FOREWORD

The ABC-CLIO *Ground Warfare: An International Encyclopedia* should be required reading for those trying to understand the *nature* and *conduct* of war. The study of war is relevant to all, not just to the practitioner of war, like me for the past 38 years, but to those who have never heard a shot fired in anger and who just want to become better educated on a subject that has been with us since our creation. Don't be fooled or misled by those who say there will be no more wars. There will always be wars and rumors of war for as long as humankind shall live.

Having had the honor of serving this great country as a soldier for 38 years, I trained for war every day of those 38 years while simultaneously praying that I would never have to put into practice what I was trained for. That was not to be the case. My career was bookended with conflict, from Vietnam as a young infantry lieutenant in 1964 to the recent 11 September 2001 crisis as the 14th Chairman of the Joint Chiefs of Staff. However, it is inevitable that soldiers, sailors, airmen, and marines will have to fight when called upon. The conduct of war is not a question of when, but merely where and for how long, because war will occur, and war and those who fight it will forever continue to be a part of this world. An old Japanese saying captures this theme: Warriors and gold may be idle, but they never rust.

From walking patrols in Vietnam as a young officer to employing our nation's armed forces to achieve our national strategic goals as the chairman of the Joint Chiefs of Staff, I have found that the study of the nature and conduct of war is always relevant to both the soldier and the layperson. Ardant du Picq stated, "Only study of the past can give us a sense of reality, and show us how the soldier will fight in the future." *Ground Warfare* provides the tools for one to study war and understand how the soldier will fight. The encyclopedia's organization and structure capture the essence of what is re-

quired of the student or novice of war to fully comprehend war's nature and conduct.

The nature of war is constant. It is a violent clash of wills to achieve a purpose, using violent means to accomplish that purpose. As Carl von Clausewitz states in *On War*, "War is thus an act of force to compel our enemy to do our will." As I advised the president of the United States regarding the employment of military force as the chairman, there are other tools available to employ besides military means to accomplish the country's objectives. Economic, diplomatic, and political tools, or a combination thereof, are applicable in many situations without having to employ force. My experiences have shown, however, that force will compel an enemy to meet your will when applied appropriately. Many of our adversaries respect only force and power. *Ground Warfare* captures a history of employing that force on the will of others to achieve a purpose, thus providing a thorough understanding of the nature of war. However, the volume goes beyond just understanding the nature of war; it is organized in such a manner to help the reader understand its conduct as well.

Ground Warfare shows that the nature of war is constant, that war is a brutal clash of peoples spanning the world and time from the ancient wars to the most current conflicts. There are literally hundreds of examples depicting the true nature of war. The narratives of each event capture this clash of wills and the violence invoked on its participants and the peoples involved.

The encyclopedia goes beyond just a description of the conflicts themselves and provides a comprehensive understanding of war's true nature. It also captures the impact of thousands of influential individuals on the nature of war, who changed its conduct through their personalities and influence and who often had an impact not just on warfare, but

on the history of the world. The influences of Attila the Hun and William the Conqueror, or General Douglas MacArthur or General Colin Powell, are outlined, providing the reader an insight into the conduct of war as shaped by different personalities and their influences. More importantly, the work reminds readers that *people* will continue to influence the conduct of war for many more centuries to come.

The work also outlines the creation of state structures through military means and the influence of different and numerous ethnic cultures and civilizations on the conduct of war. Not only is it important to understand the leadership of Attila the Hun, but the culture of the Hun warriors he led during this time frame is needed fully to understand how a culture or a civilization could affect the conduct of war. The same is true in understanding, for example, the differences in the American soldier and America's culture and civilization during General MacArthur's era of World War II and that same soldier and American culture of today. There have been changes that influence the conduct of the American way of war. Just in my 38 years of service, I have seen this change and its impact on the conduct of war. Such changes in our culture and civilization, let alone the cultures and civilizations of the rest of the world, have changed the manner in which we conduct war. Civilizations varied over time and throughout the world, shaping the conduct of war, having an impact on each other. It is evident this will continue to be a reality.

Finally, the encyclopedia covers numerous topics about warfare, from Airborne Operations to Women in the World's Militaries, all from a historical perspective. There is no doubt that certain techniques and tactics and technologies will continue to influence the conduct of war.

But, as we have seen in the past, these topics might

merely transform the manner in which we conduct war, but they will never change the true nature of war.

I am always reminded of T. R. Fehrenbach's book entitled *This Kind of War*, when it comes to the discussion of land warfare. He states: "You may fly over a land forever; you may bomb it, atomize it, pulverize it and wipe it clean of life—but if you desire to defend it, protect it, and keep it for civilization, you must do this on the ground, the way the Roman legions did, by putting your young men into the mud." This was certainly true for the Korean War, about which Fehrenbach writes so passionately, as well as for the legions of Rome, or the combat in Afghanistan and our fight against terrorism. Land warfare will always eventually come down to a young soldier, sailor, airman, or marine standing on the ground you want to control or influence. *Ground Warfare* provides you that historical perspective so desperately needed to ensure the successful lessons of the past are remembered and the mistakes of the past are not forgotten and made again, paid for in the needless loss of resources, lives, and blood. The totality of *Ground Warfare* makes it ideal for the individual who wants to study warfare. Not only is it ideal for the practitioner of war, but for the layperson as well. For the historian, it is a needed reference to ensure warfare is never forgotten as a significant element making its impact on the course of history. It is an ideal reference that captures the significant events, people, and topical areas key to fully understanding war. All-encompassing, *Ground Warfare* captures the full essence of warfare, its *nature* and *conduct*.

PREFACE

“What are these essays but grotesque bodies pieced together of different members, without any definite shape, without any order, coherence or proportion, except they be accidental.” So wrote the sixteenth-century French essayist Michel Eyquem de Montaigne of his own collection of essays. While our authors would undoubtedly object to any characterization of their works herein as “grotesque bodies,” Montaigne did hit upon the task of the editor of such works. That is to impose “order, coherence or proportion” upon vastly disparate articles so that in the end the work does cohere. No historical work requires more intense collaborative effort than an encyclopedia. Literally hundreds of contributors must be solicited, assigned their articles, the laggards chivvied along, and their articles edited when they finally arrive. Putative authors sometimes drop out for a variety of reasons, and replacements must be located, often at the last minute. (It is also not unknown for authors to die during some more protracted encyclopedia projects.)

Encyclopedias are exercises in brevity. Editors must thus make a paragraph do for a page, a sentence for a paragraph, a phrase for a sentence. Even good authors, fascinated by their topics, often run over their assigned word lengths to some degree or other and must be reined in. Encyclopedia editors have their work cut out for them. These volumes are written and edited with a broad public in mind: high school or undergraduate students who need reliable information for research papers; even university graduate scholars looking for factual information; and the general public in search of a quick, authoritative source of military history information.

The reader will find within these volumes a broad range

of military history from earliest times to the present; from the Egyptians at Kadesh (1274 B.C.E.) to the Alliance in the Gulf War (1991), the great captains, their battles, campaigns, strategies, tactics, defeats, and triumphs.

But this is not simply a battle-and-king military history that focuses almost exclusively on overt military clashes. Although the editor eschews the unoriginal term *New History*, this work does offer many topics previously slighted or ignored in past decades, such as women in war, logistics, military spending, psychological warfare, minorities, weapons development, civilians, etc.

I am indebted to the editor-in-chief of these volumes, Professor Spencer Tucker, who first broached the idea; and to editors at ABC-CLIO, especially Allison Miller, who persevered with me through the interminable process. A particular thanks is owed our mapmaker, Professor Don Frazier. Also, my thanks to my two associate editors, Michael Ashkenazi and Paul Buell, who contributed their extensive knowledge of the ancient and medieval worlds, respectively. And a special note of thanks is richly merited by our production editor, Michelle Trader, and copy editors Beth Partin and Anais Scott. My greatest debt of gratitude, however, must go, of course, to the several hundred contributors who performed the near-miracle of distilling down the contents of their topics to fit the limitations of any encyclopedia article—somehow pouring a quart into a pint. It is upon their contributions that this work will be judged. Perhaps even the shade of the aloof Montaigne might dip into these volumes to some profit or pleasure.

INTRODUCTION

Military history has come into its own in the last few decades. Courses have multiplied on university and college campuses; books on the subject proliferate, for buffs and scholars alike; and war films like *Hope and Glory*, *Braveheart*, *Saving Private Ryan*, *Enemy at the Gates*, *Pearl Harbor*, and *Black Hawk Down* make money for their producers and on occasion even enjoy favorable critical reviews. Such popularity may well be simply the result of a long peace, at least as far as the industrialized nations are concerned. Much of even the recent military past has receded into myth: little Round Top, the Red Baron (immortalized by an American pizza concern), dawn at Pearl Harbor, Spitfires over the white cliffs of Dover, D day, raising the flag at Iwo Jima, Pork Chop Hill, and, less positively, the Somme, the Bataan Death March, Auschwitz, and the Hanoi Hilton. Any night's viewing of the History Channel should confirm war's popularity in the United States, and reenactors in the industrial nations try to re-create the militaries of times past, from the classical Romans, through the Crusaders, to World War II. (There do not seem to be any Vietnam reenactor troops yet, but there is a group of British imaginary soldiers who play at being Yanks in Britain during World War II. They drive about the southern English countryside in U.S. Army Jeeps and "deuce-and-a-half"-ton trucks, with their authentic U.S. Army uniform pockets stuffed with Wrigley's Spearmint Gum and Life Savers.)

More seriously, the world's militaries—land, sea, and air—have established professional history organizations staffed with historians who spend most of their time studying and explicating their nations' past wars, and whose qualifications, research, teaching, and publishing would not disgrace a first-class academic history department. Their work, and that of military historians in academe (whose class enrollments have held up over the recent decades), have sparked a renewed interest in military history that is seen in

such phenomena as the History Channel, the historic preservation and battlefield reenactor movements, and the fact that each federal government agency of any size currently has its own history office. Entire publishing firms, journals, and book clubs devote themselves to military history, as witness an outpouring of books and articles in a wide variety of military themes, from the coffee table and buff variety to the profoundly scholarly. And, as is often the case in the history profession in general, military history publications can be both vivid and documented.

Indeed, as again in the history profession generally, military history has moved away from what has become known uncharitably as the drum-and-trumpet chronicles (the civil equivalent would be battle-and-king history) that had dominated the field since the nineteenth century, and emerged by the 1960s into a broadening of work in logistics, home fronts, financing, technologies, minorities, women, and so on, in war and in the military. In fact, some of these works have wandered so far from war itself that one feels compelled to remind the authors of such (almost literally) bloodless studies that the purpose of a military is not so much to improve the nation's economy and technology, streamline management, or integrate its minorities and women as it is to wage and win wars, and that war is humankind's most nasty and dirty business. We still need to bear in mind George Orwell's reminder that soldiers since Marathon have had "lice crawling over their testicles." (Orwell, a frontline soldier who survived being shot in the throat during the Spanish Civil War, would know.)

Indeed, an increasing number of military historians, again both within and without the military establishments, have in the last decade or so taken a particular interest in the face of battle itself, the experience of the individual soldier facing the ultimate test. Historians do try to determine how it was that masses of young men in, say, Pickett's Charge

could persevere in the face of such a hail of large-caliber bullets tearing away at comrades to the right and left of them that a fine mist of blood and tissue (according to some accounts) preceded the advanced line.

And yet, paradoxically, by the latter half of the twentieth century, war itself had become a major taboo. It may well be that photography had more to do with this state of affairs than all of the disarmament conferences and peace literature combined. Americans were stunned by the Brady and Sullivan glass plate depictions of the human detritus in the wake of the battles of Gettysburg and Antietam. No artist, with the possible exception of Goya, had been able remotely to capture the horrors of war as did the camera. The general antiwar feeling increased as photography became more widely dispersed, intensified with images of the Somme or Verdun in World War I, and peaked with the living room war of Vietnam, as military horrors in the field were presented by avuncular television newscasters only a day or so removed from the event. By the twenty-first century, the image of a hut in flames and of dead civilians would be transmitted around the globe in real time—and protests could develop almost as swiftly.

Of course, wars did erupt in this period, but with decreasing bloodshed and destruction—and this in the nuclear era, which threatened mass destruction. But no one actually declared war and rarely even admitted that they were engaged in anything as horrid as an actual war. Belligerents were engaged in what they would term perhaps *liberation struggles* or in *repelling aggression*. The term *war*, with the exception of the war on terrorism and the Cold War (which, by definition, was no war), seemed confined to such domestic concerns as the war on drugs, the war on poverty, or the war on inflation. In fact, historians have puzzled over the question of the last declaration of war. (Was it the Soviet Union's on Japan in the waning days of World War II?)

The reason for such shying away from any declaration of war was to some extent tied to the fear of nuclear Armageddon, much prophesied after 1949. But it was at least equally due to the fact that wars from the second half of the twentieth century on tended to be between ethnic and racial groups, and mostly fought guerrilla-style or through terrorism. But even the few conventional post-World War II conflicts were fought in the absence of formal declarations of war as the belligerents studiously avoided making any gesture of recognition to their opponents. The Democratic People's Republic of Korea was not about to dignify the "Lick-Spittle Rhee Puppet Regime" (otherwise known as the Republic of Korea) with the amenity of passing a formal

note that a state of war now existed between the two nations. Nor would the latter dignify the "Tyrannical Communist Regime" (People's Republic of Korea) with the same. Even when the anti-Saddam Hussein coalition threw the Iraqi dictator's forces bodily out of Kuwait in 1991, there was no declaration of war, although tens of thousands of unfortunate Iraqi troops perished. In fact, most belligerent parties go to some lengths in their official statements and in their propaganda carefully to insist that they mean the people on the other side no harm; only their evil leaders are to blame for the current sad state of affairs. Of course, declarations of war or not, mothers still find themselves mourning their lost children, cities are eviscerated, and young men are mutilated and die ghastly deaths.

War at this writing seems increasingly confined to the periphery; to the dispossessed, to the radical student dreamers (the very word *Taliban* means "students"), the fringes, the losers. They are those who wish to split off a state (e.g., Québécois, Basque, Croatian, Chechen, Kurdish, or Palestinian separatists), to purify a state (Algerian, Egyptian, Afghan, Iranian Islamists), to unite separated brethren (e.g., Serbs, Irish, Kashmiri nationalists), to impose their ideology on their own people (Chinese Civil War, Korean War, Vietnamese War, Wars of National Liberation of the 1960s and 1970s)—or varying combinations of some of the above. (The war on terrorism is an effort to combat the methods used by so many of these groups.) They generally succeed in bringing down far more misery on the inhabitants of the lands that they are trying to liberate than what the unfortunates suffered at the hands of the existing governments. (In fact, that is precisely the cold-blooded aim of numerous such revolutionary groups: to cause through their own deliberate actions and the counteractions of the government such dislocation and terror that the people will lose confidence in the legitimacy of that government.) But, by the standards of the two world wars, or even Korea or Vietnam, these struggles are still of the small war variety.

No one can foresee how long this relatively tranquil state of affairs will endure; a nuclear conflict between India and Pakistan is a horrific possibility, Greece and Turkey (midsize military powers) occasionally threaten military action, the two Koreas (one possibly with some nuclear capability) are divided by the most dangerous piece of real estate on earth, and it is increasingly difficult to isolate even the most obscure of conflicts in this day of global mass media. No era is forever, and we would do well to learn of past wars, if for no other reason than to appreciate better the current long peace—while we can.

GLOSSARY

(Recurring topics. Each listing in this glossary has its own article in the text.)

Airborne Operations The insertion of troops and equipment on the battlefield by means of parachute, helicopter, or glider.

Armor Body protection for soldiers.

Armored Fighting Vehicles Protected vehicles used on the battlefield.

Arms Control Limits, usually set by treaty, on the number and types of weapons; usually refers to nuclear weapons.

Artillery Basically, a heavy metal tube from which a missile is discharged violently by explosive force.

Awards and Honors Recognition granted by authorities for meritorious service by soldiers.

Ballistics The science of projectiles, divided into interior and exterior ballistics. Its aim is to improve the design of shells/projectiles so that increased accuracy and predictability are the result. It deals also with rockets and ballistic missiles.

Bayonet Metal blade or spike that, when fixed to a musket or rifle, facilitates its use in hand-to-hand combat. In recent decades, more likely to be used for opening ration tins.

Bazooka Shaped-charge, smoothbore, man-portable, antitank, and pillbox weapon.

Buffalo Soldiers African-American troops of the late-nineteenth-century U.S. regular army.

Catapult Engine for throwing a heavy weight, using an arm released from tension; the artillery of the ancient world.

Cavalry The noble, mobile arm of battle; the traditional horse-borne arm of mobility; can now refer to a motor vehicle-mounted unit.

Chaplains Military officers who tend to the spiritual,

moral, and physical needs of troops in the field and in camp; pastors in uniform.

Chemical and Biological Warfare The deliberate use of chemical or biological agents against an enemy.

Civil Affairs/Military Government Those activities of a commander that embrace the relationship between the military forces and civil authorities and people in a friendly country or area (Civil Affairs) or occupied country or area (Military Government).

Coastal Defense The defense of a nation's coast from an enemy sea invasion or blockade, accomplished with heavy artillery, mines, small warships, and nets.

Cold War (1946–1989) Period of tension between the Soviet Union and the People's Republic of China and their allies, representing communism (the East); and the United States and its allies, representing capitalism and democratic socialism (the West); punctuated with several "hot" wars, the most significant being the Korean War (1950–1953) and the Vietnam War (c. 1955–1975). The Cold War ended unexpectedly with the fall of the Berlin Wall and the bloodless victory of the West.

Communications, Military The application of technology to the transmission of military orders and intelligence.

Conscription The selection of persons for involuntary military service.

Death Squads Clandestine and usually irregular organizations, often paramilitary in nature, that carry out extrajudicial executions and other violent acts against clearly defined individuals or groups of people.

Disarmament The removal or drastic reduction by nation-states of major weapons.

Economic Warfare Compelling an enemy to submit either by direct action against its economic basis or indirectly through blockade or boycott.

Electronic Warfare The use of the electromagnetic

- spectrum to gain knowledge of the presence and movement of an opposing force and also to deny any opposing force the use of that spectrum.
- Engineering, Military** The application of science and technology for military purposes, primarily through the use of civil engineering.
- Ethics of War** Rules, principles, or virtues applied to warfare.
- Firearm** A tube, closed at one end, that has in it an explosive with a projectile above it, nearer to the open end of the tube. An ignition system fires the explosive charge, which forces the projectile along the tube by means of the gases from the explosion; can include both artillery and small arms.
- History, Military** History dealing with the use of organized armed force, either on behalf of some form of recognized state authority or against it.
- Infantry** Lightly armed ground troops; the backbone of any army; not only the most numerous of the fighting arms but the only one that can actually take and hold ground.
- Intelligence, Military** Military specialty that provides a commander and staff with the knowledge of the enemy and of weather and terrain required for the planning and conduct of operations. (There is no truth to the assertion that “military intelligence” is an oxymoron.)
- Laws of War** International laws, enforced sometimes by nations after war and sometimes by commanders in battle, governing both the decision to engage in war and the manner of its conduct, particularly the forms of violence used, the definition of combatants, the treatment of prisoners, and the treatment of neutrals and noncombatants.
- Logistics** Largely an American usage, encompassing military supply, transportation, medical service, and construction-maintenance.
- Machine Gun** Rapid-firing small arm that can maintain a high rate of fire without the requirement of reloading after each round, which today means a fully automatic weapon; either man-portable (“machine pistol”) or heavier.
- Maps and Cartography** The result of the utilization of cartography and topographical reproduction for military strategy and operations.
- Medals and Decorations** Tangible recognition of faithful military service or success awarded to individual soldiers.
- Medicine, Military** The medical and surgical specialty concerned with the ailments of soldiers and sailors.
- Mercenaries** Hired professional soldiers who fight for a state or entity without regard to political interests or issues.
- Military-Industrial Complex** The institutions and people that plan, procure, and fight a war and that supposedly shape the economy, the political realm, and the wider society, even in peacetime. Term first used by outgoing U.S. President Dwight D. Eisenhower in 1961.
- Mortar** Muzzle-loaded weapon firing its bomb at a high angle to attack protected positions and trenches.
- Pacifism/War Resistance** The organized opposition to war, killing, or violence; usually divided into two segments: religious (e.g., Quakers, Mennonites) and secular.
- Paramilitary Organizations** Unofficial groups organized along military lines yet lacking the traditional role or legitimization of conventional or “genuine” military organizations.
- Propellants** Compounds used to move a projectile from the firing device to the target.
- Psychological Operations** The use of psychology and propaganda by military units to persuade target audiences to adopt at least some of their views and possibly to modify their behavior.
- Rank, Military** Official indication of a soldier’s length and quality of service in organized militaries.
- Rifles** Firearms designed with barrel grooves to impart a spin and thus far greater accuracy; either small arms or artillery.
- Tactics** The theory and practice of using military forces in combat.
- Terrorism** Acts of violence intended for a wide audience in order to create an environment of fear for political reasons.
- Theory, Military** That body of knowledge usually published in books and journals that examines the nature of wars and the art of war on an abstract level.
- Unarmored Fighting Vehicles** Unprotected military vehicles, either specially built for the military or adapted from commercial models and used in combat-support roles (e.g., Jeeps, trucks, ambulances).
- Uniforms** Military clothing worn by organized bodies of troops to distinguish them from the uniformed personnel of other armed forces and to strengthen morale.
- War Crimes** Actions in wartime that violate the laws or usages of war.

A

Abbas the Great (1571–1629)

One of Persia's greatest shahs, presiding over a period of national strengthening and growing Iranian military power. When Abbas became shah in 1587, his Safavid Dynasty was in serious trouble. The Qizilbash tribal confederation, the regime's foundation, had become fractious and undisciplined. Many provinces were virtually independent. In 1590, to gain a free hand for domestic consolidation, Abbas signed a humiliating peace with the Ottoman Empire, recognizing the occupation of much of northern and western Iran by Persia's great enemy. Equally menacing, the hostile Uzbeks under the Shaybanid state controlled the central Asian and Afghan frontiers.

To balance off the Qizilbash, Abbas organized a separate corps of 10,000 cavalry and 12,000 infantry, composed of Armenian and Georgian slaves, prisoners-of-war, and converts to Shia Islam—the Ghulamans. Many Qizilbash leaders lost their fortunes and freedom to Abbas's need for revenue. The Ghulamans also proved their mettle in repressing domestic revolt and coercing disloyal provinces into submission. By 1596, Abbas was pushing back the northern frontier, cowing the Shaybanids.

In 1598, an English trade delegation arrived, seeking commercial and military exchanges. The shah persuaded them to help him modernize the army. With English coaching, the Safavids expanded their army to include 12,000 gunners, 12,000 mounted musketeers, and 500 bronze and brass cannons. At the same time, the shah enlarged his Ghulamans through regular expeditions into the Caucasus, taking thousands of prisoner-recruits.

By 1602, despite losing many cannons and troops, Abbas drove the Shaybanids out of Herat, Mashhad, and Khurasan province. The next year, he moved westward and launched an offensive against the Ottomans. In 1605, at the Battle of Sufiyan, Abbas crushed the Turks and regained Tabriz. De-

spite frequent Ottoman counterthrusts, the shah's forces routinely pushed them out. The 1618 Treaty of Sarab compelled Istanbul to evacuate Kurdistan and Azerbaijan. Persian forces also crossed the Straits of Hormuz and occupied Oman. In 1623, as domestic turmoil struck the Ottoman Empire, Abbas invaded Iraq and Anatolia. Diyarbakir, Baghdad, and Mosul fell in rapid succession, bringing the Safavid state to its greatest territorial extent. When Abbas died in 1629, Iran was stable, powerful, and respected.

Abbasid Revolution (747–751)

A violent revolution in medieval Islam that replaced the Arab-dominated Umayyad Caliphate with a more open, multicultural system that symbolized the unity of Islam for five centuries.

The Umayyad family had seized control of the Islamic empire in 661. Over the next 70 years, Umayyad caliphs presided over the conquest of an empire that spread from the Indus Valley to the Pyrenees Mountains. They created a unified state, a vigorous commerce, and a resolute military based upon Arab tribes. Their leaders ruled as patrons of the Islamic religion, and of Arabic culture, but by 740 Umayyad policies had severely polarized their subjects and generated widespread hostility to their authority. Arab armies on the frontiers resented their low pay, constant campaigning, and

the privileges of more favored tribes. Thousands of non-Arab converts to Islam seethed at discriminatory taxes, mistreatment, and Umayyad hypocrisy. Shia Muslims, committed to the rule of the descendants of the Prophet Muhammad's son-in-law Ali, saw the Umayyads as oppressive usurpers.

