage did the government collapse in any part of Malaya: the British never faced the problem of creating government where none existed. Moreover, Malayan society was racially divided. With the communist movement overwhelmingly drawn from the Chinese population (physically, readily identifiable) the counterinsurgency effort could be focused on just one section of society. Furthermore, physical geography limited insurgency to no more than one-tenth of the country. The interior was all but uninhabited, and the Chinese were scattered along the jungle fringe where it met the main north-south roads. Britain never had a major numbers-to-space problem, and the fact that Malaya was a peninsula ensured the communists' isolation from outside support.

There were other factors. The uprising of 1947 miscarried and cost the communist movement some 6–12 months as it tried to recover from failure and initiate rural-based insurgency. Failure provided the British administration with breathing space, and over time, four strands of policy were bound together: the streamlining of all levels of government in order to ensure speed and implement decisions; the principle of civilian supremacy, specifically the primacy of the police, with the military assigned the supporting role; a comprehensive resettlement program as the means of isolating the insurgents from all sources of supply; and the policy of tackling the least affected areas first. Results were slow in manifesting themselves, and resettlement made the communist task of infiltration easier, but the long-term effectiveness of resettlement can be seen by the fact that only 2 of some 400 new villages were abandoned after 1960. The policy of providing the population with something to lose, which included independence, with the communists portrayed as the obstacle to its being granted, was underwritten by boom conditions in tin and rubber prices, but the basic point was that the main features of the Briggs Plan—integrated government structure, civilian primacy, and the new villages—worked in the very special conditions of Malaya at this time. It should also be noted that the British did not send National Servicemen (conscripts) to Malaya; all were professionals who either knew their jobs or were willing to learn them in good time.

Of course, British strategy and policy may seem obvious, even easy in hindsight, but at the time it was felt that the struggle could go either way, particularly after the assassination of the high commissioner, Sir Henry Gurney, in 1951.

Maldon, Battle of (10–11 August 991)

Brave Saxon defense that failed to prevent Viking inroads. After nearly half a century of relative stability, Anglo-Saxon England was unprepared for a new wave of Viking invasions beginning in 991. Danish king Swein Forkbeard led several expeditions along the southern half of England; the English king Ethelred, consequently nicknamed “the Unready,” was on the defensive. Maldon, located about 12 miles north of the mouth of the Thames River, near the east coast of England, was the site of one of the initial battles between the Anglo-Saxons and the invading Danes. We know about the Battle of Maldon because of the near-contemporary poem, of which most has been preserved.

The Danes had ravaged the town of Ipswich, and the Anglo-Saxon ealdorman Byrhtnoth prepared to engage them along the coast of Essex in August 991. Byrhtnoth and his local shire force, the *fyrð*, allowed the Danes to land near Maldon in order to incite them to pitched battle. The Anglo-Saxons formed “shield-walls,” cohesive though mobile formations of troops, and used spears and shields to hold the Danes in check. Byrhtnoth, an ealdorman for 35 years, was portrayed as the brave leader in the poem, rallying his troops for battle. Only after his death did many of the Anglo-Saxons retreat. Three years after the battle, Ethelred was forced to make payments to the Danes as appeasement. In 1016, new Viking invasions culminated with the Danish king Cnut succeeding Ethelred's son, Edmund, as king of England.

Malplaquet, Battle of (11 September 1709)

The duke of Marlborough's last and most useless battle. After a long series of victories (Ramillies, Oudenaarde), the allied armies intended to destroy the French army and then invade France. The French main army was south of Mons, waiting behind field fortifications near the woods of Malplaquet. Marlborough and Prince Eugene, with their 7,500 men, intended to use the same tactical dispositions they had used formerly for Bleinheim and Ramillies, a straightforward advance on the enemy lines. The duc de Villars, commanding the French, had taken a defensive position, protected on his two wings by occupied forests forming a funnel-shaped line. The center was on higher grounds and the fortifications were defended by his elite regiments.

The first shots were fired at 7:30 A.M. on the French left wing by Eugene's troops; the wood of Sars was taken at 11:00, but the winning troops were too exhausted to follow the reforming French. The French right was attacked by Dutch troops, who were repulsed; the French commander was too cautious to give orders to pursue the hesitating Dutch. Villars had reinforced the wings from his well-defended center when no attack had been launched by noon. He wanted now to attack and gathered 50 battalions, but the British artillery covered the French front with a deadly fire. Two events turned the tide of the battle: Villars was wounded and taken away from the battlefield, and Marlborough and Eugene, seeing the weakened French center, launched a decisive attack. The fortifications were assaulted at a terrible human cost. Boufflers, now in command, ordered his cavalry to charge against the emerging infantry around 1:00 P.M., and six futile charges ensued. The French then decided to retire in good order, while the allies were too exhausted to pursue.

Malplaquet was the bloodiest battle of the eighteenth century, with no fewer than 11,000 killed and 22,000 wounded. The allied casualties were higher than those the French suffered; they were unable to follow their invasion plan. Malplaquet was seen as a glorious defeat in France and raised the fighting spirit of the army. Conversely, this dubious victory gave Marlborough's court enemies an argument to undermine Marlborough's position, and he was recalled in 1711.

Malta, Siege of (May–September 1565)

A defeat that blocked Turkish expansion to the west. The Ottoman emperor Süleyman, determined to seize Malta, the strategic gateway to the West, assembled nearly 30,000 men, including Janissaries and Spahis. The formidable Turkish artillery included specially made heavy artillery. One piece weighed nearly 40 tons and fired 200-pound balls. Two other pieces weighing nearly 20 tons each could fire 90-pound iron balls. The Turks also brought with them 100,000 cannonballs and 170,000 tons of powder.

These overwhelming odds could hardly be matched by Malta's 500 knights, around 5,000 Spanish soldiers, and approximately 4,000 other troops. The knights were led by Grand Master Giovanni Parisot de la Valette, who was able to strengthen Malta's fortifications before the Turkish onslaught. The knights also created a new weapon. After wrapping a circular iron band in tow, placing it in boiling pitch, and wrapping it with tow again, they lit the device and threw it at Turks scaling the fortifications. The knights also used entrenchments to stop the Turks.

The Turks began the bombardment of Saint Elmo on 10 June. Despite the death of their leader, Dragut, the governor of Tripoli, the Turks took the fortress. During the course of the siege, the fierce resistance by the knights caused the deaths of more than 24,000 Turks. Süleyman sent an additional 20,000 reinforcements, and by August Malta was nearing the end of its resistance. But the "Great Relief Force" of around 9,000 men led by Garcia de Toledo reached Mellicha Bay and refortified Malta's defenses on 7 September. Frustrated, the Turks began to evacuate Malta the following day.

Malta, Siege of (June 1940–November 1942)

German siege of British-held island, the failure of which kept open the British supply line to the Middle and Far East. Malta's strategic position in the Mediterranean between Sicily and Libya led to the island's second great siege during World War II.

Italy's declaration of war against Britain brought numerous air raids against the island, for a period defended by only three Gloster Gladiator biplanes and a small assortment

of anti-aircraft guns. The arrival of German troops in North Africa (February 1941) was accompanied by frequent Luftwaffe attacks against the island and its vital supply convoys. Despite the Axis blockade, Malta's defenses steadily improved throughout the siege, with it becoming a crucial base for surface vessels, submarines, and aircraft to operate against Field Marshal Erwin Rommel's supply lines. An Italian naval attack against Malta by explosive motorboats and "pigs," two-man piloted torpedoes, was repulsed on 15 July 1941, while a renewed Axis air offensive commenced in January of the following year. The sinking of numerous Allied supply ships increased the threat of starvation during the summer of 1942; between March and August, only 7 of 35 merchant ships bound for Malta arrived, with the most urgently needed supplies delivered by submarine.

In recognition of its heroic struggle, Malta was awarded the George Cross in April 1942. A combined German-Italian invasion, Operation HERCULES, was proposed for late June 1942, once Tobruk had been captured, but was postponed after Rommel's decision to strike against Egypt instead. However, the subsequent Axis defeat at El Alamein and lengthy retreat to Tunisia removed the threat of invasion to Malta. Following a final effort to neutralize the embattled island by air in October, Axis bombing raids progressively decreased. An ironic postscript to the siege was the surrender of the Italian fleet in Malta's Grand Harbor on 8 September 1943 (the anniversary of the ending of the Great Siege of 1565) and the awarding of a presidential citation by U.S. president Franklin D. Roosevelt.

Mamluks (1000–1600)

Soldiers who controlled the Abbasid Caliphate in Cairo between 1250 and 1517. The origins of the Mamluks lie in the famous regiment of the Abbasid caliph al-Mu'tasim (r. 833–841). They were the backbone of caliphate troops until the destruction of the caliphate at Baghdad in 1258 by the Mongols.

The Mamluks were essentially slaves recruited from the regions of Central Asia and Khorasan. They were a one-generation nobility, and their descendants were not allowed to

join the same military aristocracy as their fathers, leading to rampant conflict and unrest. Therefore, in order to ensure the continuity of this aristocracy and to safeguard nomadic vitality, a constant supply of nomadic children was maintained. Furthermore, the persistent effort at investing this aristocracy with a superior status and segregating them from the remaining urban classes had important physical implications. In earlier times, a similar situation had caused the transfer of the Abbasid capital from Baghdad to Samarra and the development of an exclusive residential district. In the era of the Mamluk sultanate's residence in Cairo, it was responsible for the use of the Cairo citadel as segregated residential quarters.

In the complex political history of the Mamluk state, as many as 45 sultans ruled for varying periods of time. In the absence of a system of legitimacy, a sultan's son succeeded him only until another Mamluk gathered enough support to seize the throne. However, some rulers, such as Qalaun (r. 1279–1290), were still able to establish dynasties of continuing rulers. Several others were also able to provide a degree of internal stability and initiate foreign conquests in the course of their short reigns. The success of this system is attested by the important Mamluk victory over the Mongols at Ayn Jalut in 1260, which brought Baybars I (r. 1260–1277) into power. Under his leadership, the Mamluks campaigned successfully against the remaining crusader possessions in Palestine and Syria and concluded a truce with the Mongols in 1323 during the long reign of al-Malik an-Nasir (1293–1341).

Egypt continued to dominate eastern Arabdom after Nasir's death in 1341, though the first signs of political and economic decline had already set in. Beginning in 1348, the Black Death repeatedly struck Egypt with large losses. So did Timur's Syrian victory in 1400 and Egypt's loss of control over its Indian trade routes to the Portuguese. The final blow was dealt by the actions of unruly Mamluk corps, which the sultans failed to effectively control. The heyday of the Mamluk sultanate was hence long past when Qait Bay (r. 1468–1496) lost the Syrian Empire to devastating raids by the Turkoman states of Anatolia and Azerbaijan and the campaigns of the Ottoman Turks.

Manchu Expansion, Wars of (1600–1681)

In the sixteenth century, the leader of one of the Jurchen tribes that lived outside the Great Wall in what is now Manchuria, Nurhaci, began to unite the Jurchen people, take on the trappings of a Chinese state, and gather talented Chinese political and military officials around him. In time, he became sufficiently powerful to threaten Ming control over the area outside the Great Wall in the northeast but not to take over China.

Nurhaci created mechanisms of government midway between nomadic rule and the bureaucratic Chinese system. One of his foremost creations was the banner system, in which companies of 300 warriors were grouped under four banners, colored either yellow, white, blue, or red; later, four more banners were added, the first three bordered in red and the last bordered in white. He appointed officers, and the system organized his people for peace and war. By 1644, when the Manchus occupied Beijing, there were 278 Manchu companies, 120 Mongol, and 165 Chinese—making an army of 169,000. Although this was a formidable striking force, it was not large enough to conquer China by itself.

Nurhaci's son, Abahai, sought to build greater power and to threaten the Ming in the north. He attacked Korea in 1627, and in 1636–1637, a renewed attack made Korea a vassal state of the Manchus. Abahai led his warriors through the Great Wall at least on three major occasions (1629, 1632, and 1634) and gained control of nearly all the areas to the north and northeast of the wall. To strengthen his appeal to those Chinese discouraged by the weaknesses and excesses of the Ming regime, he renamed his dynasty Qing, or “pure,” and encouraged Chinese “defectors” where it would aid his effort.

The Qing victory owed a great deal to the efforts of a Ming general, Wu San-gui. Wu was called to the capital to help defend the dynasty against a Chinese rebel but arrived too late and turned to the Manchus for help in restoring control over these internal rebels. Wu allowed the Manchu banners to pass through the Great Wall unhindered and to gain control of Beijing; his armies worked with Manchu armies to defeat various rebel groups and local warlords. For more than 30 years, Wu worked with the Manchus to extend their control over the whole of China.

It appeared that Wu accumulated personal power in southern China as he helped the Manchus gain control over the whole country, and in time he revolted. He set himself up as a regional warlord of a sort, and with two fellow warlords, he rebelled in 1673. It would take the great-grandson of Nurhaci, the Kang-xi emperor, eight years to end this rebellion and to gain control over continental China proper.

However, the new Qing dynasty would continue to battle to extend its power over territory typically controlled by other expansive Chinese dynasties. Thus, the Manchus

seized control of Chinese coastal areas opposite Taiwan, and the local warlord, Guo Xing-ye, fled to Taiwan, which he temporarily seized from the Dutch. The Dutch helped the Manchus gain control over Taiwan in 1683. Meanwhile, the Qing dynasty would take well into the eighteenth century to establish control over Tibet and over what is now western China and independent Mongolia, an area of traditional Chinese interest.

Mannerheim, Carl Gustaf Emil (1867–1951)

Finnish military leader and statesman. Mannerheim was born on 4 June 1867 in Louhisaari, Finland, to a noble family. He first studied unsuccessfully at the Hamina Cadet School (1882–1886) and then graduated from a private school in 1887. He completed his military training at the Nicholas Cavalry School in St. Petersburg (1887–1889). Mannerheim served in the Russian imperial army, making his way through the officer ranks and participating in the Russo-Japanese War (1904–1905).

During the initial years of World War I, Mannerheim was initially commander of a cavalry brigade and of a cavalry division in Poland and Galicia and then commander of a cavalry corps in 1917. He resigned his commission on 1 January 1918. In mid-January 1918, as a firm anticommunist, he took over the leadership of the Finnish White Guard. He was awarded the rank of general during his victorious command in the Finnish Civil War but was compelled to resign in May 1918. After Germany's defeat in November 1918, he was elected regent of Finland (1918–1919). He returned to Finnish military decisionmaking in the 1930s as the chairman of the Defense Council (1931–1939) and was promoted to the rank of field marshal in 1933.

In the Winter War with the USSR (1939–1940) and the Continuation War with Germany (1941–1944), Mannerheim was the commander in chief of the Finnish armed forces. He was awarded the title of marshal of Finland in 1942. It may well be that the stout Finnish resistance to Soviet demands

induced Stalin, who respected only force and power, to refrain from making Finland another Soviet satellite. Finland would enjoy national independence, although it was always wary of offending its giant neighbor. Much of the credit for Finnish national survival therefore must go to Mannerheim.

After the wars, with Finland having to agree to harsh peace terms with the Soviet Union, Mannerheim was elected president (1944–1946) to steer the country toward peace. During the war crimes trials (1945–1946), which were meant to satisfy the Allies' demands to assign responsibility for the Continuation War, the possibility of his prosecution undermined his position. He resigned in March 1946, exhausted by illness. Mannerheim died on 28 January 1951 in Lausanne, Switzerland.

Field Marshal von Manstein on an inspection tour in Russia, c. 1941. (Library of Congress)

Manstein, Fritz Erich von (1887–1973)

The most brilliant German strategist of World War II was born 24 November 1887 at Berlin as “von Lewinski” and was adopted by his aunt. Following family tradition, he joined a military college, becoming a lieutenant in 1907. After service in staff positions from 1914 to 1918, he entered the post-Armistice Reichswehr and made his way up (deputy chief of the general staff 1937–1938) but was removed to take over a division. When during the winter of 1939–1940 Germany prepared to attack France, Manstein managed to impress Adolf Hitler with his own plan of operations (attack through the Ardennes mountains). Hitler took Manstein’s suggestions, and France surrendered within six weeks.

Considered a military genius, Manstein received higher commands in the Russian campaign (Eleventh Army from September 1941 onward). Being fully aware of the mass murders carried out by SS units, Manstein issued an order excusing harsh measures against Jews. After the conquest of the Crimean peninsula, he was promoted to field marshal on 1 July 1942. Beginning in the autumn of 1942, he commanded Army Group Don, trying in vain to relieve the Sixth Army at Stalingrad. He refused to order a withdrawal without Hitler’s consent. After the disaster, Manstein managed to stabilize the southern part of the eastern front, but Hitler ig-

nored his suggestions for a reorganization of defenses to allow flexible tactics under Manstein as supreme commander in the east. After several quarrels and Manstein’s disregard of Hitler’s “stand fast” orders, Manstein was dismissed 30 March 1944 but continued to hope for a comeback until the final surrender.

Manstein repeatedly refused to join military resistance circles but kept silent about contacts with conspirators. A witness during the Nuremberg trials, he stood accused in 1949 of the killing of civilians and commissars. His trial received worldwide attention: Winston Churchill, Bernard Montgomery, and others intervened for Manstein, who nonetheless was sentenced to 18 years’ imprisonment but was released four years later. He acted as an adviser for the reestablished German army and in his memoirs blamed Hitler for “lost victories.” He died 10 June 1973 at Irschenhausen, near Munich.

Although his strategic abilities are undisputed, Manstein’s critics focused on his tolerance for, if not support of, war crimes in Russia and his unwillingness to act against Hitler. He despised the dictator but stayed loyal to him, refusing to draw political conclusions from military developments.

Mansûrah, Battle of (November 1249)

Pivotal battle of King Louis IX's (Saint Louis) crusade in Egypt. After wintering in Cyprus, King Louis marshaled his army of approximately 20,000 men and sailed for Egypt in May 1249. Despite attempts by the army of Sultan al-Salih to prevent a landing, the crusaders successfully captured Damietta. On 20 November 1249, King Louis began an advance southward along the Nile toward Mansûrah.

Arriving before Mansûrah in December, the crusaders found their army wedged between the Nile and a tributary. Louis intended to cross the tributary and strike Mansûrah from the rear, but it was not until 8 February 1250 that the army's vanguard successfully forced a crossing. Led by Robert d'Artois, Louis's brother, the crusaders crossed the river, attacked the Egyptian camp, and killed the Muslim commander, Fakhr al-Dîn ibn al-Shaykh. Emboldened by his success, Robert d'Artois then advanced into the city of Mansûrah rather than waiting for reinforcements.

The narrow streets of Mansûrah became a gauntlet for Robert's knights as arrows, stones, and tiles hailed down upon them from the rooftops. An Egyptian counterattack led by the Mamluks, the sultan's military slaves, annihilated the survivors. When King Louis and the main army later attempted to cross the river, they met stiff resistance from the reinvigorated Egyptians.

With the crusaders' forward advance thwarted, Muslim forces increased pressure on King Louis's army by harrying its supply lines. Disease also struck the Christian camp, leaving King Louis himself with dysentery. In March, the crusaders had no choice but to fall back on Damietta but were subject to constant attack along the way. Finally, on 6 April 1250, King Louis surrendered and offered himself as a hostage. The crusaders were too enfeebled to resist or renew the offensive. The invasion of Egypt ended with the exchange of King Louis for the city of Damietta and the ransoming of his army.

Mantineia, Battle of (362 B.C.E.)

Thebes repeatedly clashed with Sparta over the Spartans' tyrannical rule following the conclusion of the Peloponnesian Wars. Epaminondas led the Theban army on four separate invasions. His final invasion occurred in 362 B.C.E. and culminated in the Battle of Mantineia, in which he managed to repeat his tactical victory at Leuctra against the allied army of Spartans, Mantineans, Arcadians, and others.

Epaminondas deceived the Spartan allies by the manner of his march. His best troops, the Theban Sacred Band, led the march column northward toward the allies but deftly maneuvered to the left, forcing the allies to rotate at right angles. Epaminondas pretended to set up camp without giving battle. Consequently, his enemies began to remove armor and break ranks. Epaminondas maintained the integrity of his formation and posted his cavalry to protect his flanks; he made special provisions for his left flank to prevent it from envelopment.

At the signal, the Theban line and its auxiliary cavalry began a rapid advance against the surprised allies. They managed to reform, but their haste ensured a disorganized and loosely formed line. In keeping with his tactical device at Leuctra, Epaminondas withheld the right portion of his line and vigorously pushed forward his left, which he reinforced in depth at the expense of breadth. The strong impetus of the Thebans smashed into the Spartan phalanx and broke its moral and physical cohesion. After a bloody struggle on the left, the Theban center and right advanced in good order against the weaker portion of the allied line, which quickly gave way. Epaminondas won but at the highest personal cost. Wounded in the chest by a spear, he died shortly thereafter. Although not as decisive as it would have been had he lived, Epaminondas's tactical genius won peace but not hegemony for Thebes.

Mao Zedong (1893–1976)

Leader of an agrarian-based, Communist movement in China during the long period of anti-Japanese resistance and civil war against Chiang Kai-shek's Nationalist regime in the 1930s and 1940s who ultimately came close to destroying Chinese society in the Great Proletarian Cultural Revolution in the 1960s. Mao was born in Hunan Province in central China and moved to Beijing where, in the aftermath of World War I, he became active in student and revolutionary causes, joined the Communist Party, and, during the period of alliance with Chiang's Kuomintang, studied agrarian conditions in China's poverty-stricken countryside. He concluded that peasants had a great anger that could be harnessed to a revolutionary movement, and thereby he broke with the more orthodox Communists who sought the revolution among the limited number of urban proletariat in China's Western-dominated cities along the coast and the Yangtze River.

After Chiang crushed the urban Communists in 1927–1928, Mao gained more power; his “soviet” (revolutionary area) in the rural southeast became a haven for Communists. But in October 1934, after a great many Nationalist “extermination campaigns,” Mao and his followers were forced to abandon the soviet and undertake a 12-month “Long March” from southeastern to western China and eventually to the northwest by the Great Wall, near the imperialist Japanese.

Mao espoused a philosophy that both revolutionized the peasantry and helped guide them in the desperate conflict against Japanese and Nationalist power. He helped them identify entrenched interests—landlords, government officials, businesspeople, the privileged—as being in league with one another and with foreign imperialists and thereby helped peasants identify them as enemies. He also helped them understand how to fight—to harass when weak, to combat when stronger, and always to propagandize the peasantry.

Although the Communists did not play a major role in the defeat of Japan (however they later claimed to have defeated the Japanese almost single-handedly), Mao helped direct the successful campaign in Manchuria that first tied Nationalist troops to big cities, then isolated them, and finally forced them to surrender. Thereafter, as many Nationalist troops deserted or changed sides as were beaten in battle.

Before the final battle of the long civil war could take place—the invasion of Taiwan and the destruction of Chiang's remaining forces and resources—Mao felt forced to intervene in the Korean conflict as Republic of Korea troops and United Nations forces neared the sensitive Yalu River border with Manchuria. For nearly three years, Chinese troops fought better-armed and better-supplied UN forces

Portrait of Mao Zedong. (Library of Congress)

to a draw, reestablishing the North Korean regime and the thirty-eighth parallel, but at a fearsome human cost.

During the late 1950s, Mao turned his attention inward to remake China. Frustrated with what he viewed as entrenched interests in the government and party bureaucracies, he unleashed the power of youth, backed by a highly politicized army, in the destructive Great Proletarian Cultural Revolution of the 1960s. His later Great Leap Forward was an economic disaster (in which peasants were “encouraged,” for example, to build backyard blast furnaces, producing useless metal), and millions died of starvation. Eventually, Mao had to concede the breakdown in power, and he most likely died frustrated with his failure to secure his “Continuing Revolution.”

Maps and Cartography

The utilization of cartography and topographical mapping for military strategy and operations. Throughout history, considerations of terrain have influenced land warfare. Basic knowledge or ignorance of the lands in which armies traveled and fought sometimes determined their victory or defeat. However, until the invention of the scientific tools and methodologies necessary for composing precise maps, cartography held limited value for soldiers. Scouts, spies, and travelers fulfilled their ever-pressing needs for information about enemy landscapes. Because of the small scale of most campaigns in the premodern world, reliance on such non-graphically expressed intelligence was neither surprising nor particularly injurious to the conduct of war. Even the exceptionally long-distance land campaign of Alexander the Great against the vast Achaemenid Persian Empire or the Mongol incursions into Russia and eastern Europe were not expedited greatly by any formal cartographic organization of knowledge about their enemies' territories and deployments, but rather were facilitated through intelligence obtained from mounted scouts and local informants in a gradual, unfolding fashion. Likewise, the successful administration and defense of small premodern polities did not require exceptionally strong cartographic skills.

These conditions do not mean that the strategic and tactical values of landscape went undetected and unexploited by ancient and medieval commanders. As small chiefdoms and city-states expanded into kingdoms and empires with diplomatic and commercial connections of continental scope, the need for graphic representations of geographic space acquired a heightened significance. The earliest known examples of methodical collations of geographic information occurred soon after the advent of writing among the peoples of ancient Mesopotamia, where cuneiform lists of towns, rivers, and mountains appear as early as the third millennium B.C.E. Simple maps, building plans, and property surveys emerged in the next millennium, both in Mesopotamia and Egypt. Whether the traditions of the ancient Near East and Egypt considerably influenced the evolution of Mediterranean cartography presents a contentious issue, but mapping certainly reached its pinnacle in the premodern West with the Greeks and Romans, especially with the massive influx of geographic data produced by Alexander's conquests and the proliferation of long-distance trading routes connecting Europe with Central Asia, Arabia, India, and the coasts of sub-Saharan Africa in the last four centuries B.C.E. Global mapping, at least in terms of the world known to them, and mathematically grounded cartography emerged in this period, as seen in the works of Eratosthenes, followed by Marinus of Tyre and Ptolemy. The latter's *Geographike Hyphegesis* (*Manual of Geography*) served as the standard

for centuries and strongly influenced both European and Arab cartographers, the latter translating his work into Arabic as early as the ninth century.

However, these achievements existed predominantly within the civilian realm; intelligence and maps typically followed conquest in classical Europe. When produced, maps rarely incorporated significant amounts of expressly military data, as seen in the Peutinger Table, a medieval copy of a third-century map of the Roman Empire that lacks any references to military installations. Geographic and ethnographic literature was written after campaigns and oriented toward civilian audiences, such as the fantastic descriptions of India composed by Alexander's admiral Nearchus. Land surveying, an art practiced by every literate culture with increasing precision since the Sumerians, was a vital aspect of Greek and Roman cartography but was employed primarily for civilian or civil administrative purposes, such as the planning of cities and land apportionments. *Agrimensores* (land measurers) accompanied Roman legions, but their tasks principally consisted of laying out fortified camps and buildings, constructing roads, and demarcating lands for veterans, not producing maps; intelligence about territory and terrain was acquired by *exploratores* (scouts). Roman road itineraries constituted the main cartographic tool exploited for military purposes in premodern Europe. Itineraries were written descriptions of roads accompanied by enumerations of the settlements, way stations, and other important features situated along them, along with their intervening mileages, thus allowing for some marching-rate calculation. They are clearly referred to in the military textbook of the late Roman author Vegetius and sometimes were paired with rough graphic illustrations.

With Rome's demise, most of these cartographic developments were lost and replaced by unrealistic, fanciful depictions of the world, shaped more by Christian theological considerations than actual geographic data. This trend is seen most plainly in the *mappaemundi* (literally, "table-cloth worlds" for the size of their media) manufactured in monasteries as didactic tools. Itineraries retained some importance, but systematic, mathematically based cartography, military or otherwise, largely was unpracticed and ignored. Production of maps increased slightly during the Crusades, but again the chief motivation was religious, as demonstrated by the maps of holy sites and pilgrimage destinations in Palestine created by the English monk Matthew Paris.

Mapping reached a sophisticated level very early in China and was applied with considerably greater frequency to military affairs than in contemporary Europe. Dating to 168 B.C.E., silk maps clearly depicting topography, fortifications, depots, and other military sites have been unearthed by ar-

chaeologists from a tomb of an officer at Mawangdui (near Changsha, China). There are several unambiguous references to military maps contained within the historical literature of the Han dynasty, such as passages in the *Guanzi* (*Book of Master Guan*), a military text of the third century B.C.E., that urge their use for planning marches and exploiting terrain for strategic advantage. Three-dimensional military maps dating to the early first century and constructed of wood and molded rice are known, and precise, mathematically based topographical maps were drawn up as early as the third century by the imperial cartographer Pei Xiu, whose methods possibly are reflected in extremely accurate gridded maps of the entire Chinese coastline that survive in stone copies dating to the twelfth century. Throughout Chinese history, maps provided by tributary states and peoples signified their submission and allowed Chinese military leaders to amass a substantial amount of strategic geographic intelligence. Their precocious cartographic methods spread to Korea and Japan, where military administrators also adopted them. Beginning in the mid-1400s, Korean cartographers produced particularly high-quality maps for arranging the defense of their Manchurian frontier against potential Manchu invasion.

The history of medieval Islamic cartography is lengthy and rich, but its military relevance remained unrealized until the rise of the Ottoman Empire. One of the few early examples of military Islamic cartography is a literary reference to maps drafted for al-Hallaj ibn Yusuf, an eighth-century administrator who relied on them to coordinate military activities near the Caspian Sea from his palace in Iraq. Arab geographers, cosmographers, and mathematicians, although certainly gifted, drew maps from illustrative rather than strategic intent. However, the Ottoman army definitely exploited small-scale military mapping in its European operations. The *kulaguz* (reconnoiterer) figured prominently in Ottoman military practice prior to the adoption of European cartographic methodology in the nineteenth century, drafting maps and plans of enemy fortifications for use in future conflicts. The earliest example is a late fifteenth-century map of Kiev and its suburbs prepared for Sultan Bayezid II; it proposed a never-executed naval assault on the city, thus revealing its intended role in the planning of campaigns. Süleyman I probably relied upon a still-extant plan of Belgrade, drafted by an army reconnoiterer, during his successful siege of the city in 1521; similar plans for operations in Malta and Szigetvár (Hungary) also exist, as well as a map drawn much later for the ill-fated second siege of Vienna in 1683. For the most part, these “maps” were impressionistic artistic views of the targeted cities and fortresses but stand as concrete illustrations of cartographic-based advance military planning.

Mapping traditions also flourished in the Americas prior to European contact, although most of these materials were lost and what survives is known mainly from European copies of varying quality and frequently dubious veracity. The best examples of pre-Columbian military cartography are maps allegedly utilized and drawn by Aztec *pochteca* (long-distance traders), sent as spies into adjacent towns and regions in order to collect geographic intelligence under cover of their commercial endeavors. According to an illustration contained in the *Codex Florentine*, a Spanish-Nahuatl “encyclopedia” of preconquest Mexico written about 1570, it seems that the Spanish integrated Nahuatl information into new maps, which then guided the troops to their objectives; unfortunately, no actual *pochteca* maps exist today. Also, the conquistador Hernando de Cortez mentioned Aztec ambassadors who brought to him cloth maps detailing the Gulf of Mexico coast, whereupon he ordered his staff to make copies in European form and used them to plot further expeditions.

Comprehensive and accurate cartography useful for military applications in the modern sense emerged only toward the close of the medieval period in Europe. New technologies and social forces coincided to produce the enormous upsurge in map production during the Renaissance. Directional compasses appeared in China around 1150 and passed to Europe about a century later, eventually revolutionizing Western navigation and cartography. The revived study of classical urban planning and military architecture intensified interest in surveying and mapping generally, especially in Italy, where district maps and diagrams of fortifications prepared by military engineers, including the famous artist Leonardo da Vinci, appeared throughout the fifteenth century. This is a trend reflected most clearly in the military district maps commissioned in 1460 by the Council of Ten of Venice and the large regional maps of Lombardy produced as early as the 1440s. Triangulation surveying techniques, introduced by Gemma Frisius in 1533, allowed for considerably more precise measurements of distances than previously available, enabling the development of scale mapping. True-to-scale local and property maps began to be drawn in Italy, the Netherlands, and England, and English engineers produced accurately scaled maps of their coastal fortifications by the mid-1500s after French raids along the Channel coast. From the fifteenth to the seventeenth centuries, the escalation of border and frontier disputes between the emergent absolutist nation-states, extensive nautical exploration and the construction of transoceanic empires, massive religious warfare, and insurrections like the Fronde in France emphasized the need for reliable maps for the rulers and military leaders of Europe, who then enthusiastically employed surveyors to map their territories to meet such dire military and diplomatic concerns. The first

known official military cartographic project in France began in 1495 with Charles VIII's order to Jacques Signot to map the mountain passes by which the French army could traverse the Alps and invade Italy. In Habsburg Spain, where military cartography evolved slowly and to an arguably lesser extent than in other European realms, Philip II nonetheless often utilized maps to coordinate information about his far-flung empire and charted the route of his doomed armada with maps and nautical charts, and his subordinate, Fernando Alvarez de Toledo, the Duke of Alba, relied extensively on rough maps of the Netherlands to plan marches and attacks during his attempts to subdue the Dutch insurgents.

Despite these advances, before 1700 most military maps were simplistic and schematic, drafted more frequently by and for civilians and bureaucrats than soldiers, and not exploited regularly by commanders in the field. Pamphlets published in the 1750s urged British officers in India to use their maps and avoid overreliance on native guides. Frederick II constantly complained about the dearth of good military maps and was compelled to rely on captured Austrian maps for his campaigns in Silesia.

The eighteenth century brought the formalization of military cartography requisite for the production of maps serviceable for strategic planning and combat operations. Surveyors and engineers increasingly were incorporated into formal army structures, beginning with the organization of the French army corps of surveyors in 1696. Improvements in road construction, the desire for better control over larger numbers of troops, which required detailed advance logistical and operational planning, and the realization that successful defense from foreign invasion rested significantly upon geographic intelligence led to the first truly scientific efforts to map entire countries. Important examples include the topographical surveys of France undertaken by the Cassini family between 1733 and 1788, General William Roy's mapping of Scotland for the British army in the wake of the Jacobite Rebellion, F. W. Schetten's survey of Prussia in the 1780s, the mapping of Austrian crown lands ordered by Joseph II in the same decade, and the initiation of the Board of Ordnance surveys in Britain in 1791. Topographic mapping, a necessary component of modern military cartography, began to be standardized during the 1700s. First proposed in 1777 by Jean-Baptiste Meusnier, a French lieutenant of engineers, contour lines dramatically increased the military efficacy of topographical maps, especially at the tactical level; however, they did not replace entirely older topographical maps drawn with hachure lines until the next century. Thoroughly map-based advanced military planning emerged toward the end of the eighteenth century, noticeable as early as 1775 with General Pierre-Joseph de Bourcet's

work, *Les principes de la guerre de montagne*. Based on his detailed topographical surveys in the Savoy and Piedmont border regions of France, the work presented a carefully organized system by which all rates of march and supply issues for a campaign could be anticipated through reliance on detailed topographical maps. Coupled with the creation of divisional units, modern topographical maps contributed to the expansion of commanders' abilities to control significantly larger armies than existed in previous ages, thus transforming European warfare.

This process of formalization and large-scale strategic mapping continued throughout the nineteenth century. Napoleon I organized his Imperial Corps of Surveyors in 1809, whose efforts facilitated the speed with which his armies penetrated Russia a few years later. The implementation of general army staffs, which brought the art of preparing for future wars during peacetime to an unprecedented level, sustained interest in military cartography throughout the century. The predecessor of these bodies was the Great General Staff of the Prussian army, created during the Napoleonic Wars to coordinate technical and logistical information for field commanders; these goals required the systematic compilation of immense amounts of topographical data collected well before hostilities began. By the 1840s, general staff maps were available both in France and Prussia, where they exercised a strong influence on military strategy and planning, seen most clearly with the formulation of the Schlieffen Plan in Germany prior to World War I. Military cartography disseminated outside Europe, replacing older traditions in China, Japan, and the Ottoman state.

Army surveyors proved invaluable in exploring and mapping unsettled regions in the western United States throughout the nineteenth century, beginning with the famous expeditions led by Captains Meriwether Lewis and William Clark, Lieutenant Zebulon Pike, and Lieutenant John Frémont, the latter an officer with the Army Corps of Topographical Engineers, formed in 1838. The corps' work, as well as numerous surveys undertaken by the War Department, allowed for the rapid settlement and railroad construction that occurred in the American West after the Civil War. Although the western and "Indian" territories were mapped systematically, that conflict also highlighted the lack of scientific surveys of the country's eastern and southern sectors, further stimulating the development of American military cartography, so that by the Civil War's end, the Coast Survey and Army Corps of Engineers supplied Union forces with approximately 43,000 printed maps per year. Similar increases in the scale of map production took place elsewhere, especially in connection with trench warfare during World War I, which necessitated highly accurate large-scale maps for accurate, long-range artillery fire. For exam-

ple, the British Expeditionary Force (BEF) originally landed in France with two cartographers, an officer, and a clerk responsible for the provision of all maps; by 1918, the BEF contained 5,000 cartographic personnel who produced over 35 million maps throughout the course of the war.

It was in the twentieth century that the most substantial advances in scientific military cartography were made, as mapping moved into the skies. Although surveyors and artillery observers working from balloons participated effectively in nineteenth-century wars, notably the American Civil War, the invention of the airplane utterly transformed their work. Significantly more mobile than balloons and dirigibles, aircraft were acknowledged to have an advantage quite early, with the first examples of aircraft reconnaissance occurring in 1911 during the Italian campaign in Libya. The armies of all participating countries employed them during World War I, eventually equipping them with machine guns and primitive bombs and transforming them into the first fighter and bomber aircraft; the American army flew reconnaissance missions as early as 1916 during the Mexican Punitive Expedition directed against Pancho Villa.

By the outbreak of World War II, aerial operations were regarded everywhere as vital components of land warfare, leading to a demand for detailed maps for strategic bombing and aerial support of land combat and, when coupled with photography, allowing for the composition of extremely accurate maps. Two examples from the experience of the German Luftwaffe clearly illustrate this double facet of modern warfare: Nazi bomber crews relied on British Ordnance Survey maps to locate targets in England and then in preparation for the invasion of the Soviet Union flew modified high-altitude bombers over Soviet territory to collect intelligence about geography and troop deployment. Similar photo-reconnaissance missions enabled the amphibious landing of their Allied adversaries at Normandy a few years later.

During the Cold War, aerial reconnaissance and mapping saw extensive application as nuclear threats emerged. The United States conducted high-altitude reconnaissance flights over Soviet territory beginning in 1946, successfully charting their bomber bases and revealing their nuclear capabilities, although the constant emphasis that Strategic Air Command placed on using aircraft instead of missiles or rockets throughout the 1950s hampered the development of American space and satellite programs. Between the Apollo moon landing program of the 1960s and the space shuttle program of the 1980s, this disadvantage was rectified, and American satellites now provide the most accurate military cartographic services ever known. Without global positioning system (GPS) and geographic information system (GIS) satellites and computer software that produces precise three-dimensional maps of enemy terrain, the pinpoint ac-

curacy of armor fire achieved by U.S. forces during the Gulf War or in later cruise missile strikes against antiterrorist objectives in Sudan and Afghanistan would have been unachievable. Recent space cartography projects, such as the hyperaccurate digital terrain maps generated by the new Shuttle Radar Topography Mission, certainly hold potentially enormous consequences for the nature of land warfare in the twenty-first century.

Maratha Wars (1775–1818)

Three wars that doomed the Maratha Confederacy. By the late eighteenth century, the Maratha Confederacy was one of the greatest powers in the central Indian subcontinent. During the reign of Shivaji (d. 1680), the Marathas erupted from their mountain domain of the Western Ghats on the Arabian Sea and were transformed from Hindu mercenaries into warlords in their own right. Significant as was their military proficiency in the rise of the Marathas, equally important were the dissensions that afflicted Mogul rule of India. The reign of Shivaji paralleled that of the Mogul emperor Aurangzeb, whose vigorous persecution of non-Muslims in the last half of the seventeenth century served to encourage revolt among not merely the Marathas but the Rajputs and Sikhs as well. The resulting overextension of Mogul forces meant that, by the time of Aurangzeb's death in 1707, the Marathas had established themselves as the dominant power in the Deccan. In the succession crises that followed the death of the emperor, the Marathas were able to extend their power still further, until by 1740, their ruler, the Peshwa of Pune, governed from the Arabian Sea to the Bay of Bengal.

Given the nature of the Maratha rise to power, it was fitting, if not ironic, that the ultimate British victory in the three Maratha Wars had as much to do with dissension

among the Marathas as to particular proficiency on the part of their European enemy. As the Marathas extended their power across India, governance of lands seized from the Mogul emperor was left in the hands of Maratha commanders. Consequently, rather than governing a centralized state, the Peshwa of Pune oversaw what the nineteenth-century historian James Duff described as a “communion of interests.” The same tendency to internal dissension that so afflicted the Mogul empire and that largely accounted for the rise of the Marathas soon became a feature of Maratha political life.

Matters took a serious turn in the early 1770s, when the British East India Company’s Bombay presidency saw in the succession crises of that time an opportunity to expand its interests in the region. In 1775, Bombay recognized Raghunath Rao as the legitimate claimant to the Peshwaship in exchange for territorial gains and in so doing set the scene for the First Maratha War (1775–1782). It was a conflict that ran in fits and starts. At Aras (18 May 1775), Raghunath and his British allies were defeated by the Maratha commander, Hari Pant. Facing war with France and its primary Indian ally, the Sultan of Mysore, Governor of India Warren Hastings took the opportunity of this defeat to condemn Bombay’s actions and ordered the company troops back to their quarters. Subsequent negotiations with the Maratha Regency Council failed—despite British offers to abandon Raghunath Rao for territorial concessions—and in 1778 troops from Bombay again marched against the Marathas. Though their defeat at Talegaon (11–17 January 1779) represented a serious setback to British interests in the region, 1779 also marked an important turning point in British strategic interests in India. Concerned that Bombay’s actions could increase French interest in the region, Hastings ordered six battalions to march from Bengal. When the commander of this force, Colonel Thomas Goddard, heard of the defeat at Talegaon, he did not turn back but pushed on, covering 300 miles in 19 days. When negotiations with the Regency Council failed, Goddard was joined by the Gaikar, Maratha princes from Baroda, and successfully stormed Ahmadabad. Meanwhile, in 1780, a second Bengal force under Captain Thomas Popham captured the Marathas’ mountaintop fortress at Gwalior (November 1780). Just as British victory over the Marathas seemed to be assured, however, Haidar Ali, Sultan of Mysore, invaded the Carnatic, opening the Second Mysore War. As a result of the very real threat to Madras and the British position on the Carnatic, the East India Company opened negotiations with the Marathas in 1781 that would end with the Treaty of Salbai (1783). Although the latter forced the British to relinquish their support of Raghunath Rao, the expeditions of Goddard and Popham nonetheless demonstrated the British ability to strike at will anywhere on the subcontinent.

Peace between the British and the Marathas would last for the next two decades, until a succession crisis shook the confederacy in 1803. Defeated by his rival, Holkar of Indore, Baji Rao II entered into the Bassein Treaty (1803), by which the British agreed to restore Baji as Peshwa in return for the Marathas accepting and paying for British troops in their capital, together with other obligations. To restore Baji Rao and bring those princes who rejected the Bassein Treaty to heel, Governor General Sir Richard Wellesley planned a twofold campaign against the Marathas. First, Wellesley’s brother, Arthur, would lead a force of 9,000 Europeans and 5,000 Indian troops into the Maratha homeland. A second force under Gerard Lake invaded Hindustan. In March 1803, Wellesley’s force captured Pune and restored Baji as Peshwa. On 23 September 1803, Wellesley’s army met and defeated the Marathas under Doulut Rao Sindhia at Assaye. Though victorious, Wellesley would later recall this campaign as the hardest-fought action of his long career. Meanwhile, Lake captured Delhi on 16 September 1803 and in the Battle of Laswari (1 November) finally destroyed the forces of the Maratha prince, Sindhia. In the meantime, the British government had grown concerned with the extent of these operations. In particular, the siege of Bhurtpore (January–April 1805) had claimed 3,100 men before the British were victorious. Accordingly, Lord Wellesley was recalled, and with the capitulation of Holkar at Amritsar (December 1805), the Second Maratha War came to an uneasy close.

The Third Maratha War (1817–1818) was in large part the consequence of the turmoil that gripped India as Maratha power finally crumbled. In the aftermath of the Second Maratha War, a vast horde of former Maratha soldiers known as the Pendaris spread out across central and southern India in an organized campaign of violence and depredation. When the governor of India, Francis Hastings, Lord Moira, decided to move against the Pendaris with two large armies, he expected Maratha support. Instead, the Peshwa Baji Rao II, justifiably resentful of the conditions imposed on him by the British in return for their support in the 1803 war, turned on the British and attacked and destroyed their residency at Pune with a force of 27,000 men (5 November 1817). Holkar likewise took to the field but suffered defeat at the hands of Sir Thomas Hyslop at Mahidput (21 December 1817) before being forced to surrender. Nor did the Peshwa fare any better, for on the same day his forces destroyed the British residency at Pune, they were defeated at Kirkee by a mere 2,800 British soldiers. Defeated again at Koregaon (1 January 1818) and Ashti (20 February), the Peshwa finally surrendered to Hastings’s army on 2 June 1818. With Baji Rao’s surrender, the hereditary office of Peshwa was abolished by the victorious British, and with it the political and military power of the Maratha Confederacy ceased to exist.

Marathon, Battle of (490 B.C.E.)

In August 490, a Persian force of some 30,000 men under the command of Darius landed at Marathon in Attica. Nine thousand Athenians and 1,000 Plataean allies, all under Miltiades, defeated the enemy, despite having been refused immediate help from Sparta.

Who took the initiative for battle is still under debate, though it seems that the Greeks decided to attack first after they heard a rumor saying that the Persian cavalry was with-

drawing. Miltiades, wanting to make his army look equal in length to the Persian army, made its center only a few ranks deep but kept the wings deeper and stronger. The Athenians occupied the center and the right side of the line, and the Plataeans were on the left. Little is known of the Persian dispositions, except that the Persians and Sacae (a warlike people from Central Asia) formed the very strong center of the line.

After the usual sacrifice, the Greeks charged at the double (according to Herodotus, the first Greeks to have done so) across no-man's-land, taking the Persians by surprise and thus reducing the effectiveness of their archers. The fighting, according again to Herodotus, was severe and lasted a long time. The Persians broke the weak Athenian center and pursued the survivors inland. Meanwhile, the stronger Greek wings, which had already managed to route their opponents, reformed (most probably joining forces) and attacked the Persian troops who had broken through their center. The Persians started to flee toward their ships, with the Greeks in close pursuit. Large numbers of Persians perished in a nearby marsh, and even more were killed by the pursuing

Greeks attacking Persian ships during the Battle of Marathon. (Bettmann/Corbis)

Greeks. Most of the Persian navy was already at open sea, but seven Phoenician ships that were still lying close inshore, waiting for the last fugitives, were captured by the Greeks. Herodotus gives the losses as 6,400 Persians and 192 Athenians dead. The former figure may seem exaggerated, but the latter can surely be accepted as precise.

Despite the Greek victory, the Persian fleet laid course for Sounion in order to attack Athens. Miltiades immediately ordered his troops to march post-haste to Athens and managed to reach the city before the enemy fleet. When the Persians arrived soon afterward and saw an army waiting for them, they set off toward Asia.

This amazing victory of the Athenians and their Plataean allies had a huge impact on Athens's later history, and many scholars have praised the strategy and tactical brilliance of Miltiades. It should be noted, however, that although all these tactics appear to be quite sophisticated and planned well ahead (even down to what becomes, according to some views, the "falling back of the Athenian center"), it is more likely that what happened was almost accidental. If we are to believe Herodotus, the thinning of the Greek center was a purely defensive move rather than a specific plan for the wings to first crush the enemy wings and then move on to smash their center by a "double envelopment." In addition, there is no reason to believe that the victory was due to the superiority of Greek discipline because most of the Greek *hoplitai* were just common citizens and not professional soldiers. All these caveats do not decrease the importance of the victory but on the contrary enhance it and make it more astonishing.

Marcellus, Marcus Claudius (c. 275–208 B.C.E.)

Probably the most popular commander in Rome during the Second Punic War. Middle-aged when the Second War began, Marcellus had already won his spurs. While serving in the First Punic War, he saved the life of his adopted brother. As consul, he campaigned against the Gallic tribe of the Insubres in 222 B.C.E. He relieved the city of Clastidium and killed the Gallic chief Viridomarus in single combat, by which he won the so-called *Spolia Opima* (the spoils of

honor), that is, the right to offer his vanquished opponent's personal spoils to Jupiter. This honor was given only twice before in Roman history.

When in 216 B.C.E., Rome was disastrously defeated by Hannibal at Cannae, Marcellus was sent to take command of the remnants of the defeated army. He reformed it into two legions and followed Hannibal into Campania. Using the delaying tactics advised by the general Fabius Maximus, Marcellus dug in on a strategically important position, afterward known after him as "Castra Claudiana." From there he could cover a large part of Campania, threaten the defecting town of Capua, and secure important lines of communication without risking battle with Hannibal. During the following years, Marcellus frustrated Hannibal's attempts to extend his foothold in Campania.

In 213 B.C.E., Marcellus was dispatched to Sicily and assaulted Syracuse. Because of the defensive machinery created by the scientist Archimedes, the Romans were repelled, and Marcellus laid siege to the city. Although the Syracusans held out for three years, in 211 the city was taken and sacked. In later years, Marcellus remained faithful to the Fabian method. He doggedly followed Hannibal's footsteps on the Italian mainland without engaging his army. However, in 208 B.C.E., Marcellus was attacked and killed reconnoitering the battlefield. Hannibal gave him a hero's funeral, a fitting end for the commander who was called "the Sword of Rome."

March, Peyton (1864–1955)

American general of World War I, sometimes called the "Father of the Modern U.S. Army." Born 27 December 1864 in Easton, Pennsylvania, March graduated from the U.S. Military Academy at West Point in 1888 and served in the Philippine Insurrection of 1899–1902, having field command in the Battle of the Clouds at Tilad Pass on 2 December 1899. He served on the general staff from 1903 to 1907, acted as an observer during the Russo-Japanese War of 1904–1905, and served as commander of the 1st Battalion, 6th Field Artillery

Regiment in Fort Riley, Kansas, from 1911 to 1916. As a colonel, March commanded the 8th Field Artillery on the Mexican border in August 1916. In June 1917, after the United States entered World War I, March was promoted to brigadier general and led the 1st Field Artillery Brigade in the American Expeditionary Force in France. He became acting chief of staff of the army in March 1918 and chief of staff on 19 May of that year and held the position until 30 June 1921. During these crucial years, he presided over the buildup of U.S. forces in the closing months of the war, as well as the demobilization of those forces. Although today a little-remembered figure, Peyton March is credited with creating the Air Service, Tank Corps, and Chemical Warfare Service during the war. He died 13 April 1955 in Washington, D.C.

**Marcus Aurelius (Antoninus)
(121–180)**

Roman emperor, philosopher, and soldier. Born Marcus Annius Verus, Marcus Aurelius succeeded Antoninus Pius as Roman emperor (Augustus) in 161. Marcus appointed Lucius Verus coemperor to help rule and consolidate the large empire, reserving the title of chief priest (*pontifex maximus*) for himself. In 162, Marcus sent Lucius to the eastern part of the empire to campaign against the Parthian ruler Vologases III, who had placed his brother on the throne of Armenia and had attacked Roman garrisons along the Armenian border. Lucius defeated Vologases and reinforced the border along the Euphrates River before returning to Rome in 166. Marcus and Lucius suppressed rebellions in Britain and Africa and impeded an invasion of Italy by a Germanic group, the Marcomanni, who under their leader, Ballomar, besieged the strategic frontier town of Aquileia. Marcus and Lucius retook Aquileia and pushed the Marcomanni back across the Danube River among the other Germanic tribes. Lucius died on the journey north in 169, and Marcus was left to carry on the Danubian campaigns for another 11 years.

Marcus temporarily left these campaigns when Avidius Cassius, a once loyal governor of Syria, claimed for himself the title of Augustus in 175. Although Avidius was killed by his own soldiers before Marcus could reach Syria, Marcus used the opportunity to secure his power in the east and re-

Statue of Emperor Marcus Aurelius. (Library of Congress)

turned to the Germanic wars in 176. He campaigned separately against the Marcomanni, Quadi, and Sarmati tribes in order to break up any Germanic unity. Marcus planned to extend the empire past the Danube River and to place these tribes into the new provinces, thus creating a larger buffer zone between the tribes and Italy. Only the last step in his project remained when Marcus died in his camp at Vin-dobona on 17 March 180.

Marengo, Battle of (14 June 1800)

French victory over Austria in northern Italy. In early 1800, Napoleon sought to defeat Austria, his one active enemy. Crossing the Alps into Lombardy, he believed the Austrians would flee. Therefore he detached units of his army to block their escape. However, Austrian commander Michael Melas decided to fight and deployed around Alessandria. On 13 June Napoleon, increasingly convinced Melas would retreat, sent one division north to the Po River and ordered another, under Louis Charles Desaix, south to block the road to Genoa. Thus the Austrians had concentrated 31,000–34,000 troops around Alessandria, whereas Napoleon's were reduced to less than 28,000.

Early on 14 June, three strong Austrian columns surprised Napoleon by marching from Alessandria to attack. Battle was joined just west of the village of Marengo, 3.5 miles east of Alessandria. Not until late morning did Napoleon realize he confronted the bulk of Melas's army. He then ordered the recall of units he had previously detached. But the situation deteriorated rapidly for the French. Retreating eastward, by noon they had no reserves, were short of ammunition, and faced being outflanked on their right.

The Austrians, confident of victory, paused to regroup. They resumed the attack about 1:00 P.M., pushing the French back to San Giuliano, nearly 5 miles from Marengo. About 3:00 P.M. a confident Melas turned over command to his chief of staff, Anton Zach. Then Desaix arrived, having marched directly to the sound of the guns. Zach did not press the attack until approximately 4:30. Desaix led a counterattack in which he was killed, but Auguste Marmont and François Kellermann (the younger) rallied the French, who then routed the Austrians. The battle ended about 10:00 P.M. The French suffered some 4,700 killed and wounded, the Austrians 6,500.

Marengo was a very close call because Napoleon had badly miscalculated. Nevertheless, Marengo enhanced his image, strengthened his position as first consul, and quelled possible political opposition at home.

Marignano, Battle of (13–14 September 1515)

Marignano ended the myth of Swiss invincibility. At 20 years of age, François I became king on New Year's Eve, 1515. He was determined to bring the Duchy of Milan back to his crown. Gathering his army at Lyons the following spring, he faced an alliance of Massimiliano Sforza, Duke of Milan, the Habsburg emperor, and the cardinal of Sion. Their army, mainly Swiss mercenaries, occupied the easiest pass to cross the Alps. Francis I chose a smaller and more difficult draw to bypass the waiting Swiss. The two sides now looked for a financial agreement to avoid battle. The Swiss, followed by the French troops, marched to Milan. The king joined a Venetian army, and on 8 September, the agreement was to be signed. But the cardinal of Sion persuaded the Swiss to attack the king in his camp at Marignano on 13 September. With the Venetian army encamped at Lodi, the French were left on their own. The battlefield was difficult: a large plain cut by hedges and small irrigation ditches that would disrupt any French cavalry charge.

The surprised French placed their artillery in front of the large blocks of Swiss pikemen. The French king charged at the head of the royal gendarmerie more than 30 times, only to be repulsed by the wall of pikes of the Swiss phalanx. The falling night stopped the fight, with the armies resting less than 50 yards from each other. During the night, Francis I sent a messenger to Alviano's Venetian troops to join as soon as possible.

The dawn of the 14th saw a new battle, as the 20,000 Swiss attacked, again facing deadly artillery fire. The German mercenaries on the French side were overwhelmed by the Swiss, some of the latter reaching the French artillery only to be cut to pieces by the gendarmerie's heavy knights. The first Venetians reached the battlefield by 8:00 A.M., and the main Swiss pike block was assaulted on its front by the king's cavalry and on its left flank by Venetian infantrymen. By 1:00 P.M., the surviving Swiss retired to Milan, leaving 14,000 dead on the battlefield. Milan surrendered the following day, giving the duchy to the king. This battle was won by the superior French artillery and the king's stubborn defense. The most important result was the Perpetual Peace, signed in 1516, which gave France the exclusive use of Swiss soldiers. The treaty lasted until 1792.

Marion, Francis (1732–1795)

American partisan leader in the Revolutionary War. Born in Winyah, South Carolina, and by occupation a planter, Francis Marion first saw military action as a lieutenant of South Carolina militia in campaigns against the Cherokees in 1759 and 1761. In 1775, he took a captaincy in the 2d South Carolina Regiment of the Continental army.

After being promoted to major the following year, he helped defend Fort Sullivan during the British attack on Charleston, firing the last shot at their departing fleet. As lieutenant colonel, he commanded the regiment until he was injured in the spring of 1780.

After the disastrous American defeat at Camden in August had cleared the Southern Department of practically all regular U.S. troops, Marion began a partisan campaign. Commanding about 50 militiamen, he defeated a Loyalist militia force five times larger in September and then squelched a Tory uprising. British lieutenant colonel Banastre Tarleton fruitlessly chased his guerrilla fighters through the swamps in November and commented disgustedly, “but as for this old fox, the devil himself could not catch him,” thus giving Marion his famous nickname, the “Swamp Fox.” Through 1781, now a brigadier general of militia, he harassed the British from bases in the swamps and woods, often in tandem with “Light Horse Harry” Lee, capturing Forts Watson and Motte. His brilliant and ceaseless guerrilla campaign distracted the British, while General Nathanael Greene’s Continentals reestablished control of the area. In September, Marion joined Greene and commanded the militias of North and South Carolina in the Battle of Eutaw Springs. An abstemious and nonviolent man in an age of hard-drinking fighters, Marion is supposed to have clambered out of a second-story window to avoid a round of alcoholic toasts and, when forced to draw his sword (presumably in battle), found it rusted into its scabbard! After this bitter war, Marion was a leader in the reconciliation between patriot and Tory.

Elected to the South Carolina Senate in December, he was subsequently reelected twice. From 1784 to 1794, he was militia general and commandant of Fort Johnson in Charleston Harbor.

Marius, Gaius (157–86 B.C.E.)

Roman general, statesman, and military reformer who led the Populares Party during the civil war. Born in 157 B.C.E. at Arpinum, Marius—a “new man” since he achieved his position through ability and talent instead of by birth—represented the interests of the plebeian class. In 116 B.C.E., he administered Further Spain, suppressing bandits and establishing his personal wealth through mining investments. During his consulship, Marius initiated numerous military reforms, including the recruitment of troops through a headcount system in the cities, which replaced the old volunteer plebeian army of farmers. He developed a strict training program and required his men to carry their own equipment and supplies. He is credited with redesigning the *pilum* (Roman spear) so that the shaft bent after hitting a target, making it impossible to throw back on his own men. In 107 B.C.E., as consul, he led the Roman forces against Jugurtha, King of Numidia (present-day Algeria), but his rival Sulla received credit for the victory after arranging for the capture of the king. A rivalry developed between Marius and Sulla that resulted in years of bloodshed within Rome.

At the conclusion of hostilities in North Africa, Marius and Sulla fought together against the Germanic tribes. Their rivalry continued to intensify until civil war broke out in 88 B.C.E., when Marius arranged to have Sulla’s command, to lead the Roman army against the Asian king Mithradates VI, transferred to himself. Sulla returned to Rome with his army, and Marius lost his status as consul and was forced to flee. Many of his supporters lost their property and lives. After Sulla departed for Asia, Marius returned to Rome, murdering Sulla’s supporters and ruling the city. In 86 B.C.E., Marius declared himself consul but died a few days later.

MARKET GARDEN (10–24 September 1944)

The largest airdrop in history and the last defeat for British forces in World War II. In September, Allied forces had liberated most of France and Belgium. Supreme Allied Commander General Dwight Eisenhower wanted to continue along a broad front, but Field Marshal Bernard Montgomery and other commanders wanted a quick thrust along a narrow front through Holland, outflanking the Siegfried Line, breaking the paper-thin German defenses, and then turning east-

ward into Germany's Ruhr Valley. Such a move would cut the heart out of Germany's industrial capacity.

The success of such an operation depended on securing bridges on the Rhine River at Grave, the Waal River at Nijmegen, and the Mass River at Arnhem. Montgomery decided that airborne troops would seize and hold each bridge, while the Second British Army moved northward along what was called Hell's Highway. In the largest airborne operation in history, the British 1st Airborne Division was to capture the bridge at Arnhem, while the 82nd American Airborne Division was to capture the crossings at Nijmegen and Grave and the 101st Airborne Division was to secure crossings between Grave and Eindhoven.

On 10 September, the first part of the operation, called Operation MARKET and involving the seizure of bridges at Eindhoven and Nijmegen, was successful. Operation MARKET GARDEN, the British seizure of the Mass River bridge at Arnhem, turned into a logical and strategic nightmare. British forces found themselves confronted by 9th and 10th SS Panzer Divisions, which were refitting in the area. The British 1st Airborne Division was able to seize and hold one of the two bridges until 20 September, when they surrendered after waiting for the British 2nd Army, which was not able to keep to the schedule. The 1st Airborne Division was effectively wiped out, with 1,000 killed and 6,000 taken prisoner. With German reinforcements gathering around Arnhem, Montgomery ordered British forces to withdraw on 24 September. For students of military strategy, Operation MARKET GARDEN provides numerous examples of faulty decision-making on the part of commanding officers but also of simple bad luck.

Marlborough, John Churchill, First Duke of (1650–1722)

Led the British armies in the War of the Spanish Succession with great success and made the fortune of the house of Churchill in British affairs. John Churchill, born to a wealthy but far from prominent family, rose to prominence thanks to the patronage that the Duke of York, the heir to the British

Painting of John Churchill, First Duke of Marlborough. (Library of Congress)

throne and subsequent king, and later Queen Anne conferred upon his family. On the duke's accession as James II (1633–1701, r. 1685–1688), Churchill, a prominent member of James's clique of young officers, received a senior command in the king's large new army and took part in the campaign leading up to Sedgemoor. Nevertheless, he betrayed James II in the revolution of 1688 and then turned coat again and conspired with the deposed pretender during the reign of his successor, William III. These political efforts kept Churchill from much active service in 1689–1702, but Queen Anne made him her captain general upon Britain's entry into the War of the Spanish Succession.

As commander on the continent, Marlborough conquered the Lower Palatinate at the head of an Anglo-Dutch army in 1702 and won the Battle of Blenheim-Höchstädt (1704) in combination with Prince Eugene. For this, Queen Anne conferred upon him the title duke of Marlborough. The years 1703, 1705, and 1707 were fallow periods of failed campaigns, but in 1706 Marlborough led the Anglo-Dutch army into Brabant in a brilliant campaign of maneuver that made possible the victories of Ramillies and Turin. In 1708, the Anglo-Dutch forces and the imperial Habsburg army, at last combined in a single theater under the joint command

of Marlborough and Eugene, won the Battle of Oudenaarde, and, showing great strategic and logistical daring, took Lille. The year 1709 saw the more ambiguous victory of Malplaquet and the fall of Mons. In subsequent years, Eugene and Marlborough took many fortresses and devastated northern France, conducting an economic warfare that strained the French economy yet could not force peace upon the enemy. By 1712, Queen Anne faced state bankruptcy. She maneuvered her way out of the war, and Marlborough and his aggressive allies fell from office in the process.

Some historians have exaggerated Marlborough's abilities, portraying him as a prophet rising above the limits of his age and making his Dutch allies scapegoats for his failure to execute a presumed "Napoleonic" vision. Although one of history's great captains, Marlborough's genius was in keeping with the spirit of eighteenth-century warfare, and it was nowhere better exhibited than in his operational masterwork, the passage of the determinedly defended ne plus ultra French lines (1711).

Marne, Battle of the (5–10 September 1914)

Crucial battle in the opening days of World War I. Heinrich von Kluck, commander of the German First Army and right wing of the Schlieffen Plan, advanced through Belgium and northern France in August 1914. Approaching Paris, von Kluck lost contact with the German Second Army on his left and opened a gap between the two advancing armies. He also exposed his right flank when he turned southeast to roll up what he believed to be the French left flank in front of Paris. Taxicabs transported French troops from Paris and caught von Kluck unaware. He quickly transferred two corps from his left flank to the west, further opening the gap north of the Marne River between his army and the German Second Army.

The British Expeditionary Force, under Sir John French, and the French Fifth Army crossed the Marne River and surged into the breach between the two German armies. The German Second Army tenaciously attacked the French Ninth Army under Ferdinand Foch near the marshes of St. Gond. These attacks failed, and the German chief of the general staff, Helmuth von Moltke the younger, ordered a withdrawal of the First and Second Armies to the Aisne River on 10 September 1914. The Germans held this line in the face of stiff attacks, and the "race to the sea" ensued when each side attempted to outflank the opponent. Both sides established a network of linked trenches that would characterize the next four years of warfare on the western front.

The German defeat at the Marne proved a decisive Anglo-French strategic victory and has been termed "the miracle of the Marne." Despite a string of costly defeats on the frontiers, the Anglo-French forces seized the strategic initiative with the victory. As a result, Germany had to fight on two fronts, which ultimately cost it the war.

Marne Counteroffensive

(15 July–16 September 1918)

Allied response to the final German offensive push of the war, also known as the Second Battle of the Marne. This battle marked the final turning of the tide for the Allies in World War I. In early July 1918, a German offensive menaced Paris. Many residents of the French capital prepared for evacuation in a situation that bordered on panic. Worse, German long-range artillery sporadically bombarded vital war industries in and around the capital. In the middle of July, the offensive ran out of energy 50 miles east of Paris, along the Marne River.

On 15 July, the U.S. Army's 3d Infantry Division held staunchly against strong local attacks, even though the American troops were nearly surrounded. British, French, Italian, and American reinforcements were rushed to the area and thrown into a large-scale attack. Now began a multinational battle, the outcome of which could very well decide the war.

The Germans, faced with the choice of imminent retreat versus reinforcing their troops along the Marne River at the expense of their impending Flanders offensive, chose the latter. For the first month of the battle, Allied soldiers advanced eastward against the entrenched, reinforced German defenders. Some of the fiercest fighting took place near Soissons, where the Americans encountered fanatical enemy resistance. For much of August, the Germans dug in along the Aisne and Vesle Rivers and held fast against American and French attacks. A break for the Allies came on 2 September, when the American 32d Infantry Division captured the key town of Juvigny, effectively cutting off a major German supply route. Meanwhile, French troops in the south and British troops in the north steadily pushed the Germans eastward.

Day by day, Allied soldiers fought and died to reduce the German salient and eliminate the threat to Paris. Eventually, they succeeded in reducing that salient to such an extent that Paris was no longer in range of German artillery. By mid-September the question was no longer if the Germans would take Paris, but rather if they could stave off the Allies from pushing any further eastward.

The ultimate significance of this battle is that the initiative passed from the Germans to the Allies for the rest of the war. In the spring and early summer of 1918, the Germans had hoped to launch one last great offensive to win the war before fresh American manpower could have any impact on the battle fronts. At the Marne, in the summer of 1918, the Germans ran out of time. From this point forward, the Allies would launch a series of offensives designed to drive the Germans from France, a goal never completely fulfilled, even though World War I would conclude in November 1918 on Allied terms.

Marshall, George Catlett (1880–1959)

U.S. Army chief of staff and one of the foremost soldier-statesmen of the twentieth century. Born in Uniontown, Pennsylvania, on 31 December 1880, George Marshall graduated from the Virginia Military Institute in 1901 and was commissioned in the infantry in 1902. He held a variety of assignments, including in the Philippines and Oklahoma. He attended the Infantry and Cavalry School in Fort Leavenworth (1906–1907) and in 1908 graduated from the Army

General George Marshall, c. 1944. (Library of Congress)

Staff College there. After working as an instructor at the Staff College (1908–1910), he was an instructor-inspector for the Illinois National Guard and an infantry company commander. He again served in the Philippines until 1916.

Marshall established his reputation as a brilliant staff officer following U.S. entry into World War I. Sent to France in June 1917, he served on the staff of American Expeditionary Force commander General John J. Pershing and planned the September 1918 American offensive at St. Mihiel. Made operations officer for the First Army, Colonel Marshall planned the transfer of some 400,000 U.S. troops, carried out in just six days, for the September–November Meuse-Argonne offensive.

After the war, Marshall was aide to then army commander General Pershing (1919–1924). He served in China (1924–1927) and afterward was deputy commander of the Infantry School at Fort Benning (1927–1932). He held several command positions before he was promoted to brigadier general (1936). Marshall became deputy chief of staff of the army in 1938, won a promotion to major general that July, and became chief of staff on 1 September 1939.

President Franklin D. Roosevelt advanced Marshall over many more senior officers to appoint him chief of staff of the army with the rank of temporary general in September

1938. Promoted to general of the army in November 1944, he continued in that capacity, earning the unofficial title of “Organizer of Victory” for his masterful leadership, until his retirement in November 1945.

President Harry S. Truman recalled Marshall to serve as special envoy to China (1945–1947) and secretary of state (1947–1949). He was serving as president of the American Red Cross when Truman again recalled him in September 1950 as secretary of defense to preside over the 1950–1953 Korean War military buildup. He held that post until he retired altogether in September 1951. He was awarded the Nobel Prize for peace in 1953, the first soldier so honored. Marshall died in Washington, D.C., on 16 October 1959.

Marston Moor (2 July 1644)

Largest battle of the English Civil War. By the middle of 1644, the Scots had joined Parliament against King Charles I, threatening decisively to tip the scales against the royalists. Scottish forces joined parliamentary soldiers to besiege York, the center of royalist power in the north. Charles believed that his survival depended upon York and stripped his own army to send a relieving force under Prince Rupert. The allies lifted the siege to intercept Rupert and force him into decisive battle.

The two armies met 6 miles west of York, on Marston Moor. Each side had about 7,000 cavalry. Parliamentary cavalry included Oliver Cromwell’s superbly trained Ironsides. Rupert was heavily outnumbered in infantry, however, with only 13,000 men to his opponents’ 20,000. Both armies drew up into traditional battle formations on 2 July, with the infantry in the center and cavalry on either wing. The afternoon was spent in scattered exchanges of artillery, but at 5:00 P.M., Rupert concluded that there would be no fighting and retired to his quarters. At 7:00, Alexander Leslie, parliamentary commander, ordered his army to attack, catching the royalists by surprise. Cromwell’s Ironsides dispersed the royalist horse on the left and began to attack the unprotected infantry. When George Goring’s royalist cavalry threatened the parliamentary right, Cromwell moved his disciplined force to the other wing and defeated Goring. Although the unsupported royalist infantry put up a brave fight, they were enveloped and crushed. York and northern England were

lost to Charles. Although the Civil War continued for another year, Rupert’s defeat at Marston Moor made a military victory for Charles impossible.

Martí y Pérez, José Julián (1853–1895)

Cuban patriot, guerrilla fighter, poet, and philosopher. Born in Havana, Cuba, on 28 January 1853 of Spanish parentage, Martí’s father was an artillery sergeant. Martí began his writing career early, publishing various autonomist articles by 1869. Because of a letter he wrote to a friend, Martí and his companion Fermín Valdés Domínguez were sentenced in April 1870 to hard labor at the Quarries of San Lázaro, where he was put in leg irons. In January 1871, he was deported to Spain, where he wrote his famous work, *El presidio político en Cuba*. Martí and Valdés Domínguez moved to Zaragoza, Spain, to continue their studies in 1872, and in 1875, he was reunited with his parents and siblings in Veracruz, Mexico. He was again deported to Spain in 1879 but escaped to France and then to New York. His article written about the arrival of the Statue of Liberty in New York for the newspaper *La Nación* of Venezuela stands as one of the finest pieces written on the subject in any language.

In 1887, he became consul for Uruguay in New York and then for Argentina and Paraguay. In 1889, he began the journal *La Edad de Oro* (Age of Gold, i.e., childhood), dedicated to children and their needs. And in 1892, he founded in New York the Cuban Revolutionary Party in New York, with the goal of winning Cuban independence. In April 1894, Martí and Máximo Gómez met in New York. Gómez returned to Santo Domingo to begin preparations and planning for the eventual invasion of Cuba. In January 1895, Martí traveled to Montecristi, Santo Domingo, to meet with Gómez again. In March of the same year, Martí wrote the *Manifiesto of Montecristi*, in which he put forth his political views. By this time, war in Cuba was already a fact, having started on 24 February 1895. Martí landed in Cuba and joined the fighting. On 19 May, during a clash at Dos Ríos, he fell, mortally wounded. One of the most erudite philosophers of nineteenth-century Cuba and perhaps the whole of Latin Amer-

ica, José Martí is remembered as the “father of the Cuban Republic.”

Masada, Siege of (72–73)

Mountaintop fortress in the Judean desert of Israel used as a stronghold by Jewish Zealots, the Sicarii, one of the numerous groups who revolted against Rome in 66. Originally fortified by the Maccabees, Masada was improved by Herod the Great, who constructed two palaces, added heavy walls and defensive towers, and developed a cachement system to supply water for his royal citadel. After Herod's death, the Romans controlled Masada until Jewish Zealots captured the fortress by surprise in 66. After the fall of Jerusalem in 70, this group of about 1,000 men, women, and children refused to surrender. The Roman X Legion under the command of Flavius Silva besieged Masada, but the elaborate defensive system proved superior to Roman siege machines. Assembling an army of 15,000 soldiers, the Romans built a wall around the mountain to prevent any escapes and then constructed a sloping ramp up the west side of the mountain until they were in reach of the walls. After two years, Roman forces finally penetrated the fortress, only to find that the Jews, led by Eleazar ben Yair, had committed suicide rather than be enslaved. Only two women and five children survived; the rest had drawn lots to determine who would die first, with each father responsible for killing his family before taking his own life. The provisions, except for the food, were set on fire. Roman historian Josephus Flavius provides an account of the events provided to him by the survivors. Except for a brief period of Jewish control in the second century during the Bar Kochba revolt, the fortress remained abandoned until the twentieth century, when Masada became a symbol of Jewish independence.

Masséna, André, Duc de Rivoli, Prince d'Essling (1758–1817)

An extremely aggressive field commander of the French Revolutionary and Napoleonic Wars. Masséna was born in Nice (6 May 1758) and enlisted in 1775. He left the army in August 1789 and became lieutenant colonel of a volunteer regiment in 1792.

In the siege of Toulon, he gained Napoleon's attention and a promotion to division general (20 December 1793). In Italy in 1794–1795, he achieved successes but also revealed the rapacity that marred his career. Masséna played crucial roles at Lodi (10 May 1796), where he led the charge that took the bridge, and at Rivoli in January 1797.

Masséna commanded the combined Armies of Helvetia and the Danube in his most significant campaign, defeating an Austro-Russian army at Zurich (25–28 September 1799) and then crushing a Russian relief army. Thus he decisively turned the tide of war and ended the allied invasion threat in that theater.

In November 1799, Napoleon sent Masséna to Genoa, which the Austrians were besieging. After a heroic defense, he surrendered (4 June 1800) with full military honors. Relieved of command, partly because of looting, Masséna spent the next five years in civilian life. Nevertheless, Napoleon appointed him a marshal in 1804.

Masséna contributed to Napoleon's Austerlitz campaign by keeping the Archduke Charles occupied in Italy. In July 1807, Masséna again returned to civilian life, and Napoleon named him duc de Rivoli in March 1808. In the 1809 campaign, Masséna fought bravely at Aspern-Essling (20–22 May), where, covering the evacuation to Lobau Island, he was the last man across the bridge before its destruction. At Wagram (6 July), he audaciously sent his troops laterally across the enemy front to fill a gap in the French lines. Napoleon awarded him the title prince d'Essling in January 1810.

Reluctantly, Masséna accepted command of the Army of Portugal in May 1810. He captured Ciudad Rodrigo (10 July) and Almeida (28 August) but failed to defeat Arthur Wellesley, the Duke of Wellington, at Torres Vedras. Failure in Iberia ended Masséna's field command. Thus closed the active career of one of Napoleon's most capable generals. He died in Paris on 4 April 1817.

Matthias I (Mátyás Hunyadi) (1443–1490)

The first Hungarian king not of the House of Árpád and one of Hungary's greatest kings, known as "the Truthful." Matthias's father was János Hunyadi, a popular warlord who led several campaigns against the Turks. The Hungarian estates chose Matthias as king on 24 January 1458. His rule was at first tenuous, and he had to put down several attempts to overthrow him; he also had to prevent Holy Roman Emperor Frederick III from taking the Hungarian throne.

Once his throne was secure, Matthias devoted his attention to strengthening his authority over the nobility and centralizing the government. He expanded his power base within the lesser nobility but failed to win the permanent allegiance of the great nobles. Matthias reformed the army, known as the "Black Troops," which he used to keep order and collect taxes. Taxes now became permanent and provided him with a regular source of income. Not stopping his reforms with the army, he recodified Hungarian common law, reorganized the legal system, established a civil service, improved the means of communication, and promoted the development of towns. He also founded the University of Pressburg (now Bratislava), revived the University of Pecs, and introduced the Renaissance to Hungary.

Matthias saw the Ottoman Turks as Hungary's chief enemy and sought to build a united European coalition against them under his leadership. He defeated the Turks in 1479 and only after his death did they again become a serious threat, in part because of the enmity of Vienna. Matthias devoted the last 20 years of his life to establishing a Danubian empire. He became king of Bohemia in 1479 and laid siege to Vienna and took it in 1485, annexing Austria, Styria, and Carinthia. Although he failed to win his desired election as Holy Roman Emperor, he transferred his court to Vienna and died there in 1490. His strong rule provoked a reaction under his successors. His reforms were largely abandoned, and the country fell into anarchy.

Maurice of Nassau (1567–1625)

Dutch general who significantly contributed to the development of early modern warfare. Maurice was born to William the Silent, Prince of Orange, in 1567, and his family sought to free the Netherlands from Spanish control. He attended university at both Heidelberg and Leiden, but his father's assassination in 1584 thrust Maurice into leadership, and he became president of the United Provinces. He soon assumed the duties of admiral general and captain general, making him commander in chief of all Dutch military forces.

Maurice recognized the need to efficiently organize his limited manpower resources to fight the Spanish empire. His knowledge of Roman warfare and mathematics led him to develop small, maneuverable battalion formations that joined both musket and pike in a linear formation. Maurice also instituted rigorous drills for individuals and formations to increase the rate of fire and maneuverability. He experimented with artillery capability embedded within infantry formations, an early attempt at combined arms synchronization. To ensure adequate manpower, Maurice provided consistent pay and encouraged education by establishing the first military academy for officers.

With a responsive and dependable army, Maurice often inflicted disproportionate casualties during battle and soon wrested control of key provinces from the Spanish. To secure terrain, he developed an integrated defensive system of fortified towns and rivers. His success resulted in a 12-year truce with Spain in 1609.

Maurice eventually died from liver disease at The Hague in April 1625. Other commanders, such as Gustavus Adolphus, soon adopted his military innovations. Maurice's legacy of state-supported professional armies and linear gunpowder tactics mark him as one of the founders of modern warfare.

Mauricius Flavius Tiberius (539–602)

One of the eastern Roman Empire's greatest rulers. Maurice became emperor in 582, at a time of great crisis: the Justinian system was crumbling as epidemics, population loss, falling state revenues, and Slav incursions into Thrace threatened to destroy the imperial position throughout Byzantium; the latest in a long line of wars with Sassanid Persia also fared badly.

Maurice's place in history is assured on three separate counts. First, he was the author of a military manual, the *Strategikon*, which remained in imperial service for several hundred years and even today remains in print. Second, he was the architect of comprehensive victory over the Sassanid Empire. His victories at Nisbis and the Araxes (589) led to the overthrow of the Sassanid emperor Hormizd. A disputed succession allowed imperial intervention on behalf of Chosroes, the deposed emperor's son. With Chosroes installed as emperor, Maurice then imposed peace based on the status quo ante bellum and without gain: his calculation was that Sassanid indebtedness would ensure peace and stability in the east.

In the Haemus the empire faced not single, successive invasions by different tribes but simultaneous and continuous invasion by many different groupings: by the time of Maurice's accession, the imperial position had been compromised. Nonetheless, in a series of deliberate campaigns, Maurice curbed the Slavic influx and then defeated the Avars (598–601). His main problem, however, remained inadequate state revenues: his rule was noted for a series of mutinies that attended cost-cutting measures. It was Maurice's decision that the army remain on the Danube River through the coming winter that provoked the mutiny that saw him deposed and decapitated, his four youngest sons having been executed before him.

Mauryan Empire, Conquests of (321–232 B.C.E.)

Resulted in a rare, internal unification of Hindu India that had taken place only twice before outside invasions became common after 1100 C.E. The Gangetic kingdom of Magadha, with its capital at Patna, was the center of both unifications. By 500 B.C.E., 16 petty Hindu kingdoms established during the Aryan invasions of India competed for control of the Ganges River trade routes in northern India. The unfinished invasion of India by Alexander the Great in 326 B.C.E. appears to have forced India toward unification politically and militarily. Conflicting accounts of Alexander's expedition suggest that huge military forces under King Porhus in western India numbered 60,000 men, 20,000 cavalry, 2,000 chariots, and 3,000 war elephants. Further east, Gangetic forces encountered by Alexander's forward probes are listed by Pliny and Plutarch as numbering 500,000 foot soldiers, 30,000 cavalry, 8,000 chariots, and 9,000 war elephants. It is no wonder Alexander's men rebelled!

In 321, Chandragupta Maurya (325–280 B.C.E.) seized the Magadha throne in northeastern India as Alexander turned south down the Indus River in western India and returned to Persia and eventually Babylon. Chandragupta took advantage of the power gap left by Alexander's victory over King Porhus at the Battle of Hydaspes in western India. He conquered all the land between the Indus River and the Narbada River to the south. The Magadha king then closed the mountain passes in northwestern India used by Alexander and others to invade northern India. He did so by supposedly defeating the Macedonian general Seleucus Nicator in 305 B.C.E. In reality, Seleucus realized he could not defeat the huge Indian forces and negotiated a treaty with Chandragupta while both armies faced each other on the field.

In 280 B.C.E. Bindusara (298–273 B.C.E.), son of Chandragupta, inherited the throne. He extended the empire south into the Deccan plateau near Mysore. Chandragupta's grandson, Ashoka (269–232 B.C.E.), completed the empire with bloody conquests of the Kalinga kingdom on the northeast coast. The Mauryan Empire now controlled all but the southern tip of India, and Ashoka turned toward developing empire, resulting in the "golden age" of the Mauryan Empire. However, his emphasis on Buddhism over the army left India open to invasions from the northwestern mountain passes by Bactrian, Scythian, and Parthian forces. In 150 B.C.E., Indo-Hellenic forces reached Patna (Patiliputra) and found the empire in ruin.

Maximilian I (1459–1519)

Holy Roman Emperor who made the Habsburg family into a European power. Maximilian von Habsburg was born in Wiener Neustadt, Austria, on 22 March 1459, the son of Holy Roman Emperor Frederick III, whom he succeeded on 19 August 1493. His marriage in Ghent on 19 August 1477 to Mary, daughter of Charles the Bold, Duke of Burgundy, gained him the Netherlands, much Burgundian territory, and the enmity of France. French king Louis XI immediately attacked. Maximilian defended his lands well and decisively defeated the French at Guinegate on 7 August 1479, but the Franco-Austrian War continued sporadically until 1493, with Maximilian keeping almost all the disputed area.

Maximilian pursued his lifelong ambition to unite all of Europe under the Habsburgs. His three main tactics were diplomacy, arranging marriages, and waging war. His main rival was France. From 1482 to 1485, he fought the Netherlands States General, finally wresting from them the regency of his son, Philip. When Hungarian king Matthias I Corvinus died in 1490, Maximilian resumed control of Austrian lands that had been seized by Hungary and declared himself a candidate for the vacant throne. When Ladislas II of Bohemia was elected instead, Maximilian forced the Treaty of Pressburg upon him in 1491 so that the throne of Bohemia and Hungary would pass to a Habsburg if ever vacant again. In 1495 he joined the Holy League of Spain, Venice, Milan, and the papal states to drive the French out of Italy and took an active role in the league's military efforts. Having lost his war against Switzerland in 1499, he was compelled to recognize Swiss independence. Allied with English king Henry VIII, he beat the French on 16 or 17 August 1513 in a second battle at Guinegate, called the "Battle of the Spurs" because of the speed with which the French retreated. He continued fighting the French, mostly in Italy, until 1516, and died in Wels, Austria, on 12 January 1519.

Mayaguez Operation (12 May 1975)

On 12 May 1975, Khmer Rouge naval forces operating in Cambodian territorial waters seized the U.S. merchant ship *Mayaguez* and removed its crew of 41. U.S. president Gerald Ford ordered a military response to punish the Khmer Rouge and retake the ship and crew, thought to be on the island of Koh Tang. On 15 May, 11 U.S. Air Force helicopters launched from Utapao, Thailand, and transferred 70 men to the *Holt*, which subsequently came alongside the *Mayaguez* in the first hostile ship-to-ship boarding since the War of 1812; they found it empty.

Eight helicopters carrying approximately 200 men assaulted the eastern and western beaches of Koh Tang's northern neck: four were shot down in the opening minutes of the battle, and only one escaped undamaged. Thirteen survivors were rescued from the water after swimming four hours to the *Wilson* offshore, and three isolated contingents were left on the island, the largest numbering only 60 men. Unknown to the United States, the Khmer were well entrenched in anticipation of a Vietnamese attack over an ongoing territorial dispute.

As the remaining helicopters organized as the second wave, the *Mayaguez* crew was freed from an island 40 miles away. The desperately needed second wave was nearly recalled by the U.S. Joint Chiefs of Staff before the marine assault commander on Koh Tang persevered in arguing that the second wave be landed before the western beach was overrun.

The last available helicopter rescued the last group of marines as darkness closed 14 hours after the initial landings. In all phases of the operation, 50 servicemen were wounded and 41 killed, including three men believed to have been left behind alive and subsequently executed, and 23 air force personnel killed earlier while en route to the staging

area at Utapao. It is believed that approximately 60 Khmer Rouge soldiers were killed out of a land and sea force of about 300. Although there was initial rejoicing in the United States over the successful rescue of the *Mayaguez* crew, as news surfaced of the heavy loss of life in the operation, Americans became appalled. The operation, following closely on the fall of South Vietnam, seemed yet another indication that the U.S. military still could not handle operations in less than all-out war.

McClellan, George Brinton (1826–1885)

American Civil War army commander. Born on 3 December 1826 in Philadelphia, McClellan was educated at the University of Pennsylvania before entering the U.S. Military Academy at West Point, New York. After graduating second from his class in 1846, he was commissioned a second lieutenant in the Corps of Engineers. During the Mexican-American War, McClellan won three brevets for gallantry, but he later decided to resign from the army and eventually became the vice president of the Illinois Central Railroad. Soon after the outbreak of the Civil War, he was commissioned a major general in the regular army. In November 1861, after Lieutenant General Winfield Scott's retirement, McClellan was appointed general in chief of the U.S. Army. McClellan proved to be highly effective at organizing and training the Union army, but his skill as an organizer was not matched by his art as a combat commander. After his failures during the Peninsular campaign and at the Battle of Antietam, McClellan was relieved of his command and ordered home to await further orders, which never came.

In 1864, McClellan was nominated by the Democratic Party as its candidate for president on a peace platform (despite the fact that he personally believed that the war should continue until the Union was victorious), but he was easily defeated by Lincoln. After serving as the governor of New Jersey (1878–1881), McClellan died in Orange, New Jersey, on 29 October 1885. He was typical of so many failed high commanders: a superb staff officer who lacked the ability to “think on his feet” rapidly on the battlefield and who invariably took counsel of his fears—the service academies and staff colleges turn them out by the hundreds.

Engraved portrait of General George B. McClellan, with a border of Antietam battle scenes. (Library of Congress)

McDowell, Irvin (1818–1885)

Union general defeated in the American Civil War's first major battle, First Bull Run. Irvin McDowell was born on 15 October 1818 in Columbus, Ohio. He attended the U.S. Military Academy, graduating in 1838 in the middle of his class, and began his career as an artilleryist. During the Mexican-American War, he fought at Buena Vista, earning a brevet promotion. Joining the adjutant general's corps in 1848, he served in staff positions until 1861.

McDowell was promoted to brigadier general at the outbreak of the Civil War and, because of political connections,

was given command of the Washington, D.C., military district. He built an army in record time but could do little about its lack of combat experience. Under political pressure, McDowell methodically launched an offensive toward Richmond, hoping to end the war in a single battle.

Facing Confederate generals Pierre Gustave Toutant Beauregard and Joseph E. Johnston, McDowell did a capable job of deploying his divisions for the initial Battle of Bull Run on 21 July 1861 but was unable to steady his fatigued recruits when the rebels poured fresh troops into the battle after a daylong stalemate. McDowell soon faced a rout, as thousands of terrified Union troops ran back to Washington.

McDowell was soon relieved by General George McClellan and later reassigned as a corps commander. He again commanded the Washington garrison during the Peninsular campaign in 1862. At Second Bull Run, under General John Pope, McDowell's performance was suspect, resulting in his relief for cause. A court of inquiry exonerated him, but his fighting career was over. McDowell subsequently commanded several military departments, retiring in 1882. He died in San Francisco on 4 May 1885. McDowell was that very ubiquitous commander in military history: one who could achieve high command for his ability to train and supply troops but lacked the blood instinct to win on the battlefield.

McNair, Lesley J. (1883–1944)

Commander of U.S. Army Ground Forces in World War II. McNair, a combat veteran of World War I, is usually credited as the general most responsible for training American ground combat forces in World War II. He saw active duty in North Africa and was wounded at a forward observation post in Tunisia in 1943.

After his recovery, he was given “command” of a fictional organization designed to deceive the Germans about the upcoming Normandy invasion. McNair's First Army Group was ostensibly slated to cross the channel at its most narrow point and invade in the Pas de Calais area. This deception plan, generally known as Operation FORTITUDE, had the goal of convincing the Germans the invasion would come anywhere but

Normandy, the site of the real invasion. It succeeded mightily. Even after a lodgement had been secured at Normandy, Hitler continued to insist that the Allies were making a feint to draw German attention from the Calais area.

In late July 1944, roughly two months after the invasion, McNair—as was his penchant—went to a forward area to watch the carpet bombing preceding the American attack at St. Lo. The heavy bomber crews that day were told to fly horizontally along enemy lines, instead of vertically across Allied lines, in an effort to avoid friendly casualties. But, thanks to heavy German anti-aircraft fire and a steady wind that blew marking smoke toward American lines, many of the bomber crews accidentally dropped their loads on American troops, including McNair's observation trench. He and at least 100 other Americans were killed. A story quickly circulated among American combat troops that the only trace of McNair ever found was his bloody ring finger, West Point class ring still attached. McNair was the highest-ranking military American to die in World War II.

McNamara, Robert Strange (1916–)

Secretary of defense during much of the Vietnam conflict. Born in California, McNamara obtained a position at the Harvard Business School that led to his employment as an

Defense Secretary Robert McNamara at a news conference, 1967. (Library of Congress)

analyst with the U.S. Army Air Forces's strategic bombing campaign. This duty brought about his hiring by the deteriorating Ford Motor Company, where he ultimately became the firm's president before being selected as secretary of defense by President John F. Kennedy.

McNamara arrived at the Pentagon determined to apply contemporary statistical management techniques to achieve "cost-effectiveness" in terms of procurement and strategy and was indifferent to service self-conceptions of mission and image. Considered as one of those urging the escalation of American involvement in the Vietnam conflict, McNamara tried to "manage" the war in the same statistical fashion as he directed the administration of Ford and the defense establishment, apparently ignoring the historical and emotional elements of war.

Paradoxically, the supposedly "bloodless" McNamara proved unable to stand the stress of the war, failing to win concessions from Hanoi or from the turmoil his strategy provoked in American society. Resigning in 1968 before the conclusion of the Johnson administration, McNamara continued in public life as president of the World Bank and (bafflingly, considering his record) as a commentator on the United States role in the world.

Meade, George Gordon (1815–1872)

Union field commander in the American Civil War, victor at Gettysburg. Meade was born in Cadiz, Spain, to American parents on 31 December 1815. Commissioned in the artillery after his graduation from West Point in 1835, he resigned in 1836 after brief service against the Seminoles, became a civil engineer, but rejoined the army in 1842. In the Mexican-American War under Zachary Taylor, he saw action at Palo Alto on 8 May 1846, Resaca de la Palma, and Monterrey, where he was brevetted first lieutenant. He participated in the siege of Veracruz under Winfield Scott in 1847. As a military surveyor and engineer after the war, he made first lieutenant in 1851 and captain in 1856.

On 31 August 1861, Meade was commissioned brigadier general of Pennsylvania volunteers. After duty in the Washington, D.C., garrison, he fought in the Seven Days' Battles at Mechanicsville, Beaver Dam Creek, Gaines' Mill, White Oak Swamp, and Glendale, where he suffered a terrible lung wound that troubled him for the rest of his life. Nevertheless, he was able to lead a brigade at Second Bull Run; a division at South Mountain, Antietam, and Fredericksburg; and a corps at Chancellorsville. As major general of volunteers since 29 November 1862, he replaced Joseph Hooker in command of the Army of the Potomac on 28 June 1863. Meade then won his great defensive victory at Gettysburg.

For winning at Gettysburg, Meade received the thanks of Congress and a brigadier general's commission in the regular army but was criticized for his failure to pursue Robert E. Lee. The press conspired to mention him only unfavorably because his bristly temper had riled some reporters. His Bristoe Station, Rapidan Ring, and Mine Run campaigns against Lee misfired. Except for the period from 30 December 1864 to 11 January 1865, Meade commanded the Army of the Potomac until 27 June 1865, but in March 1864, Lieutenant General Ulysses S. Grant established headquarters in Meade's camp, which essentially reduced Meade to Grant's executive officer. He served Grant ably at the Wilderness, Spotsylvania, Cold Harbor, Petersburg, Five Forks, and Appomattox, achieving a promotion to major general on 18 August 1864. Debilitated by his wound, he died of pneumonia in Philadelphia on 6 November 1872.

Medals and Decorations

Throughout history, rulers and states have found ways to recognize heroic achievement and military service. Ancient Greek literature refers to the award of arms and armor to

commanders victorious in war. These gifts were often adorned with metal ornaments bearing martial symbols. This practice was later adopted by the Romans, who awarded circular medallions, or phalerae, worn on the breastplate of the recipient. Both Greeks and Romans also issued large coins, or medallions, to commemorate military victories. This practice was lost to Europe with the collapse of the Roman Empire, not to be revived (incredibly) until the fifteenth century.

The bestowing of awards in recognition of military and spiritual achievement resumed with the establishment of religious orders of knighthood during the Crusades. The pope officially recognized the oldest of these, the Order of the Knights of St. John of Jerusalem, in 1113.

As Europe emerged from the early Middle Ages, rulers established their own secular orders of chivalry, using the religious orders as models. These orders strategically bound knights, exclusively feudal nobility, to the sovereign through precepts of chivalric honor and religious duty. One of the earliest of these orders, the English Order of the Garter, was believed to have been founded by Edward III in 1348.

Awards recognizing military service were initially limited to a select number of officers. In 1588, Queen Elizabeth I of England presented medals of gold and silver to her senior commanders to mark the defeat of the Spanish Armada in 1588. Her Stuart successors continued the practice. In 1643, England's King Charles I instituted one of the first awards for gallantry when he authorized a medal awarded to any man who succeeded in a "forlorn hope." Medals, gold to officers and silver to enlisted men (the first recorded instance), celebrated Oliver Cromwell's victory over the Scots at the Battle of Dunbar in 1650.

Although the practice of awarding medals subsequently fell into disuse in England, other nations adopted the tradition. The Russian monarchs Peter the Great and Catherine the Great authorized both gallantry and service medals. During the American Revolution, General George Washington issued a heart-shaped cloth decoration known as the Badge of Military Merit as a reward for conspicuous gallantry.

The Napoleonic Wars brought a renewed interest in medals and decorations. In 1804, Napoleon established the Legion d'Honneur, an award for both bravery in action and distinguished civil or military service, regardless of the rank of the recipient. Five years later, Czar Alexander I of Russia established the Cross of St. George to honor the bravery of noncommissioned officers and enlisted men. In 1813, Frederick William III of Prussia first instituted the Iron Cross (das Eiserne Kreuz) as a gallantry award.

Great Britain hesitatingly resumed rewarding senior officers with medals, but it was not until the issuance of a silver service medal for the Battle of Waterloo in 1815 that all ranks

shared the same award. The Waterloo Medal set the pattern for subsequent British campaign medals. With the exception of those awarded for World War II, most British medals bear the name, rank, and regiment of the recipient. As Britain's imperial wars increased, so did the issuance of campaign medals. Rather than award a specific medal for every battle, medals were issued for entire wars, with separate bars affixed to denote participation in particular engagements.

The first official decoration solely for gallantry in the British army was the Distinguished Conduct Medal, first instituted in 1845, but it was awarded only to sergeants. At the suggestion of the prince consort, Queen Victoria authorized the Victoria Cross for acts of conspicuous valor, a simple bronze cross cast from Russian cannon captured during the Crimean War. From the award's creation in 1856 to the Falkland Islands War (1982), only 1,354 Victoria Crosses were awarded to officers and men. It remains Britain's preeminent gallantry decoration.

At the outbreak of the American Civil War, there were no American medals for distinguished service or gallantry. The Medal of Honor was authorized by Congress in December 1861 to recognize Union officers and soldiers who displayed conspicuous gallantry in battle. Originally intended for only the duration of the Civil War, the medal's authorization was extended to cover subsequent conflicts.

The first American service or campaign medals were issued for action in the Spanish-American War (1898). President Theodore Roosevelt, an enthusiastic advocate of military medals and awards, pressed Congress and the War Department to honor veterans of previous wars. During his presidency, service medals were issued to veterans of the Civil War, the Indian wars, the China Relief Expedition, and many other campaigns.

In the profusion of medals and decorations established during World War I, the United States created a hierarchy of decorations. The Distinguished Service Cross (1917), the Distinguished Service Medal (1918), and the Silver Star (1918) all recognized levels of heroism that did not meet the high standard set for the Medal of Honor. The British government also established auxiliary honors, such as the Military Cross (1914) and the Military Medal (1916) to meet the huge demand for awards. The Central Powers, just like the Allies, liberally created and awarded medals during the war. The Prussian Iron Cross, never a permanent decoration, was reauthorized on 5 August 1914 and issued in great numbers.

In the aftermath of war, the Romanov, Habsburg, and Hohenzollern Empires disappeared, along with their complex systems of honors and awards. In Russia, the Bolshevik leadership, slow to recognize the propaganda and loyalty value of awards, later enthusiastically embraced them. The militaristic Nazi Party in Germany established its own extensive

system of badges and honors well before it assumed power in 1933.

World War II precipitated a rash of awards. All of the belligerent nations and most of the neutral nations issued medals to mark the event. In recent years, the United Nations has increasingly played a role in settling international disputes, and it issues service medals to its peacekeeping forces dispatched to monitor the peace in ethnic and regional conflicts.

There are instructive differences between the democracies and other powers in the awarding of the higher medals: the former often honors soldiers who have saved lives; the latter awards only those who have killed or captured the enemy. The democracies also have rigid rules for the awarding of the highest awards; and rarely is it even charged that politics, favoritism, or nepotism were involved in the process. The same cannot be said for other nations.

Medici, Giovanni de (a.k.a. Pope Leo X) (1475–1521)

Vivacious warrior-pope who made major contributions to the reestablishment of Rome as a center of European cultural activity and political power. Giovanni was the second son of Lorenzo the Magnificent, ruler of the Florentine Republic at the height of the Italian Renaissance. His education was the finest Europe had to offer at the time; he studied under the tutelage of figures like philosopher Pico della Mirandola and from early on was destined for clerical service. Perhaps his most notable action was the excommunication of Martin Luther in 1521, but Giovanni made other significant historical contributions, such as expediting the construction of St. Peter's Basilica and substantially increasing the holdings of the Vatican library.

In general, Giovanni was committed to the arts in a manner befitting a Renaissance ruler, spending much of his per-

sonal wealth and the money of the church on cultural enterprises. As head of the Catholic Church, temporal ruler of the papal states, and head of the ruling Medici family, Giovanni engaged in political struggle and what some might consider an overabundance of nepotism. He granted, for example, the archbishopric of Florence to his cousin (who would later become Pope Clement VII) and called on his nephew Lorenzo and brother Giuliano to be Roman patricians.

These political maneuvers were initiated in an attempt to dominate Italy, the central European power at the time, and they often brought with them considerable danger from rival factions and outside powers. France, in particular, felt it had claims to key Italian cities like Milan and Naples, resulting in Louis XII's march on Italy in 1513. Giovanni grudgingly formed an alliance with the militarily powerful Spanish, and the French were defeated at Novara, forcing Louis to withdraw. When France's Francis I rose to power in 1515, however, the war was renewed, and Giovanni revived his alliance with Spain and England. Giovanni's defeat at Marignano on 14 September 1515 forced him to make peace and draw up the Concordat of Bologna, which regulated church and state relations until the 1790s.

Medicine, Military

The medical and surgical specialty concerned with the ailments of soldiers and sailors. Warfare provides opportunities to expand medical and surgical knowledge but, at the same time, frustrates battlefield doctors who are unable to prevent death, relieve suffering, cure disease, or mend wounds. But military doctors and surgeons are unique in their ambivalent position: they are employed in their healing tasks by the same organization that inflicts wounds and pain, more sometimes on their own patients.

Detailed descriptions of wounds in the *Iliad* show that the Greeks knew basic human anatomy very well. Ancient Chinese and Indian texts reveal similar levels of understanding. Such knowledge is prerequisite for effective trauma surgery. That does not mean that ancient trauma surgery was effective; usually, it was not. There was little a surgeon could do except pull out the arrow or spear, bandage

the wound, splint or amputate the shattered limb, numb the patient with alcohol, and hope for the best. Yet there is compelling evidence in Greek and Roman literature that army surgeons were revered. The bravest soldiers and highest-ranking officers were attended by the most skillful surgeons. Thanks to his doctors, Alexander the Great survived dozens of grim wounds before dying of fever at 33. Ancient military surgeons frequently failed, but obviously they were serious about their practical science.

Like medieval medicine in general, medieval military surgery regressed from the progress made in ancient cultures. Except for Paul of Aegina (625–690), the Chinese, the Arabs, the School of Salerno, Lanfranc (fl. 1290), and Guy de Chauliac (c. 1298–1368), few doctors made advances in surgery between the fall of Rome and about 1500. Medieval medical students learned anatomy from the inaccurate works of Galen (130–200), not by direct experience. Until laboratory dissection of cadavers began to be allowed in the sixteenth century, studying battlefield casualties was the main way for surgeons to gain firsthand knowledge of human anatomy.

Ambroise Paré (1510–1590) was the father of modern military surgery. He gained fame through his treatment of a relatively new phenomenon in warfare, gunshot wounds. Earlier surgeons studied gunshot wounds, but Paré was the first to learn how to attend to them effectively. For two centuries after Paré, the French dominated surgery in general and military surgery in particular.

The Thirty Years' War, the early colonial conflicts between England and France, and other seventeenth- and eighteenth-century European wars led to noteworthy increases in medical and surgical knowledge. John Woodall (1570–1643) wrote the first textbook of naval surgery. Johann Schultes (Johannes Scultetus) (1595–1645) wrote the standard text on surgical instruments and procedures. Richard Wiseman (1622–1676) added to the knowledge of gunshot wounds. Lorenz Heister (1683–1758) developed tourniquets. François-Michel Disdier (1708–1781) contributed to what eventually resulted in the superior first-aid bandaging techniques of Johann Friedrich August von Esmarch (1823–1908). John Hunter (1728–1793) gained new insight into gunshot wounds while serving in the Seven Years' War.

Perhaps the greatest military surgeon of all time was Dominique Jean Larrey (1766–1842), who participated in all major engagements of the Napoleonic Wars. In 1792 he invented the “flying ambulance,” by which wounded soldiers could be quickly and safely evacuated. He emphasized first aid and improved the mobile battlefield hospital. The men adored him, and Napoléon himself called him “the most virtuous man I have ever known.”

The American Civil War established the United States as

the world leader in military medicine. *A Manual of Military Surgery* (1861) by Samuel D. Gross (1805–1884) was the standard text. The surgical potential of anesthesia, introduced in the 1840s, was just beginning to be exploited. Because infection and disease proved more deadly than battles, doctors finally began to notice that sanitation and hygiene were important to military health. New knowledge appeared in several classic works, including *Outlines of the Chief Camp Diseases of the United States Armies as Observed during the Present War* (1863) by Joseph Janvier Woodward (1833–1884) and *A Treatise on Military Surgery and Hygiene* (1865) by Frank Hastings Hamilton (1813–1886).

Antisepsis, anesthesia, and hemorrhage control, the three prerequisites for intricate surgical procedures, were all firm medical facts by the start of the twentieth century. The primary medical concerns in World War I were gas warfare, artillery wounds, disease, and shell shock. During that war, the motorized ambulance first appeared, and the field hospital became more complex.

The American Medical Association's book *War Medicine*, published in eight volumes from 1941 to 1945, was the basic medical and surgical manual for World War II. American medical schools in cooperation with the War Department founded permanent or semipermanent general military hospitals throughout the world. American leadership in surgical innovation was so renowned that Nazi intelligence routinely monitored Allied medical correspondence in order for German military surgeons to acquire techniques from the Americans.

Helicopter evacuations of wounded from battlefields to mobile army surgical hospital (MASH) units began during the Korean War. Thus the speedier use of more sophisticated care than medics could provide on the battlefield became possible.

Military medicine is not only surgery. Disease and filth are sometimes greater threats than the human enemy. In the eighteenth century, beginning with the work of John Pringle (1707–1782), the British began to succeed against some of the diseases that had plagued soldiers and sailors since ancient times. James Lind (1716–1794) and Gilbert Blane (1749–1834) conquered scurvy in the British navy. An American, Walter Reed (1851–1902), discovered the control for yellow fever in 1900 while stationed with the occupation force in Cuba. Another American, Edward B. Vedder (1878–1952), stationed in the Philippines in 1911, developed a cure for amoebic dysentery.

Florence Nightingale founded the modern profession of military nursing during the Crimean War. Before her time, military nurses were typically camp followers, prostitutes, or blowsy girlfriends. Clara Barton attended the Union wounded as an independent nurse during the Civil War,

served with the International Red Cross in the Franco-Prussian War, and founded the American Red Cross in 1881.

In times when it was common to spend a lifetime within a few miles of one's birthplace, simple homesickness or "nostalgia" could sap a young soldier's or sailor's will to live, causing his debility or even death. In the twentieth century, this problem was ameliorated by initiatives such as the United Service Organization (USO) and by the fact that young adults had become more accustomed to travel far from home.

Challenges to military medicine at the beginning of the third millennium include chronic health problems such as posttraumatic stress disorder (PTSD), formerly called "shell shock" or "battle fatigue," characterized by psychologically damaging flashbacks to combat situations; the physical aftereffects of exposure to the defoliant Agent Orange in Vietnam; and Gulf War syndrome (GWS), the mysterious biological ailment of veterans of that 1991 conflict. But if there has been one field of undoubted progress in modern times, it has been medicine—and military medicine.

Megiddo (September–October 1918)

An engagement that ended Turkey's participation in World War I. General Edmund Allenby's effective strategy in Palestine used battle-hardened soldiers, including Australians, New Zealanders, Indians, and Arabs, as well as British troops, and Arab guerrilla fighters led by Thomas Edward Lawrence ("Lawrence of Arabia").

Allenby deployed 57,000 infantry, 12,000 cavalry, and more than 500 guns against the Turks' 32,000 infantry, 200 cavalry, and 400 guns. With superiority in cavalry and mastery of the air, Allenby was well placed to overwhelm the

numerically inferior and exhausted Turkish troops. His strategy, however, was based on mobility, surprise, and depriving the enemy of all communications by attacking the Turkish road and rail systems, particularly the Hejaz Railway south of Damascus, the feeder line for supplies for the Fourth, Seventh and Eighth Armies.

Dummy camps and horses were set up, mules raised dust, and a small number of soldiers marched back and forth to create the impression of a much larger force to make the Turks think an attack would come in the Jordan Valley. Allenby deployed his force to the west, with the bulk of his cavalry riding north along the coast before swinging in behind the Turks' Seventh and Eighth Armies and taking their communications centers. Lawrence and his Arab force destroyed railway lines north, south, and west of Deraa on 16 and 17 September, while British and Australian pilots bombed the track and station buildings.

On 19 September, Allenby's bombardment opened along a 24-kilometer (15-mile) front along the coast, punching a hole in the Turkish line. With communications destroyed, German general Liman von Sanders, in Nazareth, had no idea that the Allied forces were sweeping through the breach in the Turkish lines and barely escaped the advancing Desert Mounted Corps.

The retreating Turks were bombed repeatedly by Allenby's aircraft as they fell back from Nablus toward the Jordan River. The Turkish Fourth Army east of the Jordan began retreating on 22 September, surrendering near Amman and at Damascus. By 1 October, the key cities of Beirut, Homs, Aleppo, and Damascus had fallen to Allenby's army, and for Turkey the war was over.

Megiddo, Battle of (1469 B.C.E.)

In an attempt to regain land, especially cities controlling the Via Maris, the major trade route from Egypt to Syria, Pharaoh Thutmose III of Egypt invaded Canaanite territory

with a large army, which may have had as many as 20,000 men. Opposed by the Canaanites under the leadership of the king of Kadesh, the Egyptians chose to attack through the central pass (probably modern Wadi 'Ara), passing into the Jezreel valley with only a small skirmish against a Canaanite guard force. Surprised, the Canaanite army, which had expected an attack through the broader northern or southern approaches, rearranged its lines. The Egyptians deployed their chariots in a line across the pass mouth, with Thutmose III in the center and the Egyptian left wing overlapping the Canaanites to the right. The Canaanites broke under the charge and retreated into the walled city of Megiddo. Because the Egyptians paused to loot the camps of the Canaanites, especially that belonging to the king of Kadesh, the besieged were able to immediately seal the city gate, which necessitated hoisting recovered men over the wall with ropes. Thutmose III then besieged the city for seven months, after which it surrendered, yielding rich plunder, including 350 slaves and the chariots and horses used by the Canaanites.

Although Megiddo is the first recorded battle in history, the Egyptian records show that warfare was already highly developed, with the Egyptian army able to quickly move large numbers of men on forced march, supply them through a long siege, and support the manufacture of weapons and chariots for a large force. The strategy chosen by Thutmose III was closely mirrored by that of Sir Edmund Allenby in his own attack on Megiddo in 1918.

Meigs, Montgomery Cunningham (1816–1892)

The leading American engineering officer of his era and quartermaster general of the U.S. Army during the American Civil War. Born 3 May 1816 in Augusta, Georgia, he grew up in Philadelphia, graduating fifth in his class from the U.S. Military Academy at West Point, New York, in 1836. He entered the Army Corps of Engineers after graduation and supervised the construction of the Washington Aqueduct, the construction of the wings and dome of the U.S. Capitol, and the expansion of the General Post Office Building before the war. As quartermaster general during the Civil War, he provided huge quantities of materials to the Union

armies. He commanded Ulysses S. Grant's base of supplies during the Overland campaign (1864) and commanded War Department employees in the Washington fortifications during Jubal Early's raid (July 1864). He personally supervised the resupply of General William Tecumseh Sherman's army at Savannah and a few months later in North Carolina, reopening Sherman's lines of supply. He was brevetted major general on 5 July 1864. Meigs's duties as quartermaster general included the oversight of government land use for military purposes. In this capacity, he first suggested that Arlington would be an appropriate site for a national cemetery.

After the war, Meigs supervised plans for the new War Department building, the National Museum, and the extension of the Washington Aqueduct. He died on 2 January 1892 in Washington, D.C., and is buried in Arlington National Cemetery.

Mercenaries

Hired professional soldiers who fight for any state without regard to political interests or issues. The use of paid foreign military troops is as old as warfare itself. Mercenary soldiers have been utilized in every period of recorded history. Although possessing a long and rich history, the profession of mercenary has an unsavory reputation. Historically, mercenary use is almost universal in advanced societies, and they have played many key roles in history.

Nearly every ancient empire, including the Israelite, Persian, Chinese, Greek, and Roman Empires, used mercenaries at one time or another. It should be remembered that even Xenophon was a mercenary leader. Without mercenaries, Carthage could never have challenged Rome, and Hellenistic civilization would never have spread to Italy and Afghanistan. Later, mercenaries would be an essential and underrated element in medieval warfare. Flemish mercenaries allowed King Stephen of England (r. 1135–1154) to fight off the Plantagenets (a rival royal house) for nearly 20 years. By

the end of the medieval period, mercenaries were abundant in Europe. During this time, the mercenary profession earned its fame and history's scorn.

Following the Hundred Years War (1337–1457), Europe was replete with thousands of men whose only training was in the arts of war. During the fifteenth century, these unemployed men formed “free companies” and sold their services to various princes. Most famous among these mercenary groups were the *Condottieri*, named after the *condotta* or contracts they signed, who fought prominently in the wars of the ministates of Renaissance Italy (the Italian Wars of 1494–1559). The other famous mercenary formation of the time was the Swiss pikemen, who were so impressive in battle that many kings were eager to hire them, including Julius II, who recruited them as a papal police corps, a function they serve to this day.

By the late eighteenth century, conscription and standing armies had largely replaced ad hoc military formations. As a result, the use of mercenaries declined markedly, although the British used a great number of German mercenaries during the American Revolution. The change in the stigma associated with using mercenaries can be seen in the American Declaration of Independence, which lists the king of England's use of “foreign mercenaries” as a specific offense. The French Revolution, with its ideals of patriotism, universal conscription, and fighting for the nation, ideas that spread throughout Europe, made the concept of fighting simply for personal gain unacceptable. Work for mercenaries continued, only now it lacked the status it had enjoyed in an earlier time.

In the second half of the twentieth century, the reputation of the mercenary profession continued to come under assault. Modern concepts of national sovereignty required the suppression of nonstate military activities. Foreign nationals would henceforth be uniformed, trained, and given rank as units of the national army, such as the French Foreign Legion and the British Gurkhas. The 1977 protocol to the Geneva Convention of 1949 sought to codify disgust for mercenaries. For signatories to this protocol, mercenaries are considered outlaws, placing them in the category of criminals or worse.

The end of the Cold War, in much the same fashion as the end of the Hundred Years' War, has created new opportunities for mercenaries. As global military competition disappeared, thousands of highly trained soldiers were in need of employment. At the same time, the disintegration of the bipolar international structure meant that the great powers were less concerned about events happening in Third World countries. True to free market principles, the existence of a demand for military expertise and the existence of a supply invariably created a market.

The post–Cold War environment has led to the creation of private military organizations run, in a professional manner, by retired senior military officers. Among these new mercenaries are Sandline International and Military Professional Resources Incorporated (MPRI). These organizations tend to deal exclusively with national governments and for a fee will provide advice on defense strategy, train units in the nation's armed forces, help the government procure arms, or fight the government's battles.

The new era of the mercenaries has produced mixed reviews, ranging from condemnation for profiteering and, supposedly, for exacerbating civil wars in Africa to praise for providing assistance to Croatian forces in their battle with the Serbian military. The latter intervention, in fact, is credited with bringing both sides to the negotiating table.

It can be argued that precisely because the mercenary fights for money and is thus not nearly so driven by national, ethnic, or racial animosities, he is something of a moderating force in battle. Further, the professionalism of many mercenaries sometimes makes national armies look inept in comparison, and thus not all of the criticism leveled against mercenaries has been entirely disinterested.

Meroe (antiquity–300 C.E.)

Ancient Ethiopian city-state eclipsed by Christian Ethiopians of Aksum. The earliest written account of Meroe dates from 738 C.E., when Arab chronicler Wahb Ibn Munabbeth described Meroe as a city and state by the same name. The tenth-century Arab chronicler al-Masudi of Baghdad argued that the capital, a flourishing market town, was made of gold, meadows, and gems and was the home of the “sons of Kush” and the “sons of Canaan.” Meroe was known for its fine architecture and an elaborate system of temples. It was also particularly renowned for its iron smelting.

For hundreds of years, East African coastal trade was carried northwest to the town. From there caravan routes, by which the ancient Kushites traded incense and metal over

long distances, led to the highlands of Abyssinia and to the Indian Ocean along the Atbara River. The Meroites probably had ancestral ties to dynastic Egypt. The ancient Kushites of the Nile Valley have left a record of the transfer of their capital to Meroe and include among their former capitals Napata, well-known from dynastic Egyptian records.

During the first century B.C.E., invaders from Arabia conquered northern Ethiopia, forming Aksum. By the fourth century C.E., following their conversion to Christianity, the Axumites had cut Kush's major caravan routes. Ultimately, the Arabian invaders blocked Meroe's access to the Indian Ocean ports, initiating a time of sustained warfare between the city-states. Ultimately, Kush was defeated, and Meroe declined as Aksum gained in power.

Merovingians

A dynasty of Frankish kings descended, according to tradition, from Merovech, a chieftain of the Salian Franks. Merovech's grandson was Clovis (r. 481–511), founder of the Frankish monarchy. The Merovingians were known as the "long-haired kings," and the cutting of a king's hair represented his loss of royal power.

Originally little more than a tribal chieftain, Clovis became the sole leader of the Salian Franks by force of perseverance and a free use of assassination. Expanding his kingdom with a ruthless single-mindedness, Clovis consolidated the position of the Franks in northern Gaul. In 486 he defeated Syagrius, the last Roman governor in Gaul and, in a series of subsequent campaigns with strong Gallo-Roman support, occupied an area situated between the Frankish kingdom of Tournai, the Visigothic and Burgundian kingdoms, and the lands occupied by the Ripuarian Franks and the Alamanni.

Clovis came to believe that his victory over the Alamanni at Tolbiacum in 496 was due to the help of the Christian God, whom his wife Clotilda, a Burgundian princess, had been encouraging him to accept. With the support of Remigius, bishop of Reims, Clovis converted with some 3,000 of his army. Thereafter, Clovis was the champion of orthodox Christianity against the Arian heretics, the Burgundians and Visigoths. He attacked the Burgundians at Dijon

(500), and the Visigoths at Vouillé (507), where he killed their leader Alaric II in single combat.

Clovis instituted a law code (*Lex Salica*), and for the next 200 years, only his descendants were entitled to rule. When he died, having united all Franks under his rule and gained the support of the Gallo-Roman clergy, he was master of most of Gaul. He thus laid the foundation, which even four hundred years of chaos and misrule could not destroy, of the French monarchy. Clovis personifies the metamorphosis of barbarian warrior into the ruler of a state.

The Merovingians followed the Frankish custom regarding patrimony, and on the death of Clovis the kingdom was divided among his four sons. This partition was not made according to ethnic, geographical, or administrative divisions. The only factor taken into account was that the portions be of equal value (defined in terms of the royal fisc and tax revenues). Although boundaries were poorly defined, the new political units became the kingdoms of Austrasia, Neustria, and Burgundy.

These kingdoms, whose borders were constantly shifting, were for a short period united in a single realm under Chlotar I (r. 558–561), again under Chlotar II (r. 613–623), and once again under Dagobert I (r. 629–639). The rule of the Merovingians before Dagobert, who was able to preserve this unity, was troubled by chronic warfare among aristocrats (both Gallo-Roman and Frankish) and rivals for power. Dagobert was the last active ruler, and his descendants were called the "idle kings." With the decline of the royal authority in Austrasia, the office of mayor of the palace developed into the real seat of power. This appointment was hereditary in the family of the Carolingians, who became the nominal as well as the actual rulers when Pepin the Short deposed the last Merovingian king, Childeric III, in 751.

Merrill's Marauders

Defeated the Japanese in the Burmese jungle during World War II using guerrilla tactics, duplicity, and Nisei interpreters. Nicknamed for their commanding officer, Brigadier General Frank D. Merrill, the Marauders, also known as Merrill's Raiders, were conceived during the Quebec Conference in August 1943 as a counterpart to Charles Wingate's Chin-

dits. Allied leaders envisioned a guerrilla-style unit that would wreak havoc behind Japanese lines, disrupt communication and supply lines, and aid in attempts to reopen the Burma road. President Franklin D. Roosevelt called for volunteers for “a dangerous and hazardous mission,” and 3,000 army personnel offered their services.

Code-named GALAHAD and given the obscure designation of 5307 Composite Unit (Provisional), in October they were sent to India for preliminary training. Frontline troops were divided into six combat teams of 400 each. In February 1944, the regiment was transferred to a location near Ledo in the northeastern corner of India. Their only contact with the outside world by radio and plane, three Marauders battalions marched 500 miles down the Ledo road beginning on 7 February and over the next three months engaged the enemy in five major battles and 17 skirmishes. In March, supported by a Chinese division, they engaged the Japanese 18th Division at Walawbum, and even though the second division went without food or water for 36 hours, the Marauders killed 1,500 and pushed the Japanese south. In late March, they were able to establish an airstrip north of Hsamshingyang, even though Merrill, who was suffering from heart trouble, had to be evacuated soon after. Under the new command of Colonel Charles Hunter, the Marauders were able to withstand a Japanese attack, even though the battles at Inkangahtawg and Nhphm Ga cost the 5307th casualties of 59 dead and 314 wounded. The Marauders’ greatest accomplishment was the seizure of the vital airstrip at Myitkyina in May. By 4 June, the regiment’s casualties in northern Burma totaled 2,394, and only 200 of the original 3,000 men were considered fit for duty. Weakened by dysentery, skin diseases, fatigue, and malaria, the remaining members of the 5307th could not withstand a Japanese assault on 3 August from Myitkyina. After the war, the Marauders were immortalized in poems, on film, and even in comic books.

Mesoamerican Warfare (1200 B.C.E.–1521 C.E.)

Highest development of Stone Age warfare, with some variations. Pre-Columbian Mesoamerica provides an excellent

study area for the development of warfare on a different path than in the old world. The lack of draft and pack animals, wheels, metallurgy, and ships in quantity and quality all led to developments different from those in Europe.

The Olmecs (1200–400 B.C.E.) first used warfare to expand trade and access to resources. Fighters from the Olmec city of San Lorenzo utilized obsidian-edged weapons, hand-to-hand elite combat, and small, elite forces numbering in the tens to hundreds to control local trade routes from the Veracruz region. La Venta assumed power from 900 to 400 B.C.E. and introduced the sling, clay projectiles, and yucca-cotton armor to gain superiority. Tortillas were also used to feed the hundreds of troops deployed in enemy territory. By 400, trophy heads, stone knives, obsidian-tip spears, spear throwers, wood shields, upper-torso armor, and hide helmets were common for elites and, to a lesser extent, for supporting commoner forces.

Fortifications also became common, especially in the lowland Mayan area where captive taking and elite warfare dominated. In the Zapotec region, Monte Alban developed as a heavily fortified city that controlled a regional kingdom through its defensive location and warfare based on thrusting spears and hand-to-hand combat. Skull racks indicate probable religious-based warfare centered on captives and sacrifice. By 100 C.E., Monte Alban was challenged by the huge city-state of Teotihuacán in the Mexico City area. From 100 to 700 Teotihuacán, which numbered perhaps 100,000 people, spread its influence over trading partners partly by emphasizing spear throwers, shields, and stone axes and knives. The Teotihuacanos utilized military orders of eagles, jaguars, and so on, special housing, regular production of weapons, and nodal control of trade centers over 1,500 miles distant. Astronomy and religion seem to have played a large role in how and why war was carried out at the end of Teotihuacán hegemony.

In 378, the Teotihuacanos brought projectile warfare into the Mayan region and tipped the balance of power in favor of large Mayan cities like Tikal, with rulers like Smoking-Frog. These lowland Maya developed religious- and astronomy-based warfare among elites that became known as “star wars.” The kin-city competitions for resources, natural and supernatural, dominated classic Mayan warfare from 378 to 900, when warfare may have helped to collapse classical Maya civilization.

In most cases, these early and classic period civilizations in Mesoamerica focused on elite warfare and weaponry, with religion and trade as key motivating factors. Most “armies” numbered less than a thousand soldiers, were supported logistically by commoners, and sought out captives as a way of removing rival dynasties and usurping power. It was as important to take religious items of power as it was to

take a city. By the early post-Classic period, between 700 and 900, warfare began to change significantly.

At places like Xochicalca, Cacaxtla, or Bonampak, people like the Olmeca-Xicallanca increased warrior numbers, used backpacks in long-distance attacks on cities like Teotihuacán, and involved commoners in guerrilla activities. After the collapse of classic Mesoamerican civilizations, the Toltecs rose to power in central Mexico between 900 and 1200, and their ascendance marked the rise of territorial warfare, combined arms, and highly militaristic society. They would have a great influence on the later Aztecs (Mexico).

Tollan and its Toltec capital of Tula in central Mexico used large armies in the tens of thousands, concentrated projectile fire of spear throwers, obsidian blades on wood clubs and swords, siege warfare with firing platforms, and watercraft, when necessary. One leader, Topiltzin Quetzalcoatl, may have invaded Yucatan territory after 1100 and spread full-scale warfare into the region from the site of Chichén Itzá. Itzá fought with Coba for control of Yucatan for several centuries. The Itzá eventually prevailed in a conflict that saw the fortifications, attrition, and logistics of the Coba defeated by Itzá Mexican military might. However, both sides had exhausted their resources, and soon a series of smaller kingdoms returned control of the peninsula to Maya polities by 1350.

In the post-Classic period, waves of Chichemecan invaders from the north, such as the Toltecs and Aztecs, combined their nomadic, commoner-based, bow-and-arrow warfare with the elite, trained, central Mexico warfare traditions. The Maya region struggled to keep up but was about to be overrun by the time of Spanish invasions in 1519.

The Aztecs established their capital Tenochtitlán on an island in Lake Texcoco and used this combined approach to establish a huge tributary empire by war between 1300 and 1521. They eventually controlled much of Mesoamerica, notable exceptions being the west Mexican Tarascan kingdom, the Tlaxcallan kingdom, and the Maya lowlands.

Tlacauelel was most responsible for the building of the Aztec Empire. He ruled as a warrior-priest, supporting relative after relative as emperor, for most of the fifteenth century. When he died at 96, he left a legacy of military training schools for elites and commoners, arms production, the ability to field huge armies of 100,000 or more for long campaigns, a religious-military system that promoted and supported war and captive taking, and the largest, most powerful empire in the pre-Columbian Americas.

The Aztecs, like the Inca, often defeated enemies by logistics and numbers, not by military superiority. Time and again, the Aztecs were actually defeated on the battlefield by Tarascan metal weaponry and fortifications, Tlaxcallan vol-

ley bow and arrow fire, or even in hand-to-hand combat. Still, the Aztecs usually prevailed in the end.

Metz, Siege of (1870–1871)

A siege that made the Prussian defeat of France almost inevitable. After briefly skirmishing with the Prussians immediately after the start of the Franco-Prussian War, an entire French army, consisting of five corps (155,000 men), fell back to Metz in order to regroup. Led by the incompetent Marshal Achille-François Bazaine, this army was then trapped by the Prussians, who bypassed Metz and began to invest it on 19 August 1870. Bazaine never intended to remain in Metz, yet he made only one halfhearted attempt to break out, on 31 August, to link with the army advancing from the direction of Sedan under Marshal Marie-Edme-Patrice-Maurice de MacMahon, duc de Magenta. When this army was destroyed on 1 September, Bazaine made no further attempts to break out, and the Prussians intensified the ring around the city.

The problem for Bazaine after the defeat at Sedan was that his was an imperial army, and the empire no longer existed. He considered himself a representative of the imperial government and made no efforts to coordinate his defense of Metz with the Republican government in Paris. During early October, Bazaine sent an emissary to Otto von Bismarck to negotiate surrender terms entirely on his own initiative and without even bothering to let the government in Paris know what he was doing. On 27 October, the army unconditionally surrendered and was simply taken prisoner while Bazaine sneaked out to avoid his troops. Bazaine's imperial army thus fought no major battles during the Franco-Prussian War, and it surrendered without having engaged the enemy in any full-scale battle.

After the war, Bazaine was put on trial for treason. He was found guilty and sentenced to death, but President MacMahon commuted it to 20 years' imprisonment, which Bazaine avoided by escaping after nine months. The Siege of Metz is important because the surrender of the city freed troops, allowed the Prussians to more effectively encircle Paris, and

ensured that the Prussians would not be amenable to an armistice.

Meuse-Argonne (26 September–11 November 1918)

The largest and most important offensive of the American Expeditionary Force (AEF) during World War I and perhaps the largest American battle to date. After successful operations at Amiens and Albert in 1918, Marshal Ferdinand Foch decided to reward the AEF for their success at St. Mihiel with an attack on German forces in the Argonne Forest. This was part of a larger strategy to attack at interlocking points along the line, exhausting German reserves and allowing Allied forces to break German lines of communication and logistics. The southern thrust of this pincer movement was to be led by American general John J. Pershing. His 400,000-man force was to attack an area deemed impregnable by some military commanders. The hilly, rough terrain of the Argonne Forest had been reinforced with defensive fortifications by the German army since 1915. The Americans were backed by 300 tanks under the control of General Hunter Liggett and 500 aircraft of the U.S. Air Service under General William Mitchell. They were opposed by 40 German divisions under the leadership of General Max Carl von Gallwitz.

Launched on 26 September, the plan was for Pershing's First Army to attack the Meuse and Aire valleys. To its left, the French Fourth Army would also move north. They were to break through the 10 miles of rough terrain, turn right, and continue to Sedan and Mezieres. Although progress slowed as German resistance increased, in the first three days of fighting, American forces were able to penetrate 3 to 7 miles at some points in the line, capture 10,000 prisoners, and gain the villages of Montfaucon, Exermont, Gercourt, Cuisy, Septsarges, Malancourt, Epinonville, Charpentry, and Very. Yet the lack of roads created traffic jams, and inexperienced American divisions were able to gain little ground. On 4 October, the First Army began a major attack along the entire front. The harsh fighting gave rise to some of the heroic moments in American history, including the famed "Lost Battalion" and Sergeant Alvin York's capture of 132 Ger-

mans. By 10 October, Allied forces had nearly cleared the Argonne Forest of the enemy.

The heavy fighting continued until November, when the Americans and French were able to break through the German fortifications and advance some 20 miles, while the French Fourth Army captured the railroad hub at Sedan. This advance broke the transportation network that supported the German army in France. On 11 November, the Meuse-Argonne offensive ended; during the six weeks of combat, the AEF suffered 26,277 dead and 95,786 wounded.

Mexican Revolution (1810–1821)

Revolution that achieved independence from Spain. The revolt was ignited by Father Miguel Hidalgo y Costilla in the village of Dolores in the state of Guanajuato on 16 September 1810. Hidalgo called his parishioners and supporters to revolt with "El Grito de Dolores" (the cry of Dolores), shouting "Long live the Lady of Guadalupe" and "Death to the Spaniards." Hidalgo was a Creole (someone born in the colonies of European descent). His army consisted of more than 50,000 troops, whom he often could not control.

The first objective was the city of Guanajuato, and after its surrender, both Creoles and Spaniards were slaughtered. Such atrocities caused both of these groups to join forces against Hidalgo. After attempting to take Mexico City itself and failing, Hidalgo and his troops were forced north. Though his army was able to take a few other cities, Hidalgo was captured and shot on 31 July 1811. His head was exposed on a stake for 10 years.

Hidalgo's death did not halt the revolution. What was left of his army was taken over by Father Jose Maria Morelos y Pavón. He was able to seize much of Mexico, put a form of government together, and call for a constitutional convention at Chilpancingo in 1813. During this convention, a formal declaration of independence was drafted, along with the Constitution of Apatzingan. However, on 22 December 1815, Morelos was also captured and shot by Spanish troops. By now, the only remaining rebel force still in the field was that

Mexican insurrectos with a homemade cannon in Juarez, c. 1911. (Library of Congress)

commanded by Vicente Guerrero, an Indian. But for the next five years, until 1820, peace reigned throughout much of Mexico.

Events in Europe forced the Spanish king Ferdinand VII to promulgate the liberal constitution that had been put in place in 1812 and that he later had rescinded. On 24 February 1821, Agustín de Iturbide, a Mexican landowner, issued his three-point Plan de Iguala, which called for a Catholic nation, independence under a monarchy, and equality between Europeans and Creoles. Iturbide's army joined forces with those of Guerrero and entered Mexico City on 27 September 1821. Mexico had finally won its independence from Spain. Though Hidalgo's efforts did not result in an immediate victory, Mexico still celebrates its independence on 16 September.

Mexican Unrest and Civil War (1911–1929)

Series of coups and countercoups, revolts, and civil wars that did not address the basic Mexican problem of mass poverty and that twice drew in American intervention. As Mexico prepared in 1910 to celebrate the centennial of the republic's independence in 1810, the superficial signs of prosperity could not mask the widespread poverty and discontent that would soon erupt into revolution and plunge the nation into years of civil war. In 1910, Mexico was one of the world's most lucrative and alluring economies. The credit fell to the nation's longest-serving president, Porfirio Díaz. However, the prosperity was an illusion created by the selling of trading concessions and appropriated communal lands. Fewer than 1,000 landowners controlled 97 percent of all of Mexico's land. In the 1910 election, a wealthy liberal landowner, Francisco Madero, challenged Díaz, demanding expanded suffrage, limits on presidential succession, and agrarian reform. The resulting surge of public support for Madero and growing antiregime violence shocked Díaz, who resigned the presidency and left Mexico for exile.

Madero was inaugurated as president in November 1911 amid great expectations. However, timidity and compromise characterized his administration. He failed to institute promised agrarian reforms, thus alienating his rural sup-

porters. His willingness to work with the elites cost him the support of the liberals. In a conservative-backed counterrevolution, General Victoriano Huerta forced the resignation of President Madero and his vice president. Three days later, on 23 February 1913, both men were shot while under the general's protection. Huerta assumed the presidency, incurring the wrath of Madero's one-time supporters. Huerta's resistance to agrarian or social reforms mobilized his domestic opposition. Emiliano Zapata and Pancho Villa raised revolutionary armies in rural Mexico. In the north, the revolutionary army under the command of Venustiano Carranza was a formidable threat to Huerta. The regime was further destabilized by the U.S. Navy's occupation of Mexico's largest port city, Veracruz, following a minor affront to an American naval officer. Huerta resigned the presidency in July 1914, leaving Mexico for exile, while Mexico's revolutionary commanders battled for supremacy.

Carranza won broad popular support when, in January 1915, he issued a decree that outlined a program of land redistribution. The U.S. government and Mexico's Latin American neighbors recognized Carranza as the de facto head of state. His rivals, particularly Villa, sought to destroy international support for Carranza. Villa's forces attacked the town of Columbus, New Mexico, in March 1916, killing a number of Americans. President Woodrow Wilson's response was to dispatch a punitive expedition into Mexico to track down Villa. The incursion rallied Mexicans behind Carranza. A liberal constitution was ratified on 5 February 1917, the same day the United States withdrew its forces from Mexico. Carranza became the first president under the new constitution. Mexicans expecting dramatic reforms were soon disappointed. Carranza bowed to international pressure, suspending decrees that threatened foreign business interests. When he hesitated to enact the agrarian reforms called for in the constitution, his popular support eroded.

Constitutionally prohibited from succeeding himself in the election of 1920, Carranza backed a puppet candidate. This action prompted Alvaro Obregón, the former minister of war, to challenge the president's handpicked candidate. The governor of the state of Sonora called upon his fellow governors to rise up militarily against Carranza. Thirteen states followed his lead. Carranza fled the capital, only to be assassinated en route to Veracruz. Obregon was elected president and moved quickly to implement agrarian reforms. He also imposed restrictions on foreign ownership of Mexican land and resources. The election of Obregon is considered by many historians as marking the end of the Mexican Revolution of 1910. The relative peace that Obregon's presidency brought to Mexico was shattered in 1923, however. In the elections that year, Obregon threw his support to Plutarco Calles. Rival candidate Adolpho de la Huerta urged his sup-

porters to take up arms against the government. Obregon personally led federal troops in suppressing the rebellion.

As president, Calles was cautious in limiting foreign investment in Mexico. He did not show the same restraint in dealing with the Catholic Church, aggressively restricting the rights and activities of the clergy. Calles's anticlerical measures sparked violent resistance, known as the Cristero Rebellion, that continued throughout his presidency. Peace was elusive until the 1940s. Provisions of the Constitution of 1917 continued to be implemented by successive governments. Yet the twentieth century ended as it began for Mexico, with the ownership of land and disparities in wealth dominating political debate.

Mexican-American War (1846–1848)

Disastrous Mexican defeat at the hands of the United States, resulting in enormous losses of territory. President James Polk wanted land from Mexico and Canada in his drive to expand the United States from the Atlantic to the Pacific Ocean. It was an era of Manifest Destiny, when many Americans assumed they had a right to overflow the continent from coast to coast (and perhaps the Americas from pole to pole as well). When the breakaway Republic of Texas joined the United States in March 1845, Mexico was angered, and tensions increased along the disputed Texas-Mexico border, one side claiming the Rio Grande and the other the Nueces River as a border.

Polk then settled the Oregon Territory boundary dispute with Great Britain in 1846; that left Mexico and the vast and underpopulated lands in its north as a barrier to westward

expansion. In March 1846, Polk ordered General Zachary Taylor and his “Army of Observation” to the north bank of the Rio Grande to strengthen the Texan and American boundary claim. That decision soon led to fighting and formal, mutual declarations of war.

The Mexican-American War fell into three broad phases. The first phase centered on General Taylor in the north. American and Mexican armies soon clashed, first at Palo Alto and then at Resaca de la Palma near current Brownsville, Texas. The Americans won both battles, and the Mexicans retreated. Taylor slowly pursued and, in September, neared Monterrey. The Mexicans had formidable defenses. Still, Taylor sent a flanking movement that soon gained control over the dominating two hills, emplaced artillery, and caused the Mexican forces to abandon the town. Taylor proceeded somewhat south, and in February 1847, after most of his regular army troops were detached to form the main force for General Winfield Scott’s amphibious invasion, Taylor was near the Hacienda de la Buena Vista when General Antonio López de Santa Anna attacked him. The Americans had good defenses, but the Mexicans sought to outflank them on the American left. Militia units rushed to the battle, fought very well, and were able to throw back the Mexican assault. This battle largely ended fighting in north-central Mexico, as Santa Anna moved to contest Scott’s invasion.

There was, to be sure, fighting on the periphery, which could not affect the ultimate outcome nor compel a Mexican surrender. General Stephen Watts Kearny marched from Fort Leavenworth, Kansas, to take Santa Fe, New Mexico, an important trading point. Kearny proceeded to California, where other Americans, including John C. Frémont and Richard Stockton, helped take control of that Mexican province.

These American gains in the north did not translate into a Mexican surrender or cession of territory. Thus, in early 1847, President Polk somewhat reluctantly agreed to a plan by General Winfield Scott to attempt a seaborne invasion of the port city of Veracruz, then to proceed along the relatively traditional route to attack and seize the capital, Mexico City, and thereby compel surrender.

Scott’s resulting campaign was remarkable. Polk feared that if Taylor or Scott enjoyed too much success, the victorious general might make a formidable presidential campaign opponent; Scott also had to deal with shortages of equipment and limited manpower throughout the campaign. He had to attempt the first major contested American amphibious assault, and he had to cooperate well with the U.S. Navy, on whose logistical support he depended. He had to follow a mostly predictable route into the heartland of his enemy and win a series of battles mostly on grounds of his opponent’s choosing, without being able to afford losing many men.

That is, he operated under a remarkable series of constraints and surmounted all of them.

Scott gathered his invasion force at New Orleans and then, after a stop at Tampico, accepted the advice of Commodore David Conner, who was commanding the naval flotilla, and landed his command on a beach south of the heavily fortified city of Veracruz. By nightfall of the first day, 9 March 1847, some 100 ships had landed 10,000 men, their animals, and supplies—a remarkable accomplishment. Scott then established a siege line across Veracruz, and within several weeks, the city surrendered.

Scott needed to proceed up the national highway to move his men above the dreaded “yellow fever” line before the season of illness began. General Santa Anna established seemingly strong defenses at Cerro Gordo in early April, where he expected Scott to proceed up the national highway and be denied further progress. Scott’s engineering officers, led by Captain Robert E. Lee, found a goat path—a trail—that could be widened to allow the Americans to proceed around, behind, and above the Mexican defenses from the right and thereby force the Mexicans to attack or cede their positions, which they did on 17–18 April 1847. Scott then rested midway at Puebla, while he massed supplies and dealt with the enlistment terms of his militia (for many, their terms were up, and Scott wanted them out of his way before proceeding to the Mexican capital).

Again, the deluded Santa Anna felt that he had established a formidable set of defenses before the capital, Mexico City. He assumed Scott would approach from due east, and he was ready. There were deep lakes to the north, a supposedly impenetrable lava bed to the south, and several lakes in the center that he expected would channel the American invaders into the strength of his defenses. Once again, Scott’s engineers found a way around these obstacles and avoided the expected line of advance. They found a path across the lava bed to the south, and Scott managed to outflank Santa Anna, first by moving south, fighting at Contreras and Churubusco, and thereby moving south of the capital. The American commander then attacked Mexico City from the lightly defended south and west. The Americans won at El Chapultepec and then descended from the heights to take the city. After some months of negotiation, both sides agreed to the Treaty of Guadalupe Hidalgo in February 1848, in which Mexico ceded California, Nevada, Utah, Arizona, and New Mexico, along with much of Colorado and the disputed territory in southern Texas.

Taylor’s campaigns in the north did not greatly advance the military arts and sciences. Mexican troops were poorly trained and mostly poorly led. Their copper cannonballs dented rather than exploded; Americans soldiers literally jumped over the cannonballs rolling along the ground. The

fighting in New Mexico and California involved few troops. However, Scott fought an exemplary campaign of maneuver reflecting pre-Napoleonic values; that is, he could not afford the massive firepower and extensive loss of life of battles and campaigns from the Napoleonic Wars. Instead, relying on military strategy and tactics from the previous era, he mostly avoided expected lines of advance, gained psychological advantage by an indirect advance, and won a great series of battles. Scott's benign treatment of the civil populace also ensured a smooth passage along his lines of communication.

Mexico, U.S. Punitive Expedition in (1916–1917)

U.S. Army expedition sent into Mexico to seize the bandit and revolutionary Pancho Villa. Continued political instability in Mexico after the Revolution of 1910 led to a growing concern over the safety and security of the U.S.-Mexican border. On 9 March 1916, perhaps upset at the loss of American support or just desperate to once again be a player in Mexican politics, Pancho Villa, a major figure in the Mexican Revolution, attacked the town of Columbus, New Mexico. When Villa and his mounted raiders withdrew, 16 U.S. citizens had been killed, and the town center had been burned to the ground. The unprovoked attack created a firestorm of outrage in the United States, and President Woodrow Wilson dispatched General John “Blackjack” Pershing in pursuit of Villa. It took a few days to assemble a force, and Pershing did not cross into Mexico until 15 March 1916.

An 11-month-long incursion by U.S. troops hundreds of miles into the Mexican state of Chihuahua failed to find the elusive Villa. Although a military failure, it did provide the U.S. Army with much-needed field experience and a chance to develop the staff skills needed to run and support a large army in Europe. In particular, Pershing pioneered the use of aircraft (which failed in most cases even to get off the ground) and motor transport, which was more successful.

American and Constitutionalist forces went out of their way to avoid each other, and the Americans were forbidden to enter any towns. What occurred was not peace and was not war. Provisional president Venustiano Carranza at first sim-

ply wanted to contain the penetration of American forces and then get them out Mexico as fast as possible. Pershing wanted only to capture Villa, not confront Constitutionalist forces.

The Mexicans demanded that first the Americans leave and then that they jointly resolve the problem of cross-border raids. The United States countered by offering to work out a plan after it had captured Villa. Both sides tried to avoid open confrontation, but the political strain started to show as each side was unwilling to concede to the other.

To resolve this impasse, both sides formed a joint commission to find a solution. The commission met many times in New London, Connecticut, from September 1916 to January 1917, but it never reached an accord. The expedition would end only when Woodrow Wilson chose.

Militarily, Constitutionalist and American forces did clash twice, in the towns of Parrazal and Carrizal. Although there were some losses (at Carrizal, both sides suffered 25 percent casualties), commanders on both sides moved to keep the conflict from escalating into full-scale war, something that neither Wilson nor Carranza wanted or could easily afford.

In January 1917, Wilson saw that the threat from Germany was greater than the threat posed by Mexico, and he ordered Pershing to return with his command to the United States. The “hot pursuit” never came close to catching Villa, and it served only to degrade an already strained relationship between the United States and Mexico. Wilson’s attempts to “teach the Mexicans democracy” (he also sent troops to occupy Veracruz for more than a year) proved an abject failure. But that did not stop the president from mounting two further military essays into other lands for ill-defined purposes. Expeditions into Murmansk and Vladivostok, Russia, toward the end of and after World War I, like the Mexican expedition, had little purpose and no lasting effect except to create hatred of the regime.

Mexico City, Battles for (20 August–14 September 1847)

The concluding battles for the Mexican capital, which ended

the Mexican-American War. After the battle of Cerro Gordo, General Antonio López de Santa Anna established formidable defenses around Mexico City; a series of lakes would channel the invading Americans into his prepared positions, or so he hoped. He believed that Lake Texcoco limited an attack from the north and that Lake Chalco, Lake Xochimilco, and a vast lava bed limited an advance to the south; his strongest defenses anticipated an attack headlong from the east.

American general Winfield Scott faced further challenges, including his limited number of troops and supplies, capturing a capital city some 225 miles inland, and avoiding the set defenses, since he could not afford many casualties. He solved his problems brilliantly by engaging in a strategy of marching south and past the defenses, eventually to attack Mexico City from the underdefended southwest and western approaches.

There were several battles in this campaign. After resting at Puebla for several months, Scott's advance units arrived in the valley of the capital in early August. The Americans fought at Contreras, Churubusco, and El Molina del Rey and outflanked Santa Anna's defenses.

Finally, on 13 September, the Americans attacked the city itself, beginning with defenses around the Mexican military academy, El Chapultepec. After hard-fought battles, the invaders gained control of the hill on which the academy sat and thus gained entrance into the capital, which formally surrendered to Scott soon after, paving the way for the Treaty of Guadalupe Hidalgo some months after that.

Miles, Nelson Appleton (1839–1925)

Distinguished American commander, a military leader for four generations, one of few to achieve the highest rank without having attended the U.S. Military Academy at West Point. Miles was born in Westminister, Massachusetts, on 8 August 1839. A store clerk in the 1850s, he studied military science in his spare time.

As soon as the Civil War began, Miles enlisted in the 22d

Massachusetts Volunteers, where he was quickly commissioned first lieutenant. By September 1861, he was captain and then aide-de-camp to Major General Oliver Otis Howard. Miles was wounded at Fair Oaks, Fredericksburg, Chancellorsville, and Petersburg. He fought at Antietam, the Wilderness, Spotsylvania, and Cold Harbor, was brevetted three times, and commanded a division at Appomattox. In 1892, he received the (Congressional) Medal of Honor for his service at Chancellorsville.

In October 1865, Miles became major general of volunteers and in 1867 brevet brigadier general. As commandant of Fort Monroe, Virginia, until July 1866, he was criticized for rough treatment of his prisoner, Jefferson Davis. After 1868, as husband of the niece of William T. Sherman, he sought special favors, but Sherman resisted.

From 1869, as colonel of the U.S. Army 5th Infantry, until 1894, as major general of the Department of the Missouri, Miles fought the Indians of the American West. He defeated the Cheyenne in 1874 and 1875, drove Sitting Bull into Canada in 1876, and captured both Crazy Horse and Chief Joseph in 1877 and Geronimo in 1887. Soldiers under his command massacred the Sioux at Wounded Knee in 1890.

As general in chief of the army from 1895 until his retirement in 1903 (the title was changed to chief of staff in 1903), he planned campaigns for the Spanish-American War, the Philippine Insurrection, and the Boxer Rebellion, observed the Turco-Greek War, and personally led the assault on Puerto Rico in 1898. He achieved the permanent rank of lieutenant general in 1901.

Before the emergence of John J. Pershing, Miles was the best-known soldier in the United States. At the time of his death in Washington, D.C., on 15 May 1925, he was the last surviving regular Union major general.

Military and Society

The relationship between the soldier and society has been discussed and studied since human societies were formed and individuals or groups within them were armed. The nature and implications of this relationship center on those who manage political relationships within any given society. Plato juxtaposes Spartan society and Athenian society in *The Republic*. In the former, society revolves around the military, and the two are intertwined at every level from cradle to grave. In the latter, the military serves society as a distinct entity that is both apart from the rest of society but stems from it, serves it, and remains a part of society as embodied and represented by the Athenian city-state.

More recently, the field of civil-military relations has attempted to identify and describe the key elements involved in the relationship between modern military organizations and their political masters within the modern nation-state. Since the early 1950s, particularly with Samuel Huntington (*The Soldier and the State*, 1957) and Morris Janowitz (*The Professional Soldier*, 1960), the fundamental questions have revolved around how to provide for the defense of the state and concurrently keep those who dominate the use of force from applying that force to exert control over the political decisionmaking processes or to control the society within the state or both.

Two principal currents of thought have consumed most of the work on civil military relations since the 1950s in the democracies. Huntington set forth the terminology of objective and subjective control as two distinct ways to manage political-military relations. He has been viewed as the proponent of the former method of control through what he calls professionalism. Janowitz has been viewed as a proponent of subjective control. In both cases, the objectives are similar: to prevent a so-called praetorian military from dominating society and the political system.

Although either method of political control can be applied in both democratic and nondemocratic systems of government, the debate is most heated where democratic systems are at potential risk of being overthrown by military action through the use or threatened use of force. To prevent this outcome, objective control seeks to create a distribution of power between military and civilian groups that can lead to the emergence of professional attitudes and behavior among military officers. The goal is an autonomous professional military that is apolitical and focused on its missions. Subjective control also advocates a professional military, understood as expertise in the use of force, but not autonomous and uninvolved with the political dynamics of the state. Control is essentially exerted through an integration of the military into the political structures. The essential idea is, make military officers a part of the political aspects of the

state, and they are unlikely to overthrow themselves. Objective control has been crudely interpreted as “give them toys and keep them busy.”

Regardless of the method used, these theorists and their predecessors and successors have all worked with a complex but limited number of variables and issues to explain why militaries might or might not threaten societies and the governments that govern them and how one might prevent or reverse that threat when and where it exists. The key issues to understand are the nature of the state, military missions, and the relationship between these two.

The state is three things: it is a nation-state, a political system that governs relationships within the boundaries of the nation-state, and the government organs that physically exist. The nation-state is a psychological construct that includes concepts such as nationalism and notions with particular cultural attributes. It is also a physical entity. Armed forces' missions stem from this conception of the state. Military forces defend against aggression from other states in a world that is assumed to work in what international relations theorists call the “realist paradigm.” It assumes that states in the international system work as unitary actors first and foremost to ensure their survival as states. But states are bound to clash and conflict to ensue. Thus, militaries exist to defend against other militaries when such a clash occurs.

Militaries also exist to defend the existence of the state from internal enemies. Generally, civil wars, guerrilla or separatist challenges, or other armed groups that threaten the existing system of governance are threats to the second conception of the state. The government, regardless of whether it is a democracy or not, is that part of the state that directs and regulates relations within society, between society and the state, and between state organs. The government of a state ostensibly defines what those institutions are supposed to do and also manages resources and allocates those it possesses to state institutions such as the military.

Finally, the state is physically manifested in its third dimension by state institutions such as governing bodies (legislatures, executive offices, courts) and by organizations such as the social security administration, highway department, and the armed forces.

The armed forces are directly related to the nation-state because they exist to defend its existence, and they are a real part of the state as physical entities. The government and society surround the military as an organization with interests that stem from their conception of the nation-state and what they need to do to ensure the survival of the state in all its manifestations.

Here lies the crux of political-military relations. The government allocates the resources that permit the military to succeed or fail in its missions of defense. Whether fighting

an external enemy or an internal enemy, the mission is conceived as a zero-sum game. That is, either one wins or one loses. Where the use of force is involved, losing often means dying (but, then, so also can winning). Thus the government is under pressure by the controllers of the use of force to ensure that adequate resources are provided to accomplish the mission.

What that mission is and how it is conceived differently by the armed forces and by the government will greatly determine the day-to-day relationship between the military and society. Internal missions will tend to involve the military in domains within society that are not within the military's traditional competence. External missions will tend to focus the military on the expertise needed to apply force most effectively to defeat a like organization (i.e., another country's armed forces). Such a mission will tend to separate the military from society, but not in an unhealthy way.

The actual relationship between the military and society is dependent on how the military is organized, supplied with personnel, and trained and educated. The field of military sociology focuses in part on these issues. For example, Charles Moskos has written much on the nature of the U.S. military. He has looked at the results on the linkages between society and the armed forces of a conscript-based versus a volunteer-based military. He has tracked the composition of various components of the armed forces in terms of percentages of minorities, women, or people from a certain geographical region to ascertain whether manipulations of these variables affect the degree of understanding of the military by society at large or of currents within society by the armed forces. The great fear is that military and society will develop excessively distinct cultures and perspectives to the point at which they may clash. A military alienated from the society within the state it defends may become a danger to that society.

In the end, militaries reflect the societies whence they come. But they do so in the context within which they must exist. Is their mission primarily to defend from potential external threats, or is it to defend against internal threats? One nation, at least, is in the happy position of having no convincing threat. Canada, invincible, protected from external threats by the United States, and domestically relatively tranquil, is hesitant to define any mission for its armed forces beyond the benign role of peace keepers. New Zealand, enjoying even more domestic tranquility, has gone even farther than Canada in transmogrifying its armed forces into UN peace keepers, but New Zealand does face some conceivable external threats in the Pacific Rim.

The answer to the mission question will greatly determine the relationship between the military and those elements of the state that represent and manage society. How is

the military to be organized, deployed, and manned? The answers to these questions will affect how the military relates with various elements of society. How is the military trained and educated? What is its cultural perspective? An understanding of these issues will in part determine the quality of the relationship of the armed forces with society.

An understanding of why the military exists, what it does, and how it accomplishes the missions laid on it by civilian policymakers is an important element in ensuring healthy civil-military relations in both the political and societal realms, most particularly in democracies.

Military Justice

The law governing the army. It is also the system of justice exercised by the military over society during emergency situations of military government or martial law.

Prior to the development of societal organization, which we term *civilization*, there was armed conflict. Civilization is associated with the establishment of a system of law or conduct of behavior. Governance and the regulation of the civilian population were considered necessities for the semblance of order. However the concept of law as a defined set of principles was not applied or was considered inapplicable to the battlefield, since war was an anarchic activity and contest of strength.

Nevertheless it became apparent to rulers that in the interest of state preservation, order, and prosperity, limits should be placed upon the destructive potential, to population and property, of warfare. Prior to concerted efforts by governments/states to regulate warfare, philosophers and military theorists were social advocates providing the first notions of military law.

With the aggrandizement of Rome, the military became the foundation of the state, necessary to garrison, fortify, and defend the territory and perimeter of the empire. Julius Caesar's subversion of the Republic and its senatorial basis of government brought imperial rule where civil and mili-

tary law became intertwined and almost indistinguishable. The concept of *citizenship*, that of civil rights under state protection, was extended to the barbarians of the conquered lands as a reward based upon military service within the legions of Rome. Desertion, mutiny, cowardice, violence to a superior, and the sale of arms were some of the military offenses recognized and punished by the Romans.

The collapse of the Roman Empire led to a period of anarchy in western Europe due to the absence of a strong established political order with a corresponding military enforcement. This period of medieval history, known as the Dark Ages, marked the decline of professional infantry. Petty bands of cavalry rose to prominence as powers unto themselves, able to terrorize or maintain overlordship of a given territory. Rulers/princes/lords, in order to maintain and expand their political control, instituted a system for the hire of these cavalymen, rewarding them with land for military service. This lord-vassal relationship of military obligation for service fiefs became known as *feudalism*.

A system of military law and conduct for cavalry was established as the property and birthright of the nobility, which in this period became an exclusive military caste. This code of ethics and regulation of warfare became known as *chivalry*.

The first written military laws of Europe were within the Salic Code (circa 400) and revised by successive Frankish kings. There was no separation of civil and military jurisdiction. Civil judges were also military commanders. The first French military law (Ordonnance) was written in 1379, while the German version (Kriegsartikel) appeared in 1487. Habsburg emperor Charles V's penal code of 1532 is considered to be the model for the existing military codes of modern Europe. This system of military law, known as Carolina, was expanded and given national versions as the Articles of Gustavus Adolphus of 1621, the Regulations of Louis XIV of 1651 and 1665, the Articles and Regulations of Czar Peter the Great of 1715, and the penal code of Empress Maria Theresa of 1768.

The British military code, from which the American and Canadian counterparts originate, comprises the statute of the Army Mutiny Act and Articles of War. The Mutiny Act of 3 April 1689 was created after the desertion of Scottish troops loyal to the Stuarts who refused to obey the order of William III. Thereafter, any soldier causing mutiny or sedition in the army could be punished by death or alternate penalty judged by a court-martial. The Mutiny Act was replaced on 24 July 1879 by the Army Discipline and Regulation Act, which itself was revised as the Army Act of 27 August 1881.

The American military code differs from that of Great Britain in several ways. It does not have a Mutiny or Army

Act that must be annually renewed, and although the American Articles of War are derived from the British, they are nonetheless wholly statutory, being enacted by Congress as the legislative power. American military law consists of a written and an unwritten component, the former including the statutory Code of Articles of War, other statutory enactments relating to the discipline of the army, the Army Regulations, and General and Special Orders.

After resolving to raise an army to fight the British, the Continental Congress adopted a set of Articles of War on 7 November. New articles followed on 20 September 1776, dealing with treason and providing intelligence to the enemy. After the adoption of the Constitution, the Articles were readopted by an act of 29 September 1789. A further revision occurred as the Articles of 1806. The present American Articles of War consists of 128 articles from the revised Code of 1874, which prohibited punishments such as flogging and branding.

Military justice is administered through the tribunal of court-martial. Among the Romans this consisted of justice delivered from the legionary tribunes and the *Magistri Militum*. The early Germanic tribes during times of peace assembled courts of free men, while in times of war a duke or military chief and priests sat in judgment. This system developed into a court of regiments, which was presided by a colonel who carried a mace (*regiment*) as his emblem of judicial authority.

Specific military courts were established in France as *Conseils de Guerre* in 1655. In ascending hierarchy of jurisdiction, they were the courts of the Mayor of the Palace, the Constable, and the Provost Marshal. German military courts (spear courts) were established as the *Militärgerichte* of Emperor Frederick III in 1487.

The British tradition of court-martial derives from the King's Court of Chivalry, alternatively known as the Court of the High Constable and Marshal of England, the Court of Arms, and the Court of Honour. Presiding were the Lord High Constable and Earl Marshal. However not until the subdivision of the tribunal system into separate courts by Edward I did the Court of Chivalry actually derive its distinct existence. Moreover, since the Court of Chivalry extended jurisdiction over civil and criminal matters, successive acts of Parliament restrained and curtailed its power until it practically ceased to exist as a military tribunal by the time of the English Revolution.

The American Continental Congress adopted the British military tribunal system of courts-martial: general, regimental, and garrison courts. The Fifth Amendment of the Constitution, through the act of 29 September 1789, made the distinction between civil offenses and those cognizable by a military forum. Courts-martial do not fall under the

jurisdiction of the American judiciary as inferior courts. Rather, they are instruments of executive power provided by Congress for the president as commander in chief to enforce discipline in the army through his authorized military representatives. Therefore, court-martial is not a court by definition, but a creation by an order that is subject to a superior military body or person.

Courts-martial are not courts of record, and their judgment is simply a recommendation that is not made operative until approved by a revisory commander. The proceedings of a court-martial cannot be reviewed by a federal court. The only appeal process is via the judge advocate general to the president or the secretary of war/defense.

The British North American Act of 1867 gave the Dominion of Canada responsibility for its own defense and the maintenance of military forces during peacetime. The Dominion Parliament passed the Militia Act in 1868. Guidelines were provided in 1884 by the British Manual Military Law, whose fourteen chapters covered a history of military law, military crimes and punishments, English criminal law applicable to soldiers, courts-martial, and customs of war.

With the introduction of the National Defense Act in 1950, the Canadian armed forces obtained a national Code of Service Discipline. It was accompanied by the Queen's Regulations and Orders. The repatriation of the Constitution and the creation of the Canadian Bill of Rights and the Charter of Rights and Freedoms in 1982 provided the last amendments regarding standardization and fairness in Canadian judicial military procedure.

At present most member states of the United Nations recognize a large body of international law applied to soldiers during conflict known as the Law of War/International Humanitarian Law/Law of Armed Conflict. This governs the rights and obligations of combatants and aims to temper the destruction of war by setting limits to warfare. The Law of War also seeks to protect noncombatants.

The Red Cross conference of 1864 provided the original Geneva Convention for the protection of war victims. The present Law of Armed Conflict has three sources: the Hague Convention of 1907, which placed limits on the methods of conduct during military operations; the four Geneva Conventions of 1949, which provide the protection of wounded, sick, and POWs; and the Additional Protocols to the Geneva Convention of 1977, which further limits the use of unnecessary force causing suffering.

Additionally, there is the Martens Clause, which first appeared as a preamble to the Hague Convention II of 29 July 1899 and has been added to most international humanitarian treaties. The Martens Clause expresses the notion that there are universal minimum standards of behavior during warfare and customary law that all states recognize. But

there will always be a tension between military law/justice, which provides for penalties for offenses that would be meaningless in civil society (e.g., absence without leave, conduct unbecoming an officer, adultery, and so on), and the civil law, which recognizes no such offenses. The tension becomes all the more acute when the military is flooded with mass conscript troops, fresh from civilian society.

Military-Industrial Complex

In his farewell address in 1961, President Dwight D. Eisenhower warned that America must "guard against the acquisition of unwarranted influence by the military-industrial complex" (Eisenhower 1965, 616). Thus entered into the American public realm the term that captures the reality that the institutions and people for planning, procuring, and fighting a war shape the economy, the political realm, and the wider society. Although other developed nations also support extensive military structures, with the fall of the Soviet Union, the United States remains as the world's only military superpower; therefore the question of the importance and the influence of the military-industrial complex (MIC) is basically an American issue.

Advanced technological weapons and communication devices are the cutting edge for the military today. Based upon the hard lessons of World War II, the U.S. government and military assumes as a guiding tenet that it must possess the hardware for the next war before that war begins. The United States can no longer put its national defense at risk, trusting that, in the words of William Jennings Bryan, "a million men will spring to arms." The defense of the nation requires permanent armaments and a defense establishment built in the United States by American manufacturers.

This is the military-industrial complex. A constellation of

people and institutions play a guiding role in the modern United States. The constellation includes the military professionals and the Pentagon, the scientific-technological elite, the universities, and the entrepreneurs—the investing class and the corporation. Of course, money is what keeps the system operating.

A very early example of MIC occurred when Alexander Hamilton recognized that the country needed arms and armories to provide for a common defense. Seeing the expected procurement of 40,000 muskets, Eli Whitney obtained a contract to build 10,000 and succeeded in establishing the first factories making muskets with interchangeable parts. The economic boon was obvious.

The Civil War generated a massive need for arms. Consequently, arms spending increased more than a hundredfold. The procurement of cannon alone required a massive increase in coal and iron production that established Pittsburgh as the iron-making capital of the country.

By World War II, the United States had become known as the “Arsenal of Democracy,” producing 300,000 airplanes, 124,000 ships of all types, 100,000 tanks and armored vehicles, and 2,400,000 trucks. The expense for this hardware reinvigorated American corporations, in the doldrums from the Depression during the 1930s.

Similarly, the success of the Manhattan Project, the most expensive wartime undertaking in American history, revolutionized the economic landscape by creating entirely new industries, including “think tanks,” the infrastructure for fighting a nuclear war. Also, since World War II, “black projects” have likewise funneled billions of U.S. dollars into corporate coffers.

Thus, certain military contractors become essential to the defense of the country. For example, the United States financed the financial bailout of Lockheed Corporation in 1969 because of its importance to the national defense. There is also the reality of people moving from one institution to another in the military-industrial complex. When procurement officers in the Pentagon retire, they have an opportunity to become employed by the contractors with whom they had been dealing.

The problem that President Eisenhower noted was that the vested interests of both the military and the corporations may generate harmful outcomes as well. At present, the extremely large nuclear arsenals of the major powers are generally superfluous and thus pose more danger than deterrent effect, as even the recent U.S. commander of the intercontinental ballistic missile force publicly stated.

Similarly, there remains strong congressional support for the Strategic Defense Initiative (SDI) and for the next-generation fighter. Thus the atmosphere created by the Cold War ideology continues, after the demise of the Soviet Union, to influence decisions on weapon systems develop-

ment, whether the military leadership wants them or not. The argument for such spending assumes the underlying economic reality. Without such massive spending, the needed corporate infrastructure will deteriorate quickly, perhaps leaving the United States unable to build and deploy the necessary weapon systems to defend itself against its future enemies.

Some of these debates appear in Pentagon planning for U.S. military needs. Must the armed forces be able to deploy and fight two wars simultaneously? This standard foresees simultaneous wars in the Middle East and in Asia. Military readiness is defined as being combat-ready for such wars. However, during the year 2000, the United States deployed military forces in peace-keeping roles in numerous and various localities. The weapons and training required for this task are far different.

The military-industrial complex, an amorphous collection at best, had its heyday in the 1950s and 1960s, at the height of the Cold War. It even affected population patterns, as Americans moved in large numbers from the old industrial upper Great Plains and Northeast to the Sun Belt states, where the newer, more militarily oriented industries, like aircraft and electronics, were concentrated. But in the twenty-first century, its influences are waning, as the percentage of U.S. gross national product devoted to the military steadily declines from its Korean War, post-World War II peak high. Only a changed context with a new significant military threat to the United States will reverse this trend.

Milne Bay (1942)

The first defeat of a Japanese invasion force. The Japanese completed the conquest of their planned “Southern Economic Zone” in the South Pacific with the capture of Rabaul in early 1942. However, they were surprised by the rapid consolidation of Allied forces in Australia and the aggressive air campaign that followed. Plans were rapidly made to

A depiction by Peter Paul Rubens of the Battle of the Milvian Bridge. (Philadelphia Museum of Art/Corbis)

capture all of New Guinea, bases in the Solomons, New Caledonia, and Fiji to isolate Australia from the United States. To this end, the Japanese sent a force overland along the Kokoda Trail toward Port Moresby in August.

An airstrip was to be built at Milne Bay, on the far eastern tip of New Guinea, to support the Port Moresby attack and provide a base for bombing northeastern Australia. Japanese intelligence suggested that only a small garrison was present. However, the Allies had already constructed airstrips at the western head of the bay, and the defenders numbered 7,500: two Australian Infantry Brigades—the veteran 18th and the 7th Militia—accompanied by 1,300 U.S. Army engineers.

The 1,200-strong Japanese Special Naval Landing Force landed on the northern side of the bay on the night of 25 August 1942 and was reinforced two nights later by 1,200 more troops. However, they landed further east than planned. P-40 fighter-bombers, operating within their own landing pattern, destroyed the Japanese shore depot on 26 August, adding to their difficulties. Australian resistance was unrelenting as they advanced westward, and in spite of nightly fire support from destroyers, the Japanese had reached only the first airfield by the night of 28 August. Fierce fighting continued at the airstrips until 31 August. Lack of success then caused Imperial Headquarters to order withdrawal,

and the 1,300 survivors were evacuated by the Japanese navy on the night of 6 September.

Milvian Bridge, Battle of (28 October 312)

Victory that brought Constantine to power. With troops from the garrisons of Britain, Gaul, and the Rhine, Constantine invaded Italy. His aim was to wrest power from the co-

emperor of the West, Maxentius, son of Diocletian's old colleague Maximian.

Victorious over Maxentius's northern forces near Turin and Verona, Constantine marched on Rome. Maxentius opted to defend the walls of Rome and thus cut the pons Mulvius, the bridge that carries the Via Flaminia across the Tiber River, on the northern approach to the city. Constantine then crossed the Tiber River on a pontoon bridge moored just downstream of the stone bridge and gave battle at Saxa Rubra. Constantine's army, although outnumbered, was battle-hardened and confident. Maxentius's army was thrown back in confusion, and as it retreated across the Tiber River, the pontoon bridge collapsed. Maxentius and his armored cavalry were drowned in the swollen river, a scene depicted on the Arch of Constantine, erected at Rome to commemorate Constantine's victory "by divine inspiration." The Senate welcomed Constantine as liberator and proclaimed him sole emperor in the West.

It was prior to the battle, so records his biographer Eusebius, bishop of Caesarea, that Constantine saw a sign in the sky, a cross of light superimposed on the sun. He took this as a sign of victory—he stated, under oath, that he saw the words "Be victorious in this" written in stars around the cross—a message from the God whose symbol was the cross. Since Constantine was heavily outnumbered, this vision may explain his bold decision to attack. He certainly put his faith to the test when he ordered his men to paint the Greek monogram for Christ (*chi-rho*) on their shields. Victorious at Milvian Bridge, Constantine continued to wear the symbol for Christ against every enemy he faced.

Minamoto, Yoshitsune (1159–1189)

Principal Minamoto commander during the Gempei War (1180–1185). Minamoto was instrumental in the formation of the first shogunate at Kamakura under his half-brother, Yoritomo (1147–1199). Over the centuries, Minamoto has been transformed through poetry, stories, and *No* and *Kabuki* plays into one of Japan's quintessential tragic heroes, making history difficult to separate from legend.

Minamoto was placed in a monastery after his father, Yoshitomo (1123–1160), was killed warring against the virtual dictator of Japan, Kiyomori Taira (1118–1181), head of the rival Taira (or Heike) clan. Escaping in 1180, Minamoto

joined Yoritomo's rebellion against the Taira, fighting a campaign across the island of Honshu and defeating the enemy in a series of brilliant, swift maneuvers that secured the Minamoto victory over the Taira.

In 1184, Minamoto won a decisive victory in the Battle of Ichinotani, attacking the enemy castle from the Hiyodori Impasse by leading a body of 70 horsemen down a treacherously steep mountain path reportedly used only by wild boar, deer, rabbits, and foxes. He then led a small force across the Inland Sea during a fierce storm, capturing the fortress of Yashima in March 1185. On 25 April, he crushed the Taira in the naval Battle of Dannoura at the western end of the Inland Sea. Following the battle, Taira's widow leapt into the sea with the boy-emperor, Antoku. The Sacred Sword was lost, but the other imperial regalia, the Sacred Seal and the Sacred Mirror, were recovered and returned to Kyoto.

After the war, Yoritomo grew jealous of his half-brother's success and suspicious of his close relationship with Cloistered (Retired) Emperor Go-Shirakawa. Minamoto soon rebelled, fleeing to northern Honshu, where he committed suicide in 1189.

Minden (1 August 1759)

Major battle of the Seven Years' War in Germany between the Anglo-Hanoverian-Prussian army under Ferdinand, Duke of Brunswick, and the French army under Louis Georges Érasme, Marquis de Contades.

In July 1759, Contades occupied the village of Minden on the Weser River, 30 miles west of Hanover. He wanted to concentrate his scattered forces in order to advance on Ferdinand's recently defeated allied army. Minden was a strong position, with the Weser River and marshes covering the flanks of his army of 60,000 men. Ferdinand's allied army of 45,000 men lay to the west, but that skilled general began to advance toward Contades on 31 July to force battle.

Contades broke camp that same day and arrayed his superior force to take advantage of the terrain. He placed his cavalry in the middle of his line to give still-absent detachments room to deploy on the flanks. The battle began when Charles-François, Comte de Broglie, attacked and failed to break Ferdinand's surprised left flank. Contades considered

withdrawing and had no further plan for the battle beyond Broglie's attack. Ferdinand's Anglo-Hanoverian troops had advanced far ahead of the main army, which prompted the French cavalry to charge. Armed only with swords, the infantry drove the cavalry back. The French infantry advanced against the exposed allies as their cavalry reformed and enveloped the entire formation, which nonetheless held fast against the onslaught. The French center collapsed as the cavalry once again retreated. At this moment of decision, the allied cavalry failed to advance and deliver the charge. Lord George Sackville had repeatedly refused to advance, thus allowing the French army to withdraw across the Weser River. Allied casualties totaled 2,600, but the French suffered the loss of 7,000 casualties, 10,000 prisoners, and 45 guns.

Minden had the potential to be a decisive battle like Leuthen. Sackville was court-martialed for his insubordination, and the French army continued to be a threat to Hanover. Ferdinand followed close on its heels but abandoned his pursuit after Frederick the Great's disastrous defeat at Kunersdorf. As with most battles in the war, Minden proved indecisive, yet Ferdinand gained both time and space. The war continued.

Minié Ball

An improved bullet that increased the effective kill range of rifles and had a dramatic impact on the casualty rate in the American Civil War. Claude-Etienne Minié, a French army officer and part-time machinist, perfected the bullet in 1849. Along with a rifled barrel that he designed, Minié invented a conoidal-shaped bullet with a hollow base that deformed and expanded when a rifle was fired. This created the much desired tight seal around the projectile that increased the accuracy and velocity of the weapon but allowed it to be easily dropped into a barrel. Rifles equipped with the new projectile had the same reloading capability as a smoothbore musket but an effective kill range four to five times that of the older weapon.

Nearly all senior ranking U.S. and Confederate officers gained their combat experience in the Mexican-American

War. This war was fought with smoothbore muskets and a reliance on closed-rank linear infantry formations. The imbalance between technologically improved infantry weapons with greater velocity and accuracy, combined with tactics better suited to weapons of a previous generation, sent casualty rates soaring. (It is not for nothing that critics accuse most of the world's armies of "fighting the last war.") During the Civil War, Minié balls caused the majority of battlefield casualties. In fact, in light of those casualties, it can be argued that the Minié ball was the single greatest killer of American young men, even more so than automobiles or liquor or their combination.

Mithradatic Wars (88–63 B.C.E.)

Series of three wars between Republican Rome and King Mithradates VI Eupator of Pontus for control of Asia Minor. Mithradates VI ascended the Pontic throne at age 11, about 121, escaped his mother's plot to kill him, and solidified his power about 114 by murdering his mother and her supporters. Always wary of conspiracy throughout his long reign, he regularly drank tiny amounts of a wide variety of poisons to immunize himself; kept a supply of antidotes handy; and is supposed to have killed his brother, three sons, and three daughters. Gradually and secretly, by murder and intrigue, he replaced neighboring kings friendly to Rome with usurpers friendly to him. His ambitions included Cappadocia to the south, Armenia to the east, the Crimea to the north, and Bithynia and Galacia to the west.

About 89, when Roman legate Marcus Aquilius refused Mithradates' request for Roman aid against the encroachment of King Nicomedes III of Bithynia into western Pontus, Mithradates decided to wage open war on Rome and its allies. Lucius Cornelius Sulla received command of the expeditionary force against Mithradates in 88, but challenges to his consulship by Gaius Marius and others delayed his operations. Meanwhile, Mithradates took the war into Greece.

Sulla recaptured Athens in 86 and defeated a larger army under Pontic general Archelaus at Chaeronea in 86 and again at Orchomenus in 86. After Lucius Valerius Flaccus won at Philippi and Gaius Flavius Fimbria captured Pergamum, the First Mithradatic War concluded in 85 with the Treaty of Dardanus.

Mithradates rebuilt his army and navy after Dardanus. A maverick Roman commander in Asia Minor, Lucius Licinius Murena, led a preemptive strike against Mithradates in 83, starting the Second Mithradatic War, which lasted only one year. Mithradates decisively defeated Murena, who was then punished by Sulla for disobeying orders and violating the treaty.

Bithynia quietly became a Roman province in the mid-70s at the bequest of Nicomedes. Now that Rome controlled the Bosphorus, Mithradates again feared for the safety of his kingdom and launched an offensive. As the Third Mithradatic War began in 74, Lucius Licinius Lucullus led five legions against Mithradates, winning at Cyzicus in 73 and Cabira in 72. When Mithradates retreated and allied with Armenian king Tigranes, Lucullus invaded Armenia in 70 and defeated a vastly superior force, perhaps 100,000 Pontic-Armenians to 10,000 Romans, at Tigranocerta in October 69.

Pompey replaced Lucullus as eastern commander in late 67 or early 66 because of Lucullus's harsh leadership that led to mutinies after his victory at Artaxata. Quickly successful, Pompey compelled Tigranes to surrender in 65. The remainder of the war was a mop-up campaign against Mithradates, who fled to the Crimea, where he committed suicide. Pompey established direct Roman rule over the provinces of Asia Minor and returned to Rome in triumph in 62.

Mogul-Persian Wars (1622–1653)

A series of limited clashes, never growing to full-scale war, over Kandahar.

Mogul-Persian War of 1622–1623

Kandahar, in what is now modern-day Afghanistan, had represented a source of tension and rivalry between the Safavid Persian and Mogul Empires since Akbar (1542–1605) had acquired it for the Moguls when two Safavid princes defected in 1595. Patiently building his forces and taking advantage of division within the Mogul court, Shah Abbas “the Great” (1571–1629) personally led his forces against Kandahar in the winter of 1622. After a 45-day siege, the ill-prepared 300-man Mogul garrison surrendered to the Safavids. Shah Abbas then seized control of the fortress, town, and province of Kandahar before the Mogul emperor, Jahangir (1569–1627), could marshal an army to relieve the garrison. Jahangir planned to recapture Kandahar. He sent his son Khurram (1592–1666), who would later become Shah Jahan, to recapture Kandahar. However, before the Moguls could do so, Jahangir fell seriously ill, leaving his wife, Nur Jahan, and his son Khurram locked in a dynastic struggle for control of the Mogul Empire. The Moguls finally sent a force against the Safavids in 1623, but by that time the Mogul force that reached Kandahar was too weak to recapture the province.

Mogul-Persian War of 1638

Although initially distracted by the dynastic struggle within the Mogul Empire, Shah Jahan saw an opportunity to recover Kandahar in 1638. Ali Mardan Khan, a Persian noble and commander of the fortress, feared his life was in danger from the capricious Safavid emperor, Shah Safi (1629–1642), and so surrendered the fortress to Shah Jahan without bloodshed. As a reward for his defection, Ali Mardan Khan received a substantial monetary reward and a political appointment within the Mogul Empire. Upon reacquiring the fortress, Shah Jahan began to bolster the fortifications of Kandahar.

Mogul-Persian War of 1648–1653

In the decade after Ali Mardan Khan's defection, the Safavid emperor, Shah Abbas II (r. 1642–1666), regarded Mogul military setbacks in the Balkh region against the Uzbeks as a sign of weakness. In the winter of 1648, sensing his opportunity, Shah Abbas II sent an army into the region to retake the fortress at Kandahar. After a two-month siege, the Mogul garrison surrendered. Although aware of the Safavid attack, Shah Jahan's advisers convinced him that a winter campaign to relieve the city was unwise. This decision gave precious time to the Safavids to reinforce their recent reconquest.

Shah Jahan mounted three unsuccessful campaigns to retake Kandahar between 1649 and 1653. The Moguls mounted their first campaign in the summer of 1649, under the leadership of his son, Aurangzeb. Commanding a force of

50,000 men, Aurangzeb laid siege to the fortress but withdrew because he could not defeat the Safavid garrison before the onset of winter. The Moguls did not again try to take Kandahar until the fall of 1652, when they again laid siege to the fortress. Although the Moguls repulsed a relief force sent by the Safavids, they could not complete their siege of the fortress. The Moguls made their final attempt to recapture Kandahar in the spring of 1653. Led by Shah Jahan's favorite son, Dara Shukoh, the latest Mogul force came close but could not fully penetrate the defenses. Dara Shukoh employed siege guns, which breached some of the fortress walls but were not enough to force the capitulation of Kandahar by the winter. Foul weather and thinning supply lines forced the Moguls to withdraw from the battlefield.

The Moguls' Kandahar campaigns were a failure. The estimated deaths of 30,000–40,000 soldiers were unable to achieve for the Moguls what diplomacy and bribery had earlier achieved. Throughout the battles for Kandahar, the Moguls favored bows and arrows over artillery and firearms. Indeed, the Moguls considered archers to be the most prestigious of warriors during this period. At the same time, the Safavids consistently outgunned the Moguls. Safavid artillery was accurate, reliable, and inflicted very heavy casualties upon the Moguls during their sieges. Strangely, the Moguls felt little incentive to invest in systematic efforts to develop an army backed by gunpowder. In any case, Kandahar remained a part of the Safavid Empire until the beginning of the eighteenth century.

Mohács, Battles of (29 August 1526, 12 August 1687)

Turkish-Hungarian battles. The first battle of Mohács took place on 29 August 1526. Over 30,000 Hungarians under King Louis II and Bishop Tomore made a heroic stance to defend Hungary against the Turks under Süleyman the Magnificent. The Turks numbered more than 100,000 troops and had 300 guns that proved decisive in routing the Hungarians, who lost 22,000 casualties, their king, many clergy and nobility, and eventually control of their capital at Budapest.

The sultan went on to besiege Vienna, although unsuccessfully, at the height of Turkish power in eastern Europe.

The second battle took place 160 years later and marked a reversal of fortune for the Turks. A combined Austro-Hungarian force crushed the Turks under the Sultan Mohammed IV on 12 August 1687. The sultan was deposed by the soldiery and succeeded by Süleyman III. The Turks were badly overstretched, fighting wars against Venice, Russia, and the Holy League with Austria and Hungary at the same time. Turkish power, which had seen a brief military renaissance with this war against Austria, would never recover.

Mohi or Sajo River, Battle of (April 1241)

Battles in which the Mongols destroyed the Hungarian army and ransacked the kingdom. After conquering Russia, Mongol armies led by Sübedei and Batu invaded eastern Europe in February 1241, advancing as five separate but closely coordinated forces to deceive their enemies, who remained unclear regarding the Mongols' real targets until the last minute. Two advanced into Poland, one into Bohemia, and two into Hungary. At this time, Hungary, which appears to have been the primary Mongol target with its good pastures, possessed perhaps the finest army in Europe. Initially invaded by only a part of the Mongol army, it was soon invaded by the rest, after the Mongol victory against the Saxons at Liegnitz, in Silesia.

Although King Bela IV of Hungary had fortified the passes of the Carpathian Mountains, the Mongols had broken through by 14 March 1241. On 9 April 1241, King Bela advanced with an army that may have numbered 70,000 men, although there is some question whether or not he had his entire army with him because of a well-managed Mongol campaign of misinformation, including false mobilization orders. In response, the Mongols withdrew before the Hungarians for several days, until they had led the Hungarians to the plain of Mohi, between the Sajo and Tisza Rivers. The Hungarians camped in the plain, unaware that the Mongols had specifically chosen this site as a battlefield.

When the Mongols advanced to the Sajo River, prepared to do battle, Bela formed his wagons into a circle, thus forti-

fyng them against a sudden cavalry charge. He stationed 1,000 men at the only bridge to prevent a crossing.

Around dawn, Batu attacked the bridge with archers and a rolling barrage of catapults firing naphtha. The Hungarians retreated from the bridge before the Mongols. In the ensuing melee, both sides suffered heavy casualties.

Sübedei, who had meanwhile crossed the river farther upstream on pontoons, then appeared behind the Hungarians, forcing them to fall back on their camp, which the Mongols surrounded, leaving a gap on the western flank, and bombarded with catapults and arrows. Eventually, the Hungarians detected the opening and soon poured from their camp in that direction, often dropping their weapons as they ran. As the unarmed Hungarians fled, the Mongols now wheeled upon them and slaughtered the fleeing men.

The Mongols continued the pursuit for three days, ravaging Hungary. Bela IV barely escaped, and only after a long flight into the southern Balkans with Mongol forces close behind. After taking up residence in Hungary, even issuing coins and dispatching raids as far as the suburbs of Vienna, the Mongols then abruptly withdrew in late 1241 and early 1242 because of the death of Great Khan Ögödei. Hungary remained a shadow of its former might for decades.

Moltke, Graf Helmuth Johannes Ludwig von (1848–1916)

Born at Gersdorf, Mecklenburg, on 23 May 1848, Helmuth Moltke joined the army in 1869. He was a nephew of Helmuth von Moltke ("the Elder"), who commanded Prussian armies to victory over Austria and France. Although similar greatness was expected for the younger Moltke, he unfortunately possessed little of his uncle's innovative military genius.

Moltke joined the Prussian army in 1869. He served as adjutant to his uncle and the kaiser and held a variety of field commands. Promoted to colonel (1895) and brigadier general (1899), in 1900 he became a major general commanding the 1st Guards Division. He was then quartermaster general (1903). Kaiser Wilhelm II named him chief of the

Engraved portrait of General Helmuth J. L. von Moltke. (Library of Congress)

general staff in 1906, succeeding General Alfred von Schlieffen. Moltke accepted the post with reservations, knowing that he was incapable of quick decisions.

As German army chief of staff, Moltke believed war with the Entente powers was inevitable and pushed for it to be sooner rather than later. His major contribution to World War I was his ill-conceived revision of the Schlieffen Plan. Because he feared a French thrust into Alsace and Lorraine, he strengthened the German left wing at the expense of the right, which made it much more difficult for the right wing's encircling movement to succeed. Then with the offensive already under way, on 25 August he exacerbated matters by taking two corps and a division from the right wing and sending them east against the Russians. Moltke exercised little leadership during the fighting and, on 14 September following the critical Battle of the Marne, he was relieved of his post and demoted to deputy chief of staff. Moltke died suddenly of a heart attack in Berlin on 18 June 1916.

Moltke, Graf Helmuth Karl Bernhard von (1800–1891)

Prussian field marshal and architect of Prussia's victories in the nineteenth-century wars of German unification. Born on 26 October 1800 in Parchim, Mecklenburg, Helmuth von Moltke joined a Danish regiment on graduation from the Royal Cadet Corps in Copenhagen. After visiting Berlin in 1821, he decided to enter the Prussian army. Not wealthy, Moltke supplemented his income through writing.

Moltke attended the Prussian War Academy during 1823–1826 and joined the Prussian General Staff in 1833. Sent to Turkey in 1835 to study the language and advise the sultan on military matters, he entered the Turkish service contrary to instructions and campaigned in Egypt and Syria, distinguishing himself in the Battle of Nezib (Nizip) in July 1839.

Returning to Prussia in 1839, Moltke was aide-de-camp to Prince Henry of Prussia and then rejoined the general staff. Promoted to colonel in 1851, he was then aide-de-camp to Prince Frederick William (later Kaiser Frederick III). He traveled to Britain and Russia and in October 1858 became chief of staff of the Prussian Army.

Moltke and Minister of War Albrecht von Roon helped secure the appointment of Otto von Bismarck as minister-president of Prussia in 1862. These three men worked closely in the cause of German unification, reforming and increasing the size of the regular army. Moltke, who had written about railroads, well understood the implications of the railroad and telegraph for modern war. He soon reorganized the general staff into three geographical divisions and a railways department.

In 1864, Moltke oversaw Prussian military operations during a war with Denmark. His success in that campaign earned him the complete support of Kaiser William I. Moltke then drew up plans for the 1866 war against Austria, which involved a quick campaign of rapid concentration in which three armies would advance on different routes by rail, their movements coordinated by telegraph. Although communication broke down, Moltke nonetheless won a decisive victory over the Austrians in the Battle of Königgrätz (Sadowa). This Seven Weeks' War ended 120 years of rivalry between Prussia and Austria for domination in the Germanies.

Moltke noted flaws and corrected them in the final war of German unification, against France in 1870–1871. Although he allowed his subordinates considerable latitude, Moltke directed the military campaigns of the war, including the September 1870 Battle of Sedan, the October 1870–January 1871 Siege of Paris, and the final battles against the French Army of the Loire.

Advanced to both graf (count) and field marshal in June

1871 in recognition of his accomplishments, Moltke continued as chief of the general staff. In the early 1880s, he began to turn over responsibility to others, retiring altogether in 1888. He died in Berlin on 24 April 1891. Moltke wrote a number of books, most of them on military subjects.

Mongol Empire (1206–1259)

The world's greatest steppe empire was traditionally founded in 1206, when Genghis Khan (c. 1162–1227) was first elected khan; expansion had begun even before that date with raids on the northern Chinese state of Xixia. They continued with other raids on Xixia, and against the Chinese Jin dynasty, culminating in the capture of the Jin capital by the Mongols in 1215. In 1217, a new stage was reached as preparations were made for a general assault on the Khwarazmian Empire of western Turkistan and Iran in response to mistreatment of some envoys under Mongol protection. After initial moves to shore up positions in eastern Turkistan and in the north, the main Mongol advance began in mid-1219. The Khwarazmians, outflanked on several fronts, quickly collapsed, and their last ruler died on an island in the Caspian Sea in late 1220, seeking to avoid the relentless Mongols.

Freed by the death of their adversary, the Mongols now pressed on into Iran. From there, Jebe and Sabutai (1172–1245) mounted their famous reconnaissance in force around the Caspian Sea (1221–1223). They reunited with other Mongolian forces under Prince Joci, eldest son of Genghis Khan, in late 1223 or 1224.

The death of Genghis Khan in 1227, while subduing Xixia, interrupted the Mongol advance, but it was quickly resumed under his successor. Ögödei (r. 1229–1241) focused Mongol efforts in two directions. One was China, where the Jin had reestablished themselves along the Yellow River. The

other was toward the distant west, where Jebe and Sabutai had fought a battle against the Russians in 1223.

The Jin campaign began in 1231, after Ögödei had put his financial house in order. In a pattern typical of Mongolian warfare, separate Mongolian armies closed in on the Jin capital and forced the last Jin emperor to flee. He committed suicide in 1234, ending the dynasty. Although new hostilities developed with Jin's southern neighbor, Song China, that were to continue until that state was finally subdued in 1279, the major Mongol advance south was, for the time being at least, ended.

Ögödei's second major campaign began in 1235, with the convening of a council to discuss what was to be done about the west. A campaign was decided on, and armies began to move toward the Kipchak Steppe and Russia in 1236. They were under the titular command of Batu Khan, son of Joci, but Sabutai took overall strategic control. Initially, the Mongols attacked the Volga Bulgars and then the various Qipchaq tribes. Next was Russia: Ryazan was stormed on 21 December 1237, followed by Vladimir on 7 February 1238. After a pause for consolidation, the Mongols moved west again. Kiev fell on 6 December 1240, and from Kiev the Mongols advanced into eastern Europe.

Although the main Mongol target appears to have been Hungary, which had received some refugees fleeing the Mongols, the assault was a general one, with no less than five major lines of advance intended to prevent any single adversary from uniting against them. The following winter, the Mongols took the double cities of Buda and Pest, while raiding parties penetrated as far as the suburbs of Vienna. Only the death of Ögödei saved Europe from further invasion.

After Ögödei's death, there was an interregnum of nearly five years with few major endeavors. Although Ögödei's son Güyük was finally elected khan in 1246, he died two years later, and the interregnum continued. It was ended in 1251 by a veritable coup that brought a new Mongol house to the throne, that of Genghis Khan's youngest son, Tolui (c. 1190–1231/1232), in the form of Khan Möngke (r. 1251–1259), the last of the four khans to preside over a unified empire.

Under Möngke, the Mongolian advance resumed in two primary directions, against China through the southwest in an effort to outflank the Song and into Iran. The leader of the Iranian advance was Möngke's younger brother Hülē'ü (d. 1265), later founder of the Ilqan dynasty.

After Möngke, there were pretenders to the vacant throne of the khan, principally his brothers Kublai (1215–1294) and Arigh Böke (d. 1266), but none was able to impose himself on the other Mongols. Serious antagonisms between the various Mongol houses also prevented any reconciliation and a reuniting of empire.

Mongol-Song Wars (1267–1279)

The Mongols' crushing of the Song Dynasty. Kublai Khan waited for some years to consolidate his power before beginning his final assault on the surviving Chinese state, Southern Song (1126–1279). The campaign began in 1267, went on for 12 years, and was one of the most sophisticated, protracted, and hard-fought in history, not only because of the size of the armies involved, but also because of the rich pyrotechnical resources available to both sides and the sophistication of torsional artillery by that date.

The Mongols, to the greatest degree possible, sought to provoke a war of maneuver that the Song, always short of horses, were ill-equipped to counter. The Song, by contrast, relied upon enormous armies sited in fixed fortresses, knowing that the Mongols had either to assault these fortresses, advance through unsuitable terrain in central and south China, or attempt a naval envelopment, unlikely in the face of a technologically superior Song force that included some of the world's largest warships, also armed with pyrotechnical weapons.

The Mongols, well aware of Song plans, sought to counter them by using Chinese tactics against the Song fortresses, relying upon what was now a substantial siege train and large forces of Chinese foot soldiers. They were also aware of the need not just to advance but to defeat the Song morally, and thus set about destroying Song field armies piece by piece in a strategy reminiscent of Ulysses S. Grant's before Richmond in 1864–1865.