The success of the Abbasids derived from their ability to mobilize these animosities and create a revolutionary movement. Unlike the Umayyads, the Abbasids could claim a family tie to the Prophet through his uncle Abbas. They also asserted that a member of Ali's family willed his right to the caliphate to the Abbasids. Their anti-Umayyad propaganda proved especially appealing in Khurasan, the northeastern frontier of Iran, where both Arab and non-Arab Muslims harbored intense grudges against the state. Conspiratorial cells also made recruits in Iraq, Palestine, and Syria. Additionally, the Umayyads had just passed through a dynastic war, and the new caliph, Marwan II, had alienated traditional friends of the regime.

In 747, the Abbasids launched their revolt in Khurasan. To rally support, they unfurled black flags, symbols of the Mahdi, a messianic figure in popular Islam. They spoke of their movement in terms of a millennial, divinely ordained upheaval, to sweep away the wicked Marwan.

Seizing the frontier town of Marv in February 748, the Abbasid commanders Abu Salama and Abu Muslim began their westward advance. Picking up momentum and support as they advanced, the Abbasids reached central Iran in August. The next year, most of Iraq fell and the head of the movement, Abu al-'Abbas, declared himself caliph at Kufa. In January 750, Abbasid forces met Marwan's army along the banks of the Zab River in northern Iraq, and shattered the dispirited Umayyads. The defeated caliph, hounded from Syria to Egypt, finally fell into Abbasid hands, and was killed seven months later.

The establishment of the Abbasid Caliphate was a true revolution, not just a change of administrations. Caliph Abu al-'Abbas and his successor, Caliph al-Mansur, ended ethnic and economic discriminations against non-Arab Muslims, establishing the fundamental principle that all Muslims were equal before the state as well as before God. Freed of Umayyad elitism, Islam experienced a dramatic surge in conversions. They also massacred Umayyads, and former supporters of questionable loyalty, with revolutionary zeal. Their Shiite partners were honored, but denied power. To dramatize the newness and purity of their government, the Abbasids abandoned the Umayyad capital of Damascus, and built themselves a new center in Iraq, Baghdad. Here the Abbasid court welcomed Muslims of all ethnic backgrounds, laying the foundations of an intellectual, philosophical, and scientific renaissance.

Abd-el Krim, Mohammed (1882–1963)

Riff chieftain who helped spark the Spanish Civil War. In 1921 Abd-el Krim, the university-educated son of a Riff nobleman, revolted against Spanish rule in Morocco. After capturing the frontier post at Abaran, the former journalist and his Beni-Ouriaghel tribesmen attacked a column of 20,000 Spanish troops at Anual on 21 July 1921, killing some 16,000. The uprising brought Spain under virtual military dictatorship in 1923 and, a year later, squeezed the Spanish in Morocco into two fortified strongholds at Tetuan and Mililla on the Mediterranean.

Krim then moved south on 12 April 1925 against a threat from French Morocco. Armed with captured Spanish artillery, machine guns, and rifles, he eliminated 43 of 66 French blockhouses over a 50-mile span until checked outside Fez.

Joining France in a counteroffensive, Spain landed 50,000 troops in the Bay of Alhucemas on 8 September 1925. Three columns—including a Spanish Foreign Legion contingent under Francisco Franco—pushed south into Riff territory as World War I hero Marshal Henri-Philippe Pétain led six mutually supporting French forces on a wide front north to Ajdir, Krim's headquarters. The city fell on 2 October 1925.

Weakened by heavy casualties, poor harvests, disease, and diverse tribal interests, Abd-el Krim surrendered on 26 May 1926, and was exiled to a French island for 20 years. Although finally suppressed in 1934, the Riff uprising contributed to the Spanish Civil War two years later.

When released in 1947 Abd-el Krim accepted Egypt's protection and later became leader of a North African nationalist movement opposed to European rule.

Abdelkader (1808–1883)

Algerian leader, fought against French colonialism. Born 6 September 1808 near Mascara, Algeria, he became emir of Mascara when his father, Mahi-el-Din, died in 1832. He furthered jihad against the French and shrewdly increased his power. Although he won a battle at La Macta on 28 June 1835, he failed to prevent French forces from sacking Mascara in December of that year. Abdelkader met defeat at Sikkah on 6 July 1836 and was on the verge of losing support of the tribes. He began peace talks with the French, eventually agreeing to the peace of the Tafna on 30 May 1837.

Abdelkader ran an efficient government over most of Algeria until French attempts to expand their holdings prompted him to revive the jihad in November 1839. His forces struggled, losing Tlemcen in 1842, and suffering a major defeat at Smala on 10 May 1843 when his 40,000-man army lost to a French army of 2,000 led by the Duke of Aumale. He then fled to Morocco and raised another army. But he was defeated at the hands of a smaller French army at the Battle of the Isly River on 14 August 1844, a defeat that resulted in the loss of Moroccan support. He then moved to suppress a rebellion in the Dahra region of Algeria, winning several battles. Later he was forced by the French to return to Morocco, where he again attempted to raise an army. Compelled to fight against Morocco, he eventually was defeated, left for Algeria, and surrendered to the Duke of Aumale on 23 December 1847 in exchange for safe passage to the Levant. He was held in a French prison from 1848 to 1852, freed by Napoleon III, then moved to Damascus where he died on 26 May 1883.

Abercromby, Sir Ralph (1734–1801)

British general whose leadership restored prestige to the army in the 1790s, setting the stage for the defeat of Napoleon in Egypt. Born in Clackmannanshire, Scotland, on 7 October 1734, Abercromby, unusually, studied at Rugby, Edinburgh, and Leipzig, then entered the army in 1756. Service in the Seven Years' War introduced him to the doctrine of Frederick the Great. Although he rose in rank, his criticism of government policies kept him away from active service; he retired from the army in 1783 and became a member of Parliament for Clackmannan.

He returned to service in 1793, commanding a brigade against revolutionary France. During the retreat from Flanders in the winter of 1794–1795, Abercromby commanded the rear column, securing the army's retreat from a disastrous campaign. In recognition of his skills he was knighted and given command of an expedition to the West Indies, successfully taking Grenada, St. Lucia, St. Vincent, and Trinidad from the French.

Returning to Britain victorious in 1797, Abercromby was appointed commander in chief in Ireland. He successfully reorganized the forces there, but his zealous efforts to establish the supremacy of civil rather than military power met with resistance from the government and led him to resign his post.

In 1800 he was ordered to oust French forces in Egypt. His direction of the army to a successful landing at Aboukir Bay in early March 1801 in the face of stiff opposition is remembered as one of the British army's most daring exploits. Abercromby faced a counterattack by French forces on 21 March; it was repelled with heavy losses, but he was mortally wounded in the fighting. He died at sea on board the HMS *Foudroyant* and was buried at Malta, a future Wellington cutoff.

Aboukir (25 July 1799)

A battle between the French army in Egypt, about 10,000 strong under Napoleon Bonaparte, and the Ottoman army of Rhodes, 15,000 strong, under Mustafa Pasha. In October 1798, the Ottoman sultan declared war on France, and began a two-pronged advance against the French army of Egypt. The army of Damascus was to march through Syria and Palestine and into Egypt by way of the Sinai Desert. The army of Rhodes was to be transported to Alexandria by a combined Turkish and British fleet.

Bonaparte sought to deal with the first of these thrusts by invading Syria. Although he was unable to obtain any permanent advantage, and suffered heavy losses besieging Acre, he did scatter the forces of the pasha of Damascus at the Battle of Mount Tabor on 16 April 1799. Bonaparte then withdrew to Cairo, arriving on 14 June 1799. On 11 July, the infantry and artillery of the army of Rhodes arrived off Aboukir, near Alexandria, and quickly seized the town, but not the castle, which resisted for several days before submitting. This delay allowed Bonaparte, by dint of vigorous movement, to bring 10,000 men, including 1,000 cavalry, to Aboukir by 24 July.

Bonaparte found the Turkish army deployed in two lines, in front of Aboukir castle, which was strongly garrisoned with Turkish forces. Though the French infantry badly mauled the Turkish forces, the issue was decided by the French cavalry commanded by Joachim Murat. A cavalry charge by Murat forced its way through the Turkish lines, and into the Ottoman headquarters. Overwhelmed by the French cavalry, the Turkish army fled to the beaches, or toward the castle. Turkish losses were in excess of 2,000, further increased by the subsequent surrender of Aboukir Castle. French losses were 220 killed and 750 wounded.

As a result of the battle, Bonaparte secured the position of the French army in Egypt. However, both Bonaparte and the Directory independently decided to abandon the Egyptian campaign. Bonaparte, without actually receiving orders to do so, left the Army of Egypt on 22 August 1799, with only a few staff officers. He arrived in France on 9 October, where he began preparations to overthrow the Directory, which culminated in the coup of the 18th Brumaire.

Abrams, Creighton William, Jr. (1914–1974)

U.S. Army commander during World War II, Korea, and Vietnam. Creighton Abrams was born 15 September 1914 in Springfield, Massachusetts. He graduated from the U.S. Military Academy at West Point in 1936 and was commissioned a cavalry officer. During World War II, he commanded the 37th Tank Battalion and demonstrated aggressive leadership as the vanguard of the drive across Europe. During the Korean War, Abrams gained valuable staff experience serving as the chief of staff for the I, IX, and X Corps.

During the early 1960s, Abrams found himself involved in two crises—as commander of the 3d Armored Division in Europe during the Berlin Crisis and as commander of federal troops deployed to maintain order after the integration of the University of Mississippi.

In 1967, Abrams was assigned as deputy commander of the U.S. Military Assistance Command (MACV), Vietnam. During the Tet Offensive, he supervised operations in northern Vietnam, including the recapture of Hue. Abrams assumed command of MACV in the aftermath of Tet. He

changed American tactics to emphasize the defense of populated areas and replaced search-and-destroy missions with small-unit patrols.

Abrams left Vietnam in 1972 after the North Vietnamese Easter Offensive and returned to the United States to serve as army chief of staff. During this assignment he worked to rebuild the army, instituting the all-volunteer army and working to integrate reserve components. Abrams died in 1974 following a battle with cancer. He was respected as both a combat soldier and an advisor to civilian leaders. The outstanding performance of the U.S. Army during the triumphant Gulf War can be considered his memorial.

Abu al-‘Abbas (722–754)

Overthrew Umayyads and established the Abbasid Caliphate. The Abbasids—a branch of the family of the Prophet Muhammad descended from his uncle ‘Abbas—had been seeking to overthrow the reigning Umayyad Caliphate since 718. They eventually recruited a large cadre of supporters in Khurasan (northeastern Iran), raising the banners of revolt in 747. Abbasid forces swept through Iran and reached Kufa, Iraq, in September 749, but that same year their leader, Ibrahim ibn Muhammad, was caught and executed. His obscure brother, Abu al-‘Abbas, then assumed leadership of the movement.

Abu al-‘Abbas declared himself caliph at Kufa in November 749. In his inauguration, he warned his listeners he would spill whatever blood was required to eliminate any opponents. Two months later, his forces crushed the main Umayyad army along the Zab River. Marwan II, the Umayyad caliph, fled westward first to Syria, then Palestine, and finally Egypt. At the same time, the Abbasids began a campaign of massacres against other Umayyad family members and their supporters. When Yazid ibn Hubayra, Umayyad governor of Wasit, surrendered after a year of siege, the Abbasids promised him safe conduct, but shortly after his capitulation Yazid’s captors broke their pledge and killed him. Even the tombs of Umayyad caliphs were desecrated. Marwan II was finally slain in August 750.

When several Shia Muslim groups attempted to revolt, Abu al-‘Abbas crushed them pitilessly. In the end, just before

his death, the first Abbasid caliph was killing some of the men who had brought his family to power.

Abu Klea (19 January 1885)

Battle during the Gordon Relief Expedition, 1885. Sir Garnet Wolseley, sent to rescue General Charles Gordon from his entrapment at Khartoum, dispatched two columns of about 2,000 men each to the city. One was the river column under General William Earle, and the other was the desert column under General Herbert Stewart. As Earle's column worked its way up the Nile, Stewart's men set off across the desert. The desert march became a desperate race between oases both against heat and thirst and against the Mahdi's dervishes. On 19 January, the Mahdi (Muhammad Ahmad) placed about 10,000 of his men on the track between Stewart and the oasis at Abu Klea. Stewart formed a square but left outriders well ahead of the formation and allowed Colonel Fred Burnaby to weaken the rear of the square by moving sailors and their naval guns out of position. The Mahdi's forces launched a massive, determined, and well-paced attack against the square. To avoid shooting their comrades outside, the men on the front of the square held fire until the outriders could get in, by which time the dervishes were dangerously close. While sustained fire kept the front secure, the Mahdists worked their way around and smashed into the back corner Burnaby had dismantled, and broke the square itself. The square was restored, and terrible losses were inflicted on the dervishes, who were forced to retire. This represents, however, the only time a British square was broken. Burnaby and 65 British soldiers and 800 of the Mahdi's men were killed. Two days later, Stewart himself was mortally wounded, Wolseley had to send his chief of staff Colonel Redvers Buller across the desert to extract the column, and Gordon was not rescued.

Academies, Military

In the ancient world, the training of cadres for military leadership was the province of a small military elite that was responsible for the preservation and transmission of military doctrine. In the West, the collapse of Roman political institutions severely inhibited this transmittal, and in the Middle Ages, warfare had to be all but reinvented with the aid of Vegetius's treatise, *De re militari*, dating from the fourth century.

By the end of the Renaissance, powerful kingdoms were rapidly solving the problems associated with making military power a dependable school of statecraft. The need for trained military leaders combined with the application of reason to social problems produced the first military academy, the Schola Militaris, at Seigen, the Netherlands, founded in 1617 to teach the military doctrine of the Nassau family. Though it lasted only six years, its utility was evident, and other schools followed, most notably the military academy Louis XIV founded at Metz in 1668 and the Royal Military Academy founded in 1741 at Woolwich to train engineering and artillery officers. The majority of officers still bought their commissions and learned their duties by exercise or were promoted from the ranks of noncommissioned officers, who already knew the basics of military science. The experience of the Napoleonic Wars, including dramatic changes in the size of armies, tactical doctrine, and military technology, as well as a heady dose of national fervor, promoted the proliferation of military academies for the training of competent and patriotic junior officers, as well as the development of higher schools for advanced training in specialized areas and for staff officers.

The U.S. Military Academy, founded in 1802 in West Point, New York, was the first (and for decades the only) school of engineering in the United States. Sylvanus Thayer, superintendent from 1817 to 1833, modeled the institution on France's École Polytechnique and introduced modes of organization and discipline that would become normative over the institution's history. Though its graduates proved their engineering skills in the country's rapid expansion and their military skills in the Mexican-American and Civil Wars, the academy languished somewhat in the late nineteenth century.

After World War I, the academy's curriculum was reformed and updated, and in the 20 years following World War II, the teaching of humanities and social sciences was

significantly augmented to comprise nearly 50 percent of the curriculum, which leads to a bachelor's degree and commission as a second lieutenant in the army. The Corps of Cadets averages a little over 4,000. Entrants are selected on the basis of prior academic performance from nominees presented by the president and members of Congress (a process unique to the United States) and from army personnel.

Britain supplemented its foundation at Woolwich by establishing the Royal Military Academy in 1802; it has been located at Sandhurst since 1812. In 1947, Woolwich was merged into Sandhurst. The curriculum, divided into six terms of 13 weeks, comprises military subjects, mathematics, science, and modern languages, with some students prepared for examination in mechanics at Cambridge University or degree studies at the Royal Military College of Science at Shrivenham. The student body averages 1,000. Upon graduation, they receive commissions on the basis of vacancies existing in the various army branches.

Napoleon founded the *École Spéciale Militaire* in 1802 and housed it at St. Cyr, near Versailles, in 1808. Though it moved to Brittany in 1947 and absorbed other schools for cavalry, engineers' artillery, and infantry, and was renamed the *École Spéciale Militaire Interarmes*, it is still popularly known as St. Cyr. Cadets are organized into three battalions, two of persons holding the baccalaureat and one chosen from noncommissioned officers. The former are commissioned as second lieutenants after two years of study and go on to a third year of specialized study in a specific branch of the army. The latter receive their commissions at the end of a single year.

The German army system of cadet training began with the Prussian efforts to reorganize and modernize during the Napoleonic Wars and constituted one of the most highly effective officer training systems ever developed. After a hiatus at the end of World War II, West Germany developed officer training schools at Hanover, Munich, and Koblenz based on the historic system. Candidates who were secondary school graduates and had completed army basic training (or noncommissioned officers who passed a special examination) put in a year at school, followed by regimental service and schooling in a special arm, such as artillery or infantry, and were commissioned when their commanding officer was satisfied with their progress. After reunification, the training methods and institutions of West Germany prevailed over those of East Germany.

Czarist Russia opened a modern military academy in 1855 (and an air academy as early as 1910!). The Soviets closed these as antidemocratic and relied on a system of three-year officer candidate schools operated by the various branches of the army and navy. During World War II, they founded 30 junior military schools (Suvorov schools)

throughout the nation and two naval schools (Nakhimov schools) at Leningrad and Baku. Open only to children of armed service veterans, these gave children a seven-year secondary school preparation for officer candidate school. After the collapse of the Soviet Union, Russia maintained eight military academies and one military university, none of which functioned at full enrollment.

Despite drastic reductions in most of the world's military forces, military academies enjoy unprecedented prestige and can select among the most highly qualified of applicants.

Adowa (1896)

The most decisive defeat inflicted on a colonial expeditionary force by native African troops. In 1895, newly enthroned Ethiopian king Menelik II became infuriated when he discovered that Italy had assumed a virtual protectorate over his country in the altered international version of the recently signed Italo-Abyssian treaty. Menelik mounted a hastily organized raid on an Italian advance post at Coatit, which the Italians repulsed. This incident gave the Italians the impression that the Ethiopians could not stand up to European firepower.

Rome, in turn, was infuriated by Menelik's stance and ordered Eritrea's Italian governor Oreste Baratieri to punish the Africans' insolence. The general captured the towns of Makalle, Adrigat, and Adowa, and planned to fortify these outposts as a natural line of defense. Once again, vastly underestimating the military capabilities of infuriated African warriors, Baratieri's mere 25,000 men were outnumbered by Menelik's forces, which had swelled to an accretion of 196,000 men gathered at their capital, Addis Ababa, more than half of whom were half armed with modern rifles and supported with mobile field pieces.

Apprehensive, Baratieri withdrew to Adigat where Mene-

lik besieged his force for 45 days. When Menelik offered the surrounded Italian garrison safe passage, the gesture only further stung Rome, whereupon the Francesco Crispi régime dispatched reinforcements and money, urging Baratieri to press the war home.

Apprehensive, Baratieri expected that Menelik would attack his dug-in troops, but the Ethiopian commander instead concentrated his forces at Adowa and waited for Baratieri to advance. This waiting game continued through February 1896, as supplies on both sides dwindled. Menelik's system of depots was running low and he began to consider falling back. Baratieri's food, even on half rations, would last only another week. Also, he was stung by a telegram from Crispi, accusing him of cowardice, and the exasperation of his subordinates.

Hastily, Baratieri organized his 15,000 men for a march in three independent brigade columns, which were to converge on peaks overlooking Adowa to the rear of Menelik's concentration after a one-day hike (assuming that Menelik would feel compelled to assault their defensive positions on the heights). Unexpectedly forbidding terrain, combined with outdated maps supplied from headquarters, resulted in the isolated Italian columns becoming confused and disorganized. They engaged Menelik's advance guards piecemeal, opening great gaps in their disjointed line. At this juncture, Menelik's 85,000-plus multitude was reinforced by the 30,000 troops of Ras Makonnen. Swarms of African troops threw themselves upon the divided Italian brigades. One of the Italian units, in the absence of orders from Italian headquarters, nevertheless mounted a valiant, methodical fighting withdrawal. Baratieri tardily ordered the other beleaguered brigade to retreat.

Ultimately, General Baratieri's botched venture lost 6,600 Italian soldiers and 268 officers, along with an unknown number of allied Eritrean troops. Another 1,700 were taken prisoner. Abyssinian losses are variously estimated at 2,000 to 7,000 dead and 10,000 wounded, with 900 captured. On 25 October 1896 the ensuing Treaty of Addis Ababa recognized the independence of Abyssinia. But forty years later, under Benito Mussolini, the Italians would be back.

Adrianople, Battle of (Thrace, 9 August 378)

Disastrous Roman defeat by Visigoths. The Eastern emperor Valens (r. 364–378) and many high-ranking officers died in the battle. Roman historian Ammianus Marcellinus wrote of the event, “Scarcely one-third of the whole army escaped.”

In oppressive heat and dust, Valens marched 11 miles from Adrianople to attack the Goths. His 20,000 cavalry and 40,000 infantry outnumbered the 50,000 Gothic infantry, but the latter held a good defensive position in a wagon laager atop a low hill. Such Gothic wagon circles were no hastily arranged affairs. Ammianus says that the laager at Adrianople was formed as perfectly as if “turned on a lathe.” The poet Claudian tells of another with a double moat and stakes placed along the top “two deep.” The wagons themselves were covered in ox-hide and seemed “like a wall.”

To gain time and allow the return of his cavalry away foraging, Visigothic king Fritigern fired the grass on the plain below and dispatched emissaries to Valens, who refused to be delayed and attacked. At first the battle went his way. Valens used his infantry to hold the center while his cavalry closed on the laager and engaged the Goths on the right. Suddenly, some 50,000 Gothic cavalry appeared on the right and attacked the Romans “like a thunderbolt.” Valens's army was checked and his cavalry routed, the infantry trapped between the Gothic horse and foot. The latter now sallied from their wagons and overwhelmed the Roman cavalry, redeploying on the Roman left wing. The infantry broke. Valens's efforts to halt the rout with two units of the *auxilia palatina* were to no avail.

The early Christian scholar St. Ambrose called the battle “the end of all humanity, the end of the world.” Although a major defeat and a significant blow to Roman prestige, the consequences of Adrianople should not be exaggerated. The defeat was the result of Valens's impetuosity and not of the army's inefficiency.

Æthelbald's Wars (733–750)

Mercia establishes hegemony, paving the way for English unification. The early history of the kingdom of Mercia is obscure, but this changed with the reign of Penda, son of Pybba (r. 632–654). He extended his writ over Wessex (645) and East Anglia (650), gaining control of all England south of the Humber. Although Mercia declined after his death, Mercian expansion was resumed during the next century

under Æthelbald, son of Alweo (r. 716–757), a grandson of Eowa, brother of Penda.

By 731, Æthelbald controlled all England south of the Humber. In a 736 charter he is styled “king not only of all the Mercians but also of all the provinces, which are called by the general name South English.” Since Æthelbald issued coins bearing his image in a crowned war-helm (*cynehelm*), this hegemony was undoubtedly acquired through conquest.

In 737, Æthelbald raided north of the Humber, possibly with the idea of conquering Northumbria. In 740, he sacked York, while King Eadberht was absent campaigning against the Picts. Other campaigns included one against the Welsh (743).

Æthelbald’s only reversal came in 752 at the hands of Cuthred, king of the West Saxons. He encountered Æthelbald at Beorhford (Burford, Oxfordshire?) and, in the words of the *Anglo-Saxon Chronicle*, “put him to flight.” In the end, this victory did little more than postpone the inevitable. In 757, Cuthred’s successor, Cynewulf (r. 757–786), acknowledged his subordination by coming to the Mercian court.

Æthelbald’s supremacy was neither easily won nor stable; he also made many enemies. St. Boniface, archbishop of Canterbury, for example, reproached him for not taking a wife, and instead committing fornication with nuns, and for seizing the lands of the Mercian church. This was a common theme with the churchmen of the time.

As an old man Æthelbald was still violent and prone to lascivious behavior. His bodyguard murdered him at Seckington near Tamworth, in a terrible (though not unique) breach of the Anglo-Saxon code of fidelity. Who gave the orders is unclear. Æthelbald’s heir, Beornred, succeeded him, but civil war followed and his cousin Offa (r. 757–796) seized the throne.

No other king maintained so general an ascendancy for so long, and it is significant that a contemporary chronicler describes Æthelbald as a “royal tyrant.” As a consequence, Æthelbald and his successor, Offa, thus paved the way for the future unification of the English. On his death Æthelbald was Rex Britanniae, Bretwalda (“Britain-ruler”), a king to whom other kings were subject. They attended his court, paid him tribute, and fought under his leadership.

Aëtius, Flavius (c. 395–454)

Victor over the Huns. Born son of a *magister equitum* (master of cavalry) at Durostorum, Moesia Inferior, Aëtius was

appointed *magister utriusque militiae praesentalis* (master of both services with the emperor) in 430 after successful battles against Visigoths and Franks in Gaul. On the death of rival Bonifatius, Aëtius secured profound influence over Valentinian III (r. 425–455). He was consul three times (432, 437, 446), an unprecedented number for one not of the imperial house; it was said that envoys were no longer sent to the emperor, but to Aëtius. Appointed patrician (*patricius*: a title now denoting generalissimo) in 433, he became the effective ruler of the western empire. He held absolute power for over 20 years until treacherously assassinated by Valentinian himself (21 September 454). One of Valentinian’s advisers later remarked: “You have cut off your right hand with your left.”