The lynchpins of the Song position in defending their capital at Hangzhou were the dual fortresses of Fancheng and Xiangyang, facing each other across the Han River, directly athwart the best line of Mongol advance. It took Kublai Khan's armies, led capably by Marshal Bayan (1237–1295), six years to reduce them, and it was late 1274 before Mongol

armies finally penetrated to the Yangtze River, but Song resistance continued, and it was another year and a half before the Song capital was reached. Only after a massive land and sea battle in March 1275 and a protracted last-ditch resistance did the inevitable become clear to the Song court, which surrendered to the Mongols, who entered Hangzhou peacefully on 10 February 1276.

Before the Mongols could complete their occupation, loyalists fled with two young princes and took to the seas, supported by a still-powerful Song fleet. What followed was a remarkable resistance movement paralleling that of 1126–1230, in which Southern Song had once saved itself in the face of an equally determined invasion by the Jurchen of the Jin Dynasty (1122–1234). Thanks to unexpected problems encountered by Kublai Khan due to an invasion of his Mongolian homeland by Central Asian competitors, the resistance movement, based first in the province of Fujian and then in Guangdong and Guangxi, was able to rally much of the southeast and interior central China to the Song.

In the end, the Mongols had to launch a coordinated land and sea campaign to overcome Song resistance. Advancing simultaneously into the various regions supporting resistance along several land routes, they also used increasingly capable naval forces, added to as the campaign went on, in part through Song commanders going over to the Mongols, to seize coastal points behind loyalist lines. By late 1278, loyalist efforts had become confined to the province of Guangdong and to surviving units of the Song fleet carrying the surviving Song prince (one had died).

Increasingly outmaneuvered and isolated, the Song navy prepared for a final battle in early 1279, at Yaishan, an island located not far from modern Macao. Comprised of perhaps 1,000 oceangoing junks plus smaller supporting ships, the Song fleet, giving up all mobility, was drawn up in a long rectangle, tied to each other, with sterns outward. Wooden palisades were built on top so that not only the sailors, but Song land forces then on board, could participate in the battle. To a large extent, this arrangement was more a reflection of Song desperation and low morale than it was of a sound tactical judgment. It also reflected a realistic appraisal of increasingly numerous and very well handled Mongol naval forces.

Because of limited supplies of food and wood, which was important for making arrows, the Song fleet was anchored close to land. Its position gave Li Heng, one of the Mongol commanders, the opportunity to seize positions there and mount catapults to bombard the Song with stones and incendiaries and possibly exploding bombs.

On 19 March 1279, the Mongols were ready. Their fleet was at most half the size of the Song fleet, and apparently some ships arrived too late to participate in the battle. Mongol ships were also smaller, but their size proved an advan-

tage in the waters in which the battle was fought, midway between two islands. Actually, despite the large number of ships involved, the ensuing battle was fought more as a land conflict than a naval battle.

The battle went on most of the day, with the Mongol fleet using its mobility to the utmost and the Song unable to respond since their ships were tied to one another. Later, the Mongols were able to penetrate the Song line and begin operating within the Chinese rectangle. As the afternoon tide came in, the Mongols used its force to charge in again and boarded several Song ships, braving the Greek fire.

By late afternoon, the Song rectangle was in disarray, and ships began to surrender. Some 800 ships are said to have been taken. Some 100,000 corpses were left floating in the water, among them that of the last Song prince. Not only had the Mongols won a notable victory, but they had bested the Song in their own element, on the water.

Monmouth (27–28 June 1778)

A drawn battle in the American Revolution that marked the last major clash in the northern states. Faced by imperial obligations in the expanding conflict, the British decided to withdraw from Philadelphia to New York City. British general Henry Clinton began to march the 70 miles to Sandy Hook, New Jersey, and the protection of the Royal Navy. At the same time, American commander George Washington wanted to demonstrate the new American army forged over the winter at Valley Forge. The battle would take place during the British retreat and American pursuit at Monmouth Court House.

For a month, it was clear the British were making preparations to quit Philadelphia. Washington intended to pursue and catch them. The retreat was difficult in very hot and humid weather. The Americans met the British on 27 June, but General Charles Lee hesitated to attack. The next day, the British began moving to Sandy Hook and, to cover the retreat, readied to attack the American vanguard; meanwhile, it seemed that Lee had ordered a retreat, which was counter-

manded heatedly by Washington when he arrived on the battlefield.

The British attacked three times. The newly trained American army held its ground, and as more troops arrived, it pushed the British back. By evening, both sides were exhausted from the fighting and from the weather. Washington rested his troops, and Clinton continued his withdrawal to Sandy Hook and the safety of the Royal Navy. Although the Americans may have missed an opportunity to destroy the British, the battle made clear that what had been a ragtag group of militia had become a trained army and that the war of attrition increasingly favored the American republic.

Mons Graupius, Battle of (September 83)

Agricola's great victory over the Caledonians. The culmination of Tacitus's eulogy for his father-in-law describes the Battle of Mons Graupius. There have been many attempts to locate the site, but Agricola's marching camps near Huntly, Speyside, are the only pointers.

Assembled under the leadership of Calgacus (Swordsmen), "the full force" of the Caledonians, 30,000 warriors, occupied Mons Graupius. The size of Agricola's army is not given, but Tacitus does say the enemy had "great superiority in numbers." Agricola certainly had 8,000 auxiliaries and probably 5,000 cavalry, together with vexillations from the four legions of Britain. The total force numbered some 20,000. Agricola placed the auxiliary infantry in the center, with their ranks spread out, and 3,000 cavalry on the wings. The vexillations were to the rear, drawn up in front of the Roman camp. The Caledonians were deployed in tiers on the gentle slope, with the vanguard on the level ground.

The battle began with Caledonian chariots racing across the ground between the two armies, only to be routed by the Roman cavalry. Next came a brisk exchange of missiles, followed by the Roman advance up the slope. The auxiliaries were initially successful and were soon joined by the cavalry.

The sheer number of Caledonians, combined with the roughness of the ground, soon halted the advance. Gradually, the auxiliaries began to be outflanked. As a counter, Agricola sent in his reserve cavalry. They stemmed the

flanking movement and fell on the rear of the war bands, which broke. The legionaries were never engaged.

Montcalm-Gozon, Louis-Joseph de, Marquis de Montcalm de Saint-Véran (1712–1759)

French general who, according to his admirers, almost prevented a British takeover of Canada during the Seven Years' War and, according to his detractors, was the primary cause of it. Before he was given command of French regular forces in North America during the Seven Years' War (1756–1763), Montcalm had served in the War of the Polish Succession (1733–1738) and the War of the Austrian Succession (1740–1748). He arrived in New France in May 1756 and soon found himself at odds with the colony's Canadian-born governor, Pierre de Rigaud, the Marquis de Vaudreuil. Despite their differences, they managed to take Fort Oswego on Lake Ontario from the English. The following year, Montcalm captured Fort William Henry on Lake George. Even after the British government had determined to win the war in North America and sent over thousands of regular troops for the purpose, Montcalm's successes continued. In July 1758, he prevented a large British force from taking Fort Carillon (Ticonderoga) on Lake Champlain.

Elsewhere, the tide of war began to turn. Facing what he considered overwhelming odds, Montcalm wanted to use his regulars to defend the St. Lawrence Valley against the inevitable British onslaught, whereas Vaudreuil persisted in his plans for a continued guerrilla war, using the Canadian militia. Although the government in Paris sided with Montcalm and gave him command of all forces in New France, ample opportunity remained for Vaudreuil to frustrate Montcalm's efforts.

Throughout the summer of 1759, Montcalm managed to thwart General James Wolfe's British regulars from getting below the walls of Quebec. When at dawn on 13 September, however, the British surprised him by scaling the escarpment just west of the fort, Montcalm precipitously gave battle. He lost and died of his battle wounds the day after. Quebec surrendered soon thereafter. The war in North America was not yet lost, but given France's reluctance to come to the aid of its colony, the fate of New France was sealed.

Montecuccoli, Raimondo, Prince (1609–1680)

Italian commander in the service of the Habsburg emperors Ferdinand III (r. 1637–1657) and Leopold I (r. 1658–1705). One of the foremost generals and military theorists of the seventeenth century, Montecuccoli fought in the Thirty Years' War (1618–1648), the Second Northern War (1655–1660), the Austro-Turk War (1660–1664), and the Dutch War

(1672–1678) against the numerous enemies of the house of Austria.

Montecuccoli entered military service as a child and progressed rapidly through the ranks. In 1664, he became supreme commander of the imperial armies and in 1668 president of the Supreme War Council. Four years earlier, he had thwarted Grand Vizier Fazil Ahmet Köprülü's plan to march against Vienna, for which he was acclaimed as "the savior of Christendom." The middle period of the Dutch War saw him pitted against worthy opponents: Louis XIV's great generals Henri de la Tour d'Auvergne, Vicomte de Turenne (1611–1675), and Louis II de Bourbon, fourth prince de Condé (1621–1686). Montecuccoli relinquished his command in 1675 and retired.

Whether in captivity or on peacetime duty and after his retirement, he studied the sciences, classical authors, and the art of war. His most influential works on that subject are *Del-l'arte militare* and *Memoire della guerra*. Though above all a soldier, Montecuccoli on occasion also served as the Habsburg Court's diplomatic emissary. A military reformer, an advocate of "methodical warfare," and a skilled practitioner

of the war of maneuver, Montecucoli was a master of seveneenth-century warfare. He is the author of the famous dictum: to wage war, three things are needed—money, money, and money.

Monterrey (20–24 September 1846)

Major U.S. Army victory in the Mexican-American War. At the opening of the Mexican-American War (1846–1848), American general Zachary Taylor advanced with an army of 3,080 regulars and 3,150 volunteers from the town of Matamoros on the south bank of the Rio Grande to Monterrey, defended by 7,000 regulars and 3,000 militia under the command of General Pedro de Ampudia. Taylor arrived on the northern outskirts of Monterrey on 19 September and found the approach guarded by a massive citadel known as the Black Fort. Despite the Mexican's numerical advantage, he decided to divide his army into two wings and dispatch one wing to the west of the city and the other to the east. On 20 September, the west wing, commanded by William J. Worth, swung to the west, avoiding the guns of the Black Fort. The following day, Worth led his men across the Saltillo road, forded the Santa Catarina River, turned east, and stormed Federacon Hill, capturing Fort Solidado on the eastern end of the promenade. On 21 September, the eastern wing of Taylor's army, commanded by Colonel John Garland, attacked the stoutly defended fortification, El Teneria, and took it but was unable to dislodge the Mexicans from another strategic position, the earthwork fort, El Diablo. Two days later, Worth's men recrossed the Santa Catarina River, stormed Independence Hill, and took the Bishop's Palace. Worth's men next advanced into the western end of the city. On the eastern side of Monterrey, the Mexicans abandoned El Diablo and retreated to the central plaza and the cathe-

dral. General Ampudia requested a truce on 24 September, but Taylor did not agree until the next day. Without consulting President James K. Polk, Taylor agreed to allow Ampudia and his men to evacuate the city. American losses were 120 killed and 368 wounded, and Mexican casualties totaled 367.

Montgomery, Bernard Law (1887–1976)

British field marshal best known for his victory at El Alamein, 1942. Born on 17 November 1887 in London, Montgomery entered Sandhurst in 1907. His military talent was recognized in World War I, and he became a general staff officer in January 1917. After attending the staff college at Camberley in 1920, he went on to hold staff and command posts in Ireland, England, Palestine, and India and served as an instructor at the staff colleges at Camberley and Quetta.

During the Battle of France (May–June 1940), Montgomery commanded the 3rd Division energetically, and during the final days of the Dunkirk evacuation, he briefly commanded II Corps. Back in England, he was promoted to lieutenant general, becoming commander of V Corps. After the dismissal of General Claude Auchinleck, Montgomery was selected to command the Eighth Army in North Africa, halting Erwin Rommel's forces at the Battle of Alam Halfa (31 August–2 September 1942) and then grinding down the Germans' tank strength at El Alamein, the battle that turned the tide in the desert. Finally, here was a British general who could win victories, albeit with massive superiority over the enemy, and "Monty" became a popular figure with the British masses.

After commanding the Eighth Army in Italy, Montgomery took over command of the Twenty-first Army Group, which played a central role in the western European campaign of 1944–1945. Montgomery favored a single thrust to defeat Germany but, like George Patton and Omar Nelson Bradley, was forced to bow to Dwight D. Eisenhower's broad front strategy.

Montgomery was an efficient general, albeit extremely cautious, possibly remembering horrific British casualties in World War I. But he could be tactless and arrogant, often expressing the need to teach the “naive” Americans battle truths. The latter, bearing in mind Singapore, Greece, Crete, and so on, were not about to be so “instructed.” Montgomery was chief of the Imperial General Staff from June 1946 to November 1948 and deputy supreme Allied commander in Europe from 1951 to 1958. He died at Islington Mill on 24 March 1976.

Montmorency, Anne, Duc de (1493–1567)

The constable Anne de Montmorency was a distinguished warrior during his long life, serving five French kings. During the first half of the sixteenth century, as the French monarchy struggled to gain control of France and its nobles, the Valois kings faced considerable opposition to their attempts to centralize royal authority. The death of Henry II in a jousting accident in 1559 began a long period of royal weakness that would not end until the Bourbon Henry of Navarre took the throne in 1589. The Duke of Montmorency, constable of France, had immense landholdings and a personal following of several hundred vassals. When the Huguenot Montmorency converted other major nobles of France to the new religion, they became a dangerous political threat to the Catholic Valois. Montmorency is a good example of how the French kings managed to control their nobles by offering them titles in exchange for loyalty.

Montmorency was made a marshal in 1522 by Francis I and was captured with Francis at Pavia in 1525. He helped negotiate Francis's release in 1526 and soon after the king's return received the governorship of Languedoc, which remained in his family until 1632. He was made constable in 1537. Montmorency's enemies at court and his policy of peace with Holy Roman Emperor Charles V finally led to his disgrace in 1541, which lasted until Francis's death in 1547.

Henry II restored him to a degree of favor, and in return he took Metz from the Spanish in 1552. Dismissed by his successor, Francis II, Montmorency was restored to office by

Catherine de Medici. He joined the Guises in the Wars of Religion, was captured at Dreux in 1562, and was killed in the siege of St. Denis, near Paris, in 1567.

Montrose, James Graham, Marquis of (1612–1650)

Leading royalist general of Scottish “Covenanter wars.” James Graham was born in 1612 of a prominent Lowlands noble family. His brief career played out against the complex religious, social, and political turmoil of the seventeenth-century British Isles.

The Scottish Reformation conveyed the Roman Catholic Church's considerable estate into the power of a nobility, many of whom saw profit in Protestantism. Siding first with the Covenanters against Charles I's attempts to impose episcopacy, the young Montrose soon rejected the rebellion's religious absolutism and political chicanery. In his struggle to win adherents to the Royalist cause, he advocated a monarchy strong enough to uphold fundamental liberties against factionalism and fanaticism.

Obtaining Charles's commission, Montrose raised loyalist Irish and highland Scots and during his “year of miracles” (1644–1645) virtually destroyed the Covenant's larger armies with superior tactics and leadership, until his dwindling force was surprised at Philiphaugh. Montrose escaped, while his men were slaughtered after surrendering. On the king's orders, he disbanded his remaining followers and went to Europe to raise support. After Charles I's execution, he landed in the Orkney Islands, but his small force of foreign regulars and local levies was routed at Carbisdale on 27 April 1650. Montrose was captured, hanged, and quartered without a trial in Edinburgh on 21 May.

Despite repeated victories against great odds, his mostly irregular clansmen, who fought fiercely under his personal leadership, could not hold territory or establish a lasting power base. Without effective and timely support by the Royalist leadership, his victories were as ephemeral as they

were remarkable, and his legacy was more one of personal example than military effectiveness.

Mormon War (1838–1839)

Major nineteenth-century American internal conflict. The first “Mormon War” began in northwestern Missouri in 1838, when members of the Church of Jesus Christ of Latter-Day Saints (LDS, or Mormons) battled units of the Missouri state militia. This conflict escalated into a massacre of Mormons at Haun’s Hill, Missouri, and prompted governor Lillburn Boggs to issue an October 1838 extermination order against Mormons, calling for their execution if they did not leave Missouri immediately.

The Mormons understandably fled to Hancock County, Illinois, where they founded Nauvoo, which became the biggest city in Illinois. Local residents lynched LDS founder Joseph Smith and his brother Hyrum in 1844, prompting a Mormon exodus to Mexico’s Alta California Province, beginning in 1847. The province was transferred to the United States following the Mexican-American War and was renamed Utah. Conflict quickly developed between LDS leaders and federal officials and grew into the second Mormon War, or the Utah War of 1857–1858.

Mortars

A muzzle-loaded weapon firing its bomb at a high angle to attack protected positions and trenches. The mortar has been known for many centuries and was most effective as a naval weapon for shore bombardment and as a land weapon for attacking the defenders behind walled defenses. It is the

artillery of the infantry, supporting them at all levels from section up to regiment, and infantry have always held a healthy respect for their opponent’s mortars.

Mortars were prevalent in the trench warfare of World War I, firing high-explosive (HE), smoke, and gas shells. Some were rifled and had separate firing mechanisms for safety. In World War II, infantry mortars ranged in caliber from 5 centimeters (cm) (used for smoke and illumination mainly) to 12 cm (firing mostly HE bombs).

Mortars nowadays have ranges up to 10 kilometers and more, and a good mortar team can have many bombs in the air at once, adding to the effect on target. Bombs are HE, smoke, illuminating, and antitank. Mortars are used mainly for indirect fire against targets unseen by the mortar teams.

The mortar is usually intended to be man-portable, although some heavier versions are vehicle-mounted. Every infantry battalion has mortar support, giving fire for attack and defense. Mortars are normally grouped in pairs and sets of pairs in battle and can operate in the front line from trenches because of their high angle of fire. Each mortar has a baseplate, a bipod (or similar support) with sights attached, and a barrel, and each segment is normally man-portable. Ammunition supply is paramount, for mortars can achieve a very high rate of fire; in battle, many infantrymen will carry one mortar bomb plus their own equipment and spare machine gun ammunition.

Mosby, John Singleton (1833–1916)

Confederate cavalry commander and raider and leader of Mosby’s Rangers. Mosby was born in Edgemont, Virginia, on 6 December 1833 and practiced law in Bristol, Virginia, after 1855. Enlisting in the Confederate cavalry early in the war, he saw action at First Bull Run and then, under James Ewell Brown “Jeb” Stuart, in the Peninsular campaign and at Second Bull Run and Antietam. Stuart ordered Mosby to create a free-moving cavalry unit in December 1862 to harass the enemy. This unit, Mosby’s Rangers, was so successful that the area it controlled between the Potomac and Rappahannock Rivers became known as “Mosby’s Confederacy.”

Raiding usually at night in small groups armed with Colt 44 pistols, Mosby’s men diverted thousands of federal combat troops to guard duty. Their most daring exploit was the

Soviet troops maneuver a piece of anti-tank artillery through the snow in the German attack on Moscow, 1941. (Hulton/Archive)

capture of Brigadier General Edwin Stoughton at Fairfax Court House, Virginia, on 8 March 1863. Their presence prevented flank attacks as Robert E. Lee marched from Chancellorsville to Gettysburg. By late 1863, several federal cavalry units had standing orders to pursue Mosby full-time. Mosby eluded them all, and on 18 November 1864 killed or wounded all but two of the handpicked 100 men that Philip Sheridan had sent after him.

Mosby surrendered only after word came of Joseph E. Johnston's surrender. He practiced law in Warrenton, Virginia, until his death on 30 May 1916.

Moscow (30 September 1941–April 1942)

First land defeat of the Wehrmacht during World War II, marking the failure of the German Barbarossa campaign to defeat the USSR in a single operation. Adolf Hitler's Directive 21, Operation BARBAROSSA, listed Moscow as a secondary objective after the capture of Leningrad and Kiev. On 19 July 1941, because of the nonuniform advance of the three German army groups (North, Center, and South), Directive 33 instructed Panzer Group 2 to be redeployed from Center to South to assist in the capture of Kiev (21 August–27 September). At Leningrad, the German assault became a siege.

The first phase of Operation TYPHOON, the attack on Moscow, was mounted from 30 September to 30 October.

The German force amounted to 74 German divisions, including 14 panzer divisions of Panzer Groups 2, 3, and 4. They were opposed by the Western, Briansk, and Reserve Fronts, a Soviet force totaling 1.25 million men.

The Germans launched pincer movements to encircle 81 Soviet divisions in two separate pockets, Viazma and Briansk. Eliminating these pockets stalled the German advance until the second phase of Typhoon (15 November–8 December), the attempt to capture Moscow via pincer attacks from Klin and Tula. The German logistical situation was weakened, many battle formations were severely under strength and unprepared for winter, and equipment was wearing out.

On 5 December, the Soviets launched a counterattack planned by Marshal Georgy Zhukov, employing a strategic reserve of 10 armies, mostly fresh Siberian troops. The Soviet industrial plants evacuated in July–November began supplying the improved weapons from their reconstructed locations in the Urals. The German were sent reeling back.

By 6 January 1942, the Germans had retreated beyond the Volkhov River along the Orel-Rzhev axis. The Soviets expanded their action into a counteroffensive, attempting to destroy Army Group Center and break through to Leningrad. They did not succeed, although Viazma and Rostov-on-Don were liberated by the time the Soviets halted their operations in March 1942.

Moscow, Retreat from (19–23 October 1812)

The abandonment of a city whose capture Napoleon had thought would provide supplies, shelter, and an armistice. On 13 September 1812, the Russian commander, Prince Mikhail Kutuzov, decided to abandon Moscow, retreating from Fili southeast along the Kolomna road. The population evacuated, with only 25,000 of Moscow's 250,000 inhabitants remaining. The city's mayor, Count Fyodor Rostopchin, arranged for arsonists to set the city ablaze. From 15 to 18 September, four-fifths of Moscow was destroyed.

Napoleon expected the Russian nobility to greet him and negotiate an armistice. His appeals (20 September, 4 October, 14 October) to Kutuzov and Czar Alexander I were rebuffed. Left with a ruined city, without stores, supplies, or winter quarters, Napoleon decided to abandon Moscow on 19 October. The French rearguard remained until 23 October.

Napoleon had brought with him 87,500 infantry, 14,750 cavalry, 533 guns, and an enormous baggage train consisting of 40,000 wagons, most of which was loot. The French faced Kutuzov and 100,000 infantry, 20,000 Cossacks, and 600 guns. Theoretically, Napoleon had provisions for 20 days and fodder for a week. The partisans menaced French logistics so that convoys from Smolensk had to be guarded by 1,500 men.

The French marched at 10 miles per day on the Kaluga road. Russian forces pursued and forced battle on 25 October at Maloyaroslavets. The ensuing battle cost the Russians 7,000 men and the French 4,000. Napoleon now decided to retreat to Smolensk via Borovsk-Mozhaisk-Gzhatsk-Viazma.

Kutuzov followed Napoleon on a parallel route, Medyn-Smolensk, permitting only limited engagements and allowing the fatigue and famine of withdrawal to destroy the French. At Viazma on 3 November, 20,000 cavalry and infantry attacked Louis Nicolas Davout's rearguard and separated it from the main French army, while Michel Ney was also under attack.

By 7 November, it was snowing heavily. Maintaining a march pace of 12 miles per day, 41,000 French reached Smolensk on 9–12 November. Napoleon learned that the Russian armies of the Baltic and Danube were converging to cut off his retreat at Borisov on the Berezina River. Napoleon's retreat from Moscow would soon become a rout.

Mount Badon, Battle of (c. 490–516)

Unknown location of a famous victory by the Britons over invading Anglo-Saxons. After 410, the last Roman legions were withdrawn, and Britain was left to fend for itself. Dur-

ing the rest of the century, large numbers of Germanic peoples (Angles, Saxons, Jutes, and others) poured into Britain and established foundations for their kingdoms. For several years after midcentury, the invaders gradually attempted to expand but met strong resistance from the Britons. During a lengthy period of warfare, both sides alternately experienced defeats and victories.

Gildas, a native Briton living just after that period of conflict, wrote a brief account of the Battle of Mount Badon (Mons Badonicus). The site of the three-day siege is unknown, and the date is uncertain. Gildas implied that the British leader was Ambrosius Aurelianus, the last Roman leader in Britain. According to Gildas, the victory provided 40 years of comparative peace. The ninth-century chronicler Nennius tells us that the Battle of Mount Badon was the twelfth and last battle fought by a British captain named Arthur. Nennius describes how Arthur fought the Saxons in the company of the British kings and how 960 Saxons were killed by Arthur at Mount Badon. Living a generation after Ambrosius and more chronologically correct, Arthur has been generally credited with the victory at Badon. Tradition and scholarship have also suggested that he utilized cavalry against Saxon foot soldiers.

Mount Badon was probably a hill-fort in southern England. Scholars have favored Badbury, Bath, and Solsbury as the location. The dating of the battle falls broadly between the years 490 and 516.

Mountbatten of Burma, Louis Francis Albert Victor Nicholas (1900–1979)

Very influential royally related British naval and land commander and final viceroy of India. Mountbatten joined the Royal Navy in 1913 and saw action aboard capital ships *Lion* and *Queen Elizabeth* during World War I. Continuing in the Royal Navy until World War II, Mountbatten was promoted to the rank of captain and given command of the Fifth Destroyer Flotilla in 1939. In May 1940, a German E-boat torpedoed Mountbatten's own destroyer, the *Kelly*, in the North Sea. Luftwaffe Ju-87 Stuka dive-bombers sank the *Kelly*, still under Mountbatten's command, at Crete on 23 May 1941.

Lord Louis Mountbatten (right) discusses the war with General George Patton at Camp Anfa, near Casablanca, 1943. (Library of Congress)

Noel Coward's play and film, *In Which We Serve*, was based on this action.

In the summer of 1941, Prime Minister Winston Churchill promoted Mountbatten to chief of combined operations; as such, he was responsible for preparing the Allied invasion of Europe. As part of the preparations, Mountbatten developed the organizational framework for Operation OVERLORD. He also planned the commando raids, among them the disastrous Dieppe raid of 19 August 1942, which were a series of probing missions designed to assess the requirements of the future invasion force, gauge the strength of German coastal defenses, and raise morale among citizens of German-occupied countries. Churchill appointed Mountbatten as supreme commander of the Allied forces in Southeast Asia in August 1943.

Mountbatten's experience in Asia during World War II and his somewhat left-wing politics (as much as would be feasible for one of such blue blood that he looked down on

the royal Windsors) made him the ideal choice of Britain's ruling Labour Party to succeed General Archibald Wavell as India's final viceroy on 22 March 1947. After India's independence in August 1947, he served as India's first governor general until 1948. Mountbatten became fourth sea lord in 1950, commander in chief of the Mediterranean Fleet in 1952, and first sea lord in 1955. He served as chief of the United Kingdom Defense Staff and chairman of the Chiefs of Staff Committee from 1959 to 1965. The Irish Republican Army murdered Mountbatten and several members of his family by a remotely detonated bomb on his boat in Donegal Bay, Ireland, on 27 August 1979.

Mountjoy, Charles Blount, Lord (1562–1606)

Most successful Elizabethan military commander in Ireland. Charles Blount, Lord Mountjoy, repulsed a Spanish intervention at Kinsale, successfully ending nine years of war that followed the rebellion of Hugh O'Neill, the Earl of Tyrone.

Mountjoy's military career began in 1586, when he joined the earl of Leicester's forces fighting the Spanish in the Netherlands. He distinguished himself at the Battle of Zutphen in 1587 and was subsequently knighted. In the next few years, he learned the art of war by serving with Sir John Norreys in Brittany but was forbidden further field service by Elizabeth I, when he succeeded his brother as the Eighth Baron Mountjoy in 1594. Despite the queen's admonition to learn about war from books, Mountjoy took part in the Cadiz expedition under the earl of Essex. His first substantial command came in 1600, when he was appointed lord deputy of Ireland in place of Essex, who had been disgraced by embarrassing defeats at the hands of O'Neill. Though physically weak and considered a hypochondriac, Mountjoy displayed an intuitive grasp of the central problem of Irish warfare, supply. He launched a policy of campaigning in the winter, which prevented the Irish from moving their cattle,

and ordered the destruction of agricultural areas that supported the rebel forces.

His first offensive against O'Neill foundered against Irish fortifications in the indecisive Battle of Moyry Pass in October 1600, but he won a decisive victory at Kinsale in late 1601. In the later campaign, Mountjoy's brilliance as a logistician was confirmed when he managed to deploy and supply a large army with siege equipment in an isolated part of Ireland. He subsequently negotiated O'Neill's submission in early 1603. His health broken by extended campaigning in the Irish climate, Mountjoy died of illness in 1606.

Mozambican War of Independence (1963–1974)

The Portuguese occupation of Mozambique was a particularly grim affair, relying heavily on slave and forced labor. Resistance to colonial rule ranged from work stoppages to outright armed resistance. All of these factors coalesced in 1962 with the formation of the Front for the Liberation of Mozambique, or Frelimo, which comprised exiled political groups, radical intellectuals, and underground organizations that had begun to operate within the country.

To understand the situation in Mozambique, one has to understand that with numerous challenges facing it, the Portuguese government of Antonio Salazar tied its prestige to the fate of its African colonies. Much the same way that France viewed Algeria as an integral part of the republic, Portugal had declared its African holdings to be "overseas provinces."

Portugal had been quite effective in keeping a tight grip on potential resistance movements in Mozambique. During the Angolan Luanda insurrection of 1961, there were, surprisingly, no similar rural uprisings in Mozambique. Much of this lack of opposition was due to the activities of the state security police, which had been systematically detaining people known to be hostile to the regime. As a result, the most effective resistance movement flourished outside the country. In 1962, Frelimo was founded in Tanzania, led by the charismatic Eduardo Mondlane, an academic and offi-

cial at the United Nations in New York. On 25 September 1964, Frelimo launched an attack on the Portuguese in northern Mozambique, at the same time issuing a call to arms.

The Portuguese set the tone of the conflict by rounding up and detaining some 1,500 Frelimo activists in the cities, putting to an end any hope for an Algerian-style protracted urban conflict. Frelimo southern and central fronts having virtually collapsed under the weight of the Portuguese attacks, the focus turned to the north, where the Portuguese forces were minimal. However, the successes of late 1965 were soon reversed; in 1966 the Portuguese counterattacked along Lake Malawi. With the policy of grouping the population into camps, some 250,000 people were resettled in 150 villages by the end of the year, removing much of Frelimo's support base.

By 1968, the war had focused on the ambitious Portuguese civil works project, the Cabora Bassa dam on the Zambezi River. Even though Frelimo's attacks on the fortified construction sites were unsuccessful, the protection of the dam absorbed a great deal of effort and rendered the Portuguese forces static, allowing Frelimo for the first time to outflank the defenses and begin operations south of the Zambezi River.

After the death of Salazar and Marcello Caetano's succession in 1968, Portugal launched a counteroffensive. The military planned a massive sweep in the north of Mozambique in which reconnaissance and airborne assault would search out and destroy Frelimo. The group was taken by surprise by the scale of the Portuguese operation, but rather than try to hold on to the north, Frelimo withdrew troops and transferred them, through Malawi, to Tete in the center. Portugal's grand offensive succeeded, but Caetano was not pleased with the cost of the campaign; Lisbon halted further offenses.

The reopening of the Tete front proved to be a breakthrough for Frelimo. It moved units south of the Zambezi River in 1971, and in July 1972, for the first time, guerrilla activity threatened an important section of the settler population. These campaigns were psychologically successful and in the period 1972–1974 contributed to a rapid crumbling of the colonial structure.

In Portugal, there was a growing sense that an African empire was passé in the twentieth century. With the Portuguese military coup of 1974, the new government sought immediately to end the hostilities and remove all Portuguese military units from the country. On 7 September, the Lusaka Accord was signed, allowing for the rapid and unequivocal transfer of power to Frelimo, and on 28 September 1974, the granting of Mozambique independence was signed, making it an independent country with Frelimo in command.

Muhammad Ahmad (al-Mahdi, Muhammad Ahmad Ibn As-Sayyid' Abd Allah) (1844–1885)

Muslim holy man from Dongola in the Sudan who declared himself the "Mahdi," or "Guided One," and raised the banner of revolt against the excesses of the Anglo-Egyptian administration in the Sudan.

Born 12 August 1814, Muhammad Ahmad was deeply religious from childhood. At age 20, he was already a sheikh with a reputation for sanctity. His call for a jihad in 1881 to restore Islam to its pristine purity received enthusiastic response and attracted both Muslims and non-Muslims alike. The violence that accompanied the conquest of the Sudan engendered deep-seated hatred for the Turco-Egyptians. Charles Gordon's efforts to suppress the slave trade in the 1870s were bitterly resented by Muslim traders. The cattle-owning nomads of Kordofan smarted under heavy taxation, and pious Muslims were scandalized by the corruption and lack of Islamic observance by Turkish and Egyptian officials. The increasing use of European officials in the administration accentuated the loss of independence and emphasized the alien quality of the Egyptian presence.

Muhammad Ahmad knit together these disparate groups in the Sudan through his piety and stirring oratory. To the people of the Nile banks, his message was oppression of the tax collector; around the plains of Gedir, it was defilement of an ancient faith by cowardly Turks and renegade foreigners ousting the rightful owners of the land.

Ahmad and his closest advisers acted as a high command, disseminating propaganda and articulating the discontent in the Sudan. From 1881 through 1885, the bravery and fervor of the Mahdist forces won impressive victories over the better-armed Egyptian armies sent against them. In 1885, they took Khartoum, killing Gordon and the remnants of the Egyptian soldiers and officials in the city. (Gordon's death was taken as a personal blow by Queen Victoria.) Five months later, Muhammad Ahmad died, leaving the organization of the Mahdist state to his closest disciple, Abdallahi.

Muhammad Ali (c. 1770–1849)

Ottoman *wali* (governor) regarded as the founder of modern Egypt. Born in Kavala, Greece, around 1770, Muhammad Ali came from a family of Albanian soldiers long in Ottoman service. In 1801, he sailed to Alexandria with troops sent to repel Napoleon's invasion of Egypt. Exploiting ethnic and political rivalries, he obtained military command, deposed the *wali* Kurshid Pasha, and grudgingly was confirmed as *wali* of Egypt by the Ottomans in 1805. He consolidated his rule by massacring the Mamluks, exiling dissident religious leaders, and revoking tax-farming privileges for the Egyptian elite.

Through conquest and modernizing reforms, Muhammad Ali tried to establish Egypt as the foremost power in the eastern Mediterranean. At the Ottoman government's request, his armies invaded the Hijaz in 1811, quelling the Wahhabi revolt there by 1818. From 1820 to 1822, Muhammad Ali conquered the northern Sudanese territories of Nubia, Sennar, and Kordofan, using the captives to construct a new army trained by a French officer, marking a developing relationship between Egypt and France. Native Egyptians replaced the Sudanese slaves, who rapidly died from exhaustion and disease. Led by his son Ibrahim Pasha, they fought Greek rebels in Crete, Cyprus, and the Morea throughout the 1820s, capturing Athens in 1827. But the destruction of the Ottoman–Egyptian fleet obliged their withdrawal the following year.

Unhappy at not receiving compensation for his services in Greece, Muhammad Ali attacked the Ottoman Empire itself three years later, capturing Palestine and Syria by 1833. The considerably weakened Ottoman state caused Britain, which feared disruption of communications with India and encroaching Russian and French interests in the Near East, to demand his withdrawal. Ottoman forces unsuccessfully counterattacked in 1839. Subsequently, British forces occupied Beirut and shelled Acre, compelling the Egyptians to withdraw and negotiate. With the London Convention of 1841, Muhammad Ali exchanged his Levantine acquisitions for Ottoman recognition of Egypt as an autonomous province ruled by a hereditary *wali*, namely himself. Increasingly mentally incompetent, Muhammad Ali abdicated in 1847

and died in Alexandria on 2 August 1849. At least nominally, his dynasty governed Egypt until it was toppled by Gamal Abd al-Nasir in 1952.

Muhammad of Ghur, Conquests of (1175–1206)

The Ghurid conqueror of northern India, who was among the founders of Muslim rule in India. Muhammad of Ghur, also called Muhammad Ghuri or Shihab-ud-din Muhammad Ghuri, followed his brother, Ghiyas-ud-Din, who had acquired power east of Herat in the region of Ghur (present-day Afghanistan) in 1162. Among his early military expeditions, Muhammad Ghuri assisted his brother against the Oguz Turkmen nomads to regain control of the city of Ghazna (Ghazni) in 1173 and against the ruler of Khwaraz in gaining the former Seljuq holdings in the region of Khorasan. In 1204, two years after Ghiyas-ud-Din's death, Muhammad Ghuri made yet another successful attack on the Khwaraz capital of Gurganj (in present-day Uzbekistan). His victories in Hindustan were also significant, including the capture of Uch and Multan in 1175 and the annexation of the Ghaznavid principality of Lahore in 1186. In addition, he answered his rare defeat by the coalition of Rajput kings under Prithviraj III at Taraori in 1191 with a resounding victory in the following year at the same site and another at Chandawar in 1194. These two battles are considered most decisive in the course of Muslim history, and as a result, the Ghurid forces occupied Delhi in 1192–1193. Over the next two decades, the entire region of northern India also fell under their control. Muhammad Ghuri left much of the control of his territories in north India with his lieutenant Qutb-ud-Din Aybak and his armies. Aybak is credited with building some of the most important Muslim monuments in northern India, which emulate aspects of Ghaznavid and Ghurid architecture in several ways. In addition, the Ghurid soldiers retained their political connections with Ghur until Delhi was established as the permanent capital under Iltutmish (r. 1211–1236).

Muhlberg, Battle of (24 April 1547)

The only battle of the Schmalkaldic War. In the spring of 1547, Emperor Charles V turned against the Elector John Frederick of Saxony, one of the main leaders of the Schmalkaldic League. By the fall of 1546, Charles had expelled the league's troops from upper Germany, almost without a fight.

Coming from Bohemia on 11 April, Charles invaded the electorate Saxony with 17,000 men on foot and 6,300 horsemen. He marched toward the encampment of the Elector John Frederick near Meissen. Charles easily defeated the elector's troops, forcing them into disorganized retreat. John Frederick was captured by the cavalry when he tried to escape to the citadel of Wurzburg. This clash marked the end of the Battle of Muhlberg and the Schmalkaldic War itself.

The myth of the Battle of Muhlberg glorifies Charles V as the invincible military leader in the medieval sense of the ideal of the knight. This atavistic attitude stands in stark contrast to the actual modern techniques of war used by the emperor.

Mukden, Battle of (21 February–10 March 1905)

Final land battle of the Russo-Japanese War. In the winter of 1905, the land war between Russia and Japan moved from the siege at Port Arthur and fighting around Liaoyang to the contest for Mukden in central Manchuria.

The Battle of Mukden took place between 21 February and 10 March 1905. Until the massive battles of World War I, this clash involved the greatest number of land troops of any

battle in history. Japanese field marshal Oyama Iwao commanded a force of more than 200,000 soldiers and nearly 1,000 artillery pieces, and Russian general Aleksey Kuropatkin commanded nearly 300,000 men and more than 1,200 artillery pieces.

Oyama realized the need to attack before Russian reinforcements arrived from Europe. Although outnumbered and outgunned, he attacked first along a 40-mile front, beginning in late February. He wanted to turn the flanks of the Russian defense and thereby create a classic envelopment. Massed infantry attacks soon bent the Russian right so that it was facing as much west as south. Kuropatkin shifted reserves to restore his right wing, and Oyama threw more troops in the effort to continue to bend the Russian right flank.

By early March, the Japanese had pushed the Russian right so far that it seemed they might be able to threaten the Russian line of communication north to Harbin and then eventually across the Trans-Siberian Railroad. Kuropatkin withdrew in good order and very carefully, until he established a new defensive position at Harbin, where he was replaced in command.

Although more than 100,000 Russian troops had been killed or seriously wounded and much equipment had been abandoned in the retreat from Mukden, the Japanese had also suffered proportionate losses, and the Russians could more easily replace men and equipment. There would be no more major land campaigns.

Murat, Joachim, Grand Duke of Cleves-Berg, King of Naples (1767–1815)

French cavalry commander during the French Revolutionary Wars and the Napoleonic Wars. Joachim Murat was born 25 March 1767 in La Bastide-Fortunide in Gascony. He enlisted in the French cavalry in 1787 as an ordinary trooper and rose quickly after the onset of war, reaching the rank of *chef d'escadron* in May 1793.

In October 1793, Murat provided critical support to Napoleon Bonaparte during the suppression of the Parisian mob on 13 Vendémiaire—Murat secured the cannon from which the famous "whiff of grapeshot" was fired. Bonaparte,

placed in command of the Army of Italy, secured the promotion of Murat to *general de brigade* in 1793. Murat commanded the French cavalry in the first Italian campaign and accompanied Bonaparte to Egypt, where he again served as cavalry commander.

Accompanying Bonaparte on his return to France from Egypt, Murat again proved invaluable to Bonaparte. During the coup of 18 Brumaire, Murat led troops into the legislative chamber to remove protesting legislators. The creation of the Consular Guard led to his appointment to that unit, the forerunner of the Imperial Guard. Murat married one of Bonaparte's sisters, Caroline, in December 1800.

Murat commanded the cavalry of the Army of Italy during the second Italian campaign. After a brief hiatus, he was sent to command operations in southern Italy in 1801. Upon the creation of the empire, he was made both marshal and grand admiral of France.

From 1805 to 1812, Murat usually served as commander of the French cavalry, often, as in the aftermath of Jena, with spectacular results. He proved much less adept at the command of mixed formations or in independent roles. Thus, his mishandling of the occupation of Spain led to a revolt by the residents of Madrid that was suppressed only with great difficulty. Similarly, his attempt in 1809 to invade Sicily ended in failure and the capture of most of the troops landed there.

Murat was created grand duke of Cleves-Berg in March 1806. In 1808, he was made king of Naples by the Emperor Napoleon, in place of Joseph Bonaparte, who became king of Spain. In Naples, Murat continued the reform work begun by Bonaparte and attempted to fan public sentiments for the unification of Italy.

After the failure of the Russian campaign, Murat returned to Naples and began reorganizing the Neapolitan army. Although he rejoined Napoleon for the 1813 campaign in Germany and commanded the imperial cavalry at Dresden and Leipzig, he simultaneously negotiated treaties with Austria and Britain allowing him to withdraw from the war and retain his throne. His volte-face completed, he spent the 1814 campaign moving very slowly against French positions in northern Italy.

During the Hundred Days, he attempted to switch sides again, but the Neapolitan army was decisively defeated by the Austrians at Tolentino on 2 May 1815. The Neapolitan Bourbons then seized the opportunity to return to their mainland territory. Murat attempted to incite a revolution against them. This failed, and he was captured and executed at Pizzo on 13 October 1815.

As a general, he introduced few if any innovations. He is instead better remembered for flamboyance, treachery, and his failed early attempt to unify the Italian peninsula.

Murfreesboro

(31 December 1862–2 January 1863)

Important Union victory in the American Civil War, ending Confederate hopes of invading the North through Tennessee. At dawn on 31 December 1862, near Widow Smith's house across Stones River from Murfreesboro, Tennessee, Braxton Bragg threw a massive surprise attack from his left into the right flank of William S. Rosecrans. Confederate infantry under William Hardee immediately gained about 3 miles' worth of territory and threatened to push the Yankees into the river. Confederate cavalry under Joseph Wheeler and Nathan Bedford Forrest harassed the Union left. If not for Philip Sheridan's valiant defense, Rosecrans might have been routed. George H. Thomas managed to regroup around William B. Hazen's artillery, turn the line, create a salient around Rosecrans's headquarters, and hold the center so that by the end of the day the battle lines were perpendicular to the river on its western shore.

Little action occurred on 1 January, but on 2 January, Bragg made a gigantic tactical error by ordering John C. Breckinridge to charge across an open field on the eastern shore into a superior Union position. Union artillery on the western shore had a clear shot into the Rebel left. Union reinforcements swarming across the river forced Breckinridge to retreat, and the battle was over. Total casualties were 12,000 Confederate and 13,000 Union. That Bragg squandered the decisive advantage he had on the first day of this engagement went far toward undermining confidence in his leadership throughout the South.

Musa ibn Nusayr (c. 640–714)

Conqueror of North Africa and Spain during the period of Islamic expansion. Born in 640, Musa spent part of his early career fleeing from the authorities for suspected embezzlement in Basra. Musa, however, evaded the troops of Caliph 'Abd al-Malik and took refuge with the caliph's brother, 'Abd al-Aziz, the governor of Egypt. 'Abd al-Aziz helped extricate Musa from his legal difficulties by paying half of his 10,000-dinar fine. In addition, he allowed Musa to return to Egypt with him. In 698 or 699, 'Abd al-Aziz granted Musa the governorship of Ifikiya, or North Africa. It was at this point that Musa's military career began.

Because Muslim control of North Africa was incomplete, Musa led expeditions against Zaghwan and Sadjuma as well as defeating numerous tribes. After the new caliph, al-Walid, confirmed him in his position of governor, Musa continued his conquests by pursuing the Berber tribes, who had fled west into modern Morocco. His armies pushed as far west as Tangiers. He left his freedman Tariq ibn Ziyad there as his deputy and returned victorious to Egypt.

Tariq took advantage of his position, led an army across the straits, and invaded Spain in 710–711. Musa soon learned of Tariq's success in Spain and followed in 712 with another army, partially out of jealousy. Rather than following the army of Tariq, Musa and his son 'Abd al-'Aziz bin Musa took a different route, capturing several cities, including Seville, before joining Tariq en route to Toledo. Musa reprimanded Tariq for his unauthorized invasion and then resumed his campaign and conquered northern Spain.

In 713 or 714, Musa ibn Nusayr departed from Spain with a large amount of booty. He left his son 'Abd al-Aziz in Spain to rule as governor. Musa died in 714 after a long, successful career.

Music, Military

Music played in accompaniment to military activities, usually for regulating the pace of drills and marches, signaling, intimidating enemies, and enhancing morale. Even though the recognizable genre of military marches traditionally played on a combination of wind and percussion instruments is only about five centuries old, martial music possesses a far greater history that reaches deep into antiquity. Ancient Egyptian depictions of musicians playing horns and drums during regal processions and parades of soldiers attest to this fact, as do several references to music in classical military texts by Aelian and Vegetius. However, the history of this music prior to the European Renaissance largely is lost and its reconstruction conjectural at best. The standard duty accorded to musicians in most premodern cultures was the relaying of signals, usually to initiate or disengage from combat or to warn of enemy movements. Ancient and medieval horns created a piercing sound audible above the din of battle, providing somewhat effective battlefield communications for centuries. Roman commanders relied on legionary trumpeters to coordinate movements among multiple units. Medieval European chronicles and ballads frequently refer to the use of simple wind instruments as signals during combat. As for other applications of ancient and medieval military musicians, little is known for certain. Greek hoplites trained and marched to flute music. Medieval kings and rulers frequently employed musicians for processions and ceremonies.

In contrast to the simple horn-based music of premodern Europe, Islamic armies integrated Central Asian percussion traditions with a variety of horns that were the basis for many modern wind instruments, notably fifes and oboes. Crusaders encountered ensembles of Arab horn and drum players accompanying the standard-bearers of their armies; according to medieval texts, as long as the musicians played, the soldiers fought, confident that their standards were safe. As the Ottoman Empire rose to preeminence in the Islamic world, it continued and elaborated on these musical traditions, using military bands for signals, intimidation, and ceremonies. As it expanded into the Balkans and eastern Europe, it also transmitted these ideas and instruments to its Christian adversaries.

The evolution of modern Western military music coincided with other significant transformations in the manner

in which European armies trained and fought. The initial trajectory of this development was the application of field music to drill and march. In the early 1500s, soldiers playing drums, fifes, and oboes began to appear in western Europe, first among the ranks of Swiss mercenaries and then within the forces of their French employers. In 1543, a French royal ordinance delegated two drummers and two fifers for each company of 1,000 infantry. The traditional arrangement of assigning drummers, fifers, and oboists to infantry and trumpeters and buglers to cavalry and artillery emerged by midcentury. As regular military drill grew in importance, especially after the reforms of Maurice of Nassau, fife and drum music acquired a heightened significance. Drums were particularly necessary for keeping soldiers marching in step, and fifes, oboes, and bagpipes provided some aesthetic diversion and boosted the soldiers' morale. By the mid-1700s, every European military establishment considered these musicians as essential components of their armies, employing them for signal, drill, and camp calls. The subsequent process of standardization is visible in the creation of fife, trumpet, and drum major ranks in the British army and the regulation of their training, pay, and uniforms by the 1740s; in this same period, young boys also began to be used as field musicians. Fifers and drummers retained their importance until the twentieth century, by which time military bands replaced fife and drum corps and field music lost importance in the face of changing tactics and technologies.

The other standard component of military music, the formal military band, also traces its origins to early modern Europe. Descendants of medieval town bands, early military bands of oboes (known as *hautbois* or *hoboys*) appeared among a few units during the seventeenth century, although they held a tenuous, quasi-legal existence sustained only by the largesse of a regiment's officers or royal patronage; notable examples include the oboe bands of the French dragoons acquired during the reign of Louis XIV and the wind band created for the British Horse Grenadier Guard in 1678. In the early 1720s, the Ottoman government sent full military bands to Poland and Russia as diplomatic gifts, sparking a craze for "Janissary" music throughout Europe. The fad quickly spread, first to Austria and Prussia and then on to France and Britain, fulfilled by imported Ottoman bands or imitation "Janissary" musicians, usually Africans attired in exotic "Turkish" or "Moorish" uniforms. The instruments of these bands—kettledrums, side and bass drums, oboes, bassoons, trombones, cymbals—prefigured the brass, woodwind, and percussion composition of future military bands. Official acknowledgment and regulation of bands began in the mid-eighteenth century, as seen in the British government's recognition of preexisting bands for the Royal

Artillery, Life and Horse Guards, Foot Guards, and other elite units and allowance for the creation of regular regimental bands in the 1760s. The ideological services that military bands provided, especially in terms of summoning patriotic and nationalist enthusiasm during times of crisis and for recruiting drives, was recognized during the French Revolution, which witnessed the massing of gigantic bands for republican fêtes and the formation in 1792 of the earliest school for military music, the *École Gratuite de la Garde Nationale Parisienne*.

Formalization proceeded in the nineteenth century, as military bands achieved their greatest prominence. The British army began to curtail the long-standing practice of using Africans, civilians, and foreigners as bandmen during the Napoleonic Wars. In 1857, the Royal Military School of Music was formed after a particularly bad performance given at a grand review during the Crimean War. The United States followed the European model, forming its Marine Band in 1798 and authorizing regular army bands in 1834, although American military bands remained a disorganized, local affair until after the Civil War; the Army Music School was not created until 1911. In the 1820s, military bands in Prussia and Austria standardized their instruments, training, and personnel, but the most significant changes occurred in France with the reforms of Adolphe Sax, who standardized the instrumentation of the Imperial Guard in 1854, establishing the pattern for most continental European bands. Military band music reached its pinnacle in the highly militarized and competitive atmosphere of the decades leading up to World War I, as international band competitions became both a very popular means for expressing nationalist sentiment and a means for voicing diplomatic dissent. Throughout the late nineteenth and twentieth centuries, military bands of the European and American style spread through the rest of the world, either as an inheritance of colonial rule in India and most of Africa or as part of modernizing military reforms and growing nationalism, as occurred in Japan. Military band music also affected "civilian" classical music, influencing the work of such notable composers as Ludwig van Beethoven and Hector Berlioz. Some works, such as the "Colonel Bogey March," and certain bandleaders, such as John Philip Sousa, have enjoyed enormous popularity in their native lands to this day. And eminent army bands, such as the Band of the Coldstream Guards in Great Britain and the Marine Corps Band in the United States, give performances internationally of concert hall quality. Even though military bands seem to have little place on the modern battlefield, these units nonetheless have now established themselves as a permanent and valued part of most of the world's militaries.

Muslim Civil War (656–661)

Civil war that nearly destroyed new Arab empire. When Uthman ibn Affan became caliph in 644, factions were starting to emerge within the Arab conquest state. Uthman's tribe, the Umayyads, numerous, talented, and adept at both trade and arms, had once been the Prophet Muhammad's fiercest enemies. Other Meccans and Medinans of the Quraysh confederation, earlier converts to Islam, resented the Umayyad upstarts intensely. Third came the Shiites, devotees of Ali ibn Abu Talib, son-in-law of the Prophet. Convinced that Muhammad had appointed Ali his successor, the Shiites felt that Uthman and the two previous caliphs had thwarted God's prophet by cheating Ali of his birthright. Finally, throughout the army camps of Syria, Iraq, and Egypt, Arabs quarreled over privileges accorded some tribes and discrimination shown toward others.

In 656, disgruntled soldiers from Egypt surrounded Uthman's palace and, when he resisted, murdered him. The dissidents then persuaded the Shiites and many Quraysh to raise Ali to the caliphate, but az-Zubayr, a prestigious and pious Muslim, rejected Ali as tainted by the regicide. Seeking allies, az-Zubayr's party set off for Iraq, but the new caliph chased them down and defeated them at the Battle of the Camel. The battle killed az-Zubayr and many of the Prophet's closest friends, further tarnishing Ali's image.

A more serious threat arose from Muawiyah, governor of Syria and Umayyad champion. In 657, Ali left Iraq and marched against Syria. His army encountered Muawiyah at Siffin. Halfway through the Battle of Siffin, Umayyad forces called for a truce and a negotiated settlement based on the Quran. To end the shedding of Muslim blood by Muslims, Ali agreed. Muawiyah demanded the execution of Uthman's killers and the retention of all Umayyad officeholders and secretly courted Ali's wavering allies in Iraq. Ali insisted that his power derived from his religious reputation and lineage, not from the mutineers, and he refused to punish them.

Infuriated that Ali might compromise with Umayyad "apostates," several thousand soldiers denounced and deserted the caliph. Labeled "Kharijites," these men declared jihad against Ali and Muawiyah alike with their slogan, "No

judgment but God's." After several incidents, Ali wiped out a Kharijite force at the Battle of Nahrawan in July 658. As the balance of power shifted his way, Muawiyah aggressively cajoled, bribed, and strong-armed others into Umayyad ranks. In January 661, Kharijite assassins killed Ali at the Kufa mosque in Iraq.

With Ali dead, Muawiyah moved quickly. He browbeat Hassan, Ali's son and heir, into paying homage to the Umayyad house. He suppressed resistance in Iraq and made himself caliph. The Muslim civil war was now over. The Umayyad century had begun, and so had the alienation of Shiite Muslims from the rest of the Islamic community.

Muslim Civil War (861–870)

A conflict that marked the end of a unified Muslim empire under the Abbasid caliph. The Muslim world would never again be united under a single ruler or ethnicity.

Conflict developed in two major areas. The first involved a dispute over control of the highest office in Islam, that of the caliph, which fell under the control of Turkish military leaders. The dispute drained the treasury and left the empire open to rebellions from Kharijites (secessionists opposed to both the main Sunni and Shiites), slaves, and royal pretenders, to mention a few. A second area of conflict found expression in the infamous Zanj Rebellion of black slaves in Mesopotamia.

Turkish nomads from the steppes of Asia had been streaming into the eastern Islamic world of southwest Asia since the ninth century. To control them, the Turks converted them to Islam and integrated into the Muslim military structure as superb archery horsemen, generals, and royal guards. The Turks used these exalted soldiers to control the office of caliph. From 861 to 870, the Turks dethroned or killed no less than four caliphs who did not adhere to Turkish demands.

The loss of Abbasid Arabic control over the caliphate encouraged factional and ethnic rebellions in the empire. Rebellions broke out in Persia, Transoxiana, Mesopotamia, Egypt, and in Arabia itself. The worst was the 15-year Zanj Rebellion by black slaves in Mesopotamia who mined salt. Ali ibn-Muhammad, a Kharijite Persian, led the slave rebel-

lion, which built two base cities in Mesopotamia. The rebellion forces consistently defeated caliphate forces sent against them because the caliphate no longer controlled the Turks and their generals, who made up the bulk of the caliphate army. As a result, the caliphate had to send African soldiers, who often deserted the caliphate armies for the rebellion. Now unstoppable, the forces of Ali ibn-Muhammad sacked and destroyed the wealthy city of Basra and killed over 300,000 people in the region.

Finally, after draining the caliphate treasury, the Turks lost interest in control of the caliph. Their disinterest allowed Muslim forces to besiege the two African slave cities in Mesopotamia, capturing the last in 883, but the unified caliphate had been destroyed for ever.

Muslim Conquests (624–982)

Wars that transformed a religion into an empire. Islam's enemies, particularly the Byzantine Empire and Persia, which had been engaged in a protracted war, were weak and exhausted and thus ripe for conquest. Islam also brought a new vitality into the loosely organized regions in North Africa, the Middle East, and Spain, although one that built upon late Roman achievements in most cases.

After a few preliminary probes of Byzantine defenses, including victories at al-Aqaba (633) and Ajnadayn (634), the first battle in which Arabic invaders fought as an army rather than a band of raiders, Arabic armies under Khalid ibn al-Walid, and others, invaded Syria, taking Damascus in 636. Although temporarily forced back by a Byzantine counterattack, the Byzantine disaster at Yarmuk that same year signaled the permanent loss of Syria and adjacent areas. Jerusalem, left behind and isolated, like many Byzantine fortified cities, surrendered in 638, not to be recovered by Christians until the First Crusade (1096–1099).

Moving in several directions simultaneously, the Arabs, who had already taken much of Iraq in their initial raids, began a serious invasion of Persia proper in 636. In 637, they decisively defeated the Sassanids in the Battle of Qadisiya, seized the capital of Ctesiphon, and forced the last Sassanian emperor to flee to Central Asia. Most of Iran was under their control by 649, although the conquest of Khorasan was completed only in 654. From Khorasan and eastern Iran, Muslim

armies slowly advanced into what is now western Turkistan and then India, laying the foundation of modern-day Pakistan and Bangladesh.

Other Arabic forces moved into Byzantine Egypt, largely captured by 643, although Alexandria, isolated from its hinterland, was able to hold out a few years longer. Even before the final subjugation of Egypt, Arab armies began moving down the African coast, where Tripoli was captured in 643. Armenia was invaded in 642. In 650, Cyprus was invaded for the first time, and again, along with Crete and Rhodes, in 654.

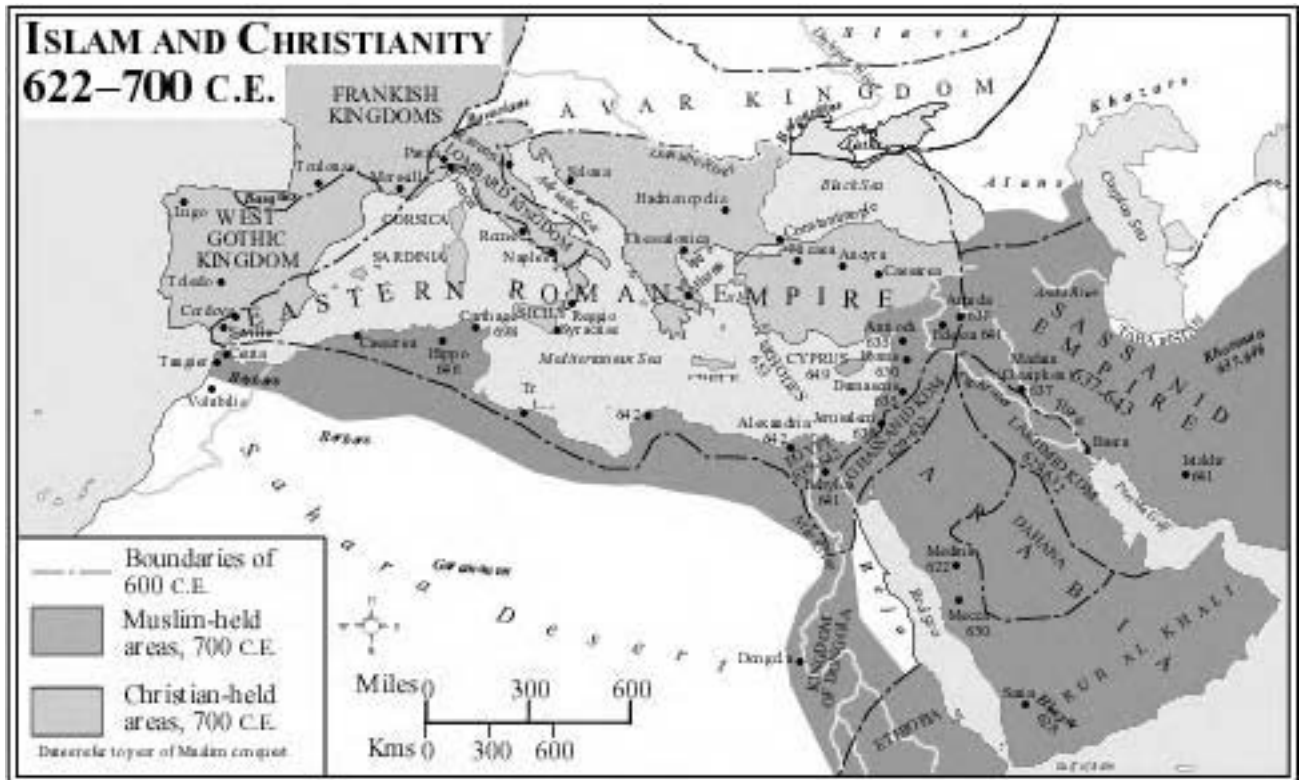

The victorious Arabic advance was temporarily interrupted by the civil war of 656–661, during which Umayyad forces defeated Ali, whose supporters became known as Shiites. The Umayyads then moved the Muslim capital to Damascus.

Resuming the advance, Umayyad naval forces appeared in the Sea of Mamora in 670, although the Byzantines, using Greek fire, heavily defeated the Arabs in a naval battle in 677. Elsewhere, other Arabic armies completed the conquest of Byzantine Africa, taking Carthage in 698. From Africa, they crossed the Straits of Gibraltar in 711, whose name (“rock of Tariq”) recalls their general, Tariq ibn-Ziyad, whose overwhelmingly outnumbered army crushed the Visigoth king Roderick at the week-long Battle of Rio Barbate. Although a number of Christian princes fled to refuge in the Pyrenees and held out against Islam, most of Spain now came under Arabic control.

From Spain, Muslim forces invaded the Merovingian kingdom of the Franks but were halted by Charles Martel at Tours and Poitiers in 732, although the importance of these Christian victories has been overstated, since Muslim armies were operating well beyond their safe range during their invasions of France. In addition, Charles's victories did not end the direct threat to Europe since Arabs were able to invade and seize Sicily from the Byzantines in the early ninth century and retain their position there for some time.

The same year that the Arabs entered Spain, 711, they also began serious raids and advances into Anatolia, which the Byzantines had hitherto defended successfully. This move inaugurated a struggle that went on well into the tenth century, although the Arabs suffered a decisive repulse by land and by sea in the failure of their siege of the Byzantine capital of Constantinople in 717–718. Although the Byzantines were attacked on two sides, by Arabic armies below the Long Walls and by Arabic ships operating in the Sea of Mamora, the experienced Byzantine Emperor Leo III was able both to defeat and to rout the depleted Arab armies.

The Umayyads, some of whom took refuge in Spain, were overthrown by the Abbasids in the mid-eighth century. The Abbasids moved the capital to Baghdad, which became a great trading city, and continued the war against Byzantium:

it was under their rule that the advance against Sicily took place, and they won the Battle of the Talas River in 751 against a weakening Chinese Tang dynasty (618–907). Nevertheless, the reign of Harun al-Raschid (r. 786–809) was, in every way, the high watermark of Muslim military power. Centralized authority declined sharply after his time, particularly during the civil wars of 861–870, which permanently lamed the caliphate as a central, Arabic authority.

The period also saw an increasingly powerful Byzantine *reconquista*, as Byzantine armies recovered Crete, major parts of northern Mesopotamia, and Syria and even threatened Jerusalem. Among the emperors taking the lead were Constantine V (r. 741–775) and his son, Leo the Khazar (r. 775–780), who gradually extended Byzantine power in Anatolia.

Later, under Leo VI (r. 886–912), the Byzantines were able to invade the emirate of Tarsus successfully and then Armenia, which also came under Byzantine control, and continued the process of the recovery of frontier territory. Subsequently, Emperor Romanus Lecapenus (r. 920–944) attacked and sacked Melitene, an Arab base, and in 928 formally restored it to the empire. Although local Arab forces counterattacked, the area was brought definitely under Byzantine control by 936.

The culmination of these efforts came during the reigns of Constantine VII (r. 913–959), his son Romanus II (r. 959–

963), Nicephorus II Phocas (r. 963–969), and John I Tzimisces (969–976). The Byzantines expanded their control in northern Mesopotamia, Armenia, and Cyprus. In 961, Nicephorus II Phocas, then the general of Romanus II, recaptured Crete. Meanwhile, Tzimisces, then still a general, took Aleppo and, as emperor, advanced into northern Palestine. The following century, the Byzantines even sought to reconquer Sicily, although it was the Normans who were the ultimate beneficiaries. Only in Spain did an era of Arabic conquest persist, despite what was by and large a stalemate existing between Muslims and Christians, thanks to the infusions of raw Berber energy from North Africa that reinvigorated the Arabic advance. Elsewhere, it was the Turks who took over the role of expanding the frontiers of Islam.

Mutaguchi, Renya (1888–1966)

Imperial Japanese army general who conceived and commanded the Imphal campaign of March–July 1944. Born in Saga Prefecture in Kyushu, southwestern Japan, a region renowned for breeding tough soldiers, Mutaguchi graduated from the Army's Military Academy in 1910 and the Military Staff College in 1917. After serving in the War Ministry and General Staff Headquarters, he assumed command of the 1st Infantry Regiment, stationed in northern China in 1936. In July of the following year, he played a role in developing the "Marco Polo Bridge incident" into a pretext for expanded war against China.

At the opening of World War II in the Pacific, as commander of the 18th Division, Mutaguchi participated in the conquest of Malaya, Singapore, and Burma in 1941–1942 and was promoted to commander of the Fifteenth Army, headquartered at Rangoon, in 1943.

Mutaguchi was initially lukewarm toward plans for an offensive into northeastern India. However, the success of Orde Wingate's first "Chindit" guerrilla operation behind Japanese lines in February–June 1943 convinced him that if British soldiers could breach the thickly jungled hills between Burma and India, his own men, aided by the Indian National Army of Subhas Chandra Bose, could break through British defenses, occupy the Imphal Plain, and inspire Indian patriots to rise up against their British masters.

Mutaguchi had grandiose visions of toppling the British Raj, but his offensive lacked proper logistical support and adequate lines of communication, especially during the monsoon rains. Some 50,000 of the 100,000-man strong Fifteenth Army died in combat or during the terrible retreat back into Burma. Mutaguchi's name became synonymous with the Japanese militarists' cavalier disregard for the lives of their men.

Mysore Wars (1767–1799)

A series of four conflicts, beginning in 1767, that by 1799 established British supremacy in the Deccan and southernmost regions of India. The First Mysore War (1767–1769), however, hardly anticipated any such British triumph. Despite its concern with the growing power of the sultan of Mysore, Haidar Ali Khan, whose territories bordered the Carnatic coast and thus threatened the trading stations at Madras and Cuddalore, the British East India Company not only failed to form an alliance to challenge Haidar but soon found itself facing invasion. Haidar defeated the British at Malbagal (4 October 1768) before being driven from the Carnatic. Invading again the next year, Haidar dictated the Treaty of Madras to the British before the gates of their city (3 April 1769).

The First Mysore War resolved none of the issues that had provoked it and, not surprisingly, sowed the seeds for the renewal of conflict. Haidar's ferocious Anglophobia was reinforced when the British, despite unequivocal mutual assistance provisions in the Madras Treaty, failed to come to his aid when his capital of Seringapatam was besieged by the Marathas in 1771. Moreover, Haidar's hatred of the English was matched only by the esteem in which he held the French. During the British siege of Pondicherry in the First Carnatic War, Haidar had led his horsemen to the assistance of the French, from whom he would later gain technical experience, gunners, and guns. When Britain and France found themselves at war in 1778 and the British captured the French posts of Pondicherry, on the Carnatic, and Mahe, within Mysore territory, Haidar needed no further compunction to go to war again. The Second Mysore War (1780–1784) opened with Haider's invasion of the Carnatic with 80,000 men and 100 guns. Taking Arcot, Haidar destroyed a British force at Pollilur (10 September 1780), forcing his enemies to flee for the safety of Madras's fortifications.

Despite this initial success, Haidar was unable to capture Madras before Eyre Coote arrived with a relieving force from Calcutta. At Porto Novo (1 July 1781), Coote, with 8,000 Europeans and Sepoys, defeated Haidar's force of some 60,000. Madras thus relieved, Haidar was again defeated at the scene of his earlier victory, Pollilur (27 August 1781), and yet again at Sholingur (28 September 1781). British victory remained limited, however, because of the greater mobility of Haidar's forces, while Haidar's son, Tipu, defeated the British at Annagudi (17–18 February 1782). The British in India likewise suffered from the greater demands in manpower and munitions made by the ongoing war in North America and the West Indies. The consequences of this wider conflict were made clear when a French squadron under Admiral Pierre du Suffren captured Trincomalee (30 August 1782). Though enabling Haidar to successfully defend Cuddalore from British

attack (13 May 1783), the arrival of French reinforcements in fact proved too late to measurably influence the outcome of the war. The Treaty of Versailles (20 January 1783) ended the war between Britain and France (and the United States), and Haidar Ali himself had died earlier (2 December 1782). It was therefore hardly surprising that his successor, Tipu, was amenable to peace, especially as the Treaty of Mangalore (11 March 1784) restored the status quo ante bellum.

If Tipu's respect for the French, inherited from his father, had been tempered by what he believed to be their failure to give adequate support in the recent war, it did not prevent his sending ambassadors to the French court in 1787. Arriving at Toulon in June 1788, the envoys were received by Louis XVI two months later. Yet if Tipu thus demonstrated his willingness to achieve his ends through European diplomatic as much as military means, the effort ultimately proved to be too little, too late. The flames of revolution soon would sweep across France, eventually consuming the ancien regime. At the same time, the global conflict that the French Revolution was to become would provide the setting for the two final Mysore Wars.

Soon after the revolution had swept the French monarchy from power, it became clear that "Citoyen Tipu" could not be counted on to support the British against revolutionary France. Sir Charles Cornwallis, governor of India, accordingly sought to strengthen British ties with the traditional foes of Mysore, such as the Marathas, while military aid was given to the Raja Rama Verma of Travancore, then at war with Tipu. It was evident to Cornwallis, however, that Tipu could only be suitably chastised by direct action, and the Third Mysore War (1790–1792), opened with General Sir William Medows invading Malabar with some 30,000 men. After Tipu proved more than capable of avoiding Medows's forces, Cornwallis himself assumed command in January 1791, while Maratha forces attacked on Tipu's northern fron-

tier. Losing his capital of Mangalore to the British (21 March 1791), Tipu fell back on Seringapatam. With the end of the rainy season in early 1792, Cornwallis moved against Tipu, opening the siege of Seringapatam on 6 February 1792. When the citadel was captured on 21 February, Tipu had no choice but to open the negotiations that would end the war with the Treaty of Seringapatam (16 March 1792).

If the inconclusive nature of the first two Mysore Wars had ensured the outbreak of their successor, the apparent conclusiveness of the Third War, represented in the harsh terms imposed on Tipu by the British, equally ensured the outbreak of the fourth and final conflict. Despite being forced to cede half of his territory to the British, Tipu's abilities as an administrator ensured a quick recovery of Mysore. The continued threat from Mysore seemed all the greater to the British, moreover, when Napoleon invaded Egypt in 1798. Fearing a French invasion of India in support of Tipu, Richard Wellesley, Lord Mornington, governor of India, ordered a force of 42,000 to invade Mysore (14 February 1799). Though the Fourth Mysore War (1799) would help establish the reputation of Wellesley's younger brother, Arthur, the future duke of Wellington, Tipu's defeat owed as much to the defection of his three senior generals as it did to British generalship. Defeated at Siddeswara (5 March) and again at Malavalhi (25 March), Tipu fell back on Seringapatam. There, having refused the exorbitant demands of General George Harris, Tipu died defending his citadel from the final British assault (4 May). With Tipu died the threat posed by Mysore to British dominion in southern India.

N

Nadir Shah (a.k.a. Tahmasp Qoli Khan) (1688–1747)

Ruler who reunited Iran after the collapse of the Safavid Dynasty, campaigning from Arabia and Iraq to Azerbaijan and the Ganges Valley. Nadir Shah rose to power in Iran at the beginning of Persia's eighteenth-century civil wars. His tribe, the Afshars, belonged to the Qizilbash, a tribal alliance that helped found the ruling Safavid Dynasty. However, in 1722, Afghan invaders seized Esfahan and deposed the Safavid shah, throwing Iran into chaos. Urban revolts, dissident tribes, and seceding provinces fragmented the state. Both Russia and the Ottoman Empire seized Persian territory.

Nadir Shah rallied the Afshar to his leadership and aligned them with Tahmasp II, a northern Safavid prince. In 1729–1730, he defeated the Afghans as well as his rivals in the Qizilbash, the Qajar. Having pacified Persia, the “Slave of Tahmasp” drove out the Ottomans while simultaneously pressuring Russia into evacuating Baku and the southern Caspian. After deposing Tahmasp's son in 1736, Nadir claimed the throne himself, becoming Shah Nadir Khan Afshar. Additionally, he secured the Persian Gulf by occupying Oman.

Nadir invaded Afghanistan in 1737. Running over the Afghans, he plunged through the Khyber Pass and east to Lahore. At the Battle of Karnal (1739), he defeated the Mogul emperor of India, marched across the Ganges plain, and sacked Delhi. Looting the Mogul treasury and the bejeweled Peacock Throne, the shah then turned north to wage war against the Uzbeks of central Asia. By 1742, Merv, Bukhara, and Khiva were Iranian vassals. In his last campaigns, Nadir crushed an Ottoman force in Iraq in 1745.

Nadir Shah was an abusive ruler, more feared than respected, and insensitive to Persia's Shiite Islamic faith. His assassination by his troops in 1747 renewed Iran's civil wars.

Nagashino, Battle of (1575)

Battle fought by Nobunaga Oda (1534–1582) and his ally Ieyasu Tokugawa (1543–1616) with Takeda Natsunori, around the strategic fortress of Nagashino. In this encounter, the forces of Tokugawa and Nobunaga Oda were the first to rely primarily on massed firepower in the form of Western armaments, helping to transform samurai warfare while pushing both houses closer to hegemony over Japan.

Ieyasu Tokugawa had actually forged a familial alliance with the Takedas, whose territories bordered his own in central Honshu. He married both a son and daughter into the Takeda household in the 1560s, but in the world of shifting alliances and steady warfare that characterized Japan at the time, the alliance quickly foundered. The Takedas were soon at war with the Tokugawa again.

The death of the elder Takeda (Shingen) in 1573, at the hands of a sniper in battle, placed his son Natsunori at the head of the Takeda house. The rising fortunes of the Tokugawa had made them fierce rivals of the Takedas, and when in 1575 a traitor to Tokugawa offered to hand over the vitally strategic castle of Ozaki to the Takedas, Natsunori Takeda jumped at the opportunity. Ozaki was the capital of Mikawa Province, the heart of Tokugawa territory, and its castle was guarded by Tokugawa's own son.

Takeda led a force of 15,000 warriors in what was expected to be a near-bloodless seizure of Ozaki Castle. In-

stead, they discovered en route that the treachery had been discovered by Tokugawa. Rather than face a humiliating retreat, Takeda opted to send his troops instead against the nearby fortress of Nagashino, another strategic castle sitting at the convergence of three rivers and guarding the entrance to Mikawa and Totomi Provinces.

Takeda began his siege of the castle in May 1575 but was still unsuccessful when word came that relief forces led by Tokugawa and Oda were on their way. Takeda opted to stand his ground near Nagashino and engage the approaching allied armies, though his forces were outnumbered more than two to one. At the Battle of Nagashino in June 1575, the alliance's greater numbers and, more important, overwhelming firepower, including musket volley fire by alternating ranks (the first time that this technique is known to have been employed in warfare), carried the day. Takeda lost almost two-thirds of his men and generals, and the mortally wounded Takeda clan would linger only until 1582, when it was overrun for good.

Napalm

A jell weapon made up of naphthenic acids, palmitic or fatty acids, and the salts of aluminum. One of the enduring images of the Vietnam conflict is the photograph of a naked nine-year-old Vietnamese girl running toward the camera screaming in pain, her flesh burned by napalm and gasoline. In popular terms, any hydrocarbon incendiary weapon is referred to as “napalm.” It is most commonly dispensed from airplanes or helicopters.

The origins of napalm can be traced back to attempts to improve the flamethrowers used in World War I. It was first developed by Dr. Louis Fieser of Harvard University during World War II. Because of the short supply of magnesium in 1942, napalm became the most widely used ingredient in incendiary bombs, such as the M-69. It was used in both the Atlantic and Pacific Theaters, especially on target cities in Japan. More than 50 percent of the bombs that destroyed Dresden were incendiaries. Napalm was also used by U.S. forces in the Korean War and by the French in Indochina and

Algeria. Yet, it was the use of napalm during the Vietnam conflict on suspected Vietcong villages, livestock, crops, and strongholds that led to a reaction among many Americans and Europeans. It is estimated that the United States used a total of 338,237 tons of napalm in the Vietnam conflict between 1963 and 1971.

Napier, Sir Charles James (1782–1853)

British general and colonial governor of Sindh. Born 10 August 1782 in London, Napier served in the Peninsular War against Napoleon and was wounded in the Battle of Corunna on 16 January 1809. He was wounded again at Busacco on 27 September 1810 and served at Fuentes de Onoro on 5 May 1811. During the War of 1812, he saw duty on the eastern coastline of the United States. Beginning in September 1814, he attended military college at Farnham, volunteered to serve under the Duke of Wellington in Belgium, and saw action following the Battle of Waterloo in 1815. After graduating from Farnham in 1817, he was appointed inspecting field officer for the Ionian Islands in May 1818 and then became resident for Cephalonia in March 1822, governing the island until 1833. Napier was then promoted to major general in 1837, assigned to India in 1841 and to the Sindh command in August 1842. In February 1843, Edward Law, Earl of Ellenborough and governor-general of India, compelled Sindh to sign a treaty that the inhabitants considered unfair and humiliating, provoking unrest in the region. The treaty stipulated that Napier could seize territory if he decided the Sindhi rulers were disloyal.

Soon afterward, war began, and Napier occupied Sindh, winning battles at Miani (17 February 1843) and Dabo (24 March 1843) with an outnumbered army. He then was appointed governor of Sindh, serving in that capacity until 1847. He was to have been the commander of British forces during the Second Sikh War (1848–1849) but arrived from England too late. In his retirement, Napier published books about his experiences. He died on 29 August 1853 in Portsmouth, Hampshire, England.

Napoleon I (1769–1821)

French field commander, revolutionary hero, and emperor, among the greatest military strategists and tacticians of all time. Born as Napoleone di Buonaparte in Ajaccio, Corsica, on 15 August 1769, he enrolled in 1779 at the military academy of Brienne le Château as Napoleon Bonaparte. He was commissioned a second lieutenant of artillery in 1785 and promoted to first lieutenant in 1791. Increasingly revolutionary, he joined both the Corsican nationalist movement and the Jacobin Club of Grenoble. In 1792, he became lieutenant colonel of Corsican volunteers and captain of French artillery. He fled Corsica in June 1793, opposed to Pasquale Paoli's anti-French and pro-British policies. He was promoted to brigadier general in December for distinguished service with the Army of Carteaux during the siege of Toulon.

Napoleon at Fontainebleau, 1814. (Library of Congress)

Briefly imprisoned in August 1794 after the fall of Maximilien Robespierre but back on active duty in 1795 with the rank of general, Napoleon “with a puff of grapeshot” saved the revolutionary convention from a popular royalist uprising on 5 October (13 Vendémiaire in the French revolutionary calendar). From that point, his rise was phenomenal. Two weeks later, the convention named him commander in chief of the Army of the Interior and on 2 March 1796 commander in chief of the Army of Italy.

Immediately taking the offensive against Austria and its allies, Napoleon won at Montenotte on 12 April, Mondovi on 21 April, Lodi on 10 May, Milan on 15 May, Castiglione on 5 August, Bassano on 8 September, Arcole on 17 November, Rivoli on 14 January 1797, and Mantua on 2 February. The coup d'état of 18 Fructidor (4 September) augmented his status. Back in Paris for only a few months, he sailed on 19 May 1798 to invade Egypt. He easily conquered Lower Egypt by routing the Mamluks at the pyramids on 21 July but was marooned by British admiral Horatio Nelson's victory over the French fleet in the sea battle of Aboukir on 1 August. After defeating the English-Turkish alliance in the land battle of Aboukir on 25 July 1799, he escaped back to France, arriving on 9 October. His coup d'état of 18 Brumaire (9 November) gave him significant political power. Quickly solidifying that power, he defeated the Austrians at Marengo on 14 June 1800, concluded peace with England by the Treaty of Amiens on 25 March 1802, became first consul for life by a national vote in May, raised money for war by selling Louisiana to the United States on 3 May 1803, and crowned himself emperor of the French on 2 December 1804 and king of Italy on 17 March 1805.

England, Austria, and many German states, fearful of Napoleon's growing power, influence, and ambition, launched the Napoleonic Wars in 1803. The British naval blockade of France was successful, especially after Nelson won at Trafalgar on 21 October 1805, but on land the French prevailed. Napoleon defeated the Austrians at Ulm on 17 October 1805; the Russians at Oberhollabrunn on 16 November; the Austrian-Russian alliance decisively at Austerlitz on 2 December; the Prussians at Jena on 14 October 1806; and the Russians at Eylau on 7–8 February 1807, Heilsberg on 10 June, and Friedland on 14 June.

Napoleon appeared only briefly in Iberia for the peninsular campaign but defeated the Spanish at Somosierra on 30 November 1808. He beat the Austrians (who were persistent, if nothing else) at Abensberg on 20 April 1809, Landeshut on 21 April, and Ratisbon on 23 April. After losing at Aspern-Essling on 21–22 May, he crushed the Austrians at Wagram on 5–6 July.

Napoleon's downfall began when, overconfident, he invaded Russia in 1812. He won at Vitebsk on 28 July,

Smolensk on 17 August, Valutino on 19 August, Borodino (barely) on 7 September, Krasnyi on 16–17 November, and Berezina on 26–28 November but was defeated by the Russian winter and endured a miserable retreat. Encouraged by Napoleon's failure in Russia, German states rose against him in 1813. He beat them and their many allies at Lützen on 2 May, Bautzen on 20–21 May, and Dresden on 26–27 August, but was hard-pressed, overextended, and finally suffered a major defeat in the gigantic Battle of Leipzig on 16–19 October. Pushed back toward Paris, he still managed to win tactical victories at Hanau on 30–31 October, Brienne on 29 January 1814, La Rothière on 30 January, Champaubert on 10 February, Montmirail on 11 February, Chateau-Thierry on 12 February, Vauchamps on 14 February, Montereau on 18 February, Craonne on 7 March, and Rheims on 13 March but lost the strategic war. The allies beat him at Laon on 9–10 March and Arcis-sur-Aube on 20–21 March. Paris fell on 30 March. He abdicated on 4 April and was exiled to the Mediterranean island of Elba on 4 May 1814.

Napoleon escaped from Elba on 26 February 1815, landed in France on 1 March, and arrived in Paris, triumphant, on 20 March. The allies immediately mobilized against him. He engaged them in Belgium, won at Ligny on 16 June, but met disaster at Waterloo on 18 June. Thus ended his "Hundred Days." But to the end, Napoleon retained much of his military genius. Wellington himself is supposed to have remarked of the Battle of Waterloo, "It was a damned close-run thing."

Prevented from escaping to the United States, Napoleon surrendered on 15 July to Captain Frederick Maitland of the *Bellerophon*. The allies sentenced him to permanent exile on the British island of St. Helena in the South Atlantic, where he died on 5 May 1821, probably poisoned by arsenic.

Napoleon was more than a military conqueror. Like Alexander the Great, he aspired to "improve" his conquests. In the spirit of the Enlightenment, he led the reform of the continental legal system, introduced rational weights and measures and money, emancipated the serfs, freed the Jews from legal disabilities, and strove to create a "European Community" or "Common Market." Had Europe possessed railroads and telegraphs at the time, he might have pulled it off. In the end, it was the sea power and money of the British, combined with British-subsidized but often-defeated Continental armies, that brought Napoleon down. Napoleon provided a focus of fear and opposition that rallied the reactionary, class-ridden British, Austrians, and Russians, as well as Spanish and Russian peasants/serfs, to combine for his final defeat, but Europe as a whole may have been the loser.

Napoleonic Wars (1803–1815)

The military campaigns from 1803 to 1815, during which Napoleon fought against Austria, Prussia, Russia, Britain, and their allies; conquered and dominated much of western and central Europe; and established the French Empire with its dependencies and allies. It is the story of Napoleon the soldier, the statesman, the emperor, whose uncompromising will and military genius propelled him to rule France and dominate Europe for more than a decade.

The Napoleonic Wars were actually a continuation of the French Revolutionary Wars that began in 1792 and ended with the conclusion of the Anglo-French Treaty of Amiens in 1802. But the peace of Amiens turned out to be a temporary rather than a long-lasting armistice. Territorial disputes between France and Britain brought them into a new confrontation. Napoleon encamped an army around the port of Boulogne on the English Channel, in anticipation of an invasion of Britain. The British retaliated and declared war on France on 16 May 1803. By the end of 1805, Europe once again entered a new round of wars of larger proportions.

Britain organized a new anti-French alliance, the Third Coalition, which included Austria, Russia, and Sweden. Napoleon (crowned emperor of the French in 1804) hastily removed his troops from the English Channel and sent them to the Rhine and northern Italy. He assumed command of the armies in Germany, routed the Austrian general Karl Mack at the Battle of Ulm (October 1805), and took 30,000 Austrians prisoner. Almost simultaneously, the British Royal Navy under Admiral Horatio Nelson destroyed the French fleet at Trafalgar (21 October), thus breaking France's naval

power and confirming Great Britain as the mistress of the seas. Trafalgar made up for Ulm and served to restore the balance of power.

While Britain dominated the seas, Napoleon continued the conquest of central Europe. He marched down the course of the Danube River and captured Vienna. The Russian army under General Mikhail Kutuzov and a second army under Czar Alexander arrived at Olmütz (Olomouc), a city in Moravia, to join the Austrians in an attempt to stop the French advance.

On 29 November 1805, Napoleon and his army took position at Austerlitz (Slavkov) in expectation of a collision with the allied forces. His strength of 73,000 men faced a combined Austro-Russian army numbering 86,000. On 2 December, he defeated the Austro-Russian armies at the Battle of Austerlitz, called “the most perfect battle in history” and Napoleon’s masterpiece. He then dispersed the Russians after frightful losses, while Czar Alexander was galloping as fast as his horse could carry him. Emperor Francis II of Austria escaped the carnage but later accepted the humiliating Treaty of Pressburg (Bratislava), ceding territories to France’s southern German allies and adding Venetia to Napoleon’s Italian kingdom. Napoleon’s brother Joseph became king of Naples, while another, Louis, was proclaimed king of Holland. After Austerlitz, France gained immeasurable prestige throughout Europe.

In August 1806, Napoleon dissolved the anachronistic Holy Roman Empire, which he pejoratively referred to as being “neither Holy, nor Roman, nor Empire.” In its place he organized the Confederation of the Rhine under French auspices and with himself as its protector. He then entered Vienna, and at his bidding, Francis II abandoned his imperial crown of Holy Roman Emperor for the more restricted title of Francis I, Emperor of Austria.

Napoleon still faced Britain and Russia, however, and Prussia now felt threatened by the creation of the Confederation of the Rhine and the stationing of French troops throughout much of Germany. The Prussians prepared for war and boastfully promised a lightning victory over Napoleon, the “revolutionary anti-Christ”! On 1 October 1806, Prussia delivered an ultimatum to Paris, while Prussian troops seized Saxony.

But no sooner were hostilities under way than events took a very different course. Without waiting for a formal declaration of war, Napoleon launched his own lightning campaign against the Prussians and routed them in two simultaneous battles at Jena and Auerstädt in October 1806. He then advanced and occupied Berlin. Within a month, Prussia ceased to exist as a military power.

Napoleon then turned against Britain and tried to destroy the “nation of shopkeepers” (his term) by imposing an economic blockade known as the “continental system.” He issued the Berlin Decree (November 1806) that banned trade and importation of British goods into continental Europe. It was the first large-scale application of economic means to win a war. But to make the blockade more effective, he had to control the entire European coastline, either directly or through allies.

On the Continent, Russia continued to pose a threat to Napoleon’s grandiose designs even after the disaster at Austerlitz. He pursued the retreating Russian army and fought an obstinate battle on ice and snow at Preussisch-Ey-

lau in February 1807. Despite tremendous losses on both sides, the outcome of the battle was indecisive. At the Battle of Friedland, however, he routed the Russians, rendering further resistance useless. On June 23, Alexander concluded an armistice.

On 7–9 July 1807, the two emperors and King Frederick William of Prussia met on a raft on the Nieman River and concluded the Treaties of Tilsit. Alexander and Napoleon agreed to divide Europe between them: Russia recognized Napoleon’s dominance in western and central Europe, and France supported Russia’s claims in eastern Europe and Turkey. Alexander also agreed to join Napoleon’s economic blockade against Britain.

The treaty with Prussia, however, was extremely harsh. That country lost half its territory to France, and all its acquisitions from the partition of Poland went to the newly established Grand Duchy of Warsaw. French troops occupied Berlin, and Napoleon’s brother Jerome became king of Westphalia.

Napoleon had reached the zenith of his power and glory by 1808. He was now the master and arbiter of Europe. He created new republics, deposed royal dynasties, established the French Empire, set up a series of dependencies ruled through relatives or close friends, and ruled 70,000,000 people. Russia maintained friendly relations with him. Only Britain, Sweden, and Turkey remained outside French influence. For all practical purposes, Napoleon had achieved complete hegemony over continental Europe.

But soon Napoleon’s power began to show signs of decline. The rise of romantic nationalism among the defeated European nations and Britain’s persistent opposition to his expansionist policy turned the tide against him. Nationalism was most evident in the Iberian peninsula. When Portugal opened trade with Britain, Napoleon invaded Spain, precipitating the costly Spanish or Peninsular War (1808–1814).

Napoleon defeated the Spaniards, deposed King Ferdinand VII, and installed his brother Joseph as king of Spain. A Spanish guerrilla war, which the British supported and financed, tied down 200,000 French troops. When British troops invaded Spain with the support of Spanish guerrillas, Joseph relinquished the throne and fled Madrid. The Peninsular War marked Napoleon’s first major defeat.

In 1809, Austria announced, rather prematurely, a “war of liberation” of the German people and launched an army of 170,000 into Germany. Napoleon left Spain and once again took command of the French army against the Austrians. He defeated them at the Battle of Wagram (5–6 July) and compelled them to sign the Treaty of Schönbrunn, depriving them of considerable territory and population.

Relations between France and Russia also began to deteriorate. Alexander lifted the economic blockade and opened

the Russian ports to British trade. Napoleon, furious, embarked on his perilous invasion of Russia. On 24 June 1812, he crossed the Nieman River with his “Grand Army” of 500,000 men—Poles, Swiss, Dutch, Italians, Germans, Prussians, and Austrians. The French advanced rapidly, capturing one town after another. Near Smolensk, Napoleon tried to engage the Russian army, hoping to destroy it quickly. But the Russians evaded a pitched battle and allowed the French to press on through burning villages, towns, and cities.

After Smolensk, Napoleon faced the army of Kutuzov at Borodino, a village near Moscow. On 7 September 1812, he fought the Battle of Borodino, one of the bloodiest engagements in Russia. Despite repeated French attacks, the Russian defense did not break. Finally, the two armies retired toward the evening to their earlier positions, after more than 90,000 French and Russian soldiers had died on the battlefield.

Kutuzov did not renew the attack next day. He decided to withdraw his troops beyond Moscow and allowed the French to enter the city. His generals insisted on defending the city, but the veteran general told them: “When it becomes a matter of Russia’s salvation, Moscow is only a city, like any other. But the loss of the Russian army means the loss of Russia. Let us, therefore, retreat!”

On 14 September, the last Russian detachment left Moscow, and next the entire population followed. Napoleon’s vanguard entered the deserted city. Mysterious fires broke out throughout Moscow, burning it to the ground and devouring supplies and everything upon which the enemy had depended for shelter and subsistence.

Napoleon offered Alexander a truce but, after waiting five weeks without an answer, decided to retreat from Moscow. But the French retreat became a complete catastrophe, as swarms of angry Cossacks and infuriated peasants constantly harassed and attacked the French army, committing horrific atrocities upon the starving, freezing, and dying soldiers. The Russian army made surprise attacks on the French at the Battles of Tarutino, Maloyaroslavets, and Vyazma. At the crossing of the Berezina River, the Russians caused thousands of French soldiers to drown or freeze to death.

Napoleon, seeing the destruction of his Grand Army, abandoned it on 5 December 1812 and returned to Paris to raise another army. Early in 1813, he returned to meet the Russians, who had already made their way into Germany.

This time, however, Napoleon confronted not only the Russians but a new European coalition as well, the Sixth, which began with the Russo-Prussian alliance to wage the “war of liberation” in Germany. In a series of battles during the spring of 1813, Napoleon defeated the Prussians and Russians at Lützen and Bautzen.

Austria soon joined the coalition. Napoleon again overwhelmed the allied armies at the Battle of Dresden, his last

major victory. But at the Battle of Leipzig, called the “Battle of the Nations,” the allies destroyed Napoleon’s forces (16–19 October 1813). On 31 March 1814, Czar Alexander entered Paris at the head of the allied armies and dictated the terms of surrender. Napoleon abdicated, and Louis XVIII became king of France.

Honorable, if not outright generous, Napoleon’s captors, following the unwritten freemasonry of monarchy, exiled him to the island of Elba, assigning it to him as a sovereign principality and allowing him to retain the title of emperor. The French treasury provided him with an annual income of 2,000,000 francs.

The Elba exile, however, lasted only 10 months. In February 1815, Napoleon escaped from Elba aboard a small ship and landed in southern France. King Louis dispatched troops to intercept the escaped exile, but the soldiers went over to Napoleon! On 20 March, he entered Paris and began his ephemeral “Hundred Days” rule.

The alarmed allies, meeting at the Congress of Vienna, raised an army under Arthur Wellesley, the Duke of Wellington. Napoleon, too, somehow gathered a new army, marched to the north, and repelled the Prussian attack under General Gebhard Blücher at Ligny. On 18 June, the Battle of Waterloo ensued. Napoleon first assaulted Wellington’s British army. At one point in the battle, when it seemed that the French would carry the day, Blücher returned and joined Wellington with reinforcements. Soon Napoleon’s army was decimated. Waterloo signaled the end of the Napoleonic Wars and Napoleon’s incredible military career. Almost to the very end, he could win battles against heavy odds, and, as the Duke of Wellington remarked of Waterloo itself, “It was a damned close-run thing.”

The British exiled Napoleon to the distant volcanic island of St. Helena, off the west coast of Africa, where he arrived on 15 October 1815. He lived on this remote island until his death on 5 May 1821 at the age of 52.

To the French and continentalists, Napoleon represented the forces of the Enlightenment, reforming, rationalizing, sweeping away the frowzy remnants of the feudal past, an armed Voltaire seeing Europe whole. To the British and their allies, he was a monster of ambition, threatening to extinguish crowns and kingdoms if not stopped. The major differences between the nations of the Continent and Great Britain can still in large measure be attributed to whether they were conquered by Napoleon.

Narses (c. 478–c. 574)

An Armenian eunuch and Byzantine general, born around 478 of obscure parentage. A bureaucrat by experience and training, he was sent in June 538 to reinforce Belisarius, then fighting the Goths.

In 551, Narses was sent by Justinian to resume Byzantine efforts to reconquer Italy from the Goths. In June or July 552, Narses won the Battle of Taginae, halfway between Ravenna and Perugia, and killed the Gothic king, Totila. He then defeated Totila's successor, Teias, in the Battle of Mons Lactarius, near Naples, in October 552. After Narses fought an inconclusive battle at Rimini in late 553 against Frankish and German invaders, the invading army divided. The smaller force, attempting to return north, was severely mauled at the Battle of Fano by a subordinate of Narses. The larger force was defeated by Narses at Capua in 554. As a result of these victories, Narses was granted the last triumph ever held in Rome. In 561 and 562, Narses defeated a Gothic revolt and in 565 a revolt by Heruli mercenaries. In 565 the death of the Emperor Justinian removed Narses's great patron. The new emperor, Justin II, recalled Narses in 566 or 567, shortly before the Lombard invasion. Narses died sometime thereafter.

Naseby (14 June 1645)

The last major battle of what has been called the First English Civil War. Naseby marked the entry of Parliament's New Model Army into the conflict and with it a new professionalism of arms. It also signaled the destruction of Charles I's hopes in the first part of this conflict and marked a major turning point in a struggle that would ultimately end in the execution of Charles I and the exile of Charles II.

By the spring of 1645, the Royalist cause in Britain was reeling. The defeat at Marston Moor the previous summer

The Battle of Naseby, 14 June 1645. (Hulton/Archive)

had meant the loss of northern England; various successes in Scotland had helped to offset that reverse. But Parliament had finally decided to reorganize its arms and had appointed Sir Thomas Fairfax to lead the new army. In early June, Fairfax's New Model Army of nearly 13,000 (approximately 7,500 of them horse or dragoons) was on the march, looking for Charles I, who himself was in the field with a force of around 7,400 (3,300 cavalry and 4,100 foot, although the numbers given on both sides represent compromises between differing claims).

On the morning of 14 June 1645, the two sides drew up their lines north of the village of Naseby. The Royalists had assembled half a mile from Fairfax's men. Their right wing, under the command of the veteran Prince Rupert of the Rhine, consisted of 1,600 horse and 200 musketeers. The numbers of the center and left wings are less certain, although it appears probable that 3,500 foot comprised most of the center, with an unknown number of cavalry on the left. In reserve was King Charles with perhaps 700 foot and a contingent of horse. Opposing them, the parliamentary lines consisted of 3,200 horse on the left and another 3,500 horse to the right (the latter under Oliver Cromwell), with the foot

in the center and one regiment of dismounted dragoons deployed along the left flank.

In midmorning the Royalist line advanced, with the cavalry soon engaged. On their extreme left, the parliamentary cavalry were dispersed, and Prince Rupert's horse rode behind their lines to attack the baggage train. In the center, the outnumbered Royalist foot soldiers held their ground but were soon attacked on both flanks; their left wing was broken by Cromwell's horse, and their right flank, exposed by the absence of Rupert's cavalry, was attacked by the remounted dragoons. By the time Rupert regathered his cavalry and returned to the field, the center of the Royalist lines was doomed. The reserves Charles held under his command fled, and with them went the last chance for Charles to make a stand.

The rout of the Royalist forces at Naseby was fairly complete: between 400 and 1,000 men were killed, and a further 4,500 were taken prisoner. Worse than this for the Royalist cause, all of Charles's papers were captured, and the terms of the sensitive negotiations they revealed crippled the Royalist plans. With the parliamentary cause in the ascendancy, Charles was incapable of fielding an army, and for all intents

and purposes the first measure of the English Civil War was ended.

Nashville, Battle of (2–15 December 1864)

A Union victory in the American Civil War that basically destroyed the Confederate Army of Tennessee. It was a ragged, battered army that approached Nashville, Tennessee, in December 1864. Turning north after the fall of Atlanta, Confederate general John B. Hood hoped to draw General William T. Sherman out of Georgia, threaten his lines of supply, and

The Battle of Nashville, fought in December 1864, during the American Civil War. (Library of Congress)

retake Tennessee. Instead, Sherman launched his march to the sea, leaving General George H. Thomas to deal with Hood. Thomas quickly organized regular and garrison troops from scattered commands.

In a vicious battle at Franklin on 30 November, Hood shattered his army in frontal charges on federal earthworks. Attacking across open ground, the Confederates suffered atrocious losses. Thomas pulled back to Nashville and began to fortify the city. Hood arrived before the city on 2 December and began to dig in. The winter weather took a heavy toll on the Confederates, and their supply system broke down.

Within Nashville, Thomas received supplies and fresh men daily. Rather than besieging the city, the Confederates could only fortify the high ground below the city. By 15 December, Thomas was ready to strike, and he launched a feint against the Confederate right, while his main attack struck their left. Driven back, the Confederates hastily established a new line behind the first. The next day the federal attack continued, and Hood's army disintegrated. The left, at Shy's Hill, and the center both broke. Several African-American units distinguished themselves in the assaults.

Thomas lost 3,061 men and Hood 6,500. The Confederate Army of Tennessee was finished as an effective combat force. Hood was removed as commander, and the remnants transferred to North Carolina, where they surrendered to Sherman at Durham in 1865. The 1864 Tennessee campaign was the last Confederate offensive of the war.

National Security Agency/ Central Security Service

Largest, most expensive, and perhaps least known of all the U.S. intelligence agencies. The National Security Agency (NSA) was established by President Harry S. Truman on 24 October 1952 as a separately organized agency within the Department of Defense to be in charge of signals intelligence (SIGINT) and communication security (COMSEC) for the federal government. The Central Security Service (CSS) was created as the central agency for cryptology. The head of the NSA is also in charge of the CSS.

The three principle functions of the NSA are information

systems security, operations security training, and foreign intelligence information. It collects, deciphers, interprets, and disseminates information gathered from a vast array of global listening posts. The NSA was first brought to world attention when the North Korean navy seized the *Pueblo* in 1968. Later, congressional investigation revealed the ship was on an intelligence gathering mission for the NSA.

As the world becomes increasingly digital, so do the means states use to wage war. The NSA, with its technical assets and expertise, will become increasingly vital to national security in the information age.

Navarro, Pedro, Count of Olivetto (c. 1460–1528)

Military engineer and infantry commander. Pedro Navarro contributed greatly to the art of military mining and fortification, but his role is not widely known. He arrived in Italy in the 1490s and served as a *condotiere* for several different armies, including that of Florence. He fought for Ferdinand V of Spain in the Italian campaigns of 1502–1503, engineering the defense of Canossa and the capture of several Neapolitan fortresses using mining operations. He was given the title Count of Olivetto and made captain general in 1508. He commanded the Spanish campaigns in North Africa, capturing the island and town of Velez de la Gomera in 1508, the city of Oran in 1509, and the major ports of Bougie and Tripoli in 1510.

In 1513, Navarro led the infantry of the Holy League against the French at the Battle of Ravenna. He incorporated his own invention, a mobile cart featuring harquebuses and a protruding spear, into his infantry. He implemented a defensive strategy for the battle with trenches, but it failed because the artillery was weak. He was captured during the battle but never ransomed by Ferdinand. Navarro changed sides and, in 1515, led a French army through the Swiss Alps to campaign again in Italy. In 1522, he led troops on the French side at the Battle of Bicocca, where his field fortifications were successfully set up by the opposing side. That

same year, Navarro was captured by the Spanish at Genoa and imprisoned at Naples until 1526. He lost his title as Count of Olivetto but engaged in one last campaign at Naples in 1527.

Ndlela kaSompisi Ntuli (?–1840)

Commander in chief of the Zulu army and chief councillor to King Dingane kaSenzangakhona during the Voortrekker invasion of Zululand (1837–1840). King Shaka appointed Ndlela, who was connected through marriage to the Zulu royal house, chief of the Ntuli people in southern Zululand and, in recognition of his prowess as a warrior, raised him to high military command. When Dingane assassinated his brother Shaka in 1828, he also eliminated many of his favorites. Ndlela was an exception, for the usurper appointed him commander in chief and also made him his chief councillor.

In mid-1837, Ndlela led an inconclusive campaign against the Ndebele people, who were already weakened by defeats at the hands of the Voortrekkers, or Boers, who were advancing into the South African interior in search of lands to settle. When in late 1837 the Voortrekkers invaded Zululand, Ndlela persuaded Dingane to resist rather than negotiate. During the ensuing war of 1838, Ndlela undoubtedly planned the campaign, which turned on destroying the Voortrekkers in their fortified encampments of wagons (laagers) and in repulsing any Boer offensives. The turning point in the war was reached on 13–15 August 1838, when the Zulu army, led by Ndlela, failed repeatedly to penetrate the all-round fire from the Boer laager at Veglaer. The Boers then mounted a counterthrust, and Ndlela was in joint command of the great army that on 16 December disastrously failed at Blood River (Ncome) to stem their advance. Following this crushing defeat, Dingane withdrew to northern Zululand and ceded the lands south of the Thukela River to the Boers.

Dynastic conflict ensued in the weakened Zulu kingdom, and in September 1839, Mpande, Dingane's brother, fled to Boer territory with a large following. Mpande entered a compact with the Boers, and in January 1840 he marched against Dingane with Boer forces in support. Ndlela commanded Dingane's army, which Mpande's forces defeated at

the Maqongqo hills on 29 January 1840. Ndlela was wounded but escaped. However, Dingane, now also a fugitive, executed him for his military failure.

Německý Brod (Deutschbrod) (1422)

Major Hussite victory over the Holy Roman emperor. After the failure of the First Crusade against the Hussites at the Battle of Prague (1420), Emperor Sigismund neglected to join with other German princes in the Second Crusade, which failed in its siege of Žatec. In October 1421, he finally entered Moravia and advanced into eastern Bohemia, meeting the Hussite army under Ján Žižka outside Kutná Hora (December 21). While Sigismund's Hungarian knights charged Žižka's wagon-fort, other troops entered the city, which was opened to them by German townsmen. Trapped between the town walls and Sigismund's army, Žižka attacked the king's lines, using his war wagons offensively for the first time as field artillery, and escaped with his army.

While Sigismund put his forces in winter quarters, Žižka gathered reinforcements from Prague and Tabor. With the support of local partisans, he attacked and overran the Hungarian garrison at Nebovidy (6 January 1422). Unable to gather his scattered forces quickly, Sigismund evacuated Kutná Hora and retreated toward Moravia. Žižka caught up with Sigismund north of Německý Brod on January 8. The Hussites attacked immediately and smashed the rear guard, causing the rest of the army to flee. Sigismund escaped with his life, but more than 500 knights drowned in the icy Sázava River. A small number of survivors, who sought refuge in Německý Brod, were massacred when the town fell to the Hussites two days later, after a short siege. The defeat of his second campaign against the Hussites marked the end of Sigismund's active involvement in the Hussite Wars, though he continued to press his claim for the Bohemian crown, finally achieved in the Compacts of Jihlava (1436), which brought the wars to a close.

Neville's Cross, Battle of (17 October 1346)

Scottish defeat during wars with England. In 1346, Scotland chose to honor her French alliance and take advantage of English commitments in France by invading northern England with an army of 12,000. It included a sprinkling of French knights, weaponry, and armor. Crossing the border above Carlisle, the Scots arrived before Durham on 16 October.

Forewarned of Scottish intentions, the English had two formations in the field as the Scots crossed the border. One, some 4,000 levies drawn from Cumberland, Northumberland, and Lancashire and commanded by the archbishop of York, immediately moved via Barnard Castle to Durham, where it scattered Scottish foraging parties on the morning of the 17th. The Scots immediately formed themselves into three formations below an Anglo-Saxon stone cross (Neville's Cross) on high ground heavily broken with ditches and walls. With memories of defeats at Dupplin Moor and Halidon Hill, the Scots had no intention of undertaking offensive action. The English were likewise inclined. The standoff was broken when the English advanced and their longbowmen wrought havoc in Scottish ranks. The men of the first echelon, rather than being killed where they stood, advanced, but the few who reached English positions were quickly dispatched. The second Scottish echelon, seeing the destruction of its sister formation, broke, whereupon the English advanced on the third Scottish force. Although this formation resisted fiercely, the day belonged to the English. King David of Scotland, along with many nobles, was captured and his army scattered.

New Orleans, Battle of (8 January 1815)

Decisive American victory in the War of 1812, fought two weeks after the war ended. To defend the strategically, politically, and psychologically important port of New Orleans from imminent British attack, Andrew Jackson established a strong defensive position 6 miles downriver at Chalmette, Louisiana. His 5,800 mostly irregular troops, including Choctaw Indians, local bayou-dwellers, Tennesseans under

John Coffee and William Carroll, the Louisiana Free Men of Color Battalion, and Jean Laffite's Baratarian pirates, built a line about a mile and a quarter long, perpendicular to the Mississippi River, extending along the northwestern bank of the Rodriguez Canal from the Mississippi levee across three-quarters of a mile of dry ground and another half mile into a cypress swamp. They widened and deepened the canal, using the mud to create breastworks. They had two dozen guns, the largest a 32-pounder. Coffee commanded the left, Carroll the center, and Jackson himself the right.

General Edward Pakenham sent 5,400 of his 8,000 regulars to attack frontally on the dry ground, providing clear targets for American marksmen. Samuel Gibbs led the main attack against the American center at the edge of the swamp, while Robert Rennie's column on the far left advanced parallel to the river. The 4,000 of Jackson's troops who found themselves engaged easily thwarted Gibbs with small arms and antipersonnel cannon fire but nearly allowed Rennie to gain the ramparts. Under John Keane, the 93rd Highlanders ran obliquely across the field from the left to reinforce the failing right, but to no avail. British artillery was bogged down in the mud too far behind the lines to be effective. Pakenham himself was killed while rallying the right. John Lambert assumed command and ordered retreat. Casualties numbered 2,000 British and 13 American. The British, especially their general, Colin Campbell, learned hard lessons at New Orleans that served them well at the similar Battle of the Alma 39 years later. But rarely has history recorded so one-sided a victory.

Ney, Michel, Duc d'Elchingen, Prince de La Moskova (1769–1815)

French field commander. Born the son of a cooper in Alsace on 10 January 1769, Ney enlisted in 1787 in the 5th Hussars and was commissioned a lieutenant after Valmy in 1792. He

Death of General Edward Pakenham at the Battle of New Orleans. (Library of Congress)

fought at Jemappes in 1792 and Mainz in 1794. Promoted to brigadier general on 15 August 1796, he won at Kirchberg on 19 April 1797 but was captured at Giessen on 20 April. After he was exchanged, he fought under André Masséna at Winterthur in 1799 and under Jean Victor Marie Moreau at Hohenlinden in 1800. Already a corps commander, Ney was promoted to marshal on 19 May 1804. He shone at Elchingen on 14 October 1805; captured Innsbruck in November; and fought well at Jena, Erfurt, and Magdeburg in 1806 and Eylau, Guttstadt, and Friedland in 1807. He led the VI Corps under Masséna from 1808 to 1810 in Iberia, capturing Ciudad Rodrigo in 1810. After setbacks at Bussaco in 1810 and Torres Vedras in 1811, Masséna accused him of insubordination and relieved him of command. During the 1812 invasion of Russia, Ney fought at Krasnoye, Smolensk, and Borodino and held the rear guard on the retreat from Moscow. In Napoleon's last German campaign, Ney fought at Weissenfels on 1 May 1813, was wounded at Lützen on 2 May, commanded the left at Bautzen on 20–21 May, lost at Dennewitz on 6 September, and proved tenacious at Leipzig.

Changing sides just before Napoleon's first abdication in

1814, Ney served King Louis XVIII, while Napoleon was exiled on Elba. Ordered to capture the escaped Napoleon, Ney instead joined him for the Hundred Days, commanding Napoleon's left on the march to Belgium, engaging Arthur Wellesley, the Duke of Wellington, at Quatre Bras, and fighting ferociously at Waterloo.

Ney was an outstanding cavalryman with extraordinary courage but was frequently criticized, especially after the Russian campaign, for his questionable battlefield decisions. Some historians have blamed him for the French shortcomings at Bautzen, Dennewitz, Quatre Bras, and even Waterloo. The humbly born Ney's rise to high command also illustrated the revolutionary and Napoleonic principle of "careers open to all talents." The restored Bourbons executed him by firing squad for treason on 7 December 1815.

Nez Percé (June–October 1877)

In 1877, the flight of the Nez Percé captured the American public's imagination and made the U.S. Army look inept. Under the leadership of Chief Joseph and his namesake father, the Nez Percé had tried to live peaceably with impinging white society. In 1855, they agreed to a reservation in Idaho and, following the discovery of gold within their boundaries, had renegotiated the reservation to land surrounding the Clearwater River. Yet leaders like Chief Joseph the Elder and

White Bird refused to live within the boundaries of this new agency. In 1871, the younger Chief Joseph was made chief and repeatedly insisted that the Nez Percé had never sold the Wallowa Valley in Oregon. Authorities insisted that Joseph had to report to the reservation and threw the Wallowa open to settlement.

While disagreeing with the decision, Joseph and his followers moved slowly to the reservation in June 1877. Three young warriors from White Bird's band disagreed with the decision and killed four white settlers. Fleeing to the gorges of the Salmon River, the Nez Percé pleas for peace went unheralded by local militia and cavalry. The Nez Percé were able to fend off their attackers and flee eastward to the inhospitable land on the south fork of the Clearwater River. General Oliver Howard soon caught up with them on a plateau above the Clearwater and engaged them for two days before the Nez Percé escaped.

On 15 July at Weippe Prairie, the Nez Percé chiefs decided the best course of action was to flee to Canada. While resting at Big River Hole in Montana on 9 August, the 900 Indians were attacked by 200 soldiers, who killed 89 Indians. But the warriors were able to pin down the soldiers for two days, allowing their families to escape. Joseph and his followers con-

tinued to dodge their pursuers and escape at places like Canyon Creek. On 30 September, at Snake Creek, less than 40 miles from the Canadian border, Colonel Nelson Miles engaged the hostiles. Three hundred Nez Percé led by White Bird were able to make it to Canada, but on 5 October, Joseph surrendered to Miles, and the Nez Percé war was at an end.

Nicaragua, Walker's Invasion of (1855–1857)

Failed filibustering expedition to Nicaragua led by the American William Walker. Known to many as the “Grey-Eyed Man of Destiny,” William Walker was both a pro-slavery southerner and a firm believer in America’s Manifest Destiny to rule the Americas. Possessing a strong desire to not only spread the institution of slavery but also to lead an independent state himself, Walker organized and led a filibuster (soldier-of-fortune) expedition to “liberate” Baja California and Sonora from Mexico in 1853. From the start, the expedition was a fiasco, and Walker and his ragged band returned to the United States in 1854. Although Walker’s foray into Mexico was a failure, it did attract the attention of citizens throughout the United States and beyond, thereby allowing him to gain experience and luring him to continue such activities in the future.

In May 1855, Walker again set out to filibuster, this time in Central America. This time Walker had chosen to meddle in Nicaragua. It should not be overlooked that Nicaragua was the primary transit point for people and goods headed for the recently discovered gold fields of California. Furthermore, Nicaragua was in the midst of a civil war between two factions—the Granadans (conservatives) and the Leonese (liberals)—so named from their respective capital cities. Losing the conflict, the Leonese forces requested Walker’s aid. Walker landed near Realejo on 16 June 1855 with 58 followers grandiosely calling themselves Walker’s “Immortals” and soon brought military success to the liberal faction. Walker was given the rank of colonel by the Leonese authorities and placed in command of La Falange Americana, or the American Phalanx. (The term was eerily evocative of

twentieth-century European fascism, with which Walker shared some attributes.)

After some military success and the seizure of a vessel run by Cornelius Vanderbilt’s Accessory Transit Company, friction between Walker and the liberal leadership soon developed. As a result, in 1856 Walker staged a coup d’état and named himself commander of the armed forces and president of Nicaragua. In addition, Walker legalized slavery in Nicaragua and made English the official language of the state. However, Walker’s tenure as president of Nicaragua was to be brief, as both the conservatives and liberals would soon unite, along with military forces from neighboring states, to oust the troublesome Walker and his fellow Yanquis. Facing a coalition of Central American states and hoping to avoid capture, Walker surrendered to U.S. naval forces on 1 May 1857 and left Nicaragua.

But Walker had not learned his lesson and, after leading another ill-fated expedition, was executed by a Honduran firing squad in 1860. William Walker was perhaps the most notorious of the nineteenth-century filibusterers.

Nicaraguan Civil War (1925–1933)

Internal conflict that paved the way for the Somoza family dictatorship. In 1925, Conservative Party candidate Carlos Solórzano was elected president, and U.S. Marines withdrew from Nicaragua after a 13-year occupation. However, opposition to Solórzano was strong, a revolution quickly ensued, and the Marines returned in 1926. Emiliano Chamorro deposed Solórzano, but his efforts did not bring peace to Nicaragua as liberal vice president Juan Bautista Sacasa led another revolt. The U.S. Department of State then brokered a deal resulting in former conservative president Adolfo Díaz’s return to power. Despite this diplomatic effort, the civil war was renewed and intensified. U.S. secretary of state Henry Stimson was appointed a special envoy by U.S. president Calvin Coolidge and sent to Nicaragua in 1927. Stimson negotiated an agreement between many of the warring factions that allowed Díaz to remain as president until 1928, at which time there would be U.S.-supervised elections. In addition, the United States agreed to help pacify the country and to establish and train a National Guard to maintain law and order.

Augusto César Sandino, one of the guerrilla leaders, rejected the accord and continued to fight both the government and the Marines. Sandino's hit-and-run guerrilla tactics frustrated all attempts to capture him and boosted his reputation. The failure of the Marines to capture Sandino caused embarrassment for the administration of incoming U.S. president Herbert Hoover, who sought a means to disengage. In 1932, the Liberal Party gained power with the election of Sacasa, and Anastasio Somoza García assumed command of the newly created National Guard. A truce was negotiated with Sandino, and the Marines left on 1 February 1933. Soon after the Marines withdrew, the National Guard attacked a rebel town, causing Sandino to declare a resumption of the war. President Sacasa offered to negotiate with Sandino, and they met with Somoza in Managua on 21 February 1934. After the meeting, Sandino was kidnapped and murdered by members of the National Guard, allegedly under Somoza's orders. Sandino's murder made him a martyr and a symbol of opposition to U.S. intervention in Central America. Anastasio Somoza used his power base as National Guard commander to overthrow Sacasa in 1936 and to establish a family dictatorship that made Nicaragua his personal family fiefdom until 1979.

Nicaraguan Civil War (1979)

The Nicaraguan Civil War began in 1961 with the creation of the Sandinista National Liberation Front (FSLN), a guerrilla group dedicated to the overthrow of the Somoza dynasty that had ruled the Central American republic as its private fiefdom since 1936. The movement gained adherents but was brutally suppressed by Luis Somoza Debayle, the president of Nicaragua, and his brother Anastasio, who commanded the National Guard. In 1963 Anastasio assumed the presidency and continued to fight the FSLN and all other opposition. In 1972, Nicaragua suffered a massive earthquake that devastated the capital, Managua, and the surrounding countryside. The Somoza regime demonstrated ineptitude and greed during the earthquake relief effort, thus intensifying opposition. Nevertheless, Anastasio Somoza was again elected president in 1974.

On 27 December 1974 FSLN guerrillas seized the minister of agriculture and several of Somoza's relatives and held

them for ransom. The government accepted the rebels' demands, paid \$1 million for the hostages' release, and provided safe passage to Cuba for the perpetrators. This event greatly enhanced the prestige of the FSLN but led the regime to increase attempts to crush the rebels militarily. By 1976, FSLN losses were high and one of the movement's founders, Carlos Fonseca, had been killed. However, the brutal tactics and atrocities committed against the civilian population supporting the FSLN drew international attention and condemnation. This pressure led in turn to a weakening of support for the Somoza government from the United States.

The FSLN struck the National Guard barracks at San Carlos in October 1977 and followed up by taking and temporarily holding several towns. Although not conclusive, these military successes resulted in moderate and conservative elements in Nicaragua throwing support to the FSLN. On 9 January 1978, Joaquín Chamorro, editor of the opposition paper *La Prensa* and a moderate opponent of Somoza rule, was murdered. Chamorro's assassination resulted in a general strike, street demonstrations, and a call for Somoza to resign. On 22 August 1978, Sandinistas commanded by Eden Pastora, whose nom de guerre was Comandante Cero, seized the National Palace and held hostage all the members of Nicaragua's Congress and some 200 government employees. Somoza was forced to pay \$500,000 in ransom, release 60 Sandinista prisoners, and grant safe passage to Venezuela or Panama for Pastora and his men. This humiliation resulted in fissures within the National Guard, but Somoza arrested rebellious officers and remained in control of much of the country.

Somoza renewed his efforts to win a military victory by calling up reserves and creating a special combat unit commanded by his son, Major Anastasio Somoza Portocarrero, and ordering the capture of the Sandinista stronghold at the town of Matagalpa. However, in early September 1978, the FSLN gained control of several other towns and most of León, Nicaragua's second-largest city. The National Guard was on the verge of collapse but concentrated its tanks, artillery, and air power on the Sandinista-held towns and drove them out by 19 September.

The counteroffensive was conducted without regard for the civilian populations, and the Somoza regime was subjected to mounting international pressure for a negotiated settlement. In addition, U.S. support for the Somoza dictatorship continued to wane. However, all attempts at a negotiated settlement by international organizations and the United States failed.

On 4 June 1979, the FSLN launched its final offensive by calling for a general strike, which soon shut down most of the businesses in the country. The guerrillas had received new shipments of arms from Venezuela, Cuba, and Panama

and by 6 June had taken control of major portions of León. A few days later, fighting broke out in Managua's poorer neighborhoods, and the National Guard responded with air attacks on residential sections of the city. Throughout June and early July, international pressure by the nations of the Andean Pact and the Organization of American States was exerted on Somoza to leave the country, but he stubbornly clung to power despite the fact that he had lost the support of the United States and controlled only some sections of Managua.

With his forces running out of ammunition, Somoza finally fled Nicaragua on 17 July. On 19 July, Sandinista troops entered Managua in triumph and were enthusiastically greeted by masses of Nicaraguans from all walks of life. On 20 July, a junta took control of the country.

The Nicaraguan Civil War was costly, with an estimated 30,000 to 50,000 Nicaraguans killed, 100,000 injured, and 300,000 left homeless or displaced to other countries. The economy was in a shambles, with most of the infrastructure of the country in ruin and a war debt of \$1.5 billion. And Nicaragua would soon be facing another conflict, this time between the Sandinistas and the Contras.

Nicephorus II Phocas (r. 963–969)

Byzantine general and emperor. Son of another Byzantine general, Bardas Phocas, Nicephorus Phocas began his military career in 955 as the successor to his father as domestic of the *scholai* (field forces). His father had been noted for his mastery of mobile tactics in defending against the Arabs, but the family itself, in spite of its military successes, had been under a cloud for some years because of the attempt of Bardas's brother, Leo, to seize power in 919.

Nicephorus came to a position of influence just as the Byzantine *reconquista* was gaining ground, and he was soon actively involved. His greatest accomplishment came in 961, under Emperor Romanos II (r. 959–963), when he successfully recovered Crete for the empire, an act for which he won

considerable public recognition. Still more recognition came the next year as a result of a highly successful raid against Arab Syria. It was primarily because of this recognition that Nicephorus was proclaimed emperor by his troops at Kaisareia in Cappadocia on 2 July 963, soon after the death of the emperor and a few months after a well-deserved triumph in Constantinople in recognition of his achievements.

This time, the Phocas usurpation was successful, and Nicephorus became emperor. As such, he continued his military successes in 965 by capturing Cyprus, Tarsos, and Mopsoestia. He was also successful in dealing with the Bulgarians, always a threat to the Byzantines of the time; his generals took Antioch in 969.

In support of the army, he increased land allocations to his soldiers and attempted to limit the growth of church lands by restricting bequests, although he supported the church in other respects. Despite the fact that Nicephorus was very much the military man of action, he fulfilled his ritual role as well, as we know from the account of papal envoy Liudprand of Cremona, although not as well as the well-liked Constantine VII, for whom the people continued to long.

Despite his success as ritual figure, there is also evidence that Nicephorus's reign was unpopular, in part on account of the heavy costs of the *reconquista* itself, which seemed to lay a heavy burden upon the population of Constantinople. As a result, Nicephorus had constantly to be on the defensive as emperor. He was murdered by his nephew, the general John I Tzimisces, in cooperation with his empress, Theophano, the widow of Romanus II, whom Nicephorus had married to cement his claim to power. John (r. 969–976) became his successor.

Nicholas, Grand Duke (1856–1929)

Russian general, commander in chief during the opening stages of World War I, and one of Russia's best commanders in that conflict. Nephew to Czar Alexander II, Nicholas was born on 18 November 1856 in St. Petersburg. After attending general staff college, he served with his father, Grand Duke

Nikolay Nikolayevich, commander in chief in the Russo-Turkish War of 1877–1878. He commanded the Guard Hussar Regiment in 1884 and served as inspector general of the cavalry from 1895 to 1905, where he instituted a much-needed modernization plan. His reform efforts continued in his next post as commander of the St. Petersburg Military District. From 1905 to 1908, he served as president of the Imperial Committee of National Defense, which was then dissolved.

Nicholas was not involved in war planning during the turbulent period from 1909 to mid-1914, but when World War I started, Czar Nicholas II named him commander in chief. Nicholas did a superb job of rallying the underprepared Russian forces against the Germans and the Austro-Hungarians, but the czar relieved Nicholas in September 1915 following defeats the previous summer. The czar, disastrously, assumed personal command of the military and assigned Nicholas command of Russian forces in the Caucasus. There he enjoyed success in campaigns in Armenia, where he captured the fortress of Erzurum in February 1916 and the port of Trabzon in April 1916. He successfully defended his gains against the Turkish offensive later that summer.

On the eve of the March 1917 revolution, the czar named Nicholas full commander in chief once again, but he held the post only a very short time. After being relieved by Prince Georgy Y. Lvov, Nicholas retired to the Crimea until 1919, when he moved to France. He died on 5 January 1929 in Antibes.

Nieuport (1600)

The first test of the Dutch army following Maurice of Nassau's reforms. Against his better judgment, Maurice was ordered by the Dutch government to "liberate" the Flemish coast from Spanish control. This move was strategically unwise, as the only Dutch base in the region was the isolated port of Ostende, but Maurice executed a brilliant logistical maneuver, moving his army of 14,000 to Ostende and marching down the coast to Nieuport. The capture of this city would deny the Spanish Netherlands access to the sea, so the Spanish governor-general, Archduke Albert of Austria, needed to break the siege. Many of his veteran units

were in mutiny, but Albert convinced them to rejoin the army, gathering 10,000 men.

Archduke Albert's army made for the coast, falling on Maurice's rear guard at Leffinghem. This force was scattered, blocking any Dutch retreat toward Ostende. The Spanish then moved rapidly down the coast, hoping to fall on the rear of Maurice's siege positions. Meanwhile, Maurice abandoned the siege and moved his army across the Yser River to face the Spanish.

The battle, fought on 2 July 1600, demonstrated the advantages of the smaller, more maneuverable companies with a higher proportion of musketeers instituted by Maurice. Both armies were forced to redeploy inland as a result of the rising tide, a maneuver that the Dutch executed with ease. The Spanish *tercios* (infantry regiments) were held at bay by the firepower of Maurice's English contingent, under the command of Sir Francis Vere. While this fight raged in the center of the battle, Maurice successfully concentrated his cavalry on the inland flank and routed the Spanish horse, exposing the flank of the Spanish infantry.

A final charge by Maurice's army then drove the Spaniards from the field. It was a brilliant tactical victory, but Albert had forced the Dutch to give up the siege of Nieuport.

Nigerian Civil War (1967–1970)

A brutal civil strife that exacerbated distrust and antagonism and has plagued Nigeria from independence to the present. Nigeria was bedeviled by regional differences at independence. Indirect rule under the British had created a north-south dichotomy. Then the 1957 Macpherson Constitution transformed regional councils into parliaments, making Nigeria a federation of three self-governing states at independence in October 1960, under Prime Minister Abubakar Tafewa Balewa. The north, the largest region, was predominantly Muslim and Hausa, the east largely Christian and Ibo, and the west religiously mixed but predominantly Christian Yoruba.

Although the federal system was touted as a model of diversity and achievement, regional differences sowed seeds of discontent. In 1965, the northern region again gained a majority in the federal legislature, and thereafter a climate of lawlessness gradually enveloped parts of the country in

1965–1966. Easterners and westerners chafed under “northern domination.” A coup by young Ibo army officers achieved very little, but in rapid succession, prominent politicians (Prime Minister Tafewa Balewa; the western prime minister, Chief Akintola; and the northern prime minister, the Sardauna of Sokoto) were assassinated in January 1966. Anarchy was temporarily averted by the coup d'état of Major General Jounson Aguiyi-Ironsi. However, the calm lasted only until mid-1966, when General Aguiyi Ironsi was kidnapped and murdered in a countercoup on 29 July by mostly northern Hausa soldiers who detested his attempts at a unified government and the failure to punish the Ibo officers responsible for the earlier coup.

In a climate of accusation and counteraccusation, thousands of Ibos working in different parts of Nigeria as clerks and civil servants were killed by Hausas in retaliation. Lieutenant Colonel Yakubu Gowon emerged as head of state and called a conference in September 1966 to determine the form of national government. The effort met with very little success because of deep-seated divisions between the three regions. Concomitant with the conference's collapse in early October was a new and vicious rebellion by part of the army in the northern region. Mobs of Hausas again mercilessly slaughtered Ibos, especially those leaving the region. Consequently, Ibos boycotted the reconvened constitutional conference in November and threatened secession.

After months of unproductive negotiations in early 1967, Colonel Odumegwu Ojukwu assumed control of the eastern region and proclaimed the sovereign state of Biafra. It attained initial military success, but by 1969, Ibos were slowly driven into a smaller part of the eastern region with the capture of Enugu. The international community and African nations were dragged into the war. Ivory Coast, Zambia, Haiti, Gabon, and Tanzania recognized Biafra. The Nigerian federal government used Soviet aircraft and Egyptian pilots for bombing runs in Biafra. Britain also provided arms, but France, Spain, and Portugal supported Biafra, albeit on humanitarian grounds. The United States officially supported the federal government but provided medical supplies, foodstuffs, and other materials to Biafra.

After Biafra's initial military victories, the federal government gradually imposed a stranglehold on Biafra, cutting off all arms, food, and medical supplies to the region, leading to starvation and malnutrition. Children were collected into orphanages, but with little food to go around, many ended up in mass graves.

By early 1970, Biafra was no longer able to prosecute the war and surrendered, and Ojukwu fled the country. International efforts were mounted for relief supplies, but the operation was weakened by the Cold War rivalry of the United States and the Soviet Union.

Nightingale, Florence (1820–1910)

Near-legendary founder of modern nursing. The daughter of wealthy English parents, Nightingale was born in Florence, Italy, in 1820. She became interested in nursing after she claimed that God had spoken to her in 1837 and directed her to serve others. Florence studied with nurses in England, Alexandria, Egypt, and Germany. Nursing was held in low esteem at the time, and Nightingale chose not to marry in order to pursue her vocation with a passion.

When the Crimean War began in 1853, British secretary of war Sidney Herbert asked Nightingale to assist British forces. She trained 38 nurses for work in army hospitals and found horrifying conditions in the war zone. Thousands of casualties suffered in primitive hospitals with poor medical care and insufficient supplies, and the experience left Night-

Photograph of Florence Nightingale, c. 1845. (Hulton/Archive)

ingale with acute posttraumatic stress disorder (PTSD) for the rest of her life. She returned to England when the war ended in 1856 and, tormented by her memories, never again made a public appearance or statement.

Yet her widely publicized service in the Crimea had made her a legend, and Nightingale used her fame to encourage the professionalization of nursing. Arguing that a nurse's care was noble and never-ceasing, she established the foundation of modern nursing by writing numerous books and pamphlets and in 1860 founded the Nightingale School and Home for nurses in St. Thomas's Hospital, London. She received the British Order of Merit in 1907 and upon her death in 1910 was buried at her family's plot in East Wellow, England. Her casket was carried by six sergeants of the British Army. Britain honored her with the Crimean Monument in London in 1915, and the international community did so by creating the Florence Nightingale International Foundation in 1934. It is due primarily to Florence Nightingale's nearly obsessive efforts that nursing, military and civilian, is the respected profession that it is today.

Nine Years' War (1595–1604)

Also known as the O'Neill Rebellion, the result of increasing English involvement in Ireland in the 1580s. Ironically, Hugh O'Neill, the Earl of Tyrone, was the product of efforts to bring the island under control, having been taken to England at a young age and educated there. He was returned to Ireland in the late 1570s to rise to leadership of the long recalcitrant O'Neill clan of Ulster, bringing them to some degree of submission and in 1593 was elevated to the English title earl of Tyrone.

Though O'Neill had been considered a loyal subject, English officials in Ulster now reported that he was preparing rebellion. Though he was probably motivated by personal grudges, these reports were taken seriously by London, which sanctioned garrisons around O'Neill's territory. Caught between two cultures, O'Neill elected for the Gaelic in late 1594; he began negotiations with Spain and started forming an army equipped with modern firearms. In defiance of Elizabeth I's orders, he assumed the Gaelic title of

"The O'Neill" in 1595. From that point on, he was considered to be in rebellion.

Fighting began in 1595, when O'Neill's brother Art attacked English garrisons on the Blackwater River. In May, O'Neill demonstrated his military talents by ambushing the English at Clontibert. He expanded his army to more than 10,000 men during a shaky truce he negotiated with Sir John Norreys in 1596. In 1597, as rebellion broke out in other parts of the island, the English decided to rebuild the forts on the Blackwater. O'Neill promptly laid siege to them, and in August 1598, an attempt by 4,000 English troops to relieve the forts led to their greatest defeat in the war at Yellow Ford, with more than half of the relief force lost. Subsequently, the province of Munster rose in bloody revolt against its English plantation.

In 1599, the Queen's favorite, the earl of Essex, brought over 16,000 troops in an attempt to salvage the situation. O'Neill whittled this force down to a mere 4,000 in just 21 weeks through the use of guerrilla tactics, combining traditional Irish tactics with modern firearms.

Essex was replaced by Charles Blount, Lord Mountjoy, who instituted new tactics, campaigning in winter and devastating the countryside to deprive O'Neill's forces of food. Though his first battle, against positions O'Neill had fortified at Moyry Pass (2 October 1600), was a draw, it was clear Mountjoy was gaining control of the situation, when on 21 September 1601, long-awaited Spanish forces arrived in Ireland. Unfortunately for O'Neill, they landed at Kinsale in the extreme south and were promptly besieged by Mountjoy. O'Neill had to face Mountjoy's army in an open field to lift the siege and was decisively defeated in the attempt on 24 December 1601. The Spanish surrendered soon after. O'Neill's rebellion was effectively crushed with the defeat at Kinsale, and he made his submission on 30 March 1603, having been defeated by the superior resources of a powerful state.

Nivelle, Robert (1856–1924)

One of the more disastrous of the French generals. Born at Tulle on 15 October 1856, Nivelle graduated from the École Polytechnique in 1878 and entered the artillery. Promoted to

colonel (1911) and then brigadier general (October 1914), he commanded III Corps at Verdun and developed tactics that won him prominence. These consisted of training selected units to assault objectives in small groups. Attacks were preceded by deception barrages that would be halted to encourage the Germans to reveal their artillery positions. With the enemy guns silenced, attacks would then resume.

In April 1916, General Joseph Joffre gave Nivelle command of the Verdun Front (Second Army). Nivelle proclaimed “We have the formula!” and launched a series of local attacks beginning on 1 May that led, after initial setbacks, to the recapture of Fort Vaux (7 June) and Fort Douaumont (24 October). Because of his Verdun success and skill at self-advertisement, Nivelle was named commander in chief of the French armies of the north and northeast in December 1916, replacing Joffre. Nivelle’s fluent English helped him secure approval from Prime Minister David Lloyd George for a plan to secure victory. The focus of the attack was in Champagne, and the key to success would be the “Verdun” formula, despite the difficulty of applying these tactics at the army level. The “Nivelle Offensive” (16 April–9 May 1917) was widely anticipated by the Germans. Aware of the French plan, they shortened their front and prepared defenses in depth. The offensive produced only minimal gains and 130,000 French casualties. It also led to widespread mutinies in the army and to Nivelle’s replacement in May by General Henri-Philippe Pétain.

Nivelle declined command of an army group and submitted to review by a military inquiry in October that whitewashed him. He commanded French troops in Algeria in 1918 and served on the Supreme War Council after the war. He died in Paris on 23 March 1924.

Nogi, Maresuke (1843–1912)

Japanese general famous for siege of Port Arthur during Russo-Japanese War. Born in Tokyo in 1843 to a Choshu clan samurai father, Nogi served in the Restoration War of 1868, attained the rank of major in 1871, and fought in the Satsuma Rebellion in 1877. He was part of the Japanese officer

contingent that studied military science in Germany in 1885–1886. He saw action during the 1894–1895 Sino-Japanese War in the siege of Port Arthur (24 October–19 November 1894) and in the Battle of Yingkow (9 March 1895) as a brigade commander. Nogi commanded the Third Army during the 1904–1905 Russo-Japanese War and oversaw the costly siege of Russian defenses at Port Arthur (22 June 1904–2 January 1905). Japan suffered 100,000 casualties before the Russians finally surrendered. Following the long siege, Nogi rushed his army to participate in the Battle of Mukden, another Japanese victory. Later, as headmaster of a private school, he tutored the future emperor Hirohito. Hailed as a hero, Nogi demonstrated his loyalty to the emperor by committing ritual suicide on 30 June 1912 following his ruler’s death. Understandably, his home is today a shrine.

Nongovernmental (Extranational) Organizations: Their Role in War and in the Wake of War

Civilian organizations that mobilize resources and individuals to alleviate human suffering in peace war and war. Since the mid-nineteenth century, people in the developed nations have founded organizations, such as the Red Cross, Cooperative for Assistance and Relief Everywhere (CARE), Catholic Relief Services, and Oxfam, aiming to provide humanitarian aid beyond local boundaries. Naturally, these efforts are applied to war-torn areas as well. The staff members of nongovernmental organizations (NGOs), neither established nor controlled by any government, bring the essentials of survival, food, clothing, shelter, and health care to people who have lost everything.

After 1945, the United Nations High Commissioner for Refugees (UNHCR) became a focal point for NGO efforts internationally. In most instances, UNHCR coordinates all major humanitarian relief efforts by NGOs in a particular country with that country’s government.

Generally, the most influential and effective NGOs are religious-based organizations founded in the prosperous countries of the Northern Hemisphere. Most of their efforts

are aimed at relieving major human disasters that are found usually in the poorer countries of the Southern Hemisphere. Because most NGOs have a long history, they are well-established bureaucracies having various levels of management and even perhaps competing suborganizations. Moreover, the NGOs frequently know each other's strengths and do not duplicate efforts. For example, among Rwandan refugees in Zaire, Oxfam alone established a water supply system for 800,000 people in 18 days.

In most cases, there are ongoing military conflicts either causing or caused by the human disaster. Thus, a range of important matters must be resolved in the relations between military forces and the NGOs. First, there may be a civil war in progress. The central government may oppose and refuse to permit NGO relief efforts from reaching those in rebellion. NGOs generally seek to remain neutral and even-handed in all conflicts. But their purpose of providing humanitarian aid to any and all people in need may lead to their staging their relief efforts in a neighboring country and crossing the international border directly into rebel territory. The government could see their efforts as rendering aid to its enemies, as happened in East Timor.

In Bosnia-Herzegovina, UNHCR and various NGOs providing relief took a different tack. Their convoys had to travel roads through areas controlled by Bosnian Serb forces in order to reach Bosnia Muslims who had been victims of ethnic cleansing. To obtain a peaceful accommodation, standard practice was to give a part of the relief aid to the Bosnian Serb forces that had ethnically cleansed the area in exchange for being allowed to proceed to deliver aid to the victims.

Second, occasions such as Somalia may arise in which the central government has ceased to exist. UNHCR and NGOs may seek military intervention to protect and assist them in their efforts to move relief supplies into the country and to the people suffering in the interior. As happened in Somalia, the results can lead to new levels of violence or new causes for military action. The U.S. military termed this effect "mission creep," and it cost American lives in the streets of Mogadishu.

In addition, some NGOs have the purpose of moving beyond emergency relief for saving people's lives to the nation-building or development phase. Here the task is to create new social and indigenous governmental institutions to sustain the people. Their concerns include the protection of human rights and the need for a war crimes tribunal. In these circumstances, repatriation or implementation of a peace settlement may require facing the issues that caused the military conflict originally. The various military forces in question may need to shift from a combat mode to a peacekeeping or peace-establishing mode.

Finally, NGOs have had to work out agreements with relief military units sent in to suppress violence. The NGOs looked upon the military as akin to those armed forces that started the problem, while the relief units, particularly those from the developed world, viewed the NGO personnel as "disaster groupies." Since approximately the time of the Kurdish protection operation in 1991, both sides have come to realize that they work much better through mutual cooperation; the NGOs need the military for its unsurpassed logistics and transportation facilities and skills, and the military has become mindful that its members are not trained for the complex tasks of running a civil economy over time and also realize that the NGOs, which generally will stay much longer than expensive military units, are their "tickets out of here."

Nordlingen (1634)

A watershed battle in the Thirty Years' War. After two disastrous years, the battle ensured the survival of the Catholic and Habsburg cause and produced a balance of Protestant and Catholic forces within Germany.

From 1632 to 1634, the Swedish and Protestant position slowly unraveled. Imperial (Catholic) forces registered a series of small but cumulatively significant successes, until September 1634, when they won a battle in Bavaria that radically changed the situation within Germany.

At Nordlingen, a numerically superior Catholic army crushed a Swedish army that was committed first to a frontal attack on an entrenched hilltop and then, after having taken but lost this position, to a withdrawal across the front of the main part of the Catholic army. The attack by this uncommitted part of the Catholic army turned a retreat into a rout: the Swedish army lost 21,000 dead and prisoners from an initial strength of just 25,000 troops. Sweden's

defeat marked the point at which it could no longer lead the Protestant cause, and Catholic France, unless it were to tolerate a Habsburg victory, was obliged to lead the war against Austria and Spain.

Norman Conquest (1066–1072)

William conquers and restructures England after victory at Hastings. The Norman Conquest of England was more than the military victory of one of three contenders for the English throne. It marked a complete restructuring of England's society, with some changes imposed and others constituting an effective application of native systems already in place. The Norman Conquest changed the ruling house, ruling class, and the legal languages of England. Changed too was ownership of the land. Before the conquest, individuals might own areas of land. Afterward, even church land was held by the king on feudal terms. This change allowed greater control over a feudal system in which many portions were held in fief from different liege lords. In England all loyalty, in the end, was to the monarch, and subinfeudation was mostly eliminated as a divisive element. The Anglo-Saxon ruling class was largely replaced by Norman supporters of William the Conqueror. As part of his administrative reorganization, a string of castles was built. The language of the court and the courts changed to French and Latin, respectively.

From 1068 to 1071, a series of regional revolts against William occurred. They were largely localized. William ended them with brutal efficiency. He laid waste to Yorkshire, killing all males and pursuing a scorched-earth policy that was apparent even 20 years later in the *Domesday Book*.

The Norman Conquest should be regarded as the seminal event in English history until the Reformation. It substantially altered the institutional structures of the church, the monarchy, and feudalism. It also changed the political, intellectual, and social framework of England, enhancing the existing rules and reinterpreting them. The character of medieval England was created in the crucible of the Norman Conquest.

Norman-Byzantine Wars (1081–1108)

Wars through which Normans tried twice to conquer Byzantium through the Balkans but were repulsed by Emperor Alexius I Comnenus (r. 1081–1118). Around 1017, the first Norman warriors landed in southern Italy, looking for lands and loot. Byzantium held southern Italy and Sicily, but revolts by the Lombard population had enfeebled its grip. Supported by constant infusions of their kinsmen, the Normans carved up southern Italy, and by 1042, very few cities remained to Byzantium. In 1053, the Norman Robert Guiscard compelled the pope to recognize him as duke of Apulia and Calabria. In turn, Guiscard became a papal vassal, just as relations between the papacy and Byzantium devolved into mutual hostility and excommunication. In 1071, after a siege and blockade of nearly three years, the Normans captured the port of Bari, ending forever the Byzantine presence in Italy.

That same year, Byzantium faced a mortal crisis more dire than the loss of Italy. The 1071 Battle of Manzikert had destroyed the Byzantine army in Asia, and Turks now flooded into Anatolia. Additionally, Manzikert plunged Byzantium into civil war. As Alexius I Comnenus won the throne in 1081, Guiscard resolved to conquer Constantinople. The empire was in tatters, Norman hirelings in the Byzantine army threatened to defect, and a deposed emperor, Michael VII (r. 1071–1078), had betrothed a son to Robert's daughter. Thus, Robert Guiscard and his son, Bohemond, took sail that year and landed on the Epirus (Albanian) coast.

Alexius persuaded the Venetians to sink the Norman fleet but could not save Dyrrhachium from Robert's siege. A Byzantine relief force, heavy with Bosnian and Turkish mercenaries, suffered complete defeat, and by 1082, Robert held northwestern Greece. Byzantine money inspired rebels in Italy, forcing Robert to return home, but Bohemond continued to occupy Greek and Bulgarian lands. Alexius lost three more battles, until the Byzantines finally stopped the Normans in the spring of 1083. The alliance with Venice now paid off by blocking support to Bohemond, and the Normans evacuated the region. Robert Guiscard was preparing

for a rematch when he died in 1085, but his aggression had cost Alexius almost all of Anatolia.

The First Crusade delayed the next Norman-Byzantine war, and Bohemond's Normans provided a major contingent to the Crusaders. After taking Antioch, Bohemond fell into Turkish captivity for several years. Once released, he struggled with Alexius's Armenian allies no less than with the Turks. By 1106, apoplectic at perceived Byzantine treachery, Bohemond returned to Italy to plan a second Balkan invasion. In 1107, Normans again landed in Epirus and threw up another siege around Dyrrhachium. Alexius then encircled the besieging army, as Venice sealed the coast. After months of relentless attrition, Norman forces finally collapsed in 1108. Pledging homage to Alexius, Bohemond returned to Italy. Norman threats to Byzantium remained dormant until the 1147 Sicilian crisis.

Normandy Landings (1944)

The greatest amphibious landing operation in the history of warfare. Allied plans for an invasion of western Europe in World War II began soon after Germany declared war against the United States on 11 December 1941, with the appointment of General Dwight D. Eisenhower to design a plan for Allied victory in Europe. Eisenhower quickly developed two plans, one for 1942, called Operation SLEDGEHAMMER in case the Soviets were routed in the east, and a 1943 invasion plan called Operation ROUNDUP. British officials persuaded American leaders to focus their principal operations on North Africa and later on operations in Sicily and Italy. Soviet leader Stalin continued to press for a "second front" to lessen the German pressure on Russia.

Finally, at the Tehran Conference (November–December 1943), President Franklin D. Roosevelt and Stalin insisted to British prime minister Winston Churchill that May 1944 be the date for the invasion and that the Soviets would mount an attack on German forces to coincide with the European invasion.

Even though the British had been reluctant, Lieutenant General Frederick Morgan had worked on an invasion plan called Operation OVERLORD since the Casablanca Conference

in January 1943. The landings were to be at Normandy, between Caen and the Cotentin Peninsula. Three Allied divisions were to be part of the landing, and two other divisions were to be air-dropped, with 11 other divisions to land within 14 days. Two artificial harbors were to be towed from England, and once a foothold in Europe had been established, several hundred divisions would be shipped from the United States and from across the channel.

The German high command had been aware of Allied cross-channel invasion planning for a long time, but with their forces dispersed in the Mediterranean and campaigns in the east, they were unable to fortify western Europe until November 1943, when Adolf Hitler issued Fuhrer Directive 51. Hitler appointed Field Marshal Erwin Rommel to oversee coastal defenses and command Army Group B. Although Rommel was able to lay 4 million mines, he was not able to position German tank divisions where he wanted because of the divided German command.

In January 1944, British general Bernard L. Montgomery was named commander of the ground invasion forces under Eisenhower. Montgomery demanded that five divisions (two British, two American, and one Canadian) make the initial landing and that the landing zone include the Orne River estuary. American landing forces would be led by General Omar Bradley and Canadian and British forces by General Miles Dempsey. Each of the five beaches where forces were to land was assigned a code name from east to west: Sword, Juno, Gold, Omaha, and Utah. One British airborne division was to land behind coastal defenses in the east and two American divisions in the west, while amphibious forces would swim ashore to prepare for the landing. To soften up German defenses, between 1 April and 5 June, 11,000 Allied aircraft flew 200,000 sorties, dropping 195,000 tons of bombs on strategic locations in France. Many of these raids were designed to persuade German forces that the landing would be northeast of the Seine. The Allies also created an entire phantom army in England under the command of George S. Patton, as well as false images of an invasion fleet sailing toward the Pas-de-Calais area on the night of the invasion.

Because of difficulties with assembling landing craft, the invasion was moved to June 1944. The invasion, threatened by foul weather, was nonetheless given the go-ahead on the morning of 5 June by Eisenhower. The cross-channel armada contained 3,000 landing craft, 500 naval vessels, and 2,500 other ships. Although the Luftwaffe had fewer than 400 airplanes in the area on D-Day, 13,000 fighters, bombers, and other Allied aircraft aided ground forces. The American 82d and 101st Airborne Divisions dropped into the Cotentin Peninsula and, although suffering heavy casu-

American soldiers wade from a Coast Guard landing craft toward the beach at Normandy on D-Day, 6 June 1944. (Library of Congress)

alties, secured their objectives, and the 6th British Airborne Division captured key bridges over the Caen Canal and Orne River.

At 6:30 A.M. on 6 June, British and Canadian forces landed on Gold, Juno, and Sword beaches with little opposition. The American forces at Utah faced a similar situation. But the 1st American Division at Omaha Beach was confronted by the 352d, the best German coastal division. The 6-mile section of beach between Port-en-Bession and the Vire River had 12 German strong points called *Widerstandsnester* and numerous other fighting positions on the cliffs surrounding the beach. By 8:30, landings had ceased at Omaha, leaving surviving American forces slowly to secure the beach and scale the cliffs. Navy destroyers steamed close in to shell German fortifications. By noon, German fire had noticeably decreased as U.S. troops took German defensive positions from the rear. An exit from the beach was finally opened, but not before the Americans had suffered 2,400 casualties and the Germans of the 352d 1,200 casualties.

German forces were caught in disarray, with Rommel on leave at home. At first, Hitler was unwilling to release an armored division for the counterattack, but he relented by midday, allowing the 21st Panzer Division to move to an area between Juno and Sword beaches, which almost reached the sea. But the Germans had long since lost any opportunity of throwing the Allies back into the sea; considering the vast superiority of the Allies across the spectrum of land, sea, and air power, it was a forlorn hope from the beginning.

North Atlantic Treaty Organization (founded 4 April 1949)

Mutual defense alliance presently comprising 19 members from Western and Central Europe and North America and formed after World War II to offset the large conventional military advantage supposedly possessed by the USSR. Immediately following World War II, Belgium, France, Luxembourg, the Netherlands, and the United Kingdom signed a collective defense alliance termed the Brussels Treaty. It was soon recognized that the Brussels Treaty was no match for the Soviet military. Almost immediately, negotiations began with the United States and Canada to enlarge the collective defense arrangement. Negotiations culminated in the signing of the North Atlantic Treaty.

The original members of the North Atlantic Treaty Organization (NATO) included Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom, and the United States. During the next 50 years, NATO expanded to include Greece and Turkey (both joined in 1952); West Germany (1955); Spain (1982); and the Czech Republic, Hungary, and Poland (1999).

The heart of the NATO alliance is Article 5 of the treaty. In Article 5, signatories declared that an armed attack upon one member shall be considered an attack against all. In such cases, NATO members have the right, recognized by Article 51 of the Charter of the United Nations, to take whatever actions necessary to safeguard their security and territorial integrity. Post-1945 proponents of such a treaty used the argument that had Adolf Hitler been faced with a similar mutual defense network in the 1930s, he would not have gone to war.

One of the early issues confronting NATO in the first half of the 1950s was negotiating the participation of West Germany in the alliance. It was less than a decade since the end of World War II, and with Nazi occupation still fresh in the minds of many, the European powers were understandably wary of rearming West Germany. But it was recognized that a revived West Germany was key to NATO's success. The large German population, its growing economy, and its geostrategic location astride probable Soviet invasion routes made its membership in the alliance critical. The Soviet Union reacted to West Germany accession to NATO by creating the Warsaw Pact alliance in Eastern Europe.

In 1966, President Charles de Gaulle of France informed U.S. president Lyndon Johnson that France, although adhering to the basic tenets of the Atlantic Alliance, would take steps to exercise her full sovereignty. Subsequently, NATO troops were permitted use of French airspace or territory. Additionally, France withdrew from the integrated com-

*Harry S. Truman holding the NATO treaty he signed on 25 July 1949.
(Library of Congress)*

mand structure and denied NATO the use of her troops. De Gaulle managed to have it both ways: France was free of the obligations of NATO but knew full well that the organization would not sit by and watch the country be again the victim of an aggressor.

Although NATO was assumed to have better-equipped and trained militaries, the huge numerical advantage supposedly possessed by the USSR and the Warsaw Pact meant that Western European security rested partly on the deterrent effect of U.S. nuclear retaliation. In 1979, NATO's Nuclear Planning Group agreed to station medium-range U.S. nuclear missiles (Pershing IIs) in Western Europe. Some member-states worried that deploying such weapons would accelerate the arms race. Additionally, several members had to contend with widespread civilian protests concerning deployment of the missiles. Many believed that the deployment of the missiles led to the 1987 Intermediate-Range Nuclear Forces (INF) Treaty banning medium-range missiles.

By the early 1990s, NATO was suffering from a crisis of identity. For half a century, the *raison d'être* for NATO had been to protect Western Europe from Soviet aggression. With the collapse of the Soviet Union in 1991, NATO's purpose became more difficult to define. (The members of the defunct Warsaw Pact engaged in no such navel gazing; they all wished to join NATO.) As leaders struggled with justifying not only the existence of NATO but a rationale for ex-

panding NATO, events in the Balkans provided possible new missions and opportunities.

A new chapter in NATO's history began in the 1990s, when for the first time it engaged in military action. In April 1993, NATO warplanes began patrolling the skies over Bosnia and later began air strikes against Serbian military targets. Later, as part of the Dayton (Ohio) Peace Accords, NATO provided ground troops as part of a multinational peacekeeping mission in Bosnia.

In 1998, the Serbian province of Kosovo was the scene of widespread Serb persecution of its secession-threatening Albanian population. NATO responded with a 78-day bombing campaign, forcing Serbian leaders to capitulate. NATO ground forces were again inserted as peacekeepers. Critics wondered publicly about just how far NATO could go as the policeman of Europe and about the extent of American forces in this policing. Further, labeling the "aggressor" to be punished was much more complex than in 1949. For example, Albanians were "victims" when persecuted by Serbs but then "aggressors" when they turned upon the Serbs in Albanian-dominated areas.

Northern Ireland, Civil War in (1969–present)

Conflict, known as "the Troubles," related to British control over six northeastern counties of the island of Ireland. The conflict has a long history, going back to the Norman conquest of England (1066). For almost a millennium, the fighting has ebbed and flowed with the tide of English control of the region. Casualties related to the Troubles (1969–2000) are in excess of 3,300 dead and 42,000 injured.

Early in the twentieth century, Britain negotiated the divestment of 26 Irish counties to the newly formed Republic of Ireland. The remaining six counties (Northern Ireland), possessing a 2–1 Protestant majority, were given their own parliament, known as the Stormont. From 1921 to 1968, Northern Ireland was ruled as a Protestant state whose purpose was to serve the interests of the Protestant majority, who felt that they had already given up more than enough to the "papists."

In the late 1960s, a civil rights movement, modeled on Dr. Martin Luther King Jr.'s movement in the United States, developed to address inequities and seek political changes. Some of the more radical and violence-prone groups demanded union with the Republic of Ireland. On 5 October 1968, nightstick-wielding members of the Royal Ulster Constabulary (RUC, the Protestant-dominated police force of Northern Ireland) attacked 400 peaceful marchers who were singing "We Shall Overcome." The entire episode was caught on film and led to riots erupting in Catholic sections of Northern Ireland's capital, Belfast.

As rioting erupted throughout the province, the exhausted RUC soon realized that they needed assistance, and the 2,000-strong garrison of British soldiers was pressed into service. At first, Catholics saw the British troops as saviors from the brutal RUC. Within a year, the British army's welcome had worn thin among Catholics. Over time, Catholics began to see British troops as an army of occupation that favored the Protestants. Tensions came to a climax on 30 January 1972, when British paratroopers fired upon a group of marchers, killing 14, an incident ever afterward known as "Bloody Sunday." The official version of the incident claims that paratroopers were returning fire from the marchers. No evidence to support this contention has ever been found.

Violence quickly escalated, and soon more troops were sent, ultimately reaching a total of approximately 21,000 in 1972. Soon, a near full-fledged civil war was being waged between Catholic and Protestant paramilitaries, with the RUC and British army caught in the middle.

During most of the 1970s, the "security phase" of the conflict dominated. Local police were put under control of army commanders. A large number of the elite British Special Air Service (SAS) troopers were introduced into the conflict as undercover operatives, with controversial results. The security measures were seen as counterproductive, and by 1977, a new policy of "police primacy" was implemented.

What British politicians originally saw as a relatively brief military deployment extended to more than a third of a century. The British army learned a lesson that has been taught many times in history: military force, no matter how well trained, equipped, and dedicated, cannot resolve a political conflict.

Northern War, Great (January 1700–August 1721)

Conflict involving Sweden against the Baltic powers, resulting in the replacement of Sweden by Russia as a European great power. Swedish expansion during the sixteenth and seventeenth centuries had antagonized the other Baltic powers. Russia's access to the Baltic was blocked; Denmark-Norway resented its loss of Scania; Brandenburg coveted Swedish Pomerania; and Poland desired Swedish Livonia. When Charles XII ascended the throne in 1697, Denmark-Norway began to organize an anti-Swedish coalition including Saxony-Poland, Denmark-Norway, and Russia.

The elector of Saxony, Augustus II, who was also king of Poland, attacked Livonia in January 1700. King Frederick IV of Denmark-Norway marched into Schleswig and Holstein in March 1700. In October 1700, Czar Peter I of Russia laid siege to Narva.

Charles made a daring landing a few miles from Copenhagen, compelling Frederick to sign the Treaty of Travendal in August 1700. Next, Charles raised the siege at Narva on 30 November 1700. Then he occupied Courland and forced Augustus to retreat into Poland. After Charles invaded Saxony, Augustus agreed to relinquish the Polish crown to Stanislaw Leszczyński and signed the Treaty of Altranstädt in September 1706.

Peter used this respite after Narva to undertake a series of reforms, the prime purpose of which was to reorganize and strengthen the Russian army. Charles resumed his attack on Russia in January 1708 with a force of 50,000. The Russians defeated an auxiliary Swedish force of 15,000 men at Lesnaia in October 1708. The main Swedish force was then trounced at Poltava in July 1709.

Charles fled to Turkey, where he convinced the sultan to declare war on Russia in 1710. However, after the Turkish victory at Jassy on the Pruth River in July 1711, the sultan decided to end the war with a negotiated settlement that returned control of the Azov region to the Ottomans.

Russia's victory at Poltava revived an anti-Swedish coalition with Saxony, Poland, Denmark, Prussia, and Hannover. Peter captured Viborg/Viipuri and Reval in 1710. During 1713–1714, the Russians occupied most of Finland. In 1714 the Russians defeated the Swedish fleet at Hango and, having captured the Åland Islands, threatened Stockholm. Charles returned to the Swedish territory of Stralsund in November 1714 and made his way the following year to southern Sweden. He opened peace negotiations in 1717–1718 while simultaneously organizing an army of 60,000 men in anticipation of a new offensive.

In September 1718, Charles invaded southeastern Norway, but he was killed at the siege of Frederikshald in De-

ember 1718. The Swedish throne passed to his sister Ulrika Eleonora and later to her husband, Frederick I of Hesse-Kassel. Frederick negotiated a series of peace settlements from 1719 to 1721.

By the Treaties of Stockholm (1720–1721), Sweden settled with Saxony, Poland, Denmark, Prussia, and Hannover. Denmark ceded its conquests to Sweden in return for a substantial sum of money. Sweden ceded Bremen to Hannover and gave up Stettin and part of Swedish Pomerania to Prussia. By the Treaty of Nystadt (30 August 1721), Sweden ceded Ingria, Estonia, Livonia, and a strip of Finnish Karelia to Russia. Thanks to his battle victories and his diplomacy, Peter the Great had made Russia the dominant power in the Baltic.

Northern War, Second (1655–1660)

War among Sweden, Poland, Austria, the Dutch Republic, Denmark, and Brandenburg. (The First Northern War was fought almost a century earlier, in 1563–1570.) In 1655, Charles X Gustav, King of Sweden, decided to abandon his peace talks with King John Casimir of Poland and to attack his neighbor instead with an overwhelming force of 50,000 troops in Poland and Lithuania. This marked the beginning of the Second Northern War. The Swedes entered Warsaw without opposition on 29 August 1655. Polish noblemen, displeased with their king, surrendered to the Swedes, as did most of the Polish forces. Only Cracow offered a two-week resistance but had to surrender to Charles X on 9 October after running out of supplies. King John Casimir fled to Glogau (Silesia). But the monastery of Jasna Góra, near Czestochowa, resisted all Swedish attacks in a manner that was deemed miraculous.

The Protestant regime established by the Swedes in Poland provoked an outburst of national and religious feeling. In 1656, a general insurrection expelled the Swedes from southern and western Poland. King John Casimir gath-

ered his troops and marched on Warsaw at the head of 25,500 regulars and 18,000–20,000 soldiers from the noble levy, undisturbed by the fact that he had neither infantry nor cannon at hand to besiege the city. The dismounted nobles and their hordes of servants attacked the walls of Warsaw repeatedly until it capitulated on 1 July 1656. A combined Swedish-Brandenburg relief army only a few miles away defeated the Polish forces because of the superiority of its cavalry in a three-day battle (28–30 July) at Warsaw. The Polish losses were relatively insignificant, and John Casimir was able to regroup his army. Even more important, he was able to convince Frederick William of Brandenburg to take his side.

With Charles X under heavy Polish pressure, the Danish National Assembly took the opportunity to launch the kingdom on a war of revenge against Sweden in 1657. Using Bremen and Verden as the base for their operations, Swedish troops marched north and struck deep into Jutland. The Danes withdrew most of their forces to the islands but left 6,000 soldiers in the newly rebuilt fortress of Fredericia to guard the passage from Jutland across the Little Belt to the island of Fyn. The Swedes pierced the bulwark on the night of 23–24 October, killing many of its defenders.

Even more unfortunate for the Danes, during the winter of 1657–1658, the water around the Danish islands froze harder than usual. In February 1658, Charles led an army of 5,000–10,000 across the waters of the frozen Little Belt. On 25 February, the Swedes surprisingly appeared in the suburbs of Copenhagen, forcing King Frederick of Denmark to sign the humiliating Treaty of Roskilde (8 March) that stripped Denmark of all of its possessions in southern Sweden.

In July 1658, a Polish-Austrian force laid siege to Swedish-occupied Thorn. Charles attacked Denmark again. This time, however, he had no success. Furthermore, a Dutch fleet broke the Swedish sea blockade of Copenhagen, while 10,600 Austrians under Prince Raimondo Montecuccoli, 14,500 Brandenburgers under Frederick William, and 4,500 Poles under Stefan Czarniecki marched from Hamburg through Schleswig into Jutland. The Swedes were trapped in the Danish islands between the Dutch and Danish fleets and a superior allied army. After the fall of Thorn in December and successful operations of Austrian, Brandenburg, and Polish troops in Pomerania in 1659, the Swedes were in retreat on all fronts. In 1660, the unexpected death of Charles X on 23 February led to the Peace Treaty of Oliva (3 May) among Poland, Austria, Brandenburg, and Sweden and the Treaty of Copenhagen between Denmark and Sweden, bringing the conflict to a close.

Norway and Denmark, Invasion of (9 April–10 June 1940)

One of the British army's worst-fought campaigns. "We-serübung" was the code name for the German occupation of Norway and Denmark, aimed at securing Swedish iron ore deliveries coming from the port of Narvik (northern Norway) as well as the German domination of the Baltic Sea.

The German military sensed when Allied intervention in the Soviet-Finnish Winter War became likely. British and French plans included aid for Finland and the interruption of German iron ore supplies that were vital to Adolf Hitler's war economy. An armistice ended the Winter War on 12 March 1940, but German as well as Allied planning for some abrogation of Norwegian sovereignty continued. It is still not clear what one side knew about the other, but German claims that its invasion was launched only to prevent an Allied breach of Denmark's and Norway's neutrality are doubtful.

According to Hitler's order of 1 March 1940, a small staff prepared a combined operation of army, navy, and air force. This planning aimed at a peaceful occupation. Allied intelligence expected a German attack against France and was struck by surprise when naval forces (detected too late by the Royal Navy) landed troops at several Norwegian ports on the morning of 9 April 1940. Denmark, invaded by land and by sea, surrendered almost immediately. The sinking of the German heavy cruiser *Blücher* by a Norwegian coastal battery south of Oslo delayed the occupation of the capital. The Norwegian government and King Haakon VII gained time to escape Oslo and to mobilize the country. Elsewhere, the German navy had more success, taking by surprise main ports against little resistance. By April, the main Norwegian ports (Oslo, Stavanger, Kristiansand, Bergen, Trondheim, Narvik) were in German hands.

Resistance by the small Norwegian army continued in the interior. A coup attempt by Vidkun Quisling, the leader of the Norwegian Nazi Party who had talked to Hitler in De-

ember 1939 (presumably on the invasion of Norway), failed. The Germans, who were interested in negotiating with the legal government to achieve an agreement, dismissed Quisling. But fighting increased when Allied forces landed at western Norwegian ports between 14 and 18 April 1940. They retook Narvik and forced German mountain troops to withdraw toward the Swedish border. Meanwhile, German divisions, supported by massive air attacks, fought their way north. When the German invasion of France proved successful, the Allies had to withdraw their troops from Norway. The situation turning hopeless, King Haakon and his government left for London 7 June 1940; three days later the Norwegians surrendered but continued the war from exile.

Wehrmacht casualties reached 3,700 dead; the Allies lost 3,900 and the Norwegians 1,350 troops. The German navy, with almost all surface units engaged, suffered heavy casualties (3 cruisers, 10 destroyers sunk) and was unable for months to profit from its new Atlantic bases. Denmark and Norway remained under German occupation until May 1945.

Novgorod, Muscovite Conquest of (1471–1479)

Grand Prince Ivan III of Moscow annexes Novgorod. Novgorod was administered by an assembly called the *veche*. It usually elected the grand prince of Moscow, although he was forbidden to station troops or reside in the city. Lacking a military capacity and dependent on imported food, Novgorod's reputation was based on its merchants.

In 1456, boyars of the *veche* advocated alliance with Lithuania-Poland, contrary to the existing treaty with Muscovy. In retaliation for their efforts, Grand Prince Vasili II of Muscovy refused any longer to recognize the right of the *veche* to pass laws without his approval. Despite this, Novgorod boyars continued to push their agenda, led by Marfa Boretskaya. They gained the support of Prince Ivan Andreevich of Mozhaisk and Vasili II's cousin, Prince Ivan Dmitrievich. In 1470, the boyars invited Prince Mikhail Olegkovich of Kiev to defend Novgorod with troops.

In February 1471, the boyars forced the *veche* to recognize Casimir of Lithuania-Poland as Novgorod's sovereign. After a failed attempt at reconciliation by Metropolitan Filip of Moscow, Grand Prince Ivan III of Muscovy declared war in June 1471.

Muscovite and Tartar forces reached Torzhok by July. The main battle took place along the Shelon River. A Muscovite advance guard of 5,000 cavalry routed a Novgorod force of 40,000, killing 12,000 and capturing 2,000. Ivan III's peace terms were lenient. He imposed a 15,500 ruble fine, reinstated the Treaty of 1456, ordered Novgorod to accept the authority of the metropolitan of Moscow, and forbade future alliance with Lithuania-Poland. Ivan returned to Moscow in January 1476.

In March 1477, Novgorod sent a petition for Ivan's review, addressing him as *gosudar* (sovereign), rather than the usual *gospodin* (lord). Ivan took this as an indication that Novgorod was willing to strengthen ties. He immediately sent envoys to Novgorod. They were detained in Novgorod for six weeks and returned to Moscow with a negative reply. Personally insulted, Ivan declared war on 30 September 1477. By the end of November, a Muscovite army and the Kasimov Tartar cavalry from Tver laid siege to Novgorod. Novgorod capitulated in December and swore an oath to their new *gosudar*, Ivan. He dissolved the *veche*, abolished the office of *posadnik* (mayor), annexed parts of Novgorod's territory, and subjected the rest to tribute.

In 1479, the boyars sought an alliance with Khan Ahmad of the Golden Horde. Simultaneously, Novgorod received support from Ivan's brothers, Prince Andrei of Uglich and Prince Boris of Volok, who were negotiating with Casimir. Ivan learned of these actions in October 1479 and, without declaring war, laid siege to Novgorod. He entered the city on 15 January 1480. One hundred boyars were executed, and many of the gentry were exiled to Suzdal. Archbishop Feofil, who had been elected archbishop by the *veche* at the death of his predecessor in 1470, was deposed. Ivan and his brothers were reconciled in October 1480.

Atomic bomb mushroom cloud over Hiroshima, 1946. (Library of Congress)

Nuclear and Atomic Weapons

Weapons that use nuclear explosives. With the discovery of fission in early 1939 came the possibility of building a bomb having unprecedented destructive power. The great Danish physicist Niels Bohr announced the discovery of fission to the scientific community during a theoretical physics conference organized by Edward Teller and George Gamov at George Washington University. Alarmed by the prospect that Germany might be able to develop an atomic bomb, Albert Einstein, persuaded by Leo Szilard, Teller, and Eugene Wigner, sent a letter to President Franklin D. Roosevelt advising the president of such a possibility. Einstein's letter led, ultimately, to the creation of the Manhattan Project to construct nuclear bombs.

As World War II grew more deadly, two physicists—J. Robert Oppenheimer and Enrico Fermi—made significant contributions to the American atomic effort. In the summer of 1942, Oppenheimer convened a study conference in his offices at the Berkeley campus of the University of California to explore the theoretical basis for developing a fission weapon. Attended by many notable physicists, includ-

ing Hans Bethe and Teller, the conferees concluded that a fission bomb was possible and that gun assembly of uranium or plutonium, the only two metals known to be fissionable, offered the best hope of success. Fermi, working at the University of Chicago, achieved the first self-sustaining nuclear chain reaction in December 1942. Because an atomic bomb is an uncontrolled self-sustaining chain reaction, Fermi's achievement, along with the theoretical knowledge developed during Oppenheimer's summer study, allowed the United States to pursue a full-scale nuclear weapon development program.

World War II research and development of the atomic bomb had two principal components. The first component was to produce enough plutonium and uranium to make one or more atomic bombs. Production of these materials was difficult, and by August 1945, barely enough of each was available to build a mere two nuclear bombs, termed Fat Man and Little Boy. The second component of the wartime atomic program was to design and build an atomic bomb. This job was assigned to the newly created Los Alamos weapons laboratory and its director, Oppenheimer.

Established formally in April 1943, Los Alamos had the single mission of designing and building a fission bomb for use in World War II. Based on the conclusions of the Berkeley summer conference, primarily that gun technology was both well understood and relatively simple, Oppenheimer organized most of the Los Alamos effort on developing gun assembly. Such a gun, essentially a naval cannon, would shoot one piece of uranium or plutonium at a second piece. When the two pieces of material came together, a supercritical mass would be formed, causing a nuclear detonation.

Experiments conducted in the spring of 1944 showed, however, that light element impurities in plutonium would cause a premature, low-order detonation in a gun assembly. Such a detonation would be, in nuclear terms, a fizzle. This discovery was disturbing, particularly since Oak Ridge was having problems producing significant quantities of uranium. Without a method of using plutonium, development of a combat atomic bomb could be delayed and might not be available for use in World War II. Recognizing that high explosives could be used to implode, or crush, a ball of plutonium, causing fission and a high-order nuclear explosion, Oppenheimer reorganized Los Alamos in August 1944, centering most of the laboratory's work on developing implosion. Doubts about implosion, an untried and radical departure from established knowledge, remained until the successful Trinity test in July 1945.

Little Boy, the gun gadget using uranium, exploded over Hiroshima with a force of approximately 16 kilotons on 6 August 1945. Fat Man, the implosion device using pluto-

nium, exploded over Nagasaki with a force of 20 kilotons on August 9, 1945. The use of atomic bombs against Japan ended World War II and inaugurated the nuclear era.

As soon as World War II ended, the entire nation, including the Los Alamos laboratory, demobilized. Senior scientists at Los Alamos returned to their prewar university positions, and younger staff left to enter graduate school. As a result, nuclear weapons work languished, and the United States possessed only a handful of such weapons. However, some research did continue on improving fission bombs, particularly the implosion device. The two wartime weapons were laboratory devices that could not be easily reproduced if needed.

In the summer of 1946, two slightly improved Fat Man bombs were used in Operation CROSSROADS at Bikini Atoll in the Marshall Islands. These tests, one an airburst and the other an underwater detonation, were designed to see how well atomic bombs worked against naval vessels. The tests were not very dramatic in that only a dozen ships in all were sunk, although the newsreel footage was spectacular enough and has been used in countless “message” films since 1946. Because of wide international press coverage, the not-so-dramatic effects of CROSSROADS may have led the Soviet Union to believe that atomic bombs were not to be feared and probably encouraged Stalin to increase Soviet international belligerence.

By early 1947, the United States had made the decision to use atomic bombs as a key part of the U.S. defense posture. The weapons laboratories at Los Alamos, New Mexico, Oak Ridge, Tennessee, and Hanford, Washington, started to rebuild from their postwar demobilization. In addition, the military began planning new weapons systems, including an expanded role for atomic bombs. Los Alamos tested new designs of fission weapons that met the new military requirements in Operation SANDSTONE, conducted in 1948. These designs made possible significant increases in stockpile numbers and delivery capabilities. Los Alamos continued to make fission bomb improvements into the 1950s, primarily working to make such bombs smaller and more efficient.

Simultaneous with fission bomb development in the late 1940s, work continued and accelerated on hydrogen bomb development. First studied in 1942, the idea for a hydrogen bomb came from the thermonuclear study of stars conducted in the 1930s by Hans Bethe. Unlike fission weapons that derive their energy from splitting atoms of the heavy elements uranium and plutonium, hydrogen bombs derive their power from fusing atoms of the light element hydrogen, particularly the isotopes deuterium and tritium. Because fusion can only be achieved with stellar temperatures, hydrogen bombs were not possible until such a heat source

became available. The improved fission bombs of the late 1940s offered the promise of near-stellar temperatures.

After years of study conducted primarily on computers and the discovery of radiation implosion, the first hydrogen bomb was detonated in October 1951. The success of the first thermonuclear test ushered in a new era in nuclear weaponry—significantly increased destructive power. Fission bombs explode with energy levels measured in thousands of tons of trinitrotoluene (TNT) equivalents. Fat Man, for instance, exploded with a force of 20,000 tons of TNT and destroyed most of the city of Nagasaki. The first hydrogen bomb, code-named Mike, exploded with a force of over 10 million tons of TNT and vaporized the entire island on which the device stood. Although civilization could survive a war fought with atomic weapons, such was not the case with thermonuclear weapons.

Just as fission weapons started with crude designs and were continually improved, so too were thermonuclear weapons. The first hydrogen bomb relied primarily on the use of liquid deuterium, a cryogenic material. Its size, three stories high and weighing more than a million pounds, made it a “bomb” only in the explosive sense; obviously it was not a deliverable weapon. From 1951 through 1956, hydrogen bomb research focused on using dry fuel. This change made it possible to reduce the size of thermonuclear bombs and made them deliverable by a wider range of aircraft, including smaller naval planes flying off aircraft carriers.

Beginning in the late 1950s, delivery systems such as ballistic missiles governed design changes in nuclear weapons. Both land- and submarine-based missiles began to take on primary importance in potential nuclear weapons delivery. Nuclear weapons had to be reduced in size dramatically in order to fit into the much smaller spaces of nose cones. Although nuclear weapons had always been constrained in size by the lift capacity of bombers, the constraints imposed by missiles were several orders of magnitude more difficult to meet. Miniaturization of weapons became a dominant theme in nuclear weapons development throughout the 1960s.

By the early 1970s, the number of new weapons designed and built began to decline. Increasing emphasis began to be placed on improving and upgrading weapons already in the stockpile, as well as enhancing safety. It became increasingly important to know that nuclear weapons would only detonate on command and not by accident. Weapon accidents at Palomares, Spain, and Thule, Greenland, underscored this need. Many of the underground nuclear tests in the 1980s and early 1990s conducted by the United States were safety tests of stockpiled weapons. With the current ban on nuclear weapons testing, other methods, primarily computer simula-

tion, are being used to ensure the safety of the U.S. stockpile. This activity, called Science-Based Stockpile Stewardship, is of critical importance as the age of individual weapons increases. As the cessation of nuclear weapons testing continues, the safety and reliability of the stockpile will be the key weapons concern well into the twenty-first century.

Nuremberg Principle

A doctrine of the international law of war holding individuals accountable for their own actions. On 8 August 1945, representatives from the United States, Great Britain, the Soviet Union, and the provisional government of France entered into the London Agreement, establishing the International Military Tribunal, which would try individuals in the Nazi German government and military who had been accused of war crimes. Twenty-four major leaders were indicted variously for crimes against peace, crimes against humanity, war crimes, and conspiracy to commit such crimes. Trials commenced on 18 October 1945.

The principle of individual responsibility for actions in war was established at these trials. There was no defense available to an individual who pled that his or her actions were made only under orders from a superior, although such a pleading might lead to a mitigation of sentence.

This principle was also applied at the International Military Tribunal for the Far East and in the ad hoc Tribunals for Yugoslavia and Rwanda and is a doctrine of the International Criminal Court contemplated by the Rome Treaty of 1998. It is also a principle of military training in NATO member-states and most other states.

Nurhaci (1559–1626)

Founder of the Manchu state. Much of the early life of Nurhaci is shrouded in legend, but his military career began in his early twenties. From his youth, Nurhaci had close contact with the Chinese Ming Dynasty (1368–1644), which bordered his homeland of Manchuria. Indeed, his father and grandfather, Taksi and Giocangga, respectively, were allies of the local Ming garrison. Both died under mysterious circumstances.

After an internecine struggle, Nurhaci successfully united the surrounding villages and tribes. Using marriage alliances and carefully planned military campaigns, Nurhaci increased his strength before embarking on a war against the Ming Dynasty. During this time, he continued to demonstrate the utmost respect for the Chinese dynasty. By 1607, many eastern Mongol tribes recognized him as khan. By 1613, all but one of the Jurchen (Manchurian) tribes submitted to Nurhaci. The final tribe, the Yehe, was aided by the Ming in their resistance.

Nurhaci's armies consisted mainly of horse archers, as well as cannon made by Jesuit priests. His primary achievement in military science was the banner system. In this, he organized companies of men under four banners of yellow, white, red, and blue. Soon the number of banners increased to eight, but the new ones added a fringe to their standard. The new banners consisted of 7,500 men divided into five regiments consisting of five companies. The banners replaced the tribal structure and created an efficient fighting machine.

In 1616, Nurhaci declared the creation of the Qing state. In 1618, he invaded the Ming Empire. His armies annihilated all the armies that opposed him, including the recalcitrant Yehe tribe. From 1621 to his death in 1626, Nurhaci campaigned extensively in the modern Liaoning Province of China. His death did not end the conquests because the new dynasty of Manchurian ethnicity he founded went on to conquer an empire larger than modern China.

O

October War (1973)

The fourth Arab-Israeli War, a doctrinal watershed providing world military powers with lessons on the latest techniques in armored and air warfare and the first Arab-Israeli clash since 1948 in which the issue was not in doubt after the first few hours. Six years after Israel had humiliated its Arab neighbors in the Six-Day War, Egypt and Syria launched simultaneous attacks from the west and the northeast on Israel.

Israeli intelligence failed to read accurately the incipient two-front attack of 6 October 1973 principally because they were convinced that the Arabs would not attempt to move forward without absolute air supremacy and could not mount a cooperative, two-front effort. Further, the Israelis believed that their air force had developed effective tactics to foil surface-to-air missile defenses (SAMs) following the War of Attrition in 1970. Nor did the Israeli Defense Forces (IDF) contemplate Arab willingness to settle for a *limited* objective under the protection of a static, tightly integrated, multilayered air defense shield. Finally, the Israelis did not anticipate the precision of the Egyptian attack plan, a well-rehearsed, scrupulously orchestrated, shallow mass assault on a broad front. Inconceivable as well, based on the lessons of 1967, was the very idea of Arab initiative and multifront coordination between allies. In short, the Israelis were complacent on the eve of a major assault.

The fact that the attack came on the holiest Jewish day of the year, when reservists were at prayer, perhaps added to the surprise but actually facilitated mobilization by leaving roads bereft of civilian traffic. Exceptional Egyptian ingenuity and the adaptation of Soviet doctrine and technology, combined with a successful deception plan, contributed to the proficient cross-canal assault. It began with a massive artillery preparation, which covered the opening stages of the assault. Once across, teams of sappers skillfully cut path-

ways through the Israeli sand ramparts and blew holes for bridging units as 70,000 infantry fanned out laterally from the crossing points to set up recoilless rifle and antitank missile ambushes. The Israeli Air Force's scramble to wipe out the widening bridgeheads was foiled by the deadly high-level SAMs umbrella covering radar-guided antiaircraft gun batteries and handheld infrared SAMs, the last directed at treetop-level attacks. Israeli reserve armor was sent forward as soon as each sub-unit mobilized—that is, piecemeal. The advance company-sized packets were badly mauled two days after landing as they blindly charged into infantry-manned antitank killing grounds.

Meanwhile, two corps-sized Egyptian armies crossed the canal and consolidated shallow bridgeheads along an 80-kilometer (50-mile) front. On the second day, the bulk of the IDF Air Force was redirected to the northern front to try to stem the Syrian advance, also begun on 6 October. Syria had committed about 75 percent of its total armor (800 tanks) to the attack, which sent four columns westward north of the Sea of Galilee. Preceded by heavy artillery fire, three mechanized infantry divisions (in no less than 2,800 armored personnel carriers) were followed by two armored divisions, ultimately 1,400 tanks, against less than 200 Israeli tanks that redeployed to specially prepared chokepoint ambushes with interlocking fields of fire. By this method, the Israeli armor was able to make the Syrians pay dearly for their initial breakthrough. An assault by Syrian heliborne infantry seized the fortified Israeli observation on the commanding heights of Mount Hermon.

Because the Syrian encroachment posed the most immediate threat to Israeli territorial integrity by crossing the narrow neck of northeastern Galilee to threaten Haifa, the IDF had quickly devoted attention to this front, even though the Egyptian deployment was more menacing. By the second day, Israeli reserves were arriving in Galilee in sufficient

numbers (an entire division) to put their highly accurate long-range tank gunnery to good use. Israeli ground attack planes at first flew into the missile umbrellas, regardless of cost. However, they soon developed evasive tactics and were able to hit a fresh column of armor advancing along the southernmost axis by coming in at treetop level over Jordanian territory, stopping the column after it had progressed almost 29 kilometers (18 miles)—the Syrians' deepest penetration. The Syrians soon outran their lines of communication and then changed their formation to line abreast, whereupon Israeli air decimated them. In this way, the Israelis bought 36 vital hours. Without a follow-on echelon to extend its incursion and lacking the improvisational capacity to regroup and explore alternative lines of advance, the Syrians were driven back with hammer blows, mounting a stubborn fighting withdrawal toward Damascus and Sasa, clear off the Golan Heights, and back to their start line by 10 October. The next day, advancing Israeli tanks were able to turn to deal decisively with the Iraqi and Jordanian armored attacks on the southwestern flank of the northern front.

On 14 October, the Egyptians responded to desperate Syrian appeals by breaking out of their secure defensive laagers and mounting a major assault. Backed by uncontested air cover, the Israelis were able to neutralize the infantry antitank teams with artillery fire, while precise long-range tank fire picked off advancing Egyptian T-62 tanks before the latter could bring their turret guns to bear, disabling more than 250 of the Soviet-built vehicles.

The next day, exploiting a seam between the two Egyptian bridgeheads discovered during the early containment probes, the IDF activated a contingency plan to span the canal into Egypt proper. Using improvised bridging equipment, the Israelis advanced to the canal through the gap between the two Egyptian army sectors. The Egyptian Second Army, on the northern flank of the crossing, slowly recognized the threat and mounted a delayed concerted effort to pinch off the corridor (Battle of the Chinese Farm). This effort was repulsed by General Abraham (Bren) Adan's division, which then crossed the canal into the bridgehead held by General Ariel Sharon's division. As Adan passed through and turned toward the southwest, Sharon attempted to surge northward and seize Ismailia but was stopped cold. Consequently, Adan's southerly push toward Suez City established the Israeli main effort. The Egyptian Third Army—astride the canal—was encircled from its rear and faced strangulation. By this time international pressure, including a direct Soviet threat and a United States counterthreat, brought about a cease-fire, just as Adan was turned back from Suez City by tenacious Egyptian urban tactics. Israel broke several successive cease-fires, as its forces tried to enhance its negotiating position. Israel had managed to turn a near dis-

aster into a muted victory, losing 3,000 soldiers in the effort. The losses were commensurate with those of the other belligerents but unacceptable by Israeli standards. On the grand strategic level, the winner appears to have been Egypt, which broke the diplomatic stalemate that had been underpinned by Israeli military superiority and secured eventual return of the Sinai and a "cold peace" with Israel five years later.

Oda, Nobunaga (1534–1582)

In the mid-sixteenth century, Nobunaga Oda was a minor daimyo who rose from obscurity to become one of the unifiers of Japan. Oda first came to prominence when Imagawa Yoshimoto attempted to seize Kyoto by passing through Oda's territory of Owari. Oda, with an army of 2,000, routed Yoshimoto's force of 20,000 men. Then in 1568, Oda proceeded to Kyoto, captured the city, and installed Ashikaga Yoshiaki as shogun.

Oda then attempted to conquer all of Japan. At the time, implacable enemies surrounded him. The first venture in his attempt to unify Japan led Oda to attack the Buddhist monastery of Hieizan in 1571 to counter its temporal influence. This action resulted in the deaths of hundreds of monks and the burning of the monastery.

After initial successes in 1573, Oda attacked the fortress of Ishiyama. At times, an army of 60,000 men surrounded it, but the fortress did not fall until 1580. In 1573, he also deposed his puppet shogun, Yoshiaki, thus effectively ending the Ashikaga shogunate.

Oda then turned to strengthening his own territories. Be-

tween 1576 and 1579, he built the castle of Azachi on the shores of Lake Biwa. It was the first Japanese fortress specifically built to withstand the effects of cannon fire. Then in 1577, his general, Toyotomi Hideyoshi, led the attack against the Mori. Oda's dreams of conquest ended abruptly, however, when one of his own generals, Akechi Mitsuhide, assassinated him while the two marched with Hideyoshi's reinforcements in 1582.

Oda's legacy laid the basis for the unification of Japan, as he had conquered a third of it. He also changed Japanese warfare by using massive armies rather than retainers. To support his conquests, he restructured the system of taxation and disarmed peasants to prevent uprisings.

Offa's Wars (771–796)

Anglo-Saxon king and builder of Offa's Dyke. Offa, son of Thingfrith, was the ruler of Mercia (757–796). He is best remembered for the immense barrier that carries his name, built in 787, although its history has remained obscure. Its main purpose seems to have been the defense of Mercia from the Welsh.

During the 770s, Offa gradually extended his influence over the whole of England south of the Humber River. Mercia had no natural boundaries. It was open on all sides to hostile kingdoms. It was thus a continuous struggle for Mercian kings to keep it intact. The only way for them to create natural boundaries was to subdue all others to their authority.

In 771, the Mercians crossed the Thames River into Sussex and overcame the men of West Sussex. The move may have been planned to consolidate Offa's influence in Kent, the most settled and civilized kingdom in England. In 776, according to the *Anglo-Saxon Chronicle*, the Mercians and Kentishmen fought at Otford. The outcome is not recorded, but it is significant that Offa possessed little authority in Kent over the next ten years.

Whatever happened at Otford did not stop Offa. He launched another expedition in 778, this time deep into Wales. He devastated the land and seized plunder. The next year, Offa moved south to attack Cynewulf of Wessex. The two kings fought at Benson, a West Saxon royal village on the north bank of the Thames River. Offa carried the day. A large

tract of what is now Berkshire was annexed. Offa, now the most powerful king in Britain, could with justification call himself a *Bretwalda* (Britain-ruler).

In the mid-880s, Offa aspired to be accepted as an equal by continental monarchs. If any single event contributed to his European perspective, it was Offa's taking direct control of Kent in 785, either due to internal dissension or by direct invasion. The following year, Offa made a pact with Pope Adrian I, who formally addressed him as the *Rex Anglorum* (king of England). In exchange, the pope increased his control over the English church while acceding to Offa's request for the creation of an archbishopric of Lichfield. Thereby he freed, albeit temporarily, the Mercian clergy from the authority of the archbishop of Canterbury. Archbishop Jaenberht of Canterbury, a Kentishman through and through, had always been Offa's staunch adversary.

Offa brought Anglo-Saxon southern England to its highest level of political unification. He ruled East Anglia, Kent, and Sussex and maintained superiority over Wessex and Northumbria. After his death, Mercian power gradually gave way before Wessex.

Office of Strategic Services

The U.S. intelligence, intelligence-gathering, and psychological warfare coordinating agency during the last three years of World War II and the ancestor of today's Central Intelligence Agency (CIA). The need for such an organization began to be felt in Washington after Nazi victories in northern and western Europe in the spring and summer of 1940. On the advice of Secretary of the Navy Frank Knox, President Franklin D. Roosevelt dispatched World War I hero and prominent New York lawyer William J. "Wild Bill" Donovan to England to study Britain's intelligence establishment, especially the Special Operations Executive (SOE). Later Donovan also toured the Mediterranean. In the winter of 1940–1941, preparations began for the establishment of an agency to handle intelligence, counterintelligence, and psychological warfare. As a result, in July 1941 the Office of Coordinator of Information (COI) was established under Donovan's leadership. Because the COI did not fulfill its creators' expectations, a year later it was replaced by a more powerful organization, the Office of Strategic Services

(OSS), also under Donovan's directorship. He reported directly to FDR and received his funding from him.

The new agency quickly expanded its budget, staff, and scope of activities. It gathered strategic information, disseminated propaganda and disinformation, and engaged in espionage and sabotage in enemy-occupied territories. At the height of its activities, the OSS employed 12,000 individuals as staff and agents and relied on the services of a great many part-timers and volunteers. One of the OSS's most successful missions was in northern Burma, where its Detachment 101 led hill tribesmen against the Japanese occupiers and, by coordinating with the British Chindits and Merrill's Marauders in its guerrilla warfare, cleared the area of the enemy.

The OSS was disbanded in the fall of 1945. Roosevelt's successor, the militantly plebeian president Harry Truman, had no use for the society blue bloods that dominated the "Oh, So Social," and for nearly two years the United States had no coordinated intelligence-gathering or unconventional warfare capability. Some OSS functions and staff were absorbed by the State and War Departments. In 1947, the CIA was established to replace the OSS but without the earlier agency's psychological warfare mission.

Ögödei (c. 1186–1241)

Second of four Mongolian khans ruling the empire established by Genghis Khan. Ögödei was probably not his father's first choice as successor but was elected khan with a reasonable majority in 1229. He was immediately faced with two major problems: an empty treasury and the need for continuing expansion to reward his followers. The first problem he dealt with through a more rational approach to the conquered territories, emphasizing revenues over expropriation. The second, Ögödei solved by initiating new campaigns in almost all directions, with efforts to complete the conquest of north China coming under his personal control and culminating in the fall of the last Jin capital in 1234. Even

before this event, another, even greater campaign was being prepared.

Joci, the oldest son of Genghis Khan, had been assigned the most distant pastures controlled by his father, in the extreme west. After Joci's death in 1225, his son Batu had taken over these pastures and had further expanded them. With the accession of Ögödei, Batu received further increments of manpower and the promise of a major western campaign. Although Batu, seconded by various other Mongol princes representing all the major lines, was theoretically to be in command, the actual organizer of the advance was the veteran general Sabutai (1172–1245). The result was a masterpiece of the tactician's art: an advance first into the Turkic areas bordering Russian on the south; then into Russia itself (1237), which was brought under Mongolian control for centuries; and finally into eastern Europe, as far as Liegnitz in Silesia and the outskirts of Vienna (1241), using almost the same lines of advance as those employed by the Soviets in 1944–1945. Only the death of Ögödei, news of which reach the Mongols around Christmas 1241, halted this attack, probably saving Austria and Germany from disaster.