Aëtius’s power was based not so much on military ability, undeniably great, as on his close relations with the Huns. He had lived as a hostage among them as a youth. He had learned much about their customs and had established ties of friendship with the Hun royal family. In 424, Aëtius raised a large force of Huns on behalf of the usurper Ioannes. Again, in 433, he recovered his hold over the imperial court in Ravenna with the aid of Hunnic mercenaries. For the next five or six years he employed them regularly. For instance, he commanded Huns during the recovery of Gaul, when his main achievement was the merciless destruction of the Burgundian kingdom. Hunnic mercenaries are not mentioned again after 439. In 451, Aëtius combined his armies with the Visigoths to defeat Attila at Châlons.

Agathocles (361–289 B.C.E.)

Ancient Sicilian warlord, notable for his ruthlessness. Agathocles was born in 361 B.C.E. in Thermae Himerenses (present Términi Imerese) on the east bank of the mouth of the Himera (present San Leonardo) River on the north coast of Sicily. About 343 he moved to Syracuse (present Siracusa), the major seaport on the east coast of Sicily, joined the army, and rose through the ranks. Frustrated by local politics, greedy for power, and seeking to subdue and unify the rival Sicilian towns, he tried three times after 323 to overthrow the government, was banished the first two times, but finally led a successful coup d’état in 317. He quickly consolidated his authority, reigned as Tyrant of Syracuse from 316 to 304, and as king thereafter until his death, probably from cancer, in 289.

Under Agathocles, Syracuse conquered most of northern and western Sicily. Worried about this growth of Syracusan military domination, Carthage, the main power in North Africa, launched a preemptive invasion of Sicily in 311. Carthaginian general Hamilcar Grisco defeated the Sicilians at Himera, just across the river from Agathocles' birthplace, and besieged Syracuse. Escaping from the siege with 13,000 men, Agathocles went on the counteroffensive in 310. He invaded Africa, disrupted Hamilcar's logistics, and defeated a superior Carthaginian force near Carthage. Usually successful against the Carthaginians on both fronts, he concluded a peace treaty in 306.

Agathocles invaded southern Italy about 305 and stayed until 302. For the rest of his life, he enlarged both the army and the navy, built fortifications and public works, and continued pursuing his territorial ambitions throughout the Sicilian countryside. The Romans later honored his memory as they fought Carthage in the Punic Wars.

Agincourt, Battle of (25 October 1415)

Great English victory during Hundred Years' War. Following England's declaration of war, an army under Henry V (r. 1387–1422) landed in Normandy in August and laid siege to Harfleur, which surrendered in September. On 12 October, the 6,000-strong English army began a march to Calais. Hampered by torrential rains, wrecked bridges, and heavily defended fords, it did not cross the upper Somme until 19 October. By that time French forces, numbering some 25,000 to 30,000 men, had crossed the lower Somme. They moved to stand astride the English line of advance at Agincourt on 24 October.

The following morning found the armies at opposite ends of a narrow defile between heavily wooded areas. After occupying the narrowest part of the gorge, the English were

King Henry V of England taking part in the Battle of Agincourt. (Hulton/Archive)

forced to fight defensively in prepared positions. The French assembled in three formations, each behind the other. This deployment negated their numerical advantage. They also failed to employ cavalry against English archers either on the flanks or in the rear, forcing them to undertake successive frontal assaults. The French attacks were broken one after the other. Only the first threatened to break into English defenses. With the second- and third-wave attacks faltering amid thick mud and suffering heavy losses, an English charge dispersed what remained of the French army.

The battle cost the French perhaps 5,000 to 6,000 dead, with hundreds taken prisoner. The English losses, allegedly, were a little more than a hundred. The battle had no immediate military result: The war continued the treaty of Troyes in 1420. By that time the English-French struggle formed part of a wider context of civil war within France. The battle's enduring fame undoubtedly owes much to Shakespeare's play, *King Henry the Fifth*.

Agricola, Gnaeus Julius (40–93)

Model governor of Britain, father-in-law of historian Tacitus. Agricola was born in the colony of Forum Iulii in Gallia Narbonensis. He had gone over to Vespasian even before the would-be emperor had publicly declared his hand (69). Agricola was later a loyal supporter of the Flavians and in 77, aged 37, he was appointed governor (*legatus praetorius*) of Britain. He came to his post with considerable local knowledge and experience, something unusual for a Roman governor of the time. Agricola had twice served in the province previously, as a legionary tribune (*tribunus laticlavus*) during the Boudican Revolt (60–61), and as legate (*legatus legionis*) of legio XX Valeria Victrix (70–73).

Agricola arrived in his province late in 77. His first action was suppression of the Ordovices of central and north Wales. The following summer (78), his first full campaigning season, seems to have found him in the territory of the Brigantes where, according to Tacitus, he built forts. He may also have spent some time north of the Solway, in what is now southern Scotland. He also operated there during his third season (79), ravaging tribes as far north as the estuary of the Tay. Again, he built forts. The next two years (80–81), Agricola consolidated the Forth-Clyde line. In a sixth season (82), spent north of the Forth, victory narrowly eluded him

against the Caledonians. A seventh (83) culminated in the Battle of Mons Graupius. Recalled in spring 84, he was, according to Tacitus, denied further appointments because of the jealousy of Emperor Domitian (r. 81–96).

Aguinaldo, Emilio (1869–1964)

Filipino nationalist. Born on 23 March 1869 near Cavite on Luzon and educated at the University of Santo Tomas in Manila, Aguinaldo became the mayor of Cavite Viejo in 1896. At the same time, he led a local faction of the Katipunan, a revolutionary group, in the Filipino insurrection against Spanish rule. In 1897, Aguinaldo agreed to go into exile in return for a pension and the promise of reform within the Philippines. During the Spanish-American War, he aided the American forces in the Philippine Islands, but then broke with the Americans on the issue of Philippine independence. Proclaimed president of the Republic of the Philippines by a provisional congress in 1899, Aguinaldo fought an epochal and costly guerrilla war against American forces until his capture by a ruse on 23 March 1901. Persuaded to take an oath of allegiance to the United States, he was granted a pension by the American government and retired to private life.

During World War II, the elderly Aguinaldo was forced to participate in anti-American propaganda by the Japanese government. Following the liberation of the Philippines, he was taken into custody by American troops and held on suspicion of collaboration with the enemy, but he was subsequently exonerated. Aguinaldo died in Manila on 6 February 1964.

Airborne Operations

The use of parachute troops began during World War II. The first operational use was in May 1940 when German glider-

borne troops attacked the strategic fort of Eben Emael. The British and American armies soon developed parachute and glider-borne troops as well. The German paratroops' last operation was the assault on Crete in 1941, after which German Fallschirmjäger saw action in the infantry role only.

Allied paratroops were in action from early in the war, but the greatest operations were Operation OVERLORD (the invasion of Europe in June 1944), Operation MARKET GARDEN (Montgomery's ill-conceived assault on Holland in September 1944), and the Rhine crossing in 1945. Since the war there have been other parachute operations, most notably the Anglo-French Suez Canal operation in November 1956, the Mitla Pass operation by Israeli airborne forces in the same year, and operations by American air cavalry in the Vietnam conflict.

Since their inception airborne troops have possessed an aura of superiority in comparison with regular infantry. They have always been seen as fit, intelligent, and aggressive troops, whose surprise and shock effect far outweigh their actual strength on the ground. Due to their method of arriving quickly in a battle area, they have great strategic mobility, although this is severely limited once they are on the ground due to their diminished scales of equipment. A paratrooper starts and finishes the battle with what he can take with him, or what can be air-dropped to him.

The greatest single advantage of airborne operations is surprise—in the time it takes the aircraft to fly over the drop zone, troops are landing on the ground, forming up, and fighting. In rear areas this can have a devastating effect, as long as planning and reconnaissance have placed the drop zone in a relatively undefended area, or the drop zone has been secured beforehand by an advance party.

Air-mobile troops—carried into battle by rotary-wing aircraft—have the added advantage that once used they can be retrieved, returned to base, and reused as necessary. The air cavalry concept is a good one, but such troops should not be committed against defended landing zones or for tasks that the ground forces are capable of performing equally well. Airborne and air-mobile troops are too expensive to train and maintain to allow them to be squandered casually.

World War II also created the glider-borne soldier. Although paratroops can be widely scattered over a drop zone (for instance the U.S. 272d and 101st Airborne Divisions' drops west of the Utah beach lodgement area on 6 June 1944), glider-borne troops are able to be landed in tactical groups exactly where they are needed (Eben Emael 1940, Caen Canal and River Orne operation, 6 June 1944). They can also bring in more and heavier equipment. But gliders soon earned an evil reputation for their landing characteristics—grimly derided as “controlled crashes.” The end of World War II also saw the end of glider operations.

Perhaps the most complicated airborne operation was

Operation MARKET GARDEN in September 1944. The commander of the British Twenty-first Army Group, General Bernard Montgomery, wanted a narrow thrust operation aimed at Berlin, a plan only reluctantly approved by General Eisenhower.

The operation, opening on 17 September 1944, involved three simultaneous airborne operations and was conducted by the U.S. 101st and 272d Airborne Divisions, and the British 1st Airborne. This air assault showed the characteristics of airborne troops in their best light—adaptable, intelligent, and above all of an indomitable spirit and a high esprit de corps. However, most particularly at Arnhem, the operation also demonstrated the limitations of such troops when faced with serious opposition. The drop zones were too far from the Arnhem bridges for the paratroops to have any reasonable chance of getting to them easily. Further, they were dropped into the middle of two German SS Panzer divisions; paratroops have a limited ability to fight tanks because they cannot carry heavy antitank weapons with them.

In all cases where airborne, glider-borne, or air-mobile troops are to be used, it has been vital to the operation's success that the airborne troops land in areas where there is no strong enemy presence, yet which are within easy striking distance of the objective. Once the landed troops have taken their objective, they must be relieved by ground forces as soon as possible, for vertical envelopment is only of short duration.

Akbar the Great (1542–1605)

The most powerful and cultured emperor of India's Mogul Dynasty, a true renaissance ruler and a brilliant warrior. Inheriting Mogul India from his opium-addled father, Humayun, Akbar came to the throne as an adolescent. The Sur Dynasty of the Punjab greeted his accession with an invasion of Hindu, Afghan, and Muslim warriors under the Hindu general Hemu. Although his army was much smaller than Hemu's, Akbar and his advisers scattered the Surid forces at the Battle of Panipat in November 1556. Within two years, the Mogul counteroffensive captured Lahore, Multan, and other Surid strongholds. From 1561 to 1564, Akbar con-

quered the Hindu rajas of Mmalwa and Gondwana, gaining control of northern central India. He also began the massive defensive complex, the “Red Fort,” at Agra.

After a four-year pause, the emperor took the field against the rajas of Chitor, Ranthambor, and Kalanjar and, in 1573, intervened in the sultanate of Gujarat. Intervention turned to annexation. Gujarat gave Akbar direct access to the Arabian Sea. He next turned east and subjugated Bihar and Bengal, then pivoted west in 1581 to subdue Afghanistan. One observer at this time remarked that his army consisted of 50,000 cavalry, 500 war elephants, 28 cannons, and uncountable infantry—Turks, Persians, Uzbeks, Afghans, and all kinds of Hindu warriors.

In 1585, the desire to control access to central Asian trade routes led Akbar to occupy Kashmir and Swat in the Indus Valley north. To secure Bengal, he then turned eastward in 1592 to take Orissa and its coastline. New disturbances in the east brought Akbar back to the Indus and, to anchor his power there, he imposed his power over Sindh, Multan, and Baluchistan. With these areas pacified by 1595, he spent the next several years trying to expand southward in the Deccan, the heartland of central India. After 1601, however, Akbar’s final military efforts had to focus on his rebellious heir, Salim, who became master of the empire on his father’s death in 1605.

Alamo (23 February–6 March 1836)

A minor siege operation of the Texan war for independence that became an effective rallying cry for Texas forces and a permanent national talisman. On 23 February 1836, General Antonio Lopez de Santa Anna arrived near San Antonio and the Mission San Antonio de Valero and began a siege of the Texas volunteers who had refused to retreat from this exposed position. Earlier, in December 1835, Texas volunteers had driven out a detachment of the Mexican army and occupied San Antonio, and now they faced Santa Anna and his army, which grew ever larger as more and more troops arrived in San Antonio. Eventually the army probably numbered somewhere between 2,000 and 6,000 men; the Texans, even with a few reinforcements who answered the “call”

from the Alamo defenders and made their way through the Mexican lines, never numbered more than 190 men.

The siege lasted for 13 days from 23 February through 6 March 1836. The Mexicans subjected the defenders to bombardment from across the San Antonio River, and as the days passed they continually moved their artillery closer, coming within 800 yards of the Alamo. By 4 March, the Mexicans had moved some batteries within 200 yards of the Alamo’s north wall, and the next day Santa Anna made plans to take the Alamo by storm. Two previous attempts had failed, and Santa Anna was determined that this one would succeed; the delay at the Alamo was giving valuable time to Texas insurgents to prepare defenses further north.

On 6 March 1836, Mexican troops moved into positions shortly after midnight and at 5:00 A.M. they received the signal to attack. Santa Anna had indicated there will be no quarter given, no mercy shown. The Mexicans attacked—one column at the northwest corner, one column in the center of the north wall, a third column toward the northeast, and a final column along the southern defenses. Twice the outnumbered defenders repelled the invaders, who took heavy casualties.

Then the attackers managed to climb the north walls and the defenders retreated toward the Mission. Santa Anna’s men broke through on the south, and then generally penetrated the outer walls. The defenders retreated to the Long Barracks, which they had fortified somewhat, and the Mexicans turned the defenders’ own cannons around to batter the walls. By 6:30 A.M. the battle was over and the Mexican army had secured the Alamo.

All the defenders were killed, including Jim Bowie, William Travis, who assumed command when Bowie became too ill to continue, and Davy Crockett from Tennessee. However Santa Anna spared the wife of one soldier, Susan Dickerson, her baby, their Mexican nurse, and an African-American youth. Santa Anna later had the bodies of the dead defenders cremated. However, the Alamo became a rallying cry for the Texas insurgents (Remember the Alamo!) who used the delay at the Alamo to declare independence, approve a constitution, form a government, and prepare for continued fighting.

Alanbrooke, First Viscount (Alan Francis Brooke) (1883–1963)

British field marshal, chief of the Imperial General Staff (CIGS) during World War II. Brooke was born on 23 July 1883 in Bagnères-de-Bigorre, France, to an Irish family. He attended the Royal Military Academy, Woolwich, and in 1902 was commissioned into the Royal Field Artillery. During World War I, Brooke served in France and was promoted to lieutenant colonel. After assignments as an instructor at both the Staff College and Imperial Defence College, Brooke assumed command of the Mobile Division in 1937. The following year he became the commander of the Anti-Aircraft Corps.

In 1939 Brooke was appointed to command II Corps of the British Expeditionary Force. During the campaign in

France he skillfully withdrew his formation to Dunkirk where it was evacuated to England. In 1940 Brooke became commander in chief, Home Forces. In this appointment he prepared the army to meet the threatened German invasion of Britain.

In December 1941 Brooke succeeded John Dill as chief of the Imperial General Staff. As the head of the army, he worked closely with Winston Churchill to shape British military strategy. On many occasions Brooke had great difficulty in discouraging the prime minister's more unsound military schemes. Brooke also engaged in often heated negotiations with his American counterparts to formulate overall Allied strategy.

After 1940 Brooke had no further opportunities for field command. In August 1942 he declined an offer to be com-

mander in chief, Middle East, as he believed he was of more use as CIGS than he would be in Egypt.

Brooke was promoted to field marshal in 1944, and was created Viscount Alanbrooke in 1946. He died in Hampshire on 17 June 1963.

Alaric (c. 370–410)

King of the Visigoths (395–410) who invaded Italy and sacked Rome (410). Alaric began his career as the leader of auxiliary mercenary troops under Emperor Theodosius I (r. 379–395). Following Theodosius's death, the Visigoths elected Alaric king. He led the Visigoth army first into Greece. There it sacked Corinth, Megara, Argos, and Sparta as well as the Athenian port of Piraeus, sparing Athens itself only after the city offered and paid a large ransom. In 400 Alaric invaded the Po Valley, but the Roman general Flavius Stilicho defeated his troops at Pollentia in 402, and again at Verona in 403. Alaric then retired from military campaigning after being appointed prefect of the Roman province of Illyricum. Two years later (404–405) he joined forces with Honorius (r. 395–423), emperor of the western empire, against his brother Arcadius (r. 383–408) who ruled the eastern empire. When Arcadius unexpectedly died, Honorius canceled the planned invasion. Alaric demanded payment of a heavy indemnity that Stilicho agreed to pay. Honorius subsequently ordered the execution of Stilicho and Roman troops massacred the families of Stilicho's barbarian auxiliaries (408). These resulted in the defection of large numbers of Stilicho's former soldiers to Alaric, who again invaded Italy. Since Honorius refused to pay a 4,000-pound gold ransom, Alaric responded by surrounding Rome on three separate occasions before allies within the city opened the city's gates to him on 24 August 410. For three days the Visigoths pillaged the city, for the first time since antiquity. Next Alaric marched south to Messina in preparation for an invasion of Sicily and North Africa, but his ships never left port due to a violent storm. He died shortly thereafter and was succeeded by his brother Ataulf.

Alba, Fernando Alvarez de Toledo, Duque de (1507–1582)

Accomplished Spanish commander, known for his severity, and political figure during much of the nineteenth century. Alvarez de Toledo, known by his noble title Duque de Alba, was born on 29 October 1507 at Piedrahita, Castille. His father died in battle in 1510, so he was raised by his grandfather, Rodrique de Toledo. At age 16, he joined the army of King Charles I of Spain against France. His defense of the Catalan coast and Perpignan during the Franco-Spanish War earned him his reputation as a great commander. By 1555, he was named generalissimo of the army of Italy. In 1567, he was named captain general of the Low Countries. He undertook a march with 10,000 troops from Italy to Brussels to put down a rebellion. Alba was able to capture many of those involved with the rebellion. He established the Council of the Disturbances, which condemned to death without appeal hundreds of citizens, including various noblemen.

In 1573 he was recalled to the court by the king, and experienced some ostracism from the king. However, in 1580 Phillip II of Spain wanted Alba to reconquer Portugal, which he claimed by inheritance. Although the duke accomplished his mission swiftly and completely, he died on 11 December 1582 in Lisbon. By this time he had become viceroy of Portugal.

Alcibiades (c. 450–404 B.C.E.)

Athenian commander and traitor. A ward of Pericles and student of Socrates, Alcibiades ranked among the most popular, handsome young men of Athens and the most notorious turncoat in Greek history. Known for winning chariot races at Olympia, Alcibiades persuaded the assembly to let

him assume control of the Peloponnesian War after the leader Nicias experienced several military setbacks. Alcibiades reopened the war and initiated a campaign against Syracuse in 416 B.C.E.

Just after the Athenian fleet sailed, all the Hermeases (stone pillars bearing the head and genitals of Hermes, god of travel) across Athens were defaced and castrated and Alcibiades was implicated. The assembly issued orders recalling him to Athens. He managed to escape and fled to Sparta where he betrayed the Athenian plans for attacking Syracuse. He also informed the Spartans that they could fortify an area outside of Athens called Decelea, denying the Athenians access to their agricultural fields at Euboea and their silver-mining operations. During this campaign over 20,000 Athenian slaves deserted and joined the Spartans. In 412 B.C.E. Alcibiades fled to Persia after the Spartan king learned that he had been sleeping with his wife. Once in Persia he offered to negotiate for the Athenians but part of the arrangements involved Athenian acceptance of a modified form of government.

Alcibiades returned to Athens in 409 B.C.E. and accepted his former position as commander of the Athenian fleet. Three years later the navy experienced a major defeat as a result of Alcibiades' placing an inexperienced acquaintance in charge. For neglecting his duties the assembly exiled him. He retired to a private villa in the Hellespont where he remained until 404 B.C.E., when he was assassinated by his enemies, who could have been Spartan, Athenian, or Persian.

Alesia, Siege of (52 B.C.E.)

Decisive battle of the Gaulic rebellion against Rome. Led by the charismatic Vercingetorix, most tribes in Gaul rebelled against Roman rule in 52 B.C.E. Provincial Roman governor Julius Caesar responded by concentrating his legions, then forcing Vercingetorix and 80,000 men into the fortress city of Alesia after three pitched battles.

Commanding fewer than 50,000 legionnaires, Caesar nevertheless began a siege. Vercingetorix then dispatched his cavalry to rally reinforcements from across Gaul, and in turn the Romans constructed a double wall of fortifications around Alesia facing toward *and* away from the city. The walls

stretched for 25 miles, connecting with more than 50 miles of trenches, 23 forts, breastworks, palisades, turrets, and extensive obstacles to slow the approach of Gaulic warriors.

When the Gaulic relief force arrived, the Romans faced 80,000 men in Alesia plus an estimated 250,000 foot soldiers and 8,000 cavalry attacking from outside the city. Caesar skillfully used interior lines, his fortifications, and the greater discipline of his men to offset the Gaulic advantage, but after two days of heavy fighting found his army pushed almost to the breaking point. On the third day the Gauls captured the Roman camp and Mount Rea, which formed a crucial point in the Roman defense. In desperation, Caesar personally led the last of his reserves in a climactic counter-attack, and when his German cavalry outflanked the Gauls and attacked them from behind, the battle decisively turned to his advantage. With all hope of victory gone, Vercingetorix surrendered the next day, and Roman power in Gaul quickly recovered.

Alexander, Field Marshal Earl the Hon Harold Rupert Leofric George (1891–1969)

British field marshal, commander of Allied forces during World War II. Born 10 December 1891 in London, Alexander was commissioned into the army in 1911.

He served in France during World War I, commanded a Baltic unit in Latvia, and led a brigade on the Indian frontier. In 1937 Alexander became the youngest major general in the British army.

Alexander served with the British Expeditionary Force in France in 1939, and in 1940 commanded the rear guard during the retreat to Dunkirk. He directed the evacuation of the troops and was the last British soldier to leave the beaches. In 1942 Alexander was sent to Burma during the Japanese invasion. Unable to retrieve an already desperate situation, he conducted a retreat into India.

In August 1942 Alexander was appointed commander in chief, Middle East. Under his direction, Bernard Montgomery and the Eighth British Army won a decisive victory at El Alamein and advanced to the Tunisian frontier. In 1943 Alexander was selected to command the Eighteenth Army Group under Dwight Eisenhower. He used his immense charm to establish an excellent relationship with his Ameri-

can superior. As Army Group commander, Alexander coordinated the capture of Tunis, the conquest of Sicily, the invasion of the Italian mainland, and the liberation of Rome.

In 1944, Alexander was promoted to field marshal and appointed supreme allied commander in the Mediterranean. He accepted the surrender of all German forces in Italy on 29 April 1945.

After the war, Alexander served as governor-general of Canada (1946–1952) and as Britain's minister of Defense (1952–1954). He was made a viscount in 1946, and ennobled as Earl Alexander of Tunis after his Canadian duty. He died at Slough on 16 June 1969.

Alexander the Great (July 365–June 323 B.C.E.)

Recognized as perhaps the foremost military commander of history. Alexander was born to Philip II of Macedon and Olympias, and spent three years under the tutelage of Aristotle at Mieza.

At age 16, Alexander was appointed regent while Philip fought in Byzantium. Alexander was appointed an army commander during the Macedonian expedition against Athenian-Theban troops at Chaeronea in 338 B.C.E. He succeeded in bringing the battle to a successful conclusion by defeating the Theban guard known as the Sacred Band.

A succession struggle between Alexander's supporters and those of other contenders followed after Philip's assassination in 336 B.C.E. Alexander eliminated the opposition by purge and execution, and attempted to consolidate his rule through a crusade against the Persian Empire.

In 335 B.C.E., Alexander marched against the Triballians, Getae, and Illyrians, who had rebelled against Philip. Restoring Macedonian control in that region, Alexander concluded a 240-mile march in 13 days to crush the revolt of Thebes.

In 334 B.C.E. an army under Alexander, including 2,000 of the 3,000 famed Companion Cavalry, joined a Macedonian force under General Parmenio that was stationed near Troy. The combined Macedonian force of 40,000 infantry and 5,000 cavalry encountered a Persian force of 40,000 under General Memnon at the Granicus River in May. Alexander attacked along a steep river embankment, which the Persians

had thought was unassailable. Greek mercenary infantry in Persian service fled, and the Persian cavalry was defeated.