Okinawa (1 April–21 June 1945)

World War II's last great battle. The large island of Okinawa was a part of metropolitan Japan and could provide a staging base for the projected invasion of the Japanese home islands. After ferocious naval and air bombardments, the first wave of U.S. Marines and army troops landed on 1 April to very light resistance. The Japanese, after losing on the beaches in their previous attempts to halt American island invasions, had devised the strategy of drawing their 500,000-man enemy to the rough terrain of the southern half of the island, where their 120,000-strong garrison would hold while kamikaze aircraft would pound the invasion warships. Meanwhile, the gigantic new battleship *Yamato* would beach itself and destroy what remained of the

A Marine of the 1st Marine Division draws a bead on a Japanese sniper during the Battle of Okinawa in 1945. (National Archives)

U.S. fleet. The Japanese commander, General Ushijima Mitsuru, understandably had his doubts about such a plan, but he faithfully followed his orders from Tokyo.

Okinawa's northern half was secured fairly early against scattered resistance, but then the invaders began to encounter stiff resistance from Japanese troops dug into a series of mutually supporting caves, ancient tombs, and ridge lines with interlocking forward and reverse slope defenses. The American offensive slowed drastically.

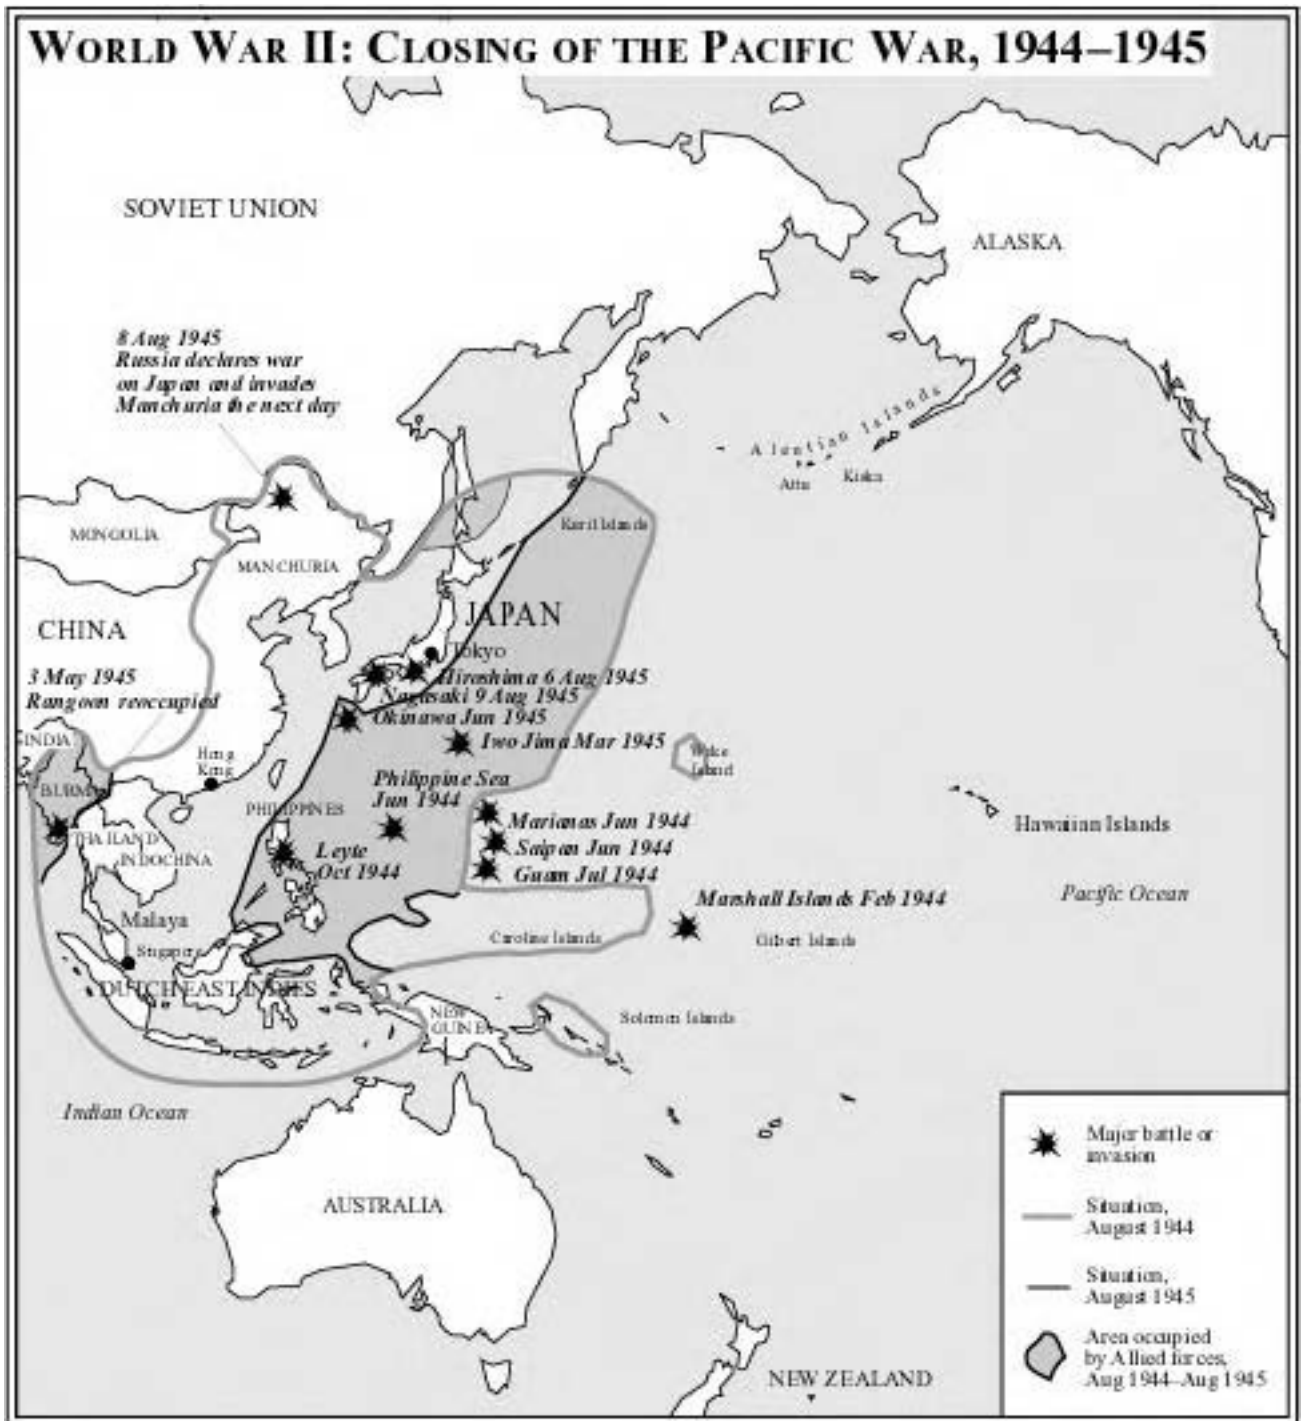

The Japanese then unleashed their counteroffensive. *Yamato* headed for Okinawa. On 7 April, it was sunk by U.S. naval warplanes, a loss that also spelled the end of Japan as a major naval power. But the kamikazes proved a far more effective weapon. In 1,900 one-way attacks, these manned projectiles killed more Americans than had been lost in all the United States' naval wars to date.

On the ground, the fighting had degenerated into a slogging match, transforming Okinawa's fields into a landscape reminiscent of World War I's western front, with gains measured in feet. Home critics began to criticize the way the fighting was going on the island. Fleet Admiral Chester Nimitz, Pacific fleet commander, took the unprecedented step of holding a press conference on Guam to defend his

land commander, General Simon Bolivar Buckner. On 18 June, General Buckner was killed by Japanese artillery fire, the highest-ranking American to die by enemy action during World War II. Buckner was succeeded by General Roy S. Geiger (who thus became the only U.S. Marine officer to command an American field army).

By then, the Japanese were being steadily pushed back; they were finally also running out of aircraft and pilots for suicide missions. American troops and supplies flowed ashore in increasing numbers, tonnage, and safety. Three days after General Buckner's death, General Geiger was able to declare the island basically secured. General Ushijima and his staff had already committed ritual suicide, contemptuously rejecting a soldier-to-soldier demand for surrender from General Buckner.

The butcher's toll on Okinawa was grim: No less than 107,000 Japanese troops had been killed in battle and some 27,000 sealed in caves to die more slowly; only 7,400 prisoners were taken. U.S. Army forces suffered 7,613 dead and the Marines 3,561. The worst losses, however, were suffered by the civilians of Okinawa. Of a prewar population of 450,000, between 60,000 and 160,000 were lost; many were persuaded by Japanese soldiers to commit suicide. Okinawa was the

only battleground in the Pacific War in which large numbers of enemy civilians were encountered by the Americans. Yet Okinawa seemed to present a mere prelude to the greatest Pacific battle of all: the invasion of the Japanese home islands, a bloody scenario averted by the dropping of the world's first atomic bombs in warfare at Hiroshima and Nagasaki.

Omani Conquest of East Africa (1622–1730)

Conquest leading to the decline of Portuguese power on the Swahili coast. Asian traders (before 900) and Muslim traders (after 900) sailed across the Indian Ocean, linking the East African coast from the Horn of Africa to southern Mozambique and the adjacent islands in a network of seagoing commerce between Asia and East Africa. Ships and merchants from Arabia, Persia, and India participated in the trade in search of gold, ivory, tortoise shell, and other products. These exchanges led to the development of many coastal and island towns (Manda, Pemba, and Zanzibar; Pate, Lamu, Mombasa, and Vumbu in Kenya; and Kilwa in Tanzania) suffused with commercial activities and Islam, which became the nucleus of Swahili civilization (African and Muslim). Many traders and settlers from Oman and the Persian Gulf also intermarried with local women and settled down.

Vasco da Gama's trip around the Cape of Good Hope in 1497 and into the Indian Ocean brought the Portuguese to the East African coast. They attacked and occupied Kilwa in 1502, Zanzibar in 1503, Sofala and Kilwa in 1505, and Mozambique in 1507. By 1508, they had established control over the Swahili coast.

To break the Portuguese stranglehold, the people of Mombasa turned to the Omanis, who had already expelled the Portuguese from Muscat, their capital, in 1508. Utilizing the Mombasa appeal for help as the excuse, Omani sultan Ibn Saif sent a fleet that attacked the Portuguese settlements at Pate and Zanzibar. In 1696, Ibn Saif sailed to Mombasa with more than 3,000 men and, in 1698, took Fort Jesus.

The Omanis had imperialist designs, however; after freeing Mombasa from the Portuguese, they imposed their rule over the Swahili states, garrisoned Pemba, Kilwa, and other cities, and set governors (*walis*) over them. Limited rebellion and Swahili refusal to pay taxes between 1710 and 1740 led to political upheaval on the East African coast. In 1724, Kilwa broke away from Omani rule with the support of Europeans in Mozambique. By 1745, Pate, Malindi, Pemba, Zanzibar, and Mafia had all revolted against Omani overlordship.

Recognizing that only by closer attention to the coast would Omani control be effective, the Omanis made Zanzibar the focal point of their East African empire. Beginning with Sayyid Said, who came to power in Muscat in 1806, the Omanis strengthened their garrisons in East Africa and gradually asserted military and commercial control along the East African seaboard. Thus, the Omanis came to dominate Zanzibar and parts of the East African coast. They then replaced the Portuguese as the imperial power and monopolized Indian Ocean–Swahili trade. Omani overlordship reached its climax in 1840, when Sayyid Said transferred his political headquarters from Muscat to Zanzibar.

Omdurman (1898)

Anglo-Egyptian victory that effectively destroyed the Mahdist state, one of the most one-sided victories in modern military history, and the last large-scale cavalry charge by a major military power. The Mahdist army, which had taken Khartoum and killed General Charles "Chinese" Gordon in 1885 under Muhammad Ahmad (a.k.a. al-Mahdi), had warded off British attempts to reassert control over the region. In 1896, the British government, propelled by public opinion and concerns over French and Italian ambitions in the Sudan, prevailed upon the Egyptian government to launch an offensive toward Khartoum. Led by Horatio Herbert Kitchener, sirdar of the Egyptian Army, a mixed British and Egyptian force moved south. Using Nile gunboats and building a railroad to keep the army supplied, the 26,000-man force took all of two years to reach Khartoum.

The Mahdist army, now under the command of al-Mahdi's successor, Khalifa Abdullah al-Taashi, launched a number of strikes against Kitchener but was driven back each time. By late summer, the Anglo-Egyptian army was within a few miles of Khartoum. There, at Omdurman, the Khalifa launched a substantial assault on the morning of 2 September. The initial attacks focused on Kitchener's fortified camp along the Nile and the cavalry units protecting its right flank. Against well-protected Anglo-Egyptian troops armed with Maxim guns, the assaults made little headway. By noon, an Anglo-Egyptian counterattack had driven the Mahdist army from the field in more of a slaughter than a battle.

The Mahdists suffered more than 10,000 killed in a few hours of fighting. The Anglo-Egyptians lost 48. Omdurman effectively destroyed Mahdist power in the Sudan. The Khalifa, who was captured a year later, lost his capital city and many of his best commanders.

Kitchener, now a national hero, turned his attention to the French expedition encamped at Fashoda. After a brief standoff, the French withdrew in late September, securing British influence in the region.

Onin War (1467–1477)

Intensified period of civil war during the Onin era (1467–1469) that began in a succession dispute. The struggle soon engulfed the Ashikaga capital of Kyoto and led to its almost complete destruction before the war ended 10 years later. The period is also aptly known as “the epoch of a warring country.”

When the eighth Ashikaga shogun, Yoshimasa (1435–1490), more interested in pleasure and the arts than in politics, announced his plans to retire at the tender age of 30, an effort ensued to find a successor to the heirless shogun. Hosukawa Katsumoto (1430–1473), a member of one of the most influential families supporting the shogun and the *kanrei* (the highest civil official in the shogunate, comparable to a prime minister), recommended Yoshimasa’s brother Yoshimi, then living as a monk. Not long after Yoshimi’s reluctant arrival in Kyoto to prepare for his duties, Yoshimasa’s wife unexpectedly gave birth to a son and heir, Yoshihisa. The chief rivals of the Hosukawa, the Yamana clan, saw their opportunity and sided with Yoshimasa’s wife, who wished to see her newborn son succeed. Only the weakness of the Ashikaga allowed this minor crisis to erupt into open war, which it soon did.

In 1467, the forces of the Yamana and Hosukawa houses came to blows in Kyoto. The decade of street warfare in Kyoto that followed was intermittent but still destructive. The once proud city and cultural center of Japan was reduced in size and population by more than half, and its culturally rich cityscape was utterly decimated.

In the end, the dispute settled nothing, and when the two original disputants, the respective heads of the Yamana and Hosukawa families, both died, the war came to an end. The decade did decisively weaken the Ashikaga shogunate, which became a powerless bystander to extended warfare that spread out into the countryside from Kyoto.

**Orleans, Siege of
(12 October 1428–8 May 1429)**

Most famous siege of the Hundred Years’ War. During the later years of the Hundred Years’ War, France responded to English tactical superiority on the battlefield (Cravant in 1423, Verneuil in 1424) by making use of positional warfare, forcing its enemy to engage in costly sieges.

In the summer of 1428, English regent John, Duke of Bedford, decided to invade southern France and its kingdom of “Bourges.” The key bridgehead was Orleans, located 90 miles south of Paris on the Loire River. The campaign was intended as training for taking many small towns downstream and upstream of Orleans. Because of the need to deploy garrisons in many captured towns, English and Burgundian forces under the earl of Salisbury are estimated to have numbered no more than 4,000.

The people of Orleans, before being surrounded behind their walls, burned the suburbs to deny the English food or any comfort. The town militiamen were assigned to defend the 34 towers of the city wall, and the professional soldiers (first 500 and then 6,000), under Jean le Batard d’Orleans, better known as Dunois, were to make sallies. Before being killed by a cannonball (26 October 1428), Salisbury gave orders to isolate the city by a line of redoubts, or bastilles, on the western side. These strongholds were to be linked by ditches and earthworks manned by artillery. The northern side facing a forest was not covered by the English, which gave the besieged troops the opportunity to keep in touch with the Dauphin Charles’s relief army.

The southern side of the Loire River was occupied by the English, and the fortification called “les Tourelles,” protecting the bridge on the Loire River, was taken. The town was to be reduced by famine rather than by assault. But by April 1429, the Burgundians allies had quit the siege, leaving the English, who were too few to surround the city effectively.

The dauphin’s army marched from Blois to relieve Orleans. Within its ranks was “the Maid,” Joan of Arc, who had recently convinced Charles that he would soon be crowned King of France. Joan decided to move on ahead of the main French force and entered Orleans on 27 April to raise the spirits of the defenders.

Exploiting the weakness of the English forces, French troops (with Joan) sallied out on 4 May to seize the bastille

on the eastern side. Two days later, they crossed the river to secure the southern bank. On 7 May, Joan attacked les Tourelles. The surrender of its English defenders persuaded Lord Salisbury to abandon the siege on 8 May. Joan of Arc cleared the way for Charles's coronation.

Osaka Castle, Siege of (1614–1615)

The final act of resistance by samurai on the losing side at the Battle of Sekigahara (1600). Ieyasu's Tokugawa assumption of hegemonic power in 1598, on the death of Toyotomi Hideyoshi, was opposed by forces led by Ishida Mitsunari (1560–1600). They backed Hideyoshi's chosen successor, his infant son Hideyori.

Tokugawa's victory at Sekigahara confirmed his mastery of Japan and his status as successor to the great project of Japanese unification begun by Nobunaga Oda and continued by Hideyoshi. After Sekigahara, the estates of the losers were largely curtailed, but the house of Hideyoshi was allowed to retain three provinces centered on Osaka Castle. Tokugawa, a ruthless strategist, would no doubt have preferred the complete elimination of Hideyoshi's family, including Hideyori, a potential opposition rallying point, but a narrow victory at Sekigahara and a still unconsolidated position initially precluded such a move.

Tokugawa bided his time while winning over many former Hideyoshi supporters. In 1614, he finally made his move. No daimyo came to Hideyori's defense, although almost 100,000 *ronin*, or masterless samurai, did. These *ronin* were the real losers at Sekigahara. They had been left destitute and desperate by the defeat of their lords.

Tokugawa's first assault against Osaka Castle, in the winter of 1614, was a costly failure, with over 35,000 casualties. Reverting to wile, Tokugawa offered an armistice to the Hideyori forces barricaded and besieged within their castle, provided that they allowed Tokugawa's men to fill in the castle's outer moat. When this was agreed to, Tokugawa instead filled in both the inner and the outer moat of the fortress. By the time that Hideyori's army realized what was happening,

it was already too late. Tokugawa's forces overran the fortress on 3 June 1615. The destruction of the castle and the annihilation of Hideyori and his supporters, followed by the confiscation of the Hideyoshi estates, removed the final barrier to complete Tokugawa dominance in Japan.

Osan, Battle of (5 July 1950)

The opening ground clash between the invading North Korean forces and U.S. troops. In the days immediately following the North Korean attack in late June 1950, General Douglas MacArthur sought to delay the onslaught and buy time until U.S. units could arrive in strength to stiffen the South Korean defense and repel the invaders. MacArthur ordered elements of the U.S. 24th Division—two rifle companies, an artillery battery, and a few other supporting units—all lightly and inadequately armed—to Osan, south of the capital, Seoul, on the west side of the peninsula, by 5 July. MacArthur referred to this 540-man force—called Task Force Smith after its commander, Lieutenant Colonel C. B. Smith—as “an arrogant display of force.”

The [North] Korean People's Army (KPA), 4th Korean Division, with its 33 Soviet T-34 tanks, struck Task Force Smith around 8 A.M. on 5 July. It suffered slight losses; the Americans did not have the numbers of men and equipment or the appropriate position to resist well, and the North Korean infantry flowed around them and turned their flanks. Two (and possibly three) KPA tanks were destroyed, however. The men of Task Force Smith had two choices—be captured or retreat—and thus retreated to the south.

Over the next several weeks, the 24th Division continued to seek to slow the North Korean advance, while the North Koreans—with greater numbers, tanks, and artillery—would seek to find them, fix them, and turn their flanks to crush them. The result was a steady American retreat down the west side of the Korean peninsula and a serious morale deflator for U.S. armed forces. However, the brief battle at Osan and others like it did create the breathing space to establish the perimeter at Pusan.

Ostende, Siege of (1601–1604)

An epic siege that captured the attention of Europe. Habsburg forces commanded by Ambrogio Spinola labored to take the city, which was surrounded by water and reputed to be one of the strongest fortifications in Europe, from the Dutch Republic. An Italian skilled in siege warfare, Spinola employed the leading military engineers in Europe gradually to reduce the city one bulwark at a time. During the siege, Spinola showcased how far the fine art of military engineering had developed in the Habsburg forces, employing a wide range of innovative devices.

The Dutch and their English allies used their control of the sea to constantly replace the losses of the garrison. Maurice of Nassau, the general of the Dutch field army, had been repulsed in his attempt on the Flemish coast at Nieuport in 1600 and declined to attempt a relief operation, considering the isolated outpost to be hardly worth the cost of defending it. He instead used the distraction to make extensive gains further inland along the Maas and Rhine Rivers while the Spanish were fixated on Ostende.

The siege became an ongoing battle of attrition and a trial of wills, with the Dutch eventually recording losses of more than 30,000 people in the siege and nearly twice that many Habsburg troops dying in the assaults or from exposure and the diseases that ran unchecked through the trenches. Altogether, the city held out for three years and 77 days, surrendering in September 1604 only after every one of the outer bulwarks had been lost and the harbor closed by Spanish batteries. By taking the city, Spinola had solidified Habsburg control of the Flemish coast, but it was at best a Pyrrhic victory.

Ostrogoths

The Ostrogoths (Eastern Goths) were a Germanic tribe first organized into an empire of sorts in the third century in the region extending north from the Black to the Baltic Seas. They first grew to prominence under Ermaneric (fl. 350–376) just before being invaded by the Huns. The Ostrogoths, as vassals of the Huns, were moved westward into Dacia during the early fifth century. After Attila the Hun died in 453, the Ostrogoths asserted their independence and followed other Germanic groups by invading the disintegrating Roman Empire, first under Theodemir and then under Theoderic. The Ostrogoths received territory in Dacia and Lower Moesia from the eastern emperor, Zeno, in 483, but they continued to raid Thrace and threaten Constantinople. In 488, Theoderic, convinced by Zeno, invaded Italy, which was ruled by the Germanic barbarian Odovacar. After three years of campaigning, Theoderic and his Ostrogoths defeated Odovacar and conquered the Italian peninsula.

Theoderic strengthened alliances by marrying off two of his daughters and his two sisters to other Germanic kings. He supported the Alemanni against the Frankish king, Clovis, and took on the remnants of the Visigoths in France and Spain. At the height of his reign, Theoderic controlled Italy, Sicily, Provence, Rhaetia, and lands south and west of the Upper and Middle Danube River, and as regent for his grandson, Amalaric of the Visigoths, he had influence in Spain. In 535, nine years after Theoderic's death, the Ostrogothic king Totila successfully fended off Belisarius, the commander under the eastern emperor Justinian, who wanted to reunite the old Roman Empire. In 552, Totila was ultimately defeated by another of Justinian's commanders, Narses, and the power of the Ostrogoths that had built up over the previous two centuries came to an end.

Otto I, the "Great" (912–973)

Real founder of the medieval German kingdom. Otto I is the only medieval German ruler to be called "the Great."

In Otto's time, Germany was made up of five largely independent duchies: Saxony, Franconia, Swabia, Bavaria, and

Lorraine. Otto took over Franconia and ruled Saxony by inheritance, putting down other ducal rebellions and consolidating control in Germany. He also made his brother Bruno archbishop of Cologne, a bastard son archbishop of Mainz, and another close relative archbishop of Trier, thus giving Otto control over the Catholic Church in Germany.

Rebellions by Otto's brother Henry and by Duke Eberhard of Franconia were ended by the Battle of Andernach in 939. This victory ensured German control over Lorraine. The following year, Otto campaigned deep into France. In 950, he campaigned against the Slavic Wends and gained suzerainty over Bohemia.

In 955, Otto won his most famous and important victory, defeating the Magyars (Hungarians) at Lechfeld, near Augsburg. After the battle, the Magyars ceased raiding into Germany and established an organized polity in what is now Hungary.

Otto was crowned emperor by the pope in 962. Hereafter, the papacy was fatefully linked with the German kingdom, and the German kings increasingly came to meddle in Italian affairs. It is thought that Otto's threatening posture toward pagan Poland probably led to Prince Mieszko's decision to convert Poland to Christianity in 966.

Ottoman Empire (1300s–1922)

The Turkish ruler Osman founded the Ottoman state in 1299, utilizing the military capabilities of his people to consolidate control over Arab lands. Known for their endurance, discipline, mobility, warrior spirit, and equestrian skill, the Turks relied on equestrian archers to win their battles. In 1326, Sultan Orkhan organized the military into three principal contingents. The feudal armed forces received fiefs in exchange for military service and the provision of soldiers, but the land reverted back to the sultan if the recipient failed to fulfill his military duties or committed a crime. Janissaries, recruited Christian youths trained in the ways of Islam, served as the standing infantry. Organized by Murad II in the fourteenth century, these troops served as escorts, security guards, and defenders of the city gates during times of peace. Auxiliary troops consisting of scouts, armed nomads, and defenders of outlying fortresses rounded out the military structure.

After establishing administrative control over Anatolia, the Ottomans invaded Europe many times during the next 500 years. In 1354, the Gallipoli peninsula fell under their control. Under Murad I (1359–1389) their light cavalry moved further into the continent. With internal strife dividing the Christians, European leaders failed to prevent further expansion. By 1400, the Ottomans had defeated the Serbs and their allies at Kosovo and, at Nicopolis, the Macedonians, the Bulgarians, and the Hungarian king Sigismund, leader of the anti-Ottoman crusade organized by Pope Boniface IV. The Ottoman troops were poised for a strike at Hungary when Tamerlane's Mongol forces captured the sultan and defeated his men at Ankara in 1402. The Venetians and the Byzantines briefly recaptured Gallipoli and Salonika, respectively, but after Mehmed I emerged as the successor in 1413, Ottoman troops once again controlled these areas. His successor, Murad II, continued the expansionist military policies, defeating the Albanians, Greeks, and Romanians as well as another crusading army organized by Pope Eugene IV in 1444. Although the Ottomans had achieved many victories and expanded their territory considerably during the fourteenth and early fifteenth centuries, the beginning of the empire period dates from the reign of Mehmed II in 1451. After expanding and improving the army and establishing a navy, Mehmed conquered the Balkans and pushed into central Europe, the Ukraine, the Caucasus region, Arabia, and North Africa. After capturing Athens, Bosnia, and Herzegovina, the new sultan won a decisive victory against the Venetians at Lepanto. Then the Ottomans turned their attention back to the east to deal with the Persian challenge. The Persians, under the Safavids, and the Ottomans waged a series of wars until the eighteenth century, when they agreed on their borders.

With the Persians checking their advance in the east, the Ottomans shifted their expansionist efforts back to the west. Selim the Grim, a great warrior, conquered Syria and Egypt, leaving his son and successor, Süleyman the Magnificent, with a full treasury and an experienced army. In 1521, Süleyman captured Belgrade and then waged a campaign against the Hungarians and the Austrians. The Hungarian defeat at Mohács led to the division of the country, with half falling under Ottoman control and the rest controlled by Austria. After forming an alliance with the French king, Francis I, against Emperor Charles V, Süleyman resumed the war against the Austrians while intermittently halting the campaigns to fight the Persians. By 1562, peace treaties had been signed with both Persia and Austria. After experiencing two major naval defeats in the Mediterranean, Süleyman once again led his army against Austria. Before he could wage war against the forces of Maximilian II, who had refused to pay tribute, Süleyman died. The sultanate passed to his son Se-

lim II, known as “the Sot,” and the military strength of the Ottoman began a rapid decline.

In 1683, the Ottoman forces experienced a crushing defeat at the hand of the Viennese. Recognizing the superiority of European arms after the introduction of gunpowder, the Ottomans attempted to reform their military. Relying on Prussian advisers to train their troops, the Ottomans fell under their influence. When World War I broke out, Turkey, after initial hesitation, allied with the Central Powers and paid the price after the defeat of Germany, when the Allies dictated armistice terms to the Ottomans. Several political factions battled over the future of the country, and finally in 1922, Mustafa Kemal abolished the sultanate, drove Greek forces out of Turkey, and officially ended the Ottoman Empire.

ough had discerned this move and sent his army to cross the river before the French arrived.

On 11 July, the French general Biron discovered the waiting allied troops and asked for orders. Vendôme refused to believe Biron and left his army without deployment orders until it was too late. Marlborough, urging his troops on, arrived at noon and deployed on a line of low hills north of Oudenaarde. His lines were protected by meadows and hedges. By 3 P.M., Bourgogne gave the order to the marching French to assault the waiting English lines. The attack began on the French right, soon supported by the center. All this uncoordinated movement gave predictable results, as all the columns were repulsed. The French left, under Vendôme, remained useless.

Eventually, with Eugene’s army facing Vendôme, Marlborough took the initiative. Following the retiring French right, he managed to encircle them, forcing thousands to surrender. The French rout sent them back to Bruges. Marlborough’s victory restored allied morale. The French had lost more than 15,000 soldiers and were no longer able to protect their northern border. France lay open to an invasion.

Oudenaarde, Battle of (11 July 1708)

The perfect illustration of the difficulties of double command. In 1708, John Churchill, Duke of Marlborough, wanted to raise the morale of his Dutch allies by winning a battle in Flanders. His main objective was to retake all the territories lost the two previous years. On the French side, the king had sent his grandson, the Duc de Bourgogne, to command the field army with the Marechal de Vendôme on a secondary front. Eugene of Savoy’s army was far away, and Marlborough’s troops were deployed all over northern Flanders, with Brussels as headquarters. On 16 May, the French army advanced toward Brussels, its superior number pushing away Marlborough’s troops. Then Bourgogne stopped waiting for orders from Versailles, 200 miles away. A very religious man, Bourgogne was also very cautious and was always at variance with Vendôme’s orders. On the other side, Marlborough asked Prince Eugene to join his army as soon as possible to coordinate an aggressive defense.

At the beginning of July, a sycophantic noble follower of Bourgogne suggested an attack toward Bruges and Ghent. The two towns were easily taken, and the royal army decided to encircle Oudenaarde on the River Scheldt. But Marlbor-

Oudinot, Nicholas-Charles, Duc de Reggio (1767–1847)

Military commander during the Revolutionary and Napoleonic Wars of France. Nicholas-Charles Oudinot was born on 25 April 1767 at Bar-le-Duc, France. He enlisted in the Royal Army in 1784 and served until just before the outbreak of the French Revolution. The revolution provided opportunities for men of humble origins, like Oudinot, with military experience and even command, and he was one of the many beneficiaries.

In 1789, Oudinot was appointed captain and rose to the rank of lieutenant colonel by 1791. Between 1792 and 1796, he campaigned with the Army of the Rhine, rising to the rank of *general de brigade* by June 1795. Frequently wounded and once captured, he was promoted to *general de division* in 1799 and made chief of staff of the Army of Switzerland in that year.

During the second Italian campaign, Oudinot served under André Masséna and so took part in the defense of

Genoa. In August 1800, he was appointed chief of staff of the Army of Italy and participated in G. M. A. Brune's campaign of 1800–1801 that led to the capture of Verona.

In February 1805, Oudinot was appointed to command the Reserve Grenadier Division, which ultimately became the 1st Division of Jean Lannes's corps during the campaign against Austria. Though the grenadiers distinguished themselves at Austerlitz, Oudinot was wounded early in the campaign and did not receive another command until 1807, when he served under the command of François-Joseph LeFebvre, Duke of Danzig, at the siege of Danzig, and again under Jean Lannes, Duke of Montebello, at Friedland.

In July 1808, Oudinot was created a count of the empire and in April 1809, duke of Reggio. He was elevated to the rank of marshal of the empire in July 1809. After receiving command of the Second Corps in 1812, he distinguished himself at Polotsk and at the Berezina crossing during the disastrous retreat from Moscow.

In the 1813 campaign, Oudinot was given command of the XII Corps and fought at Bautzen. After the conclusion of the armistice, the XII, together with the IV and VII Corps, were detached from the Grand Armée, and the whole force, under the command of Oudinot, was directed to march on Berlin. Oudinot was promptly defeated by a mixed force of Prussians, Russians, and Swedes under the command of the crown prince of Sweden, Jean Bernadotte. Oudinot was re-

placed in command of the Army of Berlin by Michel Ney, who was in turn defeated by Bernadotte at the Battle of Dennewitz. Oudinot commanded the remnants of his corps at Leipzig and in 1814 fought at Brienne, La Rothiere, and Arcis-sur-Aube.

After the Bourbon Restoration, Oudinot was appointed commander of the Metz area and made a peer of France. During the Hundred Days, he was not employed by Napoleon and so was able to continue his career after the Second Restoration. He commanded a corps during the Spanish campaign in 1823 and became governor of Madrid. In 1842, he became governor of the Invalides. He died on 13 September 1847. Overall, Oudinot was a failure as an independent army commander but was a capable corps commander and administrator.

P

Pachacutec Yupanqui (r. 1438–1471)

Sapa Inca (first ruler) responsible for the growth and development of the Inca Empire. Although Spanish and native sources differ on specifics, Pachacutec Yupanqui clearly took the early reforms and successes of his father, Viracocha, and transformed the Inca from one of several ethnic chiefdoms in highland Peru to a huge empire controlling much of the coast and highlands of western South America.

In 1438, at around 16 years of age, Yupanqui took control of the defense of the Inca capital Cuzco from his ailing father. He defeated the 30,000-man Chanca army by using allied troops in surprise flanking movements at key moments in the battle. After this victory, he was crowned Pachacutec Yupanqui, *Sapa Inca*, and ruled for 33 years. He would conquer the highland kingdoms of Lupaca and Cajamarca, form alliances with the Quechua and Charca, conquer the coastal states of the Ica and Nazca, and eventually oversee the conquest of the powerful coastal Chimú state by 1471. His development of cycling in fresh troops to threatening realms was crucial to his success.

Pachacutec developed a permanent military system and grand strategy for the empire in carrying out this expansion. The military system consisted of ethnic Inca nobility trained in the arts of war and leadership at schools in Cuzco. Other ethnic Inca were trained at military-style schools and formed the core of Inca armies. He used alliances to provide the bulk of troops from loyal provinces, utilizing their alternative weapon and fighting systems to complement the Inca core. Fortifications like Sacsahuaman in Cuzco were used to protect road systems and supply depots, and the llama was the pack animal for the expeditions.

Pachacutec's grand strategy consisted of overwhelming logistics, defense-in-depth fortifications, and a variety of alliance offers, made both peacefully and forcefully to acquire new territory. He successfully incorporated many peoples by

moving around loyal subjects to rebellious areas and vice versa. His use of the *mitmae* (labor tax) allowed for one of the most rapid developments of an empire infrastructure in world history.

Pacific War of the (1879–1884)

Major war resulting from a dispute between Chile and Bolivia. The dispute centered on control of the Atacama Desert, important because of rich deposits of nitrates used for fertilizer, on the western coast of South America. Peru soon entered the war on the side of Bolivia. Chile and Bolivia had argued over border delineation since their independence. In 1874, the dispute seemed to be resolved when Chile agreed not to pursue its claim for control over the southern portion of the Atacama in exchange for a generous tax concession for Chilean companies exploiting nitrates in the Bolivian-controlled area.

When the Bolivian dictator General Hilarón Daza increased taxes in an apparent violation of the 1874 accord, Chile protested vociferously, and Daza declared war. Chile soon learned that Peru and Bolivia had a secret alliance and that Peru intended to honor its commitments to Bolivia. These revelations resulted in an immediate declaration of war by Chile on Peru.

Naval power proved to be of great importance in the early phase of the war. Chile's navy, under the command of Admiral Juan Williams Rebolledo, established a blockade with several wooden ships off the Peruvian port of Iquique for the purpose of cutting Peru's nitrate trade. Williams then sailed north with his two ironclad monitors to attack the Peruvian navy, which he believed was defending Peru's main port of Callao. However, Peruvian admiral Miguel Grau had sailed south with his two ironclads, the *Huascar* and the *Independencia*, and on 21 May 1879 attacked the Chilean blockade, sinking the *Esmeralda* and damaging the *Covadonga*. Unfortunately for Grau, the Battle of Iquique proved a hollow victory because the *Independencia* was run aground and lost. With only one ironclad, the *Huascar*, remaining, Peru was at a decided disadvantage for the remainder of the war. Nevertheless, Grau used the *Huascar* to harass Chilean shipping lanes, resulting in Williams's resignation. On 8 October 1879, a refurbished Chilean fleet, including the ironclads the *Blanco Encalada* and the *Cochrane*, finally forced an engagement with the *Huascar*. Superior Chilean firepower soon reduced the *Huascar* to a burning hulk, resulting in the death of most of the crew, including Admiral Grau. (*Huascar* is still in existence as a Chilean memorial.)

With control of the sea assured, Chile launched an invasion of the southern Peruvian province of Tarapac in October 1879, led by General Erasmo Escala. General Hilarón Daza led a Bolivian army from the sierra to counter Escala's move and to join a Peruvian army led by General Juan Daza. But Daza's troops were ill-equipped and unprepared for the arid conditions of the Atacama, and Daza abandoned his plan. On 19 November 1879, Escala repulsed an allied attack and forced a retreat. It was followed by an assault on the city of Tarapac, which proved costly but was ultimately successful and led to the capture of Iquique.

On 8 April 1880, Chile renewed land operations to gain total control of Peru's nitrate-rich province of Tacna. The campaign resulted in extraordinarily high casualties for the invaders, but by June Chile had control of most of Tacna. When peace negotiations failed, Chile decided to attack Lima, which fell on 17 January 1881. Peruvian resistance continued despite the loss of the capital. Finally, in 1883, the Chilean army defeated the forces of Andrés Bello at Huamchaca, and Peru signed a peace treaty ceding Tarapac to Chile and permitting occupation of Tacna and Arica for 10 years. The Chileans took complete possession of the disputed areas in 1884. Bolivia lost its Pacific coast when it turned over the Atacama to Chile. Thus, Chile became the leading power on the west coast of South America, but Bolivia never forgot its lost access to the sea.

Pacifism/War Resistance

The opposition to war, killing, or violence. The word comes from the Latin *pax* or *pacis*, which means "peace," and *facere* which means "to make." Pacifists believe that nations should settle their conflicts as peacefully as possible and are often opposed to participating in military activity. Even though peace and justice are the objectives of all pacifists, the degree and circumstances of nonviolence vary from person to person and circumstance to circumstance. Although absolute pacifism declares that violence is wrong always and in every situation, most pacifists are on a moral and ethical continuum as it relates to force. For example, some pacifists refuse to enter the military service in any capacity, whereas others find their witness for peace as unarmed army medics. Thus much of the writing of those advocating peace debates under what circumstances nonviolence should be national, group, or individual policy and the degree of coercive or disciplinary violence that should be used to achieve social or personal goals.

The roots of pacifism are as old as war itself and can be traced to Asia, especially Buddhism, several of the indigenous peoples of the Americas, and the writings of Greek philosophers like Plato. Pacifism as a dominant form of philosophy emerged in western thought with first-century Christianity. After hearing passages like Jesus' Sermon on the Mount, most early Christians believed that their Christ called for nonviolent resistance to pagan political power and the ways of the world. Christianity did not change its stance toward violence until the third century, when it increasingly gained followers in power in the Roman Empire, particularly the Emperor Constantine. By the fifth century, Christian thinkers, particularly St. Augustine, developed a "just war" theory. Although no longer the dominant strain of thought, pacifism still held power in many ecclesiastical circles and later reappeared in the sects founded during the Protestant Reformation. Often called the "peace churches," the groups that elevated nonresistance to doctrinal position included Mennonites, Anabaptists, Friends (or Quakers), Moravians, Brethren, and Dukhobors. Leaders from these groups have been the heart of most peace societies founded after 1815 and have been the most vocal in the cause of peace. More philosophical advocates of pacifism can be found in the

writings of Immanuel Kant, Erasmus, Adin Ballou, and William James.

Modern pacifism began with the founding of peace societies in Massachusetts (1815) and New York (1815) and in England (1816); France, Switzerland, and other countries soon followed suit. William Ladd brought many of these groups together in the United States, establishing the American Peace Society in 1828. These groups advocated various proposals to smooth relations between nations. Yet many of these societies or individuals, like William Lloyd Garrison, the most prominent American abolitionist, allowed for some degree of violence, particularly in support of the antislavery cause. In 1843, the first peace congress met in London, and momentum seemed to be building for pacifistic reform in international relations until the American Civil War shattered the peace movement in the United States. While American peace societies were rebuilding during the latter half of the nineteenth century and European efforts were set back by the Crimean War and the wars of Italian and German unification, Sir William Randal Cremer of Great Britain and Frederic Passy of France spearheaded efforts to establish the Inter-Parliamentary Union in 1889, which brought members of national electoral bodies together in periodic conferences. The same year, the International Peace Bureau was founded in Berne, Switzerland. Alfred Nobel (1833–1896), the Swedish inventor of dynamite, established the Nobel Peace Prize to recognize and reward work for peace and humanitarian causes.

During the mid-1860s, socialist thinkers such as Cesar de Paepe developed the First International of Working Man, an organization of socialists, pacifists, and union supporters who believed the cause of peace was almost impossible until private property and class inequality could be abolished. A Second International was found in 1889, and its members advocated general strikes in case of war, arbitration treaties, arms reduction proposals, and much of colonialism. Militants such as Gustave Herve urged sabotage in the cause of pacifism. Vladimir Lenin urged the dissolution of international boundaries as the only means of true peace. Still, most peace societies were ethnocentric and nationalistic in their viewpoint, and the association with socialism (and vegetarianism, antivivisectionism, and other “fads”) in the public’s mind would hurt their efforts in the twentieth century.

Yet with conferences at The Hague in 1899 and 1907 and mainstream political leaders like William Jennings Bryan advocating international treaties and courts to settle disputes, many pacifists believed an end to war was within sight. World War I shattered these illusions, but pacifist sentiment quickly reappeared with the conclusion of the war.

Many peace advocates pushed for the League of Nations as the forum to settle international disputes. In the United States, pacifists were often actively involved in the growing women’s rights movement and sought to distance themselves from events in Europe. Pacifism was again dealt a blow by the events leading to World War II when pacifists were blamed for the isolationism and appeasement that led to that war. Still, the number of conscientious objectors in the United States and England was larger than in World War I, and most were treated with far more respect for their beliefs than in the previous conflict.

The “McCarthyite” 1950s were the low point for peace movements in the United States, and the cause was harmed by the Communists and Soviets hijacking the term *peace* for their own use. There was very little vocal opposition to the Korean War, and those who advocated measures and resolutions toward maintaining world peace were labeled “fellow travelers” or seen as disloyal to their country. Still, pacifist sentiments were nurtured by the writings of Jane Addams, Leo Tolstoy, Albert Schweitzer, Dorothy Day, Mohandas Gandhi, and Martin Luther King. They inspired efforts to work toward world peace, and by the 1960s and 1970s, pacifists and other antiwar groups were vocal in their opposition to the Vietnam conflict. They organized marches, rallies, and protests against the war, and the movement pressure was responsible in part for U.S. withdrawal from that conflict.

After the war, President Gerald Ford allowed conscientious objectors who had fled the draft to return home. The threat of nuclear weapons particularly enlivened the peace movement and helped pacifists to be taken seriously in their urging of unilateral disarmament and an end to nuclear testing.

Pacifists flourish unmolested in the developed democracies, but it can be argued that this is the case primarily because they are so few in number that they pose no threat to those countries’ military-industrial complex. A major question that will arise in any future U.S. conflict, however, is whether “secular” pacifists, that is, those who hold sincere nonviolent beliefs but do not belong to any of the state-recognized “historic peace churches,” will be given draft-exempt status.

Paekche (attributed 18 B.C.E.–660 C.E.)

One of three kingdoms dominating the Korean peninsula. Situated in the southwest, Paekche's origins and early history remain obscure. Most sources agree that its founders were warrior-refugees from the Manchurian state of Fuyu (Korean Puyo), which met its demise in 285 C.E. The oldest extant Korean history places Paekche's foundation at 18 B.C.E., but Paekche does not appear in written records until the third century C.E.

Despite purported warrior origins, Paekche was better known for its cultural achievements than for any military prowess. Its emergence coincided with the appearance of two primary rivals, Silla and Koguryo, located in the southeast and north, respectively, the other two kingdoms giving the period its name. From the mid-fifth century, the three waged an increasingly bitter struggle for hegemony.

In this climate, Paekche forged an alliance with Yamato Japan, a partnership whose nature continues to be debated. As a result, Paekche served as a conduit for technology and culture to the Japanese islands, while Yamato troops were engaged on the peninsula.

From the fifth century, Paekche was subjected to increasing pressure from Koguryo advancing south and Silla intent on going north, in a general atmosphere of winner-take-all. A Paekche-Silla alliance crumbled in 552, and in 660 Paekche was finally destroyed by Silla, which took advantage of a military alliance with the new Tang Dynasty in China to defeat both Paekche and Koguryo and unify the peninsula.

Pagan Kingdom (1044–c. 1300)

The founder of the Pagan Kingdom, King Anawrahta (r. 1044–1077), established the first state unifying Upper and Lower Burma, including most of the territory of the modern nation, except for Shan State and the remoter border areas. He and his successors recognized Theravada Buddhism as

the state religion, building magnificent pagodas at their royal capital of Pagan and making generous donations to the *sangha* (community of Buddhist monks). The Pagan dynasty's 12 kings dealt with the challenges of a multiethnic society (principally Mon, Burmese/Myanmar, and Pyu) both by absorbing non-Burmese cultural influences (especially Mon culture) and by preserving the privileges of an ethnic Burmese ruling class.

In 849, the Burmese built a fortified city at Pagan (near Nyaung-U, in Mandalay Division) that was strategically located on the banks of the Irrawaddy River and near the irrigated districts of Kyaukse and Minbu, which provided the small state with surpluses of rice. The availability of rice was the economic foundation of Pagan's military power. Linguistically related to the Tibetans, the Burmese originally lived in eastern Tibet or Yunnan but had migrated into the Irrawaddy Valley (Upper Burma) because of the power vacuum created by attacks by the Nanchao Kingdom of Yunnan (now China's Yunnan Province) on states in Burma ruled by an earlier people, the Pyu. The Upper Burma Dry Zone is a harsh, semidesert environment, and the Burmese quickly gained a reputation as aggressive warriors. They gave their capital of Pagan the Pali name of Arimaddanapura, "the city that is a crusher of enemies."

Anawrahta conquered Lower Burma (the Irrawaddy Delta and Tenasserim), capturing the Mon city of Thaton in 1057 and bringing its king, the devout Buddhist Manuha, as a hostage to Pagan. In the first recorded instance of political protest in Burmese history, the Mon king built a small and unspectacular temple claustrophobically housing large Buddha images in cavelike chambers, expressing his distress at being Anawrahta's prisoner. Although Anawrahta, Kyanzittha (r. 1084–1111), and other Pagan monarchs patronized Mon culture, more refined than their own, and venerated Mon monks as teachers of Theravada doctrine, this Lower Burma people staged numerous revolts against the Burmese that were harshly suppressed until c. 1281, when Pagan, hard-pressed by the Mongols, could not prevent the emergence of an independent Mon state at Pegu.

The Mongol emperor Kublai Khan's conquest of Yunnan in the 1250s set the stage for Pagan's fall. King Narathihapate (r. 1256–1287) rejected Kublai's repeated demands for submission, and in 1277 the Mongols invaded. In his *Description of the World*, Marco Polo chronicles the defeat of Burmese soldiers mounted on elephants by Mongol archers, a terrible rout. In 1286–1287, Narathihapate's continued intransigence led to a second invasion in which Pagan was occupied. By 1300, the Pagan Kingdom was no more. Tai (Shan) peoples came into Burma in the wake of the Mongol incursions and established a power base at Ava in Upper Burma.

Palo Alto (8 May 1846)

Early battle in the Mexican-American War. In preceding months, General Zachary Taylor and his “Army of Observation” had moved from the Nueces River to the Rio Grande, which was disputed territory between Mexico and what had formerly been the Republic of Texas and now was the United States. He was opposed by General Mariano Arista and the Mexican Army of the North.

On 8 May 1846, the two armies clashed at Palo Alto. American artillery was more mobile and far superior; the Mexican army had antiquated muskets and inferior gunpowder and shot. The fighting began around 2:00 P.M. with an artillery exchange and the U.S. troops literally dodging the solid copper Mexican shot, while the U.S. artillery caused great damage. In early evening, Arista tried to turn Taylor’s flank and failed; meanwhile, the Mexican left began to break, and the high grass caught fire. As the infantry fighting halted for the fire, the artillery duel continued, with the Americans having the better of it. The battle was probably a draw but was costly for the Mexicans.

Panama Incursion (1989–1990)

Quick U.S. military operation against corrupt Panamanian ruler. Panama had been ruled by the military from the 1960s, and by the 1980s, General Manuel Antonio Noriega Moreno had become the power behind the throne in Panama. Noriega had links with the Central Intelligence Agency (CIA) dating back to the 1960s.

Panama, cut in two by the American-built and administered Panama Canal, had always had a close, albeit one-way, relationship with the United States, but by the mid-1960s, this relationship was beginning to show signs of strain. Although Noriega assisted the United States in its war against the Sandinistas in Nicaragua, he also helped Cuba break the U.S. blockade by reselling goods to the Caribbean island. In 1986, the journalist Seymour Hersh published an article in the *New York Times* contending that Noriega was involved in gun running, drug trafficking, and money laundering.

Noriega was becoming an embarrassment for the United States, and in mid-1987, the Reagan administration initiated economic sanctions against Panama. These sanctions were tightened in December of that year, when all assistance from the United States was stopped. The situation worsened when, in February 1988, two Florida grand juries found Noriega guilty of drug trafficking and money laundering.

In the May 1989 presidential elections, qualified observers argued that Guillermo Endara Galimary had won three times as many votes as Noriega’s candidate. Noriega simply annulled the elections and appointed his own candi-

date, Francisco Rodriguez, as president. In October, Noriega survived an attempted coup, and on 15 December he became head of the government with the title "Maximum Leader."

Relations with the United States approached the crisis stage on 16 December, when a U.S. serviceman, Lieutenant Robert Paz, was shot and a U.S. Navy officer and his wife were arrested and harassed by the Panama Defense Force (PDF). These affronts were the last straw for U.S. president George Bush, who set in motion Operation JUST CAUSE on 20 December.

This operation, which involved more than 20,000 U.S. troops, had two functions: the invasion of Panama and the seizing of Noriega at H-hour before transporting him to the United States to face charges. The PDF quickly disintegrated, with U.S. forces facing more resistance from the paramilitary Dignity Battalions. Both U.S. Special Operations and conventional forces were completely successful and suffered very few casualties. But the invading force could not locate Noriega. He eventually surfaced at the Papal Nunciature on Christmas Eve, leading to a standoff with U.S. forces. Finally, on 4 January, the deposed dictator was persuaded that he had no choice but to give himself up and face the charges against him in the United States.

Panama moved quickly during 1990 toward democratization and demilitarization, and the May 1989 election results were upheld. Operation JUST CAUSE had ended Noriega's rule, but it also gave rise to questions of the legitimacy of Endora's presidency. The operation also was a flexing of the muscles of the post-Vietnam U.S. military, rejuvenated by former U.S. president Ronald Reagan.

Panipat, Battles of (21 April 1526, 5 November 1556, 14 January 1761)

Series of Persian-Afghan-Indian battles. The first Battle of Panipat took place on 21 April 1526. Ibrahim led at least

10,000 Delhi Muslims with 100 war elephants against Babur and his 2,000 handpicked Moguls. It is likely that more conscripts were involved, but only the number of professional soldiers is known. Babur scored a complete victory, with gunpowder weapons playing a significant role in frightening the elephants. Ibrahim was killed, and the Mogul Empire began in India from the ashes of the Afghan Dynasty that had ruled from Delhi. This third invasion of India by the Moguls was easily the most successful.

The second Battle of Panipat took place on 5 November 1556. Akbar Khan and 20,000 troops of the Mogul Empire faced Hemu, who commanded about 100,000 Hindu Rajah troops, 1,500 war elephants, and a chaotic baggage train full of loot from rebel-held Delhi, the former Mogul capital.

The Moguls repulsed an initial charge by the war elephants and then directed the panicked Hindu elephants toward the Hindu rear baggage train area, all but stopping any movement of Hindu reinforcements. The Moguls scored a complete victory, capturing and executing Hemu, retaking Delhi, and building a tower of Hindu heads.

The assassination of Nadir Shah, last of the Safavid-linked Persian leaders, in 1747 caused the collapse of his Persian empire to Russian, Ottoman, and Afghan interests and resulted in the third Battle of Panipat. Shah Ahmed Durani created the Afghan empire from its ashes by conquering parts of Persia and sections of Maratha India, namely the Punjab and Delhi. In response, Sedashao Bhao, cousin of the Maratha Peshwa (ruler), went forth with the largest Maratha army ever assembled, perhaps 300,000 strong, pushing back the Durani Afghans. Shah Ahmed then led 90,000 Afghan and Indian troops to face the Marathas at the third Battle of Panipat in 1761. Bhao attacked first and dispersed Ahmed's Indian allies on 14 January, but Ahmed, preaching a jihad (holy war) against the predominantly Hindu Marathas, rallied his Islamic Afghan forces and crushed the Maratha army, killing 75,000 and capturing and ransoming another 30,000. The Mogul throne, used as a pawn by Afghans, Marathas, and the British, now effectively ceased to exist, and the remnants of the once-mighty Mogul empire were divided up among the three.

Paramilitary Organizations

A wide range of groups organized along military lines yet lacking the traditional role or legitimization of conventional or “genuine” military organizations. Typical characteristics include a hierarchical organization with clear lines of authority and strict discipline, military-style ranks or uniforms, and usually an explicit ideological mission. Light weaponry may also be included. Party militias like the Nazi Stormtroopers (SA) or Italian Squadristi (Black Shirts); militarized police forces such as the armed units of the Soviet secret police or the French gendarmerie; veteran’s organizations such as the German Stahlhelm; U.S. state police and Canadian provincial police; and even many youth groups such as the Boy Scouts all may be termed paramilitary for different reasons.

Paramilitary organizations exist to perform tasks for which conventional military forces are either ill-suited or considered unworthy, for example, domestic police duties or state terrorism. They also represent an attempt to apply military forms of organization to nonmilitary or political ends because of the military’s assumed greater efficiency or to appropriate and imitate the prestige and aura of conventional military forces. These latter reasons were especially true in the first half of the twentieth century because of the great prestige that conventional military establishments had gained as symbols of national unity and was only intensified (though not without challenge) by the series of great wars that swept Europe in the late nineteenth and early twentieth centuries. By the end of World War I, military ways of organization came to be seen as possible alternatives to liberal democracy, and millions of veterans searching for meaning after the carnage of war could find in them a familiar way of life.

The most characteristic form of paramilitary organization in the early and mid-twentieth century was the party militia typified by the Squadristi of the Italian Fascist Party. Before the Fascists came to power, the Squadristi served as a way for the Fascists to organize violence against their opponents and at the same time appear to be more dynamic and effective than their conservative and liberal competitors. After the Fascists came to power, the Squadristi were institutionalized as a mechanism for mobilizing, organizing, and indoctrinating the population, yet they kept their original role as an extralegal means of exercising violence. Nearly all fascist or radical conservative movements of the period between the two world wars established similar paramilitary auxiliaries. The success of the Bolshevik Revolution and the adoption of the Soviet model of development by newly independent states in the former European colonies or by the puppet states of Eastern Europe also led to the widespread

establishment of paramilitary state youth organizations, particularly after 1945, most of which have now largely disappeared with the collapse of the Communist states that organized them.

Today, paramilitary organizations are often formed in cases in which established social groups and interests seek to exercise power yet are either unwilling or unable to use conventional military forces, which they may not fully control or which may be unwilling to dirty their own hands. Examples include private death squads established with government connivance, such as in Guatemala or El Salvador, or the ethnic Serbian paramilitaries established in Bosnia in the 1990s.

In the democracies, paramilitary organizations were not unknown, but their goals were usually entirely benign, such as the search-and-rescue mission of the U.S. Civil Air Patrol or the woodcraft of the Boy Scouts.

Paris, Siege of (1870–1871)

The climax of the Franco-Prussian War, which destroyed the French Second Empire and led to the creation of the Third Republic. After the collapse of the French armies, the Prussians surrounded Paris in September 1870. A spontaneous popular movement in the city deposed Emperor Napoleon III and created a republic. General Louis Trochu, appointed to lead the city’s defense, was competent, but not very zealous in actively ending the siege. The French National Guard, the main force available within Paris for its defense, made two poorly planned attempts to break through the Prussian lines but failed to coordinate their efforts with French forces outside the city. Both ended in total fiasco. The Prussians made no attempt to storm Paris, preferring to starve it into

surrender. French forces outside Paris, led by Léon Gambetta, were never able to mount a serious effort to relieve the capital. The siege saw the first extensive wartime use of hot air balloons for communication with the outside world; unfortunately, given the state of technology at the time, it was difficult to navigate the balloons and flights into Paris were impossible. The siege laid bare the fissure lines between conservatives and radicals in Paris. The “Reds” were increasingly critical of the way Trochu and the government handled Paris’s defense and the way the government handled the economic problems resulting from the siege. The government surrendered Paris in January 1871 largely because it feared an incipient revolt by Parisians. Shortly after the surrender, there was, in fact, a rebellion that chased a newly elected government to Versailles and led to the creation of the Paris Commune.

Parma and Piacenza, Alessandro Farnese, Duke of (1545–1592)

Spanish general and statesman. Parma was the greatest soldier of his time in western Europe. He came close to defeating the Dutch revolt against Spanish rule, but interference and lack of support from Philip II prevented his victory.

Parma was the son of Margaret of Austria, Emperor Charles V’s natural daughter, and Ottavio Farnese, Duke of Parma. He spent part of his boyhood in Philip II’s court, where he became friends with Don Juan of Austria, his cousin. Parma accompanied his mother to the Netherlands in 1565, where she was regent. Parma became very familiar with the country and the leaders of society. He volunteered for duty with the Holy League fleet under Don Juan against the Turks and distinguished himself in the victory at Lepanto on 7 October 1571. Parma continued to serve in the Mediterranean until 1574.

In 1577, Don Juan requested Parma join him in the Netherlands. At the Battle of Gembloux, 31 January 1578,

Parma led the cavalry charge that smashed the opposing infantry and nearly destroyed the Dutch army. After Don Juan’s death on 1 October 1578, Parma became Spanish commander in the Netherlands. His knowledge of the country and people was a great advantage. In May 1579, he signed a peace treaty with Catholic leaders of the southern provinces, bringing them back into allegiance with Philip. With his base secure, Parma concentrated on taking the centers of Protestant power in the north. A master of maneuver and sieges, he did not undertake any operations beyond his army’s power, which numbered only 27,000 men, but isolated cities before reducing them. Parma was merciless to his avowed enemies but persuasive in winning over others. His greatest triumph was the capture of Antwerp in August 1585, after blockading it from the sea with a barrage of boats. The opportunity to crush the revolt for good was lost when Philip ordered Parma to intervene in the French wars of religion and the invasion of England with the Spanish Armada. While he was in France, much of Parma’s gains were lost to Maurice of Nassau and his reorganized army. Frustrated by Philip, Parma became disheartened. He was wounded in the arm in a skirmish at Caudebec, fell ill, and died soon afterward. No soldier who followed him could duplicate his successes.

Parthian Empire (247 B.C.E.–226 C.E.)

The Parthians liberated Persia from Hellenistic domination and made Persia a power to rival the Roman Empire. They originated as nomadic Persian speakers living southeast of the Caspian Sea and south of the Oxus River.

Under Shah Mithradates I, the Parthians expanded through Iran and, by 141 B.C.E., reached modern-day Iraq. In 139 B.C.E., Mithradates captured the Seleucid prince, Demetrius II, and occupied the Tigris-Euphrates Valley. Under Mithradates II the Great (124–87 B.C.E.), the Parthians managed to decisively secure their eastern borders as well. Ctesiphon in Babylon became the capital.

The Parthian army was primarily a cavalry force, pro-

vided mostly from feudal levies, especially from the powerful landed nobility. Heavy cavalry wore body armor and fought at close quarters with sword and lance. Light cavalry used the compound bow, firing continuous volleys of arrows and javelins from a distance. The Parthian “lights” developed a technique of firing to their rear at a pursuing enemy, a tactic Romans called “the Parthian shot.” Infantry and mercenaries, recruited mostly from feudal landlords, played largely supporting but vital roles. This military system made the Parthians formidable and frustrating opponents. Conversely, poor logistics and dependence on an unreliable nobility severely limited Parthian capacities for sustained offensive operations.

Parthian-Roman relations began on friendly enough terms in 96 B.C.E. However, when General Pompey subjugated Armenia, traditionally a Persian vassal, frictions began. Marcus Licinius Crassus attempted a conquest of Parthia in 53 B.C.E. and died at Carrhae. Mark Anthony lost thousands of men invading Persia 15 years later. Caesar Augustus fortified Syria as a base against Persia and, in 20 B.C.E., imposed a puppet king on Armenia. Using this strategy, Rome controlled Armenia for decades. However, Shah Vologases wrecked this hegemony, waging a decade of war (53–63), until Nero accepted Vologases’s brother as king of Armenia.

In 113, Emperor Trajan invaded Armenia and, in 115, captured Mesopotamia and Ctesiphon itself. Occupation unleashed popular revolts throughout Mesopotamia, leading Emperor Hadrian to evacuate in 117. In the First Parthian War (161–166) Shah Vologases III, responding to noble and popular anti-Roman pressures, launched invasions into Syria and Armenia. Lucius Verus drove him out, reconquered northern Mesopotamia, but avoided Ctesiphon. Vologases IV started the Second Parthian War (197–199), trying to drive the Romans out of northern Mesopotamia. Rome again repulsed the shah and once more sacked Ctesiphon. In 215, the shah defeated the armies sent against him by Caracalla, granting a truce to Caracalla’s beleaguered successors in exchange for heavy tribute.

Ardashir Sassan revolted against Parthian ineptitude and venality caused by centuries of warfare and defeated Artabanus at Hormizdagh in 225, bringing an end to the Parthians and founding the Sassanian Empire.

Patton, George Smith, Jr. (1885–1945)

U.S. Army general and pioneer in modern armored warfare. Born in San Gabriel, California, on 11 November 1885, he inherited a warrior’s legacy from his father.

Patton’s family possessed a military tradition dating back to the American Revolution, and from an early age, he knew that a military career was his destiny. When he graduated from high school, there were no appointments to the U.S. Military Academy at West Point. Therefore, he enrolled at the Virginia Military Institute (VMI), the school from which his father, grandfather, and three great-uncles had graduated.

After one year at VMI, Patton secured his appointment to West Point. During his time at West Point, he became an expert fencer and demonstrated the drive, aggressiveness, and flair that would define his career. The skills developed at West Point and his competitive nature earned Patton the right to represent the United States in the 1912 Olympics. As the first American to compete in the modern pentathlon, he finished a respectable fifth.

With the start of World War I, Patton requested permission to serve with the French cavalry but was turned down. In 1916, he was an aide to General John J. Pershing on the punitive expeditions into Mexico against Pancho Villa. During one mission, Patton killed General Julio Cardenas, the

Portrait of George Patton. (Library of Congress)

head of Villa's bodyguard, using the same Colt pistol that would become his trademark.

With the U.S. entry into World War I, Patton was selected on 15 May 1917 to join Pershing's American Expeditionary Force. In August 1918, Patton commanded a tank brigade during the Meuse-Argonne Offensive. He was wounded and was awarded both the Purple Heart and Distinguished Service Cross.

During the interwar years, the size of the U.S. Army, especially armored units, was severely reduced. Patton used this time to attend the Army War College, learn to fly, and publish articles on armored unit tactics.

U.S. entry into World War II necessitated the preparation of the army's newly formed armored units. Patton was given the task. On 8 November 1942, Patton landed on the west coast of Africa. In the wake of the defeat at Kasserine Pass, General Dwight D. Eisenhower put Patton in command. His success led to his command of the Seventh Army during the invasion of Sicily. Chafing at his role of providing flank protection for his rival, British general Bernard L. Montgomery, Patton looked for an opportunity to play a more active role. Taking advantage of stiffer than expected resistance to the British advance, he received permission to drive toward Palermo, capturing it on 22 July and then capturing Messina ahead of Montgomery.

Patton missed the Italian campaign and was denied the opportunity to be the American ground commander for Normandy because of an incident in which he slapped a soldier whom he believed to be a malingerer (an action that he would repeat). On 6 July 1944, Patton was sent to France to take command of the Third Army. It was the zenith of his career, as his Third Army made a dramatic sweep across northern France in a campaign marked by great initiative, ruthless drive, and disregard of classic military rules.

When a German counteroffensive threatened to cut through thin American lines, Patton saw possibilities in this dire situation. He disengaged his troops, hurled them northward during a terrible winter storm, and attacked the German's flank, relieving the encircled troops at Bastogne. Patton's actions, considered impossible when he suggested them, are credited in relieving Bastogne and defeating the Germans in the Battle of the Bulge.

As the war ended, controversy continued to surround Patton. After Germany surrendered, Patton, a staunch anti-Communist, argued for a combined Allied-German campaign against the Soviet Union. When he later argued to keep former Nazis in administrative positions, he was removed from command.

Patton died in Heidelberg, Germany, on 21 December 1945, the result of an automobile accident. He is buried among the soldiers who died in the Battle of the Bulge in

Hamm, Luxembourg. Probably the most admired and controversial of all American generals in World War II, Patton was known for carrying ivory-handled pistols, using racy language, and having an intemperate manner but was also regarded as one of the most successful American field commanders of any war.

Pavia, Battle of (24 February 1525)

The turning point of the "Italian wars" and the end of the era of chivalry. By 1525, French kings had been claiming territories in Italy for 30 years. To reach their political goals, they had to face the thrones of Spain and Austria, which were combined in 1519, forming a threatening neighbor. The nature of the Italian wars changed as the new king, Charles V, ruled countries surrounding France on three sides. In 1524, the imperialist forces invaded Provence, but facing failure at the siege of Marseille, they had to retire in front of the main French army. Francis I, the king of France, decided to follow the retiring army in Italy.

The imperialists resisted the French invasion but had to fall back on their fortified garrisons of Pavia and Lodi. Francis decided (against the advice of his wiser commanders) to avoid a direct fight against the main imperialist army, led by the Marquis of Pescara. He chose instead to besiege Pavia.

The siege began on 28 October 1524. Facing superior French artillery, the Spanish commander Antonio de Leyva made a stubborn defense. Unable to storm the town rapidly, Francis decided to make his winter quarters in a walled park, north of the siege work. The desertion rate among the mercenaries began to rise (8,000 Swiss on 20 February 1525 alone). Pescara's army of 40,000, mainly *Landsknecht* (mercenary soldiers from the Holy Roman Empire), pikemen, arquebusiers, and light artillery, left Lodi and reached Pavia to find a waiting French army. The besieger was besieged in Mirabello Park.

The battle took place on 24 February 1525. During the night of the 23d–24th, the imperialists (23,000 soldiers) took the initiative. Their approach march turned around the high wall, and a breach was made in an unsuspected spot. Dawn took the French army of 22,000 unprepared and sepa-

The USS Shaw explodes during the Japanese attack on Pearl Harbor on December 7, 1941. (National Archives)

rated in three groups. Following the king, the French cavalry impetuously charged the *Landsknecht* as soon as they emerged from the wall while still masking their own artillery. Facing deadly fire, the French cavalry was cut to pieces, and the reinforcements, unable to stop the imperialists, were destroyed piecemeal. Francis I, wounded in the thick of the fray, was taken prisoner, and 10,000 French were killed, including hundreds of lords, as no mercy was given by either side.

This crushing defeat marked the beginning of a period of imperial control of Italy. “*Tout est perdu, fors l’Honneur*” (“All is lost but honor”) was the comment made by Francis I, writing to his mother to announce his defeat.

Pearl Harbor Attack (1941)

The devastating Japanese aerial attack on Pearl Harbor in the Hawaiian Islands on 7 December 1941 caused the United States to enter World War II with almost unanimous public support. Japan sought to neutralize the U.S. Pacific Fleet in order to invade and fortify its planned empire, which included the Philippines, Malaya, Netherlands East Indies, China, Thailand, and Burma, without U.S. naval interference. The operation was approved only 13 weeks beforehand, after the personal intervention of Admiral Isoroku Yamamoto. A fleet of six aircraft carriers, *Akagi*, *Kaga*, *Shokaku*, *Ziukaku*, *Hiryu*, and *Soryu* (by far the largest combat combination of carriers), accompanied by two battleships, two cruisers, nine destroyers, and eight supply ships, was to sail by a north-westerly route to an aircraft launch point 275 miles north of Pearl Harbor. The Japanese task force sailed on 26 November, receiving the final attack order and confirmation of the date seven days later.

Pearl Harbor was unprepared for an air attack, although war in the Pacific was thought imminent. The Imperial Japanese Navy was considered incapable of mounting any

operations additional to the invasion convoys that were being reported in the world's press and known to be moving southward from Japan and Formosa. It was also believed that Japan would not commit the strategic error of unnecessarily forcing the United States into war. As a result, the eight air groups that commenced flying off from the Japanese carriers at 6:00 A.M. on Sunday, 7 December, achieved complete surprise when they dropped their first bombs at 7:55.

The 353 strike aircraft launched in two waves, 45 minutes apart. Their targets were battleships and cruisers and U.S. Army and Navy airfields. Attacks were made on the ships by torpedo bombers, level bombers, and dive-bombers, and many aircraft also strafed after dropping their bombs. The escort fighters strafed airfields, while level bombers and dive-bombers destroyed the planes and facilities. Antiaircraft gunfire was initially sporadic, and only about 18 U.S. Army fighters managed to get airborne during the two-hour attack. Twenty-nine Japanese aircraft were lost during the raid, and approximately 20 more were destroyed by landing accidents in rough weather.

U.S. losses were severe: 2,403 dead and 1,178 wounded; the battleships *Arizona*, *California*, and *West Virginia* destroyed; the *Oklahoma* capsized; and the *Nevada*, *Tennessee*, *Pennsylvania*, and *Maryland* damaged. The target battleship *Utah*, two destroyers, and a minelayer were also sunk. Additionally, four cruisers, a destroyer, and three tenders were damaged. Of the approximately 400 aircraft based in Hawaii, 239 were destroyed or severely damaged. It was the most one-sided naval air assault in history.

The Japanese themselves blundered in not scheduling the attack to destroy the American aircraft carriers based at Pearl Harbor, in not hitting the oil tank farms, in not destroying the machine shop complex that would help to restore many of the sunken and damaged warships, and in sinking the warships in waters shallow enough to permit the raising of all but one of the sunken U.S. battleships. But Japan's worst blunder was that of underestimating American resolve, industrial capacity, and fighting power. Japan would pay for those blunders with total defeat in a war that it could not hope to win.

So successful was the attack on focusing a once-divided nation's belligerent rage against Japan that the conspiratorial-minded have ever since suspected that President Franklin D. Roosevelt at least had some foreknowledge of the attack. They ignore the obvious fact that Roosevelt was preparing the United States for conflict with Germany and would hardly have welcomed a two-front war. Further, he would have had no idea that Adolf Hitler, in an act of gratuitous folly, would declare war on the United States.

Peleliu (15 September–27 November 1944)

One of the most costly, least known, and perhaps most unnecessary of the Pacific island invasions during World War II. In September 1944, General Douglas MacArthur was planning the invasion of the Philippines and wanted his flank protected by an attack on Peleliu in the Palau Islands, located between New Guinea and the Philippines. The attack, Operation STALEMATE, would be just that.

U.S. planners had little useful information on Peleliu, including the strength and nature of Japanese defenses. The pre-invasion bombardment did not inflict much damage on the Japanese, who were well-protected in deep caves and other defenses away from the landing beaches. The invasion began well on 15 September, and then concealed machine guns and mortars opened fire, followed by tanks and troops in the afternoon. That evening, the Japanese launched suicide attacks against the Marines, who were still mostly on the invasion beach.

In the first week, the Marines Corps suffered 4,000 casualties, and some units were reduced to throwing chunks of coral at and using bayonets on the Japanese. Marine Corps fighter planes taking off from the landing strip on the island did not raise landing gear—they commenced their bombing runs too soon.

By the time that flamethrowers, bombs, naval bombardment, and the courage of the marine and army troops finally won the island, the United States had suffered grievously. The 1st Marine Division suffered some 54 percent casualties; the 5th Marine Division suffered 43 percent killed, wounded, and missing in action; and the 7th Marine Division lost 46 percent of its strength. Of 19 medals of honor given to members of the 1st Marine Division, eight were earned in the fighting on Peleliu. Worse, taking the island did not speed up MacArthur's timetable for the attack on Leyte or help defend the flank of his advance. The attack was

both unnecessary and unmindful of the lessons learned in earlier amphibious invasions in the Pacific theater.

Peloponnesian Wars (460–456, 431–404 B.C.E.)

Wars between Athens and Sparta that spelled the end of the former's role as a major Mediterranean power. The First Peloponnesian War was sparked when Athens renounced its alliance with Sparta against the Persians and allied itself with Sparta's enemy, Argos. Soon after, Megara, following a border dispute with Corinth, withdrew from the Peloponnesian League, to which they had both belonged, and made an alliance with Athens. The defection of Megara meant Sparta was now unable to strike overland at Attica.

For the alliance with Argos to be of any benefit, Athens needed to acquire a foothold in the Peloponnese. The Athenian seaborne landing at Haliae was the result, but the Corinthians successfully repulsed it (458 B.C.E.). Athens now turned its attention to Aegina, the strategy being to clear the nearby seas of hostile navies and thus secure maritime communications to Argos. Matters went well for Athens, which won two naval engagements off Aegina before laying siege to the island's chief town. Even when a Spartan army crossed the Corinthian Gulf and defeated the Athenians at Tanagra (457 B.C.E.), Athens's immediate response was to invade Boeotia, defeat the Boeotians at Oenophyta, and bring all central Greece under its control. Shortly afterward, Aegina surrendered, and the confidence of Athens was well illustrated when an Athenian fleet sailed around the Peloponnese, raiding as it went (456 B.C.E.).

Athens's success was cut short by defeat in Egypt at the hands of the Persians (454 B.C.E.). Furthermore, Athens was forced to surrender control of central Greece after the Boeotians defeated the Athenians at Koroneia (447 B.C.E.). Worse still, with Megara rejoining the Spartan alliance, a Peloponnesian army invaded Attica (456 B.C.E.). Athens had had enough, and a 30-year truce was concluded with Sparta. Athens gave up its claims to central Greece and ceased to interfere in the Peloponnese. However, it retained a grip on

Aegina and secured the recognition of its maritime empire. With these diplomatic gains, the First Peloponnesian War ended.

What made the next war between Athens and Sparta inevitable, according to the contemporary historian Thucydides, was Sparta's fear of Athens. Yet this "truest cause" was least discussed because Sparta could hardly stand before its allies and announce its fears. In Thucydides' eyes, the Spartans were not warmongers, being traditionally slow to go to war unless forced. However, when Athens started to meddle with Sparta's allies, namely Corinth, and antagonism arose between the Athenians and the Corinthians over the control of Corcyra (433 B.C.E.) and Potidaia (432 B.C.E.), Sparta was left with little choice. This was especially so when another important ally, Megara, added its voice to the clamor for war.

Now able to invade Attica through the Megarid, Sparta did so during the initial phase of the war. On Pericles' advice, the Athenians took refuge inside the walls surrounding Athens and the Peiraeus and responded to the Spartan ravaging merely by minor cavalry operations, seaborne raids on the Peloponnese, and invasions of the Megarid. But after Pericles' death (429 B.C.E.), Athens, now dominated by Kleon, adopted a more daring strategy. In addition to establishing bases on the Peloponnesian coast—notably at Pylos—it also attempted to knock Boeotia out of the war, but the second invasion ended in defeat at Delion (424 B.C.E.).

The same year saw the Spartan Brasidas surprising Athens with a campaign in northern Greece and winning over a number of Athens's dependencies, including Amphipolis. His own death and that of Kleon in battle outside Athens (422 B.C.E.) led to the conclusion of peace. The "hollow peace," as Thucydides so aptly calls it, was soon in tatters when Alcibiades cobbled together an anti-Spartan coalition in the Peloponnese. Yet it came to naught when the Spartans destroyed the coalition forces, led by Athens and Argos, at Mantinea (418 B.C.E.).

At Alcibiades' urging, Athens launched an expedition against Syracuse (415 B.C.E.), with him, along with his rival Nicias, as the commanders. Before the attack on Syracuse had begun, however, Alcibiades was recalled to answer charges of sacrilege. He fled to Sparta, and on his advice, the Spartans established a permanent base at Dekeleia in Attica (413 B.C.E.). Bugged down in the siege of Syracuse, the expedition ended in total disaster.

Athens was dependent on maritime imports, particularly grain and flax from the Black Sea region, and thus needed a navy for the protection of commerce. But sea power was of little use for the defeat of Sparta, a stalwart land power. Sparta was fully aware of this shortcoming and of Athens's dependence upon seaborne supplies. Still, Sparta had been unable to match the might of the Athenian navy and thus

could only dispatch its fleets to stir up revolts within the Athenian empire. Sparta had never been a naval power, but Athens's Sicilian debacle presented Sparta with the opportunity to become one.

Sparta sent a fleet to attempt a blockade of the Hellespont and thus cut Athens off from the Black Sea. Despite this stratagem, King Agis, who was holding Dekeleia, reckoned it was a waste of time attempting to sever Athens's supply lines when he could still see the grain ships putting into the Peiraeus. The alternative was to engage Athens on the high seas, but in doing so Sparta was to suffer absolute disaster at sea on a number of occasions.

Kynossema (411 B.C.E.) was a moral victory for the Athenians, who, lacking their former confidence, had been afraid of the Peloponnesian fleet with its Syracusan allies. Kyzikos (410 B.C.E.) was a scrambling fight along the Hellespontine coast. Off Arginousai (406 B.C.E.), the Peloponnesian fleet, with its more skillful crews, attempted to outmaneuver the Athenians. Sparta ultimately gained the upper hand, and its admiral Lysander resoundingly defeated the Athenians at the naval engagement off Aegospotami (405 B.C.E.). The following year, Lysander was able to strangle Athenians into submission, his naval victory effectively cutting the city off from Black Sea grain supplies.

The ultimate result of the Peloponnesian wars was to weaken all the protagonists. In the end, notwithstanding the resurgence of some, such as Thebes, the Greek polis fell prey to outside barbarians, as the Macedonians swept all before them.

Peng Dehuai (1898–1974)

China's field commander in the Korean War. Of peasant stock from Hunan province, Peng sought a military career by joining the local Nationalist Kuomintang (KMT) forces in his home province in 1916. By 1921, he had become an officer and remained with the GMD through the Great Northern Expedition. With the collapse of the alliance between the Nationalists and the Communists, Peng joined the latter, having always been concerned with social reform.

One of the People's Liberation Army's first professional soldiers, he emphasized the military verities of discipline, organization, and chain of command, as opposed to guerilla war tactics. Despite this focus, Peng retained Mao

Zedong's confidence and came to respect Mao's military thought.

The pinnacle of Peng's career was leading the People's Volunteer Army in Korea and sending the United Nations forces reeling back across the 38th parallel. The inability of the volunteers to follow up this victory and conclude the war on Communist terms rekindled Peng's concern with conventional approaches to war (he had seen how the United Nations' air and sea power had kept his forces from complete victory in Korea) and possible friction with Mao.

After being raised to the rank of marshal in 1955, Peng was dismissed from command in 1959 for openly challenging Mao over the failures of the Great Leap Forward. Despite partial rehabilitation in 1962, Red Guards arrested Peng in 1966, and he spent the remainder of his life imprisoned and tortured, refusing to apologize for past criticisms. The party posthumously rehabilitated Peng in 1978.

Pequot War (1636–1637)

An early colonial war that was in practice genocide against an American Indian tribe. The Pequot War began as a contest between the Pequot and Narragansett tribes over trading rights in southern New England. Both groups coveted the European textiles, tools, handicrafts, and contraband (guns and alcohol) that the Dutch and English exchanged for pelts. When the Dutch erected a trading post on the Connecticut River in 1633, Pequots murdered rival Narragansett traders. The Dutch responded by assassinating the Pequot sachem, Tatobem. In retaliation, the Pequots then murdered the captain and crew of an English trading vessel, thinking they were Dutch.

Threatened by the Dutch and the Narragansetts, the Pequots sought assistance from Massachusetts Bay Colony. In 1634, the Puritan leaders in Boston offered to negotiate peace in return for heavy tribute payments and the surrender of those responsible for the deaths of the English traders. The Pequots rejected the offer. For strategic, political, and economic reasons, Massachusetts then constructed Saybrook fort at the mouth of the Connecticut River and planted three settlements upriver.

"The figure of the Indians' fort or palizado in New England and the manner of the destroying it by Captain Underhill and Captain Mason." (Library of Congress)

Spurred on by Uncas, the scheming Mohegan sachem, Bay Colony leaders in 1636 pressed their demands for Pequot tribute payments and for the surrender of the murderers of Captain John Stone and his crew. When yet another English trader was found murdered on his vessel near Block Island, Massachusetts, the Bay Colony launched a punitive raid against the Pequots (who were, in fact, innocent of the crime). Unable to draw their enemy into battle, 90 Massachusetts men under Captain John Endecott burned the Pequot villages on Block Island (22 August 1636). The scenario was repeated at Connecticut's Thames River, where undefended villages belonging to the Pequot and their Western Niantic allies were destroyed.

The Pequots retaliated by assaulting the English outposts at Wethersfield and Saybrook, Connecticut. The war quickly escalated. The Pequots and Western Niantics soon faced a combined force of Massachusetts men, Narragansetts, and

Eastern Niantics on one front and Connecticut men and their Mohegan allies on another. In a major offensive (26 May 1637), Captain John Mason led 77 Connecticut militia and hundreds of Mohegans and Narragansetts against the Pequot fort at Mystic, Connecticut. They surrounded and burned the fort, killing 600–700 inhabitants, many of them noncombatants—a fact not lost on the Indian allies of the English, who protested the ferocity of the English attacks. The English suffered only two fatalities.

Pequot warriors at nearby Weinsauks arrived too late to save their kin. Their attempt to exact vengeance on the departing English and Indian forces resulted in the deaths of more than 100 additional Pequots. The Mystic massacre and subsequent defeat caused the remaining Pequots to abandon their villages and seek refuge with neighboring tribes. A 120-man force from Massachusetts led by Israel Stoughton engaged a much smaller Pequot force in a swamp known as

“Owl’s Nest,” killing or capturing approximately 40 Pequots (June 1637). Captive warriors were executed, and Pequot women and children were sold into slavery.

Connecticut troops then joined Massachusetts militia to battle the remaining Pequots. The English encircled their enemy in a swamp near New Haven where, following the surrender of 180 women and children, Pequot warriors battled until dawn (14 July 1637). Sassacus, the Pequot leader, and others managed to escape but were subsequently killed by Mohawks with whom they sought refuge.

The victorious English and their Indian allies treated surviving Pequots as spoils of war, dividing them and selling some into slavery. The English denied the Pequots the use of their tribal name and refused to allow them to rebuild their devastated villages. The Mohegans and Narragansetts agreed to execute any Pequot warriors still at large. In effect, the English asserted their hegemony and set an example for all American Indians by doing everything in their power to eradicate the Pequots socially, politically—and physically.

Pericles (495–429 B.C.E.)

An incorruptible aristocrat with masterful speaking skills and clear military strategies who consolidated Athenian control over the Aegean. Pericles succeeded Cimon after the Spartan people rebuffed Athenian assistance in 462 B.C.E. Pushing his aggressive policy of spreading Athenian forces from Cyprus to Phoenicia to Egypt during the war with Persia, Pericles earned a reputation as a radical politician with strong imperialistic tendencies. From 450 through 429 B.C.E., he remained the preeminent leader of the Athenian city-state.

Reelected annually as the leader of the Board of 10 Generals, Pericles dictated foreign policy, concentrating resources on the naval fleet and thereby guaranteeing the supply of food and availability of strategic materials. In 437 B.C.E., he sailed into the Black Sea region to unseat the tyrant

at Sniopie and signed a treaty with the Bosporan king to provide Russian wheat. He also established a colony at Amphipolis to secure access to Macedonia. Known for the massive building program on the Acropolis, Pericles was also instrumental in the building of the 4-mile-long walls that connected the fortified city to the port of Piraeus.

From 456 through 446 B.C.E., the Athenians remained at peace with both the Persians and the Spartans. During this time, Pericles strengthened Athenian control over the region, alienating other city-states in the process. He banned Megarian traders from Aegean markets and interfered with local political disputes and customs. Sparta finally consented to lead an expedition against Athens. From 431 to 421 B.C.E., the Athenians and Spartans fought the Second Peloponnesian War. Pericles embarked on a policy of wearing the enemy down through naval raids around the Peloponnese, while the Spartan army attacked Attica but failed to take Athens. The inhabitants of the countryside took refuge in the city, where an epidemic broke out. It killed tens of thousands of Athenians, including Pericles, who died in 429 B.C.E.

Pershing, John J. (1860–1948)

Commander of the American Expeditionary Force in World War I. Born on 11 September 1860 in Missouri. Pershing entered the U.S. Military Academy at West Point at the age of 22. Upon graduation, Jack, as he was then known, entered the cavalry and served in the West. From 1891 to 1894, he was a professor of military science at the University of Nebraska. During these years, he took a law degree and was admitted to the bar. After a brief term as an instructor at West Point, Pershing served with the 10th (Colored) U.S. Cavalry in Cuba during the Spanish-American War. His coolness under fire earned him distinction. He spent much of the next 13 years serving in the Philippines. In 1906, President Theodore Roosevelt promoted Pershing to the rank of brigadier general over 862 senior officers. From 1913 to 1916, he served with the U.S. Army’s Southern Department. From March 1916 through February 1917, Pershing commanded the punitive expedition into northern Mexico in pursuit of the revolutionary bandit, Pancho Villa.

As the only American military officer to have held a large command in a foreign country, Pershing was a natural selection to command the American Expeditionary Forces after

the declaration of war against Germany in April 1917. Secretary of War Newton Baker allowed Pershing wide leeway in establishing military policy. Pershing demanded and received greatly enlarged American divisions, the size of a European corps, as well as training based on marksmanship, emphasizing rifles over machine guns. In France, he fought to consolidate all American units under his own tactical control, as opposed to assigning U.S. soldiers to Allied units as replacements. Pershing threw his untested troops into battle in the spring of 1918 when the German offensive threatened Paris. In the fall, Pershing launched a major offensive against the Germans in the Meuse-Argonne region, still the single greatest battle in American history. An advocate of unconditional surrender, he counseled against the armistice of 11 November 1918.

Pershing returned to the United States a hero. Congress commissioned him general of the armies, the first officer to hold that title since General Ulysses S. Grant. From 1921 to 1924, Pershing served as U.S. Army chief of staff. He was considered a father figure to a younger generation of officers, including Dwight D. Eisenhower, George Marshall, and George Patton. He died in New York City on 15 July 1948.

yond the range of his tribal forces. As other Safavid princes, towns, and tribes joined the insurrection, both Russia and the Ottoman Empire sent expeditions against Iran's borders.

Declaring himself champion of the Safavids, Nadir Khan Afshar rallied much of the army. He drove the Ottomans back to Baghdad in 1733, persuaded Russia to evacuate the north, and retook the capital. In 1736, Nadir deposed the infant Safavid prince and made himself shah. To control the Persian Gulf, he launched an invasion of the sultanate of Oman. In 1739, campaigning against the Afghans, he noted the weakness of the Mogul state of India and plunged into the Ganges Valley. Nadir plundered Delhi and carried off the famous Peacock Throne. He then ranged over much of Uzbek territory, making vassals of Bukhara, Herat, and Khiva. In 1747, Nadir Shah's Qizilbash allies, fearful of his growing megalomania, murdered him.

Nadir's tribal units broke up into separate contingents, and Iran fell back into another decade of anarchy. Eventually, Karim Khan Zand made himself dominant, moving his capital to Shiraz. Recognizing the exhaustion of his people, he tried to avoid war (although he did occupy Basra in Iraq). Instead, he concentrated on repairing the state, keeping harmony among the key tribes like the Bakhtiyari and the Qajars, and patronizing Twelver Shiite Islam. Sadly, his death in 1779 set off another wave of anarchy between towns, tribes, and princes. Agha Muhammad Khan of the Qajar tribe finally succeeded in crushing or co-opting his rivals by 1796. His Qajar dynasty would rule Iran until the end of World War I.

Persian Civil Wars (1725–1794)

A near century of conflict and invasion that marked Persia's transition from the Middle Ages to the modern era. The Safavid dynasty had ruled Persia since 1514. Their shahs had been patrons of a great cultural renaissance, fixed the boundaries of modern Iran, and imposed Twelver Shiite Islam on the Persian people. But in 1718, a variety of ethnic minorities, autonomy-minded nomads, restive towns, and Sunni Muslims opposed to Shiism had begun to challenge a weakening Safavid regime. These disturbances inspired Mahmud, emir of the Ghilzai Afghans, to invade Persia in 1722. At the Battle of Gulnabad, he sliced up the larger Safavid army, captured the capital of Esfahan, and forced the shah to crown him as successor. Mahmud, however, lacked the force or support to exercise any kind of real power be-

Persian Empire (550 B.C.E.–642 C.E.)

An empire encompassing Iran and at various times parts of Armenia, Asia Minor, and most of the Middle East. It was established by an Iranian people, the Persians, in two eras, the Achaemenid and the Parthian.

The Achaemenid Era

The Achaemenid era of the Persian empire (550–330 B.C.E.) began when Cyrus II Achaemenid of Fars/Persia defeated Astyages of Media in 559, capturing Ecbatana in 550 B.C.E. In 546 B.C.E., Cyrus defeated Croesus of Lydia and occupied

Babylon in 538 B.C.E. Appreciating logistics, Cyrus commissioned the Royal Road, a military highway allowing the Persian army to travel from Susa to Sardis in Lydia (Asia Minor) in three months. Cyrus was killed during a campaign against the Massagetae in 530 B.C.E. His son, Cambyses II, conquered Egypt in 525 B.C.E.

After Cambyses's death, Cyrus's son-in-law, Darius I (r. 522–486 B.C.E.), consolidated and expanded the Persian empire to an area of 2 million square miles with a population of 10 million people, encompassed by the rivers Indus, Danube, Jaxartes, and Nile. Darius divided the empire into 20 satrapies and devised an efficient message relay system by establishing outposts at distances of one horse-travel day apart.

Further improving logistics, Darius commissioned a canal from the Nile to the Red Sea, wide enough for two galleys to pass each other under oar. In 512 B.C.E., Thrace and Macedonia were conquered. The Ionian revolt (500–494 B.C.E.) prompted a Persian army to land in Attica on the plains of Marathon in 490 B.C.E. The numerically superior Persian force was defeated by the 10,000 hoplites of Athens and Plataea.

Xerxes I (r. 486–465 B.C.E.) launched a second campaign against Greece from Sardis in 480 B.C.E. with an army of 100,000. He commissioned a canal dug through the peninsula of Athos and a bridge over the Hellespont River. The Persian army was to march through Thrace, while the fleet sailed alongside to protect and provision. Persian forces marched into Attica and sacked Athens, marking the high point of Persian expansion to the West. The Persian fleet was subsequently defeated by Themistocles in the narrow strait of Salamis, using the maneuverable Greek triremes. Xerxes and the remaining Persian fleet retreated, and the Persian army under Mardonius was defeated in 479 B.C.E. at Plataea.

Achaemenid rule ended after Darius III Condomannus (r. 336–330 B.C.E.) was defeated by Alexander of Macedon, who employed the oblique battle form at Granicus in 334, Issus in 333, and Gaugamela in 331 B.C.E. Alexander occupied the Persian empire from 331 to 323 B.C.E.

The Parthian Era

The Parthian era of the Persian empire (247 B.C.E.–228 C.E.) began when Arsaces II established the independence of Parthia from the Seleucids, who were Alexander's successors. Parthia grew to become a counterweight to Rome. The resurrected Persian empire of Mithradates II (124–88 B.C.E.) stretched from Armenia to India. In 53 B.C.E., a Roman army of 40,000 under Marcus Licinius Crassus was annihilated by the Persian forces of Orodes I.

During the continued Roman-Persian struggle, the approximate border between the two empires was the Euphrates River. Major Roman campaigns were undertaken in the years 116, 161, 195, 217, and 232 C.E. The Parthian dy-

nasty ended when Ardashir Sassan I of Fars defeated the Parthian army of Artabanus at Hormizdagh in 226. Ardashir proclaimed himself an Achaemenid heir, beginning the Sassanid dynasty of the Persian empire, which ruled until the Islamic conquest of Persia in 642 C.E.

Persian Wars of Expansion (559–509 B.C.E.)

Dramatic rise of a minor Asian kingdom into the world's most powerful empire. At the beginning of the sixth century B.C.E., Media was a tributary state of Assyria. King Astyages of Media married his daughter, Mandane, to Cambyses, king of Anshan. Cambyses governed Fars (Persia), a region about 300 miles in diameter on the northeastern shore of the Persian Gulf. His son Cyrus succeeded him as king of Anshan in 559 and immediately began intrigues against Media, inducing the Median general Harpagus to defect.

Cyrus was ready when Astyages attacked Persia in 550 B.C.E. He counterattacked, occupied the Median capital, Ecbatana, overthrew his grandfather, and ascended the joint throne of Media and Persia. This event is regarded as the founding of the Persian Empire, sometimes called the Achaemenid Empire, after the clan of Cyrus.

After incorporating Media, Cyrus marched northwest, around the Babylonian Empire, taking Armenia and Cappadocia. By defeating King Croesus at Pteria in 546 B.C.E., Cyrus gained Lydia and its tributary state of Ionia and thus controlled all of Asiatic Turkey. Between 545 and 540 B.C.E., he moved northeast into Central Asia nearly as far as modern Tashkent.

The biblical books 1 and 2 Kings, the Prophets, and Daniel show the impact of Persia on the ancient Hebrews. The 10 northern tribes were dispersed when their kingdom, Israel, fell to Assyria in 721 B.C.E. and further when Assyria fell to Babylon in 612 B.C.E. The two southern tribes were taken into captivity when Babylon defeated their kingdom, Judah, in 587 B.C.E., but after Persia conquered Babylon in 539 B.C.E., Cyrus

released the Hebrew exiles by edict in 538 B.C.E., enabling a remnant to return home and found the religion of Judaism. When he died in battle against the Massagetes in 529 B.C.E., he was known as “Cyrus the Great” as much for his merciful and intelligent administration as for his military triumphs.

Cyrus’s son Cambyses II came to power by murdering his brother, Cyrus’s heir, Smerdis, in 529 B.C.E. Smerdis’s death was kept secret. Cambyses led his army west, defeated Pharaoh Psamtik III at Pelusium in 525 B.C.E., and thus added Egypt to the empire. He died under mysterious circumstances in Syria in 522 B.C.E., possibly a suicide, probably insane.

Darius, husband of Cyrus’s daughter Atossa, murdered Gaumata, who had been masquerading as Smerdis in Cambyses’s absence, in 522 B.C.E. The Persian nobles acclaimed him king the next year. In 518 B.C.E., he expanded Cambyses’s Egyptian conquests into Libya. By 513 B.C.E., he had gained all the land in India west of the Indus River. The same year, he pushed into Thrace. After suffering a major setback against the Scythians in the Danube Valley in 512 B.C.E., Darius returned to his capitals at Persepolis and Sardis and spent most of the period from 509 B.C.E. until his invasion of Greece in 492 B.C.E. consolidating his power.

By 518 B.C.E., the Persian Empire included 20 numbered provinces, or satrapies: Media, Susiana, Babylonia, Arabia, Assyria, Egypt, Armenia, Cappadocia, Lydia, Ionia, Cilicia, Sagartia, Parthia, Ariana, Bactria, Sogdiana, Arachosia, India, Gandhara, and Gedrosia. The boundaries, administrations, loyalties, and names of these satrapies frequently changed. At its greatest extent in 492 B.C.E., just after Darius conquered Macedonia, the Persian Empire stretched from Libya to the Indus River and from the Persian Gulf to the Aral Sea. It lasted until Alexander the Great conquered the empire at the Battle of Gaugamela in 331 B.C.E.

Persian-Afghan Wars (1726–1857)

No less than three major wars between Persia and rebel Afghans in a 131-year period. These wars were intertwined

with events in Mogul India, the Ottoman Empire, and czarist Russia but centered on the rise of Afghan, British, and French power in southern and southwestern Asia.

The war of 1726–1738 saw the Persians under Nadir Shah regain control of Afghanistan and invade Mogul India. Nadir developed a disciplined army slowly, never taking on battle unless he could win and turning rival Afghan tribes against each other rather than against Persia. He first targeted the fabled border fortress of Herat. There, he defeated the Abdali Afghans, who became his allies. He then turned on the Ghilzai Afghans and defeated them in pitched battle at Mihmandust in 1729 and Zhargan in 1730. Nadir now had command of more than 100,000 Afghans plus his Persian troops, and after fighting the Turko-Persian War of 1730–1736, he stabilized Persia. In 1737, he besieged the fortified city of Kandahar with its 30-foot-thick walls and took it by deceit, partially burning it. This action opened the way for the Persian invasion of Mogul India two months later.

The war of 1836–1838 followed years of European meddling in Persian, Afghan, and Indian affairs. Shah Muhammed of Persia sought Russia’s help to retake Herat from the Afghans, who were backed by the British. A Persian siege from November 1837 to September 1838 was repulsed with Persian losses as high as 1,700 men in one frontal assault. However, the Afghan ruler Dost Muhammed then sought to launch a second war against the Sikhs in India. This led to 12 years of British-Afghan hostilities.

The war of 1855–1857 involved yet another siege of Herat by the Persians. The Afghans, who had signed a peace treaty with the British in India, received British aid and repelled the last great effort by the Persians to break through into India again, as they had done under Nadir Shah.

Peru-Bolivia Confederation, War of the (1836–1839)

Conflict caused by the brief unification of Peru and Bolivia under the leadership of Bolivian general Andrés Santa Cruz in 1836. Chile objected to the creation of the new state, which had the potential to threaten Chilean security. When Bolivia reneged on a treaty provision for tax exemptions on Chilean imports and Peru imposed a tariff on imports from

Valparaiso, tensions mounted. Chilean anger was further aroused by the use of a Peruvian port by dissident general Ramón Freire to launch a coup attempt on the government. Chile's president, Diego Portales, responded by ordering a naval attack on the Peruvian port of Callo, resulting in the seizure of three Peruvian ships. Santa Cruz responded by arresting a Chilean diplomat, an incident that infuriated Portales, who demanded that the confederation be dissolved. This along with other Chilean demands caused Santa Cruz to declare war.

Chile's initial invasion of Peru met with defeat and the capture of nearly the entire army. Santa Cruz offered to release the army in exchange for Chilean recognition of the confederation and the return of the three captured vessels. Chile agreed, and the army returned. Chile then renounced the agreement and launched another invasion. General Manuel Bulnes led Chile to victory at the Battle of Bunin and followed it up with a decisive triumph at Yungay on 20 January 1839. After his defeat at Yungay, Santa Cruz went into exile in Ecuador, and the Peru-Bolivia Confederation fell.

Peru-Ecuador Conflict (1941–1999)

One of the most persistent South American boundary disputes. Since their establishment as independent republics, Peru and Ecuador have disputed a triangular area on the upper Amazon of approximately 120,000 square miles, bounded on the south by the Mara and Amazon Rivers and on the north and east by the Putumayo River. The remoteness and topography of the region, the imprecision of Spanish colonial boundaries, the chaotic conditions that existed in the aftermath of the collapse of the Spanish Empire, and domestic politics explain why the dispute has been so long-lasting and so difficult to resolve. Numerous attempts to negotiate a settlement between 1830 and 1941 met with failure.

In July 1941, Peru invaded Ecuador's littoral province of El Oro and threatened the port of Guayaquil. Peru's army of more than 10,000 was supported by an air force of 25 planes and soon overwhelmed Ecuadorian defenses. Ecuador's ill-trained and poorly equipped armed forces, numbering less than 1,600, lacked air support. As Peruvian troops advanced on Guayaquil, Ecuador sought a negotiated settlement. The war resulted in 150 Ecuadorian and 400 Peruvian casualties. In January 1942, Ecuador and Peru signed the Rio Protocol,

which provided for the withdrawal of Peruvian troops, the cession of some 80,000 square miles of the territory to Peru, and the creation of a boundary commission to delineate the border.

The discovery of the Cenapa River in 1951 complicated the demarcation process and provided Ecuador with an opportunity to continue to press for sovereign access to the Mara River. In 1960 Jose Maria Velasco Ibarra, Ecuador's stridently nationalist president, renounced the 1942 protocol. Hostilities began anew on 28 January 1981 in the disputed Cordillera del Condor region. In a week of fighting, Peruvian commandos and warplanes attacked three Ecuadorian outposts and forced their abandonment. The incident resulted in nearly 200 casualties.

After the 1981 conflict, Ecuador made a concerted effort to upgrade its armed forces in preparation for a renewed conflict in the Cordillera del Condor sector. Ecuador obtained Kfir fighter aircraft from Israel and purchased modern shoulder-fired surface-to-air missiles. In January 1995, Peru attempted to dislodge Ecuadorian troops from fortified positions in the disputed zone. The Ecuadorian modernization program paid off as surface-to-air missiles and Ecuadorian fighters shot down two Sukhoi SU-22 fighter bombers, one A-37, one Canberra bomber, and five helicopters and held its fortified outposts. Peru suffered 300 casualties, whereas Ecuadorian losses were placed at less than 50.

Negotiations intensified after the 1995 clash because both sides had each spent \$250 million on the military operation, and both had little enough to show for it. In October 1998, Peru and Ecuador signed a final agreement that was soon ratified by both governments. Peru retained most of the territory gained in the 1941 war, while Ecuador was granted private property rights on the Mara River.

Peruvian Guerrilla War (1980–2000)

A Marxist uprising that did little to change conditions in Peru. In 1980, 12 years of military rule in Peru came to an end when Fernando Belaunde Terry became president for the second time. This was not the only aspect of the 1960s life to return to Peru in the 1980s. On the eve of the 1980 election, the guerrilla group Sendero Luminoso (Shining Path) commenced their "people's war" by burning ballot

boxes in the Ayacucho region. Guerrilla activity had taken place in the 1960s, but this new activity by Sendero Luminoso heralded a bloody new phase of Peruvian history.

Sendero Luminoso had been born of a split within the pro-Soviet Communist Party in 1970. Its believers followed the ideas of the Peruvian Marxist Mariategui and Maoism. Their tactics were brutal, and they perceived violence as the fundamental mechanism for political change. They saw anybody involved with the government as legitimate targets, including those simply participating in elections. They reintroduced the Inca practice of displaying a dead dog before attacking a village and intimidated people into joining them. In July 1992, they detonated a car bomb in the Lima suburb of Miraflores, which killed 21 people and brought the war to the middle classes.

In 1982, a second guerrilla group was founded: Movimiento Revolucionario Tupac Amaru (MRTA). This group consisted of more middle-class members and avoided the indiscriminate and widespread violence of the Sendero Luminoso. It received a reputation for “flashy” operations and in July 1990 freed 60 prisoners from Lima’s high-security Canto Grande prison.

Belaunde was succeeded as president by Alan Garcia in 1985, but guerrilla activity worsened. By 1990, half the country was under a state of emergency. In 1990, the unknown candidate Alberto Fujimori became president. Although he stood on a ticket of not increasing austerity measures, two months into office he introduced “Fujishock,” which was much harsher than anything seen before. He also gave the army carte blanche in dealing with the guerrillas and ignored human rights abuses.

“Fujishock” appeared to be working, when in 1992 MRTA leader Victor Polay and Sendero Luminoso leader Abimael Guzman were arrested. During 1994–1995, many guerrillas gave themselves up under the Law of Repentance. It appeared Fujimori had defeated the guerrillas.

This perception quickly changed on 17 December 1996, when 14 MRTA members took more than 600 hostages at a reception at the Japanese Embassy in Lima. The hostages included 19 ambassadors and Fujimori’s own brother. Although many were released, a standoff continued until 22 April 1997, when security forces attacked the embassy, freeing all the prisoners and managing to kill all the guerrillas.

Human rights abuses continued, provoking international protests of the treatment of four Chilean members of MRTA and the American Lori Berenson. (Her sentence was reduced in August 2000.)

The violent nature of Peruvian life continued, with mass demonstrations during Fujimori’s much-debated third election in 2000. Although he won, he was forced to resign in November because of bribery scandals and was succeeded by

Valentin Paniagua. The basic economic, political, and social causes of Peru’s unrest and violence remained unaddressed.

Pétain, Henri-Philippe (1856–1951)

French Army marshal and political figure. Born at Cauchy-à-la-Tour, near Arras, on 24 April 1856, Pétain graduated from St. Cyr in 1878. Had he not fought in World War I, he would have retired as a colonel. Pétain held that new weapons gave the defense superiority. When World War I began, he saw that it would be a struggle of attrition, and he argued for

Portrait of Henri-Philippe Pétain. (Library of Congress)

wearing out the Germans along the entire front and only then mounting a “decisive effort.”

At the start of the war, Pétain was temporarily commanding a brigade. He then commanded a division (September) and an army corps (November). By June 1915, he was a full general commanding the Second Army. When the Germans mounted their offensive at Verdun in February 1916, he was placed in charge of its defense, reorganizing its defenses and transforming logistics so that supplies ran smoothly to the front. His leadership at Verdun made him a national hero.

Following the disastrous April–May 1917 Nivelle Offensive, Pétain was called on to deal with widespread mutinies in the French army. Made commander of the French army in May, he improved conditions and morale and promised the men that he would not waste their lives needlessly.

In December 1918, there was general public satisfaction with Pétain’s promotion to marshal of France, and he led the victory parade down the Champs Élysées on 14 July 1919. He retained command of the French army until 1931. Pétain supported the construction of the Maginot Line and served as war minister (1934). Appointed ambassador to Spain (1939), he was recalled to be the last premier of the Third Republic (June 1940).

Following the armistice with the Germans and the granting of emergency powers, Pétain set up an authoritarian government in southern, unoccupied France at Vichy that accepted collaboration with Nazi Germany. Tried as a war criminal after the war, he was convicted and sentenced to death, which was commuted to life in prison. Removed to the Isle d’Yeu, he died there on 23 July 1951.

Peter I, Romanov, Czar of Russia (“The Great”) (1672–1725)

Recognized as the first “modern” ruler of Russia who increased the pace of modernization in a military and administrative perspective, bringing Russia into the community of European great powers. Peter was born in Moscow on 9 June 1672. After the death of his half-brother Feodor, Peter and his half-brother Ivan became co-czars in April 1682, under the regency of Peter’s half-sister Sophia, an impossible arrangement. In August 1689, Peter was acclaimed sole czar,

following an unsuccessful coup by Sophia. However, possessing a curiosity for all things technical and military, Peter left governing to his mother, Natalia Naryshkin, until her death in 1694.

Peter’s first military venture, to capture the fortress of Azov in June–October 1695, failed because of Russia’s lack of naval power. After supervising the construction of 1,400 barges and 29 galleys at Voronezh, Peter made a second attempt in May–July 1696, which succeeded.

Peter is credited as being the father of the Russian navy, sending Russians abroad to learn craftsmanship. During his Grand Embassy through Europe from March 1697 to September 1698, Peter met Sir Isaac Newton, apprenticed in a Dutch shipyard, worked as a laborer at the Royal Navy shipyard in Greenwich, and recruited foreign labor to work in Russia, among other things. In 1701, Peter established the Admiralty and commissioned Kronstadt Naval Base at a cost of 6.25 million rubles. From 1701 to 1721, Russia’s naval expenditure grew from 81,000 to 1.2 million rubles. By 1725, Russia possessed 48 ships of the line and 787 auxiliary craft, serviced by 28,000 men.

After the Swedes defeated the Russians at Narva on 30 November 1700, Peter embarked on a series of reforms to strengthen the military. Conscription was instituted in 1705, and training manuals and the order of battle were revised. After the feudal noble *strelt’sy* (musketeers) revolted in 1698, Peter patterned their replacements on the Preobrezhensky and Semonovsky regiments, which he had created for childhood war games; they were cultivated into elite, well-equipped formations known as the Guards Regiments in 1708.

A program to increase the amount and effectiveness of artillery quadrupled Russian pig iron production between 1700 and 1720. Government expenditure on the army and navy was 66 percent of the total in 1701, 80 percent in 1710, and 66 percent in 1724. By 1725, Russia possessed a regular army of 210,000 troops and 100,000 Cossacks.

Peter likewise instituted educational reforms, creating the Artillery Academy in 1701, the Engineering Academy in 1712, the Naval Academy in 1715, a Mining Institute in 1716, 40 basic schools for math and literacy in the provinces in 1722, and the Academy of Sciences in 1724.

By 1720, Russia was divided into 12 provinces and military districts, which made the military in each region responsible for its own conscription and boarding of recruits and allowed for direct expropriation of taxes. In 1722, the creation of the Table of Ranks, a grade scale of 14 positions in both the military and state bureaucracies, instituted a merit system.

Russia emerged victorious against the Swedes at the conclusion of the Great Northern War in 1721, with a victory on

land at Poltava in 8 July 1709 and at sea during the Battle of Cape Hanko in 1714.

On 8 February 1725, Peter died in St. Petersburg, the city he had founded in 1703. He personified Russia's conflicting orientations through subsequent years: to the West and cities like St. Petersburg for modernization and development; to the East and the villages and countryside, away from "decadent" Western influences, to be renewed in the authority and orthodoxy of pure "Holy Mother Russia."

Petersburg, Siege of (June 1864–April 1865)

The last major obstacle to the Union's seizure of Richmond. In June 1864, after the clash at Cold Harbor, Ulysses S. Grant settled into a siege at Petersburg, an important city about 20 miles south of Richmond. Once Grant realized that he could not take the Confederate defenses (which had begun two years earlier during George McClellan's Peninsula campaign), he decided to keep extending his line to his left to cut the roads and railroads supplying Petersburg and hence Richmond. Once he cut the last link, he knew that Robert E. Lee would have to abandon his defenses, come out into the open, and most likely be defeated by the large and well-supplied Army of the Potomac.

There were several major battles during the long siege, including Globe Tavern (18–21 August), Ream's Station (25 August), Peebles Farm (29 September), and Boydton Plank–Burgess's Mill (27 October).

Lee recognized that once winter ended, Grant would continue his plan to isolate Petersburg in the spring. Lee therefore had General John Gordon attack at Fort Stedman on 25 March 1865; Gordon's troops were led by soldiers with axes seeking to cut through the strong wooden defenses. Gordon's assault really was to cover Lee's effort to retreat to North Carolina, meet up with Joseph Johnston, defeat William Sherman's army, and then turn to face Grant—a fantastic, indeed, desperate conception. Grant was always cool when attacked and recognized that to secure a local superiority—

mass—at the point of attack, Lee must have engaged in economy of force elsewhere. Grant ordered a general attack all along the siege lines.

Thus Lee felt he had no alternative but to order the evacuation of Petersburg and Richmond. Thereafter he tried to retreat south, was cut off by superior Union cavalry, and moved mostly westward to his fate at Appomattox Court House.

Pharsalus, Battle of (48 B.C.E.)

A pivotal battle of the Roman civil wars in which Julius Caesar defeated Pompey and contributed to the demise of the Roman Republic. Fought on 9 August 48 B.C.E., the engagement occurred at an undetermined locale in the plains a few miles north of Pharsalus (Fársala, Greece), a Thessalian city near the Enipeus River.

After abortive assaults on Pompey's entrenchments at Dyrrachium (Durres, Albania) in early 48 B.C.E., Caesar retreated southeast into the interior of Greece, seeking provisions and drawing Pompey away from his supply fleet. By early August, both armies encamped near Pharsalus. Pompey's forces totaled between 36,000 and 47,000 infantry in 11 legions and almost 7,000 cavalry, and Caesar commanded approximately 24,000 infantry in eight understrength legions and 1,000 cavalry. Confident of victory through attrition, Pompey hesitated to attack. However, 200 senators accompanying him agitated for a decisive confrontation, and on 9 August he deployed while Caesar was breaking camp.

Both commanders employed traditional Roman tactics, each arraying their soldiers in three main lines of battle. Pompey hoped to flank Caesar's right with a massive cavalry assault, followed by close support from several thousand archers and slingers. Caesar brilliantly countered with a fourth line of six infantry cohorts, who charged with devastating effect into the horsemen as they passed. After obliterating Pompey's cavalry, slingers, and archers, this force maneuvered around his left, attacking the main lines from behind. Simultaneously, Caesar ordered his third line into action, relieving his first two lines. Their opponents, caught

in this dire pincer, quickly became disorganized and fled, suffering losses of 6,000 dead and 24,000 captured. After his defeat, Pompey escaped to Pelusium (Tell el-Farama, Egypt), where henchmen of King Ptolemy XIII assassinated him. Caesar subdued the remaining Pompeians the following year.

Philip, King (Metacomet)(1639–1676)

Instigator of proportionally the bloodiest war in American history. King Philip Metacomet, sachem of the Wampanoags, was the son of Massasoit, who had become allied with Plymouth colony during the Pequot War, and the younger brother of Alexander Wamsutta. Becoming leader of the tribe in 1662, Philip found that the situation in which his father had maintained the peace had significantly changed. Missionaries recruited “praying Indians,” who enjoyed better status than non-Christians under the laws of the colonies, while Philip increasingly had to sell titles to land through the colonial courts in order to have his authority validated and to raise cash for European goods. At the same time, he was constantly accused of planning to wage war against the Plymouth or Massachusetts colonies. Many of these charges came from John Sassamon, a Christianized Indian who was a former secretary of Philip’s. When Sassamon was murdered and three Wampanoags were hanged for the crime after a questionable trial, it seemed to Philip that not only had the colony forfeited its claim to his loyalty but that he had to strike quickly. Wampanoags attacked Swansea in June 1675, killing settlers, and drew other tribes to his cause after a total lunar eclipse occurred on 26 June, seemingly a portent of victory.

The settlers were enraged at the destruction of a series of towns, including Middlebury and Dartmouth, and infuriated by the “skulking” way of war used by the Indians, whose better marksmanship, stealth, and use of fire to obliterate settlements stymied their forts and defensive lines. While other tribes, including the Nipmucs, continued the war, Philip traveled to New York in the fall of 1675 to seek an alliance with the Mohawks but was defeated badly when Governor Edmund Andros incited the Mohawks against him. Philip was forced to return to Massachusetts, where he faced

Full-length engraved portrait of Philip, alias Metacomet of Pokanoket. (Library of Congress)

the problem that although the war had united the disparate and usually feuding colonies against all Indians, even those who fought alongside them, the war had done nothing to solidify the tribes, who acted independently. Philip was increasingly harried by Captain Benjamin Harris of Plymouth and then betrayed by an irate subordinate, who sought revenge after Philip ordered his brother executed for arguing in favor of surrender. Philip was killed in Harris’s raid, but in the fury of the colonists, his body was dragged from the bog in which it had fallen and dismembered and his head was displayed in Plymouth for 25 years.

Although the instigator of the war, King Philip played a minor role in the conflict, which continued in the hands of other Indian leaders until 1678. (Oddly, a U.S. Navy gunboat was named in honor of Metacomet in the mid-nineteenth century.)

Philip II Augustus (1165–1223)

Victor of the first Hundred Years War, between the Capetians and the Plantagenets. Philip was the son of King Louis VII. Crowned co-king in 1179, he ruled France a year later at the age of 16, after his father's death. He inherited the confrontation between the Capetians and the Plantagenets. The latter were kings of England but also vassals of the kings of France for Normandy, Anjou, and Guyenne.

Plantagenet power was a constant threat to Capetian monarchy. Philip's territorial policy was to extend royal domain by whatever means possible: marriage, bribe, felony, or war. In 1189, he supported the rebellion of Henry II's sons against their father and received Vermandois and Artois as a reward. He took advantage of the captivity of Richard I the Lionhearted to take Normandy but was defeated when Richard returned (at Fréteval in 1194 and at Courcelles in 1198). The French monarchy was saved by Richard's death in 1199.

The war with King John, Richard's successor, continued until 1216. John had refused to take an oath of allegiance to Philip. According to feudal law, John was a "felon" and had lost all rights to his French fiefs. Philip took Normandy (1202–1204) and Brittany (1205).

With the election of a new Holy Roman Emperor in 1213, a European alliance formed against Philip: John of England, Otto IV of Brunswick, and Ferrando of Portugal. In 1214, France was invaded from the south by John's army, soundly defeated by Philip's son on 12 July, at La Roche aux Moines, but the main threat was the emperor's coalition coming from the northern border. The Battle of Bouvines (27 July 1214) was a crushing victory for Philip. The emperor lost his crown to the French-supported Frederick II Hohenstaufen.

The end of Philip's reign saw expansion south. He accepted allegiance from Simon de Montfort for confiscated Toulouse County. He allowed his heir, Louis, to command a crusade (1217–1219) against the Albigensian heretics, resulting in a bridgehead for the French monarchy in southern France. When Philip died, he enjoyed an authority that was recognized far more widely than that of any previous French king. His nickname "Augustus" recalls the first Roman emperor, an important reformer. Philip first established bailiffs

as an institution and also organized a royal central administration, the Curia Regis (king's court).

Philip II of Macedon (c. 382–336 B.C.E.)

Ruler who used innovations and organizational restructuring to turn the Macedonian army into a competent fighting force, laying the foundation for his domination of Greece and Alexander the Great's domination of Asia.

In 359 B.C.E., Philip's father, King Amyntas III, died in battle with the Illyrians. Using guile and force and notwithstanding the opposition of several pretenders, the young Philip managed to secure the throne of Macedon. He gathered up what army he could muster. Using a combination of bribery and force, he solidified his hold on the country. Having quickly reorganized and trained the army, he marched off to defeat the Illyrians.

Macedonia was an agrarian state with little in the way of an urban population. Mounted noblemen, the "Companions," were the backbone of the military. They fought as shock troops, requiring considerably more organization than Greek cavalry skirmishers. Philip furthered the effectiveness of the cavalry by the introduction of the *sarissa*, a long spear similar to the Napoleonic lance in size and weight.

In contrast, infantry peasant levies served only as an auxiliary arm fighting en masse with no tactical organization and would certainly have been unable to stand up to Greek hoplites in battle. Philip's other innovation, therefore, was the Macedonian phalanx. He borrowed heavily from the Theban phalanx, but where the typical Greek phalanx was between eight and 12 men deep, Philip's was 16. Although this took away from the width of the line, the cavalry was there to protect the flanks. More men meant a stronger push, all-important in shock warfare.

Philip's was an integrated army that represented a fusion of the mobile warfare of the Persians and the infantry shock tactics of the Greeks. It was the last step in the military revolution that produced the army of Alexander the Great and perhaps the pinnacle of Greek military might.

Philippi, Battle of (42 B.C.E.)

Decisive battle in which Mark Antony and Octavian defeated the assassins of Julius Caesar, Brutus, and Cassius. After the murder of Julius Caesar, the consul Mark Antony, along with the designated heir Octavian and proconsul Aemilius Lepidus, formed an alliance known as the “Second Triumvirate.” It was directed against Caesar’s leading assassins, Brutus and Cassius, known as the “Liberators.”

Leaving Lepidus to control Italy, Antony and Octavian moved to northern Greece. The army of the Liberators was positioned astride the Via Egnatia, to the west of Philippi, in a position partly protected by a marsh. Both armies contained 19 legions, but the army of the Liberators was superior in cavalry. Both sides entrenched, building stone dikes, palisades, and towers. Antony attempted an outflanking movement by cutting through the marsh. After a 10-day effort, Antony’s troops finally attacked Cassius’s camp and crushed its army. Cassius, not knowing that Brutus’s forces had successfully assaulted Octavian’s camp, committed suicide.

During the next three weeks, Antony and Octavian continued to alter their angles of attack in an attempt to outflank Brutus’s remaining forces, as Brutus extended his lines eastward in response. In the end, Brutus, against his better judgment, agreed to a battle in which his army was routed. Desperate, he too took his own life.

Philippine Insurrection (1899–1902)

First major jungle war fought by the United States. The Philippine Insurrection stemmed from the Spanish-American

War of 1898, in which the United States decisively defeated Spain and acquired an overseas empire that included the Philippine Islands. More specifically, U.S. involvement in the Philippines dated from the Battle of Manila Bay on 1 May 1898, when a U.S. naval squadron commanded by George Dewey destroyed a Spanish fleet. News of the victory prompted Filipino forces commanded by General Emilio Aguinaldo to declare independence from Spain and form a national government, but Spanish forces ignored them and surrendered to the United States instead. Their action left the question of independence in the hands of the Americans, who decided to annex the Philippines for economic and military reasons in February 1899.

In the same month, fighting broke out between U.S. occupation forces under the command of Elwell S. Otis and frustrated Filipino troops who believed they were trading their former Spanish masters for newer ones from the United States. The fighting, largely provoked by the Americans, quickly spread from Manila into the countryside. It remained conventional until 1900, with Filipino forces suffering enormous casualties at the hands of better-equipped U.S. troops. These losses forced Aguinaldo to switch to guerrilla tactics, causing serious American casualties and extending the war into remote villages where atrocities on both sides became commonplace. U.S. forces herded villagers into concentration camps in an effort to isolate guerrilla bands and suffered at the hands of Filipino foes who knew the terrain, climate, and vegetation far better than they did.

U.S. forces under Frederick Funston finally captured Aguinaldo in 1901, and fighting gradually diminished until the end of the war in 1902. One of the keys to the eventual American success was the creation of the Philippine Scouts in 1899. Organized into companies of Filipino collaborators commanded by U.S. enlisted men holding local commissions, the scouts proved far superior to American forces in conquering the climate, terrain, and enormous linguistic hurdles inherent in an archipelago containing several thousand dialects and languages. The scouts garrisoned remote areas, allowing U.S. troops to concentrate near Manila, and later served valiantly in the war against Japan. The guerrillas’ cause was also hurt by the United States extending the promise of commonwealth status and, eventually, complete independence on a definite date, 4 July 1946. The U.S. Army also busied itself in a widespread program of what later would be called “civic action,” building farm-to-market roads, artesian wells, docks, telegraph lines, and, most important to the Filipinos, schools.

The other critical U.S. action during the Philippine Insurrection came in July 1901, when William Howard Taft succeeded General Arthur MacArthur (U.S. military commander and father of Douglas MacArthur) as governor of

the Philippines. Taft created a Philippine Constabulary of American officers and Filipino enlisted soldiers to garrison pacified regions. Constabulary forces became the national police force of the Philippines, formed the nucleus of the Philippine Army in 1936, and contributed an entire division to the Bataan campaign during World War II, the only sizable indigenous force to fight with their colonial masters in World War II in the Pacific. Both the Constabulary and the elite Philippine Scouts allowed U.S. forces under General Adna Chaffee (who succeeded MacArthur when Taft became governor) to rule through local intermediaries and gradually assume the daily task of enforcing law and order throughout the islands.

More than 4,000 U.S. soldiers and at least 20,000 Filipino guerrillas died before the insurrection ended in 1902, and the number of civilian deaths will never be known. The loss of life dampened American enthusiasm for empire in the early 1900s and foreshadowed the difficulty Americans would have fighting a jungle war in Vietnam during the 1960s. Most historians, in the strongly anti-imperialist climate from the 1960s on, viewed the Philippine Insurrection as a tragic mistake of American imperialism, one that delayed Philippine independence and needlessly cost the lives of thousands of Filipinos and Americans. Ironically, both sides fought together against the Japanese less than 40 years after the insurrection ended.

Philippines, U.S. Loss of (7 December 1941–9 June 1942)

The worst defeat in American military history. Oddly, neither the Japanese army nor the government had any particular interest in the Philippines, an American possession in the western Pacific scheduled to receive its independence in 1946. But the imperial Japanese navy, supposedly the least aggressive of the Japanese military services, insisted that the U.S. air and submarine forces on the islands menaced the lines of communication to the “southern resources area,” the

Dutch East Indies, the highest priority on the list of Japanese conquests.

Japan’s attack concentrated on the large northern island of Luzon, site of the capital, Manila, and where American military power was concentrated. On 8 December 1941, Japanese fighters and bombers, flying from Formosa, struck Luzon. General Douglas MacArthur, supreme commander of American and Filipino forces, and his staff knew of the attack on Pearl Harbor and had approximately 10 hours to prepare, yet the Japanese air strikes destroyed much of Major General Lewis Brereton’s Far East Air Force, including 18 B-17 “Flying Fortresses” and 53 P-40 fighters on the ground at Clark and Iba Fields. MacArthur, Brereton, and Major General Richard Sutherland, MacArthur’s chief of staff, offered conflicting postwar explanations for the catastrophe. In the following days (9–13 December), continuing Japanese raids further decimated American airpower and severely damaged Cavite Naval Base in Manila Bay. With the Japanese enjoying near-complete air superiority, Admiral Thomas Hart’s Asiatic Fleet, save a few small vessels and patrol bombers, sailed south (14 December) to join the British and Dutch for an anticipated defense of the East Indies, while the battered remnants of the Far East Air Force redeployed (17 December) to Australia.

American air and naval power having been crippled, Japanese ground forces made a series of small landings between 8 December and 24 December at Batan Island, Camiguin Island, Appari (northern Luzon), Vigan (northwestern Luzon), Legaspi (southeastern Luzon), Davao (southeastern Mindanao), and Jolo Island, procuring airfields from which short-range fighters could support the main landings, establishing a stranglehold on strategically significant San Bernardino Strait, and securing bases for the upcoming invasion of the East Indies. The main landings, carried out by Lieutenant General Masaharu Homma’s Fourteenth Army, followed on 22 and 24 December; the 48th Infantry Division came ashore at Lingayen Gulf, northwest of Manila, and a regiment of the 16th Infantry Division landed at Lamon Bay, southeast of the capital.

In accordance with a plan worked out by MacArthur, Filipino and American forces on Luzon, divided among Major General Jonathan Wainwright’s North Luzon Force, Major General George Parker’s South Luzon Force, and a reserve force, attempted to defeat the Lingayen landings on the beaches. Homma’s forces brushed aside resistance offered primarily by ill-trained, poorly equipped Filipino units and drove inland.

Quickly recognizing his strategy’s bankruptcy, MacArthur, on 23 December, ordered a phased withdrawal into the Bataan Peninsula, intending to hold out there until relief arrived from the United States. Beginning on 24 December,

American and Filipino forces executed MacArthur's order with consummate skill. Wainwright's North Luzon Force retreated south from Lingayen, holding in sequence a series of five defensive lines, while the South Luzon Force withdrew across central Luzon via Manila to reach Bataan. Japanese air commanders and General Homma unwittingly contributed to the success of the withdrawal; the former failed to bomb the crowded roads leading into the peninsula, and the latter hesitated to push his ground forces forward rapidly. The combination of American and Filipino skill and Japanese failures and hesitancy allowed somewhere between 65,000 and 80,000 American and Filipino soldiers and 26,000 civilians to reach the peninsula by 6 January 1942. U.S. artillery, often mounted on half-tracks, proved particularly effective in the retreat to Bataan.

From his headquarters on the island fortress of Corregidor at the mouth of Manila Bay, MacArthur established a defensive line near the center of the peninsula running from Mauban on the west coast to Mabatang on the east. Wainwright's forces, redesignated I Corps, assumed responsibility for the defense of the western sector (from Mauban to Mount Natib), and Parker's, redesignated II Corps, defended the eastern sector (from Mount Natib to Mabatang). Though determined, Bataan's defenders and civilians confronted a precarious situation, owing to grossly insufficient supplies of food, medicine, ammunition, gasoline, and other necessities. MacArthur's strategy of defending Luzon at the beaches had necessitated the moving to forward areas of vital supplies originally earmarked for Bataan. The bulk of these supplies had been abandoned during the retreat to the peninsula. Consequently, by the first week of January, the American and Filipino defenders of Bataan were on half-rations of 2,000 calories per day, a situation that worsened as the battle for the peninsula unfolded.

While MacArthur's forces retreated into Bataan, Manila fell to the Japanese. There Homma learned of the imminent redeployment of the 48th Infantry for the upcoming invasion of the East Indies—the timetable for which had been pushed forward in light of the spectacular successes won by Japanese forces throughout the Pacific—and its replacement by the quantitatively and qualitatively inferior 65th Brigade. Though losing the 48th cost him his best troops and left him outnumbered 3 to 1, a confident Homma anticipated a quick mop-up of Bataan's defenders.

Beginning on 9 January, the Japanese undertook a series of frontal attacks along the length of the Mauban-Mabatang line, forcing Parker's II Corps to give ground and breaching the enemy position in the center near Mount Natib. Fearing the Japanese might achieve a complete breakthrough, MacArthur ordered a withdrawal on 22 January to a new defensive position, the Bagac-Orion Line, located 8 miles to the

rear—a maneuver Wainwright and Parker completed by 26 January—and informed his superiors in Washington that the Japanese advance would be halted there. Homma, however, had other ideas, launching three small amphibious operations (23 January–1 February) against the “points” (located in southwestern Luzon) to outflank the American position. These assaults were contained and then repulsed, and Wainwright’s forces simultaneously crushed a Japanese regiment that managed to penetrate his lines.

On 8 February, his forces decimated by heavy casualties, physical exhaustion, and disease, Homma halted offensive operations, withdrawing to more secure positions and requesting reinforcement. A lull of nearly two months ensued. The Japanese strengthened themselves with the addition of infantry reinforcements from the 21st and 4th Divisions, while the Americans and Filipinos grew weaker from malnourishment and disease. In the meantime, General George Marshall, chief of staff of the U.S. Army, ordered MacArthur, now a hero in the United States, to Australia on 22 January to assume command of the Southwest Pacific Theater. Reluctantly, MacArthur, accompanied by family, staff, and Philippine president Manuel Quezon, departed on 12 March.

His forces having recuperated, Homma commenced a new offensive on 3 April, for which the starving, disease-ridden defenders of the Bagac-Orion Line had no answer. In the opening 48 hours, the Japanese collapsed the American center and right, defended by Parker’s II Corps, and forced I Corps on the left to retreat. Though MacArthur, who still considered himself responsible for the Philippines’ defense, ordered a counteroffensive, Major General Edward King, now in command of the defense of Luzon, recognized the situation’s hopelessness and surrendered on 9 April. Of the nearly 80,000 defenders in Bataan, approximately 2,000 escaped to Corregidor. The remaining 70,000-plus fell into Japanese captivity and had to endure an excruciating 65-mile trek north to San Fernando, where stifling boxcars awaited to carry them to prisoner-of-war camps. During the journey—subsequently labeled the “Bataan Death March”—Japanese soldiers acted with great brutality, beating and even executing those diseased and malnourished captives who could not continue; some 7,000 died before reaching the railhead.

During the two months that followed the fall of Bataan, the Japanese brought the Philippine campaign to a victorious conclusion. In early May, Homma’s forces, having subjected the island fortress to a 27-day siege accompanied by continuous bombardment from artillery and aircraft, assaulted Corregidor, where General Wainwright—whom the War Department had formally entrusted with command in the Philippines—a small garrison of 11,000, and civilian refugees prepared for the worst. Although Wainwright’s men

fought gallantly and inflicted serious casualties on the attackers, the Japanese successfully established a foothold and moved toward the center of U.S. resistance, Malinta Tunnel. Recognizing further resistance as futile, Wainwright surrendered unconditionally on 6 May, reluctantly agreeing to broadcast an order of surrender to other American forces in the Philippines. During the next several weeks, American and Filipino forces in the central and southern island capitulated piecemeal, and formal resistance finally ended on 9 June 1942.

From the start, the Philippine Islands, close enough to Japan to provoke that aggressive nation but too far from the United States for effective relief, were doomed and all the geopolitical arguments for colonial possessions shown to be utterly false. Although the capitulation was unprecedented in U.S. military history, the Filipino-American defenders could take at least a measure of satisfaction in the realization that they had put up a much better fight against the Japanese onslaught than had any other colonial forces.

Philippines, U.S. Retaking of (20 October 1944–2 September 1945)

Major World War II battle on land and sea for control of the Philippine Islands, which were important to the United States both symbolically and strategically. Because the islands were a former American colony (and after that a commonwealth) and one of the first targets of the Japanese advance against the United States in late 1941 and early 1942, many Americans (not the least of whom was General Douglas MacArthur himself) felt a moral obligation to retake them. They were also a possible stepping-stone to the invasion of Japan.

In the continuing debate in Washington about the direction of the American Pacific offensive, General Douglas MacArthur, U.S. commander in the Southwest Pacific Theater, argued persistently for the retaking of the Philippine Is-

General Douglas MacArthur and aides wading ashore on Leyte, Philippine Islands, 1944. (Library of Congress)

lands. In the summer of 1944, the Joint Chiefs of Staff approved the invasion plans, with the island of Leyte as the initial target and the main island of Luzon as the final goal. The Japanese army command chose to contest the invasion of Leyte, and the struggle for control of that island developed into the major land battle for the Philippines.

The Battle of Leyte Gulf, the massive naval struggle between the American and Japanese fleets, raged concurrently with the fighting on land. The Japanese, underestimating as always the strength of the Americans, hoped to engage the U.S. Navy in a decisive confrontation. When the Battle of Leyte Gulf, the greatest naval battle in history, concluded, Japan had lost no less than four aircraft carriers, three battleships, six cruisers, 11 destroyers, and 500 planes and was a spent force.

After the relatively unopposed landings on Leyte Island, General Walter Krueger's Sixth Army made steady progress toward Ormoc, the major Japanese base on the western side

of the island. General Suzuki's defensive fortifications, combined with typhoon rains, slowed but could not stop the American advance. Although Leyte was largely under American control by December 1944, fighting continued in that area through May 1945.

On 9 January 1945, the Americans landed on Luzon Island, where General Tomoyuki Yamashita (Tiger of Malaya) had withdrawn into the mountains, but a Japanese naval-marine rear guard put up a last-ditch defense of Manila, committing many atrocities against Filipino civilians and destroying most of the city. Despite the American victory, sporadic fighting continued on various islands until the end of the war and General Yamashita's surrender on 2 September.

The retaking of the Philippines produced two unforgettable images for U.S. wartime memory, one of Japanese fanaticism and the other of American dominance. During the Battle of Leyte Gulf, the Japanese resorted to suicide air

attacks by bomb-laden warplanes, or kamikazes (divine wind), strengthening the belief in the United States that Japan would never surrender. Equally significant was the photo of General MacArthur wading ashore on Leyte on 20 October 1944 and announcing to the world, "People of the Philippines, I have returned!"

Pickett, George Edward (1825–1875)

Confederate general in the American Civil War who is forever linked with one of the most gallant and heartbreaking moments in military history. Pickett was born on 25 January 1825 in Richmond, Virginia, to an upper-class family. After graduating last in the class of 1846 at the U.S. Military Academy at West Point, he was promoted to the rank of brevet first lieutenant for his service at Contreras and Churubusco in the Mexican-American War. He was then assigned to various posts, promoted to the rank of captain, and was later involved in the "Pig War," a dispute over San Juan Island with the British.

On 25 June 1861, Pickett resigned from the army and was ushered into the Confederacy as a colonel less than a month later. He was stationed on the Rappahannock River in the Department of Virginia and was later transferred to the Department of Northern Virginia, promoted to the rank of brigadier general, and given command of a brigade under General James Longstreet. He led his men in the Battles of Williamsburg, Seven Pines, and Gaine's Mill. In the last battle, he was wounded. After having recovered, he was promoted to major general and given a command of a division. He then served in the Fredericksburg and Tidewater campaigns.

On the third day at Gettysburg, Pickett's division was given the daunting task of charging straight into the center of the Union line at Cemetery Ridge, breaking through, and rolling the enemy up. His men were cut to ribbons by the Union guns, sustaining losses of 2,655 men wounded, killed, or captured. Pickett would remain bitter toward Robert E. Lee for the rest of his life. Afterward, he was sent to North Carolina, rejoined Lee at Cold Harbor, and was involved in the Richmond campaign. Lee relieved him of command be-

cause of the substantial losses he suffered at Five Forks, one day before peace was signed at Appomattox Court House.

Pilsudski, Józef Klemens (1867–1935)

Polish military commander and dictator. Born at Zulow in Russian-occupied Poland (in present-day Lithuania) on 5 December 1867, Pilsudski studied medicine at the University of Kharkov for one year before being arrested for an alleged conspiracy to assassinate Czar Alexander III. Pilsudski was sentenced to five years in Siberia and did not return to Poland until 1892. Following his return, Pilsudski became a leader of the Polish Socialist Party and published a clandestine newspaper, *Robotnik* (The Worker). After being forced to flee to Austrian-occupied Poland, he founded the Polish Riflemen's Association, with which he hoped to train an army of Poles to fight for Polish independence. Upon the outbreak of World War I, the Polish Riflemen's Association became the Polish Legion of the Austro-Hungarian army, which fought against imperial Russia. In 1916, the Central Powers proclaimed an independent Polish kingdom with Pilsudski as a member of the Polish Council of State. Refusing to fight under German command, however, he was imprisoned at Magdeburg and the Polish Legion was disbanded.

Released from Germany following the Armistice in November 1918, Pilsudski returned to Warsaw and proclaimed an independent Polish republic. As head of state and commander in chief of the Polish army, he sought to restore all the territories that had belonged to Poland at the time of the First Partition in 1772. These policies brought Poland into immediate conflict with the Bolshevik regime in the Soviet Union. During the Russo-Polish War (1919–1921), Pilsudski defeated the vastly superior Soviet armies at the Battle of Warsaw (1920) and thereby secured Polish independence. After resigning as chief of state in December 1922, he planned to live in quiet retirement, but on 12 May 1926 he led a coup d'état that overthrew the weak and inefficient parliamentary government and installed a regime under his control. From then until his death, Pilsudski was the virtual

Portrait of Józef Klemens Piłsudski. (Library of Congress)

dictator of Poland, though he retained only the positions of minister of war and commander in chief of the army. He died in Warsaw on 12 May 1935 and was buried among Poland's kings in the crypt of Wawel Cathedral in Cracow.

Pinkie (10 September 1547)

The last battle between English and Scottish national armies. The battle was fought in a war that erupted from England's attempt to secure a lasting arrangement with

Scotland: England's persuasive efforts involved the sword, fire, and looting. After one English raiding column was annihilated at Ancrum Moor in February 1547, an English army advanced on Edinburgh with 18,000 infantry and 6,000 cavalry. It mustered 800 musketeers and 15 cannon and had naval support.

The Scottish army of 20,000 men occupied a strong position on the west bank of the Esk River, between sea and marsh. The English attempt to secure the only bridge over the Esk, which had been left unguarded, provoked the Scots to abandon their positions to move to the east bank. There they were attacked by English cavalry, but the Scots troops' rudimentary squares formation defeated these attacks. The cost to the Scots, however, was in time: the English were able to bring archers, cannon, and warships into action against massed but trapped Scottish pikemen. Subjected to murderous cross fire, the Scots tried to retreat, with inevitable consequences: panic and flight. The English cavalry rode down those fleeing the battlefield. Scottish dead numbered an incredible 10,000.

The aftermath was curious. In the short term, the Scots simply refused to treat, and English holdings were progressively reduced, with Edinburgh abandoned in 1550. But Scottish fear of French intentions, the growing strength of Protestantism in the country, and the English withdrawal from southern Scotland provided the basis for a rapprochement. In 1560, the Scots and the English combined to force the surrender and evacuation of the French garrison at Leith.

Pitt, William, the Elder (1708–1778)

The architect of British victory in the Seven Years' War. William Pitt was born in 1708, grandson of Governor Thomas Pitt, founder of the family's fortune, who used profits from his place in the East India Company to buy Old Sarum, the family's rotten borough. After an education at Eton and Oxford University, Pitt was unsure of his professional future and accepted a cornetcy in Cobham's Horse before embarking on a grand tour of Europe in 1733 and returning in 1735 to take a seat in Parliament, representing Old Sarum. Quickly, Pitt made a reputation for crossing Robert Walpole and annoying George II, especially after goading the government into war with Spain in 1739. In 1746, he was named paymaster gen-

eral and ostentatiously made a show of publicly accounting for all the army funds rather than personally profiting.

In 1756, Pitt pushed for an alliance with Prussia under Frederick the Great and, after the disasters of that year (Byng's naval failure at Minorca and Braddock's catastrophic defeat and death in western Virginia), was named one of the secretaries of state. Pitt's strategy in the Seven Years' War was simple: British force was concentrated on North America and the colonies, while subsidized Prussia carried Europe. It resulted in the victories of Robert Clive in India at Dakar and James Wolfe's capture of Quebec, as well as the naval battle at Quiberon Bay, which destroyed the French fleet. By 1761, however, Pitt's arrogance and inability to work with Prime Minister Lord Bute caused him to resign, crying "Frederick Betrayed!" about the peace treaty. In 1766, he was back in the ministry after protesting the Stamp Act and Declaratory Act but suffered a physical collapse and left again in 1768. In his later years, Pitt advocated reform in India, reconciliation with the American colonies, and agricultural improvements. He died after an impassioned but incoherent speech on American liberties in April 1778.

Pizarro, Francisco (c. 1478–1541)

Spanish conquistador who subdued the Inca Empire in Peru. In 1502, Pizarro left Spain for the Caribbean island of Hispaniola in search of fame and fortune. He apprenticed for a number of years and in 1513 was one of Vasco Nunez de Balboa's lieutenants in the exploration of Panama. In Panama, Pizarro initiated plans for the exploration and conquest of lands on the west coast of South America. His first exploratory probe in 1524 met with failure, but a second expedition in 1527 revealed gold ornamentation among the indigenous populations. Pizarro organized a force of 180 men and 27 horses and landed in present-day Ecuador in 1531. After reconnoitering the coastal areas of Ecuador by land and sea, he landed at Tumbes and gathered important intelligence about internal strife in the Inca Empire. Surmising that the empire was on the brink of collapse, Pizarro boldly marched inland through narrow mountain defiles and arrived at the highland city of Cajamarca on 16 November

1532. There he encountered the Inca ruler, Atahualpa, backed by an army of 30,000. When Atahualpa rejected entreaties to convert to Christianity, Pizarro ordered his tiny band to attack. The ensuing battle resulted in the deaths of thousands of Indians and the capture of Atahualpa without the loss of one Spaniard. Pizarro held Atahualpa hostage and extracted a large ransom of gold, silver, and precious stones before ordering his execution. Pizarro next led a successful campaign against Cuzco, the capital of the Inca Empire, in 1533. In 1535 he founded the city of Lima and was the undisputed master of Peru. Explanations for the amazing success of the conquest of the well-organized and highly militarized empire that stretched nearly 2,000 miles from southern Colombia to Chile include the civil war of rival brothers for the throne, the decimating impact of smallpox on the vitality of

Half-length portrait of Francisco Pizarro wearing armor. (Library of Congress)

the population, the superior weapons of the conquerors, especially the use of horses and steel, and the audacious leadership of Pizarro. Pizarro was murdered in 1541 by members of a rival faction discontented with his governance of Peru.

Plains of Abraham (13 September 1759)

Battle that ended French power in North America. Having taken Louisbourg and Fort Duquesne in the Seven Years' War (called the French and Indian War in North America), the British the next year turned their attention to Quebec. Brigadier General James Wolfe left England in mid-February 1758, reaching Halifax in late April and Louisbourg in mid-May. When Wolfe embarked to attack Quebec, he had about 9,000 regular troops and several hundred American Rangers.

By late June, the large invasion force reached Ile d'Orleans without incident and was only 5 miles from Quebec. But the citadel's defenses were formidable, perched on a 200-foot bluff over the St. Lawrence River. Defended on two sides by rivers and steep bluffs, the city had constructed a wall on the west side and placed cannon to prevent attackers from scaling the wall.

Wolfe considered his choices. Louis-Joseph de Montcalm-Gozon, the Marquis de Montcalm de Saint-Véran, assumed that the British would attack from the north and had strengthened defenses accordingly; he also assumed British ships could not sail past Quebec to land troops to the more vulnerable western approach. Several times, the French tried to launch fire boats at the British fleet, but they were unsuccessful, and several times Wolfe sought to attack the city from the north and east and failed.

Finally, Wolfe accepted a plan from his subordinates to land west of Quebec, cutting off the city from its supplies further upriver. Meanwhile, Montcalm tried to stall matters, for by October, weather and the freezing of waterways would force a British retreat. Finally, the British secretly moved under cover of darkness and used a path to climb up to the plains west of town. Although the French received notice from pickets stationed there, they did not make good use of the information.

Montcalm decided to attack the British before they could begin siege operations and thus delay their plans. He gathered his men and attacked in the late morning of 13 September; the British held their fire and then decimated the French attackers. Both Montcalm and Wolfe were wounded several times, and both died.

The British, having cut supplies from upriver, began siege operations. The French defenders, short of food and low on morale, surrendered on 17 September, basically ending the French Empire in North America. Few battles have had such far-reaching consequences as that of the Plains of Abraham.

Plassey, Battle of (23 June 1757)

The battle that gave control of Bengal to the British. In the eighteenth century, India saw a struggle for colonial supremacy between France and England. European nations fought each other through conflicts in these remote areas. The British East India Company had the delegated power of a sovereign state and its own private army and was continuously at war with the French or with French puppet Indian rulers.

In 1756, Suraja Dowla, nabob of Bengal (supported by the French), captured Calcutta and committed atrocities against British prisoners. The East India Company sent its army under Robert Clive to take control of Bengal and punish Suraja. Clive's troops consisted of less than 3,000 men with eight guns, facing an overwhelming force of more than 50,000 soldiers, mainly Indian warriors, with 53 guns manned by French artillerymen. The nabob's army was commanded by Mir Madan, but many Indians (including left-wing commander Mir Jafar) were plotting against Suraja, a fact Clive knew. The East India Company army pursued Suraja's army and found him entrenched near the village of Plassey. Clive massed his tiny force in a mango grove and found himself besieged by a large semicircle of Indians. The weather proved to be the decisive factor: a sudden monsoon rainstorm wet Suraja's powder at the very time the British covered their artillery. The battle commenced with inconclusive cavalry charges that were easily repulsed by Clive's guns. In

the afternoon, Clive went over to the offensive and deployed to cannonade the nabob's camp at short range. After repulsing an Indian sortie, Clive assaulted Suraja's entrenchments, counting rightly on the disaffection of part of the Indian army. The Indian army disintegrated as Mir Jafar's soldiers changed side and began to flee without fighting. The French gunners continued fighting to the last, but by 5 P.M., the battle was over. Clive's casualties were incredibly low—18 killed and 45 wounded—to 500 Indians killed. Suraja was assassinated shortly afterward, and Mir Jafar became nabob, but with his power limited by the East India Company. The skirmish at Plassey proved to be the very foundation stone for the mighty British Empire in India.

Plataea, Battle of (479 B.C.E.)

Ten years after the Battle of Marathon, Greek hoplites and Persian mixed troops clashed near the city of Plataea in 479 B.C.E. in the largest land battle of the Persian Wars. Perhaps based on the Persian experience at Marathon, Xerxes had persuaded a number of Greek cities to contribute heavy infantry to complement the Persian light infantry and cavalry.

The two forces met about 25 miles northwest of Athens. The Spartans, led by their king Pausanius, had joined forces with the Athenians and other Greek cities to bring their combined force up to 40,000 hoplites and auxiliary light troops. The Persians, commanded by Mardonius, had about the same number of men (50,000), but he had an overall superiority in cavalry and infantry archers. He found it difficult to use the latter to advantage against the Greek forces, and he did not have enough heavy infantry to confidently envelop the Greeks, who had taken up their position on a hill behind the stream Asopos. There the two sides faced off for several days. Persian cavalry constantly harried the Greeks and attacked their water and forage parties. The Greeks, confident in their ability to prevail in a shock action battle, attempted unsuccessfully to draw the main Persian army into an assault. Finally, Pausanius decided to withdraw and move his force closer to Plataea. He planned a nighttime withdrawal to confuse the Persians. By daybreak, only half of his force had successfully moved back toward the city. The Athenians and Spartans had only started their retreat in the morning.

The Persians, noticing the disorder of the Greeks, rushed

forward to engage. The Persians relied on arrows to attack the hoplites. Unfortunately for Mardonius, his soldiers approached too closely to the Greeks, whereupon the Greeks charged the Persian line. Forced to drop their bows and defend themselves against bronze spears with their wicker armor, the Persians soon gave way and eventually collapsed. The Greek counterattack and pursuit killed Mardonius along with his elite guard and effectively destroyed the Persian field army.

This land victory, combined with the threat of an Athenian-led naval expedition against the Persians' lines of communications, unhinged Xerxes' military plans to conquer Greece and forced the Persians to withdraw back to Asia Minor.

Plattsburgh Movement (1915–1918)

A grassroots military preparedness campaign that began prior to the entry of the United States into World War I. The Plattsburgh Movement was an effort by private citizens to prepare for possible military action. It was led by old-stock, Ivy League-educated, eastern blue bloods and supported by General Leonard Wood. The first camp, held in Plattsburgh, New York, in the summer of 1915, trained middle-aged businessmen in military procedures. The National Defense Act of 1916 brought the War Department and these private organizations closer by permitting the federal government to pay for these training facilities, uniforms, food, and transportation. Throughout 1916 and 1917, Plattsburgh Movement training camps proliferated throughout the United States. After U.S. entry into the war in April 1917 and the enactment of conscription, the Plattsburgh camps became training centers for officer candidates recruited from civilian life.

In addition to training men for war, the groups that made up the Plattsburgh movement lobbied to improve camp conditions, organized liberty bond rallies, spoke at schools and other organizations, and produced training films. Following the Armistice, the Plattsburgh Movement advocated greater peacetime military preparedness, including universal military training.

Plevn/Plevna, Siege of (20 July–10 December 1877)

The crucial four-phase battle by the Russians to overcome Turkish forces defending Plevn/Plevna during the Russo-Turkish War (1877–1878). Russian (and Romanian, after August) forces participating in this battle numbered 130,000, against the Turkish force of 67,000.

War was declared on 24 April 1877, and a Russian army of 190,000 commanded by Grand Duke Nicholas crossed the Danube River on 27 June. They captured the Shipka Pass, situated in Turkish-occupied Bulgaria, on 19 July.

The Turkish forces of Osman Nuri Pasha marched from Vidin and reached Plevn/Plevna, where they held the Russian advance on 20 July. This action constituted the first phase of the battle.

Two subsequent Russian attempts to capture Plevn via a frontal assault failed. These second and third phases of the battle occurred on 30 July and 11–12 September. The Russian and Romanian forces lost 15,700 men.

Nicholas's decision to have the army retreat across the Danube River was overruled. Colonel Count E. I. von Todleben was placed in charge of the next assault of Plevn, and his engineers were employed to besiege the city.

Turkish forces on the perimeter of the city were not employed to aid Osman Pasha, who mounted a failed attempt to break out on 9–10 December. The Russians then launched their fourth and final, successful assault of this battle, and Plevn surrendered on 10 December 1877. The victory permitted Russian forces to continue unimpeded, entering Sofia on 4 January 1878 and Adrianople/Edirne on 20 January after the Battle of Plovdiv. The Siege of Plevn was instrumental to the defeat of Turkish forces in Bulgaria and the conclusion of the Russo-Turkish Wars on 3 March 1878 by the Treaty of San Stefano.

Poitiers, Battle of (18 September 1356)

French defeat in the Hundred Years War. With the resumption of war, the main English effort in 1356 took the form of a *chevauchée* (armored, mounted raiding parties) from Bordeaux that reached Tours. The French, crossing the Loire River at Blois and moving faster than an enemy army laden with booty, managed to get astride the English line of retreat at Poitiers.

The English army, perhaps 12,000-men strong, took up a defensive position with one flank secured by a stream. The other flank consisted of the wagon park. Sunken lanes and hedges were manned by some 3,000 archers, with dismounted cavalry serving as supporting infantry. The French, numbering perhaps 30,000 men, were formed into four echelons. The French made no attempt to use their cavalry to turn the English position and used their armored knights as infantry.

The first French attack was easily defeated by English longbowmen, with few French reaching the English positions. A second attack was denied a breakthrough only by deployment of the rear English division into the front line, leaving the English without a reserve. The failure of this attack caused the flight of the third French force before it came into range. The fourth French force, exhausted by its approach march, was caught by English light infantry and cavalry. The French king and many of the highest nobles in the land were surrounded and captured. The French lost about 2,500 killed, with a similar number captured. English casualties numbered about 2,000. After the battle, the English resumed their withdrawal to Bordeaux.

Polish Campaign of 1939

Opening campaign of World War II. The German invasion of Poland in September 1939 was the first example of a new theory of armored warfare, which the Germans referred to

as “blitzkrieg” (literally, lightning war). Poland historically suffered from a great geographic disadvantage—the central portion of Poland was flat with no natural boundaries. In addition, the Polish border with Germany extended for approximately 3,500 miles in 1939. When war broke out, Polish forces numbered about 1,000,000 men, but they were technologically outdated, especially in aircraft and tanks, and a great many of the troops were poorly trained reservists. At the same time, German forces numbered about 1,500,000 men, the most important part of which were 12 armored, mechanized, and motorized divisions. These divisions, in conjunction with the German Air Force (Luftwaffe), would be the deciding factor during the campaign.

On 1 September 1939, when Germany attacked, Poland’s forces were thinly spread in a rough semicircle from the border with East Prussia in the north to the German surrogate state of Slovakia in the south. In the northwest, approximately a third of Poland’s forces were concentrated in or near the Polish Corridor, where they were exposed to both East Prussia and Germany proper. About half of Poland’s forces were in central Poland, either facing the main axis of the German advance or massed in reserve in the center of the country. The remainder of Poland’s forces were even more thinly spread in southern and eastern Poland. Rather than deploying Polish forces behind natural and prepared defenses, which would have meant the loss of strategic industrial and resource centers in western Poland, the decision was made for them to be forward deployed. Unfortunately, this decision made it almost impossible to fight delaying actions against the German invaders because the German mechanized forces could easily overwhelm the slower Polish infantry forces.

The German forces quickly split the Polish army into disjointed fragments, some of which retreated, while others continued to fight hopeless battles. By 10 September, the Polish commander in chief, Marshal Edward Rydz-Smigly, ordered a general retreat toward the southeast. The situation was already desperate for the Poles when, on 17 September, the Soviet Union invaded eastern Poland in accordance with the Molotov-Ribbentrop Agreement. The next day, the Polish government crossed into exile in Romania. The Warsaw garrison resisted until September 28, and the last major force of the Polish army surrendered on October 6. Poland was then partitioned between Germany and the Soviet Union along the Bug River.

Despite its “lightning” victory, the Germans made many mistakes in deployment and tactics in their Polish campaign. But the remaining Allies, Great Britain and France, gave their enemy ample time to correct these deficiencies during the so-called Phony War, a time of near-immobility on the western front from September 1939 to May 1940. Though guerrilla warfare would continue (first against the Germans and

then against the Soviets) until after the formal end of the war in May 1945, the Polish nation had ceased to exist.

Polish Wars of Expansion (1386–1498)

A series of wars fought sporadically between Poland and its neighbors from 1386 to 1498. By the end of the reign of Casimir III (1333–1370), the Polish monarchy had, under the Piast Dynasty, successfully unified the Kingdom of Poland and created a bureaucratic apparatus to govern the country. After the death of Casimir III in 1370 and his nephew Louis in 1382, Poland would begin a series of wars and dynastic marriages calculated to extend Polish control over neighboring territories. Some of these efforts began at the behest of the royal family; others were undertaken at the connivance of a group of powerful oligarchs close to the royal court, the so-called Cracow nobles. As a result, by the end of the expansion in 1498, the Polish royal family governed approximately one-third of mainland Europe.

In 1386, the Cracow nobles completed the first step toward the expansion of the Kingdom of Poland. At the insistence of the oligarchs, Jadwiga married the grand duke of Lithuania, Jagiello (later Wladyslaw II). As a result of this marriage, the two nations were linked through a common set of monarchs, although both remained technically independent nations.

A combined Polish and Lithuanian army was able to evict Hungarian garrisons from Ruthenia, thus advancing Polish territorial interests, and to extend Lithuanian influence along the Baltic Sea coast to the north of the grand duchy and among the Rus to the east. Combined Polish and Lithuanian forces were also able to compel the princes of Moldavia and Walachia to render homage to the Polish kingdom.

In 1409 and 1410, hostilities between Lithuania and the Teutonic Order led to the “Great War,” which ended with the defeat of the order by a Polish and Lithuanian army commanded by Wladyslaw II and Vytautas (Witold) in the Battle of Tannenberg/Grunwald in 1410. Although the power of the order was considerably reduced, it received generous peace terms and was compelled only to recognize the right of the Lithuanians to govern some disputed territories along the

Baltic Sea. A second war with the order in 1422 forced the complete abandonment of its claims to Lithuanian territory.

The outbreak of the Hussite Wars in 1419 afforded a further opportunity for the aggrandizement of the Jagellonian dynasty. Hussite elements in Bohemia offered the kingdom to Wladyslaw II, which would have united a third country under his rule. Wladyslaw refused but allowed his cousin Vytautas to accept the offer.

Upon the death of Vytautas in 1430, Wladyslaw appointed his brother, Swidrigiello, as viceroy of Lithuania. Swidrigiello rebelled, abetted by the Teutonic Order, Sigismund of Luxembourg, and dissatisfied elements in Lithuania. Not until the death of Wladyslaw II in 1434 was the rebellion suppressed by his son, Wladyslaw III.

The death of Sigismund of Luxembourg at about the same time allowed the Jagellonian family another opportunity to acquire the Bohemian throne; the Polish court, in an effort to secure Bohemia, adopted a pro-Hussite policy. This in turn led to a pro-Hussite peasant rebellion in Poland, aimed at the church and noble hierarchy. The peasant revolt was defeated by the Cracow nobles at the Battle of Grotniki in 1439; noble dissatisfaction with the royal court enabled the Cracow nobles to compel the Jagellonians to defer further efforts to seize the Bohemian throne.

In 1440, Wladyslaw III appointed his brother Casimir viceroy of Lithuania. The Lithuanian nobles, true to form, rebelled and proclaimed Casimir as the independent grand duke of Lithuania. Wladyslaw was in no position to take action against his brother, for upon the death of Albert of Habsburg, also in 1440, he had been offered the kingdom of Hungary. As king of Hungary, Wladyslaw was drawn into the anti-Turkish crusade then being organized by the papacy in an effort to rescue Constantinople and Serbia from Turkish conquest.

After winning some initial victories in 1443, Wladyslaw negotiated an advantageous settlement with the Turks. Under papal pressure, this agreement was repudiated, and a second crusade was launched in 1444. This second crusade, the so-called Varna crusade, was poorly planned and led to the utter defeat of the crusading forces by the Turks at the Battle of Varna. Wladyslaw III was killed.

In 1454, Poland and Lithuania began the Thirteen Years' War with the Teutonic Order. This conflict led to the final defeat of the order and the Treaty of Thorn, which, although harsh, failed to eliminate completely the order as a force. The order surrendered more than half its remaining territory, and its grand master also agreed to become a vassal of the king of Poland and to accept Polish suzerainty over the remainder of the land held by the order.

Casimir IV's great object of policy was to obtain the reversion of the Kingdoms of Bohemia and Hungary for his

sons. This goal was realized, and the descendants of Jagiello were able to gain by diplomacy that which would have been utterly unattainable by conquest. But in 1485, Casimir IV began a series of campaigns in Moldavia against the Crimean Tartars on behalf of the prince of Moldavia, Stefan cel Mare. Stefan became a Polish vassal, and Polish-Tartar warfare continued until the death of Stefan in 1501.

Thus, immediately before the death of Casimir IV in 1492, the Jagiellonian dynasty controlled the Kingdom of Poland and the Grand Duchy of Lithuania through the kingship of Casimir IV and the Kingdoms of Bohemia and Hungary through the kingship of Wladyslaw, Casimir's eldest son. Moldavia and the Teutonic Order had been reduced to dependent vassal states. This unity was, however, more apparent than real, as none of the kingdoms or lands had been formally merged, and all retained some tradition of electing rulers rather than recognizing hereditary succession.

The death of Casimir IV in 1492 led to the unraveling of the Jagiellonian holdings. The decline of Tartar power made possible a Turkish-Muscovite alliance in 1498, which precluded further Polish or Lithuanian efforts at expansion in those directions. The careful efforts of the Jagiellonians thus benefited the Kingdom of Poland and the Grand Duchy of Lithuania very little in the long term.

Poltava (8 July 1709)

The triumph of Peter I's military reforms, enabling the Russian army to rout the Swedish force of Charles XII. Poltava marked the decline of Sweden and the ascendancy of Russia as a European great power.

After defeating the Russians at Narva, Charles diverted his attack to Poland. The Swedish attack against Russia recommenced in January 1708 as 50,000 Swedes crossed the Berezina River. Charles paused at Mogilev, awaiting a Swedish auxiliary force of 15,000 men and supplies traveling from Livonia and led by General Adam Ludwig Lewenhaupt. On 9 October 1708, Russian forces led by Peter and General Prince Aleksandr Danilovich Menshikov engaged and defeated Lewenhaupt at Lesnaia. Lewenhaupt reached Charles with 6,000 men but no artillery or supplies.

In an effort to sequester resources, Charles diverted his attack into the Ukraine. He also believed that the Cossack Hetman Ivan Mazepa would provide an auxiliary 100,000

Russian and Swedish armies meet at the Battle of Poltava on 8 July 1709. (Library of Congress)

troops against Peter, yet Mazepa delivered fewer than 2,000 Cossacks to the Swedish side.

Charles and 22,000–28,000 Swedish troops were forced to winter in the Ukraine. In May 1709, the Swedes laid siege to Poltava. On 8 July 1709, 40,000 Russian troops with superior artillery engaged and defeated the Swedish force. The Russians set up entrenchments within a few hundred yards of the Swedish siege lines, prompting the Swedes to attack. Charles's plan was to mount a charge past the entrenchments and assault the main Russian force, but being injured, he left command to Field Marshal Karl Gustav Rhensköld.

The latter quarreled with his subordinates, and the unclear issuing of orders contributed to the Swedish defeat. Individual Swedish generals surrendered, either on the field or several days later while trying to cross the Dnieper River. Mazepa, Charles, and 1,500 Swedish troops escaped to Turkey. Lewenhaupt had been ordered to escape with a part of the Swedish army to Crimea and later to meet Charles in Turkey. However, Lewenhaupt and his army had capitulated in Perevolotina.

Pompey the Great (Gnaeus Pompeius Magnus) (106–48 B.C.E.)

Roman general, statesman, and member of the First Triumvirate with Julius Caesar and Marcus Licinius Crassus. Romans referred to Pompey, a member of a senatorial family, as Magnus, meaning “the Great,” after he led a successful campaign in North Africa in 81 B.C.E. Prior to that, Pompey had fought on the side of Sulla against Gaius Marius during the Social War. After ending the Servile War led by Spartacus in 71 B.C.E., Pompey waged a five-year campaign against Sertorius in Spain. In 70 B.C.E., Pompey became consul, cleared

the Mediterranean of pirates, and defeated Mithradates VI Eupator of Pontus. He also conquered the kingdoms of Armenia, Syria, and Jerusalem. Disputes with the Senate resulted in the formation of an alliance between Pompey and Julius Caesar. In 60 B.C.E., the two men, joined by Crassus, formed the First Triumvirate. Caesar left the administration of Rome to Pompey and Crassus in 59 B.C.E. and for the next 10 years focused on the conquest of Gaul. Pompey's marriage to Caesar's daughter Julia ensured friendly relations between the two men, but after her death a rivalry developed. In 53 B.C.E., Crassus died in Syria, and Pompey turned to the Senate in an effort to curb Caesar's growing power. The Senate demanded that Caesar resign his office and return to Rome. Instead, Caesar crossed the Rubicon River in 49 B.C.E. and attacked Italy with his forces. Pompey fled across the Adriatic and was defeated by Caesar at Pharsalus in 48 B.C.E. He then fled to Egypt, where he was treacherously killed.

Pontiac's Rebellion (1763–1766)

A widespread Indian uprising against British power in North America. At the close of the French and Indian War (called the Seven Years' War in Europe), English settlers began to move into western Pennsylvania and New York, confident that Indian power was broken with the French defeat. France had ceded Canada to England, and the American Indians found themselves without French arms. British troops took over former French posts and established garrisons at Fort Pitt, Detroit, Venango, Erie, and other sites. For several decades, the various woodland tribes became dependent on European firearms for hunting and survival. To secure their help in defeating the French, the British had made several treaties with the Indians ensuring that they would have their own land, English troops would leave, and supplies of ammunition would continue. Many Indians then helped the English, including some of the Iroquois. The Delaware, a people conquered by the Iroquois, were forced to go along with the agreement.

In the years following the conflict, however, the British Crown was unable to restrict white settlement west of the

The death of Pontiac 1769. (Library of Congress)

Appalachians. Crown forces also kept small garrisons in the western Indian lands and began to curtail the trade of firearms and ammunition. Cut off from these supplies, many Ottawa, Potawatomi, and Chippewa faced starvation. Moreover, the Delaware, eager to be free of Iroquois rule, were also growing restless. In the summer of 1763, the western Indians organized under the leadership of a charismatic Ottawa named Pontiac. They were joined in an uprising by the Seneca, Shawnee, and Delaware.

Indian raiders overran English forts in the Ohio territory, and only two held out: Fort Detroit and Fort Pitt. From New York to Virginia, settlers fled the frontier in terror. Colonel Henry Bouquet organized a 400-man force to relieve Fort Pitt. At Bushy Run, the Delaware and Shawnee ambushed Bouquet. He was driven back and took up position on a hill that evening. The next day, the Indians resumed their attacks, having surrounded the English force as was done with

Edward Braddock in 1755. Bouquet had some of his companies feint a retreat and then struck the Indians in their flank, driving them off. He reached Fort Pitt and the next year advanced to the Muskingum River in Ohio, where the Indians sued for peace.

Another force went to relieve Fort Detroit. British Indian agent William Johnson's diplomacy was as valuable as the military victories, convincing the Iroquois to put pressure on the Delaware, Shawnee, and Seneca to end the war. By late 1764, the Seneca fell into line with their Iroquoian brethren in siding with the English, and the united tribes launched raids on the Delaware and Shawnee. In 1766, Pontiac accepted a peace treaty with Johnson at Oswego, New York. With the power of the Indians broken, western Pennsylvania and Ohio were open to settlement. To prevent further outbreaks of violence, the English government did continue restricting white settlement beyond the mountains. This restriction became a major cause of anger for colonists in the years prior to the outbreak of the revolution, in that many had been promised land for service in the French and Indian War.

Pope, John (1822–1892)

Union general in the American Civil War, loser at Second Bull Run, and a failure as a field commander. Pope was born in Louisville, Kentucky, on 16 March 1822. After graduating from the U.S. Military Academy at West Point in 1842, he was assigned to the topographical engineers. He excelled in combat in the Mexican-American War under Zachary Taylor, being brevetted first lieutenant at Monterrey and captain at Buena Vista. From 1849 to 1861, he was an army engineer and railroad surveyor in the American West.

Commissioned brigadier general of volunteers under John C. Frémont in Missouri on 14 June 1861, Pope quickly mobilized and achieved significant gains. He soundly defeated Sterling Price at Blackwater, Missouri, on 18 December; captured New Madrid, Missouri, on 14 March 1862; was promoted to major general on 21 March; and won an amphibious battle for Island no. 10 near New Madrid in the

Mississippi River on 7 April. He marched with Henry W. Halleck toward Corinth, Mississippi, in May and June.

Impressed by Pope's performance, President Abraham Lincoln called him east to take over the new Army of Virginia from George B. McClellan. Pope assumed command on 26 June and immediately alienated his men with his arrogance and insults. He also inadvertently raised Confederate morale with his harsh proposals for dealing with southern civilians. Hated by North and South alike, he soon rendered himself incapable of effective leadership.

Stonewall Jackson defeated Pope at Cedar Mountain, Virginia, on 9 August. Jeb Stuart raided his headquarters at Catlett's Station, Virginia, on 22 August and stole his uniform, dispatches, and notebook, thus providing the valuable information that Robert E. Lee needed to crush him at Second Bull Run. Jackson hampered his retreat toward Washington, D.C., at Chantilly, Virginia, on 1 September.

Lincoln relieved Pope of command on 2 September and reassigned him to the Northwest. He spent most of the rest of his career fighting the Sioux, until he retired in 1886. He died in Sandusky, Ohio, on 23 September 1892. John Pope is a prime example of an officer who does very well in school, is excellent at staff work, but finds himself out of his depth on the battlefield or in overall command.

Porkchop Hill (16–18 April 1953)

Scene of heavy fighting amid Korean War armistice negotiations. In an effort to gain leverage in the negotiations, the Communist Chinese launched a major attack on the thinly defended and otherwise worthless position. The weight of the attack fell on E Company of the 31st Infantry Regiment,

7th U.S. Infantry Division. By the early morning hours of 17 April, the Chinese had captured the hill, along with several men from E Company. At this point K Company, under Lieutenant Joe Clemons, was given the task of recapturing the hill. After a tough all-night fight, severely depleted K Company held shaky positions on the hill.

As a fresh Chinese attack began, the question of whether or not to reinforce Porkchop now became political. The whole matter boiled down to this question: Were American commanders willing to expend more lives over a worthless hill in Korea in order to demonstrate U.S. resolve in the negotiations? After much hemming and hawing among senior officers, Porkchop was eventually reinforced and held, but at great cost, and then a few months later finally abandoned. The battle was memorialized in the 1959 film *Pork Chop Hill*, starring Gregory Peck.

Port Arthur, Siege of (May 1904–January 1905)

The first major phase of the Russo-Japanese War. The conflict opened with a Japanese naval attack on Russian warships in Port Arthur, before any declaration of war by Japan. The siege of Port Arthur began in May 1904 with Japanese landings on the Liaodong Peninsula in China and the movement of Japanese troops northward through Korea and ended in early January 1905 with the capitulation of the weakened Russian garrison. For the Japanese, capture of the port would deny the Russian navy a warm water anchorage and thereby help secure the sea-lanes between the Japanese islands and the northeast Asian mainland.

Russian land defenses included a series of trench works around the town, a series of linked concrete forts about 4,000 yards outside the line of trenches, and then some outer works—fortified hills and other positions—beyond the forts. These defenses should have presented a formidable problem to the Japanese, but it did not seem that the Russians made the position as difficult as they could have.

The Japanese made a series of costly assaults. On 25 May 1904, General Oku Yasukata's frontal assault was thrown

back with heavy losses, but an effort to turn the Russian left succeeded. The Russians abandoned Nashan Hill and thereby conceded the port of Dairen to the Japanese. Throughout June, the Japanese prepared for the attack, and an indecisive Russian naval sortie failed. The Japanese army probed defenses in July and then in August and September made three unsuccessful efforts to penetrate defenses with heavy casualties.

In early October, the Japanese brought siege artillery that complemented efforts to mine Russian positions. In November, the Japanese concentrated on the weakened eastern defenses, and in early December they broke through at 203 Meter Hill, moved in artillery, and destroyed the Russian warships in Port Arthur harbor. Throughout December, the Japanese continued their attacks on northern defenses, and finally, on 1 January 1905, the hungry and weakened Russian garrison surrendered.

The Japanese suffered three times as many casualties as the Russians in the long, costly siege. Japanese commanders had favored mass attacks, in dense formations, at night. Such mass attacks actually demonstrated the defensive power of properly placed machine guns and supporting artillery, foreshadowing the carnage of World War I.

Portuguese-Castilian War (1369–1385)

War of Portuguese independence. Portugal grew out of Spain, and even when Portugal had emerged as a separate realm, its ruling houses still maintained close Spanish contacts and were very much involved in Spanish politics. Despite these connections, political changes led increasingly to an assertion of Portuguese nationhood totally separate from that of Spain. Two key events played a vital role in this process. One was the coming of the Black Death to Portugal in 1348 (with many subsequent outbreaks), initiating an era of agrarian crisis that undermined and then destroyed the old feudal landed order and turned Portugal into the largely commercial and maritime nation that it has been since. The second was the Portuguese-Castilian War of 1369 to 1385,

actually a series of separate wars, which ultimately decided the issue of Portugal's independence from Spain to Portugal's advantage.

The war had its origins in a dispute over succession to the throne of Castile. Claimants to the throne included the Portuguese king, D. Fernando I (r. 1367–1383), and Enrique de Trastámara (later Enrique II of Castile, r. 1369–1379), both descended from Sancho IV (r. 1284–1295) of Castile. To advance his cause, Fernando allied himself with Aragon, Castile's hereditary enemy, and with the Muslim king of Granada. Although most of Portugal was not directly affected by the first war (1369–1371), because Portugal remained the aggressor for the most part, it was nonetheless disastrous for the Portuguese. The peace, however, was not overly severe.

With few of the outstanding issues of the first war resolved, a second (1372–1373) and then a third (1381–1382) followed quickly. Although both were Portuguese wars with Castile, both were also part of the Hundred Years War. Fernando had renounced his claim to the Castilian throne in favor of John of Gaunt, son of the English king Edward III. John was married to an illegitimate daughter of the old Castilian king, who had been assassinated by Enrique in 1369. Enrique allied himself with France. Aragon vacillated between the sides.

This time Portugal was not spared, and central Portugal, as well as the extreme northwest, suffered major Castilian invasions by land and sea. During the second war, much of Lisbon was destroyed by Enrique because the city had outgrown its walls and a large part of it now lay exposed to attack. Fernando's English allies were nearly as destructive as the Castilians. During the third war, the Portuguese launched a naval counterattack, but the Portuguese fleet was nearly destroyed, and the Spanish returned again by sea to attack Lisbon.

One result of repeated Portuguese disaster was the growing unpopularity of the monarch, D. Fernando, and his consort Leonor Teles de Meneses, who identified closely with Portugal's great landholders. When D. Fernando died, his legal successor was his daughter D. Beatriz, married to Juan I (r. 1379–1390), king of Castile. The hated Leonor became the regent, and Juan, anxious to assert his claim to Portugal, invaded.

The result was a revolution. The master of Avis, the later João I (r. 1385–1433), representing maritime and commercial Portugal, took the lead in the war despite the fact that much of the interior of the country and its landed interests still remained loyal to D. Beatriz. The fortunes of the war varied, but Portugal won a number of important victories, including the Battle of Aljubarrota (1385), on the site now occupied by the Portuguese national cathedral at Batalha,

and ultimately forced the Spanish to withdraw. Although the final peace was not signed until 1432 and there were skirmishes as late as 1396–1397, the separateness of Portugal had been established.

Potemkin, Prince Grigory Aleksandrovich (1739–1791)

Russian general, statesman, and lover of Empress Catherine the Great (r. 1762–1796). Born September 1739 in Smolensk Province, Potemkin joined the horse guards in the mid-1750s. Promoted to junior lieutenant in 1762, his initial command, in the Izmailovsky Regiment, followed in 1766. Potemkin distinguished himself during the Russo-Turkish War of 1768–1774. After spending the first year of the conflict on the staff of Field Marshal Aleksandr M. Golitsyn and as an aide-de-camp to Field Marshal Peter A. Rumiantsev, he received a field command in 1770. Potemkin proceeded to participate in many of the Russian army's most important victories on the Danubian front, proving himself Russia's most effective cavalry commander and winning a promotion to lieutenant general.

Returning to St. Petersburg in March 1774, Potemkin spent two years as Catherine's favorite, a position bringing rewards and responsibilities, including the war college's vice presidency. Replaced as official favorite in 1776, he remained the empress's most trusted adviser while devoting himself to administrative work, serving as governor-general of New Russia, president of the war college, and head of the Black Sea Admiralty. Under his leadership, the war college sponsored reforms ranging from alterations in army uniforms to adjustments in the composition of large-scale commands, and the Black Sea Admiralty strengthened Russia's naval power in the south.

Following the outbreak of a new war against the Turks (1787–1791), Catherine appointed Potemkin, now a field marshal, supreme commander of Russian forces. Although Russia achieved victory and Potemkin's performance earned substantial gifts and rewards from the empress, Potemkin

was outshone by General Aleksandr Vasilyevich Suvorov, who won several critical victories. Potemkin died suddenly, in October 1791, en route to the Jassy peace conference.

Powell, Colin L. (1937–)

U.S. Army commander and first African American to hold the positions of national security adviser, chairman of the Joint Chiefs of Staff, and secretary of state. Powell was born on 5 April 1937 in Brooklyn, New York, to Jamaican immigrants. He found his future career path while attending City College of New York, when he enrolled in the Reserve Officers Training Command, where he eventually held the highest student leadership position of cadet-colonel. In 1958 Powell received his commission as a second lieutenant in the U.S. Army.

In 1963, Powell served his first of two tours in Vietnam as an adviser to the Republic of Vietnam's 3d Infantry Regiment. As an adviser, he came under fire for the first time during Operation GRASSHOPPER in the A Shau Valley. In 1965, Powell was promoted to major two years ahead of schedule. He returned to Vietnam in 1968 as the plans officer for the Americal Division. After earning his M.B.A. at George Washington University, Powell was given command of the 32d Infantry Battalion in South Korea. In 1974, he was sent to the National War College and later served a brief tour as brigade commander in the 101st Airborne Division. In a rare step, Powell was promoted to brigadier general from lieutenant colonel on 1 January 1979.

During this time, Powell served in a variety of political-military positions for two administrations. Powell came to the public's attention in 1987 when he was nominated as President Ronald Reagan's national security adviser at a time when the National Security Council was reeling from the Iran-contra scandal. Powell was rewarded with a fourth star after the Reagan administration ended, and he briefly took command of U.S. Army Forces Command (FORSCOM) before President George Bush nominated him to be chairman of the Joint Chiefs of Staff. It was as chairman that Powell led the armed forces and captivated a nation with his presence and style during Operation JUST CAUSE in Panama and the Gulf War. He retired from the military in 1993, and

in 2000 he was nominated by President-elect George W. Bush as secretary of state and was quickly confirmed.

Powell has been criticized for applying the "lessons learned" of Vietnam too rigidly, allowing Saddam Hussein to remain in power after his brutal invasion of Kuwait had been reversed, all in the name of avoiding a Vietnam-type "quagmire." Nonetheless, for perhaps most Americans of the time, he represented all that was right with the country, and he was so appealing that only his adamant refusal to run for office ended the "Powell for President" movement in 1996.

Powhatan War (1622, 1644)

A decade-long war against American Indian tribes in the Virginia colony that resulted in the first Indian reservation in North America. The English settlement of Tidewater Virginia brought people from two aggressive societies into contact in the early seventeenth century. With hopes of finding precious minerals and in expanding their empire, an English expedition founded Jamestown in 1607, constructing a wooden fort. At the same time, eastern Virginia was controlled by a confederacy of American Indians, numbering perhaps 10,000, under Powhatan. With initial contact, each side hoped to use the newcomers against traditional enemies, the English against the Spanish and the Powhatan Indians against rival tribes. A brisk trade developed: the English needed food, and the Powhatans wanted metal tools and weapons.

In the decade leading up to 1620, English settlements branched out up and down the James River. The colony's population was largely single and male and died young. Disease and starvation took a high toll on early settlers. Desperate for food, namely corn, the English were willing to take it forcibly if unable to trade for it with the Powhatans. By the 1620s, a tobacco boom swept Virginia, and this soil-depleting crop drove the British further inland in search of new land to cultivate. This period saw an aggressive expansion of English settlements as far west as present-day Richmond.

Powhatan died in 1618, just a few years after his daughter Pocahontas married an Englishman and left for London.

Powhatan's brother Opechancanough took over as head *werowance* (chief) and began to consolidate his control over various tribes such as the Mattaponi, Pamunkey, Appamatuck, and Chickahominy.

Realizing that the British demand for corn and land was insatiable, Opechancanough organized a strike to take the English out with one blow. The Indians planned a coordinated attack for the morning of 22 March 1622. Some settlements were forewarned, but others were entirely unprepared. Although successful in destroying some communities, the Powhatans could not fight a sustained war, and the English retaliated with raids on Indian towns and cornfields. Intermittent warfare continued for the next few years, punctuated by a few brief truces that never lasted.

English soldiers fought with matchlock muskets, accurate at ranges up to 30 yards. Musketeers were supported by troops armed with swords and pikes. The bow and arrows used by the American Indians had greater range and accuracy than the muskets, yet matchlocks became a highly prized item among them. Steel swords, shields, and weapons were also stolen from the English. After a decade of exhausting warfare, both sides agreed to a peace treaty in 1632.

English settlement expanded, and families increased the colony's population to 8,000 by 1640. Again hoping to eradicate the British swiftly, Opechancanough orchestrated another assault on 18 April 1644. Powhatan strength had never recovered from disease, warfare, and the poor crops of the previous decades. Brutal English counterattacks again destroyed villages and cornfields. In 1646, the Powhatans agreed to another peace treaty, establishing the first Indian reservations in what would become the United States. With the Indians crushed, colonial Virginia was free to expand to the west. The descendants of those who fought in the Powhatan wars still reside on these two reservations in Tidewater Virginia.

Prague, Siege of (1420)

Victory of Ján Žižka over Emperor Sigismund. The conflict in Bohemia between Catholics and the followers of the executed reformer, Ján Hus, became a civil war after the death of King Wenceslas IV, when his brother, Holy Roman Emperor Sigismund, claimed the throne over the objections of the Hussites. Supported by a papal bull denouncing his oppo-

nents as heretics, Sigismund entered Bohemia in May 1420, with a crusading army of 80,000, mostly Germans. He quickly captured Hradec Kralove (Königgrätz) and Kutná Hora and then marched toward Prague.

Responding to the entreaties of the Hussites in the city, the town of Tabor sent several thousand men under Hus's commander, Ján Žižka, to the capital. They defeated an army sent to block them. Under Žižka's direction, the Hussites strengthened the city's fortifications, built a watchtower on Vitkov hill, and put up barricades against Hradčany and Vyšehrad castles, which had fallen into Sigismund's hands. Unwilling to risk a direct assault on the city, Sigismund moved to blockade Prague. After capturing several surrounding towns, the crusaders crossed the Vltava River and approached Vitkov from the northeast on 14 July. Initially caught off-guard, Žižka led a counterattack up the south slope of the hill, surprising the crusaders in turn and driving them off the heights.

Though the losses to Sigismund's army were light, the Hussites' determination discouraged his hopes for a quick settlement of the war. After having himself crowned king at Hradčany, he abandoned the siege of Prague and sent the crusaders home. The victory at Vitkov saved the most important center of the Hussite movement and raised Žižka to prominence as the leading Hussite commander.

Preston (17 August 1648)

The decisive battle of the Second English Civil War, ending Charles I's hopes. Following the collapse in spring 1658 of negotiations between crown and Parliament, it emerged that Charles had reached a settlement with the Solemn League and Covenant that controlled Scotland. This revelation led to a resurgence of royalism and scattered risings in England and Wales. Accordingly, on 8 July 1648, a Scottish army of 3,000 horse and 6,000 foot under the command of James, the Duke of Hamilton, crossed the English frontier and marched to Carlisle, where they were soon joined by 3,000 English royalists. This force was the basis of the army that marched south, attempting to gather further support as they went. At the same time, Parliament's officers marshaled their forces and moved to intercept Hamilton.

By 16 August, Hamilton had 20,000 troops, primarily Scots, and neared Preston on the west coast of England, but

his men were tired, and their supplies were limited. With poor intelligence, Hamilton was unprepared for any serious opposition, and his men were strung out along the muddy roads into Preston. Skirmishing soon began as Oliver Cromwell's parliamentarians approached from the east (less than 9,000 men but primarily veterans). On the 17th, as rain poured down, Cromwell launched an attack against the disorganized Scots. Smashing through their lines, he forced Hamilton to withdraw. In the chaos, Cromwell's troops took the town, capturing much of the Scottish baggage train, taking 4,000 prisoners, and killing another 1,000. As night fell, although the fighting continued, so did the rain, and in the confusion the demoralized Scottish army retreated, having already abandoned most of its powder.

For all intents and purposes, this battle marked the end for Charles I's cause. Following this defeat, the beleaguered Scots were unable to provide any real assistance to the English royalists, and on 25 August Hamilton surrendered, with most of the remaining royalist strongholds in England quick to follow. What few forces remained in the field were quickly dispersed because after the disaster at Preston, it was diffi-

cult to find any who thought that Charles I's cause could continue.

Princeton, Battle of (3 January 1777)

A minor battle of the American Revolution, but one that appreciably raised American morale.

In the aftermath of the surprise attack on the Hessians (German mercenary troops allied with the British) at Trenton, New Jersey, on 26 December 1776, Sir Charles Cornwallis moved from winter quarters to attack General George

George Washington on horseback during the Battle of Princeton. (Library of Congress)

Washington. He first moved to Princeton, gathered some 8,000 men, and left several regiments there as a rear guard.

Washington faced a difficult situation, for he was chronically short of food and supplies, and the enlistments of many of his men would expire at the New Year. Retreat across the Delaware to Pennsylvania was not possible. Rather, Washington and the Americans continued on the offensive and once again surprised their enemy. Leaving behind 400 men who kept campfires burning, made noise, and acted as if the entire army were in place, Washington and the bulk of American forces silently slipped around the enemy and then moved north-northeast from Trenton and advanced on Princeton. Fortunately for the Americans, Cornwallis chose to wait until the morning of 3 January to attack, disregarding advice from subordinates to attack immediately on January 2.

On 3 January, the Americans attacked a British regiment that was marching to join Cornwallis; initially, it was a confused fight, and the British more than held their own. After the main American contingent and Washington arrived, the Americans won, but fearing dispersion and Cornwallis's pursuit, they seized what supplies they could and broke off the attack.

Thereafter, Cornwallis withdrew British forces to New Brunswick, New Jersey, while Washington and the Americans went into winter quarters in Morristown. This brilliant campaign of maneuver, beginning at Trenton, helped renew confidence in the American cause and in Washington as commander of the American army.

Prisoners of War

Persons captured either during military operations or as a consequence of military occupation. Technically, the term *prisoner of war* (POW) is of rather recent origin and has little in common with the people captured during or as a result of belligerent activities in earlier times. This is because the definition of POW relies on the principle of differentiation between combatants and noncombatants, which did not exist prior to the late nineteenth century.

In earlier times and especially antiquity, wars were mostly waged because of two reasons: to conquer new territories and their resources or only to rob these resources without permanently occupying the territory. The resources mainly were human ones, which means that the workforce was the single goal of the belligerent operation. Thus any persons captured during the operation, be they male or female, old or young, were regarded as having exclusively economic value and treated as slaves. Their lives were but part of the booty obtained in course of the operation. The Greek philosopher Plato stated that all those captured alive should be left to the victor's sole discretion as a "gift." That captivity was a very frequent fate in the ancient world is demonstrated by the Roman philosopher Seneca, who differentiated people not as slaves and free but as slaves and "not-yet-slaves." For the enslaved people, it was irrelevant if they were captured as soldiers or as simple inhabitants of the invaded city or territory. The only distinction made concerned the inhabitants of a fiercely defended town, who frequently were massacred as a deterrent for other cities.

This way of treating captured persons was not limited to the Greek and Roman cultures but merely mirrored a universal principle followed in ancient Egypt as well as medieval China, tribal Africa, and the pre-Columbian Americas. However, in certain cultures, it was also common to sacrifice the captured enemies on the altars of their gods.

Significant change was introduced by the Catholic Church in the Middle Ages, when in 1179 the Third Lateran Council prohibited the selling of Christians as slaves. From that time on, capturing people for the sole purpose of enslaving them was no longer acceptable. Instead, captives were released after their relatives had paid a certain ransom. This practice especially affected knights and later officers of noble ancestry, whose families could afford the large sums. As a consequence, the possibility of ransom payments offered a certain protection to the captured. However, those persons considered not profitable enough (footmen, members of the rural population) were either released or killed. Yet under the auspices of the church, many medieval treaties declared it inadmissible to kill women, children, peasants, and people of the church.

However, an entirely different attitude was held toward non-Christian enemies. Thus, it was still common either to kill or enslave non-Christian prisoners. During the Crusades, most Muslim soldiers were killed after having been captured by the Christian knights. Not until many knights themselves had fallen into the hands of their enemies did the system of sparing lives in favor of ransom payments also apply to Muslims.

The end of the Middle Ages brought important changes

in the way war was being waged: fighting became highly professionalized, with trained soldiers, officers, and mercenaries battling with each other, while the rest of the population left behind only bore the task of supplying the armies in the field. A differentiation between captured soldiers and “civilians” slowly became common. Only soldiers were specially treated as prisoners. However, this change did not cause an improvement in the situation of the ordinary soldier, who had no ransom to offer for his life or release. Therefore, it still was common to kill prisoners, but sometimes captors would hold back to ensure that the enemy would not kill those it had captured. Sources published in the famous seventeenth-century collection of military statutes, the *Corpus Iuris Militaris*, suggested, however, that it was the generals’ Christian obligation to treat their prisoners with mercy and kindness. The exchange of prisoners between the belligerents according to a certain mathematical ratio (for example: one lieutenant equaled six soldiers, and one general equaled 3,000 soldiers) became more frequent during the following centuries and was very much consonant with Enlightenment rationality and precision.

In the nineteenth century, the Industrial Revolution and the French Revolution concept of mass citizen armies combined to cause many more soldiers to be captured in wartime. These prisoners were not exchanged but detained until the end of the hostilities to ensure that they would not fight again. The American Civil War and the Franco-Prussian War (1870–1871) are the most important examples of this new phenomenon. Suddenly, it became necessary to keep tens of thousands of prisoners in camps until the end of the war, which in the case of the American Civil War could be as long as four years. The countries’ local infrastructures were often overwhelmed by the situation, and consequently a large percentage of prisoners died from starvation or lack of medical treatment.

But the nineteenth century was also a time of rising humanitarian sentiment, and the midcentury decades saw the first efforts to regulate the treatment of prisoners by international legal instruments. Although the 1864 Geneva Convention applied only to sick and wounded soldier personnel falling into the hands of the enemy and refrained from calling these persons “prisoners,” the well-known “Lieber Code” issued by the U.S. Army in 1863 introduced the term *prisoners of war* and framed it by a legal definition. Articles 56 and 76 of the code prohibited their mistreatment and imposed the obligation to supply them with food. Yet this was an internal statute of the United States and by no means an internationally binding treaty.

Such an international instrument was not ratified until 1899, when the Hague Peace Conference adopted the Hague Convention (II) Respecting the Laws and Customs of War on

Land. In its annex, Articles 4 to 20 dealt with the treatment of prisoners of war, taking as an example the regulations of the Lieber Code and the 1874 Brussels declaration (which also had not had the status of a treaty).

The experiences of World War I clearly demonstrated the shortcomings of the Hague Convention’s provisions on prisoners. Initiated by the International Committee of the Red Cross, a new Geneva Convention was adopted by the community of states in 1929. This treaty supplemented rather than replaced the articles laid down in the Hague Conventions and proved invaluable for countless thousands of prisoners during World War II. However, the massive mistreatment of prisoners of war in Germany, Japan, and the Soviet Union clearly revealed even this convention’s limits. In particular, the range of persons qualifying as POWs was too narrow to cover adequately the reality of twentieth-century war.

As part of a large-scale revision of the laws of warfare, the 1949 Geneva Convention greatly enlarges its predecessors but again proved to be far from perfect. Both the Korean War and the Vietnam conflict resulted in legal problems regarding the repatriation of prisoners against their will at the conclusion of hostilities. Additionally, guerrilla warfare brought forward new definitions of combatants that were different from the traditional ones tailored to the uniformed soldier operating in organized units. To entitle these belligerents to the protected status of prisoners of war, the 1977 Geneva Protocol I supplemented the 1949 convention but remains highly controversial.

Propellants

Compounds used to move a projectile from the firing device to the target. Originally, gunpowder was used for this purpose. The cannon was a smoothbore, muzzle-loading weapon, firing solid round shot. Manufacturing techniques were extremely simple, and the explosive force of gunpowder is limited, which meant that until the late eighteenth century, gunners (and musketeers) were faced with problems of accuracy and consistency. One of the biggest prob-

lems was “windage,” caused by gaps between barrel and projectile as the projectile traveled along the barrel after firing. These problems were partially solved with the invention of rifling and driving bands.

Gun propellants are mostly manufactured in powder form. They are low explosives, providing a developing thrust for the projectile as it travels along the barrel. In the early days of gunpowder, the consistency of the mixture of saltpeter, charcoal, and sulfur was difficult to control, but with the advent of nitrocellulose and similar powders, manufacturers were able to increase quality.