Alexander continued through Asia Minor, reducing the Persian naval ports of Miletus and Halicarnassus after siege. To speed the march and provide better security against marauding Persian forces, the Macedonian forces were divided: Parmenio advanced inland while Alexander followed the coast. A linkup was effected in April 333 at Gordium.

Emperor Darius III Condomannus and a Persian force of 140,000 met the Macedonians at the Pinarus River along the Gulf of Issus in November. Alexander displayed a fluid command by attacking off the march and shuffling his formations according to battlefield needs and developments. This, combined with a concentration of brute force against a weak point in the Persian defenses, won the battle.

After rejecting an armistice proposed by Darius, Alexander spent 332–331 eliminating the remnants of Persian coastal naval power. This expedition culminated in November 332, at Tyre, after a seven-month siege. Alexander then proceeded to capture Egypt, founding Alexandria.

Realizing that his manpower and supplies were running out, he called in June 331 for reinforcements from Macedonia. Logistic difficulties were minimized because Macedonians were trained to march with their own pack requirements, eliminating an extravagant baggage train.

In October, Persian and Macedonian forces met at Gaugamela. The Persians again held numerical superiority and attempted to envelop both flanks of the Macedonian line. However, Alexander executed the oblique order of attack, which suddenly concentrated his forces from its line formation, to attack and overwhelm the Persian left flank.

Alexander pursued the remnants of the Persian force until July 330 B.C.E., when Darius was assassinated by one of his own satraps, effectively terminating Persian rule of the empire.

Alexander continued his conquests with six sieges in 329, as he advanced through northeastern Persia, concluding in 328 with the battles at Sogdian Rock and Rock of Choriens. Thereafter he attempted to legitimize his presence by marriage to Roxane, daughter of a Sogdian prince. Alexander also adopted Achaemenian courtly dress and customs.

He continued through the Indus Valley to capture Ora, Rock of Aornos, and Multan in 327, defeating King Porus at Hyphasis in 326.

Alexander attempted to justify his leadership and consolidate his gains by advocating a joint Macedonian-Persian elite to administer the empire. During 330, 328, and 327, Alexander defeated plots against his leadership.

But it was a mutiny in 326 that forced him to call off his Indian campaign and return to Persepolis. He died of fever in June 323 while preparing a campaign against Carthage.

A drawing depicting Alexander's address to his officers before the Battle of Issus. (Library of Congress)

Alexander's accomplishments did not survive his death. The quarrels of Alexander's generals, the Diadochi 323–280, split the empire into the monarchies of Macedonia and Asia Minor, Egypt, and Persia. Internal disharmony in Persia, ruled by the Seleucids, created an environment for resurgent Persian power during the Parthian era, 247 B.C.E.–228 C.E. But Alexander the Great did achieve a semidivine status in the ancient world and is still remembered for his great military and administrative skills.

Alexander's Wars of Conquest (334–323 B.C.E.)

One of history's greatest military leaders, Alexander of Macedon conquered an empire that stretched from Greece to India. The son and heir of Philip of Macedon, Alexander in-

herited the kingdom at age 20 in the year 336 B.C.E. Within two years he consolidated his rule over the Greek city-states and turned his attention to Asia, more specifically to the rich and powerful empire of Persia. He commanded perhaps the most formidable fighting force in the world. The Macedonian army was a marvel for its time, with revolutionary formations of infantry (the phalanx) and the innovative use of cavalry; the Macedonians fought with great precision and discipline and were augmented by Greek allies and mercenaries. They were not citizen-soldiers but a professional force that constantly trained and drilled. Alexander himself was a daring cavalry warrior, often leading the charge and inspiring his men with his personal bravery, suffering several serious wounds in the process. Among his qualities was a wide strategic vision along with a talent for the tiny details of warfare. With his soldiers he brought scientists and men of the liberal arts; one of his goals was to spread Greek thought across the known world. The first step of his war of conquest was the invasion of Asia Minor, once home to the already legendary city of Troy and now controlled by the Persian Empire.

In an act heavy with symbolism, Alexander crossed the Hellespont into Asia Minor in the spring of 334 B.C.E. with slightly fewer than 40,000 men. His immediate goal was to free the Greek cities along the Ionian coast, presenting himself to the people as a liberator, and to swell his ranks in the process, as well as seizing ports to neutralize the Persian naval advantage. The armies of the Persian provincial satraps who held local command in the region's armies met Alexander's forces in battle at the Granicus River (modern-day western Turkey) in May 334 B.C.E. The Greeks won a dramatic victory, with Alexander himself leading a daring cavalry charge across the river. This victory set a precedent in that it established Alexander as a bold commander whose risks paid off and it inspired fanatical devotion in his troops. After that victory, Alexander moved southward into Asia Minor, laying siege to Halicarnassus in September and November 334. During the winter of 334–333 he conquered Phrygia (central Turkey). In April 333 Alexander captured Gordium and severed the legendary "Gordian Knot" with his sword. Moving farther west, Alexander then conquered Capodocia and began moving toward Syria, surprising the defenders at the Cilician Gates (near Balkar Daghari, Turkey) and forcing them to surrender without fighting.

The Persian emperor Darius III, who had ignored previous advice from his officers on how to best handle the invasion, led an imperial army into southern Turkey in an attempt to stop Alexander from reaching the sea. Darius managed to get behind Alexander, whose troops were greatly outnumbered when the armies met in battle at the Pinarus River near the town of Issus in early November 333 B.C.E. De-

spite his numerical superiority, Darius could not bring his full force to bear on Alexander because of the mountainous terrain. Still, the battle was in doubt until Alexander charged directly toward Darius, who fled the field. Upon seeing their leader retreating in his golden chariot, the Persian morale was broken and the Macedonians won the day. After this battle, Alexander made the strategic decision not to pursue the fleeing Darius but to capture more territory and build up his strength and wealth for an invasion of Persia itself.

From Issus, Alexander moved south along the Phoenician coast. The city of Tyre fell in July 332 B.C.E. after a seven-month siege and Gaza fell in October after a shorter siege. Following a precedent set with Thebes, any city that resisted Alexander was sacked. At Tyre, Alexander received a peace offer from Darius that presented all the territory west of the Euphrates River as well as marriage to a Persian princess in exchange for an end to the invasion. Alexander refused. In December 332, Alexander arrived in Egypt to be welcomed as a liberator and proclaimed as pharaoh. He founded the city of Alexandria, one of many new cities left in his wake, and was hailed as the son of Re, an Egyptian god. While Alexander may have already considered himself divine, the battle-weary veterans that had followed him from Macedo-

nia grumbled at this development. Alexander remained in Egypt for some time, ensuring his supply lines and gaining recruits until he felt confident of his ability to face Darius once again. In the summer of 331, he set out for Mesopotamia. The army crossed the Tigris River on 19 September 331 and met the Persian forces on 1 October 331.

Determined not to repeat the failure of Issus, Darius wanted to fight on open plains to take advantage of his greatly superior numbers. The armies clashed at Gaugamela in northern Iraq near the ancient city of Nineveh. Once again, however, Alexander charged directly toward Darius, who again panicked and fled. This time, the Persian army was thoroughly defeated but Darius himself escaped. Alexander entered Babylon in triumph as the new king of Asia. In November 331 B.C.E., Alexander occupied Susa in modern-day Iran, and in late December he captured a strongly defended mountain pass called the Persian Gates with a brilliant night surprise maneuver. That victory cleared the way to the capital of Persepolis. Alexander occupied the city in January 330 and seized the enormous Persian treasury. The immense wealth put into circulation had economic ramifications that lasted for centuries. After some discussion, Alexander decided to burn the palace of Darius,

partly in retribution for the burning of the Acropolis by Xerxes in 480 B.C.E. As in other conquered lands, Alexander allowed local officials who pledged loyalty to remain in their positions, a move designed to gain Alexander favor with the public and ensure some continuity of government under his rule. Darius remained alive in Media, south of the Caspian Sea, trying to raise another army. In the summer of 330 B.C.E., Alexander pursued Darius, who failed to find a protector among the remaining Persian nobility. In July Persians fleeing from Alexander's army murdered Darius. Alexander was disappointed because he wanted to catch Darius alive and have him continue as the king of Persia under Alexander's overall rule. Upon Darius's death, however, Alexander himself assumed the trappings of the Persian throne, a move that further separated him from his officers.

With Persia defeated and only scattered Persian forces still offering resistance, Alexander looked further to the east. His geographers assured him that the great ocean and the end of the world lay just beyond India, which they assumed to be merely a peninsula. The Greek and Thessalian troops were sent home, leaving the Macedonians to continue this unparalleled campaign. After subduing the tribes on the south shore of the Caspian Sea in September 330 B.C.E., Alexander occupied Parthia and Aria later that fall. In October, there was an alleged conspiracy among the officers to overthrow Alexander, which resulted in the execution of Philotas and his father Parmenio, who had been one of Alexander's most valuable generals. In early 329, Alexander invaded Arachosia in southern Afghanistan and then moved north to Bactria and Sogdiana. He spent two years campaigning in this rough mountainous terrain, advancing as far north as the Jaxartes River and founding cities along the way. These expeditions contributed greatly to Europe's knowledge of the geography of the east. It was around this time that Alexander ordered that everyone should abase himself, Persian style, in his presence. This practice drove a deeper wedge between Alexander and his troops and he was forced to deal with further plots and conspiracies against him.

In early 327 B.C.E., he laid siege to the heavily fortified stronghold at the Chiorenes Rocks in Sogdiana. After the victory that cleared the way to India, he married the daughter of the Sogdian leader and, as in other lands, incorporated locals into his army. Despite the misgivings of the troops at taking on another campaign so far from home, Alexander entered India through the Khyber Pass in mid-327 and in May 326 faced the army of King Porus in battle near the Hydaspes River. For the first time, Europeans met elephants on the battlefield. Alexander won the battle and for the first time, the troops refused to go any farther and threatened open mutiny. They wanted to go home and no

amount of persuasion from the charismatic "King of Asia" could convince them to continue. Reluctantly, Alexander gave the order to return but he did not simply backtrack along his original route. He decided to build a large fleet of ships, numbering 800 to 1,000, to help transport his army down the Indus River toward the Arabian Sea. When the journey began, half of the troops rode in the ships while the other half marched along both riverbanks. Alexander incorporated war elephants into his own army and along the way there was hard fighting with local tribes, including the Malli. When they reached the Indus Delta, Alexander chose to march some of his men back overland toward the cities of Persia, while others sailed in some of the ships to the Persian Gulf. In the fall of 325, Alexander's army underwent a harsh passage across the desert region of Gedrosia (Baluchistan), beset by rough weather and poor terrain. Many of them died during this journey.

Alexander reached Susa in the spring of 325 B.C.E. and retook the task of administering his newly won empire. During this period, he deposed more than a third of the provincial satraps he had previously appointed and furthered a policy that aimed to unite the Macedonian and Persian people through intermarriage. This, along with his practice of admitting eastern recruits into the army, was not popular among the rank and file, who finally erupted into open rebellion at Opis in the summer of 324. Alexander defused the situation by threatening to replace his entire army with Persians but Alexander's views on his own divinity remained a point of contention. Most accounts say he thought himself a god and requested divine honors be given to him. Historians have raised questions regarding his mental state and at the very least most conclude that Alexander was very unstable at this time. In late 324, he sent an army into Luristan for a punitive strike against the Cossaeans but he conquered no new lands after this point. Some speculate that he planned eventually to spread his empire toward the west and invade Italy and the rest of Europe. His immediate strategy was to travel south into Arabia and he was preparing for that campaign when he fell ill.

Alexander died in Babylon on 10 June 323 B.C.E. at the young age of 32. The legacy of his conquests shaped the grand pattern of world history for centuries. He was the first to truly bridge the gap between East and West, creating a two-way cultural flow that influenced both continents. Upon the framework of his Hellenistic empire were built the Roman and Byzantine Empires. Later, while much knowledge was lost in the West during the Dark Ages, the Greek thought that Alexander carried to the East survived to be reintroduced to Europe, contributing to the renaissance that spread Western civilization around the world.

Alexandria (20–21 March 1801)

Battle for Egypt between British forces, about 14,000 strong, under Sir Ralph Abercromby, and French troops numbering about 10,000, under Adolphe Menou. Once Bonaparte landed in Egypt in 1798, the defeat and removal of the French army became a major concern for the British government. Because of difficulties in Ireland and elsewhere, no large force could be spared until December 1800, when the British commander at Gibraltar, Sir Ralph Abercromby, was ordered to prepare and lead an expedition of 15,000 men to Egypt. The expedition arrived off Aboukir on 1 March 1801, but the British were prevented by bad weather from landing for several days. This gave Menou the opportunity to collect the widely scattered French garrisons.

On 8 March, Abercromby finally landed, and quickly drove away the small French force at Aboukir. He was then prevented from immediately exploiting his success by his need to land horses and supplies. The landing of stores was impeded by more bad weather, and Abercromby halted 11 miles from Alexandria.

On 13 March, Abercromby defeated a sizable French force under General Friant at the battle of the Roman Camp, about two-thirds of a mile from Alexandria. The British advanced on the same day to the main French position, the Heights of Nicopolis. An attempt to storm the heights late on 13 March failed, and Abercromby set about fortifying his own position, and on landing heavy guns from his ships.

On 19 March, Menou arrived from Cairo, bringing reinforcements. Because the French expected the arrival of both a British-allied Turkish army and a second British expedition from India, under Sir David Baird, Menou decided to strike first.

The French plan called for a night assault on 20–21 March. The French began a rather noisy demonstration on the left of the British line. At the same time, an attack on the right flank, to be followed by an attack on the center, was

supposed to drive the British from their position. Both attacks were defeated. Menou then launched an attack on the British left, which failed, and a cavalry charge, which reached the British lines. In the confusion, Abercromby was captured by the French cavalry and rescued by the British. He was also wounded in the leg, which subsequently proved fatal on 28 March. By 9 A.M. the French retreated in good order, with losses of 1,600 killed and wounded and 200 captured. British losses were around 1,500.

As a result of this action, the British were able to besiege Alexandria, and in the company of Turkish forces to march on Cairo. Cairo surrendered to the combined British and Turkish force on 27 June, and with this all French forces except those in Alexandria capitulated. Alexandria surrendered on 2 September. The French effort to conquer Egypt and threaten India thus ended.

Alexius I Comnenus (1048–1118)

Byzantine general and emperor, founder of the dynasty of the Comnenoi. As the nephew of the emperor Issac (r. 1057–1059) and brother of the Grand Domestic of the East, also named Issac, Alexius Comnenus received important military commands at an early age. In 1075 he was assigned the task of fighting a rebellious Norman mercenary, Russell of Ballieul, who had defected to the Turks. Alexius paid a group of Turks to kidnap Russell, for delivery to the Byzantine government.

In 1081, he was appointed Grand Domestic of the West by Emperor Nicephorus III and directed to defeat two pretenders to the throne, Nicephorus Bryennius and Nicephorus Basilacius. Alexius accomplished this, and also turned back a Petcheneg raid across the Danube. Later in 1081, after being threatened by Nicephorus III, Alexius entered into a conspiracy with his brother and in-laws to seize power, which was easily accomplished. Alexius was crowned emperor.

Almost immediately Alexius I was forced to face an invasion by the Norman duke Robert Guiscard, allegedly upholding the rights of another deposed Byzantine emperor, Michael VII. Alexius sent diplomatic missions to the Holy Roman Empire and Venice, which were successful. He also ordered the fortification of strong points, and marched out

with the Byzantine army to oppose the Normans. In this he was less successful, and was repeatedly defeated in the campaigns of 1081 and 1082. The war with the Normans continued with uneven results until the death of Robert in 1085. Robert's sons declined to continue the war, preferring to argue over the succession to their own lands.

As a consequence of this war, Alexius cashiered a unit of Manichean, or Bogomil, troops. These rebelled, along with their coreligionists. In 1086, the rebels invited a group of Petcheneg nomads across the Danube. Alexius marched on the rebels in 1087, but was defeated at Dristra. Petcheneg raids continued until 1091, when a Cuman force, invited by Alexius, defeated the Petchenegs at Lebnium. The Bogomil Revolt then collapsed.

In 1093 and 1094 Alexius campaigned, with some success, against the Serbian principality of Raska. In 1095, he sent an embassy to Pope Urban III requesting mercenaries; Urban took the opportunity to preach a crusade, the First Crusade, against the Turks. Alexius spent most of the next two years coordinating the passage of the crusading armies across Byzantine territory, and attempting to persuade the leaders of those armies to swear fealty to him. As the crusading armies reached the Muslim-held territories of Syria, Lebanon, and Palestine, Alexius used the opportunity to recover parts of Anatolia in 1098 and 1099. From 1100 on, Alexius sought the submission of the crusader states to Byzantine governance, finally securing that of Antioch in 1111. He died in 1118 and was succeeded by his son John II.

Alexius also reformed the currency, and thus left the empire stronger both financially and militarily. He also sought to strengthen his government by assigning offices and revenues to members of his family. As a result, he made many enemies, both inside and outside of the empire. His work, while ensuring the stable succession of members of his family for many years, may thus not have resulted in the long-term advantage to the empire.

Alfonso VIII (1155–1214)

Christian king of Castile, whose victory at Las Navas de Tolosa began the demise of Muslim rule in Spain. Alfonso

succeeded his father, Sancho III, as king of Castile in 1158. His regency was a period of political unrest, but in 1169 he took firm control of the government and made an important alliance the following year by marrying Eleanor, the daughter of King Henry II of England.

In 1188 Alfonso combined forces with his tributary, King Alfonso IX of León, to attack the Muslims in southern Spain, but was decisively defeated at Alarcos on 19 July 1195 by Abu Yusuf Ya'qub al-Mansur. Taking advantage of Alfonso's momentary weakness after Alarcos, the Muslims from the south, León from the northwest, and Navarre from the northeast all threatened to invade Castile. Alfonso placated his Christian rivals with diplomacy, and renewed his plans to drive the Almohad Muslims out of Spain.

In 1211 Alfonso asked Pope Innocent III to authorize the archbishop of Toledo, Ximénes de Rada, to preach a Spanish Crusade against the Almohad regime. The response was enormous, with 70,000 volunteers from Italy, France, and Germany joining 60,000 Spaniards under Alfonso and King Pedro II of Aragon. This army, huge by medieval standards, easily took Malagón on 24 June 1212 and Calatrava on 1 July. Many troops died from disease or deserted, but Alfonso was reinforced by Sancho VII of Navarre by 13 July. Encountering the main Muslim force under Muhammad al-Nasir, emir of Morocco, at Las Navas de Tolosa on 16 July 1212, Pedro commanded the left, Alfonso the center, and Sancho the right. They caught the Muslims in a classic pincer formation and routed them, killing thousands. By 1260 the Muslims in Spain were confined to a small area of Andalusia around Granada. Alfonso died on 6 October 1214.

Alfred the Great (849–899)

King of Wessex, laid the foundation for a united Christian Anglo-Saxon kingdom. Alfred was born in Wantage, Berkshire, and grew up in Wessex, the major Saxon kingdom in southwestern England. After 865, he was involved in a series

of wars with pagan Danish invaders who had conquered most of northern and eastern England. In 871, with his brother King Ethelred, he defeated the Danes at Ashdown. Alfred succeeded Ethelred, but was defeated by the Danes at Meretum later in the year. The Danes took Mercia, the region to the north, and invaded Wessex in 876. Alfred took prominent hostages and forced peace with the Danes, only to be invaded again in 878.

Alfred successfully defended his fortress at Athelney and in 886 the Danish king, Guthrum, converted to Christianity and withdrew from Wessex for good. For the remainder of his reign, Alfred consolidated his power in Anglo-Saxon England, keeping the Danes at bay. He reorganized the army of Freeman, the *fyrd*, placing half permanently on duty and half at home and in the fields. He also established more than 30 new fortifications called *burhs* throughout Wessex. These *burhs* featured large walls; the more hides, or large acreages of land, a person had in the countryside, the more wall that person was responsible for protecting. As a result of this reorganization, the Danish army broke up in 896. Alfred died on 26 October 899, succeeded by his son Edward.

Algiers, Battle of (7 January–24 September 1957)

An example of how military success can fail to bring political and diplomatic victory. After more than a century of French occupation, organized Algerian insurrection began on 1 November 1954, All Saints' Day, with a series of explosions and assassinations. The underlying cause was the exclusion of the Muslim populations from political and economic affairs and a series of unstable French governments' inability to effect any meaningful reforms. The National Liberation Front (FLN) organized by Ahmed Ben-Bella and eight others spearheaded the uprising.

After an inconclusive, three-year campaign in the Algerian countryside, both the French and FLN concentrated their efforts on Algiers, one of the largest cities of France (Algeria was legally a part of metropolitan France itself).

Following a series of bombings at public sites and the call for a general strike on the part of the native population, the

10th Paratroop Division, with units of the French Foreign Legion, occupied Algiers in January 1957. The military quickly divided the city into zones that were swept by the soldiers, arresting and interrogating detainees without judicial authority. French operations were successful and the FLN was driven out of the city by September.

The French military sealed the Algerian borders with Tunis and Morocco with electrified fortifications, and intensified the use of helicopters to transport assault forces rapidly to rebel opposition points. By 1959 French forces were on the verge of military victory; however, for political reasons, President Charles de Gaulle offered the insurrectionists self-determination. In 1962, Algeria was granted independence. The cost of the war was appalling. Casualties on both sides totaled almost 3 million or nearly one-third the population of Algeria.

Allen, Ethan (1738–1789)

American guerrilla leader in the French and Indian War, the conflict between Vermont and New York, and the American Revolution. Allen was born in the frontier community of Litchfield, Connecticut, on 21 January 1738. A voracious reader and freethinker, later a Deist, he expected to enroll at Yale College, but his father's death in 1755 made that hope financially impossible. Based at Fort William Henry in the French and Indian War, he became familiar with the Lake Champlain Valley and what is now Vermont.

In the 1760s, Allen and four of his brothers settled in Vermont, then called "The Grants," disputed territory between New Hampshire and New York. Taking the side of New Hampshire, Allen raised a guerrilla militia of about 400 farmers, the "Green Mountain Boys," and waged an effective defensive campaign against intrusions from New York, fighting to wound and to humiliate, not to kill. New York governor William Tryon offered £100 for his capture, but in vain.

On 10 May 1775, accompanied by Benedict Arnold, Allen led the Boys in the bloodless capture of Forts Ticonderoga and Crown Point. His bombastic personality suffered when the Boys joined the Continental army and voted Seth Warner their colonel instead of him. He volunteered for Arnold's and Richard Montgomery's invasion of Lower Canada. Outnum-

bered, outmaneuvered, and captured in Montreal, he was a prisoner of war from 25 September 1775 until exchanged for a British officer on 6 May 1778. Upon his release, he reported to Valley Forge, where George Washington brevetted him colonel in the Continental army. Returning to Vermont that summer, he heard about Warner's success at Bennington.

Disappointed by the refusal of the Continental Congress to consider Vermont the fourteenth state, he negotiated fruitlessly in 1779 and 1780 with the British in Quebec for a separate peace. He died, embittered, in Burlington on 11 February 1789.

Allenby, Edmund Henry Hynman, Viscount (1861–1936)

British cavalryman and field commander in the Middle Eastern theater of World War I. Born in Brackenhurst, Nottinghamshire, England, on 23 April 1861, Allenby graduated from the Royal Military Academy at Sandhurst; joined the Inniskilling Dragoons in 1882; fought in South Africa in 1884, 1885, and 1888; and served as both staff officer and field officer under Horatio Herbert Kitchener in the Second Boer War. He commanded the 5th Lancers in England from 1902 to 1905 and was inspector general of Cavalry from 1910 to 1914.

Allenby commanded the cavalry of the British Expeditionary Force in France in 1914, was soon promoted to command the Fifth Corps, and by October 1915 he was commanding the Third Army. Despite his several successes, notably at Arras on 9–15 April 1917, his cavalry background and especially his preference for the tactics of mobility and swift assault made him unsuitable for trench warfare. His attitude irritated his superiors, and in June they got rid of him by reassigning him to replace General Sir Archibald James Murray as head of the British Expeditionary Force in Egypt.

Allenby's decisive leadership and inspirational personality immediately restored British morale in the Near East. At last free to take advantage of cavalry tactics, he quickly mo-

bilized and pushed north toward Damascus, exploiting Lawrence of Arabia's capture of Aqaba on 6 July and coordinating his strategy with both Lawrence's guerrilla harassment of the Turks in the east and Frederick S. Maude's successes in Mesopotamia. He won the third battle of Gaza by a brilliant outflanking maneuver at Beersheba on 31 October, routed the Turks throughout November, and entered Jerusalem in triumph on 10 December after two days of heavy fighting. In early 1918 his offensive campaign stalled only because his superiors sent many of his troops to France. He received enough reinforcements to resume full operations in July. Relentless in pursuit and matchless as a tactician, he beat the Turks decisively at Megiddo on 19–21 September, Damascus on 1 October, Homs on 16 October, and Aleppo on 25 October. His conquest of Palestine, Syria, and nearby lands forced Turkey out of the war on 30 October. Allenby was rewarded by promotion to field marshal and elevation to viscount. He served as high commissioner for Egypt from 1919 to 1925 and died in London on 14 May 1936.

Alma (20 September 1854)

First major engagement in the Sevastopol campaign of the Crimean War, decisive allied victory over Russia. Marching south toward Sevastopol from their landing at Eupatoria, 60,000 allied troops found 35,000 Russians under Prince Alexandr Sergeevich Menshikov in a good defensive position on high ground south of the Alma River, about 20 miles north of Sevastopol, blocking their line of march. The allies deployed on the north bank, in sight of the Russians, but out of range. Omer Pasha held the far right with 7,000 Turks on the shore of the Black Sea. General Armand Jacques Leroy de Saint-Arnaud commanded 37,000 French on the right. General Fitzroy James Henry Somerset, Baron Raglan, led 26,000 British in the center and on the left. The Light Brigade of Brigadier General James Thomas Brudenell, seventh earl of Cardigan, secured the allied far left, about eight miles in-

land. Among the troops on the British left were three Highland regiments under Major General Colin Campbell, the 79th, 93d, and 42d.

The allied plan was to charge uphill along the whole front after the French had turned the Russian left flank, but Raglan, in his first battle since Waterloo, became confused and advanced into the center too early. Campbell, perceiving the danger, saved the day by attacking with a moving firing line 2,000 yards long and only two ranks deep. Firing muskets while on quick march was difficult, but Campbell's soldiers were the best trained and best disciplined in the British army. They routed the Suzdal Regiment, captured a 12-gun redoubt, and opened the Russian right. After that, despite Raglan's tactical error, superior firepower prevailed. Soon the entire Russian force was in full retreat. Raglan wanted to pursue, but Saint-Arnaud, citing logistical concerns, refused.

The British lost about 2,000, the French and Turks about 1,000, and the Russians about 6,000.

Almohad Conquest of Muslim Spain (1146–1172)

Rescued Muslim Spain from the forces of the Christian Spanish Reconquest for at least another century. When the Almohad movement overthrew the Almoravids in Morocco in 1147, Muslim Spain was thrown into turmoil. The Almoravid governors in Granada, the Banu Ghaniya, managed to hold on there and in the Balearic islands, but most towns declared their independence under governments led by Muslim judges, military emirs, or sectarians. Northern Christians quickly took advantage of these conditions. Alfonso VII of León-Castile made Cordova his vassal in 1146, and went on to occupy Calatrava, Andujar, and Almeria. Portuguese forces entered Lisbon in 1147, aided by English and Lowland crusaders.

Abd al-Mu'min, the Almohad caliph, watched the Christian advance with grave concern. Islamic messianic revivalists, the Almohads had declared jihad against the Almoravids for letting Muslim security in Spain deteriorate.

Therefore, Abd al-Mu'min knew he had to intervene as soon as his forces had pacified Morocco and completed the conquest of Algeria and Tunisia. His general, Abu Ishaq Bazzaz, crossed over to the Algarve in 1148, received allegiance from several cities, and drove the Almoravids out of Seville, but Almohad harshness inflamed revolts in Morocco that spread to Spain. Nonetheless, Castilian threats to Cordova soon forced the Andalusis to return to Almohad again in 1149. After reinforcing Cordova, the caliph eased his treatment of Spanish Muslims.

In 1157, with Maghrib affairs settled, the Almohads returned to Spain. They wrested Almeria back from the Castilians, and fortified Gibraltar. Muhammad ibn Mardanish of Valencia and Ibn Hamushk of Jaen, Muslim freebooters and sometime allies of Aragon and Castile, bedeviled the caliph's efforts, and in 1162 Ibn Hamushk took Granada by ruse. The Almohads proved just as wily, and slipped into the city fortress through their own deceptions and chased the rebels out, inflicting heavy losses.

Abd al-Mu'min died in 1163 while preparing a massive expedition to invade Portugal, Castile, and León simultaneously (one observer placed his forces at 100,000 horsemen and 100,000 infantry). The new caliph, Yusuf I, sent many of these forces into Spain in 1165, where they humiliated the army of Ibn Mardanish near Murcia. The Almohads also managed to relieve a Portuguese siege of Badajoz and cow Ibn Hamushk into submission. Caliph Yusuf I arrived in Seville in 1171, bringing in Berber and Arab troops from as far as Tunisia. Shortly thereafter, Ibn Mardanish died, and his family submitted to Yusuf's authority. The caliph passed the year campaigning against Heute, Cuenca, and faced down a Castilian expedition. By August, the army had returned to Murcia. Islamic Spain was now in Almohad hands, but the struggle between Christian and Muslim over Spain would very soon resume.

Almoravid Empire (1050–1148)

The Almoravid movement conquered an empire that extended from central Iberia south to the Senegal River, spreading Islam deeper into west Africa and rescuing Muslim Spain from the Spanish Crusades.

The Almoravid Empire began in the 1030s, with the ef-

forts of one Abdullah ibn Yasin to reform the practice of Islam among the Sanhaja Berbers of Morocco. Appalled at Sanhaja ignorance and moral laxity, he imposed heavy fines, severe punishments, and outlawed many traditional customs. Expelled by one Sanhaja tribe, Abdullah turned to another, the Lamtuna. Here he found a more sympathetic reception, especially from Abu Bakr ibn Umar, head of the Targut clan. Training at a fortress (*rabat*) in Mauritania in both warfare and Abdullah's puritanical vision of Islam, these Lamtuna warriors came to be known as the Almoravids ("Those of the *rabat*"). By 1042, the Lamtuna had persuaded or coerced the rest of their Sanhaja kin to enlist in their ranks.

Proclaiming the slogan "Spread righteousness, correct injustice, and end evil [non-Quranic] taxation," the Almoravids launched their jihad around 1050. In 1054, Abu Bakr captured the Moroccan trade center at Sijilmasa, then pivoted south to drive the pagan Soninke out of Awghadust and capture the gold routes from the Niger basin. To control the High Atlas region, he set up a fortified camp on the site of what would become Marrakech under his cousin, Yusuf ibn Tashfin. These two men would divide the empire between them, Abu Bakr campaigning south in Mali-Mauritania, and Ibn Tashfin subjugating the cities and tribes of northern Morocco. Abdullah ibn Yasin had died in 1060 and, when Abu Bakr died in 1087, Yusuf ibn Tashfin became ruler of the burgeoning Almoravid Empire.

In 1085, the king of Castile captured Muslim Toledo, foraged at will throughout the little emirates of Islamic Spain, and laid siege to Zaragoza. Desperate, the emirs appealed to Yusuf to rescue them from the Christian crusaders. The Almoravids crossed into Spain in 1086 and, at the Battle of Badajoz, inflicted a crushing defeat on the Castilians. Continued threats from Christian warriors forced Ibn Tashfin to return to Andalus several times. Finally, encouraged by Andalusian clergy and popular support, the Almoravids annexed most of Muslim Spain to their empire in 1099.

Almoravid forces do not seem to have numbered more than 30,000. They rode to battle on horse and camel, but the bulk of their fighters were infantry. They advanced on foot in ranks, the lead elements using long spears and the rear forces carrying javelins. Distinctive for their blue garb and facial coverings, their cohesive forces proved extremely formidable, although a lack of technical skills did put them at a severe disadvantage against towns and fortifications. In such circumstances, they usually turned to Spanish Muslims or other experts. Thus, while the Almoravids could defeat Spanish Christian forces in the field, they repeatedly fared poorly in siege craft.

Yusuf died in 1106. His sons, Ali and Tamim, took over, with Ali remaining in Africa and Tamim handling Spain. In Spain, Almoravid forces took Coimbra, Ucles, Lisbon, and

Santarem, and ranged north to the Pyrenees, but Toledo remained unattainable. Then, in 1118, the balance of forces shifted as Alfonso I of Aragon captured Zaragoza, and mauled Muslim relief forces. Shortly thereafter, in 1120, Muhammad ibn Tumart of Morocco, founder of the Almohad movement, denounced the Almoravids, and launched his rebellion against them at Tinmal, in the hills above Marrakech. Confronting foreign invasions and internal revolt simultaneously, defeats in Spain alienated the Andalusian population, and seemed to validate Almohad accusations that God had turned against the regime. Frantic, Ali fortified Marrakech and hired Christian mercenaries. Ali died in 1143; his son, Tashfin, was slain fighting in the Tlemcen-Oran region only two years later. In 1147, Almohad troops entered Marrakech, and a series of revolts in Spain completed the Almoravid collapse.

Amazons

Race of warrior women described by the Greeks. The Amazons were thought to have been fierce fighters who from their birth were brought up to be warriors. The name Amazon is believed to derive from the Greek word *amazos* (breastless), referring to the legend that the Amazons had their left breast seared during childhood to facilitate the use of a bow. In addition to the bow, the Amazons, who usually fought from horseback, used swords, double axes, and crescent-shaped shields. Various Greek myths and works of literature refer to encounters between Greeks and Amazons, such as *The Iliad* and *The Labors of Hercules*.

Though their place of origin remains in dispute, the lands most associated with the Amazons are Thermiscrya in the mouth of River Thermodon (in modern-day Turkey), the Black Sea region, and Libya.

Until very recently, the Amazons were seen only as a mythological phenomenon. Archaeological work in Kazakhstan, however, has brought to light female burials accompanied by weapons, suggesting that the Greek myths may have had some basis in fact. In particular, seven female graves contained iron swords and daggers, bronze arrowheads, and whetstones for sharpening the weapons. In addition, the curved leg bones of a teenage girl attest to a life on

horseback, while an arrowhead found in the skeleton of another female suggests that she had been killed in battle. Although these women, who were members of the Sarmatian tribe, cannot have been the Amazons of Greek myth (who were said to have lived far to the west), they may have been members of similar nomadic tribes who occupied the Eurasian steppes in the Iron Age.

American Civil War (1861–1865)

The bloodiest war ever fought in the Americas. Ultimately, the new lands acquired from Mexico proved the undoing of the Union. Increasingly, politicians in the slave and nonslave states were unwilling to compromise, and a new political party, the Republican Party, dedicated to halting slavery's expansion, rose to power in the North. As the two major par-

ties prepared to nominate candidates for the 1860 presidential election, the fissures and fault lines were obvious.

There were four major candidates for the presidency in 1860. The Republicans nominated Abraham Lincoln as their standard-bearer; combining many regional issues and emphasizing their resistance to the expansion of slavery since it threatened "free" labor, the Republicans were assured a majority in the North. The Democrats fractured into three groups. Senator Stephen Douglas was the candidate of the northern Democrats; John C. Breckinridge was the candidate of the Deep South; and John Bell became the candidate of Democrats living in the uplands South, which had a stronger commitment to the idea of the Union.

Lincoln's election set the process into motion. Once the electoral college in December confirmed the popular vote of November 1860, South Carolina seceded from the Union. In the next several months before Lincoln became president (which was 4 March 1861), six other Deep South states followed South Carolina. The new Confederate States of America chose Montgomery, Alabama, as its capital.

The first key battle of the Civil War would be over the fate of the remaining eight slave states. Washington, D.C., after all, rested between the slave states of Virginia and Maryland; if all the slave states left the Union, the North would have a difficult time indeed! However, if the eight remaining slave

states remained in the Union, the South might not have a defensible border with the North.

Fort Sumter helped firm the battle lines. An artificial fort in the middle of Charleston Harbor, South Carolina, it was one of the few federal facilities in the Deep South that remained under northern control after secession. Lincoln wanted to hold the fort, but not appear aggressive; the South needed to gain control over the fort. Ultimately, the South fired on Sumter, which soon surrendered, and the eight remaining slave states divided in half, with Missouri, Kentucky, Maryland, and Delaware somewhat uneasily remaining in the Union.

Both the North and South had advantages (and disadvantages) in the coming conflict. The North had some 20 million white citizens; the South about 6 million, and white immigration clearly favored the North. The North had a clear superiority in manufacturing, banking, transportation—indeed, in industrial power. It had 110,000 manufacturing establishments to the South's 18,000; the North produced more pig iron and coal—the basis of industry. The North had more than 22,000 miles of railroad track, and longer lines and more common gauge; the South had but 9,000 miles of frequently shorter lines with different gauges. And the main transportation system of the South—rivers—provided easy access for northern invasions into the South's heartland. If the war became a long, drawn-out, and costly affair, the North had the industrial might and population numbers to prevail.

However, the South did have advantages. It was on the defensive, in a conflict that to some extent did pit families, friends, and business partners against one another. It did not need to win, only to continue to exist to emerge victorious. The South had many experienced and talented military leaders and more of a martial tradition, it believed, than the North. And it had so-called King Cotton. The South believed that Great Britain and, to a lesser extent, France were so dependent on southern cotton for their growing textile industries that the two countries would soon recognize southern belligerency and come to the South's aid.

And so both sides stumbled into the Battle of First Bull Run. President Lincoln initially did not accept a proposal from the North's leading general, Winfield Scott, victor of the Mexican War, that his "Anaconda" Plan would take time and require marshalling of much resources. But it would squeeze the South through a naval blockade and then drive through the natural invasion corridors—the Mississippi River, eastern Tennessee to Atlanta to the coast—until the South ceased to exist as an organized entity.

Instead, General Irwin McDowell marched an ill-trained army to defeat as it met another ill-trained army under Generals P. G. T. Beauregard and Joseph Johnston. The July 1861

battle was significant for the conclusions both sides drew. Lincoln began to accept that the war would be costly and take time, and made plans for such a contingency. His counterpart, Jefferson Davis, and other southerners were emboldened by the results and never really organized the South—which, as a confederation, had weaker central government than the North—for an extensive conflict.

The fighting began in the West, the area between the Appalachian Mountains and the Mississippi River. The South probably made a strategic mistake in moving its capital to Richmond, Virginia, because it focused attention on the battlefields between Washington, D.C., and Richmond—only 100 miles apart. However, the war for the South was lost—and perhaps could have been won—in the broad area between the mountains and the great river. In February 1862, General Ulysses S. Grant and Flag Officer Andrew Foote gained control over Forts Henry and Donelson and thus access to the Tennessee and Cumberland Rivers; CSA General Albert Sidney Johnston then retreated into Mississippi to recoup. The ensuing battle at Shiloh was, to that date, the bloodiest day of war on the North American continent, but its inconclusive result left Grant in possession of the battlefield and helped the North continue its drive to divide the South along the Mississippi River (New Orleans would soon fall, adding to the pressure).

In the East, Robert E. Lee demonstrated his mastery over a series of inferior northern commanders. Lee was a Napoleonic general in that he wanted battlefield victory, but defensive firepower was evident in this war—rifled muskets that were accurate at hundreds of yards, as well as mortars and cannon; to gain such victory meant sustaining huge losses in manpower—which the South could hardly spare. Still, after Stonewall Jackson confounded and then eluded several Union generals in the Shenandoah Valley, Lee struck against George McClellan, who had used the Union navy to transport a huge army to the peninsula between the York and James Rivers and very slowly advance on Richmond. In the so-called Seven Days' Battles, Lee tried to envelop and crush isolated parts of the Union army, but while he pushed that army back to Harrison's Landing, he could not destroy it and he sustained huge losses. Committed to an offensive-defensive strategy, Lee moved north, badly defeated John Pope's Army of Virginia, and then cartwheeled around Pope to "invade" Maryland. Ultimately Lee had to concentrate at Sharpsburg, Maryland, where his Army of Northern Virginia sustained an uncoordinated series of attacks from McClellan's larger force. Imagine the results if either McClellan had committed the 20,000 fresh troops he held from battle or he had attacked the next day as Lee prepared to cross the Potomac River with his baggage and his wounded. The campaign season in the East ended with Burnside's unfortunate

assault at Fredericksburg, after his quick march to get behind Lee failed when pontooning equipment did not arrive to allow a quick movement across the Rappahannock River.

In the West, Confederate general Braxton Bragg, with Kirby Smith guarding his right flank, moved north threatening both Louisville and Cincinnati, and then fought indecisively at Perryville and retreated south soon after Lee left Sharpsburg. The year ended and the next began with inconclusive fighting at Murfreesboro between Nashville and Chattanooga. While not broadly recognized at the time, the two failed southern offensives—Lee into Maryland and Bragg into Kentucky—represented the high tide of the Confederacy and perhaps the last opportunity for foreign recognition. Lincoln announced the Emancipation Proclamation, foreign support for the South muted, the North grimly applied its manpower and industrial advantages, and the blockade began to bite deeply.

The next year, 1863, saw the tide turn to the North. Grant had tried to take Vicksburg, the last major southern stronghold on the Mississippi River, and failed. However, while waiting for winter rains to subside, he came upon a brilliant strategy. He moved his men to the west side of the river opposite Vicksburg; he would have the U.S. Navy transport his army across the river below Vicksburg; they would live off the land and drive inland to repel any relief for the army at Vicksburg, and then turn to the city and either besiege it or take it. The strategy was brilliant, and worked, as Grant drove John Pemberton back into Vicksburg and in May settled into a siege that ended with Vicksburg's surrender on 4 July 1863.

Meanwhile, another Union commander felt he could defeat "Bobby Lee." Joseph ("Fighting Joe") Hooker revived the Army of the Potomac, and then set into motion a broad turning movement that would force Lee to retreat or else to be trapped between the Union corps remaining at Fredericksburg or the superior forces that had marched north and west and then southeast to get behind him. Lee, however, divided his army, leaving 10,000 men under Jubal Early at Fredericksburg, and then divided again, keeping but 17,000 in front of Hooker's 70,000-plus men and sending Jackson with about 26,000 to find the hanging flank. It was a brilliant conception, but Jackson was fatally wounded by a southern sharpshooter. Most of Hooker's men did not even see battle. Lee then received permission once again to invade the North; promised his senior subordinate, James Longstreet, that he would avoid battle; and stumbled into Gettysburg, the greatest battle ever fought in the Americas, and a Union defensive victory. Once again the North could have won a huge victory if George Meade had attacked as Lee retreated back to Virginia.

Still, attention turned to the campaign around Chat-

tanooga. William Rosecrans maneuvered well and forced Braxton Bragg to evacuate Chattanooga in September 1863. With a lull in fighting in the East, Lee sent Longstreet and his corps to help Bragg. The battle at Chickamauga ("bloody creek" in Cherokee) was one of the few times the South outnumbered the North; Rosecrans lost track of his units and moved a division out of the line he felt was in reserve—and this occurred just as Longstreet's veterans attacked that part of the front. Most of the northern troops fled to Chattanooga and Bragg slowly followed, frittering away the advantage he had won in costly fashion at Chickamauga. Lincoln appointed Grant to command, and Grant came to Chattanooga, brought in reinforcements, opened a more secure supply line, tried to roll the Confederate left and then right, and was surprised by the performance of troops assigned to demonstrate against the Confederate center. The Army of Tennessee fled the field and Grant was appointed to command all Union armies.

The Union blockade was also having its destructive effect. Most southern ports were closed—either seized by the Union navy or guarded by Union gunboats; while some blockade runners did get through, the high cost of such cargoes attested to the declining frequency of their success. And southern commerce raiders never imposed the cost to northern merchants that American privateers exacted from British merchants during the American Revolution.

The war ground on in 1864. Grant had a strategic vision. He would accompany (but not directly command) the Army of the Potomac as it confronted Lee; he would lock onto Lee and not release his grip. Meanwhile William T. Sherman would maneuver from Chattanooga to Atlanta and eventually to the coast, cutting the South in half again; Union forces at Mobile, Alabama, would cut through the Deep South to meet Sherman at Atlanta while Benjamin Butler and the Army of the James would move up the peninsula to threaten Richmond and Petersburg while Grant (and Meade) occupied Lee.

So Grant and Lee fought a series of bloody campaigns from Wilderness to Spotsylvania Court House to North Anna to Cold Harbor to the siege of Petersburg and Richmond. While Grant took many casualties, he ended Lee's ability to take the offensive, ground down under the weight of fighting a total war. Meanwhile, Sherman and Joseph Johnston maneuvered brilliantly to the outskirts of Atlanta where President Davis replaced Johnston with John Hood. Hood attacked somewhat rashly, lost, and moved north through Alabama hoping to tempt Sherman to follow. Sherman decided to give up his long supply line (the relief drive from Mobile never took place; instead Union troops moved into Arkansas), and with 62,000 troops, he set off to march through and destroy the Deep South. Hood moved north,

won a costly victory at Franklin (12 generals killed), and then was destroyed by George Thomas at Nashville in mid-December. Sherman reached the Atlantic coast at Savannah, Georgia soon thereafter, and began moving north through the Carolinas.

In spring 1865, Lee recognized the desperateness of his position. Grant was about to cut the last Confederate link to the south from the siege at Richmond and Petersburg; Sherman was moving north against a small army commanded by Joseph Johnston. Lee tried to disengage and march south, but the large and well-armed Union cavalry cut off his retreat, forcing his weakening army to march west, where he decided to surrender to Grant at Appomattox Court House, Virginia. Johnston soon surrendered to Sherman at Durham Station, North Carolina, and the remaining Confederate armies followed.

Ultimately, the South tried to fight as the North fought, and became caught up in a strategy of annihilation where it simply did not have the numbers, the strength, or the organization. A confederation did not provide for sufficient central power to resist. Moreover, too many generals did not understand the tremendous advances in killing power—the greater accuracy of rifled muskets, the introduction of breechloading repeating rifles, rifled cannons, and siege mortars; too often, generals sent troops straight ahead into well-prepared defenses and entrenched troops.

The American Civil War might be termed the first “modern” war, for both sides employed the major products of the Industrial Revolution: railroads, telegraphs, steamships, ironclads, rifled small arms and artillery, photography. None were used for the first time in this conflict, but all were employed on a far larger scale than ever before.

The Civil War was also by far America’s bloodiest conflict; more than 600,000 died—nearly 2 percent of the population. But, as in the aftermath of so many of its conflicts, the United States emerged far stronger economically and politically than it had been at its beginning.

American Indian Wars

The continuous military confrontation between the European invaders and the indigenous population that lasted from the early seventeenth to the late nineteenth century. Those wars represented a fundamental struggle over land and resources. Throughout those campaigns Euro-American colonists demonstrated their technological superiority and justified the military expansion through social Darwinist ideologies of manifest destiny and religious evangelism. Most of the indigenous societies defended their homelands in fierce struggles and attempted to compensate for demographic and technological disadvantages through elaborate techniques of guerilla warfare and the military experience gained in intertribal conflicts. Ultimately, the Indian wars resulted in the complete military defeat of the indigenous societies and brought them to the verge of extinction.

Fighting already accompanied the colonial period, which was marked by almost continuous warfare. The Spanish colonists encountered heavy military resistance against their missionary efforts in the Southwest. In 1680 the rebellion of the Pueblo tribes drove the Spaniards out of the Rio Grande province for more than a decade. The French colonizers were engaged in frequent military confrontations with the Iroquois Confederacy while French traders and missionaries maintained friendly relations with other cultures of the Northeast. The English settlement efforts sparked war almost from the beginning. Prominent campaigns and battles were the Pequot War (1636–1637); the uprisings of the Wampanoag and Narragansett against the New England colonies, known as King Philip’s War (1675–1676, proportionally the bloodiest conflict in American history); and Pontiac’s Rebellion in the Northwest Territory in 1763.

Those conflicts in the colonial period were part of a larger imperial contest between Britain and France in which the Indian tribes served as respective allies. Their expertise as scouts but also their manpower was important as both sides struggled for dominance of the North American possessions. This practice of instrumentalization did not end with the founding of the United States. Although the military power of the Indians east of the Mississippi River had already substantially declined by 1776, tribes north of the Ohio River continued with British support to protect their homeland against the further encroachment of white settlement. Their efforts were repelled in the Battles of Fallen Timbers (1794) and Tippecanoe (1811). The army’s victory ended the military ability of the tribes in the Northwest Territory effectively to challenge white intrusion. British support for Indian military campaigns ended in 1813 with the Battle of Thames in southern Ontario.

Between 1812 and the 1840s the remaining eastern tribes

were relocated by the federal government to territories west of the Mississippi so far untouched by white settlement. Washington hoped that the removal would end the military confrontation between Native Americans and the U.S. Army. The resettlement of the tribes was accompanied by occasional military resistance. Most prominent campaigns were the Florida Seminole Wars (1817–1818, 1835–1842, 1856–1858) and the Black Hawk War sparked by the refusal of the Sac and Fox to leave their homeland.