The problem with any propellant is to make it burn completely. Cannon would often produce a large muzzle flash, which was propellant burning after the projectile had left the bore. Modern rifles and guns still exhibit this problem, but to a lesser extent. The invention of smokeless powder also made the firing task easier, especially in an enclosed turret.

To ensure that the maximum propellant is burned out while the projectile is still in the barrel and therefore subject to the pressure caused by the propellant burning, powders are now manufactured in specific forms, with numerous holes pierced through each piece of propellant. These holes allow burning to proceed equally inside the powder grain as well as on the surface.

Manufacturers now produce single-base gun propellants from nitrocellulose with the addition of stabilizers and flash reducers. The powder is pressed into cylindrical or other shapes with the burning holes scientifically calculated to ensure maximum efficiency. These charges are assembled in varying weights for small-, medium-, and large-caliber guns.

Multibase propellants such as ballistite are used to make mortar increments. Just as guns do, mortars vary their range partly by changing the elevation of the gun or mortar barrel and partly by the amount of propellant charge used. Mortar increments are added externally to the mortar bomb and are fired by the basic charge, which is fitted to every mortar bomb. Some large-caliber weapons also use ballistite, which is prepared in grains, sticks, and multiperforated kerfed stick. Spherical powders in both single- and double-base (of nitrocellulose-nitroglycerine) are produced for small- and medium-caliber weapons, and some mortar increments are also made this way.

Until the late twentieth century, it was normal for a projectile to be propelled by a charge loaded into the weapon inside a cartridge case. Smaller-caliber ammunition was prepared as fixed ammunition, with bullet/projectile and propellant united in manufacture. Larger weapons, or those that fired more than one type of projectile (high-explosive alternating with smoke, illuminating shell, and solid shot, for instance), loaded the projectile first and then the cartridge case containing the required amount of propellant.

Nowadays, caseless propellant is coming into general use, something that has been normal as bagged charge in naval guns since the mid-nineteenth century. These prepared propellant charges are designed to be totally self-consuming, leaving no empty shell case to be ejected.

Artillerymen have always been inventive by nature and have always tried for ever-longer ranges. The concept of rocketry appealed to them, and they adapted the idea of rocket propulsion by producing the base-bleed shell. These projectiles have a small rocket-type motor at their base, which is ignited on or after firing. Fueled by powder, the rocket-assisted shell has increased ranges quite significantly.

Rockets are fueled with either solid or liquid fuel. The solid fuel rocket has a warhead, a powder chamber and some means of igniting the propellant charge, and a shaped exhaust system to allow concentration of the expanding gases at the rear of the rocket. Early solid fuel rockets included the antitank rockets of World War II, fired from rails underneath aircraft wings. Aiming these rockets was done by eye, and they were essentially fire-and-forget weapons, having no internal guidance system or course correction mechanism. Modern solid fuel rockets are far more sophisticated, however, and have onboard guidance systems as well as sensor systems to aid target identification and even target selection.

Liquid-propelled rockets came of age with the German V-2 rocket. The previous venture, the V-1, was merely a pulse-jet-propelled semiaircraft, but the V-2 was a fully fledged ballistic missile. It was fueled by a mixture of liquid hydrogen and alcohol and achieved a range of more than 200 miles. It was a free-flight rocket, having no course correction capability.

Modern free-flight rockets have their ancestors in the weapons of the German and Russian armies during World War II. The German *Minenwerfer* and the Russian “Stalin Organ” were very simple solid fuel rockets with short ranges, but their effect was devastating because of the concentration of fire they could achieve. Area weapons such as these are now represented by the Multiple Launch Rocket System, which had such a destructive effect during the Gulf War.

Solid fuel rockets are preferable to liquid fuel rockets because of the high volatility of liquid propellants and because handling the concentrated acids used for some ballistic missiles is extremely hazardous. The main reason to use liquid fuel is that such rockets can be easily fueled when needed, for solid powder propellants have a habit of settling over time and deteriorating in performance.

Psychological Operations

The use of psychology and propaganda by military units to persuade target audiences to adopt at least some of their views and possibly modify their behavior. The term *psychological operations* has been preferred since the Korean War in that target audiences might not be actually enemy personnel.

The employment of psychological operations goes at least back to biblical times, as when the Hebrew commander Gideon stampeded a numerically superior Midianite force by the sudden midnight display of torches accompanied by shouting, which gave the impression of a much larger force. In more recent times, American rebels were able to garner thousands of British and Hessian defectors by the use of leaflets promising free land in the New World. These leaflets were almost a textbook case of the basic principles of effective psychological operations: (1) know your target audience, (2) make believable promises, (3) do not mock or caricature your targets, (4) keep it simple but official-appearing, and most important, (5) do not lie. The Americans knew that for the British the very term *land-owning class* meant the rich, and it was obvious that the Americans had plenty of land, if nothing else. The leaflets decried the conditions in the British army, did not denounce the enemy, and were brief and to the point, sometimes bearing the name of George Washington; and defectors were indeed given land.

Nonetheless, such eighteenth-century efforts were isolated and limited. But the coming of the Industrial Revolution, with its railroads, telegraphs, cheap paper, and fast, powered printing presses, made large-scale psychological operations possible for the first time by World War I.

Here, the Allies conducted much more effective operations against the morale of the German army than vice-versa. Allied leaflets depicted the German soldier as a decent fellow who would be promptly returned to a better Germany at the end of the war, whereas the Germans' propaganda emphasized the "We Shall Crush You" theme, more effective to the already converted on the German home front than to enemy soldiers. One of the most effective American leaflets simply listed the weekly rations of the U.S. doughboy. The German target soldier needed but to compare such bounty with his own diet of mostly *kommisbrodt* (a rough army field loaf). No mention of the kaiser, "Huns," or the "Rape of Belgium," just a simple "Are You Hungry?" theme. Many German prisoners asserted that this one leaflet was primarily re-

sponsible for pushing a disgruntled, hungry soldier over the line to the actual act of wartime desertion. Another U.S. Army leaflet used the "Brave German Soldier, Your Government Has Lied to You" theme, counting up the actual 1 million or so U.S. troops already in France, compared to the minuscule number that the German High Command had publicly insisted would ever make their way through the U-boat-infested Atlantic. The German High Command first stupidly forbade their troops to read the leaflets, which simply whetted the soldiers' curiosity; then offered to pay for each "lying" leaflet turned in; and then simply gave up in despair. After the war, both the chief of staff of the German army and Adolf Hitler himself praised Allied propaganda.

World War II was in many ways a repetition of World War I on the propaganda front, except on a much larger and broader scale, but with the Germans and the Japanese still greatly inferior in their use of psychological weapons. Both Axis powers denigrated the Allied soldier as cowardly, weak, and misled. Their use of stilted, archaic language undermined any remaining validity of their leaflets. ("The fraud Rousevelt, hanging the President Election under his nose and from his policy ambition worked not only poor NIMITT but also MACCASIR like a robot, like this, WHAT IS PITY!!") A Japanese "sex" leaflet somewhat spoiled the effect with its last line: "Then, under the beautiful tropical moon, only DEATH awaits you, bullet hole in your guts . . . organizing death!" Actually, such "sex" leaflets were very popular with Allied troops, but for their explicit graphics, certainly not for their clumsy "political" messages, and they generated a brisk souvenir trade. German leaflets used less egregiously mangled syntax and language ("Well, what about the blisters *at* your feet?") but still could not refrain from clumsy, "un-American" phraseology ("Judeo-Bolshevik war-mongers"). That said, it should be pointed out that Axis radio propaganda was quite professional, if for no other reason than that its originators had the wit somehow to obtain the latest in popular American music, thus ensuring that "Tokyo Rose" and "Axis Sally" were widely listened to, if not taken seriously.

The garnering of prisoners of war is not the main intent of psychological operations; the goal is rather the weakening of morale. But Allied psywarriors did interview tens of thousands of German and Japanese troops for their reactions to their products. Few enemy soldiers admitted that Allied leaflets talked them into surrender, but many did say that they did adversely affect their morale. Whatever the value of the opinions of troops in the hands of their enemies, it is difficult to argue against the opinions of the Third Reich's hierarchy. Almost without exception, top Nazi and military officials took Allied psywar very seriously and (privately) gave it high praise. German propaganda minister Joseph Goebbels fulminated publicly against the "printed filth" composed by

the “hireling Jewish scribes of Churchill and Roosevelt.” At least one Nazi publication, *The Secret Weapon of the Enemy Is at Work*, warned all Germans to turn in any of the enemy’s “lying filth” (presumably after it had been carefully read).

In the Pacific, the United States bungled badly at the start of the conflict. One leaflet displayed the words in Japanese and English, “I surrender.” Wondering why this leaflet seemed to have no effect on the enemy, American psywarriors contacted Japanese Americans (in their internment camps) and got their answer. Japanese soldiers do not surrender; it is considered a fate literally worse than death. But “I Cease Resistance” or “I Take the Honorable Course” might have done better. Still, far fewer Japanese troops surrendered than did Germans (and many of the “Japanese” defectors were actually Koreans or Taiwanese), but those who did “cease resistance” proved invaluable. Being “dead men” as far as their homeland and families were concerned, they were willing to point out their former comrades’ strongholds, give over information to Allied intelligence personnel, and generally cooperate in any way they could. But, again, the morale of the enemy was more important a target than actual surrendered troops, and Allied leaflets emphasized the Japanese army’s indifference to its wounded (“Grenade Medicine”) and the horrific casualties suffered by Japanese troops in the Philippines and in Burma and held out hope for a better life for Japan after the war. (This attitude was in distinct contrast, of course, to civilian propaganda on the American home front, which depicted the Japanese as bats, slugs, or myopic morons and emphasized America’s duty to “Slap the Jap from the Map!”)

The Korean War was the first “ideological” war for the United States, a battle between communism and democracy. On the battlefields, the United Nations (UN) Command rarely denounced communism or glorified capitalism or freedom but rather focused on the individual Communist-led soldier and his problems. Some leaflets cleverly played upon the differences between the Chinese and the Russians, with one map graphically contrasting China’s vast expanse of old with the lands lost more recently through the notorious “unequal treaties”—lost to the Russians, not to “imperialist” Americans.

Once again, enemy propaganda to American and allied troops was nearly ludicrous in its language barbarisms and political tangles. But some showed commendable wit: “Use Your Head Soldier—If You Don’t Want to Lose It!” (e.g., get out of the war); “Old Soldiers Never Die—But Young Ones Do”; “You Risk Your Life—Big Business Rakes in the Dough”; and (the best of the lot) “Leave Korea to the Koreans!” But the greatest Communist propaganda coup was their dissemination of the myth of the “brainwashing” of certain American POWs to favor communism and even to commit treason

and of “collaboration” in the camps by a majority of those prisoners. Over the years, the documented rebuttals have never caught up with the unsupported assertions.

The great propaganda coup for the West in the Korean War was the refusal of some 22,000 Communist prisoners of the UN to return to their homelands. But here, again, the mere 22 U.S. captives of the Communists who refused repatriation seemed to receive the most publicity, particularly in the United States. (The fact that all of these defectors eventually returned to their capitalist hells was very rarely noted.)

In the Vietnam conflict a decade later, the Communist side directed its psychological operations as much at its enemies’ home fronts as against its troops in the field. Propaganda directed to the Republic of Vietnam (South Vietnam) emphasized that the communist Vietcong was really a group of anti-imperialist freedom fighters who wanted nothing more than an independent and united Vietnam. The same theme played to receptive audiences in the United States, along with the theme that Americans were committing industrial-scale atrocities.

But in the field, it was a different story, as sophisticated and culturally aware American and South Vietnamese psyops garnered some 100,000 lower-level Vietcong cadre over 10 years in the Chieu Hoi (Open Arms) program. Once again, U.S. psyops concentrated on the enemy soldier, on his miseries in the field, his longing for his home village, and the horrors of modern warfare. A particularly clever leaflet illustrated President Richard M. Nixon’s and Chairman Mao Zedong toasting each other during the former’s unprecedented trip to Communist China. “The Mad Bomber of Hanoi” being feted by the “Elder Brother” of Asian communism! (“So now what are you fighting for?”) No matter; the successful Communist strategic propaganda to the American home front and to the outside world is what is remembered to this day.

In the Gulf War (1990–1991), the coalition forces ranged against Saddam Hussein brought psychological operations to a fine art. Thousands of copies of the video entitled “Nations of the World Take a Stand” were distributed throughout the Middle East and in Baghdad itself. The message: “Your wicked leader, Saddam, is leading your beloved nation to ruin. We have no quarrel with the Iraqi people.” At the strategic level, the Iraqi command was fooled by a well-orchestrated campaign of “disinformation” in the coalition media that emphasized the likelihood that the anti-Saddam forces would attack from the sea. They thus fell victim to the coalition’s left-hook, cross-desert offensive. The “Arab Feast” leaflet, drawn up by the king of Saudi Arabia’s personal illustrator so as to avoid any “alien” look, showed “brother Arab” troops inviting surrendering Iraqi soldiers to a sit-down feast—complete with bananas, unobtainable because of the coalition blockade. More ominous was the “B-52” leaflet that

warned Iraqi soldiers: “You Cannot See This Bomber, You Cannot Hear It, but You Will Know When It Comes.” The next such leaflet was addressed “To the Survivors of the Iraqi —th Division: How Many Times Must You be Bombed Before You Get the Message?” Loudspeaker teams talked terrified Iraqi soldiers out of their bunkers and directed displaced civilians to the nearest shelter.

The dissemination of leaflets, always a weakness in earlier conflicts (leaflet “shoveled out” of an airplane tended to fly all over the cabin, fouling control cables and distracting the flight crew), were replaced by pinpoint drops using “hundred-mile-an-hour tape,” and the leaflets themselves were carefully cut so that they could autorotate into a confined area. Helicopter-mounted loudspeakers replaced the nearly unintelligible aircraft-mounted speakers of previous conflicts, and Arabic-language tapes could be made in professional studio conditions and then broadcast in the field with good fidelity. The vast numbers of surrendering Iraqi troops waving safe-conduct passes gave vivid testimony to the effectiveness of coalition psyops.

In the former Yugoslavia, North Atlantic Treaty Organization (NATO) psychological operators faced a different challenge, civilian target audiences. American psyopers came in early with AM radio facilities, only to be confronted with FM local stations fully as developed as anything in the United States. NATO peacekeepers had to adapt to an audience that was as aware of Michael Jackson as of Slobodan Milosevic. Thus, instead of simple “Be Careful of Unexploded Mines” leaflets or radio and television messages, American psyopers contracted in the United States for a Superman comic book that much more vividly illustrated the dangers of unexploded ordnance to young people, eventually saving lives and limbs by the hundreds. Messages on soccer balls, pens, buttons, and newspapers drove home similar messages. But whether such effective psyops had any lasting ameliorative effect on historic Balkan ethnic hatreds is questionable.

As a result of the success of psychological operations in the former Yugoslavia and in the Gulf War, psychological operations are becoming an increasingly valued part of the armies of the developed world. But the principles of successful psywar have changed little, if at all, since the time of Midian or George Washington.

Ptolemy I Soter (c. 367–283 B.C.E.)

Alexander's general, king of Egypt, and founder of the Ptolemaic dynasty. Born in Macedonia in c. 367 B.C.E., Ptolemy achieved the rank of general under the leadership of Alexander the Great. After Alexander died in 323 B.C.E., his empire fragmented, with Ptolemy ruling Egypt and Libya. Legitimizing his position as successor by kidnapping the body of Alexander and erecting a lavish tomb in Alexandria, Ptolemy then successfully defended his territory against other Macedonian rulers and in the process gained control over Cyprus, Cyrenaica, and Judea.

While Ptolemy I solidified his position, three of Alexander's generals fought for control of the whole empire. Antigonus I attacked Seleukos I, the ruler of Babylon, but was defeated at Gaza in 312 B.C.E. Antigonus's son, Demetrius I, defeated Ptolemy I off the coast of Cyprus before laying siege to Rhodes in 304 B.C.E. Although Ptolemy lost Cyprus, Demetrius failed to capture Rhodes with 30,000 troops and the use of siege towers. In celebration of the victory, Ptolemy ordered the construction of the Colossus of Rhodes from materials abandoned by Demetrius after the siege. That same year, Ptolemy declared himself king of Egypt, establishing the Ptolemaic dynasty that lasted until Egypt became a Roman province upon the death of Cleopatra VII in 30 B.C.E.

In 301 B.C.E., Antigonus died in battle fighting against Seleucus I and Lysimachus. Ptolemy and Lysimachus joined forces against Demetrius, who had conquered Macedonia and ruled Greece. Two years after Demetrius's defeat in 285 B.C.E., Ptolemy abdicated the throne to Ptolemy II, his son by Berenike. He died in his sleep in 283 B.C.E. During his lifetime, he succeeded in creating a thriving capital at Alexandria, building and expanding the collection of ancient manuscripts of the renowned library of Alexandria, and constructing the lighthouse of Alexandria, one of the seven wonders of the ancient world.

Pugachev's Revolt (1773–1774)

Largest popular rebellion in Russian history before the twentieth century. Named for its instigator, Emelian Pugachev (1726–1775), the revolt erupted from tension between the Russian government and the Yaik Cossacks. Living along the Yaik River in the plain between the Ural Mountains and the Caspian Sea, the Yaik Cossacks were a frontier people who lived by fishing, herding, and salt production. Since the 1500s, they had fought a losing battle to preserve their independence against the encroachment of the Russian state.

During the eighteenth century, especially the opening decade of Catherine the Great's reign (1762–1796), the state's infringement upon Yaik independence produced resentment within the Yaik community. By the early 1770s, the Yaik Cossacks were ready to explode.

Discontent became open rebellion when Pugachev, a Don Cossack by birth and deserter from the Russian army, arrived in August 1773. Claiming to be the emperor Peter III (1762), who had been deposed and murdered 11 years earlier, Pugachev invited the Cossacks to help him reclaim power. Promising freedom and a special place in the Russian state, the "Pretender" quickly won the Cossacks' support. On 17 September, Pugachev and his followers attacked Yaitsk, capital of the Cossack community, initiating what became the largest popular rebellion Russia had yet experienced.

Once under way, the revolt spread rapidly, engulfing western Siberia, the Ural Mountains, and the Middle Volga River valley, as it attracted support from a variety of disaffected social groups, including the non-Russian Bashkirs, ascribed peasants, Old Believers, and private serfs. Each of these groups held specific grievances against the existing political and socioeconomic order and saw in Pugachev their liberator.

Undisciplined and poorly armed, Pugachev's motley armies proved no match for Russian army regulars, who arrived in force in December 1773 and January 1774. Winning major victories at Tatishchev (22 March), Ufa (23–24 March), Kazan (12–13 July), and Tsaritsyn (25 August), government troops crushed the rebellion and forced Pugachev and 300 of his followers to flee.

On route to Yaitsk, a small group of Cossacks, to save themselves, seized the "Pretender" and handed him over to government forces on 15 September. Transferred to Moscow, Pugachev was tried by a special court, which found him guilty of several crimes and sentenced him to death. Public execution followed on 10 January 1775. To wipe away the memory of the revolt, Catherine renamed the Yaik Cossacks, the Yaik River, and the city of Yaitsk the Ural Cossacks, the Ural River, and Uralsk. These measures could not, however, erase the memories of Russia's rulers, who—at least until

the mid-nineteenth century—lived in fear of another Pugachev revolt.

Pulaski, Count Kazimierz (1747–1779)

Polish revolutionary who fought in the American Revolution. Born on 4 March 1747, in Podolia, Poland (in present-day Ukraine), Pulaski became a leader of the Confederation of Bar, a revolt against Russian control of Poland. Following the failure of the revolt, he traveled to France, where in December 1776 in Paris, he met Benjamin Franklin, the American ambassador, who convinced him to join the American colonists in their fight against Great Britain. In 1777, he was commissioned a colonel in the Continental army, and as a result of his distinguished service at the Battle of the Brandywine (where he served as Washington's aide-de-camp), he was appointed chief of cavalry and promoted to the rank of brigadier general. In 1778, with the permission of the Continental Congress, Pulaski organized an independent combined-arms unit of cavalry, infantry, and artillery, known as the Pulaski Legion. In 1779, Pulaski and his legion were ordered to South Carolina to support Major General Benjamin Lincoln. After helping to defend Charleston, South Carolina, against a British attack in May 1779, Pulaski and his legion joined with Lincoln and a French force, who were planning to besiege Savannah, Georgia. In an attack on 9 October 1779, he was mortally wounded and died two days later aboard the *Wasp* en route to Charleston. He was buried at sea.

Punic Wars (264–146 B.C.E.)

In 264 B.C.E., the first of three wars broke out between the Roman Republic and the North African sea power Carthage.

An epic struggle for control of the western Mediterranean ensued.

The First Punic War (264–241 B.C.E.)

Messana (Messina), Sicily, threatened by the Greeks of Syracuse, appealed for help first to the Carthaginians, who garrisoned the city, and then to the Romans, who in turn expelled the Carthaginians. The Carthaginians besieged Messana but withdrew to Syracuse in the face of a Roman army. The Romans besieged Syracuse, and the city switched sides. Sicily was divided into Roman (the eastern part) and Carthaginian (the western part) possessions.

After two seasons of campaigning, the Romans realized they could not defeat the Carthaginians without challenging them at sea. In the winter of 261–260 B.C.E., the Romans finally built a fleet, arming the ships with marines and boarding devices rather than a ram. In 260 B.C.E., at Mylae, the new technology proved itself, and the Carthaginians, relying on intricate ramming techniques, were badly beaten.

The war in Sicily remained undecided, and the Romans invaded Africa. A Carthaginian fleet was defeated at Ecnomus in 256 B.C.E. The Roman campaign in Africa was successful for a time, but under the leadership of the Spartan Xanthippus, the Roman army in Africa was destroyed by the Carthaginians. The fleet evacuating the survivors was destroyed by a gale in 255 B.C.E.

Notwithstanding Carthaginian control of coastal waters, the Romans remained successful in Sicily. They captured Panormus (Palermo), and in 251 B.C.E., a Carthaginian force was decisively defeated, leaving the Carthaginians without a field army in Sicily. However, the remaining Carthaginian strongholds could not be taken. In 249 B.C.E., the Romans were severely defeated near the city of Drepana, and another fleet was lost on the south coast of Sicily.

In 247 B.C.E., Hamilcar Barca was sent to Sicily to take command of the fleet. He landed near Panormus and, from the nearby coastal height of Heircte, initiated a guerrilla war on land. He raided the coasts of southern Italy to pin down enemy forces and incite rebellion against Rome. When this strategy was ineffective, Hamilcar captured Eryxin in the vicinity of Drepana under cover of darkness (244 B.C.E.). From there, he continued his guerrilla war. However, in 241 B.C.E. the Romans defeated the Carthaginians at sea near the Aegeates Islands. Forced into a peace treaty, Carthage had to give up Sicily.

Rome had wrested the island of Sardinia from Carthaginian hands (238 B.C.E.), taking advantage of a mercenary revolt and subsequent war in Carthage (247–231 B.C.E.). To compensate for their loss, the Carthaginians started to extend their Spanish possessions. Initially under the com-

mand of Hamilcar and afterward under his son-in-law Hasdrubal, the Carthaginians conquered a large part of the Iberian Peninsula. In 220 B.C.E., Hamilcar's son Hannibal was chosen by the army to be its commander. Initially, he set out to subjugate the northern tribes of Iberia, but soon he would turn his eyes upon Rome.

The Second Punic War (218–202 B.C.E.)

In 219 B.C.E., Hannibal besieged Saguntum (Sagunto) in Spain, which turned for help to Rome. The Romans accused Carthage of breaking previous agreements, and although Rome did nothing to save Saguntum from capture (218 B.C.E.), Rome declared war.

In 218 B.C.E., Hannibal marched over the Pyrenees, and having evaded Publius Cornelius Scipio's army near the Rhone River, he marched over the Alps into the Po Valley, where he defeated the Romans near the river Trebia (218 B.C.E.). In 217 B.C.E., he destroyed a Roman army at Lake Trasimene in Etruria (Tuscany) and then won his most brilliant victory (216 B.C.E.) at Cannae in Apulia, completely wiping out two consular armies in one stroke. In reaction, Rome's age-old ally Capua (near Naples) switched sides, as others in Italy did later. Following the advice of Fabius Maximus Verrucosus, the Romans dogged Hannibal's footsteps, recapturing the towns he had taken, harassing his lines of supply, but never facing him in a decisive battle.

After Scipio failed to intercept Hannibal at the Rhone River, he sent his army to Spain under the leadership of his brother Gnaeus Scipio. Rejoining it after the Battle of the Trebia, he attacked the Carthaginians in northern Spain. In 215 B.C.E., the Scipios defeated the Carthaginians at Ibera (215 B.C.E.). By 211 B.C.E., the Carthaginians were pushed back far beyond the Ebro River, and the Scipios decided to attack their basis of power in southwestern Spain. However, attacked by three armies, both Scipios were defeated and killed.

In 214 B.C.E., Syracuse had broken its alliance with Rome and went over to the Carthaginians. Under the command of Marcus Claudius Marcellus, the Romans stormed the city (213 B.C.E.). The defenders were assisted by the machinery of the scientist Archimedes. A lengthy siege ensued, combined with campaigning against Carthaginian troops and numerous hostile towns. In 211 B.C.E., Syracuse was taken, and by 210 B.C.E., Sicily was entirely under Roman control. Besides the overseas expeditions to Sicily and Spain, the Romans also campaigned in Sardinia and Illyria (Albania).

After the secession of Capua, the war in Italy had been mainly fought in Campania. Continuing their delaying strategy, the Romans kept in the vicinity of Hannibal's army, avoiding direct battle. In 213 B.C.E., the Romans besieged Capua. The citizens held out for years, but Hannibal could

not relieve the city. As a last resort, he marched to Rome but eventually retreated into Apulia. Capua surrendered in 211 B.C.E., and with Campania secured, the Romans followed Hannibal and continued the war in southern Italy.

In 210 B.C.E., Publius Cornelius Scipio Africanus Major, the son of Publius Cornelius Scipio, who had died the year before, was sent to take command in Spain. In 209 B.C.E., he captured Cartagena, Carthage's most important city in the peninsula, and the next year, he defeated Hannibal's brother Hasdrubal at Baecula (Bailen). Hasdrubal escaped with part of his army and marched to Italy to reinforce his brother. The Romans assembled a large force, intercepting and defeating Hasdrubal at Metaurus Valley (207 B.C.E.). Hannibal retreated into Calabria and remained there until his return to Africa (202 B.C.E.).

Scipio continued the war in Spain successfully, defeating the Carthaginians at Ilipa (206 B.C.E.) and forcing them to evacuate Spain. In 205 B.C.E., Scipio landed in North Africa and defeated the Carthaginians at the Great Plains (203 B.C.E.), whereupon Hannibal was recalled from Italy. At Zama (202 B.C.E.), Hannibal was finally defeated, and Carthage surrendered. As a result, Carthage lost all its overseas possessions and most of its African empire. Its fleet was limited to 10 ships, it was not allowed to make war without Rome's consent, and it was tributary to Rome.

The Third Punic War (149–146 B.C.E.)

From about 170 B.C.E., Massinissa, king of the neighboring Numidians, encroached upon Carthaginian possessions. Because he had been an important ally of Rome during the last stages of the Second Punic War—and possibly because of resentment, fear, and envy of Carthage's riches—Rome permitted Massinissa's encroachment. In 150 B.C.E., the Carthaginians assembled an army, marched to meet the Numidian king, and were defeated.

By attacking the Numidians, the Carthaginians had broken their treaty with Rome, and the Romans sent an army to Carthage. The city surrendered but resisted Roman demands that the population move inland and that the city be destroyed. The Romans besieged the city unsuccessfully because of incompetent command.

In 147 B.C.E., Publius Cornelius Scipio Aemilianus, the adopted grandson of Scipio Africanus Major, was chosen as consul and sent to Africa. Scipio invested the city completely by sea and by land, and in 146 B.C.E. the city was taken after fierce fighting. Carthage was pillaged and razed, and the surviving citizens were sold as slaves.

Pusan Perimeter (August–September 1950)

United Nations Command final defensive lines along the Naktong River and the farthest advance of the North Korean invasion. By early August 1950, General Walton Walker was arranging for the defense of the most vital port of Pusan in southeastern Korea, essential to the support of the large-scale introduction of U.S. armed forces onto the peninsula. The U.S. 24th Division had sought to delay the North Korean advance down the western plain, while Republic of Korea (ROK) units fought a series of delaying actions in the more mountainous east side of the peninsula. Meanwhile, other units arranged for the defense around Pusan.

Initially, the Pusan perimeter was the Naktong River on the west and a northern line stretching eastward from Yongdok. Walker waged a flexible and aggressive defense. He used interior lines of defense to shift forces around and the U.S. 24th Division as a reserve to blunt North Korean attacks and to maintain the perimeter. He engaged in spoiling attacks and was able to blunt the initial greater armored strength of the enemy. Meanwhile, the North Koreans may have weakened their attack by assaulting too many objectives (including taking all of the southwestern plain while they were still assaulting Pusan), considering their limited forces.

From about 27 August through 10 September, the North Koreans attacked the perimeter. They had little success in maintaining bridgeheads across the Naktong River in the American sector of defense; they were able to push the ROK defenses about 10 miles south, but the South Koreans did not break, and the defense line held. Walker had maintained this defense, while General Douglas MacArthur diverted forces coming from the United States and the Pacific and even removed some battalions from Pusan to put together the two-division assault force for the Inchon invasion.

The North Koreans had their difficulties. Allied air power had quickly destroyed the small North Korean air force and then turned to Communist armor, truck traffic, and the road and rail communications from North Korea to the south,

mostly on the western side of the peninsula. North Korean units besieging Pusan depended on a long supply line. The Soviets provided virtually no resupply (the reasons for which are still the subject of argument today). And to fill out decimated units, North Koreans press-ganged South Korean civilians and prisoners of war, but these conscripts were unwilling, little trained, and inexperienced—they certainly did not approach the quality of the initial invasion forces. Meanwhile, U.S. naval gunfire and allied airpower helped strengthen the defense of the perimeter until sufficient numbers of men, tanks, and artillery could be shipped to Korea.

Then, on 15 September 1950, MacArthur launched the Inchon invasion, while Walker scheduled a breakout from the Pusan perimeter for the next day. Led by the U.S. 1st Cavalry Division, which covered the final 100 miles in 11 hours, the Pusan defenders linked up with the Inchon invaders on 26 September near Osan, and it appeared the days of desperate defense were over. Eight North Korean divisions were cut off in the southwest, and virtually all of the North Korean units had to leave their tanks, heavy weapons, and supplies as they raced to the 38th parallel to avoid the rapidly advancing UN forces.

Pyramids (21 July 1798)

A battle between French forces of the Army of Egypt, 25,000 strong, commanded by Napoleon, and Egyptian and Mamluk forces 18,000–21,000 strong, commanded by Murad and Ibrahim Bey, on the west bank of the Nile River near Cairo. Although it was called the “Battle of the Pyramids,” the pyramid complex at Giza is about 15 miles away from the site of the battle, and the pyramids played no role in the engagement; the name is something of a misnomer.

Since landing in Egypt on 1 July 1798, Bonaparte had sought to bring the Mamluk forces, commanded by Murad and Ibrahim Bey, to a decisive battle. Although several sharp actions were fought as the Mamluks retreated down the Nile, the French were unable to complete the destruction of their foe.

When the Mamluk forces arrived near Cairo, the com-

manders divided their force. The bulk of the forces, perhaps 100,000 strong, crossed the Nile River under the command of Ibrahim Bey and remained in Cairo. These troops played no part in the subsequent battle. A small force of about 6,000 cavalry and 12,000 or more unreliable infantry occupied the village of Embabeh, under the command of Murad Bey.

The French, arriving at 2 P.M. on the 21st, deployed in five large, division-sized squares, with noncombatants, wagons, and cavalry sheltered in the middle. The French deployed their available artillery at the corners of the squares.

At 3:30 P.M., the Mamluks opened the battle with a vigorous cavalry charge against the westernmost of the French squares, posted on the open flank of the French army. These squares, commanded by Jean Louis Reynier and Louis Charles Antoine Dessaix, had not quite fully deployed and were almost taken by surprise by the charge. Nevertheless, the French managed to form and to fend off the cavalry attack. While the Mamluk cavalry sought to overwhelm the French right, the French left, with its flank protected by the Nile, attacked the village of Embabeh and evicted the reluctant, conscripted peasants who formed Murad’s infantry.

By 4:30 P.M., the Mamluks withdrew from the field. Two thousand heavily armored Mamluk cavalry were cut off from the retreat and attempted to swim the Nile under fire from the French. Few survived the attempt. Murad and 3,000 more cavalry were able to flee south toward Giza. The surviving infantry simply dispersed. The Mamluks lost 2,000 cavalry and an unknown number of infantry, and the French lost 29 killed and 260 wounded.

As a result of the battle, Bonaparte was able to occupy Cairo, which had been abandoned by Ibrahim Bey, and to undertake the government of Egypt. The practical benefits of the victory, however, were very largely negated by the destruction of the French fleet at Aboukir Bay on 2 August, which cut off communications between France and the Army of Egypt.

Pyrrhus (319–272 B.C.E.)

King of Epirus (in northwestern Greece) and inspiration for the term *Pyrrhic victory*. Supposedly descended from

Achilles and related to Alexander, Pyrrhus became king of Epirus at age 12 in 307 B.C.E. Losing the throne in a revolt, he earned a reputation as a fierce warrior, fighting along Demetrius Poliorcetes of Macedon at Ipsus (301 B.C.E.). As a royal hostage in Egypt, Pyrrhus allied with Ptolemy I, who helped him regain control of Epirus with Neoptolemus II (297 B.C.E.). Pyrrhus assassinated his co-ruler in 296 B.C.E., becoming the sole monarch. He engaged in a series of campaigns against Macedon, then ruled by Demetrius. In 281 B.C.E., the Tarentines (Italian Greeks) asked Pyrrhus for military assistance against Rome. Pyrrhus led an army, including elephants, to Italy and forced the Romans to retreat in a costly battle at Heraclea in 280 B.C.E. He is said to have remarked, "One more such victory and I am lost," thus the term *Pyrrhic victory*. Pyrrhus, impressed by his foe, sued for peace. When the Romans declined, he withdrew to southern Italy. After another hard-fought battle at Asculum (279 B.C.E.), Pyrrhus left Italy for a mostly successful campaign in

Sicily against the Carthaginians. He ruled much of Greek Sicily until his dictatorial manner inspired an uprising. Pyrrhus returned to Italy, badly losing the Battle of Beneventum to a Roman army. Pyrrhus returned to Epirus, conquered Macedonia in 274 B.C.E., and failed in an attempt to restore Cleonymus in Sparta in 272 B.C.E. He was killed in street fighting during a civil war in Argos. Perhaps the most famous general of his time, Pyrrhus was not a statesman and did not follow through on successes. He wrote several lost works on military strategy.

Q

Qianlong (Ch'ien-lung) (1711–1799)

Last great emperor of Qing dynasty (1644–1912). The Qianlong emperor was the grandson of the Kangxi emperor (1662–1722) and, after taking the throne in 1736, reigned for nearly 60 years. He abdicated in 1795 in favor of his son, the Zhia Qing emperor, so as not to rule longer than his beloved grandfather. He retained effective power until his death in 1799.

The Qianlong emperor expanded Qing boundaries to their greatest extent, gaining control over Tibet in 1751. In the next 10 years, Chinese armies secured Chinese Turkistan, what is now Xinjiang in extreme western China. Although China was not as successful in expanding its southern and southwestern boundaries, local rulers in what is now Vietnam and Burma accepted Chinese suzerainty.

The Qianlong emperor continued systems of control put into place by his predecessors. To preserve Manchu power in a sea of Chinese, he carefully apportioned key administrative posts between Chinese and Manchu appointees and continued the banner system, dividing both military forces and military leadership among Chinese, Manchus, and Mongols. He continued the examination system for entry into the bureaucracy.

Despite Qing successes against peoples on its immediate borders, the Qianlong emperor did not widen relations with the emerging West. Prohibitions against Christian missionaries remained, and Qing authorities sought to limit trade with Western nations to the distant port of Guangzhou, or Canton. Thus the Qianlong emperor would leave his successors a larger territory to protect and a bigger population to feed but also the greater corruption in government that marred his later years and thus less capacity to deal with the more confident and more powerful West.

Qin Shi Huangdi (Ch'in Shih-huang-ti) (259–210 B.C.E.)

The reign name of the first documented emperor of a unified China. Zhao Zheng was the son of the king of the state of Qin, one of seven contending states in China during the several-centuries-long Warring States Period. The state of Qin was located to the west, in the famous “bend of the Yellow River,” where its rulers could have a protected rear as they fought the other warring states. Qin was also one of the first states to move from bronze to iron weapons. With a solid agricultural foundation based on irrigated sorghum and millet fields, it could afford to arm its peasantry and thus fielded larger armies than its opponents. The rules of chivalry that had characterized earlier fighting had long since been discarded, and Qin had the men, weaponry, organizational structure, and economic power to prevail in the final stages of the fighting.

Zhao became king at age 13 and assumed real power at age 21. In 230 B.C.E., Qin conquered the weakest of the six states, Han. By 221 B.C.E., it had united China, and King Zheng became the first Qin emperor, or Qin Shi Huangdi.

As emperor, he divided the country into districts, seeking to end the former feudal boundaries and loyalties; established uniform weights and measures, including axle lengths on carts; and constructed roads to improve communication and control within his vast empire. He is best known in the West for connecting many existing walls into the first of many Great Walls, delineating the settled agriculture of China from the nomadic agriculture north of the wall.

Zhao constructed a remarkable tomb—Mount Li—which is still unexcavated and is protected by a vast life-size army of more than 6,000 terracotta soldiers and horses. The find in 1974 of one division of this army has provided invaluable insights into Qin army organization and the role of various ethnic Chinese peoples in the army.

Zhao died, probably from mercury ingested as part of an alchemically inspired elixir of longevity, and his son was unable to continue the dynasty, which soon collapsed.

Quadruple Alliance, War of the (1717–1719)

Conflict in which Spain, attempting to revise the settlement of the War of the Spanish Succession, fought the Holy Roman Empire, Britain, France, the Netherlands, and the House of Savoy. The end of the War of the Spanish Succession in 1714 and the death of Louis XIV (1638–1715) the next year left Europe a mine about to explode, a point fully grasped by the most energetic and able politician in Europe in the first half of the eighteenth century, Queen Elizabeth Farnese of Spain. Of the victors, the governments in France and Britain were considered illegitimate by a large portion of their subjects, and Duke Victor Amadeus of Savoy and Piedmont, now also king of Italy, and the Holy Roman Emperor Charles VI (1685–1740), now in direct control of Spain's former northern Italian imperial fiefs and the island of Sardinia, were utterly exposed to a resurgent Spanish navy.

In 1716, Elizabeth Farnese's husband, Philip V, uncle to the minor king of France, launched a conspiracy with sidelined members of the regency council; while at sea, her rapidly rebuilt navy initiated war by landing troops in Sardinia and Sicily. The emperor, despite losing Sardinia, was not at

first disposed to intervene. He had grievances against France and Britain over the settlement of the previous war, and another segment of the European power train, Turkey, had just launched a revanchist war against Venice. The Venetians folded rapidly, compelling the emperor to intervene in eastern Europe. Thus, it was left to France to take the lead, drawing in Britain, already smarting from the effects of Spanish-supported internal subversion.

The Turks were defeated in 1717, freeing Habsburg forces, and the Holy Roman Empire was brought into the war. The emperor secured a reversion of Sicily for Sardinia (confirmed in the 1720 Treaty of London) and offered troops for expeditions to Sicily that reduced the Spanish garrisons there in 1717–1719, while a British fleet under George Byng, Earl of Torrington (1663–1733), destroyed the Spanish at Cape Passaro and subsequently in Messina harbor, and James Fitzjames, the Duke of Berwick (in French service), invaded Spain, burning the shipyards at Pasajes to check the buildup of the Spanish fleet in 1719.

Berwick's campaign was efficiently conducted, and at the time much attention attached to the imperial army's model campaign of sieges in Sicily, but the main interest of the War of the Quadruple Alliance in military history remains the naval battle of Cape Passaro.

Quatre Bras and Ligny (16 June 1815)

Simultaneous battles in the Hundred Days, just before Waterloo. Returned from Elba and rapidly remobilizing, Napoleon learned that the Congress of Vienna planned to gather a multinational army in Belgium to invade France. Napoleon decided to make a preemptive strike into Belgium to destroy the allied force before it could gain sufficient strength. His plan was to drive his 124,000-man army as a wedge between Gebhard Leberecht von Blücher's 116,000 Prussians and the 93,000 British and Dutch troops of Arthur Wellesley, the Duke of Wellington and then defeat each foe separately.

Marching north toward Brussels and crossing the frontier

on 15 June, Napoleon divided his forces, with Michel Ney commanding the left and Emmanuel de Grouchy the right. With his vanguard solidly between Blücher and Wellington, he ordered Ney's 53,000 to attack the Duke of Weimar's garrison of about 4,000 at Quatre Bras, a strategic crossroads about 18 miles south of Brussels, while he himself simultaneously led Grouchy's 71,000 against Blücher's 83,000 at Ligny, about 5 miles southeast of Quatre Bras. Ney inexplicably hesitated, which ruined the coordination of Napoleon's two-pronged attack and allowed Wellington to reinforce Weimar. When Ney finally attacked with 20,000 in midafternoon, the allied force had grown to about 21,000. Because of a miscommunication, the 30,000 men of the French I Corps never saw action in either battle. Wellington counterattacked after about four hours of fighting.

In the indecisive encounter at Quatre Bras, Ney lost 4,300 men and about 2 miles' worth of ground, and Wellington lost 4,700 men, including the Duke of Brunswick. Because Ney prevented Wellington from reinforcing Blücher, Napoleon won at Ligny, inflicting 16,000 casualties, losing only 11,500, and forcing Blücher to retreat away from Wellington. It was Napoleon's last victory. Heavy rain on 17 June stopped his pursuit of the Prussians.

Quebec, Battle of (31 December 1775)

The unsuccessful American assault on the seat of British power in Canada. During the early months of the American Revolution, many in the Continental Congress felt that Canada might join in the rebellion against England. The addition of Canada would also deny the British an invasion route into New England. A two-pronged invasion got under way in the fall of 1775. Few gave consideration to the fact

that Canada's predominantly French Catholic population was mostly reconciled with English rule and suspicious of American intentions.

Colonel Benedict Arnold led a militia column through present-day Maine, traversing 300 miles through a wilderness devoid of roads or supplies. The group ran out of food and nearly starved to death, losing half its numbers en route. Outside Quebec, Arnold met General Richard Montgomery's force, which had come up through New York and had taken Montreal. The English garrison inside the walled city consisted of British regulars and Canadian militia under Sir Guy Carleton. The besieging Americans were outnumbered 1,800 to 1,000.

Knowing that in the spring British reinforcements would arrive, Arnold and Montgomery decided to assault the city on 31 December. A blizzard dumped snow on the attackers, and barricades impeded their progress. Montgomery and Arnold each struck different sectors of the city. Montgomery was killed at the head of his column, and his survivors retreated. Arnold's force entered the city itself but was unable to push on. Arnold was wounded, and rifleman leader Daniel Morgan was captured. The assault cost 372 casualties. Arnold was forced to retreat with the survivors, ending American hopes of annexing a "fourteenth colony." In the spring, British reinforcements did arrive, and Canada became a base for invasion for the remainder of the war and eventually an independent nation on its own.

Queen Anne's War (1702–1713)

War between Britain, France, and Spain in North America during the War of the Spanish Succession (1701–1714). Compared to the huge battles and large-scale sieges on the theaters of operation in Europe, the fighting in North America was relatively small-scale. The main reason was probably that New York and the Iroquois, who declared their neutrality in 1701, stayed out of this conflict. Warfare was limited to several raids against French or British villages or strongholds. The most famous example of the frontier campaigns was the Deerfield raid of 1704. Hertel de Rouville, a French Canadian, led 48 militia and around 200 Indians (Abkenaki,

Caughnawagas, and Hurons) 300 miles across the Green Mountains in the depths of winter to attack the town of Deerfield (in present-day Massachusetts) on 29 February. The small force killed 30 to 50 inhabitants, devastated the place, and carried off 100 prisoners on their return.

The New Englanders retaliated in 1704. A force of 550 men from Massachusetts attacked Castine. But as in King William's War (1689–1697), the main objective of the English colonists was Port Royal, the leading French base in Acadia. Two expeditions against this valuable port were launched in June and August 1707. Both failed because of the heavy resistance of the defenders under their new governor, Auger de Subercase. The fiasco called for the use of regulars, and a third attack proved to be successful. Francis Nicholson took the town at the head of 3,000 regular and militia troops in October 1710. By that point, Auger de Subercase commanded only 156 men. Port Royal, renamed Annapolis Royal, remained in English possession and the peninsula of Acadia became British Nova Scotia.

In 1711, the British decided to take New France in what could be called a complex combined military operation. This large expedition was designed to improve Britain's position in negotiations with France. A seaborne force under the command of Rear Admiral Sir Hovenden Walker and Brigadier General John Hill was to sail up the St. Lawrence River to attack Quebec, while Francis Nicholson led an army of 2,300 men from Albany to raid Montreal. Walker's invasion fleet of 31 transports escorted by 14 ships of the line sailed from Boston on 30 July. On board the vessels were 7,500 troops. But on 23–24 August, stormy weather and poor nighttime piloting caused eight transport ships to founder in the mouth of the St. Lawrence. Nearly 900 British sailors, soldiers, and accompanying women drowned near the Ile aux Oeufs. This led not only to the withdrawal of the fleet but also to the abandonment of Nicholson's landward advance on Canada. However, the Peace of Utrecht (1713) left Britain with Nova Scotia, Newfoundland, and Hudson's Bay. These gains strengthened the British position in an expected decisive struggle for the colonies and weakened the defenses of New France.

In the South, some 500 Carolina volunteers and 300 Yamasee under Governor James Moore of Carolina invaded Florida, but the garrison of St. Augustine successfully repulsed the attack. At the head of a large American Indian army, Moore returned in 1704, raiding western Florida and attacking Spanish missions near Tallahassee. Franco-Spanish privateers took revenge in 1706, when they attacked Charleston. This again resulted in British pressure on Florida: raids on Pensacola in 1706 and 1707 and an advance of a small force as far as Mobile in 1709. Although the British took the initiative in the following years, they did not

gain any land in Florida from Spain in the Peace of Utrecht. The global contest for supremacy would continue for more than a century.

Queenston Heights (13 October 1812)

One of several American setbacks along the Canadian border during the first year of the War of 1812. Major General Stephen Van Rensselaer, commanding American troops along the Niagara front, hoped to revive American plans to seize Canada following General William Hull's surrender of Detroit (August 1812) by attacking Queenston Heights. The Americans initially gained the advantage by attacking the British rear, but General Alexander Smyth, a regular army officer, refused to take orders from Van Rensselaer, a militia officer, and never moved against Fort George to prevent British general Isaac Brock from sending reinforcements to Queenston Heights. Brock overwhelmed the Americans, nearly forcing them off the precipice before being killed. A subsequent British-Iroquois attack cut the Americans to pieces. The presence of Indians, the sight of Americans returning wounded in battle, and dislike of Van Rensselaer caused the New York militia to refuse to cross the river to join the fight. The Americans lost approximately 90 killed, 100 wounded, and 800 captured at Queenston Heights. This defeat, coupled with failed campaigns against Fort Erie and Montreal in late 1812, contributed to the disintegration of the American army on the Niagara front and demonstrated the difficulty of relying on militia to fight the war, exposing the "War Hawk" Henry Clay's boast that the invasion of Canada would be a "mere matter of marching" by the militia for the ignorant bombast it truly was.

R

Rajput Rebellions (1679–1709)

A series of conflicts that afflicted Mogul rule almost from the moment of the Muslim conquest of Hindu India. Those conflicts of the last decades of the seventeenth century and first of the eighteenth in particular exposed the hollow shell that Mogul rule had become by that time. Drawing their name from Rajasthan—the northwestern region of modern India, roughly between Delhi and Pakistan—the Rajputs were a collection of Hindu families whose military and political power dated from pre-conquest times. Under Mogul rule, Rajasthan remained a tangle of opposition combining the prickliest of resistance with the least rewards.

In an effort to avoid such unrewarding conflict, in the late sixteenth century Mogul rulers had initiated a policy of integration whereby a number of non-Muslims, including the Rajputs, gained entry into the Mogul nobility. In 1562, Mogul emperor Jalud-ud-din Akbar married a Rajput princess. Over time, Rajput cavalry became a valued element of the Mogul war machine, as did their commanders. In 1664, it was the Rajput Jai Singh who, as the head of the Mogul forces, inflicted the first major defeat on the Maratha prince Shivaji.

This policy of integration, however, was not entirely successful in ending conflict between the Muslim rulers of India and the Hindu Rajput princes. Despite having a Rajput wife—or perhaps because of it—Akbar personally led the imperial army against Uday Singh, rana of Mewar and leader of the Sesodia, the most senior Rajput clan. From 1567 to 1568, Akbar laid siege to and finally destroyed Uday's capital at Chitor. He did not, however, break either Sesodia power or their willingness to use it. Its capital reestablished at Udaipur, Mewar would be at the heart of the greatest Rajput rebellions of the late seventeenth and early eighteenth centuries.

These latter Rajput rebellions bear testimony to the peculiarly Byzantine aspect of Rajput rebelliousness that was be-

stowed by the latter's close connection to the Mogul aristocracy even as they fought against the Mogul emperor. Rather than mere outsiders to and opponents of the Muslim state, the Hindu Rajputs within the Mogul nobility were in a position to take advantage of conflicts within the state itself. Muslim-Hindu conflict was thus given an added dimension as Muslim rivals to the imperial throne sought to enlist Rajput forces in their fight against fellow Muslims. This victory did not prevent the Rajput princes from joining Shah Jahan a decade later, when he rose in revolt against his father and seized the Mogul throne. A similar pattern was followed in 1658, when Shah Jahan was himself deposed by his son, Aurangzeb. The subsequent reign of Aurangzeb was not merely among the longest—lasting until 1707—but was also among the most turbulent in the long history of Mogul India. In large part, this unrest was the consequence of Aurangzeb's own domestic policies, aimed as they were at suppressing the power and influence of non-Muslims within India. Among the non-Muslims to whom Aurangzeb directed his attention were the Rajputs of Marwar.

In 1678, the death of Rathir Maharaja created for the Rajputs of Marwar the type of succession crisis that they had often taken advantage of when afflicting the Mogul throne. When, in 1679, Aurangzeb used the power of the empire to award the succession to a Rajput sympathetic to Mogul interests, revolt erupted and soon spread from Marwar to Mewar. Meanwhile, Prince Akbar used the crisis within the empire to mount his own challenge to his father, Aurangzeb, and made a bid to seize the throne. Like Shah Jahan over a century before, Akbar led Mogul forces against the Rajputs of both Mewar and Marwar, and now the Rajputs supported him in his bid for the throne. Unlike Shah Jahan, however, Akbar was not successful, in large part because his hesitation in the field alienated his Rajput allies at the moment of final confrontation with his father. With the defeat of his re-

bellious son, Aurangzeb was free to turn on the Rajputs. Yet though in 1680, the Mogul host seized and sacked Udaipur (the city built to replace Chitor, destroyed a century before), the destruction of Udaipur did not bring the Rajputs to heel. Facing revolt and unrest elsewhere in India, Aurangzeb was eventually forced to grant an honorable peace to the Rajputs, including the confirmation of the infant son of Rathor Maharaja as rana of Mewar.

Upon the death of Aurangzeb in 1707 and in the midst of the inevitable succession crises, that infant son, Ajit Singh, led the Sesodias of Mewar in a revolt against the empire. Joined shortly by the Rajput Kacchwahas of Amber, Ajit was forced to come to terms with the Mogul governor Bahadur Shah but rose in revolt yet again less than a year later. That Aurangzeb's successors were unable to crush this final Rajput revolt reflected the inability of the Mogul empire to effectively meet these challenges to its authority in the early eighteenth century. Indeed, the final Rajput rebellions reflected the extent to which Mogul rule in India was in the process of disintegration. The sad story of this disintegration had already been written by Prince Akbar, who, after his failure to seize the Mogul throne with the assistance of the Rajputs, fled into the arms of his father's other internal foes, the Marathas, before finally seeking asylum in Persia. By the 1730s, the Rajputs had successfully established their autonomy over Rajasthan, only to find themselves challenged as the eighteenth century drew to a close, not by their Mogul masters but by the British traders and soldiers who had begun to usurp them.

Ramillies, Battle of (22 May 1706)

A severe French defeat and the best illustration of the tactical skill of John Churchill, the Duke of Marlborough. Two years after the Blenheim disaster, the War of the Spanish Succession was still a draw, and Louis XIV yearned to have the glory of his army restored. He ordered François de Neufville, Duc de Villeroi, to bring Marlborough to battle in the plains of Brabant. Villeroi, was a courtier and a former king's friend. The French army, numbering 60,000, moved to Tirlemont to engage the enemy camp near Tongres. Learning that the allied camp had been left empty, Villeroi sent his

army south toward Namur. He reached the area of Ramillies on 22 May to discover that Marlborough was close to him.

The French deployed first on a 4-kilometer line, between the villages of Autre-Eglise and Tavières. Their center, on high ground, was cut in two by the village of Ramillies, 500 meters to the front. This area was garrisoned by three weak battalions of foreign troops, including former prisoners of war. The French cavalry was on both wings, but the left wing faced uncrossable marshes and streams.

Marlborough immediately saw the weakness of this deployment. It took five hours before the allied army was ready to fight; he had to regroup his troops, leaving his right covered by some cavalry squadrons. In the meantime, French generals requested and then begged Villeroi to attack the deploying enemy. He refused all entreaties but instead took infantry from his center to reinforce his useless left cavalry. Marlborough gathered his troops in front of both Ramillies and the right side of the French deployment, gaining numerical superiority. Then he closed all the troops on a single battle front, mingling cavalry squadrons with infantry battalions. The assault on Ramillies was easy, and the French right wing sustained the fight less than an hour before retiring, first slowly and then routing into a disordered mob. The French left wing ran away without having to fight. The French lost 8,000 killed, 7,000 prisoners, and all their artillery. This French defeat allowed Marlborough to overrun the Spanish Netherlands.

Ramleh, Battle of (Palestine) (5 September 1101)

Battle that thwarted Fatimid intentions to regain Palestine from the crusaders. King Baldwin I of the Latin Kingdom of Jerusalem had campaigned extensively since gaining the crown in 1100. Most of his campaigns were designed to demonstrate his strength and secure the borders of the Kingdom of Jerusalem. These small campaigns also gained the cities of Arsuf and Caesarea.

The Fatimid dynasty of Egypt watched these events closely. While Baldwin was at Caesarea, the Fatimid vizier, al-Afdal, hoped to catch the crusaders off guard and avenge

losses suffered in 1100. An army under the command of Sa'ad al-Daulah al-Qawasi advanced into Palestine and reached Ascalon in the middle of May.

Upon hearing of this, Baldwin withdrew from Caesarea and marched to Ramleh, which he fortified. After receiving reinforcements, Sa'ad marched toward Ramleh on 4 September 1101. Although some contemporaries estimated the Egyptian army to number 11,000 cavalry and 21,000 infantry, it was no doubt much smaller. King Baldwin, on the other hand, possessed slightly over 1,000 men, consisting of 260 cavalry and 900 infantry.

Despite the overwhelming odds, Baldwin divided his army into five corps and attacked at sunrise on 5 September 1101. Three of the corps were decimated, and the fourth retreated after suffering heavy casualties. Victory appeared imminent to the Muslims, but Baldwin made a last-ditch effort and charged them. Leading the way, he surprised the Egyptians. The initial shock turned to panic, and soon the Egyptians were routed. Baldwin's army maintained its discipline and did not stop to pillage the dead or the Fatimid camp but pursued them back to Ascalon. Ironically, the king's impetuosity would lead to the capture of Ramleh by the Fatimids the following year.

Rank, Military

Official indication of a soldier's length and quality of service in organized militaries. The need for soldiers quickly to recognize their own as well as their enemy's leaders is as old as warfare itself. When fighting forces were small and leaders local, it was less critical; soldiers generally knew who was in command.

As forces grew in size, more complex command structures developed. In the army of the Roman Republic, the overall command of a legion rested with its six tribunes, officers sharing command in pairs and alternating every few months. The real authority within the legion was entrusted to the centurions, professional officers each commanding 100 men. Supporting them were the decurions, with a command of 10 men. The senior centurion, the *primus pilus*,

guided the often inexperienced and transitory tribunes in the command of the legion. As the armies of imperial Rome moved to secure the empire, the need grew for officers with specific skills to coordinate the logistics of transporting men and material. There followed a proliferation of specialist ranks.

The fall of Rome signaled an end to formal armies in Europe. They did reappear, but the process was slow. It was not until the twelfth century that a structured military started to develop, in France, with the establishment of a general staff under the command of an officer, designated the *marechal de France*. Still, there remained a wide gulf between the senior commanders and their soldiers. There were no intermediate ranks between general and captain. Most soldiers continued to serve under officers that they knew.

In England, the largest permanently organized body of professional soldiers until the Elizabethan period was a company, commanded by a captain. His deputy was the lieutenant captain, later shortened to simply lieutenant. The lowest-ranking officer in a company was the ensign, or ancient. In battle, he was the standard-bearer, which accounts for his less exalted title, "rag carrier." In cavalry regiments, the ensign was known as a coronet. Both ensign and coronet ranks were gradually replaced in the eighteenth century with the rank of second lieutenant.

Increased domestic political stability, territorial avarice, and complex military alliances created a formula for larger armies. Regiments were raised by forming a column of companies and were commanded by colonels, from the Latin *colonna*. In continental Europe, as in Tudor and Stuart England, the principal obligations of a colonel were in raising and paying the regiment that often bore his name. It was left to his deputy, his lieutenant colonel, to exercise actual command. Officers bearing the rank of major assisted the lieutenant colonel in maintaining discipline within the regiment and with administrative duties. Officers themselves were ranked, with major, lieutenant colonel, and colonel as field officers; those holding the rank of captain and below were designated as company officers.

Armies, divisions, and brigades were commanded by general officers, yet they mimicked the rank structure of the much smaller company. In seventeenth-century England, the senior general held the rank of captain general. In time, this was shortened to merely general. His deputy was a lieutenant general. The army's administrative functions were assigned to a sergeant-major general, now simply called major general. King George II imported the continental rank of field marshal to Britain in 1736, a rank that was never adopted in the United States.

The one rank that can be either general officer or field officer, depending on the army, is brigadier. In the U.S. Army, it

is a general rank. The British consider it a senior field rank. There is no brigadier rank in the Russian or Chinese armies.

There was a great difference between officers who received their military rank through a commission from the monarch and those who were appointed to their rank by the regimental commander. These latter officers occupied a lesser military and social rank, but they still held important positions in the regimental hierarchy, serving as adjutants and quartermasters. Discipline in the ranks was the purview of the company sergeants. Supervision of the company sergeants was the responsibility of the regimental sergeant major. The lowest noncommissioned officer rank was lance corporal, a rank that originated with mercenaries serving the Italian city-states and denoted an officer who commands a small body of men, a *corpo*.

In times of war, some officers and noncommissioned officers have been given a brevet rank, a temporary higher rank for the duration. During the American Civil War, George Armstrong Custer held a brevet rank as major general but ended the war with a substantive, or permanent, rank of lieutenant colonel.

Military rank, like social rank, is often inconsistent with the egalitarian ideals found in some modern societies. The revolutionary armies of the United States and the Soviet Union resolved the issue by allowing soldiers initially to elect their own officers. However, once revolutions are over, military authorities are generally unwilling to allow military commands to be decided by ballot. The People's Republic of China found the matter of rank so ideologically troubling that in 1965 military rank insignia was abolished in the People's Liberation Army to close the gap between officer and soldier. In a massive modernization of the military in the 1980s, China, like every other significant military power, reestablished rank insignia.

Tradition frequently complicates order and confounds logic. This is particularly true in military organizations. In Britain's Household Cavalry, there is no sergeant rank. Instead, there is the corporal-of-the-horse. The Royal Artillery has no corporals. Instead, they are bombardiers. In the infantry, soldiers are privates; they are troopers in the cavalry, sappers in the engineers, gunners in the artillery, and guardsmen in the foot guards. In some British regiments today, the quartermaster sergeant is referred to as color sergeant, a nineteenth-century rank that was officially abolished in 1914.

Every army by its very nature is complex and all are idiosyncratic. Not every rank is comparable between armies; Russia has more officer ranks, and the United States has a dizzying array of enlisted, technical, noncommissioned officer, and warrant officer ranks.

Raphia, Battle of (Palestine) (217 B.C.E.)

Antiochus marched southward with 6,000 cavalry, 102 Indian elephants, and 62,000 infantry. Ptolemy countered with a force containing 5,000 cavalry, 73 African elephants, and 70,000 foot soldiers, many of them newly trained Egyptian natives, recruited for Ptolemy's army by his Egyptian minister, Sosibus. They met on the plains south of Gaza at Raphia.

In the complex evolution of the Alexandrian successor wars, Antiochus III, the prevailing Seleucid ruler had, since 220 B.C.E., stripped Ptolemaic territory in South Syria. In 217 B.C.E. Antiochus marched toward Egypt itself.

Both armies formed up for battle identically: heavy infantry phalanx at the center, protected by cavalry on both wings, and outside flanking columns of elephants, protected by archers and skirmishers and screened against enemy cavalry.

Antiochus opened by sending the 60 elephants on his right wing against Ptolemy's elephant escort of 40 on the latter's left. Antiochus's larger Indian elephants overpowered Ptolemy's North African ones, backing them against the latter's cavalry. Next, Antiochus circled Ptolemy's left wing, attacking it from the flank, stampeding it, and pursuing it off the field. Ptolemy, however, was still in the fight. On his other flank, Ptolemy's Greek mercenaries checked the Seleucid cavalry and Asiatic peltasts, accompanied by the remaining Ptolemaic elephants, which assisted in the rout of Antiochus's left wing. Thus the wing elements of each force had left the scene, leaving the phalanxes to decide the outcome alone. The superior numbers of well-trained native Egyptian heavy infantry inspired by the appearance of Ptolemy, who

had left his fleeing wing in order to lead his phalanx forward, penetrated the Seleucid center. Antiochus III returned from the command of his pursuing wing only to accompany his collapsing phalanx off the field.

Ptolemy lost 1,500 infantry, 700 cavalry, and almost all elephants killed or captured. Antiochus lost less than 10,000 infantry, a little more than 300 cavalry, 5 elephants, and more than 4,000 soldiers captured. Even though Ptolemy won the battle, the nationalist Egyptian spirit awakened by the muster and the decisive role of native troops resulted in the decline of Ptolemaic authority in Egypt.

Ravenna (1512)

Pivotal event in the Italian Wars of the early sixteenth century, enabling the pope and his allies to oust the French from Italy. The Holy League, an alliance between Pope Julius II, Spain, and Venice at the time, had been pushed back from Brescia by the French. On Easter Sunday, 11 April 1512, the Battle of Ravenna took place along the Ronco River 2 miles south of the city. At the battle's outset, the French army consisted of more than 23,000 Frenchmen, Germans, and Italians; the Holy League's army consisted of over 16,000 Spaniards and Italians dug in behind a long trench. In contrast to the usual medieval battle, in which fighting began once all troops were lined up, the Battle of Ravenna began with an exchange of artillery fire. The French, led by Gaston de Foix, and the league, led by Ramon de Cardona, Fabrizio Colonna, and Pedro Navarro, each took heavy casualties.

After three hours of being pounded by artillery, the league's army charged out of the trenches, and infantry and cavalry fighting determined the remainder of the battle. When the fighting ended, the French army had a Pyrrhic victory. The league's army lost nearly 9,000 troops, and its cavalry and infantry commanders, Colonna and Navarro, had been captured. The French casualties were fewer in number—nearly 4,000—but they included many commanders, including de Foix. Because of the heavy losses, including that of his nephew, de Foix, King Louis XII ordered

his army to stop its push toward Rome. Louis sought negotiations with Julius II in order to free himself for the defense of France against Spain and England, only to have Julius and the Holy League expel the French from northern Italy the next year.

Razin's Revolt (1667–1671)

Cossack-led popular rebellion against late-seventeenth-century Russia's existing order. Razin's Revolt gets its name from Stepan "Stenka" Razin (1630–1671), a Don Cossack, who in April 1667 led nearly 1,000 of his fellow Cossacks on a plundering expedition down the Volga River and into the Caspian Sea. For nearly two years, from July 1667 to June 1669, Razin and his followers ravaged Caspian shipping and coastal settlements, seizing people, animals, and booty while defeating every effort to stop them.

By the time Razin returned to the Don in September 1669, stories of his daring exploits and lavish riches had spread. In the winter of 1670, these rumors attracted to Razin's camp a multitude of impoverished Cossacks hoping to participate in the next campaign. Filled with delusions of grandeur by the influx of new supporters, Razin concluded he could achieve mastery of the entire Volga and maybe even Russia itself. In March 1670, he announced his intentions to destroy Russia's nobles and attack Moscow itself. One month later, Stenka and some 4,000 followers returned to the Volga River.

Meeting little opposition, Razin won control of the river from Astrakhan in the south to Simbirsk in the north, a distance of 800 miles, in only five months. In doing so, Razin unleashed a genuine popular rebellion, as thousands of townspeople, soldiers, lower clergy, non-Russian tribes people, and peasants, all with grievances against the existing order, rose up in the belief that Stenka would bring freedom from autocracy and serfdom. By September 1670, no fewer than 20,000 people were in open revolt across a 250-mile expanse of the middle Volga region, while Razin, who was then threatening Simbirsk, appeared poised to strike west, toward Moscow.

At Simbirsk, however, Razin was decisively repulsed. The city's defenders beat off three rebel assaults in mid-September, and on 1 October, czarist forces armed with muskets

and artillery, trained in the “European” manner and battle-hardened by the recent Russo-Polish War (1654–1667), arrived from Moscow and defeated the ill-equipped rebel army. While the townspeople, peasants, and tribesmen scattered, Razin and his Cossack followers fled home. Returning to the Don, Razin was subsequently seized by prosperous members of the Cossack community, who had never supported him, in April 1671. Transported to Moscow, interrogated, and tortured, he was executed on 6 June 1671. His rebellion, however, continued until 26 November of that year, when czarist forces extinguished its last ember by capturing the rebel stronghold at Astrakhan.

Though Russia’s social and economic structure remained unaltered, Razin’s Revolt demonstrated the widespread dissatisfaction existent throughout late-seventeenth-century Russian society and provided a foretaste of what was to come in the 1770s, when another Don Cossack, Emelian Pugachev, instigated an even greater rebellion on Russia’s southern frontier. Furthermore, in Razin the revolt produced a popular leader whose memory and legend lingered in the minds of Russia’s discontented and dispossessed into the twentieth century.

Reconquest of Spain (711–1492)

Spanish Christian states slowly reconquer territories lost to the Muslims. Shortly after the Arabs completed their conquest of Byzantine Africa, Berber general Tariq ibn Ziyad crossed the Straits of Gibraltar in 711 and, with an overwhelmingly outnumbered Umayyad army, crushed the Visigothic king Roderick at the week-long Battle of Rio Barbate. A number of Christian princes fled to refuge in the Pyrenees and held out against Islam. Nonetheless, few kingdoms have been overthrown so quickly and completely as Visigothic Spain, as city after city surrendered to the invaders, including Toledo, the Visigothic capital. The very name of the nation was changed, as Muslim Spain henceforth became known as al-Andalus, “the West.” After a pause for consolidation of their conquests, Arabic forces under Abd-ar-Rahman, the Umayyad governor of occupied Spain, then advanced against the Frankish Merovingian kingdom but were repulsed by Charles Martel at Tours and Poitiers in 732.

Despite this setback, Abd-ar-Rahman went on to estab-

lish an independent caliphate based in Córdoba in 756, in the name of the Umayyads who had been overthrown in a civil war with their successors, the Abbasids, and he and his successors began a profound Arabization of the Iberian Peninsula whose effects persist to the present. For many hundreds of years, Spain and Portugal were a land, above all, of small, often self-governing urban communities known for their culture, comfort, and intensely cultivated gardens.

Even as the Arabs dug in, a Christian reconquest was brewing below the surface. In 718, Pelayo (690–737), the Visigothic Christian chieftain, established the kingdom of Asturia and won the Battle of Alcama near Covadonga against the invaders, by then named Moors. A second Spanish kingdom, that of Navarre, was established in the remote Pyrenees. Other small Spanish Christian kingdoms appeared in the eighth and ninth centuries and began slowly to recover land from the Muslims. Assisting them in their endeavor was Frankish intervention on the Spanish side of the Pyrenees, resulting in, among other things, the creation of a small number of marcher states (Aragon and Barcelona) under Frankish protection and the emergence of a major pilgrimage route stretching across northern Spain, from the frontier of Francia to the shrine of Saint James in Galicia. Not only did this route provide much needed revenue for the local Christian kingdoms, but participation in a common cult helped promote feelings of unity in Christian Spain.

The process of Christian self-assertion and then reconquest accelerated considerably in the tenth and eleventh centuries. From 930 to 950, Ramiro II (900–951) of the new kingdom of Leon in northwestern Spain, where it had taken over the former territories of Asturia, defeated the Córdoba caliph Abd al-Rahman III at Talavera, Simancas, and Osma. In 932, Count Fernan Gonzales (c. 912–970) declared himself king of Castile.

In the eleventh century, Sancho III (c. 992–1035), king of Navarre, recaptured a large part of Aragon and brought Castile under his power, but at his death, his kingdom was divided among his sons. His son Ferdinand became king of Castile (r. 1035–1065) and in 1037 king of Leon. He also captured Moorish Galicia. Ferdinand declared himself emperor of Spain in 1056 and officially began the reconquest. Toledo was recaptured by an alliance of Castile, Leon, and Galicia led by Alfonso VI (king of Leon from 1065 to 1109 and of Castile from 1072) in 1085. Later, the Kingdom of Aragon took, in succession, Huesca in 1096, Saragossa in 1118, Tortosa in 1148, and Lerida the following year. Almost simultaneously, Alfonso VII of Leon-Castile (1126–1157) turned Córdoba into a vassal in 1146 and also occupied Calatrava, Andujar, and Almeria. Farther west, the new kingdom of Portugal, founded in the late eleventh century, occupied Lisbon in 1147 with the assistance of passing crusaders.

In 1212, after a major Muslim counterattack under the Almohads, the kings of Aragon, Castile, Leon, Navarre, and Portugal defeated Caliph al-Nasir at the Battle of Navas de Tolosa. Jaime I (1208–1276) of Aragon reconquered Mallorca in 1229. From 1217 to 1252, Ferdinand III (c. 1198–1252) of Castile-Leon conquered Seville, Jaen, Murcia, and Córdoba, leaving only Granada and its region in Moorish hands. Its continued survival was more a reflection of squabbles among the now dominant Christian states and the convenience of Moorish allies than it was of any real power of Granada.

In 1469, Ferdinand II (1452–1516) of Aragon married Isabella (1451–1504), who became queen of Castile in 1474. The conquest of Zahara in 1482 quickly led to the conquest of Almah. Although defeated at Loa and Ajarquia, the Christian forces regained Coin, Almeria, Velez, Malaga, Basa, and Guadix. Moorish Granada, the last stronghold, surrendered on 2 January 1492. To ensure Christian conformity, some 180,000 Jews were expelled, and the Moors were required to become Christian. A new era of religious intolerance had begun. Their most Catholic majesties asked Pope Sixtus IV (1414–1484) for permission to establish the Inquisition in Spain. The *Reconquista*, the crusade, was complete.

Red Cross

Group of interdependent international humanitarian institutions and an internationally recognized humanitarian protective emblem. In 1859, the Swiss merchant Jean-Henri Dunant witnessed the Battle of Solferino and saw how the medical services of both parties completely failed to deal with the huge number of wounded soldiers. His account of his experience, titled *Un Souvenir de Solférino*, was published in 1862 and had tremendous impact. A committee of five Geneva citizens decided to pursue Dunant's idea of national volunteer medical services assisting their armies in

times of war as well as an international treaty protecting both these services and the wounded soldiers.

This treaty was initiated by the committee in 1864 and ratified by the major powers as the Geneva Convention. It was revised in 1906 and especially in 1929, when its applicability was widened to protect prisoners of war (POWs) as well. After World War II, the convention was found to be insufficient in the face of a highly mechanized warfare and was completely reworked into four independent Geneva Conventions. In 1977, two additional protocols further expanded the conventions' field of application.

The group of Red Cross institutions is integrated into a more or less common organizational structure: The original Geneva Committee is now the International Committee of the Red Cross (ICRC). The ICRC's main task during peacetime is to uphold and disseminate Red Cross principles as laid down in the conventions as well as to monitor the correct implementation of the conventions by the contracting parties. Therefore, it maintains delegations abroad that keep in contact with national or local authorities. Additionally, the ICRC aims to further develop international legal instruments to reduce suffering during war and conflict. These drafts are presented to national governments during international conferences taking place every four years.

In times of armed conflict, the ICRC's main function is to trace POWs, civilian victims of war, refugees, and displaced persons by means of its own tracing agency. Furthermore, its delegates visit POWs and civilian internees. Possible violations of the conventions and protocols are reported to the party concerned but not investigated by the ICRC itself. Diplomatic, more than legal means, are then used to resolve any critical situation.

National Red Cross societies are set up as private associations under national laws. They organize emergency and relief actions within their national boundaries. All national societies are members of the International Federation of Red Cross and Red Crescent Societies (until 1991, the League of Red Cross Societies). When international coordination is necessary, the federation functions as a body of coordination between national societies and internationally promotes their humanitarian activities. Every four years, an international conference is held as the general assembly of the Red Cross movement. Delegates from the ICRC, the national societies, and the member states of the conventions attend the conference.

The first Geneva Convention introduced a red cross on a white background as the movement's emblem. All parties are obliged not to attack persons, vehicles, and buildings showing this emblem. The conventions also include the Red Crescent, in use by most Islamic states, and the Red Lion and Sun, originally used by Persia-Iran, but given up in 1980.

Refugees being fed by the Red Cross, 1940. (Library of Congress)

Currently, the adoption of a new emblem free of religious symbolism is under consideration.

Refugees and Victims of Ethnic Cleansing

Civilians displaced by war. In 1950, the United Nations established the Office of the United Nations High Commissioner for Refugees (UNHCR). Through Article I of the 1951 Geneva Convention Relating to the Status of Refugees, the international community defined “refugee” as a person “who, owing to a well-founded fear of being persecuted . . .

is outside [their] country of nationality” In more common terms, refugees are those forced to leave their homes as a result of war or political oppression. Those who leave their homes but do not cross their country’s international borders are known as “internally displaced persons.”

As the twentieth century progressed, the numbers of refugees and internally displaced persons grew, so that it is a far larger problem worldwide than ever before. In Europe, for example, the war in Bosnia-Herzegovina generated 2.5 million displaced persons or refugees, out of a population of 4.5 million, during its first few months in 1992. Again, in Kosovo in 1999, there were 800,000 refugees and nearly another 1 million displaced out of 2 million inhabitants. But Africa led the world in the 1990s, with more than 10 million refugees per year displaced by wars and civil wars—“small wars”—in Sudan, Rwanda, Angola, Liberia, and Zaire (now the Democratic Republic of Congo), not to mention the lesser disruptions in Burundi, Mozambique, Somalia, Kenya, and Ghana. In each situation, UNHCR gathers information and coordinates the humanitarian assistance that these people need.

In addition to the general disruption caused by warfare, refugees are generated by ethnic cleansing and genocide.

Article II of the United Nations convention adopted in 1948 defined *genocide* as “any of the following acts committed with the intent to destroy, in whole or in part, a national ethnic [sic], racial or religious group, as such: (a) Killing members of the group; (b) Causing serious bodily and mental harm to members of the group; (c) Deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part; (d) Imposing measures intended to prevent births within the group; (e) Forcibly transferring children of the group to another group.”

A perhaps lesser crime against humanity is ethnic cleansing. Here a particular ethnic group is terrorized until it flees from a locale. For example, in 1992 in Bosnia-Herzegovina, certain Bosnian Serbs adopted this strategy, initially against Bosnian Muslims or Bosnian Croats. The Bosnian Serbs sought to make it possible to form their own territory that could become part of a Greater Serbia. Croatia undertook a similar policy in order to regain control over certain areas within Croatia, such as the Krajina.

All know well the Nazi genocide against the Jews. But after the end of World War II, there were large-scale movements of people that constituted ethnic cleansing. Czechoslovakia expelled about 3 million Germans. The Allied powers redrew the borders of Germany, forcing many more millions of Germans to flee Silesia, East Pomerania, and Prussia.

In Asia during World War I, Turkey engaged in genocide against the Armenians. When India and Pakistan became independent of the British Commonwealth in 1947, 7 million Muslims and 5 million Hindus and Sikhs found themselves on the wrong sides of the borders and fled to their ethnic homelands. Of course, there are the ongoing problems in the Middle East regarding the Jews and the Palestinians. In 1947–1948, the creation of the modern state of Israel left about 750,000 Palestinians as nearly permanent refugees because no other Arab state would take them in. Palestinians seeking their own state today number 3.5 million.

The war over Kuwait caused more than 1 million refugees. First, most of the 400,000 Egyptians and 300,000 Palestinians who worked in Kuwait before the war fled. Later, the Kurds in northern Iraq suffered reprisals from Saddam Hussein’s regime after the war. The pictures of hundreds of thousands fleeing to Turkey dominated the news immediately after Desert Storm.

Ethnic cleansing, of course, is not solely a twentieth-century phenomenon; the removal of American Indians to reservations certainly qualifies as such, as does the removal of the biblical Hebrews from Israel and Judea—whence the Hebrews had earlier displaced the Canaanites. Nonetheless, the twentieth century seems to have perfected and practiced the concept more than any other century.

Warfare, especially warfare directed specifically or indirectly against civilians, creates untold suffering. National policies in war and about war respond to these realities and require decisionmakers to count these costs as part of the military burden.

Religion and War

Cause, limiter, and encourager of war. At times, the belief systems of a particular religion have limited war, encouraged it, or even been the sole cause of it. Even in the supposedly dominantly secular twentieth century, world wars were caused or affected at least partially by religion.

Early human society had a variety of religious belief systems, often characterized as natural, animistic, or shamanistic. It is clear however, that these belief systems could have a significant impact on conflict. Head-hunting, a religious ritual involving the taking of the “power” of another warrior, could be seen from Neolithic times until the twentieth century in all the human-occupied continents.

Easier to measure are early written records of war. These records often contain a significant religious component. The *Rig Veda* of ancient Hindu India discusses all elements of formal warfare and the religious beliefs that influence such warfare. The Hebrew Scriptures do likewise; in them, for example, the Hebrews conquer the “Promised Land” of Canaan by the sword at the behest and with the blessing of Yahweh and are punished by him if they fall short in their military mission. And Yahweh himself is termed “A Man of War.” Sumeria, the world’s first civilization, appears to have had a particularly strong religious dogma to its warfare traditions. This dogma culminated in the Assyrian Empire, the world’s first military state, with its need for conquest to satisfy its god, Assur. In ancient Egypt, the pharaohs named their military units after important Egyptian gods such as Amun,

Ptah, Seth, and Pre. In China, the literature generated during the Warring States Period shows the strong effects of religious belief on war.

Greco-Roman religious mythology obviously affected the ways of war in the ancient Mediterranean. From Greek gods fighting for control of the cosmos to Roman emperors attempting to divine the fortunes of war in the entrails of an animal or the flight of a bird, religion played a crucial role in the western way of war. One has only to look at the formal war god Ares/Mars of the Greco-Roman eras.

Nomadic horse societies on the Asian steppes also had their warfare practices strongly shaped by religious beliefs. Turko-Mongol groups, including famed leaders like Genghis Khan, felt they were empowered by sky gods to conquer the known world. Like those in the Greco-Roman world, they looked to auguries for help in deciphering the supernatural.

The end of the Roman Empire was marked by the emergence of Christianity in the fourth century. In the east, the Byzantine world embraced Eastern Orthodox Christianity, while Rome developed Roman Catholicism. Such splits in religious beliefs within a formal religion often led to war, as was the case with Christianity and later with Islam. Religion tends not only to promote and motivate war between differing religions and regions but also within differing sects or groups in a single religion and region. Far from being a unifier, religion has often served, particularly within religious groups themselves, to create strife.

Even basic tenets of why and how a people engaged in war could be structured by religious beliefs. A Norseman's very religious belief suggested he must die in battle to attain immortality, which in turn allowed him to fight and die again and again in the heavenly hall of warriors. Viking religious beliefs, like those of the Aztec and Assyrian, structured the reasons they carried out warfare in the first place.

Such military-religious influence perhaps reached its zenith in the Middle Ages. Formalized monotheistic religions such as Christianity and Islam had special orders of warriors and warrior-priests who helped spread the message of the religion via potentially or actually coercive means. The Knights Templar and Hospitaller are just a few of many examples.

Three models of the blending of religion and war via leadership emerged during the Middle Ages around the globe. Great medieval military leaders such as Constantine, Charlemagne, and al-Rashid clearly carried the banner of religion before them and used it to rally, recruit, and inspire troops. In other cases, religious leaders of the period, such as the Roman Catholic popes, the caliphs in the Islamic world, or the Mayan priest-rulers, transformed themselves from religious leaders into military leaders as situations demanded. In other cases, warrior-priests like Quetzalcoatl of the Toltecs or Tlacaélel of the later Aztecs often wore both the re-

ligious and military hats at the same time. In yet another model, military leaders like Moses or Constantine could later become religious leaders.

In several parts of the globe at the end of the Middle Ages, the emergence of gunpowder weapons helped to delineate the beliefs of cultures toward lethal warfare and the sharing of power in class societies. It can be argued that at least some of these beliefs had a relationship with basic religious tenets in those cultures and societies.

In China, the birthplace of gunpowder weapons, and in the surrounding East Asian realms, both land and sea warfare had already integrated gunpowder weapons by the thirteenth century. Mongol conquests began to export such concepts throughout the Old World. Yet China pulled back from the world's first industrial age and the associated gunpowder revolutions, perhaps because of the hold of such religious beliefs as Daoism, Confucianism, and Buddhism.

The Ottoman Empire also never fully integrated gunpowder weapons into its culture and society. European gun casters were brought in to construct the huge siege guns used by the sultan finally to capture Constantinople in 1453. Janissaries, Balkan slaves, or tribute children were trained in volley-fire musket tactics, but their Turkish overlords often detested the use of gunpowder weapons, considering them a necessary evil that could pollute Turkish culture.

In Japan, the religious-feudal Samurai system was overthrown by Nobunaga Oda's adoption of Portuguese muskets. His system involved Samurai sword makers producing European-style muskets and then training Japanese peasants in volley-fire tactics. The results gave Oda power throughout Japan, with his peasant, volley-fire forces scoring a stunning victory over the medieval samurai at the Battle of Nagashino in 1575.

However, no sooner did the old order of Japan crumble than questions began to arise about the increased wielding of power by the peasantry. The castles were torn down, the guns removed from the hands of peasants and elites, and the samurai sword makers were prohibited from manufacturing gunpowder weapons.

Why could the Chinese, Turks, and Japanese so easily control the spread of gunpowder weapons in their regions, while Europe proved unable to do so, despite early Christian doctrine that guns were "weapons of the devil"? Underlying religious beliefs may have played a role, but not in an easily explained fashion.

In the Western Hemisphere, early civilizations like the Olmec, Zapotec, and Maya appear to have waged war with heavily religious overtones. A sacred book of the Maya, the *Popul Vu*, even discusses biological warfare. At the Zapotec capital of Monte Alban, depictions of head-hunting and sacrifices of war captives appear to foreshadow the industrial-

level war captive sacrifices encountered by the Spanish. In classical Maya times, the goal of warfare itself was the capture of enemy religious and military leaders, along with their religious banners. In Africa, Zulu- and Bantu-speaking warriors in general often underwent a “washing of the spears” ceremony to cleanse their spirits after they had killed an enemy warrior.

North American Indian tribes often relied upon shamans to bless shields and warriors, making them immune to the bullets of European invaders. Even in historic times, such Native American blending of warfare and religion serves as an excellent model of how early tribal societies around the globe practiced the integration of religious belief and warfare practice.

Europe experienced the impact of religion in war as much as any region on the globe, with the possible exception of the Islamic world. During the early modern period (about 1500–1650), Europe was torn apart by strife within Christendom.

Such intrareligious conflict was really nothing new in Christendom, as competition between the Roman Catholic Church in Rome and the Eastern Orthodox Church in Constantinople had been taking place since the time of Constantine in the fourth century. But the integration of new technologies, namely gunpowder weapons, into warfare greatly increased the lethality of warfare and allowed the common person to seize some of the reigns of power from the old medieval elites, who had previously controlled the very expensive art of war.

By the time of the early modern period, religious leaders in Christendom, the popes included, were skilled in utilizing warfare as a tool to achieve power. The very concept of a Holy Roman Emperor had been developed by Charlemagne in 800 as a way to combine church and state power.

After the Christian sacking of Constantinople in 1204 during the Fourth Crusade, Rome became the center of Christianity and international politics for Europe. However, in the thirteenth century, the coming of the Mongols and the Black Death served to call into question the competence of the papacy. The Renaissance and the discovery of new worlds further questioned its doctrine. The stage was set for a series of challenges to papal authority that became known as the Wars of Religion.

The Spanish Habsburg Empire allied with Catholicism and the pope, as did their Austrian Habsburg relatives. The French Bourbons often stayed in the middle, while Dutch, English, and Scandinavian realms sided with Protestant communities. Eastern Europe added an additional variable with its Eastern Orthodox background. Eventually, the Protestant realms and their north Atlantic sea power came to dominate the more Catholic Mediterranean land powers.

However, whether it was the Thirty Years’ War in Europe, or the Seven Years’ War abroad (called the French and Indian War in North America), religion played a key role as a motivator, organizer, and point of contention.

Even after the close of Europe’s Wars of Religion, sectarian strife continued, although usually bound more closely with rivalries between the emerging nation-states. This type of political-religious clash was most evident in the wars between England and Spain. As late as 1745, France assisted Charles Edward, the “Young Pretender,” in a vain attempt to restore a Catholic monarch on the English throne.

By the 1800s, religious wars had given way to a second phase of European colonialism and warfare. Religious-sponsored and -inspired warfare now became wars between nation-states. The first half of the twentieth century was scarred by gigantic world wars waged by nation-states, conflicts that cut across religious lines and reflected the religious indifference of at least Europe. Yet in World War II, the officially atheist Soviet Union actually called upon the once-persecuted Russian Orthodox Church to bless its cause. Still, among the major belligerent powers in both world wars only Russia (in World War I) and Japan (in World War II) were highly motivated by religion.

The post-World War II era saw a resurgence of religion in warfare, if not of actual wars of religion. In India, the newly independent Indian state (1947) had to deal with murderous tensions between Hindus, Muslims, and other religious sects. This tension led to the assassination of Mohandas Gandhi, mass religious-ethnic killings, and the spawning terrorism on all sides until the present day. The Muslim state of Pakistan had to be formed in the west of India, to separate Indian Hindus and Pakistani Muslims. The two nations have fought each other twice since 1947, and their borders remain among the most unstable on Earth.

The formation of Israel as an independent Jewish state after World War II (1948), created similar hatreds in the mostly Islamic Middle East. The basically secular state of Israel has fought numerous wars and been engaged in almost constant strife with its Islamic neighbors, including Egypt, Syria, and the Palestinian people. Many of Israel’s enemies have proclaimed a jihad (holy war) against Israel. This strife has spilled over to the United States, as numerous hijackings of American airliners and the horrendous bombings of the World Trade Center towers in New York City and the Pentagon in Washington, D.C., have shown. Islamic militants, outraged by U.S. support for Israel and by its perceived anti-Islam bias, made no secret of their role in these “holy wars.” It may well be that the early twenty-first century will be dominated by what most developed nations will call a “war against terrorism” but what Islamic zealots already term a jihad for Islam.

To a lesser extent, religious beliefs have also contributed to ethnic conflicts in the Balkan states, West Africa, central Africa, East Timor, Zimbabwe, Southeast Asia, and Northern Ireland (probably the closest thing to an actual war of religion in the twentieth to twenty-first centuries). Clearly, conflicts such as those in Ethiopia and the Sudan also have strong overtones of the age-old competition between Christianity and Islam.

Certain religions, particularly in the West, have emphasized pacifism, and their young men and women have refused to go to war. The most prominent of these religious groups are the Germanic Anabaptists and Jehovah's Witnesses. Although both groups were persecuted somewhat for their stand during World War I, by World War II, their position had been accepted in the United States and the British Commonwealth. Provision was made for such people eligible for induction into the military to undertake some form of alternate service, ranging from battlefield stretcher-bearers to home-front smoke-jumpers, hospital workers, and so on. Although this consideration for small religious groups outside the mainstream churches can be considered a commendable attribute of the democracies, more cynical commentators have pointed out that the Western nations could afford such leniency precisely because these groups are so small in numbers that they pose no real threat to the military.

World history has seen everything from military religious orders to human head-hunting, human sacrifices, ethnic cleansing, terrorism, and mass killings of civil populations carried out by devotees of religion. Although most of the world's major religions today emphasize the amelioration of suffering and charitable obligations, along with more formal sacerdotal practices, religion has its dark side of intolerance and has been present to some degree in perhaps a majority of the world's conflicts throughout history.

Reporting, War

The shaper of public opinion. It is arguable that war reporting, like military history, begins with Thucydides, in that he was a participant-observer trying to make sense of a military conflict for a contemporary audience. As such, he re-

mained a paradigm into the nineteenth century, when public opinion in the Western world was as much influenced by privately produced pamphlets commenting on the course of political and military circumstances as it was by the press. Newspapers were sufficiently widespread in Britain and the American colonies by the time of the American Revolution (albeit unabashedly partisan) to influence public opinion in both countries.

The state of affairs in which professional news reporters cover events, instead of publishers depending on the ad hoc reception of personal accounts, really emerged with the Mexican-American and Crimean Wars. Responding to the beginnings of mass politics (in turn a result of the Industrial Revolution's railroads, steam shipping, and telegraphs), American and British newspapers created organized courier systems, putting steamships and the telegraph at the disposal of paid correspondents seeking the "scoop," the novel, sensational story that would bolster their employer's reputation for immediacy and move copies of the latest edition. The climax of this style of competitive "newsmongering" was probably best represented by William Randolph Hearst's supposed admonition to artist Frederic Remington, sitting bored and tired in Cuba in 1898: "You furnish the pictures and I will furnish the war."

An important transition came with World War I, when the natural desire of governments to maintain the operational security of their respective war efforts took the additional turn of seeking to use the mass media as a conduit of advocacy for the general public. The goal was the creation of general enthusiasm for what is now referred to as "total war." Thus began the era of formal propaganda.

In response to this trend, plus the brutal disenchantment with romantic notions of war in the face of modern industrial combat (now being captured in still and motion pictures) and the rapidly increasing shock of a public faced with rocketing casualty lists, a more critical style of journalism began to emerge. In the democracies, where there was a tradition of respect for public opinion, the burgeoning distrust of official news created an increased demand for truth telling, a trend that continued into the twenty-first century.

Allied with this demand was another continuing trend, the new perceptions brought about by the direct visual record of war via tools such as the camera and television. The apparently unmediated record of the photo, be it Matthew Brady's record of the dead on American Civil War battlefields, Robert Capa's alleged snapshot of a Spanish Civil War soldier at the moment of death, or today's stream of television imagery from the world's ongoing military conflicts, serves to create new public opinion pressures.

The chronic question of war reporting is, for what and whom do the media advocate? Is it the general public, the

government, the soldier in the field, or perhaps simply the business interests of the employer of the working correspondent? All of these rationales have been invoked at one time or another, but a balanced amalgam seems to be most satisfying for all concerned, if the hardest to attain.

Perhaps conflict between the media and government is the inherent state of affairs that must simply be accepted. World War II did see the creation of an image of war reporting at its best, when professional and committed reporters operated in concert with government support to cover the reality of the war and, if not bring meaning, at least act as honest witnesses to events. Some witnesses, such as Ernie Pyle in print and Edward R. Murrow in sound broadcasting, became heroes in their own right.

In that global conflict, motion pictures expanded exponentially from their beginnings in World War I (whose cinematic record for the most part consists of marching troops). Combat camera operators were routinely expected to do their work *in advance* of the troops. Allied camera operators were instructed never to “stage” battle scenes, and for the most part, they followed this injunction. Even the German army’s combat camera operators were able to film authentic combat, with a very light propaganda larding. Paradoxically, the most authentic battlefield scenes were the least rewarding when shown to the folks on the home fronts; in twentieth-century war, troops are spread out, fighting in interlocked small groups—not very exciting film but all the more authentic.

For the first time, also, war reporting could be instantaneous, and correspondents’ actual voices could be heard, as when radio correspondent Edward R. Murrow’s tobacco-cured voice opened his report to New York from a London rooftop during the Battle of Britain with the magnificent: “This . . . is London.” Robert Trout, Richard C. Hottelet, or Eric Severeid could record their impressions from bombers over Berlin, from the D-Day beaches, or from just-liberated Nazi concentration camps. Their voices and their faces became about as well-known to Americans and Britons as those of film stars.

The lesson was learned in World War II, at least by the democracies, that the destruction of credibility is the loss of a weapon. The British Broadcasting Corporation’s reputation for accuracy was such that even those who wished Great Britain ill would listen in to get some true picture of what was happening. By contrast, the German information and propaganda machine was justly and widely distrusted, particularly in the Third Reich itself, and its head, Dr. Josef Goebbels, was widely known as one who would give lying a bad name.

But some two decades later, the arrival of television and the exigencies of the Cold War’s ideological conflict created a

crisis of advocacy. Journalists who saw their duty as that of bringing an accurate portrayal of events (or at least capturing the scoop) again came into conflict with governments and militaries seeking to put the best interpretations on policies that appeared to be counterproductive at best and pointlessly destructive at worst. War reporters in the democracies came to look upon their profession as paramount, and if their reporting gave aid and comfort to their nation’s adversaries, so be it. The fact that these correspondents were not recording declared wars but “twilight conflicts” like Korea, Algeria, or Vietnam made it easier for them to put their craft above what might be considered their country’s interests and even to intrude their political views. In the case of the Vietnam conflict, this tendency created a situation in which, in the United States, the world’s most active news industry and the world’s leading military came to view each other in an adversarial light. The military reciprocated the distrust of the news media, as may be seen in the possibly apocryphal story of correspondents who complained that they had been kept in the dark about the anti-Iraqi coalition’s war plans for DESERT STORM (1991), but that war correspondents had gone ashore on D-Day at the Normandy beaches. Their military “handler’s” response cut to the point: “But we knew back then that you were on our side.”

By the late 1960s, television had brought near-instantaneous reporting “into America’s living rooms,” as the cliché went. The process of making celebrities of correspondents accelerated, with Walter Cronkite regularly topping any poll of the most trusted man in the United States in the 1960s. When Cronkite reported from Vietnam in the wake of the Communist Tet Offensive that he did not see how the United States could win this war, public opinion began to move away from support for the conflict, even though Tet was in reality a Communist defeat.

In some ways, there has been a return to the situation of the late nineteenth and early twentieth centuries and the era of “yellow” journalism, in which sensation has become the main criterion of value to the business interests of contemporary media corporations. What does seem to be unchanged is that there are limits to the obvious manipulation of public opinion, at least in the democracies. If the general public remains a viable force in politics, it would seem that there will be no shortage of war reporters seeking to bring the experience of war back to the public forum. Perhaps the next golden age of war journalism will be made by independents using the Internet.

Resaca de la Palma (9 May 1846)

U.S. victory that shook Mexico's confidence in its military superiority over the United States, used by President James Polk to gather support for a declaration of war on Mexico. Prior to Polk's declaration of war issued on 14 May 1846, General Zachary Taylor fought the Battles of Palo Alto and Resaca de la Palma on his way to relieving Fort Texas on the Rio Grande.

Taylor pursued the retreating Mexican forces on the morning following the Battle of Palo Alto. Reconnaissance reported that Major General Mariano Arista had fortified a dry riverbed approximately 5 miles south of Palo Alto. With dense chaparral before him and artillery deployed on the banks behind, General Arista positioned his 3,000 troops within the 8-foot-deep *resaca* that bisected the road to Matamoros and Fort Texas.

Taylor ordered his infantry to attack through the chaparral, which quickly broke the soldiers into small, disorganized groups. A battery of artillery was sent down the road by Taylor to engage the Mexican gunners. Unsupported by infantry, the battery called for help. A charge by dragoons penetrated the Mexican line but was unable to hold the guns. Assaults by the infantry on the east flank captured Arista's guns. Simultaneously, troopers on the west turned the Mexican flank and sent the defenders in a panicked retreat across the Rio Grande.

Taylor pursued to the Rio Grande and relieved Fort Texas, under siege since 3 May. Of his 1,700 troops engaged, Taylor suffered 33 dead and 89 wounded.

Reserves

Troops with some military training and practice that are not always in arms. Before the modern period, militias and yeomanry supplemented or substituted for professional armies and could properly be considered reserves. In fact, all able-bodied males were considered a mass reserve in medieval Europe, to defend against Saxon, Viking, Saracen, or other invaders or raiders. The difference between these "reserves" and those who followed the profession of arms more often than not came down to who could afford a horse. Horses were expensive, high-maintenance animals and almost useless in the peasants' small strip and plot holdings. These peasants were invariably arranged in foot soldier units, while the yeomanry (small landowners) could afford horses and generally served in cavalry units.

Responding to acute manpower needs in the Napoleonic Wars, Prussia instituted a system of universal conscription in which subjects would be called to the colors when reaching a set age, would serve a year of active duty that included basic training, two years of active reserve with continuous training, 12 years in the first-line reserve with periodic training (Landwehr), and eight years in the second-line reserve (Landsturm). In the Franco-Prussian War (1870–1871), this mode of organization furnished a mass army that quickly overwhelmed the French army, a long-service professional army that had only recently adopted a pattern of five years' active duty followed by four in reserve.

This example led other nations to adopt mass conscription and training with a reserve component. Most schemes organized reserve units on a territorial basis for ease of training and mobilization and envisioned the active reserve fleshing out frontline units on mobilization, as first-line reserves manned depots and guarded lines of communication while being further trained prior to being drawn on for combat replacements. Second-line reserves were intended for home defense and police duty, as necessary. In the German army, however, first-line reserves were trained to function as frontline troops immediately upon mobilization, providing the manpower for the immense enveloping attack launched on France in 1914.

Britain began experimenting with reserve schemes after 1870. This decision resulted in 1908 in the division of the British army into regulars and territorials, the former supplemented by a special reserve from the militia and the latter intended for home defense but able to volunteer for overseas service. In World War I, the territorials contributed 24 divisions that fought abroad. In the United States, the Officers Reserve Corps and Enlisted Reserve Corps were established in 1916. Though the Enlisted Reserve Corps never attracted many recruits, the Officers Reserve Corps accounted

for 88,000 officers in World War I and 200,000 in World War II. The U.S. National Guard was state-oriented, under the control of the governor until activated into federal service.

After World War II, the changing military missions of the various states made for alterations in reserve configurations. France adopted a national service of 18 months, followed by reserve service until age 45 and civil defense service until age 60. Britain assigned anti-aircraft defense to the territorials until 1955, then downsized the force until merging it with the Army Emergency Reserve into a Territorial Auxiliary and Volunteer Reserve of 50,000 to supplement the army in small conflicts. The United States activated individual reservists rather than units in the Korean War and maintained only one-third of the authorized reserve strength. Increasingly, the National Guard became the combat reserve, and the Army Reserve supported service units. After the draft ended in 1973, the reserves dropped from 1.2 million to just over 300,000. By the Gulf War, reserve strength was nearly 900,000 and was integrated in a total force policy that made reserve mobilization necessary in case of war.

In most developed nations, a tension has long existed between the regulars and the reserves, the former viewing the latter as slack, politics-infested “weekend warriors” and the latter scorning the former as narrow, tradition- and regulation-bound types who could not make it in the civilian world (“real life”). Britain and the United States have to some extent successfully addressed these antagonistic views with their post-World War II reserve policies.

Revolutions of 1830 (July–August 1830)

Uprisings that led to significant government changes in France and the independence of Belgium. The restored

Bourbon monarchy of Charles X of France was, by 1830, deeply disliked by liberals for the king's attempts to install an ultraroyalist government and set aside the charter granted by his predecessor, Louis XVIII, in 1814. In July 1830, the king suspended the national guard and the privilege of the middle class and called for new elections to the chamber of deputies while restricting the franchise and censoring the press. While middle-class liberals wanted to protest by refusing to pay taxes, the common people of Paris began forming unruly mobs that attacked royalist symbols and clashed with the city gendarmes. The king's general, Marechal Auguste-Frédéric de Marmont, who was particularly disliked as a former Napoleonic general who had surrendered Paris to the allies in 1814, wanted to move on the mobs immediately, but the king hesitated. This delay allowed the mobs to take up barricades in strategic areas of Paris and former national guardsmen to join in the rebellion. Because the army in Paris was arrayed to protect the king rather than quell disturbances, Marmont's eventual three-column attack on the rebels failed because the columns were isolated and attacked within the city and forced to retreat. The national guard attempted to protect private property but could not keep the mobs from attacking the archbishop of Paris's house and storming the Louvre. While liberals called for Louis-Philippe, a cousin of the king, to take the throne, a mob marched on the king at Rambouillet and forced him into exile. The marquis de Lafayette, accompanied by Louis-Philippe, quieted the revolutionaries in Paris, and Louis-Philippe accepted the throne from the chamber of deputies, who refused Charles X's attempts to abdicate in favor of his nephew, a minor child. The revolution starkly illustrated the inability of the army or the police to keep order in the old city streets of Paris and led to a rethinking of French tactics.

In August, revolution spread to Belgium, under Dutch rule since the Congress of Vienna (1815). After riots by agricultural and industrial workers, which had been put down by civilian authorities in Brussels, the Dutch were not alarmed by a spontaneous rising following a nationalistic French opera, *La Murette de Portici*, and delayed sending troops until Brussels was rife with revolutionaries. A clash between Dutch troops and rebels in a Brussels park ended with 400 rebels and 750 Dutch dead, an enormous toll that led to the Dutch evacuation of the city and the establishment of a provisional, French-speaking, Catholic government. This government proclaimed the independent state of Belgium on 21 July 1831, which then crowned Leopold of Saxe-Coburg-Gotha its first king.

Revolutions of 1848 (12 January 1848–13 August 1849)

Series of liberal uprisings throughout Europe. Immediate causes included the famine and economic depression that had gripped Europe since 1846; years of oppression by the Bourbons, Habsburgs, Hohenzollerns, and other restored or post-Bonapartist monarchies; lingering republican sympathies from the French Revolutions of 1789 and 1830; feelings of ethnic solidarity and nationalism; and the ideologies of such firebrands as Karl Marx, Mikhail Aleksandrovich Bakunin, Arnold Ruge, Pierre-Joseph Proudhon, Lajos Kossuth, Ferdinand Lassalle, George Sand, and Giuseppe Mazzini.

The first revolt occurred in Palermo, Sicily, on 12 January 1848. Workers skirmished with police in Paris on 22 February. French king Louis-Philippe abdicated on 24 February and fled to England. Liberals, republicans, and nationalists rebelled in several Rhineland cities on 3 March, Vienna on 12 March, Berlin on 15 March, Milan on 18 March, and Venice on 22 March. Because so many of the 1848 revolutions began in March, historians call the period of European monarchical revival between 1815 and 1848 the *Vormärz* (German for "pre-March").

The sites of the major revolutions were France, Italy, Germany, Austria, and Hungary. Scattered minor insurrections arose in Ireland, Scotland, England, Poland, Greece, and the Balkans. Democrats managed to achieve peaceful reforms within the established order in Denmark and the Low Countries. Only the Russian, Spanish, and Scandinavian monarchies remained unchallenged by revolutionary activities.

In France, the provisional republican government, consisting mainly of moderates and conservatives, immediately came into conflict with the far left. The assembly of this government gave dictatorial powers to General Louis Eugène Cavaignac to restore order. His national guard and about 100,000 conservative provincial volunteers killed between

5,000 and 15,000 rebels in the streets of Paris during “Bloody June” while losing only about 1,000 of their own forces. Cavaignac’s government wrote the constitution of the Second Republic, but Cavaignac lost the presidential election in December to Louis Napoleon (Napoleon I’s grandson), who gradually consolidated his authority until, in 1852, he could proclaim the Second Empire with himself as Napoleon III.

In Austria, the mob forced the resignation of Emperor Ferdinand I’s powerful regent, Prince Klemens Wenzel Nepomuk Lothar von Metternich, on 13 March. The empire seemed ready to dissolve. Shortly after dissatisfied Bohemian subjects revolted in Prague on 12 June, Austria and other royalist governments launched sustained counterrevolutionary attacks. By fall, they were succeeding throughout Europe, most notably in the Austrian Empire and its satellites. Field Marshal Alfred Windischgraetz recaptured Vienna from the revolutionaries on 31 October. But Ferdinand I proved incompetent to aid in the restoration of his authority. Because he was unable to reestablish civil order, recover lost Italian provinces, or subdue Hungary, he abdicated on 2 December in favor of his nephew, Franz Josef I, who reigned until his death in 1916.

Unchecked rioting erupted in Berlin on 18 March. The most powerful German prince, Prussian king Friedrich Wilhelm IV, after eight years of failing to pursue liberal reforms instituted by his father, Friedrich Wilhelm III, was compelled on 22 March to promise a constitution for a representative government. Yet the violence continued throughout the German realm, mostly as urban riots. In Frankfurt in the spring of 1848, the philosopher Arthur Schopenhauer invited soldiers into his rooms to fire down on the insurgents and lent his opera glasses to an officer for reconnaissance. Following the success of the German counterrevolution, huge numbers of constitutionalists and liberal sympathizers fled. Many settled in the United States, where they became known as “48ers.”

Nationalism was the primary fuel of revolution in Italy, where rebels of all political leanings sought to throw off Austrian, French, and papal influences in order to create a unified country. Austria dispatched Field Marshal Josef Wenceslas Radetsky to suppress anti-Austrian uprisings in northern Italy. Radetsky defeated King Carlo Alberto of Sardinia at Custoza on 24–25 July 1848 and captured Milan on 9 August. After the loss of Milan, the fervent Italian nationalist Giuseppe Garibaldi briefly waged guerrilla warfare against the Austrian presence in Italy, until he was driven into Switzerland. Returning to Rome in December, he took command of Italian resistance to French incursions. He won at Rome on 30 April 1849, Palestrina on 9 May, and Velletri on 19 May, but the French captured Rome on 30 June. Garibaldi and 4,000 guerrillas retreated to San Marino. After

losing to Radetsky at Novara, Carlo Alberto abdicated on 23 March in favor of his son, Vittorio Emanuele II, who would in 1861 become the first king of Italy. Radetsky secured Venice for Austria in the spring and summer of 1849. The restoration of papal political sovereignty over Rome in 1849 forced Mazzini and his republican nationalist movement, “Young Italy,” into exile.

Kossuth made a famous speech in the Hungarian Diet on 3 March 1848, agitating for Hungarian independence from Austria. He took increasing advantage of Austrian disorder to establish Hungarian home rule that summer. Emboldened by Kossuth’s defiance of Austria but unwilling to be part of a Hungarian republic, Serbs, Croats, Czechs, Slovaks, Romanians, and other ethnic minorities, mostly Slavic, demanded their own separate nations and revolted against both Hungary and Austria, thus weakening Kossuth. Croatia, especially, was so active against Hungary that Kossuth had to appeal to Austria for help in September. But Croatian general Josip Jelacic was in the service of Austria. Jelacic invaded Hungary on 19 December and captured Budapest on 4 January 1849. Windischgraetz won at Schwechat and Kápolna but lost at Gödöllő and was relieved of command. Hungary declared full independence from Austria on 14 April. Artúr Görgey, commander in chief of the Hungarian armies after February, was very successful against Austria that spring, finally recapturing Budapest on 21 May. Austria requested assistance from Russia. The revolutions ended when Kossuth fled into exile on 11 August and Görgey surrendered to the Russians under Prince Ivan Feodorovich Paskevich at Világos on 13 August.

Rhodes, Sieges of (1480 and 1522)

The island of Rhodes, off the southwestern coast of Turkey, had been taken by Christian crusaders and fortified with medieval-style castles. These castles were constructed with stone recycled from the toppled “Colossus of Rhodes,” a statue that once stood astride the great natural harbor as one of the “seven wonders of the world.” On 23 May 1480, the

Ottoman Turks under Meshid Pasha combined with a fleet of 160 ships and besieged the fortifications, defended by the Knights of St. John of Jerusalem under the Grand Master Pierre d'Aubusson. The siege lasted three months, with the Turks withdrawing after the second direct assault, having sustained casualties of 10,500.

The second siege of Rhodes took place on 28 July 1522. Süleyman the Magnificent led the Turkish attack, and the knights were led by Villiers de L'Isle Adam. The Christian order held out until 21 December, finally surrendering to famine. The Turks lost as many as 60,000 men but gained a significant port in the Mediterranean Sea. Reportedly, explosive bombs were successfully used for the first time in this siege.

Richard I (1157–1199)

King of England, crusader. Richard the Lionhearted was born 8 September 1157, the second son of Henry II of England and Eleanor of Aquitaine. His education, heavy on martial training, especially in horsemanship, at which he excelled, was significantly tempered by training in music and the social graces, including poetry. After being named duke of Aquitaine in 1172 and assuming his mother's lands and title, Richard honed his military skill while keeping order among the fractious barons and engaged in the war his elder brother Henry sparked against their father. When Henry died in 1182, Richard became heir to the throne, but continued to fight against Henry II on the side of his friend, the French king Philip II Augustus, until becoming king of England himself in 1189. Richard's first concern was to launch a crusade to retake Jerusalem from the Muslims, and he spent nearly a year arranging the logistics of the massive project, including making treaties with the kings of Aragon and Navarre.

Leading an army of perhaps 500,000, Richard journeyed to the Holy Land via Sicily, where he captured Messina and intimidated the Sicilians into releasing his sister Joanna, the widow of Frederick of Sicily. Moving on to Cyprus, he seized it by force from Isaac Comenus Ducas to use as a base. In

Bust portrait of Richard I, King of England. (Library of Congress)

both cases, Richard failed to accept the tacit truce among Catholic, Orthodox, Jew, and Muslim in these cosmopolitan lands.

Richard was successful at taking and holding Acre, but the disunited Christian crusaders quickly fell out among themselves, as he then moved on Jerusalem via the coastal road. Attacked by Saladin at Arsuf, Richard was victorious but pragmatically realized that he could not take Jerusalem with his available resources. While maintaining a scrupulously polite relationship, Richard and Saladin, the Muslim commander, engaged in a chess game of holding and relieving key fortresses like Jaffa and Ascalon until 1192, when both realized that a truce was the only solution to their stalemate, exacerbated by epidemic illness and the scorching heat.

Returning to England, Richard was captured by Leopold of Austria near Vienna and ransomed by Eleanor of Aquitaine through a massive tax on English property, while John, Richard's brother, assumed power in England. Richard, finally free, returned briefly to England before crossing back

to France to retake the land lost to Philip II Augustus while he was on the crusade. In 1194, he began the construction of Chateau-Galliard on the Seine, a massive example of military fortification.

While marveling at the bravery of one of the defenders of Chalus, Richard was wounded in the shoulder in April 1199 and died of gangrene. Bigoted, violent, and ruthless to prisoners and rival Christian princes, Richard nonetheless won a reputation for bravery and chivalry that has passed into legend.

Richard III (1452–1485)

Opponent of Henry Tudor at Bosworth. Richard Plantagenet, the Duke of Gloucester, was born 2 October 1452 at Fotheringhay Castle, Northhamptonshire, England, and died on 22 August 1485 at Bosworth, Leicestershire. He was sometimes referred to as “Crookback” because of a slight deformity in his shoulder.

Richard was the youngest son of Richard, the Duke of York, and history has tended to paint him as a conniving, vicious opportunist, a characterization not a little influenced by Shakespeare’s play *Richard III*, in which he is portrayed as nothing short of a monster. Although Richard’s tactics were clearly Machiavellian, given the political climate and the nationalistic circumstances, many historians are willing to give his reign a more sympathetic interpretation. The circumstances were indeed complicated, but suffice it to say that Richard’s primary concern lay with the challenge to his succession after Edward IV had proclaimed that he would be “Lord High Protector of the Realm” after that king’s death in May 1483.

The family of Edward’s widowed queen, the Wydviles, were the main challengers, and to thwart their claim to the throne, he imprisoned the young king Edward V in the Tower of London. After that, he managed to secure his own claim to the throne in a mere 11 weeks. Once his claim was secure, he was forced to deal with peripheral rebellions by Henry Stafford, Duke of Buckingham, and Henry Tudor, a descendant of Edward III and the last Lancastrian claimant to the throne. The former revolt was unsuccessful because of poor

planning and bad weather, and Stafford was captured and executed at Salisbury on 2 November 1483. Henry Tudor invaded in August 1485 at Market Bosworth in Leicester, where Richard was killed in an attempt to kill Henry himself, quickly ending one of the shortest reigns in British history.

Ridgway, Mathew B. (1895–1993)

Prominent American general in World War II and Korea. A 1917 graduate of West Point, Ridgway rose through the ranks as an infantry officer, eventually serving on General George C. Marshall’s staff on the eve of World War II.

In 1943–1944, Ridgway commanded the 82d Airborne Division. Under his command, the division made combat jumps in Sicily and Normandy. Ridgway himself jumped in the latter operation. In late 1944, he assumed command of the XVIII Airborne Corps, composed primarily of the 82d, 101st, and 17th Airborne Divisions. The 82d and 101st played important roles in the Battle of the Bulge. Both units held out against strong German forces in December 1944. Later, his XVIII Airborne Corps engaged in a combat drop across the Rhine River and the envelopment and capture of over 300,000 Germans in the Ruhr pocket.

At the close of hostilities, Ridgway was one of the most highly regarded American field commanders. After serving in a variety of field and staff commands in the late 1940s, he was appointed commander of the Eighth Army in Korea upon the death of Lieutenant General Walton Walker. Ridgway worked wonders raising morale and restoring his army’s fighting spirit. At a time when United Nations forces were under heavy pressure from a Chinese offensive, he held fast, counterattacked, and established Line Kansas, the United Nations main defense line across Korea.

In April 1951, Ridgway replaced General Douglas MacArthur as commander of UN forces in Korea and, at the behest of policymakers in Washington, D.C., initiated truce talks that eventually, after Ridgway had left, culminated in an armistice in 1953. After the Korean War, Ridgway served as supreme commander of the North Atlantic Treaty Organization and as chief of staff of the U.S. Army. Always an advo-

cate of strong ground forces, he warned against overemphasis on air power and nuclear weapons during the tense 1950s. In 1954, he successfully counseled President Dwight D. Eisenhower against taking over the French role in Vietnam and later opposed American involvement in that country in the 1960s. Ridgway was one of the most influential and gifted military figures in American history.

Riel's Rebellion (1885)

In 1867, Canada became a commonwealth under a confederation and in 1870 assumed authority from the Hudson Bay Company over the Prairie Provinces, planning to join them to the rest of Canada via a transcontinental railway. This new authority, asserted by the Mounted Police on behalf of an increasing wave of emigrant settlers, angered and provoked the métis, descendants of the original French-British traders and local natives, who felt cheated by the new courts and displaced from their land. Finding a charismatic leader in Louis Riel, the métis and the Cree tribes rebelled in 1885, declaring a provisional government at Batoche and issuing a Revolutionary Bill of Rights.

When a 100-man police force was unable to dislodge the rebels and was forced to evacuate Fort Carleton, the government in Ottawa, fearing an Indian war like those recently fought by the United States, assembled a 3,000-man army under Sir Frederick Dobson Middleton, joined by 1,700 volunteer settlers. The government also commandeered steamboats and railways and provided the army with a Gatling gun (sent on approval with an agent from the Connecticut factory). The main body of troops under Middleton was ambushed at Fish Creek in April but managed to stalemate the rebels at Batoche, fighting behind fortified wagons, until an unauthorized bayonet charge by the volunteers routed the rebels. Meanwhile, two other columns skirmished with the Cree under Chief Big Bear and Chief Poundmaker. When the rebels sensed their defeat, they fought a series of retreating skirmishes before disbanding and melting away. Riel himself was captured 15 May and tried in Regina, Saskatchewan,

for treason. He was hanged on 16 November 1885, ending the rebellion and proving the authority and strength of the federal government of Canada to keep order on the frontier.

Rifles and Rifling

The “killing zone” of both cannon and small arms was basically doubled when it was discovered that if the missile were spun between rifle and target, it was far more accurate. Rifling consists of grooves cut lengthwise in a spiral in the barrel that impart the spin to the bullet when it emerges from the muzzle. Experiments established the rate of twist required and the number of grooves needed, which vary according to the length of the barrel and the caliber of the weapon. The bullet, once lead, now has a metal jacket around its core to allow it to be squeezed into the rifling to prevent gas escaping and to withstand the greatly increased pressures of modern military firearms.

Early firearms were smoothbore muzzle loaders. The lead ball fired was roughly made and needed packing to seat it above the powder in the breech of the weapon. In traveling down the barrel when the weapon was fired, gases from the explosion of the charge escaped, and muzzle velocity, accuracy, and penetration were lost, which could be remedied only when rifling was invented.

Rifling was first applied in about 1800 in the British Baker rifle; then, in 1838, the Brunswick percussion rifle was introduced, but both suffered from the problem of “windage”—gas escaping along the sides of the bullet.

The Minié ball was one solution. This bullet had a hollow base that expanded on firing to fill the barrel, and it was elongated, rather than a simple ball. The slaughter of the American Civil War was in large part due to the unprecedented killing power of rifling and the Minié ball, a development that escaped military authorities of the time. However, the real solution to the problem of quick and accurate fire lay in breech-loading weapons.

The nineteenth-century British Boxer cartridges were the first metal-cased cartridges and as such constituted single

units (bullet and case sealed together), which allowed breech loading. Ultimately, they also allowed bolt-action and even semiautomatic operation.

Rivoli (14–15 January 1797)

One of the most severe of the many defeats of the Austrians by revolutionary and Napoleonic France accomplished by the military genius of Napoleon. By January 1797, the French Army of Italy had besieged the fortress of Mantua for eight months, and the 30,000 Austrian troops inside were on the verge of surrender. Bonaparte had defeated three previous efforts to relieve the fortress. However, the Austrians gathered nearly 45,000 men for a final attempt to rescue the garrison. Bonaparte, though commanding nearly 55,000 men, was forced to detach 20,000 of these to continue the siege and to protect his line of communication. To further complicate the French situation, Mantua could be approached along three routes, by way of Legnano, Verona, or Rivoli. In order to cover all three approaches adequately, Bonaparte was forced to divide his forces. Thus, a French division under Pierre Francis Charles Augereau was posted to Legnano; another, under André Masséna, was stationed at Verona; and a third, under Barthélemy Joubert, was at Rivoli. In the event of an attack, Bonaparte planned to reunite these forces before any one detachment could be overwhelmed.

Josef D'Alvintzi, in turn, divided his forces, sending 9,000 men under Provera to attack Legnano. This force would, he hoped, push through to Mantua. A further 6,000 men under Bayalitsch were to demonstrate against Verona. The balance of the Austrian army, nearly 30,000 strong, moved against Rivoli. Once the nature of the Austrian plan became apparent, on the afternoon of 13 January, Bonaparte proceeded to consolidate his forces. Leaving a small detachment at Verona, the remainder of the French army hurried north, while Joubert, badly outnumbered, held the heights around the village of Rivoli. While French reinforcements streamed into Rivoli throughout the 14th, the Austrian assault, divided into no less than six separate forces, eventually failed in the

face of a determined defense. Bonaparte then left Joubert in command of forces at Rivoli and turned south to face Provera, now heading toward Mantua. Joubert completed the rout of the Austrian army on 15 January. The Austrians lost 3,000 killed and 11,000 prisoners over the two days of the battle.

As a result of the victory of Rivoli, Bonaparte effectively destroyed d'Alvintzi's force and subsequently forced the surrender both of Provera and of the garrison of Mantua. Subsequently, the French were able to occupy Rome and central Italy without opposition. Despite the success of the French, however, the Austrian government declined to make peace with the Directory, and a further campaign, on the Rhine and along the Adriatic, would be necessary before the signature of the Treaty of Campo Formio on 17 October 1797.

Roberts, Frederick Sleigh, First Earl, Viscount St. Pierre of Kandahar (1832–1914)

Late-nineteenth and early-twentieth-century British military commander. Born in Cawnpore, India, Frederick Sleigh Roberts joined the Bengal artillery in 1851 despite his blindness in one eye. He won the Victoria Cross during the suppression of the Indian Mutiny in 1857. Earmarked thereafter for the highest command, he was involved in an Afghan border campaign in 1865, the 1866–1868 Abyssinian expedition, the 1871 northeastern India campaign, the 1874 Bihar famine relief, and the 1875 Imperial Assembly at Delhi, where Victoria was proclaimed empress of India.

An advocate of a forward Afghanistan policy to deny Russia control of the Himalayan passes, Roberts commanded the Punjab Frontier Force at the Battle of Charasia, during the occupation of Kabul and during the famous march from Kabul to Kandahar in 1878–1880. After serving as commander in chief in India from 1885 to 1893, as a field marshal he was commander in chief in Ireland from 1895 to 1899 before being appointed to command British forces in South Africa during the Boer War.

Taking command in January 1900, Roberts was responsible for the lightning campaign that within six months had relieved all threatened British garrisons, forced many Boer formations to surrender, and resulted in the capture of

Bloemfontein, Johannesburg, and Pretoria and the flight of President Paul Kruger from the Transvaal. With the war apparently won, Roberts was recalled to serve as commander in chief in Britain until the post was abolished in 1905. Thereafter Roberts, by now an earl, campaigned in favor of conscription and in 1914 was deeply involved in the attempt to persuade army officers not to obey orders from the liberal government that would have given effect to the provision of home rule for Ireland. On the outbreak of war in Europe in 1914, he was appointed colonel in chief of the Indian Expeditionary Force and died at St. Omer while visiting Indian units.

Rochambeau, Jean-Baptiste-Donatien de Vimeur, Comte de (1725–1807)

Marshal of France who played a vital role in the final Franco-American victory at Yorktown. Born in Vendôme, Rochambeau was the third son of a noble family who intended he become a priest. He chose instead to enter the army as a cavalry officer in 1742 to serve in the War of the Austrian Succession. During the Seven Years' War, Rochambeau distinguished himself and earned a promotion to brigadier general in 1761.

In 1780, Rochambeau was promoted to lieutenant general and given command of a 5,500-man expeditionary force to aid the Americans against the British. Though he spoke no English, he quickly integrated his army into George Washington's operations near New York City. Rochambeau expressed great reservations about plans to assault the entrenched British and instead, in coordination with Admiral de Grasse, suggested operations in Virginia, where Cornwallis had established a base at Yorktown. Washington agreed, and the combined allied army, supported by the French fleet, moved more than 400 miles. Rochambeau helped direct a formal siege and supplied heavy artillery to batter the enemy fortifications.

Unable to withstand the bombardment, Cornwallis surrendered in part because of the professional and disciplined performance of Rochambeau and his army.

Rochambeau returned to France in 1783, held a succession of district commands, and was appointed a marshal of France in 1791. During the French Revolution, he survived

imprisonment and narrowly escaped the guillotine. Napoleon made him a grand officer of the Legion of Honor in 1804 in recognition of his courage and skill as a professional soldier. Rochambeau died at Thore, France, in May 1807, his legacy his invaluable service to the American Revolution.

La Rochelle, Siege of (27 June–28 October 1628)

Great Catholic victory in Europe's Wars of Religion. Cardinal Armand du Plessis, Duke de Richelieu (1585–1642), meant to break the strong bulwark of Huguenot power and to augment the absolutist regime of King Louis XIII (r. 1610–1643). La Rochelle sided with Protestant England, which led to unsuccessful attempts by English ships to relieve La Rochelle in April. In May, the incompetent command of George Villiers, Duke of Buckingham (1592–1628), caused the loss of most of his 8,000–10,000 men.

Unable to use the tiny French navy to blockade La Rochelle, Richelieu used impressive military engineering to close off access from the sea by building a massive dike measuring 4,500 feet long, 50 feet thick, 25 feet wide at the top, and 50 feet wide at the bottom, with a 200-yard gap to accommodate the tide from the west. A Catholic citizen betrayed La Rochelle in March by showing Richelieu's commanders a secret passage, but the anticipated entry was thwarted through bungling.

In May, English food ships succeeded in running Richelieu's blockade and passing through the dike's center. Nonetheless, horses, mules, cats, dogs, rats, and mice had to be slaughtered for food. Wildly escalating prices led to hoarding and a black market, with women forcing themselves into prostitution to obtain food. By September, 100 people a day were dying of starvation. Louis would accept only complete surrender.

The 400-person-per-day death rate in October led to an agreement on peace terms on 28 October. Between 18,000 and 26,000 people had died during the 16-week siege; only 5,000 survivors were left to surrender. Louis triumphantly entered the city on 1 November and ordered the immediate destruction of La Rochelle's fortifications.

Rogers, Robert (1731–1795)

Credited as the founding father of the rangers of the modern U.S. Army. Born in Methuen, Massachusetts, and raised in Dunbarton, New Hampshire, Rogers recruited for the Massachusetts provincial forces and then enlisted in the New Hampshire regiment, fighting at the Battle of Lake George (8 September 1755) in the French and Indian War.

After the battle, Rogers undertook the first of what would be many scouting missions, reconnoitering enemy positions at Crown Point (24 September) and Ticonderoga (7 October). In 1756, Rogers was promoted to captain, with orders to raise one of three companies of irregular light infantry called “rangers.” Appointed major in 1758, Rogers participated in the disastrous expedition against Ticonderoga that

same year. In 1759, while serving with Major General Jeffrey Amherst’s army on the Hudson River, Rogers led his most infamous operation: the destruction of the Abenaki mission village of St. Francis (October 1759). Rogers was dispatched by Amherst to Niagara and Detroit in late 1760 to inform both the French garrisons and their native allies of the surrender of New France to the British.

Peace in Europe did not mean peace in North America, however, and in 1761 Rogers was sent to South Carolina to join the forces fighting the Cherokee there since 1759. With the outbreak in 1763 of the general American Indian rising known as Pontiac’s Rebellion, Rogers and his rangers were back on the frontier, assisting in the relief and defense of Niagara and Detroit.

Although Rogers’s play *Ponteach: or, the Savages of America* (1766) was something less than a critical success, his account of his wartime operations established throughout the years his reputation as a ranger leader. *Journals: Containing an Account of the Several Excursions He Made under the Generals Who Commanded upon the Continent of North America* (1765) was sufficiently popular (more so than *Ponteach*) to attain for Rogers the command of Fort Michilimackinac, despite the opposition of the secretary of war and the British commander in North America, Thomas Gage. In 1768, Rogers found himself not merely removed from command but charged with high treason and transported to Montreal

in chains. Though the subsequent court-martial acquitted him of all charges, his reputation was badly damaged.

At the outbreak of the American Revolution, Rogers sided with the British and raised the Queen's Rangers. Inefficiencies within this unit and its repeated defeats at the hands of the rebels resulted in his removal from command in 1776. With no prospect of employment in America, Rogers returned to England, where he remained on a half-pay pension from the army until his death.

Although extraordinarily effective in field craft, rangers proved resistant to regular army discipline. Rogers in particular often found himself bested in action against French regulars, American Indians, and Canadian *coureurs de bois*. But concerned with the growing expense of these irregular units, British commanders sought to create regular light infantry formations to supplement them. The consequence was, after 1770, the creation of a permanent light infantry company in every British line regiment.

Rokossovsky, Konstantin Konstantinovich (1896–1968)

Soviet World War II commander and marshal of the Soviet Union (1944). Born in Pskov Province, Rokossovsky grew up in Warsaw, son of a Polish railway worker and Russian mother. Drafted into the Russian army in 1914, he emerged from World War I a junior officer in the 5th Cavalry Division. Rejoining his regiment after October 1917 (renamed the Kargopolsky Red Guard Cavalry Detachment), he was a squadron commander in the Russian Civil War, fighting Aleksandr Vasil'evich Kolchak in eastern Russia and White and Japanese forces in Mongolia.

Rokossovsky graduated from Leningrad Higher Cavalry School (1924) and Frunze Military Academy (1929) and led the 5th Independent Cavalry Brigade of Marshal Blukher's Far Eastern Army in Transbaikal (1929), defeating Chinese Kuomintang forces. After further successful Far Eastern commands, he was arrested in 1937 because of his links with the purged Blukher, imprisoned, but released after the poor Soviet performance in the Finno-Soviet War, also called the Winter War (1939–1940).

Recalled to command by Semen Konstantinovich Timo-

shenko, Rokossovsky led the 5th Cavalry Corps into Bessarabia (1940). During the initial German invasion of the USSR, he commanded the IX Mechanized Corps in the South-Western Sector, Fourth Army, on the Western Front, delaying the Germans at Smolensk and the German Sixteenth Army in the battle and counteroffensive before Moscow.

In 1942–1945, Rokossovsky held commands on more than one front, proving himself one of the best Soviet World War II commanders. As Don front commander, he participated in the Stalingrad victory, and he commanded the Central Front at Kursk, withstanding the main German assault and allowing the Soviet counterattack and victory. He commanded the first Belorussian front through Operation BAGRATION and the second Belorussian front through East Prussia and Pomerania, covering the advance on Berlin although he was bitterly disappointed at missing out on the city itself. Nonetheless, Stalin marked his achievements, giving him command of the Victory Parade in Moscow.

After the war, Rokossovsky commanded Soviet forces in Poland until 1949, becoming Polish defense minister. Returning to Russia, he was appointed deputy minister of defense and chief inspector of the Ministry of Defense (1956–1957 and 1958–1962). His career ended with his being removed to Transbaikal (1957–1958) during Communist Party leader Nikita Khrushchev's purge of Marshal Georgy Konstantinovich Zhukov. While writing his memoirs in retirement, Rokossovsky died in Moscow.

Roland

Roland, Lord of the Breton Marches, died when the rear guard for Charlemagne's column was cut off and ambushed in the Pyrenees. Einhard mentions Roland as one of the commanders killed in an ambush by the Basques in 778. Part of the success of the Basques was attributed to their

light arms and the uneven terrain in which the battle was fought. The Franks were also hampered by darkness and their heavy equipment. Roland's death was immortalized in the *Chason de Roland*, which emphasizes the actions of a loyal vassal rather than the actual battle in which he died.

Rollo

Duke of Normandy (c. 911–c. 930), also known as Hrolf Geganger (Ralph the Walker), who was the successful leader of a Norse raiding band that entered into a treaty with Charles III (the Simple). The treaty of St.-Clair-sur-Epte in 911 ceded the strategic coastal counties of Neustria, the lower basin of the Seine River, as a duchy for Norse settlement to Rollo. As duke of Normandy, Rollo became Charles's vassal, was baptized, and agreed to defend against other raiding bands. After Charles's death in 924, Rollo enlarged his duchy by the addition of Bayeux.

Roman Army

One of the world's longest-lasting and most successful military organizations in history, enlarging and defending Rome. The Roman army started as a tribal militia during the kingdom and early republic periods, but the pressure of the surrounding Etruscan and Greek cities brought about the adoption of the Greek phalanx and its weaponry and, more important, a formalized system of recruitment by centuries of families of different economic ability, who furnished cavalry, heavy infantry, or light infantry, as appropriate. The expansion of the empire brought about the formation of the legion, a flexible heavy infantry (plus support) formation of about 5,000 men. Property requirements for recruitment were relaxed, and soldiers were paid on a regular basis. New types of weapons and armor were introduced. Formal regu-

lations for all aspects of army discipline, organization, training, and tactics were adopted. The legion formation lasted throughout most of the empire's existence. As armored and often mounted barbarians pushed into the empire from about the second century C.E., the Roman army was divided into two types of units. The old legion, the mainstay of the army for centuries, became (often understrength) *limitanei*, who garrisoned frontier zones. Mobile armored cavalry field armies, or *comitatenses*, under the command of an emperor or his deputy, a caesar, could move rapidly to repel invaders. The ultimate defeat of the Roman army came about for numerous reasons, including the economic and political exhaustion of the empire and pressure by "barbarians" from beyond the empire's borders who had learned more sophisticated military technologies and organization, often from the Romans themselves.

Organization, Manpower, and Training

The Roman army was composed of legions of about 4,200–5,000 heavy infantrymen. Legions were divided into cohorts of about 500–800 men, in turn divided into centuries or maniples of 60–120 men. Support troops at various times included *velites*, or allied light infantry, as skirmishers; cavalry troops of around 120 men for the scouting and communication role; and field engineers. Separate *ilarii* (regiments) of cavalry were raised from among the wealthier classes. At its height, the empire had some 30 legions stationed throughout the empire.

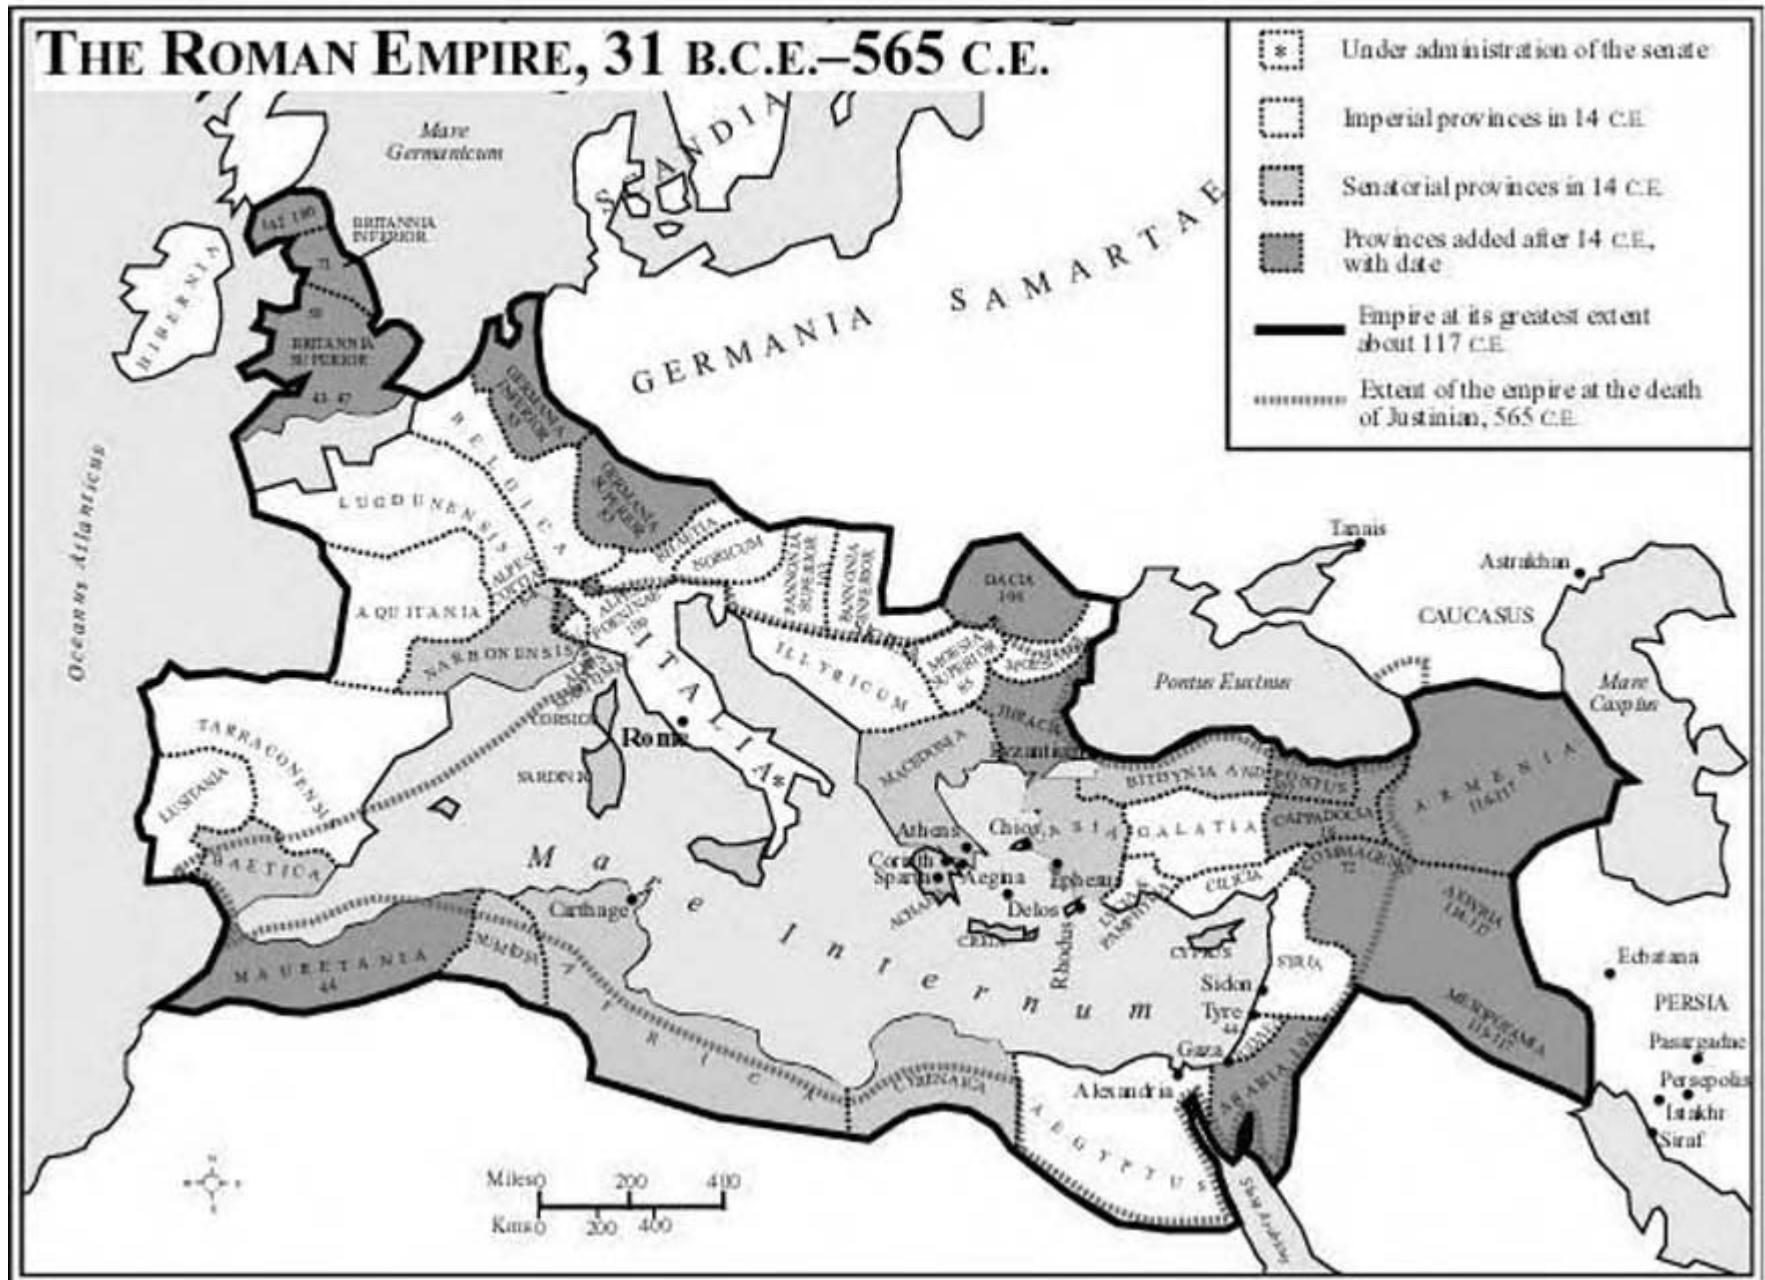

Non-Roman auxiliaries provided the army with specialist forces—light infantry skirmishers, light and heavy cavalry, slingers, and archers—where the Romans were weak. Auxiliary soldiers could become Roman citizens upon completion of service.

Command was exercised by officers appointed by the Senate or in the field. Legions were commanded by consuls or legates appointed by the Senate and (later) the emperor. The legate was assisted by six tribunes, young men on a career path to the Senate, or senior tribunes aiming for a legate's post themselves. Each century was commanded by a centurion, assisted by an *optio* and a *signifer*, who, in addition to carrying the century's standard, served as the century's banker. The senior centurion of the legion served on the staff with the tribunes.

Recruits to the legions were trained in marching, close order drill, use of weapons, and making and breaking camp. They normally served 16 or 20 years.

Weapons

Soldiers were equipped with body armor (breastguards, chain mail shirts, or the *lorica segmentata*) and a bronze or iron helmet. A large oval or rectangular *scutum* shield, composed of layers of laminated wood covered with hide cen-

tered by a metal boss, was used as a weapon of offense in the charge and defense against arrows and blows. The principle weapons were a single-use *pilum* javelin, thrown before charging or in defense, and a broad, short, stabbing blade, the *gladius hispanensis*. Fire support was offered by *ballistae*, using wound leather and sinew coils to throw stones and firebrands, and single or repeat-shot *onager* bolt throwers.

Tactics and Movement

Roman doctrine emphasized a one-foot-on-the-ground approach. In battle, troops of the front line charged, while the rear formed a mobile defense base, hurling javelins and other ranged weaponry from behind a shield wall or charging in turn. The legion on the move established fortified camps at the end of every day. Engineering was emphasized strongly, and by the time the rear elements had left the previous day's camp, the forward elements would often already be building the next one. A legion was capable of constructing bridges and offensive and defensive siege works of great magnitude, as Alesia, Masada, and other surviving sites attest.

In a pitched battle, the light elements engaged first, breaking up enemy charges (particularly lightly armored Celtic and Germanic troops) with volleys of javelins, stones, and arrows. The front maniples or centuries then charged, after discharging their *pilla*. Hand-to-hand combat followed, the legionaries on the contact line sheltering behind their shields and thrusting with their swords. For 1,000 years, through republic and empire, defeats and victories, the Roman military endured with remarkably little change.

Roman Civil Wars (88–30 B.C.E.)

A series of civil wars that ultimately led to the end of the Roman Republic. Immediately following the Social War, which set a precedent for internecine conflict, competition among members of the Roman aristocracy was so intense that political solutions were usually only achieved through vio-

lence. This competition was further exacerbated by foreign wars, which put immense power in the hands of ambitious military leaders who put personal interest above the welfare of the republic.

88–73 B.C.E.

The personal and political rivalry between Gaius Marius (157–86) and Lucius Cornelius Sulla (138–78) led to the first outright civil war in the history of the Roman Republic. Conspiring with the tribune, Publius Sulpicius (Rufus?), Marius had Sulla replaced as commander of the war against Mithradates in 89. Back in Rome, Sulla responded by declaring religious holidays in order to prevent meetings of the assembly. Sulpicius and his followers rioted, forcing Sulla into hiding in the home of Marius. In exchange for rescinding the religious decrees, Marius allowed Sulla to flee into exile. However, Sulla used Marius's favor as an opportunity to form an army in Campania, with which he marched on Rome. Rome's plebeians stubbornly resisted the attack but gave up once Sulla's forces began setting fire to their homes. Once in control of the city, the victorious Sulla forced the Senate to declare Marius, Sulpicius, and other nobles enemies of the state. In addition, he obtained proscriptions (i.e., laws establishing death sentences) for these men. Sulla executed Sulpicius, but Marius escaped to North Africa. Sulla then attempted to consolidate his power by rescinding Sulpicius's laws. However, while Sulla was on campaign again against Mithradates, Lucius Cornelius Cinna (d. 84), the new consul, rescinded Sulla's laws and recalled Marius to Rome.

A deranged and elderly Marius, furious over his exile by Sulla's faction, raged through the city, brutally murdering the senators and nobles who had opposed him. Even Cinna, Marius's ally, was disturbed by these actions and begged him to stop. Marius died suddenly of illness in 86, whereupon Cinna became de facto dictator and tried to govern without the excesses of Sulla and Marius.

Sulla, still outraged by Cinna's alliance with Marius, temporarily restrained Mithradates and returned to Italy to take revenge upon his enemies in the spring of 83. Landing at Brundisium, Sulla quickly defeated one of the two armies sent against him and convinced the other to defect to his side. Near Rome's Colline Gate, Sulla met a force of Samnites, among Rome's fiercest opponents in the Social War. Sulla narrowly avoided defeat and took control of Italy thanks to the excellent generalship of Marcus Licinius Crassus, who led Sulla's right flank. Sulla's victory led to a reign of terror, which began with the torture and execution of 6,000 Samnite prisoners and culminated in proscriptions that exceeded even the brutality of Marius. Sulla's reign of terror, not limited to Roman elites, extended to those Italian cities

that had supported resistance to Sulla. Many of the inhabitants of Praeneste, Florentia (Florence), and especially Samnina were sold into slavery and their lands destroyed and turned into desert.

Making an effort at military reforms, Sulla gave the lands of many of his defeated enemies to his loyal soldiers and tried to limit the power of provincial commanders to make war by giving control of the army over to the Senate. Sulla died in 78, thinking his work successful. However, chaos soon overtook Roman political life as the families of the victims of Sulla's proscriptions sought revenge, and Sulla's soldiers, unused to farming, fell into indebtedness. Moreover, Quintus Sertorius (123–c. 74), provincial military commander in Spain and opponent of Sulla, combined the guerrilla tactics of his Spanish troops with Roman discipline to create an effective renegade force that was feared by the Roman Senate. Quintus Caecilius Metellus Pius (d. 63) led a failed campaign against the renegade. Only Sertorius's assassination in 74 or 73, allowed Gnaeus Pompeius Magnus, Pompey the Great (106–48), to wrest control of the rogue forces, declaring them loyal to Rome.

70–45 B.C.E.

Julius Gaius Caesar, initially the least powerful member of the First Triumvirate, which also included Pompey and Crassus, would eventually destroy the republic and briefly become master of Rome. In 70, Pompey and Crassus, Rome's most powerful generals after the defeat of Spartacus, discarded Sulla's reforms and were both elected consuls. Despite their intense rivalry, Pompey and Crassus cooperated in order to achieve their political goals until the rise of Caesar, when, in 60, they joined with Caesar in forming the First Triumvirate. Although not an alliance or faction in a legal sense, the members of this triumvirate agreed to pursue only those political ends agreeable to the others. Crassus was killed on campaign against the Parthians at Carrhae in the spring of 53, leaving only Caesar and Pompey.

Fearing Caesar's steady rise in prestige and power from to his success in the Gallic Wars, the Senate commanded him to surrender his legions in the summer of 50. Caesar defied the Senate and marched a Roman legion supported by German and Gallic auxiliaries into Cisalpine Gaul. On 20 November 50 B.C.E. (traditionally 11 January 49 B.C.E.), Caesar sent a small force to seize the village of Ariminum, just south of the Rubicon River, which separated Cisalpine Gaul from Italy. In a brilliantly calculated risk, Caesar quoted the Greek playwright Menander, "The die has been cast," crossed the Rubicon with only one legion, and invaded Italy that winter.

Pompey had two legions to Caesar's one, but they were untrained, isolated, and could offer only token resistance to

Caesar's organized and fast-marching force. Caesar quickly conquered Italy and entered Rome. Pompey and the Senate fled to Epirus in Greece, where they attempted to consolidate their forces. With Rome under control, Caesar marched toward Spain. Half of his forces, led by Domitius Ahenobarus, laid siege to Massilia (Marseilles) in Gaul, which was both a Pompeian stronghold and an important communication link between Spain and Italy. The other half, led by Scribonius Curio, defeated Pompey's generals, Afranius and Petreius, at Ilerda, Spain, in the summer of 49. Curio was soon after killed in North Africa, fighting Attius Varus and King Juba of Numidia.

In the winter of 48, Caesar surprised Pompey by sailing across the Adriatic from Brundisium to the port of Dyrrhachium in Greece. This campaign almost immediately ended in disaster, when Calpurnius Bibulus, leading Pompey's fleet, captured Caesar's ships and supplies. Caesar was forced to retreat from Dyrrhachium to Pharsalus in Thessaly, where, attacked by Pompey on 9 August 48, he again faced disaster.

However, although vastly outnumbered, Caesar's well-trained veterans humiliated Pompey, who fled to Egypt. Upon arriving in Egypt, Pompey was murdered by Ptolemy XIII, who hoped to ally with Caesar. Angered by Ptolemy's action, Caesar instead allied with Ptolemy's sister and opponent, Cleopatra. With a force of 20,000, Ptolemy led a four-month-long siege against Caesar's small legion of 4,000 in Alexandria. Often close to defeat, Caesar survived until January 47, when he was relieved by two legions led by Mithradates of Pergamum. Caesar, leading Mithradates' legions, won the Battle of the Nile in February 47 and gained control of Egypt.

In the fall of 47, Caesar, again outnumbered, defeated a Pompeian force led by Cato the Younger and the inept Metellus Scipio at Thapsus in North Africa. Rather than be captured by Caesar, Cato committed suicide, thus becoming a martyr to the republican cause. Caesar's final victory against Pompeian forces came at Munda in Spain in 46–45. Attacking uphill, his forces defeated Pompey's two sons, Gnaeus and Sextus.

Caesar returned to Rome, where he was proclaimed dictator for 10 years and given four military triumphs. Over 60 senators assassinated Caesar on 15 March 44, just as he was about to depart on a campaign against the Dacians and the Parthians.

44–30 B.C.E.

In the winter of 44–43, Mark Antony, Caesar's protégé in the consulship of 44, besieged the republican Decimus Brutus at Mutina (Modena) in Cisalpine Gaul. Decimus Brutus was allied with Octavian (later Augustus), Caesar's adopted son. Two armies sent by the Senate, one led by Octavian and the

other led by Aulus Hirtius and Gaius Vibius Pansa, forced Antony to retreat to Gaul in the spring of 43.

Octavian returned to Rome, where he became consul. Despite Antony's retreat, Octavian respected him and appreciated that a strong general leading robust legions could be more useful than a republican allegiance. Meanwhile, Antony had won the admiration of the powerful legions of Marcus Aemilius Lepidus. On 27 November 43 B.C.E., Octavian, Antony, and Lepidus formed a formal executive committee, known as the Second Triumvirate. Almost immediately, the triumvirs imposed proscriptions in which 130 senators and 2,000 knights, including the great orator Cicero, were killed. In the fall of 42, two of the triumvirs, Antony and Octavian, pursued Marcus Brutus and Gaius Cassius, among the co-conspirators in Caesar's assassination, to Greece.

At Philippi in 42, Brutus defeated Octavian. However, Antony inflicted an even more crushing defeat upon Cassius, who committed suicide. Relieving Octavian, Antony soon crushed Brutus, who also committed suicide. Tension developed immediately as Antony's wife, Fulvia, and brother, Lucius, fomented suspicion against Octavian among veterans and landowners. In 40 B.C.E., an outraged Octavian commanded two of his generals, Quintus Salvidienus and Marcus Vipsanius Agrippa, to besiege Fulvia and Lucius at Perusia (Perugia). Although he spared their lives, their deaths soon after eased tensions between Antony and Octavian. Later in 40, Octavian and Antony made an agreement known as the Pact of Brundisium, which reaffirmed the triumvirate and officially divided the empire (the east to Antony, the west to Octavian, and Africa to Lepidus).

The peace would not last long. Pompey's son, Sextus, harassed Italy from the sea and threatened Rome with starvation. In exchange for ending the blockade against Rome, the triumvirs agreed to compensate Sextus for his father's confiscated lands and to give him control of Sicily, Sardinia, Corsica, and the Peloponnese. Peace lasted until 38, when Octavian attempted an invasion of Sicily that ended in disaster. Antony, angry with Octavian for failing to consult him and for delaying his campaign against the Parthians, nevertheless reaffirmed his support of the triumvirate by agreeing to the Pact of Tarentum in 37.

In 36, Octavian's general, Agrippa, finally defeated Sextus in a sea battle at Naulochus near the straits of Messina. Lepidus tried to take Sicily for his own. Angered by Lepidus's action and sensing an opportunity to rid himself of another rival, Octavian spoke directly to Lepidus's legions and convinced them to defect. The defection of these legions eliminated Lepidus as a triumvir.

With Lepidus's departure, tensions increased between the remaining triumvirs, Octavian and Antony. The latter had suffered significant losses in his campaign against the

Parthians in 36 but remained strong and popular, until his relationship and alliance with Cleopatra began to tarnish his reputation. By declaring war on Cleopatra rather than Antony in the fall of 32, Octavian cleverly avoided the risk of appearing to initiate another civil war. On 2 September 31, Octavian won a decisive victory over Antony at Actium. Octavian's dependable general Agrippa blockaded Antony's camp, causing plague, famine, and desertions. Antony and Cleopatra escaped the blockade, abandoning the bulk of the army. Octavian's victory was so complete that, instead of pursuing Antony and Cleopatra, he returned to Italy.

Octavian returned to Egypt the next summer. Unable to mount a serious defense, Antony and Cleopatra committed suicide. Cleopatra's death marked the end of the Ptolemaic dynasty and the beginning of Roman rule of Egypt. Octavian's victory also marked the end of the Roman Republic. Although many republican institutions remained, the power of Rome was now concentrated in one man, Octavian (soon to be Augustus Caesar).

Roman Civil Wars (235–284)

The interval from the Severans to Diocletian began and ended with strong government, separated by political instability and military stress. Traditionally known as the “period of anarchy,” this half-century saw at least 18 “legitimate” Roman emperors and many more if numerous usurpers who failed to establish themselves are counted. Nearly all had short reigns and met violent deaths.

The assassination (March 235) and replacement of Severus Alexander by a tough officer from Thrace, Maximinus I Thrax (r. 235–238), was a stark reminder that the empire needed soldier-emperors who knew the army. An equestrian outside the ruling clique, Maximinus had exploited the opportunities of the Severan army to gain numerous senior appointments. He also established the pattern of succession by murder and civil war.

The Persian campaign of Gordian III (r. 238–244) ended in the emperor's defeat and death, perhaps at the hands of his successor Philip the Arab (r. 244–249). In the mid-250s, Shapur's invasion ended with the capture of the emperor Valerian (r. 253–260), who remained in captivity until his death. Mesopotamia and Syria were overrun by the advancing Persians, but the Sassanians failed to drive the Roman frontier back to Syria. By the end of the century, the campaigns of Aurelian (r. 270–275) and Carus (r. 282–283) had helped reestablish Roman predominance.

By 249, the Goths had emerged as a threat on the Danube River, with Franks and Alemanni pressing the Rhine frontier and Saxons raiding Britain and Gaul. Gothic invasions penetrated Thrace and Asia Minor. The emperor Trajan Decius (249–251) fell fighting this new enemy.

Although the empire was hard-pressed for two decades, much was achieved in the name of Rome by the regimes of the usurper Postumus and his successors in Gaul (the Gallo-Roman Empire, 260–274) and in the east by the Palmyrene Empire of Septimius Odaenathus and Septimia Zenobia. Aurelian suppressed both rebellions but had to abandon Dacia to the Goths. His successor Probus (r. 276–282) cleared Gaul of Germanic invaders who had crossed the Rhine River after Aurelian's assassination, but the Alemanni retained territory seized in southern Germany.

During the third century, the number of those of senatorial rank holding senior army positions became fewer and fewer, and the practice disappeared entirely under Gallienus (r. 253–268). Far more opportunities lay open to equestrians, especially those who had campaigned under the emperor himself. These equestrian officers were generally career soldiers. They owed their advancement purely to their military record and imperial favor. It was usually such men who murdered emperors and nominated usurpers from their own group. Several of the most successful emperors of the second half of the century came from a small group of Illyrian equestrians. A number proved very capable.

Internal instability led to losses and defeats on all sides and encouraged internal rebellions. Each emperor had to campaign without respite. Few could afford to entrust command of an army to a potential rival. While the emperor was campaigning in one theater of operations, there was great

danger that other, neglected parts of the empire would put forward rivals.

It was Gallienus who developed the new device by which his Illyrian successors fought off Persians and Germanic tribes alike. It was an "elite army," in the words of one observer, a mobile force not tied to frontier defense. The troops were drawn from units in Britain, on the Rhine River, and on the Danube River. They operated independently and were forerunners of the fourth-century *comitatenses* (field armies). There are also reports of cavalry corps under their own commanders.

A measure of stability was created by one of the Illyrian soldier-emperors, Diocletian (r. 284–305). He gradually developed a system of dividing imperial power (the Tetrarchy). In the mature form of this system, there were two senior Augusti, ruling the eastern and western provinces respectively, each assisted by a junior colleague or caesar. The system was intended to provide sufficient commanders to deal with simultaneous crises. At the same time, by nominating the caesars as successors to their senior colleagues, civil wars could be prevented by providing for the ambitions of all men with armies.

Roman Republic, Wars of the (111–63 B.C.E.)

A series of internal conflicts and wars that furthered the expansion and security of the Roman Republic.

111–106 B.C.E.

King Jugurtha, with the help of corrupt Roman senators, wrested control of Numidia in 111 through murder and intrigue. The Roman Senate supported Jugurtha but became concerned when Jugurtha laid siege to Cirta (Constantine, Algeria), an important source of grain for Rome. Jugurtha foolishly enraged Rome's popular classes by murdering several Roman knights (*equites*), who as merchants were trapped in the city during the siege. Although forced to declare war by the *equites*, the Senate pursued only a half-hearted campaign against Jugurtha. Only after Jugurtha openly intrigued to murder one of his Numidian opponents in Rome did the corrupt Senate pursue the war with serious-

ness. The Senate renewed its war against Jugurtha in 110 but was soundly defeated. In 109, the frustrated popular classes, especially the *equites*, forced the Senate not only to prosecute the corrupt senators who had supported Jugurtha but also to appoint Quintus Caecilius Metellus as consul to lead the campaign. Despite his honesty and competence as a general, Metellus was soon politically outmaneuvered by his subordinate, Gaius Marius (157–86). Marius gained the consulship and control of the Numidian campaign in 107. Marius's subordinate in the campaign, Lucius Cornelius Sulla (138–78), won a swift end to the Jugurthine War in 106 by bribing Jugurtha's ally, King Bochas of Mauretania, to betray him. Jugurtha met his death in the dungeon of Tullianum after Marius's triumph in 104.

105–88 B.C.E.

In preparing for the Numidian campaign, Marius instituted the permanent acceptance of recruits into the army, regardless of property qualifications. Roman generals had only previously employed this manner of recruitment in exigent circumstances. This move kept Rome supplied with a steady contingent of recruits, but it also tempted some commanders to incite foreign crises in order to win personal glory. It would also have tremendous implications during the Roman Civil Wars by effectively making propertyless recruits more loyal to individual commanders than to the interests of the Senate. The end of the Jugurthine War also marked the beginning of the rise of both Marius and Sulla as *popularis* leaders.

After the defeat of Jugurtha, Marius reorganized the Roman legions. Standardizing equipment and training for the legions, he also eliminated light units and divided each legion into 10 cohorts of 500–600, which he further divided into centuries of between 80 and 100, thus creating legions of 5,000–6,000 heavily armed men. Marius's reforms made the legions more cohesive, versatile, and formidable. They were devastatingly effective against the migrating Cimbri and Teutons, who had humiliatingly defeated several Roman armies in Transalpine Gaul in 109, 106, and 105. In 104, the slaves of Sicily rebelled into full-scale war. Tens of thousands were killed before Marius's easy victory over the Cimbrians at Vercellae near Turin in 102 freed his troops to put down the rebellion in 100.

As threatening as was Sicilian slave revolt, nothing threatened Roman hegemony in Italy more than the Italian or Social War (90–88). Rome's Italian allies (in Latin, *socii*) had hoped to secure the right of citizenship through peaceful means but were rejected by the city's privileged *optimates*. The Italian allies, called *Corfinum* (later renamed Italia) and led by the Marsi and Samnites, raised a force of

100,000, many of whom had been trained in Rome's legions. Initially, Rome fared poorly; thus the Senate reluctantly, but wisely, conferred citizenship upon those Italians who laid down their arms. As that was the goal of the Italians, the Social War ended, with a few exceptions, by 88. However, the Social War boded ill for the future of Rome by setting a precedent for the Roman Civil Wars.

89–72 B.C.E.

Taking advantage of the upheaval caused by the Social War, Mithradates VI Eupator (134–63) of Pontus tried to build an empire modeled on that of Alexander the Great, in part by expelling Rome from the eastern Mediterranean in what became known as the Mithradatic Wars. Wary of Mithradates' aspirations, Rome sent an envoy to Asia Minor, where he skillfully checked Mithradates' advances, but he also foolishly impelled Nicomedes III of Cappadocia to attack Pontus. Mithradates responded by sweeping aside the Romans in Asia Minor, taking Pergamum, and pressing on toward Greece. Because of Rome's unpopularity in the region, Mithradates soon won the support and control of much of southern Greece, including Athens. However, Sulla recaptured Athens and pushed Mithradates from Greece by the summer of 86. In Asia Minor, Lucius Valerius Flaccus, Sulla's rival, was murdered in a mutiny, but his force defeated Mithradates' son and took Pergamum. Although Sulla soon expelled him from Asia Minor, Mithradates was not yet defeated. In 74, Mithradates, fearing the Romans would block his access to the Aegean Sea, occupied the Roman client state of Bithynia. In 72, the Roman commander Lucius Licinius Lucullus (116–57), after the failures of several other Roman commanders, defeated Mithradates, who was aided by formidable Mediterranean pirates, in a series of crushing victories. Mithradates fled into exile to the court of King Tigranes II in Armenia.

68–53 B.C.E.

In 68, Gnaeus Pompeius Magnus, Pompey the Great (106–48), cleared the Mediterranean of pirates in a mere 40 days by concentrating his forces and treating the outlaws mercifully, many of whom became his valuable allies. Pompey's resulting fame gained him the command of the final operation against Mithradates. Mithradates' last attempt to challenge Rome was a pathetic effort and was quickly crushed by Pompey in the Crimea. Mithradates committed suicide in 63, and much of his empire came under Roman rule. Also in that year, Pompey marched on Syria to restore order in the wake of the Seleucids' loss of their eastern empire to the Parthians, who became Rome's major rivals in the east. In the winter of 54, Marcus Licinius Crassus, Pompey's partner

Roman hero Horatius defending the Tiber Bridge against the army of Lars Porsena c. 505 B.C.E. (Hulton/Archive)

and rival in the First Triumvirate, confidently set off on a militarily unnecessary campaign against the Parthians. However, the Parthians at Carrhae slaughtered him and his seven legions.

Roman-Etruscan Wars (509–234 B.C.E.)

In 509 B.C.E., the Romans, led by Brutus, overthrew the last king of Rome, a member of the Etruscan line of Tarquin. Although the Etruscans had been forced out of Rome, there were still powerful Etruscan cities in Italy that challenged Rome for vital resources and strategic control. The most dangerous of these was Veii, only 12 miles north of Rome on the Tiber River. Closer to Rome and more powerful than any other Etruscan city, Veii controlled much of the west bank of the Tiber and contested with Rome over the lucrative trade to the Italian hinterland, as well as access to the port of Ostia and the valuable salt flats there.

The Fabii family in Rome, who had long-standing Etruscan connections and owned much of the land between the two cities, largely took responsibility for frontier defense, building a small fortress at Cremora and assembling a private army of clients while engaging in cattle raiding. In 476 B.C.E., however, the Veii attacked the fortress, and more than 300 Fabii were killed, leaving the area, including the Janicu-

lum Hill, in enemy hands. Forced to retreat, Rome made a truce.

During the cold war that ensued, Rome and Veii focused on the town of Fidenae, a station on the “salt road” between them, which changed hands several times. Rome, growing stronger, prepared for a battle to the death with Veii, overhauling its government by replacing the two consuls with six military tribunes, each with consular authority, and implementing censorship in order to maintain rolls of citizens liable for military service. Noting that the Etruscans had been defeated at sea by the Greeks at Cumae in 443 B.C.E., Rome seized Fidenae in 435 B.C.E. (or 425) and declared war on Veii, which appealed to the other Etruscan cities in vain for assistance. A six-year siege ensued, with the Veii cutting their cliffs to make them harder to climb and erecting stone and earth ramparts. The Romans, under the command of Camillus, who had forced them to accept continual military operations (with no breaks for seasonal agriculture) and organized regular pay for soldiers, seized the land neck to Veii and discovered irrigation conduits leading under the city walls. A small force crept through them into the city, which fell swiftly to the Romans. As a lesson, Rome destroyed Veii and occupied all its land, nearly doubling Rome’s acreage.

Triumphant, Rome adopted Veii’s worship of Juno, and Camillus sent a gold bowl to the Oracle at Delphi to celebrate his victory. During the Gallic invasion of 387–386 B.C.E., the Etruscan city of Caere aided Rome, saving refugees and many of the city’s relics while pressuring the Gallic chief Brunnus to leave the area. Caere was rewarded with special privileges by Rome, but in 353 B.C.E., it joined with another Etruscan city, Tarquinii, to resist Roman expansion and was defeated, although the Romans afterward offered a generous century-long truce. Other Etruscan cities continued to cause problems for Rome. Capua joined with the Samnites, Umbrians, and Gauls against Rome in the Third Samnite War (298–290 B.C.E.) and was defeated at Sentinum, after which Rome ravaged the area.

Because of continual warfare in the peninsula, the Romans adopted the legionary organization and maniples, which allowed maximum flexibility on the battlefield, and began to issue standardized equipment. Through contact with Etruscans, Rome learned the craft of shipbuilding, crucial in its wars with Carthage, and adopted gladiatorial combat as entertainment. The Etruscans, seven of whose cities had joined in a pact with Rome in 280 B.C.E., erupted only once more. While Hannibal and Hasdrubal marauded through Italy, disaffected Etruscan cities offered him assistance, until Hasdrubal’s defeat at Metaurus Valley in 209 B.C.E. ended the long-standing rivalry between the ancient Etruscans and their upstart neighbors, the Romans.

Rommel, Erwin Johannes Eugen (1891–1944)

Prominent and influential German commander of World War II. Commissioned an infantry officer in January 1912, from his first moments under fire in August 1914, Erwin Rommel displayed remarkable aggression, complete faith in his troops and himself, and great gallantry.

In October 1916, he married Lucie Mollin, then a Red Cross nurse. In 1917, his Gebirgsjäger Battalion was transferred from the Romanian front to the Italian, where he took Monte Matajure and turned the Longarone position, for which he received the Pour le Mérite. After the Armistice, he was accepted into the Reichswehr but remained a regimental officer, never being selected for general staff training. Rommel also wrote *Infantry Attacks*, which brought him to Adolf Hitler’s attention.

During the invasion of Poland (1939), Major General Rommel commanded the Führer’s headquarters battalion. His loyalty was rewarded with the 7th Panzer Division, which he led to great acclaim during the French campaign. Command of the Afrika Korps in February 1941 resulted in his promotion to field marshal in June 1942 for reducing the British fortress of Tobruk. But Hitler’s “stand fast” order at El Alamein in November 1942, resulting in needless Axis casualties, probably marked a turning point in Rommel’s life.

Despite an award of diamonds with swords and oak leaves to his Knight’s Cross and command of Army Group B, Rommel became embittered by German casualties and conduct in Italy. Only his personal friendship with Hitler slowed his growing defeatism and pessimism: unlike Hitler and most of the German High Command, Rommel took American troops and industry seriously, despite early U.S. defeats in North Africa.

Rommel’s defense of Normandy in June 1944 incurred savage German losses. Hitler’s refusal to use these sacrifices to negotiate a surrender led Rommel to confront Hitler about strategy, war crimes, and finally the continued fighting in the West itself and to have at least a marginal involvement in the 1944 bomb plot against the Führer. Wounded by British fighter-bombers, he was doomed by the failed assas-

General Rommel standing in a command car in the North African desert, 1942. (Library of Congress)

sination of Hitler on 20 July. On 14 October 1944, he committed suicide to protect his family and staff.

Roosevelt, Franklin D. (1882–1945)

Born in Hyde Park, New York, the only son of an elderly businessman and his second wife, Roosevelt was privately educated at home until age 14. Following graduation from Groton and Harvard University (1904), Roosevelt studied law at Columbia University but left before earning a degree. A Democrat, he was elected to the New York State Senate in 1910. He was appointed assistant secretary of the navy in the

Wilson administration (1913–1921). He advocated preparedness and a big navy and instituted training for reservists prior to American entry into World War I. He also supported universal military training. In the Democratic debacle of 1920, he failed to win election to the vice presidency as James Cox's running mate, and his political activity was interrupted by a bout of polio in 1921. Partially recovered by 1928, though he never regained the use of his legs, he was elected governor of New York (1928) and thirty-second president of the United States (1932, 1936, 1940, 1944). In foreign policy, Roosevelt, well ahead of most Americans, gradually came to appreciate the threat posed to world peace and American security by totalitarian dictators. The United States maintained an uneasy neutrality during international crises such as the Spanish Civil War (1936–1939). At first reluctant to challenge isolationists, by 1940 Roosevelt initiated Lend-Lease to Britain and later the Soviet Union; exchanged overage American destroyers for the use of British naval bases in the Caribbean; and embargoed Japanese purchases of oil and steel. Following the Pearl Harbor attack in December 1941, Roosevelt was accused of having provoked Japan

into attacking the United States first, but no credible evidence of this has yet been uncovered. (No one has yet been able to explain why Roosevelt, his hands full with the German menace, would wish to provoke Japan as well.) With British prime minister Winston Churchill, Roosevelt determined that Nazi Germany, the more dangerous foe, must be defeated before Japan. In sometimes uneasy alliance with Churchill and later Soviet premier Stalin, a second front strategy was devised, with invasions of North Africa, Italy, and finally, in June 1944, France and the continent of Europe itself. Other challenges included German submarine attacks on Atlantic shipping and the decision to develop an atomic bomb. Following the American victory at Midway (June 1942), Roosevelt supported an indirect policy in the Pacific. Naval and Marine forces “island-hopped,” temporarily bypassing Japanese strong points, while General Douglas MacArthur’s troops fought their way north from Australia to New Guinea and the Philippines. Roosevelt believed that with American material support, Nationalist China would be a strong postwar partner, but internal corruption and inter-

mittent civil war with Communist forces rendered that policy untenable.

Wartime growth of the U.S. economy overcame the lingering effects from the Great Depression. Compared to the Allies and belligerents, the American public had guns as well as butter during the war. Roosevelt never fully mobilized the American home front. The United States could also depend in part on growing Soviet might to help confront Germany and Japan and hold down American casualties. Alone among the leaders of the belligerent powers of World War II, Franklin Roosevelt had to face the public in a general election; he won handily over the New Yorker Thomas E. Dewey and became the only American president to win a fourth term, after his unprecedented third-term victory in 1940.

Valuable worldwide intelligence services were performed by the wartime Office of Strategic Services (OSS), forerunner of the modern Central Intelligence Agency, and by the Office of War Information (OWI), as well as a host of government and military-governmental agencies that projected American military and economic might around the globe.

President Franklin D. Roosevelt meets with Soviet premier Josef Stalin (left) and British prime minister Winston Churchill (right) at the Russian embassy in Teheran. The conference, held 28 November to 1 December 1943, was one of several meetings held by the three to discuss strategy during World War II. (Library of Congress)

Roosevelt, Churchill, and Stalin initiated a policy of unconditional surrender for Axis forces and punishment for their crimes. Looking toward the postwar world, Roosevelt supported the creation of the United Nations, International Monetary Fund, and World Bank. His characteristic optimism led him to believe that Nationalist China would be a powerful ally during the war and to rely too much on Stalin's good intentions toward eastern Europe. Literally worn out by his labors, Roosevelt died of a cerebral hemorrhage on 12 April 1945, stunning the nation, many of whose citizens had no adult memories of any other chief executive.

Root, Elihu (1845–1937)

Lawyer and statesman who developed organizational structure for the twentieth-century U.S. Army. One of the leading corporate lawyers in the United States during the late nineteenth century, Root served as secretary of war under Presidents William McKinley and Theodore Roosevelt (1899–1904). Charged with the administration of territories acquired in the Spanish-American War, Root promoted effective government in Puerto Rico through the Foraker Act and drafted the Platt Amendment to safeguard U.S. interests in Cuba. He guided the suppression of the Filipino insurrection and wrote the constitution and legal code that governed the territory.

At home, Root's reforms improved the War Department's efficiency and the army's readiness. The General Staff Act of 1903 created the General Staff Corps and the Office of Chief of Staff, eliminating long-standing problems regarding the chain of command. It also established the Army War College to prepare officers for war. The Militia Act of 1903 established federal control over militia training, thereby transforming the state militia into the modern National Guard. Root also initiated the practice of rotating staff and line assignments.

As secretary of state (1905–1909), he improved U.S.–Latin American relations, smoothed U.S.–Japanese difficul-

ties, negotiated arbitration treaties, and resolved the U.S.–Canadian fisheries dispute. For these accomplishments and his earlier administration of U.S. possessions, Root received the Nobel Peace Prize in 1912. In 1917, President Woodrow Wilson sent Root to Russia in a futile attempt to bolster the government of Alexander Kerensky. In 1921, President Warren G. Harding appointed him as a delegate to the Washington Conference on naval disarmament. During his later years, Root unsuccessfully advocated U.S. membership in the World Court and directed the Carnegie Endowment for International Peace (1910–1925).

Rorke's Drift (22–23 January 1879)

A battle during the Anglo-Zulu War that was significant in restoring British morale after a crushing defeat at Isandlwana earlier the same day. Between 3,000 and 4,000 of the Zulu reserve under Prince Dabulamanzi kaMpande, who had taken no part in the Battle of Isandlwana on 22 January 1879 but were determined to prove their prowess, crossed the Mzinyathi (Buffalo) River to invade Natal.

Lieutenant J. R. M. Chard of the Royal Engineers, the commander of the small British base at Rorke's Drift, learned at about 3:00 P.M. that the Zulu were approaching. He hastily improvised a defensive perimeter of mealie-bags connecting the loopholed commissariat store, hospital, and stone cattle kraal held by 8 officers and 131 men, 35 of whom were sick. The Zulu began their assault at about 4:30, first from the south and then from the northwest, but were driven back by point-blank fire and the bayonet. At dusk, the Zulu extended their attack along the northern perimeter. The garrison fell back on final, improvised defenses, abandoning the hospital before it was fully evacuated.

However, heavy casualties, darkness, and fear of a relieving British force dissuaded the Zulu from making another full-scale assault after about 9:00 P.M., and firing ceased at about 4:00 A.M. The Zulu withdrew at first light, avoiding the remnants of the British column marching back from Isandlwana. Seventeen of the defenders were killed, and at least 600 Zulu. Eleven Victoria Crosses were awarded to members of the garrison.

Rosecrans, William Starke (1819–1898)

Union general in the American Civil War. Rosecrans was born in Kingston, Ohio, on 6 September 1819. After graduating fifth of 56 in the class of 1842 at the U.S. Military Academy at West Point, where his roommate was James Longstreet, he was commissioned in the army engineers and assigned to the construction of fortifications at Hampton Roads, Virginia. He taught at West Point from 1843 to 1847 and then resigned from the army in 1854. He quickly became a successful businessman, mining engineer, architect, and inventor.

Volunteering for duty under George B. McClellan in Ohio as soon as the Civil War broke out, Rosecrans first supervised the building of Camp Dennison, Ohio, and then became colonel of the 23rd Ohio Volunteer Infantry in June 1861. Among the soldiers under his command were future presidents Rutherford B. Hayes and William McKinley. As brigadier general of regulars and commander of the Army of Western Virginia, Rosecrans was the victor at Rich Mountain, Virginia (now West Virginia), on 11 July and at Carnifex Ferry, Virginia, on 10 September. When McClellan neglected to give him credit for these victories in the official reports, Rosecrans requested and received a transfer to the western theater.

Rosecrans performed well as commander of the left flank of the Army of the Mississippi during Henry W. Halleck's march to Corinth, Mississippi, and replaced John Pope as commander of this army in June 1862. Under Ulysses S. Grant, he won at Iuka, Mississippi, on 19 September and at Corinth on 3–4 October but failed both times to exploit his advantage. After Corinth, he was promoted to major general and given command of the XIV Corps, which he reshaped into the Army of the Cumberland. He defeated Braxton Bragg at Murfreesboro, and in the Tullahoma campaign that summer, he maneuvered Bragg out of Chattanooga with

minimal casualties. After Bragg routed him at Chickamauga, he retreated to Chattanooga, where Grant relieved him of command in October.

Rosecrans served out the rest of the war in minor functions and resigned in 1867. He represented California in Congress as a Democrat from 1881 to 1885 and died at Redondo Beach near Los Angeles on 11 March 1898.

Rossbach (5 November 1757)

Battle of the Seven Years' War (1756–1763) between Prussia and France and its imperial allies. In September 1757, Prussia was bankrupt and faced defeat. Frederick the Great, convinced that only military victory could secure peace, decided to attack the Franco-Imperial army under Prince Joseph von Sachsen-Hildburghausen and the French marshal Charles de Soubise. In two weeks, Frederick marched 170 miles, encountering the allies near the village of Rossbach. The Prussian army numbered 22,000 soldiers and 80 guns versus 42,500 allies and 114 guns. Sachsen-Hildburghausen convinced Soubise to attack, believing that a major victory would end the war.

Frederick crossed the Saale River on 3 November and awaited the allies' attack. On the morning of 5 November, they crossed his front. He marched his troops parallel to and ahead of the allied army in order to turn onto their right flank and stand perpendicular to their advancing columns. The allies interpreted Frederick's movement as a retreat and ordered a general pursuit. At 3:00 P.M., they realized their mistake as Prussian guns opened fire. Friedrich von Seydlitz led a cavalry counterattack and soon overwhelmed the allied advance units. Victorious, he then led numerous charges against the flanks of the allied army as Frederick ordered his infantry forward. The Franco-Imperial army disintegrated into a confused mass. French units formed columns, only to be torn to shreds by Prussian artillery and musket fire. By late afternoon, a final cavalry assault settled the affair, and the allied army retreated haphazardly into the darkness.

Roszbach was a spectacular Prussian victory. Frederick lost only 169 killed and 379 wounded, whereas France and the empire lost 5,000 dead and wounded, 5,000 prisoners (including 11 generals), and 72 guns. Because of Roszbach, Great Britain granted a subsidy to Prussia, thereby saving Frederick's war effort.

Rundstedt, Karl Rudolph Gerd von (1875–1953)

German field marshal. Rundstedt was commissioned an infantry officer in 1893, serving mainly as an adjutant. In 1902, he married Louise von Goetz and passed the general staff exam. After graduating from the Kriegsakademie and

-serving his probation, Rundstedt joined the Troop General Staff as a captain.

World War I saw Rundstedt serving on various staffs on both fronts, where he gained experience in occupation duties and mobile operations. After the Armistice, he was selected as a *Truppenamt* (the successor to the now-forbidden general staff) officer. Rising quickly within the small Reichswehr, he made general lieutenant in 1929 and in 1932 received the command of the Wehrkreis III, the troops used to destroy Prussia's social-democratic government.

Retiring in 1938, he nonetheless played a significant role in the conquest of Poland and France, being promoted to field marshal in June 1940. Rundstedt had been raised to serve a civilized state, and nothing in his background fitted him to confront barbarism: he promulgated Adolf Hitler's commissar order and another granting the troops immunity for virtually any crimes committed against Soviet civilians. Rundstedt also ordered the troops to cease photographing these crimes.

Hitler first relieved Rundstedt of command on 1 December 1941, sending him home with a guard of honor. Although they would differ, Rundstedt repaid Hitler's respect with total devotion. Appointed commander in chief on the western front in March 1942, he was relieved on 3 July 1944 and reappointed on 4 September 1944 to the same position.

Portrait of Karl Rudolph Gerd von Rundstedt. (Library of Congress)

Aware of but never participating in the plots against Hitler, Rundstedt sat on the Court of Honor that expelled dissident officers from the army for Gestapo prosecution. He delivered the eulogy at Rommel's funeral when the latter committed suicide, and rank folly though the Ardennes Offensive was, he nonetheless oversaw it. Rundstedt died in straitened circumstances on 24 February 1953.

Rupert, Prince (1619–1682)

British general and admiral. Rupert was the leading British military figure during the Civil and Dutch Wars of the seventeenth century.

Rupert was the nephew of Charles I, king of England, and son of Frederick V, “winter king” of Bohemia during the Thirty Years’ War. Driven into exile after the Battle of White Mountain on 8 November 1620, Rupert was raised in Holland, where he learned the art of war and command from Frederick Henry of Orange. Charles was greatly impressed with his nephew when Rupert visited England from 1635 to 1637. When Rupert was captured by imperial forces in 1638, Charles negotiated his release after three years.

Rupert arrived in England just before the war broke out between Charles and Parliament in August 1642. Despite his youth, Charles named Rupert to command his cavalry. The mounted troops constituted the cream of the royalist forces. The “Cavaliers” were natural riders, and their mounts were the best in England. Rupert’s attempts to discipline his command, however, were largely unsuccessful. The royalist cavalry proved to be irresistible in a charge but nearly impossible to reorganize for further attacks.

Rupert proved his abilities in battle at Powick Bridge and Edgehill on 23 October. He won further victories with his small forces in the spring of 1643 and then joined Sir Ralph Hopton to capture Bristol. In 1644, Rupert led a devastating march into Yorkshire and relieved the royalist garrison at York. At Marston Moor, on 2 July 1644, Rupert devised the royalist plan of battle. His horse successfully drove off the opposing Parliamentary cavalry, but Rupert was unable to rally them to defeat Cromwell’s Ironsides. Rupert’s army was virtually destroyed.

In November 1644, Rupert was named lieutenant general of all royalist armies. Against his advice, Charles decided to accept battle against Cromwell and Fairfax at Naseby on 4

June 1645. Despite a brilliant performance by Rupert, the royalist cavalry dispersed itself in pursuit and was unable to prevent the defeat of its infantry by the New Model Army. Rupert counseled peace, but his enemies at court convinced Charles to send Rupert into exile.

Rupert led a privateering expedition for the royalist cause between 1649 and 1653. After the Restoration in 1660, Charles II welcomed Rupert back to England. During the Dutch Wars, Rupert held several naval commands. He proved to be a competent naval commander and fought at Lowestoft (1665), the Four Days Battle (1666), and Sole Bay (1672). Rupert became commander in chief of the fleet in 1673 and led it to partial victories at Schooneveldt Bank and Texel, both in 1673.

Russia, Allied Intervention in

The entry of American, British, French, and Japanese forces onto Russian territory during the Russian Civil War (1918–1921). Following clashes between the Czech Legion and the Bolsheviks as the former tried to evacuate Siberian Russia, the Allies agreed to intervene to assist the Czechs but never cooperated with one another. Britain and France landed in Russia with two and three battalions, respectively, even entertaining the possibility of opening an eastern front against the Germans. The Americans landed units equal in strength to a division at Arkhangel’sk, Murmansk in northwestern Russia, and Vladivostok in the Far East, both to support the legion and to monitor the Japanese, who had entered Siberia with 12 divisions. Japanese intervention was motivated by that country’s own imperialist aims and without consultation with the Allies. The interventions proved ineffectual and had no real effect on the outcome of the Russian Civil War, though Russia resented the intervention and remained wary of the West for years afterward.

Britain withdrew support for the main White Army following an unsuccessful drive into central Russia by General Anton Ivanovich Denikin’s Volunteer Army, which was stopped 80 miles short of Moscow. General Peter Nikolae-vich Wrangel’ replaced Denikin, and France continued to

support Wrangel' until his army retreated into the Crimea and the Kuban region; the general and some of his forces were evacuated from the Crimea in 1920. Britain also supported General Nicholai Yudenich's unsuccessful drives on Petrograd (St. Petersburg, later Leningrad) from the Baltic states. Though the policy did not destroy Bolshevik power in Russia, the Baltic states did win their independence from Russia.

Admiral Aleksandr Vasil'evich Kolchak's White Army in Siberia launched an offensive in March 1919, but it quickly collapsed and the Whites were routed completely. The Czech Legion, which reached an agreement with the Bolsheviks, handed Kolchak over to the Reds and finally evacuated Russian Siberia in 1920. American troops in Vladivostok were soon evacuated as well, leaving only the Japanese, who remained in eastern Siberia until the Soviets gained control there in 1924.

Russian and Soviet Armies

The Rus', or Russian army of the Kievan period (ninth to thirteenth centuries), was made up of the princes' mounted retinues (*druzhina*) of cavalymen supplemented by city or town militias of infantry and mercenaries from among the non-Slavic tribes. Usually made up of some 15,000–25,000 men, it is thought to have reached 60,000 troops during Prince Sviatoslav's invasion of Bulgaria in 970. The troops were armed with bows and arrows, swords, spears, and clubs.

During the Mongol period (thirteenth to fifteenth centuries), Russia fragmented into various principalities with their own armies, usually made up of cavalymen. With the centralization of power in Muscovy in the late fifteenth century, the army was reorganized to serve the central government rather than regional princes. In the early Muscovite period, the army is thought to have numbered 40,000–50,000 men, and frontier troops were organized in the fourteenth century. Grand Prince Ivan III established a middle-service class of mounted troops in 1498, when he redistributed the newly confiscated Novgorodian lands to servitors

who held land on condition of service to the grand prince. The beginnings of an artillery corps was started by the Italian mercenary Aristotle Fioraventi, who brought bronze cannon to Russia in 1478. It was greatly expanded by Czar Ivan IV the Terrible when he attached two to four light cannons to each regiment in 1552. That same year, Ivan took 150 medium and heavy cannon on his campaign against Kazan. By the end of the 1500s, the Muscovite artillery park is thought to have numbered 2,000 guns, and the armed forces numbered some 300,000 men, including artillerymen and engineers.

In addition to these advances, Ivan IV established the *strel'tsy* (musketeers), who in addition to their military functions served as a police force and fire brigade in Moscow and also protected the czar and other Russian and foreign dignitaries. At this time, the army consisted of five regiments: a vanguard regiment, a left and right regiment, the czar's regiment (which took the center in battle), and a rearguard regiment. The Muscovite period also saw the establishment of the chanceries (*pristavy*) to oversee the recruitment, training, payment, and feeding of the armed forces and the production of weaponry and artillery.

In the seventeenth century, foreign mercenaries were hired but proved unreliable, defecting during key points in several battles and leading to Swedish and Polish victories over Russian forces. By 1630, western European officers were recruited to train Russian troops. These "New Formation Troops" or "Regiments of New Formation," as well as the *strel'tsy*, served as the backbone of the army until the time of Peter the Great. The standing army at this time numbered 90,000 regulars and 60,000 irregulars, mostly Cossacks. The army was managed by 18 chanceries prior to the reforms of 1682, when power was concentrated in three chanceries under a single directorate.

Military reform was one of the main aims of the Petrine reforms, and the czar built up a new army around what originally had been his "playmate" regiments, the Preobrezhensky and Semonovsky regiments. Following a revolt by the *strel'tsy* in 1698, Peter suppressed them and rebuilt the army along Western lines, creating 27 regiments drawn from the new formation regiments to replace the disbanded *strel'tsy*. After suffering initial defeats in the Great Northern War (1700–1721), Peter's new army won a resounding victory over Sweden's Charles XII at Poltava in the Ukraine in July 1709. During the war, the Russian army also captured the western Baltic coast, where Peter built his new capital, St. Petersburg (1703), and also took what is now Estonia and Latvia. By the end of the war, the army totaled 180,000–220,000 men. Russian armies were less successful in the south, where they were defeated by the Turks in 1711. At the time of Peter's death in 1725, the army comprised 2 Guards

Infantry Regiments, 5 Grenadier Infantry Regiments, and 33 regular infantry regiments totaling 70,000 men; 3 Grenadier Cavalry Regiments and 30 Dragoon regiments totaling 38,000 cavalry; 4,000 artillerymen and engineers; 78,000 local (garrison) units; and 35,000 other regular troops; plus an unknown number of irregular troops such as Cossacks and Kalmyks. Peter placed the army under three government offices: the military department, the commissariat (supply and staffing), and the artillery department. He created a Military College in 1719 and established the Table of Ranks in 1722. A School of Mathematics and Navigation had been established in 1701 and an Artillery School in 1714. An engineering school was established in 1712 and moved to St. Petersburg in 1719.

In the eighteenth century, the Russian Empire became a major European power, and the Russian army came to play a role in European wars, winning engagements at Gross-Egersdorf, Palzig, Kunersdorf, and Colberg during the Seven Years' War and briefly occupying Berlin in 1760. At that time, the army comprised 331,000 men, including 172,000 in the field army, 74,000 garrison troops, 28,000 in military settlements, 13,000 artillerymen and engineers, and 44,000 irregular troops. The artillery was very well equipped with the Shuvalov "secret" howitzer and the "Unicorn" artillery piece. In 1793, the term of service was reduced from life to 25 years. By the end of the century, the military numbered 500,000 men. A general staff was created in 1763, and training regulations were issued that same year.

During the Napoleonic Wars, an army under Aleksandr Suvorov operated in Switzerland and Italy and achieved some success against the French revolutionary armies at Focsani, Rumnic, and Novi before being withdrawn by Paul I in 1798, when the czar reversed his mother's anti-French policies. At the beginning of the nineteenth century, the Russian army numbered 204,000 infantry, 45,000 cavalry, 25,000 artillery, and 2,700 engineers, as well as 100,000 irregulars. The infantry was armed with the 1753 flintlock and the 1809 seven-line gun. The Ministry of War was created in 1802.

Following the Napoleonic Wars, the Military Academy of the General Staff was established in 1832, and the term of service was reduced to 20 years in 1834. The Russian army continued to play a role in Europe, putting down uprisings in Walachia and Hungary in 1848–1849, but was defeated in the Crimean War because of inferior weaponry and poor infrastructure and logistics in the region. After the war, Russia withdrew from European affairs for several decades. In 1864, the army consisted of 47 infantry divisions, 47 artillery brigades, and 10 cavalry divisions and numbered 760,000 men in peacetime with 1,000,000 reserves. Smooth-bore muskets were replaced by repeating rifles, and the ar-

tillery was given repeating steel guns. Universal military obligation was established in 1874 for all males over 21. Six years of service was the norm, with nine more in the reserves. An Artillery and Engineering Academy was established in 1855, along with Academies of Military Law and Military Medicine.

In 1878, Russia clashed once again with Turkey, defeating it in the Balkans and bringing independence to Bulgaria. Following the reforms of the 1860s and 1870s, the Russian army had become a people's army, and by the time of the Russo-Japanese War (1904–1905) numbered 1 million men in peacetime, with the ability to expand to 4.5 million men. The 7.62 five-shot repeating Mosin rifle was the standard infantry weapon until the time of World War I. Despite reforms, poor supplies and infrastructure again plagued the Russian army, and Russia lost to Japan in the Far East. After the Russo-Japanese War, military service was set at 18 years, with 3 or 4 years in active service and 15 years in the reserves.

On the eve of World War I, Russia's army numbered 1.3 million men; 3.5 million men were mobilized in the first five months of the war. The army also had 7,112 light guns, 791 heavy guns, 4,157 machine guns, 4,519,000 rifles, 263 aircraft, and 4,037 automobiles, but a poor supply network meant that almost one-quarter of the troops at the Battles of Tannenberg and the Masurian Lakes in 1914 came to the front without rifles.

The Russian army was disbanded in 1917, and the Workers' and Peasants' Red Army was established in 1918 under Commissar of War Leon Trotsky, utilizing old czarist officers. It eventually defeated the White forces in the revolution and ensured the survival of the Soviet Union. By 1937, the Red army had the largest armored and airborne forces in the world, consisting of 1,500 tanks and 10,000 aircraft. But the Red army suffered massive losses during the Stalinist purges. Perhaps 40,000 officers were executed, their loss probably contributing to the catastrophic defeats in the initial period of Operation BARBAROSSA. In World War II, the Red army numbered 5,300,000 men in 527 rifle divisions, 302 armored and mechanized brigades, and 42 artillery divisions. It had 13,400 tanks and 16,000 planes.

During the Cold War, the Soviet armed forces were divided into five branches: the army, navy, air force, antiaircraft defense forces, and strategic rocket forces. The Soviet armed forces totaled 3,425,000 men in the 1960s. In the 1970s, the army alone numbered 2 million men in 164 divisions. The Russian Federation kept a lion's share of the former Soviet armed forces (2 million troops in 1992). By 2000, in the post-USSR era, the Russian armed forces had been reduced to 1.2 million troops (not including border troops or strategic rocket forces). The army numbered 670,000 troops

organized into 69 divisions (17 armored, 47 motorized infantry, and 5 airborne), with 15,000 tanks and 20,000 artillery pieces, though low morale and poor training and equipment maintenance meant the army was less effective than such numbers would indicate.