With the further territorial expansion of the United States after the Mexican War, the Indian territory no longer marked the effective western boundary of the United States, but divided the country in two. The effects of this division on Indian land became obvious as the California gold rush of 1848–1849 massively increased migration through tribal territories. This migration violated the Indian Intercourse Act of 1834 and set the stage for an ecological disaster as intruders increasingly decimated the bison herds that served not only as the foundation of the economic life but also the cultural existence for many of the Plains tribes.

As military confrontations remained a constant experience, the army concentrated on keeping the travel routes to the West open through a series of military outposts. In addition to this primary military objective, hostile tribes were crushed in a number of campaigns such as the Rouge River War, Yakima War, and the campaign of 1858, which eliminated Indian military resistance in the Oregon Territory.

The Civil War temporarily diverted the military energies of the government. As regular troops departed for the battlefields in the East they were replaced with local volunteers. Those regiments often displayed little discipline and training and frequently contributed to the escalation of Indian-white confrontation. During the Civil War many tribes actively participated on both sides. Particularly the Confederacy gained the support of numerous tribes, or tribal factions, such as the Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles. They were motivated by the location of their tribal lands, which were surrounded by Confederate states, and their lack of confidence in the seriousness of Washington's Indian policy. On whatever side they fought, the Indian nations suffered terrible economic and social disruption to their territories as troops from both sides devastated their land and the continued fighting resulted in food shortages and famine.

While a number of tribes participated in the war effort, others saw the diversion of the U.S. Army as an opportunity to defeat a supposedly weakened enemy. The western tribes began their campaign in 1862 when Sioux attacked New Ulm in Minnesota, killing approximately 700 settlers. The Minnesota militia retaliated and captured more than 1,500 Indians. President Lincoln prevented the execution of at

least 300 prisoners, a measure favored by the militia's commander, General John Pope. Warfare in the West escalated dramatically during those years. Army records indicate that fighting peaked during the years 1864–1867. But not only the frequency of campaigns increased. The dehumanization and brutalization, inherent in any war, reached new lows. The Indians themselves, understandably, held a low opinion of whites. Fostered by racism and derogatory stereotyping of Indians as savages, Indian-fighters took a savage stand. Instructive in this respect was the Sand Creek massacre.

On 29 November 1,200 troops of the First and Third Colorado Cavalry under the command of Colonel John M. Chivington attacked a partially disarmed and surrendered camp of Cheyenne Indians and killed anywhere from 150 to 500 men, women, and children. Formal investigations into the massacre did result in the condemnation of the attack through the U.S. government, an early forerunner of the guilty conscience Americans were beginning to develop, particularly in the East and, as westerners were quick to point out, away from the Indian wars.

In the years following the Civil War, the U.S. Army underwent dramatic reorganization. The troops were reduced in numbers. Continuous conflicts between the federal government and local commanders and the lack of proper doctrine highlighted the constraints imposed by demobilization. The army's task was to clear the way for settlement of the West by forcing Indians onto reservations.

By 1868 military commanders, such as Major General Philip Sheridan, embarked on a new strategy of total warfare that carried the war into the winter camps of the western nations. The army attacked the Indians during the winter when their food supply and thus their mobility were at a low point. This approach further obscured the division between combatants and noncombatants and highlighted the totality of warfare as carried out by both sides. Overall, however, the troops and commanders were more sympathetic to the plight of the Indians, much to the disgust of the local whites. The army, after all, was not after the Indians' lands.

War continued for another two decades. Outstanding battles and campaigns included the Little Bighorn (1876), the Red River War (1874–1875), the Modoc War of 1872–1873, and the Apache Wars that ended with the defeat of Geronimo in 1886. The final military engagements took place at Wounded Knee, Dakota Territory (1890), and on a military expedition against the Ojibwa in Minnesota in 1898. Despite occasional Indian victories in the years after the Civil War, the tide had long since turned against the indigenous Americans. Despite their increased military activities as fighting peaked between 1866 and 1869, resistance became futile as the tribes were outnumbered and outgunned. Massive western migration created an atmosphere in which Indian mili-

tary actions could cause temporary delays but could not halt their defeat. With the escalation of military commanders to a strategy of annihilation, warfare caused increasing numbers of casualties. The number of Indian victims is unknown. The U.S. Army suffered 932 killed and more than 1,000 wounded between 1866 and 1891.

With those last engagements, more than two centuries of military confrontation between Native Americans and Euro-American settlers had ended. The military defeat threatened the very survival of Indian nations and ended tribal control over the trans-Mississippi West. The army gained valuable experience in those decades of war, although its doctrine remained fixed on the wars of Napoleon. Many famous Indian-fighters rose to prominence in military and civilian life as the United States entered the stage of world powers. The expertise of those who militarily matured during the Indian wars provided the backbone of colonial warfare in America's emerging colonial empire.

American Revolution (1775–1783)

The war for independence of the former British North American colonies.

The American Revolution in many ways was a consequence of the Seven Years' War (1756–1763)—called the French and Indian War in America. When that conflict ended, Great Britain had gained much territory from France but had also incurred vast wartime expenses. In seeking to rearrange governance of their territories, especially in North America among the 13 British colonies, formerly French Quebec, and the Native American tribes west of the Appalachian Mountains, and in seeking new sources of taxation to repay the vast debt, the British perhaps inevitably would have angered their American cousins. The king and Parliament wanted to separate the peoples of now larger

British North America; they wanted to reinforce the Navigation Acts and end the long era of “salutary neglect” to strengthen the mercantilist trading empire; and they wanted the colonists who benefited from the results of the Seven Years' War to bear a fair share of the resulting financial costs of the conflict.

Between 1763 and 1774, the king and Parliament in Great Britain and revolutionary leaders in America increasingly and more bitterly disagreed on the meaning of a series of acts; the consequence would be war. At first, the colonists tried to make a case about the rights of Englishmen. This increasingly separate British society in North America interpreted the Proclamation of 1763, the Sugar Act, Stamp Act, Declaratory Act, and Townsend Duties as violating their rights, especially the right of taxation only by one's own representatives—ultimately a call for a separate parliament in America and an anticipation of the dominion theory of government.

Thereafter, the American revolutionaries viewed the so-called Intolerable Acts (really the Coercive Acts and the unrelated Quebec Act) as severe infringements on their basic rights. In 1774, the colonists engaged in actual rebellion by calling for and convening a Continental Congress, an alternate authority to the Crown. Later, in the Declaration of Independence (July 1776), they would hold “these truths as self-evident,” including “life, liberty and the pursuit of happiness.”

When fighting broke out in April 1775 with the British march from Boston to Lexington and Concord and the colonial militia raids on the column on its retreat, the British not unnaturally assumed the fighting would reflect the style of fighting in Europe in the late eighteenth century. Warfare featured small, highly trained armies and navies; the goal was maneuver and demonstration of the helplessness of the enemy—not his destruction, since there was no value in destroying royalty. Armies relied on muskets that were not accurate at long distances. So armies marched in columns; flankers as much sought to keep the columns under control as to seek out the enemy. Having marched in columns typically along well-traveled routes in Europe, armies deployed into lines in a relatively narrow field for battle. The two opposing forces (most often professional lifetime soldiers) would come relatively close—50 or 100 yards—fire a volley or two, fix bayonets, and then charge one another. It was a test of discipline and courage, reflecting brutal parade-ground conditions. Within the confines of this theory of warfare the British excelled, winning all of their eighteenth-century wars to date and almost all of their battles, land or sea.

Indeed, the advantages, based on this style of fighting in mid-eighteenth-century Europe, seemingly rested with the British. An island nation of more than 7.5 million, it outnumbered the 13 colonies in population by three to one.

Great Britain had great wealth; emerging industries capable of supplying the needs of the world's most powerful navy; a highly trained army and the financial resources and royal family connections to hire German mercenaries to augment its forces; and a trained if not evenly effective officer corps.

By the same analysis, the rebellious colonies had real difficulties. Population was thinly spread along 1,200 miles of Atlantic coastline; there were few cities, and they were more locations for trade than for the industry and finance necessary to fight a war. The American colonies had neither army nor navy nor trained officers; there was no central governing authority with real power. Moreover there were many Loyalists in the United States—the number will always be in dispute—who favored the king and continuing ties to the Mother Country. In theory and in practice, they represented manpower to augment trained troops, sources of supply, and information. In addition to the Loyalists, most numerous in New York and the South, there were many Americans who took no side in the conflict, for they wished to avoid authority in all its guises.

However, there were real advantages for the revolutionaries if they would stay the course. Several million Americans occupied a vast land; it was sparsely settled; there were few roads or waterways to connect isolated towns surrounded mostly by independent farmers. The nature of the conflict would differ from the tradition of fighting in mid-eighteenth-century Europe. Indeed, save for the continuing existence of a colonial army, there was no center of gravity whose capture or destruction would cause the American resistance to collapse. Moreover, in this war of attrition, the British did not have unlimited resources. They would have to maintain a secure seaward connection between home and the war front; they would have to support thousands of soldiers many thousands of leagues from home. Taxes were already high to pay for the costs of the Seven Years' War; there was a degree of war weariness in the British population, and there was a risk of imperial overstretch. Committing too many resources to the revolutionary war could mean drawing down defenses in the West Indies, India, Africa, and perhaps even the British Isles. The longer the war continued, the greater the pressure from various domestic interest groups to end it.

Whatever the theoretical advantages of the British, they faced very real and practical problems in winning. They had problems settling on an effective strategy that maintained the initiative. Not only did the British have difficulty finding a center of gravity of colonial resistance, they also changed objectives several times—perhaps an indication they could not understand how to win in this different kind of war. In 1775 at Bunker Hill and in 1776 during the Battles for New York City, the British believed to some extent that the mere

demonstration of their military prowess in battlefield tactics would cause the Americans to concede they could not win, and to return to the fold. The brothers Admiral Richard Howe and General William Howe not only were charged with defeating the colonists in war, they also were commissioners to seek a peace—somewhat contradictory goals that may have caused them to avoid landing the true knockout blow that was within their grasp around New York City, and to ease a reconciliation that, unknown to them, was no longer possible. In 1776 and again in 1777 the British believed that the taking of apparently geographically significant sites would cripple the colonial war effort and compel surrender, as indeed it would in similar circumstances in more populated and more developed western and central Europe. By 1779–1780, the British believed the objective was to locate centers of Loyalism and so they turned south to win at Savannah, Charleston, and Camden, but to lose and ultimately face disaster at King's Mountain, Cowpens, Guilford Court House, and ultimately Yorktown.

No discussion of the difficulties for Great Britain in settling upon an appropriate strategy—at an affordable cost with a convincing explanation to the men at war and the people at home—should underestimate the considerable difficulties faced by the rebellious United States. There was no central authority; the Continental Congress lacked a true executive; and the new states were sources of contending power reflecting the fear of might threatening liberty that motivated the Revolution in the first place. The lack of an effective central government impeded the development of a national economy. Reflecting the mercantilist system the British had sought to establish, the colonies had little industry, few banking or financial resources, and thus little ability to provide for the fiscal needs of war. The colonial militia had not proven particularly effective in the Seven Years' War, and there were few experienced military leaders. Of course, the people were not unified: Somewhere between 20 and 33 percent of the population favored continued ties with Britain; an unknown percentage wanted to keep power at a distance and avoid authority—British or American.

The conflict proved costly for both sides. The British people suffered another conflict at great cost in blood and wealth. About 1 percent of the American population—approximately 25,000 people in a nation of around 2.5 million—died as a result of the war, a higher percentage of American dead than any other conflict save for the American Civil War.

There were several phases to the conflict. From 1775 to 1778, the conflict was largely in the North. In April 1775, the British, wanting to end the rebellion quickly, marched the relatively short distance from Boston past Lexington to Concord to seize colonial weapons and ammunition. The retreat

to Boston displayed the advantages of a militia, armed with relatively effective rifled muskets, firing at a distance from the woods and behind stone walls at British troops marching in formation and easily located in their brightly colored uniforms. Soon thereafter, a huge gathering of New England militia and the hauling in of cannon from captured Fort Ticonderoga caused the British to quit Boston for Halifax, Nova Scotia, and to plan for an offensive the following year.

In summer 1776, a large British navy transported a vast army to New York City and by October the British had defeated the Americans at Long Island, Manhattan, Harlem Heights, and White Plains. The British had followed their strategy of fighting, outflanking one American position after another, and generally made clear the hopelessness of colonial defense. But the American army survived, and George Washington secured vital, morale-boosting victories in December 1776 and January 1777 in the Trenton and Princeton campaign. He crossed the Delaware River on Christmas night, compelled the surrender of German troops in Trenton, surprised Charles Lord Cornwallis, and won at Princeton before retiring to Morristown, New Jersey, for the winter.

In 1777, the British violated the principle of mass, and divided their forces. One army sought to march, row, and portage from Montreal to Albany, where it would join with forces coming from the west along the Mohawk River and up the Hudson River from New York City on the assumption that cutting the colonies in two would result in colonial surrender. At the same time, the British navy transported most of the army in New York City southward for an advance on Philadelphia, the largest city in North America. The result was not what the British had sought. Burgoyne surrendered his bogged-down army at Saratoga in October, having no option of retreat or resupply; the British withdrew from Philadelphia in 1778, demonstrating, perhaps, the uselessness of occupying it in 1777; and finally France, impressed with the infant republic's military successes, entered into a more formal and overt alliance, which made British victory in North America problematic.

After a lull for the better part of a year from mid-1778 to mid-1779, the British looked to the southern colonies to salvage a victory in the increasingly expensive conflict. The French-American alliance after the victory at Saratoga meant increased obligations on the Royal Navy and a dispersion of British strength from North America. Thus, the British army that went south to Savannah in December 1779 was smaller than the British army that invaded New York City in 1776 or that seized Philadelphia in 1777.

The British enjoyed early victories in the southern campaign. After taking Savannah and Augusta, the British quickly regained control over sparsely settled Georgia, protecting British interests in adjacent Florida. The advance

into South Carolina in 1780 brought two major victories and several minor ones. Indecision among civilian leaders in Charleston afforded the British an opportunity to blockade an American army commanded by General Benjamin Lincoln and to compel its surrender. Soon thereafter, the British smashed an American army at Camden in central South Carolina whose commander, Horatio Gates, had foolishly assigned equal combat responsibilities to raw militia as to trained Continental troops. The inexperienced militia fled the field at the first British bayonet charge, and the outnumbered Continental troops fought valiantly but hopelessly.

The Americans rebounded with some luck and the emergence of outstanding leaders who reconciled European military tactics to the reality of the colonial scene. Militia fought militia at King's Mountain in northwest South Carolina, and that American victory threatened the British hold over the recently subdued colony. A classic victory at Cowpens by General Dan Morgan over Lieutenant Colonel Banastre Tarleton in western South Carolina suggested a way to use inexperienced militia to advantage. He only asked the militia to use the greater range of their rifled muskets to fire a few rounds at the advancing British and then retreat; in the end, the Continentals held firm, the militia reentered the fighting, and the British lost in a classic double envelopment. The battle strategy at Cowpens became a campaign strategy of retreat to the Dan River and Virginia and a subsequent battle at Guilford Court House. General Nathanael Greene engaged in a careful retreat, drawing the British under Cornwallis farther and farther from their supplies. Greene then fought on a field he had previously selected. While the British technically held the field, they soon had to abandon it and retreat toward the coast to obtain needed supplies.

Finally, the bankruptcy of the British search for a strategy became clear when Lord Cornwallis, after retreating to Hillsboro and Wilmington, North Carolina, marched into Virginia seeking to destroy a smaller American army commanded by the Marquis de Lafayette and others and then retreated down the York River peninsula to Yorktown. A nearly unique coordination of forces saw General Washington marching down from his siege of New York City, the French supplying payment in gold to American troops—who had not been paid in a year in many cases—and the French fleet winning one of its very few victories over the British navy. For the first time and only briefly, the trident of seapower passed briefly to the French. Cornwallis was besieged by land and by sea and forced to capitulate.

The American Revolution demonstrated the importance of many of the Nine Principles of War. The length of the war front from Massachusetts to South Carolina and Georgia made economy of force difficult. The lack of a true capital or center to the colonial economy made it more difficult to se-

lect a center of gravity to conquer or destroy. The distance of the conflict from the Mother Country prevented the British from employing real economy of force to achieve a continuing mass. And given the sympathies of British and Americans alike, it was hard to maintain security and secrecy.

The conflict also called into question the military tactics that proved effective in Europe. Marching in tight columns with flankers more concerned with keeping men in columns than in defending those columns exposed the British to harassing attacks. The vastness of the country and the distance from England permitted harassing guerrilla attacks on supplies by sea, privateers, and by land, foraging parties. Indeed, the main contribution of the American navy was the actions of private ship captains, so-called privateers, seizing British merchant vessels and selling the cargoes and ships in foreign ports; it was costly and weakened support at home for the British war effort. Finally, it is difficult to see how Great Britain could have held on much longer to a stretch of colonies whose main city, Philadelphia, was the second largest metropolis in the British Empire.

Amiens (1918)

Two offensives from 8 August to 3 September 1918, fought between the Allies under Marshal Ferdinand Foch and the Germans under General Erich Ludendorff. Its aim was to disengage Amiens and the Paris-Amiens railway line and open the northern coalfields to the Allies. Field Marshal Douglas Haig's plan involved the consolidation of Allied positions along the old French front line, which extended from Mericourt to Hangest. While the British were to press the enemy in the direction of Chaulnes, the French First Army was to move toward Roye. Meanwhile, General Rawlinson's

Fourth Army, consisting of three Canadian, two Australian, one American, and two British cavalry divisions, was to form the main assault group. The French and Fourth Army, preceded by tanks, caught the Germans off guard, and by nightfall the Allies were 10 miles inside enemy lines, having captured 15,000 prisoners and 400 guns. This breakthrough could be termed the turning point of the war; as German units collapsed, Ludendorff announced that "the war must be ended," and termed 8 August the "Black day" for the German army. By the time the second offensive began on 21 August the Germans had already evacuated Mondidier, thus freeing the Paris-Amiens railway line. As the Allied forces penetrated across the Somme, taking Peronne, St.-Quentin, Queant, Meautte, and the Arras-Albert railway line, the Germans, whose morale and defenses were low, retreated back to the Siegfried Line. German losses during the Battle of Amiens were 50,000 killed and wounded and 33,000 prisoners. British and Colonial losses were 22,000 and French losses 24,000.

Amin, Idi (1925–)

Military ruler of Uganda (r. 1971–1979). Amin was born in northern Uganda. He joined the King's African Rifles (formerly the Uganda Rifles) and proved successful as a non-commissioned officer and a boxer.

In the Africanization of the officer corps that followed Uganda's independence in 1962, Amin was promoted to captain. Promotions were rapid in the new army, and by 1964 Amin was a colonel. Civilian control of the military proved a serious problem for the Obote government, resulting in numerous attempts at army reorganization. Amin won favor by leading the government's assault on the powerful Kabaka Mutetsa of the Buganda in 1966. By 1968, he was a major general and commander of the army.

Amin began to promote a disproportionate number of northerners, straining relations with Obote. In January 1971 Amin staged a coup. Initially pro-British and pro-Israeli, Amin proved to be an unstable though canny leader.

His foreign policy drew Uganda closer to the Arab world,

offending Israel, and increasing internal repression included the expulsion of almost all of Uganda's Asian population in late 1972. He skillfully exploited ethnic tensions within the army, which he used to crush dissent and threaten Uganda's neighbors.

Amin, ill equipped to lead a nation, became progressively more erratic. In 1976, he allowed a hijacked El Al jetliner to land in Kampala, resulting in the humiliating Israeli commando raid at Entebbe Airport on 4 July. Condemned internationally for human rights violations, Amin was increasingly isolated diplomatically. In March 1978 he attempted to seize part of Tanzania. The resulting counterattack, aided by Ugandan exiles, took Kampala on 11 April 1979 and forced Amin into exile. He eventually settled in Saudi Arabia.

Amin's career is an example of the problems of civil-military relations in the developing world, and his policies had a long-term destabilizing effect on Uganda and the region.

Amoaful, Battle of (Ghana, 31 January 1874)

Decisive victory by British over the Ashanti tribes. The Second Ashanti War was fought over trade routes to the interior and influence on the coast. In February 1873, the Ashanti invaded the British protectorate to safeguard their interests and prevent the further extension of British administrative control. When British allies, the Fante, failed to stop the advance, Gladstone's government committed itself to a military offensive and appointed Garnet Wolseley as commander of the expedition.

On 14 January 1874, Wolseley and 3,500 British, West Indian, and locally raised Hausa troops crossed the Prah River and entered Ashantiland. The Ashanti force, numbering upwards of 15,000, concentrated in and around the village of Amoaful. On 31 January, the British attacked. The artillery laid down barrages as the infantry advanced in loose square formations. By noon, due to the heavy firepower, the Ashanti were forced to abandon the village. Rather than retreat, they launched a determined counterattack. Carrying nothing but muskets and other outdated weapons, the extremely mobile attackers were able to break into many of the squares. British reinforcements, however, threw back the enemy. British casualties were light: 4 dead and about 200 wounded. Ashanti

losses were very heavy; probably more than 2,000 were killed. After the victory at Amoaful, the British advance continued. On 4 February, Kumasi, the political seat of the Ashanti kingdom, fell with little resistance, and the Second Ashanti War was over. The British protectorate over the Gold Coast was further extended and strengthened.

'Amr ibn al-'As (al-Aasi) (c. 585–664)

Arab general who conquered Egypt during the early Arab invasions. A contemporary of the Prophet Muhammad who converted to Islam before the fall of Mecca, 'Amr ibn al-'As rose to become one of the leading Arab generals during the initial Arab conquests. Throughout his career, 'Amr served on numerous important missions. His first major expedition took him to Oman on behalf of the Prophet to convince the local rulers to convert to Islam. 'Amr succeeded on this mission, but during his stay in Oman the Prophet died, prompting 'Amr to return to Medina.

Abu Bakr, the successor of Muhammad, gave 'Amr command of the army to invade Palestine in 633. Although reports of this invasion were conflicting, 'Amr was responsible for the conquest of the Byzantine territories west of the Jordan River. In addition, 'Amr took part in the battles of Yarmuk and during the capture of Damascus.

'Amr's major achievement was yet to come. In 640, 'Amr led another army of conquest into Egypt. There remains some debate on whether 'Amr did this on his own initiative or whether the caliph 'Umar directed him to invade Egypt. In either case, 'Umar ostensibly approved of it, as 'Amr did receive reinforcements and the conquest ended in 642 with the capture of Alexandria. Afterwards, 'Amr contributed greatly to the administration of Egypt and built the city that became Cairo. His career in Egypt, however, was short-lived as the caliph 'Uthman recalled him to Medina.

After this, 'Amr remained absent from major military events until the Battle of Siffin in 657, when Mu'awiyya and 'Ali battled for the caliphate. 'Amr sided with Mu'awiyya and led the cavalry. The battle ended more or less in a draw with the dispute settled through arbitration. Before the decision came, however, 'Amr was able to occupy Egypt and remove

‘Ali’s factions from power there in 658. ‘Amr remained governor of Egypt until his death.

Anaconda Plan (1861–1862)

The strategy adopted early in the American Civil War to strangle and cut up the Confederacy. The commanding general of Union armies, Winfield Scott, proposed the Anaconda Plan, realizing that the war would be long and costly, and that victory would reflect the Union’s superiority in manpower, industry, transportation, etc.—the elements of total war.

He proposed a multipart plan that would take time to put into effect and would require considerable resources. First, the U.S. Navy would blockade southern ports. The Confederacy was deficient in manufacturing and war material, and thus required markets to sell its cotton and other commercial crops. Scott proposed cutting off such contact, depriving the South of trade and income, and squeezing it—hence “Anaconda.”

He then proposed a series of offensives designed to cut the South in half and half again, until its ability to resist was destroyed. He called for a drive along the Mississippi River, to cut off Texas and Arkansas from the rest of the Confederacy; he further proposed a drive through the breadbasket of the South—into Kentucky (which was “neutral” at the time) and Tennessee, into Georgia, and then to the coast. And, if such action did not compel the South’s capitulation, Scott proposed cutting again and yet again.

Initially, this idea met a cool response. Too many northerners (and too many southerners) believed that after one battle and one big victory the other side would give up and there was no need for such a long-term strategy.

Eventually, however, the North very much came to adopt Scott’s idea, with a highly effective blockade reducing the South to occasional blockade “runners” and some raiders, and with a series of offensives in 1863 and 1864 that cut the South into parts and made defeat inevitable.

Anawrahta (d. 1077)

First king of Burma. His exact birth date is unknown. By 1044, he ruled the Kingdom of Pagan on the Irrawaddy River in modern-day central Burma. Through military force and political skill, he united the formerly separate fiefdoms of central Burma and moved to take possession of Arakan and Lower Burma between 1044 and 1056. In 1057, he conquered the kingdom of Thaton, which introduced Theravada Buddhism to Burma. He raided Thailand perhaps as far as the Chao Phraya Valley and guarded his frontier by building a series of forts on the Thai border. He died in 1077 after being gored by a wild buffalo near the gates of Pagan. Anawrahta in effect created the Burmese state and his dynasty ruled until 1287 when Burma was invaded by Chinese forces under Kublai Khan.

Ancient Warfare

A form of warfare practiced exclusively until the development of firearms in most human societies, and more sparsely into the twentieth century. It is characterized by varied forms of organization focused on the use of weapons and mobility motivated by human and animal muscle.

Ancient warfare can be divided into a number of types. These types roughly (but not wholly) correlate with the ability of human societies to organize themselves into more organizationally complex systems, which in turn is highly dependent on the society’s ability to produce material and energy surpluses.

Band

Band warfare is characterized by small-scale operations of face-to-face (all members of a band are known to one another) bands, usually led by one or more experienced or politically powerful war leaders. This form of warfare is the most ancient, limited usually by the small size and resources

of groups who practiced it. As a form of warfare it was practiced well into the twentieth century by native people in areas such as New Guinea and Melanesia, Borneo, and Africa. Larger temporary assemblies of such bands could overwhelm much more sophisticated organizational forms, as Arminius demonstrated at Teutoburger Wald.

The motivation for such war was usually defensive, or raids for women, goods, or trophies.

Mass warfare

With the rise of societies that had sufficient surpluses for permanent leaders and large populations came mass warfare. This was usually characterized by the use of citizen or peasant levies who engaged in warfare at the command of, or in response to, the needs of the city-state. Early Roman military formations, the armies of Ur and early Egypt, and the Athenian *hoplitoi* were of this type. Such armies suffered from an inability to keep in the field during important agricultural periods, as well as a low level of training, uneven equipment distribution (often a soldier had to supply his own kit), and often weak motivation except in defense.

Champion/chivalrous warfare

Practiced in a number of ancient cultures, a heavily (and expensively!) equipped individual with superior training and usually some form of support by servant-soldiers fought his opposite number in a duel-like event. The loser's side forfeited the battle, sometimes being pursued to destruction. Such warfare could be practiced by two sides having the same cultural and religious matrix (as in the case of Homeric Greek champions) or one, the stronger, forcing another side to accept its definition of how warfare was to be conducted. Thus the battle between David and Goliath and the Aztec "Flower Wars" where one side forced a form of warfare on another.

The resources for a culture in champion warfare required pinpoint investment and training. Thus Chinese warring-states champions fought as archers mounted on expensive chariots drawn by expensive horses; Homeric champions required a full set of bronze armor; and Japanese cataphract-knights dueled cap-a-pie with long bows and swords, while the rest of the army was poorly equipped.

Champion warfare was utterly helpless against orga-

nized, objective-oriented armies (although they almost always held such armies in contempt), as the Japanese mounted samurai learned when faced by an organized Mongol invasion in the thirteenth century, and the Native American nations' warriors learned in the nineteenth.

Organized and professional warfare

Organized professional armies emerged in parallel with the other types. They came in a variety of forms, either a core of professionals supplemented by volunteers and levies (as in most Fertile Crescent states, including Egypt and Assyria) or wholly professional armies, such as the Roman army of the Imperial period, and possibly the Chinese army of Qin Shihuangdi (third century B.C.E.). Professional armies were characterized by internal organization into detachments, lines of command, clear ideas of tactics (and often formal manuals), and political-military objectives. Such armies could only be raised and maintained by states with large surpluses, which if depleted, as in the case of the later Roman, became effectively moribund.

Unit types and technology

Two main types of units dominated ancient warfare: infantry and cavalry. Later, ancient armies included engineering and fire-support elements to a limited degree. The type of unit relied on by any particular culture depended on two main factors: available technology and organizational innovations.

Infantry

Infantry was the mainstay of most ancient armies, and tactics and strategy were geared to the extensive exploitation of infantry. Two factors dominate the type of infantry and its capabilities: metallurgy and training, both individual and in formation.

The availability of metals or other hard materials determined the individual soldier's armaments and armor, and thus the possible range of tactics that could be employed. At one end of the scale, stone, wood, and obsidian, along with salt-saturated cotton armor, were the fundamental tools of Aztec and Meso-American warfare. Ancient and Middle Kingdom Egyptian armies relied heavily on stone-headed maces. At the other end were the sophisticated armor and steel weapons of Rome, India, and China.

Major weapons were blades (daggers, axes, and swords) and polearms (spears, pikes, and javelins). Slings and bows provided longer-range support fire. Although the technology did not determine the goals of warfare, it did mean that comparatively little physical damage was done to opponents. Most casualties were sustained as the losing side was slaughtered in flight.

Due to the limitations on a standing army, most ancient armies varied in the degree of training of their components.

Thus the army of Xerxes, the great king of Persia, was composed of discrete national units with training ranging from none to professional, and battle tactics that depended largely on mass effects. The emergence of organized city-states and nations brought ideas of unit cohesion and organization. This allowed armies to apply force multipliers in the form of organized mass tactics. Ur, c. 2500 B.C.E., was first to utilize a phalanx of well-protected spearmen, an art brought to its apotheosis by the Greeks a millennium and a half later. Roman and Chinese organization into flexible company-sized units, who attacked after a barrage of missile fire, was even more effective.

Cavalry

Many armies utilized some form of cavalry (except in the New World) as a shock, scouting, or maneuver element. Cavalry use in ancient warfare was determined by two technological innovations. Until about 400 B.C.E. horses were used more often to pull chariots than in an actual cavalry role. Chariot cavalry evolved in parallel in the Middle East, East Asia, and South Asia, possibly spreading from some common Central Asian source. Egyptian, Assyrian, Indus, and Chinese tactics relied heavily on chariot cavalry. The breeding of horses strong enough and with sufficient wind to carry a man arrived on the scene fairly late in the Middle East and China, earlier, apparently in Central Asia, and quickly superseded unwieldy chariots.

The stirrup allowed a cavalryman a reasonably stable platform for shooting a bow, couching a lance, or delivering a sword cut so that his entire weight lay behind the point. Cavalry was used extensively by Central Asian peoples who invented the stirrup, and those people, the Parthians, Indians, and Chinese, in direct contact with them. By about the fourth century C.E. major armies in Europe were heavily cavalry oriented. This was much less the case in China, where great reserves of manpower meant greater reliance on peasant levies, and even less so in India and Southeast Asia, though even in those areas, cavalry had great impact. Elephants and camels, a form of cavalry, were utilized as well, though rarely to any great effect.

Engineering and siege warfare

Siege warfare was a haphazard affair, and not undertaken lightly, as the records of Thutmose III indicate. The first to set about siege warfare in an orderly and efficient manner were the Assyrians, and a number of records indicate the sophistication of Assyrian siege practices. These included towers, protected wheeled rams, mining, armored archers, and deceit. Less attention was paid to siege warfare in East, South, and Southeast Asia, where doctrine emphasized mobility, and where sieges were usually terminated by stratagem or storm.

Engineers could also be used in the field, and the Roman army excelled in the use of support field artillery, including single-shot and repeating catapults, and ballistae, to support cohorts in the field.

Command and control

Command and control in ancient warfare were extremely chancy due to technical limitations. Sun-tzu's *Bingfa* implies that standard battle communication by flags and trumpet calls was common in the Chinese armies of the Warring States period (fifth to third centuries B.C.E.). The Roman army used a variety of signaling devices.

The band form of ancient warfare invested command in a well-known and experienced war leader, who knew his followers and their capacities and could plan and act accordingly. With the development of mass, and later of organized ancient warfare, this process changed dramatically. Command, often of very large formations, was given to "gentlemen," that is, to representatives of whatever power elite was in control. Though many of these served successfully in what amounted to a training regime, gaining experience gradually, it was not uncommon in any ancient army to appoint a general simply on the basis of his position in the regime. Thus Nebuchadnezzar II of Chaldean Babylon sent his master chef (!), Nebuzaradan, to capture Jerusalem.

Supply

Most ancient armies lived off the country by pillaging as necessary; but the Egyptian army under Thutmose III gives some evidence of a supply train. Assyrian and Chinese armies were accompanied by a well-organized baggage train of supplies, though they too were encouraged to live off the locals for at least part of their support. The Roman army had an efficient supply service, providing troops with standard measures of grain, oil, and wine. At the other end of the scale were ancient armies such as the Mongols, who were able to move rapidly in part because they had no supply train at all: in addition to living off the country, soldiers would sustain themselves by bleeding their horses, or by consumption of dead or lame animals from the strings of horses that each soldier maintained.

Doctrine and manuals

A number of ancient warfare manuals have survived. They represent a vast sweep of ancient military thinking, indicating that in the armies of the great states at least, there were clear standards of military doctrine. Three of these deserve mention, from three different military traditions: Sun-tzu's *Bingfa* (c. fifth century B.C.E.), Kautilya's *Arthashastra* (c. third century B.C.E.) and Vegetius's *Epitoma Rei Militaria* (c. third century).

To summarize very briefly, each of these three manuals or guides reflects the doctrinal imperatives of the society that created them. For the Chinese, warfare was embodied in the imaginative and independent application of general principles, emphasizing dynamism, intelligence work, and strategic oversight. For the Indians, warfare was to be conducted with a firm eye on politics, and on the exploitation, in imaginative ways, of variations on set-piece battles or maneuvers that had been worked out over lengthy periods of time. For the Romans, success in war was a matter of meticulous planning and preparation, and close, even finicky, attention to the minutiae and details of an army's functioning.

Those who believe that military history (and history in general, for that matter) moves from the simple to the complex in a Darwinian arc of progress that flatters our own times might note that illiterate hill peasants in the late twentieth century could be trained in about six weeks on the use of the high-tech American Stinger missile. But it took a lifetime to master the medieval English longbow. The complexity and sophistication of ancient warfare were, on balance, comparable to the conduct of conflict in the modern world.

Anders, Wladyslaw (1892–1970)

Polish World War II commander. Born in Blonie, Russian-occupied Poland, on 11 August 1892, Anders served as a cavalry officer in the Russian Imperial Army during World War I. After the war he was commissioned in the newly formed Polish army and fought against the Bolsheviks during the Russo-Polish War, 1919–1921. The outbreak of World War II found Anders commanding the Novogrodek Cavalry Brigade. He was wounded twice as he led his men against the advancing German and Soviet armies. After being cap-

tured by the Soviets, he was denied medical treatment while being pressured over a period of several weeks to join the Red Army, but continually refused. Anders was then moved to Lubyanka Prison in Moscow, where he was kept under inhuman conditions for more than a year.

After the German invasion of the Soviet Union, Joseph Stalin formally recognized the Polish government-in-exile in London. After being removed from his prison cell, a stunned Anders was informed that he had been promoted to lieutenant general and appointed the commander of all Polish troops in the Soviet Union. But Anders was hampered by Soviet unwillingness both to provide proper supplies and to disclose the location of approximately 15,000 vanished Polish military officers. As a result of both Polish and British pressure, Anders was allowed to move his force into Iran in 1942 so that they could be supplied by the British. In 1943, the Germans discovered the mass graves of approximately 15,000 Polish officers in the Katyn Forrest, which confirmed Anders's worst fears—that the Soviets had murdered all of the missing officers.

The Polish II Corps, as Anders's force was designated, served with distinction during the Italian Campaign, eventually capturing Monte Cassino. At the end of the war, the Polish II Corps was disbanded and the vast majority of its men refused to return to Soviet-dominated Poland. As an ardent anti-Communist, Anders lived in the United Kingdom after the war, and died in London on 12 May 1970. At his request, he was buried alongside his men in the Polish cemetery at Monte Cassino.

Angles, Saxons, and Jutes

Germanic peoples from the Baltic that took part in the settlement of lowland Britain. The Angles are mentioned by the Roman historian Tacitus. During his time (first century) they formed part of the Suevi confederation. The Saxons are called raiders of the empire by later Roman historians, including Ammianus Marcellinus. They came from lands around the lower Elbe and were closely linked with the Angles, who lived immediately to the north. The Jutes have often been associated with Jutland, but archaeological evi-

dence suggests links with the Rhineland Franks. The collective term *Anglo-Saxon*, covering all three peoples, was coined by the Normans.

By the end of the sixth century, Anglo-Saxon war bands and federations in Britain had begun to coalesce into proto-kingdoms: Northumbria, Lindsey, Mercia, Hwicce, Mid-Anglia, East Anglia, Essex, Wessex, Sussex, and Kent. Starting with Bede (673–735), chroniclers identified Seven Kingdoms (the “Heptarchy”), although this may overstate the degree of political distinctions among the various groups. Three of the seven, Essex, Sussex—the kingdoms of the East and South Saxons respectively—and predominately Jutish Kent, but named after the Celtic Cantiaci, are remembered in the names of the English counties. The fourth kingdom, that of the East Angles, lay in the extreme east of Britain. This region is still known as East Anglia. The two other Angle kingdoms were those of Northumbria (the land north of the Humber), and Mercia. Mercia had its origins in the upper and middle Trent Valley but expanded gradually at the expense of its neighbors, the Middle Angles and Hwicce. It eventually took in the whole of what is now the English Midlands. Among these kingdoms, it was Wessex, the kingdom of the West Saxons, that was destined to unite the Anglo-Saxons under a single crown.

In the early archaeology of the period it is often very difficult to distinguish between the graves of late Roman soldiers of Germanic descent and those of continental Saxons. Weapons, buckles, and shields are often identical. There was a Saxon saying that warfare was proper “for a nobleman,” and male burials in Britain during the pagan period were often accompanied by war gear. Chieftains and more important noblemen would possess a mail-shirt (*byrne*) and a crested helmet (the *Spangenhelm* type being common), a sword, shield, and spear(s). The early Anglo-Saxon mail-shirt reached to just below the waist and had short sleeves. Noblemen of middling rank may have possessed a helm, perhaps a sword (an expensive item requiring skill in its production), and a shield and spear(s). The lowest-ranking warriors would have been equipped with just a shield and spear(s), and perhaps also a secondary weapon such as an ax or *seax*. This was the long single-edged knife from which the name *Saxon* derives. Primarily an everyday tool, it could also be used to finish off a felled opponent in battle. Although the main weapon was the spear, not only for the peasant but also for the professional soldier and even the nobility, all warriors carried the *seax*. The wearing of a knife may have actually been a symbol of freemanship. Saxon shields, round or near-round ovals in shape, were stoutly made of solid planks of linden wood and with heavy projecting iron bosses. Although bows were widely used by the continental Saxons, the Anglo-Saxons seem to have used the

bow mainly for hunting, displaying certain disdain for its use in battle. Bows were mainly made of yew, elm, or ash.

Anglo-French Wars (1542–1628)

Conflicts between the English and French between the reigns of Henry VIII and Louis XIII. These were not the most decisive wars in European history, but the fighting did exemplify the changes taking place in warfare at the time. The fortress design revolution, the greater reliance on gunpowder weapons in battle, and the increasing size of armies made this period of warfare between England and France an important transition in European warfare. In addition, the administrative improvements that took place during the sixteenth and early seventeenth centuries enabled the French and English to fight nearly constant warfare, spreading across four dynasties (Valois and Bourbon, Tudor and Stuart).

French preoccupation with its own religious civil wars meant that it had little energy to devote to war with its main Protestant rival. English preoccupation with the Spanish meant that France was not England's main focus. However, the two nations did differ constantly, participating on either side of no less than three major series of wars in Europe, including the German Wars of Religion, the Revolt of the Netherlands, and the Thirty Years' War.

In the Anglo-French War of 1542–1546, Henry VIII joined the Hapsburg Dynasty in a war against the Valois. The English captured the port of Boulogne. Though they had gained a French port, the war cost England 2 million pounds. Years of border skirmishes short of all-out war followed. When hostilities reached all-out war in 1549, the French king Henry II declared war with the intention of retaking Boulogne, which reverted to French control in 1550.

In 1557, England's Queen Mary drew her country into a war allied with Spain, whose king was her husband, though the war was very unpopular with the Protestant English people. During the Anglo-French War of 1557–1560, Mary managed to lose England's last continental foothold in the port of

Calais on French territory. When Elizabeth succeeded Mary to the throne, religious and political differences split the fragile Anglo-Spanish alliance.

In the Anglo-French War of 1589–1593, Elizabeth I embroiled England in the great Protestant-Catholic wars on the Continent. Protestant England sided with the Protestant Dutch rebels against Spain while France supported fellow Catholic power Spain. Later, England sided with the Huguenot (Protestant) French against the Catholic Valois in the French Wars of Religion, a series of French civil wars primarily over religion. In 1589, after defeating the Spanish Armada, Elizabeth I sent troops to aid the French Protestants. In the Anglo-French War of 1627–1628, known in France as the Third Bearnese Revolt, England again came to the aid of Huguenot rebels fighting the French government.

The Anglo-French Wars between 1542 and 1628 may have centered on the religious differences between Catholic France and Protestant England, but major changes taking place during the military revolution permitted the two major European powers to battle each other constantly and to little conclusion.

Anglo-Scots Wars (1290–1388)

England tries to subdue Scotland. The thirteenth century witnessed many wars within England and Scotland, but no conflict between the two kingdoms until its last decade. The deaths of Alexander III, in 1286, and of his successor, Margaret, the Maid of Norway, in 1290, left Scotland exposed to the hazards of a disputed succession. With a dozen claimants to the throne, the Scots asked Edward I, king of England, to mediate. His nomination of John Baliol as king was a reasonable decision but for the fact that Edward used his position to exact recognition of English overlordship. Further demands pushed the Scots into an alliance with France. In 1296, despite the distraction of a Welsh rebellion, the English "conquered the Kingdom of Scotland and searched it through in twenty-one weeks." Baliol was forced to abdicate and Edward assumed for himself the title of king of Scotland, but, to use the Clausewitzian dictum, the English found it "easy to conquer but hard to occupy."

English behavior aroused bitter hatred and this led to the 1297 uprising. Raids into England, in turn, provoked the English invasion of 1298. Despite the overwhelming victory at Falkirk in that year, the English were unable to subjugate Scotland until 1305 when William Wallace was captured and executed. Thereafter Robert Bruce emerged as Scotland's leader and king, and between 1307 and 1314 the Scots largely cleared their country of the English: only Stirling, Dunbar, and Berwick remained under English control.

The attempt to relieve Stirling resulted in the disaster at Bannockburn (24 June 1314). A renewed English attempt to invade Scotland in 1322 again ended in emphatic defeat, this time at Byland. The Peace of Northampton, concluded in 1328, brought English recognition of Scotland's independence.

This independence survived the disastrous Scottish defeats in 1333 (at Halidon Hill) and in 1346 (at Neville's Cross), but in the 60 years after Northampton, Anglo-Scottish conflict was not so much national as cross-border raiding by local magnates as the outbreak of the Hundred Years' War forced the English to adopt a defensive posture. Thus the disastrous English defeat at Otterburn in 1388 was less a Scottish as opposed to a Douglas victory. It was part of the continuing cross-border raiding that plagued the area. Likewise, the Scottish defeat at Homildon near Woolmer in 1402 was a Percy victory.

Cross-border raiding continued intermittently over the next century with both sides seeking to profit from the other's distractions and civil wars. After Homildon there was no conflict between the English and Scottish kingdoms until 1513, and the Battle of Flodden.

Anglo-Scots Wars (1513–1560)

Intermittent conflicts in Scotland that eventually ended the French presence and ensured English dominance. In 1503, James IV of Scotland, having temporarily tamed the McDonald clan and set his domestic affairs in order, married Margaret Tudor, sister of Henry VIII, as part of a truce that

would allow Scotland to develop in peace with its southern neighbor. Instead, under the guise of building a fleet to fight the Turks, James IV engaged in an arms race with England, while still earning the name “Rex Pacificator” for not joining with France. In 1513, however, he renewed the “Auld Alliance” when France was attacked by Spain, England, the Pope, and Venice, and took an army over the Tweed, successfully besieging four English castles before being routed at the Battle of Flodden on 9 September 1513, at which James IV and most of the Scottish nobility were slaughtered.

Scotland was now in the hands of regents, ruling in the name of James V, a child, and policy shifted from pro-French to pro-English until 1528, when James came of age. He then made peace with England in order to restore law and order to Scotland before making a marital alliance with France by marrying first Madeline de Valois and then Marie de Guise in 1537. War flared again when several Irish chiefs offered James V the crown of Ireland, enraging Henry VIII, who sent an army to lay waste. When Scottish nobles, remembering Flodden, refused to go to war, James V led a small army to doom at Solway Moss on 24 November 1542, after which he died of exhaustion and defeat, leaving Mary Stuart, an infant, as queen under the regency of Marie de Guise.

Henry VIII wanted the infant queen as a bride for his son, Edward VI, a marriage that would unite the kingdoms, and sent an army to seize her. In the subsequent “Rough Wooing,” carried out after Henry VIII's death by Protector Somerset, the English, with help from the McDonalds, marauded the borders for four years, until French troops arrived to assist the regent by reducing the Castle of St. Andrews by sea with naval guns, where English-backed rebel assassins were hiding. Peace was signed in 1549, and the child queen was smuggled to France as the wife of the dauphin, Francis II. During the reign of Mary I, Scotland and England remained at peace, but internally Protestants assailed the regent and her French garrison, led by John Knox and many of the nobles.

The accession of Elizabeth I in 1559 led to open English support for the Protestants against the regent, including an English fleet that arrived at Leith to harass the French troops. The war ended in 1560, when Marie de Guise died, and Mary, Queen of Scots, widowed in France, returned to Scotland to rule and signed the Treaty of Edinburgh, recognizing Elizabeth I's right to rule England, and stipulating the withdrawal of English and French troops from Scottish soil.

Anglo-Sikh Wars (1845–1849)

Two conflicts between the Sikh nation and the British East India Company, resulting in Britain annexing the Punjab, the Sikh homeland. In 1845 the largest and best-trained native army on the Indian subcontinent was the Khalsa, which Maharaja Ranjit Singh, the founder of the Sikh kingdom, had built on the Napoleonic model. A fierce power struggle erupted upon Ranjit Singh's death in 1839, because his son and heir, Dalip Singh, was only two years old. The Khalsa was the dominant political force, but it was essentially leaderless. The British grew fearful of its 45,000 infantry, 26,000 cavalry, and 376 cannon. Governor-General Sir Henry Hardinge mobilized south of the River Sutlej, the boundary of the Punjab.

Around 11 December 1845, five divisions of Sikhs crossed the Sutlej, forcing the British to withdraw southeast. Lal Singh and Sir Hugh Gough fought to a bloody draw at Mudki on 18 December. At Ferozeshah on 21–22 December, Gough's 22,000 routed 35,000–50,000 Sikhs under the split command of Lal Singh and Tej Singh. The two Sikh commanders unwittingly aided the British by not trusting each other, not communicating, and keeping their forces separate. At Aliwal on 28 January 1846, Sir Harry Smith's 10,000 caught an undetermined number of Sikhs under Runjoor Singh in a classic pincer attack.

After Aliwal, the Sikhs abandoned all territory south of the Sutlej except a heavily fortified three-mile stretch of shoreline at Sobraon, where Tej Singh garrisoned a nest of concentric entrenchments. On the north shore, Lal Singh commanded artillery. A bridge of boats spanned the river. Gough's 30,000 advanced against the 25,000–40,000 Sikhs just after midnight on 10 February, began heavy bombardment at dawn, and broke through in midmorning. As the Sikhs tried to flee, the bridge collapsed and thousands drowned.

The British occupied Lahore, the Sikh capital, on 20 February. By the terms of the treaty imposed on 11 March, the Sikhs had to cede much territory, pay reparations, limit the Khalsa to 20,000 men, and recognize the joint authority of Dalip Singh as raja, his mother Jindan as regent, Lal Singh as vizier, and Sir Henry Lawrence as British resident.

The Second Anglo-Sikh War began in April 1848 when Diwan Mul Raj, a minor Hindu leader, revolted. Governor-General James Andrew Broun Ramsay, Earl and Marquis of Dalhousie, sent three British columns and one Sikh column

to capture Mul Raj's fortress at Multan. The Sikh column, led by Shere Singh, defected on 14 September, forcing the British to raise the siege and await reinforcements. Dalhousie sent Gough to the northwest frontier of the Punjab, but ordered him to undertake no offensive operations north of the River Chenab until after Multan fell. Shere Singh outmaneuvered and ambushed Gough at Ramnagar on 22 November, inflicting significant casualties. The British completed their siege of Multan on 4 January 1849, sacked the town, and massacred the inhabitants.

At Chillianwallah on 13 January, Gough's 14,000 faced Shere Singh's 30,000–40,000 along a five-mile front. After an hour of only artillery engagement, Gough attacked through dense jungle where hand-to-hand fighting favored the Sikhs. Three hours later Gough ordered retreat.