Russian Civil War (1425–1453)

Muscovy succession dispute that led to a protracted power struggle. Throughout the Kievan and early Muscovite periods, the princes of Russia followed the custom of lateral succession. The throne passed from brother to brother, and when that generation died out, it passed to the eldest son of the eldest brother who had held the throne before. Sons whose father had died before holding the throne were excluded (*izgoi*) from the line of succession. This changed in the late fourteenth and early fifteenth centuries, when the grand princes of Moscow, after consolidating their power, attempted to adopt a policy of linear succession to keep power in Moscow, rather than allowing princes outside Moscow to gain the grand princely throne.

Dmitry Donskoi (r. 1359–1389) stipulated in his last testament that his second son, Yury, was to succeed Vasily I should Vasily die without male issue, but Vasily's son, Vasily II, was born in 1415. In 1425, Vasily II succeeded his father. A regency council was set up consisting of Vasily's mother, the Metropolitan Foty of the Orthodox Church, and Boyar I. D. Vsevolozhsky. Vasily's maternal grandfather, Grand Prince Vytautas (Vitold) of Lithuania, served as Vasily's guardian.

Faced with this situation, Vasily's uncle, Yury Dmitrevich, argued that in his testament, Dmitry had stated that Yury was to succeed Vasily I (ignoring the fact that this provision was to have no effect if Vasily had a son). Further, by the custom of lateral succession, he, Yury, was the rightful heir to the grand princely throne and refused to recognize Vasily II

as grand prince. He was joined in this dispute by his sons, Vasily Kosoi and Dmitry Shemiaka.

The dynastic war of succession that ensued lasted for much of Vasily II's reign. Yury refused to come to Moscow and swear allegiance to Vasily, but an outbreak of the plague, as well as Vytautas's protection of Vasily, led to a truce. The deaths of Vytautas in 1430 and Foty in 1431 allowed Yury to renew his claim to the throne. Both Vasily and Yury appealed to the Tartar khan of the Golden Horde for resolution of the dispute, and the khan ruled in favor of Vasily. Yury, granted the principalities of Dmitrov by the khan, would not accept the decision and marched against Vasily, defeating the grand prince's forces on the Klyazma River in April 1433. Yury marched into Moscow and made peace with Vasily but was unable stay in power and soon ceded the grand princely throne and his own principality of Dmitrov to Vasily. At this point, Vasily launched a campaign against his cousins, who had not been party to the agreement between Vasily II and Yury. The grand prince's army was again defeated (September 1433). Soon afterward, Yury again attacked Vasily and defeated him yet again, in March 1434. Vasily fled, and Yury again occupied Moscow, where he died on 5 June 1434.

Contrary to the custom of lateral succession and the decision of the khan, Yury's son, Vasily Kosoi, assumed the throne of the grand prince. (By the rules of lateral succession, Vasily II, as eldest member of his generation, was the rightful heir.) Despite his succession, Kosoi lost even the support of his brothers and was defeated, captured, and blinded by Vasily II in 1436. (Kosoi means "squint-eyed" in Russian, referring to this blinding.) Removed from the political scene, Kosoi died in 1447 or 1448.

Following Vasily II's return to power, tensions continued over the next decade between Dmitry Shemiaka and Vasily II. Also at this time, Vasily's son Ivan (the future Ivan III) was born in 1440. Disputes over the distribution of inheritance, Shemiaka's contribution to Vasily's military ventures, and tribute to the Golden Horde never resulted in open warfare. An unrelated incident was the catalyst for renewed conflict. Khan Ulu-Muhammed, migrating with his horde from Crimea, clashed with Muscovite troops near Murom and remained in the area to pillage. Leading a small force, Vasily unexpectedly came upon Ulu-Muhammed outside Suzdal, on 7 July 1445 and was wounded and captured.

Dmitry Shemiaka, the next senior member of this generation, assumed the grand princely throne, but Vasily negotiated with the khan and was released in November 1445, on the condition that he pay a large ransom and a higher tribute than before. Rather than yield, Dmitry used the incident to renew the dynastic struggle. He seized Vasily's mother and wife while Vasily was on pilgrimage to the Trinity Monastery north of Moscow and sent a force to arrest Vasily. Vasily was

accused of showing favoritism to the Tartars as well as blinding Dmitry's brother, Vasily Kosoi. In retaliation, Vasily II was likewise blinded. Shemiaka then released Vasily in September 1466, on the condition that Vasily renounce his claim to the throne and swear allegiance to Shemiaka. Vasily immediately made a pilgrimage to the St. Cyril-Beloozero Monastery, where the abbot absolved him of this oath. He then began gathering his supporters against Shemiaka. In the face of growing opposition, Shemiaka abandoned Moscow. Vasily returned in triumph in 1447 and continued the war, finally defeating Shemiaka. Fleeing to Novgorod, Shemiaka was poisoned there in 1453.

Russian Civil War (1918–1922)

A civil war in the wake of the Bolshevik Revolution of 7 November 1917, which left the Communist Bolsheviks victorious and secured the existence of the USSR. Following the Bolshevik Revolution, which was little more than a coup d'état, the Bolsheviks were recognized by the All-Russian Congress of Soviets as a new provisional government that would hold power only until the Constituent Assembly, to be elected in late November, could meet in January 1918 and establish a permanent government. However, the Bolshevik leader, Vladimir Ilich Ulyanov (known as Lenin), allowed the Constituent Assembly to meet only once, on 18 January, and then dispersed it. The Bolsheviks were then declared the permanent government by the Third Congress of Soviets on 25 January, and opponents of the Bolsheviks dispersed across the country, fearing arrest. Monarchists, conservatives, less radical leftists (mainly Socialist Revolutionaries), members and supporters of the Constituent Assembly, peasant opponents of the Bolshevik policy of forcible seizure of foodstuffs and other goods from the countryside, opponents of the Treaty of Brest-Litovsk (which gave a large swath of the western borderland of the Russian Empire to the Germans in March 1918), and others took up arms against the Bolsheviks in the first months of 1918. But the Whites, as these opponents of the Reds or Bolsheviks came to be known, never were able to form a truly united front against the Communist forces.

The Bolsheviks, united by their Communist ideology and effective leaders such as Lenin and Commissar of War Lev Davidovich Bronstein (known as Leon Trotsky), were able

first to hold off repeated attacks by Whites and foreign interventionists and then push back the Whites and take control of most of the former Russian Empire. Trotsky was instrumental in the formation of the Workers and Peasants Red Army (RKKA), which first went into combat on 23 February 1918 against the Germans near Petrograd (St. Petersburg/Leningrad/St. Petersburg), often using former czarist officers and noncommissioned officers (NCOs) to lead the new Red Army. During January and February 1918, Bolshevik forces succeeded in taking control of most of Central Asia, except for Khiva and Bukhara, and took many of the Cossack lands in the south of Russia. German intervention in the West kept the Bolsheviks from taking immediate control of Belorussia and the Ukraine, and Turkish pressure in the Caucasus led the joint commissariat in that region to divide into three separate states.

On 8 June 1918, the Komuch (Committee of the Constituent Assembly), made up mainly of more moderate Socialist-Revolutionaries, formed an opposition government in Samara (Kuybyshev) on the Volga River, and in the first part of 1918, many regional governments came out in opposition to the Bolsheviks. The main anti-Bolshevik opposition changed over the course of 1918. At first, the opposition was headed mainly by Socialist-Revolutionaries, thus making this period of the civil war an internal struggle among the socialists. Beginning in November 1918, it shifted to an opposition headed by military dictators, most notably Admiral Aleksandr Kolchak and General Anton Denikin. At this point, the civil war became a truly Red versus White conflict.

At its lowest ebb, in mid-1918, the Communists held only the territory of central, European Russia, around Moscow and Petrograd. (Neither city ever fell to the anti-Communists.) Admiral Kolchak's Volunteer Army in Siberia numbered some 150,000 men, and General Denikin's army in the Ukraine and southern Russia numbered perhaps 125,000 men. Eugeny Karlovich Miller had a small army near Arkhangelsk, and General Nikolai Nikolaevich Yudenich formed a small force army in Estonia, which operated around Petrograd. However, the White armies were never as united as the Red Army. Denikin and the rest recognized Kolchak's supreme authority, but the White armies were never able to establish regular channels of communication and thus coordinate their activities to defeat the Reds. Furthermore, peasant and Ukrainian nationalist opposition hampered Denikin's activities, and Socialist-Revolutionaries under Victor Chernov undermined the Whites in Siberia, proclaiming "Neither Kolchak nor Lenin."

The Red Army reorganized several times to meet the challenges against it, reaching numbers several times larger than its White adversaries. By the end of 1918, it had some 800,000 conscripts under arms. In the course of 1919, it en-

listed another 1.5 million men, including 50,000 officers and 200,000 NCOs from the old czarist army. Despite its numbers, the Red Army was plagued by desertion and poor leadership to an extent never experienced by the Whites. The Bolshevik government decided to defeat Kolchak first and then turn south to crush Denikin. It defeated Kolchak in a series of engagements in the summer of 1919 and pushed him back into Siberia. The first encounters with Denikin's forces were unsuccessful, but in October 1919, the Bolsheviks were able to stop his advance at Orel and push his army back. Peasant uprisings in his rear forced his troops to retreat to the Black Sea port of Novorossiisk, where they were evacuated by the British in March 1920. Kolchak's army fell back to the Crimean Peninsula. He resigned in favor of Denikin in January, and Denikin himself resigned in favor of General Peter Wrangel' in April, leaving Wrangel' in control of the remnant of the White armies on the Crimea until it too was evacuated in November 1920.

Following the defeat of the White Army, the Soviets then turned to consolidate their authority and regain control of Ukraine, Belorussia, Siberia, the Russian Far East, the Caucasus, and other areas that had gained independence since 1917. In the aftermath of the Russo-Polish War and the defeat of the Red Army before Warsaw, the Soviets were able to take control of much of Ukraine and Belorussia. In the course of 1920 and 1921, Red forces took control in Siberia, the Far East, and the Caucasus. Consolidation of Soviet power in the Far East was not effected until 1922, when the Japanese finally withdrew. Casualty figures have never been accurately compiled, but most authorities put the number of dead at least above 1 million. The USSR emerged from its civil war exhausted from eight years of nearly continuous conflict, and in many areas, actual starvation stalked the land.

In addition to defeating the White armies, the Bolsheviks attempted to wipe out the Romanov Dynasty, which had been overthrown by a moderate revolution in February 1917. Czar Nicholas II and his immediate family were executed, along with two associates, on 16 July 1918. The czar's brother, Grand Prince Mikhail, was later executed by the Bolsheviks as well. Those members of the royal family left alive fled to the West, including Grand Prince Nicholas, who had been commander in chief of Russian armies during the first months of World War I. After the Russian Civil War, Soviet power was never seriously challenged internally until the nonviolent fall of the USSR in 1991.

Russian Colonial Wars (1552–1917)

A series of wars over more than three centuries through which Russia spread across northern Eurasia and became the largest country on earth and a major European and Asiatic land power. It has been noted that during the period 1462–1914, the Russian Empire expanded at a rate of some 50 square miles per day for almost 500 years.

The Russian colonial empire was different from the British, French, Portuguese, Spanish, Dutch, and other colonial empires in that the colonies of Russia were contiguous with the Russian heartland, rather than being scattered across vast continents or oceans. It was also different in that many of the colonies remain to this day part of Russia or under Russian influence. Furthermore, Russia has held dominion over non-Russian peoples from the very beginning of its foundation as an organized polity in the tenth century. The earliest Russian chronicles refer to non-Slavic (and non-Christian) tribes who paid tribute to the Russian princes as “our pagans.” However, only in the late sixteenth century did the Russians begin to colonize significant territories populated by non-Russians.

In 1552, Ivan IV the Terrible personally led a campaign against the khanate of Kazan, east of Moscow, capturing that city after a prolonged siege. Four years later, his armies captured the khanate of Astrakhan, at the mouth of the Volga River, thus bringing the entire Volga Basin (and the lucrative trade routes along the Volga to Persia) under Russian control. Not only were the Tartars of Kazan and Astrakhan brought under Russian control, but the Chuvashians, Mordvinians, and other peoples along the Volga River became subject to the Russian czar.

In 1558, Ivan launched the Livonian War against the German cities in what are now Estonia and Latvia. After initial successes, the war turned out badly for Russia. Poland, Lithuania (the two merged in 1569), and Sweden entered the war. In 1571, the Crimean Tartars raided Moscow and destroyed much of the city. Polish king (and Lithuanian grand duke) Stepan Bathory drove the Russians out of Livonia in 1577 and then marched into Russia, capturing Polotsk in 1579 and besieging Pskov in 1582, forcing Ivan to ask for an

armistice. Finally in 1583, Ivan sued for peace, having lost any gains from the first period of the war. Russian efforts to colonize the Baltic States would not begin again until the reign of Peter the Great.

However, Russia continued to hold the Volga Basin, and Ivan the Terrible's reign also saw Russian explorers, such as the famous Yermak, advance along the major rivers of Siberia, subduing indigenous tribes as they went. Russia finally reached the Pacific Ocean in 1639 and expanded into Alaska and North America, reaching as far south as Fort Ross in California, near present-day San Francisco.

During the reigns of Mikhail Romanov (r. 1613–1645) and his son Aleksei (r. 1645–1672), Russia expanded into Polish-held lands in Ukraine. The Smolensk War led to the Russian capture of that city in 1632. A Cossack uprising in Ukraine in 1648 led to a prolonged struggle between the Cossacks and Poland. Cossack hetman Boghdan Khmelnytsky asked for Russian protection, leading to the incorporation of the Cossack territories into the Russian Empire in 1654 by the Union of Pereiaslav. Conflict with Poland, however, continued until the Treaty of Andrusovo in 1667 gave Russia control of Left Bank (eastern) Ukraine and temporary control of the city of Kiev (called “the Mother of all Russian cities” in the earlier chronicles). The Russians never did relinquish control of that city, and over the next several decades, Russia subdued the Cossacks, destroying their autonomy and consolidating control of Ukraine.

Early in his reign, Peter the Great (r. 1682–1725) declared war on Sweden, assuming Sweden's young king, Charles XII, would be easily defeated, but Charles dealt the Russians a crushing defeat at Narva in 1700. The war, known as the Great Northern War, would last 21 years. After Narva, Charles turned and defeated Polish king Augustus the Strong and then marched deep into the Russian Empire before being defeated by Peter at the Battle of Poltava in Ukraine in July 1709. This battle proved the turning point in the war. Charles fled into the Ottoman Empire, never regained the initiative in the war, and was killed under mysterious circumstances in 1718 at the siege of Frederikstad in southeastern Norway. In the course of the war, Peter captured the eastern coast of the Baltic (Karelia, Ingermanland, Estonia, and Livonia), founding St. Petersburg at the mouth of the Neva River in June 1703. By 1712, he had transferred the Russian capital to St. Petersburg, demonstrating his determination to stay and to make Russia a western nation and a naval power.

The newly formed Russian navy defeated the Swedish fleet at Hanko in Finland, and Russian troops landed in Sweden, forcing Sweden to sue for peace in 1721. A further war with Sweden in the early nineteenth century led to the annexation of Finland to Russia in 1809.

Peter's efforts to expand at the expense of the Ottoman Empire met with initial success with the capture of Azov in 1696, but he suffered a humiliating defeat on the Pruth River in 1711 and lost Azov as part of the peace treaty. Peter also moved in to take advantage of unrest in Persia, and Russia took control of northern Persia from 1722 to 1735.

Repeated wars with Turkey, Persia, and various Caucasian tribes, as well as intertribal disputes, led to Russian annexation of the Caucasus. Fear of Persian conquest led the ruler of Georgia to accept annexation by Russia in 1801. Russian armies moved into Transcaucasia in 1813, annexing Armenia in 1828 and excluding Persia and Turkey from the Caucasus. Despite nominal control over the region, Russia fought a brutal and at times genocidal war to put down the Cherkas, Chechens, Ossetians, Kabardians, and other tribespeople and to defeat famous fighters such as Ghazi Muhammad and Shamil. The Caucasian War ended by 1864, but uprisings occurred in Dagestan and Chechnya in 1877 to 1878.

Under Catherine II (r. 1762–1796), Russia participated with Prussia and Austria in the three partitions of Poland in 1772, 1793, and 1795, which expanded the Russian Empire deep into Europe and led to the destruction of the Polish state. (Polish revolts in 1830–1831 and 1863 were brutally suppressed.) Several wars with Turkey led to the annexation of southern Ukraine and the Crimea in 1783, but Catherine's “Greek Project,” a plan to conquer Constantinople and place her grandson Konstantin on the throne of a Christian kingdom there, never materialized.

Russian threats against Turkey in the next century led to the Crimean War (1853–1856) and Russia's defeat at the hands of France and Britain. The next two decades saw Russia withdraw from European affairs, but Russian armies again warred against Turkey in 1877–1878. Oddly, Russia turned over its North American Alaska outpost to the United States in 1867 in a straight cash deal. In the Balkans, a Russian army crossed the Shipka Pass, forced into surrender the Turkish army besieged at Plevna, and marched on Constantinople. On the Caucasian front, Russian troops took the fortress of Kars (Qars), which remained in Russian hands until 1918. The Treaty of San Stefano, signed 3 March 1878, gave Bulgaria independence from the Ottoman Empire, but Russia never colonized the Balkans.

In Central Asia, the Russians subdued the Uzbeks between 1864 and 1873. Kokand was annexed outright in 1876, and Bukhara and Khiva were made protectorates. Turkmenistan, Russia's last conquest in Central Asia, came under Russian control in the early 1880s. Russian attempts to expand into Afghanistan led to heightened tensions with Britain and almost erupted into war in 1885.

Halted in Central Asia, Russian armies continued to expand Russian control in the Far East, gaining territories

south of the Amur River and spheres of influence in Manchuria and Korea. Russian expansion in the Far East, however, led to the Russo-Japanese War of 1904–1905. Arrogant beliefs in the racial inferiority of the Japanese were replaced by the humiliation of defeat on land and sea when the Japanese launched a sneak attack on the Russian Pacific Fleet at Port Arthur. The Treaty of Portsmouth ended the war, giving Japan control of Korea and southern Sakhalin Island.

The Treaty of Brest-Litovsk, which ended Russian participation in World War I, resulted in vast colonial losses. Finland, the Baltic States, western Belorussia and Ukraine, Poland, Bessarabia, and Kars were lost, and subsequent internal strife led to the fragmentation of the old Russian Empire. Only gradually did the Soviet Union regain the territories lost after World War I; much of the old Russian Empire was regained by the end of the Russian Civil War, including eastern Ukraine, the Caucasus, Central Asia, and Siberia, all of which saw failed efforts to create independent nation-states following the October Revolution. The motivations for these territorial acquisitions are widely debated, with some scholars arguing that Soviet expansionism was nothing more than Russian geopolitical and nationalist ambitions cloaked in a red flag, whereas others argue that the Communist ideology of the Soviet Union provided new motivations for expansion.

Soviet efforts to spread world revolution into Central and Western Europe met a stunning defeat in August 1920, when the Poles under Marshal Józef Piłsudski routed the Red Army under Mikhail Tukhachevsky at Warsaw. The subsequent Treaty of Riga gave parts of Lithuania, Belorussia, and Ukraine to Poland and recognized the independence of the Baltic states.

On 26 August 1939, the Soviet Union and Nazi Germany signed a Non-Aggression Pact, secret provisions of which gave the Soviet Union a sphere of influence in Estonia, Latvia, and eastern Poland and were later revised to include Lithuania. On 17 September 1939, Soviet troops entered eastern Poland and met up with German troops who had conquered eastern Poland. The year 1939 also saw the launching of the Winter War against Finland, an effort to push the Finnish border away from Leningrad, gain lands in the north to defend access between Leningrad and Murmansk, and gain access to ports along the southern Finnish coast. The war went badly for the Soviet Union initially, though the Finns were eventually forced to surrender in March 1940. In May 1940, the Soviet secret police executed some 15,000 Polish officers at Katyn, near Smolensk, and at two other sites in the Soviet Union in an attempt to destroy any opposition to Soviet control of eastern Poland. A month later, while the world watched Nazi Germany smash the French and British armies, Soviet troops entered the Baltic

states and annexed the three nations. Bessarabia (Moldavia) also was taken from Romania at this time.

Following the Nazi invasion of the Soviet Union and the Soviet victories at Stalingrad and Kursk in 1943, Soviet armies pushed into Eastern Europe, capturing all territories lost to Germany and occupying Romania, Bulgaria, Hungary, Czechoslovakia, Poland, and parts of Germany and Austria. Although the Allies had agreed at Yalta to hold elections in the occupied territories, Stalin saw the need to set up a buffer zone in Eastern Europe, arguing that Russia and the Soviet Union had suffered multiple invasions that had originated in or passed through Poland. The Soviet Union, therefore, needed friendly states on its western borders and achieved this by installing pliant Communist governments there, which ruled those countries until 1989. The Red Army maintained control of the region by brutally suppressing uprisings in East Germany in 1953, in Hungary in 1956, and in Czechoslovakia in 1968.

In the Far East, the USSR attacked Japan in the summer of 1945 and took control of Manchuria, North Korea, the southern half of Sakhalin Island, and the Kurile Islands. Withdrawing from China and Korea, the Soviet Union nevertheless supported Communist movements there, leading to the formation of the People's Republic of China in October 1949. Stalin also cautiously supported the North Korean invasion of South Korea in June 1950, and later Soviet leaders supported backed Communist movements in North Vietnam and elsewhere in Asia. In 1979, Soviet troops invaded Afghanistan in support of the Communist government there. A long guerrilla war ensued, ending with a Soviet withdrawal in 1989.

The Soviets also supported “movements of national liberation” in Asia, Africa, and the Americas throughout the latter half of the twentieth century. In 1962, the world came closest to full-scale nuclear war when the USSR placed 42 intermediate-range ballistic missiles on the Communist-ruled island of Cuba. The United States blockaded the island and forced their withdrawal in October.

Reforms brought about during the tenure of Mikhail Gorbachev as general secretary of the Communist Party of the Soviet Union led to decreased tension during the Cold War and a reduction of Soviet pressure on its Eastern European satellite states. By 1989, the Soviet bloc in Eastern Europe had fallen, and internal strife in the USSR itself, including nationalist movements in the Baltic states and Ukraine and outright wars in the Caucasus, led to the breakup of the USSR in December 1991.

Russian/Soviet Women in War and Resistance (1800–2000)

In no modern nation, including Israel, have women come close to the extent of Russian/Soviet women's participation in actual combat. Very few Russian women served before 1917, although in 1808, the Order of St. George was con-

ferred on cavalrywoman Nadezhda Durova. During World War I, three women were similarly decorated: Antonina Pal'shina (cavalry and infantry); Mariya Bochkareva ("Battalion of Death" commander); and nurse Rimma Ivanova (infantry), killed in 1915 while leading troops in a successful attack.

Women's recruitment during the Civil War was largely limited to medical and political appointments. About 60 received the prestigious Order of the Red Banner, created in 1918.

In the interwar period, female career officers were usually employed in staff work, without line troops under their command. Soviet women began mastering military specialties, especially after the German invasion of the USSR, when they were given access to special courses. In 1942 about 222,000 were trained as mortar, submachine gun and machine gun operators, snipers, and communications specialists.

In addition, women trained in reserve regiments and forward units. They moved into nontraditional categories to fill developing shortages of male personnel and as part of their struggle for equality. About 400,000 were mobilized, mainly for service in Air Defense Forces and logistical units.

Female troops march during the Russian Revolution, 1917. (Hulton/Archive)

More than 800,000 served in late 1943, including 27,000 partisans, amounting to about 8 percent of military personnel. About 200,000 were decorated; by May 1990, 95 had become Heroes of the Soviet Union. The proportion of women was greatest in Air Defense Forces, amounting to 24 percent, or replacement of some 300,000 men. Still, it is evident that women were drafted mainly for auxiliary or “defensive duties” (including air defense and mine clearing) and advanced despite official policy.

Soviet sources on the history of World War II often stress that “the face of war is not a woman’s face,” as the wartime situation was unprecedented. After the war, women’s participation declined to about 10,000 in the mid-1970s. Following the USSR’s collapse, some military schools admitted women, and female military personnel increased, in part because of changes in the job market and reluctance of men to sign up. For all of their strong military participation in the twentieth century, the status of women in the Russian military remains problematic.

Russo-Chechen Conflict (1994–1996)

Separatist struggle that demonstrated Russia’s military decline since the collapse of the Soviet Union. On 11 December 1994, 40,000 Russian troops invaded the small northern Caucasus territory of Chechnya. Anticipating an easy victory, Russian president Boris Yeltsin launched the attack to overturn the declaration of independence issued by Chechnya’s president, the former Soviet air force general Dzhokhar Dudayev, in November 1991. The result was a bitter, 22-month war that left, according to one estimate, an incredible 80,000 dead.

During the first six-plus months of the fighting, Russian forces, superior in heavy weaponry on the ground and in the air, captured Chechnya’s major population centers, the capital city of Grozny falling (February 1995) after a seven-week siege. These successes weakened Chechen military capacity but failed to produce victory. Chechen separatists took to the hills and waged, with overwhelming civilian support, guerrilla warfare against an enemy whose morale waned with each passing day.

Beginning in June 1995, full-scale fighting ceased while peace negotiations occurred. Prompted by Shamil Basayev’s daring separatist raid (14 June) into Russian territory and the capture of several hundred hostages in the town of Budenovsk, these negotiations ultimately failed; yet the accompanying cease-fire provided the Chechens an invaluable breathing space while simultaneously allowing them to reoccupy territory lost in the opening months of the conflict.

When fighting resumed in mid-December, Chechen forces launched a series of successful offensives over an eight-month period, the most significant (6 August 1996) yielding the recapture of devastated Grozny and the driving back of Russian forces to their starting point in December 1994. Though a Russian air raid killed Dudayev (21 April), this inconsequential success neither reversed demoralization in the Russian army nor altered domestic public opinion, which had turned irrevocably against the conflict. In early August, Yeltsin’s government, faced with essentially starting the war over, decided on peace, dispatching National Security Chief Alexander Lebed to negotiate with Chechen supreme commander General Aslan Maskhadov. At the Daghestani border town of Khasavyurt, the generals reached an agreement (31 August) providing for Russian withdrawal, new Chechen presidential elections, and the shelving of Chechnya’s constitutional status until 2001. In more recent years, the struggle has been sporadically renewed, and Chechnya seems far from accepting its status as a territory of Russia.

Russo-Finnish Wars (1939–1944)

Border clashes between the Soviet Union and Finland. In October 1939, the Soviet Union demanded that Finland lease its naval base on the Hanko Peninsula; cede several islands in the Gulf of Finland, including Hogland and Koivisto; and demilitarize the Mannerheim Line, a series of fortifications along the Karelian Isthmus. After brief negotiations, the Soviets ended talks and created an incident along the frontier. Expecting rapid victory in its largest operation since its civil war, the Red Army attacked Finland on 30 November,

attempting to cut the country in two. Anticipating the attack, the Finns had mobilized the equivalent of 14 divisions, or 300,000 troops, mostly reservists. The Finnish army was well trained for waging war near the Arctic Circle and for maximizing the country's static defenses but was desperately short of artillery, armored vehicles, and ammunition. Finnish army troops, pressed for arms by low budgets, coined the phrase *Molotov cocktail* after improvising petrol-filled bottles as substitute grenades.

The Finnish campaign was a disaster for the Soviets. Although the Red Army mobilized many more troops than the Finns, 22 divisions in all, its preparations were frightfully inadequate. General Kiril A. Meretskov, commanding the attack, invaded Finland without training soldiers for storming fixed defenses, acquiring accurate intelligence about Finnish positions and terrain, preparing for winter combat, or ensuring adequate supply and transportation. The Soviets called off the offensive on 20 December because of heavy casualties sustained against the Mannerheim Line. Following this disaster, the Red Army reassessed its strategy and replaced Meretskov with Semen Konstantinovich Timoshenko, one of the few commanders from the civil war to survive Stalin's purges. With improved training in waging winter warfare and storming fixed positions, the Red Army renewed its offensive on 12 February 1940. The Red Army finally pierced the Mannerheim Line, after transferring 27 new divisions to the front and backing these troops with armor. After suffering more than 264,000 casualties during the campaign, the Red Army was too exhausted to conquer the entire country. (Apologists for the Soviet Union stressed the bitter cold of the battlefield, but Russia was hardly noted for its balmy climate.) On 12 March 1940, Finland and the Soviet Union agreed to a brief armistice. The entire Karelian Isthmus had to be ceded to the Soviet Union. According to the Finns, the entire population evacuated Karelia rather than live under Soviet rule. The Soviet invasion had two major diplomatic results: the Soviet Union was expelled from the League of Nations, and Finland became a cobelligerent with Germany following the German invasion of the Soviet Union on 22 June 1941.

Once Finland had recaptured the territory it lost in 1940, the front between Finland and the Soviet remained static between 1941 and 1944. This changed when Stalin ordered Generals Leonid A. Govorov and Meretskov (who had somehow survived Stalin's wrath) to attack the Karelian Isthmus on 10 June 1944. The carefully prepared Red Army assault, partly designed as a diversion from the Red Army's upcoming offensive against German Army Group Center, Operation BAGRATION, avoided the disaster of the first campaign. The numerically superior and vastly improved Soviet forces quickly overwhelmed Finnish defenses. General Govorov

moved along the Baltic Sea and captured the city of Vyborg on 21 June, while Meretskov moved north, securing central Karelia. These combined operations forced Finland to agree to a separate peace in September 1944.

Perhaps surprisingly, Finland retained its independence, proving the adage that dictators like Stalin respected only force, and the Finns had performed quite well on the battlefield. Until the fall of the Soviet Union, however, Finland's main diplomatic goal was to maintain a strict neutrality between East and West in the Cold War and to avoid aggravating its giant neighbor.

Russo-Japanese War (1904–1905)

The first major defeat of a European power by an Asian nation. There was a certain air of inevitability about the Russo-Japanese War. To the proud Japanese, Russian had denied Japan the well-deserved fruits of its victory over China in 1894–1895 with the Triple Intervention; thereafter, the Russians used their assistance in the Boxer Rebellion to move more troops into Manchuria and even tried to deny Japan's position in Korea. So the Japanese strengthened and expanded their army and navy, signed an alliance with Great Britain to neutralize France and Germany, and tried half-hearted diplomacy with Russia.

The Japanese broke off diplomatic relations and then struck at the Russian fleet in Port Arthur on 8 February 1904, which was followed by two days later by a mutual declaration of war. When the war began, it appeared that the advantages rested with Russia, which had a huge army and one of the world's largest navies. However, the Japanese had a major theater superiority of forces, better quality officers, and more motivated soldiers and sailors.

There were several phases to the conflict. The Japanese engaged in a long, costly, and ultimately successful five-

month siege of Port Arthur, from late May 1904 until early January 1905. Armies commanded by General Kuroki Tamemoto, Nozu Michitsura, and Oku Yasukata converged on the Russian positions. In late May, the Japanese gained control of Nashan Hill and later the port of Dairen, which meant that Port Arthur was surrounded and cut off. Meanwhile, the Russian defenders did not strengthen a reasonably formidable defensive position; there were real possibilities for defense in depth, but they made little effort. The Japanese made three bloody assaults—in each case, the men charging in close and packed formations and then waiting for siege artillery. Two more direct and costly assaults were similarly unsuccessful. Finally, a sixth major offensive in late November 1904 captured a key hill that enabled the Japanese to bring the inner defenses under artillery fire. Finally, after yet another major attack, on New Year's Day, 1905, the Russians, short of food, sick, and without hope of relief, surrendered. The Japanese suffered more than double the Russian casualties despite poor Russian handling of the defenses.

As the siege tightened, fighting moved to Manchuria, as the Japanese sought to drive the Russians out of the resource-rich Chinese province. Both sides poured tens of thousands of troops into the series of battles. Fighting began with battles near Liaoyang, 200 miles north of Port Arthur, in August and early September. Although outnumbered, the Japanese attacked but could not crush the Russian positions. Then, in January 1905, the Russians chose to attack in snow, and after failing to drive the Japanese back, the Russians chose to retreat to Mukden in more central Manchuria. Both armies dug in and then engaged in a series of battles in January, February, and March. The Japanese wanted victory before huge numbers of Russian troops arrived from European Russia. About 200,000 Japanese attacked nearly 300,000 Russians; the Japanese sought to turn first the Russian right and then the left; hard fighting pushed the Russians into a kind of “U,” and the Russian commander, Aleksey Kuropatkin, feared for his communication lines and executed a good retreat further north to Harbin. By this point, the Japanese were too exhausted to pursue and attack. Russian mobilization was creaky, but eventually Russia could strengthen its forces in northeastern Asia. Both sides were ready for peace talks.

Finally, the Russian Baltic Fleet, after a dramatic sea voyage from eastern Russia around Africa (although several ships did go through the Suez Canal), Southeast Asia, and north through the China Sea, finally arrived in the war zone in the Straits of Tsushima and was nearly destroyed in the ensuing battle on 27 May 1905. Admiral Togo managed to cross the “T”—a maneuver by which he could bring his main guns to bear on the enemy, and the few surviving Russian ships made their way into harbor.

Eventually, the two warring powers accepted a mediation effort by U.S. president Theodore Roosevelt and signed a peace treaty at Portsmouth, New Hampshire, on 6 September 1905. The Russians gave up Port Arthur and the southern half of Sakhalin Island and evacuated Manchuria, clearly opening that province to Japanese exploitation, but the Japanese largely were not satisfied with the concessions gained at the peace table.

The conflict demonstrated the strength of the defense at this point in military history, especially of the machine gun; it also perhaps demonstrated the folly of direct and predictable attack. The Japanese tended to charge right at Russian defenses or at most to seek to turn a flank but still to advance in close formation, ideal for machine gun and more modern artillery fire. The Japanese also did not consider taking advantage of an indirect approach to sever Russia's long, vulnerable, single-track supply line back to eastern Russia. Instead, they forced the Russians to retreat but never truly destroyed their larger foe and thus permitted the Russians to fight again. Interestingly, the major Western powers, perhaps having little regard for Russia or Japan as military powers, did not study the impact of the machine gun on fighting against prepared defenses and hence stumbled, a decade later, into the carnage of World War I.

Russo-Polish War (1919–1921)

Conflict that established the integrity of the reborn Polish nation until the German invasion of 1939. With the end of World War I on 11 November 1918, the Polish nation re-emerged on the world stage after more than 100 years of foreign occupation. In January 1919, Józef Piłsudski, who had so long fought against imperial Russia, became Poland's chief of state and commander in chief of the armed forces. The war between the Soviet Union and Poland resulted from Soviet attempts to spread communism westward, although the war-devastated nations of France and Germany would have seemed more likely candidates. Soviet aspirations were at least as much territorial as ideological. An Allied proposal

for a border between the Soviet Union and Poland (known as the Curzon Line) was rejected by both sides.

In June 1919, the Red Army launched an offensive that led it to the outskirts of Warsaw itself by early August. Poland was saved by Pilsudski's counterattack (and the advice of a French military mission) on 16 August, a battle commonly known at the time as the "Miracle of the Vistula" (and sometimes also as "the battle that saved Europe from godless Bolshevism"), which forced the overextended Soviet forces to retreat back to their own territory. An armistice was signed in October 1920, which was followed by the Treaty of Riga, concluded on 18 March 1921. The new border, which corresponded roughly to pre-partition Poland, included Ukrainian, Belarusian, and Lithuanian territories, the latter of which caused a rift between the historic allies of Lithuania and Poland. Interwar Poland had an area of approximately 150,000 square miles and approximately 30 million inhabitants. The result of this conflict, other than the establishment of the border that would exist between these two nations until the Soviet invasion of Poland on 17 September 1939, was a Polish nation that contained a significant number of ethnic minorities, including Ukrainians (16 percent), Jews (10 percent), Belarusians (6 percent), and Germans (3 percent), who had no religious, ethnic, or linguistic loyalty to the Polish nation.

Russo-Swedish Wars (1240–1809)

No less than seven wars fought between Russia and Sweden over a 600-year period, often centered on the Baltic states. The war of 1240–1242 began when a Swedish, Danish, and Livonian Knight army backed by Pope Gregory IX took advantage of the second Mongol invasion of Russia. Novgorod's Prince Alexander Nevski decisively defeated them at the Neva River in 1240 and again in the famous "Battle of the Ice" at Lake Peipus, on 12 April 1242.

The war of 1590–1655 began with Czar Fedor I invading Swedish-controlled Estonia and defeating 20,000 Swedes near Narva. A one-year truce ended with Swedish forces pushing back the Russians and regaining control of northern Estonia and Livonia.

A Swedish attempt to gain the Russian throne ignited the war of 1613–1617. The Swedes occupied Novgorod, hoping to enhance the chances of King Gustavus II Adolphus to ascend the Russian throne. Muscovites attacked the Swedes at Novgorod but were repulsed. Gustavus then besieged Pskov unsuccessfully for six months in 1614. Muscovite military performance thus established Czar Michael Romanov on the Russian throne, and Gustavus made no further claims.

The war of 1656–1658 saw Czar Alexis try to regain the Baltic states from Sweden, while the Swedes were occupied in the Second Northern War (1655–1660). After capturing border towns, the Russians besieged Riga, Latvia, in July–August 1656. The Swedes responded with sorties that killed thousands and caused Alexis to flee the field. A 1658 offensive by the Russians was also repelled and resulted in a peace treaty.

In the war of 1741–1743, the Swedes attempted to regain power in eastern Europe after being foiled by the Russians under Peter the Great in the Great Northern War of 1700–1721. A poorly prepared 20,000-man Swedish army invaded Russia but was defeated at the Battle of Wilmanstrand on 3 September 1741. Russia then invaded Swedish-controlled Finland and forced 17,000 Swedes to surrender at Helsinki on 20 August 1742.

While Catherine the Great and Russia were involved in a second Russo-Turkish War, King Gustavus III invaded Russian-controlled Finland, thus beginning the war of 1788–1790. Rebellious Swedish officers caused Swedish defeats in the first two years on land and at sea. Gustavus returned home, ended the rebellion, and then returned to besiege St. Petersburg by land and sea, winning a stunning naval victory at Svensksund in July 1790. More than 150 Russian ships were sunk or captured, fully a third of the Russian fleet. However, Denmark had invaded southwestern Sweden and besieged Göteborg, forcing the Treaty of Wereloe.

The war of 1808–1809 centered on the Napoleonic Wars. France and Russia made peace in 1807 and called on Sweden to drop out of the anti-French alliance with England. Sweden refused, and Czar Alexander I invaded Swedish Finland in February 1808 and pushed the Swedes out of Finland entirely. Alexander then invaded Sweden, causing the election of a new Swedish king, Charles XIII, who signed the Treaty of Fredrikshamm, making Finland a province of Russia and marking the last Russo-Swedish War.

Russo-Turkish War (April 1828–14 September 1829)

A conflict centering around the question of Greek independence from Turkey that revealed the decline in Turkish power. The Greek revolt against Turkish rule, beginning in March 1821, led Turkish sultan Mahmud II to order his vassal, Egyptian pasha Mehmet Ali, to land a force to suppress the Greeks in February 1825. Russian czar Nicholas I then issued an ultimatum in March 1826 that Turkish troops withdraw from the Danubian principalities and restore autonomy to the Greeks. The Turks agreed at Akkerman on 7 October, but military action against the Greeks continued.

By the Treaty of London (July 1827), Great Britain, France, and Russia pledged to establish an autonomous Ottoman Greek state. An allied fleet commanded by Royal Navy admiral Sir Edward Codrington sailed to the Bay of Navarino and engaged and destroyed a Turkish fleet on 20 October. On 18 December, the Turks declared war. Britain and France abandoned Russia, which declared war in April 1828 after concluding hostilities with Persia (June 1826–22 February 1828).

Russian forces occupied Moldavia and Walachia and crossed the Danube River in June. The fortress of Varna was captured on 11 October 1828, but Russian inability to secure Shumla and Silistria forced a retreat behind the Danube. A Russian army in the Caucasus had meanwhile captured Anapa, Sukhum-Kale, Poti, and Kars (5 July), reaching the upper Euphrates River by autumn.

Appointed commander of the Russian Danubian army, Field Marshal Ivan Diebitsch captured Silistria, Kulchava, and Adrianople. Meanwhile, in the Caucasus, General Ivan Paskevich took Erzurum and advanced on Trebizond and Batum. With Russian forces just outside Constantinople, Turkey surrendered on 14 September 1829 by signing the Treaty of Adrianople.

The Ottomans recognized Russian annexation of Persian territory in the Caucasus, guaranteed Russian merchant shipping passage through the straits (Dardanelles, Bosphorus), reaffirmed Serbian autonomous institutions as provided in the earlier Treaty of Bucharest (28 May 1812), and demilitarized and established independent national governments in Moldavia and Walachia under Russian protection. The Greeks gained autonomy and then by European agree-

ment on 3 February 1830 became an independent hereditary kingdom. After considerable intrigue, in January 1833 Prince Otto (son of King Louis of Bavaria) became king of Greece.

Mehmet Ali's revolt in November 1831 caused Mahmud II to appeal for Russian military intervention. Consequently, the Treaty of Unkiar-Skelessi on 8 July 1833 provided Turkey's closure of the straits to all except Russian warships.

Russo-Turkish Wars (1676–1878)

Lengthy series of conflicts resulting in the decline of the Ottoman Empire and the extension of Russia's frontier. Russia's attempt to secure its southern frontier against nomadic raiders and the Ottomans and its desire to establish a warm-water port were the initial causes of the wars. The Russian government tried to pay for these campaigns by a reform of taxation that based rates on household size rather than land.

V. V. Golitsyn's Crimean campaigns of 1687 and 1689 and Czar Peter I's attempt to capture the fortress of Azov in June–October 1695 failed because of a lack of naval power. Undaunted, the energetic czar supervised the construction of 1,400 barges and 29 galleys at Voronezh, and Peter's second attempt in May–July 1696 succeeded. During the Great Northern War of 1700–1721, Sultan Ahmed III entered the conflict against Russia in 1710 and, after Peter's failed campaign in the Balkans and defeat at Jassy, regained Azov by the Treaty of the Pruth River in 1711.

Nevertheless, Peter's reign was marked by a series of military reforms. Conscription was instituted in 1705, formation reorganization was undertaken, and the order of battle was revised so that the army was built around the new, elite, well-equipped Guards Regiments of 1708. Government expenditure on the army and navy reached 80 percent of total government expenditures in 1710. By 1725, Russia possessed a regular army of 210,000 troops and 100,000 Cos-

sack troops and a navy of 48 ships of the line and 787 auxiliary craft serviced by 28,000 men.

War was renewed in 1735, with a Russo-Austrian alliance against Turkey. Of the 25,000 Russian troops fatalities in 1737, 60 percent died of disease. The Russians invaded Turkish Moldavia and the Austrians entered Jassy in 1739, and Azov was recaptured. Alarmed by Russian ambitions in the Balkans, Austria concluded a separate peace with the Turks in 1739, the Treaty of Belgrade. Russia was forced to demilitarize Azov and prohibited from building a Black Sea fleet.

The war of 1768–1774 began after Sultan Mustafa III demanded that Empress Catherine II abstain from interfering in Poland's internal affairs. The Russians (again) recaptured Azov and the Crimea in 1771. Field Marshal Peter A. Rumiantsev occupied Moldavia and Walachia, and the Turks were defeated in Bulgaria. By the Treaty of Kutchuk-Kainardzhy in 1774, the Crimean khanate was made independent of the sultan. Russia gained territory from the Bug to the Dnieper Rivers and was allowed to reconstruct the Azov fortress. The czar was acknowledged as protector of Ottoman Christians and allowed to maintain a fleet on the Black Sea and passage through the straits.

In 1781, Catherine II and the Austro-Hungarian emperor Joseph II agreed upon the division of the spoils in the event of the Ottoman Empire's collapse. Catherine (who had grandiose dreams of annexing Constantinople so as to return the Byzantine Orthodox seat of religious-political power to a Holy Christian Orthodox sovereign—herself) annexed the Crimea in 1783, and a Russo-Turkish War began in 1787. Joseph II entered the war as Catherine's ally in 1788 but was cajoled by Prussia to withdraw from the alliance in 1791. Russian victories attained by Marshall Aleksandr Vasilyevich Suvorov gained Russia control of the Black Sea coast from the Kerch Strait to the Dniester River. These gains were codified as the Peace Treaty of Jassy in 1792.

While Russia was occupied with Napoleon, Sultan Selim III deposed the Russophile governors of Moldavia and Walachia in 1806. War was declared, and Marshal Mikhail I. Kutuzov's victorious campaign of 1811–1812 forced the Turks to cede Bessarabia to Russia by the Treaty of Bucharest (1812).

Russia had thus secured the entire northern coast of the Black Sea. Its subsequent wars with Turkey were fought to gain influence in the Balkans, win control of the Dardanelles and Bosphorus Straits, and expand into the Caucasus.

The Greek war of independence sparked the Russo-Turkish War of 1828–1829. Russian forces advanced into Bulgaria and the Caucasus and were encamped outside Constantinople by the time of the Treaty of Adrianople/Edirne in 1829. Moldavia and Walachia were given autonomy with Russian protection, and Greece gained independence the following year.

As a result of Russian aid to Turkey during the revolt of Egyptian pasha Mehmet Ali, the Treaty of Unkiar-Skelessi in 1833 pledged that Turkey would close the straits to all except Russian warships. Britain and Austria-Hungary managed to replace this agreement with a general European guarantee, the Straits Convention of 1841.

The Crimean War (1853–1856) began after Emperor Nicholas I attempted to assert Russia's control of the Black Sea straits via extra guarantees from Turkey. Britain and France entered the conflict against Russia in 1854. By the Treaty of Paris in 1856, Russia lost its protectorate over Moldavia and Walachia and was forbidden to maintain a navy on the Black Sea.

Defeat in the Crimean War prompted the reform of the Russian military. Minister of War General Dmitri A. Milyutin proposed in January 1862 the improvement of mobilization; the creation of 14 military districts by 1865 to decentralize command and increase battlefield agility; the reorganization of force structure; standard officer education; an improved rearmament; a reevaluation of tactics; and training to be handled by General M. I. Dragomirov. Expenditure was also allotted to railway construction to improve logistics.

The war of 1877–1878 was a Russian effort to aid the Balkan rebellions of 1875–1876 against Ottoman rule. The battle plan was based upon the lectures written by General Obruchev and delivered by Lieutenant Colonel N. D. Artamonov of the main staff in 1876. It was a case study of the rapid victory achieved by General Ivan Diebitsch during the Russo-Turkish War in 1829. These reforms bore fruit in 1877–1878. The Russians attacked through Bulgaria, and after successfully concluding the Siege of Plevna/Pleven, they captured Adrianople/Edirne in January 1878. The Treaty of San Stefano in 1878 would have achieved the collapse of Ottoman rule in Europe had Russia's military victories not been overturned by European reaction, as codified in the Treaty of Berlin in June–July 1878.

Further conflicts between Russia and Turkey continued as the Balkan nationalities attempted to break free of Ottoman rule and created tension between Austria-Hungary and Russia for the spoils of or influence over the decaying Ottoman Empire. It also brought into question the re-arrangement of the European balance of power, leading eventually to World War I.

Rwanda and Burundi, Civil Wars of (1959–2000)

The worst bloodletting in postcolonial Africa. Originally inhabited by the Twa (pygmy) people of the rainforest, the region saw successive waves first of Bantu Hutus and last of tall, nomadic Tutsis over a period of roughly 2,000 years. The Tutsi in time came to rule the region, both as royalty and as the administrative backbone of the domain. Under European control, the Tutsi were given the task of administering the colonies, as well as a monopoly in the educational system established by Catholic missionaries. More important, however, the colonial administrators (especially the Belgians) established the myth of Tutsi superiority that would in time come to haunt the country.

In the wave of decolonization that swept over Africa in the years following World War II, Rwandan and Burundian independence was achieved in 1961, with both counties fa-

tally fractured down ethnic lines. In 1959, as the Belgians were preparing to leave Rwanda, Hutus rose up and slaughtered an estimated 100,000 Tutsis. Hutus, jealous of centuries of second-class citizenship, seized the reigns of government from the minority (15 percent of the population) Tutsis in a 1961 U.N.-supervised referendum, which instituted a constitution and brought the Hutu majority party to power.

In Burundi, meanwhile, Louis Rwagasore, a Tutsi nationalist leader, was assassinated in 1961, just months before independence. It was under this cloud of suspicion that the Tutsis lost the 1964 parliamentary elections. When the head of state refused to name a Hutu prime minister, a Hutu faction staged a failed coup. A brutal purge of the army and government ministries of Hutus followed, which in turn led to the Hutu uprising of 1972. The Tutsi government decided to deal with the “Hutu threat” by killing every Hutu with an education, government job, or wealth; an estimated 200,000 Hutus were dead within three months.

In Hutu-dominated Rwanda, the situation was identical, except that it was the minority Tutsis who were being oppressed. In 1963, a Tutsi guerrilla incursion into Rwanda was beaten back swiftly, which in turn resulted in 10,000–

Tutsi rebels. (David and Peter Turnley/Corbis)

20,000 dead Tutsi in a massive wave of repression. Both Rwanda and Burundi instituted a passbook system, which indicated the ethnicity and residence of the holder. These books were designed to restrict the movement of and exclude the majority Hutu in Burundi and minority Tutsi in Rwanda from key government, university, and military positions.

Matters degenerated into literal genocide, at least in Rwanda, in the 1990s. In Rwanda, those demanding real democratic reform and the forces of extreme Hutu supremacy were forcing President Juvenal Habyarimana (who had ruled a one-party state since 1973) into a corner. In addition, the rebel Rwandese Patriotic Front (RPF) had been battling the Hutu-dominated government for years and was growing stronger. A compromise was reached in 1993 that incorporated the RPF into a coalition government and army.

In Burundi, the country's first multiparty elections were won by Hutus. A Hutu civilian president, Meldior Ndadaye, was sworn in, but three months later the Tutsi-controlled army overthrew the government, killing the president and instigating an massacre that claimed more than 100,000 dead and produced 500,000 refugees.

Incredibly, matters deteriorated even further; both Rwandan president Habyarimana and Burundian president Cyprien Ntaryamira were killed in a rocket attack as their

aircraft was flying into Rwanda on 6 April 1994. At once, the Hutu extremist forces in Rwanda (which are widely suspected of staging the attack to rid themselves of Habyarimana, who was seen as caving into the Tutsi-led RPF) took the initiative and instigated the pogroms that eventually led to the death of between 800,000 and 850,000 persons. What has often been lost in the Western press is that many of those killed in the pogroms were political targets (journalists, human rights advocates, etc.)—both Tutsi and Hutu.

Burundi escaped much of the violence that plagued Rwanda following the assassination of the two leaders. But in Rwanda, the Tutsi-led RPF took control of the country and attempted to form a government and repatriate many of the Hutu who had fled in fear after their victory. Currently, it is estimated that more than 1,500,000 Rwandans are living in refugee camps outside their native country.

S

SA (1922–1945)

The largest paramilitary auxiliary of the Nazi Party. The SA (Sturmabteilung, or “Stormtroopers”) was designed to protect meetings, exercise force against opponents, and make mass public marches, one of its most effective forms of propaganda. With its characteristic brown uniform, discipline, and violence it came to symbolize the entire Nazi movement. Furthermore, once the Nazis were in control of the German state in 1933, the SA played a major role in spreading terror, eliminating enemies, and “coordinating” allies. In the process, it grew into a mass organization of several million men. By the late spring of 1934, however, the SA and its leader, Ernst Röhm, seemed out of control. Faced with the choice between the professional army or an SA-led militia army, Adolf Hitler chose the tool best suited for his expansionist plans and purged the SA violently in June and July 1934 (“Night of the Long Knives”). Thereafter it was eclipsed by the SS (Schutzstaffel, or “Protection Squad”). Though it never again regained its earlier importance, the SA continued to exist. It organized pre- and postmilitary training, served as a source of committed and competent leaders for the Nazi movement, and performed auxiliary and covert duties for the war effort. The SA also served as a convenient cover for local misfits, drunks, bullies, sadists, and busybodies to lord it over their neighbors with impunity. Like other paramilitary auxiliaries of fascist movements in the interwar period, it existed to perform all those tasks related to the seizure and preservation of power that traditionally conceived political parties and state regimes could not do or could do only with considerable difficulty. It was a constant threat that the rule of law could be suspended, as its leading role in the 1938 Kristallnacht pogrom demonstrates.

Saipan, Battle of (15 June–9 July 1944)

Major battle in the Pacific in World War II. As part of its advance through the central Pacific Ocean, the United States planned to attack Saipan, the northernmost island in the Marianas. Approximately 1,200 miles from Tokyo, Saipan and the other islands of Guam and Tinian would provide the United States with airbases for B-29 raids against Japan. Operation FORAGER commenced with the heavy bombardment of the island by American battleships and followed with landing of the 2d and 4th Marine Divisions on the west coast of the island the morning of 15 June 1944. American progress was steady but slowed by a combination of the dense terrain and the determined resistance by approximately 30,000 Japanese defenders.

While the land battle continued, the Japanese navy launched Operation A-GO, hoping to trap the American ships supporting the invasion between Japanese land-based aircraft and carrier planes. Under Admiral Ozawa, a Japanese force moved from the Philippines toward the Marianas, unaware that American attacks had neutralized the Japanese land-based planes on Guam. The United States was able to

Marines move onward against the Japanese at Saipan, 24 June 1944. (Library of Congress)

attack the Japanese fleet with its own air power, and the subsequent “Great Marianas Turkey Shoot” resulted in a devastating defeat for both the Japanese warplanes and its surface ships.

On Saipan the marines, supported by the army’s 27th Infantry, fought northward through thick jungle and against Japanese positions dug into rocky ridges. Using devastating firepower, the American forces continued their advance, but when the marines pushed ahead more quickly than the infantry, marine commander Major General Holland Smith created an interservice controversy by removing General Ralph Smith, the army commander. The ferocity of the fighting across the island continued, as suggested by the marine names for Japanese positions: Death Valley and Purple Heart Ridge. In addition to the jungle and cave obstacles, the marines encountered difficult street-to-street fighting through the towns and villages of Saipan. Despite fierce resistance and one of the war’s most ferocious banzai attacks on 7 July, when 3,000 Japanese soldiers charged the American lines, the Japanese were eventually pushed to the northernmost tip of the island. Rather than surrender, the Japanese garrison fought on until virtually all were killed, while

simultaneously thousands of Japanese civilians blew themselves up with grenades or jumped off the cliffs in mass suicide. Included in the Japanese losses were the former commander of the attack on Pearl Harbor and commander of the central Pacific, Admiral Chuichi Nagumo, who committed suicide, and Prime Minister Hideki Tojo, who resigned shortly after the loss of Saipan. The United States took the island by 9 July but suffered 14,000 casualties, including almost 3,500 killed. The American forces followed this victory by capturing Guam and Tinian, but Japanese fanaticism remained a permanent image in American memory of this battle and the Pacific War.

Saladin (al-Malik al-Nasir Salah al-Din aba'l-Mussafer Yusuf ibn Ayyub ibn Shadi) (1138–1193)

Muslim warrior and ruler. Saladin defeated the Third Crusade and the Crusader Kingdom of Jerusalem, overthrew the Shiite Fatimid Caliphate, and established the Ayyubid Dynasty that ruled Egypt from 1171 until 1250 and Syria-Palestine, Yemen, and northern Iraq for another decade.

Salah ad-Din ibn Ayyub, known to the crusaders as “Saladin,” came from a family of Kurdish army officers in the service of Nur ad-Din al-Zangi, ruler of Syria. Nur ad-Din had defeated the Second Crusade of 1148, becoming an Islamic hero. Still, the situation remained ominous. Crusaders controlled Palestine and raided regularly across the Jordan. Worse, the Isma’ili Shiite regime in Egypt, the Fatimid Caliphate, tottered on the brink of collapse. In 1163, the crusaders menaced Cairo itself. In response, Nur ad-Din dispatched troops to prop up the Fatimids and block new crusader thrusts.

Saladin, then a subaltern, defended the coastal approaches. The crusaders withdrew in 1168, just as the commander of Nur ad-Din’s expedition died. As the commander’s nephew, Saladin took charge. He forced the Egyptians to appoint him military and administrative chief to the sickly and heirless Fatimid caliph. Gradually making himself ruler de facto, he refused to name a successor when the caliph died in 1171. He instead abolished the Fatimid Caliphate and paid homage to the Sunni Abbasid Caliph of Baghdad, in whose name he now ruled Egypt. Death again befriended him in 1174 when Nur ad-Din died, leaving a child heir. Saladin was now the most powerful leader in the western Middle East.

Although Saladin clashed with the crusaders episodically, his primary concern for the next 12 years focused on gaining control of Nur ad-Din’s lands in Syria and Iraq. Until 1186, his battles and sieges were primarily against fellow Muslims, but the unstable combination of reckless leaders and dwindling manpower made the Kingdom of Jerusalem increasingly vulnerable. When the crusaders launched out from Acre in 1187, Saladin resolved to confront them. In July, he trapped the Christian forces at Hattin and inflicted a catastrophic defeat on them. King Guy of Jerusalem and numerous officers and knights fell into his hands. Capitalizing on this triumph, Saladin captured city after city, taking Jeru-

salem itself that October. By the end of the year, Tyre alone remained under crusader control.

The Muslim occupation of Jerusalem was free of the appalling slaughter that marked the 1099 crusader conquest. Nonetheless, the European response came swiftly. The Third Crusade, led primarily by Richard I the Lionhearted of England and Philip of France, raised new armies to reclaim Palestine. In June 1191, Richard and Philip stormed into Acre. After Philip returned to France, Richard and Saladin continued to spar along the coast. Richard took several coastal towns but dared not advance into the hill country that sheltered Jerusalem. Saladin, consolidating power in northern Iraq, did not want to risk a pitched battle. Acknowledging a stalemate, the two concluded an amicable treaty in 1192. Richard received the coast from Acre to Jaffa but returned several other posts. In return, Saladin pledged to leave these towns unfortified and to protect Christian pilgrims traveling inland to Jerusalem.

A year later, Saladin died. His family, the Ayyubids, continued to rule Egypt and Syria for the next half-century. Ironically, Europeans would eventually romanticize him into a symbol of chivalrous warfare and diplomatic integrity.

Salerno (9–17 September 1943)

World War II landing on the mainland of Italy following the Allied liberation of Sicily. Salerno was selected as the site of the Anglo-American landing because it was within operational range of Allied fighter aircraft and only 30 miles south of the port of Naples, the Allies’ immediate objective. The Salerno plain, however, was hemmed in by mountains that provided the German defenders superb observation of Allied movements below. As a prelude to the Salerno landing, code-named AVALANCHE, General Bernard Montgomery’s British Eighth Army crossed the Straits of Messina on 3 September to occupy the toe of Italy.

American lieutenant general Mark W. Clark commanded the Fifth Army that landed at Salerno. It comprised the U.S. VI Corps (Major General Ernest J. Dawley) and the British X Corps (Lieutenant General Richard L. McCreery). Defending Salerno was the German Tenth Army, commanded by General Heinrich von Vietinghoff, who served under Field Marshal Albert Kesselring’s overall command.

In the days that followed the Anglo-American landings on 9 September, it appeared as though the Allies would suffer another Gallipoli or Dunkirk. German counterattacks threatened to break the bridgehead in half and cut the British off from the Americans. The critical moment of the battle came during the afternoon of 13 September, when the Germans came within 2 miles of the beaches. Withdrawal appeared imminent, until Allied reinforcements, including two British battleships with their 15-inch guns, helped to beat back the attacks.

On 16 September, American patrols made contact with units of the British Eighth Army advancing from Calabria. The Battle of Salerno was over. The Germans began a slow withdrawal to the first of their mountain defensive lines that blocked the approach to Rome.

Salvadorian Civil War (1977–1992)

One of Latin America's bloodiest wars, but one that did end with a measure of reconciliation. The conflict may be said to have begun with the October 1979 ousting of General Carlos Roberto Romero, who had come to power in a second successive dubious election in 1977. Government repression was rife, provoking increased guerrilla activity.

Romero was replaced by General Jose Napoleon Duarte. Although Duarte's was a civilian-military junta, reforms were not forthcoming, and repression continued. On 24 March 1980, the outspoken Archbishop Oscar Romero y Galdames was shot while conducting mass in San Salvador's cathedral, a shocking act causing repercussions in the United States as well as in El Salvador.

In 1980 the Farabundo Marti National Liberation Front

(FMLN) was created as an umbrella organization of leftist guerrillas. Buoyed by the Sandinistas' triumph in Nicaragua, they launched a massive "final offensive" in January 1981. It was met with repression from the government and paramilitary groups, as a downward spiral of violence continued. In January 1982, the FMLN even managed to destroy 70 percent of the air force when it attacked the Illopongo Air Force base.

Elections for the Constituent Assembly (1982) and presidency (1984) were held against a backdrop of intimidation and violence. The descent into violence and repression continued with the militarization of the country, achieved by massive aid from the United States. The United States was determined to prevent another Nicaragua and would pour \$6 billion into the country as well as provide American trainers for the Salvadorian army. The army more than trebled in size between 1980 and 1986.

Presidential elections were scheduled for 1989, and in January the FMLN offered to participate if they were delayed for six months. The government rejected this offer, and Alfredo Cristiani was elected president. Peace talks between the FMLN and the government in September 1989 failed, and in the aftermath of this failure, the FMLN unleashed its second "final offensive." It started in the country but soon moved to the cities and even managed to control parts of the capital, San Salvador, itself. The government and paramilitary groups countered with even more violence. On the night of 16 November 1989, members of the Altacalt battalion murdered six Jesuits, their maid, and her daughter in the Central American University.

As the world picture began to alter with the decline of the Soviet Union and the Sandinistas' electoral defeat in Nicaragua, both sides became more interested in the idea of peace talks. In April 1990, the United Nations became involved with these talks, and an agreement was finally signed on 1 February 1992 in Mexico. Throughout 1992, demilitarization increased, with the FMLN even becoming a legal and recognized political party. This process was declared completed in December 1992, and 15 December was declared National Reconciliation Day. During the civil war, both sides had fought themselves to a stalemate, which resulted in the loss of some 75,000 lives.

Samnite Wars (343–290 B.C.E.)

A series of conflicts fought between the Samnites and the Romans for possession of southern Italy. Samnium was a region located in the Apennine Mountains in southern central Italy. The Samnites spoke Oscan and were composed of several tribes, four of which—the Caraceni, Caudini, Hirpini, and Pentri—were united in a loose confederacy.

As it weathered Celtic and Etruscan attacks during the fourth century B.C.E., Rome continued to expand beyond the borders of Latium, gradually annexing and colonizing non-Latin territory and thus coming into contact with the Samnites and other Oscan-speaking peoples. Simultaneously, the Samnite population grew as they acquired more territory and allies. The First Samnite War, fought from 343 to 341 B.C.E., arose from the tensions between the two growing powers. Some modern scholars believe this war to be fictitious, created later to justify Roman aggression in Italy; little evidence can be offered to settle that debate satisfactorily. Nonetheless, by 340 B.C.E., Rome dominated Samnium's allies in northern Campania.

Better known than the preceding conflict, the Second Samnite War lasted from 327 to 304 B.C.E., broken only by a tense pause between 321 and 316 B.C.E. Initially, the Samnites held the advantage, marked by their decisive victory under Gavius Pontius in 321 B.C.E. at the Caudine Forks (location unknown). Obligated to seek a truce, the Romans reconstructed their armies and renewed hostilities in 316, only to be defeated the following year at Lautulae (near Taracina, Italy). Despite these setbacks, by 304 B.C.E. Rome controlled nearly all Samnite lands and allies in southern Campania, Apulia, and Lucania. Probably in connection to this war, the Romans restructured their infantry, abandoning the Greek phalanx organization and introducing the revolutionary manipular system.

The Third Samnite War, fought from 298 to 290 B.C.E., signaled the demise of the Samnites as a free people. Roman troops crushed a combined Samnite, Etruscan, Celtic, and Umbrian force at Sentinum (Sassoferrato, Italy) in 295 B.C.E. The tribes' final surrender was negotiated in 290 B.C.E., and with their acquiescence, Rome claimed possession of most of peninsular Italy, resisted only by a few minor Italic tribes and Greek cities. Despite their capitulation, the Samnites continued to rebel in later years, assisting both Pyrrhus and Hannibal. They fought bitterly against Rome during the Social War, and Samnium remained a rural, superficially Romanized region well into the imperial period.

Samory Touré (1835–1900)

West African war chief who established an empire and who fought against French colonialism. Born circa 1835 in Guinea, near Sanakoro, he became a soldier, assumed the title of Almamy (prayer leader), and became chief of Bissandougou after raising a private paramilitary force armed with modern weapons in 1868. He went on to overthrow the aristocracy and establish an organized state over the next decade that stretched from Upper Volta in the east to northwestern Guinea in the west. In 1879, his forces captured Kankan and began edging toward territory in the north occupied by French colonial troops, wreaking havoc along the way. Entire villages fled in fear from Samory's army and sought protection from the French. After some inconclusive battles (1883–1884), Samory signed the treaty of Bissandougou with the French, which set the Niger River as Samory's western boundary (1887). He then invaded Sikasso (present-day southern Mali) but French intervention forced him to withdraw in 1887–1888. He repudiated the treaty in 1891. The French drove him from his bases, so he established new ones along the Ivory Coast in 1893. From 1892 to 1895, his troops moved into Sierra Leone and Ghana. In 1897, he captured the Dioula capital of Kong, but the British forced a retreat at Sierra Leone. Later, he sacked Kong, which had allied with the French in 1897, and sacked Bondoukou in mid-1898. On 29 September 1898, the French captured Samory at his camp and sent him into exile on the island of N'Djole on the Ogooué River, where he died on 2 June 1900. Seen as a hero by many for his protracted struggle against the French, Samory is also considered a brutal oppressor who spread terror in his wake.

Samudra Gupta (330–380)

Samudra Gupta reconquered much of the old Mauryan Empire in India. The Gupta dynasty (320–480) claimed descent

from the earlier Mauryan dynasty (321–232 B.C.E.) and again unified Hindu India for the second and last time. Chandragupta I founded the Gupta dynasty when he inherited the famed throne of Magadha at Patna in 320 C.E. Marriage to the daughter of a rival king produced Samudra Gupta. Chandragupta I then began the process of reunification of the Ganges River Hindu kingdoms.

Samudra inherited the throne in 330 and completed the mostly political, sometimes military, conquest of the Gangetic kingdoms. Samudra may have relied heavily upon Kautiyla's "Arthashastra," a political manual along the lines of *The Prince* by Niccolò Machiavelli. Kautiyla, adviser to Chandragupta Maurya of the earlier Mauryan dynasty, espoused a well-organized military state. Clearly Samudra used this concept successfully, creating a loose federation by political alliance, military threat, and sometime conquest.

Samudra conquered or subjugated Rajputana, Assam, the north Deccan, Andhra, the Punjab, and even Nepal before his death in 375. Naval fleets proved instrumental in overcoming the coastal factions of India.

His son, Chandragupta II, extended the empire into Punjab, Gujarat, Saurashtra, and Malwa while creating a Gupta golden age. However, his lack of control of the northwestern mountain passes left India open to the same invasions that helped collapse the Mauryan dynasty. In came the White Huns, who overwhelmed the last Gupta rulers, Kumaragupta and Skandagupta, by 480.

Samurai

Japan's provincial warrior aristocracy. Samurai were warriors in service to their lords; they could carry long and short swords and had status that peasants, artisans, and merchants lacked.

After the establishment of the Tokugawa shogunate, the samurai increasingly became bureaucrats to great lords and lost their warrior edge. With the Meiji Restoration, they lost their hereditary privileges and disappeared into the general population.

San Jacinto (21 April 1836)

The Mexican defeat that ensured the independence of Texas. In the aftermath of the Texan defeats and massacres at Goliad and the Alamo, General Antonio López de Santa Anna, after a fruitless race to capture the leaders of the Texan insurgents, had separated himself from the bulk of his army. Samuel Houston wanted to take advantage before Santa Anna could return to his main force, so he blocked his enemy's retreat.

After some cavalry charges on 20 April that accomplished little, the main fighting took place the next day. In late afternoon, the Texans rushed and surprised the Mexican positions without firing but shouting "Remember the Alamo" and "Remember Goliad." Then, as the Mexicans fired (going mostly over the heads of the onrushing and infuriated Texans), the Texans fired before the Mexicans could reload their muskets. By that point, the Texans had reached the breastworks and the struggle became hand-to-hand. The fighting was so fearsome that Santa Anna supposedly declared that "so sudden and fierce was the enemy's charge that the earth seemed to move and tremble." The fighting (and slaughter) was over within 25 minutes.

At a cost of six men killed and 30 wounded, the Texans had killed more than 600 Mexicans, wounded 200, and captured 700 (including Santa Anna), or virtually the entire Mexican wing of 1,500 of the main army. To gain his freedom, Santa Anna had to concede Texan independence and an end to the fighting. Few victories have been so one-sided or so profound in their consequences.

San Juan Hill/El Caney (1 July 1898)

The crucial land battle in the 1898 Spanish-American War. As part of the effort to shut down all of Spain's major ports in Cuba, the United States began a joint army-navy campaign against Santiago de Cuba in June 1898. The U.S. Army V Corps, under the command of General William Shafter, approached the port city only to encounter strong Spanish resistance at El Caney and San Juan Ridge, the high ground east of Santiago.

Shafter's plan for 1 July called for the reduction of El Caney, followed by an attack up the stronger positions at San Juan Ridge. Although heavily outnumbered and spread too thinly across their front by General Arsenio Linares, the Spanish fought stubbornly. More than 4,000 Americans took eight hours to capture El Caney from 520 Spaniards, with both sides taking heavy casualties. The unnecessary attack on the easily isolated El Caney stole attention and manpower from the more important battle at San Juan Ridge.

After a two-hour delay and with insufficient artillery support, American forces consisting of infantry and dismounted cavalry attacked up San Juan Ridge. After a short, intense fight, the Spanish forces on San Juan Hill abandoned their positions in the face of a strong charge and withering fire from a well-placed American Gatling machine gun. On Kettle Hill to the north, the dismounted cavalry—including the 1st Volunteer Cavalry Regiment (Theodore Roosevelt's "Rough Riders") and the "Buffalo Soldiers" of the black 9th and 10th Cavalry Regiments—took the heights from the outnumbered Spaniards.

Although not prosecuted with the greatest operational skill, the Battle of San Juan Hill/El Caney was the only major land battle in the "splendid little war" and proved vital to the overall American strategy. After a short siege, Santiago formally capitulated on 17 July, and the war was over by August. Perhaps more important, the battle put Theodore Roosevelt squarely in the national spotlight, thus beginning his meteoric rise that would eventually land him in the White House.

San Martín, José Francisco de (1778–1850)

Liberator of Argentina, Chile, and Peru. San Martín was born to Spanish parents in Argentina. His military career began in

Spain in 1789, and he participated in campaigns in Africa, France, and Spain before retiring in the rank of lieutenant colonel in 1811 and returning to Argentina. San Martín soon joined the patriot cause in its struggle for independence. In 1816, he formed the Army of the Andes at Mendoza for the mission of liberating Chile and Peru. His army of 4,000 regulars and 1,000 militiamen accomplished the logistical feat of moving supplies and equipment across some of the highest passes in the world. San Martín and his men defeated the Spanish at Chacabuco on 12 February 1817 and liberated Santiago two days later. San Martín secured Chile's independence at Maipo on 5 April 1818, when his forces killed 1,000 Spanish troops and captured 3,000. With Chile secure, San Martín turned his attention to Peru, embarking with an invasion force of 4,400 on 20 August 1820. San Martín initially avoided the 23,000 Spanish troops in Peru and developed a strategy that encouraged rebellion and desertion. On 6 December 1820, he defeated one Spanish army and proceeded toward Lima. Attempts to negotiate a settlement with the viceroy failed, and San Martín liberated Lima. Peruvian independence was declared on 28 July 1821.

San Martín could not reach an agreement with Simon Bolivar over the final strategy to defeat Spain. He resigned his position as protector of Peru and returned to Argentina. In 1824, distraught over the death of his young wife, he departed for Europe, where he spent the rest of his life. San Martín's military campaigns are remarkable for the logistics of crossing the Andes and the use of surprise, audacity, and psychological warfare to defeat vastly superior and better equipped forces.

Sand Creek (29 November 1864)

A massacre perpetrated by a U.S. Army contingent on surrendered Native Americans. On 29 November 1864, 1,200 U.S. troops of the 1st Colorado Cavalry and the 3d Colorado Cavalry, under the command of Colonel John M. Chivington, attacked a surrendered and partially disarmed Cheyenne Native American camp in southeastern Colorado Territory. Chief Black Kettle, the camp's leader, had negotiated for peace and camped near Fort Lyon with the consent of the fort's commander. As the attack on the camp began, Black

Kettle raised the U.S. flag as well as a white flag. Despite those signals, anywhere from 150 to 500 Native Americans, among them women and children, were massacred.

Americans in general at first celebrated the Sand Creek action and its commanding officer. However, as it became clear that the soldiers had slaughtered defenseless Native Americans, extensive formal investigations followed, and the U.S. government officially condemned the attack. The massacre was also a chief cause for the Arapaho-Cheyenne war that followed and had far-reaching influence in the Plains American Indian wars of the next decade.

On 7 November 2000, President Bill Clinton signed into law the Sand Creek Massacre National Historic Site Establishment Act.

Sandino, Augusto César (1893–1934)

Leader of a guerrilla movement in Nicaragua from 1927 until his death. Sandino sided with the Liberal Party in its conflict with the Conservative Party that resulted in civil war in 1926. When U.S. Marines intervened in January 1927, Sandino formed his own military command at San Juan del Norte in a mountainous area. He refused to participate in a truce brokered by U.S. diplomat Henry Stimson that resulted in the disarming of the Liberal army and the placing of the Nicaraguan National Guard under the control of the U.S. Marines.

Subsequently, Sandino formed the Defending Army of National Sovereignty of Nicaragua and frustrated all attempts by the marines to capture him. It was during this period that Sandino and his movement achieved fame and admiration in many parts of Latin America for standing up to the Colossus of the North. In 1932, the Liberal Party returned to power with the election of Juan Batista Sacasa. In addition, the United States was weary of its involvement in Central America and began to withdraw the marines. Command of the Nicaraguan national guard was given to Anastasio Somoza García, and a truce was negotiated with Sandino. The final contingent of marines departed on 1 February 1933, and Sandino's army disarmed a few weeks later.

However, the national guard attacked the Sandinista town of Las Segovias, and an outraged Sandino demanded that the guard be declared unconstitutional. President Sacasa, Somoza, and Sandino met at the presidential mansion in Managua on 21 February 1934. Following the meeting, Sandino was kidnapped and murdered by the National Guard. Sandino's classic use of guerrilla tactics against the superior numbers and technology of the U.S. Marines, his martyrdom, and his revolutionary philosophy were the inspiration for the Sandinista National Liberation Front (FSLM) that came to power in Nicaragua in 1979.

Santa Anna, Antonio López de (1794–1876)

Mexican general, president, and dictator. Santa Anna joined the Spanish army in 1810 and supported Augustín de Iturbide during the Mexican Revolution in 1821. Later, in 1823, he played a key role in Iturbide's overthrow, which resulted in the establishment of a republic. In 1829 at Tampico, Santa Anna defeated an invading Spanish army bent on reconquest, and this event vaulted him to national prominence. In 1833, he assumed the presidency of Mexico but soon relinquished the office, only to take it again the following year in a military coup. Santa Anna decided to command the Mexican army in its effort to thwart the Texas Revolution. His most infamous victory was in March 1836 at the Alamo. But, on 26 April 1836, he was defeated and captured by Samuel Houston at the Battle of San Jacinto. He was forced to sign away Texas and briefly retired. When a French army invaded Mexico in 1838, Santa Anna returned to command and lost a leg fighting the French. This act redeemed him in the eyes of many Mexicans and revived his political life as he returned to the presidency in 1839. However, he was alternately ousted and returned to power in 1841, 1843, and 1844.

The Mexican-American War (1846–1848) provided yet another opportunity for Santa Anna ("The Napoleon of the West") to display his military genius. He met defeat in each of his battles, at Buena Vista (23 February 1847), Cerro

The flight of Santa Anna at the Battle of Cerro Gordo. (Library of Congress)

Gordo (18 April), and Chapultepec (13 September), after which he went into exile.

In 1853, a conservative coalition brought Santa Anna back to Mexico and established him as a military caudillo (strongman). For two years, Santa Anna ruled with a heavy hand but failed to remedy Mexico's myriad political, economic, and social ills. He was forced from office in the 1855 Revolution of Ayutla and, fortunately for Mexico, never returned to power.

Santo Domingan Revolution (1844)

By 1822, France and Spain had been forced to abandon all hope of retaining colonies on the Caribbean island of His-

paniola, which became the Republic of Haiti. However, there remained decided distinctions between the eastern and western sections of the island. The east, long known as Santo Domingo, retained much of its Spanish colonial identity, whereas the west was a blend of African and French influences. The southeastern city of Santo Domingo was the center of the blend of Spanish, Creole, African, and indigenous cultures that became known as Dominican. Nevertheless, the political and economic life of the island was dominated by the Haitians centered in the capital, Port-au-Prince. The Dominicans chafed under Haitian rule and refused to be integrated into the life of the republic. In 1838, Juan Pablo Durate, a Dominican intellectual, formed the Trinitaria, a secret society devoted to freeing Santo Domingo from Haitian rule. The group created a flag and began propaganda efforts to stir Dominican nationalism. When the Trinitaria was betrayed to Haitian authorities, the conspirators formed a new organization and continued their work. During the period 1839–1843, Durate and his supporters plotted and sought assistance in Venezuela and Curacao, but to no avail. On 27 February 1844, Dominican rebels struck the city of Santo Domingo, captured the Ozma fortress, and expelled the Haitian governor. Within a week, Azua, Santiago, and other cities and towns surrendered to the rebels. A central junta

was formed, and on March 15 Durate made a triumphal entry into the city of Santo Domingo.

Two Haitian armies were dispatched by the Haitian president to bring the rebellious Dominicans to heel. In addition to Durate, Buenaventura Baez and Pedro Santana figured prominently in the revolt, and they soon began arguing over a strategy to oppose the Haitian forces. Santana favored foreign support and a defensive posture against the numerically superior Haitians, whereas Durate opposed both measures. Santana plotted with the ruling junta to have Durate relieved of his command. Although the Haitians enjoyed superior numbers, they were met with fierce resistance from the Dominicans and were unable to make a decisive advance. In April, Haitian general Jean Louis Pierott led a coup against the Haitian regime, leading to a retreat by Haitian forces. Santana used this opportunity to secure the frontier and to establish roughly the border between Haiti and Santo Domingo.

In early July, there was a popular demonstration in Santiago to have Durate assume the presidency, a move he accepted only with the provision that a fair and free election be held. On 12 July, Santana marched into the capital and declared himself dictator. Durate was later arrested and sent into exile in Germany, and Santana became dictator. Although the Domingan revolution led to what eventually became known as the Dominican Republic, it also ushered in decades of political instability and foreign intervention.

Saratoga (1777)

A series of battles in the fall of 1777 in New York's Hudson Valley region that resulted in one of the very few capitulations in British military history, which was instrumental in inducing the French to ally themselves with and tip the balance in favor of the American cause.

In early 1777, British general John ("Gentleman Johnny") Burgoyne had convinced the British government that an invasion from Canada into the Lake Champlain–Hudson River watershed would isolate New England and bring the American revolutionaries to terms. His force of 7,500 infantry and

a small flotilla of gunboats reached Fort Ticonderoga, New York, in June and besieged its 2,500 defenders under General Arthur St. Clair. Within a few days, St. Clair's situation became untenable, and the Americans withdrew.

British forces pursued the Americans down the Hudson River and fought engagements at Hubbardton and Skenesboro, while a separate British army under Lieutenant Colonel Barry St. Leger moved along the Mohawk River and engaged the Americans at Fort Stanwix and Oriskany in western New York.

Burgoyne's advance down the Hudson was foiled near Fort Edward, and the American rebels inflicted heavy casualties on German and loyalist troops sent to capture rebel supplies and horses near Bennington, Vermont. Seizing the initiative, General Horatio Gates determined to meet Burgoyne near the confluence of the Hudson and Mohawk Rivers and entrenched along Bemis Heights south of present-day Saratoga. Burgoyne met Gates's challenge, despite the erosion of his troop strength from casualties and desertions, and advanced on Gates's position.

On 19 September, Burgoyne advanced on Gates's position, only to be thwarted by Colonel Daniel Morgan, Major Henry Dearborn, and General Benedict Arnold near Freeman's Farm below the heights. In this clash, the Americans suffered 300 casualties and the British 600. Burgoyne, concerned by these losses and hopeful of reinforcements, fortified his position. Growing more desperate when his lengthy supply line was severed and his reinforcements stalled, Burgoyne attacked again on 7 October, producing only a harvest of an additional 400 British casualties. Burgoyne withdrew his depleted army to Saratoga, pursued by Gates's rapidly swelling army of 14,000 Continentals and militia.

When General John Stark cut off Burgoyne's retreat with his New Hampshire militia units, Burgoyne was forced to surrender. Besides saving New England, Gates's victory at Saratoga convinced a skeptical world that the colonials could win their independence, thus prompting France formally to recognize the United States of America on 17 December and sign a military alliance in February 1778. Historians today give most of the credit for the Saratoga victory in the field to Benedict Arnold, although Gates reaped the consequent adulation.

Sargon of Akkad (ruled c. 2334–2279 B.C.E.)

Founder of a Sumero-Akkadian dynasty in southern Mesopotamia and the creator of the first world state in history. Not only is providing a synthesis of the reign of Sargon (in Akkadian, Sharrum-kinum, or “rightful king”) and his military exploits difficult, but one cannot with any certainty place them in chronological order. He was the ruler of Agade, a city near Babylon (which has not yet been located), and may have first undertaken expeditions to western Iran and northern Mesopotamia. He also claims to have conquered the powerful Syrian states of Mari and Ebla and reached the Mediterranean Sea. Although it is not possible to discern the nature of these conquests, there is archaeological evidence for destruction at Ebla that has been attributed, in part, to Sargon.

At some point during his reign, Sargon advanced toward the Sumerian cities in the south, conquered Ur and Umma, and defeated Lugalzagessi of Uruk, who had claimed to be the leader of the Sumerian cities. After the conquest of the south of Mesopotamia, Sargon proceeded to establish Akkadian as the language of bureaucracy, creating a Sumero-Akkadian synthesis of cultures. To ensure legitimacy in this area, he installed his daughter, Enheduanna, as the high priestess of Ur, one of the more important cities.

Sargon claims to have controlled territory from western Iran to Anatolia and the Mediterranean Sea (possibly including Cyprus). He was one of the first rulers to employ a continuous standing army.

Although the Akkadian dynasty begun by Sargon lasted only two centuries, this king became the subject of later narratives for nearly the next two millennia that described his rise to power and his campaigns.

Sassanid Empire (225–642)

In 224, Ardashir Sassan revolted against Artabanus V, reigning shah of the Parthian dynasty, and killed him in battle at

Hormizdagh. The Sassanids replaced the loosely structured Parthian government with an absolutist-style monarchy. To achieve military parity with their Roman enemies, something the more confederal Parthian state repeatedly failed to accomplish, the Persian feudal nobility seemed willing to accept royalist authority. The Sassanids also established a state-church alliance with Persia’s traditional Zoroastrianism.

Ardashir fought Rome until his death in 241, and his son, Shapur I, wrung territorial concessions from Emperor Philip the Arab in 244. He returned to war with Rome in 252 over Armenia. Shapur bested several generals and, in 260, took Emperor Valerian prisoner. Persistent military limitations continued to hobble Sassanid ambitions, however. Persia could conquer Roman population centers but could not hold them. Nomad attacks from central Asia prevented concentrating forces against Europe. Finally, distance made sustained operations too far from the Iraq-Iran heartland extremely hazardous, though distance also protected Persia. Shah Vahram II could not save Ctesiphon, the Persian capital, from Carus’s expedition in 283, but exposed supply lines soon forced Carus’s retreat. Ten years later, Shah Narseh started a war that again saw Ctesiphon fall into Roman hands, to be returned after a peace agreement in 298. If the Sassanids could not solve their “Roman problem,” neither could the Romans solve their “Persian problem.”

Shapur II stabilized the eastern frontier by annexing the Oxus Valley, Bactria, and parts of the Indus Valley. In 337, he replaced Armenia’s pro-Roman king with his own man. Emperor Constantine died before redressing the situation. In 359, the shah informed Rome that Armenia and northern Mesopotamia were his and seized Amida (Diyarbakir). In retaliation, Emperor Julian marched on Ctesiphon in 363, while Shapur, avoiding combat, used scorched-earth tactics to demoralize and decimate the Romans. Julian died retreating from Ctesiphon. His successor, Jovian, conceded most of Armenia, several key Mesopotamian towns, and tribute to the shah. In 387, Emperor Theodosius, entangled with German tribes, reconfirmed Jovian’s deal.

Despite a short war in 422, decades of self-interested cooperation followed, and in 448, Ctesiphon and Rome signed a virtual *détente*. As barbarians overwhelmed their borders, imperiling their very survival, both empires were too distracted to threaten each other. In 484, eight years after Rome “fell,” Shah Peruz and thousands of troops fell before the White Huns in a catastrophic defeat. Shah Kavad negotiated peace with the chieftains but at the price of a heavy annual tribute and the virtual loss of his central Asian, Afghan, and Indus provinces. Beset by famines, refugees, and sectarian strife, Kavad tightened his absolutism and sought more revenue to maintain control. Thus, in 502, Kavad demanded that Byzantium pay new tribute.

After 502, Persia and Byzantium alternated between war and truce. Unlike the Parthians, the Sassanids learned siege craft, as they demonstrated by sacking Antioch in 540. Generally, operations concentrated on traditional fronts—Syria, Mesopotamia, and Armenia—with neither side obtaining a decisive advantage. The strains of prolonged war, however, revived factionalism within Persia's military nobility. The 572–591 war ended in a truly bizarre fashion when a coup toppled Shah Hurmazd in 590. The new shah, Khusrauw II, no tool of mutineers, convinced Emperor Maurice to send Byzantine troops to help him take the throne in his own right. Maurice in turn fell victim to a coup in 602, and the outraged Shah Khusrauw II began a grinding two-pronged offensive against the usurper: by 610, General Shahin occupied all of Armenia, and General Shahrbaraz overran Syria, Palestine, and finally Egypt in 615–620. These were not glorified plunder raids but deliberate annexations by brilliant commanders. A new emperor, Heraclius, found himself fighting simultaneously in Anatolia, in Syria, and against the Avars in the Balkans. His strategy was to hold on in Anatolia and then thrust into Iraq. A massive threat to Ctesiphon might intimidate the shah into making peace.

Khusrauw marshaled his resources for the historic goal of taking Heraclius's capital. In the spring of 626, Shahin, Shahrbaraz, and the Avar chiefs converged against Constantinople, determined to smash it open. Instead, disease, weather, and the vigilant Byzantine navy ground down the besiegers. As the encirclement collapsed, Heraclius now risked his invasion of Iraq. The Byzantines defeated the Persians at Nineveh and at Dasgared and camped before Ctesiphon. In August 627, Khusrauw II died at the hands of his own son, Kavard II, who immediately sued for peace. The price of peace in 628 was restoration of the borders of 602. Twenty-five years of war made Heraclius a hero, exhausted both empires, and doomed the Sassanid dynasty.

Fury over the war's debacle led to several years of murders (including that of Shahrbaraz) and power struggles within Persia. When Yazdgird III took the throne in 632, he was still negotiating power when the Islamic invasion began. In 637, the Arabs shattered the Sassanids at Qadisiyyah, overran Iraq, and took Ctesiphon almost without resistance. Standing against the tide at Nihawand, Yazdgird and the remnants of the Sassanid army went down to defeat and death in 641. With him, too, died his dynasty.

Savannah, Siege and Taking of (September–October 1779)

In the fall of 1778, the British turned to the American South. They believed loyalist sympathies were greater there, and the southern colonies were closer to key British bases and colonies in the West Indies. They quickly subdued the Georgia colony, took Savannah and Augusta, and began a strategy intended to bring the Carolinas and eventually Virginia under control.

To regain Georgia and take advantage of a powerful French fleet in the West Indies under Admiral Comte Charles-Hector Theodat d'Estaing, the Americans proposed a joint operation to recapture Savannah. On 1 September 1779, the allied fleet arrived and gained control over the mouth of the Savannah River. Comte d'Estaing unwisely permitted the British time to prepare defenses of Savannah and bring in reinforcements from Beaufort, South Carolina. D'Estaing and the American commander, Benjamin Lincoln, did not cooperate well. Formal bombardment did not begin until early October, and by that time, the French admiral feared being caught away from his base during hurricane season as well as being trapped by a British fleet.

Finally, the allies settled on a direct assault on 9 October 1779. The attack from the west was expected, and the diversionary attacks failed. The main assault was intense and the fighting extremely bloody. Despite the courage of the French attackers, the British and loyalist defenders were equally determined, and the defense held. Thereafter, d'Estaing decided he needed to sail for the West Indies, and by 19 October Lincoln and the American troops retreated to Charleston.

Savannah, Siege of (9–21 December 1864)

Near-bloodless seizure of a key Confederate port city. In early 1862, the U.S. Navy captured Fort Pulaski and established an effective blockade of Savannah harbor. But the city's strong defenses prevented a Union attack, and thus Savannah was spared much of the destruction visited upon other southern ports.

When William Sherman and his 62,000 troops left Atlanta in mid-November 1864, Confederate lieutenant general

William Hardee and 10,000 troops built defenses against Sherman's eventual arrival and attacked to augment those defenses, keeping the Union navy from exploiting its position in the harbor.

Sherman's troops began arriving on 9 December 1864. Sherman soon decided to establish a siege because he had no desire to test the strong defenses; he was content to await the arrival of siege guns and to destroy the city and its defenses from a distance.

On the night of 20–21 December, Hardee had his men construct makeshift pontoon bridges, destroy Confederate navy ships, spike the guns, and dump ammunition into the river; by 3:00 A.M., the last Confederate troops were escaping toward Charleston, South Carolina.

Soon thereafter, Union troops cautiously moved forward, entered the trenches, and realized that Hardee had abandoned the city. City leaders then offered to surrender the city and sought protection by Sherman. On 22 December 1864, Sherman sent a famous telegram to President Abraham Lincoln: "I beg to present to you as a Christmas gift, the city of Savannah, with one-hundred fifty heavy guns and plenty of ammunition, and also about twenty-five thousand bales of cotton."

Saxe, Hermann Maurice, Comte de (1696–1750)

French general, marshal of France, military theorist, and victor of Fontenoy (1745). Born on 28 October 1696 in Goslar, Saxony, Hermann Maurice was the first of 354 acknowledged illegitimate children of Frederick Augustus II, Elector of Saxony and King of Poland. His mother was Countess Maria Aurora von Königsmarck, a Swedish noblewoman. Saxe began his very successful military career with the Saxon army at the age of 12, when he was sent to campaign with Prince Eugene of Savoy at Malplaquet (1709) during the War of the Spanish Succession (1701–1714). In 1711 he was given the title Graf von Sachsen, or comte de Saxe in French, by his father. In 1719, his father also purchased a regiment in the French army to further his son's training in the art of war.

Upon the conclusion of the War of the Spanish Succession in 1714, Saxe followed his former commander Eugene of Savoy to southeastern Europe to fight with the Austrian imperial army against the Turks. Beside Eugene, Saxe would serve against the Swedes under Peter the Great.

Returning to France, Saxe turned his very capable mind to the science of war, and wrote *Mes Rêveries*. Although not published until 1756, this work was a seminal treatise on warfare from the hand of a truly great field commander. In *Rêveries*, Saxe advocates smaller armies whose key characteristics should be mobility and speed, the emphasizing of shock tactics, and concentrated artillery fire. In addition, Saxe was one of the first to see the battlefield value of light infantry, as the allied forces at Fontenoy would soon learn. Chief among Saxe's tenets on war were that battle should be the last resort of a general and that unlike other sciences, the science of war has no guiding principles or rules.

During the War of the Polish Succession (1733–1738), Saxe served with distinction against his half-brother, King Augustus III of Poland, and was promoted to lieutenant general in 1734. Three years after the war in Poland, the War of the Austrian Succession began, and Saxe was again on the move, this time into Bohemia. In November 1741, General Saxe's name became widely known and respected when he captured Prague in a daring, surprise night attack. Not only was the city secured by Saxe's army without a prolonged siege, but he also kept his forces from plundering.

Following the French success at Prague, King Louis XV made Saxe a marshal of France, a rank held only by Henri de la Tour d'Auvergne, Vicomte de Turenne, and Claude Louise Hector, Duc de Villars, before him. In 1744, he was given command of the French invasion that was to support "Bonnie Prince Charlie," the Young Pretender to the English throne. However, this invasion misfired when the French fleet was destroyed off Dunkirk by storms.

Saxe's greatest victory came in 1745 at Fontenoy. On 11 May 1745, Saxe led French forces to victory over a combined force of British, Dutch, and Austrian troops sent to relieve the French siege of Tournai. This great victory (one of the very few battles of the eighteenth century that the British lost to the French) by Saxe allowed the French army to secure the major cities of the Netherlands, including Ghent, Brussels, Antwerp, Mons, and Namur.

Two other key victories would come under Saxe's excellent generalship, at Raucoux in 1746 and Lauffeld in 1747. The Battle of Maastricht in 1748 was the capstone of a brilliant military career for this illegitimate son of a king. Though often overshadowed by such military writers and generals as Karl Maria von Clausewitz, Antoine Henri, Baron de Jomini, Napoleon I, and Frederick the Great, Saxe deserves to be ranked as one of the truly original students and practitioners of the art of war. The brilliant light that was

Saxe came to an end on 30 November 1750, at Chambord, his estate in France.

Saxon Raids (205–577)

Raids by Saxons and others across Roman Britain. Seaborne raids across the North Sea were known prior to the third century, but their effects had been limited and localized. The raids of the third and fourth centuries, by contrast, were far more serious. In response, the Romans established a chain of forts along coastal southeastern Britain and northwestern Gaul that eventually came under the command of a “count of the Saxon shore” (*comes litoris Saxonici*).

Ten forts are known in Britain. The earliest, Branodunum (Brancaaster) and Regulbium (Reculver), date to the early third century. The latest, Anderitum (Pevensy), was built after 330. Although constructed piecemeal, the forts were carefully located at strategic points, such as on river estuaries, and may have formed part of a unified defensive system.

Fifth-century Gallo-Roman writer Sidonius Appollinaris characterizes the Saxons that these forts were supposedly intended to defend against as intrepid and ferocious seafarers. Each, he writes, acted like he was the captain of a pirate ship. He warns his friend Namatius, who was about to set out on a sea voyage, about these brutal adversaries who attack without being spotted and, if seen, give their pursuers the slip. Pagans, they were reputed to make human sacrifices, killing one in 10 of their prisoners by drowning or crucifixion when ready to make sail home.

The term *Saxon* is actually a misnomer since a number of Germanic and non-Germanic groups were involved. They included the Saxons themselves but also Angles, Jutes, Frisians, Franks, and even Slavonic Wends. The raiders were also willing to make common cause with Britain’s own barbarians, such as the northern Picts and Scots, who raided along with the “Saxons” in 367, according to Ammianus Marcellinus.

Although primarily enemies of the Romano-Britons, the Saxons also served as their allies as well. By the early fifth century, most Roman troops seem to have been withdrawn

from Britain, including the last detachments of the Roman field army (*comitatenses*). In a letter of 410 whose exact meaning is disputed, Western Emperor Honorius advises the Britons to see to their own defense. This they did in part by hiring their enemies to protect them. These mercenaries included the group of Saxons, Angles, and Jutes, under the Jutish warrior-brothers Hengist (“Stallion”) and Horsa (“Horse”), invited by the Romano-British leader Vortigern to protect his domains against the Picts and Scots. In exchange for their services, the Germanic tribesmen were reward with grants of land. This cooperation marked the real beginning of a Germanic presence in Britain, but archaeological evidence now suggests that some Saxons and perhaps representatives of other Germanic groups as well were present well before 449.

Although originally invited as mercenaries by the Romano-Britons, the Saxons and others appear to have quickly become the dominant partner in the relationship. They are said to have later revolted and to have invited compatriots from across the sea to settle, for example. One source, the *Gallic Chronicle*, even claims that Britain was already under the control of the Saxons in 441.

Despite this claim, the *Anglo-Saxon Chronicle* suggests that the new arrivals came initially in groups of two to five “keels” (ships). Thus their early settlements in eastern Britain would seem to have been on a small scale and may be represented archaeologically in England by brooches and pottery similar to that found in the continental homelands of northwestern Germany. In the course of the fifth and sixth centuries, Germanic material culture became prevalent across southern and eastern Britain, but the true scale of immigration is difficult to assess since it is possible that “native” Britons had, by then, become acculturated to Germanic ways.

Scandinavian War (1448–1471)

The Scandinavian War was caused by the breakup of the Kalmar union of the three Scandinavian kingdoms in 1397. The union had been held together first by Margaret and sub-

sequently by her grandnephew Eric until his dethronement in 1440. Eric's nephew Christopher was elected to the position until Eric's death in 1448. At this point, different actions were taken in different countries by various parties. In Denmark, the council crowned Christian of Oldenburg with the proviso that all power was held by the Council of the Realm. In Sweden, a party elected and crowned Karl VIII Knudsson. In Norway, rival parties elected both Karl and Christian. The scene was set for civil war.

There was no clear heir to the unified throne. Christian and Karl, in a manner reminiscent of the War of the Roses in England, contended, held, and lost the consolidated throne over the next two decades. Sweden endured invasion and civil war until 1457. At that point, Karl was driven out and Christian crowned. Then Christian was turned out in 1464, and Karl returned to the throne until his death in 1470.

As with other medieval civil wars, who was on the throne and the support of nobles for a specific candidate were determined more by the disputes between the nobles than the relative merits of the potential monarchs. Support and funds were available, and the church, the Hanseatic League, and the nobles were happy to provide them for a price. The Kalmar Union was seen as a less costly alternative to the civil war.

Although the Oldenburg line was eventually successful, the initial two decades of Christian's reign resulted in the decline of the Norwegian kingdom and the loss of the Hebrides and the Isle of Man. The Orkneys were mortgaged, as were the Shetlands. Despite Christian's financial difficulties, he upheld the interests of the towns and the commoners against the encroachment and demands of the Hanseatic League. His son Hans continued this policy.

Scharnhorst, Gerhard Johann von (1755–1813)

Driving spirit of Prussia's liberation from Napoleon and architect of the modern German army. This self-educated son of Hanoverian farmers was born on 12 November 1775 in Bordenau and through his father's hard work was able to enter military school. He excelled and received officer training in Nordheim, where, as a lieutenant, he began to publish articles on tactics and handbooks for officers. After training in the artillery in 1783, he traveled to study the military of other German states. In 1793 and 1794, Scharnhorst saw ac-

tion as a captain of horse artillery, distinguished himself at Menin, and began the *New Military Journal*. His reputation drew the attention of the Prussians, who wooed him into their ranks in 1801 as a lieutenant colonel with noble status. A social misfit in Berlin, he nonetheless held the trust of King Frederick William and Prince Louis Ferdinand, who allowed his transformation of the Academy for Young Officers and instruction from his handbooks. In the Duke of Braunschweig's headquarters in 1806, he witnessed the disaster at Auerstädt. With Gebhard Leberecht von Blücher, he retreated in vain to Lübeck.

Scharnhorst joined L'Estoq's staff in 1807 and led a Prussian contingent at Eylau. After the Treaty of Tilsit, he was promoted to major general and appointed head of the Military Reorganization Commission, which included Prime Minister Stein, August Neidhart von Gneisenau, and former students Grolman, Boyen, and Karl Maria von Clausewitz. With orders to reconstruct the army, these gifted intellectuals made it their goal to arouse patriotic loyalty for the army and the state through far-reaching military, political, and social reforms. Foremost was the education of a cadre of officers, selected by merit rather than birth, to advise the king. Although not completely successful, Scharnhorst and his colleagues laid the foundation for a Prussian spirit and a modern general staff that characterized the German army to the twentieth century.

As Blücher's chief of staff in the spring of 1813, Scharnhorst was wounded in the leg at Lützen but continued to serve at Bautzen. He was sent to plan strategy with the Austrians, but his neglected wound festered, and he died in Prague on 28 June.

Schlieffen, Graf Alfred von (1833–1913)

General staff officer known as the author of a plan intended to forestall Germany's facing of a two-front war against France and Russia. Born on 28 February 1833 in Berlin, Schlieffen joined the 2d Guards Uhlan Regiment in 1854. Assigned to the Prussian General Staff in 1865, he took part as a staff officer in the Austro-Prussian War (1866) and the

Franco-Prussian War (1870–1871). In 1889, he was appointed deputy to the chief of the general staff.

In 1891, Schlieffen himself became chief of the general staff, a position he held until 1905. During this period, he introduced a number of military reforms: a more mobile infantry, modern signals equipment, and infantry regulations that promoted mission tactics. However, his major contribution was to strategic planning, particularly after 1894 when France and Russia formed an alliance, threatening Germany with a two-front war. The “Schlieffen Plan” departed from previous thinking, which had aimed at defeating Russia quickly before turning toward France. It sought rather a quick decision in France before major operations were undertaken against the Russians. Schlieffen’s thinking was influenced by Hannibal’s victory at Cannae, but as German resources would not permit a double envelopment, he foresaw a single enveloping movement through Belgium and northern France.

Schlieffen’s Plan was modified somewhat before the outbreak of war, but remained the basis of German operations in 1914. It has been frequently criticized as one of the causes of World War I, as well as for its complexity and its need for each part to work nearly flawlessly. Schlieffen died on 4 January 1913 in Berlin. Despite the flaws in his plan, his writings enjoyed something of a renaissance in the post-World War I German Reichswehr.

Schmalkaldic War (1546–1547)

The first religious war in Germany. In 1530, at the Imperial Diet in Augsburg, Emperor Charles V declared religious non-conformity to be a breach of the empire’s peace. For defense reasons, the Lutheran estates of the empire formed the Schmalkaldic League, which was headed by Hesse and electorate Saxony.

Victorious in the Battle of Muhlberg, Charles V was at the height of his power in Germany and Europe. Yet his military success in the Schmalkaldic War failed to restore religious unity to the Holy Roman Empire.

The Schmalkaldic War consisted of two campaigns: the first at the Danube River in the second half of 1546 and the second in the spring of 1547 at the Elbe River, where the only

battle in this war occurred. By 20 July 1546, the Schmalkaldic League had gathered some 44,000 men on foot and 6,600 horsemen near Memmingen, marching against the emperor, who was at Regensburg. Retreating to Landshut, Charles V was able to gather most of his troops from Italy and the Netherlands, unimpeded by the league. On 17 August, the united army of 42,000 men on foot and 14,000 horsemen marched to Ingolstadt. From 31 August until 3 September, the armies of the emperor and the league stood facing each another. The league’s troops cannonaded the emperor’s camp, and there were a few skirmishes and attacks by smaller units. Finally, the league’s troops retreated to the vicinity of Donauwörth, which Charles V soon conquered. As before, only a few skirmishes took place between the armies. It was the conquering of Saxony through one of Charles’s allies and the league’s desolate financial situation that were decisive to the war. On 24 November, the league’s army was dissolved, and most of its troops were dismissed; its allies retreated to their according states. The elector of Saxony reconquered his land. The emperor subjugated Upper Germany and dismissed some of his troops.

In March 1547, Charles V recruited new troops and attacked Saxony on 11 April. Meeting no resistance, he conquered the land until he met the elector’s small army, defeating it completely.

Charles V was able to defeat the Schmalkaldic League thanks to his modern conduct of war. The Spanish Tercio formation facilitated interaction between riflemen and pikemen in accordance with the new weapon techniques. Charles V tried to cut off the enemy’s military and financial supplies without having to risk casualties. The league failed to do the same, nor did it have any significant strategy of its own. What finally decided the war was the league’s poor financial support. The league’s financial means were limited by its members’ contributions, raised through taxes and credits from local investors, whereas Charles V could rely on subsidies and credits provided by the great business houses of Italy, Flanders, and Upper Germany.

Schwarzenberg, Karl Philipp zu (1771–1820)

Austrian commander who led the military coalition that ousted Napoleon I from power in 1814. Karl Philipp von

Schwarzenberg was born in Vienna on 15 April 1771 into an old aristocratic family. He embarked on a military career at 16 and distinguished himself in the Turkish War of 1787–1791 and in the French Revolution. By dint of good leadership, Schwarzenberg advanced to field marshal in 1799, and the following year he successfully extricated his command from the defeat at Hohenlinden. In 1805, he commanded a division in the army of General von Mack, and fought his way out of encirclement rather than be captured at Ulm. After serving as ambassador to Russia, Schwarzenberg commanded a cavalry division during the ill-fated 1809 campaign against Napoleon.

After the war, Schwarzenberg ventured to Paris on a diplomatic mission and artfully arranged the marriage between the French emperor and the Austrian princess Marie Louise. Napoleon was impressed by his abilities, and in 1812 he insisted that Schwarzenberg command the Austrian contingent accompanying the invasion of Russia.

After the disastrous retreat from Moscow, Austria entered secret negotiations with Prussia and Russia to form the Sixth Coalition against Napoleon. Because of his reputation—and the fact that Austria contributed the largest share of manpower—Schwarzenberg was appointed commander in chief of coalition forces. He thus became responsible for the monumental task of defeating Napoleon in the field while simultaneously juggling the national priorities of Austrian, Prussian, and Russian monarchs. Assisted by the great Austrian diplomat Prince Clemens von Metternich, Schwarzenberg devised the so-called Trachenberg Plan, whereby the allies avoided direct confrontation with Napoleon in favor of hammering his less capable subordinates. A series of successful encounters ensued that culminated in the October 1813 Battle of Leipzig, whereby the Sixth Coalition was victorious and the French were expelled from Germany.

The ensuing invasion of France tested Schwarzenberg's ability and tact to the limit, but he managed to hold together his uneasy coalition long enough to take Paris in April 1814, which led to Napoleon's abdication and exile to Elba. Schwarzenberg also insisted that France not be partitioned, so as not to upset the balance of power in Europe at Austria's expense. Schwarzenberg died at Leipzig on 15 October 1820, widely admired as a talented general and a skillful coalition leader.

Schwarzkopf, General Herbert Norman (1934–)

Allied commander during the Gulf War. A graduate of the U.S. Military Academy at West Point (1956), Schwarzkopf was himself the son of a general. He spent his childhood in various locales, including a significant amount of time in the Middle East, an experience that would serve him in good stead in later years. In these formative years, he learned much about Arab mores, customs, and values, which made him the ideal person to hold together the diverse coalition of participants in Desert Storm. Schwarzkopf's childhood was marred by his mother's alcoholism, which forced him to grow up quickly.

Upon graduation from West Point, Schwarzkopf served for a time with an airborne unit and then returned to the academy as an instructor. He served two separate tours in Vietnam, one as an adviser to a South Vietnamese airborne brigade in 1965–1966 and the other as a battalion commander in the 6th Infantry Regiment of the troubled Americal Division near Chu Lai. He served with great bravery and distinction in Vietnam, winning three Purple Hearts and three Silver Stars. His seminal moment in Vietnam came on 28 May 1970, when his men stumbled into a minefield. One soldier was grievously wounded, screaming horribly, and threatening to panic the entire unit. Schwarzkopf went into the minefield himself, step by step, until he reached the soldier and got him to calm down. He then extricated the rest of his troops from the minefield.

After the war, he graduated from the prestigious Army War College and assumed command of an infantry brigade. Promoted to brigadier general in 1978, he served as an assistant division commander in Germany. In 1983, he was deputy commander of the successful but poorly coordinated American invasion of Grenada. Schwarzkopf was quite critical of the operation's shortcomings.

In 1988, newly promoted to full general, he took command of the U.S. Central Command, with responsibility for the Middle East. Two years later, Saddam Hussein's Iraqi army invaded neighboring Kuwait. President George Bush decided to deploy American forces to Saudi Arabia to prevent an invasion of that country and eventually eject the Iraqis from Kuwait. Schwarzkopf immediately went to Saudi Arabia as commander of a coalition force representing a bevy of non-Arab countries. Additionally, he worked closely with Arab commanders in planning the coalition's response to Saddam Hussein's invasion. In late 1990, he presided over a major buildup of coalition forces. These Allied forces trained and prepared for an invasion of Kuwait.

Schwarzkopf is generally credited with developing the famous "left hook" or "Hail Mary" plan, a fast envelopment flanking attack that worked magnificently. Schwarzkopf's plan clearly caught the Iraqis by surprise. His forces quickly

plunged into the Iraqi right flank and cut off the main road by which Hussein hoped to extricate his forces from Kuwait. This ground war ended in roughly 100 hours, with Saddam's forces (the "battle-hardened Iraqi army," according to most of the "experts") virtually destroyed and clearly ejected from Kuwait.

Schwarzkopf, a plain-speaking, burly man whose fiery temper and heavy-handed manner with subordinates sometimes provoked criticism, returned home a major war hero. He subsequently retired, engaged in youth work, and wrote his memoirs, in which he discussed his life with characteristic honesty.

Scipio Africanus Major, Publius Cornelius (236–183 B.C.E.)

Rome's greatest general during the Second Punic War. He defeated Hannibal and brought Carthage to the point of surrender. Scipio is first mentioned saving the life of his father, the consul Publius Cornelius Scipio, who was severely wounded in a skirmish before the Battle of the Trebia (218 B.C.E.).

In 210 B.C.E., Scipio was sent to Spain to take command over Roman forces there. In 209 B.C.E., he captured the coastal city of Cartagena, and in 208 B.C.E., he defeated Hannibal's brother Hasdrubal Barca at Baecula (Bailen). Scipio divided his troops in three divisions. One attacked the Carthaginians from the front, diverting attention from the other two that outflanked the enemy. However, Hasdrubal retreated, avoiding total defeat, and escaped to Italy with the remainder of his troops.

Having consolidated his position in Spain, Scipio, though severely outnumbered, defeated the Carthaginians at Ilipa (206 B.C.E.). Knowing that the Carthaginians would position their best troops in the center, Scipio positioned his Spanish allies opposite them at a safe distance. The wings, consisting of Scipio's best troops, maneuvered and attacked the enemy flanks. Thus Scipio outflanked the enemy with a smaller army, defeating the Carthaginians before they could put their best troops to use. The Carthaginians subsequently evacuated Spain.

In 205 B.C.E., Scipio attacked the Carthaginians in North Africa. He destroyed a Carthaginian army by setting its camp on fire. A month later, he defeated the Carthaginians again in the Battle of the Great Plains. In this battle, he used the rear lines of his army, not in the traditional way of reinforcing the center but for lengthening his frontage instead, a method that would bring him final victory against Hannibal at Zama (202 B.C.E.).

Scipio was an inspiring leader who could gain and keep the loyalty of his men. His charismatic character and judicious diplomacy won him many allies, without whom Rome might not have won the war. Seeing the deficiencies of the rather static traditional Roman tactics, Scipio experimented with small tactical units that could operate with greater flexibility. He saw the value of capable subordinates who could proceed on their own initiative.

Upon his final victory over the Carthaginians, Scipio was assigned the honorary title Africanus. However, his success had made him many political rivals. Scipio died in self-imposed exile, embittered about the ingratitude of his countrymen.

Scott, Winfield (1786–1866)

Accomplished U.S. Army commander. Born at Laurel Branch, Virginia, on 13 June 1786, Scott, after briefly attending the College of William and Mary and then studying law, received a commission as a captain in the light artillery. With the declaration of war against Britain in 1812, Scott was promoted to lieutenant colonel in the newly formed 2d Artillery Regiment. Sent to the Canadian frontier, he distinguished himself during the sometimes disastrous frontier battles. His military successes along the Canadian border had made him such a national hero that Scott emerged from the War of 1812 with the brevet rank of major general and a reputation second only to Andrew Jackson's.

In the years following the War of 1812, Scott negotiated the end of the Black Hawk War in Illinois, fought the Seminoles and Creeks, and was a major influence in the pacifica-

tion of the Cherokee and the Winnebagoes, who had refused to give up their eastern lands. In 1838, President Andrew Jackson appointed Scott to maintain federal authority during the nullification crisis in South Carolina (when that state attempted to nullify federal law within its borders). The next year, Scott negotiated an end to the “Aroostook War,” a border dispute between Maine and the Canadian province of New Brunswick. During this period, he also managed to find the time to make two trips to Europe to study military operations and, in 1835, published his three-volume *Infantry Tactics*, which was still being used during the Civil War. During the more than quarter of a century after the end of the War of 1812, therefore, Scott proved himself to be an able soldier, an adept military theorist, and an efficient diplomat.

In July 1841, Scott was appointed general in chief of the U.S. Army, a post he would hold for more than 20 years, a record never equaled. In 1847, after the opening of the Mexican-American War, he was dispatched to capture Mexico City via Veracruz on the Gulf Coast. During his campaign, Scott, despite being consistently outnumbered two-to-one or more, was able to overcome an enemy who was fighting on familiar territory with interior lines of supply. The brilliance of his campaign was borne out by the fact that Congress brevetted Scott with the rank of lieutenant general, making him only the second American to ever hold that rank and the first since George Washington. In 1852, Scott was nominated by the Whig Party for the presidency, but he was decisively defeated by Franklin Pierce. Returning to the army, he remained general in chief until the beginning of the Civil War.

By the opening of the American Civil War, Scott was so overweight and out of shape that he could not even mount a horse. Too old for an active field command, he offered the post to Lieutenant Colonel Robert E. Lee of the 2d U.S. Cavalry Regiment, who declined. Unlike Lee, a fellow Virginian, Scott remained loyal to the Union. Directing operations from Washington, D.C., he conceived the “Anaconda Plan,” which would later serve as the blueprint for the Union’s victory. The plan called for the capture of the Mississippi River and a blockade of the Confederate ports. Scott believed that this plan would strangle the Confederacy and prevent the great loss of life that an invasion of the South would entail. Although ridiculed by many military and civilian officials at the time, Scott’s plan was later rightly recognized as the last great strategic accomplishment of his long and distinguished military career. After retiring on 1 November 1861, he remained a strong supporter of the Union and was the only non–West Point graduate of southern extraction in the regular army to remain loyal to the Union. Scott died on 29 May 1866 at West Point and was buried in the academy cemetery.

Scythians

Nomadic people who played an important role in the Black Sea region and the northern Middle East from the eighth to the third centuries B.C.E. Originating in the steppes of central Asia, they moved into the Caucasian region and eastern Europe. In the eighth century B.C.E., Scythian groups crossed the Caucasus, fighting the Assyrians and threatening Egypt. However, by the end of the century, they were driven back into southern Russia.

The best-known center of Scythian civilization lay on the northern Black Sea coast. From the fifth to the third century B.C.E., the Scythians dominated this region. They came into conflict with the Persian king Darius. The Scythians lured his army into the hinterland, depriving them of resources by a scorched-earth policy and harassing them with hit-and-run tactics until they withdrew and barely escaped with their lives.

In the fifth century the Scythians pressed increasingly into the Balkans. They were stopped by the Macedonian king Philip II, who defeated them and killed their king. A few years later, they avenged themselves by destroying a Macedonian army. From the third century B.C.E. onward, Scythian influence in the Black Sea region decreased. However, in 247 B.C.E., Scythians from the Caucasus region established the Parthian Empire.

The primary weapon of the Scythians was the bow. Most Scythians fought on horseback and were feared for their hit-and-run attacks. Through their contact with Middle Eastern cultures, defensive body armor and horse barding were introduced. From then on, the nobility served as heavy cavalry, armed with bow, sword, axe, javelin, and lance.

Modern historians have only scant knowledge about Scythian tactics. Before the seventh century, they probably relied heavily on horse archers. After the introduction of body armor, heavy cavalry played an important role. In major battles, the bulk of the cavalry was probably positioned in the center. After an initial hail of arrows, the cavalry charged with the armored cavalry in the lead. The flanks were covered by any foot troops available. If confronted by a massive host like the Persian army, the Scythians avoided large battles and re-

sorted to a scorched-earth policy and hit-and-run warfare instead. On several occasions Scythians served as mercenaries or auxiliaries in foreign armies. In the sixth century, a small force of archers served in Athens as a police force. In 479 B.C.E., Scythian troops took part in Xerxes' invasion of Greece. Scythians in Persian service fought Alexander the Great at Gaugamela, and those in Macedonian service fought with Alexander at the Battle of the Hydaspes. They are also known to have been present in Seleucid armies.

Sea Peoples (1236–1166 B.C.E.)

Groups of seafaring invaders of different ethnic origins who swept down through Anatolia, Canaan, Syria, Egypt, and Cyprus near the end of the Bronze Age, disrupting normal patterns and destroying the power of the Hittite Empire in the thirteenth century B.C.E. Waves of people, including women and children, accompanied these warriors as they migrated from their homelands in search of better land. The exact origin of this group remains unclear. Egyptian records are the only surviving sources concerning the Sea People, and they indicate that they might have been Ekwesh (Achaeans) from Bronze Age Greece. Other sources refer to them as Tyrrhenians, the ancestors of the Etruscans. Some Egyptians believed them to be Sardana (Sardinians) who had served as mercenaries with Egyptian forces at the Battle of Kadesh in 1299 B.C.E. The only major group of Sea People to settle in the region were the Peleset, commonly referred to as Philistines, possibly from Crete. Sources reveal that the Egyptians successfully fought off the advances of the Sea People during the reign of Merneptah (1236–1223 B.C.E.) and during the reign of Ramses III (1198–1166 B.C.E.), but other areas along the eastern Mediterranean suffered greatly during this period. By 1150 B.C.E., most of the Sea Peoples had merged into the native populations or moved out of the region as quickly as they had arrived.

Sedan (1–2 September 1870)

The penultimate French defeat in the Franco-Prussian War. After the outbreak of war with Prussia, the French fortress at Metz had been quickly surrounded, trapping Marshal Achille François Bazaine and an entire army. A second French army was created under Marshal Marie Edmé de MacMahon to lift the siege. His primary task was to link with Bazaine and then bring the Prussians to battle. MacMahon marched east, hoping to reach Metz before it was compelled to surrender, but the Prussians intercepted him at Beaumont, east of Sedan, and the French were compelled to pull back to Sedan in order to rest and regroup. But Prussian general Helmuth Karl Bernhard von Moltke (the Elder) followed hotly on MacMahon's heels. The Prussians enveloped the French positions around Sedan and on 1 September began pouring extremely effective artillery fire onto the hapless French. MacMahon took a shell fragment in the leg, and command passed to General Auguste Alexander Ducrot, who immediately ordered a withdrawal to the west in order to avoid the total destruction of the army (he did not know he was surrounded).

However, General Emanuel Felix Wimpffen arrived from Paris with the news that he had been appointed MacMahon's successor by the government and ordered a halt to the retreat and an attack to the east. By midmorning, the front east of Sedan had completely collapsed under withering Prussian shellfire. The Prussians began advancing from west of Sedan at the same time, and by early afternoon, all fronts had collapsed and remnants of the army began straggling to Sedan, where Napoleon III had set up camp to watch the action. The emperor himself grasped the severity of the collapse and hoisted the white flag. He was taken prisoner and played no further role in the war.

Napoleon's capture led to a political crisis in Paris, and by 4 September the empire had been replaced by the Third Republic. The French were stopped from relieving Bazaine and were unable to field any army capable of helping him for the remainder of the siege. The loss of the only army in the field also meant that the road to Paris lay open, and after a few minor skirmishes, the Prussians invested the city beginning in mid-September. After Sedan, the French had no hope of defeating the invading Prussians.

Sedan was also the site of the main German breakthrough in May 1940, leading to France's complete defeat. It is a place of unhappy memory for France.

Sedgemoor (5–6 July 1685)

Battle that doomed the cause of the Duke of Monmouth. Upon the death of Charles II in 1685, James II, his openly Catholic brother, inherited the British throne. James Scott, the Duke of Monmouth, Charles II's illegitimate but Protestant son who had been in exile in the Netherlands for previous challenges to the crown, planned an invasion of England, to be complemented by a simultaneous landing in Scotland led by Archibald Campbell, the Duke of Argyll, in order to overthrow his uncle. Landing at Lyme Regis and met by support from the economically depressed and dissenting Protestant (largely Presbyterian) population, Monmouth marched for Taunton, where in the hopes of swelling his support from commoners to include the local gentry and nobility, who never joined his cause, he proclaimed himself the rightful king. With about 5,000 men, Monmouth moved to take Bristol, while the Royal Army, led by Louis Duras, Viscount Feversham, marched west to meet him.

Monmouth failed to take Bristol, which was defended by John Churchill, the future duke of Marlborough. James II's offer of free pardons for those who deserted Monmouth, as well as news that Argyll had failed in Scotland, began to whittle down the ranks of rebels, pushing Monmouth to move south and attack while he still had an army. After a skirmish at Norton St. Philip, on the road to Bath, Monmouth, wrongfully underestimating the number and fortifications of the enemy, decided to make a night attack upon the main Royal Army camp, hoping to exploit surprise and win a victory to repair morale. Beginning at 11:00 P.M. on 5 July 1685, the rebels marched in silence, but while negotiating the banks of the Langmoor Rhine River in the fog, the men were heard, and the Royal Army was alerted by a gunshot at about 1:00 A.M.

The disciplined and trained Royal Army quickly assembled and met the rebel cavalry, which was followed by straggling infantry, racing to keep up. Even worse, the powder runners, meant to keep the infantry supplied with ammuni-

tion and powder, fled soon after the battle began. Hoping to save himself, Monmouth fled for Dorset, where he was apprehended.

Monmouth may have lost as many as 1,400 men in the battle, with large numbers of prisoners taken by the crown. James II unleashed the full fury of the government on the rebels, sentencing 333 to death and a further 814 to transportation to the West Indies. Monmouth himself was executed at the Tower on 15 July 1685.

Seeckt, Hans von (1866–1936)

World War I general and chief of the Army Command during the Weimar Republic. Hans von Seeckt was born on 22 April 1866 in Schleswig. He entered the Prussian army in 1885 and the General Staff Corps in 1897. A brilliant staff officer, by 1913 he had achieved the position of chief of staff of the Third Army Corps during the German advance on the western front. In March 1915, he was appointed chief of staff of August von Mackensen's Eleventh Army in Galicia. Seeckt planned the Eleventh Army's offensive and breakthrough at Gorlice in May 1915, which helped drive the Russian army out of Poland. In the fall of 1915, Seeckt served as chief of staff of Army Group Mackensen, which overran Serbia. Throughout 1916, Seeckt served as a kind of troubleshooting chief of staff on the eastern front. In these various positions, Seeckt played an important role in halting the Brusilov Offensive and in the conquest of Romania during the summer and fall of 1916. In December 1917, Seeckt was sent to Constantinople to serve as chief of staff for the Turkish Army Command, a position he held until the end of the war.

In 1919, he served as the chief of staff's representative at the Paris Peace Talks. In November 1919, he was appointed head of Truppenamt, the successor to the now-forbidden general staff. As such, Seeckt oversaw reforms in military doctrine that helped lay the foundation for the success of the Wehrmacht during World War II. He was able to forge a clandestine agreement that enabled German armored and air forces to train in the Soviet Union, giving them valuable training that the Allies had forbidden in Germany itself.

Seeckt was dismissed in October 1926, after which he served as a member of the Reichstag (1930–1932) and as a

military adviser to Chiang Kai-Shek (1934–1935). He died on 25 December 1936 in Spandau. Well before the advent to power of Hitler, von Seeckt represented the determination of even the Weimar Republic to negate the Versailles Treaty.

Sekigahara (1600)

The Battle of Sekigahara in 1600 capped the rise of the daimyo (a term referring to powerful, landed military lords, each controlling his own territories and private armies) Ieyasu Tokugawa to hegemon of Japan, paving the way for his establishment of the Tokugawa shogunate (1603–1868) and putting an end to the long period of civil war that had characterized Japan for at least a century before the fall of the Ashikaga shogunate in 1573.

With the death in 1598 of Toyotomi Hideyoshi, a man who had risen from the lowest ranks to become hegemon of Japan, power ostensibly passed on to his infant heir Hideyori. Named as one of five joint regents by Hideyoshi was a dominant daimyo and general, Ieyasu Tokugawa (1542–1616). As the leading landholder among the regents and as veteran of the wars of unification fought by Hideyoshi and his predecessor Nobunaga Oda, many daimyo gravitated to Tokugawa as the natural heir to Hideyoshi's authority, something Tokugawa himself encouraged. A coalition of western daimyo, however, resisted Tokugawa's attempts at leadership. This coalition, whose prominent members were the great western daimyo of Satsuma and Chōshū, was led by Mitsunari Ishida (1560–1600), a former vassal of Hideyoshi's. The forces of the Ishida coalition would ultimately meet those of Tokugawa and his allies in a battle to determine final hegemony.

With over 160,000 troops involved, the Battle of Sekigahara was the largest land engagement Japan had ever witnessed. In August 1600, Tokugawa led his principle force of about 75,000 west from his headquarters at Edo (Tokyo), keeping the Ishida forces guessing as to his strategic intentions throughout the summer. Determining to stop any attempt by Tokugawa to move south to Kyoto and Osaka and threaten the young Hideyori, Ishida opted to stand his ground at the narrow pass at Sekigahara, which linked the

capital region to eastern Honshu, and it was here that Tokugawa finally determined to engage Ishida. The forces of both sides deployed during the night of 20 October 1600, with battle commencing the following morning. Like Waterloo, the day of battle opened foggy and damp from the previous night's rain. Throughout the day, the contest, fought with both modern musketry and more traditional weapons, proved indecisive. Central to the victory of either side were the forces of the Kobayakira daimyo, which by midday still remained unengaged. However, Tokugawa was able to convince Kobayakira to change sides and to commit his forces against his erstwhile ally Ishida in the heat of battle. This he did, thus ensuring Tokugawa's final victory. Ieyasu Tokugawa used his narrow victory to punish disloyal daimyo and reward the loyal through the confiscation or granting of land, thus solidifying his own power base and paving the way for his assumption of the title of shogun in 1603.

Seljuqs

Turkish conquerors of Byzantine Anatolia. One of many splinter groups emerging in the aftermath of the two central Asian Turkish empires (552–630 and 680–742), the Seljuqs appeared sometime in the ninth century. Their eponymous founder, Seljuq, is said to have liberated his people from the control of others and moved them to Jand, along the middle Syr Darya. Converted to Islam, the Seljuqs became *ghazi* warriors, driving back the infidel and pushing forward the frontiers of Islam.

By the tenth century, there were two distinct groups, one in Khorasan and the other in Khwaraz. Both expanded aggressively in cooperation or conflict with others, including Mahmud of Ghazna (971–1030). In 1040, the Khwaraz Seljuqs defeated Mas'ud, Mahmud's successor, at Dandanqan and poured into Iran. By 1055, the Seljuq ruler Tughril (d. 1063) had control of Baghdad and with it power over the remaining Abbasid dominions. His successor, Alp Arslan, continued Seljuq expansion in virtually all directions, including into Byzantine Anatolia. In 1071, he defeated Byzantine armies at Manzikert, captured the Byzantine emperor, and began the process by which the Turks have gradually turned Anatolia into the Turkey of today.

Seljuq power declined in the twelfth century. In Anatolia,

the Byzantines recovered much of their former holdings, although not the interior, which remained strongly Turkish. In the aftermath of a second major Byzantine defeat, at Myrioccephalon (1176), the Seljuks completed their conquest of Anatolia, except for a few enclaves. Their success was short-lived because the Seljuqs were severely dealt with by invading Mongols and never recovered. Their successors were the Ottomans, who went on to unify Turkey, conquer Constantinople, and forge an empire.

Sempach, Battle of (9 July, 1386)

Swiss close shock combat triumphs over the dismounted knight. Sempach was the second battle of the long-running Austro-Swiss conflict (1315–1499).

Following the addition of the cantons of Zug, Glarus, and Bern by 1353, the rural Swiss of the northern cantons rebelled against their Habsburg lords, establishing independent cantons. The militia forces of these cantons expanded further into Habsburg lands, sacked the castle of Rothenburg, and threw a garrison into the nearby town of Sempach. The Austrians moved an army of about 1,500 men-at-arms and 2,500 other infantry under Duke Leopold the Valiant into the alpine valleys. The Swiss opposed him with 1,500 militia, mostly armed with the halberd. Both groups advanced in three divisions, the Austrians preferring the medieval style of three columns and the Swiss in a single column of three squares. When the first Swiss column crested the small rise to his front, Leopold dismounted his first and attacked the Swiss with a mass of heavily armored men carrying lances. The other two columns remained mounted to pursue the enemy.

The leading Swiss square uncharacteristically halted on a favorable slope of terrain and received the Austrian attack. After heavy fighting, the Swiss began to retire, when the remaining two Swiss squares rapidly approached and threatened the now exhausted dismounted knights.

Leopold promptly dismounted his second column, but it advanced in an irregular and disorganized fashion. The Swiss, after tearing apart the ranks of the first column, made quickly for the second. In the furious melee, the Swiss halberdiers easily cut down their exhausted opponents. The third column, sensing defeat, withdrew to leave Leopold and

his dismounted forces at the mercy of the enraged and encircling Swiss. They took no prisoners.

The Battle of Sempach showed that the Swiss were capable of defeating dismounted knights just as easily as they had overcome mounted ones at Laupen. From this time forward, the Swiss became increasingly aggressive and expansionist, confident as they were in their near invincibility.

Sennacherib (r. 705–681 B.C.E.)

One of the major rulers of the late Assyrian Empire, probably best known for his third campaign in Syro-Palestine in 701 B.C.E., where he threatened the existence of Jerusalem. Sennacherib (in Akkadian, Sin-ahhe-eriba) succeeded his father, Sargon, as king of Assyria in 705 B.C.E. The most serious issue that confronted Sennacherib during his reign was the unstable situation with Assyria's tributary to the south, Babylon. In Babylon, the rebellion was headed by Merodach-Baladan and supported by a coalition of Syro-Canaanite states led, apparently, by Hezekiah of Judah. This rebellion is known from both Assyrian and biblical sources (2 Kings 18–19, 2 Chronicles 32, and various portions of Isaiah). Sennacherib suppressed the revolt and destroyed Babylon in 689 B.C.E. Subsequently turning to the other rebels, Sennacherib invaded the area in 701 B.C.E., claiming to have "caged Hezekiah in Jerusalem like a bird." There is archaeological evidence of massive destruction by the Assyrians in Judah, especially at the Judean fortress city of Lachish, where an Assyrian siege ramp has been uncovered. Though diverted from occupying Jerusalem (either by an Egyptian army led by Tirhakah that was advancing from the south or by a plague), Sennacherib demanded and received harsh terms from Judah. All fortified cities and outlying areas (including some cities in Philistia and Phoenicia) were seized, Hezekiah's treasury was emptied, and some of his daughters were sent as concubines to Nineveh, Sennacherib's capital.

Sennacherib conducted many urban renewal projects in Nineveh, including a new palace complex, parks, irrigation projects, and massive fortifications. The Assyrian king was murdered by some of his sons in 681 B.C.E. and was succeeded by another son, Esarhaddon.

Septimius Severus (Lucius Septimius Severus Pius Pertinax) (146–211)

Successful soldier-emperor. Consul in 190, Severus became governor of Pannonia Superior the following year. Twelve days after the murder of Pertinax, he was proclaimed emperor at Carnuntum (9 April 193) to become the avenger of Pertinax, whose name he assumed. Backed by all 16 Rhine and Danube legions, he marched on Rome, which he entered without opposition (9 June 193). The praetorians were dismissed, and a new guard, twice as strong, was formed from the Danubian legions.

Severus was the winner of a series of civil wars, defeating his last rival, Clodius Albinus, the governor of Britain, at the Battle of Lugdunum (Lyon, 19 February 197). He mounted a successful Parthian expedition. Ctesiphon was captured (28 January 198) and northern Mesopotamia annexed. Of the three new legions (I-III Parthicae) raised for the campaign, two formed the garrison of the new province, but in a significant break with tradition, Severus entrusted their command to equestrian prefects rather than to senatorial legates. The third (II Parthica) was stationed at Alba, just outside Rome. This legion, combined with the new praetorian guard, provided a force of about 17,000 troops at his immediate disposal in Italy.

Severus spent the last three years of his life fighting the Caledonian tribes of northern Britain. The scale of his operations is impressive, suggesting that Severus intended to advance the frontier to the Antonine Wall once more. Long a victim of gout, he died at Eboracum (York, 4 February 211), leaving his sons the advice "not to disagree, enrich the soldiers, and despise the rest" (recorded by the contemporary Greek historian Cassius Dio and quoted in Loeb Classical Library). Severus, whose military ability was allied to a shrewd political insight, followed a policy of keeping the army loyal.

He not only raised army pay (for the first time since Domitian) but also granted Roman soldiers the right to marry legally.

Sevastopol, Siege of (October 1854–11 September 1855)

Costly allied capture of their main objective in the Crimean War. After retreating from the Alma River on 20 September 1854, the outnumbered Russians elected to defend Sevastopol while waiting for reinforcements to attack the allied

rear. Almost a month passed before the allies began shelling the city on 17 October. This delay gave Lieutenant Colonel (soon Major General) Frants Eduard Ivanovich Todleben time to apply his considerable engineering skills to strengthening the Russian fortifications. His brilliant defenses included 7 bastions; a tower; 14 coast batteries with over 600 guns; an octagonal fort; and a complex of earthworks, redoubts, salients, lunettes, and field batteries. The allies could have captured Sevastopol much earlier had Todleben not been on the scene at the time.

Czar Nicholas I, disappointed by Prince Alexandr Sergeevich Menshikov's failure at Inkerman on 5 November 1854, replaced him in December with Prince Mikhail Dmitriyevich Gorchakov as commander in chief of the Russian forces in the Crimea. This change, together with the lessening of allied activity throughout the winter, allowed Todleben more opportunity to order repairs and improvements in the Russian fortifications. When the allies' shelling resumed in earnest in the spring, the Russian defenses at first met the challenge, and Russian morale rose. But the allies were bringing in longer-range guns and more men. By June 1855, the 54,000 Russian soldiers and sailors trapped in Sevastopol and the 21,000 additional Russian troops in the

The French army captures the Russian fortress Sevastopol after a year-long siege, on September 11, 1855. (Library of Congress)

surrounding hills faced 100,000 French, 45,000 British, 15,000 Italian, and 10,000 Turkish troops.

The allies launched a concentrated infantry offensive on 18 June. Covered and supported by constant shelling, allied sappers undermined the Russian works throughout the summer. The French took the Malakov Tower, and the British temporarily took the Redan on 8 September. Casualties on that day alone were 13,000 Russian and 10,000 allied soldiers. The Russians then burned the city and demolished its military installations between 9 and 11 September, prior to their abandonment of Sevastopol.

their retreat, or else turn the flanks of the Union army and perhaps achieve a Cannae-like result.

The plan was ambitious, perhaps overly ambitious. Although Jackson had selected the date for the attack, he and his men—perhaps tired from their exertions in the valley—arrived late, and the Union forces once again held. For the remainder of the week, Lee sought to find weak points in the Union position. Despite McClellan's passivity, the corps and division generals defended well, and the outnumbered Confederates could not destroy the invading army. However, McClellan retreated to Harrison's Landing on the James River and the safety of Union gunboats. Lee then looked north to strike the smaller Union army defending Washington, D.C., which led to Second Bull Run/Manassas Junction.

Seven Days' Battles (25 June–1 July 1862)

An American Civil War drawn battle that showed the passivity of Union general George B. McClellan and the operational brilliance of Confederate general Robert E. Lee. For nearly a month, a small Confederate force under General Jeb Magruder near Yorktown had delayed General McClellan's Union advance up the peninsula between the James and York Rivers. In early May, Magruder retreated, McClellan followed, and at Seven Pines, General Joseph Johnston tried to overwhelm two Union corps that were somewhat isolated south of the Chickahominy River on 31 May–1 June 1862. Union forces held, Johnston was wounded and temporarily had to give up command, and President Jefferson Davis's military adviser, Robert E. Lee, assumed command.

In the Seven Days' Battles, Lee tried to continue Johnston's strategic conception, only in reverse. He felt he had to attack the somewhat passive Union general before additional Union forces concentrated around Washington, D.C., joined the already larger Union army, giving them a near overwhelming superiority in manpower, supplies, and artillery. McClellan had four corps south of the river, and Lee wanted Thomas "Stonewall" Jackson, moving from the Shenandoah Valley, to augment the strike on the weaker Union right and either seize the Union supply base, forcing

Seven Years' War (1756–1763)

The third war between Austria and a rising Prussia for control over Silesia, the culmination of the long Anglo-French struggle for colonial supremacy, and the last major conflict before the French Revolution to involve all the traditional great powers of Europe. There were three principal theaters of this war. Great Britain helped support Frederick of Prussia in battling Austria, France, and Russia and their allies: British finances helped purchase mercenary troops to augment Prussia's army. The British navy battled the French navy in the Atlantic and Indian Oceans as well as the Mediterranean and Caribbean Seas. Finally, augmented by colonial militia, the British made a determined and ultimately successful effort to destroy French power in North America. When the Seven Years' War ended, Frederick gained Silesia, though with significant manpower losses; the British gained territory in India and all of French Canada (save for tiny St. Pierre and Miquelon Islands off the Newfoundland coast).

When hostilities erupted in America after British general Edward Braddock's disastrous effort in 1755 to take Fort Duquesne, British king George II sought a treaty with Frederick II of Prussia to guarantee the state of Hanover, where

George's family had ruled before moving to England. This friendship eventually led Austria to ally with France and Russia (and Saxony and Sweden and very much later Spain) against Prussia, England, and later Portugal.

Two years later, the European fighting, mostly to the east and south of the Kingdom of Prussia, began. When Czarina Elizabeth joined the Austrian-French alliance, Frederick, who understood the advantages of interior lines, believed strongly in the initiative, and was an aggressive, tactically oriented commander, attacked Saxony to take that kingdom out of the opposing alliance. In spring 1757, he invaded Bohemia and defeated the Austrians at Prague. Then he laid siege to Kolin and, dividing his forces to retain the siege and meet a large relief army, lost one-third of them in the resulting five-hour battle against Austrian count Leopold von Daun in June. Thereafter, Frederick retreated.

At this point, Frederick demonstrated his understanding of interior lines and of the proper use of audacity. He faced the French advancing onto Hanover, which he was pledged to defend, the Swedes on his north, the Russians to his east, and the Austrians from the southeast. He fought a larger French-led army at Rossbach in the state of Thuringia and won a two-hour battle, and a month later, in early December, he defeated the Austrians in Silesia near the town of Leuthen.

The victory at Leuthen was remarkable. Frederick hurried 170 miles in 12 days to take command of a defeated Prussian army and expel the Austrians, who occupied a sound defensive position about 5 miles long on a north-south axis. Frederick's forces approached, and then, as several oblique hills hid his advance, he moved the bulk of his smaller army—infantry and cavalry—to his right. When he attacked, his force greatly surprised and eventually overwhelmed the Austrian left. Despite the efforts of Austrian prince Charles to reestablish his line on an east-west axis, when nightfall came, the Austrians had fled the field, having suffered major casualties heading into winter quarters.

This victory may well have marked the high tide for Prussia during the conflict. Although Prussian forces initially defeated the Russians in a costly battle at Zorndorf in the summer of 1758, Frederick was defeated by a combined Austrian-Russian army at Kunersdorf in the summer of 1759, losing some 18,000 men in six hours of battle. Frederick crossed the Oder River near Frankfurt and attacked the larger allied army seeking to envelop its flanks, but his forces became disorganized, attacked in piecemeal fashion, and suffered grievously. Later, Prussia lost a detachment at Maxen before going into winter quarters.

In 1760, the main fighting occurred in Silesia, although there were battles elsewhere. In the fall of 1760, the Russians seized Berlin, the Prussian capital, although Frederick soon

defeated von Daun at Torgau. It was a bloody and costly victory, however, where Frederick lost one-third of his attacking force.

In 1761, William Pitt stepped down as British prime minister, and his policy of subsidizing Frederick's European land campaigns to free British power to seize France's overseas empire ended. This development led more to campaigns of maneuver and countermove in Europe. Still, before the weight of the Austrian-based alliance could overwhelm Prussia, Elizabeth of Russia died and was succeeded by Peter III, who greatly admired Frederick, agreed to an easy peace, helped arrange peace between Prussia and Sweden, and helped Frederick push Austrian forces out of Silesia. In the ensuing peace treaties, Austria lost Silesia to Prussia; otherwise, territorial borders remained mostly unchanged.

The conflict between Great Britain and France was more decisive. Called the French and Indian War in North America, it was the last of four great colonial conflicts on that continent and across the globe, and it resulted in a great British victory. Prime Minister William Pitt planned financially to support Prussia to contain the French on the European continent while he concentrated British power on conquering French colonial possessions. Despite some fits and starts and perhaps less than ideal cooperation by American colonial governments and militia, the British ultimately triumphed over the French in North America while defeating the French in India and thus paving the way for the vast British empire on the subcontinent.

Pitt put the wealth of Britain into the war effort. He sent large armies transported by huge navies to the New World; he purchased supplies from colonial purveyors; and he engaged colonial militia and rangers. And he kept his focus on the objective—winning Quebec. Similarly, he sought to defeat the French fleet and to take French possessions on the Indian subcontinent.

By 1758, the weight of British (and colonial) power began to be felt in the conflict. Pitt brought focus and determination to the conflict. The British under General John Forbes again attacked Fort Duquesne, this time advancing from western Pennsylvania in the fall. The attack succeeded, the French retreated, and the British cut off Quebec from French Louisiana. Also, that year, another offensive commanded by General Jeffrey Amherst sailed from Halifax, Nova Scotia, to attack Louisbourg, a French fort on Cape Breton Island, guarding the entrance to the Gulf of St. Lawrence and the St. Lawrence River, the route connecting Quebec and France. Amherst landed west of Louisbourg and brought up siege weapons, and the fort surrendered. However, an attack against Fort Ticonderoga on Lake George did not fare as well, and the British rather unexpectedly retreated when the

French commander expected a continuation the next day and he in turn contemplated retreat.

The victories of 1758 were completed by greater victories in 1759. General Amherst gained control over Ticonderoga, which the French had mined and exploded before abandoning. Meanwhile, General James Wolfe sailed to Quebec, approached the city from the western side, engaged in a battle on the Plains of Abraham against the French commander, Louis-Joseph de Montcalm-Gozon, the Marquis de Montcalm de Saint-Véran, and the British compelled the surrender of the citadel. Both opposing commanders died in this pivotal battle.

In 1760, Amherst compelled the surrender of Montreal, and the French had lost their colony in Quebec. The war would drag on for another several years as the conflict expanded to include the Spanish and Cuban and Gibraltar areas of operation.

Meanwhile, the British defeated the French in India. After the British won at Wandiwash in early 1760, they pushed the French back upon their main base at Pondicherry in southern India. British control of the seas guaranteed the attackers adequate supplies, while the French defenders weakened. Finally, some months later, the British began a siege bombardment in January 1761, and the French garrison surrendered five days later. Thereafter, the British East India Company, through diplomacy, trade, bribery, and force, managed to expand British power along the coast from the Tamils in the south to north of Madras to the east and north. Thereafter, the British engaged in four so-called Mysore Wars against local rulers to solidify their growing empire that developed from the fighting of the Seven Years' War. In the end, this world war of a sort led to Britain gaining French Canada, Minorca, and Florida; France ceding Louisiana to Spain; and Prussia keeping Silesia.

Shaka kaSenzangakhona

(c. 1787–1828)

The founder of the Zulu kingdom, celebrated for his military skills and who today symbolizes Zulu nationalism.

Shaka was born in about 1787 to Senzangakhona kaJama, chief of the Zulu people, who owed allegiance to the Mthethwa, one of the major chiefdoms then fighting to dominate the region of southeastern Africa that would later become the Zulu kingdom. In about 1794, Shaka was driven into exile and eventually entered the service of Dingiswayo kaJobe, the Mthethwa chief, who recognized and rewarded his extraordinary military aptitude. In 1816, with Dingiswayo's support, Shaka seized the Zulu chieftainship from his brother.

Southeastern Africa was already falling into a period of turmoil known as the *mfecane* (the crushing). In 1817, the Ndwandwe defeated the Mthethwa and attacked the Zulu. Shaka responded by improving his military capability. All the men and women in his chiefdom were grouped in age-grade regiments under his authority for the purposes of social control and the exploitation of their labor and military potential. His warriors' style of combat was not new in the region, but under Shaka it was perfected. They attacked in the "bull" formation, with the two "horns" outflanking and enveloping the enemy while the "chest" charged in. The "loins" acted in support or pursuit. Essential to his armies' success and the psychological advantage they enjoyed was Shaka's emphasis on the deadly stabbing spear in hand-to-hand combat and his insistence on giving no quarter. Shaka's military system required that his warriors be adequately rewarded, which entailed endless campaigns for booty.

Shaka finally defeated the Ndwandwe in 1819 and incorporated their territory. He consolidated his hold over other neighboring chiefdoms through diplomacy when he could or through conquest if they resisted. Many chiefdoms took the option of flight, further destabilizing the region. There were limits, however, to the extent of territory Shaka could effectively control because of great distances and the lack of a developed administration. His armies levied tribute from the subordinate chiefdoms along the uncertain borders of the Zulu kingdom proper and regularly raided more distant peoples for booty. In 1824, white traders and hunters established a settlement at Port Natal with Shaka's permission. They had firearms, and Shaka increasingly relied on them as mercenaries.

Shaka faced opposition from rivals within the royal house and from dissident members of chiefdoms incorporated into the Zulu state. Even his warriors, exhausted by incessant campaigns, began to turn against him. As part of a wider conspiracy, his half-brothers, Mhlangana and Dingane, assassinated him on 24 September 1828 at kwa-Dukuza, his royal residence.

Shapur I (r. 240–272)

Son and successor to Iranian Sassanid Dynasty (224–651) founder, Ardashir I. More formidable than the Parthian Empire it supplanted, the Sassanid Empire constantly sought to alter the military status quo with Rome in Mesopotamia, Armenia, and Syria. The long struggle that resulted focused around border fortresses such as Dara, Nisibis, Amida, and Dura Europus.

Taking full advantage of their internal crisis, Shapur campaigned with great success against the Romans. He defeated and killed Emperor Gordian III in 244. The peace treaty between Shapur and Philip the Arab, the new emperor, forced the Romans to pay tribute (Shapur claims Philip paid 500,000 *denarii*). A further Persian offensive led to the occupation of Armenia, the devastation of Syria, and the first Persian conquest of Antioch (253). The third campaign of Shapur culminated in the capture and destruction of Dura Europus (255). In a rock-cut relief from Naqsh-e Rostam, another emperor, Valerian, is depicted cowering in front of the king after his defeat and capture at the Syrian city of Edessa in 260; one lurid tradition even claims that after his execution, Valerian's body was stuffed with straw and put on display. It was left to Septimius Odaenathus, dynast of Palmyra, to play the major role in forcing Shapur to withdraw from Roman territory (262–266). In addition to his brilliant military achievements, Shapur, "King of Kings, King of Iran and non-Iran," was famed for his grandiose building operations (he used the labor of Roman prisoners of war).

Shapur II (309–379)

Persian monarch and opponent of Julian. In 359, Shapur II led his armies into Mesopotamia and captured several Roman frontier fortresses, including Amida. The following year, Shapur invested Singara and Bezabda. It became apparent that the Sassanids, unlike the Parthians, had developed an adequate siege-warfare technology.

Three years later, the Emperor Julian, hoping to restore Roman prestige, advanced to Ctesiphon. Unable to assault it, Julian retreated up the Tigris River, where he died in a confused ambush (26 June 363). His generals quickly elect Jovian as their emperor. It was his task to extract the army from its perilous position. Not wishing to let the Romans retreat unmolested, the Persians hovered on their flanks, striking whenever an opportunity arose. Their elephants and *clibanarii* (heavily armored cavalry), according to eyewitness Ammianus Marcellinus, terrorized the Roman soldiers. His troops exhausted and hungry by the continued attacks, Jovian agreed to a humiliating treaty. He was forced to give up Nisibis and concede parts of Armenia and Mesopotamia to Shapur. The Persians had besieged the fortress of Nisibis three times in 12 years without success: its defenses, in the words of a Syrian chronicle, had made it as safe as "a rose behind thorns."

Shays's "Rebellion" (1786–1787)

An agrarian revolt in Massachusetts that influenced the creation of a stronger centralized federal government in the United States under the Constitution in 1787. An economic depression led farmers to unsuccessfully petition the state government to print paper money to increase the currency supply and change legal-tender laws to allow taxes and debts to be paid in agricultural commodities. They intimidated tax collectors and obstructed the debtor courts in order to force them to postpone business. Under the nominal leadership of Daniel Shays, 1,500 farmers forced the state Supreme Court at Springfield to adjourn in September 1786. The state then appealed to the federal government for military assistance, although the rebellion would be put down before federal troops were needed.

Governor James Bowdoin appointed Revolutionary War veteran General Benjamin Lincoln to suppress the rebels

with an army of 4,400 men. On 25 January 1787, Shays tried to seize the federal arsenal in Springfield in order to march on Boston and have the issues addressed. Rebel commander Luke Day, leading men from the west, tried to send word to Shays to delay actions for one day. The 1,200 arsenal defenders under General William Shepard fired their cannon into the advancing rebels, killing 4 and wounding 20. Shays's 2,000-man force retreated in disarray, pursued by Lincoln's militia coming from Boston. Marching his troops through a snowstorm the previous day, Lincoln surprised the rebels at Petersham on the morning of 3 February. The farmers were scattered, and the rebellion was broken. Isolated violence continued in the state for several months.

Although most of the rebels surrendered after being granted amnesty, Shays was able to elude capture briefly by escaping to Vermont. The Massachusetts Supreme Court sentenced Shays and 13 of the other rebel leaders to death for treason, but newly elected Governor John Hancock pardoned most of the leaders at the last moment. However, in Berkshire County, John Bly and Charles Rose were hanged. The state legislature then began to address the farmers' issues. This near-comic opera "rebellion" highlighted the weaknesses of the Articles of Confederation and strengthened the case for a stronger central government.

Sheridan, Philip Henry (1831–1888)

The most successful Union cavalry field commander in the American Civil War. Sheridan was born on 6 March 1831 to Irish immigrants in Albany, New York, grew up in Ohio, and lied about his age to gain admittance to the U.S. Military Academy at West Point in 1848. After a year's suspension for assaulting a superior officer, he graduated in 1853, thirty-fourth in a class of 49.

During his lieutenancy, he served with the 3d Infantry in Texas and the 4th Infantry in the northwest. A captain in the 13th Infantry at the outbreak of the Civil War, he was stationed as a quartermaster in southwestern Missouri until May 1862, when he was promoted to colonel of the 2d Michigan cavalry and joined Henry Halleck on the march to Corinth, Mississippi. His performance at Boonesville, Mis-

issippi, in June earned him a promotion to brigadier general and command of the 11th Division of the Army of the Ohio. He was a key element in the Union victory over Braxton Bragg at Perryville, Kentucky, on 8 October. At Murfreesboro, his outnumbered men held the enemy until their ammunition ran out, allowing William S. Rosecrans and George H. Thomas to fall back into new lines and subsequently defeat Bragg. Promoted to major general in March 1863, he excelled at Chickamauga, Chattanooga, and Missionary Ridge.

Ulysses S. Grant placed Sheridan in command of the cavalry of the Army of the Potomac in April 1864. Sheridan fought at the Wilderness and rode completely around Lee's army near Richmond, Virginia, from 9 May to 24 May, cutting Lee's communications. He defeated and killed Jeb Stuart at Yellow Tavern on 11 May and engaged the enemy at Spotsylvania on 12 May and Cold Harbor on 2 June.

Grant gave Sheridan command of the Army of the Shenandoah in August. After Jubal A. Early smashed the Union left flank at Cedar Creek on 19 October, Sheridan's counterattack completely turned the tide. Having destroyed Confederate agriculture in the Shenandoah Valley, he returned to the Richmond campaign early in 1865. He defeated George E. Pickett at Five Forks, Virginia, on 1 April and was at Appomattox for Lee's surrender.

Sheridan commanded the Gulf of Mexico Division from 1865 to 1867, was military governor of Texas and Louisiana from 1867 to 1869, and led attacks against Indians from 1868 to 1869. In a rude remark to Comanche chief Tochaway at Fort Cobb, Oklahoma, in 1869, Sheridan is supposed to have originated the slur, "The only good Indian is a dead Indian." (The more accurate quotation is "I only saw one good Indian, and he was dead.") Promoted to lieutenant general in 1869, he was in Europe observing Prussian field operations during the Franco-Prussian War. In 1884 he became U.S. Army commander in chief, succeeding William Tecumseh Sherman. Congress made him general of the army just before his death on 5 August 1888.

Sherman, William Tecumseh (1820–1891)

U.S. Army Civil War commander. Born on 8 February 1820 in Lancaster, Ohio, Sherman graduated from the U.S. Military Academy at West Point, New York, in 1840 and was commissioned a second lieutenant of artillery. After an undistinguished military career, he resigned his commission in 1853 to enter private business. Having failed as both a banker and a lawyer, Sherman, who was unable to reenter the army, became the superintendent of the Louisiana State Seminary of Learning and Military Academy (the present-day Louisiana State University) from 1859 until Louisiana seceded from the Union in early 1861.

At the outbreak of the Civil War, Sherman volunteered for service in the Union army, was commissioned a colonel, and commanded the 13th U.S. Infantry Regiment. Within a month, he was given command of the 3d Brigade, Tyler's Division, Army of the Potomac. After First Bull Run, Sherman was promoted to brigadier general of volunteers and sent to Kentucky, where he was quickly given command of the Department of the Cumberland. On 1 March 1862, he was ordered to the command of the 5th Division, Army of the Tennessee. Sherman commanded his division at the Battle of Shiloh, where he was wounded but refused the leave the field. Cited for bravery by both Generals Ulysses S. Grant and Henry W. Halleck, he was rewarded for his part in the Union victory by being promoted to major general of volunteers.

In 1864, following Grant's promotion to general in chief of the Union army, Sherman was made commander of the Military District of the Mississippi, making him de facto supreme commander of the Union armies in the West. Sherman then initiated the Atlanta campaign, which led to the capture of the city on 1 September 1864. After ordering the military resources of the city burned, he launched his most celebrated military action, Sherman's "March to the Sea." The campaign involved marching, without any line of communications or supply, his army of 62,000 men from Atlanta to Savannah, Georgia, on the Atlantic coast. During the campaign, Sherman's army pillaged the areas it passed through, demolishing military resources along with railroads and other private property. Sherman believed that the destruction of his campaign would lower southern morale and bring the war to a quicker conclusion. It was an early example of twentieth-century "total war."

After reaching Savannah, Sherman next began the Carolinas campaign, in which his army swung up through

North and South Carolina in order to join forces with Grant and the Army of the Potomac in Virginia. On 9 April 1865, Confederate general Robert E. Lee surrendered to Grant, and two weeks later, on 26 April 1865, Confederate general Joseph E. Johnston surrendered to Sherman at Durham Station, North Carolina.

After the war, Sherman was promoted to the rank of lieutenant general in the regular army. On 4 March 1869, following Grant's election as president, Sherman was promoted to the rank of full general and became the general in chief of the U.S. Army. He retired from the army in 1884 and died on 14 February 1891.

Both Grant and Sherman epitomized what major wars would become in the industrial age: a nasty business involving nearly all of a nation's assets. Both could efficiently muster vast resources and did their best to deny them to the enemy. The pomp and "glory" of war would fade by the end of the century, as these unbuttoned, almost scruffy commanders would foreshadow in their very persons. And it was Sherman who reminded a group of veterans that war was nothing but "all hell, boys."

Sherman's March to the Sea (mid-November–December 21, 1864)

A form of "total war" used by General William T. Sherman to bring the American Civil War to a quick conclusion. After evacuating Atlanta in late summer, Confederate general John Hood moved north through eastern Alabama to threaten William Sherman's long supply line to Chattanooga and Nashville. In a brilliant strategic concept, Sherman decided to abandon his communications, send sufficient troops to central Tennessee to resist Hood, and set out for the coast to lay waste to the Deep South and to convince southerners of the futility of continued resistance.

In mid-November 1864, Sherman's "March to the Sea" began. Some 62,000 Union troops and many camp followers (including a large number of freed slaves) set out. Sherman divided the troops into divisions, and there was no clear line

of march. For the outnumbered defenders, it was unclear whether Sherman intended to march to the Gulf Coast; Savannah, Georgia; Charleston, South Carolina; or Columbia, South Carolina, the state capital and birthplace of the Confederacy. Thus the Confederates had to divide, while Sherman was able to concentrate and easily brush aside any opposition he faced.

For 250 miles, Sherman's troops cut a swath through Georgia; supposedly, one can see the outlines of the march to this day. The troops burned, looted, ate, and generally sought to bring the horror of war to the deep South, which thus far had been spared the agony of such "Up South" states as Tennessee and Virginia.

Finally, on 21 December, Sherman and his troops took Savannah, after a 10-day siege. Confederate troops evacuated before the final assault. Sherman's men met up with the Union navy, and Sherman sent a message to President Abraham Lincoln presenting him with Savannah and thousands of bales of cotton as a Christmas present. The Civil War was drawing to its inexorable conclusion.

Sherman always maintained that he liked southerners

and that his march was the best means of bringing the war to a quick and merciful end. He may well have been correct, but most southerners remained unconvinced.

Shiloh (6–7 April 1862)

An early Union victory by General Ulysses S. Grant, and one of the American Civil War's bloodiest battles. After defeat at Forts Henry and Donelson in February, Confederate general

Battle of Shiloh, 1862. (Library of Congress)

Albert Sidney Johnston retreated to Corinth, Mississippi, where he concentrated forces for an attack against Grant. Grant had most of his command at Shiloh Church along the Tennessee River while waiting for Union general Don Carlos Buell and reinforcements from Nashville.

Johnston felt obligated to attack Grant before Buell arrived; he wanted to attack on 4 April but was delayed two days before the unfortified Union position. He also decided to have his men attack in waves, each wave commanded by a different general, which would make command and control more difficult once the battle was fully engaged.

Still, the initial attack was a great surprise, and many of Grant's untrained and raw troops fled to the riverbank. Union troops at one point did put up such furious resistance that Confederates dubbed the battle the "Hornet's Nest"; still, additional artillery turned the tide for the South.

Johnston was wounded in battle (and later would die of his wounds); his subordinates needed time to straighten out units. Grant, meanwhile, deployed artillery and Union gunboats as shields along Pittsburg Landing for his routed men to recoup and for forward elements of Buell's Army of the Ohio to join the defense. Surprisingly, Grant's forces held on that day, and on 7 April, reinforced by Lew Wallace's "lost division" and more and more divisions of Buell's army, he went over to the offensive. Meanwhile, the Confederates, now commanded by General Pierre Gustave Toutant Beauregard, decided to retreat further south.

Shiloh shocked the American people—North and South—with its high casualties (more than 23,700 killed and wounded on both sides) and made clear that this would not be a short nor painless conflict. In the meantime, Grant was ordered to defend rail and communications lines and was unable to follow up his victory with an advance further south.

Shimabara Revolt (1637–1638)

An uprising of peasants and masterless samurai of the Shimabara domain near Nagasaki that later spread to the neighboring Amakusa Islands, both areas that were heavily

taxed and Christianized during the latter part of the sixteenth and early seventeenth centuries. The uprising, though not entirely Christian in inspiration, was perceived as such by the young Tokugawa shogunate (1603–1868) and contributed greatly to that government's decision to sever all relations with foreign countries.

The domain of Shimabara had been a center of Christian activity since the religion's introduction there in the sixteenth century, and it hosted an unusually high number of converts. Repeated attempts at uprooting Christianity in both Shimabara and the nearby Amakusa Islands, another stronghold of Christians, during the early years of the Tokugawa shogunate proved unsuccessful until the application of severe persecution, and even then many Christians proffered only an outward renunciation of their faith while secretly maintaining it. Further, the peasants of the area suffered under heavy taxation by both the Tokugawa government and their local daimyo (overlord).

The region was also home since the Battle of Sekigahara (1600) of many impoverished and embittered *ronin* (literally, wave men), or masterless samurai. The combination of these *ronin* with persecuted Christians and an overtaxed peasantry proved fertile ground for the revolt. In December 1637, a combination of peasants and *ronin* rose in rebellion in Shimabara. The rebels soon chose a boy as their leader, Amakusa Shirô (1621–1638), whose samurai father had been executed after the Battle of Sekigahara for having fought on the losing side. Though the revolt's motivating factors had more to do with overtaxation and persecution, it quickly took on millenarian and Christian aspects, with rebels shouting the names of Jesus or Mary during their attacks.

The rebels encountered some initial success, and over 35,000 of them were able to seize and entrench themselves in Hara Castle on the Shimabara Peninsula. The Tokugawa government then raised an army from among the domains of its feudal lords in northern Kyushu. Despite the more than 100,000 troops employed in the siege of Hara Castle and the help of a Dutch naval bombardment, the rebels held out for several months before the fortress fell to the Tokugawa armies in April 1638. All told, the rebels, including their youthful leader Amakusa Shirô, suffered some 35,000 deaths, the majority executed following the fall of Hara Castle, whereas the forces of the Tokugawa lost about 13,000. The army raised against the Shimabara rebels was to prove the last major mobilization by the Tokugawa until the troubles preceding that shogunate's fall in 1868. The uprising, viewed officially as Christian in nature, was crucial in the Tokugawa shogunate's decision in 1639 to promulgate its strict policy of national seclusion from the outside world.

Short, Walter Campbell (1880–1949)

U.S. Army officer and central figure in the Pearl Harbor controversy. Born in Fillmore, Illinois, Short graduated from the University of Illinois (1901) and was commissioned in the U.S. Army in 1902. In 1916, he participated in the U.S. incursion into Mexico. Promoted to captain, he was attached to the 1st Division, which traveled to France in 1917. He developed expertise in the use and deployment of machine guns, rising to staff positions at corps-level automatic weapons schools. His war and postwar weapons work culminated in his book, *Employment of the Machine Gun* (1922).

Short progressed in rank through the interwar years, taking command of the 1st Division (1939). With promotion to major general, he took command of I Corps, but in February 1941 he was tapped for command of the Hawaiian Department. Brevetted lieutenant general, Short's command was focused on defending Oahu and the Pearl Harbor naval base.

The 7 December 1941 Japanese attack began a long personal nightmare for Short. Publicly tagged with “dereliction of duty” by the investigative Roberts Commission (1942) for ignoring signs of an impending Japanese attack, he was demoted to major general, relieved of command, and then pressured into retirement. Never granted an opportunity before a military court to defend his actions and decisions in Hawaii, Short spent the war years working in private industry. He died in 1949 and was buried in Arlington National Cemetery.

Siamese (Thai)–Burmese Wars (1548–1792)

By the sixteenth century, Siam (modern Thailand) and Burma, two of mainland Southeast Asia's most powerful

states, emerged as bitter rivals in regional politics and war. Burma repeatedly invaded Siam, and both polities struggled for control of neighboring countries such as Laos and Lanna (Chiang Mai).

In a physical environment in which land was plentiful but labor scarce, Burmese invaders of Siam in the sixteenth and eighteenth centuries sought slave labor, skilled artisans, and royal hostages, as well as treasure and above all prestige. Placing a compliant vassal on the Siamese throne was a way the Burmese monarch could display his authority as a *chakravartin* (world-conquering king). Often, the pretext for war was the Siamese monarch's refusal to provide the Burmese king with tribute in the form of a sacred white elephant, a potent symbol of universal kingship.

Tabinshwehti (r. 1531–1550), second king of the Burman Toungoo dynasty, attempted to subjugate Siam in 1548, but his campaign failed, and it fell to his brother-in-law King Bayinnaung (r. 1551–1581) to occupy the Siamese capital of Ayutthaya (located about 80 kilometers north of modern Bangkok) in 1564. A Siamese revolt necessitated a second campaign in 1568–1569, in which the Burmese looted and destroyed Ayutthaya, hitherto one of Southeast Asia's richest cities, dismantling its fortifications and bringing many of its inhabitants back to Lower Burma.

Siam won its independence led by Phra Naret (King Naresuan, r. 1590–1605). Originally a vassal of Bayinnaung's son Nanda Bayin (r. 1581–1599), he instigated a revolt by Siamese deportees in Lower Burma in 1584, returned to Siam, and five times during 1584–1593 frustrated Nanda Bayin's attempts to reassert control over his native land. In 1593, Naresuan brought the war to Burmese soil, occupying Tenasserim, Tavoy, and Martaban and playing a role along with Arakanese and Portuguese invaders in bringing about Burma's disintegration in 1599.

After establishing a new royal dynasty, the Konbaung (1752–1885), and pacifying Mon-inhabited Lower Burma, the warlike Alaungpaya (r. 1752–1760) led his army over the Three Pagodas Pass into Siam but died in 1760 before repeating Bayinnaung's conquest. His son Hsinbyushin (r. 1763–1776) captured Ayutthaya in April 1767, completely destroying it. According to a Siamese historian, Bayinnaung waged war “like a monarch,” but Hsinbyushin waged it “like a robber.”

The Chinese-Siamese general Phraya Taksin, a gifted military leader, succeeded in wresting control of central Siam from the invaders in 1767–1768 and crowned himself king at Thonburi. When Taksin was deposed in 1782, the founder of the new royal dynasty, Chao Phraya Chakkri (Rama I, r. 1782–1809), built a new, more easily defended capital at Bangkok on the east bank of the Chao Phraya River and thwarted repeated Burmese invasions by King Bodawpaya (r. 1782–1819).

The struggle against Burmese aggression became an important theme in modern Siamese/Thai nationalism. The strong state established by Taksin and Chakkri preserved Siam's independence in the nineteenth century, whereas Burma fell under British colonial rule.

Sicilian-Byzantine Wars (1147–1185)

Two wars rematching the Normans of Sicily with the Byzantines in 1147–1158 and 1185–1186. In the summer of 1147, the Byzantine emperor Manuel I Comnenus (r. 1143–1180) had just watched French and German armies depart his lands for the Second Crusade when he learned that Roger II of Sicily was raiding Greece. Roger, Norman king of Sicily and southern Italy, had inherited his forefathers' fondness for Balkan adventurism. Rooted on Corcyra island, his Norman raiders sacked Thebes, Corinth, and defied Manuel, Conrad III (Holy Roman Emperor), and the Republic of Venice.

The Byzantine emperor first made a pact with Conrad III, humiliated by the failure of the Second Crusade, to conquer Roger. Then Manuel captured Corcyra in 1149 with the help of a Venetian fleet, but uprisings in both Byzantine and German lands and then, in 1152, the death of Conrad III derailed his anti-Norman campaign.

On his own, Manuel dispatched his fleet to the Italian coast against a new Sicilian king, William, in 1155. At first, aided by Norman rebels, the Byzantines took Bari and seemed ready to regain Sicily. Then William struck back and crushed Byzantine land and naval forces together at the Battle of Brindisi in 1156. Chastened and distracted by war in Syria, Manuel and William made peace in 1158.

The Byzantine-Norman truce held, largely because both sides were distracted by threats and opportunities closer to home. In 1166, when William II became king of Sicily, Emperor Manuel tacitly renewed their understanding. William was equally cordial when Manuel died in 1180, and his son, Alexis II (r. 1180–1183), mounted the throne, especially since Alexis had Norman blood in his veins, but conditions changed drastically in 1183 when Andronicus I Comnenus (r. 1183–1185) seized power and murdered Alexis. As plots and revolts swirled, William of Sicily prepared to invade Byzantium.

In June 1185, William's fleet took Corcyra, landed in Epirus (Albania) at Dyrrhachium, and marched south toward Thessalonica, Byzantium's "Second City." The Sicilian fleet circled around Greece at the same time, blockading the Thessalonians from the sea. When the city fell in August, the Normans ran riot, burning, looting, desecrating, and massacring thousands. By September, William's foragers were but 200 miles from Constantinople, as his fleet entered the Marmora Straits. That same month, Isaac Angelus (r. 1185–1195) rallied the demoralized city, overthrew Andronicus, and seized the throne of Byzantium.

The new emperor struck quickly. He scattered William's main force at Mosynopolis and then crushed his other flank on the banks of the river Strymon. In Thessalonica, public fury exploded against the Sicilians, who fled the city, awaiting recovery by William's retreating navy. Norman losses proved so severe that they barely resisted in 1186 when Isaac marched overland to retake Epirus. The Sicilian menace was ended.

Sidi Barrani (1940)

Battle signaling the beginning of the Italian collapse, which eventually drew German forces into North Africa. After declaring war on 10 June 1940, Benito Mussolini immediately began planning an Italian attack on Egypt, with a view to linking the Libyan and Ethiopian territories. Marshall Rodolfo Graziani had nearly 1 million troops in Libya facing General Archibald Wavell's 36,000 but remained hesitant to attack for fear of logistical difficulties. The Italian Comando Supremo applied considerable pressure that Graziani be ready to attack on the same day as the projected German invasion of Britain. Eventually, on 7 September 1940, Mussolini personally ordered Graziani to attack Egypt within two days.

British troops withdrew in good order before the overwhelming Italian force. The Italian Tenth Army advanced cautiously, eventually occupying Sidi Barrani, a coastal village 60 miles inside Egypt, on 17 September. There the Italian army halted and commenced construction of an arc of strong points stretching 30 miles south and southwest of Sidi Barrani.

Wavell, in turn, came under strong pressure from Win-

ston Churchill to counterattack and by December was ready to strike. On the night of 8 December 1940, the 4th Indian Infantry Division and 7th British Armored Division moved forward and at dawn crashed through the center of the Italian line. Turning northward toward the coast in an encircling move, they attacked Italian strong points from the rear as they advanced. The Italians were caught by surprise, in spite of having obtained accurate aerial intelligence of British preparations during previous days. By nightfall on 10 December, four Italian divisions—the 1st Libyan and 4th Blackshirt at Sidi Barrani, 2d Libyan at Tummar, Maletti Task Force at Nibeiwa, and the 64th Catanzaro near Buq Buq—had surrendered. British forces continued westward, pursuing elements of the 62d Marmarica, 63d Cirene, and 1st and 2d Blackshirt Divisions that were retreating rapidly into Libya.

During the three-day action, the British suffered 624 casualties but captured nearly 40,000 Italian troops and their equipment. A 7th Armoured Division report later stated that prisoners were too numerous to count but amounted to about 5 acres of officers and 200 hundred acres of other ranks. However, the Italian fiasco led in time to the German dispatching of Erwin Rommel and his Afrika Korps to North Africa. No longer would the British have matters their own way in the desert.

Sikorski, Wladyslaw Eugeniusz (1881–1943)

Polish army commander in World War II. Born on 20 May 1881 at Tuszow in Austro-Hungarian-occupied Poland, Sikorski attended the Polytechnic Institute of Lvov and served in the Austro-Hungarian army prior to World War I. During the war, he served in the Polish Legion, which had its origins in the Polish Riflemen's Association (a paramilitary organization of Polish nationalists founded by Józef Pilsudski), and fought against imperial Russia.

After World War I, Sikorski served in the Polish army and was decorated for valor during the Russo-Polish War (1919–1921). By 1921, he had been named chief of the Pol-

ish general staff. After briefly serving as the minister of war and then as prime minister of Poland, Sikorski remained neutral during Pilsudski's 1926 coup d'état. After retiring from the army in 1926, he joined the anti-Pilsudski opposition and remained out of power until 1939.

When the Germans invaded Poland in 1939, Sikorski became prime minister of the government in exile in London and established excellent relations with the other Allied leaders. In April 1943, however, the Soviet Union used Sikorski's request for an International Red Cross investigation into the murder of thousands of Polish officers at Katyn, who had previously been prisoners of the Soviets, as an excuse to break off diplomatic relations with the Polish government in exile. Although the Allies were fairly certain that the officers had been murdered by the Soviets, with the war raging, they felt that they could not publicly denounce their wartime comrades-in-arms against the Nazis.

Only three months later, Sikorski was killed in an air crash at Gibraltar on 4 July 1943. Though foul play has often been suggested in connection with Sikorski's death, which was certainly convenient for Allied leaders, nothing has ever been conclusively proved. The loss of Sikorski did leave the Polish government in exile rudderless and may have contributed to Poland's diminished position among the Allied powers in the later stages of and immediately following World War II.

Silla Kingdom

One of the three centralized kingdoms, along with Koguryo and Paekche, to emerge on the Korean peninsula from the second to fourth centuries. Silla developed in the peninsula's southeastern corner and would go on to defeat the other two Korean states—Koguryo and Paekche—with the assistance of Tang China, uniting the peninsula for the first time in 668.

Silla emerged from an earlier tribal system in place in the southern peninsula. These tribes were led by elite chieftains, and a strict hierarchy would remain a salient characteristic of Silla society and politics. Silla continued to develop and

strengthen through the course of the fifth and sixth centuries. The importation of Buddhism and its adoption as a state religion helped augment central authority, with Silla monarchs by the sixth century promoting themselves as Buddha-kings. Special bands of young warriors called the *hwarang* (flower youth), trained through a unique mixture of Buddhist asceticism and militant loyalty to the state, strengthened Silla and aided its drive toward unification of the peninsula.

Interkingdom rivalries on the peninsula intensified over the course of the sixth and seventh centuries. In the sixth century, Silla succeeded in annexing the lesser Kaya polities along the southern coast. By an alliance with Tang China, Silla was finally able to muster the strength to overwhelm its rivals, attacking and defeating Paekche in 660 and Koguryo in 668.

The century or so that followed unification was a golden age for Silla, as peace and security fostered Buddhist art and the development of a uniquely Korean Buddhist philosophy. International trade, perhaps as far as the Middle East, brought wealth and prosperity, with the population of Silla's capital Kyongju reaching close to a million. Kyongju remains today a treasure-house of Buddhist architecture and iconography.

The final century of Silla was one of political upheaval, government corruption and weakness, and increasing popular unrest. Rival families vied for the kingship, often resorting to coups and assassinations. Silla had never made a heartfelt attempt to incorporate the acquired territory of Paekche and Koguryo into a single unified peninsular state. As a result, with the increasing popular unrest and decentralization of the ninth century, successor states to Paekche and Koguryo, named appropriately "Later Paekche" and "Later Koguryo," sprang up. The leader of the latter defeated Later Paekche and forced the abdication of the last Silla king in 935, establishing the Koryo Dynasty that would rule Korea until 1392.

Sinai-Suez Offensive (1956–1957)

A seven-day Israeli offensive into the Sinai Peninsula to break the Egyptian blockade of the Tiran Straits, eliminate the forward operational bases of Egyptian-sponsored Palestinian raiders, and shatter the rearming Egyptian army.

Egyptian leader Gamal Abd al-Nasir fomented instability in the Middle East in his quest for leadership of a newly formed pan-Arab, anti-Israel alliance that included Syria and Jordan. He supported fedayeen (guerrilla) advance bases along Israel's Sinai border, illegally barred Israeli shipping through the Suez Canal, installed artillery at Sharm el-Sheikh (Red Sea passage at the Strait of Tiran) near the southern apex of the Sinai peninsula, purchased a huge hoard of modern arms from Russia via Czechoslovakia, and nationalized the British-owned Suez Canal when the Americans withdrew funding for his Aswan dam electrification project. The Israeli response to the expanding terrorist raids had become extravagant and predictable, producing unacceptable Israeli casualties. Israeli chief of staff Moshe Dayan planned a large-scale incursion into Sinai to crush the terrorists, shatter the Egyptian military buildup before the new armaments could be deployed, and dislodge the antishipping barrier at the straits.

Through the French attaché, Dayan learned of the projected Anglo-French offensive to regain the Suez Canal, dubbed "Musketeer." French and Israeli representatives arranged a loose coordination, in return for which France filled Israel's last-minute order for modern ground attack aircraft and light tanks. The joint plan required Israel to provide a pretext for the European assault. Accordingly, Israel's invasion had initially to appear as another deep raid, albeit on a larger scale and threatening the canal, which would induce intervention. Thus the Israelis had to devise a uniquely complex operation, retaining the option of reverting to the "raid" concept should Israel's associates renege on their promised air-naval operation to the Egyptian rear.

On 29 October 1956, following a feint toward Jordan, a battalion of Ariel Sharon's 202d Paratroop Brigade was air-dropped at the eastern end of the Mitla Pass, concurrent with southwesterly border crossings by the 4th Infantry Brigade, the balance of the 202d Paratroopers, and elements of the 9th Infantry Brigade. These opening moves, ostensibly mere raids, diverted attention from intended final-phase operations against fedayeen and Egyptian army concentrations in the peninsula's northeastern quadrant. The success of these border incursions encouraged the Southern Command's chief to prematurely launch the 7th Armored Brigade and 10th Mechanized Infantry Brigade in an effort to isolate the Gaza Strip formations by an armored assault along the Abu Ageila–El Arish axis, which contained a heavily fortified defensive network. The remainder of Sharon's

paratroopers linked with their airhead near Mitla Pass in an overland forced march, while the 7th Armored Brigade successfully probed for a deserted gorge through which it encircled and overpowered the impregnable Egyptian entrenchment at Abu Ageila. Subsequently, it turned westward to race toward Ismailia alongside the canal. Musketeer was tardy, leaving the Israelis to take the Sinai unaided. Meanwhile, the 202d Paratroop Brigade exceeded its orders and entered Mitla Pass, where it sustained heavy casualties from an ambush. Finally extricating itself, the brigade moved along the peninsula's southwestern coast via Ras Sudar to Sharm el-Sheikh, where it was assisted in taking the position by the 9th Infantry Brigade, approaching via a fatiguing march from the northeast.

Simultaneous with the advance toward Sharm el-Sheikh, the 1st Infantry Brigade, supported by elements of the 27th Mechanized Brigade, took Rafah in a complex pincer operation on 1 November and routed the Egyptian-fedayeen Gaza Strip garrison. As Sharm el Sheikh fell on 5 November, Musketeer belatedly opened with an airborne drop at Suez City, followed by a British amphibious assault and advance to Kantara.

The Soviet Union and the United States jointly imposed a cease-fire and a withdrawal of all of the invasion forces from Egyptian territory. A United Nations buffer force was installed in Sinai, and the United States halfheartedly agreed to ensure Israeli passage through the straits. Israel gained little from its tactically successful exploit; the *casus belli* persisted.

Singapore (1942)

Great Britain's most ignominious military disaster of the twentieth century, opening the way for the end of Asian colonialism. Singapore was Britain's primary seaport in Southeast Asia and the lynchpin of British Far East defense policy

between the world wars. In the interwar period, the British poured resources into Singapore in an attempt to make it a fortress stronghold, along the lines of Malta or Gibraltar. The focus of the entire project was to protect the island from a Japanese naval attack.

Major construction started in 1923. A key component of the fortification was the King George V Graving Dock, at the time the largest in the world. This dry dock would provide Britain with repair facilities in the Far East. The British installed 15" naval guns to repel a sea invasion. Contrary to popular belief, the naval guns were able to fire to the landward side, but they did not have ammunition that would have been effective in the jungle. In addition, the British built aboveground storage tanks that held enough fuel for the Royal Navy for six months.

Like its contemporary interwar project, the Maginot Line, the Singapore facility was doomed from the start. Its design philosophy was that an army could not attack Singapore from the rear because of the jungle and thus any attack must come from the sea. The British also grossly underestimated Japanese fighting power and military skill.

On 8 December 1941, Japanese troops landed in Malaya and moved south against Singapore. The British had sent the old battle cruiser *Repulse* and the modern battleship *Prince of Wales* to Singapore to bolster the defenses. Dispatched to intercept any further landings and lacking any air cover, both were sunk by land-based Japanese aircraft, and their loss was a major blow to British morale. The Japanese advanced quickly through the jungle using 18,000 bicycles, and after a not-very-effective defense, the British, under the ineffectual and uninspiring Lieutenant General Arthur E. Percival, were forced to surrender on 15 February 1942.

The fall of Singapore drastically reduced the sense of Western invincibility as Asians witnessed the most powerful Western nation defeated by an Asian power. It fell mainly upon the Americans, who had put up a much better resistance at the same time in the Philippines (as Winston Churchill pointedly informed Percival) to take the measure of the Japanese for the rest of the war.

Sino-Japanese War (1894–1895)

A conflict that marked a shift of power from China to Japan and the beginnings of Japanese expansion onto the Asian continent. The conflict began in Japanese efforts to gain in-

The Japanese defeat the Chinese at the Yalu River in 1894 during the Sino-Japanese War. (Library of Congress)

fluence over Korea. Rising anti-Japanese feeling among Koreans brought Chinese troops, and that seemed sufficient provocation to the Japanese, who planned for a two-phase war against Korea and China, ultimately leading to an attack on Shandong and a drive to seize Beijing. On August 1, after armed clashes between their armies and navies, Japan and China declared war on one another.

The fighting was never seriously in doubt. Japan had a small but well-organized state army that reflected modern training methods, organization, and armaments patterned after the German army and a modern navy mostly purchased in the West. China had provincial armies (and military leaders) of varying quality and willingness to fight.

The war was marked by several major battles, all won handily by the Japanese. Japanese forces prevailed at Pyongyang on 16 September 1894; General Nozu Michitsura and 20,000 men overwhelmed 14,000 Chinese defenders, who withdrew to the Yalu River. Then Admiral Ito Yuko won the next day at the naval Battle of the Yellow Sea; the Japanese had more heavy guns, better gunnery, and ship handling, and the bulk of the Chinese fleet suffered serious damage. Two months later, the Japanese seized control of Port Arthur in southern Manchuria after negligible Chinese resistance; the Japanese secured their military victories with a landing near Weihaiwei and the subsequent destruction of the northern Chinese fleet there on 12 February 1895.

The ensuing peace negotiations at Shimonoseki were difficult for the Chinese and the Japanese alike. Soon thereafter, Russia allied with France and Germany in the so-called

Triple Intervention to force the Japanese to renounce some of the territorial gains they had achieved and to settle for a larger indemnity payment, diplomatic moves that may have foreshadowed the Russo-Japanese War 10 years later.

Sino-Japanese War (1937–1945)

A conflict marked by horrific bloodshed that tied down substantial portions of Japan's military forces during World War II. Japan annexed Manchuria in the early 1930s, but the imperial Japanese army, not content with this vast new territory, on 7 July 1937 engineered an armed incident at the Marco Polo Bridge near Beijing to justify a campaign to incorporate the remainder of China into the Japanese empire. Warfare rapidly spread southwestward from Beijing and from Shanghai westward along the Yangtze River valley.

Japan possessed a modern army with effective air and naval support. However, logistical requirements tended to

channel operations along railway corridors. Chinese forces consisted of a series of private peasant armies, which lived partially off the land. Equipment and ammunition were scarce and support services virtually nonexistent. The strongest and best organized army was that of the Nationalist leader, Chiang Kai-shek.

The Chinese continually fell back, often offering no resistance. Occasionally, Chinese units fought with determination, such as when the Communist Eighth Route Army destroyed large Japanese units at P'ingshingkuan in the north. By December 1937, Nanjing and Shanghai had fallen, and the two zones of operations joined. The Japanese employed amphibious operations and further developed their air-ground coordination. Many Western nations posted military observers to China, and the Soviet Union operated an expeditionary air force against the Japanese for some time.

The war was marked from the outset by its barbarity. A series of massacres preceded the capture of Nanjing, where Japanese troops were ordered to butcher more than 20,000 prisoners of war and subsequently raped, mutilated, and slaughtered as many as 200,000 civilians. Japanese recruits reported being made to bayonet live Chinese prisoners during training before being sent to southern Pacific theaters.

Some fighting was very fierce. At Teierchuang in early 1938, the Japanese took five months to capture the city and lost 16,000 killed. The last phase before Japan entered World War II in December 1941 was the battle for Wuhan. By then, Japan controlled most of the Chinese coastal provinces, the lower and central Yangtze River valley, and much of the north.

China had been receiving some supplies over the Burma Road via Rangoon, but it was cut when the British capitulated to Japanese diplomatic pressure, and the Japanese invaded Burma. Although the Japanese continued to press within China, Chinese troops participated in the first Burma campaign of 1942, suffering 50,000 casualties. In 1942, the Japanese army launched an offensive designed to destroy all eastern Chinese airfields in Chekiang and Kiangsi Provinces within bombing range of Japan. Again, in 1943, Japan launched an offensive designed to prevent Chinese reinforcement of Burma and maintain political pressure on Chiang Kai-shek's government.

China committed 18 divisions to the Burma theater in 1944, where they performed well. Meanwhile, the Japanese had concentrated 500,000 troops in the south of China for Operation ICHIGO. They planned to open a continuous land-transport corridor from Indochina to northern China, as the Allies had by then severely restricted the transport of raw materials to Japan from Southeast Asia by sea. The massive attack was initially successful and produced serious military and political instability within China, which continued after the Japanese surrender on 9 September 1945.

In 1937, China had fielded approximately 200 divisions and in 1945 about 131. When the Japanese forces surrendered, their strength in China was estimated at 1,283,000. More than 3 million Chinese soldiers and 18 million civilians are thought to have died during the eight-year war.

By devastating and bankrupting large sections of China, the Sino-Japanese War led almost directly to the victory of the Chinese Communists over the Nationalists by 1949. Both Chinese factions seemed more concerned with the postwar situation than with fighting the Japanese, and large sections of the country for long periods of time were spared the direct experience of war. The Japanese were even able to establish a puppet Chinese government in Beijing.

As for Japan, its unprovoked aggression in China could be said to have caused its eventual catastrophic defeat in 1945. Americans, many of whom had a sentimental attachment to China, were outraged by Japanese aggression against that chaotic nation. Such outrage was stoked by such influential Americans as the Chinese-born Henry Luce, editor of *Time*, *Life*, and *Fortune* magazines. Growing American animosity led to concrete actions short of war against Japan, such as an oil embargo, which led to the Japanese decision to go to war against the Western Allies of World War II.

Sino-Korean Wars and the Wars of Korean Unification (598–676)

Standoff on the Korean Peninsula ended by Tang intervention. In the sixth century, the three dominant states that had emerged on the Korean peninsula—Koguryo in the north, Paekche in the southwest, and Silla in the southeast—entered a period of increasingly fierce competition for peninsular hegemony. Though each of these states at times enjoyed a period of relative dominance and strength, the roughly equal stature of the three powers, combined with a series of ever-shifting alliances, ensured that a balance of power was maintained. Only the participation of Chinese armies turned that balance ultimately toward Silla.

Except for a brief period of reunification under Western Jin Dynasty (265–317), China had been divided into northern and southern states after the fall of the Han Dynasty (206 B.C.E.–220 C.E.). Competition for power was particularly severe among the northern states, most of them of “barbarian” origin, and out of this crucible the Sui Dynasty (581–618) finally succeeded in reuniting China and ushering in a renewed period of centralized authority.

The new dynasty soon came into competition with the northern Korean state of Koguryo. Positioned in both Korea and Manchuria and thus in direct conflict with China, it was seen as an increasing threat by the Sui. In 598, after Koguryo had made a military foray into the Liaodong (Liaotung) Peninsula, a Sui military response was foiled only by bad weather. Sui did not let the matter drop, and a series of Sui attacks on Koguryo followed in the first decade of the seventh century. They resulted in costly Sui defeats and were a primary cause of the dynasty’s sudden collapse in 618.

Tang (618–907) replaced Sui and quickly became involved on the Korean Peninsula. In 642, Paekche launched a large-scale assault on Silla for control of the Naktong River basin and the rich alluvial plains that were its boon. Faced with this onslaught, Silla sought an alliance with its erstwhile foe, Koguryo. Now under the rule of the military strongman Yŏn Kaesomun (d. 666), who had seized power through an aristocratic purge, and more concerned about the new Tang Dynasty, Koguryo rejected any Silla alliance.

Koguryo had every reason to be concerned, and in 645 Tang emperor Taizong (600–649) began the first in a series of attacks on what he perceived to be a hostile and expansionist Koguryo. As had been the case under the Sui, these attacks, made by land at an extreme distance from the center of Tang power along the Yellow River, proved costly failures. Taizong even lost an eye to a Koguryo arrow.

Under Taizong’s successor, Emperor Gao Zong (643–683), the campaign against Koguryo was temporarily suspended as Tang China sought to catch its breath, but a new opportunity arose as Silla began a secret diplomatic initiative to organize an allied attack on Paekche. Rejected, in turn, by Koguryo again, and then by the nascent state of Japan, Silla finally sent an envoy to the Tang court in 655. Tang welcomed an alliance with Silla to overcome the other Korean states from within, especially Koguryo. The fact that a war in Silla could be supported by sea, rather than over distant land supply lines, made the prospect all the more attractive to the Chinese.

In 660, a Silla-Tang force converged on Paekche. While a Silla army of about 50,000, led by General Kim Yu-sin (595–673), advanced from the southeast, a Tang force of almost 130,000 approached by sea. The badly outnumbered Paekche army suffered a crippling defeat at Hwangsan (modern Yonsan), sealing the demise of the Paekche kingdom.

Koguryo would meet a similar fate in 668, after resisting the Tang-Silla alliance for nearly a decade. Its defeat was hastened by the internecine struggle that erupted at the Koguryo court following the death of Yon Kaesomun in 666.

Upon the defeat of Paekche and Koguryo, Tang China was eager to retain its gains in Korea and to incorporate the peninsula into a larger Chinese state. To Silla’s chagrin, Tang reestablished the defeated Korean states as Chinese colonies, with a son of the former Paekche king even ruling that defunct kingdom for it. Unwilling to accept this situation, Silla determined to face down the Tang forces. In a series of decisive encounters from 671 to 676, Silla was finally able to wrest full control of the peninsula from the Tang and establish the first unified Korean state.

Sioux Wars (1862–1891)

In the 1860s, the Sioux Indians of the northern Great Plains felt that treaties made with them were not being upheld by the government or by local whites and took the opportunity of the American Civil War to strike back. A Sioux war band under Chief Little Crow ambushed and destroyed a detachment from Fort Ridgely, Minnesota, and then besieged the fort while killing and plundering in local farms. A militia force led by the state governor from Fort Snelling defeated Little Crow at Wood Lake on 23 September 1862. Little Crow escaped, but when he returned the next year, he was shot by a farmer.

Sibley then allied with General Alfred Sully, and both carried out separate but successful campaigns against the Sioux in North Dakota in 1863 and 1864. Sully crushed a large Sioux force at Killdeer Mountain on 28 July 1864. Fort Rice was then established at Bismarck, North Dakota, to keep the Sioux in check.

From 1865 to 1868, the Oglala and Dakota Sioux carried on a war against white settlers and soldiers entering Sioux hunting grounds along the Bozeman Trail, a shortcut from Fort Laramie, Wyoming, to the gold mines in Bozeman, Montana. In 1866, the Sioux slaughtered 83 soldiers sent to relieve a besieged work party, in the so-called Fetterman Massacre. In 1867, Chief Red Cloud agreed to a peace treaty that removed forts on the Bozeman trail if the Sioux settled on a sacred Black Hills area reservation by 1876.

In 1874, gold was found in the Black Hills, and the white prospectors made it impossible for the 1867 peace treaty stipulations to be carried out. General Crook led a military expedition out to enforce the treaty anyway, and one column destroyed the village of Sioux chief Crazy Horse before it was defeated and forced to retire for reinforcements. A second expedition under General Alfred Terry, including the Seventh Cavalry of Colonel George Armstrong Custer, was sent in relief. Custer disregarded orders and attacked 2,500 Sioux under Chiefs Sitting Bull and Crazy Horse near the Little Bighorn River. Custer had divided his command into three columns, and he and his 266-man column were wiped out on the morning of 26 June 1876 in the legendary “Custer’s Last Stand.” Custer’s other two columns were saved by the arrival of General Terry.

Terry and Crook continued the campaign against the Indians year-round, and Crazy Horse was defeated and killed under suspicious circumstances in 1877. Sitting Bull fled to Canada, and most other Sioux surrendered.

In the final episode of the Sioux Wars, most of the reservation Sioux, suffering terribly, turned to a new religion that promised a messiah to deliver them from whites. The Ghost Dances of the Sioux alarmed government agents, and the military came in to stop them. Sitting Bull was shot dead by Indian police in 1890. Finally, the same Seventh Cavalry that lost to the Sioux under Custer surrounded a village at Wounded Knee and massacred 200 men, women, and children in revenge. By 1891, all the remaining Sioux had been rounded up or defeated.

Sitting Bull (1831–1890)

Hunkpapa Lakota Sioux chief and holy man responsible for the stunning series of Sioux victories over U.S. forces. Sitting Bull developed his war skills against the Crow and then fought U.S. troops at the 1864 Battle of Killdeer Mountain. He successfully besieged Fort Rice in 1865 and became Lakota chief in 1868.

In 1874, conflict broke out over gold discovered in the

Sioux Black Hills. Sioux, Cheyenne, and Arapahoe forces guided by Sitting Bull defeated U.S. troops led by General George Crook at the Rosebud on 17 June 1876 and wiped out the U.S. Seventh Cavalry under George Armstrong Custer at Little Bighorn.

U.S. strategy to pacify the Indians changed to elimination of food supplies, and Sitting Bull’s formidable force was broken apart. The chief fled with followers to Canada but surrendered and was a prisoner of war from 1881 to 1883. He then returned to his birthplace and people in 1883. In 1885 he toured for four months with Buffalo Bill’s Wild West Show.

Sitting Bull lived the old tribal lifestyle until 1890. In the fall of that year, his association with the Ghost Dance religion prompted his attempted arrest, during which he was shot and killed by Indian police before the massacre at Wounded Knee on 29 December 1890.

Six-Day War (5–10 June 1967)

Devastating Israeli preemptive lightning offensive into Egyptian, Syrian, and Jordanian territory on 5–10 June 1967. Eleven years after Gamal Abd al-Nasir’s military defeat in 1956 and after he had previously rebuilt his shattered forces with Soviet equipment, Syria questioned his claim to military leadership of the 1966 anti-Israel coalition in May 1967, when he failed to react to a stunning Israeli retaliatory air patrol that bagged six Syrian MiGs. Further, he defiantly deployed much of his revitalized army in the same forward “lynchpin” positions that had been neutralized in 1956, unraveling the entire Sinai command structure.

Reacting both to Syrian scorn and to their report of an imminent Israeli invasion of Syria (a threat contrived via Soviet “disinformation”), al-Nasir resumed the illegal blockade of Israeli shipping from the port of Eilat, ordered the evacuation of the United Nations (UN) buffer force from the border areas in Sinai, incited the Egyptian masses with martial rhetoric defying Israel to take his bait, and signed a pact with Jordan and Iraq, placing the alliance forces under Egyptian command. Thus, all the Israeli tripwires to war

A victorious Israeli convoy in Egypt during the Six-Day War, 8 June 1967. (Hulton/Archive)

had been broken. Nevertheless, al-Nasir evidently did not expect Israel actually to attack. Contrary to its early postwar rhetoric, neither did the Israeli Defense Forces (IDF) contemplate an Arab invasion of Israeli population centers.

Israel doubted its capacity to fight simultaneously on three fronts (Egyptian, Jordanian, and Syrian) and preferred that fighting take place in Arab rather than Israeli territory. Hence, it made the decision to strike first. On the morning of 5 June, the Israeli air force attacked Egypt, the largest military power in the region. The timing of the attack, 8:45 A.M., was designed to catch the maximum number of Egyptian aircraft on the ground and the Egyptian high command in traffic en route to military bases. The Israeli aircraft took evasive measures to elude Egyptian radar rather than to destroy it and thereby ruin the surprise. The first wave approached from unanticipated directions, achieving complete surprise. Within hours of the strike, the Israelis, who focused their attacks on military and air bases, had destroyed 309 of the 340 total combat aircraft of the Egyptians. Israeli ground

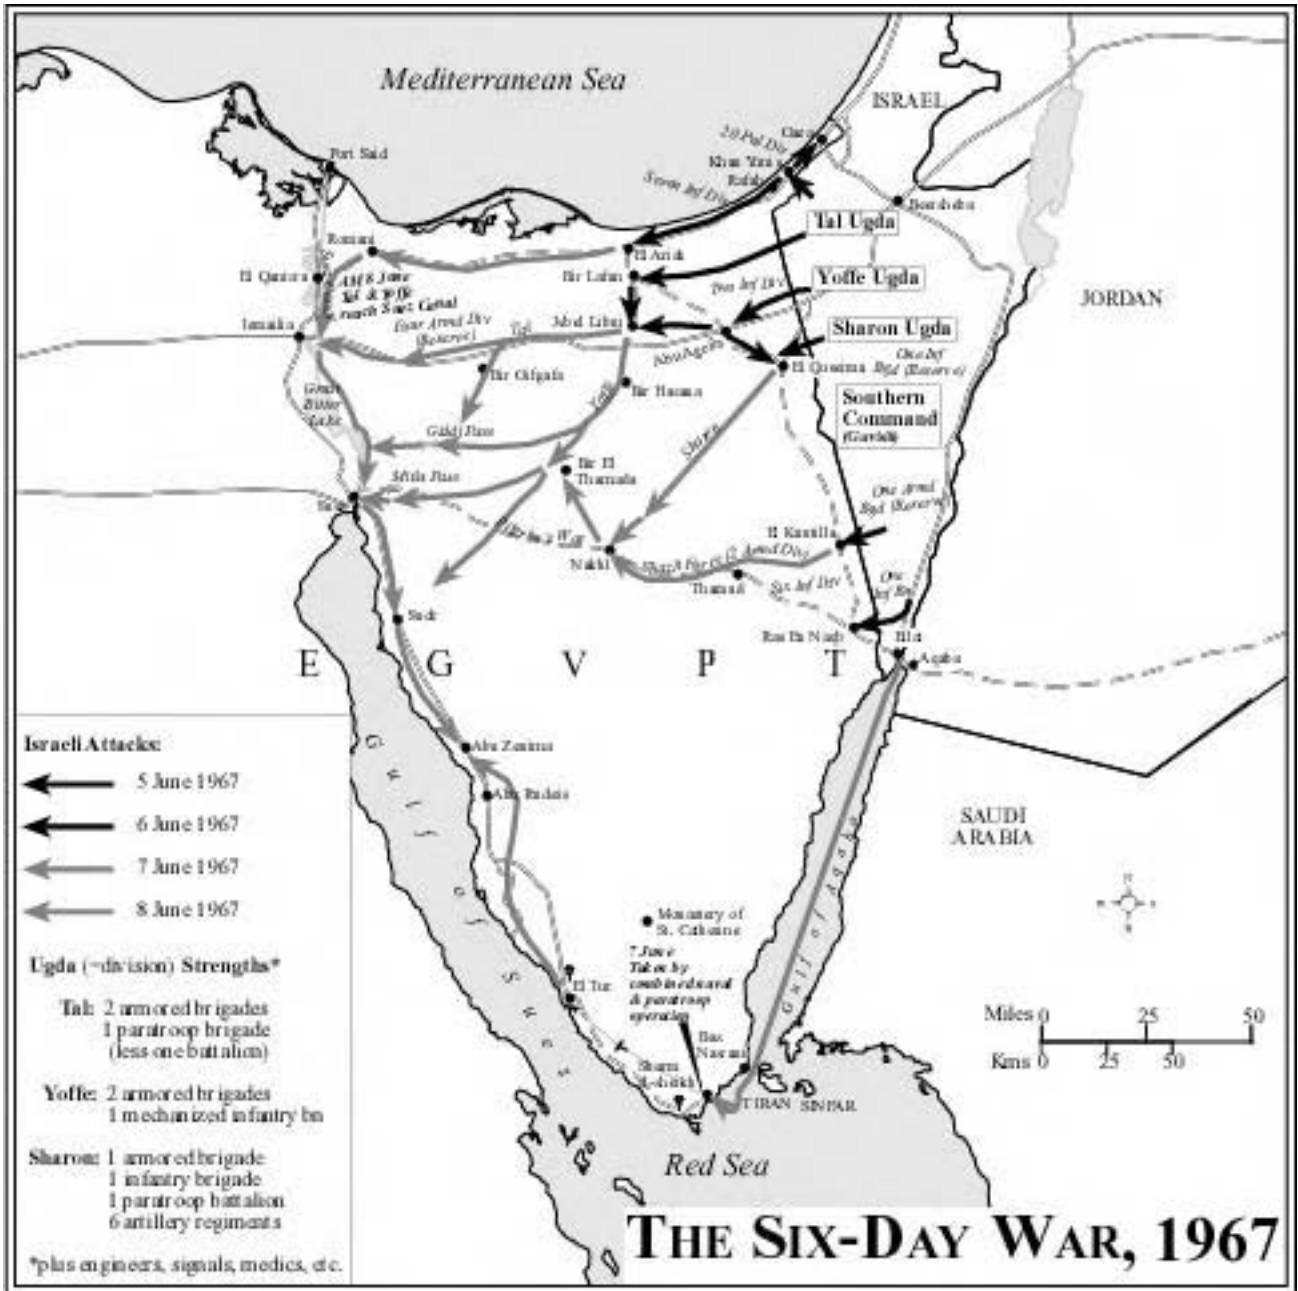

forces then moved into the Sinai Peninsula and Gaza Strip, where they engaged Egyptian units.

Israeli “tanks ahead” combined armored-mechanized infantry units maneuvered to disrupt the Egyptian forces, destroying their cohesion. General Israel Tal’s thrust across the Sinai was the main attack. Israel expected the Egyptians to follow the Russian “sword and shield” doctrine for mechanized defense against this thrust, with mobile armored reserves holding back to counterattack any forces penetrating the defensive shield. Anticipating this tactic, Israeli formations under General Abraham Yoffe infiltrated between General Tal’s thrust in the north and General Ariel Sharon’s seizure of the Abu Ageila strong point in the south, intercepting the armored counterattack and completely breaking the cohesion of the Egyptian tactical plan. This disruption allowed General Tal’s formations to rush to the Suez Canal after breaking Egyptian defenses and precipitated the headlong retreat of Egyptian forces back to the west. Although a significant percentage of the physical elements of the Egyptian force remained to be destroyed by the Israeli Air Force as they retreated through the Sinai passes, they already had effectively been defeated by Yoffe’s maneuver. Egyptian casualties were heavy and Israel’s minimal.

Hostilities flared up immediately on Israel’s eastern front. Israel had conveyed a message to King Hussein of Jordan requesting him to stay out of the conflict. However, on the first morning of the war, al-Nasir called Hussein and encouraged him to fight, mendaciously advising the Jordanian monarch that Egypt had been victorious in the morning’s fighting—an illusion that the Egyptian public also believed for several days.

At 11:00 A.M., Jordanian troops attacked the Israeli half of Jerusalem with mortars and gunfire and shelled targets in the Israeli interior. Israel’s air force, having disabled the Egyptian air force, turned its attention to Jordan. By evening, the Jordanian air force had been largely destroyed, again with minimal Israeli casualties. At midnight, Israeli ground forces attacked Jordanian troops in Jerusalem, and by the morning of 6 June, Israeli troops had nearly encircled the city. On the second day of the war, the Israeli air force continued to pound Arab air bases, raising the total number of destroyed Arab planes to 416, which included more than two-thirds of the Syrian air force. With nearly total control of the skies, Israeli fighter planes and bombers were free to support the tank and infantry forces on the ground. Thus Jordanian reinforcements were prevented from reaching Jerusalem, and by 10:00 A.M. on 6 June, the Israelis had taken the Western Wall, also known as the Wailing Wall, in the Old City, the holiest site in Judaism.

Ground battles continued in the Sinai, where Egypt’s armies fell back in the face of Israeli advances. On the third

day of the war, 7 June, Jordanian forces were pushed from the West Bank across the Jordan River. The UN arranged a cease-fire between Israel and Jordan that went into effect that evening.

The following day, 8 June, Israeli forces reached the Suez Canal. As artillery battles continued along the front, the Israeli air force decimated retreating Egyptians, who were backed up on the few roads through desert mountain passes.

As the Sinai shifted to Israeli control, Israel turned its forces toward the Golan Heights. There, on 9 June, Israeli forces began an arduous assault up steep terrain in the face

of entrenched Syrian forces. Israel sent an armored corps into the front of Syrian lines, while infantry forces surrounded the Syrian positions. The balance of power soon shifted to Israel's favor, and at 6:30 p.m. on 10 June, Israel and Syria concluded a cease-fire agreement. Israel thereby controlled all the Golan Heights, including parts of Mount Hermon. Although Israel also controlled the Sinai Peninsula, fighting between Israel and Egypt did not formally end for many years. Not until the 1979 Camp David Accords did the two countries finally reach peace.

The speed and scope of Israel's victory were devastating to the Arabs, who had expected a triumph. Egypt, Jordan,

and Syria lost almost all of their air forces and much of their weaponry. About 10,000 Egyptians were killed in Sinai and Gaza alone. These numbers contrasted with 300 Israeli casualties on that front. In all, Egypt lost about 11,000 troops, Jordan lost some 6,000, Syria around 1,000, and Israel 700. Arab leaders had to overcome the shock and frustration at home. Abroad, the USSR, which had strongly supported the Arab powers, was embarrassed because an ally of the United States had defeated its clients. Further, Soviet weapons systems had failed against Western weapons.

On 22 November, the UN passed Resolution 242, which called for Israel to withdraw from the Occupied Territories, in return for which Arab states would recognize Israel's independence and guarantee the sanctity of Israel's perimeter. Both sides interpreted the resolution to their own advantage. The Arabs and Palestinians declared their intention to continue fighting Israel, and Israel refused to return the Occupied Territories in the face of continued terrorist attacks and conducted reprisals. Israeli-Egyptian artillery, sniper, and occasional air attacks persisted for several years, escalating into the 1969–1970 War of Attrition.

But the 1967 war had yielded to Israel strategic buffer territories, chiefly comprising those segments that had been originally designated by the UN (1948) as the proposed Palestinian entity and that presently are the disputed Occupied Territories. The campaign earned the Israeli military a global reputation, and leading military establishments analyzed Israel's war-fighting methods in their war colleges.

Slim, William Joseph, First Viscount (1891–1970)

Perhaps the best British field commander during World War II. Slim came from a middle-class background. He participated in the Officer Training Corps but entered the army only after the outbreak of World War I. His service included heading off a mutiny in December 1914 and the Gallipoli cam-

paign. After being wounded, Slim was eventually posted to Mesopotamia and served as a staff officer. Following the war, he transferred with a regular commission to the Indian Army.

Between the wars, Slim's postings included teaching at the Imperial Staff College and Imperial Defense College. By the outbreak of World War II, he was a brigadier general. On 23 September 1939, Slim took command of the 10th Indian Brigade. He prepared it for mechanized desert warfare and led it in the conquest of Italian East Africa. After being wounded in January 1941, Slim assumed command of the 10th Indian Division. He led his command in the conquest of Vichy French Syria and the occupation of Iran to open supply lines to the Soviets.

On 13 March 1942, Slim took over the newly created I Burma Corps at Prome. He conducted a skillful delaying action against the Japanese invaders. Reinforcements were not available, and Chinese assistance was rare. During March and April, Slim retreated 900 miles to Imphal. He successfully defended India for the remainder of 1942, despite the nationalists' "Quit India" campaign. After the failure of the British Arakan offensive in early 1943, Slim assumed command of IV Corps as well. He was promoted to commander of the Eastern (later Fourteenth) Army in October 1943 and defeated Japanese offensives at Arakan and Imphal-Kohima in 1944.

Slim's army was chronically undersupplied, and morale was low when he took command. His energetic and flexible manner, as well as his ability to empathize with the common soldier, inspired his troops and created an effective army. During the last half of 1944, Fourteenth Army liberated northern Burma. Between December and March 1945, Slim directed the recapture of the rest of the country. His campaign was a masterpiece of planning, deception, and logistics in a difficult theater. By May, Slim had recaptured Rangoon, destroying the opposing Japanese army. By the end of the war, he had been promoted to commander in chief of Southeast Asian ground forces.

Smolensk (1941)

Operation BARBAROSSA envisaged Fedor von Bock's Army Group Center capturing Moscow and eliminating Soviet

army groups en route within four months. Smolensk, a crucial communications center 200 miles west of Moscow, was a major German objective.

The Bialystok-Minsk encirclement (9 July), netting 300,000 Russian prisoners, exposed Smolensk. With Adolf Hitler's support, Hans Gunther von Kluge ordered Heinz Guderian's 2d and Hermann Hoth's 3d Panzer Groups, the enveloping arms of Army Group Center's pincer, halted for mopping up operations. This action would have allowed his Fourth Infantry Army to catch up, but the Panzers nonetheless advanced. Crossing the Dnieper River (10 July), they entered Smolensk from south and north (16 July), with the Fourth Army lagging.

Stavka, the Soviet High Command, reeling from 2,000,000 manpower losses since BARBAROSSA began, deployed the new Nineteenth, Twentieth, Twenty-first, and Twenty-second Armies along the Dnieper River and the Sixteenth Army around Smolensk, thus halting the German blitzkrieg. Western front commander in chief Semen Timoshenko coordinated capable commanders such as Ivan Konev, Konstantin Rokossovsky, Pavel Kurokhin, and Mikhail Lukin.

The Panzer breakthrough on 16 July threatened encirclement of the Soviets. Timoshenko gave the only orders that could deal with the situation at the front: his commanders were to cut their way out with systematic fighting with withdrawals, regroup into mobile detachments, and counterattack, accompanied by tank trap defenses and aerial support. Amid fierce fighting, the Soviets escaped the German trap before Smolensk fell on 8 August. Despite 100,000 Soviet casualties and 300,000 Soviets taken prisoner, along with 2,030 tanks and 1,900 guns lost, a stable line held 25 miles east of Smolensk. The Red Army had proved the German blitzkrieg could be halted, even when facing odds of 2:1 in personnel, artillery, and aviation and 4:1 in tanks, thus crucially regenerating its morale.

The Soviets at Smolensk tied down Wehrmacht tank forces designated for Leningrad. Hitler, targeting Leningrad and Ukraine before Moscow but perhaps deterred by Smolensk, reversed himself and stripped Group Center of Panzers, delaying Operation TYPHOON, the seizure of Moscow, until 2 October and leaving Army Group Center's infantry open to further counterattacks. The two-month delay was vital. Georgy Zhukov formed the Army Group before Moscow and mobilized the population to construct defenses. The Germans reached Moscow in deep winter, ill-equipped, exhausted, and off-balance for the 6 December Soviet counteroffensive.

Smuts, Jan Christian (1870–1950)

Boer guerrilla leader and field commander, South African statesman and philosopher, and British field marshal. Smuts was born into a Boer family in Riebeeck West, near Malmesbury, in the British Cape Colony of South Africa on 24 May 1870. After receiving his baccalaureate from Victoria College in Stellenbosch in 1891 and his law degree from Christ's College, Cambridge, in 1894, he began practicing law in Cape Town in 1895. In the simmering dispute between Cecil Rhodes and Paul Kruger over South African governance, Smuts was at first pro-British, but the Jameson raid of 29 December 1895 induced him to change his opinion.

Smuts moved to Transvaal in 1897, was state attorney from 1898 until Pretoria fell on 5 June 1900, and thereafter was general of guerrillas, serving at Diamond Hill on 11–12 June, Nooitgedacht and Magaliesburg on 13 December, Modderfontein on 31 January 1901, Elands River Poort on 17 September, and the siege of O'okiep from 4 April to 3 May 1902. He cosigned the Treaty of Vereeniging on 31 May and entered politics as a supporter of Louis Botha.

Allied with the British in World War I, Smuts suppressed the Boer revolt of Christiaan Rudolf De Wet between September and December 1914 and defeated the Germans in Namibia between February and July 1915. His 1916 campaign in Tanganyika against General Paul Emil von Lettow-Vorbeck proved tougher, but by December, Smuts had captured most of the German-held territory. The former enemy was now a military hero in Britain, and David Lloyd George invited him to London to help conduct the European war effort. He served the British in several capacities and cosigned the Treaty of Versailles in 1919.

Smuts was prime minister of South Africa from 1919 to 1924 and from 1939 to 1948. In 1926 he published *Holism and Evolution*, his only philosophical work, which brought the concept of holism into philosophy. For his personal mobilization of South African forces against the Nazis, Britain named him a field marshal in 1941. He contributed to drafting the United Nations charter in San Francisco in 1945. He

died of a stroke on 11 September 1950 at the family farm near Pretoria.

Although Smuts gained international stature in his time, today he is nearly forgotten, his philosophy dismissed as mere popularizing, and his lack of interest in the obsessions of the later twentieth and early twenty-first centuries—race and imperialism—making him seemingly a mere creature of his time.

Soccer War (1969)

A four-day war between the Central American republics of Honduras and El Salvador, ignited in part by close soccer matches between their national teams. The real causes of the conflict were much deeper. Tiny El Salvador's 3 million people were pressed into 8,000 square miles of national territory, resulting in a density of 400 per square mile. By 1969, 300,000 Salvadorians had migrated into neighboring Honduras, a country of 42,300 square miles and a population of only 2,333,000. The Salvadorian expatriates found relative prosperity in Honduras as small plot farmers or as factory workers. However, they were never fully accepted by Hondurans, and discrimination flared, especially during hard times. Moreover, the border between the two nations was ill defined and in many areas not patrolled. The two nations had reached temporary accords on the immigration problem, but these expired early in 1969. A series of closely contested soccer games for a World Cup qualifying round in June 1969 revived old animosities and prejudices among ordinary citizens. Spontaneous violence following each game spun out of control, and nearly 17,000 Salvadorians fled Honduras for their homeland. After the final match was won by El Salvador, the two nations broke diplomatic relations.

On the morning of 14 July, Honduran air force fighters crossed into Salvadorian airspace and made mock strafing

runs. The Salvadorian air force responded late in the afternoon with an air assault on Tegucigalpa's Toncontin Airport, which had the dual function of commercial field and military base. Other military and civilian installations along the border were also struck. This preemptive strike by the Salvadoran air force failed in its purpose to destroy the Honduran air force on the ground. The air attacks were followed by a more successful land invasion that resulted in the occupation of nine Honduran towns. The Hondurans, however, had the advantage of superior air power and launched an attack on Ilopango, the San Salvador commercial airport and air force base, as well as petroleum facilities at Acajutla and El Cutuco. The damage to the oil storage tanks soon caused a gasoline shortage in El Salvador. Thus El Salvador's success on the ground was offset by Honduran air superiority. In addition, both sides nearly exhausted their military stores of ammunition by the fourth day of the war.

The Organization of American States (OAS) negotiated a cease-fire that went into effect on 18 July. OAS military observers and human rights experts arrived to monitor the cease-fire agreement. The war resulted in some 2,000 deaths, mostly of Honduran civilians, and the expulsion of 130,000 Salvadorians from Honduras. Eventually, the OAS pressured El Salvador to withdraw its troops from Honduras, and relations returned to their normal level of tension.

Solferino (24 June 1859)

Austro-French-Piedmontese battle that gave birth to the Red Cross. After their victory at Magenta (4 June 1859), the French and Piedmontese armies pursued the retiring Austrians. Sure that their enemy would be defending the Mincio River lines, French emperor Napoleon III and Piedmontese monarch Vittorio Emanuele II were surprised to find the Austrians bivouacking near Solferino.

The battle erupted over a 25-kilometer line from the hilly countryside south of Lago Garda to Mantua. Neither the Austrians nor the Franco-Piedmontese commanders expected a battle on 24 June. The French advance guard left its camp at 2:00 A.M., unexpectedly encountering Austrian troops by 6:00 A.M. Tactical surprise explains this unmethodical battle, as the army corps on both sides joined the fight without coordination, simply feeding their troops into the battle. The allied forces took the initiative and attacked on the whole line, corps after corps. The Piedmontese fought

Soldiers from Sardinia-Piedmont and French troops under Napoleon III defeat the Austrians in 1859 at the Battle of Solferino. (Library of Congress)

to a standstill against Ludwig Ritter von Benedek's corps. The southern battlefield saw two French corps blocking the First Austrian Army. The decision was made to attack on the center of the line. The ridge and the village of Solferino were held by three Austrian corps. The French artillery poured a terrible fire on the outranged Austrian artillery all morning. Then, the French Imperial Guard assaulted Solferino at a tremendous cost. With the support of two more corps, the guard eventually took the ridge and broke through the Austrian center. At 3:00 P.M., the Austrians tried a late flanking movement on the French right wing. But the supreme commander, Austrian emperor Franz Joseph, sickened by the slaughter, decided on a general retreat. More than 20,000 corpses were scattered over the battlefield, and 25,000 wounded soldiers were begging for help. Napoleon himself supposedly became physically ill in the presence of this battlefield carnage.

He was not alone. The ghastly panorama so moved a Swiss journalist, Jean-Henri Dunant, that he determined to found a new charitable organization dedicated to alleviating battlefield suffering. The Red Cross was eventually founded in 1864.

The days following the battle saw negotiations that ended in a separate Franco-Austrian peace. The disappointed Piedmontese did receive Lombardy, something like a consolation prize. One of the lesser-known consequences of Solferino

was the Prussian improvement of corps coordination and the development of a modern breech-loaded rifled artillery that would serve them well in their coming wars of unification. Conversely, French military reputation, very high to begin with since the days of Napoleon I, soared, causing a complacency that would lead to disaster in the Franco-Prussian War 11 years later.

Somalia, U.S. Military Operations in (1987–2000)

Africa's first post-Cold War conflict. The conflict in Somalia arose from the regime of Mohamed Siad Barre. In power from 1969 to 1991, Barre created a patron-client relationship with the nation's clan-based society. This system required continuous outside assistance, first from the Soviet Union (which eventually chose Ethiopia as its local client instead) and then from the United States or various nongovernmen-

tal charitable assistance groups. By 1987, some 57 percent of Somalia's gross national product was generated by international aid.

In the wake of a losing war effort against Ethiopia in the Ogaden region and a declining economy, General Mohammed Farah Aideed overthrew Barre. However, Aideed lacked legitimacy outside his own clan, leading to the collapse of the state, continuous clan-based civil war, and famine.

This situation provoked the deployment of the United Nations Operation in Somalia (UNOSOM I) in April 1992. But the force proved insufficient to control the "technicals," mercenaries hired under the euphemism of "technical support" by in-country humanitarian organizations who remained loyal to their clans. Under these circumstances, between November 1991 and March 1992, some 30,000–50,000 Somalis died of starvation.

The U.S.-led Unified Task Force (UNITAF) broke this cycle in December 1992, forcibly expediting food distribution and seeing the end of the famine by the spring of 1993. The hope was that UNITAF's mission would be a springboard to the political unification of Somalia.

The successor force to UNITAF was UNOSOM II, which continued the UN constabulary role but with less U.S.-supplied firepower. While the UN contemplated reconstitution of a central government, Aideed and his forces prepared to take the initiative against UN forces, as they felt their claim to power was superior and unrecognized. This decision led to an escalating cycle of conflict that culminated in the Mogadishu firefight of 3 October 1993, in which 18 Americans and hundreds of Somalis were killed.

In retrospect, the Somali experience reflects poorly on the UN administration and U.S. arms. The UN leadership failed to comprehend the level of difficulty involved and underestimated the level of international support it enjoyed. The U.S.-led manhunt for Aideed was prosecuted with a divided command structure, with all the control problems that implies, not to mention the failure to consider that Aideed's forces might be able to offer effective resistance under the right circumstances.

At the end of December 2000, Somalia remain more a region than a country, the last UN troops having decamped in 1995, Aideed having died in 1996 as a result of battle wounds, and there being little easy enthusiasm for peace-keeping operations in marginal portions of the world.

The Somme (1916)

One of the most bloody and futile campaigns of World War I, consisting of several offensives from 1 July to 18 November 1916. The battle was fought between the Allies under General Ferdinand Foch and the Germans under General Erich von Falkenhayn along a 25-mile stretch from the river Somme, north of the river Ancre. The plan as originally conceived by the French commander in chief, Joseph Joffre, was adopted by Field Marshal Douglas Haig—the newly appointed commander in chief of the British Expeditionary Force—to ease pressure on the French at Verdun. The British Fourth Army under General Henry S. Rawlinson was to direct its main effort to the north of the Somme, the Third Army under General Edmund Allenby was to go even further north, and south of the river, Foch's army would make a holding attack. As a preliminary to the main push forward on 1 July 1916, the Allies undertook an eight-day nonstop artillery bombardment of German defensive positions in the occupied towns. The aim was to destroy the well-developed system of deep concrete bunkers and barbed wire entanglements, thereby allowing the 750,000 Allied troops to advance unopposed through German front lines to Bapaume and Peronne.

The artillery bombardment failed to penetrate the German trenches and barbed wire tangles. The Germans simply remained in their dugouts for the duration of the barrage, reemerging in time to arm their machine guns as the British advanced in close order. By nightfall, the British had advanced only 1,000 yards and had lost 57,450 men, 19,000 of whom were dead. For the next 10 weeks, the Allies settled for a battle of attrition that culminated in a 7-mile penetration into the German lines on 15 September as a result of the arrival of British tanks. Fighting ended with bad weather in mid-November. In all, only 125 square miles were gained by the Allies in the five months of fighting. Total casualties for the Battle of the Somme were 1,265,000: 650,000 German, 420,000 English and colonials, and 195,000 French. The Somme has lingered in British memory as a symbol of the loss and futility of the western front.

Songhay Empire (15th–16th Centuries)

The most powerful state in western Africa at the dawn of early modern history. The Songhay people first appear in African history as a fisherfolk living along the upper bend of the Niger River. Different in language and culture from their neighbors, they inhabited a string of towns from Kukya to Gao. Later, they turned to farming, river transportation, and commerce with the northern oasis towns. The Dia, the first Songhay dynasty, embraced Islam and made Gao a little economic dynamo. However, in 1325, the empire of Mali subjugated Gao, making vassals of the Songhay. In 1335, the Sonni, another Muslim noble house, deposed the Dia.

In 1375, as the empire of Mali fragmented, King Suleyman-Mar regained the independence of Songhay. For decades thereafter, the Songhay people apparently remained in their Kukya-Gao area until Sonni 'Ali became king in 1464. It was Sonni 'Ali who set Songhay on the course of empire. He raised an elite cavalry force of more than 5,000 crack troops and developed a war canoe for transportation and assault. He pushed the anti-Muslim Mossi people southward and annexed several of the great Niger cities, including the prestigious Islamic city of Timbuktu. A tireless campaigner but harsh ruler, he frequently abused his pious Muslim critics. After his death in 1492, Sonni 'Ali's son lost the throne in less than two years.

Askia Muhammad Ture, a distinguished army officer, seized power in 1493. An astute, cultivated administrator, he made Gao, Timbuktu, and Jenne centers of commerce and Islamic learning. Like Sonni 'Ali, Askia Muhammad was a warrior. His armies made the Songhay Empire the most powerful state in central West Africa. In addition to policing the Mossi, old foes of the Songhay, Askia Muhammad conquered many of the old Mali provinces to the west. He captured oasis towns in the north to control Tuareg nomads. His forces annexed Hausa towns in northern Nigeria, ranging east to Lake Chad. Enfeebled at age 80, he was deposed by his sons in 1529.

Askia Muhammad bequeathed later rulers the problems of imperial overextension—rebellions, border harassments, and declining trade revenues. In 1586, the sultan of Morocco captured the Taghaza salt mines, nominally Songhay terri-

tory, and began to plot an attack on Timbuktu. He assembled an expedition of about 6,000 Moroccans, Granadans, and Spaniards, arming them with arquebus firearms and some cannons. In 1591, this force marched through the Sahara and met the Songhay at Tondibi. Despite their valor and greater numbers, the Songhay suffered massive casualties, and the Moroccans occupied both Timbuktu and Gao. Unable to recover, the Songhay Empire crumbled into various city-states and disappeared.

Song-Jin Wars (1125–1141)

The onslaught of Jurchen invaders and the reestablishment of a diminished Song dynasty. The Jurchen were a Tungus-speaking people living in Manchuria and southeastern Siberia who had learned a great deal from exposure to both to the Khitan, who then ruled northwestern China, and Chinese culture. The founder of a new Jurchen state, later known as the Jin dynasty (1125–1234), was the Wanyan chieftain Aguda (1068–1123), who knew how to use cavalry effectively in warfare, pointing up his debt to the nomadic Khitan.

Between 1116 and 1122, Aguda's armies surprised and overthrew the Khitan Liao dynasty (907–1125), capturing four of the five Liao capitals in turn. Although the Northern Song (960–1126), which ruled the rest of China, sought initially to take advantage of the discomfort of its old rival, Liao, they quickly found the Jurchen mobilized against them under Aguda's successor, Wuqimai (r. 1123–1135), as soon as he had reduced the last Khitan holdouts.

In 1125, the Jurchen went over to a general assault on the Song. It proved surprisingly successful, in part because of a shortage of warhorses in Song armies. Two main Jurchen forces advanced toward Kaifeng, the Song capital on the Yellow River, which was surrounded by one of the forces in February 1126. By that time, the Song emperor, Huizong (r. 1100–1126), known more as an artist than for his governing ability, had abdicated in favor of his son, Qinzong (r. 1126–1127), who proved equally inept in resisting the invaders and had no choice but to open negotiations with them.

In 1227, Qinzong surrendered his capital, himself, and his throne and was led north, along with his father, as Jin captives. Jurchen forces then spread out to extend their Song conquests. The Northern Song Dynasty had collapsed.

During the next four years, Song survived only with the greatest difficulty and then only because the sheer size of Song China gave loyalists the time and space to organize resistance. The primary leader was 20-year-old prince Zhao Gou, the younger brother of Qinzong. Although originally among the Song royal captives, he had managed to escape the Jin net and, even if not originally in favor of continued resistance, quickly became its center as he moved from one loyalist base to the other, often just ahead of Jin horsemen sent to apprehend him.

Song resistance drew upon two foundations: one was the surviving Song field armies left behind by the speed of the Jin advance. The other was popular resentment and the appearance of local militias provoked by the harsh treatment meted out by the Jin to the Song population.

In 1127, as Jin armies retreated north to avoid the harsh summer heat of southern China, Zhao Gou finally tried to organize his forces and supporters more effectively. Despite being uncertain regarding the status of his brother and father, Zhao Gou ascended the throne himself as Emperor Gaozong (r. 1127–1162) in the Southern Song capital of Shangqiu.

As a next step, the Song, in addition to marshaling surviving regular forces, began organizing the local forces that had flocked to their support, often under their own, local leaders. Here Gaozong was ably assisted by Song minister Li Gang, an organizational genius who had escaped Jin capture because he had been away at the time that the capital had fallen. Gaozong had also to organize a government, which meant drawing China's elite classes into resistance activities and calling upon the people to support his new regime, that of Southern Song (1126–1279).

Thus it was an organized force and government that the Jin now faced as it resumed its advance later in 1127. Although some at court desired an immediate counterattack, the court wisely pursued a strategy of avoiding direct confrontation, withdrawing south to avoid Jin armies. Ultimately, the court ended up at Hangzhou, which, after a brief abandonment in 1130 when the court took to the seas, relying on superior naval forces, and later settled at a number of intermediate points, remained the Southern Song capital.

The pattern of Jin winter assaults and Song summer recoveries continued for several years, with neither side making much progress, until the Jin retreated during the summer of 1130 and did not return. The court finally returned to Hangzhou in 1133 and began to reassert its control generally within much reduced boundaries, ultimately signing a

treaty with the Jin in 1141–1142. In it, the Song openly recognized the loss of the north, but before that event, a serious crisis erupted.

It centered around Yue Fei (1103–1141), one of the great tragic heroes in Chinese history because of his mistreatment by a government that felt it had no other choice. Yue Fei had begun a formal military career in one of China's regional armies in 1122, and after a brief period in which he had had to return to his home area after his father's death, became one of the most active of Song China's local commanders, ultimately carrying the battle to the enemy after 1134 in a series of highly successful counterattacks. So successful, in fact, did Yue Fei's counteroffensive become that the court peace party, headed by minister Qin Gui, began to find him threatening.

In the end, largely innocent, he was imprisoned and put to death at Qin Gui's orders. There were later Song offensives against the Jin, but never again did the Song have as capable a general as Yue Fei, and his death marked the end of any serious attempt by Southern Song to recover all the territories in the north ruled by its predecessor. To this day, in memory of Yue Fei, when the Chinese prepare a fritter called a Qin Gui, named after the Song minister, they curse him as they throw it into the hot oil to cook.

Sonni 'Ali (d. 1492)

Founder of the Songhay Empire of late medieval West Africa and a tireless military campaigner. The Songhay were originally Niger River fisherfolk. Although overshadowed by the empire of Mali, the Songhay people became active in farming, commerce, and riverine transportation. After 1375, as Mali crumbled, Songhay strengthened economically but remained a relatively small state until 1464.

That year, Sonni 'Ali became king. He built an infantry from his own people and drafted his neighbors while importing cavalry horses from Morocco. Sonni 'Ali used his army first on the southern Mossi tribe. Enemies of Islam, Mossi raiders had bedeviled Songhay for decades. Sonni 'Ali's horseman drove them back to their forest territories.

Additionally, Sonni 'Ali built a river fleet, adapting traditional Niger canoes into combat ferrying vessels. With the

Mossi cowed, he turned west against Tuareg nomads occupying Timbuktu, Niger's religious and cultural capital, which fell in 1469. Sonni 'Ali then exiled, executed, or flogged many leading Timbuktu as collaborators, not sparing even Muslim clergy. In 1473, marshaling 400 battle canoes, he captured the Malian city of Jenne. Subsequently, he launched regular raids against neighboring nomads (Tuaregs and Fulani) and the Mossi. In the 1480s, the king campaigned annually along the eastern bend of the river in Gurma. On one of these expeditions in 1492, Sonni 'Ali died, in either a flash flood or an assassination.

Sosabowski, Stanislaw Franciszek (1892–1967)

World War II Polish army commander. Born on 8 May 1892 in Stanislawow in Austro-Hungarian-occupied Poland, Sosabowski served as a supply officer in the Austro-Hungarian Army during World War I. During the interwar period, he frequently served on the faculty of the Polish General Staff College and, after being promoted to colonel, took command of the 21st "Children of Warsaw" Infantry Regiment in March 1939.

During the Polish campaign of 1939, Sosabowski and his regiment fought to defend Warsaw but were defeated and captured by the Germans. After escaping from a prisoner-of-war camp, he made his way to France, where he served as the deputy commander of the 4th Polish Infantry Division during the French campaign of 1940. After being evacuated once again, to Scotland, Sosabowski was given command of the Polish Independent Parachute Brigade in 1941. The brigade, which initially existed only on paper, would eventually become one of the most elite Allied units of World War II. In September 1944, the brigade took part in Operation MARKET GARDEN, which was the poorly planned attempt to establish a bridgehead over the Rhine River at the Dutch town of Arnhem. The brigade was decimated during the battle, and to add insult to injury, Sosabowski's British superior, Lieutenant General Frederick Browning, attempted to shift blame for the Polish inability to achieve battle objectives to Sosabowski. Removed from the command of his brigade,

Sosabowski spent the remainder of the war in unimportant staff positions.

After the war, he refused a British military pension and became a day laborer in London. He died penniless on 26 September 1967. After lying in state in London, Sosabowski's remains were returned for burial in his family plot in Poland.

Soult, Nicolas-Jean de Dieu (1769–1851)

French field commander in the French Revolutionary and Napoleonic Wars. Born on 29 March 1769, the son of a notary in St. Amans-la-Bastide, Soult volunteered as an infantryman in 1785 and rose through the ranks to brigadier general in 1794. He replaced François-Joseph LeFebvre as commander in chief of the Army of Sambre and Meuse in 1799 and commanded the Army of Italy as André Masséna's adjutant from 1799 to 1800. After serving with distinction in the Piedmont campaign, including two months as a prisoner of war, and becoming colonel general of the Consular Guard in 1802, Napoleon elevated him to marshal in 1804 and named him Duke of Dalmatia in 1807.

Soult had early combat experience at Marsthal in 1793, Fleurus in 1794, Altenkirchen in 1796, Stockach and Zurich in 1799, and Genoa and Monte Cretto in 1800. He commanded a corps at Ulm and Austerlitz in 1805; Jena in 1806; and Eylau, Heilsberg, and Königsberg in 1807.

In the Peninsular War from 1808, Soult lost to John Moore at Corunna on 16 January 1809 and to Arthur Wellesley, later the Duke of Wellington, at Oporto on 12 May but defeated Juan Carlos Areizaga at Ocaña on 19 November. He invaded and ruled Andalusia in 1810, unsuccessfully besieged Cádiz from 1810 to 1812, captured Badajoz on 11 March 1811, and lost to William Carr Beresford at Albuera on 16 May.

Chief of staff Louis-Alexandre Berthier recalled Soult to Germany in 1813. Shortly after replacing Jean-Baptiste Bessières (killed at Rippach on 1 May) as commander of the Imperial Guard, Soult fought at Bautzen but then was ordered back to Iberia. Wellington defeated him at Orthez and Toulouse in 1814.

He was Louis XVIII's minister of war while Napoleon was on Elba but the latter's chief of staff during the Hundred Days. His mistakes at Ligny and Waterloo contributed to Napoleon's downfall in 1815.

A consummate diplomat, Soult held important government offices from 1820 until he retired in 1847. He died on 26 November 1851 in St. Amans-la-Bastide, now called St. Amans-Soult.

South Africa/Namibia (1960–2000)

Scene of a peaceful transition to multiracial democracy after decades of bloodshed. The year 1960 was a watershed for Africa, as well as for South Africa. No fewer than 17 African countries gained independence, but in South Africa, the National Party white supremacist apartheid government was determined to continue swimming against the tide of human and equal rights and world opinion. The government of Prime Minister H. F. Verwoerd did not heed the well-meant warnings given by British prime minister Harold Macmillan in his “wind of change” speech, delivered in parliament in Cape Town on 3 February 1960. Shortly afterward, a bloody clash between police and protesters (against racist pass laws) took place at Sharpeville (21 March 1960), sending shock waves around the world. Instead of trying to find a negotiated solution, the South African government banned the African National Congress (ANC) and Pan-Africanist Congress (PAC). Both organizations set up offices abroad and went underground in South Africa itself, establishing armed wings: Umkonto we Sizwe (MK) of the ANC and Poqo of the PAC. In due course, these organizations launched attacks against a variety of targets.

The Republic of South Africa was born on 31 May 1961. It was established after a small majority of whites voted in fa-

vor of a republic in a referendum held on the matter in October 1960. The black majority was, of course, not consulted. The new republic soon developed into a pariah state, with growing isolation with regard to sport, culture, and economic matters. One of the white government's few allies was Rhodesia (now Zimbabwe), where the small white minority declared itself unilaterally independent of Britain in November 1965—soon to be invaded by freedom fighters of the liberation movements. On 23 August 1966, the first clash between South African security forces and the South-West Africa Peoples' Organization (SWAPO) freedom fighters took place in the north of South-West Africa (SWA/Namibia).

This conflict was the start of the Namibian war of independence that dragged on until 1989 and eventually spilled across the border into Angola. When Portugal withdrew from its colonies of Angola and Mozambique in 1975, for the first time, South Africa had neighbors supported by the Soviet Union, and MK cadres henceforth had easier access to South Africa.

In 1976, a revolt took place in the sprawling black township of Soweto, and violence soon spread to other areas. Once again there was an international outcry, but the apartheid regime reacted by banning more organizations and further limiting press freedom. This, together with the death in police custody of black consciousness leader Steve Biko (1977), led to South Africa's further international isolation. During the 1960s and early 1970s, the South African Defence Force (SADF) was built up into a sizable modern force, but in November 1977, the United Nations Security Council imposed a mandatory arms embargo against South Africa. As is so often the case with such sanctions, the only tangible result seems to have been the expansion of the South African arms industry.

In SWA/Namibia, but especially in southern Angola, the SADF launched several operations against SWAPO freedom fighters and in due course also became embroiled in the Angolan Civil War, taking sides with the National Union for the Total Independence of Angola (UNITA) against the Popular Movement for the Liberation of Angola (MPLA) and its Cuban and eastern bloc allies. In military operations code-named REINDEER, SCEPTIC, PROTEA, ASKARI and others, the SADF inflicted heavy losses on its opponents, but in the long run, South Africa paid a heavy economic price. Eventually a cease-fire was negotiated, and after many months of negotiations, SWA became independent as Namibia on 21 March 1990.

In the meantime, the traumatization of South African society continued. Black-on-black violence (which left about 30,000 people dead), as well as terror attacks against government and other white targets, escalated in the course of the 1980s. Just as it seemed as if a low-intensity civil war was

about to wreck the South African economy and destroy the country, the government in February 1990 heralded the unbanning of the ANC, PAC and other organizations, and the freeing of political prisoners like Dr. Nelson Mandela. Multi-party negotiations put the country on the road toward a negotiated settlement, which led to the country's first-ever truly democratic elections in April 1994. In that same year, the country's defense force was reinstated as the South African National Defence Force (SANDF), amalgamating the old SADF, MK, and several other military organizations. By the beginning of the new millennium, the SANDF had shed its old racist nature that it was able to take part in United Nations and other peace-keeping operations.

South American Wars of Independence (1810–1824)

Series of wars that liberated South America from Spanish rule. Spain's colonial empire in the Americas began to unravel as a result of growing discontent by the Creoles (Spaniards born in the Americas). The British occupied Buenos Aires on 17 June 1806, as Spanish administrators and regular troops fled. Jacques de Liniers marshaled the colonial militia and forced the British to surrender, greatly boosting the confidence of the Creoles and discrediting the Peninsular Spanish. In 1808, when Napoleon invaded Spain, removed Ferdinand VIII, and installed his brother Joseph on the throne, there were revolts throughout South America. By 1810, as the collapse of Spanish resistance appeared imminent, Creole leaders, while proclaiming loyalty to Ferdinand but with the ultimate goal of independence, organized popular uprisings in Caracas, Buenos Aires, Santiago, Quito, and Bogotá. Organized fighting soon erupted between patriots and royalists. Venezuela and Buenos Aires were the principal centers from which organized revolts spread.

In northern South America, the patriot army was headed by Francisco de Miranda, who proved to be conservative and indecisive in his military strategy. A massive earthquake on 26 March 1812 devastated Caracas and other patriot-held areas. Royalist clergy proclaimed this natural disaster an omen that the patriot cause lacked divine approval. Following several military setbacks, Miranda first sought a negotiated settlement and then attempted to flee Venezuela. He was arrested, and Simon Bolivar assumed command.

On July 1811, Venezuela declared its independence, but the royalist armies drove Bolivar's forces from Puerto Cabello and temporarily ended the entire revolt as Bolivar went into exile in Curacao. Bolivar returned in May 1813, recaptured Caracas (6 August 1813) and followed up with victories at La Victoria (February 1814), San Mateo (March 1814), and Carabobo (May, 1814). However, at La Puerta the Spanish dealt Bolivar a stunning defeat, and Venezuela was once again under royal control. Bolivar managed to escape to New Granada (Colombia) and assumed command of another army.

The defeat of Napoleon in 1815 freed Spanish troops for South American duty, and General Pablo Morillo put them to good use, defeating Bolivar at Santa Mara and bringing many of the rebellious provinces under royal control. Bolivar next fled to Jamaica, where he issued his famous letter outlining his vision for an independent republic for all of Spanish South America. He subsequently returned to Venezuela in December 1816 and won an important victory at Barcelona (16 February 1817). He suffered another reversal at the second battle at La Puerta (15 March 1817). Bolivar then shifted operations to dislodge the Spanish from New Granada. Beginning on 1 June 1819, the patriot army of 2,500 departed Angostura, crossed seven rivers and ascended the frozen passes of the Andes, arriving in the Sagamore Valley on 6 July. In the decisive Battle of Boyaca (7 August), near Bogota, Bolivar outmaneuvered the Spanish army and completely routed it, killing 100, taking 1,600 prisoners, and capturing numerous stores and munitions. Bolivar entered Bogota in triumph on 10 August, founded the Republic of Colombia, and was installed as president.

With Colombia liberated, Bolivar again turned his attention to liberating his native Venezuela. At the Battle of Carabobo (25 June 1821), he found a route through the mountains unknown to the Spaniards and surprised their right flank with an attack by the British Legion, resulting in the disintegration of the entire force and the freeing of Venezuela.

Bolivar dispatched his principal lieutenant, General José Antonio Sucre, to liberate the province of Quito in present-day Ecuador. Sucre smashed a Spanish army on the slopes of the Pichincha Volcano (24 May 1822), and the rebel army

surrounded Quito the following day. With Quito liberated, Bolívar established the Republic of Gran Colombia (Colombia, Venezuela, Ecuador, and Panama).

In the Southern Cone, a Creole junta was in control of Buenos Aires by 1810 and attempted to extend the revolt, with varying degrees of success, throughout the entire viceroyalty of Rio de la Plata (Argentina, Chile, Bolivia, Uruguay, and Paraguay). In 1816, José de San Martín took command of the Army of the Andes at Tucuman and proposed one of the most audacious campaigns in military history. In January 1817, he crossed some of the highest passes in the Andes into Chile with an army of 3,300 regular infantry, 700 cavalry, 1,000 militiamen, and 21 cannon. He defeated the Spanish at Chacabuco on 12 February 1817 and liberated Santiago two days later. After a setback at the Battle of Cancha-Rayada on 16 March 1818, San Martín secured Chile's independence with a victory at Maipo on 5 April 1818.

The patriot cause was boosted on 18 November with the arrival of former British admiral Thomas Cochrane, who took command of the Chilean Navy. Cochrane captured the port of Valdivia on 18 June 1820, thus opening the western coast for an invasion of Peru by San Martín's forces. On 8 September, the patriot army landed at Pisco, Peru, and Cochrane bottled up a Spanish naval squadron with a blockade of Callao. San Martín liberated Lima and declared Peruvian independence on 28 July 1821.

Bolívar and San Martín met at Guayaquil, Ecuador, on 26–27 July 1822. The proceedings of the famous meeting were not recorded, but it is generally believed that the two men could not work out their differences for a final strategy to defeat Spain. San Martín abruptly resigned after the meeting and soon retired from public life.

Bolívar's final campaign was aimed at liberating the highland areas of Peru and Bolivia, then known as Upper Peru. Bolívar and Sucre engaged the Spanish army commanded by General José Canterac at Junin on 6 August 1824 in the largest single cavalry engagement of the war. The patriot forces were victorious, and the Spanish retreated into the sierra southeast of Lima. In the final battle of the war, the Spanish, with 10,000 men, attacked Sucre's army of 7,000 at the Battle of Ayacucho on 9 December 1824. Sucre's smaller force prevailed, killing 1,400 and wounding 700 while losing only 300 killed and 600 wounded. Ayacucho ended Spain's hold on South America, and all Spanish forces were withdrawn under the terms of capitulation.

Soviet-Afghan War (1979–1989)

The Soviet Union's Vietnam. In April 1978, Soviet aid had helped establish a Communist regime in Afghanistan. In December 1979, to save the regime from opposition forces that were building throughout the country, the Soviet Union invaded Afghanistan. From the onset, the USSR directed and dominated the military effort. Soviet commanders and advisers orchestrated almost all military operations. Once the Soviets met their immediate objective, taking Kabul, they deployed ordinary motor rifle units, not elite troops, to fight the insurgency.

The Soviet invasion triggered a reaction that linked Islamic insurgency to national liberation. Over time, the mujahidin (Muslims fighting a jihad, or holy war) built up experienced commanders capable of effective limited military operations. In the war's first four years, the Soviets failed to use their 115,000 troops decisively.

When Yuri Andropov succeeded Soviet leader Leonid Brezhnev (d. November 1982), he consistently opposed the Soviet military presence in Afghanistan. Andropov's policy led the Afghan military leader Ahmad Shah Massoud to sign a 12-month cease-fire in January 1983. A stalemate resulted. Andropov's (d. February 1984) successor, the senile Konstantin Chernenko, returned to a tough policy. The Soviet military had learned from their past weaknesses. Mikhail Gorbachev succeeded Chernenko (d. March 1985), continuing the tough policy. From 1984 to 1986, the USSR escalated militarily.

The United States, Saudi Arabia, Iran, and others provided the Afghan resistance billions in financial support. The resistance procured weapons and equipment that tipped the balance in their favor. Pakistani president Mohammed Zia demanded that the money be funneled through Pakistan to the Afghan resistance. In addition, Zia's Islamization program heavily favored Afghan fundamentalists.

In 1986, the U.S. Central Intelligence Agency supplied mujahidin leading commander Ismail Khan large amounts of weaponry. By 1988, the mujahidin had acquired U.S. Stinger handheld surface-to-air missiles and gained the tactical initiative. Massoud continued to succeed offensively in the north.

In 1987, Gorbachev decided to end the conflict. The mujahidin had fought the Soviet and the Afghan Communist

forces to a stalemate. Moscow's Afghan policy alienated it from Islamic, Western, and nonaligned countries, and the Soviets had not found a political leader who could gain the Afghan people's loyalty. Geneva talks in March 1988 involving Soviet foreign minister Eduard Shevardnadze and U.S. Secretary of State George Shultz led to a Soviet withdrawal from Afghanistan in February 1989. The war's end was reduced from international to regional status, but the civil war in Afghanistan continued.

The war was costly for all sides. The Soviets lost 13,310 military personnel. The resistance rarely acknowledged their casualties, but something like a million Afghan civilians were killed, and 5,000,000 Afghans became refugees.

Spanish Civil War (1936–1939)

Conflict that led to more than 500,000 casualties on both sides and ended with a victory for General Francisco Franco and the right-wing Nationalists over the Republicans. On 17 July 1936, the military garrison in Spanish Morocco began a rebellion against the leftist Republican government in Madrid, supported by conservative army officers on the mainland and in Spain's other colonial possessions. Also supporting the coup attempt were members of the fascist Falange Party, monarchist forces, and Catholics. The initial uprising failed to take over the entire country but by 20 July had seized power in Morocco, most of northern and western Spain, Seville, and the remnants of the Spanish empire. The socialist-supported Republican government maintained control over Madrid and Barcelona, the two largest cities, most of eastern Spain, and the industrialized areas of the Basque country and Asturias. The initial leaders of the military revolt, which came to be known as the Nationalists, were Generals Francisco Franco and Emilio Mola.

Most of the Nationalist army remained isolated in Morocco during these early days, however, and as the navy and air force had remained loyal to Madrid, Franco asked for aircraft and naval support from Nazi Germany and Fascist Italy, assistance that soon came and enabled the Nationalists to airlift their forces to southern Spain in late July and early

August. Within a few weeks, the German and Italian governments also began to send significant military supplies to Franco and even military units, hoping to prevent a socialist victory in Spain. France and the United Kingdom were unwilling to become involved in the civil war, however, and refused to sell or send weapons to the Spanish Republican government, forcing it to request aid from the Soviet Union. Soviet aid to the Republicans did arrive in large amounts (at the cost of Spain's total gold reserves), along with advisers, who upon their arrival began immediately to strengthen the Spanish Communist Party.

After a diversion of forces to Toledo to lift the siege of the Alcazar fortress, in November the Nationalist forces attempted an assault on Madrid, hoping to end the war in a knockout blow. Initial Nationalist successes, including seizing most of University City in northwest Madrid, were blunted by the arrival of thousands of Communist-led volunteers of the International Brigades. By the third week of November, Madrid was nearly surrounded, but the Nationalists were unable to force a victory. Also during this month, Soviet and German aircraft began flying bombing missions in the first large-scale aerial bombardment of urban areas on behalf of the Republican and Nationalist sides, respectively, and Germany and Italy recognized Franco as the legitimate ruler of Spain.

Early 1937 saw the front shift to the south, with the Nationalists and Italian forces attacking and seizing Malaga in February and gaining ground in the southern suburbs of Madrid at the Battle of Jarama the same month. A Nationalist offensive against Guadalajara in March, however, was defeated by a Republican counterattack, aided by Soviet tanks and aircraft. As the first major engagement involving the Italians, it was seen as an embarrassing defeat for Benito Mussolini, who expected his forces to have easy victories in Spain.

The Nationalist army in northern Spain then turned its attention to the Basque country, which despite its heavy industry, ports, and mines was less defended than Madrid. Cut off from the rest of the Republicans by the Nationalists and attacked by German air units of the Condor Legion, including the notorious bombing of the town of Guernica in late April, the Basques were forced to give ground. By late spring, the Nationalists had taken the entire province except the industrial city of Bilbao, which surrendered in mid-June. During the attack on the Basques, General Mola died in a plane crash, leaving Franco as the unchallenged Nationalist leader.

On the Republican side, the socialist and anarchist movements, along with other smaller parties, fought to prevent the dominance of the Soviet-backed Communist Party. After May 1937, the Republican government became dominated by a socialist and Communist alliance under Prime Minister

A battalion of shock troops marching in Madrid during the Spanish Civil War, c. 1937. (Library of Congress)

Juan Negrin. Almost to the last day of the civil war, however, arguments over politics and strategy translated into internal violence on the Republican side. The Nationalists suffered fewer internal struggles, thanks largely to Franco's insistence on the unity of command, as evidenced by his forcible union in April 1937 of the Falange, monarchist, and other rightist parties into a single legal political party, the Falange Española Tradicionalista y de las Junta de Ofensiva Nacional-Sindicalista.

The Republicans attempted to launch a counteroffensive in July 1937, attacking Nationalist forces to the west of Madrid in the direction of Brunete. This attempt failed, however, as the superior discipline, air support, and defensive positions of Franco's forces prevented the Republicans from gaining an advantage. In August and September the Republicans attempted to seize Saragossa and other territories, launching an offensive from their base in Catalonia. These attacks, too, failed, and they also proved to be the last major offensive of the Republicans, who after this point could only hope for outside intervention to win the war.

In late 1937 and early 1938, Nationalist offensives regained the initiative, conquering Republican-held cities

throughout Spain: Santander in August, Gijon in October, and Lerida in April. In July 1938, the Nationalists called a halt to their offensive in order to prepare for what they hoped would be a final attack in Catalonia, which together with Madrid was the last remaining significant base of Republican support. The Republicans tried to negotiate an end to the conflict, but the Franco regime was uninterested in anything less than total victory. A Republican effort to disrupt the Nationalist army in late 1938 by attacking across the Ebro River failed to achieve its objectives, and the Republicans withdrew their forces in early November after a series of defeats. In late December, the Nationalists launched their offensive on Catalonia, and the demoralized Republicans were unable to put up much resistance. Barcelona fell on 26 January 1939.

This marked the end of serious hostilities. With some Republicans hoping to surrender with good terms and others vowing to fight to the end, internal fighting broke out, enabling the Nationalists to conquer the rest of Spain with little effort. Madrid surrendered on 28 March 1939, and on 1 April 1939, Franco declared that the war was over.

Spanish Colonial Wars (1492-1898)

Created the second global empire, along with that of Portugal, spreading Christianity and Western civilization to the Americas, Africa, and Asia but also disease and death among

the native populations. In 1492, with the commission of the Catholic king and queen of Spain, the Genoese captain Christopher Columbus sailed from Spain to find a direct trading route to Asia. Instead of finding this passage, he became the first European to establish permanent contact with the Western Hemisphere, claiming lands for Spain in the Caribbean and establishing that nation's first overseas empire.

Although Columbus had been the first European since the Vikings to land in the Americas, Spain did not have an unchallenged claim to the hemisphere. Faced with competition from Portugal, in 1494 Spain agreed to the Treaty of Tordesillas, which divided the world between the two nations. With the approval of the pope, Spain gained authority over the Americas, other than the eastern portion of South America, which would later become Portuguese Brazil, and Portugal was given first claim over most of Africa and Asia.

Over the next few decades, Spain embarked on a series of expeditions of discovery and conquest in the Americas. In 1513, Vasco Nuñez de Balboa hacked his way through the Isthmus of Panama, reaching and sighting the Pacific Ocean. The same year, Ponce de Leon began a seven-year exploration of Florida, searching for the fountain of youth.

In 1519, the Spanish conquistador Hernando Cortez defeated the Aztec empire in Mexico, including its capital, Tenochtitlán. Although initially accompanied by a small army of just over 500 Spaniards, along with a few cannons and horses, he was aided by Indian allies who resented Aztec rule, as well as an outbreak of smallpox, which struck down many natives, including one of the Aztec emperors. Some Aztecs also considered Cortez a god, the revered Quetzalcoatl whose return was prophesied by myth, and so refused to fight him. Even the Aztec king, Moctezuma, was unwilling to send all of his strength against someone who might be a god and allowed Cortez to enter the Aztec capital unopposed. Spanish attacks on Aztec temples and religious ceremonies, however, enraged the population and nearly brought defeat to Cortez and his Indian allies in 1520. Some captured Spaniards were even offered as human sacrifices to the Aztec gods. By 1521, Cortez had conquered the last of the Aztecs and installed himself as the new ruler in what would become Mexico City. The Spaniards executed the last of the Aztec royal family in 1524.

To the south, another Spanish conquistador, Francisco Pizarro, won the same kind of victory over the Incas, the other major organized native civilization in the Americas. Landing in Peru in 1532, Pizarro was fortunate to arrive in the midst of an Incan civil war and was able to capture the Inca king, Atahualpa, in November, in the process killing more than 1,500 of his retainers without losing a single Spaniard. Atahualpa attempted to buy his own release by filling a room with gold and another with silver, but once this was accomplished, leaving the Spaniards with 11 tons of gold, Pizarro ordered the Inca executed. Despite being outnumbered by the Inca forces, Pizarro went on to exploit the ongoing civil war to defeat the remaining native armies. Pizarro was also aided by the deadly impact of a smallpox epidemic, probably spread from Spanish forces in Central America, which had devastated Peru in the 1520s. By 1534, he had put down the last organized resistance to Spanish rule in Peru and the Andean region of South America.

These initial conquests were not the end of Spanish military activity in the Americas, however, as foreign intervention, piracy, native rebellions, and events in Spain continued to plague efforts to establish stable colonial rule. Minor revolts in Peru in 1571–1572 and 1742–1755 interrupted silver mining and other colonial operations, but a major rebellion in 1780–1783 was even more serious. During this

uprising, Túpac Amaru II, claiming to be a direct descendant of the Inca kings, led a force of 80,000 Indians against Spanish forces, at one point controlling most of southern Peru and Bolivia, before being harshly put down by the Spanish army and local militias. By the time the uprising was crushed, more than 100,000 lives had been lost, most of them Indian.

Other minor conflicts plagued the Spanish colonial system in the Americas, including an uprising by the Pueblo Indians in northern Mexico that drove the Spaniards out of their northern frontier for more than a decade, from 1680 to 1692, and a tax revolt in Colombia in 1781. More serious for the long-term survival of the empire was the increasing tension between Spanish officials born in the home country and Creoles, white descendants of Spanish colonists born in the Americas. Creoles were resentful of being excluded from positions of authority in the colonial system and mistrusted the administrators and commanders sent from Spain to rule over them and the native populations.

Spain also had to cope with attacks by the French, Dutch, and English and corsairs, pirates, and privateers, all of whom were hoping to rob Spanish colonies and merchant fleets of their silver, gold, and other goods extracted from the Americas. As early as 1555, French pirates attacked and temporarily seized Havana, as did the English in 1762. It was Francis Drake, however, who had the most negative impact on Spanish possessions in the late 1580s. Although he began his career as a corsair, by the 1570s he was sailing as a privateer, licensed by Queen Elizabeth I to attack Spanish ships and possessions. His victories over garrisons and fleets in Santo Domingo and Cartagena, as well as his destruction of fortifications in St. Augustine, embarrassed and damaged Spanish power, demonstrating Spain's vulnerability in the heart of its empire. Drake was followed in the seventeenth century by other buccaneers who captured many precious Spanish cargoes and raided cities throughout the Americas. Only after 1748, when Spain signed a peace treaty with England, did the attacks end.

Neither native rebellions nor Creole resentments ended this empire, however, but rather Napoleon I, who indirectly put an end to Madrid's control over most of the Americas. After tricking the king of Spain into an alliance with him in 1807, the French emperor placed his brother, Joseph, on the throne in Madrid, triggering a revolution and guerrilla war in Spain. In response to the French actions in 1808, similar rebellions began throughout most of the Americas, ostensibly on behalf of the legitimate Spanish king, Ferdinand VII.

Creole juntas seized power in Venezuela, Chile, and Argentina in 1810 to protest French rule, and an independence movement began in Mexico, led initially by the priest Miguel Hidalgo y Costilla. By November 1810, Hidalgo had formed

an army of Indians and mestizos and had surrounded Mexico City, where they outnumbered the Spanish garrison by at least 10 times. Hidalgo tried and failed to take Mexico City and then divided his forces and moved into northern Mexico, where his forces dwindled and he was captured and executed in 1811. Leadership of the Mexican independence movement weakened, and by 1815, Spanish forces had once again reasserted royal rule in Mexico. In 1821, however, a former royalist commander, Agustín Iturbide, joined forces with the rebels and had himself declared emperor. Although his regime lasted only until 1823, Mexico remained independent after his abdication. Central America, which had followed the lead of Iturbide, formed a federation of independent republics and broke away from Mexico.

In 1811, Venezuela and Paraguay declared their independence. Forces loyal to the Spanish monarchy protested and fought against these steps, but the simmering Creole resentment over peninsular rule was more powerful than loyalty to the Spanish crown. By 1814, independence movements had begun throughout Spanish possessions in the Western hemisphere.

Even after the restoration of the Spanish monarchy in Madrid with the final defeat of Napoleon in 1815, the fledgling states in the Americas refused to accept the reinstatement of their colonial status. Independence leaders such as Simon Bolivar in Venezuela and José de San Martín in Peru gained the support of white Spanish colonists against the monarchy and fought ongoing battles against the expeditions of Spanish troops sent by Ferdinand VII. To add to Spain's difficulties, Argentina declared its independence in 1816, with Chile doing so as well the following year.

In their efforts to win and maintain independence, the Latin American rebels had an important ally in the government of Great Britain, which saw great commercial opportunities in the newly opened markets and supplied the republican armies with whatever they wanted to buy. The U.S. declaration of the Monroe Doctrine in 1823, which asserted that no European power should attempt to recolonize the Americas, also played a small role in legitimizing the new states. For 10 years, armies of the Spanish crown attempted unsuccessfully to force the new republics to surrender until 1825, when Spain finally withdrew its forces, exhausted and defeated.

Of its Latin American possessions, Spain was able to hold only Cuba and Puerto Rico, primarily because the Creoles on those two islands remained loyal and integrated into the system of Spanish governance. A 10-year independence movement did begin on Cuba in 1868, led by Carlos M. Céspedes, but Spanish forces eventually crushed it. Closer to Spain, the tiny Moroccan enclave of Melilla, Spanish territory since 1497, rebelled in late 1893. The city and surrounding terri-

tory controlled by Spain had previously come under Moroccan attack in 1562, 1687, 1696, 1697, 1771, and 1774. Supported by the sultan of Morocco, in September 1893 the Berber and Arab rebels launched attacks on the Spaniards from the Rif Mountains, but this insurrection was put down in just over six months, by March 1894.

A more serious rebellion began in Cuba in 1895, when in late February an uprising began against Spanish rule. Spain sent in March a force of 6,000, led by General Martínez Campos, to crush the independence movement, but this expedition was plagued by failure, beginning with the sinking of a heavy Spanish cruiser, the *Reina Regente*, in a storm off the coast of Gibraltar immediately after sailing. Upon arrival, Martínez Campos attempted to engage the Cuban rebel army, but its guerrilla commanders, including Antonio Maceo y Grajales, refused to engage in direct confrontations with the Europeans. In early 1896, Martínez Campos was replaced by General Valeriano Weyler y Nicolau as commander of Spanish forces in Cuba. He began a policy of concentrating the population in fortified villages to isolate the rebel forces from their base of rural support, sometimes leading to civilian deaths from poor conditions. Weyler went on to defeat Maceo in several military engagements, finally capturing and killing the rebel leader in December 1896.

Taking advantage of these victories, the Spanish government in February 1897 issued an autonomy decree for Cuba, but this concession failed to satisfy demands for independence or stabilize the islands, and so the war continued. Weyler's tactics against the civilian population came under severe criticism in Spain and the United States, however, and so despite his victories, he was relieved of command in October 1897 and replaced by General Ramón Blanco. In November, Spain amnestied Cuban political prisoners and granted voting rights for adult males to vote in Spanish elections, but these reforms did little to address the demands of the population for complete freedom from Spain.

U.S. intervention in 1898, prompted by the explosion of the American warship *Maine* in February, began the Spanish-American War. Unable to defeat the superior navy and army of the United States, which easily overpowered Spanish forces in Cuba and the Philippines, Spain surrendered in August.

In the Philippines, a revolt led by Emilio Aguinaldo was unable to achieve much against Spanish regulars and local Filipino auxiliaries. But on 1 May 1898, the U.S. Navy destroyed the Spanish Pacific fleet in Manila Harbor and took control of the archipelago. Aguinaldo returned to Manila on 19 May 1898 and aided the American seizure of the islands.

Aguinaldo's declaration of Philippine independence on 12 June was not well received by the United States, which declared him an outlaw. He declared war on the United States on 4 February 1899 and led a prolonged guerrilla war, in

which both sides resorted to atrocities. The American public became uneasy about this colonial war on the other side of the globe. Aguinaldo was captured on 23 March 1901. His parole stipulated that he swear allegiance to the United States, which he did on 1 April 1901. By this time, the United States was seriously considering some sort of commonwealth status or actual independence for the Philippines.

But as far as Spain was concerned, by the events of 1898 it had lost the last of its colonies in the Americas and Asia, except for some small territories in northwestern Africa.

Spanish Succession, War of the (1701–1714)

A European struggle for the inheritance of the childless King Carlos II of Spain. In late 1700, the last Spanish king of the Habsburg dynasty, Carlos II, died. His Austrian relatives, led by emperor Leopold I, took up the fight against the French Philip V of Bourbon, who inherited the whole Spanish monarchy, according to the last will of Carlos II. But in fact, the War of the Spanish Succession was a war about European hegemony between Louis XIV of France, Philip V, and the elector of Bavaria and on the other side a Grand Alliance consisting of the Austrian Habsburgs, England, the Netherlands, the Holy Roman Empire, and some lesser German states. All attempts to avoid a war by dividing the Spanish inheritance had been unsuccessful, although all European powers were war-weary after the War of the Grand Alliance, which had ended in 1697.

The fighting began in Italy in 1701, where the main Austrian commander, Prince Eugene of Savoy achieved the first victories. In 1702, the conflict became a general European war. It lasted until 1714, with no decision in the field. The main European theaters of war were the Low Countries; the Upper Rhine, including Bavaria; northern Italy; and Spain.

In 1703 and 1704, French and Bavarian forces were suc-

cessful in southern Germany, threatening the Habsburg capital, Vienna, as well as the imperial circles of Swabia and Franconia. But in 1704, the English commander in chief, John Churchill, Duke of Marlborough, after his famous long march from the Netherlands to the Danube River, shifted the situation in favor of the allies together with the imperial generals Eugene of Savoy and Ludwig Wilhelm of Baden. After the decisive Battle of Blenheim-Höchstädt (13 August 1704), the Franco-Bavarian forces were driven out of southern Germany.

But this great success could not decide the war. The French lost more battles at Turin (1706), Oudenaarde (1707), and Malplaquet (1709), but they were not defeated. Heavy losses and enormous financial cost made all parties weary of the conflict. The allies were not able to secure Spain for their candidate, Carlos III (later the emperor Charles VI). When his elder brother, Joseph I, died in 1711, the fear of a too-powerful Habsburg Spanish-Austrian empire led to a dissolution of the Grand Alliance. England and the Netherlands were fighting for a balanced system of powers, not for Habsburg interests.

Thus in 1713, they signed the Peace of Utrecht with France. Charles VI waited until 1714, when the treaties of Rastatt and Baden brought the war finally to an end. With this settlement, the principle of a balance of powers took precedence over dynastic or national rights. The Spanish inheritance was divided. Spain fell to Philip V, and the Habsburgs gained Belgium and the former Spanish possessions in Italy.

Spanish-American War (1898)

Conflict that ended Spain's control over its last major colonial territories and established the United States as a world power. In February 1895, Cuban revolutionaries led by the poet José Martí renewed efforts to free the island from Spain. The rebels waged guerrilla warfare, destroying cane fields, sugar mills, and military outposts in an attempt to make the colony worthless to Spain. The following year, General Valeriano Weyler y Nicolau was placed in command of

the Spanish army and initiated the reconcentration program that involved the removal of large segments of the civilian population from western Cuba into camps known as *reconcentrados*. Weyler planned to separate the guerrillas from their support base and to distinguish the insurgents from the civilian population. Cubans who refused to be relocated were considered rebels and could be summarily shot. The camps were hastily constructed and lacked adequate sanitary facilities, resulting in horrific conditions. Malnutrition, disease, and Spanish brutality resulted in the deaths of more than 200,000 Cubans in a period of only two years.

Spanish abuse of the Cubans caught the attention of American media moguls William Randolph Hearst, publisher of the *New York Journal*, and Joseph Pulitzer, whose leading paper was the *New York World*. Hearst and Pulitzer dispatched their best reporters and illustrators to Cuba, and their lurid reports of Spanish atrocities were widely circulated. The “yellow press” accounts enjoyed a wide readership and were largely responsible for the pro-Cuban sympathies of the American people. By the end of 1897, there was a public outcry from the popular press, Protestant groups, and politicians for U.S. intervention to end the conflict and establish Cuban independence.

President William McKinley was reluctant to involve the United States directly in the Cuban insurrection. Instead, he offered the good offices of the United States to negotiate a settlement but warned Spain that intervention was a possibility if the civil war continued. A new Spanish government seemed receptive, promised reforms, and recalled Weyler.

Several events quickly doomed any hopes of a peaceful settlement to the Cuban issue between Spain and the United States. On 9 February 1898, the *New York Journal* published the contents of a letter written by Dupuy de Lome, the Spanish minister in Washington. The letter, which had been pilfered by a rebel sympathizer, was highly critical of President McKinley, claiming that he was weak-willed and overly concerned with his popularity. This embarrassing revelation led to de Lome’s resignation and further soured diplomatic relations.

On 15 February, the U.S. battleship *Maine* mysteriously exploded, resulting in the deaths of 266 American sailors. A U.S. Navy board concluded that the explosion had been set off by an external mine but could not determine culpability. Spanish investigators claimed the explosion was internal and denied any involvement in the *Maine* catastrophe. Modern investigators using computers have concluded that the *Maine* tragedy was the result of a coal dust explosion and an unfortunate accident unrelated to events in Cuba. In any event, the Pulitzer and Hearst papers asserted that the *Maine* had been the victim of a Spanish mine, and this notion was generally accepted by an outraged American public.

On 17 March, Vermont senator Redfield Proctor gave an account of his recent visit to Cuba to the Senate. His findings validated yellow press accounts of the suffering and misery of many Cubans in the reconcentration camps. Proctor was considered an honest man and not given to exaggeration; therefore, his speech convinced many skeptics of the need to intervene in Cuba. Proctor’s account also increased the pressure on President McKinley to take decisive action.

McKinley gave diplomacy one last chance when, on 27 March, he sent his final peace proposal to Madrid. Spain was to end the reconcentration policy, agree to an armistice, and allow McKinley to negotiate a peace settlement. On 28 March, the president added the demand that Cuba be granted complete independence. Spain considered McKinley’s proposals, agreed to end the reconcentration policy, and declared an armistice. Nevertheless, McKinley found Spanish actions to be inadequate and on 11 April requested authority from Congress to use naval and military force to end the civil war in Cuba. On 20 April, Congress passed several resolutions calling for Cuban independence and for Spain to completely withdraw from the island. Spain chose not to agree to the terms offered by the United States and declared war on 24 April. The following day, the United States reciprocated by declaring war on Spain.

Ironically, the first major action in the war did not involve Cuba. On 1 May, the U.S. Asiatic Squadron, led by Commodore George Dewey, attacked the Spanish fleet at Manila Bay in the Philippines. The American squadron totally destroyed the Spanish force of four cruisers, three gunboats, and three other vessels. American casualties were a mere eight wounded, whereas Spanish losses amounted to 381 killed or wounded. Dewey took possession of the Spanish naval base of Cavite and blockaded the city of Manila. General Wesley Merritt arrived at Cavite on June 30 with 10,000 men. Merritt, with the assistance of Filipino guerrillas under Emilio Aguinaldo, captured Manila on 13 August, effectively ending Spanish possession of the Philippines.

Spain attempted to prevent an invasion of Cuba by sending Admiral Pascual Cervera to the port of Santiago de Cuba on the eastern end of the island with four modern cruisers and three destroyers. The ships arrived safely, but Rear Admiral William T. Sampson, in command of U.S. naval forces, ordered a blockade and bottled up the Spanish fleet in the port.

Major General William R. Shafter was placed in command of the Fifth Army Corps, consisting of 16,888 officers and men. Shafter’s force had 15 regiments of regular army troops and three regiments of volunteers. Among the volunteer regiments (the last U.S. Army units to be so raised) was the 1st Volunteer Cavalry, commonly referred to as the Rough Riders, soon to be commanded by the former assis-

tant secretary of the navy, Lieutenant Colonel Theodore Roosevelt. Shafter's original objective was to establish a beachhead in Cuba so that supplies could be funneled to the Cuban guerrillas. Logistical support for the expeditionary force was woefully inadequate, as evidenced by the lack of horses for the six cavalry regiments. The expedition landed unopposed at Daiquiri, east of Santiago, and debarked between 22 and 25 June. After a skirmish at Las Gusimas (23 June), Shafter ordered an advance on Santiago.

There were 200,000 Spanish troops in Cuba but only 35,000 in the vicinity of Santiago, and the force defending the city numbered but 13,000. The road to Santiago was blocked by Spanish trenches on San Juan and Kettle Hills manned by 1,200 Spanish soldiers. To the northeast was El Caney, held by 500 defenders. On 1 July, Shafter ordered both positions attacked simultaneously. The American charges on Kettle and San Juan Hills commenced shortly before 1:00 P.M. and were over in little more than an hour. On the far right of the American line, Theodore Roosevelt led the Rough Riders up Kettle Hill and was soon joined by the 1st, 3d, 9th, and 10th Cavalry regiments. Roosevelt and his men swept the crest of Kettle Hill and poured fire into Spanish positions on San Juan Hill to support the assault of the 1st Brigade led by Brigadier General Hamilton S. Hawkings. By 1:30, the southern end of San Juan Hill had been breached by Hawkings's men. Roosevelt then led a charge on the northern end of the hill and swept the Spanish from their trenches. The battle resulted in 124 American killed and 817 wounded. Spanish losses were 58 killed and approximately 170 wounded. The famous charge made Roosevelt a national hero and accelerated his political career.

On 3 July, Cervera attempted to break the American naval blockade with disastrous results. Four Spanish cruisers and two destroyers were so severely damaged by American fire that they were run aground in an attempt to save as many of the crew as possible. Only one U.S. sailor died in the action, whereas 323 Spanish seamen lost their lives. Santiago was surrounded by American land forces, and with no hope of relief, General Jose Toral surrendered on 17 July. The fall of Santiago ended active Spanish resistance in Cuba.

On 25 July, Major General Nelson A. Miles landed on the island of Puerto Rico with a force of approximately 5,000 men. Miles's army grew to 16,000 and, in an orderly and well-executed operation (in contrast to the U.S. expedition to Cuba), subdued the Spanish forces on the island by 13 August. The Puerto Rico campaign cost only nine American lives, whereas Spanish losses were 28 killed and 125 wounded.

The Spanish-American War officially ended with the Treaty of Paris, signed on 10 December 1898. Cuba was freed from Spanish rule, and Puerto Rico and Guam were ceded to

the United States. The Philippine Islands were sold to the United States for U.S.\$20 million. The war removed the last vestiges of Spanish power in the Western Hemisphere and made the United States the principal power in the Caribbean basin. The U.S. acquisition of the Philippines resulted in a bloody insurrection that cost more than 5,000 American and 200,000 Filipino lives and sparked debate within the United States about its role as an imperial power.

Spanish-Portuguese Wars (1580–1763)

Five wars waged between Spain and Portugal for control of the Iberian Peninsula. At stake was control of the world's first global seafaring empires.

In 1580, Spanish king Philip II claimed the Portuguese throne by invading Portugal. Spanish forces under Fernando Alvarez, Duke of Alva, defeated a peasant army of Portuguese king Antonio at the Battle of Alcantra on 25 August 1580. Spanish forces then pursued Antonio to Oporto and the Azores Islands. Despite support from Catherine de Medici, Antonio failed to hold the Azores. After the defeat of the Spanish Armada in 1588, Elizabeth I sponsored an English invasion of Portugal. This, too, failed to reinstall Antonio, and Portugal remained a dependent of Spain until 1640.

In 1641, Portuguese King John IV regained the throne and allied with England, France, and the Netherlands to hold it. Spain invaded, but Portugal won battles at Olivenca and Beira in 1642, then invaded Spain in May 1644 under General Mathias d'Albuquerque, and won a major victory at the Battle of Montijo. However, the cessation of the Thirty Years' War in Europe brought a truce to the Iberian Peninsula.

The death of John IV in 1656 sparked another invasion of Portugal by the Spanish between 1657 and 1668. Spain was victorious at Olivenca and Badajoz in 1658, and Portugal was victorious at Elvas in January 1659. Spanish forces under Don Juan of Austria defeated Portuguese forces at Evora

in May 1652. Portuguese forces commanded by Herman Schomberg then turned the tide at the Battle of Ameixal on 8 June 1663. Following Portuguese victories at Alcantara, Villaviciosa, and Montes Claras, Portugal invaded Andalusia. England then mediated a treaty forcing Spain to recognize the House of Braganza as heirs to an independent Portugal.

From 1735 to 1737, global conflict between Portugal and Spain took place as part of the War of the Polish Succession. Spain invaded the stronghold of Colonia on the Rio de la Plata in South America. It was finally returned to the Portuguese after British intervention.

In 1761, Spain and France, both ruled by the Bourbon family, entered into a compact against the British, which appeared likely to win the Seven Years' War and upset Spanish trade in the Americas. In 1762, Britain occupied Spanish Cuba and the Philippines. In response, Spain invaded British ally Portugal and captured the town of Bragança and the fortress of Almeida in early 1763. British reinforcements under John Burgoyne and John Campbell landed in Portugal and combined with Portuguese forces under Count William of Schomberg to repel the Spanish in late 1763. The Treaty of Paris, which ended the Seven Years' War, also brought an end to hostilities in the Iberian Peninsula.

Special Operations Executive (SOE)

British unconventional warfare organization that conducted sabotage and intelligence operations during World War II. The Special Operations Executive (SOE) Charter was approved on 22 July 1940 in the wake of the fall of France. It merged Section D of the Secret Intelligence Service (SIS), which previously investigated nonmilitary means of attack; MI(R), the general staff body responsible for irregular warfare; and the Department of Propaganda (a.k.a. "EH" for its Electra House headquarters), responsible for "black," or unattributable, propaganda.

Popular belief held that British strength lay in sea power and airpower. Thus a land campaign of assisting popular uprisings, believed inevitable against the occupying Nazis, would avoid committing regular troops to a mainland invasion. Activating this strategy would emphasize trade blockade (Royal Navy), augmented by bombing strategic indus-

tries (Royal Air Force, or RAF) and sabotage/psychological warfare (SOE).

The SOE charter was sufficiently vague that rivalries between SOE and the Foreign Office, military chiefs of staff, and the SIS plagued smooth operations throughout the war. For example, conducting sabotage to an extent adequate to cause embarrassment to the occupying forces would disrupt the peaceful environment conducive to SIS intelligence operations and Foreign Office diplomacy. On a more mundane level, once it became apparent that infiltrating agents by sea was not practical, the requirement for aircraft to insert personnel (by parachute or rough-field landing) caused a conflict over resources with the RAF hierarchy; SOE planners claimed a requirement for 102 heavy aircraft for western Europe and the Balkans alone.

By 1945, SOE was conducting operations throughout Europe (except in Spain and Portugal) and in the Far East. SOE sabotage was particularly effective against German petroleum, U-boat, and air operations in France, the Balkans, and Scandinavia.

There were always critics who argued that the resources "diverted" to SOE would have been better employed in conventional operations and that special operations more often than not aroused the enemy to take drastic measures against civilians in the areas of operations. But even if these points were conceded, for several years SOE and aerial bombing were the only way that the British could somewhat directly demonstrate to the peoples of conquered Europe and Asia (not to mention Britain's enemies) that it was still very much in the fight.

Special Operations Forces

Forces expressly trained and equipped for military or paramilitary tasks deemed unsuitable for conventional forces. Special operations forces (SOF) candidates typically undergo a grueling, often lengthy selection and training process before achieving basic special operations status. Training emphasizes fitness, independent thinking, and often nonstandard equipment. Expertise is developed in traditional military skills such as battle craft and navigation; less standard skills such as free-fall parachuting, mountain operations, or scuba diving are common. Acquiring and main-

taining individual and small-unit proficiency in multiple unconventional or distinctive skills provides this “special” capability.

SOF are employed where clandestine ability permits government deniability or where peril, special qualifications, or lack of alternatives precludes conventional forces. They may be employed in counterterrorism, intelligence collection, raids, guerrilla warfare, training of foreign military/paramilitary personnel, civil affairs, and psychological operations. Mission success is often dependent upon the soldiers’ personal capacity (such as initiative or fitness), detailed intelligence support, mission planning, and possibly support from in-theater indigenous personnel. (This support distinguishes U.S. Army special forces from Rangers, Special Operations Executive, and so on.) SOF generally lack the integral firepower and organic combat service support of conventional forces.

Unconventional operations, such as raiding enemy supply depots or command centers, have been conducted throughout history, but not until the twentieth century were units specifically created and maintained for these tasks within peacetime armies, navies, and air forces. Some examples of SOF units’ actions in the twentieth century include the U.S. Army Detachment 101 and the British Chindits in northern Burma and the U.S. Office of Strategic Services Jedburghs in Europe and British commandos, operating far behind enemy lines, working with indigenous resistance forces, and preparing the way for the Allied invasion of the Continent. Aptly named long-range penetration groups shot up Axis supply lines and airfields almost with impunity deep inside enemy territory in North Africa.

Oddly, the Germans, who supposedly had “fifth columns” everywhere, made very little use of SOF, as did the Japanese. The long Allied supply lines over land in both the European and the Pacific theaters of operations faced far greater losses from pilferage than from any Axis guerrilla attacks. And despite some hysterical fears of an “Alpine Redoubt” peopled by Nazi diehards ready to carry on the struggle by any means, when the order came to surrender unconditionally, that is just what the Germans—and the Japanese—did. Axis psywar against the Allies was pathetic, ridiculing Allied soldiers or gloating over imaginary disasters. The Axis powers had no such thing as civil affairs, and their military government was simply rule by terror, punctuated by “violators will be shot” bulletins. Even subject peoples who had at first welcomed the Germans and the Japanese as liberators were soon enough plotting against them and conducting guerrilla warfare against their new, even worse, oppressors.

U.S. SOF in Vietnam proved one of the few success stories from that conflict. No less than 100,000 Communist defectors were garnered by the imaginative “Chieu Hoi/Open

Arms” program. By contrast, the Communist “masters of propaganda” could not produce one U.S. defector. Civic action teams indeed won “hearts and minds” by improving the lives of the people, and the special forces work with the Montagnard hill tribes made Communist supply lines extremely vulnerable.

In the Panama incursion of 1989–1990, U.S. Army Civil Affairs troops set up a refugee camp, built and administered primarily by Panamanian civilians, so well run that a major problem was keeping unqualified persons *out*. Imaginative special forces troopers used the “Ma Bell” technique, calling ahead to enemy headquarters, warning them of the wrath to come from U.S. Army gunships (occasionally a gunship was called in for a tree-cutting demonstration at the edge of the forest), and then arranging dignified ceremonies in which the American flag was raised alongside that of Panama, preserving everyone’s dignity.

Later that same year, in the Gulf War, coalition psyops (along with relentless aerial attacks) took the heart out of the “battle-hardened” Iraqi army, leaving its soldiers vulnerable to the land offensive. Other psyops teams talked terrified Iraqi soldiers out of their bunkers. Still other SOF reconnoitered Iraqi supply lines, extracted downed coalition airmen, administered enemy prisoner of war camps, and established camps for Kurdish refugees, which those refugees soon ran themselves.

Extensive training and equipment expense may make SOF casualties appear more significant when compared with those of conventional soldiers. This, plus bureaucratic intransigence and service jealousies stemming from the perception that SOF absorb high-quality soldiers who would otherwise improve conventional units, often make them unpopular among conventional military leadership. SOF have waged a continual battle through much of the twentieth century for permanent acceptance in the world’s militaries. The following century will undoubtedly prove no different.

Spotsylvania Court House (12–20 May 1864)

The second major battle of General Ulysses S. Grant's 1864 overland campaign, featuring some of the most savage fighting of the war. After inconclusive combat in the Wilderness (5–6 May), Grant attempted to turn General Robert E. Lee's right flank. Lee's columns reached the junction at Spotsylvania Court House and began to prepare trenches reinforced with logs.

Spotsylvania consisted of a series of federal attacks and Confederate counterthrusts. Grant directed the Army of the Potomac to strike on 8 May; this first assault failed with heavy casualties. On 12 May, the Union army launched the most famous attack at the Mule Shoe, a salient in the Confederate line. A drizzling rain dampened the Confederates' powder, and few rifles could fire. Initially, it was one of the most successful attacks of the war, capturing an entire division, including several generals. Beyond the earthworks, Union troops met stiff resistance. Led by Lee himself, Confederate counterattacks drove them back to the trenches. Both sides poured in reinforcements. Combat raged for the next 12 hours in the most continuous hand-to-hand fighting of the war. All day, close combat raged within the confines of the earthworks. The action gave Lee time to prepare a second line, to which his troops fell back.

Federal attacks against this line met with failure on 18 May. The next day, a Confederate assault on Union positions along the Fredericksburg Road also failed. On 20 May, Grant again turned south, moving closer to Richmond.

By this period of the war, earthworks and fortifications dominated the battlefield; the days of open field maneuver that characterized the conflict's early years were over. Grant lost 18,000 men at Spotsylvania and Lee about 10,000. Calling on draftees and garrison troops, Grant could replace his losses, but Lee had no reserves.

Sri Lankan Civil War (1983–)

Violent civil war between the two main ethnic forces in Sri Lanka. The onset of Ceylon independence in February 1948 only exacerbated deep-seated resentment between the island's two major ethnic groups: the Buddhist Sinhalese majority and the Hindu Tamil minority, comprising 18 percent of the population. There were periodic outbursts of violence between them through May 1971, when Ceylon adopted a new constitution and a new name: Sri Lanka. However, the Tamil, weary of being accorded second-class status, spawned several liberation-minded guerrilla groups intent upon carving out an ethnic enclave on the northern part of the island. The most vocal and violent of these, the Liberation Tigers of Tamil Eelam (LTTE), commenced hostilities in July 1983 by ambushing a Sri Lankan army patrol and killing 13 soldiers. This attack prompted a wave of retribution from the Sinhalese majority, who over the following weeks killed an estimated 384 Tamils and rendered 50,000 homeless. Furthermore, the government outlawed the Tamil Tigers, banned all separatist political activity, and installed a lengthy curfew. None of these measures addressed the basic Tamil grievance of a lack of autonomy, and their ranks continued swelling with every terrorist act.

The Tamils escalated their attacks beginning with a 14 March 1985 attack on a bus in which 120 Sinhalese civilians were machine-gunned. On 21 April 1987, a bomb killed 113 people at a Colombo bus terminal. This ruthlessness sparked retributive atrocities from the Sinhalese side, and several hundred Tamils were killed in rioting against their business establishments. The Sri Lankan army, meanwhile, doubled in size to near 50,000 soldiers and conducted several ruthless sweeps through Tamil-held territory, killing hundreds. Despite heavy loss of life, the LTTE remained adamant in its demand for autonomy.

Sporadic fighting and bombing continued over the fol-

lowing months, and in July 1987, the Sri Lankan government, exhausted by counterinsurgency efforts, invited outside assistance from India. The government of Prime Minister Rajiv Gandhi responded by sending a garrison force of 67,000 soldiers to serve as a buffer between the two groups. However, LTTE forces remained dissatisfied by the terms of the Indo–Sri Lanka Peace Accord, signed on 29 July 1987, which called for rebel forces to lay down their arms. In May 1989, a new government under Prime Minister Ranasinghe Premadasa announced a new cease-fire agreement, which included an Indian withdrawal. However, fighting and terrorist acts continued unabated, and the violence extended into India when, in 1991, Prime Minister Gandhi himself was killed by a Tamil suicide bomber. Two years later, Premadasa was also murdered. By the time Indian forces finally departed Sri Lanka in March 1990, they had lost more than 1,100 soldiers to the guerrillas. The civilian toll has since topped 18,000 dead, and fighting continues, although currently on a reduced scale.

SS

The most sinister of the Nazi paramilitary affiliates. Founded in 1925, the SS (Schutzstaffel, or Protection Squad) was not really significant until Heinrich Himmler took over its leadership in 1929. At first, it was merely intended to provide bodyguards for party leaders at meetings and to be more reliable than the larger SA. Under Himmler, it first took on new duties as the internal police and intelligence service of the Nazi Party.

When the Nazis took power in 1933, the SS, together with the SA, was a main agent of terror against leftists and other enemies. It was subordinate to the SA until 1934, but Himmler cleverly and brutally used the purge of the SA in that year to gain independence. The rapid subsequent expansion of the SS was the product both of Himmler's ambition and Nazi obsession with internal security. The SS gradually absorbed and centralized the various police forces of Germany. It took over the administration of the concentration camp system and turned it into an empire of terror with an increasingly

important economic component, as slave labor was used to finance other SS operations. Himmler also saw the SS as the guardian of both the ideological and the racial purity of the Nazi movement and state and enforced strict racial standards within the SS while staking a claim for SS influence in all questions of race and settlement in Eastern Europe. It became the main executor of Nazi racial policy and terror. To expand the SS police powers, Himmler formed armed SS units, which in the fall of 1939 were consolidated into the armed—or Waffen—SS.

During World War II, the Waffen SS developed into an elite fourth branch of the armed forces and was deeply implicated in the Nazi regime's most heinous crimes. Under Himmler's constant push to expand, the Waffen SS also began to rely on conscription, first of ethnic Germans from eastern Europe and then of German nationals, and even began accepting foreign volunteers from both eastern and western Europe, until it became necessary to make a distinction between the General (Allgemeine) SS and the Waffen SS to maintain even a pretense of SS racial "purity." Though it was the home of some of the most famous armored divisions of the war and once considered a main contributor to German military success, the SS, according to more recent scholarship, also sacrificed manpower under often incompetent leaders, and the duplication of organization and procurement hindered the Nazi war effort. Because of the horrific crimes of the Nazi movement in which they were so implicated, both the General and Waffen SS were declared illegal organizations at the Nuremberg trials of the major Nazi leaders.

St. Clair's Defeat (4 November 1791)

One of the most thoroughgoing defeats in American military history. When Josiah Harmar's raid against a Miami Indian village (now Fort Wayne, Indiana) failed, President George Washington blamed undisciplined militia rather than the skill of the American Indian warriors commanded by Little

Turtle. Washington's solution was to increase the regular army to 2,200 men and appoint Major General Arthur St. Clair (not one of Washington's wiser choices) to command a new expedition. St. Clair's mission was to establish a fort near the Miami village in order to secure the territory and deter Indian attacks.

During the summer of 1791, St. Clair organized his army but could not overcome many problems with logistics and training. On 6 September, the army advanced from Fort Washington (Cincinnati) by building a road and establishing a series of fortifications to guard the line of communications. However, in two months the army had made little progress, advancing a little more than 100 miles and reduced by illness and desertion to 1,400 men.

At dawn on 4 November, as the army camped near the Wabash River, more than 1,200 Miami warriors led by Little Turtle surprised, surrounded, and attacked the Americans, who quickly lost all form of organization. After several hours, St. Clair's army had been decimated, with 630 killed and almost 300 wounded, a 66 percent casualty rate and three times the number of men that George Armstrong Custer would lose at Little Bighorn. More significantly, Little Turtle had effectively destroyed almost the entire existing U.S. Army. Two years later, Anthony Wayne would avenge St. Clair's failure by raising and training the Legion of the United States and defeating the Indians at Fallen Timbers in 1794. Those contemporary U.S. Army officers (including George Washington) who constantly deprecated the militia might well have considered the fate of St. Clair's regulars.

St. Gotthard Abbey (1664)

Conclusive battle of the Austro-Turkish War (1663–1664). In 1658, Ottoman grand vizier Ahmed Köprülü deposed Transylvanian prince György II Rákóczi, replacing him with Michael I Apafi. When Habsburg emperor Leopold I was slow to recognize Apafi, Köprülü attacked Habsburg-controlled Hungary in 1663. Leopold's army under Count Raimondo Montecuccoli was unprepared for a major war and retreated before the invading Ottomans.

Köprülü took the fortress of Neuhausel (Nové Zamky) in September after a six-week siege and withdrew into winter quarters. In November 1663, Croatian Ban Miklós Zrinyi re-

placed Montecuccoli as Habsburg field commander. Throughout the winter, Zrinyi conducted bold mounted operations in the Ottoman rear areas along the Mura River, disrupting supply lines but failing to recover any territory.

The following summer, Montecuccoli was again given command of the imperial armies, reinforced by a French contingent under the Duke of Lorraine. When the Ottomans invaded Croatia, Montecuccoli refused Zrinyi's demands for reinforcements to relieve the siege of Zrinyi-újvár, which fell on 30 June. Instead, he withdrew to a position on the Raab River, where on 1 August, he caught and defeated Köprülü's army at Szént Gotthard/Mogersdorf as it attempted to cross into Austria. Leopold used the opportunity of the victory to conclude quickly the Treaty of Vasvár, which established a 20-year peace and awarded the Ottomans an indemnity and possession of Neuhausel. Leopold's neglect of Hungarian interests in securing the peace provoked a magnates' conspiracy against Habsburg rule, which was exposed and suppressed in 1670. Refugees from Habsburg reprisals fled to Transylvania, from which they launched raids into Hungary for the next decade.

The Battle of St. Gotthard was the only major confrontation of the Habsburg and Ottoman armies between the Fifteen Years' War (1591–1606) and the second Siege of Vienna (1683).

St. Mihiel (12–16 September 1918)

The first purely independent operation for the newly organized U.S. First Army in World War I. The commander of the American Expeditionary Force, General John Pershing, tenaciously insisted, against vocal and bitter opposition from his French and British counterparts, that American troops serve as part of an independent American entity under his command. To Pershing, the question of such an independent command was a matter of national sovereignty. French and British commanders argued that, owing to American inexperience and the desperate situation facing the Allies in mid-1918, the wiser use of American manpower would be as mixed formations with other Allied units wherever they might be needed.

In the summer battles at Belleau Wood and the Marne,

Pershing reluctantly permitted some of his divisions to be used in this manner, but he and General Ferdinand Foch, supreme Allied commander, agreed that in September Pershing would conduct an independent offensive. The goal was to reduce a German salient in eastern France that dated to 1914. Pershing's hope was to push all the way to the Metz area of Germany by early 1919. After a heavy bombardment, American troops attacked on 12 September and made excellent advances, partially because the Germans had chosen to pull back from their positions to prepare a new defensive line. The American captured 15,000 prisoners and incurred roughly 7,000 casualties. Instead of continuing east, though, Pershing's forces turned northeast in the direction of the Meuse River and thus began an even larger American offensive generally known as the Battle of the Argonne Forest. As a result, the St. Mihiel offensive has been overshadowed by the larger offensive in the Argonne area.

St. Quentin (10 August 1557)

One of the most disastrous defeats in French military history. Philip II of Spain wanted to invade France to commence his reign on a glorious note. The Spanish army was regrouped along the river Meuse, and Philip gave the order to the Spanish general Philibert Emmanuel of Savoy to take the town of St. Quentin, the “key to Paris,” because it was the place where he was to meet reinforcements from England. The French were expecting a direct attack and waited without encamping. The old French constable, Anne de Montmorency, discovered the Spanish too late; he could only send Gaspard de Coligny and 500 soldiers to garrison the town. These reinforcements arrived just a few hours before the Spanish vanguard.

The siege began on 2 August 1557. The walls were in poor condition, and only Coligny's will managed to raise the fighting spirits of the militia. The Spanish established their camps on both sides of the river Somme, which flows through the town.

Montmorency had to obey the king's orders to attack the invaders, but he knew that the Spanish had brought overwhelming numbers: 35,000 infantrymen, 12,000 cavalry, and dozens of guns. He decided to surprise the southern

Spanish camp by the Somme and then to send thousands of troopers to the besieged town by boat.

On 10 August, at about 9:00 A.M., he surprised the Spanish by a sudden and violent attack on Philibert's camp. Most of the Spanish managed to flee and take refuge in Comte Lamorel d'Egmont's camp on the northern side of the river. The 1,500 French now had to wait for four hours for the small boats from the town. D'Egmont and Philibert, recovering from their surprise, mounted an overall attack on the waiting French. The only bridge across the river and the marshy grounds was taken without a fight, and a charge from d'Egmont's cavalry sent the flanking French cavalry in flight. At 1:00 P.M., Montmorency decided to retire toward his line. The French noble cavalry refused to obey and charged the Spanish to its doom (700 against 8,000). The French commander now had to face the whole Spanish army. “C'est assez de reculer; il faut mourir” (No more way back; it is time to die) was his last command before being wounded and taken prisoner. Crushed by the deadly volleys of 42 Spanish guns, the shrinking French infantry stayed four hours under fire before retreating headlong.

France no longer had a field army, but Philip II made an unforgivable mistake in ordering Philibert to continue the siege of St. Quentin. Time was won by the French, and extra taxes, plus volunteers from throughout the kingdom, gave the nation a new army.

Stalin (Iosif Vissarionovich Dzhughashvili) (1878 or 1879–1953)

Revolutionary, Russian Civil War commissar, Soviet Union leader (1929–1953), and Soviet Army commander in chief. Born in Gori, Georgia, son of a shoemaker, Iosif Dzhughashvili completed theological school (1894) and enrolled at Tiflis Seminary. He joined the Russian Social Democratic Labor Party (RSDLP) in 1898 and was expelled from the seminary for revolutionary activities the next year.

Prior to 1917, he was a party worker in Petrograd, but mainly in the Transcaucasus, where he was involved in the 1905–1907 Revolution (and possibly also several bank robberies for the cause). He organized party expropriations, was arrested by czarist authorities, and exiled or imprisoned

Stalin seated with President Franklin Roosevelt during the Teheran Conference. (Library of Congress)

seven times, escaping five times. He assumed the alias Stalin in 1912 and wrote *Marxism and the National Question* (1913).

Stalin was drafted into the czarist army in February 1917 but was excused on health grounds. After the February Revolution, he returned to Petrograd, supporting the Petrograd Soviet cooperation with the provisional government and a defensist continuation of World War I. Upon Vladimir Ilich Lenin's arrival in April, Stalin took up Lenin's "no cooperation, no war" stance.

Stalin played no active role in the October Revolution, editing the *Rabochy put'* (Workers' Path) newspaper at this time. In the wake of the revolution, he served as Peoples' Commissar for Nationalities (October 1917–April 1922) and, fittingly, as Peoples' Commissar for State Control (1919–1920).

During the Russian Civil War, Stalin held political positions, often disagreeing with and being insubordinate to the Red Center Command, and led the military opposition to

Leon Trotsky against his use of former czarist officers but had scant positive military input. He was dispatched to Tsaritsyn as CEC plenipotentiary to requisition grain from the northern Caucasus (June 1918), but he abandoned these duties, forming a "Tsaritsyn" clique around Kliment Voroshilov, Sergei Konstantinovich Minin, and later Semen Budennyi (1919) and controlling the northern Caucasus politico-military apparatus. Stalin then served as chairman of the northern Caucasus military soviet (July) and the southern front Military Revolutionary Committee (RVS) (September–October) against Lieutenant General Peter Nikolaevich Krasnov. In October, he was recalled to Moscow for insubordination, beginning his feud with Trotsky.

His disagreements aside, during the Russian Civil War, Stalin was made a member of the Military Revolutionary Committee of the Republic (RVSR), serving from October 1918 to July 1919 and from May 1920 to April 1922), as well as a member of Central Committee Commission investigating the Perm catastrophe (January 1919); and he opposed

Trotsky and Lenin at the Eighth Party Congress military debates (March 1919). He then became a member of the RVS of the western front (July–September 1919), defending Petrograd against Nikolai Yudenich and the southern front (October 1919–January 1920) against Anton Denikin.

During the Polish-Soviet War, Stalin was southwestern front RVS member (January–August 1920) and is considered most at fault for the debacle at Warsaw, ignoring Sergei Kamenev's orders to support Mikhail Tukhachevsky's western front and seeking the glory of taking Lvov instead.

He secured his position as Soviet Union leader after Lenin's death early in 1924 by outmaneuvering Trotsky, Grigory Zinov'ev, Lev B. Kamenev, and Nicolai Bukharin. While in power, he modernized the heavy industry segment of the USSR through rapid industrialization drives and the collectivization of agriculture, enabling modernization and mechanization of the armed forces under Tukhachevsky (who was later shot). Millions of peasants starved as grain was exported to pay for industrial investment.

Stalin's manic Great Terror (1937–1938) resulted in the execution of nearly half of the Soviet military command and political staff from brigade commander upward and thousands more below, leaving a cowed leadership unprepared for war. With Britain and France reluctant to sign a collective security pact against Germany, Stalin signed the Nazi-Soviet Pact (1939, also called the Molotov-Ribbentrop Agreement), taking over eastern Poland, Bessarabia, Bukovina, and the Baltic states (1939–1940). Whatever their official propaganda "lines," Adolf Hitler and Stalin actually thought quite highly of each other, understandably, as they had much in common.

The poor Soviet performance against Finland (1940) encouraged German aspirations, and the damaged Red Army leadership prepared for the wrong war, assured by Stalin that the Germans would not invade the USSR. Stalin, ever the blunderer, ignored repeated warnings, allowing the surprise German attack (June 1941). His initial stunned inactivity, refusal to allow withdrawals, and costly unprepared offensives increased Soviet losses, but his willpower finally instilled morale for the crucial Moscow counteroffensive (December 1941), halting Operation BARBAROSSA.

Installing himself as commander in chief (from July 1941), he increasingly listened to his generals, creating an effective military leadership. The politico-economic system established in the 1930s enabled Soviet recovery and victory, but at the enormous cost of more than 20 million dead.

After the war, Stalin established the Warsaw Pact in Eastern Europe, contributing to the emergence of the Cold War. He only grudgingly acknowledged the Chinese Communist success but had the wit to remain uninvolved in the Korean War (1950–1953).

Stalin died in Moscow, and his funeral evoked genuine grief from the Soviet peoples who had suffered so much under his iron rule. But in 1956, Nikita Khrushchev began the process of "de-Stalinization" and in the process revealed some of Stalin's worst blunders and excesses. Although he never achieved the mythic legend of pure evil that has rightly cloaked the memory of his erstwhile partner Adolf Hitler, Stalin was actually responsible for the deaths of far more persons.

Stalingrad (17 July 1942–2 February 1943)

The German failure to defeat Red Army forces in the southern European part of the USSR and capture Soviet petroleum resources, a turning point in World War II.

Directive 41, issued on 5 April 1942, outlined Operation BLUE, a renewed German offensive. The principal objectives were capturing the Kerch Peninsula (8–15 May), Kharkov (17–28 May), and Sebastopol (7 June–4 July); seizing the oil and mineral wealth of the Caucasus (28 June, unachieved); and capturing Leningrad (unachieved).

On 12 May, the Sixth and Fifty-Seventh Soviet Armies were destroyed in a failed bid to liberate Kharkov, leaving the area between the Don and Volga Rivers undefended. Adolf Hitler split Army Group South in early July: he directed Army Group A to advance to the Caucasus and Army Group B to provide flank protection while advancing to the Volga River. The capture of Stalingrad became an objective of Army Group B only on 13 July.

From 17 July to 18 August, the conflict was in the area of the Don bend and moved to between the Don and Volga Rivers on 19 August–3 September. Maikop was captured by Army Group A on 8 August, and the Sixth Army of Army Group B was fighting in the vicinity of Stalingrad on 4–13 September. Covering the latter were the Hungarian Second

Army, Italian Eighth Army, and Rumanian Fourth Army, protecting the northwest corridor to Stalingrad, while the Rumanian Third Army held the southwestern flank. These Axis armies had no significant antitank defenses or armored reserves.

To deter further Red Army retreat, Stalin issued the “Not one step back!” order no. 227 on 28 July, which contained draconian disciplinary measures. General Vasili Chuikov assumed command on 12 September of the Soviet Sixty-Second Army defending Stalingrad.

On 14 October, Hitler limited German operations to Stalingrad and the Terek River in the Caucasus. The mechanized divisions of Sixth and Fourth Panzer Armies were employed in the battle for Stalingrad itself (13 September–18 November) but were unsuited for close-quarter urban fighting.

The Soviet counteroffensive planned by Marshals Georgy Zhukov and Aleksandr Vasilevsky, Operation URANUS, began on 19 November, when 90 percent of Stalingrad was in German hands. On 23 November, Soviet pincers closed to encircle 330,000 Axis forces. General Erich von Manstein and the Eleventh Army’s attempt to break through on 12 December was unsuccessful, as was the Luftwaffe’s bid to airdrop supplies to General Frederick von Paulus’s Sixth Army. Adolf Hitler’s refusal to allow the Sixth Army to retreat sealed its doom. The Soviet reduction of the Stalingrad pocket continued until 2 February 1943. The surrender of the Sixth Army was the greatest capitulation in German military history. Except for the wounded earlier evacuated by air, not one Axis soldier escaped the entrapment.

Stamford Bridge, Battle of (25 September 1066)

First battle between two contenders for the English throne, Harald II Godwinsson and Harald III of Norway (also known as Harald Sigurdsson or Harald Hardradi). Although the English and Scandinavian sources differ about geogra-

phy and the actions immediately preceding the battle, they concur about the outcome.

Tostig, Harald’s brother, joined forces with Harald Hardradi, and in late September, they invaded England along the Humber River. Two of Harald Godwinsson’s earls, Edwin and Morcar, attempted to repulse the Norwegian forces but were unsuccessful. They were defeated at Fulford before Harald Godwinsson could arrive to help them.

Buoyed by his defeat of English forces, Hardradi overcame York and accepted its surrender. Harald Godwinsson’s arrival with seasoned forces and archers came as a complete surprise. The Norse invaders were vanquished, and Harald Hardradi and his ally Tostig Godwinsson were killed.

Steuben, Friedrich Wilhelm Augustin, Freiherr von (1730–1794)

German officer who fought with the Americans in the Revolutionary War. Born on 17 September 1730 in Magdeburg, Prussia, Steuben became a soldier at age 16. During the Seven Years’ War (1756–1763), he rose to the rank of captain in the Prussian army and was for a time attached to the general staff of Frederick the Great. After the war, Steuben retired from the army and became court chamberlain for the prince of Hohenzollern-Hechingen. Recruited by Benjamin Franklin, the American ambassador in France, he was given a letter introducing him to General George Washington as a “Lieutenant General in the King of Prussia’s Service” and an ardent supporter of the American cause.

Arriving in America in December 1777, Steuben impressed the Continental Congress and George Washington with his fictitiously high rank and his accommodating personality, and he was appointed to train the Continental forces stationed at the winter encampment of Valley Forge, Pennsylvania. No more valuable appointment could have been made at this nadir of the American fortunes. With the rank of major general and the position of inspector general, he wrote a manual, *Regulations for the Order and Discipline of the Troops of the United States*, which became the standard for the entire army and served as the country’s offi-

cial military guide until 1812. He also remodeled the army's organization, improving its discipline and organizing an efficient staff. The American near-victory at Monmouth, New Jersey, in June 1778 demonstrated that, in the northern states at least, Steuben had made an American army.

In 1780, he sat on the court-martial of the British army officer Major John Andre, who was charged with espionage. In the same year, he was finally granted a field command, when he served as a division commander in Virginia and participated in the siege of Yorktown (1781), which basically marked the final defeat of the British.

After the war, Steuben became an American citizen and settled in New York City, where he lived so extravagantly that, despite large awards of money from Congress and the grant of 16,000 acres of land by New York State, he fell into debt. Finally, in 1790, he was voted a life pension of \$2,500 per year, which sufficed to maintain him on his farm near Remsen, New York, until he died on 28 November 1794.

Stilicho, Flavius (365–408)

Half-Roman, half-Vandal Roman commander appointed guardian for Theodosius's son Honorius, emperor of the western empire after 394. Theodosius also appointed Rufinus as guardian for his son Arcadius, who ruled the eastern empire.

Differing opinions concerning the treatment of barbarians within the empire resulted in a rivalry between Stilicho and Rufinus. It was interrupted when barbarians led by the Visigoth Alaric invaded Thrace and Macedonia. Several campaigns against Alaric failed to result in a definitive victory for Stilicho, but an understanding was reached between the two men. By 407, Stilicho arranged for Alaric to hold Epirus for Honorius, while he pursued his plans to capture Illyricum. A false report that Alaric had died resulted in the abandonment of the plans. Alaric then marched south, demanding a heavy compensation for his time and efforts. Stilicho persuaded the Senate to pay Alaric 4,000 pounds in gold. Unhappy with having to pay Alaric and hearing rumors that Stilicho planned to elevate his son to the eastern throne

after Arcadius's recent death, Honorius ordered the execution of Stilicho. He was beheaded on 22 August 408.

Stilwell, Joseph Warren (1883–1946)

Prominent and acerbic American general during World War II. Born on 19 March 1883 in Florida, he grew up in Yonkers, New York, in fairly comfortable surroundings. Stilwell's father decided that his mischievous son should attend the U.S. Military Academy at West Point to learn some discipline. He graduated in 1904 and joined the infantry.

After serving two years in the Philippines, Stilwell returned to West Point to teach Spanish and French. Lack of action led him to seek overseas assignments during the summer months. Between 1907 and 1910, he made several

Lieutenant General Joseph W. Stilwell, portrait in uniform, 1942. (Library of Congress)

undercover intelligence-gathering trips to Latin America. During World War I, Stilwell served as an intelligence officer for the IV Corps of the American Expeditionary Forces. When the war ended, Stilwell volunteered for overseas intelligence gathering once again and was assigned to China. Over the next two decades, Stilwell alternated between staff and field commands in both the United States and China.

In 1942, Stilwell was assigned command of the China-Burma-India theater of operations. In addition, he managed Lend-Lease aid to China. In early 1942, he personally led a small group of Americans and Chinese out of besieged Burma in an epic trek just ahead of the invading Japanese. Upon his arrival in India, he cut through the self-serving propaganda of “fighting retreats” and “strategic withdrawals” and stated flatly, “I claim we took a hell of a beating.” He soon enough became known, and not always with affection, as “Vinegar Joe.”

With his theater at the bottom of the Allied list of priorities, Stilwell found it difficult to get the men and supplies necessary to liberate Burma and open a land supply route to China. Between his acerbic demeanor, stinging comments, and ambitious goals, Stilwell did not get along with either his Chinese or British (“limey”) allies. The Chinese dictator Chiang Kai-shek (“Peanut”) several times asked for his recall, especially after Stilwell called for greater cooperation with Chinese Communist forces fighting the Japanese. Stilwell was recalled in October 1944 and returned to the United States to command the Ground Forces Command. In June 1945, he took over as commanding general of the Tenth Army.

After the war, Stilwell commanded the Sixth Army. He died of stomach cancer on 12 October 1946 in San Francisco, California.

Stimson, Henry Lewis (1867–1950)

Soldier, statesman, and adviser to five U.S. Presidents. As secretary of war in the cabinet of President William Howard Taft from 1911 to 1913, Stimson attempted to initiate reforms to modernize the U.S. military. During World War I, he

held the rank of colonel in the army as a field artillery officer in France. In 1927, Stimson was appointed by President Calvin Coolidge as special emissary to Nicaragua to bring an end to that country’s civil war. From 1927 to 1929, he administered the Philippine Islands as governor-general. President Herbert Hoover appointed Stimson secretary of state from 1929 to 1933. On 7 January 1932, following Japan’s occupation of Manchuria in 1931, the United States issued the so-called Stimson notes, which stated that the United States did not recognize the Japanese puppet state in Manchuria (Manchukuo).

Stimson represented the U.S. delegation to the London Naval Conference in 1930. In an attempt to develop bipartisan support for his foreign policy, President Franklin D. Roosevelt selected Stimson, a Republican and prominent member of the interventionist Committee to Defend America by Aiding the Allies, as his secretary of war in 1940. As secretary of war, Stimson proposed the adoption of selective service, advocated Lend-Lease, supervised the expansion and training of the U.S. Army, and supported the internment of U.S. citizens of Japanese descent on the West Coast. Stimson also acted as the chief adviser on atomic policy to Presidents Roosevelt and Harry S. Truman. Stimson’s role in Truman’s decision to drop the bombs on Japanese cities of Hiroshima and Nagasaki is controversial. He justified the use of the atomic bombs, arguing that their use hastened Japan’s surrender and ultimately saved more lives than they cost by obviating Operation DOWNFALL, the proposed American invasion of the Japanese home islands. He also appreciated that demonstrating the bombs’ power might impress the USSR, the United States’ future Cold War rival.

Stirling Bridge (11 September 1297)

Great victory of the Scots over the English invaders. After the 1296 campaign of conquest, Edward I’s high-handed de-

General Jeb Stuart returning with captured horses and supplies after the Gettysburg campaign, 1863. (Library of Congress)

mands on Scotland, when combined with the rapacious, brutal behavior of English troops, provoked rebellion. This rebellion in turn led in 1297 to the intervention of an English army numbering some 20,000 heavy cavalry, archers, and infantry, which advanced through the lowlands while some 10,000 Scottish troops were investing Dundee. Abandoning the siege, William Wallace led his force across the Tay River to positions north of Stirling, around Cambuskenneth Bridge, in order to block any English advance beyond the Forth.

At dawn on 11 September 1297, English forces began to cross the bridge, which was so narrow that only two people could pass along it abreast, a nearby ford being totally ignored. The Scots allowed about half the English army to cross before moving to block the ford crossing and trap those English north of the river. The latter were caught first by archers and then by massed pikemen, and an attempt to rush reinforcements across the bridge resulted in its collapse. As English troops, whether from the north bank or the bridge, were forced into the Forth and drowned, Scottish infantry crossed at the ford and fell on the English rear: a number of Scottish nobles and retainers in English service turned coat, and added to the general slaughter. What re-

mained of the English army fled; after the battle just Roxburgh and Berwick remained in English hands.

Stuart, James Ewell Brown (“Jeb”) (1833–1864)

Flamboyant and very successful Confederate cavalry commander, “Lee’s Eyes and Ears.” Stuart was born in Patrick County, Virginia, on 6 February 1833. Commissioned in the Mounted Rifles after graduating thirteenth in the U.S. Military Academy class of 1854, he served in Texas until 1856 and then with the 1st Cavalry in Kansas. Wounded in battle

against the Cheyenne in 1857, he recovered in Washington, D.C., and then served as Robert E. Lee's aide-de-camp in the suppression of John Brown's 1859 raid on Harpers Ferry, Virginia. He resigned his captaincy on 14 May 1861 to join the Confederacy and was immediately commissioned lieutenant colonel.

For heroism at First Bull Run, sweeping his troops from the Confederate left around the Union rear, Stuart was promoted to brigadier general on 24 September. Until the spring of 1862, he led his 1st Virginia Cavalry in skirmishes throughout the Shenandoah Valley. During the Peninsular campaign in June, he rode completely around George B. McClellan's army, gathering important intelligence for the Seven Days' Battles and boosting Confederate morale. This exploit won him his major general's star and command of a cavalry division on 25 July. In a daring raid on Yankee headquarters at Catlett's Station, Virginia, on 22 August, he stole John Pope's uniform, dispatches, and notebook, giving Lee a great advantage for Second Bull Run.

In September, during Lee's first invasion of the North, Stuart fought valiantly at South Mountain and Antietam, and then led a raid on Chambersburg, Pennsylvania, again encircling McClellan before returning to Confederate lines on 12 October. He commanded the Confederate right at Fredericksburg, harassed Joseph Hooker throughout the spring of 1863, took over Stonewall Jackson's corps command when Jackson fell at Chancellorsville, and fought Alfred Pleasonton to a draw in the huge cavalry battle at Brandy Station, Virginia, on 9 June. But he arrived at Gettysburg too late to be effective. He continued raiding and skirmishing until the Wilderness and Spotsylvania campaigns of 1864, when he made a concerted effort to stop the advance of Ulysses S. Grant and Philip H. Sheridan. Shot by one of Sheridan's soldiers at Yellow Tavern on 11 May, he died in Richmond the next day.

Student, Kurt (1890–1978)

Germany's premier airborne officer. Kurt Artur Benno Student was born on 12 May 1890 and entered a military school in 1901. In 1910, he was commissioned into a Prussian infantry battalion and became a pilot in 1914. He was involved with the fledgling Luftwaffe after the war, joined the Ministry of Aviation, and then became commander of the Test Center for Flying Equipment in 1935 as a colonel.

In 1938, he was given command of the new 7th Airborne Division. He became Germany's foremost paratroop officer and created the glider force. The first operation for his paratroopers was the landing in Holland on 10 May 1940, where he was wounded and away from duty for some months.

In January 1941, he was promoted to general and received the Knight's Cross. He had already planned the airborne component for the invasion of England and later examined possible airborne landings on Gibraltar, Cyprus, Malta, and Crete.

During the operation against Crete, the battle—and the Airborne Division—were in the balance for some days until the 5th Mountain Division arrived to relieve the hard-pressed paratroopers. After the heavy losses in Crete, Adolf Hitler lost interest in the paratroopers, committing them as ground troops instead. In this role, they still achieved an enviable reputation as good fighters.

Student planned the successful liberation of Mussolini in 1943 and received the Oak Leaves to his Knight's Cross as a reward. In 1944, Student witnessed the failed Allied airborne assault in Holland but could only wish that he had had such resources.

He commanded Army Group H as a colonel general. In 1945, he was captured, later sentenced to five years' imprisonment for alleged war crimes in Crete, and served two years. Student died in the Federal Republic of Germany at age 88 on 1 July 1978.

Sudanese Civil War (1955–)

One of Africa's longest-lasting, bloodiest, and most intractable of civil wars. As a national entity, Sudan has been beset by traditional hostility between a largely Arabic, Islamic north and an African, animist, Christian south. Such

Guerrillas of the “Venom Army” fighting the government troops in southern Sudan, 1971. (Hulton/Archive)

animus predates the arrival of Sudanese independence from Great Britain in 1956 and was almost immediately exacerbated by it. This resentment largely stems from northern attempts to impose Islamic religion and law upon the southern third of the country, as well as a generally condescending attitude of Arab political leaders toward citizens of African descent. Fighting erupted on a small scale in 1955 and was generally contained until September 1963, when African resistance coalesced into a broad-based guerrilla movement called Anya-Nya (Venom of the Gabon Viper). The central government, based in Khartoum, responded with land campaigns and air strikes, which created a flood of refugees. Numerous attempts by Arabic northerners to conduct slave-raiding campaigns were also reliably reported. Fighting was sporadic but vicious, with few prisoners taken on either side. The northerners were generally better equipped for prolonged conflict because they received outright money and material assistance from neighboring Arab states and the Soviet Union. The Africans, meanwhile, welcomed aide from fellow states like Ethiopia, Uganda, and Congo. Fighting sputtered on and off for nearly a decade, with government forces controlling major cities in the south,

while the guerrillas moved about the countryside with impunity. By the time a peace accord was reached in May 1972, the Sudan concluded—after 16 years—Africa’s longest civil war. An estimated 500,000 people perished from either combat, starvation, or disease.

In 1983, a new government under Gaafar Mohammed Nimeiri attempted to further Islamicize the southern regions by imposing strict religious laws upon non-Muslim peoples. The ensuing hue and cry brought old animosities back to the surface, and armed resistance began anew. Curiously, when the government dispatched Colonel John Garang, a member of the Dinka tribe, to suppress the rebellion, he joined them instead. Nimeiri was overthrown in 1985 and replaced by an even more hard-line Islamic regime with close ties to Iran and Iraq. This new alignment, in turn, enabled Garang’s force, the Sudanese People’s Liberation Movement (SPLM), to receive clandestine aid from the United States and Israel, and his forces became exceptionally well armed. To date, fighting continues along a similar pattern: government aircraft bomb villages; its army seizes and controls major urban areas and encourages slave raiding; but SPLM forces roam freely. They have also eliminated nu-

merous government garrisons and closely invested the provincial capital of Juba for several years. Since 1990, an estimated 1 million Sudanese of every ethnic group and religious persuasion have died.

Süleyman I (c. 1495–1566)

Sultan whose long reign marked the apogee of Ottoman military power. Born in Trebizond, Turkey, around 1495, Süleyman succeeded his father, Selim I, without incident in 1520 and immediately initiated an aggressive policy of expansion, personally conducting 13 imperial campaigns in Europe and Asia, along with a myriad of smaller operations throughout his lengthy reign. Süleyman's initial conquests incorporated Rhodes, the few remaining autonomous Christian principalities in the Balkans, and most of Hungary. He decisively defeated the Hungarian nobility at Mohács in 1526 but increasingly came into conflict with Ferdinand I, the archduke of Austria and rival for possession of Hungary, sparking an Ottoman-Habsburg struggle that continued intermittently for decades. Süleyman conducted the first Ottoman siege of Vienna in 1529 and frequently raided the Habsburg frontier. An arrangement dividing Hungary between Ferdinand and Janós Szapolyai, a Transylvanian prince and Ottoman vassal, temporarily secured peace until the formation of an Ottoman-French coalition in 1536. Although this alliance swiftly collapsed under papal pressure, fighting raged throughout the Mediterranean, with Süleyman's navy, commanded by the pirate admiral Hayruddin Barbarossa, destroying the Habsburg fleet under Andrea Doria at Preveze, Albania, in 1538. A 1547 treaty reaffirmed the partition of Hungary, but a Habsburg-Polish offensive in 1551 renewed hostilities until a settlement was reached in 1562.

Süleyman renewed dormant hostilities with the Safavid kingdom in Persia in 1533, invading with two armies that annexed most of Mesopotamia and Kurdistan. He made smaller gains in Georgia and northeastern Anatolia in 1548, attempting to support the Safavid rebel Elkas Mirza against Shah Tahmasp I. Süleyman launched a final Persian offensive in 1554 that reached Azerbaijan. A treaty in 1555 for-

malized Ottoman control of Mesopotamia, Kurdistan, and eastern Anatolia.

In addition to the Habsburg and Safavid wars, Süleyman campaigned against the Portuguese in the Indian Ocean throughout the 1540s and 1550s; annexed the coastal regions of Aden and Yemen, southern Moldavia, and Bessarabia; unsuccessfully tried to capture Malta; and survived numerous insurrections and palace intrigues. During his final Hungarian campaign, he died on 6 September 1566 near Szigetvár and was succeeded by his son Selim II.

Sulla, Lucius Cornelius (138–78 B.C.E.)

Roman general and statesman who led the aristocratic party, the Optimates, in opposing the Populares, led by Sulla's rival, Gaius Marius. Born into a patrician family, Sulla entered military service during the Jugurthine War, persuading Bochas I, the king of Mauretania, to arrange for the capture of his son-in-law Jugurtha, the king of Numidia, thus ending the war. Sulla's success created tension that eventually erupted into a feud between him and his commander, Marius. For several years, he continued to serve under Marius. During the Social War (90–88 B.C.E.), Sulla became consul, thereby possessing the right to lead an expedition against Mithradates, King of Pontus. Marius's attempt to deprive Sulla of his command resulted in a civil war. After Marius fled and Sulla eliminated the opposition, he led the Roman army to Asia Minor. While Sulla fought the Mithradatic War, Marius returned to Rome, where he and his supporters ousted the Optimates, confiscated their property, and received appointments as consuls. Shortly thereafter, Marius died in 86 B.C.E. After Sulla sacked Athens and defeated Mithradates, he returned to Rome in 82 B.C.E. with 40,000 soldiers to learn of the fate of his supporters and immediately declared himself dictator. Under this authority, he captured and executed 8,000 of Marius's supporters, confiscating their property and distributing it among his friends. He then restructured the government to strengthen the power of the Senate while limiting the power of the tribunes.

He also allotted land for his veterans in Roman colonies. Sulla retired from public office in 79 B.C.E. and died the following year.

Sumter, Thomas (1734–1832)

American militia general and guerrilla fighter, nicknamed “the Carolina Gamecock.” Born in Hanover County, Virginia, on 14 August 1734, Sumter fought at Braddock’s Defeat during the French and Indian War (9 July 1755). Rising through the ranks, he became lieutenant colonel in the Second Rifle Regiment (South Carolina) in 1776. He fought the Cherokees, British, and Tories before resigning from the regular army when the British burned his home in September 1778.

After Charleston fell in 1780, Sumter organized patriot militia units for partisan action against the British in South Carolina. He was victorious at Williamson’s Plantation (12 July 1780), lost at Rocky Mount (1 August 1780), won at Hanging Rock (6 August 1780), and was defeated in a surprise attack by Banastre Tarleton at Fishing Creek (18 August 1780). He was promoted to brigadier general of South Carolina militia on 6 October 1780 and was wounded at the Battle of Blackstocks (20 November 1780). An aggressive, tenacious commander, Sumter and the backcountry southern “partisans” did not receive their due at the time or in subsequent historical accounts. They not only threw the British and Tories off balance and eventually were a major factor in driving them out of the back country but also kept the local economies functioning by protecting the homesteads and by allowing their men to return home at harvest and planting seasons. As an inducement, Sumter rewarded his troops with loyalist plunder, a policy known as “Sumter’s Law.”

Sumter eventually retired to North Carolina and became a member of Congress. He died in Stateburg, South Carolina, on 1 June 1832, at 98 the last surviving Revolutionary War general. Fort Sumter in Charleston was named in his honor.

Sundjata (c. 1215–c. 1255)

Ruler of Mali. Son of a hunchback woman, whom Mansa Maghan con Fatta of Mali married to fulfill a prophecy, Sundjata was a terrible disappointment. Unable to walk or talk as a child, he was cruelly treated by his stepmothers and their children. On his deathbed, Maghan con Fatta left Sundjata a griot, or bard, to train him for kingship but left his kingdom to an elder son, who continued to harass and demean him and his mother. Sumanguru, the conqueror and expansionist ruler of nearby Ghana, invaded Mali and, while leaving Sundjata’s elder brother as a puppet, killed the rest of the royal family, sparing only Sundjata because of his apparent disabilities.

In exile, Sundjata and his mother traveled the region, befriending the skilled metal workers and enduring legendary trials, such as a confrontation with the Nine Witches of Mali, who failed to curse Sundjata because of his goodness. Eventually learning to speak and walk, Sundjata was taken in at the court of Mema, who had survived Sumanguru’s invasion of his lands with a few strongholds, and treated as a prince. During a tax revolt in Mali, the people called for the return of Sundjata as their ruler, prompting him to raise an army with Mema’s assistance. Uniting the tribes of Mali and the oppressed subjects of Sumanguru, he waged a five-year campaign climaxing in the Battle of Karina, which Sundjata won not only with cavalry but with the secret knowledge that Sumanguru could be defeated by the talon of a cock, which, according to legend, he attached to an arrow and used to kill Sumanguru.

Sundjata then ruled as mansa of Mali, a kingdom approximately the size of western Europe, from 1230 until his death around 1255. During this time, he established a fortified capitol at Niane, conducted cultural and hostage exchanges among the other royal families of West Africa, and ensured that the trade routes were safe from Berbers and banditry. Sundjata’s successors included the famous Mansa Musa, whose pilgrimage to Mecca established Mali as one of the great civilizations of the medieval world.

Sun-tzu (Sunzi) (fl. 500 B.C.E.)

Ancient Chinese general and influential military strategist. According to Chinese writer Ssu-ma Ch'ien, Sun-tzu, sometimes called Sun Wu or Sun Tzi, was born in the state of Ch'i in what is now the Shandong region of China. Sun-tzu's vital dates are most obscure. He was a general for the Kingdom of Wu and led it in victorious battles against the rival kingdoms of Yueh and Ch'u. These accomplishments are still being debated, and there is some disagreement about whether he actually existed, but the influence of the work attributed to him cannot be denied. His 13-chapter book on military strategy, *The Art of War*, considered a classic in the field, stressed deception, mobility, field intelligence, and logistics. The work influenced Chinese military thinking for centuries. Mao Zedong used it for the basis of his handbook on guerrilla warfare. A Jesuit, Father J. J. M. Amiot, translated the work into French in 1782, and Napoleon supposedly studied its precepts extensively during his campaigns. Translated into English in 1905, *The Art of War* is required reading in many business schools as well as military academies around the world.

Suvorov, Aleksandr Vasilyevich (1729–18 May 1800)

Recognized as the foremost military mind of his time. Suvorov was born in 1729 and enlisted in a guards regiment in 1742. During the Russo-Turkish War of 1768–1774, Suvorov captured Hirsov fort on 14 September 1773, for which he was promoted to lieutenant general. On 19 June 1774, Suvorov's army defeated the numerically superior Turkish force of Abder-Rezak Pasha at Kozludji.

During the Russo-Turkish War of 1787–1792, Suvorov repelled two Turkish seaborne assaults (September–October 1787) against the Kinburn fortress. On 22 September 1789, Suvorov ousted Yusuf Pasha's forces from their encampment on the Rymnik River. For this, Suvorov was made a count

and received the honorific title of "Rymniksky." In 1790, he captured the fortress of Ismail. He was promoted to field marshal in 1794 and wrote *The Science of Victory* in 1797.

During the War of the Second Coalition (1798–1801) against Napoleon, Suvorov defeated the French at Cassano d'Adda, the Trebia River, and Novi Ligure. His troops then crossed the Alps to attempt to link up with Russian and Austrian forces in Switzerland, commanded by General Aleksandr Rimsky-Korsakov and Archduke Charles. However, while Suvorov's forces negotiated the St. Gotthard Pass, Charles was ordered back to the Rhine, and Rimsky-Korsakov was defeated.

Suvorov's 18,000 Russian and 5,000 Cossack troops now faced 80,000 French troops under Marshal André Masséna's command. Suvorov, wisely, did not accept battle and managed to conduct 16,000 troops to Lindau and over the Alps. He was promoted to generalissimo and wrote *Rules for the Conduct of Military Actions in the Mountains*.

After falling out of favor with the czar, Suvorov was stripped of his titles on 21 January 1800. He died on 18 May 1800. Suvorov is credited with winning 63 battles without suffering a single major defeat.

Swinton, Sir Ernest Dunlop (1868–1951)

British army officer and father of tank warfare. Born in Bangalore, Mysore, India, on 21 October 1868, Ernest Swinton was educated in England and attended the Royal Military Academy in Woolwich. Commissioned in the Royal Engineers (1888), he spent five years in Indian service before becoming an assistant instructor in fortification at the school of military engineering in Chatham (1896). Following participation in the Boer War as an engineer, he published two books on tactics and future warfare.

A year after being promoted to major in 1906, Swinton became chief instructor in fortification at Woolwich. Posted to the historical section of the Committee of Imperial Defence in 1910, he became its assistant secretary in 1913.

An official war correspondent in France at the beginning of World War I, Swinton believed the deadlock of trench warfare might be broken by an armored vehicle that could roll over the trenches and in October 1914 suggested to the

Committee of Imperial Defence that Holt caterpillar tractors be converted into fighting machines. First Lord of the Admiralty Winston Churchill created a Landships Committee, and a prototype vehicle was produced. An official demonstration of the tank in February 1916 went well, although skeptics thought that it would easily be destroyed by artillery fire. Swinton coined the generic word *tank* as camouflage when the vehicles were shipped to France.

Appointed commander of the new unit, Swinton protested its premature use but was overruled when British commander General Sir Douglas Haig sought to break the deadlock in the Battle of the Somme. The tanks were first employed (15 September 1916) without great success. Swinton, meanwhile, had been “released” to his former duties in the War Cabinet secretariat and without direct association with the force he had fathered. After U.S. entry in World War I, Swinton was promoted to temporary major general and traveled to the United States to speak on behalf of war bonds. In 1934, he became colonel-commandant of the Royal Tank Corps. Swinton died at Oxford on 15 January 1951.

Swiss Neutrality, Defense of

The history of Swiss neutrality spans almost five centuries but has evolved in the international context from a convenient stopgap measure for a troubled nation into a cornerstone of international diplomacy. From its formation in 1291, the loosely united Swiss Confederation, initially consisting of three cantons, often supplied mercenaries to princes and states. This practice was dictated in part by the poverty of the country, which depended on mountain farming to support its citizens and had limited natural resources. For centuries, mercenaries thus helped the Swiss economy, sometimes going so far as to fight each other.

The first expression of neutrality followed the Battle of Marignano in 1515, at which Francis I of France defeated a 20,000-strong Swiss mercenary army. Under the terms handed down in 1516, the Swiss Confederation was to agree not to engage in any concerted effort against France or its al-

lies. The treaty did not ban the use of mercenaries because Francis I himself saw an immediate use for their services. Cantons also retained their own means to carry out foreign policy, but overall, the confederation showed a definite reticence to act internationally.

The next shift toward full-fledged neutrality came at the Congress of Vienna in 1815. There, Switzerland, which had endured French occupation between 1798 and 1814, was recognized as a buffer state in the middle of western Europe, and a federal agreement confirmed this state of affairs. The Swiss federal constitutions of 1848 and 1874 further codified neutrality as a foreign policy stance by subordinating Swiss cantons' foreign relations to a federal ministry.

Foreign policy actions that reflected Swiss armed neutrality were expressed first through Switzerland's backing of the International Red Cross (founded in 1863 and relying on Swiss diplomatic immunity to carry out its rescue operations) and, in 1871, through Switzerland's internment of French general Bourbaki's defeated army following Franco-Prussian hostilities. In so doing and with the backing of a militia-based army, the Swiss Confederation began to build further on its new identity as an armed neutral state. Switzerland also signed The Hague Convention of 1907 that outlined the rights and duties of neutral nations in war.

In World War I, however, Swiss neutrality faced a test of wills because of the country's multiple cultural identities. The French-speaking part of Switzerland sympathized heavily with the Allies, whereas the German-speaking region was more circumspect. Things came to a head, however, in the person of General Ulrich Wille, who had been named commander of the Swiss army at the beginning of the hostilities. Related to the German kaiser through his marriage, he openly stated his sympathies for Germany and often rejoiced privately over Allied stalemates and defeats. Although he was almost relieved of duty in 1917, he continued to serve until the end of the war. This awkward state of affairs was remedied somewhat when Switzerland became actively involved in protecting the shipping of goods to eastern Europe after World War I. Because all governments had agreed to such Swiss armed escorts, neutrality was not questioned.

In 1920, Switzerland joined the League of Nations and adopted the stance of differential neutrality, whereby it agreed to participate in economic sanctions against states that violated international agreements. Sanctions leveled against Italy in 1938, however, prompted the confederation to withdraw from such a stance and revert to full, integral neutrality.

Such a stance had both positive and negative consequences for the country during World War II. Although the Swiss army generally enforced neutrality against all belligerent incursions, ideological and cultural sympathies did

affect the behavior of the military and civilian leadership. A profound hatred of communism, combined with some sympathies for the promise of stability in a German-dominated Europe after the war, prompted such orders as banning Swiss pilots from attacking German formations smaller than three aircraft during the early phase of the war. At the same time, the tightening of Swiss neutral attitudes prompted the closing of borders to refugees as of 1942. This was a peculiar interpretation of the neutral stance because parallel economic cooperation with Nazi Germany did take place. Although such economic action may have been required to help the country survive, in many instances, agreements were reached with very little pressure from Nazi authorities. As the tide began to turn in favor of the Allies, however, Swiss attitudes began to change, but the damage had been done, despite the army's proper defensive stance at the border.

Consequently, Swiss neutrality shifted anew after the war, this time to a stance of "neutrality and solidarity." The term reflected a kind of active involvement whereby Switzerland, although it did not join the newly created United Nations (UN), provided neutral observers in conflicts. For example, it acted as one of the four nations monitoring the cease-fire agreement between North and South Korea. This evolution toward a more flexible armed neutrality stance has involved the reimplementation of economic sanctions in the 1990s (against Iraq) as well as allowing planes from the UN armed agencies to transit over Switzerland on their way to the Balkans.

Today, Switzerland maintains its active neutrality stance backed by a militia army. The end of the Cold War has required a revision of the militia system, whereby all young men must undergo basic training and then serve two or three weeks per year for a decade. Although termed *militia*, the Swiss army has a very strict interpretation of the word. Corps commanders (a general is named only in times of war) and command staff, as well as certain weapons specialists (such as interception pilots), work full-time, but mid-level officers serve a few weeks a year, like enlisted men (nobody can jump straight to officer level; additional training is required of enlisted men selected during basic training). Although male citizens who serve with the troops (a civil service now exists for conscientious objectors) are given care of an assault rifle to keep at home (officers and hospital personnel receive a handgun), the weapons' usage follows a clearly defined protocol, as gun control in the country is based on strict laws (whereby even gun collectors have to register with police). The rationale for entrusting weaponry to common citizens is that it can accelerate the level of preparedness in case of a crisis. Soldiers joining their units have much of their equipment ready, which implies, according to

some theoretical projections, that some 400,000 men could be ready to fight within 48 hours. The smallness of the territory and the various installations and self-destructive systems (major bridges and dams are wired to detonate in the event of enemy occupation) help back the argument of a convincing armed neutrality. In recent years, however, pacifists as well as serving citizens have questioned the need for such preparedness in the context of a post-Cold War world, stressing the need for greater international involvement (solidarity over neutrality) as well as the rising costs of a military that has no other use but the defense of a territory less than half the size of Massachusetts. However, it could be remembered that Adolf Hitler called Switzerland "a pimple on the face of Europe," but Switzerland was one of the few European countries that he did not invade; he was undoubtedly aware of the strong defenses of the country. No one can predict that there will be no future Hitlers.

Syracuse, Siege of (415–413 B.C.E.)

Ill-fated expedition by Athenian forces that brought about a major decline in Athenian power in the Peloponnesian Wars. During a truce between the Athenian Empire and the Peloponnesian League, led by Sparta, the Athenian Assembly was persuaded by the charismatic Alcibiades to mount an expedition against the Corinthian colony of Syracuse, ostensibly to preserve the independence of Athenian allies Segesta and Leontini but in reality to seize the wealth of Sicily for operations against Sparta. The force under three generals—Alcibiades himself, Nicias, and Lamachus—comprised 134 triremes, 5,100 hoplites, and well over 30,000 combatants in all.

Just before the expedition sailed, Athenians discovered that the *hermae* (stone figures standing in front of houses and temples) had been desecrated. Alcibiades was linked to the outrage and was also accused of impiety. He was allowed to sail with the expedition but was later arrested. Escaping and defecting to Sparta, he betrayed the plan there.

The cities of Naxos and Catana on Sicily were won over to Athens, and the fleet made a foray into the Great Harbor of Syracuse. Nicias lured the Syracusans to the Athenian camp

at Catana to parley, while the fleet sailed to the Great Harbor of Syracuse, landed, and fortified a strategic position. The first battle of the war was fought when the Syracusan forces returned, resulting in an Athenian victory. But Nicias failed to follow up this success, sailing away with the fleet and allowing Syracuse to prepare for more attacks.

The Athenians returned to Syracuse and began to build a wall across the strategic height of Epipolae above the city, planning to run the wall down the cliff to the harbor and cut off Syracuse's land communications, while the fleet stopped communications by sea. The Syracusans began to build a counterwall to stop the Athenian wall from reaching the harbor, but they were attacked and their wall was destroyed. Another wall they built lower down was also destroyed, but at the cost of Lamachus's life. The expedition was now under the control of the ailing Nicias.

The Syracusans, about to make terms with the Athenians, were told that Corinthian ships under a Spartan general, Gylippus, were coming to their relief. Gylippus slipped past Nicias and entered the city. There he put fresh heart into the Syracusans, and a frenzy of wall building and counterbuilding began. The Athenian wall never reached the coast. Although Nicias had fortified the strategic point of Plemmyrion, commanding the harbor entrance, the Syracusan wall and four forts obstructed the Athenians' access to Epipolae.

Nicias wrote to Athens for permission to retire or, failing that, for more troops to be sent. The assembly sent a second expedition. The day before it arrived, the Athenian fleet already at Syracuse was defeated at sea by the Syracusans. Demosthenes, leader of the second expedition, ordered a night attack to seize Epipolae that ended in confusion, with a loss of about 2,000 Athenian and allied lives.

Demosthenes realized evacuation was the only way to save the Athenian force, but Nicias was difficult to persuade. A lunar eclipse caused the superstitious Nicias to delay the expedition's departure for a month. The Syracusans discovered the Athenians' plans and engaged them in battle in the Great Harbor. Defeated at sea, the Athenians resolved to try to break through the barrier erected across the harbor mouth by the Syracusans, but their ships were driven into the center of the harbor and attacked. After a day-long struggle, the Athenians fell back on their camp.

The force set out on foot, attempting to reach the friendly city of Catana, with Nicias in front and Demosthenes at the rear. The two parts of the army became separated under the constant harrying of the Syracusans. The force under Demosthenes was trapped, and 20,000 men were killed, while 6,000 surrendered. Nicias's starved and thirsty army made its way to the Asinarus River and, while slaking their thirst, were attacked by the Syracusans, who slaughtered

them as they drank. Nicias surrendered to stop the killing, and the survivors were taken prisoner.

Both generals were executed. The prisoners were sent to the stone quarries, where many died during their six months of imprisonment or were later sold into slavery. Only a handful survived to return to Athens.

Syrian-Egyptian Wars (274–168 B.C.E.)

Six wars fought between the Ptolemaic and Seleucid Empires during the third and second centuries B.C.E. Founded by Ptolemy I Soter, the Ptolemaic Empire included Egypt, Cyprus, and possessions throughout the eastern Mediterranean seaboard. Seleucus I Nicator established the Seleucid Empire, which spanned Syria to Afghanistan. Most fighting of the Syrian-Egyptian wars occurred along the empires' common frontier zone, running from Judea (roughly, modern Israel and western Jordan) to the Aegean Sea.

Little is known about the First Syrian-Egyptian War (274–271 B.C.E.). Ptolemy II Philadelphus sent troops into Judea and annexed several harbors and islands along the Mediterranean coast of Asia Minor (modern Turkey). Counterattacking Seleucid forces led by Antiochus I Soter curtailed his offensive and possibly threatened a direct invasion of Egypt. Domestic problems intervened, and Antiochus withdrew, leaving Ptolemy in control of many cities in Judea and southern Syria.

During the Second Syrian-Egyptian War (260–253 B.C.E.), Antiochus II Theos took advantage of Ptolemaic weakness, caused by their disastrous participation in an earlier Greek insurrection against Macedonia, to reoccupy the lost ports and islands of Asia Minor. Seleucid operations in Syria and Judea were intermittent and inconclusive. The marriage of Antiochus to Berenice II, daughter of Ptolemy II, temporarily secured peace.

This marital diplomacy contributed to the outbreak of the Third Syrian-Egyptian War (246–241 B.C.E.), also known

as the Laodicean War for Antiochus II's first wife, Laodice. Antiochus abandoned Berenice and returned to Laodice, only to die in mysterious circumstances. Laodice assassinated Berenice and her son, claiming the throne for her own son, Seleucus II Callinicus. Ptolemy III Euergetes I marched his forces unopposed into Seleucid territory as far as Babylon, capturing much of Syria and Asia Minor and several bases in the Aegean. After Ptolemy's return to Egypt in 245 B.C.E., Seleucus consolidated power and attempted to recover his losses, meeting with little success. A treaty ratified in 241 B.C.E. formally ended the conflict.

In the Fourth Syrian-Egyptian War (219–217 B.C.E.), Antiochus III Megas returned southern Syria and Judea to his dominion after two years of hard campaigning. An emergency force assembled by Ptolemy IV Philopator fought Antiochus's army to a draw at Raphia (Rafah) in 217 B.C.E., forcing the Seleucids to evacuate and negotiate a truce that extended Ptolemaic control as far north as Damascus.

Antiochus III initiated the Fifth Syrian-Egyptian War (202–200 B.C.E.) by invading Judea again in 202 B.C.E., although a Ptolemaic counteroffensive conducted the following year wrested these gains from him. Antiochus launched another offensive in 200 B.C.E. He decisively defeated his ad-

versaries at Panion (Banyas, Israel), bringing all of Palestine as far south as Gaza under his control and ending the war.

Hostilities erupted again in 169 B.C.E., when the regents of Ptolemy VI Philometor threatened an invasion of Judea, sparking the Sixth Syrian-Egyptian War (169–168 B.C.E.). Antiochus IV Epiphanes reacted by occupying Sinai, capturing the major Egyptian frontier garrisons, and annexing Cyprus. The Seleucid ruler opened negotiations with Ptolemy VI, but the Ptolemaic court shifted its support to Ptolemy VIII Euergetes II and called for Roman military assistance. Although encamped outside the walls of Alexandria with victory in his grasp, Antiochus was compelled to disengage by problems in Judea—the beginnings of the Maccabean revolt. Seleucid forces returned in 168 B.C.E. to besiege Alexandria but retreated when Rome threatened intervention.

T

Tactics

The theory and practice of using military forces in combat. Tactics includes movement of troops and supporting arms and services; their deployment and positioning prior, during, and after combat operations; and their use in combat. Thus tactics involves defense as well as attack and all operational use of military forces for low- and high-intensity warfare.

Tactics have been discussed for millennia, but from these discussions has come a distillation of the main principles of war upon which most modern military doctrines are based. All commanders—whether of small units or large formations—disregard the principles of war at their peril. The first of these principles is selection and maintenance of the aim. At the Battle of Marston Moor (1644), Oliver Cromwell put Prince Rupert's cavalry out of the battle early on and had his horse reformed soon after his attack. Goring (fighting on the royalist side), on the other flank, charged and routed Leslie's Scots. Then, however, the royalist cavalry went off to pillage; Cromwell seized the opportunity to attack the cavalry, who had totally forgotten why they were on the battlefield, and destroyed them.

John Churchill, the Duke of Marlborough, took advantage of French persistence in their aim in 1704 by merely anticipating their move. Napoleon always concentrated on defeating his enemy in the field. In 1812, however, he failed to defeat Prince Peter Bagration initially and followed his retreating forces. When Bagration and Barclay de Tolly linked up in the retreat to Moscow, suddenly Napoleon changed his aim and concentrated on Moscow, which led to his ultimate defeat. In World War II, Adolf Hitler's change of goal from Moscow to the southern flank altered the main thrust of the German army, again leading to total defeat.

Offensive action allows a commander to influence the outcome of a battle or campaign, as it confers the initiative on the attacker. In the Russo-Japanese War of 1904–1905,

the Russian concept of warfare was to find somewhere to defend and then to defend it. The Russian general Aleksey Kuropatkin had the chance to defeat the Japanese ground forces piecemeal, but he failed, so ingrained was the concept of positional warfare. The same can be said of the Maginot mentality pervading French military thought in the 1930s.

Surprising one's enemy is fundamental. If surprise is achieved, relatively small forces can often inflict disproportionate damage on an enemy. Operations such as the airborne landing on the Belgian fort Eben Emael show how effective surprise can be. Again, Cyrus at Thymbra (554 B.C.E.) surprised Croesus by attacking in winter. Not expecting military operations in what was regarded as the closed season for warfare, Croesus had allowed his forces to disperse. In 1917, General Edmund Allenby surprised the Turks at Beersheba by using diversionary tactics; he appeared to be about to attack Gaza but took Beersheba on the flank.

Tactical methods can also be used to surprise the enemy. At Marathon (490 B.C.E.), Miltiades defeated Darius by thinning his center and concentrating his forces on his flanks. As the fighting increased in intensity, the thin Greek center withdrew, and Miltiades attacked on both flanks. The Persians lost over 6,000 men, whereas Greek losses were 192. Hannibal basically repeated this tactic at Cannae (216 B.C.E.), as did the patriot commander Daniel Morgan (on a much smaller scale) against the British at the Cowpens (1781), all with overwhelming success. History's great commanders frequently used surprise, a sure sign of their confidence and their mastery of the battlefield.

Gustavus II Adolphus was ahead of Napoleon in using maneuver warfare. At Breitenfeld (1631), Gustavus faced Johann Tserclaes, Graf von Tilly, who had never before suffered defeat. The whole military world was taken by surprise at Gustavus's army organization as revealed in the battle. This mobility led to Gustavus being able to counter every move

made by Tilly, even though the Saxons of Gustavus's army had already been driven from the field. Gustavus made up for inferiority in numbers by fast movement, which countered ponderous moves by the imperial army.

Other surprises include the German attack through the Ardennes to Sedan in 1940. The Germans had done the same in 1870 and in 1914, and no one could believe that they would come the same way again, but this time with armor. Nevertheless, they did, and they did so again in their Ardennes offensive late in 1944. The British were surprised when the Japanese did not oblige them by attacking Singapore by sea in 1942 but, instead, substantially outnumbered, made their relatively easy way down the Malay peninsula to seize the fortress whose guns pointed uselessly out to sea. Again, in the Gulf War (1990–1991), General Norman Schwarzkopf enveloped the right flank of the Iraqi army through almost open desert, when the Iraqi expectation (and that of most “experts”) was for an attack in the region of the Persian Gulf.

Naturally, security and deception play a large part in securing success in war. Both are principles of war, and used in conjunction, they can have far-reaching effects. A good example is the creation in 1944 of a phantom army group in eastern England to convince the Germans that the real thrust of the invasion of France would come in the Pas de Calais region. Even after D-Day had taken place, the Germans were loath to move troops from that area toward the invasion lodgment for fear that the Normandy operation was a feint, so effective was the deception as to Allied strength.

Needless to say, no army can defend itself everywhere. Thus, it is important to economize on effort wherever possible and to concentrate forces where they are most needed and where they will be the most effective. Napoleon used these principles to great effect in his campaign in Italy in 1796, when he defeated Jean Pierre Beaulieu and Baron General Colli piecemeal because they never managed to concentrate their forces against him. Failure to concentrate one's forces is amply shown in Helmuth Johannes Ludwig von Moltke's adaptation of the Schlieffen Plan. He weakened the flank and essentially flawed the German invasion of France in 1914.

It is important to ensure that an army is flexible—the rigidity of Tilly's maneuvers should be contrasted with those of Robert E. Lee and Thomas “Stonewall” Jackson at First Bull Run/Manassas and Second Bull Run/Manassas Junction and at Chancellorsville. Cooperation between commanders is also essential, as is central command and control. The Union was unable to bring its preponderance of resources to bear fully against the Confederacy because of the inability of the federal force commanders to cooperate, until Ulysses S. Grant was given command.

Currently, as throughout history, military forces must be flexible, mobile, and highly trained. In sum, maneuver is

what warfare is really all about, and the inability to move troops around to suit changing circumstances will almost inevitably lead to defeat.

Taginae, Battle of (552)

Taginae, or more properly, the Battle of Busta Gallorum, heralded the end of the Gothic War in Italy. In the spring of 551, Emperor Justinian I named Narses supreme commander of the Byzantine army. Narses entered Italy from the northeast and then marched his troops south on the Via Flaminia toward Rome. In late June–early July 552, the Byzantine army reached the plateau of Busta Gallorum. Meanwhile, the Ostrogoths under King Totila had left their camp at Taginae, near present-day Gualdo Tadino, and advanced north to meet the enemy.

Narses had some 25,000 men under his command, including 5,500 Lombards; 3,000 Heruli; and smaller contingents of Gepids, Huns, Persians, and Romans. Totila could field no more than 15,000 men. Not only were the Ostrogoths outnumbered, but their infantry had suffered in recent years from a lack of proper training and equipment, a serious shortcoming that would cost them dearly in the forthcoming battle.

Narses deployed 8,000 archers in a crescent-shaped formation before his infantry, with the dismounted Lombards and Heruli in the center, while 1,500 cavalry took position on the left wing to outflank the enemy's infantry. Totila formed his army in two lines, with the infantry deployed behind the cavalry. After 2,000 more horsemen had arrived, Totila launched a frontal assault of his cavalry, using the same tactics that had proved successful in many earlier battles. But the broken ground and narrow confines at Busta Gallorum were far from ideal for a massive cavalry attack. Indeed, the charge of the Ostrogothic lancers broke down completely in a torrential hail of arrows unleashed by the Byzantine archers. Narses then seized the initiative, ordering his own cavalry against the remnants of Totila's cavalry and outmatched infantry, who were quickly overwhelmed.

The Ostrogoths suffered devastating losses, with perhaps

some 6,000 men killed, among them King Totila, who had been mortally wounded at the beginning of the battle. The crushing defeat at *Busta Gallorum* signaled the downfall of the Ostrogothic kingdom in Italy, which was to last for barely three more months.

Taiping Rebellion (1850–1864)

The bloodiest civil war in history. After failing his civil service examination in Canton in 1843 for the fourth time, Hong Xiuquan became delirious and fancied himself the son of God, brother of Jesus Christ, and designated savior of China. Soon a large group of followers drew to Hong's curious mixture of Christianity, socialism, idolatry, and revolutionary politics. Feng Yünshan, an early convert, founded the Bai Shangti Hui (God-Worshipping Society) in 1844, and Hong became its leader in 1847. It dedicated itself to overthrowing the Qing dynasty, the Manchu regime that had ruled China since 1644.

Revolt erupted in the summer of 1850 in Guangxi Province. On 11 January 1851, Hong proclaimed the Taiping Tianguo (Heavenly Kingdom of Great Peace) and renamed himself Tian Wang (heavenly king). He awarded lofty titles to his most devoted subordinates: Feng became Nan Wang (south king), Yang Xiuqing became Dong Wang (east king), Wei Changhui became Bei Wang (north king), Xiao Chaogui became Xi Wang (west king), Shi Dakai became Yi Wang (assistant king), Zhen Youzheng became Ying Wang (hero king), Hong Rengan became Gan Wang (shield king), and Li Xiucheng became Zhong Wang (loyal king).

With more than 500,000 men at arms by 1853, the Taipings were mainly victorious until 1856. One reason for these victories is that many Taipings were miners with knowledge of explosives and tunneling. They undermined thick fortress walls to neutralize Qing defensive heavy artillery.

On 25 September 1851, Tian Wang took Yongan. In early 1852, he moved north. In June, Nan Wang was killed in battle near Quanzhou. The siege of Changsha began on 12 September but stalled when Xi Wang was killed there on 17

September. Tian Wang captured Nanjing on 19 March 1853 and made it his capital. He ordered a second northern campaign to capture Beijing. It reached Tianjin and created a panic in the Forbidden City but failed due to communication problems.

The decline of the Taipings can be dated from 2 September 1856, when Dong Wang was murdered on Tian Wang's orders. Thereafter, the rebellion was marked by overconfidence, decadence, internal strife, mutual suspicion, and two serious strategic errors: not acquiring China's major seaport, Shanghai, and not threatening the imperial capital, Beijing. Tian Wang had no talent for generalship and relied on the cult of his personality and the military prowess of his subordinates. He demanded that his rank and file remain celibate while he and his cronies enjoyed luxuriant harems. But his ultimate refusal to move beyond Nanjing and expand his gains doomed his rebellion. After 1859, as Tian Wang's sanity and character deteriorated, Gan Wang as prime minister and Zhong Wang as commander in chief became the real heads of the Taiping government.

Except for the successes of Li Xubin at Wuhan in 1856 and Jiujiang in 1858, the Qing Dynasty was generally impotent to check the rise of the Taipings until, toward the end of the 1850s, three Qing loyalists, Li Hongzhang, Zeng Guofan, and Zuo Zongtang, mobilized powerful regional armies.

From 1856 until 1864, the Taipings fought defensively. Their two military heroes of this period were Zhong Wang in the east and Ying Wang in the west. Twice between May 1860 and May 1861, Zhong Wang attempted to capture Shanghai, failed, and alienated the large foreign population there, turning sympathies, which had been either positive toward the Taipings or neutral toward the imperials. The American adventurer Frederick Townsend Ward founded a crack mercenary outfit, the "Ever-Victorious Army" (EVA), for the Qing in 1860. Britain, which was just mopping up after its victory over the Qing in the Second Opium War (1856–1860), allowed Charles "Chinese" Gordon to lead and train the EVA after Ward was killed in action in 1862.

The two main military factors in ending the war were Gordon's EVA and Zeng's Hunan Braves. Ying Wang's defense of Anjing against Zeng broke in 1861. His death in 1862 left only Zhong Wang to fight. He resisted Zeng, Li, Ward, and Gordon and even made a few gains. Tian Wang died on 1 June 1864 just before Nanjing fell to the Qing on 19 July after a two-year siege. Zhong Wang was executed on 7 August. Sporadic Taiping resistance continued until 1866. The rebellion had claimed upward of 30 million dead.

Takeda, Shingen (1521–1573)

A prominent warlord (daimyo) of Japan's Sengoku period ("the Age of the Country at War"). Shingen Takeda was born Harunobu Takeda in 1521, the eldest son of Katsuyori Takeda, ruler of Kai Province in north-central Japan. Young Takeda overthrew his father in 1541 and installed himself as the provincial *shugo* (military governor). He then embarked on the conquest of neighboring Shinano Province, which was secured by 1555. However, this action brought him into direct conflict with Kenshin Uesugi (1530–1578) of Echigo Province, another young and dynamic military figure. For nearly two decades, the two leaders clashed at the battlefield of Kawanakajima, with especially severe encounters in 1553, 1554, 1556, and 1563.

At length, neither side could gain a decisive advantage over the other, and both turned their territorial ambitions elsewhere. During this period, Takeda shaved his head, became a Buddhist priest, and assumed the more familiar name of Shingen.

At this time, Japan was seething with conflict as major families of samurai battled for control of the country. In 1568, Takeda attacked the Imagawa family and drove it from Surguga Province. However, the ever-shifting balance of power forced him to ally with the Hojo, Asakura, and Asai families to oppose the growing strength of Nobunaga Oda. In 1573, Takeda attacked the combined forces of Oda and his surrogate, Ieyasu Tokugawa, at Mikatagahara, driving them from the field. This defeat had the effect of inducing the weakened shogun, Yoshiaki Ashikaga, to denounce Oda, a feat that ultimately led to the shogunate's downfall. However, Takeda became distracted by events elsewhere and, by failing to follow up this impressive victory, allowed his enemies to consolidate.

In the spring of 1573, Takeda again advanced against Tokugawa and besieged one of his castles in Noda. Events are not clear, but he died either of disease or a gunshot wound on 13 May 1573. The Takeda clan did not outlive his demise and were eliminated as a military threat by Oda at Nagashino in 1575.

Beyond his military prowess, Takeda was also renowned

for his administrative and organizational abilities. He placed Kai Province on a very high order of efficiency and was affectionately regarded by the populace. Takeda was also celebrated for his calligraphy and poetry, military guile, and capacity for great acts of both chivalry and cruelty.

Talas River, Battle of (July 751)

Encounter with Arabs that checked Chinese advance. After the Han, most Chinese dynasties controlled points in Central Asia only to limited degrees because the costs of maintaining Chinese military forces so far from home were enormous. A noteworthy exception was the Tang Dynasty (618–907), which, during its first half at least, could bring enormous resources to bear on the problem.

The Tang interest in central Asia had two roots. One was the desire to control Silk Route commerce, which, by Tang times, was enormously profitable. Second, the Tang needed to control advanced positions in central Asia to forestall potential enemies, above all the powerful Turkic tribes and states of the time that sought to control central Asian commerce for their own interests and to use the profits from it against China.

Thus Tang moved to control the Tarim Basin and points beyond almost from the beginning of its power, following up the lead of the previous dynasty, the Sui. As a result of these advances, Chinese influence extended to the Pamirs by the middle of the seventh century. China continued to maintain a dominant position in the area for the next 100 years, despite incursions by Turks, Tibetans, and others.

While the Tang were building and maintaining their central Asian empire, a new power had arisen in the west. Between 637 and 652, the Arabs conquered Sassanian Iran and Khorasan and, after a pause to assimilate their conquests, began a new advance into central Asia under Qutayba. This brought them directly into the Chinese sphere of influence, and a proxy war developed during the reign of Tang emperor Xuanzong (r. 713–755), with each side attempting to control its vassals and prevent the other from making any real inroads, although open warfare was avoided.

What finally broke this stalemate was the decision of the Tang government to restore its former position in the west to

forestall the Tibetans, resulting in a series of expeditions by the Tang general Gao Xianzhi (750). Established in a new position of power by his conquests, Gao then overreached himself by executing the Turkic king of Tashkent. The king's son called in Arabic troops from Sogdia. In late July 751, on the Talas River, Gao was crushed by the Arabs (although his army was not totally destroyed) after his Qarluqs auxiliaries had switched sides. Details are sketchy, even to the size of the armies (Arabic sources claim more than twice as many were killed or taken prisoner as were in the army of the Chinese general). Existing accounts are also from long after the event.

Some authorities have labeled the battle as decisive in determining that Islamic powers, not China, would control Turkistan. In fact, it was not the battle on the Talas River but the virtual collapse of the Tang dynasty during the An Lushan rebellion and its aftermath (755–763) that ended Tang influence in central Asia once and for all. The dynasty, Arabs or no, simply lacked the resources to assert itself again the way that it had under Xuanzong.

Tamerlane (Temürlenk, 1336–1405)

A Mongol-Turkic ruler whose empire of Central Asia stretched from India to Turkey. Temür of the Barlas tribe was born in Kesh (south of Samarkand) in 1336. Transoxania was ruled by Amir Kazgan of the Chagatai khanate (founded by a son of Genghis Khan). Temür acquired the nickname *lenk* (Persian), meaning “the lame,” after being wounded by an arrow while on a raid to steal sheep. Thereafter, he could not bend his right knee or lift his right arm.

Tughluq Temür invaded Samarkand in 1361 and installed his son Ilyas Khoja as ruler. For his support, Temürlenk became chief minister. Temürlenk overthrew Khoja in 1364 and then killed his co-conspirator Amir Husayn in 1370, proclaiming himself the Chagatai heir who would resurrect the empire of Genghis. Temürlenk then fought against the Jagatai khans (eastern Turkistan) for regional supremacy until 1380.

Temürlenk captured Herat, Khorasan, and eastern Persia from 1383 to 1385. Azerbaijan, Armenia, Mesopotamia, and Georgia were occupied in 1386–1394. The khan of the

Golden Horde, Tokhtamysh, invaded Azerbaijan in 1385 and Transoxania in 1388. Temür's struggle with him (1391–1395) continued until Tokhtamysh surrendered at the Kur River. Temürlenk occupied Moscow for a year. Meanwhile, Persia revolted. Temürlenk massacred 70,000 people in Esfahan in 1387 and had buildings constructed out of their skulls. On 24 September 1398, Temürlenk crossed the Indus River toward Delhi. He destroyed Sultan Mahmud Tughluq's army at Panipat on 17 December and massacred 100,000 inhabitants in Delhi.

In 1399, Temürlenk campaigned against the Mamluk sultan of Egypt and the Ottoman Sultan Bayazid I. Regaining Azerbaijan, Temürlenk destroyed Aleppo, defeated the Mamluk army, occupied Damascus, and massacred 20,000 people in Baghdad in 1401. On 20 July 1402, he destroyed Bayazid's army near Ankara. After capturing Smyrna from the Knights of Rhodes, the Byzantine co-emperor John VII negotiated peace.

While preparing an invasion of China, Temürlenk died of illness at Otrar on 19 February 1405. Prior to his death, Temürlenk divided his territory among his sons and grandsons. His youngest son, Shah Rokh, reunited the empire and established the Timurid Dynasty.

Temürlenk campaigned for plunder or to prevent the rise of rivals but made few administrative innovations or successes. His army was territorially grouped into *tuman* of 10,000 on the basis of Mongol organization. Advance and flank guards were employed on the march. Cavalry was held in reserve and employed as shock troops after infantry engagement.

Tannenberg, Battle of (15 July 1410)

Also known as the Battle of Grunwald in Poland, in which a combined Polish-Lithuanian army routed the army of the Teutonic Order. By the beginning of the fifteenth century, the conflict between the Teutonic Knights and Poland-Lithuania over territories bordering the Prussian lands escalated, until open war broke out in the fall of 1409.

In the morning hours of 15 July 1410, the opposing armies met on the fields between the villages of Grünfelde (Grunwald), Tannenberg (Stebark), and Ludwigsdorf in western Prussia. Wladyslaw II Jagiello, king of Poland, was supreme commander of the combined forces and personally led the Polish army, while his cousin, Grand Duke Vytautas (the Great), headed the Lithuanian troops. The size of both armies cannot be exactly determined. The Polish-Lithuanian army probably consisted of 25,000 to 30,000 men, mostly Polish heavy cavalry and Lithuanian light cavalry, but also smaller contingents of Czech, Moldavian, Ruthenian, and Tartar troops.

Grand Master Ulrich von Jungingen commanded the 18,000- to 20,000-strong army of the Teutonic Order, which comprised their own heavily armored knights, perhaps 100–200 knights from western Europe as “guests,” and several contingents of mercenaries from the German and Polish lands. The order also fielded a few pieces of artillery.

Ulrich von Jungingen made the opening move by launching a major attack against Vytautas’s troops. Initially, the Lithuanians withstood the onslaught, but when the grand master threw additional forces at them, they started to give way and retreated. The Teutonic Knights followed suit, sensing the opportunity for a knockout blow, but the Lithuanians had feigned retreat. The disruption caused in the order’s ranks by this bold maneuver opened the way for a Polish-Lithuanian counterattack. Outmaneuvered and outnumbered, the order’s troops faced encirclement and certain destruction. By the evening, the grand master, many of the order’s political and military leaders, and several thousand soldiers had fallen. The Battle of Tannenberg effectively ended the Teutonic Order’s bid for hegemony in northeastern Europe and contributed to Poland-Lithuania’s rise as the dominant power there.

Tannenberg and the Masurian Lakes (25–30 August, 9–13 September 1914)

Opening battles on the eastern front in World War I. In accordance with prewar military planning, two Russian armies advanced into the German province of East Prussia in Au-

gust 1914. The First Army, commanded by Paul Rennenkampf, advanced from the northeast, while the Second Army, commanded by Alexander Samsonov, advanced from the south. The two armies were to defeat the German Eighth Army garrisoning East Prussia, cut off the province from Germany, and open up the way for a general offensive toward Berlin. The Russian attack was poorly coordinated and ineptly led. The Russian commanders communicated in the open by radio—and were listened to by German radio intercept teams. On 20 August, Rennenkampf failed to follow up on a local defeat inflicted on the Germans at Gumbinnen. For his part, the German commander, Max von Prittwitz, panicked and was replaced on 23 August by Paul von Hindenburg, with Erich Ludendorff serving as his chief of staff. Upon arrival at Eighth Army Headquarters, Hindenburg and Ludendorff began to implement a plan, already drafted by the Eighth Army’s first staff officer, Max Hoffman. Leaving a light screening force of cavalry before Rennenkampf, the bulk of the Eighth Army moved south to deal with Samsonov. During the ensuing Battle of Tannenberg, the Eighth Army inflicted a crushing defeat on the Second Army, which suffered some 50,000 casualties and 90,000 captured. Realizing the extent of his defeat, Samsonov committed suicide. Having annihilated the Second Army, the Eighth Army now turned north to deal with Rennenkampf’s First Army. At the Battle of the Masurian Lakes, the Russian First Army suffered 70,000 casualties and 30,000 captured. In both battles, the Germans suffered some 40,000 casualties. A brilliant tactical victory, Tannenberg resulted in the emergence of Hindenburg and Ludendorff as the most popular and ultimately the most powerful generals in Germany, with disastrous long-term consequences for the nation.

Tarawa (20–23 November 1943)

First U.S. amphibious assault against a heavily defended island in World War II. American planners in 1943 determined upon the capture of Betio, the main island of Tarawa

Marines in battle with the Japanese at Tarawa, 1943. (Library of Congress)

Atoll in the Gilbert Islands. Betio, 2.5 miles long, a maximum of 500 yards wide, and typically less than 10 feet above sea level, was home to an airfield that could support further American advances in the Pacific. It bristled with fortifications and 4,500 Japanese marines under the command of Rear Admiral Shibasaki Keiji, who boasted that a million men could not take Tarawa in a hundred years.

To prove him wrong, Major General Julian Smith's 2d Marine Division, accompanied by the protective hail of naval gunfire from Raymond Spruance's Fifth U.S. Fleet and a company of tanks, assaulted Betio on 20 November 1943. From the beginning, however, the assault went wrong. The bombardment lifted early, a strike by heavy bombers never materialized, and planners overestimated the depth of the water covering Betio's outer reef. This last mistake proved especially deadly. Although the first three waves of marines rode in amphibious tractors that could pass over the reef,

follow-on waves carried in conventional landing craft that could not. These landing craft unloaded their marines on the northern, lagoon side of Betio, 800 yards from the beach, forcing them to wade half a mile through chest-deep water under intense enemy fire.

By nightfall, marines held two shallow perimeters and were desperately short of ammunition, water, and reinforcements. They attacked the next morning, however, and with the aid of a fresh battalion and several tanks, cut the island in two. Despite more desperate fighting, the island was finally declared secure following a massive—and futile—Japanese banzai charge on 23 November.

Tarawa ranks among the most bloody assaults of the Pacific War and one of the few instances in which an American amphibious attack almost failed. U.S. casualties amounted to 1,009 dead and 2,101 wounded, and virtually the entire Japanese garrison of 4,500 perished. Four marines were

awarded the Medal of Honor at Tarawa, which provided abundant lessons for amphibious assault planners during the remainder of World War II.

Tariq ibn Ziyad (fl. 711–712)

Berber military leader who led the Muslim conquest of Iberia, creating the medieval Islamic realm of Andalus (Spain). In 694, the Umayyad caliph sent Hassan ibn al-Nu'man to Qayrawan, Tunisia, to pacify North Africa. Needing reinforcements, he began recruiting among the local Berber tribes, converting them to Islam in the process. Fiercely independent, Berber society shared much with the Arab, including horse-mounted and mountaineer warrior traditions. Hassan's replacement, Musa ibn Nusayr, used these tribes with increasing success. In 708, Musa took Tangiers and appointed a Berber Muslim chieftain, Tariq ibn Ziyad, as governor.

In April 710, apparently on his own initiative, Tariq crossed the Straits of Gibraltar with 20,000 to 30,000 troops, fixing his base camp at the mountain bearing his name (in Arabic, Jabal Tariq). His Berbers may in fact have been invited into Spain by enemies of the Visigothic king, Roderick. In July, the Visigoth army, over 50,000 strong, confronted the Berbers near Medina Sedonia. Nonetheless, Tariq drove the Visigoths from the field, perhaps because some Visigoth nobles had planned to desert the king from the start. With Roderick dead and the Visigoths demoralized, Tariq captured Roderick's capital, Toledo. In 712, Musa ibn Nusayr followed Tariq, leading his Arab army into Spain. The two joined forces and swept north to the Ebro River, taking more cities by negotiation than siege. In 714, the two were summoned to Damascus, and Tariq's military career ended in obscurity. Nonetheless, he had established an Islamic presence in Iberia that endured eight centuries.

Taylor, Zachary (1784–1850)

American field commander and president. Taylor was born in Orange County, Virginia, on 24 November 1784 and grew up in Kentucky. A volunteer for the militia in 1806, he was commissioned a lieutenant in the regular army in 1808 and promoted to captain in 1810. Serving under William Henry Harrison against Tecumseh in 1811 and 1812, he was brevetted a major for his defense of Fort Harrison, Indiana, outnumbered eight to one, on 4 September 1812. He repulsed an Indian attack at Credit Island, Iowa, on 5–6 September 1814. For the next 18 years, he constructed and commanded a number of frontier forts. Serving as colonel under Henry Atkinson in the Black Hawk War, he distinguished himself at Bad Axe River on 2 August 1832. He won a brevet to brigadier general for his victory over the Seminoles at Lake Okeechobee on 25 December 1837.

As tensions between Mexico and the Republic of Texas increased, Taylor was stationed at various southern forts. Ordered in February 1846 to secure the Rio Grande Valley, he won a skirmish at Brownsville on 25 April, defeated Mariano Arista at Palo Alto on 8 May and at Resaca de la Palma on 9 May, and occupied Matamoros on 18 May. Among his subordinates on this expedition were many future American Civil War generals. He attacked Monterrey on 21 September and concluded an armistice in his favor on 24 September. He then drove deeper into Mexico, capturing Saltillo in November.

The victory of his 4,600 men over the 15,000 of Antonio López de Santa Anna at Buena Vista in February 1847 made him a war hero and a viable candidate for president. At the Whig Party Convention in June 1848, he beat Henry Clay, Daniel Webster, and another war hero, Winfield Scott, for the nomination and won the election in November. But "Old Rough and Ready" did not survive the hordes of office seekers and petitioners and the intense debate over the expansion of slavery into the Mexican Cession territories. He died unexpectedly in Washington, D.C., on 9 July 1850, and his vice president, Millard Fillmore, became president.

A brave, simple soldier who shared his men's hardships in the field, Taylor nonetheless lacked the finesse of General Winfield Scott. The latter commander was able to secure his lines of communication by his wise treatment of the Mexican population; Taylor's men, by contrast, were known by the native inhabitants as "fiends, vomited from Hell." Taylor himself complained of his troops that "there is scarcely a

form of crime that has not been reported to me or committed by them” (Smith 1917–1918, 249).

Tecumseh (1768–1813)

Great Shawnee Indian leader. Born in March 1768 near Old Piqua, Ohio, Tecumseh fought against white settlers during and after the Revolutionary War. During the Northwest Indian Wars (1790–1794), he fought at the Battle of Fallen Timbers and opposed any treaties made with Americans. Tecumseh believed that land belonged to all Indians in common and could not be ceded without consent of all tribes. He joined with his brother Tenskwatawa, known as the Prophet, to form an Indian confederacy and traveled to tribes as far away as Iowa and Florida to spread his message of Indian nationalism. Opposing Tecumseh was William Henry Harrison, governor of the Indiana territory, who persisted in treating with separate tribes. Tecumseh's vision of Indian unity was jeopardized when the Prophet attacked Harrison's army at Tippecanoe in 1811 and was defeated.

During the War of 1812, Tecumseh supported the British cause in hopes of gaining an independent Indian state. Tecumseh often commanded Indian and British forces during campaigns in the Northwest, earning himself an appointment as a brigadier general in the British Army. When Harrison prepared to invade Canada in September, Tecumseh urged the British to stand firm against the invasion. However, the British retreated until they found themselves committed to battle near the Thames River on 5 October 1813. During the battle, Tecumseh was killed, and his death signaled the end of organized Indian resistance to American expansion to the Mississippi River. Tecumseh's military skill and determination to rise above tribal allegiance and to unite his people against American invaders established his legacy as one of the great American Indian leaders. The fact that his body was never found added a mythic quality to his memory. Even the Americans honored him, and during the

Portrait of Tecumseh. (Library of Congress)

Civil War, the Union monitor *Tecumseh* commemorated his name.

Tel-el-Kebir (13 September 1882)

Decisive battle that began 70 years of British domination of Egypt. In 1881, the Egyptian army under the nationalist leader Arabi Pasha revolted against the Ottoman viceroy, or khedive, of Egypt, Mohammed Tewfik Pasha, who was actually a British puppet. Early in 1882, Arabi compelled Tewfik

to make him minister of war. By March, Arabi was exercising dictatorial powers. His followers massacred Christians in Alexandria and demanded the expulsion of all foreigners from Egypt. In August, Britain sent Garnet Joseph Wolseley with 25,000 soldiers to reassert British presence and restore Tewfik's authority.

Wolseley's four-and-a-half-week campaign, precisely coordinated with naval operations, was nothing short of brilliant. The Royal Navy bombarded Alexandria and landed some troops there, leading Arabi to believe that the main British assault on Cairo would come from that direction. Arabi solidified his position south of Alexandria, with his eastern flank guarded by a large garrison at Tel-el-Kebir, a fortified hill about 50 miles northeast of Cairo, on the railroad line from Ismailia on the Suez Canal to Zagazig. Meanwhile, the Royal Navy secured the Suez Canal and landed Wolseley's force at Ismailia. Two divisions assembled at Kassassin on 12 September and then quick-marched 7 miles west that night across the desert. They were within 200 yards of the garrison along a 4-mile front when they were detected at dawn with the harsh rising sun at their backs. Surprise was total. In less than an hour, with small arms and bayonets, the British captured the hill and routed the garrison with the loss of only 57 men. Wolseley's victory outflanked Arabi's entire army and allowed British cavalry to enter Cairo on 15 September nearly unmolested. Arabi was tried and condemned to death but spared and exiled to Ceylon.

Terauchi, Hisaichi (1879–1946)

World War II Japanese field marshal. Eldest son of Japanese general and statesman, Count Masatake Terauchi (1852–1919), Hisaichi Terauchi was born in 1879 in Yamaguchi Prefecture, Honshu. A graduate of the army's military academy (1899) and war college (1903), Terauchi enjoyed a distinguished military career that culminated in his commanding Japanese forces in the southwest Pacific during World War II.

Promoted to general in October 1935, Terauchi served as

war minister (1936–1937), inspector general of military training (1937), commander of the North China Area Army (1937–1938), and military councilor (1938–1941) before his appointment in November 1941 as commander in chief of the Southern Expeditionary Army. In this capacity, he coordinated the Japanese conquest of the Philippines, Malaya, Burma, and the East Indies (1941–1942); oversaw the construction of the infamous “railway of death” linking the Thai and Burmese rail systems (1942–1943); and directed the defense of an area extending from Burma to western New Guinea (1943–1945). Terauchi's successes, which rested primarily on his willingness to allow subordinate commanders to conduct operations as they saw fit, won him a promotion to the honorary rank of field marshal in June 1943 and consideration to replace General Hideki Tojo as prime minister in July 1944. Retaining command of the Southern Army until September 1945 despite suffering a debilitating stroke that year, Terauchi became the only senior Japanese general to hold the same post throughout the disastrous Pacific War.

At war's end, Terauchi avoided trial as a war criminal thanks to Admiral Lord Louis Mountbatten, Allied supreme commander in Southeast Asia, who arranged for his settlement near Johore Bahru, Malaya. There, in June 1946, Terauchi died after suffering a second stroke.

Terrorism

Acts of violence intended for a wide audience in order to create an environment of fear for political reasons. The term originated during the French Revolution when the Jacobins used it in a positive sense to refer to themselves. Later, after the revolution turned the violence in upon itself, *terrorism* became a term of derision with criminal implications. The concept of terrorism has been used and abused in so many different senses as to become almost meaningless, covering almost any and not necessarily political acts of violence.

Although the term *terrorism* entered the modern lexicon in the late eighteenth century, the concept has been known throughout history. The term can be divided and subdivided into a myriad of categories, but two of the most important are “state” and “subnational” terrorism. State terrorism, or terror from above, occurs when the impetus for terror comes from the apparatus of government. State motivation for this type is usually enhanced power and control over subjects

within their jurisdiction. Jacobin terror during the French Revolution, Stalin's Great Terror in the Soviet Union (1920s–1930s) and the “dirty war” of the 1970s in Argentina are examples of this type of terrorism.

Subnational terrorism, or terror from below, is terrorism originating from outside government structures aimed at altering relationships within the corridors of power. The motivations take many forms but can be roughly categorized as religious protest movements, political revolts, and social uprising. Examples from history would include the Irish Republican Army (IRA), Basque Separatists Movement (ETA), Irgun Zvai Leumi, Palestine Liberation Organization (PLO), and Baader-Meinhof Gang, to name a very few.

When denounced for their acts of violence, terrorists respond that an unjust nation's power structure engages in daily “terrorism” and can number its own victims in the hundreds of thousands among the suffering masses crushed by poverty and state-sponsored (or at least -protected) inequality, persecution, and violence. They have no recourse but to undertake a program of decentralized violence to overthrow the unjust powers or at least to bring their cause to public or world attention.

Listing terrorist groups can be very controversial. The adage that “one person's terrorist is another person's freedom fighter” is historically quite true. To the British and Arabs of Palestine, in the late 1940s, the Irgun Zvai Leumi were terrorists, but to the Jewish settlers, they were heroic freedom fighters. To Protestants in Northern Ireland, the Irish Republican Army is a vile band of criminals; to Catholics of the region, they fight the good fight against religious and economic oppression.

Others always force the tactics of the terrorist—they are the tactics of the weak. Terrorists must stay hidden, attacking at opportune moments, creating fear, and spreading terror, because by their very nature, terrorists lack the capabilities to confront the government forces in open battle.

The strategy of the terrorist is to create a climate of fear and vulnerability. As a result, the people demand protection. As the government's response becomes increasingly militarized, terrorists attempt to trap the government and security forces into overreaction. By overreacting, the government alienates the people and the terrorists can portray themselves as the defenders of the masses.

One of the earliest known examples of a terrorist movement is the *sicarii*, a highly organized religious sect active in the Zealot struggle during the first decade of the Jewish Revolts (66–135). Their favorite weapon was a short sword called a *sica* that they would hide under their cloaks. The *sicarii* preferred to attack in daylight, on holidays, or in crowded locations to increase the level of fear and vulnerability of their intended victims.

Group terrorism became more common in the Middle

Ages. One such group, which has fascinated Western authorities, was the Assassins, who were active from the eleventh to the thirteenth centuries. The modern term *assassin* has its roots in the Arabic term *hashashin*, which literally means “hashish-eater.” It is recorded that these terrorists used hashish and other drugs while committing their acts of violence and terror. The assassins were very successful, killing governors, caliphs, and even the crusader king of Jerusalem. Assassins only used daggers, never poison or missile weapons—murder was a sacramental act.

Except in Russia, assassinations until the twentieth century were the work of disturbed “loners,” such as the murderers of the prime minister of Great Britain (1912) and of two U.S. presidents (1865, 1881). But the late nineteenth and early twentieth centuries saw assassination (as well as bombings) increasingly assumed by “political” or terrorist organizations, as in the assassinations of the king of Italy or the Austrian Archduke Ferdinand at Sarajevo in 1914. In 1934, King Peter of Yugoslavia and Prime Minister Engelbert Dollfuss of Austria were assassinated. Zionist terrorists assassinated the British high commissioner to Egypt in 1944 and later bombed the King David Hotel in Jerusalem, and Arab terrorists responded in kind or initiated their own violent acts. The carnage continued; in one year (1951), the prime ministers of Iran and Pakistan, the British high commissioner to Malaya, and the king of Jordan were all victims of assassins with a “political” agenda.

The gun was the favorite weapon of terrorists for the first half of the twentieth century, but by the 1970s, new technology created more opportunities for the weak to strike at the strong. Airplane hijacking became the primary weapon for terrorists to garner the publicity they craved while striking terror into the public. Governments whose aircraft and citizens were victims of acts of terror responded with greater security, increased study of the phenomenon of terrorism, and sometimes even military action. Four hijacked airliners spearheaded the worst terrorism attack in history when they crashed into New York City's World Trade Center and the Pentagon in Washington, D.C., on 11 September 2001. This terrorist attack inflicted on the United States the worst single-day casualty toll in its peacetime history. The fight against terrorism became, overnight, the primary concern of the U.S. government and a much higher priority for the rest of the world.

The military has played an important role in both aiding state-sponsored terrorism and combating the subnational variety. The most famous military raid to rescue hostages was the 1976 raid on Entebbe by Israel. Israeli commandos flew 2,000 miles to Uganda to rescue passengers (most of whom were Jewish) on an Air France jet hijacked by the PLO. This was certainly not an isolated incident. The German government used military force to liberate German hostages

on a hijacked Lufthansa airplane that was forced to land in Mogadishu (1977), and Netherlands security forces successfully stormed a train hijacked by South Moluccans (1979).

Force is no guarantee of success, however. In response to Iranian zealots holding American embassy personnel hostage in Tehran, President Jimmy Carter ordered a large-scale rescue mission. The April 1980 rescue operation was a disaster. In the fight against terrorism, the military is but one of many tools available to governments. The military can be used to end a terrorist standoff (as in the raid on Entebbe), or it can make a situation worse (use of British troops early in the unrest of Northern Ireland). In the latter case, various degrees of reliance upon the military have led to several decades of unconventional warfare between British troops and Irish terrorist organizations.

Political terrorist groups, like the Marxist Baader-Meinhof Gang or their opposing right-wing death squads, seem to pose less of a threat in the early twenty-first century. The most obvious threats now come from violent ethnic and religious groups and possibly narco-terrorists. Even those violent groups that supposedly fight for economic justice usually have strong ethnic support, such as Mexico's rebels in Chiapas, who draw their strength from the local indigenous peoples. Complicating such matters is the propensity of some terrorist groups to engage in illicit drug manufacturing and smuggling, supposedly purely to raise money for "the cause."

With Middle East terrorist groups, not to mention militant Basque, Filipino, Irish, Kurdish, Mexican, Chechen, and East Timorese groups, demanding at least self-government, with narco-terrorists controlling a large swath of Colombian territory, and with "rogue states" like Libya and North Korea sponsoring transnational violence, the opening of the twenty-first century gives little hope for any foreseeable easing of the threat of terrorism to established societies.

Tet Offensive (January–March 1968)

All-out Communist offensive of the Vietnam conflict. During the fall of 1967, the U.S. command in Vietnam began sensing victory. Enemy forces seemingly were increasingly retreating

into the rugged interior of the country, away from populated areas, or across the border into Cambodia and Laos. Perhaps the attrition rate had finally turned against the Communists, and the light at the end of the tunnel was near.

Then, like a thunderbolt, came the Communist Tet Offensive. Previously, there had been a lull in the fighting during the celebration of the Vietnamese Lunar New Year—Tet. This year would be different. North Vietnamese general Vo Nguyen Giap, a master of logistics, had infiltrated nearly 100,000 Vietcong and North Vietnamese main force troops into key urban and coastal areas, and on 31 January they began attacks on 36 of South Vietnam's 44 provincial capitals, 5 of 6 autonomous cities, 64 of 242 district capitals, and 50 hamlets. Clearly, Giap had violated the principle of mass and had badly divided and thinly stretched his forces; he had counted on popular uprisings to augment his troops and to sap his enemy.

Instead, the American and South Vietnamese military responded well, and the people of South Vietnam turned to them for protection. Within a few days, most of the attacks had been repulsed, the Vietcong were destroyed as an independent military force (thereafter, regular North Vietnamese army troops filled out Vietcong units), and the enemy lost more than 120,000 men from January through June 1968; indeed, for the most part, the failed Tet Offensive provided a unique and very valuable breathing space to help the South Vietnamese government with necessary nation-building efforts.

The battle did rage in a few places. Vietcong sappers managed to breach the walls of the U.S. Embassy before being killed; press reports of the aftermath of the attack discounted official reports attesting to this victory. And North Vietnamese troops seized and held the traditional imperial capital of Hue for more than a month. U.S. Marines and South Vietnamese troops had to fight bitterly to break into the old capital to destroy the North Vietnamese positions.

In contrast to the military victory it justifiably claimed, the American command seemingly lost the psychological war when press reports began doubting stories of progress in the war. President Lyndon Johnson asked for a review, eventually called for a bombing halt, and indicated he would not seek reelection.

Teutoburger Wald, Battle of (9)

Major defeat of a Roman army under Varus. By the first century, the Roman army had apparently subjugated the semi-barbaric German tribes east of the Rhine River, extending the borders of the empire as far as the river Elbe. In 9, Augustus appointed Publius Quintilius Varus as legate to the area of Germany between the Rhine and Elbe Rivers.

Varus was an able administrator, but he had little experience leading large-scale military operations. On receiving reports of a tribal uprising near the Wesser River, Varus led Legions XVII, XVIII, and XIX out of summer quarters to quell the unrest and prevent it from spreading to other tribes. His force consisted of approximately 20,000 men, including German auxiliaries and camp followers. They moved slowly through the heavily wooded terrain of the Teutoburger Wald, near the modern area of Osnabrück and Detmold. The legions were ambushed by the Cherusci, a German tribe led by Arminius (Hermann), a former auxiliary with Roman citizenship. Arminius, angered by Roman support for rival chieftain Segestes, wanted to create a confederation of tribes to oppose Roman rule. He was familiar with Roman infantry tactics and devised a strategy to ambush the Romans in a wooded area where numbers and Roman close-order discipline would be negated by the uneven, rain-soaked terrain. Arminius equipped his forces with short javelins, which were hurled at the legionnaires in hit-and-run assaults.

When the fighting began, Varus's German auxiliaries deserted to the enemy. Despite the fierceness of the German assault, the Romans maintained their discipline and were able to build a makeshift fort to fend off the enemy. In the morning, Varus ordered his troops to resume the march. They were savagely attacked and soon lost unit cohesion. The disorganized Roman cavalry was ordered to escape but was slaughtered by the Germans in the rain-soaked forest. After day-long fighting, the Romans had heavy losses but still held their position. The fighting was renewed on the third day, but the hopelessness of the situation was apparent. Varus and most of his senior officers committed suicide. Many of the legionnaires surrendered and were slaughtered by the victorious Cherusci. Few, if any, Romans escaped the massacre. German casualties are unknown. Arminius followed up his victory by capturing most of the Roman forts east of the Rhine River. Only Mainz, defended by the two remaining Roman legions, held out. Augustus dispatched his stepson and heir Tiberius to take command in Germany. Six legions were withdrawn from Raetia, Spain, and Illyricum and transferred to the German frontier. Tiberius strengthened the Rhine defenses, and further territorial loss was prevented.

Varus's defeat stopped further expansion into Germany and prevented the spreading of Roman culture into the re-

gion. Augustus was forced to accept the Rhine River as the northern border of the Roman Empire in the west. Despite occasional forays, the Rhine would remain the border with the Germans until the fifth century, when the Germanic tribes would hasten the fall of the empire in the West.

Teutonic Knights

A military religious order, more formally and properly known as the Order of Teutonic Knights of the Hospital of St. Mary. The order was formed during the Third Crusade, in which large numbers of Germans participated. During the Siege of Acre in 1190 and 1191, crusaders from Bremen and Lübeck built a hospital from the sails of their ships and organized a hospital brotherhood dedicated to the care of sick crusaders. After the fall of Acre, the order was given a house in the city and converted it into a hospital for German crusaders and pilgrims. The order had close ties to the Holy Roman Emperor and to a number of German nobles, and in 1198, the organization was transformed into a knightly brotherhood similar to the Knights Hospitallers of St. John and the Knights Templar.

From 1200 to 1230, the order received donations of property throughout Europe; initially, it focused on the Holy Land and preferred properties along roads or passes leading toward southern Europe or toward ports of embarkation used by crusaders. The order also began efforts to build an independent state, free from secular control. In 1211, King Andrew II of Hungary granted the order land and privileges in Transylvania and encouraged the knights to crusade against pagan Cumans. The order established several towns and castles near pagan areas, defeated the pagans, and then began to assert control over Christian areas bordering the conquered territory. The conquests proved sufficiently threatening that Andrew II expelled the order in 1225, the same year that it gained an exemption from secular control for its holdings in the Holy Land.

In 1230, the Polish dukes of Mazovia and Silesia sought help in fighting the pagan Prussians. The order responded, employing the same tactics it had used in Hungary, though taking care to receive an exemption from secular control for

its holdings in advance. In 1237, the Teutonic Order absorbed the membership and lands of a smaller crusading organization, the Livonian Sword Brothers. This action brought the order into conflict with the pagan Lithuanians and the Orthodox Rus princes of Novgorod. Conflict with the princes of Novgorod ended in 1242, when Alexander Nevsky defeated the order in a battle on the ice of Lake Peipus. The order's conflict with the Lithuanians continued long after the Christianization of Lithuania in 1386.

In battle, the order enjoyed numerous advantages against the Prussians and Lithuanians. The order employed the crossbow, and its use of heavily armored knights proved superior to the more lightly armed and armored forces of its Baltic opponents. By the 1280s, the Order had completed the conquest of the Prussians. The grand master of the order, perhaps sensing that the opportunities for similar expansion in the Levant were limited, moved the headquarters of the order first to Venice in 1291 and then to the Castle of Marienburg in Prussia in 1309. The designation of Marienburg as the seat of the order necessitated expansion of the fortress; by the time it was completed, the castle had a triple set of walls and was one of the strongest in Europe. In the 1300s, the employment of baggage trains carrying supplies enabled the order to conduct winter raids that were sufficiently novel to be regarded by contemporary chroniclers as unusual and noteworthy.

In territory conquered by the order, the Teutonic Knights maintained control by building large farms, and cities, upon which they settled Germans, Poles, and converted Prussians. Many of the order's cities joined the Hanseatic League, a trading organization of German towns, and the order thus gained opportunities for trade and built up great wealth. The order also built castles of brick and stone in conquered territory; indeed, the Teutonic Knights introduced brick manufacture to the Baltic region.

In 1309, the order turned from fighting Prussians and Lithuanians to attack the Catholic Polish population of Pomerania, west of the Vistula River. Though the order was able to incorporate the region, the Polish kingdom was henceforth hostile to the order. In 1386, the Kingdom of Poland and the Grand Duchy of Lithuania were united through a dynastic marriage. As a result, Lithuania converted to Latin Christianity. Nevertheless, the order continued efforts to expand into Lithuanian territory along the Baltic Sea coast. These actions led to war in 1409 and 1410. The forces of the order were defeated in the Battle of Tannenberg by a combined Polish and Lithuanian army, and it was forced to abandon some claims to Lithuanian territory.

The order suffered further difficulties in the Council of Constance in 1415, when Polish and Lithuanian theologians questioned the need for a crusading order to attack either

the Catholic Poles or the Catholic Lithuanians. Though the Teutonic Order was not suppressed, as the Poles and Lithuanians demanded, the rhetorical attack did preclude further crusaders from joining the order, which was forced increasingly to rely upon mercenaries.

A second war, in 1422, led to the abandonment of claims upon disputed parts of Lithuania. In 1454, a rebellion against the order broke out in both the cities and rural lands of the Teutonic Knights. The king of Poland, Casimir IV, taking advantage of the situation, attacked the order and defeated it. The result was the Treaty of Thorn, under which the order ceded the western part of its lands to the Kingdom of Poland, in the process losing Marienburg and all its large cities except Königsberg. The grand master of the order also was compelled to swear fealty to the king of Poland and hold the rest of the order's Baltic properties in Livonia under the suzerainty of Poland. Branches of the order in the Holy Roman Empire were able to ignore this treaty; the knights in Livonia accepted the Treaty of Thorn with very poor grace. Nevertheless, the grand master of the order was compelled to abide by the treaty while seeking the support of the electoral dukes of the Holy Roman Emperor and of the pope to avoid the effects of the agreement. Very little support from either the empire or the papacy was forthcoming. As a result, Albert von Hohenzollern, grand master of the order from 1511 to 1525, made an accommodation with the Kingdom of Poland designed to further his own interests, rather than those of the Teutonic Knights. He was created the first hereditary duke of Prussia by the king of Poland, resigned from the order, and became a Lutheran. His descendants became, in due course, the electors of Brandenburg and the kings of Prussia.

The order continued in its lands in the Holy Roman Empire under the patronage of the Habsburgs, contributing a regiment to the Austrian army. Although temporarily suppressed by Napoleon after 1805, the order was reconstituted by the Emperor Ferdinand after the Napoleonic Wars under the permanent grand mastership of an imperial archduke. After World War I, the properties of the order in the former Habsburg domains were confiscated by various successor governments. The order itself, now lacking its property, was reorganized by the Catholic Church as an honorary organization for priests, and no new knights were admitted. The last knight of the order died in 1970.

Teutonic Tribes

Peoples inhabiting northern and central Europe since about the second century B.C.E. The variety of tribes designated as “Teutonic” or “Germanic” cannot be defined as closed groups of ethnic societies. Even the different peoples were far from homogeneous, being conglomerates of families and nomadic groups. Without written culture to survive as archaeological testimony, knowledge of the Teutonic tribes mainly stems from Roman historiography. At the end of the second century B.C.E., the tribes of the Cimbri and Teutons invaded northern Italy. From that time, Germanic groups pressed southward, often small and barely organized but sometimes dangerously persistent. Julius Caesar was the first to give a rather accurate account of the militant tribes he encountered near the Rhine River, naming them “Germani.”

The most detailed report about the Teutonic tribes is *Germania*, published by the Roman writer Tacitus in 98. In his book, Tacitus praised the Germanic way of living as an example for what he considered a degenerate Roman culture. Besides his moral concerns, Tacitus’s *Germania* lists dozens of different tribes, mainly inhabiting the land east of the Rhine and north of the Danube. Some of them became more prominent over the centuries, as they gradually conquered most of Europe and northern Africa. The Angles, Alemanni, Goths, Vandals, and Lombards are but some examples, but the important Franks, Saxons, and Burgundians were still unknown at Tacitus’s time.

Despite their ethnic variety, the Germanic tribes shared a somewhat common organizational structure. Based on their life as farmer-warriors, important decisions were made in the assembly of all free and able-bodied men (*ding*). Military and political leadership was in the hands of either a council of noblemen or a king. If the former were the case, the council elected one of them as military leader (*dux*) in battle. The relationship between the warriors and their leaders was that of the *trustis*, in which the men owed allegiance and armed service, and the leaders guaranteed them loyalty and social security. This system later developed into a central component of medieval feudality.

Tewkesbury (4 May 1471)

Yorkist victory in the Wars of the Roses. Returning to England from exile in France, Margaret of Anjou and her son Edward, the Lancastrian Prince of Wales, hoped to arrive and join in the success of their ally Richard Neville, Earl of Warwick. Instead, they landed at Weymouth on 13 April 1471, the same day that Warwick and his armies were crushed at Barnet by the Yorkist king Edward IV. Stranded because of the departure of their French ships, Margaret and her son moved to Cerne Abbey to rally their supporters, most notably Henry Beaufort, Duke of Somerset, and the earl of Devon, for a forced march to northern Wales to join Jasper Tudor and his allies in Lancashire and Cheshire. By 28 April, the Lancastrians were on their way to Gloucester.

Edward IV, understanding the need to prevent his rivals from reaching Wales, ordered his brother Richard Plantagenet, Duke of Gloucester (the future Richard III), to hold out against the Lancastrians and pursued with a newly raised army, his Barnet troops having already been released. Unable to cross the Severn River at Gloucester and without the ability to besiege the city, the exhausted Lancastrians moved to Tewkesbury to ford there, stopping for the night and fortifying their position. The next morning (4 May 1471), Edward IV attacked, using bowmen to cover a charge led by the duke of Gloucester. Met by stiff resistance from Somerset, the Yorkists retreated, Somerset advanced against them with archers, and the two armies met in close combat in the open field. Using cavalry held in reserve, Edward IV charged, scattering the Lancastrians, many of whom fled into the town or drowned in the river. Denying Tewkesbury Abbey the right to give sanctuary, Edward IV seized Somerset and Sir Ger vase Clifton from the church and added them to the other captives, including John Courtney, Earl of Devon; John, Lord Wenlock; Edmund, Lord Beaufort; and Margaret of Anjou herself. Somerset and 11 others were executed on 6 May. Among the 2,000 Lancastrians killed was Edward, Prince of Wales, a death that, along with the military victory, secured the throne for Edward IV and the Yorkists for another 15 years.

Texas War of Independence (1835–1836)

Conflict that resulted in Texan independence from Mexico.

In the mid-1820s, American settlers had begun moving into the northern Mexican province of Texas. The new Mexican government permitted such immigration, hoping to forestall an American takeover of this area far from the central government in Mexico City. However, from the beginning there were tensions between the Mexican government and the American settlers in Texas. Two sources of contention were the mostly Protestant religion of the American settlers and their efforts, for they were mostly southerners, to bring slavery with them. Slavery was outlawed by the Mexican constitution. Mexico tried in 1830 to limit American immigration and especially the importation of slaves. Political unrest in Mexico and the growing rift between Mexicans and so-called Texicans caused the Mexican government to prepare to send an army in the late spring of 1835 to establish firm control over the province.

The so-called Texas War of Independence lasted from October 1835 through April 1836. Hostilities began at Gonzales on 2 October 1835, when the Mexican commander demanded the return of a cannon lent to the settlers for defense against American Indians; rather than fight, he decided to retreat to San Antonio de Bexar. In early December, the rebels attacked General Martin Perfecto de Cos and his soldiers in San Antonio. Cos surrendered on 10 December, and the Texans may have felt the fighting was over and the war won.

However, General Antonio López de Santa Anna was determined to crush the rebellion and reestablish Mexican control over the province. On 16 February, he crossed the Rio Grande, and a week later, his forces began a siege of the Alamo in San Antonio that ended with the death of all its defenders on 6 March. Another army under General Jose Urrea cut off a group of rebels between Goliad and Victoria on 19 March, and on 27 March, Urrea's army executed the captives in the so-called Goliad Massacre.

The final significant action occurred several weeks later along the San Jacinto River near present-day Houston. Santa

Anna had moved ahead of his main army in an effort to capture the rebels' leadership. He failed, and Texas general Samuel Houston moved to take advantage of the temporary opportunity, cutting off Santa Anna's retreat and readying for a battle. After a day of skirmishing and another day of ineffectual cavalry duels, on 21 April 1836, the Texans, emboldened by shouts of "Remember the Alamo" and "Remember Goliad," charged the Mexican defenders. The Texans did not fire until the Mexicans had discharged their weapons; then, taking advantage of the Mexicans' incapacity, the Texans fired into the Mexican lines and engaged in desperate hand-to-hand fighting. Within 30 minutes the battle was over; the entire Mexican force of 1,500 was either killed, wounded, or captured. The captives included Santa Anna. The "Napoleon of the New World" had to recognize Texan independence to gain his release.

Santa Anna had lost only a small part of his army at San Jacinto, but the war then seemingly ended. The Mexican army faced severe logistical problems operating so far from its capital; the political situation at home was not settled, and it was difficult to maintain control at home with the army engaged so far away. Mexico agreed to Texan independence but also asserted that if its lost province joined the United States, that would be grounds for war. Texas independence was not assured until after the Mexican-American War and the resulting treaty of Guadalupe Hidalgo.

Thai (Tai) Wars (c. 1300–1569)

The migration of Tai peoples into the lowland areas of mainland Southeast Asia was greatly stimulated by Mongol conquest of their original homeland, Yunnan and the adjacent areas, in the 1250s and the decline of older Southeast Asian kingdoms, especially Angkor (Cambodia) and Pagan (Burma), by the end of the thirteenth century. During the thirteenth to fourteenth centuries, Tai rulers established three major states in what is now Thailand: Sukothai (founded in 1238, becoming a major power under Ramkhamhaeng, r. 1279–1317), Lan Na (founded c. 1296 by

Mangrai), and Ayutthaya (founded in 1351 by Ramathibodi, r. 1351–1369). These states supplanted earlier polities ruled by Mons and fought major wars with each other during the fourteenth and fifteenth centuries. Another important Tai state was Lan Sang (Luang Prabang, in modern Laos), established by Fa Ngum in 1353.

By the early fifteenth century, Ayutthaya, located north of modern Bangkok on an island in the Chao Phraya River, was the most powerful Tai state, the core around which the modern nation of Siam/Thailand was built. Ayutthaya's King Intharacha (r. 1409–1424) reduced Sukothai to vassalage, and his successor Borommaracha II (r. 1424–1448) captured the temple-city of Angkor in 1431, forcing the Cambodians to abandon it. Lan Na, located at Chiang Mai (northern Thailand), preserved its independence from Ayutthaya, though Siam's King Trailok (r. 1448–1488) sought to subjugate it. But Lan Na became a pawn in Siamese-Burmese wars during the sixteenth century.

Ayutthaya was one of the richest kingdoms in Southeast Asia. Its economy was based on international commerce and the "rice basket" of the Chao Phraya River valley, making it second in wealth only to the Malay trading port of Melaka (Malacca). Overseas Chinese and other foreign traders contributed to its prosperity. The rise of a unified Burma under Kings Tabinshwehti (r. 1531–1550) and Bayinnaung (r. 1551–1581) spelled disaster, however. The latter's armies occupied Ayutthaya in 1564 and looted the rich city completely in 1569.

Thames (5 October 1813)

Also known as Moraviantown, the Battle of the Thames signified the end of British influence on the Great Lakes frontier. Throughout 1813, the British and Indian allies, commanded by Major General Henry Procter and the Shawnee chief Tecumseh, frustrated efforts by Major General William Henry Harrison to regain U.S. control of the region. When Oliver Hazard Perry achieved control of Lake Erie in September, Harrison could mount an offensive to recapture Detroit and invade Canada. Procter sought to avoid engaging the Americans and withdrew through Upper Canada along

the Thames River. Though Tecumseh opposed this decision, the allies agreed to try to make a stand somewhere along the route.

On 27 September, Harrison's army landed in Canada with almost 5,000 men. His mobility was greatly enhanced by mounted Kentucky riflemen who pursued Procter's army along the Thames to Moraviantown. There in a beech forest clearing, Procter deployed his regulars with a single 6-pound gun. Tecumseh's Indians held the right flank using the cover of a marsh. Harrison ordered the mounted riflemen to attack, and they quickly drove through the enemy lines, flanked them, and attacked them from the rear. The British line crumbled, but the Indians held their ground until Tecumseh was killed leading a counterattack. The whole battle lasted less than an hour but resulted in a complete rout of the British force and capture of more than 600 prisoners. The American victory at the Thames provided a rare success and signified the end of a 60-year struggle for the Northwest, territory for further American expansion.

Thayer, Sylvanus (1785–1872)

U.S. Army officer who professionalized the curriculum at the U.S. Military Academy and thus gave the United States its first engineering school. Born on 9 June 1785 in Braintree, Massachusetts, Thayer, after attending Dartmouth College for three years, graduated from the U.S. Military Academy in February 1808 (he was only the thirty-third graduate in its history). In the four years that followed his graduation from West Point, Thayer divided his time between supervising the construction of coastal fortifications and serving as an instructor at the Military Academy. During the War of 1812, Thayer was outraged by the incompetence or outright cowardice of many of the American officers, which convinced him that it would be necessary to train officers properly in order for them to lead troops competently in combat.

Thayer's opportunity came in 1817, when the brevet major was appointed superintendent of the Military Academy. He initiated a series of reforms in the curriculum of instruction at West Point that would remain basically unchanged

for more than a century. Between 1817 and 1833, the course of study at the Military Academy was formalized, the fourth-class system was established, and a more professional sense of both instruction and military discipline was created. With the addition of both better-educated instructors and more diverse subjects of study, Thayer was able to convert West Point from a rather academically undisciplined environment into the first true engineering school in the United States. For the first half of the nineteenth century, most engineering works in the United States were in one way or another in the hands of the U.S. Army Corps of Engineers, all West Point graduates.

After leaving the Military Academy in 1833, Thayer became responsible for the design and construction of the coastal fortifications at Boston Harbor. Promoted to colonel on 3 March 1863 and brevetted brigadier general in the regular army on 31 May 1863, Thayer retired after more than 50 years of active duty on 1 June 1863. A confirmed bachelor all his life, Thayer died at the home of his niece in Braintree, Massachusetts, on 7 September 1872 and was eventually buried at the Military Academy.

Theory, Military

That body of knowledge usually published in books and journals that examines the nature of war and the art of war on an abstract level. Military theory should be distinguished from other related terms, such as military science, military thought, the science of war, and strategic studies, in that it normally refers to theoretical texts that either discuss certain general hypotheses such as the principles of war or seek to extrapolate from history in order to make predictions. It should be seen as overlapping with military history, but nonetheless distinctly different. The historical significance of military theoretical texts rests on the influence they have exerted on commanders; the reception they received on publication, either in their country of origin or abroad; the quality and originality of the ideas and hypotheses; and whether they have continued to be read after the death of the author or are representative of a specific era or school of thought.

The first known major theorist of warfare was the Chinese general Sun-tzu, whose *The Art of War* (c. 500 B.C.E.) contains maxims on such subjects as war plans, attacks, tactics, terrain, and spies. The first French translation was made in 1782 and the first English translation only in 1905, but interest in his work has been nonetheless great. Another Chinese soldier, Sun Pin, reputedly Sun-tzu's great grandson and born around 380 B.C.E., produced a follow-up work, *Military Methods*, which was first discovered in 1972 and published in English only in 1995. Although basing his tactical principles on Sun-tzu's work, Sun Pin introduced some refinements; hence the opportunity to study this text has increased the understanding of the concepts and influence of *The Art of War*.

The most influential military treatise to survive from Roman times is Flavius Vegetius Renuat *De re militari*, often referred to as *The Military Institutions of the Romans*. Although not a professional soldier, Vegetius sought to summarize the contents of previous texts and military regulations. His work played no great part in Roman military history, but it contains important insights into the art of war of ancient armies, as well as many maxims that became commonplace in later military theory, such as "he, therefore,

who aspires to peace should prepare for war.” The influence of Vegetius’s work cannot be underestimated; it was reputedly carried by Richard the Lionhearted and Henry II during their campaigns. Translated into French and English before the advent of printing, the first published edition appeared as early as 1473 and the first English version in 1489. Not long after, Niccolò Machiavelli’s *The Art of War* (1521) was published, elucidating a series of general rules for the conduct of warfare, together with a call for new military institutions. Signaling a new phase in military theory, Machiavelli was later regarded by Friedrich Engels as the first modern military writer.

My Reveries upon the Art of War, by Hermann Maurice, Comte de Saxe, is an example of a text that is significant much less for its influence than for its content. Maurice’s *Reveries* were published in 1757, seven years after his death, and translated into English in the same year but so badly that the sense was completely distorted. Maurice wrote his text because he found it strange that all the sciences had rules and principles, but war apparently none. His arguments are pertinent because he was at heart a military innovator and reformer who disdained conventional wisdom: he wanted, for example, to redesign uniforms to make them suitable for wearing in the field rather than on the parade ground. His work is significant for the modernity of its insights into tactics and leadership, and his dislike of dogmatic schemes allows it to be compared favorably with Raimondo Montecuccoli’s writings (written in the period 1640–1670), particularly *The Military Art*, which was a more exhaustive study of the key factors in generalship.

The Enlightenment produced other theoretical works of note: Frederick the Great’s *General Principles of War* (1748), better known as *Military Instructions for the Generals*; on sieges and fortifications, the highly mathematical system of ideas developed by Sébastien le Prestre de Vauban; and the *General Essay on Tactics*, published in 1772, in which the Frenchman Comte Jacques-Antoine de Guibert attempted to establish universal principles for tactics. These works, although they touched on the issue of war as a science, were generally restricted to a how-to-fight approach. Ironically, the man who should have contributed most to the theory of generalship, Napoleon I, died without writing any work on either the art or the science of war. His *Military Maxims* were compiled from his letters and memoirs, reinforcing the view that an understanding of war could be gained by studying the great commanders. However, the experience of the Napoleonic Wars arguably produced the two single most influential military theorists: Antoine Henri, Baron de Jomini, and Karl von Clausewitz.

Jomini’s writings exerted great influence during the nineteenth century, particularly on French and Russian military

thought. His first book, *Treatise on Grand Tactics*, was published in 1804–1805 and his most famous work, *Summary of the Art of War*, in 1837–1838, the latter being translated into German in 1839, Spanish in 1840, and English in 1854. There has been a tendency to deprecate the significance of Jomini’s work in favor of the work of Clausewitz, but the classification of types of wars and the definitions of strategy, grand tactics, and tactics in *Summary of the Art of War* continued to influence theorists well into the twentieth century.

Nonetheless, historians of military theory are in agreement that Clausewitz’s magnum opus, *On War*, published posthumously by his widow in 1832, remains not only the seminal military theoretical work of the nineteenth century but the most important treatment of the theory of war and strategy ever published. Serious interest in Clausewitz’s writings emerged after the conclusion of the Franco-Prussian War (1870–1871). They were popularized partly by Helmuth Karl Bernhard von Moltke (“the Elder”), who himself made important contributions to military theory, most notably in his writings on operations. In France, Ferdinand Foch sought to digest the lessons of 1870–1871 in *The Principles of War* (1903), citing Clausewitz rather than Jomini; but he was influenced more by Ardent du Picq and the “cult of the offensive”; his book illustrates the dangers of succumbing to the intellectual fashions of the day. In fact, neither Foch nor Moltke bettered the work of Jomini or Clausewitz.

The interwar period (1919–1939) was perhaps the most dynamic in the development of military theory. In the British, German, and Red armies it is possible to speak of a flowering of military theory caused by a number of factors: The complexity of military operations in World War I led to intense debate and the search for lessons for future war; the reduced military budgets in the 1920s and the rapid development of military technology in the period led to pressure within armies to study war systematically; the catastrophe of World War I, the influence of pacifism, disarmament conferences, and the League of Nations compelled theorists to examine the nature of war in more depth than ever before; major military controversies—such as the cavalry versus the tank—led to a culture of military dispute enlivened by the growing involvement of publicists in military theory, which widened the scope of theoretical debates.

In the search for a general and scientific theory of war, the two most important interwar works are J. F. C. Fuller’s *The Foundations of the Science of War* (1926) and A. A. Svechin’s *Strategy* (2d ed., 1927). Although very different in approach, both works are similar in some of their fundamental assumptions and goals: both are serious attempts to analyze the effects and lessons of World War I, Fuller using a highly abstract approach based on a threefold system in which war consists of mental, moral, and physical dimen-

sions; and Svechin employing a more historical method based on a thorough knowledge of military-political literature. Both works identified three levels of war (tactical, operational, and strategic); both emphasized the importance of the political direction of war and the role of economics in strategy. Moreover, both authors were advocates of open debate on military-theoretical questions, which led to their being shunned in their own armies.

The opposition that the radical ideas of innovative thinkers provoked was partly due to the resistance of the hierarchical general staff systems (not that much earlier the products of military “reform” themselves) to an opening up of military theoretical discussions to younger officers and civilian outsiders. The most widely read civilian writer of the period was Basil Liddell Hart, who published works on tactics, strategy, and military policy, one of his most important concepts being his provocative but contentious “strategy of the indirect approach.” The emergence of civilian theorists had, in fact, begun before World War I, the most noteworthy writer being the Polish banker I. S. Bloch, who produced six volumes on the changing nature of war in 1897; volume 6 appeared in English with the title *Is War Impossible?* (1899), predicting with considerable accuracy the stalemate of World War I. Nonetheless, it should not be forgotten that in the interwar period, heated theoretical discussions were conducted in military journals over the future organization, employment, and tactics of mechanized forces, the most innovative thinking taking place in the British army in the 1920s and the Red and German armies in the late 1920s and throughout the 1930s. The theoretical discussions conducted by younger officers contributed greatly to the successful development of the new weapons of mobile warfare but led to an excessive preoccupation with tactics and operations.

During the course of World War II, the involvement of civilian scientists, code breakers, inventors, economists, and even historians in the war effort of all the major participants led to a new development: the expansion of military theory and its increasing fragmentation into subdisciplines. In the period of superpower conflict (1945–1990), civilian, academic involvement dominated the developing fields of strategic studies, nuclear theory, geopolitics, and operations research. In Western Europe and the United States, traditional considerations of land warfare and conventional military theory became almost footnotes in discussions of limited nuclear war and surprise attack. However, when the American frustration in Vietnam exposed the grave limitations of many of the methods employed by civilian analysts, the U.S. Army and defense establishment embarked on a major rethinking of the foundations of military conflict. An expression of the return to traditional theory was Colonel

Harry Summers’s *On Strategy* (1982), which used Clausewitz to assess the Vietnam conflict. The discovery of Soviet military theory was also instrumental in this theoretical change. Although somewhat based on the ideologies of Marxism-Leninism, Soviet military theory in the twilight of the Soviet system had developed sophisticated theories on the nature and types of war, military operations (or military art), strategy, nuclear war, and the concept of the military-scientific revolution. One of the most important claims of Soviet military theory was that the principles of war are not eternal but are historically conditioned, leading to the emergence of new laws and the extinction of others. (The “laws” of Marxism-Leninism itself, of course, remain eternal.) The influence of the study of Soviet theory on U.S. military doctrine can be argued as one of the causes of success in the Gulf War of 1990–1991.

Considering its historical evolution, then, military theory can be determined as mainly, although not exclusively, ideas that are not classified and thus accessible to a reasonably large group of individuals. In this sense, it differs from military doctrine, which normally falls under security regulations and cannot necessarily be discussed publicly, and in addition, military theory is not always written by serving officers.

Thermopylae, Battle of (480 B.C.E.)

Opening battle of the Second Persian War between the Greeks, led by the Spartan king Leonides, and the Persian army of Xerxes I. After learning that a foreign army (of more than 3 million men, according to Herodotus, though this figure is probably highly exaggerated) had crossed the Hellespont, the Greek city-states joined forces in an effort to protect the southern part of Greece. Initially, the military leaders planned on stopping the Persian advance at Tempe

in Thessaly but finally agreed that the narrow pass at Thermopylae provided the best possibility for a defensive strategy. When Xerxes and his men arrived at the pass, the Greeks held them off for two days. On the third day, an informer showed the Persians a path over the mountains, providing them with an opportunity to surround the Greeks. Realizing that the entire Greek force would be annihilated unless measures were taken, Leonides ordered all the troops to retreat except for the Spartan warriors, who continued this heroic battle against superior numbers until the last man had fallen. In revenge, Xerxes ordered the decapitated body of Leonides to be hung on a cross at the site of the battle. That same day, the Greeks won a naval victory at Artemisium offsetting the losses at Thermopylae.

The Persian victory at Thermopylae opened the way for an attack on Attica. The inhabitants of Athens, relying on Themistocles' interpretation of the Oracle of Delphi's words, fled the city for the safety of their wooden walled ships. With a major portion of the Persian fleet destroyed by a storm at Artemisium, the best defense for the Greeks remained the sea. After winning naval victories at Salamis and Mykale and a land battle at Plataea, the Greeks forced the Persians troops out of Greece.

Thirty Years' War (1618–1648)

A series of devastating political and religious conflicts in central Europe, primarily involving Germany but expanding to include such countries as the Netherlands, France, Spain, and Sweden, that had important consequences for the conduct of international relations and the internal development of Germany.

The Thirty Years' War began with a local revolt against the king of Bohemia. Coming as it did at a time when central Europe was deeply divided by issues of religion and politics, it perhaps inevitably ignited a wider conflict. Local issues almost immediately took on larger implications because the king, Matthias of Habsburg (1585–1618), was also Holy Roman Emperor of the German nation (abbreviated herein as Germany, but it included modern Austria, Belgium, the Czech Republic, Germany, Liechtenstein, Luxembourg, Mon-

aco, and Slovenia, as well as portions of France, Croatia, Italy, and Poland). Moreover, strong religious minorities in Bohemia were united in their resistance to Matthias and his successor Ferdinand II and their re-Catholicization policies, already successful in Austria. In this resistance, they had already made common cause with the Protestant princes and cities of the emperor that likewise viewed the rising power of the most zealously Catholic emperor since Charles V (1500–1558) with concern, including the kings of Denmark and Sweden and the Dutch Republic, states whose territories overlapped the sprawling borders of the empire. Nor was the emperor without foreign enemies as well. The prince of Transylvania would be a thorn in his side throughout the war, and because the emperor's Spanish cousins held vast territories that virtually surrounded France, it was inevitable that he would be brought into the ongoing conflict between France and Spain. Finally, he was a threatening figure to factions in both Protestant Britain and Catholic Rome.

As if his enemies were not enough, the formation by the Protestant princes of an armed independent league had encouraged the Catholic princes of Germany to form their own Catholic League and army under Duke Maximilian of Bavaria. Despite their shared religion, it was far from certain whether the Habsburg emperors and their ambitious Bavarian cousin would be allies or rivals. As with many of the more bitter and protracted civil wars of history, the Thirty Years' War persisted in large part because the sheer number of participants involved made a final peace difficult to shape.

Events and the precipitate actions of radicals forced the hand of the Bohemian Diet in 1619. Forced into arms against its sovereign, the rebel army under Count Thurn enjoyed immediate success. Acting in concert with the Transylvanians, it cleared the southern crown lands and even reached the walls of Vienna in 1619. This success, however, was followed by a disastrous political error.

The 1619 death of Matthias that brought Ferdinand II to the throne gave the radicals another opening. They pushed the Diet to depose the Habsburg claimant and to replace him with the head of the Protestant Union, the zealous and ambitious young elector Palatine, Frederick V, a man with powerful family connections in Holland and Britain. Frederick was in his own right a powerful prince with a substantial army, but the short reign of the so-called winter king demonstrated that bringing him to power was an error and one that ignored the personal side of politics, for Frederick was a member of the convoluted House of Wittelsbach, just as was Maximilian of Bavaria. Where the Bavarian had previously been content to remain neutral, the rise of a royal rival for power within his much-ramified dynasty alarmed him, and he brought his league and his army to the aid of the emperor.

In November 1620, the Catholic League army under Prince Claudius Tilly de Tserclaes (1559–1632) combined with the emperor's force under another Belgian, the Count de Longueval, to win the Battle of White Mountain, smashing the Bohemian resistance and sending Frederick into flight. Among the Czech Catholic magnates who benefited from the emperor's victory and the resulting flight of the Bohemian radicals was an Albert von Wallenstein (Waldštejn).

Meanwhile, Spain was abiding by the conditions of the 1609 12-year truce in the seemingly endless Dutch War of Independence, which left it equipped with an idle army and a concerned strategic imagination. When the truce ended at the beginning of the campaign season in 1622, the rebuilt Army of Flanders was to be thrown against the Dutch from its Belgian base of operations. But a strong elector Palatine, a natural Dutch ally, threatened that route, so in 1620, Spain came to the aid of the emperor by invading Frederick's westernmost territories. Under its Genoese commander, Ambrose Marchese Spinola, the Army of Flanders swept all before it, and when the Bavarians overran the Upper Palatinate the next year, while the emperor's troops cleaned various minor garrisons out of Bohemia, the war seemed virtually over.

But the general of the Protestant League, Peter Ernst, Graf von Mansfield, extracted a species of army from the wreck of Bohemia and found a way to maintain it with virtually no external support by living "off the land." In 1621–1625, Count Mansfield took the field each campaigning season with his army of the Protestant League despite defeat after defeat. In the background, the Dutch, French, and the British subsidized Mansfield.

In 1625, King Christian IV of Denmark led an army to his support. The king held substantial German territories and supposedly raised his expeditionary army in those territories, but in essence it was a foreign intervention. After early gains in 1625, the Danes found themselves arrayed against not only Tilly's leagues, but also a new imperial army. Although the emperor's own troops continued to be engaged in the far southeast, in 1626 the Count Wallenstein (or as he now was, the Duke of Friedland) raised his own imperial army, Mansfield-style. In 1626, it campaigned in Hungary, but in 1627 Wallenstein united with Tilly to overrun Denmark.

From 1627 to 1629, no Protestant army was ready to take the field in Germany. The French, Spanish, and Dutch were locked in battle, but in Italy and the Netherlands; and the interventionist king of Sweden, Gustavus II Adolphus, was engaged in Poland. Ferdinand exploited Wallenstein's army as a club to reverse the most recent Protestant gains in northern Germany, and when Wallenstein broke with Ferdinand over this strategy, he was relieved of command in 1630.

Even as Wallenstein departed, the northern Protestant

princes were turning to one more savior, Gustavus II Adolphus, who blamed imperial support of the Poles for his lost Polish war. He began disembarking an army in Mecklenburg in June 1630. In 1631, Tilly returned from western Germany to oppose the Swedes and suppress internal revolt, most notably by besieging Magdeburg and sacking it in scenes of horror in May 1631. These events helped the Swedish king to cement an alliance with the Elector John George of Saxony.

Gustavus was not universally successful in the bold, wide-ranging operations that ensued as he fought to bring local rulers around Germany in line with a larger Protestant coalition. But he maneuvered the ever-cautious Tilly to attack unsuccessfully his fortified camp at Werben in July 1631. Then he defeated Tilly in the open field of Breitenfeld (17 September 1631). Tilly died standing against the Swedes on the line of the Lech (4 April 1632).

With Tilly's death, the Swedes were too powerful for even his allies, and the emperor could at last bring Wallenstein back without provoking the jealousy of the German princes, but the Duke of Friedland would only command if he were granted plenipotentiary powers. Nevertheless, when the emperor conferred those powers, he raised and funded an army in a matter of weeks and led it directly into a series of campaigns that finally forced Gustavus II Adolphus to give battle at Lützen on 6 November 1632. The Swedish king's indefatigable energy prevailed, but his death in battle ruined the victory for the Swedes and sealed Wallenstein's fate as well.

In 1633, the residual Swedish army began to receive the French subsidies that were to keep it in play until 1648, but Wallenstein used his new powers to conspire against the emperor. Fortunately for the house of Habsburg, Wallenstein's officers balked at this and murdered him in February 1634.

In the final 14 years of the war, there was little further internal German challenge to the emperor, but that was hardly necessary to compound central Europe's agony. Swedish and French armies operated deep in Germany, and the imperial and allied Spanish armies did hardly less damage as "defenders" of the Reich. Nor could the enemies of the Habsburgs accomplish much. From their sanguinary repulse from the camp of Nordlingen in September 1634 to their threatening encampment before Vienna in 1645, the Swedes stormed about Germany without accomplishing anything truly lasting, and for their part, the French unsuccessfully aimed all their efforts against Spain.

The French effort was on a truly vast scale. Two hundred thousand men were in the field in Italy, Switzerland, Lorraine, Alsace, Franche Comté, and Belgium in 1636, above and beyond the subsidized Swedes in the northeast and Rhineland. Nonetheless, new captains won their spurs against the French. Bavarians under Johann von Werth and

the Army of Flanders under Prince Thomas of Savoy even brought their armies within striking range of Paris.

In 1637, the Spanish invaded France, and in 1638, France returned the favor by invading Spanish territory and adding yet another theater of misery to the long war, but it was in northwestern France and Belgium where Spain and France proved able to absorb apparently limitless damage. Although the legendary slaughter of the Spanish Army of Flanders by Louis II de Bourbon, Fourth prince de Condé, at Rocroi on the Meuse road to Paris on 19 May 1643 has been called the final defeat of the Army of Flanders, in fact it was no such thing. Frustrated, the French attempted to force the emperor and Bavarians out of the war. The heavy fighting produced a new generation of generals (Henri de la Tour d'Auvergne, Vicomte de Turenne; Prince Raimondo Montecuccoli; and Franz, Freiherr von Mercy), but at last the Bavarians and imperialists had had enough.

Yet it was not their willingness to treat that finally permitted the peace talks that had been going on each winter to succeed. Cardinal Jules Mazarin, at the head of a weak regency council, was tired of compromising with internal enemies in return for the revenues needed for the war. Immediately on the news that the Prince de Condé had defeated Spain's final invasion of the war at Lens on 5 August, Mazarin ordered the arrest of his most intransigent foes, unleashing the civil war of the Fronde even as the diplomats of Europe gathered to negotiate the Treaty of Westphalia that ended the long war.

The consequences of the Thirty Years' War were undoubtedly significant but controversial. It has been said that the war caused a decline in the population of Germany by a third or more, but there is not enough demographic evidence for this assertion. Politically, the Peace of Westphalia was supposed to inaugurate a new era in German politics, not least by forcing the Habsburgs to give up their stranglehold on the imperial office, but the "August House" was able to subvert those provisions within a decade. Certainly the war did not bring an end to religious strife in German politics. Nor did it lead to the suppression of Czech culture in favor of German in Bohemia, as Czech nationalists once claimed. Perhaps its most important consequence was that over the next two centuries, intelligent Germans such as Johann Christoph Friedrich von Schiller and Leopold von Ranke led educated Germans to the conviction that the next time Germany faced the choice of the charismatic leadership of a soldier or political chaos, it would do well to choose the former.

Thomas, George Henry (1816–1870)

Skillful but modest Union field commander in the American Civil War. Known as "the Rock of Chickamauga," Thomas was born in Southampton County, Virginia, on 31 July 1816. Commissioned in the artillery after graduating from West Point in 1840, he was brevetted first lieutenant against the Seminoles in 1841. Under Zachary Taylor in the Mexican-American War, he fought at Resaca de la Palma and was brevetted captain at Monterrey and major at Buena Vista. He taught at West Point from 1851 to 1854, served in Texas from 1855 to 1860, and was lieutenant colonel in command of Carlisle Barracks, Pennsylvania, when the Civil War began.

Although a Virginian, he supported the federal cause. He was appointed colonel of the 2d Cavalry in May 1861, brigadier general of volunteers in August, and commander of the 1st Division of the Army of the Ohio in December. For his victory at Mill Springs, Kentucky, on 19 January 1862 and his distinguished fighting at Shiloh, he was promoted to major general of volunteers. He commanded Henry Halleck's right in the Corinth campaign. Under Don Carlos Buell at Perryville, Kentucky, on 8 October and under William S. Rosecrans at Murfreesboro, he contributed immensely to defeating Braxton Bragg.

When Bragg defeated Rosecrans at Chickamauga (1863), Thomas performed an amazing defense of Snodgrass Hill against James Longstreet and Leonidas Polk. This rearguard action earned him his nickname and, combined with Bragg's failure to pursue, allowed Rosecrans to retreat to Chattanooga. Thomas replaced Rosecrans as commander of the Army of the Cumberland. The combined forces of Thomas, Ulysses S. Grant, Joseph Hooker, and William T. Sherman routed Bragg at Chattanooga, with Thomas excelling especially at Orchard Knob and Missionary Ridge.

As Sherman's second in command in the Atlanta campaign, he repelled John Bell Hood at Peachtree Creek, Georgia, on 20 July 1864. Disobeying Grant's orders to attack, he waited until he was ready and thus emerged the decisive victor over Hood at Nashville. As a reward, he received the offi-

cial thanks of Congress and a major general's commission. He commanded the Division of the Tennessee and the Cumberland until 1869 and was in command of the Division of the Pacific when he died of apoplexy in San Francisco on 28 March 1870.

Thutmose III (d. 1450 B.C.E.)

Greatest Egyptian warrior pharaoh (r. 1504–1450 B.C.E.), who led 17 successful military campaigns against Egypt's enemies without losing a battle. Son of Thutmose II and son-in-law of Queen Hatshepsut through a marriage to her daughter, his half-sister, he succeeded to the throne in 1504 B.C.E. upon his father's death. Hatshepsut assumed control until her death in 1483 B.C.E., giving Thutmose III a nominal role during her reign. Avenging her usurpation of power, he defaced all her monuments and tried to erase the memory of her. Then he initiated a policy of expansion by leading his troops against the armies of Syria and Canaan, engaging them on the Plain of Jezreel. The Syro-Canaanite forces fled to the safety of Megiddo. Thutmose III laid siege to the city for 11 months, during which time his army constructed a wooden wall and a moat around the city to prevent anyone from escaping. In 1479 B.C.E., his opponents sued for peace. After taking an oath of allegiance and paying tribute, the people lived peacefully under Egyptian rule. Following this victory, Thutmose III attacked Joppa and the kingdom of Mitanni in northern Mesopotamia, conquering territory up to the Euphrates River, where he erected a stela to mark Egypt's easternmost border. Consolidation of his control over Canaan and Syria allowed the pharaoh to turn his attention to the south, where he attacked and conquered Nu-

bia. The success of his ventures increased the royal treasury, allowing him to donate large gifts to the temples, especially at Karnak, where his triumphs adorned the walls. He also funded building programs at Heliopolis, Abydos, Aswan, and Memphis. He was buried at Dayr al Bahri.

Tiberius (42 B.C.E.–37 C.E.)

Second emperor of the Roman Empire (r. 14–37 C.E.), who succeeded Augustus, his adopted father. The son of Tiberius Claudius Nero and Livia Drusilla, Tiberius was born in Rome in 42 B.C.E. His mother divorced his father and married Octavian, who later became the Emperor Augustus. In 11 B.C.E., Augustus compelled Tiberius to divorce his first wife, Agrippina, with whom he enjoyed a happy marriage, so that he could marry Julia, the daughter of Augustus and widow of Agrippa. After the marriage, Tiberius devoted the next seven years of his life to studying in Rhodes. Upon his return, he learned that Julia had been exiled for adultery; the two grandsons of Augustus died shortly thereafter. In 4 C.E., Augustus formally adopted Tiberius, who spent the next 10 years leading campaigns against the Germans and suppressing rebellions in Pannonia and Dalmatia. In 9 C.E., Tiberius and Germanicus Caesar led Roman troops on two expeditions into Germany and returned to Rome, where Tiberius was welcomed as a victor, complete with a triumph.

After the death of Augustus in 14 C.E., Tiberius assumed control of the government without opposition. Initially, affairs of state proceeded smoothly, but during the later years of his reign, he experienced periods during which he believed senators and potential rivals were conspiring to assassinate him. He retired to Campania and then to Capreae (Capri), leaving the administration of the empire to Lucius Aelius Sejanus, the prefect of the Praetorian Guard. Tiberius learned of Sejanus's attempt to seize power and ordered that he and his supporters be executed. After reestablishing control, Tiberius returned to Capreae, where he died on 16 March 37 C.E.

Tibet, Chinese Occupation of (1949–)

The gradual reduction by force of semi-independent Tibet to the status of an “autonomous” region of the People’s Republic of China. In 1949, the Communists triumphed over the Nationalist regime of Chiang Kai-shek, who fled with his government and followers to Taiwan. Until that point, Tibet had enjoyed an independent status of a sort, untouched by the great changes taking place in eastern Asia.

In October 1949, the same month of the proclamation of the People’s Republic of China, the Chinese People’s Liberation Army (PLA) invaded eastern Tibet and on 19 October 1950 captured Chamdo, the traditional capital of eastern Tibet. Some 40,000 soldiers of the PLA attacked Chamdo from eight directions. The 8,000 Tibetan militia and volunteers were easily defeated; local officials refused to open the arsenal to use the more modern and powerful weapons stored there.

An uneasy Sino-Tibetan relationship continued for nearly a year; the Chinese decision to intervene in Korea had given Tibet a temporary breathing space. On 23 May 1951, a Tibetan delegation that had been meeting with Chinese leaders in Beijing signed a “17-Point Agreement on Measures for the Peaceful Liberation of Tibet,” in which the new Chinese government indicated its belief that Tibet comprised part of historic China and its politics and social organization would reflect the values of the “New China” that Mao Zedong and his colleagues were creating.

On 9 September 1951, 3,000 Chinese troops marched into Lhasa, and an additional 20,000 arrived in the next several weeks to complete the Chinese occupation of western Tibet. The PLA occupied such cities as Ruthok, Gartok, Gyangtse, and Shigatse. When the seizure was completed, the Chinese detached Kham and Amdo from eastern Tibet and eventually additional territory, adding it to the Chinese provinces of Qinghai, Gansu, Sichuan, and Yunnan and renaming the remaining part of Tibet the Tibet Autonomous Region.

In the years since, the Chinese occupation has been difficult for native Tibetan peoples. Millions of Chinese have emigrated to Tibet; the Dalai Lama, the spiritual and former political leader of Tibet, fled across the Indian border in 1959; and the excesses of the Cultural Revolution brought about the destruction of more than 6,000 monasteries as well as pain and suffering for the deeply religious Tibetan people.

Tiglath-Pileser I (r. 1115–1077 B.C.E.)

In spite of the fact that Assyria had been in decline for nearly a century by the time he came to the throne, Tiglath-Pileser I (in Akkadian, Tukulti-apil-Esharra), the first known Assyrian king to have his military exploits recounted in chronological order (as opposed to fragmentary accounts), was successful in reorganizing the military and began Assyria’s military expansion into surrounding areas. He appears to have first launched a campaign into eastern Anatolia, the former domain of the now defunct Hittite Empire, and reached Lake Van, where he placed inscriptions on the rocks. He also turned westward to subdue the Phoenician states of Byblos and Sidon on the Syrian coast and evidently reached the Mediterranean Sea.

In these campaigns, he was confronted by the Aramean tribes who inhabited the regions in and around the Euphrates River in Syria, who constantly evaded the Assyrian army, raided the local communities, and destroyed agricultural produce. Though the Assyrian king was not successful in completely subduing the Arameans, he claims to have crossed the Euphrates River 28 times to campaign against them.

Tiglath-Pileser I also campaigned against Assyria’s southern neighbor, Babylon. The Babylonian king, Nebuchadnezzar I (1124–1103 B.C.E.) had formerly raided Assyrian territory, and Tiglath-Pileser I riposted by penetrating deep into Babylonia and plundering a number of cities, including Babylon itself. However, he did not attempt to control the area. Although the later years of this Assyrian king are not recorded in the annals, a fragment of text describes Aramean attacks and a famine in the heartland of Assyria.

Tiglath-Pileser I was more than a military chieftain. During his reign, the Middle Assyrian Laws and Court Edicts were compiled, and a major library was constructed in Assur. He was also an indefatigable builder, constructing numerous monuments and temples, as well as public parks and gardens.

Tiglath-Pileser III (r. c. 745–727 B.C.E.)

Tiglath-Pileser III (in Akkadian, Tukulti-apil-esharra) was a neo-Assyrian king who initiated the Assyrian world state of the eighth and seventh centuries B.C.E. He doubled the size of the Assyrian army and created a rapid communication and intelligence system that was inherited by the Persian Empire. He most likely usurped the throne during a period of decline and unrest in the Assyrian state.

Tiglath-Pileser III was able to defeat the Urartians (a powerful state from the region of present-day Armenia) and claims to have invaded Urartu itself. He also moved west into the territories of Syro-Canaan and caused many of the Aramean, neo-Hittite, and Phoenician states to pay him tribute (including the cities of Damascus, Tyre, and Byblos). In 734 B.C.E., he conquered the city of Damascus, thereby ending the Aramean state centered there.

Tiglath-Pileser III invaded northern Israel at least twice, and both Israelite and Judean kings are listed in Assyrian sources as paying tribute to Assyria in this period. He was also involved in Babylonian political problems and took the Babylonian throne himself (apparently using the throne name of Pulu or Pul; cf. 2 Kings 15:19), although there was continued resistance during his reign.

Tiglath-Pileser enacted major changes in Assyria by doubling the size of the army, putting the provincial administration under the direct control of the crown, and continuing the centuries-old Assyrian policy of deporting conquered peoples to other regions of the empire.

Tigranes the Great (c. 140–c. 55 B.C.E.)

King of Armenia who participated in the Mithradatic Wars against Rome. He spent his early life as a hostage of the Parthians, who placed him on the Armenian throne in about 100 B.C.E. As he consolidated his power after his accession, Tigranes married the daughter of Mithradates VI Eupator, the king of Pontus, forming an alliance with him. Together, they seized territory in Cappadocia and Bithynia in about 91 B.C.E., directly precipitating the First and Second Mithradatic Wars.

Simultaneously, Tigranes aggressively campaigned against the Parthian Empire, capturing Mesopotamia and Adiabene and adopting the Persian title “king of kings.” In about 84 B.C.E., he annexed former Seleucid principalities in Syria, Phoenicia, and Cilicia. He also deported thousands of prisoners to inhabit his new capital at Tigranocerta (Silvan, Turkey).

During the Third Mithradatic War, Mithradates sought refuge with Tigranes after his defeat at Cabira (near Niksar, in present-day Turkey) in 72 B.C.E. Tigranes refused to surrender him to the Romans as they demanded, and they invaded Armenia in 69 B.C.E. Roman forces commanded by Lucius Licinius Lucullus defeated the Armenians, capturing Tigranocerta and Artaxata (near Yerevan, Armenia); however, fatigue and Lucullus’s recall compelled them to halt their advance. A much larger Roman army led by Pompey finally conquered Pontus, causing Mithradates to flee yet again to Tigranes, who reversed his policy and broke the alliance; Mithradates later committed suicide. In light of this huge force and heavy Parthian counterattacks, Tigranes surrendered to Pompey in 66 B.C.E. and lost all his territorial acquisitions outside Armenia. Allowed to keep his throne, he ruled until his death in about 55 B.C.E. and was succeeded by his son Artavasdes II.

Tilly, Johann Tserclaes, Graf von (1559–1632)

General of the army of the Catholic League (1620–1632). A Walloon, Tilly started his military career under Alessandro Farnese, Duke of Parma and Piacenza, at the time of the Dutch revolt, then fought against the Turks, and finally entered Bavarian service in 1610. In the Thirty Years’ War, he led the army of the Catholic League to numerous victories and established the military and political dominance of imperial Catholic rule nearly throughout the Old Reich. He won the Battle of White Mountain (1620), crushed the army of Christian of Brunswick twice (Höchst, near Frankfurt, in 1622 and Stadtlohn, near the Dutch border, in 1623), had several encounters with Mansfield (Mingolsheim in 1622 and Wimpfen in 1622), forced the Danish king Christian IV to retreat (Lutter am Barenberge in 1626), and gained control of northern Germany. After these successful campaigns,

he lost the battle of Breitenfeld against Gustavus II Adolphus (1631) and was defeated again at Rain am Lech (1632), where he was mortally wounded. He died at Ingolstadt on 30 April 1632.

Tilly developed a unique battle-seeking strategy, which proved to be successful in the 1620s. His failure during the Swedish campaign cannot be explained sufficiently by the modern tactics of the Swedish army. The disastrous outcome in 1631 was at least partly due to the political tensions within the Catholic Party, which prevented Tilly from executing his approved offensive campaigning.

Timoshenko, Semen Konstantinovich (1895–1970)

Soviet military commander and marshal of the Soviet Union (1940). Semen Timoshenko was born in Odessa Province of peasant origins. Conscripted at the outbreak of World War I, he served through the conflict as a machine gunner, emerging as a junior officer.

When the czarist army collapsed, Timoshenko returned to Odessa, joining the Red Guards in early 1918 and fighting against the Germans and anti-Soviet forces in the Kuban and Crimea before becoming Cavalry Brigade Commander in the Tenth Army in November, defending Tsaritsyn. Becoming part of Stalin's "Tsaritsyn" faction, from June 1919, he served as divisional commander in Semen Budennyi's 1st Cavalry Army, fighting Anton Denikin, Peter Wrangel', and Poland until 1920.

Timoshenko completed Officers' Higher Academy Courses (1922, 1927) and graduated from the Lenin Military-Political Academy (1930). During the purges, Stalin dispatched him to occupy numerous short-term command posts, replacing purged commanders.

After commanding on the Ukrainian front in occupied Poland (1939), Timoshenko led the Soviet assault on the Mannerheim Line during the Russo-Finnish War (1939–1940), achieving victory with appalling losses. Witnessing here the adverse effect of the military purges, from May 1940, as defense commissar, he attempted to strengthen

Soviet border defenses against Germany, working with Georgy Zhukov, but Stalin's vacillations and preparations for the wrong war led to the disastrous Soviet performances during the initial German invasion.

Timoshenko became chairman of the Soviet military command (Stavka) (June–July 1941), commanded the Western Sector (July–September 1941), and directed the battle for Smolensk, crucially delaying the German Center Group. As Southwestern Sector commander (September 1941–May 1942), Timoshenko brilliantly counterattacked at Rostov (November 1941) but was responsible for the Kharkov encirclement (May 1942), where 240,000 Russians were taken prisoner. Never recovering from this debacle, he received only minor postings for the rest of the war, only escaping execution because of his good relations with Stalin.

After the war, Timoshenko again held minor postings, commanding Baranovich, South Ural, and Belorussia Military Districts. He was inspector general of the Defense Ministry from 1960 and chairman of the Soviet War Veterans Committee from 1961. He died in Moscow, neither the best nor the worst, but rather typical of Stalin's generals.

Tinian (24 July–1 August 1945)

Japanese-held Pacific island just south of Saipan, taken by the U.S. Marines in heavy fighting. The Americans needed this island as the site for the construction of the long runways that the new U.S. Army Air Forces heavy bomber, the Boeing B-29, would require for the planned strategic bombing of the Japanese home islands.

For 40 days, Japanese defenders were pounded by aerial and naval ship bombardment. Then, on 24 July, some five weeks after the invasion of Saipan, the 4th Marine Division crossed the waters dividing Saipan and Tinian, while the 2d Marine Division demonstrated off the southwest. The marines achieved tactical surprise; for the beaches were very narrow—only 65 and 130 yards wide—and the Japanese assumed that the United States could not land suffi-

cient force and supplies on so narrow a set of beaches. Air and ship bombardment was directed elsewhere, helping to further the deception. Thus, the Japanese did not defend the beaches strongly, and the marines were able to land, move inland, and bring ashore sufficient supplies to maintain the offensive. The Japanese counterattacked on the first night, but the marines beat them back, inflicting losses of more than 1,200 men. The 2d Marine Division soon joined the 4th Division in the invasion; later, one division went north and the other south to clear the island. By 1 August, organized Japanese resistance was over. As on Saipan, Japanese civilians jumped off the cliffs on the southern part of the island to their deaths. The marines suffered 290 killed and 1,515 wounded, while the Japanese lost at least 6,500 killed and an undetermined number missing.

Soon thereafter, Navy SeaBees constructed runways making Tinian island temporarily one of the world's largest airports to facilitate the bombing of Japan. Tinian is today remembered primarily as the home base of the B-29 bombers that dropped the atom bombs on Hiroshima and Nagasaki.

Tippecanoe, Battle of (7 November 1811)

A battle in the American war with the old Northwest Indians (1811–1813). Throughout 1811, relations between the United States, represented by Indiana Territory governor William Henry Harrison, and an Indian confederacy, led by the Shawnee brothers Tecumseh and the Prophet (Tenskwatawa), steadily deteriorated. In the autumn, Governor Harrison took advantage of Tecumseh's trip to the south to

Music cover, c. 1840, illustrated with scene of W. H. Harrison leading troops at the Battle of Tippecanoe, Indiana, in 1811. (Library of Congress)

march his troops against the Indian confederacy. On 6 November, Harrison and his troops camped just outside the Indian village of Prophetstown.

The Prophet, a religious figurehead, convinced his warriors that his medicine would make them invulnerable. With the Prophet chanting incantations on a nearby hill, the Indians, armed with British muskets and powder, attacked the American camp two hours before dawn on 7 November.

Harrison's camp stood on the high ground, but an unwise series of bonfires around its perimeter blinded the Americans. As a result, a few warriors quickly infiltrated the American lines and sought out Harrison. The governor narrowly escaped death only through mistaken identity.

Harrison acted well during the two-hour battle. Despite significant casualties, he shored up his lines and prevented the Indians from gaining an overwhelming advantage anywhere on the battlefield. By dawn, the Indian warriors realized that the Prophet's medicine would not secure victory, and they broke off the attack.

Harrison called Tippecanoe a "complete and decisive victory," but the truth is less romantic. The battle was not decisive, but it did have lasting importance. Harrison's troops destroyed the credibility of the Prophet, increased the governor's fame throughout the country, and eventually led to his short-lived presidency.

Tito (Josef Broz) (1892–1980)

Partisan hero during World War II and Yugoslav dictator who pursued a foreign policy that helped lessen tensions and promoted interaction between the superpowers during the Cold War. Josef Broz was born on 7 May 1892 in Kumrovec, Austria-Hungary. Leaving school at 12, he joined the Croatian Social Democratic Party and was conscripted into the imperial army at age 18. With the outbreak of World War I, he was sent into combat against the Serbs, was wounded in 1915, and was taken prisoner by the Russians. While in a hospital, he was influenced by Bolshevism. In 1917, upon the abdication of Czar Nicholas II, Broz tried to join followers of Lenin in the streets of Petrograd but was recaptured by au-

Portrait of Tito. (Library of Congress)

thorities. He remained imprisoned until freed by the Communists in October 1917. He then joined the Red Guard during the Russian Civil War.

In 1920, Broz returned to Croatia to work as a Communist Party organizer. Arrested several times and imprisoned from 1929 to 1934, he gained Moscow's attention. He was named deputy of the Politburo of the Communist Party of Yugoslavia (CPY) central committee and leader of the Croatian and Slovenian committee. He emerged as a national leader in 1941, when Germany attacked Yugoslavia and he founded a Yugoslav partisan force. Well-organized, by 1942, he was able to set up a provisional government in areas freed from Axis control. In constant conflict with Serbian Chetniks, Tito's forces were officially recognized by the Allies at the Teheran Conference in 1944. By the next year, he was named prime minister of Yugoslavia and consolidated control by purging non-Communists from his government.

Tito soon came into conflict with Stalin over how the Yugoslavian leader was running his government and economy and his independent foreign policy decisions. This led to the expelling of "Tito's clique" from the Communist camp in

June 1948. Stalin then imposed sanctions and boycotts against the country.

Tito retaliated by purging Stalinists, decentralizing the economy, and turning to Western nations for support. He sealed the border between Greece and Yugoslavia, thus ending Soviet support to the rebels during the Greek Civil War. Upon Stalin's death in 1953, Tito tried to reconcile with Nikita Khrushchev's Soviet Union. Yet he maintained some degree of independence by protesting the USSR's invasions of Hungary (1956), Czechoslovakia (1968), and Afghanistan (1979). He also implemented a foreign policy in which smaller countries like his own acted like neutral blocs between the superpowers and promoted nonalignment. He died on 4 May 1980 in Ljubljana. With his death, the multi-ethnic Yugoslavian federation, which he had held together with an iron hand, fell apart in civil war and the worst conflict Europe had seen since World War II.

Tobruk, Battle of (April 1941)

The first substantial defeat of German land forces in World War II. After the collapse of Italian forces in 1940, Adolf Hitler ordered Lieutenant General Erwin Rommel and the Afrika Korps to North Africa in defense of Libya. However, Rommel, ignoring Hitler's express order to remain defensive, struck eastward from El Agheila on 31 March 1941. Rommel's advance was virtually ignored by the British command for the first few critical days because of the looming German invasion of Greece. On 8 April, the same day as the first ominous signs of Greek collapse, both Archibald Wavell and Winston Churchill realized that holding Tobruk was vital for the defense of Egypt. The first clash at Tobruk occurred on 12 April.

Within the 30-mile perimeter were the Australian 9th Infantry Division and 18th Infantry Brigade, the British 3d Ar-

British soldiers patrolling in tanks at Tobruk, Libya, 1944 (Library of Congress)

moured Regiment, and British artillery units. The defenses consisted of an incomplete series of concrete strong points and antitank ditches that had been built earlier by the Italians. Against this force, Rommel deployed the 15th Panzer and 5th Light Divisions and the Italian Brescia and Ariete (and later the Bologna and Pavia) Divisions. The Luftwaffe maintained heavy bombing throughout the siege.

All attacks during the first week failed, but both the Italian and German Commands considered Tobruk harbor vital for the supply of operations in Egypt, and further attacks commenced on 30 April. A salient was created, but although heavy fighting continued, the perimeter line was not broken again before the siege was lifted by the Axis retreat on 10 December 1941. The magnificent defense put up by “the Rats of Tobruk” made the loss of the strong point to the Germans in the spring of 1942, after confused and not very effective resistance, all the more galling.

Tokugawa, Ieyasu (b. Matsudaira Takechiyo) (1543–1616)

For much of his life, Ieyasu Tokugawa stood in the shadows of Nobunaga Oda and Toyotomi Hideyoshi. Although he aligned with both, Tokugawa reaped the benefits of their successes. During the reign of Oda, Tokugawa expanded his lands, and by 1583, he held five provinces. Despite these successes, he did have to kill his wife and order his son’s suicide to demonstrate his loyalty to Oda. With the death of Hideyoshi, Japan once again slipped into civil war.

During the reign of Hideyoshi, Tokugawa was moved away from the center of Japan to the east coast, which undercut his strength. Although at first the move nullified his role in Hideyoshi’s period, it did allow Tokugawa to conserve and build his strength in the long run. During this time, he transformed the small village of Edo into his capital, which

became known as Tokyo. When Hideyoshi died, Tokugawa emerged as one of the paramount powers in Japan.

Still, other contenders existed. War began in earnest in 1600 with Uesugi, another who had aligned with Hideyoshi early. Much of western Japan formed an alliance against Tokugawa, including the daimyo of Mori, Ukita, Shimazu, Nabeshima, Chosokabe, and Ikoma. On 21 October 1600, the armies of Tokugawa and the western armies met at the battle of Sekigahara. During the battle, the daimyo Kobayakura deserted to Tokugawa, which the two had prearranged. Tokugawa emerged victorious.

Ten days later, Tokugawa captured Osaka. In 1603, he assumed the title of shogun but gave it to his son Hidetade in 1605. War was not over, however, until 1615, when he defeated Toyotomi Hideyori, Hideyoshi’s son. With the unification of Japan complete, Tokugawa established the Tokugawa shogunate, which ruled Japan for over 250 years.

Tondibi (1591)

One of the most devastating military defeats in western Sudanese history. The Moroccan sultan, al-Mansur, cherished control of Songhay, the gold mines, and the tolls from caravan traders. A 1582 civil war between two Songhay princes weakened the empire and played into al-Mansur’s hands.

Al-Mansur’s two expeditions against Songhay in 1584 perished in the desert because of poor preparation, incompetent leadership, and unmanageable supply lines. A better-organized expedition in 1590 was composed of 4,000 disciplined soldiers (1,500 Moroccans, 2,500 renegade Spanish, and Portuguese and Turkish mercenaries) under a Spanish renegade, Judar Pasha. Half were armed with arquebuses, 500 were mounted gunmen, and 70 were musketeers, accompanied by 600 engineers and 800 camels carrying 31,000 pounds of gunpowder and a similar quantity of lead.

Leaving Morocco on 16 October 1590, the expedition, with difficulty, landed at Bamba on the Niger River in February 1591. On 13 March 1591, they met the Songhay army at the Battle of Tondibi, near Gao, the capital. With superior weaponry, the invaders routed the Songhay force, armed

with bows, arrows, and spears and terrified by the noise and smoke of the guns. After the initial panic, however, the Songhay forces rallied and harried the Moroccan forces.

The demoralized Askia Ishaq was replaced with Askia Nuh, who adopted guerrilla tactics against the invaders. Despite this resistance, the Moroccan forces pressed on, seizing Gao and later Tombouctou in 1593. Nuh's forces harried the Moroccans until they eliminated him through treachery, inviting Nuh to peace talks and murdering the Songhay contingent. As a result, the Songhays plunged into disintegration and anarchy.

TORCH, Operation (1942)

The landings in French North Africa on 8 November 1942 that constituted the first major American intervention on the Atlantic front. TORCH was primarily a U.S. Army operation, with General Dwight D. Eisenhower in command, though the Royal Navy provided two-thirds of the naval force. Some have argued that it was "Roosevelt's secret war baby."

As was so often the case in World War II, military considerations had to take account of the political situation, and historians now tend to agree that the complete military success was marred by the mishandling of the political aspect. The disagreements between the Americans, who wanted to put the emphasis on Casablanca (on the Atlantic), and the British, who prized Algiers (on the Mediterranean), were only finally resolved in September, with the decision to launch a three-pronged attack on Casablanca, Algiers, and Oran in between.

Contrary to the expectations of the American strategists, who believed that their "kingpin," General Alphonse Giraud, would soon rally the local garrisons to the Anglo-American cause, the 65,000 Allied troops met with sometimes fierce resistance from French Vichy forces, especially the navy in Algiers. By 10 November, General Mark W. Clark hastily negotiated a cease-fire with Admiral François Darlan, heavily compromised with Vichy, who seemed to be the only French leader able to put an immediate end to the fighting. The "deal with Darlan" raised an outcry in the British pro-

Gaullist press: was Europe to be "liberated," only to be entrusted to men like Darlan? Winston Churchill, who concurred, wrote that "Darlan's murder [on 24 December], however criminal, relieved the Allies of their embarrassment." Now the way was clear for Giraud, but he was no match for Charles de Gaulle, who eventually established his provisional government in Algiers, much to Franklin D. Roosevelt's displeasure.

With their position secure in Morocco and Algeria—the initial objective of TORCH—the Allies (including the rallied French troops) turned against the Axis forces in Tunisia, the decisive battles taking place at Kasserine Pass (14–23 February 1943) and on the Mareth Line (20–29 March) against Erwin Rommel's armor. Combined with massive air superiority and with naval supremacy to cut off the Axis supply lines from Italy, these victories opened the path to Tunis, which fell on 7 May, leading to the final German surrender in North Africa on 12 May 1943.

The conquest of French North Africa constituted the greening of American troops in the face of the hardened Panzer divisions, and even those historians who doubted the strategic value of the whole operation agreed that it provided a valuable training ground for the more difficult landings to come, in Sicily, Italy, and, of course, Normandy. This was also the first occasion when a now-famous quartet had to cooperate: Eisenhower, Bernard Montgomery, George Patton, and Omar Bradley, with Churchill and Roosevelt somehow trying to make a political success of military victories—a rehearsal here again for the real show in northwestern Europe.

Torgau (3 November 1760)

One of the last battles of the Seven Years' War (1756–1763) between Prussia and Austria.

In October, Marshal Leopold Daun occupied Torgau on the Elbe River, thus severing the Prussian army from its forces in the west. Fresh from victory at Liegnitz (15 August), Frederick the Great marched toward Torgau with 49,000 men and 250 guns. Opposing him were 53,000 men

and 275 guns. His high command doubted the necessity of battle, but Frederick believed a decisive victory was possible.

Daun's army occupied a ridge west of Torgau. Frederick planned to march 30,000 troops across the Austrian front, wheel around its right flank, and strike the rear. Early in the morning of 3 November, Frederick broke camp. The march took several hours, and the columns became confused as Daun's army discovered the gambit and opened fire. The Austrians altered their right flank and formed a triangle. Beginning at 1:00 P.M., the Prussian king attacked this extreme end of the Austrian line twice and nearly broke the enemy's flank before they counterattacked. Prussian cavalry arrived and led a nearly successful third attack, but at 4:30, Frederick was stunned by a spent musket ball and was carried from the field. Yet the day was saved for Prussia when Hans Joachim von Zieten advanced and forced a wounded Daun to shift units from his right to secure his center. Johann von Hülsen then led a fourth and final attack against the Austrian right. Franz Moritz Lacy ordered a withdrawal under cover of darkness, and the exhausted Austrian army made safe passage across the Elbe River.

Torgau represents Frederician warfare past its apogee. Nearly 17,000 Prussians were killed or wounded, and Austria lost 16,000 casualties and 7,000 prisoners. Frederick's strategy of winning political victories on the battlefield had failed, and his tactics had become predictable.

Toulon, Siege of (September–December 1793)

Throughout July and August of 1793, many towns in southern France, dissatisfied with the course of the French Revolution, rebelled against the central government in Paris. Some of the rebels desired the restoration of royal authority. Others supported the principles of the revolution but demanded more local authority.

On 27–28 August 1793, rebels in Toulon, home of the French Mediterranean fleet, declared a fourth royalist government in exile and placed the city under the protection of a combined British and Spanish fleet commanded by Samuel, Lord Hood. The revolt of such an important city was

viewed by the revolutionary government in Paris as a serious threat. Consequently, a force under General J. F. Carteaux, already operating against 12,000 insurgents in the area, was dispatched to subdue Toulon. A further 4,000 men were detached from the Army of Italy and sent to attack Toulon from the east. By early September, both these forces had arrived outside the city and had begun an uncoordinated series of assaults upon the defenses. In the interim, British, Spanish, and Sardinian forces had been landed in the city, raising the strength of the garrison to 15,000.

On 16 September 1793, Napoleon Bonaparte, then a captain of artillery, offered his services to General Jean François Carteaux when the original artillery commander was wounded. Napoleon began to gather artillery, supplies, and personnel. On 20 September, he orchestrated the seizure of two small forts commanding the eastern half of Toulon's inner harbor. This success forced the British fleet to move closer to the city itself but also induced the British to strengthen another post, Fort Mulgrave, which controlled the exit to the harbor.

On 1 October, an attempt to assault the city from the east was repulsed with heavy French losses. On 23 October, Carteaux was assigned to command the Army of Italy and was replaced by General Doppet. Doppet was in turn removed from command on 16 November and replaced by General Jacques Coquille Dugommier.

While the bulk of the French forces were paralyzed by such command uncertainties, Napoleon had, on his own initiative, prepared several new batteries designed to support an assault upon Fort Mulgrave. An assault of 30 November failed. A second attack, on 17 December, proved successful, and by the afternoon of 18 December, a battery began to bombard the British fleet itself in Toulon harbor.

Lord Hood ordered the evacuation of the garrison and of as many civilians as possible. An attempt to burn the French ships in the harbor failed. On the morning of 19 December, the French revolutionary army reoccupied Toulon.

The siege of Toulon was significant because it ended the *federaliste* uprising in the south of France. It also brought to prominence Napoleon, who was promoted to brigadier general on 22 December. The siege gave added prominence to a number of other officers and political figures, including André Masséna, who would subsequently become a marshal of the French Empire, and Paul Barras, who would head the directory.

Tours (October 732)

Charles Martel (“the Hammer”) defeats Muslim army led by Abd-ar-Rahman, governor of Córdoba. After crossing the western Pyrenees, Abd-ar-Rahman made for the Loire River. Charles and the Frankish army met him just outside Tours, somewhere just south of the river, and directly in the path of the invaders. The Muslims had not anticipated the arrival of the Franks.

After a few days of maneuver and countermove, Abd-ar-Rahman decided to attack. Little is known of his army, except that most were horsemen lightly armed with sword and lance. The Muslims, relying upon an overwhelming superiority, especially in cavalry, rushed forward. The Frankish infantry stood their ground against the ferocity of the assault. As one monkish chronicler put it, the Franks stood “firm as a wall” (Hadrill 1960, 13).

Arab sources record that the battle lasted two days, whereas Christian sources claim that it went on for seven. It ended when the Franks captured and killed Abd-ar-Rahman. His forces then withdrew quietly overnight, and even though Charles Martel expected a surprise retaliation, there was none. For the Muslims, the death of their leader was a sharp setback. They were left no choice but to retreat back across the Pyrenees.

The Battle of Tours has been considered the high-water mark of Muslim invasions of western Europe. The victory helped consolidate Charles Martel’s leadership of the Franks. He was able, for example, to assert his authority in Aquitaine. Its duke, Eudes, swore allegiance.

Toussaint L’Overture, Wars of (1793–1803)

Conflicts that established Haitian independence but also began the tradition of political violence and strongmen. The French Revolution had a profound impact on France’s colony of Saint-Domingue (present-day Haiti) on the western portion of the Caribbean island of Hispaniola. The class structure of Saint-Domingue included whites, free mulattoes (known as *affranchis*), and slaves. The ideals of liberty, equality, and fraternity for the *affranchis* were manifested in an unsuccessful revolt that was over in a few months. On 14 August 1791, slaves revolted and rampaged across the

northern plain, murdering whites and putting plantations to the torch. Moreover, there was fighting among whites, mulattoes, and slaves throughout the colony. As the slave revolt grew, Spain allied with the rebels, hoping to regain possession of all Hispaniola. One of the most capable of the rebel leaders was the former slave Toussaint L’Overture, who first fought with the Spanish army but in May 1794 declared his loyalty to France when the National Convention abolished slavery. The Spanish expedition was decimated by yellow fever, and in 1795 Spain withdrew from Saint-Domingue and also ceded its colony of Santo Domingo to France.

L’Overture, with the able assistance of his principal lieutenant, Jean-Jacques Dessalines, brought political order to the slave insurrection as well as sound military leadership. By 1798, the British expedition, which had supported the whites, was defeated and withdrew. L’Overture still had to contend with the mulatto general Andre Rigaud, who attacked his army on 16 June 1799. The resultant race war, known as the War of the Knives, brought even greater destruction to the war-ravaged nation. L’Overture not only defeated the mulatto armies but invaded the former Spanish colony of Santo Domingo. By 1801, he controlled all of the island of Hispaniola and was installed as governor for life by a hastily written constitution. He also ruled with the approval of Napoleon, who appointed him captain general of the colony.

Portrait of Toussaint L’Overture. (Library of Congress)

Napoleon soon realized that Saint-Domingue was in fact independent under L'Overture, and he was determined to renew France's holdings in the New World. In 1802, he dispatched an expedition commanded by his brother-in-law, General Charles Leclerc, to reconquer the island. Leclerc was initially successful and seized Port-au-Prince and other ports. In the interior, L'Overture, Dessalines, and another guerrilla general, Henri Christophe, continued to resist. In a sudden turn of events, L'Overture arrived at a truce with Leclerc, and Christophe surrendered his army. Shortly after these capitulations, Dessalines also came to terms, and it appeared that Leclerc had successfully regained Hispaniola for France. A month after the truce, Leclerc arrested L'Overture and had him imprisoned in France, where he died on 7 April 1803.

Leclerc's problems did not end with the disposal of L'Overture. Yellow fever and other tropical diseases took their toll on the French army. Attempts to disarm the black population led only to increased resistance as the people realized the French intended to reinstate slavery. The brutality of the war increased, and Dessalines and Christophe re-joined the rebel cause. Leclerc himself was stricken by yellow fever and died on 2 November 1803. His replacement, General Donatien Rochambeau, initiated even more brutal tactics and seemed determined to kill all the former slaves in order to successfully pacify the island. Atrocities mounted as Rochambeau waged a war of extermination.

Events in Europe turned the tide in favor of the rebels. Great Britain had initially approved of Napoleon's invasion but went to war with France in May 1803 and soon attacked French fortifications on the island. Dessalines intensified his attacks in the interior by burning plantations at will and executing captured whites. Panic among the whites resulted in their evacuation in November 1803, ending French control of Saint-Domingue, but France did retain control over Santo Domingo.

The victorious rebels named their new country Haiti, and Dessalines was named governor-general for life. Formal independence was declared on 1 January 1804. The ambitious Dessalines was not content with the title of governor-general and became the self-anointed Emperor Jacques I on 8 October 1804. He was assassinated on 17 October 1806. Haiti's political tradition of strongmen seeking lifelong rule and meeting a violent demise is firmly rooted in the Haitian Revolution.

Towton, Battle of (29 March 1461)

Allegedly the longest, biggest, and bloodiest battle ever fought on British soil. The truth of such claims is difficult to establish: calculations of numbers involved and deaths in this battle have generated heated historical debate.

The battle was fought in the month that Edward, Duke of York, had himself proclaimed king, forestalling a Lancastrian advance on London. The Lancastrians withdrew, pursued by Yorkist forces, the vanguard of which was apparently overwhelmed at Ferrybridge, on the river Aire, on the night of 27–28 March. The next day, the Yorkists sought to fight their way over the river, and the Lancastrians tried to inflict a telling defeat on their pursuers. Perhaps 6,000 troops were killed before the Yorkists established themselves on the north bank.

After clashes during the night, Palm Sunday found two armies between Towton and Saxton, the Lancastrian army having advantages of ground and numbers but facing into a blizzard. The initial exchanges by longbowmen apparently favored the Yorkists, but the Lancastrians advanced, and there followed a close-quarter battle lasting over five hours, in which the Yorkists slowly gave ground. What seems to have decided the battle was the timely arrival of forces that, working their way around the Yorkists' right flank, fell on the Lancastrian left: thereafter the Lancastrian force disintegrated, with thousands being killed as they fled the battlefield or drowned in the Cock or in the Wharfe at Tadcaster.

It has been suggested that some 20,000 Lancastrians and 8,000 Yorkists were killed and that some 37,000 died in the actions between Ferrybridge and Towton, totals that must include those drowned and dead of wounds. In any event, the battle was salutary and ensured some form of peace for a decade.

Trajan, Marcus Ulpius (53–117)

Roman emperor (98–117) and conqueror of Dacia and Parthia. Born near Italica, Spain, in 53, Trajan trained for military service from an early age. He advanced to the rank

of general by distinguishing himself through his talent and ability. Trajan received the title of consul in 91, and eight years later, Emperor Nerva formally adopted him and named him as his successor. In 98, Nerva died, and Trajan became emperor. He prepared for an expedition to subdue the Dacians, who continued to exert military pressure on Rome's Danubian border. The Dacian Wars (101–102 and 105–106) proved expensive, but the capture of their large treasury compensated Trajan for his efforts. Returning to Rome, he ordered the construction of Trajan's Forum, one of the largest and most elaborate of the Roman centers. He arranged for the six-story marble annex built on the slopes of the Quirinal Hill to be decorated with visual depictions of his victories over the Dacians, reminding the people that war yielded financial gain for the victor. The 140-foot-high column of Trajan later served as his burial monument.

In 113, Trajan embarked on another campaign, this time against the Parthians. His troops advanced eastward, conquering Armenia and northern Mesopotamia and incorporating them into the empire as provinces. He reached the Persian Gulf before ill health forced him to return to Rome. Trajan died on board ship during the return voyage. The majority of his reign focused on military campaigns, but he also addressed administrative reforms and initiated a large number of construction projects.

Trebia, Battle of the (22–23 December 218 B.C.E.)

The first of three successive defeats that Rome suffered at the hands of the Carthaginian general Hannibal Barca. The Roman force, consisting of two consular armies, was led by a single consul, T. Sempronius Longus, because his colleague, Publius Cornelius Scipio, had been severely wounded.

The Roman army had encamped on the east bank of the river Trebia, a tributary to the Po. Hannibal had set up camp on the other side of the river. The night before the battle, he had sent his brother Mago with 2,000 troops to hide in the hills south of the battlefield. At daybreak, Hannibal provoked the Romans into battle. Longus immediately ordered his troops to cross the ice-cold river. His four Roman legions took position in the center, with allied infantry on either

wing. Skirmishers covered the front of the army; the flanks were covered by cavalry. The Roman force numbered about 36,000 foot and 4,000 horse.

Hannibal had deployed his army about a mile from his camp. He positioned his Spanish and Celtic infantry in the center behind his skirmishers. His large cavalry force was positioned on the flanks, reinforced by the few elephants that had survived the passage of the Alps. On either side behind the cavalry stood his crack African infantry. The Carthaginian army totaled about 30,000 foot and 6,000 horse.

When the light troops had withdrawn, the heavy infantry engaged. The numerically superior Carthaginian cavalry drove the Roman horse from the field and together with the African infantry outflanked the Roman infantry. Then Mago's force appeared from hiding and attacked the Roman line in the rear. The army was completely surrounded and destroyed, save for 10,000 legionnaires who cut their way through the Carthaginian center and retreated to the nearby city of Placentia. Hannibal lost only 7,000 troops.

Trenton (26 December 1776)

A minor American victory, but one that raised patriot morale at a low point in the American Revolution. The battles in and around New York City in the summer and fall of 1776 had gone badly for the American revolutionaries; the British had taken the city and established posts across New Jersey and up the Hudson River. Meanwhile, General George Washington knew that the enlistments of many of his few remaining troops would end on 31 December 1776. He needed a victory both to support the cause and to maintain his army.

At this nadir in revolutionary fortunes, Washington devised a brilliant plan. He intended to send forces back across the Delaware River into New Jersey; one unit would serve as a picket line north of Trenton, and another would perform the same task south of the city. Meanwhile, his main force would divide into two and attack the town from opposite ends on the morning of 26 December; he figured that the

garrison of about 1,000 Hessian mercenaries would be sated from a day of heavy drinking and eating and thus unable to defend well.

The plan did and did not work. Neither of the advanced units crossed to and stayed on the New Jersey side. But Washington's main units achieved complete surprise and total victory. In a severe winter storm, delayed somewhat by the difficulty of a broad river crossing, the Americans attacked around 8:00 A.M., shortly after dawn. Moving faster than the Hessians could form, the Americans gained control of the town, breaking up formations, blocking exits, and securing the advantage—all within 90 minutes. Nearly the entire force was captured at minimal cost to Washington's army.

Later, as Washington returned to Pennsylvania, the delayed units belatedly moved across the Delaware to New Jersey, and Washington decided to return—leading to the victorious Princeton campaign and a long winter in Morristown, New Jersey.

Trinh-Nguyen Dynastic Struggles (1620–1673)

The centuries following Vietnam's achievement of independence from China in 939 witnessed the state's expansion from the Red River valley southward along the coast, conquering and absorbing the country of Champa in what is now south-central Vietnam and then the Mekong Delta, which was inhabited by Cambodians. Vietnam's unity at this time was fragile, owing to strong regional rivalries and the logistical difficulties of controlling an elongated state squeezed between the Annamite Cordillera and the sea. Although Le Loi drove out Ming Chinese invaders in 1428 and established a new dynasty, his kingdom broke apart in the sixteenth century, and there were frequent wars between the regions, especially in the seventeenth century. In the late eighteenth century, the Tayson Rebellion swept aside the two rival northern and southern states.

Although emperors of the Le Dynasty remained the country's nominal sovereigns, the Trinh family held real power in the north (Tonkin), and the Nguyens controlled the south-central region (Annam, Cochin China). War broke out in 1620 over the Nguyen refusal to pay tax revenues to the Trinh. Trinh military forces, including war elephants, a navy,

and a 100,000-man land force, were superior to those of the Nguyen, but the latter, controlling a thinly populated realm but one richer in natural resources than the north, were equipped with Portuguese firearms and fought a successful defensive war. The protracted conflict was indecisive.

China intervened to broker a peace in 1673, and a wall was built from the mountains to the sea near Dong Hoi, marking the boundary of the two domains. This wall was very close to the 17th parallel, which divided North and South Vietnam after the 1954 Geneva Conference.

Triple Alliance, War of the (1864–1870)

South America's longest and most violent war. The war began in November 1864, when Brazil meddled in Uruguay's internal affairs, an action that drew an immediate response from Paraguay's bellicose dictator, Marshal President Francisco Solano Lopez. Lopez was convinced that Brazilian dominance of Uruguay would upset the balance of power in the region, and he reacted by blocking the Paraguay River and invading Brazil's Matto Grosso Province. Not content with Brazil as an enemy, he provoked Argentina by crossing Misiones Province to attack Brazil from the west. On 1 May 1865, in response to Lopez's attacks, Argentina, Brazil, and Uruguay formed an alliance and declared war on Paraguay. Paraguay's initial thrusts into Brazil and Argentina were soon blunted, and Lopez was forced on the defensive for the balance of the conflict. Although vastly outnumbered, Paraguay's army was modern and well-disciplined. Allied advances, led by the Argentine general Bartolome Mitre, were stopped at the Battle of Curupait in September 1866. In November 1867, the Paraguayans slowed another allied offensive at the second battle of Tuyuti. In 1868, Brazilian general Luis Alves de Lima e Silva assumed command of allied operations, and the fortunes of the allies soon improved.

Lopez's defense centered on a fortress at Humaiti, which guarded the Paraguay River. In February 1868, a Brazilian warship ran by the guns of Humaiti and bombarded Asunción, the Paraguayan capital. Lopez was forced to withdraw from Humaiti, and Asunción fell in early 1869. However, the capture of the capital and heavy casualties did not end either Paraguayan resistance or Lopez's hold on his people.

The Paraguayan army retreated to the northeast but was defeated at battles at Caacupé and Piribebuy on 15 August 1869. The allied victory at Piribebuy under the Conde d'Eu, Gaston Luis Felipe d'Orleans, destroyed the Paraguayan army as an effective fighting force. Nevertheless, Lopez was able to rally remnants of his force and wage guerrilla warfare from the north. On 1 March 1870, a Brazilian cavalry unit cornered Marshal President Francisco Solano Lopez and his band at Cerro Cora. Lopez and his son were killed, and the war ended.

The war demonstrated the ability of Latin American republics to wage modern war against each other on a large scale. Paraguay exhibited extraordinary resourcefulness, improvising as needed, building ships and armaments with its own resources, and continuing the war under the most adverse circumstances. Brazil and Argentina organized large armies and worked out problems of allied commands.

The war devastated Paraguay, which lost between 8.6 and 18.5 percent of its population, as well as 38 percent of its national territory. Moreover, Paraguay's vibrant prewar economy was wrecked and the country plunged into a period of political instability. Argentina, however, made significant territorial gains with relatively little disruption of its economy or political stability. The impact of the war on Brazil was mixed: territory was gained, and the military gained new respect, but the cost of the war in Brazilian lives and funds was high.

Trojan War (12th or 13th Century B.C.E.)

Legendary Bronze Age conflict between Mycenaean Greeks and Troy. Despite the problems inherent in any attempt to employ the Homeric epics in a historical reconstruction of the Trojan War, the latest archaeological evidence from and around the site of Troy has led many scholars to reappraise the Homeric tradition of a major expedition against the city.

For the Greeks, the Homeric epics were history, and they located Troy at a hill now called Hissarlik in northwestern Anatolia. Excavations of the site have revealed at least nine settlements dating from the early Bronze Age to late antiquity.

With its recently discovered fortified lower town, Troy VIIh/VIIa, destroyed about 1270 B.C.E., is the favored candidate for the "well-walled city with lofty towers" of Homer's *Iliad*. Archaeology has revealed that it was not only in contact with the Near East but also with Mycenaean Greece, where a flourishing and warlike civilization existed. Near Eastern texts also suggest an involvement of the Mycenaean in western Anatolia at about the right time. In particular, Hittite archives mention individual chieftains and their war bands crossing the Aegean Sea and raiding up and down the Anatolian coastline.

The unearthing of an extensive Bronze Age cemetery below the headland of Yassi Tepe and within a few meters of what was then a sheltered sandy beach suggests Mycenaean military activity within the vicinity of Troy. Comprising some 200 graves that included Mycenaean artifacts dating to about 1300 B.C.E., the cemetery, which the ancients always regarded as the tomb of Achilles, lies only 7 kilometers to the southwest of Troy. Because it does not relate to any permanent settlement in the area, it seems reasonable to infer that the cemetery was once associated with an anchorage for Mycenaean ships.

It did not need many warships full of armed raiders to threaten and sack a small city and enslave its people: six vessels, each manned by 50 warriors, sack Troy in a Hercules legend. In the Homeric epics, a leader's greatest claim to glory was to be awarded the title "sacker of cities." In the *Iliad*, a hero does not sack cities to increase his political power but does so in order to gain booty and women for himself and his followers. Indeed, the Linear B tablets that list captive women from the eastern Aegean provide vivid evidence for the predatory nature of the Mycenaean in this region.

Guarding the mouth of the Dardanelles (Homer's Hellespont), Bronze Age Troy's strength and wealth lay primarily in its location. There is evidence for a marine bay that existed in what is now the Trojan plain, and it is clear that Troy was founded on a spur that stuck out into it. The bay provided a valuable harbor for any shipping entering the Dardanelles from the Aegean Sea and facing adverse currents and winds. More often than not, ships had to wait for favorable winds in Trojan waters, whereby the Trojans could exact levies and provide goods and services. Troy may have grown rich from tribute and long been a thorn in the side of people like the Mycenaean. Its sack by a coalition of Mycenaean war bands has made an everlasting impression.

Trotsky, Leon (1879–1940)

Russian revolutionary. Trotsky was one of the leaders of the Bolshevik Revolution that established a communist government in Russia in 1917. He was responsible for creating the Red Army to defend the revolution and with inspiring it to victory.

Trotsky was born Lev Davidovich Bronstein in Yanovka (later Kirovograd) into a middle-class Jewish family. He was educated in Odessa and was arrested there in 1898 for revolutionary activities. He escaped in 1902 to England under the name “Leon Trotsky.” Trotsky returned to Russia in 1905 during the general strike protesting the Russo-Japanese War. After proclaiming the Petersburg Soviet of Workers Deputies, Trotsky was exiled to Siberia again but escaped in 1907. He spent the next 10 years as a wandering journalist, calling for revolution in Russia. During this time, Trotsky developed the concept of “permanent revolution,” which became the Russian Bolshevik “party line.”

Trotsky returned to Russia in May 1917 after the revolution that ended czarism. He worked closely with Vladimir Ilich Lenin to seize power. Trotsky was entrusted with the military planning, while Lenin assumed the political leadership. Trotsky was also elected chairman of the Petrograd Soviet in October 1917. When the Bolsheviks seized power on 7 November, Trotsky presided over the Congress of Soviets. In the new government, he became commissar of foreign affairs. He headed the delegation that traveled to Brest-Litovsk to negotiate a peace treaty with the Germans. Trotsky responded to the harsh German terms with a policy of “no peace, no war.” He hoped that German soldiers occupying Russia would be infected with Bolshevism and spread revolution to their own country. When the Germans responded by marching on Petrograd, Lenin ordered the delegation to sign the even more harsh Treaty of Brest-Litovsk. Trotsky refused to attend the signing ceremony on 3 March 1918.

After the failure of his foreign policy, Trotsky was demoted to commissar of war. He proved extraordinarily talented at organizing, equipping, and training the new Red Army. He did not hesitate to force former czarist officers to staff his army. He traveled the fronts in his private train, distributing orders, rewards, and punishments. Trotsky combined the ability to inspire his troops with a sound sense of strategy. He made good use of the Bolsheviks’ central position and control of the railroad net to defeat the White and foreign armies. In 1920, he directed the invasion of Poland on Lenin’s orders, and its failure justified his doubts. Once again, nationalism had trumped international communism. Nonetheless, by 1921, Trotsky’s Red Army had defeated its counterrevolutionary foes.

After the Russian Civil War, Trotsky supported the idea of a national militia force, instead of a professional army. He

was outmaneuvered politically and replaced by Mikhail Frunze in 1923. When Lenin died in 1924, Trotsky lost in the struggle to replace him. Stalin gradually forced Trotsky out of the party and exiled him in 1929. Trotsky eventually moved to Mexico, where a Stalinist assassin killed him in 1940.

Trumpeldor, Yosef (1880–1920)

First hero of modern Israel. Born in 1880 in Pyatigorsk in the Caucasus, Trumpeldor served with distinction in the Russo-Japanese War. After losing his left arm in combat, he returned to the front and fought at Port Arthur. He was awarded for his bravery and became one of the few Jewish officers in the czarist army.

An early convert to socialism and Zionism, Trumpeldor organized a group of pioneers and emigrated to Palestine in 1912. He worked on several pioneer settlements, inspiring his comrades with his hard work and dedication.

Deported to Egypt during World War I, Trumpeldor joined Vladimir Jabotinsky in lobbying Britain to create a Jewish military unit. Instead of a combat unit, the British formed Jewish volunteers into a 500-strong support battalion, the Zion Mule Corps, with Trumpeldor as its deputy commander. The corps served with distinction at Gallipoli and was repeatedly praised for bravery.

The unit was disbanded after the withdrawal from Gallipoli, though many of its members later served in the Jewish Legion. Trumpeldor left for Russia, where he organized Jewish self-defense forces to fight back against the pogroms that swept the war-torn country. In 1919, Trumpeldor returned to Palestine, where he helped establish the defense of the isolated settlements of the Upper Galilee as part of Hashomer, the Jewish defense organization.

On the morning of 1 March 1920, Arab irregulars attacked the Jewish village of Tel Hai. Trumpeldor, severely wounded early in the fighting, directed its successful defense. He died that night, supposedly proclaiming: “It is good to die for our country.” His dedication to hard work, nation building, and self-defense inspired a generation of Zionist settlers.

Trung Sisters, Rebellion of (39–43)

The modern nation of Vietnam traces its origins to the Red River Valley, in what is now Tonkin, or northern Vietnam, where peoples with cultures and languages distinct from the Han Chinese founded societies based on wet rice cultivation. One of the unique features of their way of life was the high status accorded to women. The Trung sisters, who struck a blow for independence from Chinese colonial rule in 39–43, were among the earliest Vietnamese patriots.

The Han Chinese emperor Wu-ti (r. 140–87 B.C.E.) conquered the region in 111 B.C.E., but Chinese rule was loose and did not deprive indigenous leaders of authority on the local level. By the early first century, however, it became more intrusive. Heavy taxes in labor and kind were extracted from the population, and Chinese officials promoted cultural assimilation. The keystone of their cultural policy was the replacement of the loosely structured Vietnamese family system with their own rigid patriarchal system, a highly effective instrument of social control. Both policies aroused intense resentment.

According to history and legend, the Chinese prefect of Giao-chi district (the modern Hanoi-Haiphong region) executed an indigenous noble, Thi Sach, who was suspected of anti-Chinese activities. His widow, Trung Trac, refused to don the traditional attire of mourning and raised the banner of rebellion, swearing to avenge her husband and restore the independent Vietnam (Van Lang) of old. Joined by her younger sister Trung Nhi, she raised an army numbering in one account over 80,000 soldiers and drove the Chinese out of the country. Many of her officers were women, indicating the strength of matriarchal values in ancient Vietnam. In 40, Trung Trac was proclaimed queen, and a capital was built for her at Me-linh, an ancient district associated with Vietnam's legendary Hung kings.

The Chinese emperor fielded his best general, Ma Yuan, against the Trungs, and they suffered defeats at his hands in 42–43. Rather than be captured, the two sisters reportedly drowned themselves in a river (Chinese accounts say they were captured and beheaded). Ma Yuan imposed tight colonial control over the region, executing thousands of rebels and bringing in large numbers of Han Chinese soldiers, officials, and settlers. Only in 939 did Vietnam break free of Chinese rule.

Recent scholarship suggests that Thi Sach was not in fact executed by the Chinese but participated loyally in the uprising instigated by his strong-willed wife. One of the more colorful legends associated with the Trungs is that they killed a man-eating tiger and used its hide to inscribe their call to arms. After Vietnam became independent, temples were raised in their honor, including the twelfth-century Hai Ba Trung temple in Hanoi and the Hat Mon temple in Son Tay Province. Having fought wars against China as well as France and the United States, socialist Vietnam reveres these sisters as national heroines.

Tukhachevsky, Mikhail Nikolayevich (1893–1937)

A brilliant Soviet military theorist who pioneered the concept of “deep battle” and was also the first major victim of Stalin's military purges. Mikhail Nikolayevich Tukhachevsky was born in the Dorogobuzh district of Smolensk on 4 February 1893. He graduated from the Aleksandrov Military School in 1914 and was rushed off into combat, where he fought with distinction. Captured and exchanged in 1917, he returned home to find Russia convulsed by the Bolshevik Revolution. A political pragmatist, Tukhachevsky joined the Communists simply from a belief that they could best reconstitute Russia as a world power. He then went on to distinguish himself in fighting throughout the Russian Civil War and spearheaded the Soviet invasion of Poland. There, in 1920, Tukhachevsky was heavily defeated by Marshal Józef Pilsudski, owing to the lack of cooperation from Soviet general Kliment Voroshilov and his political adviser, Stalin. This defeat started a long-standing, rancorous dispute among the three men.

During the postwar period, Tukhachevsky gained renown as the Soviet Union's premier military theorist. He proffered a new notion of combat, “deep battle,” based on the idea of highly mechanized forces that would penetrate enemy lines and destroy their rear areas. However, he ran afoul of Voroshilov, who insisted that armor forces were better dispersed to assist slow-moving infantry formations. Nonetheless, Tukhachevsky was made a marshal in 1935, and he helped orchestrate the growth of Soviet military professionalism. Stalin, however, came to fear his growing popularity, and in 1937, with the aid of German intelligence “disinfor-

mation,” Tukhachevsky was arrested on trumped-up charges. He was summarily executed on 11 June 1937, the first of several thousands of army officers liquidated by the regime, seemingly the most professional and competent. The toadies, the hacks, the time-servers, and the inexperienced officers who took their places were no match for the German army in the disastrous opening months of the German invasion of the Soviet Union in the summer of 1941.

Turenne, Henri de la Tour d'Auvergne, Vicomte de (1611–1675)

The military support of Louis's XIV's early reign. Henri de la Tour d'Auvergne belonged to a high nobility non-French family related to the famous Nassau. He was educated in the remote little city of Sedan and was commissioned at the age of 13; he studied military art in Paris but above all in Holland with his Nassau uncle.

He chose to serve France from 1631 and became brigadier general at the age of 23. The French phase of the Thirty Years' War gave him his opportunity. Until 1644, he was often second in command; because Turenne was a Protestant, Louis XIII mistrusted him. After the king's death (1643), Mazarin, the main minister of the underage new king, gave him the title he craved, *marechal de France*, at age 32. Turenne commanded the victorious French army in Germany, winning battles at a regular pace: Fribourg in 1644, Nordlingen in 1645, and Zusmarshausen in 1648. During the Fronde civil war, he hesitated for a year between the king's side or the rebellious nobility. His interests dictated that he support the king, and from 1650, he was at the head of the royal army against the Spanish-supported rebels.

He gained his most famous victory in 1658 over Louis II de Bourbon, fourth prince de Condé, at the battle of the Dunes. He was made “*marechal general*” by the king in 1660. His way of making war was at the same time scientific and realistic; he never tried to achieve goals he knew he could not reach. His military doctrine was to avoid siege operations and to bring the enemy to battle as often as possible.

From 1661, Louis XIV decided to rule France on his own without reference to his ministers, to Turenne's disappoint-

ment. Nonetheless, as a member of the military council, he reorganized the army, giving preference to petty nobility over courtiers for field command, thus creating a professional officer corps. He was also the king's tutor in military affairs and foreign policy.

Turenne had also to command during the 1667 campaign (War of Devolution, 1667–1668). The Dutch War (1672–1678) saw an aging Turenne criticized for his supposed lack of keenness. Yet the winter campaign of 1674–1675 is considered his masterpiece. The French province of Alsace was invaded, and with fewer troops than his old enemy, Prince Raimondo Montecuccoli, Turenne outflanked him and forced him to the German bank of the Rhine River. Received by the king as the savior of France, Turenne was killed by a gunshot during a skirmish in the following summer's campaign.

Turkish Wars of European Expansion (1413–1699)

Series of wars through which the Ottoman Empire established control of southeastern Europe. The Ottoman state, defeated by Tamerlane (1402) and divided by civil wars, was reestablished by Sultan Mehmed I (1413–1421). The first expansion of the empire came under Murad II, who acquired Salonika, Epirus, and southern Albania from Venice (1423–1430). In 1439, he seized Serbia, involving him in conflict with Hungary. Occupied with a war against the Karamids in Asia Minor, Murad was forced to relinquish Serbia in 1443 but regained the province after defeating the Hungarians under János Hunyadi at Varna (1444) and Kosovo Polje (1448).

Murad's son Mehmed II earned his title, “the Conquerer,” by eliminating the weak Byzantine state and capturing Constantinople in 1453, the Turks' greatest conquest and one they still hold under the name “Istanbul.” With the Ottoman Empire now firmly established on the Bosphorus, Mehmed turned to the consolidation of his control over the Balkans. He failed in an attempt to capture Belgrade (1456) but occupied Herzegovina and eastern Bosnia after an ineffectual war with Hungary (1460–1464). The conquest of Greece was completed with the defeat of the Duchy of Athens (1460) and the capture of the Morea (1464) and Lemnos in a

renewed war with Venice (1463–1479). In 1476, Mehmed cut Walachia's ties with Hungary, making it a tributary vassal. After the death of Skander Beg (George Kastrioti), Mehmed reconquered Albania (1478), ending a 35-year independence struggle. With the conquest of the Balkans complete, Mehmed sent raids into southern Italy (1477–1478) and besieged Otranto (1480) and Rhodes (1481).

After Mehmed's death, the Ottoman Empire was torn by a civil war between his successors. The single important conquest of this period was the acquisition of Cyprus, taken from Venice (1499–1503). After defeating his rivals, Selim I again turned to foreign expansion, making Moldavia tributary (1512) and capturing western Bosnia from Hungary (1520).

The Ottoman Empire reached the height of its military glory under the rule of Selim's son, Sultan Süleyman I, "the Magnificent," who captured Belgrade (1521) and then defeated the Hungarians at the Battle of Mohács (1526). Süleyman's support of Ján Szápolyai in the Hungarian Civil Wars (1526–1547) involved the Ottomans in the first of the Austro-Turkish Wars (1529–1791).

Though unsuccessful in the First Siege of Vienna (1529), Süleyman captured Buda (1541) and gained control of central Hungary, making Transylvania into a tributary vassal state. In the Mediterranean, Süleyman drove the Knights of St. John from Rhodes (1522) and defeated the papal-backed alliance of the First Holy League in a renewed war with Venice (1537–1540), but his forces failed in the Siege of Malta (1565). Further Ottoman expansion at sea was seriously checked by the naval forces of the Second Holy League (1571–1581), which destroyed the Ottoman fleet in the great Battle of Lepanto (1571).

Raids along the Habsburg-Ottoman borders in Croatia led to a renewal of the war in Hungary in 1593. In Holy Roman Emperor Rudolf II's "Long Turkish War" (1593–1606), the Ottomans briefly lost Transylvania, Walachia, and Moldavia before anti-Habsburg revolts restored the territories to Ottoman control. The bitter stalemate of the war signaled an important shift in the strategic balance of power of the Ottoman Empire vis-à-vis its European enemies. A succession of weak sultans, financial difficulties brought about by an inflationary crisis, and social turmoil combined at the turn of the seventeenth century to erode Ottoman military capacity. Subsequent wars added little territory to the empire and were fought primarily to recover or round out earlier conquests.

In the first stages of the long and costly Venetian War (1645–1670), the Ottoman navy suffered defeats at Páros (1651) and the Dardanelles (1656), leading to the appointment of Grand Vizier Mehmed Köprülü with extraordinary powers in 1657. Under the Köprülü family of grand viziers,

Ottoman power briefly revived. Mehmed's son, Fazil Ahmed Köprülü, reasserted Ottoman sovereignty over Transylvania, added to the Hungarian possessions, and forced the surrender of Crete (1670) after a 23-year siege. War with Poland (1672–1676) led to the occupation of Podolia and western Ukraine, the Ottoman Empire's last significant territorial acquisition.

The first territorial loss came shortly thereafter, in 1679, when Ahmed's son-in-law, Kara Mustapha, was forced to cede Ukraine to Russia. Mustapha sought compensation in further Hungarian conquests, leading to war with the Habsburgs. The Ottoman threat to Vienna sparked the formation of the Third Holy League (1684–1699), whose combined forces liberated Buda (1686), Athens (1687), and Belgrade (1688). The Ottoman recovery of Serbia and Greece after 1690 was balanced by the loss of Azov to Russia (1697). In the Treaty of Karlowitz (1699), the Ottoman Empire was forced to accept its losses and acknowledge the permanence of its new frontiers, bringing its era of imperial conquest to a close.

Tyre, Siege of (January–July 332 B.C.E.)

After his victory over the Persians at Issus, Alexander the Great marched south into Phoenicia (Lebanon). Most cities in that region submitted to Alexander, with the exception of the mighty trading city of Tyre, necessitating a siege.

Tyre was well-protected. It lay on an island somewhat less than 500 yards from the coastline and surrounded by a wall 150 feet in height. Because Alexander's naval power was limited, he was unable to blockade the city's harbors. He resorted to building a mole to the island to give his troops access to the wall. The mole progressed rapidly to within bowshot of the walls, where the Macedonians built two siege towers on the mole to protect against missile fire from walls and Tyrian ships.

With naval reinforcements, Alexander attempted to force the city by sea. This was unsuccessful, but he was able to blockade the harbors. Using ship-mounted rams, Alexander

attempted to breach the seawall away from the mole, removing rock obstacles placed by the Tyrians to limit such an attack. Meanwhile, the Tyrians had erected wooden towers upon the battlements to counter attacks from the siege towers on the mole.

Sorties and attempts to destroy or cut loose the ramming ships were eventually unsuccessful, and the Macedonians succeeded in breaching the seawall. Two ships of troops under the command of the king himself landed before the breach, and the soldiers succeeded in fighting their way into the city. Simultaneously, two squads of ships broke into the harbors. Assaulted from three points, the city was taken; 8,000 Tyrians were killed. The rest, some 30,000 persons,

were sold into slavery. The Macedonian losses amounted to 400 dead.

U

ULTRA

The World War II security classification for compartmentalized information acquired from high-level Axis signals intelligence (SIGINT). The Enigma machine, automatically encrypting message traffic, was used with the highest-level German communications, including those between Adolf Hitler and his field commanders. The Japanese acquired variations of the machine, which once understood by cryptanalysis, provided the Americans a reading of Japanese SIGINT. An original Enigma machine was acquired for British intelligence in 1939 by a Polish secret service contact formerly working in the production factory. The term *ULTRA* was coined for Enigma products because of the requirement for a classification more restrictive than the British “most secret.”

ULTRA's significance is that it allowed insight into opposing commanders' beliefs based on their transmitted strategy discussions and on their current situation based on their routine status reports. For example, the North African campaign at El Alamein (July–November 1942) saw Erwin Rommel extremely short of supplies and planning a final breakthrough to Cairo. ULTRA provided Bernard Montgomery with the complete German plan, participating units, their deployment, and the date of the offensive itself. The close-fought result, even with this advance knowledge, illustrates this information's importance for the campaign.

ULTRA may have provided the margin for the survival of Britain during the early days of the war. For example, it allowed a reasoned apportionment of aircraft sorties to defeat Luftwaffe fighters yet still provided some measure of security against the bombers. For the remainder of the war, ULTRA provided details on German weaknesses and expected attacks and confirmed Allied deception operations, as seen during the Normandy invasion, including the Pas de Calais assault ruse. This most vital Allied intelligence break-

through was not revealed for some three decades after the close of World War II.

Unarmored Fighting Vehicles

Unarmored military vehicles, either specially built for the military or adapted from commercial models and used in combat-support roles. Although armored vehicles (e.g., tanks) are the more glamorous war machines and garner most of the publicity, modern armies rely on tens of thousands of “thin-skinned” unarmored fighting vehicles (UFVs) for an almost unlimited variety of purposes. These vehicles include not only motorcycles and cars but also light and heavy trucks, buses, ambulances, tractors, wreckers, fire trucks, snowplows, amphibious vehicles, and construction equipment. The backbone of any army's UFVs is the truck (lorry).

Although it might be argued that the first UFV was Joseph Cugnot's three-wheeled, steam-powered artillery towing device invented in 1769, the modern use of such vehicles began in 1898 with the use of motorcycles and autos in the German army's maneuvers. World War I saw extensive mechanization in the major armies, carried out both by purchase or capture of civilian vehicles and by development of appropriate vehicles produced by manufacturers, who were subsidized by government and addressed specifications that emphasized standardization of controls, interchangeability

of parts, and ability to perform under service conditions. At war's end in 1918, Great Britain had 168,128 such vehicles in use. The United States, entering the war 32 months after the British, had procured 275,000 vehicles. Both nations were able to achieve a degree of standardization by taking commercially produced vehicles and modifying them for military work. No all-wheel-drive truck entered war service, although several were in the testing stage by November 1918.

In World War II, the Axis powers of Germany, Italy, and Japan produced 594,859 trucks, and the major Allies, the United States, Great Britain and the Soviet Union, manufactured 3,060,354. Germany was able to flesh out its needs somewhat with a huge array of captured vehicles and by utilizing the production of factories in occupied nations, but in doing so it created immense maintenance difficulties. Germany's great UFV failure lay in its inability to standardize. It also wasted considerable sums in producing tracked personnel carriers that carried a mere 12 troops in theater-seat luxury (but that could also be used as a prime mover) and a tracked motorcycle that could go practically anywhere—but that carried only two to three persons. The Soviets also produced tracked trucks but found, like the Germans, that the considerably higher expense and complexity of such arrangements nearly negated their superior overland capabilities. The British motor industry turned out tens of thousands of UFVs, but the troops in the field seemed to prefer the U.S. product. (For one thing, it was much easier to change gears in any U.S. UFV.)

The stars of the war, for Allies and enemy alike, were the American Jeep and the "deuce-and-a-half" truck. The Jeep, developed in 1940 by the Willys corporation and manufactured also by Ford, was a 0.25-ton, 4 x 4 (four-wheel drive) truck and command-reconnaissance vehicle that could operate with ease up to 60 miles per hour, mount a 40-degree slope, turn in a 30-foot circle, and tilt without tipping at a 50-degree angle. With a machine gun or recoilless rifle mounted, it was truly a fighting vehicle. Its only real weakness was its vulnerable standard commercial water-cooled engine; the U.S. auto industry had no off-the-shelf air-cooled engine available. The "deuce-and-a-half," a General Motors 6 x 6, 2.5-ton truck also produced by Studebaker and International Harvester, became the workhorse of the Allied cause in World War II, so widely used that Russians still call multi-drive axle trucks *studeborky* (without knowing why). The Germans were more than happy to utilize captured 6 x 6s, and the Soviets imported tens of thousands of them through Lend-Lease. The Chinese Nationalists, the Free French, the British, the Italian Co-Belligerent forces, and every Allied military force of any consequence were all allotted thousands of 6 x 6s. And at the end of the war, the U.S.

Army, paradoxically, turned over thousands of its supposedly worn-out 6 x 6s to the German economy to maintain some sort of transportation net. They soldiered on for yet another decade over torn-up roads, with minimum maintenance facilities in conditions almost resembling wartime. The 6 x 6 (along with newer models of the Jeep) continued to be produced through several model changes, serving in Korea and Vietnam (an unmatched record).

The Jeep and the 6 x 6 accurately reflected the American motor industry, which at the time out-produced the rest of the world combined, turning out vehicles that were often technologically behind their European counterparts but were more rugged and cheaper to produce and thus would be better adapted to the rigors of land warfare. Considering the literally hundreds of uses the 6 x 6 was put to, in World War II and in war and peace in the decades that followed, it may be arguably the best truck in history, military or commercial.

The contemporary era abounds in thin-skinned military vehicles, with Third World nations vigorously developing and producing their own designs so as to strive for military self-sufficiency and underwrite it with the proceeds of sales abroad. But the U.S. military seemed to have retained its UFV lead over its last remaining major military rival, the former Soviet Union. In the Gulf War (1990–1991), those anti-Saddam Hussein coalition forces unlucky enough to miss out on being issued the U.S. Army new high mobility multipurpose wheeled vehicle (HMMWV, and now, like the Jeep, produced for the civilian market), sometimes "hot-wired" Iraqi-Soviet UFVs to gain some battlefield mobility. After about 300 miles of use, these enemy trucks failed because their transmissions had worn out. There were no reported significant difficulties with the HMMWVs. Unglamorous workhorses the UFVs may be, their use in large numbers can be assured in the wars and near-wars of the foreseeable future.

Uniforms

It is often thought that military uniforms are as old as the profession of arms itself. In truth, uniforms are relatively recent innovations that were slow to gain wide acceptance. Even today, military uniforms are constantly evolving. Modern combat soldiers are invariably pictured wearing uniforms bearing scientifically designed camouflage and helmets made of the latest polymers. Yet some of those soldiers, on ceremonial occasions, may don uniforms designed centuries earlier. Even the most modern uniform incorporates some elements based more on tradition than on utility.

A degree of uniformity in the dress of soldiers existed in ancient armies, but it was a matter of function and economy, not fashion. Roman soldiers were issued a coarse wool tunic, linen undergarments, and a thick wool cloak for bad weather, hardly a proper uniform. The sartorial magnificence of the Roman legionnaire came from his armor. The weapons and shield he carried, as well as the helmet and body armor he wore, were generally manufactured to pattern in order to reduce costs.

The fall of the Roman Empire left Europe without formal armies. Defense was a local concern, and it fell to the regional warrior-leader to organize and arm the neighboring peasantry when necessary. Soldiers were generally amateurs and wore what clothing and armor was available to them, without regard for uniformity. In time, wealthier feudal lords provided their men with mantles, a loose cloak covering their armor and bearing badges based on the lord's heraldic arms. The wearing of badges advertised the wealth and power of the patron and also helped soldiers differentiate friend from foe in close fighting.

As nation-states began to form in Europe, monarchs raised their own troops. Pope Julius II established the Swiss Guard, his personal bodyguard, in 1505, and Michelangelo is credited with designing the opulent ceremonial uniform the Swiss Guard still uses.

England's King Henry VII raised the Yeomen of the Guard in 1485, the first permanent unit in the English army. They wore a red mantle bearing the badge of the king that covered their chain-mail shirts and tight hose on their legs and carried halberds. That uniform, with only minor adjustments, remains substantially unchanged.

In the sixteenth century, monarchs grew less tolerant of the armed retainers that gave military power to the lords and threatened their own power. In 1512, early in his reign, Henry VIII feared invasion. He called upon his lords to raise an army in defense of England, allowing the soldiers to wear the badges of their feudal lords. Thirty-three years later, the king issued explicit regulations prohibiting the wearing of feudal badges by either soldiers or their lords. By wearing

only Henry's badge, English soldiers ceased to be soldiers of their lords and became soldiers of their king.

Armies represented power. They provided the state the ability to make war and to defend or expand its territory. Armies also reflected the strength of the monarch. A well-equipped army dressed in uniforms bearing the king's heraldic arms or family colors bespoke a nation that was both powerful and united.

The long period of political instability that culminated in the Thirty Years' War (1618–1648) saw the formation of European standing armies. The cost of maintaining a national army represented a major drain on the treasury. Providing that army with uniforms added to that cost. Still, many continental monarchs were willing to bear the expense.

In England, the growing conflict between the crown and Parliament over royal finances slowed the move toward uniforms. There was some standardization in body armor but nothing that could be called a national uniform. When England descended into civil war, men on both sides wore the same clothing. Scarves and hat ribbons were used to denote allegiance, red for royalists and orange for the roundheads. The interregnum marked an expansion of the army but produced little change in English military dress.

The restoration of the monarchy in 1661 placed Charles II on the throne of England. He returned from his continental exile with an eye for fashion and an appreciation of the authority that a well-dressed royalist army could give to the monarchy.

By the end of the seventeenth century, military dress grew less utilitarian and more fashionable, tending to be exaggerations of civilian fashion. Body armor continued to shrink until it was reduced to little more than a small metal crescent, or gorget, worn at the neck by officers. The steel helmet disappeared until World War I. It was replaced with a felt hat folded into various styles and adorned with feathers, ribbons, lace, or cockades. A particularly cumbersome three-cornered, or tricorne, version became the style that would last the longest. The decorative breastplate, or cuirass, and ornamental helmet would reappear in cavalry dress later in the eighteenth century.

Cavalry regiments, considered elite units, were drawn to exotic uniforms. In the protracted war between Spain and the United Provinces, the Spanish king employed Hungarian Hussars. The Hussar's distinctive dress of a fur cap, or busby, tight pants, high boots, and a fur-lined short jacket casually worn over the left shoulder was copied by other European nations that quickly established hussar regiments of their own.

The eighteenth century saw an explosion of interest in military uniforms. No longer were they mere caricatures of

civilian dress; they became an art form of their own, showcasing the considerable talents of military tailors and embroiderers. Uniforms reflected the prestige of a nation, designed to fill its soldiers with pride and, their makers hoped, its enemies with trepidation.

During this period, national uniforms became associated with particular colors, red for Great Britain, white for Austria; dark blue for Prussia, and green for Russia. Each infantry regiment wore distinctive colored facings (collars, cuffs, and piping) to differentiate it from other regiments. The importance of soldiers of the same army wearing the same uniform finally became obvious on a chaotic battlefield, thick with smoke.

The British government issued a clothing allowance to regimental commanders for each soldier. Some commanders kept expenditures low, pocketing the savings. Others, finding the allowance too small, would generously supplement the allotment with their own funds. This led to some regiments, particularly cavalry units commanded by wealthy officers, having extremely elaborate and expensive uniforms.

The military dress of the eighteenth century was more suited for the parade ground than the battlefield, but the splendidly outfitted soldiers who marched off to the Napoleonic Wars altered and simplified their uniforms to meet the realities of warfare. General officers often dressed in uniforms based on civilian sporting attire when going into battle.

Once Napoleon was finally defeated and peace was restored to Europe, military tailors received new commissions. The multinational occupation army in Paris provided great inspiration. The elegantly dressed Polish Lancers were copied by most nations, who clothed their own lancer regiments in Polish dress, including the distinctive four-cornered helmet known as the *chapka* and billowy Cossack trousers.

The European fascination for military uniforms was exported to the colonial outposts of emerging empires. The uniforms of the native armies of the East India Company were just as extravagant as the uniforms of the British army. The Far East also influenced the Europeans. The Prussian army adopted a spiked helmet, the *pickelhaube*, based on the traditional headgear of the Middle East.

Military fashion, like civilian fashion, is often fickle. The military successes that France enjoyed in the early nineteenth century resulted in its uniform, and particularly its slope-fronted cap, the *kepi*, being adopted by many of the world's armies, including both the armies of the United States and the Confederate states during the Civil War. When France was defeated by Prussia in 1870, the *kepi* quickly fell out of favor, giving way to Prussian-styled spiked helmets adopted by most British imperial forces and the U.S. Army.

The successors to the elaborate cutaway infantry uniforms of the seventeenth century were replaced in most armies with the infinitely more practical tunics by the 1850s. Brightly colored uniforms remained battle attire until Boer marksmen in the Boer War found them inviting targets. The British army quickly adopted khaki service dress. The practicality of the khaki (from the Hindustani word for "dusty") uniform was recognized by British soldiers in India, who dyed their impractical white summer uniforms with tea as early as the 1850s.

By the outbreak of World War I in 1914, most armies had already adopted a monochromatic service uniform. The French still retained their bright blue and red uniforms, not changing to the "horizon blue" uniform until May 1915. Officers and men alike resisted helmets until they were ordered to wear them because of the growing number of head injuries.

The end of World War I did not bring a return to dress uniforms. It ushered in an era of utility and function in which battle dress became a part of the soldier's daily life. However, most armies still have fairly elaborate (and expensive) uniforms for formal occasions. The introduction of women into armies on a large scale in the twentieth century brought about an entirely new line of uniform design, some of it quite appalling, in the first decades of the century. Even maternity uniforms must be provided. Today, only a few elite units with ceremonial duties, like the U.S. Marine Corps Band, Britain's Guards Division, and the French Garde Republicaine, continue to wear the type of splendid military uniform that once graced the world's parade grounds and battlefields.

United Nations and Conflict Resolution

Procedural instruments and set of measures taken by the United Nations (UN) to prevent or to end serious conflicts. A system of collective security was already established within the interwar League of Nations but remained impotent. The UN considerably increased these mechanisms, following the idea that the community of states should transfer the monopoly of force to the UN. Consequently, the UN charter adopted several different means of resolving serious conflicts.

Peaceful Settlement of Disputes

Under Chapter VI (Articles 33–38) of the UN Charter, the attribute of peacefulness does not refer to the means of settlement but to the dispute itself. As long as the conflict has not reached a phase in which organized violence is used, a peaceful settlement is possible. If their dispute might potentially endanger international peace and security, the parties are obliged to take all possible steps to settle it peacefully (Article 33). If they do not succeed, the initiative can be taken by the Security Council (SC). The SC then is authorized to become active by investigating the disputed facts (inquiry, fact finding), trying to mediate, and suggesting ways to resolve the dispute. It is important to note that the SC can only make recommendations in this procedural stage. In addition, it has no competence for the settlement of legal disputes; they have to be referred to the International Court of Justice. Although the rules of this chapter lack clarity, the SC nevertheless uses its competence laid down therein rather often and successfully.

Settlement of Violent Conflicts

The previous chapter dealt with situations that are likely to endanger international peace only if not resolved. Once a conflict reaches a more acute phase, the SC has more possibilities. If the SC determines that an imminent danger to peace is present or a breach of peace or aggressive act has occurred, under Chapter VII (Articles 39–51) of the UN charter, it can decide measures necessary to maintain or restore peace (Article 39). Unfortunately, it is left to the SC's discretion what constitutes an imminent danger to peace, a breach of peace, or an aggressive act. Experience shows that not only international conflicts but also intrastate crises trigger the SC's activity according to Chapter VII. Thus the policy of apartheid has been regarded as an imminent danger to peace, as have the civil wars in Somalia and Liberia. Even following Libya's refusal to hand over two citizens accused of having destroyed a Pan American jet over Scotland (Lockerbie), the SC determined a threat to peace. The invasions of Korea, Kuwait, and the Falkland Islands consequently were classified as breaches of peace.

United Nations Headquarters building, New York. (Library of Congress)

With a situation or an act has been determined to fall under Article 39, the SC can order the parties to follow the preliminary measures suggested (Art. 40). These can be a cease-fire, the withdrawal of troops, or the commencement of peace negotiations. In cases of noncompliance, the SC can recommend to the community of states other measures to restore peace—even their participation in acts of military self-defense (as in Korea, 1950).

The UN Charter's main provisions about measures of collective security are laid down in Articles 41 and 42. Article 41 covers actions that—although still peaceful—already constitute grave means to enforce compliance of the disputing parties with the SC. These include economic sanctions, partial or complete traffic blockades, and the severance of diplomatic relations. They were used quite often, yet with mixed success at best. Some examples are the economic

sanctions imposed on Iraq, South Africa, and the former Yugoslavia.

If even these measures have no success, the SC may take the steps provided for in Article 42: such deployment of military forces as is necessary to restore the peace. However, the SC is not bound to follow the order of the steps listed; it can use military force without having imposed economic sanctions if it believes that the latter will be inadequate. The creators of the charter had foreseen the formation of a military force exclusively under the control of the UN. Individual treaties between the UN and the member states were to have arranged the number, type, and use of military personnel and material available to the SC's disposition (Article 43). These contingents were to have been commanded by a Military Staff Committee. Unfortunately, such special agreements never came into existence. The closest approximation was the formation of the UN Command to repel the North Korean invasion of South Korea in the early days of the Korean War (1950–1953). Therefore, a central pillar of the UN's system of collective security is missing. A solution to the problem, however, lies in the wording of Article 42, paragraph 2; therein the cooperation of military forces not under command of the SC is provided for. This provision was the base for the authorization the SC issued to member states in the cases of the Kuwait invasion in 1991 and East Timor in 1999. A main difference from a UN action as envisaged by Article 42, paragraph 1, is that the military units engaged are not under the command of the UN but remain in their national command structure. The authorization by the SC is only the legal basis of their employment.

Peace-Keeping

Strangely enough, the UN's traditionally most effective means of resolving serious conflicts is not even mentioned in the charter. The employment of peace-keeping forces originally had the goal of keeping the disputing parties separated from each other (Cyprus, Golan Heights) until a steady peace was arranged by diplomatic means. The condition for this employment was that all parties agreed upon it. Today, however, the formerly limited mandate of the peace-keeping forces is stretched by combination with observation tasks (such as disarmament, democratic elections, humanitarian relief), interim administrations (as in Kosovo, East Timor), and increased cooperation with multinational combat units.

The last decade of the twentieth century demonstrated that the planned monopoly of the UN over all collective security measures is far from being realized. The recent conflicts brought a massive shift of initiative from the UN and the SC toward other international organizations. Tasks of observation, mediation, and fact finding often are taken on un-

der the auspices of the European Union (EU) and the Organization for Security and Cooperation in Europe (OSCE), whereas activities of a predominantly military nature are carried out by the North Atlantic Treaty Organization (NATO) or its Partnership for Peace (PFP). Therefore, the future of the UN's role in the system of collective security remains unclear, which is unsurprising in light of the fact that, for most of the world, nationalism undoubtedly remains the strongest force in international relations.

U.S. Army

The U.S. Army can trace its roots to the Continental army organized by the Second Congressional Congress on 14 June 1775 as a measure to support the local militia in preparation for the war of independence. This original force had two primary troop types: the local militia, whose job it was to intervene in times of immediate threat and return home afterward; and the "Continental," a standing army with more thorough training and traditional, longer terms of service. Here was also the beginning of the tension between "regulars" and the militia/reservists/National Guard.

After the war, the Continental army was officially disbanded, and the size and effectiveness of the militia that was left in its place varied so greatly—in large part because of low pay and inadequate equipment—that by the time of the Mexican-American War in 1846, it was clear that a more traditional standing army was again needed to protect the United State's ever-widening frontier.

Americans, although personally a violent people, inherited a distaste for a standing army from the British, and from the days of Thomas Jefferson in the eighteenth through early nineteenth centuries and William Jennings Bryan in the twentieth, indulged the ruralist-republican fantasy that "a million men would spring to arms overnight" if the nation were actually threatened. Regulars were considered an "aristocratic" threat to the democracy. Thus, like the United Kingdom and unlike almost all other developed nations, the United States did not conscript its young men in peacetime until 1940. Even the selection of candidate officers to the U.S. Military Academy was, uniquely, in the hands of local members of congress, as a bar to the development of an offi-

cer class. Those who persisted in a military career were barely tolerated—that is, until after the outbreak of war, when they might (also unique to the United States) be elected president.

Between the Revolution and the Mexican-American War, however, the 1st American Regiment had been the stock fighting force for the fledgling country, dealing primarily with skirmishes over newly claimed land in the Northwest Territories (now the midwestern states) that was already occupied by American Indians. Lines of communication and supply were poor, however, and several key defeats, including a debacle at the Miami villages in Ohio, eventually led to the regiment being absorbed by the 3d Infantry, considered the oldest regular regiment in the U.S. Army.

Because the U.S. Military Academy at West Point (founded in 1803) was the only school of higher civil engineering instruction in the nation until the founding of Rensselaer Polytechnic Institute in the 1820s, the army, through its Corps of Engineers, was the primary builder of the nation's infrastructure until after the Civil War. To this day, the development, construction, maintenance, and improvement of its navigable waterways and flood control structures is in the hands of the corps.

By the time of the Civil War, the army had been expanding and modernizing considerably. By 1865, it had increased in size nearly sixfold to almost 1 million officers and infantry. By contrast, the Confederate army was only half this size at its strongest. With the end of the Civil War came massive demobilization, of course. By the time of the Spanish-American War in 1898, the army was again forced to rely on volunteers to buttress its numbers, a failure in planning that Secretary of War Elihu Root determined to change by reconfiguring the War Department through an army general staff and officer corps education. This he accomplished by 1903, and by the time of U.S. entrance into World War I in 1917, the ranks had swollen to nearly 4 million men, the majority of whom were conscripted (“drafted”) under the Selective Service Act that was put into place on 18 May 1917.

After World War I, pell-mell demobilization left the army with a paltry 125,000 men between the two world wars—the smallest of any major power at the time and roughly the size of Romania's ground forces. Selective Service was called upon again following Germany's rapid defeat of France in 1940, quickly increasing the numbers to 1,640,000 by the time Japan attacked Pearl Harbor in 1941. At its peak, the army was more than 8 million strong during World War II (more Americans were involved in military service in World War II than in any other organized activity in the nation's history). Equally important, however, the U.S. Army was reorganized into three main commands: the Army Ground Forces, the Army Service Forces, and the Army Air Forces, a

massive and complex organizational network that was directed by the army chief of staff, General George C. Marshall.

The reason for this unprecedented size and complexity was straightforward enough: prior to the U.S. involvement in World War II, its overseas intervention had been limited to one geographic area, but during World War II, troops and matériel were employed in Europe, Africa, Asia, and the Pacific, requiring not only greater numbers of men and machines but also new organizational divisions and improved techniques to administer them. Even with U.S. victory in Europe and the Pacific—and the obligations to administer occupied territories that came with it—the U.S. Army once again downsized and demobilized to just over 500,000 troops by 1948.

The Cold War quickly changed this policy, however, with a rapid buildup to compete with the perceived Soviet threat taking place even before the outbreak of the Korean War in 1950. Both the public and the Truman administration felt that a show of force was the best deterrent to a nuclear war, and the army was bolstered accordingly. During this same time, the Army Air Force split into an independent military unit, the U.S. Air Force, in large part because of the complexity and ubiquity of intercontinental bombers carrying atomic weapons. During the Korean War, troops were again drafted, giving the army 1,500,000 total men.

Following this war, the army did not demobilize, maintaining at least 800,000 men until the outbreak of conflict in Vietnam in the mid-1960s. As a world leader during the Cold War, the U.S. government felt it necessary to maintain such a large standing army, even though the service returned to volunteer status following U.S. withdrawal from Vietnam in 1973. Probably no single move contributed more to the professionalism of the post-Vietnam U.S. Army than the abolition of conscription. Also, separate female army units were disbanded and their personnel distributed throughout non-combat units, opening many new military occupations to a much broader spectrum of soldiers. (The ban on female ground combat troops remains.) In many ways, the “lessons of Vietnam” were taken to heart by the U.S. Army: unconventional warfare forces were built up, particularly in the years of the Reagan presidency, and in military technology, the United States leaped ahead of its allies and rivals. This improvement was made apparent in the Grenada and Panama incursions (1983 and 1989–1990, respectively) and in the Gulf War (1991).

The primary post-Cold War army field commands are the Forces Command, including the Army Reserve and Army National Guard, which is responsible for domestic protection in the continental United States; Matériel Command, whose role is to research, develop, and test new weapons and equipment; Intelligence and Security Com-

mand, which is responsible for national security and information gathering; Medical Command; Criminal Investigation Command; Corps of Engineers; Special Operations Command (which includes Civil Affairs and Psychological Operations Command); Military Traffic Management Command; Military District of Washington; U.S. Army Europe; and U.S. Army Pacific.

Increasingly in recent years, the army has served in more than a military capacity, redefining and expanding its roles in environmental protection and civil development; it also provides military assistance to federal, state, and local governments. But perhaps its most important function in recent times has been as an agency of federal relief during times of disaster, often providing much-needed medical aid, helping reconstruct whole communities after natural catastrophes, or supplying medical assistance during outbreaks of disease. Some, however, have questioned if these “operations other than war” might detract from army battle readiness.

It could be argued that no military force in history has so reflected its parent nation than the U.S. Army. An individually violent people, who have elected army commanders to the presidency at least four times yet feel that professional army men are “losers” who cannot make it in civilian life; tolerate conscription and high taxation only in wartime; expect its military to trade firepower for casualties; and retrench savagely with the coming of peace, the American people (when they even consider such matters) basically have the army that they want. Although several other armies are appreciably larger, with the collapse of the Soviet Union, the United States is the world’s only military superpower, and the U.S. Army, with its mere 10 divisions, is almost by definition the world’s leading ground force.

U.S. Marines

The amphibious elite of the United States, a unique military force that has its own armor and air arm. Despite repeated domestic challenges to its very existence, the U.S. Marine Corps has survived for more than 200 years, amassing a record of bravery and military success that has secured its place in the American military establishment.

A Marine recruitment poster from the 1920s. (Library of Congress)

In 1775, as Britain’s North American colonists organized for rebellion and war in earnest, both the Continental Congress and several state governments commissioned warships. The ship commanders provided for marine detachments as part of their crews. Congress specifically ordered the creation of two marine battalions on 10 November 1775 to spearhead an attack on Nova Scotia. Although these battalions were never formed, marines continue to commemorate this day as the birth of their service. Modeled on the marines of the Royal Navy, they served as ship security and provided the core of boarding and shore parties. Marines served on most of the ships of the Continental navy, including John Paul Jones’s *Bonhomme Richard*, and they were crucial to her victory over the *Serapis*.

Congress refused to fund a navy after the Revolutionary War; so the marines ceased to exist until 1798, when Congress authorized a small fleet. Each ship of the fleet received a detachment of marines, and they were later assigned to the navy’s shore installations. Over the next decades, marines distinguished themselves in battles on shore and sea against a host of enemies, including the British, the Seminoles, and

assorted pirates. In the Mexican-American War, marines spearheaded several landings along Mexico's coast as well as General Winfield Scott's invasion at Veracruz. A battalion of marines fought with Scott's army in its march on Mexico City.

During the Civil War, marines spearheaded numerous landings, and a marine battalion fought at Bull Run. Although technological advances have made marine sharpshooters superfluous and boarding actions unlikely, marines often crewed part of a warship's main armament.

Quickly reduced to its prewar size of 1,800 men after Apomattox, the corps resumed its old duties, helping the navy police the seas and protect American interests. Marines landed in Korea, Panama, Samoa, and numerous other locations.

The marines expanded and modernized along with the navy in the late nineteenth century. The corps continued its shipboard service (despite the protests of reform-minded naval officers) and after the Spanish-American War helped police the nation's new empire, often forming the strong arm of the United States' new active foreign policy. Marines helped suppress the Philippine Insurrection and the Boxer Rebellion, secured Panama following its revolt from Colombia, and intervened repeatedly in the nations of the Caribbean and Central America. The corps tripled in size and fielded battalion, regiment, and even brigade-strength formations. Artillery and support units expanded as well, and the marines formed a small aviation unit.

In World War I, a marine regiment formed part of the initial commitment of the American Expeditionary Force, making good on the marines' claim to be the "first to fight." Later expanded to a full brigade, marines helped stem the German attack at Chateau-Thierry and spearheaded the Allied counterattack at Belleau Wood. As part of its wartime expansion, the Marine Corps began recruiting women.

As the U.S. Navy adjusted to its expanded role in the twentieth century and prepared for future wars, naval officers realized they needed a specialized force to seize and hold advance bases to support fleet operations. They assigned that role to the marines, who developed the doctrine for amphibious assault that would serve them so well for the rest of the century. When World War II came, the U.S. Marine Corps was virtually the only force in the world thoroughly prepared for amphibious warfare.

In the months following the attack on Pearl Harbor, the stout resistance of isolated marine garrisons in the Pacific was virtually all the United States could point to with pride. Particularly noteworthy was the fierce resistance of the marines defending Wake Island. During the war, the corps built up to a force of six divisions and almost 500,000 marines. They spearheaded the island-hopping campaign across the Pacific, often bearing the brunt of the fighting from Guadalcanal, Tarawa, and Pelelieu to Iwo Jima and Okinawa.

Easily the most remembered photograph of the U.S. Pacific War was that of marines raising the U.S. flag over Mount Surabachi on bitterly contested Iwo Jima.

After World War II the marines, reduced in size by half, survived continued institutional challenges to their survival and cemented their place as the United States' principal, ready military force. Marines served in numerous small operations from the Caribbean to the Middle East and Africa and in all three of the major U.S. military actions of the post-war period. In the Korean War, marines again proved their mettle, helping defend the Pusan perimeter, landing at Inchon to cut the North Korean army's lines, and later fighting their way out of the Chosin Reservoir with such effectiveness that Chinese troops were soon surrendering to *them*. (Their fighting spirit was summarized by the marine officer who insisted that his men were not "retreating" from North Korea; no, they were simply "attacking in another direction.")

Marines landed at Da Nang in March 1965, beginning the large-scale U.S. commitment to the Vietnam conflict. Deployed along the so-called demilitarized zone (DMZ), the marines developed an innovative approach to counterinsurgency operations and added to the corps' combat reputation, most notably at Khe Sanh and Hue. In the Gulf War, marines and the threat of marine landings fixed Iraqi units in place as allied armor outflanked and surrounded them. Although often resented by the other American military arms for their elitism and their "creaming off" of the best fighters, the marines remain the United States' principal ready military force.

U.S. Militia (1603–1815)

System of common defense utilized by British colonials and the United States. With a lack of regular army units available for service in North America, colonial leaders instituted a militia modeled on the example of Elizabethan England. Under this system, all able-bodied (white) males between the

ages of 16 and 60—although the age range varied from colony to colony—were required to serve in the militia. Service was compulsory, and training and drill were mandatory. Militiamen were also required to maintain their own weapons. Some professions were excluded from duty. Officers were usually selected from the higher stations of society. Normally, there were two levels of militia service: the common militia, based on universal service and mostly local and defensive in nature, and the volunteer militia, who formed special companies, normally with elaborate uniforms. The volunteer militia tended to take their obligations more seriously and were more willing to engage in missions outside their colonial boundaries.

The militia served three purposes. The first was to protect local communities from American Indians. To this end, the militia was used most famously in the ferocious fighting of King Philip's War (1675–1676) in Massachusetts. Because King James II refused to send troops to aid his colonials, they were forced to turn to the militia for protection. Second, the militia was to fight rival European colonial powers in time of war. If the force was sent outside colonial boundaries, most typically Canada, volunteers were requested from the ranks of the militia. Throughout the colonial period, New England and New York militia units were employed in invasions and raids on French holdings in Canada. During King William's War (1689–1697), Queen Anne's War (1702–1713), and the French and Indian War (1754–1763), militia troops made several forays into Canada. During the last conflict, the militia took part in the forcible removal of French from Nova Scotia. In the South, Georgia and South Carolina militia fought Spaniards in Florida, most notably during the War of Jenkins' Ear (1739–1748). The most ambitious use of militia overseas occurred in 1741, when 3,000 men from throughout the colonies joined British regulars in an attempted invasion of South America. Yellow fever took a greater toll than the fighting, and only 1,300 made it back to North America. Third, the militia was to uphold domestic order. In the South, for example, militia units took part in suppressing slave rebellions. Occasionally, the militia became the source of unrest. During Bacon's Rebellion (1675–1676), Virginia militiamen critical of Governor William Berkeley's cautious Indian policy took it upon themselves to attack frontier American Indian villages. The rebellion soon faded away, thanks to loyalist militia and news that King Charles II had dispatched 1,100 regulars to quell the uprising. The militia was later used to suppress the backwoods Regulators of North Carolina at the Battle of Alamance (1771).

The quality of the militia deteriorated with the waning of the American Indian threat. In cities like Boston and New York, the night watch replaced the militia as the civic respon-

sibility of white male citizens. With the arrival of large numbers of British regulars after the French and Indian War, the militia became less important for defense and more of a social institution. As colonial assemblies challenged the executive power of royal governors, the legislatures increasingly used the power of the purse to exert greater control over the militia. During the early months of the American Revolution, the militia played a vital role. At the Battles of Lexington and Concord, the Massachusetts militia stood well against the British regulars, and Ethan Allen's Green Mountain Boys captured Forts Ticonderoga and Crown Point in 1775. At Bunker Hill (1775) militia troops inflicted heavy casualties on the British. The creation of the Continental army eclipsed the militia in importance, although the militia made favorable contributions at Saratoga (1777) and Cowpens (1781), among others. General George Washington preferred drilled, trained, disciplined, and long-term enlisted regular army troops to the unreliable militia, ignoring the invaluable role that the militia played in guarding homesteads and keeping the rural economy going. British commanders were surprised by the rapid ability of the militia to mobilize when the king's troops pushed inland. But the militia also melted quickly in battle and proved unable to prevent Sir Charles Cornwallis from occupying parts of the South. However, they did stop him from occupying all the South after a string of disasters had decimated the Continental forces there. In areas such as New York City, loyalists formed militia units that operated with the British army, patrolled Long Island and Westchester County, and fought pitched battles with the patriot militias in the Southern Department.

After independence, the debate over the need for a standing army and how much reliance should be placed on the militia continued. The stunning defeat in 1791 of General Arthur St. Clair's combined militia and regular force by American Indians in Ohio convinced many of the foolishness of giving too much responsibility to the militia. With the Militia Act of 1792, Congress gave the president greater control over the militia and attempted to standardize practices among the different states.

However, the War of 1812 and the reality of waging large-scale offensive and defensive campaigns caused a reassessment of the militia in the defense structure of the United States. The militia troops performed poorly throughout the war. In October 1812 at Queenston Heights, New York, militia troops refused to leave the state even though American regulars were losing to the British on Canadian soil within eyesight. When the British threatened Washington, D.C., in 1814 only 7,500 of the 95,000 militia called to the colors fulfilled their duty, and they fled after suffering a mere 66 casualties.

At the conclusion of the war in 1815, American national-

ist politicians realized that the militia was no substitute for a regular army, despite the continued hostility of Jeffersonians to a standing army. They enlarged the standing army, created the office of commanding general of the army, and reorganized the War Department. In the Mexican-American War, the United States supplemented the regular army not with militia but with volunteer forces. Only in the South, where they stood ready in case of slave revolts, was the militia taken seriously. Although the militia continued to exist until the end of the nineteenth century, it was mainly considered a social club, as it no longer played an important role in the military of the United States.

Utah War (1857–1858)

The armed conflict in Utah Territory between President James Buchanan's administration and the leadership of the Mormon Church. In May 1857, President Buchanan's goal was the restoration of federal authority in a violent, out-of-control Utah. His strategy involved the replacement of Brigham Young, president of the Mormon Church, as governor, and the assignment of a military escort—ultimately nearly one-third of the U.S. Army—to protect a new slate of territorial officers and to enforce federal law. In fact, the conflict was the culmination of a 10-year struggle for power and authority in Utah Territory, then an enormous entity stretching 600 miles from Kansas to California. Pitted against one another were Young's efforts to establish a millennially oriented, Mormon theocracy and the attempts by Presidents Millard Fillmore, Franklin Pierce, and Buchanan to deal with the region as they would any other American territory. Compounding these conflicts was a national uproar following the 1852 confirmation of Mormonism's polygamy doctrine and a growing number of sensational, unsolved murders in

Utah. In 1856, the new Republican Party adopted an anti-polygamy platform plank, and congressional moves were afoot to dismember Utah Territory as a political entity. By the time Buchanan took office the next March, every non-Mormon federal appointee had fled the territory, the second such mass exodus of Utah's officials in five years.

For Buchanan, the catalyst for action was his receipt in April 1857 of a petition from Utah's legislative assembly couched in rhetoric so inflammatory that his cabinet interpreted it as a de facto declaration of war. Accordingly, in late May 1857, Buchanan ordered the creation of an army expeditionary brigade of 2,500 infantry, dragoon, and artillery troops. Planning for the campaign was both hasty and seriously flawed from the outset. During August 1857, Young mobilized his 6,000-man territorial militia (Nauvoo Legion); accelerated earlier efforts to accumulate and manufacture both arms and ammunition; pulled in the outlying Mormon colonies in San Bernardino, San Francisco, Carson Valley, and Las Vegas; attempted to align Indian allies; cached grain; and instructed Mormon missionaries in Europe to channel converts to Canada. Concurrently, 300 miles to the south at Mountain Meadows, Nauvoo Legionaries and Indian allies massacred settlers, committing what was until 1995 the largest American incident of mass murder involving unarmed civilians. On 15 September 1857, Young proclaimed martial law and took the offensive to deny the army access to Salt Lake Valley. While abandoning all other outlying colonies, Young prepared a last-ditch contingency escape route north to Montana's Bitterroot Valley (and perhaps to the British possessions beyond). The most dramatic and costly such Mormon action came on 4–5 October, when a small detachment fell successively on two large but unescorted contractor wagon trains camped on Green River and the Big Sandy. The attack destroyed an enormous quantity of irreplaceable army matériel and rations.

Shocked by the army's reverses in the Rockies and the enormous cost of the campaign, Congress went into an investigative and debating posture. This political climate prompted Buchanan to accept the offer of Thomas L. Kane, a Philadelphia friend of the Mormons, to travel secretly to Utah to mediate the conflict without government sanction. Traveling covertly via New York, Panama, and California, Kane arrived in Salt Lake City on 25 February 1858 and immediately began discussions with a friendly but unyielding Brigham Young.

Unquestionably, Young's knowledge of the previous September's Mountain Meadows Massacre and its implications, if not his December federal indictment for treason, caused him to draw back. Consequently, by mid-March, he sought to buy time and preserve his options by entering into three nearly simultaneous initiatives to supplement legion plans

for an aggressive spring campaign: a willingness to discuss acceptance of the federal governor (without the army); the evacuation of northern Utah (including Salt Lake City) by 30,000 Mormons who were to flee to Provo; and an extensive, misguided exploration of the deserts of western Utah Territory to locate oases to which Young mistakenly believed he could lead his people while fighting a rearguard guerrilla campaign after firing northern Utah.

Unaware of these developments, Buchanan sent out two peace commissioners bearing a blanket amnesty conditional upon Mormon acceptance of federal authority. Young eventually accepted these terms with much posturing and the understanding that the army would not occupy settlements. On 26 June 1858, federal troops marched through a deserted (and prepared for burning) Salt Lake City and on to establish Camp Floyd 40 miles to the south, the nation's

largest military post. In July, Mormon refugees returned home. The active phase of the Utah War was over, although tensions, conflicts, and legal maneuvers between the Mormon Church and the federal government would continue in different forms into the first decade of the twentieth century.

V

Vacietis, Jukums (1873–1938)

Red Army commander in chief. Of peasant origins, from Courland, Latvia, Vacietis joined the czarist army (1891) and graduated from Vilno Infantry Academy (1897) and the General Staff Academy (1909).

In World War I, Vacietis was an infantry battalion commander, was promoted to colonel, and commanded the 5th Zemgalsky Latvian Rifle Regiment, a rare national minority-based formation. He backed the Bolsheviks in October while retaining the loyalty of his regiment. Appointed Twelfth Army Commander, he participated in the takeover of the czarist General Staff Headquarters at Mogilev (November 1917) and was head of operational field staff under Stavka (December 1917). Vacietis also suppressed the revolt of Polish general Josef Dowbór-Musnitsky in Belorussia (January–February 1918).

During the Russian Civil War, Vacietis continued to command the remnants of his Latvian regiment, renamed the Soviet Latvian Rifle Corp and then Division (March–April 1918). This unit became the Kremlin bodyguard of the Soviet regime, suppressing the Left Social Revolutionaries uprising in Moscow (July 1918) and earning Vladimir Ilich Lenin's and Leon Trotsky's trust. Vacietis was appointed eastern front commander in 1918 and oversaw the reorganization of Red Army forces into five regular armies, launching successful offensives against Komuch and the Czech Legion (September) and retaking Kazan, Simbirsk, and Samara in the Volga region.

As commander in chief of Red Army forces (September 1918–July 1919), Vacietis oversaw mixed Red fortunes: reverses on the southern front against Anton Denikin, setbacks, and then successes against Aleksandr Kolchak on the eastern front.

In July 1919, Vacietis was removed, arrested, and accused of treason and counterrevolutionary conspiracy after strate-

gic disputes with eastern front commander Sergei Kamenev, which were connected with emerging political disputes between Trotsky and Stalin (the latter Kamenev's sponsor). Released without charge in October, he served in the field until 1921. Vacietis then taught military history, was a senior lecturer on tactics, was professor of Red Army senior military training in the Red Army Military Academy (called the Frunze Academy from 1925), and wrote his memoirs and works on military history and doctrine.

In 1934, Vacietis was a member of the People's Commissariat of Defense. But Stalin's murderous purges caught up with him, and he was arrested in November 1937 and executed in 1938 in Moscow. His past links with Trotsky and disputes with Stalin condemned him, but also his degree of popularity and professional independence, all fatal "flaws" in Stalin's eyes. Vacietis was rehabilitated in 1957. Soon after, Khrushchev's de-Stalinization program began, and a memorial museum in Vacietis's honor was opened in Latvia in 1973.

Valley Campaign (23 March–9 June 1862)

One of the most brilliant military campaigns by an outnumbered force, one that is still studied in the twenty-first century. As Union general George McClellan began moving the Army of the Potomac to the peninsula between the York and James Rivers, he expected reinforcements to march down from Washington, D.C., to Richmond, thereby presenting the outnumbered Confederates under Joseph Johnston with a serious dilemma.

To help the defense of Richmond from afar, Thomas J. “Stonewall” Jackson received orders to threaten the Union capital from the Shenandoah Valley. Jackson carried out his orders magnificently. He began by attacking a larger Union force under Nathaniel Banks at Kernstown at the northern end of the Shenandoah Valley in late March; Jackson then retreated, somewhat retraced his steps, and moved westward to meet John Frémont at McDowell on 8 May. On 23 May, Jackson’s “foot cavalry” (so named for its celerity of movement) surprised a small Union garrison at Front Royal, which caused Banks’s army to retreat from Strasberg to Winchester, where Jackson’s men drove them back so far that they retreated across the Potomac River into Maryland. When Frémont’s troops sought to move down the valley and cut off Jackson’s retreat, he attacked them at Cross Keys on 8 June and once again drove them back.

Thus, Jackson made great use of superior mobility and Massanutten Mountain in the middle of the valley; his men marched more than 400 miles and fought a series of battles in six weeks. With only 17,000 men, he kept some 63,000 Union troops from uniting and thereby prevented them both from driving him out of the valley and from adding to the preponderance of force that General George McClellan was slowly assembling in the peninsula campaign. Finally, Jackson slipped away with his men, Union prisoners, and captured supplies to help Robert E. Lee in the Seven Days’ Battles, which neutralized McClellan’s advance on Richmond, the Confederate capital.

Valley Forge (1777–1778)

Testing place of the American Revolution. In the winter of 1777–1778, General George Washington, commander of the

Continental army, encamped at Valley Forge, Pennsylvania, some 20 miles from British-held Philadelphia. Washington and his men experienced severe difficulties in their winter camp, including starvation, exposure to the elements, and a plot to remove Washington as commander in chief. Throughout this period, Washington lobbied the Continental Congress on behalf of his army, which persuaded the infant government to change its ineffective approach to managing the conflict. His ability to instill professionalism in his troops and to secure the support of the Continental Congress during this distressing period is considered one of his major achievements during the American Revolution. But Washington also received assistance from two important foreign visitors, Marie Joseph du Motier, the Marquis de Lafayette, and Baron Friedrich von Steuben. Lafayette quickly won the admiration of the common soldiery, which helped to bring him battlefield successes later in the war, and he was instrumental in exposing the conspirators against Washington.

Steuben, a Prussian veteran under Frederick the Great, was credited with training the American recruits and instilling the military discipline necessary to confront the professional British army. He also wrote a book of regulations for the Continental army that enjoyed wide circulation throughout the officer ranks. Although Washington’s troop levels dwindled to about 4,000, Valley Forge produced a more capable fighting force, which proved itself with a near-victory at Monmouth Court House in New Jersey on 18 June 1778.

Valmy (20 September 1792)

French victory over Prussian forces, halting their invasion of France and proving the value of mass conscript armies. In 1792, Charles François Dumouriez’s Army of the North advanced toward Belgium. The allied army of Karl William Ferdinand, Duke of Brunswick, moved west, capturing Longwy (23 August) and Verdun (2 September). In late August, Dumouriez turned south to stop Brunswick in the Argonne.

When Austrian troops turned Dumouriez’s northern flank, he retreated south to St. Ménéhould at the southern

Washington at Valley Forge. (Library of Congress)

end of the Argonne. Brunswick delayed, permitting the arrival of François Kellermann's Army of the Center, allowing some 64,000 French to mass around Valmy. The allies numbered 36,000. The French deployed facing westward in an arc from Mount Yron, around Valmy, across the main St. Ménéhould–Paris road. On 19 September, Frederick William II of Prussia ordered Brunswick to capture this road to cut Dumouriez off from Paris. On 20 September in dense fog and rain, the Prussians moved south toward the road. About 7:00 A.M., they encountered French artillery fire from their east. Thus began the battle of Valmy.

The Prussians crossed the road, and by noon Brunswick had deployed facing northeast toward the hill of Valmy. As the fog lifted, they confronted well-organized French troops. Frederick William and his officers then ordered an infantry charge up the hill. The French unleashed a massive artillery barrage. After advancing only 200 yards, Brunswick halted. The cannonade increased. A French counterattack failed, as did a second Prussian thrust. Brunswick then abandoned the attack. The battle dwindled out in dusk and heavy rain.

The French lost fewer than 200 casualties and the Germans about 300. The French left the battlefield, but in terms of ability to continue, the Germans had lost at Valmy. On 30 September, Brunswick's demoralized troops began to evacuate France. Dumouriez, some of whose own men had tried to mutiny, did not interfere.

Valmy temporarily halted the foreign invasion, thus saving the revolution and the republic. It foreshadowed the use of massed artillery and showed Europe that the French army and volunteers were a formidable force. In time, all major European powers would adopt the French concept of *levée en masse*—mass conscript armies.

Valois-Habsburg Wars (1521–1559)

Italy brought France the Renaissance, and France brought Italy warfare, strengthening the Valois Dynasty. However, war in Italy was about more than Italy. The peninsula was just one theater of the conflict between the Valois and Habsburg Dynasties for the domination of western Europe. When the Habsburg king of Spain, Charles V, became Holy Roman Emperor in 1519, France faced encirclement from the Spanish Netherlands to Germany to Spain to Italy. The wars were really about dynastic considerations and for the prestige and glory of the warrior-kings involved.

The French monarch, Francis I, began war against Charles in Italy in 1521 but was defeated and captured at Pavia in 1525. Charles imprisoned Francis in Spain and ransomed the king, who returned to France in 1527. After another round of fighting, the two monarchs made peace in 1529, and Francis married the emperor's sister, Eleanor. The two monarchs fought further inconclusive wars from 1536 to 1538 and from 1542 to 1544. In this period, Francis, a Catholic, did not hesitate to ally against the Catholic Habsburgs with German Protestant princes and with Muslim Ottomans.

Yet these wars fought largely in Italy also sparked a revolution in military affairs that included the construction of great fortresses on the model called the *trace italienne* and saw the rise of the musket as the newest infantry weapon. By 1529, large standing armies were the norm, not small dynastic armies raised for a war and then disbanded. To pay for the armies and artillery now required in the new age of warfare, Francis I used his personal fortune to buy the loyalty of his nobles with titles and cash. He used the new form of patronage to control his nobles by creating vertical ties that bound them to him as tightly as had the old ties of feudalism.

The most significant battle of the period, Pavia (1525), was the first attack on France from Italy in centuries. Arquebusiers came out from behind their ramparts and attacked in ranks, in the first battle in which small arms fire was decisive. It was also a battle of surprise, maneuver, and massacre. The French lost 8,000 to the imperials' 700. By 1530, successful sieges were a matter of execution, not invention. However, bastional fortresses on the Italian design were expensive, and only rich states or cities could afford them. Recognizing the importance of the fortress, the French began constructing a double line of fortresses in the northeast, which held through a lack of resolve among its enemies and would hold through the wars of Louis XIV.

The Treaty of Cateau-Cambrésis in 1559 that ended the Valois-Habsburg Wars also illustrated their international aspect beyond Italy. The French renounced any claims on the Italian peninsula, acquired Calais from the English, and secured Toul, Metz, and Verdun.

Van Fleet, James A. (1892–1992)

Eminent U.S. Army commander of the early Cold War. Born in New Jersey and raised in Florida, Van Fleet graduated from the U.S. Military Academy in the class of 1915, his initial combat service being in World War I. Though achieving corps-level rank in World War II, Van Fleet labored under the unusual burden of having been mistaken for a dissolute officer who had served at the U.S. Army's infantry school at the same time George C. Marshall was commandant, a career-killing perception not corrected until 1944.

In the immediate post-World War II period, Van Fleet led the American military mission to Greece during that country's civil war and furthered his reputation by making the Greek military battle-worthy. Replacing Mathew Ridgway as the commander of the Eighth Army in Korea in 1951, Van Fleet directed the war of attrition that characterized most of that conflict, also presiding over the reconstruction of the South Korean army.

Van Fleet retired from service not long after the armistice signed at Panmunjom, evidently embittered by the failure to wage a more aggressive war and the combat death of his son, though he made a return to public life as a special ambassador to the Far East during the Eisenhower administration. He is best remembered as an aggressive infantry officer with a talent for motivation and training.

Vandals

A Germanic tribe from Jutland. The Vandals crossed the Rhine River with the Alans and Suevi in 406. Three years later, they were in Spain.

In 429, facing pressure in Spain from Romans and Visigoths, the Vandal king, Gaiseric (r. 428–477), ferried his people across the Strait of Gibraltar and led them east along the North African coast. The crippled son of a slave, Gaiseric was a proud and ruthless leader and a gifted conspirator with a genius for political intrigue that for 50 years foiled the plans of Romans and fellow Germanic rulers alike. One by one, the Roman cities with their well-stocked granaries fell to the Vandals. Even before the Vandal conquest of North Africa was complete, Gaiseric turned restlessly to a new project: he built a fleet and launched himself on a lucrative career of piracy.

Establishing themselves as a warrior aristocracy and leaving administrative chores to Roman bureaucrats, the Vandals carved out large estates and made their homes among the provincials. Vandals, like many other Germanic tribes, had been converted to “heretical” Arian Christianity, which argued that Jesus was less than divine. Relations of Vandals with the majority Catholics were thus strained. Gaiseric, an ardent Arian, barely held animosities in check. Under his successor, Huneric (r. 477–484), violence erupted.

Gratuitous cruelty was only one symptom of the Vandal degeneration after Gaiseric. Warriors seduced by luxuries grew weak, corrupt, and disorganized. In 533, the eastern Roman general Belisarius crossed into Africa with his army. In one campaigning season, he crushed the Vandal kingdom completely.

Nic Fields

opportunity to reveal his talents. In charge of all fortification works from 1678, he was appointed lieutenant general in 1688 and eventually marshal of France in 1703, the first time a technical officer had been raised so high.

Vauban is more famous for his fortification design than for his military achievements. He formalized the system of fortification in memoranda that were to be the focus of military studies until the late nineteenth century. His *Treatise on Attack of Forts* (1701) summarized his actual experiences: the weakest point had to be assaulted first after having dug parallels and zigzagging communication trenches; any siege needed five times the number of besieged troops. His *Treatise on Defense of Forts* (1706) is his military legacy; he improved earlier forms (those of Blaise de Pagan and Baron Menno von Coehoorn) by his own three systems: first, each bastion is covered by the fire from a flanking bastion; second, three lines of fortification are built: low towers on the curtain, bastions and tenails (low rampart in the ditch), and ravelins as exterior works with ditch and glacis; third, the fortification is integrated into the urban project (Neuf Brisach is the only example). During his active service, he built 33 new fortifications and worked on 300 older ones, including those in allied countries. He persuaded Louis XIV and his war minister Michel le Tellier, the Marquis de Louvois, to define a defensive strategy called *le pré carré* (squared meadows), which involved the making of linear borders easy to defend by a double line of fortified towns. His system of fortifications and fortresses saved France in 1709.

Vauban, Sébastien Le Prestre de (1633–1707)

The most famous military engineer of the seventeenth century. Vauban was born into very modest country nobility. His only way to climb the social scale was to serve in the army. He bought a cadet brevet in the Condé regiment in 1651, but his first battles were against king's troops during the Fronde civil war. Taken prisoner in 1653, he sided with the strongest side and soon distinguished himself in the king's army in siege warfare. He was admitted in 1659 as a “king's ordinary engineer,” one of a corps of specialized technical officers in charge of building and besieging fortifications. The wars against the Dutch and of the Augsburg League gave him the

Vegetius Renatus, Flavius (fl. late 300s)

Roman military strategist and thinker writing in the twilight of the empire. His *De re militari* became a standard military guide throughout medieval Europe.

Likely born in Roman Spain, Vegetius was a nobleman, a Christian, and a well-traveled civil servant. A breeder of cavalry horses, he was deeply versed in the military literature of Republican and imperial Rome. Vegetius wrote his *Epitoma* some time after 380 but before 410, the first “fall” of Rome.

Epitoma sought the military rejuvenation of the empire through a revival of Augustan-era professionalism. Vegetius

deplored as self-destructive the empire's dependence upon undependable Germanic and other barbarian tribal levies. Rome instead required an army and navy recruited from indigenous peoples, trained according to proper discipline, esprit, and patriotism. Vegetius also discussed tactics to deploy such forces, which, though smaller, would be more reliable and manageable than the tribal levies. Military historians find Vegetius an invaluable guide to the ways of warfare in Europe at the end of the classical era and the dawn of the Middle Ages.

Venetian-Genoese War (1255–1381)

The war between the city-states of Venice and Genoa lasted almost 130 years and resulted in the bankruptcy of Genoa. Mostly conducted at sea, the number of troops and ships involved were staggering for the day. Conventional and unconventional tactics were used throughout.

Although rivals for years, the cities went to war over control of a church in Acre. A scuffle one day ended in a death. The Genoese invaded the Venetian quarter, setting it aflame and driving the refugees out. Now in control of the city, the Genoese stretched a heavy chain across the harbor to keep out Venetian ships. In September 1257, a Venetian fleet arrived. It sailed into the harbor and broke the chain; the Venetian forces captured all the Genoese merchant ships and burned two galleys. They then fought their way inland to the disputed church. The Venetians burned all the surrounding fortifications and houses and then moved into the Genoese quarter to treat the Genoese as they had treated the Venetians.

The Genoese regrouped and made a stand at Tyre, where the fleeing fleet met up with other Genoese ships. The Venetians formed a battle line at the mouth of the harbor and challenged the Genoese to come forth. The harbor mouth would allow only one ship to leave the harbor at a time. But the Genoese sailed forth anyway, with predictable results. All the ships were burned or captured.

Despite winning the battles, the Venetians were forced by the pope into a truce that would last until 1293. At the expiration of the truce, the Genoese controlled the unfortified town of Pera. The Venetians burned this town and moved on to the city of Caffa. A winter in Crimea cost the Venetians more than half their crews and equipment. In the spring, the two fleets met off Curzola in the Adriatic Sea. Although out-

numbered, the Genoese admiral Andria Doria held some ships in reserve, with orders not to engage until the wind allowed them to bear down in the heat of the action. The result was that 65 Venetian ships burned.

The two sides declared peace in 1299, with the Genoese prohibiting any armed Venetian ships from entering the Black Sea or the harbors on the coast of Syria for 13 years. It would be a third party that would cause the two to go to war again. Both Venice and Genoa had agreed to suspend commercial activity with the city of Tana. Venice broke the agreement and began trading. Genoa, still in control of the Black Sea, declared an embargo on all Venetian ships entering that sea. The Venetians sent a ship to the archipelago region to challenge the embargo. The two nearly equal fleets met in the Bay of Caristo, with the victory going to Venice.

Three years later, the fleet met in February off the Dardanelles. Pisani commanded the Venetian fleet, and Doria commanded the Genoese. The battle and a storm began at the same time. Wreckage littered the Sea of Marmara. The Genoese won, but only because Pisani's battered but intact squadron could not renew the fight.

A year later, Doria entered the Adriatic Sea with reinforcements and joined the main fleet at Pola, reconquering the Dalmatian and Istrian cities that Pisani had taken the previous year. The war on land was going just as badly for the Venetians as the naval war. The Genoese allies took unfortified villages and besieged the cities.

By 1380, it appeared all but over for Venice. Doria attempted to take Malamacco on August 6. The Venetians repelled him, and he burned Pelestrina in revenge. He then seized and attached little Chioggia. It fell on 16 August, and thereby the encirclement of Venice was complete. Doria then proceeded to harry the Venetian outposts. By October, the Genoese withdrew to Chioggia and established a blockade around the city of Venice.

To save the city, Pisani proposed the radical step of blockading the blockade. On 22 December, 34 galleys left Venice and stood off Chioggia. The next day, the Venetians landed 4,800 men on Sottomarina as a diversion. Meanwhile, the rest of the fleet sank two barges across the mouth of the port, in Brondolo canal, and blocked the Lombard canal. Now, there was no way out of Chioggia for the Genoese. Nevertheless, the Venetians remained blockaded too.

In a New Year's miracle, Zeno sailed into view on 1 January and broke the Genoese blockade. The blockade continued, the Venetians preferring to starve the Genoese out rather than face them in battle. Grimaldi (in command after the death of Doria) finally surrendered on June 24.

The pope again pushed the two sides to settle their dispute. Venice and Genoa signed a peace treaty on 8 August 1381 at Turin. Venice lost Trieste to the Duke of Austria and

Tenedos to the Duke of Savoy. It was forced to renounce its claim to Dalmatia. However, Venice did recover its commercial privileges on terra firma and at Constantinople.

Venezuelan Civil Wars (1858–1870)

A confusing revolving-door succession of caudillos (strongmen) who did little to deal with Venezuela's real problems of poverty and political immaturity. The civil wars began on 15 March 1858, with the overthrow of the liberal oligarchy of president José Tadeo Mongas by General Julian Castro. Venezuela was plagued by political arguments over the form of the national government. The two divergent issues were federalism and centralism. However, the main cause of political unrest that gripped the nation was not ideology but the desire for power by caudillos. For the balance of 1858, Castro's opponents plotted his ouster, while a constitutional convention drafted a new document that was approved on 31 December, but the country still drifted toward anarchy.

On 20 February 1859, the Federal Revolution began, when 40 rebels captured the city of Coro and proclaimed a new federation for all of Venezuela. General Juan Crisóstomo Falcón, Antonio Leocadio Guzmán, and General Ezequiel Zamora were the leading members of the provisional junta. On 10 December, Zamora led the Federal Army to victory over the Constitutionals at Santa Inéz and followed this success by driving his opponents out of western Venezuela. The federalists were on the verge of complete victory when Zamora was killed on 10 January 1860 and Falcón took direct charge of the federal army.

The federal cause was dealt a serious setback on 17 February, when a Constitutionalist army, commanded by General León Febres Cordero, smashed Falcón's force at Coplé. Falcón escaped to neighboring New Granada (Colombia), and the war might have ended at this point, had the political anarchy of the government not given the federalists a chance to regroup and continue the fight. The presidency had become a revolving door. For example, in 1859 Castro resigned, reclaimed his office, was imprisoned, and was pardoned. Several men, including Pedro Gaul, held the position until José Antonio Paéz once again became head of state of Venezuela in 1861.

In August 1862, at the direction of Falcón, the federalist army opened an offensive in the center of the country and threatened the capital, Caracas. By May 1863, General Antonio Guzmán Blanco led the federalists to further victories and control of most of the country. On 6 June, Paéz ratified the Treaty of Coche, Falcón became president, and Guzmán Blanco became vice president.

The federalist victory and Falcón's leadership brought little peace. From 1863 to 1868, he had to deal with numerous uprisings and civil unrest. In January 1868, the Blue Revolution, so named because the rebels adopted a blue badge, made a concerted effort to depose Falcón. The revolution was initially led by General Miguel Antonio Rojas, but José Tadeo Mongas soon took the lead. The rebel army entered Caracas in early June, and Falcón went into exile. The death of Mongas led to in-fighting between his son, José Ruperto, and his nephew, Domingo Mongas. José Ruperto was able to assume the presidency on 8 March 1869.

In February 1870, Guzmán Blanco led an invasion to take control of the liberal movement and to seize power. He entered Caracas on 27 April and soon became president, a position he held until 1877. Venezuela would know peace thereafter but not much democracy.

Veracruz, Siege of (9–28 March 1847)

When it became clear that victories in northern Mexico would not bring about Mexico's surrender, U.S. president James Polk agreed to the seizure of Veracruz and a march to Mexico City itself. General Winfield Scott, following a suggestion from Commodore David Conner, proposed landing on a beach south of Veracruz's formidable defenses and laying siege to the city—all timed to move up into the mountains before yellow fever (El Vomito) season incapacitated the invaders.

The landings began on 9 March 1847. By midnight, reflecting great army-navy cooperation, more than 100 vessels helped land more than 10,000 men, their supplies, and draft animals without loss of life. The Mexican commander, General Juan Morales, remained within Veracruz's defenses and did not contest the landing. Scott declined a suggestion from

some of his officers to rush the defenses and set about to establish a siege. The landward bombardment began on 22 March; two days later the U.S. Navy joined the bombardment from the sea, and Scott cut off supplies to the city, including fresh water. Mexican artillery was not effective in response, in part because of its use of solid copper cannon balls.

Six days after the bombardment began, on March 28, the Mexican army surrendered the city and the fortress of San Juan de Ulua, and Scott managed to move his command inland and up the mountain pass for the eventual attack on Mexico City before the yellow fever epidemic season began.

The Americans would return to Veracruz in 1914, acting as the agents of President Woodrow Wilson's absurd attempts to "teach the Mexicans democracy" and as part of an overreaction to an imagined Mexican "insult" to the United States. After intense fighting, the U.S. Army would occupy and administer the city for six months.

Veracruz, U.S. Landings at (1914)

Relations between Mexico and the United States deteriorated with the onset of the Mexican Revolution in 1910. In 1914, tensions mounted when U.S. president Woodrow Wilson refused to recognize the regime of General Victoriano Huerta. The Tampico incident of 9 April, involving the brief arrest of a group of U.S. sailors by Mexican soldiers, intensified the crisis. On 21 April, U.S. troops seized the Mexican port of Veracruz to stop a shipment of arms from Germany to Huerta's forces and to retaliate for the Tampico incident.

At first, Navy bluejackets planned a limited operation to secure the waterfront and the customs house. However, spirited opposition by the general population and Mexican soldiers caused U.S. commanders to order the seizure of all of Veracruz. The capture of the city resulted in 17 American deaths. Estimates placed Mexican losses at 126 killed, including civilians. The American intervention caused Huerta to call for the unification of all revolutionary factions to resist. When it became apparent that the intervention would be limited to Veracruz, Huerta's opponents, including Venus-

tiano Carranza, Pancho Villa, and Emiliano Zapata, renewed their efforts to depose him.

The occupation of Veracruz did not completely cut off the supply of arms to Huerta, and the United States was frustrated by its inability to control events in Mexico. A diplomatic effort to negotiate a settlement at the Niagara Falls Conference failed. Moreover, President Woodrow Wilson found that he had little leverage with revolutionary forces in Mexico under the command of Carranza, who refused to negotiate with the Americans. Nevertheless, the Huerta regime fell in July.

After a seven-month occupation, American forces withdrew in November 1914. Carranza's forces then took control of the city and the large quantities of military stores, which were soon used in the next phase of the Mexican Revolution.

Vercingetorix (d. c. 45 B.C.E.)

Chieftain of the Avernii, one of the dominant Gallic tribes, Vercingetorix led a confederation of tribes against Rome and was defeated by Julius Caesar. Vercingetorix's leadership presented Julius Caesar with a major crisis in Gaul. Vercingetorix was soundly defeated in an open field battle against Caesar at Noviodonum in the winter of 52 B.C.E. Now wary of direct confrontations with the Romans, Vercingetorix employed guerrilla raids and scorched-earth tactics. In March 52 B.C.E., Caesar moved quickly to eliminate one of the centers of Gallic rebellion and so laid siege to the Biturigan stronghold of Avaricum. During the siege, the Gauls effectively used fortifications, fire, and ballistics against Caesar's two legions. Despite the Gauls' attempts to end the siege, the Romans ultimately broke through the fortifications and slaughtered the city's 40,000 inhabitants. Roughly a month after the defeat of Avaricum, Caesar turned his attentions to Gergovia, another center of rebellion in central Gaul and an imposing fortress situated on a steep hill. Vercingetorix, however, beat Caesar to Gergovia and, employing many of the tactics used at Avaricum, carefully prepared its defenses. Vercingetorix repulsed the Roman attacks and handed Caesar one of the rare defeats of his career. In the summer of 52 B.C.E., Caesar briefly engaged Vercingetorix's forces near Ale-

sia. Retreating from the Romans, Vercingetorix expelled the city's women and children in order to make room for his 60,000 troops. Caesar's 50,000 legionaries and Germanic cavalry laid siege to Gergovia. Caesar withstood three bloody assaults against his position by 100,000–250,000 (sources differ) Gallic troops who attempted to relieve Vercingetorix. He attempted to break out of the city but soon realized that Roman victory was inevitable. Upon surrender at Alesia, Vercingetorix was taken to Rome and executed in 46 B.C.E.

Verdun (21 February–18 December 1916)

The most concentrated carnage in military history. The campaign was the brainchild of German field marshal Erich von Falkenhayn, who hoped to force France to commit the bulk of its army to defend the fortified city of Verdun, where it could then be destroyed in place. (Falkenhayn fastidiously termed this “bleeding the French.”) Operation GERICHT (place of judgment) began on 21 February with a massive artillery barrage. The German Fifth Army under Crown Prince Wilhelm followed with attacks on French forts east of the Meuse River. On 25 February, Fort Douaumont fell, and Field Marshal Joseph Joffre named General Henri-Philippe Pétain to command Verdun's defenses. Pétain proclaimed of the Germans, “Ils ne passeront pas!” (“They shall not pass!”), a statement that rallied the weary French military and civilians.

The German offensive switched briefly to the west bank of the Meuse River, where it again met stiff resistance. In the east, the Germans came within 5 miles of Verdun but were unable to clear the defenders from Fort Vaux. On 6 June, the attackers finally overran Vaux and advanced to within 2 miles of the city by the end of the month.

The French, under the command of Pétain and his successor Robert Nivelle, were able to keep the army supplied and reinforced by truck along the *voie sacrée* (sacred way). On 24 October, they launched a series of counterattacks, which took back the lost forts and erased most German gains.

The German high command, shaken by the British offen-

sive on the Somme, Romania's entry into the war, and its failures at Verdun, lost confidence in the operation. On 29 August, Falkenhayn was replaced as chief of staff by Paul von Hindenburg and Erich Ludendorff. Fighting around Verdun ended by mid-December.

Casualty figures vary, but it appears that the two sides suffered nearly 1 million combined casualties at Verdun. To this day, the battlefield is hazardous, with unexploded ordnance still lurking.

The holding of Verdun was a tremendous morale boost for the French and marked the end of the German “western” strategy. But it would be difficult to argue that either side “won” the Battle of Verdun; the losers can be more easily identified—the youth of France and Germany.

Vespasian (9–79)

Roman emperor and general and founder of the Flavian Dynasty. Vespasian was born at Reate in the Sabine region of Italy on 18 November 9. As a young officer, he rose through the ranks, serving in Thrace, Crete, Cyrenaica, and Germany, and was commander of the second legion in the invasion of Britain in 43–44. He was consul in 51, proconsul of Africa in 63, and governor of Judea in 67 during the First Jewish Revolt. After a year of fighting against fanatical resistance, the Romans subdued the countryside and prepared to besiege Jerusalem. Upon the death of Nero in 68 and the subsequent political instability in Rome, Vespasian conspired with other Near Eastern governors to seize control of the empire. Their plan was for legions from Syria to attack Rome, while Vespasian held sway over the crucial supply of Egyptian grain. However, without orders, legions from the Danube River under Primus invaded Rome and defeated Vespasian's rival Vitellius in December 69. The Senate formally declared Vespasian emperor on 21 December 69.

For the most part, once Judea was conquered and a Gallo-German rebel force under Civilus was defeated, the empire had peace under Vespasian. Exceptions included the extension of the border in Britain and the taking of some strategic territory in Germany. As emperor, he raised taxes and suc-

cessfully reformed finances to replenish the treasury, which had been drained by the civil wars that preceded his reign.

Vespasian sought to found a dynasty, and both of his sons, Titus and Domitian later became emperors themselves. He died of illness on 24 June 79. History regards Vespasian, known for his work ethic and honesty, as one of the better emperors.

Vicksburg, Siege of (18 May–4 July 1863)

The most significant siege of the American Civil War. In late 1862, Union general Ulysses S. Grant had sought a way to

take the last major Confederate bastion interdicting the Mississippi River, the city of Vicksburg. But his efforts to advance south from Corinth left him vulnerable to raids by Generals Nathan Bedford Forrest and Earl Van Dorn against his lengthening supply line. Grant had to retreat.

The Union commander then decided to cross to the west and move opposite Vicksburg; he tried various means to take the city, none of which were successful, and eventually devised a brilliant strategy. He had Admiral David Porter move his gunboats south at night, past Vicksburg. The Union navy helped transport Grant's command across the Mississippi below Vicksburg at Bruinsburg, and then shedding his supply line, he said his men could live off the land. He moved first to block Joseph Johnston at Raymond on 14 May, driving him back to Jackson, the state capital, and then trapping the Vicksburg the garrison commanded by John Pemberton. On 16 May, as Pemberton looked for the nonexistent Union supply lines, Grant attacked him at Champion Hill and Big Black River, and Pemberton—perhaps unwisely—retreated into Vicksburg.

Two days later, Grant reestablished contact with the navy (and hence his supply line). He unsuccessfully tried to rush

Surrender at the Siege of Vicksburg, 4 July 1863. (Library of Congress)

the city's defenses and thereafter settled in for an ever-tightening siege. Many city residents lived in caves dug into the bluffs to avoid the constant artillery shelling and were reduced to eating domestic animals. On 4 July 1863, one day after the end of fighting at Gettysburg, Pemberton surrendered his surviving 29,000 men and the key city. Several days later, the defenders of Port Hudson also surrendered, and the Union controlled the Mississippi River, opening "the Father of Waters" to commerce all the way to New Orleans and the sea and cutting off Texas and Arkansas from the rest of the Confederacy.

Vienna, Sieges of (1529, 1683)

From 27 September to 14 October 1529, Süleyman the Magnificent besieged the city of Vienna in hopes of breaking the power of the Austrian Empire and opening the way to central Europe. More than 120,000 Turks repeatedly assaulted the fortifications around the city, defended by 16,000 troops and many civilians under the Count de Salm. A final attempt to storm a breach in the walls was repulsed with heavy losses, and Süleyman withdrew. The Turks soon found themselves fighting multiple wars against Russia, Venice, Persia, Austria, Hungary, and others and were not able to return their attention to Vienna until 1683.

In September 1683, the Turks, riding a resurgence of power, besieged Vienna again with 138,000 troops under Kara Mustapha Pasha. By this time, complex *trace italienne*-style fortifications, developed by the French engineer Sébastien Le Prestre de Vauban, were employed to defend many European cities, including Vienna. Giant Turkish guns, so successful against the old walls of Constantinople in 1453, were no longer very effective. The Turkish siege was poorly conducted, with no defensive breastworks to protect Turkish lines in case of rear attack. That is exactly what happened when King Jan III Sobieski of Poland came to the aid of Vienna with 30,000 troops. He was also given command of 40,000 Austrian troops, and a rear attack on the Turkish line led to a fierce, desperate, daylong battle that found the Turks sandwiched between the fortifications of Vienna and the forces of Sobieski. The Turks were crushed with huge losses, including six pashas. Kara Mustapha Pasha narrowly es-

caped, and Austria went on to take Belgrade, the Turkish Balkan stronghold, and then marched on Constantinople itself before the Turks sued for peace. Turkish power was forever broken in Europe.

Vietnam Conflict (1961–1975)

The United States' most controversial conflict and Vietnam's most devastating one. The roots of this conflict go back to French colonial presence in the area. During World War II, President Franklin D. Roosevelt had mixed feelings about France and, to a lesser extent, other European nations as colonial powers. However, in the extreme haste and confusion that marked the end of the war against Japan, the British and Nationalist Chinese accepted the Japanese surrender in Indochina, and the British helped reintroduce French military control.

Once Vietnamese nationalists were convinced that the French intended to return, an increasingly strong and successful resistance movement began. In 1949, Communist forces had occupied southern China, which gave the Vietminh, the communist-dominated Vietnamese resistance movement, access to sanctuary, supplies, and perhaps Chinese "advisers." The conflict soon worsened for the French, who after the debacle at Dien Bien Phu in May 1954 agreed to a cease-fire and to participate in a meeting at Geneva that would spell the end of their Asian empire.

In the aftermath of the North Korean attack on South Korea and the subsequent and related adoption of the nearly hysterically anticommunist National Security Council document 68/4, the United States increased assistance to the French. By 1954, the United States was bearing perhaps 80 percent of the material cost of the conflict. Although the Geneva Conference provided for the division of Indochina into three countries—Laos, Cambodia, and Vietnam—it also provided for a temporary division of Vietnam at the 17th parallel to facilitate the movement of troops and civilians prior to French withdrawal from the area. And at about the same time, the United States, believing that South Vietnam could be the first of a series of "dominoes" to fall to communism in that resource-rich and important region, set

about to organize an independent government, the Republic of Vietnam, for the area south of the 17th parallel.

From 1956 to 1961, there was relative peace in Vietnam. Ho Chi Minh and his Communist colleagues set about organizing a Maoist-style regime in the north, while a Catholic Vietnamese who had collaborated with the French and perhaps Japanese colonial authorities, Ngo Dinh Diem, set about creating an authoritarian government in the south with American assistance. Late in the period, the government in Hanoi began preparing for the takeover of the south, organizing Groups 559, 759, and 959 to facilitate the infiltration of men and matériel by land and sea routes.

Communist insurgency increasingly began to threaten the government in Saigon after 1961. Although a growing number of American advisers brought new ideas, including the new concept of air mobility using helicopters to transport troops quickly and safely to the battlefield, they did not seem to be able positively to affect the battle in the countryside. The battle of Ap Bac in January 1963 seemed a demonstration of the weaknesses of the South Vietnamese regime.

At about the same time that Ngo Dinh Diem and President John F. Kennedy were assassinated in November 1963, the U.S. government was engaging in a review of its Vietnam policy. In the aftermath of the alleged North Vietnamese attacks on U.S. destroyers on patrol in the Gulf of Tonkin in August 1964, the U.S. government decided to increase its commitment. Ultimately, President Lyndon Johnson chose to compromise, seeking to maintain a pro-U.S. government in the south but not to grant the military all that it requested in terms of U.S. troops and matériel to assist the Saigon government. The clever idea of Johnson's advisers was for a "gradual escalation," designed to impress the Hanoi regime with the possibility of greater U.S. commitment but also giving that government time to prepare for such increased escalation; it became a kind of *pas de deux*, in which each U.S. additional commitment was met and neutralized by a similarly increased North Vietnamese commitment. The United States largely conceded the strategic initiative and concentrated on the tactical initiative, allowing the North Vietnamese to determine when and where most battles would take place.

The Vietnamese Communists felt that they were fighting for their nation, whereas the Americans were testing interesting theories of counterinsurgency to deal with the threat of Moscow-encouraged "wars of national liberation." The Vietnamese Communists were fighting their own all-out war of liberation, whereas the Americans conducted a "limited war," as the Johnson administration made repeatedly clear. Finally, the South Vietnamese themselves knew that if they won, Vietnam would remain divided for the foreseeable future; if the other side prevailed, the nation would be re-

united, even if on Communist terms. Thus, it should not have been too difficult to identify which party to the conflict would prove the most determined.

The strategic conduct (and on occasion, the operational and even the tactical level) of the American war from its earliest days was the hobby of "defense intellectuals," individuals (always characterized as "brilliant" by a fawning press) who had little or no experience of war and who believed that "rationalism" and "quantification" could be brought to humankind's most irrational and profligate of enterprises. They were to be confounded by an "irrational" enemy, who would pay any price for victory and who seemed oblivious to their "signals," "graduated responses," or "surgical strikes," unless it suited Communist propaganda purposes. For all of their vaunted "toughness," none of the defense intellectuals stayed the course; the Communist high command was in it from the beginning to the end.

It was little better when the Johnson regime attempted to formulate and publicize its war goals (the term *victory* was eschewed as hopelessly "primitive"). Basically, they were to stop "aggression from the North" (or, as Secretary of State Dean Rusk thrillingly put it, "To stop the other side from doing what it is doing") and give the Republic of Vietnam a chance to survive—hardly enough spiritually to rally a nation. Priding themselves on their knowledge of history, Johnson's advisers argued against a large call-up of reserves, instead relying on gradually increased draft calls, just when the inequities of the Selective Service System, with its student deferments and National Guard bolt-holes, became increasingly apparent.

The rules of engagement imposed on American forces in this limited war were most remarkable, in many ways reminiscent of the other "limited war"—Korea. For example, U.S. pilots on bombing and strafing runs over North Vietnam could engage enemy pilots in the air but could not seek to destroy planes on the ground. In addition, there were all kinds of restrictions on bombing targets and on the routes and times for bombing missions, leading to a certain predictability that had grave consequences for the pilots flying these missions. The view from over Hanoi was considerably different from that of defense intellectuals arguing around a table in the White House Situation Room.

As a consequence, General William Westmoreland initially selected a holding strategy until sufficient U.S. troop commitment could affect the battle. He established positions along the coast to develop port and base facilities and engaged in some spoiling operations, the most famous of which was the Ia Drang Valley battle in October–November 1965. Thereafter, from 1965 until he left Vietnam in 1968, Westmoreland settled on a strategy of attrition. He wanted to kill, seriously wound, capture, or cause to desert more en-

emy troops—main force North Vietnamese and Vietcong units—than the enemy could replace. When the attrition rate favored the United States and South Vietnam, he reasoned, the enemy would quit fighting. This strategy relied upon the superior mobility and firepower of U.S. units and supply capacity that enabled them to leapfrog across the country to surround and attack suspected enemy strong points. But it conceded the strategic decision—the initiative—on whether to bring the fight at all to the enemy.

For a while, Westmoreland's strategy seemed to work. In a series of major search-and-destroy missions like Attleboro, Cedar Falls, and Junction City, U.S. troops, the South Vietnamese, and other national allies inflicted many enemy casualties and destroyed vast quantities of supplies and ammunition. More important, by late 1967, the pace of fighting seemed to have slowed, and the enemy appeared to have retreated toward the borders, perhaps reflecting the terrible pounding it had sustained in this campaign.

Perhaps in reaction to this difficult situation, the Communists mounted the Tet Offensive of January–February 1968. It was a logistical triumph, as North Vietnamese general Vo Nguyen Giap managed to infiltrate 100,000 men and supplies into key positions in virtually every major city and town in South Vietnam. But the expected popular uprising never materialized, and swift U.S. and South Vietnamese reactions doomed the attackers, who were spread too thinly. It was an allied military victory (although a viewer of the networks' nightly news could be pardoned for not thinking so), but the initial strength of the Communist gamble seemed to contradict claims of progress that Westmoreland and the U.S. military had been making prior to the surprise attack. And, apparently, the Tet Offensive soured President Johnson on the war, who turned to his new secretary of defense, Clark Clifford, for advice. He, in turn, counseled that the war was not winnable. In late March 1968, Johnson announced that he would seek peace, order a bombing halt over North Vietnam, and not stand for reelection. The defense intellectuals, now deeming their war "unwinnable," had for the most part left Washington for more lucrative employment, as had former defense secretary Robert McNamara, supposedly something of an intellectual himself. As he confessed decades later, he had given up on any hope of victory some years earlier but still mendaciously proclaimed publicly his faith in victory.

Richard Nixon succeeded Johnson as president in January 1969 with a new idea for the conflict. He believed it a distraction to his complex diplomacy with the Soviet Union and the People's Republic of China; he wanted to downgrade the U.S. commitment while providing the South Vietnamese with the means ("a fighting chance") to resist future North Vietnamese aggression. He called for a three-part strategy:

Vietnamization (turning the war over to South Vietnam), American troop withdrawal, and an end to the draft.

It seemed to work for several years. Recovering from losses sustained as a result of the Tet Offensive and from the continuing bombing campaign, Communist activity certainly decreased in 1969 and 1970. Nixon relied on U.S. airpower and a series of spoiling attacks across the border into Cambodia to destroy enemy supply caches necessary for a renewed attack on the south. But by 1971, the North Vietnamese had recovered to some extent and planned for a major offensive after the bulk of U.S. troop strength had been withdrawn.

On 30 March 1972, more than 14 North Vietnamese divisions (out of a total of 20) attacked the south. It was an all-out attack in three places—across the Cambodian border toward Saigon, across the central highlands toward the coast, and straight across the 17th parallel toward Hue. Hanoi had assumed that the south was weak and that, with a reelection and diplomacy with the USSR and China at stake, Nixon would not recommit U.S. power.

Hanoi made major miscalculations, and the invasion failed. President Nixon committed the full U.S. air arsenal, and the South Vietnamese fought well and hard. In the north, ARVN retook land temporarily lost to the offensive, routing six North Vietnamese divisions. In the central highlands, the North Vietnamese failed to capture Kontum and failed to take a single provincial capital or defeat decisively any major South Vietnamese ground forces. The drive to Saigon similarly failed. In the end, the North Vietnamese lost more than half of its 200,000-strong invasion force and suffered similar losses in tanks and artillery. Once again, General Vo had divided his strength sufficiently to deny mass where he needed it. Once again, as after the Tet Offensive, South Vietnam had time to gain control over its people and territory. (But once again, the viewer of the networks' nightly news would see almost solely accounts of ARVN inefficiency and government corruption.)

The Watergate cover-up and the consequent pendulum swing of power from the president to the Congress dramatically affected the U.S. ability to assist South Vietnam. Congress passed the War Powers Act, set limits on where U.S. forces could operate, and limited the transfer of matériel to the south. The American people were becoming heartily sick of this war; public opinion played little part in the planning and decisions of the North Vietnamese regime. Hanoi dramatically upgraded its supply capacity to the south, improving roads, constructing fuel pipelines, and preparing for yet another all-out assault.

The final offensive began with an attack on Phuoc Long Province in December 1974. Strongly supported enemy forces overwhelmed the defenders, and Hanoi concluded it

could fight without risk of massive U.S. intervention as had happened in spring 1972. Then, in March 1975, North Vietnam concentrated its forces and attacked Ban Me Thuot, an important provincial capital in the central highlands. The attack succeeded, and a counterattack failed, given the north's superiority in artillery support. As the North Vietnamese prepared to follow up the victory at Ban Me Thuot, South Vietnamese president Nguyen Van Thieu decided to abandon the northern half of South Vietnam and concentrate his forces in a defense of Saigon and the Mekong Delta. The retreat soon became a rout and despite the valiant defense of Xuan Loc on the road to Saigon, the North Vietnamese entered the capital on 30 April 1975, and South Vietnam collapsed the next day. Soon thereafter, Communist forces conquered neighboring Laos and Cambodia, and the longest U.S. war was over.

Nonetheless, it is a fallacy that the U.S. military "lost" the Vietnam War. It won every engagement of any size that it fought. But, as one North Vietnamese negotiator replied to an American military historian who raised the point, "That is irrelevant." The U.S. Army could win all its battles, but the U.S. government could not achieve its goal of a democratic South Vietnam. Tactically, the U.S. won; strategically, it lost.

The war had a profound effect on the American home front, dividing large segments of the population and causing distrust and actual hatred of many American institutions, such as the army and the federal government. It would take the U.S. Army some 15 years to recover its morale and its fighting edge after Vietnam, and it could do so only by abolishing the draft in 1973. Trust in the U.S. government has never fully recovered.

Vietnam held no end of lessons for the U.S. military, most of which seemed to have been learned well enough, judging from subsequent American battle performance. These lessons were the basic ones of hard training, unit morale, and a jettisoning of contemporary fads, as well as the conviction that military affairs should remain with the military (always subject to civilian control, of course), not with civilian intellectuals. But perhaps the most significant military lesson from the Vietnam War is that no democracy can fight a war with conscripts in cold blood.

Vietnamese Civil War (Tayson Rebellion, 1773–1802)

Civil war that established a single Vietnam national entity. In the eighteenth century, Vietnam was divided into two states, one controlled by the Trinh family in Tonkin, with its capital at Thang-long (Hanoi), and the other dominated by the Nguyen family in Annam, with its capital at Hue, though an emperor of the Le Dynasty, founded in the fifteenth century, remained the country's nominal ruler. The Tayson Rebellion of 1773–1802 swept away both states but was overthrown by a Nguyen prince who established a new dynasty unifying all of Vietnam in 1802.

The rebellion flared up in Tayson (Western Mountain) village, in what is now central Vietnam. Its leaders were three brothers, Nguyen Nhac, Nguyen Lu, and Nguyen Hue (no relation to the Nguyen ruling family), of whom the last proved to be the most talented. According to a Spanish missionary witness, "They began moving through the villages, announcing to the inhabitants that they were not bandits, but envoys from Heaven, that they wanted to see justice prevail and liberate the people from the tyranny of the king and his mandarins. They preached equality in everything" (Nguyen 1993, 100). After gaining control of their home region, Annam, the rebels turned south and occupied Gia Dinh (Saigon). But a Nguyen prince, Nguyen Anh, put up determined resistance. He persuaded his close ally, King Rama I of Siam, to provide him with an army of 20,000 men, who invaded the western Mekong Delta in 1784. Nguyen Hue defeated them in battle on the My Tho River and then turned his attention to the Trinh domain in Tonkin, capturing Thang-long in 1786.

Although the Tayson brothers recognized the powerless Le emperor as sovereign, the Le crown prince turned against them after his father died and sought aid from the Chinese emperor Qian Long. The latter sent an army of 200,000 to eradicate the Taysons. Nguyen Hue proclaimed himself Quang Trung emperor (r. 1788–1792) in December 1788 and drove the Chinese out of Tonkin the following year in a series of epochal battles including a "Tet [Vietnamese New Year] Offensive" that cleared the way for the liberation of Thang-long.

Nguyen Hue/Quang Trung's son and successor, Quang Toan (r. 1793–1802), a boy of 10, could not prevent internal divisions in the Tayson movement that worked to the advantage of the perennially ambitious Nguyen Anh. Vilified by modern Vietnamese historians for seeking foreign assistance, most notably from the Siamese and the French (he signed a treaty with Louis XVI in 1787 and obtained limited French funds, military supplies, and advisers in exchange for territorial concessions), he steadily turned the tide of war against the Taysons, proclaiming himself Gia Long emperor

(r. 1802–1820) in June 1802 and capturing Thang-long the following month. His reign name signified that he held sway from Gia Dinh (Saigon) to Thang-long (Hanoi), the territorial extent of modern Vietnam, which in fact had been unified by his archenemy Nguyen Hue.

Viking Raids (c. 800–1016)

Scandinavian raiders who preyed on Europe. Viking warships, with their combination of oars and efficient sails, made it possible for the Vikings to range far beyond their homelands in search of booty and new places to settle. England, directly across the North Sea from Norway, from which most Vikings came, provided a particularly vulnerable target. The earliest documented foray by the Vikings in the British Isles was a raid on Lindisfarne in Northumbria (793). Later the raids expanded to other parts of Europe.

Scholars distinguish four distinct phases of Viking raids. During the first (790–840), Vikings raided directly from Scandinavia, using to full the advantages provided by their small, shallow-draught ships, ideally suited for hit-and-run raids on coastal locations and along rivers. Fleets were modest in size and were usually manned by personal war bands. Raids were seasonal and isolated.

During the second phase (841–875), raids grew in number, size, and intensity. For the first time, Vikings wintered on foreign soil, on Noirmoutier Island, in the Loire estuary, in 843. Still meeting little or no organized resistance and arriving unexpectedly in overwhelming force, the Vikings achieved enormous success. Immense amounts of booty were secured and returned to the homeland. Victims were killed or enslaved.

The establishment of winter bases meant that the Vikings could extend their range considerably, as far as Spain and the Mediterranean. In 844, a Viking fleet harried Seville, although it suffered a bloody repulse. Survivors returned to the Loire Valley to settle. Another fleet raided Spain, North Africa, Provence, and Italy, where it was finally defeated (859–862).

In England, desultory raiding had continued but began

again more earnestly in 865. A large force, known as the “Great Danish Army,” led by the sons of Ragnar Lothbrok, Healfden, and Ivar the Boneless, wintered in East Anglia. By remaining on foreign soil, the Vikings increased political pressure on local rulers. Many Anglo-Saxon and Frankish kings tried to buy off the Vikings in an attempt to remove them from their kingdoms.

In a third phase (876–980), the Vikings were out for more lasting gain. They expanded their holding in England and Francia and permanently settled in Ireland and Iceland. Occasionally meeting strong opposition, the “Great Danish Army,” the focus of Viking activity in the West, conquered the kingdoms of East Anglia and Northumbria and reduced Mercia to a fraction of its former size (865–879). It was unable to subdue the Wessex of Alfred “the Great” (r. 871–899). A truce was made in 878; it later became the basis of the Treaty of Wedmore, signed in 886, which recognized that much of England was in Danish hands (the *Danelaw*).

Although hard-pressed by fresh armies of Vikings from 892 to 899, Alfred was finally victorious. His son, Edward the Elder (r. 899–924), began the reconquest of Danish England. Before his death, small Danish states on old Mercian and East Anglian territory had fallen. All lands south of the Humber estuary were once more in Anglo-Saxon hands. The more remote Northumbria resisted longer, largely under Viking leaders from Ireland. Eadred (r. 946–955), the son of Edward the Elder, finally liquidated the Scandinavian power there in 954. Eric Bloodaxe, the last independent Viking king in York, was driven out and killed.

The fourth phase (980–1016) coincides with the reign of Æthelred the Unready (r. 978–1016). At its end, England was a part of the empire of the Dane Canute I. It can be subdivided into four stages. During the first (980–991), there was a resumption of Viking activity in England after a lull of 25 years, though with mainly local effects. The second stage (991 to 1005) witnessed heavier attacks, the effects of a single large Viking army on English territory. It arrived in 991 with 93 ships under Olaf Trygvason, future king of Norway, and only returned to Denmark in 1005, forced by famine. This army fought Byrhtnoth at Maldon and received tribute (*Danegeld*) in 991 (10,000 pounds of silver), 994 (16,000 pounds), and 1002 (24,000 pounds). Its raids were destructive forays designed to inflict the maximum damage and extort the maximum tribute.

The third stage (1006–1012) saw two invasions. The first, in 1006, was only halted with a massive payment of tribute in 1007 (36,000 pounds of silver). At this nadir of his fortunes, Æthelred was finally cajoled into action. In 1008, he ordered that a fleet be built, but local rivalries limited its usefulness. It did not prevent the arrival of another immense Viking army, led by Thorkell the Tall, in 1009. Thorkell har-

ried much of southern England and only ceased after the payment of tribute in 1012 (48,000 pounds of silver).

During the fourth stage (1013–1016), there were two more invasions, culminating in the conquest of England. The first, in 1013, was led by Svein Forkbeard of Denmark. He was accompanied by his teenage son, Knut Sveinsson. The son returned with a second invasion force in 1016 and went on to rule England as Canute I. Now virtually a king without a country, Æthelred vacated his throne in favor of a safe haven in Normandy.

Ironically, Normandy itself was ruled by other Vikings. Charles the Simple, king of the West Franks, had ended raids on his kingdom by granting Normandy to the Viking leader Rollo in the Treaty of St. Clair, signed in 911. In return, Rollo had pledged allegiance to Charles, was baptized, and agreed to defend him against other Vikings.

Vikings

Term used generally for the peoples of Scandinavia, about 800–1100. More specifically, it refers to the non-Christian raiders of the ninth and tenth centuries described in the monastic chronicles of western Europe.

The Viking Age began with the first recorded raid at Lindisfarne Abbey, in 793, and ended with the death of Harald Hardradi at Stamford Bridge in 1066. Outside Scandinavia, it was defined by the bands of raiders originating in Scandinavia. The intense raiding activities had two definite periods: a first Viking Age (800–900) and a second Viking Age (930–1100), separated by a period of consolidation throughout Scandinavia of independent law assemblies into kingdoms. Later Viking activities were larger and closer to national raids in response to other raids, as opposed to the individual raids against accessible targets of the first Viking Age.

Viking raiding activity depended upon speed and the technology of shallow-draw boats with keels. Viking ships were able to navigate in rivers and streams as shallow as 3 feet. Typical early Viking warships carried 30 to 50 men, arms, and horses and were powered by sail or oars. Raids are

described as hit-and-run, with no warning. Sources from western Europe repeatedly describe the speed and ferocity of the raids by the pagan Northmen.

Although the Viking Age outside Scandinavia is defined primarily by the raiding activities of a small portion of the population, in Scandinavia the Viking Age is regarded as a golden age of technology, art, and literature. One aspect of the Viking Age for Scandinavians was the exploration, settlement, and trade east and west that established a series of cities, kingdoms, and trade routes.

Viking activity was responsible for the discovery of Iceland and Greenland; the building of Dublin and York; and the settlement of the Orkneys, Hebrides, and Faroes. Icelandic settlement eventually created a parliament and resulted in the Icelandic Sagas of the thirteenth centuries. Other notable settlement areas include Normandy and the northeastern area of England around York, known as the *Danelaw*.

Viking exploration resulted in trading routes into Byzantium. Norse kingdoms were founded in Russia, with Swedish and other settlers invited into the area to end the internecine wars of the local Slavic population. Major centers included Kiev and Novgorod. The Vikings who settled in these eastern kingdoms rapidly assimilated.

The legacy of the Vikings was primarily in technology, art, and a body of literature that bears the Norse name to this day, saga. Scandinavian raiders also affected every area of contact with their patterns of land use and legal traditions.

Villa, Francisco “Pancho” (Doroteo Arango) (1878–1923)

Mexican revolutionary and bandit. Doroteo Arango was born the son of a sharecropper in La Coyotada, Durango, Mexico, on 7 July 1878. At 16, he killed a man who allegedly was trying to rape his sister. A petty thief and cattle rustler, Arango was described as “animal in his passions and rages.” In 1892, he joined a gang of bandits led by Francisco Villa, whose name Arango adopted. Around 1902, Villa moved to Parral, Chihuahua. By February 1911, he had joined the rebellion against the regime of President Porfirio Díaz. An able leader but a poor subordinate, Villa lacked military discipline. Beginning as a captain of irregulars, he rapidly rose to colonel. His *dorados* (dismounted horsemen), drawn from

Portrait of Francisco "Pancho" Villa, c. 1910. (Library of Congress)

ranches, mining camps, and poorer precincts of American border towns, frequently defeated professional generals whose men lacked the will to fight. Captured by federal troops in 1911, Villa learned to read and write in prison. Narrowly avoiding execution, he escaped to the United States. Returning in February 1913, he was commanding a force of 3,000 men within a month. In September 1914, Provisional President Venustiano Carranza, the constitutionalist leader, named him commander of the Division of the North. As self-appointed military governor of Chihuahua, Villa was an able administrator but often broke relations with other revolutionary leaders. His power declined after his defeat by the constitutionalist general Alvaro Obregon at Celaya, Guanajuato, in 1915. Villa was angered when President Woodrow Wilson extended recognition to the Carranza regime in 1916. In separate incidents, he executed 15 American engineers at Santa Ysabel, Chihuahua, in January 1916, and killed 16 people in a raid on Columbus, New Mexico, in March of that year.

General John J. Pershing's punitive expedition (March 1916–February 1917) effectively destroyed Villa's band, al-

though Villa himself escaped. Villa retired in July 1920 and, with seven of his men, was assassinated in Parral on 23 July 1923.

Vimy Ridge (9 April 1917)

Canadian military triumph considered by many to be a major step in the evolution of a sense of nationhood. Early 1917 saw the four Canadian combat divisions on the western front reunited. (One Canadian soldier remarked at the sight that he had never imagined that there were that many Canadians in existence.) The Canadian Corps took over a 10-mile section of the front line west of the town of Givenchy-en-Gohelle. They faced three German divisions from General Freiherr von Falken's Sixth Army. The German forces occupied Vimy Ridge, an escarpment rising 450 feet above sea level and dominating the surrounding flat countryside.

The Germans constructed a complex maze of concrete fortifications, trenches, tunnels, and dugouts. Ferdinand Foch's French troops twice tried to take the ridge and failed, incurring 150,000 casualties.

The Canadian Corps, under the command of British lieutenant general Julian Byng, received orders to take Vimy Ridge as part of the British-led Arras offensive. They launched the attack at 5:30 A.M. on 9 April 1917, Easter Monday. All four Canadian divisions advanced in line, following a creeping artillery barrage toward the German lines. By noon, three of the Canadian divisions had achieved their primary objectives. The 4th Division, assigned to take the town of Givenchy and a well-defended hill known as "the Pimple," experienced the greatest difficulty. The Canadian Corps achieved all of its primary and most of its secondary objectives. It also held the captured territory in the face of sustained German counterattacks. The cost was 3,598 Canadians killed and 7,004 wounded. Four Canadians received the Victoria Cross for the action. On 12 April, the Germans withdrew from Vimy Ridge along the Douai Plain. The Battle of Vimy Ridge and the other battles of Arras gave the British their first victory on the western front in 32 months of war.

To many Canadians, Vimy Ridge remains a symbol of pride and national maturity.

Visigoths

Germanic rulers of southern Gaul and Spain. When Theodosius died in 395, the Visigoths renounced their treaty with the Romans. Six years later, Alaric decided to invade Italy but was defeated by former comrade-in-arms Flavius Stilicho. A second invasion also ended in defeat, but this time Alaric forced the Senate in Rome to pay the Visigoths a large endowment.

Alaric blockaded Rome twice (in November 408 and again in late 409) to force western emperor Honorius in Ravenna to give his people land. When negotiations failed, Alaric returned to Rome and broke in (24 August 410). The Visigothic army plundered the city for three days but did comparatively little damage.

Alaric died soon after. His brother-in-law Athaulf assumed the leadership. Alaric had planned to lead the Visigoths to North Africa, but a lack of ships had prevented it. Athaulf instead went north, crossing into Gaul in 412, but was assassinated in Spain three years later. In 418, Theodoric I (r. 418–451), one of his successors, made a treaty with the Romans. It granted the Visigoths Aquitania Secunda in return for a military alliance with the western empire. Under this alliance, the Visigoths helped subdue the Vandals and Alans, which gave them territory in Spain and allowed their expansion in southern Gaul. The kingdom in southern Gaul lasted until 507, when Frankish king Clovis defeated the Visigoths. Thereafter they were mainly confined to Spain. In 711, the Visigothic kingdom there fell to the invading Moors.

Unlike their cousins, the Ostrogoths, the Visigoths did not take to the horse. Chieftains and their companions might fight mounted, but the bulk of a Visigothic army was made up of archers and spearmen, fighting in a dense mass. Like other Germanic bowmen, the overwhelming majority were armed with compound bows.

Vo Nguyen Giap (1911–)

Military commander of Communist-nationalist Vietminh forces against the French (1946–1954) and later of the People's Army of [North] Vietnam against the Republic of [South] Vietnam and the United States (1959–1973). A key figure in the ruling hierarchy of the Hanoi government, Giap joined the Communist Party in his youth and was imprisoned by French authorities at age 16. A very good student, he went to the University of Hanoi and began writing Marxist analyses of the situation he perceived in Vietnam. When France banned the Communist Party in 1939, Giap fled to southern China and became an early supporter of Ho Chi Minh.

Giap thereupon became a major military commander, first fighting the Japanese, soon thereafter the French, and later organizing the campaign against the United States and its Saigon ally. Giap believed in Mao's theories of guerrilla war and that the army should be highly indoctrinated and moral to win support of the local people.

From 1946 to 1953, Giap led an increasingly successful military effort against the French and benefited from the Communist conquest of southern China after mid-1949. In 1953, he commanded more than 300,000 troops and launched a drive into northern Laos when the French chose to occupy a plateau in northwestern Vietnam, Dien Bien Phu, to lure Giap into a rash and costly attack. Giap massed 50,000 troops and surprised the French when he brought artillery and radar-guided antiaircraft to the surrounding hills and began a 55-day siege that ended with the French surrender on 8 May 1954 and independence for North Vietnam.

In his campaign against the United States and South Vietnam, Giap violated the principles of concentration and mass in organizing the Tet Offensive of January 1968. He apparently was forced into this offensive by the political leadership, and militarily it was a disaster, destroying the Vietcong as an independent military force in the south, although it resulted in a great political-psychological victory. In March 1972, again apparently against his own feelings, he launched the so-called Easter Offensive to drive across the 17th parallel to conquer the south, which supposedly could not resist after U.S. troop withdrawal. The South Vietnamese held, President Richard Nixon unleashed U.S. air power, and the

North Vietnamese suffered a major defeat. Thereafter, Giap lost power, gradually was eased out of the ruling hierarchy, and thus played no major role in the final victory of 1975.

Vouillé, Battle of (spring of 507)

Victory of Roman orthodox Christianity over Arianism. Clovis, king of the Franks, had inherited a small territory from his father. He eagerly sought to increase his power and made an alliance with the Orthodox Nicene church that became a cornerstone of his success.

Clovis was christened in 498, in Rheims, the first Christian king of the Franks. Now enjoying the support of the church against his enemies, Clovis subdued the Alemanni by 501 and then prepared to seize southern France, ruled by Alaric II of the Visigoths, who controlled territories from the Loire River to central Spain. Alaric was an Arian Christian and thus a heretic to the Orthodox bishops of Gaul and their congregations.

In 507, Clovis invaded Visigothic Aquitaine. The sources

are few and strongly Christian. Thus the Vouillé campaign is replete with divine intervention: after crossing the Loire River, Clovis was cured of a lethal disease by Saint Severin; Saint Martin (dead for a century) helped the Frankish army ford the Vienne River.

The Visigoths advanced north against the invading Franks. The two armies finally met near modern Vouillé. The name derives from Latin *Vocladis*, believed to be a compound of two words: *clades*, "disaster," and *vo*, possibly a corruption of "Goth."

The sources provide few details on the battle and no reliable information on the sizes of the opposing armies. At that time, Franks and Visigoths primarily fought as infantrymen, formed in dense, close masses and relying on wild charges for victory. Frankish chronicles emphasize the personal qualities of Clovis. Seeing that Alaric stood at the front of his army with some of his retainers, Clovis charged them with his own guard. In the ensuing fight, Clovis killed Alaric. The Visigothic king's death quickly became known to his army, which left the battlefield in a complete rout.

The battle of Vouillé was an important one for Christianity. Orthodox Roman Christianity now established itself as the only religion of western Europe. In addition, Clovis increased his territory through his conquest of southern France. The Visigothic kingdom, now confined to Spain, was eventually destroyed by the Arab conquest of the eighth century.

W

Waffen SS (1934–1945)

Both an elite fighting unit and a notorious criminal organization of the Third Reich. Subordinate to Reich Leader of the SS (Schutzstaffel, or Protection Squad) and Police Heinrich Himmler, the so-called SS Verfügungstruppe (an early name for the Waffen SS) was founded after the Nazi regime's bloody purge of the SA (Sturmabteilung, or Stormtroopers) in the summer of 1934. Squads of the SS regiment "Leibstandarte SS Adolf Hitler," which would later form the nucleus of the 1st SS Division, participated in this massacre.

The early SS Verfügungstruppe consisted of three regiments. Retired army general Paul Hausser was their first military instructor. Under his command, these units became the core of the future Waffen SS. Ignoring his generals' animosity toward the SS, Hitler permitted the establishment of a separate headquarters for the Waffen SS on 17 August 1938.

During the invasion of Poland in September 1939, SS regiments were still attached to divisions of the regular German army. However, the battle of France witnessed the deployment of three independent SS divisions, including the SS Division "Das Reich" of the regular SS Verfügungstruppe and the SS "Death's Head" Division, this last made up of concentration camp guards.

The Waffen SS participated in most German campaigns during World War II. It established a reputation for tenacity and ruthlessness on the eastern front. Its battle record includes the participation by the "Death's Head" and "Viking" divisions in the encirclements of Demjansk in February 1942 and Cherkassy in January–February 1944, respectively. The SS tank corps also distinguished itself by unexpectedly retaking Kharkov in March 1943. Also in 1943, during the last German offensive at Kursk, SS tank units spearheaded the advance.

The early Waffen SS divisions had more casualties than most units of the regular army. These higher than expected

losses compelled the SS Recruitment Office to enlist ethnic Germans and non-German foreigners. By the end of the war, the 38 divisions of the Waffen SS consisted of almost 600,000 men, of whom approximately one-third were of non-German origin. Little was left of the early elite formations, however. Indeed, an examination of the combat records of all Waffen SS units reveals that, overall, their fighting capabilities were no better than those of their regular army counterparts.

The Waffen SS was unique in two respects. First, it was under the overall command of Heinrich Himmler, who was a political leader, not a military commander. Second, a significant number of its formations were involved in heinous crimes. For example, "Death's Head" units guarded the concentration camps, and mounted SS regiments took part in the mass killings of Jews in the western Soviet Union in 1941. The infamous SS task forces (Einsatzgruppen), which murdered hundreds of thousands of Soviet Jews in 1941–1942, consisted not only of policemen but also of Waffen SS troops. Moreover, the crimes of the Waffen SS were not limited to the eastern front. SS combat formations were also responsible for the slaughter of French civilians in the village of Oradour-sur-Glane and for the killing of Canadian prisoners of war in Normandy in 1944. Not surprisingly, therefore, the postwar International Military Tribunal at Nuremberg declared the Waffen SS to be a criminal organization.

Wagram (5–6 July 1809)

A battle fought northeast of Vienna between French forces, 188,000 strong, under Napoleon I and Austrian forces numbering 155,000 under the Archduke Karl von Habsburg. On 9 April 1809, the Austrian Empire declared war on France. After losing the battle of Eckmühl on 20–22 April 1809, the Austrians withdrew across the Danube River, losing Vienna in the process. The first effort of the French to cross the Danube and make contact with the Austrians led to failure at the battle of Aspern-Essling on 21–22 May 1809. As a result of that battle, the French began to make careful preparations for a second attempt, and the Austrians withdrew to more defensible positions about 6 miles away from the Danube, centered on the village of Deutsch-Wagram.

By early July, the French, having built 12 prefabricated bridges and many small boats, were ready for a second crossing attempt, led by Nicholas-Charles Oudinot's and André Masséna's corps. On the evening of 4 July, Oudinot's troops crossed the river and quickly defeated the Austrian left flank forces, while the French opened a bombardment upon the rest of the screening force. As a result of this vigorous attack, the French army was able to cross the Danube by evening and had begun to advance against the main Austrian position, with the French right flank of Oudinot and Masséna thrust somewhat ahead of the French left flank, which had made somewhat slower progress.

On 6 July, the Austrians planned three simultaneous attacks beginning at 4:00 A.M., the main one to fall on the weak French left, commanded by Masséna, with two supporting attacks on the center and right. The French themselves planned an attack in the center, commanded by Jean Baptiste Jules Bernadotte and Oudinot, also for about 4:00 A.M. Before the French attack could develop, the Austrian attack on the right began prematurely. It was easily defeated by Louis Nicholas Davout, but, in the ensuing confusion, Bernadotte abandoned his forward position in an effort to maintain contact with the French forces on his flanks. The Austrian attack in the center, intended to be diversionary or supporting, thus went forward with no opposition. As a result, there was very little to oppose the main Austrian attack, which began four hours late but was nevertheless perfectly timed. The Austrians pushed back the French forces before them and seemed likely to advance all the way to the Danube River. The Austrians moved very slowly, however, and the French were thus able to move up troops and 112 cannon to prevent disaster.

At 10 A.M., Davout, on the French right, renewed an attack upon the Austrian left flank, making slow but steady progress. A second series of assaults pinned the Austrian center and the Austrian right flank. The Archduke Karl ordered the withdrawal of the Austrian army. The French, bat-

tered and expecting the arrival of an Austrian reinforcing force under the Archduke Johann, were in no condition to pursue.

The French lost about 32,000 casualties and 7,000 prisoners. The Austrians lost about 37,000 casualties. As a result of the Battle of Wagram, the Austrians asked for an armistice and began peace negotiations, thus ending the 1809 war against France.

Wainwright, Jonathan Mayhew, IV (1883–1953)

U.S. Army commander. Born in Walla Walla, Washington, on 2 August 1883, Wainwright's family members on both sides were army and navy officers. Wainwright, who was nicknamed "Skinny" by his classmates, graduated from West Point in 1906 and was commissioned a second lieutenant in the cavalry. In the World War I, he was the assistant chief of staff for operations and planning (G-3) of the 82d Division during the battles of St. Mihiel and Meuse-Argonne. After graduating from the Command and General Staff School in 1931 and the Army War College in 1934, Wainwright served as the assistant commandant of the Cavalry School in Fort Riley, Kansas, before being promoted to brigadier general and given command of the 1st Cavalry Brigade at Fort Bliss, Texas, between 1938 and 1940. Promoted to major general, he took command of the Philippine Division in September 1940.

After the Japanese invasion of the Philippines on 8 December 1941, he commanded the North Luzon Force in its fighting withdrawal to the Bataan peninsula. Promoted to lieutenant general in March 1942, Wainwright was appointed commander of U.S. Forces in the Far East after General Douglas MacArthur was ordered to Australia. Forced to withdraw the remnants of his combined American-Filipino army to the island fortress of Corregidor in Manila harbor,

Wainwright's forces held out, the mighty guns of the Corregidor forts denying Manila Bay to the Japanese and inflicting heavy losses on the enemy, until 6 May 1942.

Wainwright was transported to Japanese-occupied Manchuria, where he spent the next three years as a prisoner of war. Forced to watch the barbarous mistreatment of his men at the hands of the gloating Japanese, Wainwright often attempted to intervene on their behalf, but his efforts were almost always unsuccessful. For three years, he was starved, mistreated, and forced to perform menial tasks in an unsuccessful effort to humiliate him.

Liberated on 25 August 1945, Wainwright expected to be court-martialed and imprisoned for surrendering his forces in the Philippines. Instead, he was honored, first on 2 September 1945, when he stood behind MacArthur at the surrender ceremonies on the *Missouri* in Tokyo Bay. Next, when Wainwright returned to the United States, he was promoted to full general and awarded the Medal of Honor by President Harry S. Truman. His health shattered by his long and harsh imprisonment and slighted by the egotistical MacArthur, Wainwright retired in August 1947 and died on 2 September 1953, the eighth anniversary of the Japanese surrender. Wainwright, a tough, simple cavalryman, must be given credit at least equal to that given MacArthur for commanding multiracial forces that delayed the Japanese invaders for months, while Allied Pacific and Asian forces (except for the Canadians at Hong Kong) put up confused and ineffectual resistance and quickly surrendered to an enemy that they substantially outnumbered.

Wake Island (8–23 December 1941)

The loss of an American Pacific Island possession after a determined defense. Little more than a cluster of three small islands in the middle of the Pacific Ocean, 2,000 miles west of Hawaii, Wake Island had served as a refueling base for American airplanes and submarines. At the commencement of hostilities in December 1941, the Japanese decided to seize the islands. On 8 December, they dispatched Kwajalein-based bombers to soften up defenses manned by a force of some 400 marines, sailors, soldiers, and another 1,200 civil-

ian construction workers. More than half of the dozen fighter planes guarding the island's airstrip were destroyed or damaged.

The defenders had enough firepower and morale to repulse a Japanese invasion force that sailed into the waters off Wake Island on 11 December. Utilizing naval guns salvaged from battleships before the war, the Americans sent damaging salvos into the invasion fleet, which sustained significant damage and retreated without landing troops. Having underestimated the island's defenses, the Japanese redoubled their efforts. For nearly two weeks, they pounded Wake Island with round-the-clock air raids. On 23 December, they were finally in a position to land troops. When they did so, Wake Island's fall was only a matter of time. By midday, Navy commander Winfield S. Cunningham had little choice but to surrender his beleaguered survivors. The Japanese sustained more than 800 casualties in taking Wake and the Americans roughly 170. However, those Americans who surrendered had nearly four years of brutal captivity ahead of them if they were not executed on the island itself. The heroic defense of Wake Island was about the only bright spot in a trail of disaster in the first weeks of World War II in the Pacific.

Walker, Walton (1889–1950)

U.S. Eighth Army commander during the early months of the Korean War. Born in Texas, Walker had a typical career for an officer of his generation, graduating from West Point in 1912 and serving in Mexico and France, plus the usual round of interwar school and regimental assignments. World War II saw Walker leading XX Corps as a subordinate of George Patton, creating a reputation as an aggressive mission-oriented commander, despite accusations of affecting too much bravado.

With the outbreak of the Korean War, Walker, as Eighth Army commander in occupied Japan, led his ill-prepared forces into combat. By 31 July 1950, he found himself conducting a desperate but successful stand at the Pusan Perimeter. By this time, the United Nation (UN) forces within the perimeter outnumbered the Communist forces by some two to one and enjoyed absolute air control and great heavy

weapons superiority, yet the situation remained critical until the successful Inchon Landings of mid-September.

Walker began a slow personal decline from the time of those landings through to the disastrous retreat from the Chinese counterattack at the Yalu. He failed to adapt to the environment of MacArthur's staff, being dubious about the viability of Inchon and resenting the splitting off of X Corps as an independent command. MacArthur, in turn, doubted Walker's aptitude for independent command, an assessment apparently justified by Walker's incomprehension of the Chinese style of war and the continued low capability of the Eighth Army.

By the time of his death in a vehicle accident on 23 December 1950, Walker was an inconvenient hero, burned out and presiding over a staff discussing the actual abandonment of Korea. This critical situation was rapidly reversed by Walker's successor, Mathew B. Ridgway.

Walker, William (1824–1860)

Leader of American filibuster expeditions in Mexico and Nicaragua during the 1850s. After failing at careers in medicine, law, and journalism, Walker, in search of personal glory, led an unsuccessful filibuster expedition to Mexico in 1853 to colonize Sonora and Lower California. Two years later, at the request of the Liberal Party (also called Leonese) in civil war-torn Nicaragua, Walker defeated the Conservative Party (the Granadans) and emerged as the dominant figure in the new government. In June 1856, he became president and sought American support by expressing interest in establishing a federal republic of Central American states and Cuba, with slavery in both regions. But he had made important enemies, notably Cornelius Vanderbilt, who controlled the proposed transit route across Nicaragua, and opponents within Nicaragua supported by other Central American states. Northern antislavery forces in the United States also opposed Walker's plan and pressured President Franklin Pierce not to recognize his government. Cut off from sup-

plies and recruits by Vanderbilt and facing a hostile Central American coalition aided by England, Walker surrendered to U.S. naval authorities in May 1857. Two subsequent filibuster efforts in November 1857 and September 1860 also resulted in failure, the latter ending in Walker's execution by a Honduran firing squad. Walker's filibusters aggravated the debate over the extension of slavery in the United States and Anglo-American relations on the isthmus. They also reinforced the negative image of the United States as the "Colossus of the North" throughout Latin America.

Wallenstein, Albrecht von (1583–1634)

A prominent and successful military commander. This Bohemian nobleman started his career during the Bohemian revolt of 1618–1620, when he proved his loyalty to the Habsburgs. In 1625, he was appointed commander in chief to organize imperial forces. Wallenstein, who successfully led the imperial troops against Mansfeld and Christian IV of Denmark, rose to princely status. In 1630, he had to retire from his command mainly because of the pressure of the Catholic League. But after Graf Johann Tserclaes von Tilly's crushing defeat at Breitenfeld, Wallenstein was quickly reinstated to save the Habsburg power from the threatening Swedish forces under Gustavus II Adolphus. In 1632, Wallenstein managed to stop the Swedish advance. Afterward, he was unwilling to fight any longer and preferred a political solution. But in the course of those negotiations, he fell under the suspicion of high treason, which led to his condemnation as a rebel against the Reich. Wallenstein was put to death at Eger on 25 February 1634.

Wallenstein showed his extraordinary talent as an organizer of the military when he built an army numbering more than 100,000, perfected the method of funding, and established a viable logistical system of magazines. As a general, Wallenstein tried to avoid battles and adopted mainly defensive tactics. He was especially eager to force the enemy to attack his strong defensive forces. Thus Wallenstein inflicted heavy losses, as on Mansfeld at the Dessauer Brücke in 1626 and on Gustavus Adolphus at the Alte Veste near Nuremberg

in 1632. Wallenstein was not infallible, however; for example, at Lützen, Gustavus Adolphus nearly achieved complete surprise of Wallenstein, who hardly held the field (16 November 1632).

War Crimes

Actions in wartime that allegedly violate the laws or usages of war. The boundaries of customary behavior in waging war have gradually evolved and been codified. As early as 1305, the Scottish leader William Wallace was tried by an English court for depredations on the civilian population of England. The French National Assembly in 1792 banned murder and maltreatment of civilians. During the American

Civil War, U.S. Army General Order No. 100 (1863) specified which behaviors were improper for soldiers, and at war's end Henry Wirz, the Confederate commandant of the Andersonville prisoner-of-war camp, was tried and executed for the horrific conditions in his camp.

By World War I, certain weapons and practices had been outlawed by the Geneva Conventions of 1864 and 1906, the St. Petersburg Declaration of 1868, and The Hague Conventions of 1899 and 1907. Articles 227–230 of the Treaty of Versailles provided for the trial of the kaiser and a number of German officers for war crimes, but little came of it.

Between the world wars, the Pact of Paris (Kellogg-Briand Pact) of 1928 and the Geneva Prisoner-of-War Convention of 1929 further clarified the rules of combat. At the end of World War II, the International Military Tribunal set up by the victorious Allies at Nuremberg indicted carefully selected representatives of the German government, armed forces, and business for various war crimes, including genocide and planning aggression. Of the 22 tried in 1945–1946, 12 were hanged, 3 sent to prison for life, 4 given lesser prison sentences, and 3 acquitted. An American court at Nuremberg tried another 177 persons between 1946 and 1949, condemning 25 to death, 20 to life in prison, and 97 to lesser terms and acquitting 25. International trials of 25 defen-

Jews used for pulling German trucks and soldiers in Poland, 1939–1943. (Library of Congress)

dants in Tokyo between 1946 and 1948 resulted in 7 death sentences, 16 life sentences, and 2 lesser prison terms. The volume of trials in Russia and Eastern European countries is not yet adequately documented. When these trials were criticized as “victor’s justice” conducted ex post facto with insufficient basis in law, the Allied governments pointed to the international conventions and the Paris Pact of 1928 as establishing sufficient legal basis.

This basis was extended in the postwar period by the four Geneva Conventions of 1949, the United Nations Convention on Prosecution and Punishment of the Crime of Genocide (1951), and the Geneva Protocol of 1977 that extended protection of the laws of war to persons participating in “national liberation” struggles. By the end of the century, a United Nations tribunal in the Hague was prosecuting war crimes arising from the collapse of Yugoslavia, and another, in Tanzania, was dealing with crimes arising from ethnic cleansing in Rwanda. Efforts were under way to establish a permanent International Criminal Court in the Hague for the prosecution of all war crimes.

One of the criticisms of war crimes tribunals is that they are indeed dispensing “victor’s justice” and that they are often guilty of the same crimes that they condemn in the vanquished. For example, Soviet judges at Nuremberg rounded on the Nazi defendants for their treatment of prisoners of war and for the establishment of concentration camps, both standard features of the Soviet system. Nonetheless, the concept of war crimes has led in certain situations to an amelioration of the rigors of war, for soldiers and civilians alike.

War of 1812 (1812–1815)

Chaotic and inconclusive war between the United States and Great Britain that nevertheless provided a new surge of American nationalism. There were four main causes: American insistence upon its neutral trade with both sides in the Napoleonic Wars, British boarding of American ships on the high seas and impressment of American seamen, conflicts between American pioneers and British-supported American Indians on the western frontier, and the desire for land

in Canada. William Henry Harrison’s victory at Tippecanoe in 1811 was used as propaganda by the bombastic “War Hawk” political faction to demand action against Britain for supposedly arming the Indians and as an excuse for the seizure of Canadian land.

Soon after the U.S. Congress boldly declared war on Great Britain on 18 June 1812, Secretary of War William Eustis and his generals decided that the best defense was a good offense and set their sights on Canada. Major General Henry Dearborn envisioned a four-pronged attack: from Lake Champlain to Montreal; from Sackets Harbor, New York, to Kingston, Ontario; west across the Niagara River; and east across the Detroit River.

The British were too involved with Napoleon in Europe to commit significant naval, military, or matériel resources to North America in 1812 or else Britain might have crushed the United States early. The small American navy was a match for British ships in single combat, but the initial unpreparedness and inadequacy of American land forces spelled disaster for Dearborn’s plan. The chain of command was unclear, with junior officers of regulars often expecting to take command over senior officers of militia.

On 17 July 1812, American lieutenant Porter Hanks, who had not heard that there was a war on, surrendered the 57-man garrison of Fort Mackinac to British captain Charles Roberts’s 900 soldiers. This surrender gave Britain control of Lake Huron. Pro-British Potawatamis massacred about 70 American soldiers and civilians under Captain Nathan Heald as he was surrendering Fort Dearborn, now Chicago, on 15 August. Brigadier General William Hull first intended to attack Fort Malden, Ontario, but dropped that plan and instead surrendered Fort Detroit without a fight on 16 August to Major General Sir Isaac Brock. Hull was court-martialed, convicted of cowardice and neglect of duty, and condemned to be shot, but President James Madison commuted the sentence in light of Hull’s service in the Revolutionary War.

Stephen Van Rensselaer, a major general of New York militia despite his utter lack of military experience, crossed the Niagara River with about 4,000 of his 6,000 men to invade Ontario at Queenston Heights on 13 October. Although the British garrison was only about 300 strong, they held Van Rensselaer’s disorganized force on the heights. Brock was killed as his 1,800 reinforcements routed the Americans. Dearborn’s campaign against Montreal fizzled in November when his 8,000 troops, marching north from Albany, refused, like the New York militia across from Queenston Heights, to cross the Canadian border.

In the Northwest theater, Captain Zachary Taylor successfully defended Fort Harrison, Indiana, against eight-to-one odds on 4 September. Colonel Henry Procter’s 500 British

and 600 Wyandots crushed Brigadier General James Winchester's 400 Americans at the River Raisin, Michigan, on 21 January 1813. Procter was censured for recklessness and for allowing his native allies to commit atrocities but was promoted to brigadier general.

Dearborn and Brigadier General Zebulon Pike burned the capital of Upper Canada, York (now Toronto), on 27–29 April. The British burned some American matériel at Sackets Harbor on 28–29 May but failed to capture the fort. British admiral George Cockburn patrolled Chesapeake Bay, landing raiders to burn Frenchtown, Havre de Grace, Georgetown, Fredericktown, Principio, and other Maryland settlements that spring. A year later, on 14–15 May 1814, American lieutenant colonel John B. Campbell burned Port Dover, Ontario, in retaliation for the destruction of these Maryland towns.

Aided by 1,200 Kentucky reinforcements under Brigadier General Green Clay, who arrived on 5 May 1813, Harrison's 550 defenders of Fort Meigs, Ohio, withstood siege by Procter's 900 British regulars and 1,200 natives from 1 to 9 May. Defying Harrison's direct order to evacuate, Major George Croghan successfully defended Fort Stephenson, Ohio, at five-to-one odds on 2 August against Procter's attack.

On 27 May, after three days of naval shelling, 4,500 Americans under Major General Morgan Lewis took Fort George, Ontario, from Brigadier General John Vincent's garrison of 1,900. From this dominant position, the Americans threatened the entire Niagara Peninsula. Vincent ordered other nearby forts abandoned, but on 5 June, 700 British under Colonel John Harvey surprised and defeated 2,600 Americans under Brigadier Generals William Winder and John Chandler at Stoney Creek, Ontario. On 24 June, at the Battle of the Beaver Dams, also known as the Battle of the Beechwoods, several hundred pro-British natives commanded by French captain Dominique Ducharme forced Lieutenant Colonel Charles Boerster's column of 570 Americans to surrender. Revitalized, the British won a skirmish at Fort Schlosser, New York, on 5 July.

American brigadier general Robert B. Taylor's 700 militiamen repelled British admiral John Borlase Warren's and Major General Sydney Beckwith's 4,000 amphibious invaders at Craney Island, near Norfolk, Virginia, on 22 June. However, Beckwith captured Hampton, Virginia, on 25 June and allowed his French mercenaries to rape and plunder.

Encouraged by Commodore Oliver Hazard Perry's naval victory on Lake Erie on 10 September and supported by Perry thereafter, Harrison took Fort Malden and Amherstburg on 27 September, recaptured Detroit on 29 September, and won at the Thames, near Moraviantown, Ontario, on 5 October. Harrison's nemesis, Tecumseh, died in that battle.

At Châteauguay, Quebec, on 26–28 October, Lieutenant

Colonel Charles Michel d'Irumberry de Salaberry's 1,400 French-Canadian woodsmen and militia ambushed, enveloped, and defeated 4,500 American troops marching on Montreal under Major General Wade Hampton. At Crysler's Farm, Ontario, on 11 November, British lieutenant colonel Joseph Morrison's 800 regulars stopped American major general James Wilkinson's 2,000-man expedition to Montreal dead in its tracks. A small British detachment under a Major Hancock repulsed Wilkinson at La Colle Mill, Quebec, on 30 March 1814.

Increasingly vulnerable, American brigadier general George McClure abandoned Fort George and burned the nearby town of Newark, Ontario, on 10 December 1813. The British then invaded New York, captured Fort Niagara on 18 December, massacred the inhabitants of Lewiston the same day, and burned Black Rock and Buffalo on 30 December.

Preparatory to attacking Sackets Harbor, Drummond planned to destroy the American supply depot at Oswego, New York, but the British attack on 5–6 May 1814 was only moderately successful. About 3,500 Americans under Major General Jacob Brown and Brigadier General Winfield Scott captured Fort Erie, Ontario, on 3 July. Brown and Scott defeated British major general Phineas Riall in a smart victory at Chippewa on 5 July, but Riall did stop the American invasion, halting Brown and Scott at Lundy's Lane on 25 July, the bloodiest battle of the war. Brigadier General Edmund P. Gaines repulsed a concerted British effort to recapture Fort Erie on 13–15 August. Brigadier General Peter Porter led a successful sortie from Fort Erie against British batteries on 17 September. Brigadier General George Izard ordered Fort Erie abandoned and demolished on 5 November, ending the American military presence in Canada.

Other action during the summer of 1814 included about 300 American sharpshooters under Major Lodowick Morgan, behind earthworks at Conjocta Creek, New York, defeating 600 British under Lieutenant Colonel John Tucker on 3 August. The British occupied Eastport, Maine, on 11 July and Castine, Maine, on 1 September, and George Croghan failed to retake Mackinac on 4 August.

A 4,000-man British invading force under Major General Robert Ross routed the American defenders at Bladensburg, Maryland, on 24 August and burned Washington, D.C., that night. Ross then moved toward Baltimore. British navy captain Peter Parker died when he impulsively led a detail of 124 men ashore for a "frolic with the Yankees" at Caulk's Field, near Chesterton, Maryland, on 30 August, and was soundly defeated by local patrols. American brigadier general John Stricker fought a delaying action against Ross at North Point on 12 September. Ross died in this engagement. His successor, Colonel Arthur Brooke, retreated from the Baltimore area after the British navy failed to neutralize Fort

McHenry the night of 13–14 September. (The British repulse at Fort McHenry inspired the writing of “The Star-Spangled Banner,” but it was not officially adopted as the U.S. national anthem until 1931.)

British lieutenant general George Prevost, governor-general of Canada, led 10,000 men south in August to attack Plattsburgh, New York. Defending the area were only Brigadier General Alexander Macomb’s 3,500, since Izard’s 4,000 had been diverted toward Sackett Harbor. The Battle of Plattsburgh occurred on 11 September, coincident with the decisive American naval victory on Lake Champlain. Each side lost only about 100, but the British withdrew.

Several subsidiary conflicts between the Americans and the indigenous peoples occurred during the War of 1812. The largest of these was the Creek War, fought mostly in Alabama. It began with attacks on whites at Burnt Corn Creek on 27 July 1813 and Fort Mims on 30 August. Brigadier General John Coffee destroyed Tallushatchee on 3 November, and Major General Andrew Jackson demolished Talladega on 9 November. Battles at Emuckfau on 22 January 1814, Enotachopco on 24 January, and Calabee Creek on 27 January wore the Creeks down and prepared the way for Jackson’s decisive victory at Horseshoe Bend on 27 March. The Treaty of Fort Jackson ended the Creek War on 9 August and freed Jackson for other campaigns.

As early as summer 1812, Jackson had urged a Florida campaign but was ignored. The Spanish government of Florida allowed Britain to occupy Pensacola on 14 August 1814, but Jackson captured it on 7 November. Having neutralized Pensacola’s military capability, Jackson rushed west to defend Mobile and New Orleans. Americans had already repelled one British naval attack on Fort Bowyer, guarding Mobile, on 12 September and were expecting another.

With the defeat of Napoleon, the British took counsel of Arthur Wellesley, the Duke of Wellington, as to the terms that they should insist upon in the continuing negotiations with the Americans at Ghent. “The Iron Duke” pointed out that the British themselves had not gained any clear-cut advantage and that they would do well to conclude the war on the basis of the status quo ante bellum. The British government took this wise advice. The war indeed ended in a virtual draw by the Treaty of Ghent on 24 December, but that news did not reach the United States until after the Americans under Jackson had inflicted on the British one of the most one-sided defeats in military history at the Battle of New Orleans on 8 January 1815, giving Americans the idea that they had somehow won the War of 1812.

All the causes of the war were moot by the time of its end: the British had no further need to interfere with American shipping after Napoleon’s defeat, the Americans had obviously failed to take any part of Canada, and with the British

cutting their losses in the United States, the Americans could handle the American Indians by themselves. For the British, compared to the great struggle against Napoleon, the War of 1812 was always a sideshow. But for the Americans, the war had produced enough military heroes and legends (not to mention presidents and presidential candidates) for generations to come.

War Plan Orange (1907–1940)

American war plan first designed in 1907 to address a possible war situation between the United States and Japan. Although it evolved over the next three decades to account for international developments and domestic political considerations, War Plan Orange remained in effect until replaced by the Rainbow series of plans in 1940.

Under Plan Orange, American strategists prepared for a three-phase, one-front war in the Pacific Ocean between the United States and Japan. In the first phase, it was assumed that the Japanese would overrun frontier positions. (The plan never anticipated a surprise attack like that on Pearl Harbor.) In the second phase, American forces would launch a counteroffensive from a base in the western Pacific. Fortifications on Corregidor Island, however, had been halted in accordance with the provisions of the Naval Limitations Treaty of 1922, and no suitable substitute could be found. In the final phase, the American forces would take the offensive and initiate a campaign of island hopping, bypassing the stronger enemy positions and attacking the weaker bases. Once close to Japan, War Plan Orange called for a bombing campaign and blockade to end the war. Under Plan Orange, the army would hold the Philippine Islands, while the navy (including ships from the Atlantic Fleet) raced to the rescue. Although replaced by the Rainbow plans, American strategy

during World War II in the Pacific theater followed many of the precepts of War Plan Orange.

Wars of the Roses (1455–1464, 1467–1471, and 1483–1485)

A series of violent civil battles resulting from dynastic struggles in England. Their origin lay in the weakness and apparent incompetence of Henry V's son, Henry VI (1421–1471). Henry VI was unable to control the conflicting ambitions of England's nobility and was said not to be able to govern without his noble advisers.

Most prominent among them was Henry Beaufort (1436–1464), the Duke of Somerset. The effective leader of the House of Lancaster, in view of the weakness of the Lancastrian monarch, Somerset was unpopular with both the peasantry and the nobility. He became even more unpopular when, in the summer of 1450, the Irish-born peasant leader, Jack Cade (d. 1450), led a peasant revolt against London from Kent. Frustrated by repeated French raids on the English coast during the final years of the Hundred Years War, Cade's peasants occupied London for several days, and beheaded the king's unpopular treasury minister, Lord Saye. After royal forces suppressed Jack Cade's rebellion, Richard, the Duke of York (1411–1460) and a potential heir to the throne, assumed leadership of the nobles opposed to Somerset's control of the government.

Somerset, jealous of York's rising stature, exiled him to Ireland. York soon allied with Richard Neville (1428–1471), the Earl of Warwick, known as "the Kingmaker," and returned to England to challenge Somerset's control over Henry and the Lancastrians. Meanwhile, the powerful Percy family of Northumbria, who were foes of the Nevilles, had allied themselves with the House of Lancaster. The conflict between the nobility escalated in August 1453, when the Percys and the Nevilles skirmished at Stamford Bridge.

The conflict moved toward full-scale civil war, when the first signs of Henry VI's mental illness appeared, and the queen, Margaret of Anjou (d. 1482), gave birth to a son, thus ensuring the Lancaster line of succession. York temporarily wrested control of the government away from Somerset, who was unable to hide the king's incapacitation. The king's re-

covery in the fall of 1454 allowed Somerset to regain his position, but York could no longer tolerate Somerset's domination at court.

York's ambush of the king and his forces in the town of St. Albans on 22 May 1455 was a complete victory for Yorkists. The battle, which began with a volley of arrow fire and ended in a savage melee, saw several Lancastrian nobles killed, including Percy and Somerset. York became protector of the realm until October 1459, when his forces were routed by a contingent led by Margaret at Ludford Bridge. In November 1459, the "Parliament of Devils" met at Coventry to pass a Bill of Attainder, legislative abrogation of an individual's property and rights because of treason, against York, who escaped the Tower to Ireland. Warwick, York's ally, defeated Lancastrian forces at Northampton on 10 July 1460.

York, returning to England and to a pliable Parliament, was declared the rightful heir of Henry VI, and Margaret's son, the infant Prince of Wales, was disinherited. Margaret, now leader of the Lancastrians, led a force against York, secure in Sandal castle. For unknown reasons, York left the security of the castle to meet defeat and death at the hands of the queen's forces at Wakefield on 30 December 1460. York's son, Edward, Earl of March (1442–1483), avenged his father by seizing London and proclaiming himself King Edward IV on 4 March 1461.

At Mortimer's Cross, near Hereford, on 2 February 1461 and at Towton, near the city of York, on 29 March 1461, Edward IV's leadership won stunning victories against Lancastrian forces. The Battle of Towton, fought in the driving snow and largely in the dark, was the bloodiest battle of the wars. Edward IV spent the next several years consolidating his rule; his victory at Hexham on 15 May 1464, ended Lancastrian opposition.

However, Edward IV suffered opposition from within Yorkist ranks. As early as 1467, Warwick, "the Kingmaker," openly opposed the king's marriage to Elizabeth Woodville (1437–1492) and his foreign policies. Hoping to control Edward IV the way that Somerset had controlled Henry VI, Warwick captured the king at Edgecote on 29 July 1469. Edward IV proved no dupe, and Warwick released him, hoping to reinstall the hapless Henry VI. Despite leading a much smaller force, Edward IV defeated Warwick's rebels in a battle at Barnet on 14 April (Easter Sunday) 1471, where both sides employed cannon and artillery. On 4 May 1471, at Tewkesbury, Edward IV's exhausted forces finally defeated the equally exhausted Lancastrians, led by Margaret. Edward IV captured Henry VI and Margaret in the battle; Henry VI was murdered in the Tower of London, and Margaret was ransomed to her father, Louis XI of France (1423–1483). The dynastic conflict was ended until the death of Edward IV in April 1483.

Edward IV's brother, Richard, Duke of Gloucester, seized power as protector of the realm through two coups d'état. Richard may have murdered Edward IV's two young direct heirs, Edward V, the Prince of Wales, and Richard of York, but the nature of their deaths remains in doubt. In any case, Gloucester was soon able to have himself proclaimed king as Richard III. Richard III ruled for just over two years, until he was challenged by the Lancastrian Henry Tudor (1453–1509) at Bosworth Field on 22 August 1485. Richard III's forces outnumbered those of Henry Tudor. Richard III was also a superior commander compared to the untested Henry Tudor and would have won the battle were it not for the treachery of Lord Thomas Stanley (1435–1504). Stanley's betrayal turned certain victory into defeat for Richard III, who met his death on the battlefield. As a result of the Lancastrian victory, Henry Tudor was proclaimed king as Henry VII. His marriage to Elizabeth of York (1466–1503) not only strengthened his hold on the crown but also ended the Wars of the Roses.

This 30-year conflict takes its name from the colored roses used to identify the rival factions, the Houses of York and Lancaster, but the term *Wars of the Roses* is a misnomer.

Although the House of York occasionally carried the white rose as its emblem, the House of Lancaster did not adopt the red rose as a symbol until well after the wars.

Warsaw/Vistula (August 1920)

The culminating battle of the Russo-Polish War. Polish general Józef Pilsudski drove back Russian Bolshevik Mikhail Tukhachevsky's offensive toward the Polish capital, most

Army volunteers with scythes, Warsaw, 1920. (Library of Congress)

likely thwarting much more ambitious objectives of the Russian revolutionists in Europe. Tukhachevsky's Bolshevik forces, having repulsed Pilsudski's effort to conquer the Ukraine for a Polish Federation, pursued the reeling Poles back to the gates of Warsaw.

Tukhachevsky had launched the attack with poorly armed disaffected divisions from his western front operations. The intervening Pripyat marshes forced Tukhachevsky to advance along two isolated axes. Pilsudski's plan exploited the Soviet's divided command by concentrating four and a half divisions of the Polish Fourth Army under General Edward Rydz-Smigly for a counterattack that would penetrate the seam in the enemy formation and then hook around to fall on the rear of the Soviet northwestern front. Pilsudski assigned ten and a half divisions of the First and Second Armies the task of the static defense of Warsaw on a wide front facing east, while the Fifth Army's five divisions were designated to cover Warsaw's northern perimeter. Assigned the most difficult task, the Polish Fourth Army, the smallest unit, was fatigued from its rapid redeployment from Byelorussia 125 miles to the east. Political necessity forced Pilsudski to allocate the bulk of his forces in this static defense of Warsaw. His troops were inadequately clothed and inefficiently armed. Notwithstanding, he rallied his forces for the planned offensive, but not before Tukhachevsky launched his own Fourth Army west across the Vistula River in a wide hook to attack the capital from the northwest, leaving only token forces to guard the vital link with Semen Budyennyi's First Cavalry Army. The latter ignored the general staff's order to link with the northern wing. On 15 August, Pilsudski personally led his Fourth Army to counterattack the southern flank of the Russian forces in covering Brest-Litovsk, breaking through the enemy lines in three days. With the southern Russian army paralyzed by passivity and the Pripyat marshes, the whole Red front crumbled, allowing the Poles to advance 200 miles by 25 August. More than 70,000 Russian troops were captured, and another 30,000 fled into East Prussia, where they were interned by German forces. The armistice signed at Riga on 12 October 1920 set the Polish boundary until the combined Russian and German offensives of September 1939.

Washington, George (1732–1799)

American general, field commander, statesman, and first president, beloved as “the Father of His Country.” George Washington was born on 22 February 1732 in Westmoreland County, Virginia. After the death of his father, Augustine, in 1743, he was raised by his older brother Lawrence. He learned surveying; worked as a surveyor in Culpeper County, Virginia, from 1749 to 1751; and inherited his father's plantation, Mount Vernon, when Lawrence died in 1752.

The same year, he was appointed a major in the Virginia militia. In October 1753, Virginia governor Robert Dinwiddie sent him to the western frontier to warn the French in the name of King George II not to encroach upon the Ohio Valley. In December, the French refused. Dinwiddie promoted Washington to lieutenant colonel and ordered him in March 1754 to lead 150 men to evict the French. Discovering about 1,000 French constructing Fort Duquesne at the confluence of the Allegheny and Monongahela Rivers, Washington retreated and quickly built Fort Necessity, defeated the French in a skirmish on 27 May, but surrendered after a 10-hour siege on 3 July.

As a full colonel of militia, he accompanied Edward Braddock to the disaster at the Monongahela on 9 July 1755 and fought in that theater until November 1758, when the British took Fort Duquesne and renamed it Fort Pitt. From 1759 to 1775, he lived quietly as a Virginia planter.

As a member of the Virginia House of Burgesses from 1759 to 1774 and the First and Second Continental Congresses in 1774 and 1775, Washington became an outspoken leader of the opposition to British rule. Congress appointed him commander in chief of the Continental army on 15 June 1775. In his first campaign, from 3 July 1775 to 17 March 1776, he forced the British under Sir William Howe to evacuate Boston.

Defending New York City against Howe, Washington abandoned Long Island on 27–30 August, fought a delaying action at Harlem Heights on 16 September, and lost at White Plains on 28 October. He led an orderly retreat into eastern Pennsylvania in November, regrouped, and made a dangerous night crossing of the ice-filled Delaware River to surprise and defeat the Hessians at Trenton on 25–26 December. Skillfully avoiding the main British force under Charles Cornwallis, he outmaneuvered and defeated three British regiments at Princeton on 3 January 1777.

That summer, Howe invaded Pennsylvania from Maryland, defeating Washington at Brandywine on 11 September and Germantown on 4 October and forcing him into winter quarters at Valley Forge. Emerging in the spring with a tough, seasoned, reinvigorated army, he would have beaten

Sir Henry Clinton at Monmouth on 28 June if not for the errors of one of his divisional commanders, Charles Lee. With increasing French support, he planned and successfully executed the Yorktown campaign in 1781, accepting Cornwallis's surrender on 19 October. He entered New York City in triumph on 25 November, said goodbye to his officers at Fraunces Tavern on 4 December, and then resigned his commission in Annapolis, Maryland, on 23 December.

Not renowned as either a strategist or a tactician, his success came from his persistence, courage, inspirational leadership, and occasional flashes of strategic and tactical brilliance, such as in the winter 1776–1777 New Jersey campaign. After serving two terms as the first president of the United States, from 1789 to 1797, he retired to Mount Vernon, where he died in agony on 14 December 1799, probably from botched medical care for an acute respiratory ailment.

Washington, Burning of (24–25 August 1814)

Low point of the War of 1812 for the United States, the destruction of the American capital. Following Napoleon's exile to Elba in May 1814, Britain was able to divert more troops to the conflict in North America. Major General Robert Ross sailed from France on 27 June, bound for the United States with 4,000 soldiers. Landing without resistance at Benedict, Maryland, on 19 August, he marched toward Washington, D.C., which Secretary of War John Armstrong had left only poorly defended.

Between 5,000 and 7,000 hastily mustered American militiamen under Brigadier General William Winder engaged Ross at Bladensburg, Maryland, the afternoon of 24 August. About 250 British and 100 Americans were killed or

wounded, but Ross's disciplined troops easily outmaneuvered Winder's unskilled defenders and won the field. From Bladensburg, the British could enter Washington unhindered. Ross decided to burn all the federal government buildings in retaliation for the burning of York (now Toronto, then capital of the British territory of Upper Canada) by American invaders under Major General Henry Dearborn and Brigadier General Zebulon Pike on 27–29 April 1813.

Even before the Battle of Bladensburg was over, most Washingtonians had fled the city. First Lady Dolley Madison oversaw the salvation of important national treasures, such as the Declaration of Independence, but lost her personal property. Ross entered Washington at dusk and burned the White House, the Capitol, the Library of Congress, the Treasury, the Departments of State and War, and nearly every other public building except the Patent Office, which Superintendent William Thornton saved by a ruse. After the fires burned all night, Ross abandoned Washington on 25 August and took ship again at Benedict on 30 August. President James Madison returned on 27 August to begin rebuilding the government, with Secretary of State James Monroe replacing Armstrong as Secretary of War.

Waterloo (18 June 1815)

Decisive allied victory that ended Napoleon's career. Under heavy rains on 17 June 1815, Arthur Wellesley, the Duke of Wellington, ordered the Anglo-Dutch army north from Quatre Bras to the Belgian village of Waterloo, and Gebhard Leberecht von Blücher pulled back the Prussian army, first northeast from Ligny to Gembloux and then north by northwest to Wavre, about 8 miles east of Waterloo. The mud prevented the French from pursuing.

Just south of Waterloo, Wellington deployed 68,000 troops and 156 guns on high ground at Mont-St.-Jean along an east-west line from Ohain to Braine-L'Alleud, with a strong right and a weak left. He felt confident that Blücher would soon reinforce his left with 70,000 Prussians.

The rain ended at 6:00 A.M. on 18 June. Napoleon arrived

Washington, D.C., under attack by British forces led by Major General Robert Ross on 24 August 1814. (Library of Congress)

from Ligny and deployed 74,000 troops and 256 guns along a ridge south of and parallel to Wellington's line. He could have attacked at 9:00 A.M. but waited until 1:00 P.M. so that the soggy ground could dry out enough to make his field artillery effective. He mistakenly believed that Emmanuel de Grouchy's 30,000 soldiers would keep Blücher out of any engagement between the French and Wellington. Grouchy engaged Blücher at Wavre but was unable to cut the Prussians off or prevent Blücher from communicating freely with Wellington. By 11:00 A.M., Blücher had already dispatched fresh reserves under Friedrich Wilhelm von Bülow toward Napoleon's right. Their arrival at the town of Plancenoit around 4:00 P.M. would decide the battle.

After about an hour of artillery fire, the French launched their main attack about 1:15 P.M. Jean Baptiste Drouet d'Erlon's I Corps, 16,000 fresh and strong, charged Wellington's center left. Honoré Charles Michel Joseph Reille threw the 13,000 men of II Corps against the British salient at Chateau de Hougomont, garrisoned by only 2,000 guards. The

British lines held, d'Erlon quickly lost 5,000 men, and the fighting at Hougomont lasted all day.

At about 2:15, Wellington made the first of his many successful counterattacks, sending two brigades of heavy cavalry under the Earl of Uxbridge charging from Mont-St.-Jean southward through La-Haye-Sainte toward La-Belle-Alliance, smashing d'Erlon's left and threatening Napoleon's center.

By 3:00, both sides were reeling from heavy losses. All French attacks had been repulsed, but at the cost of 40 percent casualties in Uxbridge's units. Napoleon, perceiving this slight lull to his advantage, ordered Michel Ney northward to capture La-Haye-Sainte. Ney, perhaps to atone for his failure to follow Napoleon's orders at Quatre Bras, hurled himself into the fray against Wellington's right about 3:45, but the British infantry formed defensive squares and held its ground. Fighting was fierce and deadlocked around La-Haye-Sainte when the Prussians arrived, turned the French right, and soon routed the whole French army. Wellington

Napoleon at the Battle of Waterloo. Lithograph by Currier and Ives. (Library of Congress)

and Blücher finally joined forces about 9:00 at (aptly named) La-Belle-Alliance, midway between Waterloo and Genappe, and instantly ordered Count August Neidhart von Gneisenau's fresh cavalry to pursue the French.

The most cogent theories that historians offer as to why Napoleon lost at Waterloo concern his errors in choosing key personnel. He wasted the talents of both Louis Nicolas Davout by leaving him in Paris and Nicolas Jean de Dieu Soult by making him chief of staff, a task for which he was clearly unsuited. If Davout had commanded the left instead of Ney, and Soult the right instead of Grouchy, the outcome might have been quite different. As it was, Wellington is reliably reported to have asserted well after the battle that Waterloo "was a damned close-run thing."

Wavell, Archibald Percival, First Earl (1883–1950)

British field marshal responsible for the first British land victories during World War II. Wavell first saw service in South Africa and India. During World War I he served in France, losing an eye at Ypres, and in Palestine under General Edmund Allenby. He returned to Palestine in 1937 to command the British forces during the Arab-Jewish riots. In

August 1939, Wavell was appointed commander in chief of British forces in the Middle East.

Following Benito Mussolini's invasion of Egypt, he launched Operation COMPASS, destroying the Italian Tenth Army, although vastly outnumbered, in Great Britain's first major land victory of World War II. However, the first half of 1941 was a difficult period for Wavell, who was confronted by the campaign against the Italians in East Africa, Erwin Rommel in Libya, the loss of Greece and Crete, political unrest in Iraq, and the occupation of Vichy-held Syria. Although faced with little alternative, his decision to defend Tobruk remains one of his greatest feats. Winston Churchill, however, was unimpressed by Wavell and following the unsuccessful offensive to relieve besieged Tobruk, Operation BATTLEAXE, transferred him to India as commander in chief. Wavell briefly became supreme commander of Allied forces in the Southwest Pacific until the fall of Malaya, Singapore, and Rangoon. Returning to his earlier command in India, he was promoted to field marshal at his own behest. After Wavell retired from military service, Churchill appointed him viceroy of India in 1943. He was also made Viscount Wavell of Cyrenaica and Winchester. Until his dismissal in 1947, Wavell worked toward Indian independence, but Louis, Earl Mountbatten, got all the credit. The same year Wavell was appointed first earl.

A taciturn man, Wavell, never publicly spoke out against the most unfair association of his name with disaster. He was a talented scholar who wrote *The Palestine Campaigns* (1928), *Allenby* (1940), *Generals and Generalship* (1941), *Allenby in Egypt* (1943), and *Speaking Generally* (1946). He also edited the popular poetry collection, *Other Men Flowers* (1944). The British liked to say that they lost all but the last battle. Except for when his opponents were Italians, it was Wavell who had to preside over so many of those lost battles.

Wayne, Anthony (1745–1796)

American officer in the American Revolution. Wayne was noted for his bravery and quick temper, which earned him the nickname "Mad" Anthony. Born on the family estate of Waynesborough in Chester County, Pennsylvania, on 1 January 1745, he received a private education in Philadelphia. Af-

ter the outbreak of the American Revolution in 1776, Wayne commanded a Pennsylvania regiment that successfully covered the retreat of American forces from Quebec. In 1777, he was promoted to brigadier general and participated in the Battles of Brandywine and Germantown. But he was culpable in the so-called Paoli Massacre of October 1777, when his sleeping troops were bayoneted in a British night assault. He distinguished himself the following year at the Battle of Monmouth. At Stony Point in 1779, Wayne achieved his greatest victory of the war when he seized the seemingly impregnable British defenses.

After the war in 1783, Wayne retired to civilian life. He dabbled in politics and business and failed in both. In 1792, he returned to active duty when President George Washington selected him commander of the Legion of the United States to destroy an American Indian confederacy that had routed two previous expeditions. On 20 August 1794, Major General Wayne defeated the hostile confederacy near modern-day Toledo, Ohio, in the Battle of Fallen Timbers. The following year he skillfully negotiated the Treaty of Greenville with the defeated American Indians. He died on 15 December 1796 in Presque Isle, Pennsylvania. His military and diplomatic skills ensured the opening of the Ohio country to white settlement.

Wellington, Arthur Wellesley, Duke of (1769–1852)

British field commander, war hero, and politician. Wellington was born in Dublin, Ireland, as Arthur Wesley on 1 May 1769, schooled at Eton, and commissioned an ensign on 7 March 1783. He became a member of the Irish Parliament in 1790 and thereafter was constantly involved in politics unless on military duty overseas. As lieutenant colonel by purchase in 1793, he led the 33d Foot against the Dutch at

Hondschoote on 8 September and then commanded a brigade in Flanders and at Hanover in 1794. In India from 1796 to 1805, where his elder brother Richard was governor-general from 1797 to 1805, he achieved decisive victories at Seringapatam in 1799 and Poona, Ahmadnagar, Assaye, Argaon, and Gawilgarh in 1803. After returning to Britain as the hero of both the Fourth Mysore War and the Second Maratha War, he commanded a brigade in Hanover in 1805 and defeated the Danes at Kjöge on 29 August 1807.

Disgusted by the overly cautious tactics of his commanding officer, Sir Hew Dalrymple, which prevented him from pursuing Jean Andoche Junot after defeating him at Vimeiro, Portugal, on 21 August 1808, Wellington resigned and went home. Back in Iberia after April 1809, he won at Oporto on 12 May and Talavera on 27–28 July and held the Lines of Torres Vedras around Lisbon over the winter of 1809–1810. He defeated André Masséna and Michel Ney at Bussaco on 27 September 1810 and Masséna at Fuentes de Onoro on 5 May 1811. Wellington captured Ciudad Rodrigo in January 1812 and Badajoz in April, thus preparing ground for him to rout Auguste Frederic Viesse de Marmont at Salamanca on 22 July. He captured Madrid on 12 August, lost it, recaptured it on 17 May 1813, and then crushed Joseph Bonaparte at Vittoria on 21 June. For his successes in the Peninsular War, he was promoted to field marshal in 1813 and created duke in 1814.

Called in 1815 by the Congress of Vienna to lead the Anglo-Dutch forces against Napoleon, recently escaped from Elba, Wellington fought Ney to a draw at Quatre Bras on 16 June and retreated to Waterloo, where he and Gebhard Leberecht von Blücher's Prussians combined to give Napoleon his final defeat two days later. Given his string of victories on widely scattered battlefields, it would be difficult to dispute that Wellington was unquestionably Britain's greatest soldier of the nineteenth century.

Wellington's career after 1818 was entirely in politics. From 1828 to 1830, he was prime minister and a force for ultraconservatism.

Westmoreland, William (1914–)

One of the more controversial generals of the twentieth century because of his role in the contentious Vietnam conflict. William Westmoreland was born on 26 March 1914 in Spartanburg County, South Carolina, and was a member of the West Point class of 1936, where he was first cadet and winner of the Pershing Award for leadership. During World War II, he was commander of an artillery unit in North Africa and Sicily and thereafter became a staff officer in the 9th Division throughout the remainder of the war. He was given command of an airborne brigade during the Korean War and was promoted to command of the 101st Airborne Division and the 19th Airborne Corps. At 42, he was named a general, and four years later he was the second-youngest superintendent in West Point history.

In 1964, Westmoreland was named commander of U.S. forces in Vietnam and became army chief of staff in 1968. Four years later, he retired. Since then, he has been on several corporate boards, run unsuccessfully for governor of South Carolina, and sued Columbia Broadcasting System for libel for claiming that he misrepresented body count statistics during the Vietnam conflict.

In Vietnam, Westmoreland employed a strategy of attrition whereby more Vietnamese Communists were to be killed than could be replaced, leading to a successful conclusion of the conflict. To implement this plan, he engaged in large search-and-destroy missions (in at least battalion strength) in which Communist forces would be flushed out and eliminated. His policies were later modified by General Creighton Abrams when he became chief of staff. Because of President Lyndon Johnson's insistence, Westmoreland became a public proponent for the war and identified American failure, but not defeat, in Vietnam.

Weyler y Nicolau, Valeriano, Marquis of Tenerife (1838–1930)

Spanish general known for his harsh policy in Cuba. Weyler was born in Palma de Mallorca on 17 September 1838. At the age of 15 years, he enrolled in the Infantry School of Toledo.

By the time he was 20 years old, he was a full lieutenant. He became part of the Queen's Infantry Regiment, stationed in Madrid, Spain. He was first in his class at the Escuela Especial de Estado Mayor, graduating in September 1860.

In September 1862, he was promoted to captain and sent to the Balearic Islands. In March 1863, he requested a transfer to the commandant of Ultramar in Cuba, where he nearly died from yellow fever. He volunteered to join the command of General José de la Gándara in Santo Domingo, where he was twice decorated for bravery in the Battle of the Jaina River. In 1868, when he was back in Cuba under the command of the Count of Valmaseda, Weyler took Bayamo from the rebel forces and was made a colonel. During the next several years, he commanded a group of volunteer forces known as the Cazadores de Valmaseda. His rise continued, and he was made a brigadier general. It was under his command that the Cuban revolutionary leader Ignacio Agramonte was killed. Toward the end of the Cuban war, he returned to Spain, where by 1878, he was made lieutenant general.

After being transferred to the Canary Islands, where he was made marquis of Tenerife, he spent several years in the Philippines, in the Basque Provinces, and Catalpa. He was then named general in charge of the Spanish army in Cuba. His policy of *reconcentración*, that is, placing the civilian population in concentration camps where starvation and disease were the order of the day, made him very unpopular with the Cuban people and undermined the Spanish cause in the United States. As a result of such unfavorable publicity, he was removed in 1897. Upon his return to Spain, he was named to the War Ministry, where he served for a number of years. In 1910, in an attempt to justify his campaign of terror in Cuba, he wrote *Mi Mando en Cuba*. These and other books about other operations were well received, and other honors were lavished on him. In 1928, he celebrated 75 years of military service and died in 1930, full of years and honor—if only in Spain.

sumption of state debts. The tax proved enormously unpopular with western farmers, whose economic livelihood depended on the distillation of whiskey as the only feasible way to sell their grain while Spain forbade American navigation of the Mississippi River. Also, because of a shortage of currency, whiskey served as a medium of exchange because it was portable as well as potable.

Discontent against the tax erupted into open rebellion in the summer of 1794. Tax resisters in western Pennsylvania terrorized excise officers, destroyed the stills of those paying the tax, stopped federal judicial proceedings, and feigned an attack against Pittsburgh. As these disturbances spread throughout the frontier, President George Washington and Secretary of the Treasury Alexander Hamilton viewed the insurrection as a test of survival for the federal government. Failure to enforce Congress's right to levy internal taxes, they feared, would undermine the central government.

Washington moved cautiously to suppress the rebellion, conscious of the need to allay the public's distrust of standing armies. In September 1794, he issued a proclamation calling for obedience to the law and offered the rebels amnesty for past criminal behavior in return for their acceptance of the tax. When the rebels rejected this olive branch, Washington federalized 12,950 militiamen from eastern Pennsylvania, Maryland, Virginia, and New Jersey to stifle western unrest. The force, commanded by Virginia governor Henry Lee, set out for western Pennsylvania in October. Although the militia encountered evidence of western discontent, it met no rebel force. Resistance to the tax collapsed once the army reached Pittsburgh. Militia officers and federal marshals rounded up scores of suspects but arrested only 20 men. Only two were convicted of treason, and Washington wisely pardoned both of them. The bulk of the militia force returned home after a month in the field, while a contingent of 1,500 men remained in western Pennsylvania throughout the winter to maintain order.

In establishing a precedent to enforce federal law, Washington recognized that federal military intervention in what was ordinarily a process for civil or criminal law was a potentially explosive political act. He scrupulously adhered to the provisions of the Militia Act of 1792 for using federalized militia to maintain order, subordinating military to civilian authority to avoid any appearance of an occupying army. Equally important, he obtained support from state authorities and the general public before embarking on a military expedition. But Washington's use of force against the Whiskey rebels contributed to a political backlash against the Federalists that aided the Democratic-Republican Party's rise to power in 1800.

Dean Fafoutis

Whiskey Rebellion (1794)

First use of state militia to enforce federal law in the United States. In 1791, Congress authorized an excise tax on distilled whiskey to help pay for the federal government's as-

White Mountain, Battle of (Weißer Berg, 8 November 1620)

Battle that crushed the rising of the Bohemian estates against Habsburgian rule and marked the beginning of the Habsburgian absolutist regime over this territory. At the end of October 1620, the season for campaigning was coming to an end, but Maximilian, Duke of Bavaria, and his general, Graf Johann Tserclaes von Tilly, who commanded the allied forces of the Catholic League, pressed for a decision in 1620 and convinced the imperial commander to march with them directly to the Bohemian capital. The combined imperial and league forces, numbering 28,000, met the Bohemian army of about 21,000 men about one-half mile west of Prague on 8 November 1620. Christian, Prince of Anhalt, commander of the Bohemian forces, had posted his troops on the White Mountain in a strong defensive position. He failed to attack Tilly's forces while they were passing a little brook on the battlefield. Nevertheless, it was a risky operation for the allied armies to advance uphill against the Bohemians. At the beginning of the battle, the advancing imperial troops on the right wing were hard-pressed by the counterattacking Bohemian cavalry. But as Tilly dispatched his troops to relieve the right wing, the Bohemian forces fled. After barely two hours, the battle was won for the emperor and the Catholic League. The victorious troops took the town of Prague on the following day without fighting.

The battle did not destroy the entire Bohemian military force, but the psychological impact of the defeat was so strong that Frederick V of the Palatine, the elected Bohemian king, fled immediately. His enemies' propaganda derided him as the "winter king."

White Plains (28 October 1776)

A well-fought defeat of the American forces under General George Washington early in the American Revolution. After the disastrous campaign resulting in the loss of New York City, Washington's battered American forces fled north to Westchester County. In late October 1776, Washington hoped to regroup his forces, and he dug in at the village of White Plains, New York. The Bronx River flowed south through Washington's right, and beyond it rose Chatterton Hill, upon which a few regiments were posted.

Pursuing at their usual leisurely pace was General William Howe's confident English and German army. On 28 October, Howe prepared to attack Washington's position. In one of the rare instances of the war, both armies stood at even strength, around 13,000 men each. Seeing a vulnerable flank, Howe struck Chatterton's Hill, which was held by only one American brigade. German and English troops ascended the hill under artillery and small arms fire and managed to break the militia stationed there. Delaware and Maryland Continentals held longer yet soon were overwhelmed.

During the night, Washington pulled back his entire force to a stronger line to the north. The small engagement cost Howe 300 men, whereas Washington lost about 150. As was usually the case, Howe did not press the advantage and instead turned south to mop up the isolated garrison at Fort Mifflin on the Delaware. General Howe probably missed one of his best opportunities to finish off Washington's army at White Plains. The Continental forces were able to retreat across New Jersey to the Delaware, where they later struck back at Trenton.

Whitney, Eli (1765–1825)

American inventor and entrepreneur. Born in Westborough, Massachusetts, Eli Whitney demonstrated from an early age great technical skill in repairing such diverse intricate objects as violins and watches. During the American Revolution, Whitney also demonstrated a talent for business. Seeing that the British blockade of the colonies had cut off the supply of British-made nails, he established a small work-

shop on his father's farm to meet the wartime demand for these and other items such as hatpins and walking sticks.

Graduating from Harvard College in 1792, Whitney traveled to South Carolina, where he had accepted a teaching position. En route, he stopped at the plantation of Nathanael Greene, now run by the general's widow. There, in partnership with the plantation's manager, Phineas Miller, Whitney designed and built the invention for which he is justly famous: the cotton gin.

Unfortunately, despite the great economic impact that Whitney's invention would have on the United States and indeed the global economy, piracy of his patent meant that the inventor saw comparatively little reward for his efforts. In 1798, therefore, Whitney turned to gun making. Specifically, he proposed to produce for the fledgling U.S. Army 10,000 muskets in the space of two years. Although at that time the manufacture of military firearms depended on the arduous work of skilled craftsmen producing a weapon at a time, central to Whitney's proposal was to employ machines and unskilled labor to mass-produce many basically identical weapons in a short time. Further, with the introduction of the "uniformity system," Whitney proposed to reduce the cost and time needed to repair weapons through the use of interchangeable parts.

Historians still debate how much of Whitney's success in the mechanization of gun making is fact and how much early American mythology. Clearly, he brought little practical experience to the task when awarded the contract in 1798. Indeed, it was not until a year later that his factory was built at Whitneyville, New Hampshire. The awarding of the contract had as much to do with Whitney's friendship with fellow Harvard graduate Oliver Wolcott Jr., secretary of the treasury, as it did to the efficacy of his proposal. Further, Whitney's close friendship with Captain Decius Wadsworth, the government's arms inspector, helped keep the project alive when, instead of 4,000 muskets, Whitney delivered only 500 after the first year of the contract. There can be little doubt that Whitney failed in his promise to mechanize completely the process of gun making. Nonetheless, at the end of eight (instead of two) years, Whitney had delivered the last of his 5,000 muskets. In 1812, he received another contract for a further 15,000 weapons for the federal government and the same number for the state of New York. By that time, Whitney's system had been adopted at federal armories, including Harpers Ferry, of which Whitney had been offered the inspectorship, only to decline it in 1807. Though the true mechanization of arms manufacturing and interchangeability of gun parts would have to wait until after the mid-nineteenth century, Whitney in many ways symbolized the first hesitant steps toward the modernization of war.

Wilderness (5–7 May 1864)

Drawn but extremely bloody battle in the American Civil War. Union general Ulysses S. Grant wanted to engage and occupy Robert E. Lee's Army of Northern Virginia, while Union forces elsewhere cut up the South and destroyed its ability to resist.

The Battle of the Wilderness was the first of a series of battles between the Army of the Potomac (with George Meade nominally in command) and the Army of Northern Virginia. Grant kept seeking to move to his left to turn Lee's right flank; Lee kept sliding to his right to blunt the Union advance. By late June 1863, the two armies were beginning to dig trenches and other fortifications for the long sieges at Richmond and Petersburg, and Lee's force would never again take the offensive.

On the morning of 5 May 1864, Grant and Lee ran into one another in an area known as the Wilderness; the brush and scrub was so thick that movement was difficult, and superior numbers and, more important, superior Union artillery, did not matter greatly. Lee attacked on familiar ground near the Fredericksburg and Chancellorsville battlefields. During the fighting, the woods caught on fire, and the smoke, fire, and screaming of wounded men added to the confusion. Fighting continued the next day, as both sides rushed reinforcements along the two main roads, the Orange Turnpike and the Plank Road. Both sides suffered some 17 percent casualties, and typically Union generals had retreated after such bloody conflict.

But, on 7 May, Grant ordered his men to retreat and then swing left, trying to find Lee's elusive right flank. Lee, however, was prepared to meet such an offensive, and the two armies once again would meet one another at Spotsylvania Court House.

William II (Friedrich Wilhelm Viktor Albert) (1859–1941)

Germany's last monarch. The reign of William II as King of Prussia and emperor of Germany saw dramatic cultural and economic advancements by the German nation, but it ended with Germany in political chaos and William II with neither a throne nor a country.

William was born on 27 January 1859 to Crown Prince Frederick of Prussia and Princess Victoria of Great Britain. Young Prince William's paternal grandfather was the reigning Hohenzollern king of Prussia, William I. In 1871, following the German victory in the Franco-Prussian War, William I was proclaimed emperor, or kaiser, of the new German Empire.

The education of young Prince William was supervised by his grandfather's conservative court to distance the boy from the liberal ideas espoused by Prince Frederick. William I died in 1888. Frederick acceded to the throne but died 99 days later, leaving his unprepared son as emperor, in what was known as the "Year of the Three Kaisers."

Throughout his reign, William II sought to strengthen the monarchy and increase Germany's international prestige. He dismissed Chancellor Otto von Bismarck in 1890 over matters of imperial prerogative. William believed that a strong military and navy were key not only to German defense but also to making Germany a major international power.

The emperor's interference in foreign affairs often had disastrous consequences. In 1890, his refusal to renew a treaty with Russia led to a Franco-Russian rapprochement and the threat of a two-front war, Bismarck's nightmare in his old age. Despite attempts to improve relations, William's caustic public comments about British policy alienated the British government, driving it into an alliance with France and Russia.

When the European nations lurched toward war in 1914, William II vainly tried to mediate peace. As supposed war leader, William in reality became largely a figurehead and spectator, while German generals increasingly exercised power. Faced with mutinies and revolution as the war ground on unsuccessfully, in November 1918, William II abdicated, seeking asylum in neutral Holland. He died there in exile on 4 June 1941. Despite mendacious efforts by the Allied propaganda machines to portray "the Kaiser" as an evil warlord, William was more unstable and weak than wicked.

William the Conqueror (c. 1028–1087)

Victor of Hastings who reigned in England 1066–1087. William was the illegitimate son of Robert I of Normandy and Herleve. He ascended the ducal throne at the age of eight and survived the upheavals of any minor ruler with dissident vassals. Fortunately for William, it was in the best interest of Henry I of France to support William against his Norman vassals.

French support shifted away when William upset the balance of power in the region in 1053 by marrying Matilda of Flanders. Henry I's overt actions against William ended with two defeats, in 1054 at Mortemer, and in 1058 at Varaville. French activities against William continued behind the scenes, first with Henry I and later with Philip I (1060–1108).

As the duke of Normandy, William refined and reorganized the feudal organization of the duchy. He was quick to maintain the duchy's sovereign rights in the intricate network of feudal loyalties and service requirements. It should be noted that Normandy continued the Viking/Norse social pattern of institutionalized migration, which sent excess young men out to distant territories to raid, trade, or settle. Normandy's younger sons fueled the southern Italian wars, the foundation of the Norman state in Sicily, and the conquest of England.

Edward the Confessor's death on 5 January 1066 signaled the inevitable invasion of England by William. Anticipating an attack from William, Harald Godwinsson set up a coastal defense that waited through the summer. The situation radically changed when Harald's brother Tostig joined forces with Harald Hardradi to invade with a large Viking fleet at the Humber estuary. Harald went north with his housecarls and defeated Tostig and Harald Hadradi at Stamford Bridge (25 September 1066). Sharp on the heels of this victory came the news that William's flotilla had crossed the channel. Harald rode south with depleted and limited forces. On 14 October 1066, William attacked near Hastings. Repeated

Eighteenth century engraved portrait of William the Conqueror, with ornaments and vignette of Britannia in supplication below. (Library of Congress)

attacks and greater numbers resulted in a victory for the Normans. England was now William's.

As part of his conquest, William set out upon a total reorganization of England. Land was redistributed to Norman followers, and a series of strategically placed castles were built throughout England. Opposition to William's conquest continued until 1070, although it was largely a series of local revolts. These ended when he systematically devastated the archdiocese of York and, in large part, Cheshire, Shropshire, Staffordshire, and Derbyshire. Further consolidations of power included the reform of the English Church and the compilation of the *Domesday Book*. The *Domesday Book* surveyed the area south of the Tees River. It not only accounted for taxes but also ultimately covered the king's vassals, allowing him to enforce their military and monetary obligations to the crown.

Wingate, Orde (1903–1944)

British general and advocate of irregular warfare. Wingate was a highly controversial figure whose contributions to the British war effort were highly publicized but limited.

Born on 26 February 1903, Wingate was the son of a religious British army officer. He was commissioned into the artillery in 1923 and served in the Sudan between the wars. In 1936, he was sent to Palestine as an adviser to the Jewish Settlement Police. A convert to Zionism, Wingate conceived the idea of special night squads, later to become the *Pal-mach*. Wingate trained these soldiers in guerrilla and counterinsurgency warfare and is regarded as a founder of the Israeli army.

When World War II broke out, Wingate was posted to the Sudan to advise Ethiopian nationalist fighters. He organized and led a guerrilla unit known as Gideon Force in a series of successful operations from January to May 1941. But he was dismissed and demoted for interfering with local politics. Depressed, he attempted suicide in June 1941.

In May 1942, General Archibald Wavell called Wingate to India to organize long-range penetration operations against the Japanese. Wavell had commanded Wingate in East Africa and respected his unorthodox methods. Wingate organized the 77th Brigade and led it in a harassment campaign against the Japanese in northern Burma from February to June 1943. Movement was by foot, with resupply by air. Nicknamed the "Chindits" by war correspondents, Wingate's raiders caught the attention of many, including Winston Churchill. Wingate was temporarily promoted to major general in September 1943 and given five brigades for a larger operation. Supported by the American No. 1 Air Commandos, Wingate launched his raid in February 1944. Four brigades were inserted by air, while the fifth marched to its area of operations. Wingate expected that his units could hold jungle airstrips for resupply and reinforcement. Wingate was killed in an air crash on 25 March 1944 during the operation.

Wingate's operations were controversial. They resulted in nearly 50 percent casualties, and their effect on the Japanese was limited. Wingate himself was eccentric and managed to

antagonize his superiors. He demonstrated that British soldiers could operate in the jungle, although he is sometimes credited with inspiring the French operation at Dien Bien Phu.

Wolfe, James (1727–1759)

British general accredited by many historians as the pivotal figure in ensuring Canada for England during the Seven Years' War. Born 2 January 1727 in Westerham, Kent, England, Wolfe entered the military at 14. Having fought in the War of the Austrian Succession and holding a distinguished service record, Wolfe was appointed a brigadier general by Prime Minister William Pitt in 1758 and sent to North America as second in command to Lord Jeffrey Amherst. His troops fought heroically under heavy fire at the capture of the French fortress of Louisbourg on the island of Cape Breton in Nova Scotia. Returning to England, he was given command of the Quebec campaign and promoted to major general.

With 2,000 soldiers and 140 ships under his command, Wolfe was opposed by a French army two-thirds his size under the commands of Louis-Joseph de Montcalm-Gozon and François-Gatson Levis. For three months, because of the well-entrenched French position and faulty decisionmaking and poor positioning by the British, Wolfe's troops failed in their frontal assaults. He decided on 13 September 1759 to have his soldiers make the risky attempt to take 5,000 of his men down the St. Lawrence River at night and land 2 miles (or 3.5 kilometers) above the city. Climbing rugged cliffs, British troops met the French coming from Beauport in the open field of the Plains of Abraham in the morning. The well-disciplined British soldiers routed the French quickly. Yet in the moment of British triumph, both Montcalm and Wolfe were killed. Wolfe was shot twice but was still in active command until a third bullet hit him in the chest, mortally wounding him. His victory broke French power in the New World.

Wolseley, Garnet Joseph, Viscount (1833–1913)

British field commander and military administrator, depicted by William S. Gilbert and Arthur Sullivan as "the very model of a modern Major-General" in *The Pirates of Penzance*. Born the son of a major on 4 June 1833 in Golden Bridge, Ireland, Wolseley was commissioned an ensign in 1852 and immediately requested a transfer to a regiment bound for combat in India. He suffered a severe leg wound in the Second Burmese War and lost an eye during the siege of Sevastopol in the Crimean War. For his service at Lucknow in the Indian Mutiny, he was brevetted a lieutenant colonel and became Sir James Hope Grant's staff officer. Accompanying Grant to China in 1860 during the Taiping Rebellion and the Second Opium War, he was present at the fall of the six Dagu forts on 21 August.

Stationed in Canada after 1861, he occasionally observed the American Civil War in the company of Robert E. Lee and Stonewall Jackson. In 1870, his bloodless capture of Fort Garry, Manitoba, crushed the first uprising of Louis Riel (the second was in 1885). Back in Britain, he was reprimanded for his 1869 book, *The Soldier's Pocket-Book for Field Service*, which criticized some army practices. Ordered to West Africa in 1873, he won the Ashanti War with victories at Amoafu and Kumasi in 1874.

Given command of all British forces in South Africa after the disaster at Isandlwana, he arrived on 23 June 1879 and followed up Baron Frederick Chelmsford's victory at Ulundi on 4 July by capturing Cetshwayo on 28 August, thus ending the Zulu Rebellion. Leading a punitive expedition to Egypt in 1882, he won decisively at Tel-el-Kebir and captured Cairo. He tried to rescue Charles "Chinese" Gordon at Khartoum in the First Mahdist War but arrived on 28 January 1885, two days too late.

Created viscount in 1885, promoted to field marshal in 1894, and serving as commander in chief from 1895 to 1901, Wolseley used his worldwide experience to modernize and reform the British army. His innovations showed immediate benefits in the Second Boer War. He died in Mentone, France, on 26 March 1913. Well into the twentieth century, it

was common to characterize things well in hand as “All Sir Garnet.”

Women in the World's Militaries

Despite popular misconceptions, women have played a vital role in the conduct of war throughout history. They served in traditional roles as mothers and wives, making male-dominated warfare possible by supporting armies and caring for children on the home front; supported armies in the field as camp followers or spies; led armies in battle; and sometimes fought in the front lines beside male warriors. Millions suffered at the hands of invading conquerors, and many fought as terrorists or irregular warriors. In this light, the recent trend to expand military opportunities for women is merely a recognition of the contributions female warriors have always made, rather than a politically correct break with tradition as some critics have suggested.

Indeed, the record of war-making women stretches well into antiquity. Deborah led the armies of Israel during the twelfth century B.C.E., the Assyrian warrior queen Sammu-rat invaded India in the ninth century B.C.E., and Artemisia commanded a portion of the Persian fleet at the Battle of Salamis. In western Europe, Boudicca led a rebellion of the Icenii Tribe that killed 70,000 Romans in Britain in 60, and Aethelflaed (daughter of Alfred the Great) directed the storming of the Viking stronghold at Derby in 917. Matilda led armies in the service of the papacy between 1060 and 1114, and, of course, there is Joan of Arc.

In Asia, Trung Trac and Trung Nhi commanded 80,000 soldiers who expelled the Chinese from Vietnam in 40, and the Syrian queen Mawia defeated Roman legions during invasions of Phoenicia, Palestine, and Egypt a century later. In China, Wei Hua Hu fought with the imperial army for 12 years in the third century, and Princess Ping Yang led an army of 70,000 during the 600s.

Wei Hua Hu's example is rare because she fought as a common soldier, but it is hardly unique. The Spanish heroine Augustina (the Maid of Saragossa) rallied the defense of Saragossa during a French siege in 1808; Nadezhda Durova fought against Napoleon for nine years in the Russian cavalry; Salaym Bint Malhan fought with Muhammad in the early years of Islam; and Phoebe Hessel suffered a bayonet wound at the Battle of Fontenoy while fighting with the British 5th Regiment of Foot in 1745. Women like Hessel often dressed as men to enlist and were discharged if their sex was revealed, but they fought and died like their male counterparts and deserve to be remembered.

Some civilizations went beyond individual examples and fielded units composed entirely of women. Libyan and Scythian Amazons fought en masse, as did the Amazons of Dahomey, who fought in Africa during the nineteenth century, and the Serbian female battalions that served in World War I. The most prolific use of women soldiers came during World War II, when the Soviet Union enlisted almost 1 million in the fight against Germany. Soviet women served in every type of combat unit, from fighter and bomber squadrons to infantry and artillery battalions, and a select few distinguished themselves as snipers.

The Soviet example foreshadowed a greater utilization of military women after World War II. Increasingly sophisticated weapons required technical expertise rather than brawn, reducing the need for all soldiers physically to dominate their enemies, and military forces mirrored civilian bureaucracies by assigning women to handle most administrative work. Feminist movements in many countries created greater equality for women, making it more difficult for the armed forces to segregate women from most military jobs, and in the United States, the end of the draft in 1973 heralded a greater reliance on women to meet recruiting goals.

Since the 1970s, the United States has dramatically increased the number of women in uniform and opened up greater opportunities for women to serve in combat than ever before. By 2001, women comprised more than 14 percent of active-duty military personnel and were eligible for assignment to more than 90 percent of all military occupations. Ground combat units remain off-limits to female soldiers as a rule, but women have flown combat missions as pilots and served on combat ships in the Navy.

Other nations have followed the U.S. example. Women now serve in the armed forces of every country in the North Atlantic Treaty Organization and make up more than 14 percent of the Russian and more than 25 percent of South African armed forces.

The dramatic and relatively recent increases in the number of women serving in military assignments have come at considerable social cost in many countries, where debates

regarding the “proper” role of men and women and the efficacy of sexually integrating combat units continue to rage. Critics worry about unit cohesion and sexual assault or harassment, whereas others deride or fear the erosion of traditional sex roles.

There is no denying, however, the trend toward greater reliance on female soldiers in the future or the fact that outside the developed world, women continue to play vital roles in warfare. Alice Lakwena led an army against the Ugandan government in 1987, women represent more than 40 percent of Peru’s Shining Path terrorist organization, and female soldiers have fought from Kosovo to Chechnya and from Vietnam to the Middle East. They are, it seems, as important to regular and irregular military units today as they have always been, no matter what many conventional histories may argue.

Wood, Leonard (1860–1927)

Former U.S. Army chief of staff who captured the public’s imagination with his exploits in the Plains Wars and Cuba and whose personal honor made him reject a deal that would have made him president of the United States in 1920. Born on 9 October 1860 in Winchester, New Hampshire, Wood was educated at the Pierce Academy in Middleboro, Massachusetts, and graduated from Harvard Medical School in 1884.

He joined the army in 1885 and was appointed assistant surgeon. On 8 April 1898, he received the Medal of Honor for his role in the pursuit of Geronimo and carrying dispatches through hostile Apache territory. He was promoted to the rank of captain in 1891 and was named assistant attending surgeon to the president and other senior officials in 1895.

He gained his greatest fame in 1898 as a colonel in the 1st Volunteer Cavalry (the Rough Riders) in Cuba in the Spanish-American War and led the attack on Santiago de Cuba. Promoted to brigadier general and then major general of the Rough Riders, he was given military command of Santiago and was made military governor of Cuba from 1899 to 1902.

In 1904, he was named governor of the Moro Province of the Philippines for three years and was instrumental in putting down a revolt in that province, although his administration was criticized for ruthlessness. He then served as U.S. commander of military forces in the Philippines from 1906 to 1908. Wood brought American progressive principles to Cuba and the Philippines, that is, administration by professionals, which vastly improved health, education, and infrastructure but did little to alleviate the mass poverty of these lands. In many ways, Cuba and the Philippines served as a “laboratory” for progressivism in the United States, and many progressives believed the U.S. Army ideally suited for the imposition of progressive methods.

After serving as commander of the Department of the East and special ambassador to Argentina, Wood was named army chief of staff on 22 April 1910, a position he held until 20 April 1914, when he was replaced by General John Pershing.

Wood then returned to command the Department of the East and was openly critical of President Woodrow Wilson’s neutralist position, advocated military preparedness, and founded the movement of the same name. Although Wood trained the 10th Division at Camp Funston, Wilson refused to commission him for service in Europe. After running for the Republican nomination for president in 1920 and serving as commander of the Central Division, Wood was appointed governor-general of the Philippines in 1921. His administration was criticized for its severity by the Thompson Commission in 1926. Wood died on 7 August 1927 in Boston, Massachusetts. Wood could be rightly termed the “armed progressive,” bringing the principles of the American movement—order and good governance by “experts”—to less developed countries.

Worcester, Battle of (3 September 1651)

The last great battle of the English Civil War. Worcester marked the supremacy of Oliver Cromwell and the end of Charles II’s immediate hopes.

After Cromwell's victory at Dunbar in 1650, Charles had raised a new army to replace the one he had lost. By June 1651, he had 15,000 foot, and 6,000 horse at his command in Scotland. In July, as Cromwell invaded the north, Charles's army moved south, hoping to gather more support from the English royalists.

As the king's army marched, it did attract some supporters but also lost Scots who had not anticipated a campaign in England. On 22 August, when Charles entered the city of Worcester, his tired army had shrunk to little more than 12,000 men, and Cromwell continued to gather troops.

On 28 August, Cromwell approached Worcester from the east with about 28,000 men. Heavily outnumbered, Charles could only hope to hold off the parliamentarians at the bridges that crossed the Severn and Temes Rivers. On the 29th, 11,000 of Cromwell's men crossed the Severn River to the south of Worcester, and as they moved on the town from that direction, others threw bridges of boats over the two rivers. On 3 September, the anniversary of his victory at Dunbar, Cromwell ordered the attack and his men began to advance on the Scottish positions. When Cromwell's men took one of the earthworks at the southeast of the city and turned its guns on the town, the end was clear. Many of the royalist horse attempted to flee by the one open gate at the north road, but the royalist foot was pinned in the town. As Cromwell's troops encircled the city, most people in the town surrendered.

Worcester was one of the most complete disasters for the royalist cause, with many of Charles's leading supporters killed or captured. Very few of the Scots managed to escape the town, and even fewer made it back to Scotland. Charles managed to evade his pursuers and fled into exile, not to return until 1660.

World War I (1914–1918)

The first of the great twentieth-century conflicts. The assassination of Austrian archduke Franz Ferdinand on 28 June 1914 in Sarajevo by a Slavic nationalist triggered World War I, although a complex and competing European alliance system was the underlying cause. The Austro-Hungarian Empire blamed the Serb government for inciting the murder. Throughout July, tensions mounted as Austria-Hungary is-

sued insulting ultimatums to Serbia. In response, Russia mobilized in support of its ally, Serbia, while Germany fully supported Austria-Hungary. Although the cold-blooded murder of the archduke was viewed by most Europeans as an act of barbarism, Austria-Hungary's treatment of tiny Serbia was also seen by many as blatant bullying. On 28 July, Austria-Hungary declared war on Serbia. Russia began a full mobilization the following day, a move considered by Germany to be an act of war. Fearing a protracted war on two fronts (France and Russia were allies), Germany attacked France through Belgium (Germany had been signatory to an international treaty guaranteeing Belgium's territorial integrity) in accordance with the Schlieffen Plan. The violation of Belgian neutrality brought Great Britain into the war on the side of the Russians and the French. This alliance was called the Triple Entente. Turkey joined Germany and Austria-Hungary in October 1914, comprising the Central Powers.

On the evening of 4 August, German troops crossed the border into Belgium. Using huge siege guns manufactured by Skoda, Germany reduced the Belgian fortification systems around Liege to rubble, opening the way to Paris. Within a month, the Germans were in France. Throughout the next two weeks, the British and French conducted a rapid retreat, covering as much as 25 miles a day, to avoid being outflanked to the north by the Germans. French commander in chief Marshal Joseph Joffre hoped to deliver a decisive defeat to the Germans in the open plains before Paris. While the Germans attacked to the north in accordance with the Schlieffen Plan, the French assaulted the center in Alsace-Lorraine, following their prewar strategy. The French assault in Alsace-Lorraine ended in bloody failure, much to the dismay of Joffre, who overestimated the assistance Russia could provide France in the opening weeks of the war. Nevertheless, the French offensive, as well as the unexpected duration of Belgian resistance and the Russian invasion of East Prussia, caused the Germans to weaken their attack through northeastern France. To the north, Joffre waged his decisive battle along the Marne River in September, halting the German advance. At the battles of Aisne, Picardy, and Artois, the French sustained heavy losses in a vain attempt to regain lost territory from the entrenched Germans. By the third week of September, the British, French, and Germans were driving north in the famous "race to the sea," each hoping to outflank the other. A series of battles in Flanders (the First Battle of Ypres) lasted until 22 November 1914 and closed the last gap in the lines. Two systems of trenches stretched nearly 500 miles from Switzerland in the south to the North Sea in the north.

In the east the lines were more fluid; trench warfare did not take hold. The initial Russian advance into East Prussia was reversed at the Battle of Tannenberg at the end of August 1914. The Russians enjoyed some successes, but they

proved unable to achieve a decisive victory. A series of strategic retreats by the Russian forces led to the evacuation of western Poland in the hope that they would be able to concentrate on driving across the Carpathian Mountains into Silesia and knock Austria-Hungary out of the war. Neither the Russians nor the Central Powers could claim victory at a series of battles around Warsaw, Lodz, and Masuria waged in the winter of 1914–1915. Only in capturing the fortified city of Przemysl could the Russians claim a clear victory. In the Caucasus region, Turkey attacked Russia in several battles that came to resemble results on the other fronts, in that they only led to deadlock. In April 1915, Turkey undertook one of the most controversial actions of the war by massacring a large but undetermined number of Armenians, claiming that they were aiding the Russians.

Much of 1915 and 1916 was spent trying to break the stalemate that had developed. Lured by promises of territorial compensation, both Italy and Bulgaria entered the war in 1915. Italy sided with the Triple Entente, and Bulgaria joined the Central Powers. Italy made few contributions to the war and failed to relieve Austro-Hungarian pressure against Russia. Over the next two years, the Italian army fought a series of indecisive but bloody battles in the vicinity of the Isonzo.

The Bulgarians joined the Germans and the Austro-Hungarians in attacking Serbia. During the first month of the war, the Serbian army repelled an Austro-Hungarian invasion. Although the British and French landed more than 100,000 troops in nearby Greece, the combined Central Powers forces defeated Serbia, driving its army into Albania to be evacuated by the Italian navy.

In hopes of relieving pressure on their Russian allies, Great Britain expanded the war by waging vigorous action against the Turks. Urged by Winston Churchill, First Lord of the Admiralty, the Australian and New Zealand Army Corps (ANZAC) forces launched a campaign against Turkey on 25 April 1915 along the Dardanelles peninsula on the approaches to Constantinople. The Gallipoli campaign was marked by months of bitter fighting. After suffering more than 265,000 casualties, the British withdrew in January 1916. The British also attacked Turkey from Egypt through Palestine and from Central Asia toward Baghdad. Like most peripheral campaigns of the war, the offensives against the Turks failed to significantly alter the strategic balance, and the British surrendered an entire army at Kut El Amara.

On the Western Front, the combatants remained locked in trench warfare. The Battle of Nueve-Chapelle in March 1915 established the pattern of offensive operations that was maintained for the next two years. Massive artillery bombardments were followed by waves of troops who overran outlying enemy positions. (The Germans slightly altered the

pattern in April 1915, when they introduced poison gas attacks.) The attackers, however, soon outran their reinforcements and artillery support. Once exposed, the attackers sustained heavy casualties from massive counterattacks and machine gun fire. Eventually, the front lines stabilized near the starting points. At Ypres, Artois, and Champagne, the pattern was repeated throughout the year.

The Germans had much better luck on the Eastern Front. As the Russians withdrew from the bulge of Poland to strengthen their line around Warsaw and its rivers, the Germans and Austro-Hungarians launched a massive attack in March 1915 that became known as the Battle of Gorlice-Tarnow. By end of the offensive in September, the Germans had cleared Poland; taken the Russian cities of Brest-Litovsk, Grodno, and Kovno; and had captured more than 300,000 Russian prisoners. In September 1915, Czar Nicholas II assumed direct control of the army; if anything, morale among the ranks declined ever further. Nonetheless, Russia managed to fight on because of enormous reserves of manpower and a war-induced economic boom.

In the west, 1916 followed a pattern similar to the previous year. Both sides launched offensives that they hoped would be the decisive battle of the war. In February, the Germans attacked at Verdun with the cold-blooded purpose of “bleeding” the French army white. The offensive ground to an indecisive halt only after each army lost some 400,000 men in what may have been the most intense battle of all time. To the north, the British initiated a massive assault that became known as the Battle of the Somme. Beginning in July and ending in November, the battle claimed more than 1.2 million men on both sides as killed, wounded, or missing with no significant strategic outcome. Morale among the combatants declined in the face of rising carnage and indecisive results; Allied commanders could think of nothing other than more of the same.

On the eastern front, the Russian army surged forward in June and July 1916 in a series of actions known as the Brusilov Offensive. After achieving a number of victories, the attacks came to an end when the Russian logistical system failed to support the needs of a follow-up advance. In August 1916, Romania entered the war on the side of the Allies. France and Russia promised Romania territorial compensation in exchange for its support. Romanian troops attacked Austro-Hungarian forces but met stiff resistance. Soon after, the Germans and Bulgarians came to the aid of their Central Powers ally and invaded Romania. By the end of the year, Romania, which received no military assistance from Russia, France, or Great Britain, was almost completely conquered.

Unrest and a collapse of morale marked 1917. After the failure of the French army to achieve decisive results during

French soldiers fire from front line trenches in France during World War I. (National Archives)

the abortive Nivelle Offensive, a near-complete collapse in the army's morale resulted. Civilians protested the treatment of the soldiers as well as the management of the war. Yet the overwhelming number of soldiers who participated in the mutinies went unpunished. The French army vowed to defend France but refused any further futile offensives. After the Battle of Passchendaele (July–October 1917), British morale also suffered in the face of heavy casualties for little gain. Italy's defeat by the Austro-Hungarians at the Battle of Caporetto in autumn 1917 triggered a similar crisis of morale among Italian soldiers. Only the infusion of British and French troops stabilized the Italian front and kept Italy in the war. Not until the last days of the war did the Italian army resume offensive operations.

In Russia, revolutionaries forced Czar Nicholas II to abdi-

cate. Alexander Kerensky, leader of the liberal democratic forces of the Russian Duma, attempted to keep Russia in the war. A series of Russian offensives gained some ground against the Austro-Hungarians but only succeeded in draining the Russian army in the long run. In November, Vladimir Ilich Lenin, leader of the Bolsheviks, wrested power from Kerensky. Lenin, who had been transported from Switzerland and financed by the Germans, promised to pull Russia out of the war if he attained control. In December, he began treating with the Germans, who continued to drive through an undefended Russia. In the spring of 1918 at Brest-Litovsk, Russia withdrew from the war and accepted great losses of territory and the payment of a huge indemnity.

Almost the only bright sign for the Allies in 1917, the entry of the United States into the war in April tipped the

strategic balance in favor of the Triple Entente. The United States, however, was poorly prepared for war and could not contribute significant numbers of troops for more than a year. There were two causes for American belligerence: Germany resumed unrestricted submarine warfare in 1917. German leaders gambled that they could starve Great Britain out of the war before the United States could decisively alter the strategic balance. And Germany engaged in a harebrained scheme to entice Mexico into the war with a promise of the return of its “lost territories” from the United States.

With Russia out of the war and the United States still building an army, the Germans transferred troops from the east to the west as fast its rail system could carry them. In the spring of 1918, the Germans launched a massive offensive. Using newly designed flexible surprise assault tactics first tried in the east (the German High Command seemed to be the only belligerents to have learned anything from the deadlock of trench warfare), the Germans crashed through the British and French lines and even threatened Paris. But the offensive ground to a halt in July because of a combination of logistical problems and the renewed resolve of the defenders, now bolstered morally and militarily by increasing numbers of American troops. At Amiens in August, the British launched an offensive with more than 500 tanks, driving back the Germans. Military aircraft played an increasing role on both sides. Although the Allies had far greater resources here, the Germans had pioneered strategic bombardment of their British cities. In the following month, the Americans, who had more than 1.3 million soldiers in France at this point, vigorously launched their first exclusively American attack at St. Mihiel. Morale among the Germany army deteriorated as it was driven back. German military leaders realized that it was only a matter of time before surrender was necessary.

As the German high command fretted about the future, revolution swept through the multiethnic Austro-Hungarian Empire. The Italians attacked at the Battle of Vittorio Veneto on 24 October 1918, breaking the Austro-Hungarian lines. On 3 November 1918, Austria-Hungary sued for peace. The situation in Germany continued to deteriorate. After being told that he no longer held the loyalty of the army, Kaiser William II abdicated and fled to the Netherlands. The socialist government that replaced the kaiser sued for peace the following day. On the 11th day of the 11th month of 1918, the war finally ended with an armistice, after 10 million had died and 20 million had been wounded. Four empires—Austria-Hungary, Russia, Germany, and the Ottoman Turkish—had collapsed. The map of Europe awaited redrawing, but only among the Americans (who had suffered comparatively briefly and lightly) was there any sense of unalloyed

triumph. A peace treaty was imposed on Germany that was harsh enough to engender the deepest resentment but weak enough that it could not prevent Germany from eventually once again coming within an ace of mastering Europe.

World War II (1939–1945)

The greatest and most destructive enterprise in human history. World War II is the name given to the series of interrelated conflicts that took place from 1939 to 1945. Although often presented as a monolithic conflict between democracy and dictatorship, World War II was in fact a number of complex (and interrelated) conflicts that saw combat on six of the seven continents. The two major theaters of combat were the European theater and the Pacific theater. Within these two theaters were many subareas, such as the Soviet front, North Africa, the Mediterranean and the central Pacific.

The war formally started with the German invasion of Poland on 1 September 1939. The result of a crisis over the alleged mistreatment of Germans living in Poland, it ignited the war since England and France had given guarantees for Poland's security after the failure of the Western powers to protect Czechoslovakia in the Munich Crisis of 1938. On 15

September 1939, the Soviet Union, under the secret protocol of the German-Soviet Non-Aggression Pact, invaded the eastern half of Poland. (France and Great Britain, despite the Polish treaty, did nothing.) Germany achieved quick success by use of a joint-arms tactic known as blitzkrieg (lightning war). Massed use of armor and aircraft overwhelmed Polish defenses. By October 1939, Poland had been divided between Germany and the Soviet Union.

After the fall of Poland, both sides lapsed into inaction during a period known as the Phony War (or “Bore War”). France and Britain worked to rearm against an expected German attack in the spring of 1940. At the same time, the USSR attacked Finland to regain Soviet land lost during Finnish independence. This conflict, known as the Winter War, saw the USSR engaged in a costly conflict in which the outnumbered Finnish held off the Soviets for weeks.

The USSR’s high command was still suffering from the effects of Stalin’s purge of Red Army officers in 1938. The poor showing of the Soviets in the Winter War with Finland was to give Adolf Hitler (and many Western military “experts”) the impression that it would be easy to defeat the Soviet Union.

On 10 May 1940, Hitler launched an attack on the West, using the same blitzkrieg tactics seen in Poland. The Germans overran the Low Countries and France by June 1940. The French, demoralized by domestic politics and tied to an outmoded strategy (although they had many modern tactical weapons), were quickly beaten back by the Germans as they raced to the sea. The French were depending on the Maginot Line, a series of interconnected bunkers and forts, to hold the Germans at bay.

In a daring strategy, the Germans simply circumvented the line, attacking the dense forest of the Ardennes, in Belgium. (The “experts” had ruled that the Ardennes was “not good tank country.”) Caught off guard, and with many of their troops tied to the defensive forts, the French fought bravely but were overrun by the Germans. The British Expeditionary Forces in France were driven back to the coastal town of Dunkirk, where an armada of Royal Navy and private “little ships” rescued hundreds of thousands of British and French troops. In late June, Benito Mussolini, expecting an easy victory, declared war on France and England. Instead, French troops held back the Italians in the south of France. With the fall of France, the northern half of France became a German-occupied zone, and a collaborationist government was formed in the south of France under the World War I hero, Marshall Henri-Philippe Pétain. The defeat of France (again, unexpected by the experts) allowed the Germans to establish submarine and air bases in order to carry the war to Great Britain itself.

The British refused and sought to continue the war from

England. The Germans launched a series of air attacks that became known as the Battle of Britain. At the same time, the Germans and the British fought the Battle of the Atlantic, as German U-boats sought to sink enough Allied shipping to starve the British into submission. The United States, although neutral, became more involved in the war as it provided supplies to the Allies.

The battle now moved to North Africa, as Italy invaded Egypt in September 1940. The Italians were ignominiously routed by the British, and Hitler, to forestall a Italian collapse, sent Erwin Rommel to take over command of the Afrika Korps. For almost the next three years, the battle would seesaw between the British and the Germans and, later, the Americans in North Africa.

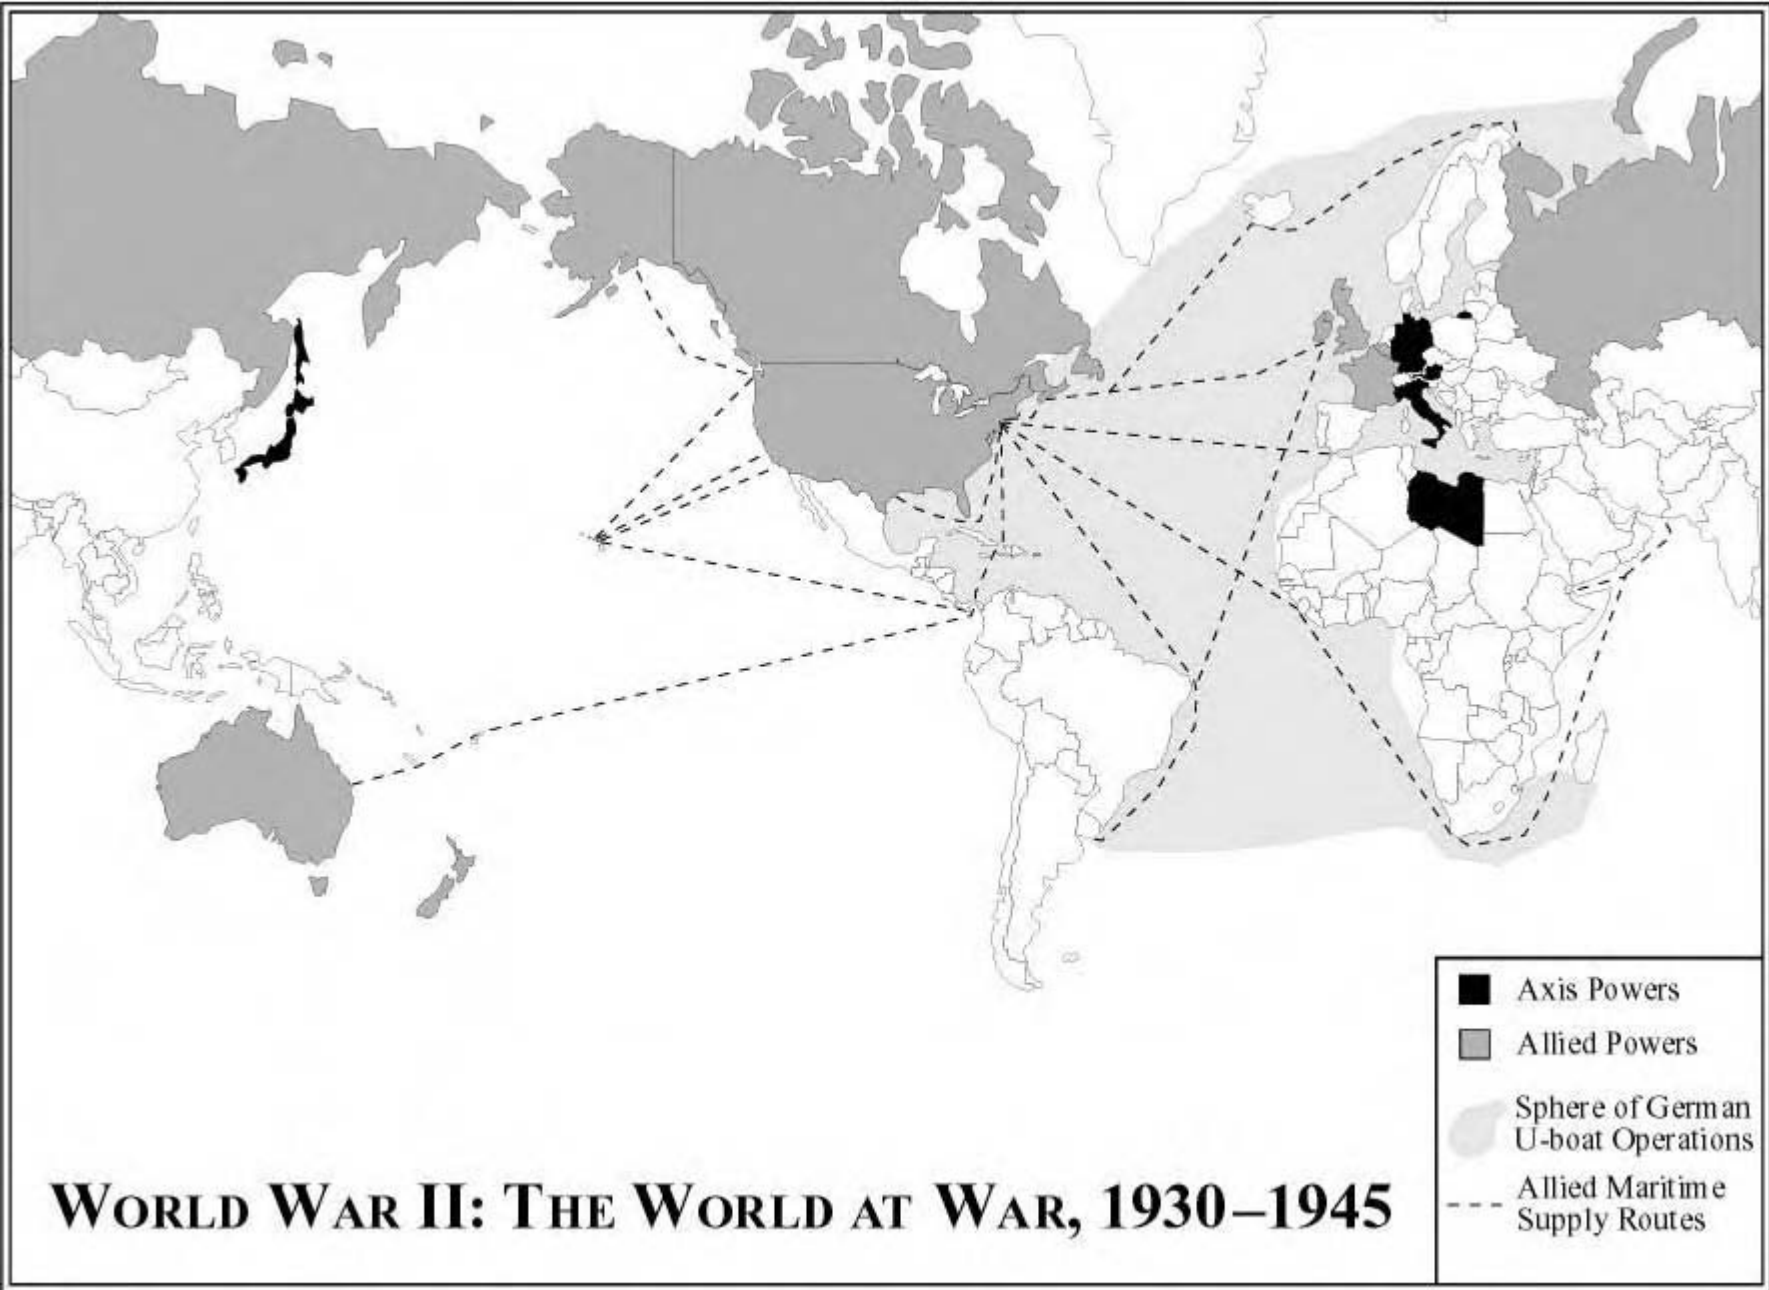

Mussolini was also having his problems in Greece, which he had invaded absolutely without provocation late in 1939. But the Greeks put up a stout resistance and chased the Italians out of Greece into Italian-occupied Albania. It is thus erroneous to state that “Britain stood alone” in 1940; Greece also withstood the Axis on the battlefield.

In 1941, Germany had proven unable to defeat Britain and turned its efforts to defeating the Soviet Union, Hitler’s main goal all along. Launching his attack on 21 June 1941, the Germans pushed deep into the Soviet Union in the greatest military operation to date, taking millions of prisoners and dealing the bungling Stalin, who had been repeatedly warned by the West, a massive blow. His best generals and marshals were either dead (shot in the purges) or, like Georgy Zhukov, far from the scene of the action. Only by bringing in reinforcements from eastern Soviet Union were the Soviets able to stem the flow of the German attack at the gates of Moscow.

In 1941, with the Nazis in control of large parts of Europe, a plan was formalized for what the Germans called “the Final Solution,” in which the Jews of Europe would be systematically murdered. In January 1942, Reinhard Heydrich held the Wannsee Conference, in which the mechanics of the Holocaust were planned in meticulous and wide-ranging detail. The Jews of Europe were not to be enslaved, as were the Slavs or other conquered peoples; they were to be exterminated. They were not to be shot but to be gassed, as vermin.

The Germans turned south to the Balkans in April 1941 to salvage Mussolini’s aborted adventure and punish Yugoslavia for its recent turn to a pro-Allied policy. In one of the shortest campaigns on record, German columns, spearheaded by armor, slashed through Yugoslavia and Greece in a matter of weeks. The British and Commonwealth forces, which had retreated to the island of Crete, were overwhelmed by German airborne landings.

In Asia, Japan had started a policy of expansion in 1931 with the annexation of Manchuria, run by a puppet govern-

ment known as the state of Manchukuo. In a fabricated affair called the Marco Polo Bridge Incident in 1937, the Japanese engaged China in open warfare that was to last until 1945. In response to this aggression, the United States, in concert with other Western powers, enacted a series of embargoes to protest the Japanese actions. This response would lead to increased tension between Japan and the West and a Japanese belief that war was the only solution to its problems.

The Japanese military was divided between two factions in the 1930s. The Go North faction, which sought expansion into the Soviet Union, and the Go South group, which sought to move into the Pacific region. After defeat at the battle of Kohlin-Go on the Mongolian border in 1939 by Soviet forces, the stunned Japanese military leaders chose to adopt the Go South policy.

By 1941, the American and British embargo was having a serious effect on Japan, and the military leaders, led by Hideki Tojo, felt that talks with the United States were not producing the desired results and put into place his absurd plan to knock the United States out of the Pacific with a lightning stroke. The Japanese hoped that once the United States was defeated, it would be willing to come to the bargaining table. To the Japanese, the Americans were “decadent” and “soft.”

On 7 December 1941, the Japanese launched a sneak attack on the American Naval Base at Pearl Harbor, Hawaii, and on that “day of infamy,” Japan lost the war. The Japanese sank a number of elderly American battleships in shallow water, where all but one were raised, but missed the U.S. carriers, which by sheer luck were out at sea on the day of the attack. They missed the oil tank farms and the machine shops that could repair all but the worst damage. The attack was severe enough to fill all Americans (even those who had bitterly opposed Franklin D. Roosevelt’s aid to the British) with a cold rage and determination to fight Japan to the finish, yet it failed to inflict much strategic damage. Few states have so miscalculated with such disastrous consequences. The United States declared war on Japan the next day, and Germany declared war on the United States on 11 December, thus bringing the United States into both the European and Pacific wars. Both nations would pay a terrible price for this miscalculation of U.S. power.

The Japanese lacked the industrial bases and the resources to carry out a long war with the United States. Only by a lightning blow against the Western powers would the Japanese be able to consolidate their hold on east Asia.

At the same time as Pearl Harbor, the Japanese attacked the British in Singapore and Dutch holdings in the Dutch East Indies (now Indonesia) to consolidate their hold. For the first six months, the Japanese scored success after suc-

cess, driving the British ignominiously out of Singapore and Hong Kong; defeating the Americans in the worst defeat in U.S. military history, the loss of the Philippines; and easily taking over Dutch possessions in the East Indies. Yet despite the desire to avenge Pearl Harbor, the decision was made at the highest levels in the United States and Britain that Germany would come first and then Japan.

In May 1942, the Japanese were turned away from an attack on New Guinea at the battle of the Coral Sea, marking the first time a Japanese attack was spoiled and showing the Japanese that the United States was not yet out of the war. And at the Battle of Midway, the Japanese Navy lost four carriers and their irreplaceable crews. In August 1942, the United States started its first land offensive against Japan, landing on the island of Guadalcanal.

In Russia, after weathering a brutal winter, the Germans renewed the attack on the Soviets, with the campaign in the Caucasus culminating in the Battle of Stalingrad in the fall of 1942. It was a geographical high-water mark for the German advance into the USSR, but nonetheless, on the Soviet front, after months of brutal house-to-house fighting, the overextended Germans were defeated and tens of thousands of survivors taken captive. The year 1942 was to be the time of the greatest advance of the Axis nations.

In November 1942, the United States landed troops in North Africa to help support the British, who had achieved the upper hand against Rommel. In 1943, after two years of toil, the Red Army went onto the offensive against the Germans, slowly driving them off Soviet soil. And in July 1943, the Soviets and Germans engaged in the largest tank battle in history, at Kursk. It would be the last offensive of the Germans in the east.

In 1943, Allied troops landed in Sicily and precipitated the capitulation of the Italian government. German troops occupied northern Italy and sought to stave off the Allied attack. The Allied troops landed on the Italian peninsula in September 1943 and soon bogged down in the difficult terrain of Italy. What Churchill termed “the soft underbelly of Europe” proved a tough proposition, as the Germans fell back in fighting order from one prepared line of defense to the other.

Meanwhile, in Asia, Allied forces started to push the Japanese back, making advances in New Guinea, Burma, and the central Pacific. The United States attacked Japan from two directions. From his bases in Australia, General Douglas MacArthur attacked up through New Guinea in the southwestern Pacific, while Admiral Chester Nimitz attacked through the central Pacific. There was also an increased tempo in the air war against Germany in 1943, as the Royal Air Force (RAF) and U.S. Army Air Forces started bombing Germany around the clock. The Allied air offensive sought to

destroy German industry and reduce the Luftwaffe as an effective fighting force.

By 1944, Germany was being pressured by Soviet Union in the east and was facing the imminent threat of an Allied invasion in France. It was no longer a matter of if there would be an invasion, but when and where. In June 1944, the Allies landed at Normandy and started pushing the Germans out of France, while the Soviets advanced into Poland and central Europe. The Allied armies in Italy slowly advanced, taking Rome in June 1944.

Germany tried to retaliate for Allied area bombing with a number of “wonder weapons,” such as the V1 and V2 rocket and jet warplanes, but the former were a misuse of resources and the latter a case of too little too late. In the Pacific, the Japanese attempted to stem the tide of the American advance by the use of kamikaze (divine wind) suicide pilots to sink American ships. Although horrific to deal with, these weapons (which caused more casualties than any other Japanese weapon) did not stem the tide of the Allied advance.

By January 1945, Germany was surrounded on both sides by Allied armies, while the Japanese were preparing for attacks on the very boundaries of the empire. Hitler personally approved a plan for a great counteroffensive, known later as the Ardennes Offensive or “the Battle of the Bulge.” Despite initial successes, the Germans no longer had the resources to continue any such operation on any scale, and the Ardennes, if anything, hastened the German collapse.

The Soviets advanced into eastern Prussia by March 1945, and the British and American forces had crossed the Rhine River, closing in on Berlin. After a costly assault by the Soviets, Berlin fell in May 1945. Hitler had committed suicide in his Berlin bunker and named Admiral Karl Donetz as the new leader of Germany. Donetz surrendered to the Allies in May 1945.

The Allies now turned their full efforts to Japan. In February 1945, Iwo Jima was captured, and Allied forces invaded Okinawa in April 1945. The Americans began the most horrific bombing campaign in history, burning out the heart of numerous Japanese cities. The worst air raid of all, the fire-bombing of Tokyo in March, snuffed out the lives of some 100,000 civilians. Although the Americans rarely perpetuated the personal atrocities of the Japanese, with the fire-bombings and the all-out submarine sinkings of any Japanese ship, civilian or military (in protest of which the United States had gone to war in 1917), to starve out the home islands, it was evident barbarism was spreading among all of the belligerents. There was even talk of poison gas to flush out the Japanese from their island caves and bunkers.

After the costly invasion of Okinawa, the Allies started

planning for an invasion of the Japanese home islands in the fall of 1945. Estimates were that such an offensive would have costs hundreds of thousands of casualties on both sides and caused massive destruction to Japan. All of this planning became academic, however, when the United States dropped atomic bombs on Hiroshima and Nagasaki in August 1945. The Japanese surrendered a few days after the bombings, and their formal surrender came in September 1945. The morality of the nuclear bombings is still debated into the twenty-first century. But such thoughts did not trouble Allied military personnel poised for the invasion of Japan. They thanked God. It is indeed difficult to see how the Japanese, dug in and imbued with a death wish, could have surrendered before literally millions of casualties would have been inflicted on both sides; young girls were training with bamboo spears to drive the *gaijin* devils into the sea. The mindless official slogan, even after Hiroshima, was “Our spirit against their steel!” The invasion of the Japanese home islands would have proven the most bloody military operation in history and would have left Japan a charnel house.

World War II was “total war” for practically all belligerents. This meant that the home fronts were to be mobilized. Labor was conscripted, and women were often given the choice of war production or the military. As is so often the case, minorities and women made progress, at least for the duration of the war, in securing employment in many fields that had been closed to them before the war. It was a war of production, and production was the home front’s battle front. Each side had to produce tens of thousands of weapons, as well as rations, clothing, transportation, and medical supplies. Here the Allies excelled, although the German home front, under the superefficient Albert Speer and after the Stalingrad catastrophe, produced some miraculous figures under Allied round-the-clock bombings and ignorant interference by Nazi officials. Great Britain also mobilized hundreds of thousands of women and boys to turn out the Spitfires and artillery to win the war of production, again under the bombs, although nothing like what the Reich had to endure increasingly. The Japanese and German home fronts were under the tightest military discipline, with no strikes or demands for better conditions tolerated. People could be, and were, shot for “defeatism” or for listening to enemy broadcasts. Both nations were reduced to the barbarism of slave labor, using enemy prisoners of war, foreign civilians, and “undesirables” to toil in factories and mines. Both Axis nations saw a drastic drop in the living standards of civilians, although only Japan suffered rising death tolls caused by malnutrition as the American submarine blockade tightened on the home islands. German civilians lived well enough during the war from the booty of other peoples’ countries. Of course, both nations suffered far more than any

nation in history from aerial bombardment, with the Germans losing some 600,000 and the Japanese about 393,000 civilians. Yet under the bombs, the Germans and the Japanese home fronts accomplished miracles of production, the Germans more than the Japanese. Nineteen forty-four, a year when almost all of the territory of the Third Reich was subject to aerial bombardment, was the year of the greatest German aircraft production.

But by far, the greatest production powerhouse of the war was the United States. Its factories, untouched by the enemy, poured out hundreds of thousands of tanks, warplanes, small arms, and other items. Even ship production was increasingly carried out on an assembly-line basis. For example, the United States could supply the Soviet, British, and Nationalist Chinese armies with thousands of its immortal 2.5-ton 6 x 6 army trucks (perhaps the greatest trucks in history) and still see to it that there were enough for every GI to ride into battle. Locomotives were sent to Russia, as were aircraft and aluminum; canned meat went to Britain and uniforms to the Chinese; and still the American soldier was the best-equipped of any soldier in history. Germans capturing or killing GIs made a point of stripping them of their boots and cigarettes.

American factories did not always turn out the best weapons, however. The M-4 Sherman tank was adjudged inferior on almost all counts to contemporary German armor, but the Americans could out-produce the Germans almost five-to-one in tanks. The world war on the American home front saw nothing like the anti-German hysteria of World War I, but in one of the most shameful episodes in the history of American civil rights, all Americans of Japanese ancestry, citizens and aliens alike, living on or near the West Coast, were rounded up and placed in uncomfortable internment camps.

Estimates of the cost of the war are in excess of \$1 trillion 1945 dollars and more than 60 million military and civilian deaths. The Allies were indeed fortunate that their enemies, for all their bluster of “never surrender” and “fighting to the last man,” actually followed their enemy’s dictum of “unconditional surrender,” once ordered to capitulate by their own governments and, if anything, cordially cooperated thereafter with their conquerors. After the war, war crimes trials were held in Nuremberg, Germany, and Tokyo for some of the top Axis leaders, with a number being put to death, although as is so common in such politically charged matters, some of the worst criminals escaped justice.

The war dramatically changed the geopolitical landscape, with only two nations, the United States and the Soviet Union, left as superpowers. The next 50 years would be taken up with the Cold War, as tensions between the capitalist West and the Communist East rose at times to nearly un-

bearable heights, and then, in the last decade of the twentieth century, miraculously, the Cold War ended almost entirely without bloodshed as the Soviet Union quietly collapsed.

More than half a century has passed since the Allies were victorious over the pure evil of Nazism and the manic nationalism of Japan. The post-World War II period, for all of its midsize and small wars, was a far more happy time than that after World War I, if for no other reason than that no global conflicts have erupted since 1945. Winston Churchill’s prediction that if the Axis lost the war, the world could then proceed upon “broad, sunlit paths,” has more or less come true. Most of that conflict’s belligerent nations, victors and vanquished alike, enjoyed living standards by the end of the twentieth century that were unimaginable before the war, and democracy seems more broad-based and stronger than ever. None of this would have been possible, of course, had the Axis prevailed. World War II, for all its bitter cost, was indeed “the Good War.”

Troops of the U.S. Army open fire on a Sioux camp on the morning of 29 December 1890. (Library of Congress)

Wounded Knee, Battle of (28 December 1890)

The crushing of the last aboriginal resistance in North America. It served as revenge for the defeat of Custer and the Seventh Cavalry at the Battle of Little Bighorn in 1876.

The once-proud Sioux nation had been relegated to reservation life by 1890. Crazy Horse had surrendered in 1877 and then been bayoneted to death. The remaining Indians turned to a new religion centered on rituals like the “ghost dance” as a remedy for their poor treatment by the U.S. government.

In 1890, alarmed Indian agents sought to put a stop to the ghost dances and met stiff Sioux resistance in Dakota territory. Sitting Bull, thought to be at the center of the resistance, was shot dead in 1890 at Grand River, allegedly while trying to escape.

Two weeks later, on 29 December 1890, the U.S. Seventh Cavalry (Custer’s old outfit) attacked a Sioux reservation encampment at Wounded Knee Creek in the Black Hills. Estimates of the dead ranged between 150 and 200 on the Sioux side, including women and children. The U.S. Cavalry may have had 30 casualties. The last Sioux surrendered on 16 January 1891, marking an end to the tragic chapter of U.S. expansion in the west.

Wrangel', Peter Nikolaevich (1878–1928)

Czarist and White Russian Civil War general. Of noble origins, Wrangel' was born in Kovensk Region (modern-day Lithuania). A mining engineer graduate from St. Petersburg Mining Institute (1900), he fulfilled his Russian army national service in the Horse Guards until 1902, leaving to pursue a mining career. He was recalled for the Russo-Japanese War and served in the Transbaikalian Cossack Formation as

lieutenant. Remaining in the army, he graduated from the General Staff Academy in 1909 and from the Cavalry Officers' Academy the following year, becoming captain and squadron commander (1912).

In World War I, Wrangel' commanded the Ussaryskaia Division and was a major general by the February Revolution. He fought on the southwestern front in the June 1917 offensive but, after participating in the Kornilov Coup (August), left the army and went to Yalta. He was arrested there in January 1918 by Red Guards but was released and lived in German-occupied Ukraine before joining Anton Denikin's "volunteer army" in August.

Wrangel' commanded the 1st Cavalry Division and Corps in conquering Kuban and commanded the Caucasus Volunteer Army in January 1919 within Denikin's Armed Forces of Southern Russia (AFSR). He led the right wing of Denikin's drive on Moscow, but as early success turned into lengthy retreat, he attempted to have Denikin removed as commander in chief. Instead, he himself was removed by Denikin in February 1920.

In exile in Constantinople, Wrangel' was summoned back in April to replace Denikin and head the White movement. He successfully reorganized AFSR remnants into a 40,000-strong Russian army. But he made an error similar to that of

Denikin's, not cooperating with Poland—that newly independent nation fought the Soviets in April 1920.

Despite some initial success in taking Tauride (June 1920), Wrangel' had little chance against the Red Army. He survived as long as the Polish-Soviet War lasted but was then pushed back into the Crimea. Wrangel' was successful in evacuating 146,000 Whites in November 1920, distracting enough Red troops in August to help determine the outcome of the Polish-Soviet War. In exile, he lived in Paris, founded the Union of Former Soldiers of Russia (1924), and headed the White émigré movement until his sudden death in Brussels.

X

Xenophon (c. 431–c. 354 B.C.E.)

Greek soldier and historian and a leader of one of the greatest fighting retreats in history. In the spring of 401 B.C.E., the Athenian-born Xenophon joined an expeditionary force of Greek mercenaries recruited by the Persian prince Cyrus. Cyrus, an ally of Sparta (Athens's traditional rival in the Peloponnese), led a force, including a corps of perhaps as many as 14,000 Greek mercenaries, against his half-brother, the king Artaxerxes. Xenophon joined the battle at Cunaxa, near Babylon. The Greek mercenaries routed the Persian troops facing them. Cyrus and a small cavalry force attempted a coup de main by killing Artaxerxes, but Cyrus was killed. The Greeks, abandoned by their Persian erstwhile allies who had sworn allegiance to Artaxerxes, started retreating toward their homeland. The Greek commanders were invited to a conference with the Persians, where they expected to discuss terms. They were treacherously seized and executed. The "ten thousand," as Xenophon called the mercenary force, were now left leaderless. The Greeks elected new commanders, among them the young Xenophon. The ten thousand marched home through Mesopotamia and the Armenian mountains without the aid of maps or guides. Harassed by inclement weather and hostile marauders, the Greeks pressed their way homeward for four months until they reached the Greek colony of Trapezus on the Black Sea. Xenophon recorded the exploits of this mercenary force in the *Anabasis*.

For reasons that are unclear, Xenophon was exiled from his native city, Athens. Having developed a close relationship with Sparta's king, Agesilaus, Xenophon found refuge in Sparta. In 394 B.C.E., Xenophon again led the ten thousand (now a force of perhaps 8,600) on the Spartan side at Coronea against Thebes. The battles between Sparta and Thebes around Argos and Corinth were a static affair, and the record

of the ten thousand in this conflict was not as glorious as it had been in Persia.

Xerxes I (c. 519–465 B.C.E.)

The son and successor of the Persian king Darius, Xerxes headed an unsuccessful invasion of Greece. His first military expedition after his father's death involved crushing an Egyptian revolt in 486 B.C.E. Three years later, Xerxes turned his attention to Greece. In preparation for the Second Persian War, he ordered the digging of a canal across the Athos isthmus and instructed his engineers to construct a pair of bridges, utilizing both suspension and pontoon designs, across the Hellespont.

Once Xerxes and his vast army crossed the Hellespont, he initiated a combined land and sea campaign. Victorious at Thermopylae, Xerxes marched with his army on Athens, while his fleet engaged the Greeks just off the coast. The Persians sent a second fleet of 200 ships around the island of Euboea to block any possible escape, but these ships crashed

against the rocks during a violent storm. The main Persian fleet was also hit by a storm and severely weakened, paving the way for a later Athenian naval victory.

With his army still strong, Xerxes captured Athens. He then ordered his fleet to engage the Greeks at Salamis, where they experienced another naval defeat. Escaping back across the Hellespont before the Greeks could destroy his bridges, he ordered his brother-in-law Mardonius to remain in

Greece and continue the offensive. Mardonius sacked Attica several times before falling in battle at Plataea.

Y

Yalu River (1 May 1904)

A major Japanese victory in the opening phases of the Russo-Japanese War. The conflict had begun with a Japanese naval attack on the Russian fleet at Port Arthur in February 1904; the next phase would be the rapid movement of Japan's armies through Korea into the Liaodong Peninsula to control the warm water ports and hence secure Japan's sea bridge to the Asian continent. The first major ground fighting would be forcing the crossing of the Yalu River, which divided Korea from China's Manchurian region.

The Russians recognized the probable Japanese strategy and did make plans to defend along the Yalu River. General Aleksey Kuropatkin organized his troops into four main groupings, one in Port Arthur, one near Port Arthur, one guarding the area just west of the Yalu River, and finally a small army of 7,000 covering the main Yalu crossings. The Russians wanted to defend and give ground slowly while waiting for reinforcements to come from European Russia—a sound strategy. However, the czar appointed Admiral Evgeni Alekseev to overall command, and he insisted on an immediate offensive against the upstart Japanese.

So 7,000 Russian troops attacked 40,000 troops near Wiju. The Japanese easily withstood the attack and badly mauled the outnumbered Russians, losing about 1,100 compared to 2,500 Russian killed and wounded. Thereafter, the Japanese First Army crossed the Yalu and, along with other armies landed in the Liaodong Peninsula, began the long and decisive siege of Port Arthur.

Yamagata, Aritomo (1838–1922)

Soldier and statesman who is considered the father of the modern Japanese army. Yamagata was born on 3 August 1838 in Hagi. As a young officer, he recognized that Japan's military was inferior to that of the Western powers. After participating in the Meiji Restoration in 1868, he gained a series of government posts and planned the modernization of the army. Studying European military organization, he sought to emulate the Prussian system, where the military is distinct from civilian government. His reforms included the introduction of universal conscription and the establishment of a general staff.

He was vice minister of military affairs in 1871, minister of the army in 1873, army chief of staff in 1878, home minister from 1881 to 1886, and prime minister in 1890. Disliking party politics, he resigned in 1891. He commanded the First Army in Korea during the Sino-Japanese War (1894–1895), but illness forced him to return to Japan. He was special ambassador to Russia in 1896 and helped to settle territorial disputes that arose from Japan's victory over China.

Serving as prime minister a second time in 1898–1900, he appointed a cabinet dominated by the military and decreed that only active-duty officers would be eligible to be armed forces ministers. He also promoted an expansionist policy that would seek to extend Japanese control over much of Asia.

Yamagata was chief of the general staff during the Russo-Japanese War (1904–1905). It was his last official position,

although he held much influence until his death in Tokyo on 1 February 1922. Yamagata is widely credited with building Japan's military to that of a world power.

Yamashita, Tomoyuki (1885–1946)

World War II Japanese general. Born 8 November 1885, at Skikoku, Yamashita graduated from Japan's Central Military Academy (1908) and General Staff College (1916). Between 1916 and 1940, he distinguished himself as a general staff officer; assistant military attaché to Switzerland; military attaché to Austria; commander at regimental, brigade, division, and army levels; chief of the Military Affairs Bureau; and inspector general of air aviation. In November 1941, Yamashita, a lieutenant general since 1937, assumed command of the Twenty-Fifth Army, just weeks before Japan went to war against Great Britain and the United States.

Although opposed to war against the Western powers, Yamashita guided the Twenty-Fifth Army to the greatest land victory in Japanese history, conquering Malaya and Singapore in only 70 days (7 December 1941–15 February 1942). Though Malaya made him a national hero, Yamashita suffered an assignment to a minor command in 1942 because Prime Minister Hideki Tojo saw him as a potential rival. For two years, he languished in forced exile, while the war turned irreversibly against Japan. Finally, in September 1944, he received command of the Fourteenth Area Army. Under Yamashita's leadership, this force defended the Philippines against an American invasion that began on 20 October 1944. Denying the enemy a quick victory, Yamashita held out on Luzon until 2 September 1945, when news of Japan's capitulation prompted his surrender.

Tried as a war criminal, Yamashita was convicted, in a controversial verdict, of failing to control troops under his command who committed atrocities in the Philippines, although no direct evidence linked him to the crime. Sentenced to death, Yamashita—"the Tiger of Malaya"—was hanged (he pleaded directly to General Douglas MacArthur for the more "honorable" death by shooting, but even this was denied him) on 26 February 1946 on Luzon. Even some

contemporary Allied observers thought that Yamashita was executed more for his success against the Allies than for any particular war crimes that could legally be held against him.

Yang Jian (Yang Chien) (541–604)

The second emperor of the Sui Dynasty (581–618), who would take the reign name of Wendi (Wenti), Yang Jian was born of mixed Chinese and northern blood into an aristocratic family serving the rulers of the Northern Zhou (Chou, 557–581), whose territory spanned most of western China beyond the bend in the Yellow River. The marriage of his daughter into the imperial Northern Zhou household allowed Yang Jian in 578 to gain the post of regent to a Northern Zhou child emperor. Yang Jian moved quickly to consolidate his position, and through a ruthless purge of Zhou princes, seized the throne itself, establishing the Sui Dynasty. Yang Jian kept its capital at Chang'an (modern Xian), which had served as the capital of various dynasties going back to the Qin (Ch'in, 221–206 B.C.E.). As with various other imperial families of the north, Yang Jian readily adopted the Buddhist faith and promoted himself as a Buddha-king (*Cakravartin*), a ruler who uses the sword to build the Buddhist kingdom on earth. In the years that followed, Yang Jian, now emperor of the Sui, undertook a series of bold military campaigns to reunite China proper under a single imperial rule, something it had not witnessed since the fall of the Han Dynasty in 220. Yang Jian's reunification of the long decentralized empire firmly established in the consciousness of China the idea of a single unified Chinese state.

By 589, with the conquest of southern China and the reunification of the empire, Yang Jian had accomplished his primary task. In the following years, he would make great efforts in attempting to strengthen the Sui through land and administrative reforms. Yang Jian's accomplishments, however, would soon be lost in the failures, particularly military, of his two successors, and the young Sui empire would fall in 618.

Yang Xiuqing (c. 1817–1856)

Rebel leader in the Taiping Rebellion. Yang was born on a farm in Xincun village, Guangxi Province, China, around 1817. Orphaned at an early age, he became a charcoal burner and a skilled explosives technician in mines and tunnels. When he was about 30, he and many of his fellow burners joined the God-Worshipping Society, a dissident, charismatic movement recently founded by Feng Yünshan and inspired by Hong Xiuquan. Yang quickly rose to a position of authority by interpreting his various illnesses, whether real or faked, as signs from God. By 1850, he, Hong, and Feng uneasily shared the leadership of tens of thousands of followers. When the Qing emperor sent troops in December 1850 to suppress the God Worshippers, they offered stiff resistance, immediately mobilized seven divisions, and decisively defeated the imperial forces on 1 January 1851 at Jintian, with Yang commanding the left flank. Confident after this victory, Hong declared the Taiping Tianguo (Heavenly Kingdom of Great Peace) on 11 January, thus formally initiating the Taiping Rebellion.

Known thereafter as Dong Wang (East King), Yang served Hong as chief of staff. His many early victories, his escape from the imperial siege of Yong'an on 3 April 1852, and his distinguished performances at Yuezhou on 13 December 1852, Wuchang on 12 January 1853, and Nanjing on 19–21 March 1853 all contributed toward his reputation as the Taiping Rebellion's most skillful tactician and most talented field commander. He brilliantly repulsed the imperial attempt to recapture Nanjing in the summer of 1856.

As Yang's stature grew, Hong became afraid that Yang wanted to replace him. On Hong's orders, Wei Changhui, known as Bei Wang (North King), murdered Yang and 6,000 of his followers in Nanjing on 2 September. Hong then had the murderers murdered. The rebellion was irreparably weakened from that point but staggered on for another eight years.

Yangzhou (Yang-chou), Siege of (1645)

A siege by Manchu armies of the newly established Qing (Ch'ing) Dynasty (1644–1912) of the city of Yangzhou, a holdout of forces still loyal to the toppled Ming Dynasty (1368–1644). The siege of Yangzhou and later annihilation of its Ming supporters was of extreme brutality and is sometimes referred to as the “Yangzhou Massacre.”

The last Ming emperor, Chongzhen (r. 1628–1644), had died by his own hand in a besieged Beijing in 1644, but the Ming loyalists soon moved their capital to Nanjing, near the terminus of the Yangtze River. After the Manchu armies entered Beijing in 1644, toppling the Ming Dynasty, efforts by supporters of the Ming concentrated on keeping the Manchu north of the Yangtze River. They selected Chongzhen's first cousin, Zhu Yousong, the prince of Fu, as the new Ming emperor. The troops of the Ming loyalists were garrisoned just north of the Yangtze River and east of Nanjing at the walled city of Yangzhou. It was the Manchu Prince Dodo (1614–1649), brother of the new Qing emperor, who was chosen to lead the Qing assault on this Ming challenge. In November 1644, Dodo led a force of about 300,000 troops, a mixture of Manchu and Chinese, from Beijing, arriving outside Yangzhou in May 1645. A fierce five-day battle ensued between the Qing troops and the Ming loyalists, but the force arrayed against them was too much for the Ming, and the gates of Yangzhou were eventually breached. What ensued was a 10-day slaughter of the Yangzhou's surviving defenders and inhabitants and a razing of the city, so brutal it is referred to as “the ten-day slaughter of Yangzhou.” It would prove just one of several massacres perpetuated by the Qing armies along the Yangtze River as they struggled to bring China's richest region under their control. Though it brought a definitive end to the Ming loyalist efforts behind Prince Fu (who would soon be captured and die in Beijing), it would be another 30 years before the last vestiges of Ming resistance were wiped out. So vivid were memories of the Qing massacre at Yangzhou, however, that on a tour of his empire in 1684, the Qing Emperor Kangxi (Kang-hsi, r. 1661–1722) opted wisely to bypass the city.

Yarmuk, Battle of (20 August 636)

Arab victory that destroyed any Byzantine hopes of the reconquest of Syria and Palestine. By 635, the Arab Muslim armies had conquered virtually all of Palestine and Syria, driving the Byzantine armies before them. In response, Emperor Heraclius recruited a new army consisting of Byzantine soldiers from Anatolia, Armenian infantry, and light Arab cavalry from the Christian Arab tribe, Bani Ghassani. Upon the Byzantine army's arrival into Syria under the command of Theodorus, the Arab forces of Khalid ibn al-Walid withdrew.

The Arabs abandoned Syria and withdrew through the Deraa Pass, possibly hoping to draw the Byzantines into the open. Theodorus did not comply and instead fortified the Deraa Pass. The Muslims ceased their retreat and then laid siege. The Byzantine felt certain that if they held Deraa, then the Arabs were effectively barred from entering Syria. Although the pass was geographically imposing, with rifts and lava fields, small parties could infiltrate behind it and raid.

Four months passed, and they began to show on the Byzantines as rivalries increased between the Greek and Armenian soldiers. The Arab forces patiently waited. Then a sandstorm occurred. In the midst of the storm, the Arab army attacked on 20 August 636.

The small parties of soldiers who had infiltrated behind the Byzantines cut off their routes of communication by seizing a bridge across the Yarmuk River. Then the main Arab force stormed the fortifications with the sandstorm at their back. The Byzantine army panicked in the face of the unexpected onslaught and the storm. With the Byzantine retreat route held by the Muslims and the fortifications overrun, the Arabs eradicated the Byzantine army.

Afterward, the Arabs continued their northward drive and successfully reconquered Syria. Heraclius realized that Syria was lost to the empire and did not attempt to regain the former Byzantine territories.

Yellow Ford (1597)

Sometimes called the Battle of Blackwater, the greatest defeat of the English during the Elizabethan wars in Ireland. The battle resulted from Sir Henry Bagenal's attempt to resupply a besieged English outpost on the Blackwater River. Bagenal, with between 4,000 and 5,000 men, underestimated his opponent, Hugh O'Neill, Earl of Tyrone, who had recently added the forces of Hugh O'Donnell from Connacht to his army. Bagenal's force left Newry on 12 August and marched toward the Blackwater in a column of six regiments, with gaps in between. He was nearing the Blackwater on 14 August but had to cross the small tributary Callon Brook.

As he approached, his forces came under harassing fire from the woods flanking their route of march, delivered by light infantry who had recently been rearmed with firearms in place of traditional javelins and bows. The English were already in disorder when the regiment at the head of the column crossed the ford and encountered a fortified position manned by the bulk of O'Neill's forces, armed in the English fashion with shot and pike.

With the column stalled, O'Neill unleashed O'Donnell's warriors to overrun and destroy the column in close combat. Bagenal, directing his forces from the ford, was shot in the head in plain view of the army, which initiated a complete rout. Fifteen English captains were killed and nearly 3,000 men lost in the retreat, with several hundred subsequently joining O'Neill's forces.

Not only was this battle a great victory for the Irish, but it also served notice both of O'Neill's tactical brilliance and the effectiveness of his army. It also forced the deployment of 16,000 men to Ireland, a commitment Elizabeth I could ill afford at that point in her long-running conflict with Spain.

Yemenite Civil Wars (1961–1967, 1994)

Conflicts that followed the fall of the theocratic government that reflected the Cold War. In the late 1950s, Yemen was a theocratic state loosely united with the United Arab Republic. When a republican opposition began an insurgency in 1961, Egypt broke with the Imam Achmad to support his opponents. The death of Achmad and the installation of his son as imam on 19 September 1962 led to the arrest of the imam by insurgents and the proclamation eight days later of the Yemen Arab Republic, which was immediately recognized by the Communist-bloc nations. A military government took office on 31 October.

The imam managed to escape and rally royalist forces to his cause. Egypt immediately began sending military supplies and troops to assist the republicans. Eventually, the Egyptian troop commitment reached 35,000. Frustrated at their failure to coerce the royalists and at escalating casualties, the Egyptians employed poison gas. On the royalist side, Jordan and Saudi Arabia were furnishing military aid, and Britain lent diplomatic support. An internal split in the republican government led to an agreement that all outside aid to both sides would be halted in 1967.

In addition to the Egyptian aid, the Soviet Union allegedly supplied 24 MiG-19s to the republicans. Wherever the republicans got their aircraft, they were crucial in preventing the royalists from concentrating their forces. The high point for the royalist cause came with the siege of the capital, San'a, between December 1967 and March 1968. After that, the tide turned rapidly, and the last royalist citadel, Sa'dah, fell in September 1968. The Saudis recognized the republican regime in 1970, and royalist resistance ended completely in 1971.

In 1972, Yemen agreed to a future merger with the People's Democratic Republic of Yemen, a Marxist successor to the South Arabian Federation cobbled out of Aden and 16 tribal states in 1963. The two Yemens finally united in 1990. Conflicts within the governing coalition led to the outbreak in May 1994 of a civil war in which the southerners sought to secede. The northern-dominated government put down the rebellion in just nine weeks.

Yonglo (1360–1424)

The fourth son of Ming Hongwu, founder of the Ming Dynasty (1368–1644). Yonglo seized power from his nephew and moved the capital from Nanjing along the Yangtze River to Beijing, site of the former Mongol capital, only a short distance from the Great Wall.

Yonglo's reign was probably the height of the Ming era. The Great Wall was rebuilt in its current form and style during this time; Yonglo oversaw construction of the so-called Forbidden City and the temples and palaces where the Ming ruled and lived; and he began the Ming Tombs outside the city.

Militarily, Yonglo's reign was a time of limited military expansion. He continued his father's system of guard units of 5,600 men, each divided into fifths. During Yonglo's reign, there were about 400 such units, although many of the men were more self-supporting farmer-soldiers than effective professional soldiers. Yonglo led expeditions against the remaining Mongol forces and other northern barbarians to secure Ming power, but the Ming never achieved the territorial gains of the earlier Tang Dynasty or of the Qing, which succeeded them. Yonglo wanted to expand the tributary system of diplomatic relations and sent a Muslim eunuch, Zheng He, on seven naval expeditions to Southeast Asia and even the east coast of Africa. While the Portuguese were cautiously moving down the West African coast in small ships with few seamen, Zheng He led more than 28,000 men and 60 vessels on his journeys. After Yonglo died, the Ming turned away from naval expansionism and focused on assuaging barbarians outside the Great Wall.

Yorktown (1781)

The campaign that won American independence. Sir Charles Cornwallis had been unsuccessful in his efforts to bring the

Carolinas under British control, mostly because of the efforts of regular Continental units under General Nathanael Greene and General Daniel Morgan and guerrilla bands under Francis Marion and Andrew Pickens. Cornwallis believed that American forces maintained their strength from bases of supply in Virginia, so he campaigned northward to disrupt them. After he raised his troop levels to 7,500 by joining with other British forces in the Chesapeake Bay region, Cornwallis established a headquarters at Yorktown, at the mouth of Virginia's York River, in order to facilitate communication with the northern British army under General Henry Clinton in New York.

In the meantime, Washington had lobbied his French allies to conduct a joint operation against Clinton in New York, a plan that was not enthusiastically endorsed by the French commander, General Jean Baptiste Donatien de Vimeur, Comte de Rochambeau. In fact, the French commander left the fleet of Admiral François-Joseph Paul, Comte de Grasse, in the West Indies so that he could decide for himself whether to support operations in New York or French troops under General Marie Joseph du Motier, the Marquis de Lafayette, who had been monitoring Cornwallis's movements in Virginia. Washington persisted in his New York plan, but when he discovered that he lacked the forces necessary for decisive action against Clinton and that de Grasse had determined to move against Cornwallis in the south, he made the fateful decision to transport the bulk of the Continental army to Virginia. De Grasse arrived off Yorktown on 30 August and engaged British naval units, giving the French complete control of the waters surrounding Cornwallis's position. De Grasse then helped to move Washington's troops down the Chesapeake Bay in late September. Once established on the base of the Yorktown peninsula, allied forces numbered about 17,000.

With the arrival of Washington, the entrapment of Cornwallis at Yorktown was complete. The allies pounded the British for several weeks until 14 October, when they seized control of two key redoubts on the British left. After Cornwallis failed to retake these positions and could not manage the escape of his troops across the York River, he surrendered. The allies suffered 262 casualties during the campaign, whereas the British listed 552 killed, missing, and wounded. News of Cornwallis's capitulation resounded throughout the colonies and Europe. This was the second capitulation of a British army in North America. (The first had been at Saratoga, which had brought the French openly into the struggle.) The British government of Frederick, Lord North collapsed, and a new ministry was voted in with a mandate to negotiate an end to the war. The result was the Peace of Paris of 1783, which included formal recognition of the independent United States of America.

Yorktown was a near-miraculous victory: the French, most unusually, had defeated the British at sea; French money had come through just in time to reinspire the ragged American forces; and the complex movements of the American and French forces (including the vital French siege train) had gone off like clockwork. A rare moment in history, indeed.

Ypres, Battles of (1914–1918)

Three major engagements of World War I fought in and around the town of Ypres in southwestern Belgium. The first battle of Ypres (October–November 1914) was the culmination of the flanking series of engagements referred to as “the race to the sea.” The British at Ypres checked the German thrust toward the Channel ports of Dunkirk and Calais.

The Germans retreated from the Marne River in the late fall of 1914. Next, British and Belgian forces raced the German army under General Erich von Falkenhayn northward to keep the Germans from advancing through gaps in the Allied lines and thus regain momentum to resume the march on Paris. The race evolved into opposing static lines of massive trenchworks spanning all the way to the English Channel.

Ypres was taken by the Germans in the first days of October 1914 but recaptured by the British on 14 October, whereupon the British I Corps under General Douglas Haig occupied the bulge thereafter known as the Ypres salient. In the middle of October, the German offensive along the Lys River almost succeeded in breaking the line before fierce British resistance drove them back. Swampy conditions (the Belgians had blown the dikes) hindered supply and movement from Ypres northward to the Belgian coast. On 21 October, the Allies advanced northeast toward Bruges, just as the German Fourth Army opened up its own counteroffensive towards Ypres. The converging forces met on a line around Zonnebeek, where the British checked the Germans and then threw them back. The Germans hurled themselves repeatedly into a hail of accurate, rapid British rifle fire, incur-

ring heavy losses. The French rapidly reinforced the British line. The Germans now concentrated their available forces on taking Ypres and launched a major attack on 29 October. This eventually broke the British line near Gheluvelt, but reserves had been brought up and counterattacked, regaining the lost positions. The Germans continued to assault, and the Allies kept rushing up reinforcements, until a final German attack on 17 November failed. The Allies held, but their forces were depleted and down to the last reserves. Only winter saved the Allied lines from total collapse, and they remained stabilized until the next year. British losses are estimated at about 50,000, the French 70,000, and the Germans 150,000 during this prolonged engagement.

On 22 April 1915, the Germans blanketed the Allied lines near Ypres with an intense artillery barrage. As the barrage continued, a yellow-green cloud descended on the trenches, inaugurating the use of poison gas on the western front in the form of chlorine gas shells, more commonly known in the trenches as “green cross.” The attack caused several of the defending units (British regulars and reserve territorial troops) to flee their positions, which opened a 4-mile gap in the sector.

The Germans quickly exploited the breach but underestimated the time needed for the gas to dissipate and charged straight into their own gas cloud and the waiting 1st Canadian Regiment, which was the only unit to endure the gas to repel the German assault. The Canadians held off the Germans long enough for reinforcements to arrive following the dissipation of the gas. The line once again stabilized.

However, the battle soon flared up again, and random fighting took place all over the Ypres front. On 24 May 1915, the Germans launched a massive gas attack on the lines once more. The British managed to hold off the attackers but only by suffering terrible casualties. By the end of spring, the Ypres front had once again stabilized, and the fighting had died down for the time being.

The third battle of Ypres, popularly known as Passchendaele, began on 31 July 1917 and continued until November. The principal aim of this battle was to force the Germans to yield their grip on the Channel ports and thus facilitate operations against the U-boat threat. The British and French high command had decided that a three-prong attack on the German lines was necessary to break the stalemate that had ensued since the end of 1914. The plan was for the British forces to attack at the Ypres front as part of the three-phase attack. On 18 July, the British and French artillery started a massive barrage on the German lines, preparing for an attack set for 31 July. The battle itself was focused on the small town of Passchendaele. Continuous artillery pounding had wrecked the ancient drainage systems and rendered the ground on which the troops had to fight increasingly muddy

and pocked with water-filled craters that could drown a man. Notwithstanding, the British high command insisted that a full-scale artillery preparation be laid down before the infantry could attack, ignoring the lessons of the previous disasters at Ypres and the Somme.

The British infantry began its advance early on the morning of the 31st and despite massive German counterattacks, managed to creep forward 2 miles. The battle seemed to be going well until the eve of 1 August, when heavy rains flooded the area even worse than before. Most of the 144 tanks the British deployed were mired within a few hours and no longer of any use. The rain continued without stop for two weeks, and the British army was heavily bogged down. However, they continued to press against the German lines. The German infantry was also mired, preventing them from counterattacking, but they still mounted a stubborn resistance. They hit the British with mustard gas and heavy machine gun fire, but the British still attacked relentlessly.

After a long, hard struggle, the Canadians took Passchendaele in heavy rain on 6 November. They then managed to continue into Ghent, bringing the offensive to a close at an overall cost of 250,000 casualties for an advance of 5 miles (8 kilometers). Fortunately, for the troops on both sides, there would not be another offensive at Ypres.

Yuan Shikai (1859–1916)

Chinese general and first president of the Republic of China. Yuan was born in 1859 in the Honan Province of China, but his exact date of birth is unclear. He served under Li Hongzhang in the Ch'ing brigade of the Anhwei army, commanding that brigade in Korea. Success led to an appointment as Chinese ambassador to Korea (1884–1894). In 1895, Li Hongzhang assigned him the task of raising and

equipping a modern army, which became known as the Peiyang army. The personal loyalty of that army was invaluable in his rise to power. Yuan supported the Empress Tz'u-hsi over the Emperor Kuang Hsü but refused to support the Boxer Rebellion in 1900. In addition to his military command, he assumed Li Hongzhang's civil authority following his death in 1901. This concentration of power prompted officials at Beijing to assign Yuan to an administrative position with no direct command. With the support of the empress, Yuan set about the modernization of the Chinese armed forces. When the empress died in 1908, Yuan lost his official powers but remained a man of influence among the military.

In 1911, the imperial government asked Yuan to return to active duty to suppress the Double Ten revolution. Yuan arranged to be named prime minister and played both sides to his own political advantage. With his control of the military secure, he coerced the imperial dynasty into abdicating and had himself named as the first president of the Chinese Republic in 1912. Later, he dissolved the National Assembly and seized virtual absolute power. He then attempted to begin a new imperial dynasty with himself as emperor. This provoked significant opposition, and Yuan lost his support and his power. He died 6 June 1916 in Beijing.

Yue Fei (1103–1141)

Semilegendary military hero of the Southern Song Dynasty (1126–1279) of China. Yue Fei was born in 1103 in Tangyin, Henan Province, China, probably into a poor family. He became a common infantryman while still a child and rose quickly through the ranks by virtue of his bravery and skill. In 1128, he was named commander in chief of the Southern Song forces.

The Juchen tribes established the Jin Dynasty in northern China in 1115 and completed their conquest of the Northern Song in 1126. The Southern Song was weak and seemed doomed also to be conquered by the Jin. Yue Fei met the invasion head on, frustrated the Jin cavalry in the rugged hills where he chose to engage the enemy, and cleverly coordinated his land campaigns with the Song navy. He recap-

tured all Song territory south of the Yangtze River and pursued north of the Yangtze as far as Luoyang. Incredible feats are attributed to him. Defending Kaifeng with only 800 men, he is supposed to have defeated a Jin army of 500,000.

With the defense of Southern Song lands secure by 1140, some leaders wished to continue the war and push the Jin farther north, whereas others wished to accommodate the Jin and make peace. Yue Fei led the War Party. His main political opposition came from Emperor Gaozong's prime minister, Qin Gui, head of the Peace Party and a fervent capitulationist. Qin Gui had Yue Fei executed on trumped-up charges in 1141.

In 1162, the new emperor, Xiao Zong, rehabilitated Yue Fei's reputation. He ordered a magnificent tomb and temple built in Hangzhou to honor Yue Fei. The temple, which was still standing in 2001, includes cast-iron statues of Qin Gui, his wife, and two other conspirators, all four bound as prisoners and kneeling in submission to the man they murdered.

Yugoslavian Civil Wars (1990–2000)

Europe's most destructive conflict by far since the end of World War II. It destroyed the Yugoslav Federal Republic, caused the deaths of more than 250,000, forced more than 2 million people from their homes, and brought the North Atlantic Treaty Organization (NATO) into two major peace-keeping operations.

In 1989, Slobodan Milosevic was elected president of Serbia, the largest of the six republics of Yugoslavia. Facing the collapse of communism as an ideology, he hoped to use Serbian nationalism to gain support throughout Yugoslavia. Also in that year, he abolished the autonomy of Kosovo—an Albanian majority province in Serbia.

Croatia and Slovenia were alarmed at these developments and, faced with Milosevic's unwillingness to negotiate, in

late 1990 began to consider secession. These moves angered Serbia, as well as the 600,000 Serbs living within Croatia. On 25 June 1991, Croatia and Slovenia declared their independence from the four other republics, Macedonia, Montenegro, Serbia, and Bosnia-Herzegovina, precipitating the intervention of the Yugoslav army, controlled by Serbian commanders, to prevent these secessions. Led by allies of Milosevic, the federal army and air force gave military assistance to Serbs living outside Serbia, with the objective of creating a Greater Serbia to replace the collapsing Yugoslavia.

Although Slovenia, ethnically homogeneous and geographically isolated from the rest of Yugoslavia, was allowed to go its own way, the situation in Croatia was more complex. Approximately one-third of the population of Croatia in 1991 was ethnic Serb, and these Serbians rebelled against the idea of an independent Croatian state. Aided by the Yugoslav army, these Serbs, located in a region known as the Krajina, declared their own state and fought bitterly against Croatian forces for the rest of 1991. More than 20,000 deaths resulted on both sides. Encouraged by Germany, in December 1991 and January 1992, the European Union recognized the independence of Croatia. Following this, in January 1992, the United Nations (UN) brokered a cease-fire between the Croatians and the Serbs, leaving approximately one-third of Croatia under the effective control of the Serb minority. Approximately 14,000 UN peacekeepers entered Croatia to observe the settlement. Macedonia also declared its independence at this time.

In March 1992, after a referendum, Bosnia-Herzegovina also proclaimed its independence. As in Croatia, in Bosnia the Serbs also constituted approximately one-third of the population, and as in Krajina, they called on the Yugoslav army to aid their resistance to Bosnian independence. In April, despite recognition of Bosnian independence by the European Union and the United States, Serbs in the republic launched a rebellion and with Yugoslav military aid seized over two-thirds of Bosnia. During the summer of 1992, the fighting escalated in Bosnia, with the Muslims and Croats allied against the Serbs in most areas.

The Serbs especially, but other ethnic groups as well, practiced a tactic known as "ethnic cleansing," whereby tens of thousands of people were killed or driven from their homes in an effort to make regions of Bosnia ethnically pure—all Serb, all Croat, or all Bosniac Muslim. The Serbs even overran UN-declared safe zones, planned as centers for refugees, massacring or expelling all within. Several cease-fires in 1992 and 1993, along with UN and European mediation, failed to end the conflict, primarily because of Serbian intransigence. In 1994, Bosniacs and Croats signed a federation agreement and began a combined offensive against

Serb-occupied territories. The Bosniac capital of Sarajevo remained under siege and subject to shelling and sniper attacks, even against the UN-held airport during this period.

NATO became involved in 1995, sending over 700 air strikes against Bosnian Serb positions around Sarajevo. Also in 1995, Croatia launched a successful offensive to reclaim the Krajina from the Serbs. These two defeats convinced Slobodan Milosevic to agree in late 1995 to a cease-fire, ratified in the Dayton Accords and enforced by more than 50,000 NATO-led peacekeepers who began entering Bosnia in December 1995. The Dayton Agreement gave the Bosniac-Croat federation 51 percent of Bosnia, with the remaining 49 percent going to the Serbs. The war left more than 200,000 people dead and had forced almost 2 million from their homes.

In 1996, in the Serb province of Kosovo, the Albanian majority began to demand independence. Serbian police and paramilitaries began a campaign of repression, while at the same time the Kosovo Liberation Army (KLA) emerged, launching attacks on Yugoslav military and police units. The conflict continued at a low level until 1998, when Albanian leader Ibrahim Rugova demanded complete independence for Kosovo. In late 1998, faced with increasing fighting between the KLA and Serb forces in Kosovo, the UN Security Council called for a cease-fire, threatening further action if Milosevic refused to agree.

In October 1998, Serbia agreed to allow 2,000 unarmed observers to enter Kosovo to guarantee a new cease-fire. Faced with renewed fighting, tens of thousands of Kosovar Albanians being driven from their homes, and Serbian refusal to sign a peace accord, the international team withdrew in March 1999, and NATO began air strikes to force Milosevic to comply with Security Council resolutions. After 11 weeks of the air campaign, in June 1999 the government of Yugoslavia agreed to a cease-fire and allowed a NATO-led force to enter Kosovo to supervise the end of hostilities and the return of the more than 800,000 ethnic Albanian refugees. UN and NATO leaders estimated that Serb forces had killed 10,000 ethnic Albanians in battle and in massacres of civilian populations, and the government of Yugoslavia claimed 5,000 deaths of Serbs from KLA attacks and NATO's bombing campaign, although neither of those figures has been proven to any degree of certainty.

In July 2000, Yugoslavia's federal parliament approved constitutional changes to allow Milosevic to seek a second term as president and called for elections in September. Despite his efforts to manipulate the results of the election, Milosevic lost and in October 2000 surrendered the presidency to Belgrade lawyer Vojislav Kostunica.

Milosevic was later arrested and indicted by a UN court

for war crimes. Peace in the former Yugoslavia seems about as far from accomplishment as it was several years earlier.

Z

Zama, Battle of (October 202 B.C.E.)

Carthage's last effort during the Second Punic War to ward off defeat. After the Roman general Publius Cornelius Scipio Africanus Major had invaded Carthage's home territory in Africa in 202 B.C.E., Hannibal had been called back from Italy. Both armies met near Zama, probably some 50 miles from Carthage.

Hannibal's army probably counted some 36,000 infantry, 4,000 cavalry, and about 80 elephants. Behind a line of elephants, he positioned his infantry in three lines of roughly 12,000 men each. The front line consisted of mercenaries and the second line of levy troops. Hannibal's hardy veterans formed the third line, some distance behind the others.

Scipio had about 30,000 infantry and 6,000 cavalry. Among them were two penal legions that were formed from the survivors of Cannae. The infantry took position in the center in such a formation that there remained open alleyways through the Roman line. Scipio's superior cavalry took position on the flanks.

The battle commenced by an attack of the elephants. Confused by the sounds of Roman horns, the beasts turned upon their own troops or passed harmlessly through the gaps in the Roman line. Thereupon, the first Carthaginian line charged, but the Romans held ground. The second Carthaginian line reinforced the first, but to no avail: the troops were driven back. By that time, the Carthaginian cavalry was driven from the field, and the Roman cavalry was in pursuit.

The remnants of the repulsed Carthaginian lines reformed on the wings, lengthening the frontage. Scipio ordered the Roman rear lines to the wings to avoid being outflanked. Both lines fought on until the Roman horse returned and attacked the Carthaginians in the rear. The Carthaginians turned and fled. Hannibal escaped, but his veterans fought bitterly to the death, pitted against those

very legions that they had disgraced at Cannae. Some 25,000 Carthaginians were killed and 8,500 taken prisoner. The Romans lost no more than 5,000 men.

Zapata, Emiliano (c. 1879–1919)

Mexican revolutionary. Emiliano Zapata was born in Anenecuilco, a small village in the central Mexican state of Morelos, probably in August 1879, though evidence has been advanced for earlier years (1873 and 1877). Orphaned at 15, he had no formal education. Zapata owned a small plot of land near his village and also worked as a sharecropper and horse trader. In 1909, he was elected village council president. During the Mexican Revolution of 1910, Zapata, an unwilling revolutionary, fought for the rights of the ordinary rural Mexican. His Plan (proclamation) of Ayala (25 November 1911) called for "liberty, justice, and law." Zapata favored the forcible expropriation of land from major landowners. Unlike many revolutionary leaders, however, he remained loyal to the Roman Catholic Church.

Quiet and uncomfortable in formal settings with federal officials or other revolutionary leaders, Zapata was at his best when on his native turf. Vilified by his many enemies—politicians, the army, idealistic reformers, and organized ur-

Portrait of Emiliano Zapata, between 1900 and 1919. (Library of Congress)

ban laborers—as an inflexibly radical, impractical, and loutish country bandit, he has been regarded since his death as a hero by many of his compatriots. Whenever possible, Zapata's peasant *guerrilleros* were paid wages from loans made under duress by landowners and businesspeople. Fighting as irregulars in Morelos and several neighboring states, Zapata's forces controlled at the peak of his power an area roughly 200–300 miles long and scored considerable success against federal troops but were helpless in regular battles. They would melt into their native hills to regroup when defeated. In 1919, the conservative Venustiano Carranza, nearing the end of his term as president, viewed Zapata as a threat to any permanent peace. Early in April, Zapata was treacherously ambushed while arriving for a conference at the Chinameca hacienda, south of Villa de Ayala in central Morelos, some 45 miles from his native village.

Zapatista Rebellion (1994–)

An uprising by economically depressed indigenous Mexicans, indicative of the dismal economic conditions faced by a majority of rural Latin Americans. On 1 January 1994, Mexico signed the North American Free Trade Agreement (NAFTA) with the United States and Canada. The Mexican government hoped that signing the agreement would not only help the country but also mark Mexico's move toward becoming a First World country. NAFTA was not the only important event to take place in Mexico on this date. A guerrilla group, the Emiliano Zapata Liberation Front (EZLN), took control of the main town, San Cristobal, in Chiapas, Mexico's poorest province.

Chiapas also held the highest percentage of indigenous Mexicans in the country, has a history of being run by tough governors, and is often ignored by Mexico City. The Zapatistas (named after a revered early-twentieth-century revolutionary) did not want to overthrow the government, but their demands in the Declaration of the Jungle outlined the economic problems they faced.

The government quickly responded by dispatching the military into the region. Much brutality and abuse of human rights took place, and the Zapatistas were forced into the mountains, but under the skillful command of Subcomandante Marcos, the Zapatistas have not been crushed. The government did quickly become involved in talks with the Zapatistas, with the help of the Archbishop of San Cristobal, Samuel Ruiz. Mexico City has often been accused of dragging its feet during these talks, but the military buildup has continued, not just in Chiapas but also in neighboring regions. Paramilitary groups have also started to operate in the region, resulting in some of the worst cases of human rights abuses, such as the massacre at Acteal in December 1997.

The year 2000 saw great changes in Mexico. In July, Vicente Fox became the first president of Mexico who was not a member of the Partido Revolucionario Institucional (PRI), and in August, Pablo Salazar Mendiguichia became the first non-PRI governor of Chiapas. These events changed the situation for the Zapatistas, in that Salazar was a Zapatista

sympathizer and stood for Indian rights. The new government offered some hope for a resolution of the rebellion and at least some amelioration of its causes.

Zenta (1697)

Conclusive battle in the Habsburg conquest of Hungary in the Austro-Turkish Wars. After the losses of Buda (1686) and Athens (1687) and the defeat at Nagy Harsany (1687), the Ottoman army deposed Sultan Mohammed IV, provoking empirewide civil unrest. The forces of the Holy League capitalized on the disorder, capturing Belgrade (1688) and occupying Transylvania, Serbia, and Macedonia (1689). Order was reestablished under Sultan Süleyman II and his grand vizier, Mustafa Köprülü, who drove the Habsburg forces out of Serbia and recaptured Belgrade (1690). The resilience of the Ottoman army was demonstrated in the narrow Habsburg victory at Szalánkemén (1691), in which Köprülü was killed. In the following years, the Habsburg army failed in a second siege of Belgrade (1694) and suffered serious defeats at Lugos (1695) and Bega (1696), while the Venetians lost Chios (1695).

In 1697, Sultan Mustafa II took personal command of the Ottoman forces and undertook a major invasion of Hungary from Belgrade with 100,000 men, intending to besiege Szegedin. While crossing the Tisza River near Zenta, Mustafa was attacked by the Habsburg army under Eugene of Savoy. Waiting until the main body of the Ottoman army was engaged in the crossing, Eugene attacked and broke through the Ottoman defensive lines guarding the bridgehead. Thrown into disorder, the Ottoman army collapsed, with the grand vizier and 30,000 troops killed in the confusion.

The defeat at Zenta ended Ottoman hopes of recovering substantial territories in Hungary and revealed the exhaustion of both sides after 16 years of war. Anglo-Dutch mediation led to the Treaty of Karlowitz (1699), by which the Ottoman Empire for the first time recognized territorial losses.

Zhukov, Georgy Konstantinovich (1896–1974)

Soviet World War II commander in chief and marshal of the Soviet Union (1943). A peasant furrier from Kaluga Province, Zhukov was conscripted into the czarist army in 1915 and served through World War I, emerging as a junior officer.

Zhukov joined the Red Army in August 1918 and fought against Aleksandr Kolchak in the east under Mikhail Frunze and Mikhail Tukhachevsky; fought against Anton Denikin in the south in the 1st Cavalry Army under Semen Budennyi, becoming involved with the Stalin “Tsaritsyn” clique; participated in the defeat of Peter Wrangel; and served under Tukhachevsky and Yurionim Uborevich in crushing Aleksandr Steponovich Antonov’s Tambov Revolt.

After completing the Red Army cavalry commanders’ course in 1920, Zhukov graduated from the Leningrad

Georgy Zhukov seated at a desk, 1942. (Library of Congress)

Higher Cavalry School in 1925 and the Frunze Military Academy senior officers' courses five years later. He served as assistant inspector of cavalry under Budennyi (1931–1933) and became commander of III Cavalry Corps in 1937, having served under Konstantin Rokossovsky and Semen Timoshenko and worked with Ubovich, Alexandre Il'ich Egorov, Tukhachevsky, Vitali Markovich Primakov, and others striving for modernization and mechanization of the Soviet army.

Barely surviving Stalin's manic military purges through his Tsaritsyn connections, Zhukov displayed the knowledge he had amassed from the purged commanders at the Battle of Khalkin Gol (1939), decisively defeating the Japanese with a combined-arms encirclement and thus securing the Far East.

After serving as Kiev Special Military District commander (June 1940), chief of the general staff, and deputy defense commissar (January 1941), Zhukov attempted in vain, with Timoshenko, to bolster the USSR's borders, even outlandishly suggesting a preemptive strike against Germany in May 1941—one month before the devastating German invasion of the Soviet Union. Stalin refused this advice as well as Zhukov's and Budennyi's suggestion, during Operation BARBAROSSA, that Kiev be abandoned, leading to the capture of 500,000 Russian troops. In Leningrad in September, Zhukov laid the foundations for a successful defense of the city as western front commander, as well as coordinating the defense and counteroffensive before Moscow.

Serving as deputy commander in chief to Stalin from August 1942, Zhukov moved from front to front, organizing and coordinating the major Soviet war operations: the Stalingrad counteroffensive and encirclement (with Aleksandr Vasilevsky); penetration of the Leningrad blockade; the Kursk cauldron; and the Belorussian offensive. Commanding on the 1st Belorussian Front (November 1944–June 1945), he conducted the Vistula-Oder operation with Konev's 1st Ukrainian Front and the seizure of Berlin with Ivan Konev and Rokossovsky's 2d Belorussian Front.

Zhukov accepted the German capitulation and led the victory parade in Red Square. He then served as commander in chief of Soviet forces in Germany and chief of Soviet military administration (1945–1946), but Stalin viewed his popularity as a threat and dispatched him to Odessa and Urals Military Districts.

Upon Stalin's death, Zhukov became the deputy defense minister and then defense minister (1953–1957). His crucial support of Nikita Khrushchev in the 1957 leadership struggle was rewarded with removal and disgrace amid accusations of a planned coup. Zhukov wrote his memoirs during his difficult retirement and died in Moscow. He is considered one of the great commanders on any front in World War II.

Zibhebhu kaMaphitha Zulu (c. 1841–1904)

The most innovative and resourceful Zulu general of the 1880s. A cousin of King Cetshwayo and chief of the Mandlakazi people in northeastern Zululand, Zibhebhu counseled against war with Britain in 1879 but nevertheless fought gallantly throughout the Anglo-Zulu War. He was slightly wounded at Isandlwana on 22 January while serving as senior *induna* (officer) of the uDloko ibutho (age-grade regiment) and was one of the junior commanders at the Battle of Khambula on 29 March. On 3 July, he was in command of the mounted scouts who drew a British reconnaissance-in-force into a successful ambush in the Mahlabathini plain.

In the settlement that followed their victory in Zululand, the British appointed compliant chiefs (including Zibhebhu) over the 13 chiefdoms into which they divided the former kingdom. Zibhebhu remained their staunchest ally in Zululand, collaborating with the British to suppress the aspirations of the royal house and their supporters, known as the uSuthu.

When the British restored Cetshwayo in 1883 to part of Zululand, civil war broke out between the uSuthu and Mandlakazi. At Msebe on 30 March 1883, Zibhebhu made effective use of mounted riflemen (supplemented by white mercenaries) to ambush, outflank, and pursue Cetshwayo's numerically superior army. After a forced night march, he surprised the uSuthu at oNdini on 21 July 1883 and scattered them, forcing Cetshwayo to take refuge with the British in southern Zululand. Zibhebhu proceeded to ravage uSuthu territory, and in 1884 Cetshwayo's desperate successor, Dinuzulu, formed an alliance with the neighboring Boers. The Boer commando's firepower proved crucial on 5 June 1884 in defeating Zibhebhu, who had attempted to lay an ambush at Tshaneni, and in his turn Zibhebhu was compelled to take refuge with the British.

In May 1887, the British finally annexed Zululand and in

November 1887 restored Zibhebhu to his chieftom to act as a counterweight against Dinuzulu and the uSuthu, who were resisting their administration. On 23 June 1888, Dinuzulu, copying Zibhebhu's own successful tactics of 1883, surprised him at Ivuna after a night march and routed the Mandlakazi. Zibhebhu and his people were again resettled in southern Zululand. In 1898, the colonial authorities allowed Zibhebhu to return to his old chieftom as part of a general settlement of the warring Zulu factions.

Zimbabwe Independence Struggle (1967–1980)

African independence struggle using terrorist and guerrilla warfare tactics often representative of colonial liberation movements. Britain's granting of independence to Northern Rhodesia (Zambia) and Nyasaland (Malawi) was denied to Southern Rhodesia because London insisted that blacks had to be brought into the government. Ian Smith's Rhodesian Front Party responded with its 1965 Unilateral Declaration of Independence, and Rhodesia was subsequently branded a pariah state subject to international sanctions.

The 228,000 residents of white, European heritage retained political and economic control over the 4.8 million black, native inhabitants (1970 census). The two fractious political groups splintered from the National Democratic Party—Joshua Nkomo's Zimbabwe African People's Union (ZAPU) and Malabaningi Sithole's Zimbabwe African National Union (ZANU)—resorted to violence. Their Marxist and Maoist rhetoric and support from Communist nations allowed the Rhodesian government to claim they were merely defending against Communist anarchy. But despite Cold War tensions, Rhodesia remained isolated.

The Rhodesian Security Forces maintained almost uncontested control of the frontier during the early campaigns. For example, three times in 1967–1968, ZAPU loyalists crossed into Rhodesia from Mozambique in units 80–100 strong. They were quickly defeated with a loss of only 13 security force personnel. Their major problem appeared to be a lack of cohesion between the factions, since they were receiving adequate arms and training from the Soviet Union,

China, and Cuba during this period. Tactical failures further divided the factions. Sithole subsequently formed the Zimbabwe African National Liberation Army (ZANLA), leaving ZANU under Robert Mugabe. ZANLA had limited military utility, being noted more for its brutality.

December 1972 marked an escalation in hostilities with the well-publicized but militarily ineffective ZANU attack on Althena farm in northern Rhodesia. By this time, the Rhodesian Security Forces consisted of 4,700 regular army and air force personnel, 10,000 white Territorial Army reservists, 8,000 British South African Police (BSAP, 75 percent black), and 35,000 police reservists (75 percent white). The BSAP was the principal counterterrorist organization until Althena, when the regular military took the lead. Its assets included two infantry battalions (the all-white Rhodesian Light Infantry and the white-officered, black Rhodesian African Rifles), two SAS squadrons, artillery, engineers, and 67 assorted tactical aircraft and helicopters.

Rhodesia added to the vindictiveness of the conflict in 1977 by sponsoring the Mozambique National Resistance (RENAMO), utilizing terrorist tactics similar to those of its ZAPU/ZANU/ZANLA opponents. The fighting can be summarized as early conventional set-piece battles lost overwhelmingly by the rebels, evolving toward a guerrilla/terrorist campaign, which the blacks could exploit politically only after the government was weakened by international isolation. As is common within irregular warfare, political aspects became more significant than the military.

The Rhodesian government, suffering from its international isolation, began moves toward majority rule in 1976. The Rhodesian African National Congress won the first "one-man, one-vote" election in 1979. It was not accepted because of ZANU/ZAPU internal fighting. However, independence and international recognition followed the subsequent 1980 election victory by Robert Mugabe's reformed ZANU-Popular Front. Although Zimbabwe (former Rhodesia) had achieved black majority rule, it remained a long way from democracy.

Žižka, Ján (c. 1360–1424)

Hussite leader noted for his tactical skill and charismatic leadership. Born into the Bohemian lower gentry, Žižka learned the art of war in small-scale baronial feuds. He

fought in Poland against the Teutonic Knights, possibly participating in the Battle of Grunwald (1410). Returning to Bohemia, he joined the king's guard (1414). An early and enthusiastic convert to the Hussite religious reform movement, Žižka helped seize Prague for the Hussites (1419). He defended Pilsen against Catholic attacks (1419) and then joined the radical Taborite movement (March 1420). While marching to Tabor, he defeated a Catholic force near Sudoměř, using his column of wagons as an improvised fort. Žižka subsequently refined this tactic, making the use of specially prepared "war wagons" key to Hussite operations.

When Holy Roman Emperor Sigismund's army threatened Prague in May 1420, Žižka brought reinforcements from Tabor and defeated the crusaders' attack on Vitkov hill, saving the city. In the winter of 1421, Žižka campaigned in western Bohemia, taking Beroun (March) and Rabí (June), where he was wounded in his right eye, leaving him blind (he had lost sight in his left in his youth). In December 1421, Sigismund trapped Žižka's army outside Kutná Hora. Using his war wagons as field artillery, Žižka broke through the king's lines and escaped. Two weeks later, Žižka attacked Sigismund's army in winter quarters, destroying it in a running battle from Nebovidy to Německý Brod (6–10 January 1422). When the tensions between the conservative and radical wings of the Hussite movement broke into open conflict, Žižka took the lead of the radical Taborite Party, defeating the forces of Prague at Strachuv (August 1422) and again at Malešov (June 1424). He died shortly afterward at Přibyslav, Bohemia, on 11 October 1424.

Zulu Civil Wars and Rebellion (1879–1888)

The conflicts in Zululand (present-day KwaZulu Natal, South Africa) from 1879 to 1888 that resulted in the dismemberment of Zululand by its white colonial neighbors. After victory in the Anglo-Zulu War, the British did not annex Zululand but eliminated its future military potential by breaking it on 1 September 1879 into 13 fragments under appointed chiefs. Growing strife between some of these chiefs and the uSuthu (supporters of the deposed and exiled King Cetshwayo) persuaded the British on 11 December 1882 to restore Cetshwayo to the central part of his former kingdom. To check Cetshwayo's aspirations, they gave Chief Zibhebhu kaMaphitha of the Mandlakazi in northeastern Zululand,

who had proved himself the staunchest of the appointed chiefs, an independent chiefdom. The southern third of Zululand was placed under British protection as the Reserve Territory, with Cetshwayo as nominal chief.

This settlement served only to increase uSuthu-Mandlakazi rivalry. The uSuthu invaded Zibhebhu's territory, but he ambushed and routed them at Msebe on 30 March 1883. Zibhebhu retaliated, and at oNdini on 21 July 1883 scattered the uSuthu and forced Cetshwayo into the Reserve Territory, where he died on 8 February 1884.

Dinuzulu, Cetshwayo's heir, was unable to contain the rampant Mandlakazi and turned to the Boers of the neighboring South African Republic for military assistance. With their firepower, he crushed Zibhebhu at Tshaneni on 5 June 1884 and drove him into the Reserve Territory. In return, on 16 August 1884, Dinuzulu ceded the Boers the northwestern two-thirds of Zululand outside the reserve.

To contain the land-hungry Boers and forestall imperial rivals, on 19 May 1887 Britain annexed the Reserve Territory and the rump of Zululand still under Dinuzulu as the Colony of Zululand. However, Dinuzulu would not cooperate with the colonial administration. To curb him, the Zululand officials restored the collaborationist Zibhebhu to his former chiefdom in late 1887. His return sparked off renewed unrest, and by April 1888 the uSuthu were in open rebellion, defying the paramilitary Zululand Police, the regular troops of the British garrison, their Mandlakazi allies, and other African auxiliaries.

On 2 June 1888, the uSuthu repulsed a British force on Ceza Mountain and at Ivuna on 23 June completely routed the Mandlakazi. The British withdrew south of the Black Mfolozi River to regroup. On 2 July, the reinforced British drove the uSuthu from Hlophekhulu Mountain, and the uSuthu started abandoning their other fastnesses. Between July and September, British flying columns traversed the disaffected areas north of the Black Mfolozi River and along the coast, securing submissions. Dinuzulu and other uSuthu leaders were exiled, and the British consolidated their rule in pacified Zululand.

Zulu Kingdom (c. 1820–1879)

Military-based kingdom of southern Africa. Historic Zululand is today part of the KwaZulu Natal Province in modern South Africa. Zululand takes its name from the Zulu clan of the Nguni Bantu people. Early in the nineteenth century, under the leadership of Shaka kaSenzangakhona (c. 1787–24 September 1828), this small clan became the most powerful and feared nation of southern Africa. Shaka modernized weapons and tactics, instilled a brutal discipline and complex organization, and transformed war in the region from a largely ceremonial to a very serious business. As part of Shaka's process of aggrandizement and absorption of neighboring populations, Zululand grew southward. This process was continued by his heirs, Dingaan (Dingane), Mpandi, and Cetshwayo. In so doing, the Zulu came into contact with the Boers, who were moving northward to escape the British Empire. The resulting clash of cultures erupted in violence, particularly the Battle of Blood River on 16 December 1838 and in various attempts by Britain to gain control of Boer and Zulu alike.

In late 1878, the British issued an ultimatum to Zulu king

Zulu chief, South Africa, c. 1880. (Library of Congress)

Cetshwayo to dismantle his military system. Upon his refusal, a force under Lieutenant General Frederic Theesiger (later the second Baron Chelmsford) invaded Zululand. Despite a major defeat of the British by the Zulus at Isandlwana in January, Lord Chelmsford completely subdued the Zulus at the battle of Ulundi in July. Zululand was then divided into a series of small divisions under the control of puppet chieftains ruling at the direction of the British government. The result was instability and endemic rebellion.

Zuo Zongtang (Tso Tsung-tang) (1812–1885)

Chinese imperial politician, military administrator, and field commander important in suppressing the Taiping, Nian, and Muslim Rebellions. Zuo was born on 10 November 1812 in Xiangyin, Hunan Province, China, and was raised to be a gentleman scholar in the Confucian tradition. After passing his civil service examinations, he worked as a geographer and agricultural scientist. When the Taiping Rebellion erupted in 1850, he mustered Hunan volunteers loyal to the emperor. After initial defensive successes, he was ordered in 1853 to join forces with Zeng Guofan. He organized imperialist volunteers in Jiangxi and Anhui Provinces, became a general in 1860, and was soon among the most powerful warlords in China. He was appointed governor of Zhejiang Province in 1862, governor-general of Zhejiang and Fujian Provinces in 1863, and governor-general of Shaanxi and Gansu Provinces in 1866.

Zuo led the troops that suppressed both the Nian Rebellion (1853–1868) in east-central China and the various Muslim revolts in the west. While his rival, Li Hongzhang, lobbied for stronger coastal and naval defenses, Zuo successfully pushed west into central Asia, using Western technology and innovative logistics. He defeated the charismatic Muslim leader, Yakub Beg, in 1877, secured Xinjiang in 1878, and forced Russia to cede the strategic Ili region by the Treaty of St. Petersburg in 1881.

Old, ill, and half-blind, Zuo asked to retire in 1882, but because he had done so much to revive the Qing Dynasty and restore its power within Asia, his request was denied. Instead, he was rewarded with many high positions, including

governor-general of Liang Kiang in 1882 and grand secretary of state in 1884, with full military authority in Fujian and southern China for the Sino-French War (1883–1885). He died in Fuzhou, Fujian Province, on 5 September 1885.