At Gujerat on 21 February, Gough, now reinforced and commanding 23,000 men, was more careful than he had been at Chillianwallah. He gathered sufficient intelligence about the strength and position of Shere Singh's 60,000, neutralized the Sikh batteries with artillery, broke the Sikh lines with well-coordinated infantry attacks, and pursued with cavalry. The Khalsa surrendered. Dalhousie annexed the Punjab in March, but scattered resistance continued through April.

Anglo-Spanish War (1585–1604)

Conflict resulting from growing rivalry between Spain and England, once traditional allies, encouraged by the temporary neutering of their common enemy, France, as a result of the French Civil Wars. The issues included the English desire to enter the lucrative New World trade, which Spain was attempting to monopolize. Religious differences also separated the two nations in the wake of the English Reformation. However, the main cause of this conflict was undoubtedly the Spanish deployment of its powerful Army of

Flanders in the Low Countries. While its primary mission was to end the revolt of the Netherlands against Philip II, the presence of this large professional force, especially near the North Sea ports, was considered a security threat by the English. Following the arrival of this force in the Netherlands in 1567, Elizabeth I allowed English privateers to begin raiding the Spanish New World, and English “volunteers” (often raised and supported by the Crown) to serve against the Spanish forces in the Low Countries. This initiated a two-decade-long balancing act, during which Spain and England moved gradually toward open war.

Open warfare effectively began in August 1585, when Elizabeth I signed the Treaty of Nonsuch, guaranteeing English military support to the Dutch rebels. At the same time she released Sir Francis Drake to carry out a large expedition against the Spanish New World, and mobilized her home defense forces in case of Spanish attack. The latter was a wise move, for with the Treaty of Nonsuch Philip II finally resolved to undertake an invasion of England, and began mobilization of forces that would eventually comprise the Great Armada of 1588.

The war was waged on both land and sea. In the later 1580s English forces under the Earl of Leicester and then Lord Willoughby faced the Spanish in the Netherlands under the Prince of Parma in a series of largely indecisive actions that tied down significant numbers of Spanish troops and bought time for the Dutch to reorganize their defenses. At sea, English forces under Drake effectively raided the New World, and then the Spanish coast itself in 1587, delaying the Spanish attempt to invade England until 1588.

The defeat of Philip’s Armada in 1588, due to a combination of poor planning, bad weather, and English naval activity, is often considered the decisive point of the war, but in fact England’s attempt to counterattack with an invasion of Portugal, commanded by Drake and Sir John Norreys, also failed, and Spanish sea power gradually recovered. An extended stalemate followed, as both sides were drawn into the final round of the French Wars of Religion in the early 1590s. Both Spain and England deployed expeditions to Brittany in this period, enterprises that ended in 1594 when Norreys destroyed Spanish fortifications threatening the Brest harbor. This was an important victory, as it deprived the Spanish of a base for a renewed attempt to invade England. The Earl of Essex and Lord Admiral Charles Howard further forestalled the Spanish by launching a major expedition to Cadiz in 1596, successfully taking the town and inflicting substantial damage on Spanish shipping.

Nevertheless, despite these preventative actions, England faced “Armada scares” in 1596, 1597, and 1599. The Spanish fleet approached the English coast on each of these occasions, only to be dispersed yet again by bad weather. In 1600,

Spanish forces actually managed to land at Kinsale in Ireland in support of Hugh O’Neill’s rebellion there, but were contained and subsequently defeated by the rapid reaction of Charles Blount, Lord Mountjoy.

By the late 1590s, the war was proving to be a serious financial drain on both sides, and the source of growing internal dissent in England. The death of Philip II in 1598 removed one obstacle to a negotiated settlement, but believing they were near victory, the Spanish continued the war until the defeat of O’Neill’s rebellion in Ireland convinced them otherwise. The almost simultaneous death of Elizabeth I, and the succession of the pacifistic James I in early 1603, cleared the final barrier to a negotiated peace, which was concluded in August 1604 with the Treaty of London.

Anglo-Zulu War (11 January–1 September 1879)

Battle that shattered the military power of the Zulu kingdom, leaving it vulnerable to colonial dismemberment. On 11 January 1879, British and colonial forces under Lieutenant General Lord Chelmsford invaded the Zulu kingdom with the objective of eliminating it as a military power in southern Africa. Three columns totaling 18,000 men were to converge on oNdini, King Cetshwayo’s capital, rapidly forcing a battle where their superior military technology would secure a decisive conclusion to the campaign.

However, inadequate transport and supply bogged down the British advance, and Chelmsford’s strategy was dislocated on 22 January when the main Zulu army of 24,000 men outmaneuvered, divided, and annihilated the British center column at Isandlwana. The Zulu failure that same night to capture the center column’s depot at Rorke’s Drift, and the inability at Nyezane of the Zulu coastal army of 6,000 men to prevent the right column from fighting its way through to Eshowe, did not alter the situation. Chelmsford was forced onto the defensive, and had to raise more than 8,000 Black levies to defend the borders of Natal. Meanwhile, the Zulu blockaded the right column in Fort Eshowe, and only the left column under Colonel Evelyn Wood based at

Khambula in northwestern Zululand retained the initiative through mounted raids.

Lack of commissariat arrangements and the requirements of ritual purification after battle meant the Zulu were unable to mount a sustained campaign and press their advantage. But they were ready for a second round by March. On 29 March the main Zulu army assaulted Khambula, but the British routed them in the most tenaciously fought and decisive battle of the war. At Gingindlovu on 2 April the Eshowe Relief Column broke another Zulu army and evacuated the Eshowe garrison. Zulu morale never recovered from these two defeats, for they reconfirmed the lesson of the war of 1838 against the Voortrekkers that warriors armed mainly with sharp-edged weapons were helpless against concentrated firepower from behind all-round defenses.

Chelmsford launched his second invasion in May, offering lenient terms of surrender, which increasingly detached Zulu support from Cetshwayo. While the 1st Division moved clumsily up the coastal plain, the Second Division advanced into the Zulu heartland from the northwest in cooperation with the left (now flying) column. Drawn up in an impenetrable infantry square, this joint force conclusively routed the Zulu army at Ulundi on 4 July. Flying columns during July and August completed the pacification of Zululand, and any lingering resistance ended with the capture of the fugitive King Cetshwayo on 28 August. The Zulu formally surrendered on 1 September and the British withdrew. Zulu military power never recovered.

Angolan Civil War (1975–1991)

Following the overthrow of the fascist regime in Portugal in 1974 by the armed forces movement (MFA), negotiations began on a program for Angolan independence. A transitional government was established, consisting of Portugal and the three nationalist groups: the Popular Movement for the Liberation of Angola (MPLA), the National Front for the

Liberation of Angola (FNLA), and the National Union for the Total Independence of Angola (UNITA). However, this arrangement broke down and the country was plunged into civil war. Angola was invaded by regular troops from Zaire in support of the FNLA and by South African regulars in support of UNITA.

The invasions failed, and the MPLA, backed by combat troops from Cuba, Guinea, and Guinea-Bissau and with equipment from Mozambique, Nigeria, and Algeria, was able to seize control of the bulk of the country by early 1976. Many years were to pass before the FNLA and FLEC (Front for the Liberation of Cabinda, a smaller rebel faction in the far north) were crushed. UNITA continued to wreak havoc in the south and southeast, though its fortunes waxed and waned according to the extent of South African and U.S. involvement at any particular time; UNITA was receiving up to U.S. \$50 million a year in covert aid from the United States at one point.

Even at the height of the Cold War, though, the internal conflict never prevented the United States or other Western countries from doing business with Angola or exploiting its oil reserves. Oil companies operated in the Cabinda enclave for many years, more or less unaffected by the turmoil in the rest of the country other than a South African-inspired attempt to destroy their installations in 1985. Though thwarted by the Angolan armed forces, had it succeeded it would have crippled the Luanda government (around 95 percent of Angola's exports are oil-based). Additionally it would have been a diplomatic coup for the South Africans because they would then have been able to claim that the Luanda government was obviously a communist client state.

A high-level meeting was held in Luanda in early 1988 among American, Cuban, and Angolan government officials in an attempt to hammer out a settlement—the withdrawal of the Cuban troops in return for peace in Angola and the independence of Namibia. This proposal was certainly a step in the right direction, but in practice did not result in serious disengagement until 1990, following the independence of Namibia and the demise of communism in Eastern Europe and the USSR.

Despite having to rely heavily on assistance from its socialist allies, Angola has been reestablishing ties with the U.S. and other Western countries since the early 1990s. A cease-fire was signed in Lisbon in June 1991 between the Angolan president, Jose Eduardo dos Santos, and Jonas Savimbi, the leader of UNITA. The agreement provided for the integration of government and rebel troops into a new, reduced national army of some 50,000, the withdrawal of all foreign troops, and multiparty elections to be held under UN supervision. The agreement has been holding, more or less, into the twenty-first century.

Angolan War of Independence (1962–1975)

Angola has a history of occupation dating back to the Portuguese settlement established at Luanda in 1575. Popular resistance to colonial rule had its roots in the system of forced labor; after World War II spontaneous clashes between the various African communities and the colonial administration became increasingly frequent. In the 1960s this resentment flared into full-scale war.

Three indigenous Angolan political movements rose to the forefront in this time. The Popular Movement for the Liberation of Angola (MPLA), receiving substantial assis-

tance from the USSR and its allies, emphasized the importance of transcending tribalism. The National Front for the Liberation of Angola (FNLA) appealed to tribal allegiances in the country's north and was supported by Zaire and a number of Western countries opposed to a communist takeover of Angola. Finally the National Union for the Total Independence of Angola (UNITA), coming onto the scene in the late 1960s, drew the bulk of its support from the south, forming an open alliance with right-wing Portuguese forces and later South Africa.

The war began in early 1961 with attacks on prisons in Luanda and coffee plantations in northwest Angola. For four months the area under attack increased until it covered all of northwest Angola. These actions caught the Portuguese government of Antonio Salazar off guard. Salazar realized that these were more than isolated peasant rebellions, and large contingents of regular troops soon arrived in Luanda by steamship.

The ground forces quickly occupied the areas in question, and by 1 July 1961, Portuguese troop strength in Angola had reached 17,000. The military instituted a Strategic Hamlet policy similar to that used in Vietnam. Meanwhile, the MPLA forces had to pull back over the border into

newly independent Congo, while the FNLA operated out of Zaire.

International pressure, both from the United Nations and a strange coalition of the United States and newly independent African countries, was quickly tying Portugal's hands. The MPLA and FNLA were waging an increasingly successful media campaign, but by 1965 the war had reached a stalemate.

Portugal had succeeded in recapturing control of all the towns and plantations in the north. But Angolan nationalists, with added pressure from other rebel groups, were forcing Portugal to spend almost half its national budget on defense. Fifty thousand Portuguese troops were tied down in Angola alone. The end of the 1960s brought UNITA to the fore, and saw the three Angolan independence movements fighting as much with each other, or seeking a solution to their internecine warfare, as with opposing the Portuguese.

By the 1970s, with MPLA and FNLA conducting cross-border attacks from Congo and Zaire, respectively, and UNITA operating in the center of the country, the Portuguese were growing weary. In both Lisbon and Luanda, there was a growing sense that the African Empire had passed the peak of its importance. With the Portuguese coup of 1974, the new Lisbon government sought immediately to transition the country to independence.

The Portuguese tried to form a transitional power-sharing government with all three warring parties. However, when it became obvious that the parties were intent on seizing power by force, the Portuguese government quietly left on 10 November 1975, handing power to the MPLA and setting the stage for the 15-plus years of civil war to come.

Animals in War

Man's companions in battle. If war is defined as organized violence in the service of the state, arguably animals have been participants from the beginning: horses in both the combat and logistical roles, mules and oxen and camels as beasts of burden, dogs as guards and fighters, birds as messengers, etc.

Though animals have been admired throughout military history, their limitations in war are often the most striking thing about their use. In animal-dependent logistical systems, there is the tyranny of fodder. Under nineteenth-century criteria a man needed three or four pounds of supplies on a daily basis, as compared to a mule or horse, which needed more than twenty pounds of grain and hay to function. Assuming such food is not available on the march and a given supply train has to carry its own supplies, the reasonable radius an army could operate from its source of supply was estimated to be a hundred miles.

Even with the rise of the railroad, providing strategic logistical support, armies were still dependent on horses and mules for supply at the operational and tactical levels of war into the middle of the twentieth century. Even in World War II, only the American and British armies were able to forgo the use of animal transport except in certain specialized circumstances, such as mountain and jungle warfare.

For example, the German army in its prime of 1941 had some 600,000 horses to support a field force of more than a million men during the invasion of the Soviet Union. Both sides used large numbers of horses in the eastern campaigns. The irony is that Germany, the power that symbolized mechanized warfare, came to be ever more dependent on literal horsepower as the war progressed, due to fuel shortages, disruption of industrial production due to the Allied strategic bombing campaign, and disjointed industrial planning.

With the decimation of animal populations in two world wars and ever-increasing industrial output, the post-World War II period has seen the near demise of animal transport. Still, there is always the specialized circumstance, such as in 2000 when an Ethiopian army, using pack animals as transport, was able to forge mountainous territory in its final offensive against Eritrea.

Besides being the mainstay of logistics until relatively recently, there is also the application of animals to communications, mostly in the form of dogs and pigeons.

While there are traditions of pigeons being used to carry messages going back to the Bronze Age, the real boom in the use of carrier pigeons occurred during the Franco-Prussian War. With that conflict, the birds were a mainstay, keeping communications open during the siege of Paris. This example having been set, various armies set up pigeon services that were maintained until the rise of the radio; by 1887 Germany is said to have had eight regional lofts with some 400 birds at each installation. During World War I, as many as 500,000 of the birds may have been used in the course of the war.

While there have been experiments with ocean mammals, such as dolphins and sea lions, in guard and recovery

roles, the other most notable use of animals in war has been that of the dog.

While it was no doubt an obvious choice to make to take dogs to war, considering that war probably first evolved from the hunt, some traditions are better documented than others. In the Bronze Age, Assyrians, Babylonians, Greeks, and Persians all made use of war dogs, not simply as sentry animals, but also as packs of implacable attackers in the front ranks of battle. The Romans then acted as a channel for this tradition to be transferred to western Europe, where it was maintained until the gun made this role impractical, except in an environment such as the colonial wars against traditional peoples. A reprise of this role was the desperate use by the Soviets of antitank dogs: animals trained to run under German tanks in World War II while bearing explosive charges.

More typical is the use of dogs as scouts and sentries, where their alertness and sense of smell make them of value as trackers. Related to this is the use of the animals as retrievers in World War I, where Red Cross dogs were sent into no-man's-land to help wounded soldiers. Even with advances in robotic technology, the dog at least still seems to have a future in specialized military roles.

Antietam/Sharpsburg (17 September 1862)

The bloodiest single day in U.S. history. Confederate general Robert E. Lee believed in an offensive/defensive strategy for the Confederacy, and thus proposed to follow up the victory at Second Bull Run/Manassas Junction with an invasion of the North. Using cavalry along the passes to screen movement of infantry units, Lee had an ambitious plan to seize Harper's Ferry, take several other towns for their supplies, and eventually wheel the Army of Northern Virginia around Washington, D.C., into Pennsylvania.

In one of the strange twists of fate, one set of orders were lost, and eventually came to the attention of Union general

Battle of Antietam, 1862. (Library of Congress)

George McClellan. Moving slowly, McClellan missed an opportunity to put the larger Army of the Potomac between the smaller units of Lee's badly divided army.

Lee drew his army together along Antietam Creek in Sharpsburg, Maryland, with the Potomac River to his rear—hardly an ideal defensive position. D. H. Hill's division had slowed the Union advance at Turner's Gap while Stonewall Jackson captured Harper's Ferry and 12,500 Union troops. McClellan tossed away his advantage by having Joseph Hooker's corps attack from the Union right in early morning, his center under Edwin Sumner attack at noon, and Ambrose Burnside's corps attack from the Union left in late afternoon, permitting Lee to shift his few reserves to meet each threatened Union breakthrough. Indeed, at the crucial moment, A. P. Hill's division arrived from Harper's Ferry and drove back Burnside's men, who were about to break through the weakened Confederate lines. McClellan held more than 20,000 troops in reserve (who might have affected the outcome). But the irresolute commander, fearing a Confederate trap, did not continue the battle on the following day or pursue Lee as the Confederates crossed the Potomac River and retreated to Virginia.

Antietam was the single bloodiest day in American history, with more than 23,000 casualties on both sides. Combined with Bragg's ineffectual battle at Perryville, Kentucky, this truly was the Confederate high tide.

Antioch, Battle of (Syria, 1098)

The First Crusade's victory at Antioch established a Latin state in the Middle East and divided the crusader leaders by petty jealousies. The Battle of Antioch existed in two stages. The first part consisted of the crusaders' siege of Antioch, the second of their defense of the city.

On 20 October 1098 the crusaders, led by Bohemund of Taranto and Raymond of Toulouse, entered the territory of Yaghi Siyan, ruler of Antioch. The crusaders did not immediately assault the city, as Bohemund hoped to win the city through subterfuge and then keep it for himself.

Despite sorties from the Yaghi Siyan's armies and diminishing supplies, the crusaders slowly continued to surround the city through the construction of their own fortifications. During this period they also routed two relief armies.

Bohemund eventually secured an ally within the city. In accordance with their plan, Bohemund led the crusader army away. Then on 3 June, 60 knights entered a tower, which the traitor Firuz commanded, by climbing a ladder. These knights then seized two other towers and lowered ladders for the rest of the infantry as well as opening the gates. The crusaders charged in and by nightfall the Turkic garrison was defeated.

Despite their victory, the approach of Kerbogha of Mosul loomed over their heads. On 7 June 1099, Kerbogha camped before Antioch. After failed negotiations on 28 June 1098, the crusaders marshaled their army before Antioch. The knights advanced through a hail of arrows from the Turkic horse archers. This failed to stop them and panic seized the Muslim army. Kerbogha attempted to turn a flank, but Bohemund countered it adeptly. Kerbogha's forces began to desert. In a rare episode of discipline, the crusaders did not pillage their camp but pressed home their advantage and completely routed the Muslims.

Antwerp, Siege of (1585)

Central episode in the revolt of the Low Countries against Spain. The siege was conducted by Philip's general Alexander Farnese, the prince of Parma, between September 1584 and August 1585. In taking the supposedly impregnable city, Parma would establish himself as one of the great military engineers of all time.

Conditions for such an attempt on the strongest citadel of the Dutch rebels were good in the summer of 1584, as the assassination of William the Silent on 10 July 1584 had left the rebels leaderless. It was believed that the fall of Antwerp would finally break the back of the rebellion while restoring to Philip II's control the largest port in Europe.

Parma, knowing the defenses were extremely strong and surrounded by low-lying country, which the defenders flooded, eschewed a standard close siege and settled for an extended blockade, building forts on all routes into the city. The final piece of his investment was the construction of a vast fortified bridge across the Scheldt River, which effectively cut off the city from the sea. A Dutch small-boat attack against this construction failed on 22 December. Likewise, an attempt to destroy the completed ridge with two incendiary ships designed by Francisco Giambelli also narrowly failed on 5 April, although heavy casualties were inflicted on the Spanish, with Parma himself narrowly escaping death. The final hope of the city was for outside intervention: It was believed that Queen Elizabeth I of England would be reluctant to let this important port fall into Spanish hands. Ironically, the city was forced to surrender by starvation on 17 August, only one day before Queen Elizabeth finally decided to commit and ordered Sir John Norreys to take 4,450 English troops to relieve the city.

Anzio, Battle of (22 January–23 May 1944)

Allied amphibious attempt on the west coast of Italy to outflank the German defenses along the Gustav Line and at Monte Cassino 60 miles to the south. Anzio was some 35 miles south of Rome. A near-disaster, Anzio (Operation SHINGLE) became one of the most controversial operations of World War II. What some consider to be one of the great missed opportunities of that war others regard as an ill-conceived gamble. Winston Churchill later wrote that he had hoped the Allies were hurling a wild cat onto the shore but that all they got was a stranded whale.

Commanded by Major General John P. Lucas, units of the VI Corps (Fifth Army) came ashore at Anzio and nearby Nettuno on 22 January 1944 against practically no opposition. With only two divisions in the first wave, Fifth Army commander General Mark Clark told Lucas not to take risks. The German commander in Italy, Field Marshal Albert Kesselring, reacted quickly and within days he had no less than six divisions of a hastily improvised Fourteenth Army, commanded by General Eberhard von Mackensen, besieging the Allied forces. The Germans made vicious but unsuccessful attempts to drive the Allies back into the sea, and Anglo-American forces reciprocated with attempts to break out

of the vise. Although SHINGLE's primary purpose was not achieved, the operation was not a failure. Anzio helped to draw into Italy German troops from as far away as the Balkans, France, and Germany itself.

It was not until May that VI Corps broke out and linked up with Fifth Army, and began the victorious march on Rome. Allied casualties were approximately 7,000 killed and 36,000 wounded or missing in action; 44,000 were disabled with injuries or sickness. German losses were estimated to have been 40,000, including 5,000 killed and 4,500 captured.

Apache Wars (1860–1886)

Sporadic but bloody outbreaks of violence across the desert Southwest as the U.S. Army stamped out resistance to white settlement in the area. In 1848, after American rule replaced that of Mexico following the Mexican-American War, relations with most Apache tribes failed to improve. American trappers, miners, and settlers continued to penetrate the region, especially after the California Gold Rush. At the same time, the Apaches continued to raid both north and south of the new border. Conflict was almost inevitable.

Several military outposts were established in the region during the 1850s but failed to bring the Apaches under effective control. In 1860, the Apaches and their relatives, the Navajo, commenced wide-scale raids and depredations. This Apache war continued until 1865. With regular army troops sent east at the start of the American Civil War, militia troops attempted to hunt the Apaches led by Cochise. In late 1862, having made no apparent progress using unreliable irregulars, regular troops had to be recalled from the East. In 1863, the noted Indian-fighter Christopher "Kit" Carson implemented a scorched-earth campaign in which Apache males were simply shot, regardless of the circumstances, and Apache women and children were rounded up and imprisoned. By 1865, those Apaches who were not already dead or captured had been driven into the mountains.

In 1871, the Apaches banded together to cut another swath across Arizona and New Mexico. U.S. troops under General George Crook successfully duplicated Carson's feat. Cochise's band was pacified by 1872, but other warring bands under the war leaders Victorio and Geronimo continued to operate sporadically. By 1873, the Apaches had had enough. Hunger had taken its toll, and the tribe, especially

the women and children, were exhausted. The Apaches were unceremoniously installed on a nearby reservation.

By 1876, the war had returned. Led again by Victorio and Geronimo, the Apaches once more spread terror across the Southwest. The U.S. Army chased them into Mexico, but the raids continued. Crook finally hunted down the Apaches for a second time, pinning Geronimo in his mountain refuge in 1883 and forcing his surrender.

Geronimo's nomadic band remained only two years on the reservation before breaking out for a last attempt at freedom. In 1886, Geronimo was finally run to ground, this time by troops under General Nelson Miles. Geronimo and his tribesmen were transported first to Florida, then Oklahoma. The Apache Wars were finally over. By the end, the names of fierce Apache warriors like Geronimo, Cochise, Victorio, Mangas Coloradas, and Juh were known nationwide.

Appomattox Court House (9 April 1865)

Site of the surrender of General Robert Lee and the Army of Northern Virginia. When Robert E. Lee evacuated Richmond and Petersburg he had intended to move south, join with Joseph Johnston's army in North Carolina, defeat William Sherman's Union army, and then turn to face the forces of U. S. Grant. But Grant and the Army of the Potomac blocked the line south, and Lee was forced to move westward to escape Grant and to secure supplies.

On 7 April 1865, the two generals exchanged letters exploring possible terms of surrender. Lee still had hopes that, as he approached Appomattox Court House, his forces could arrive at Appomattox Station, about three miles away, first and thereby obtain vital supplies and an escape route south. Many southern soldiers had deserted or fallen out from the army from hunger, exhaustion, and defeatism.

That evening Lee saw campfires to the southwest, which meant that Philip Sheridan's cavalry had arrived first, and the Army of Northern Virginia had few viable options. On Sunday morning, 9 April, southern infantry sought to break through Sheridan's cavalry and failed; the cavalry were too

numerous, and the remainder of the Army of the Potomac was beginning to arrive on the scene.

Lee nobly declined a suggestion from his subordinates that the army retreat to the Appalachian Mountains and engage in partisan warfare. He met that afternoon with Grant in the McLean family home in Appomattox Court House. (Paradoxically Mr. McLean had moved to this supposedly peaceful corner of Virginia to escape the war.) Grant offered generous surrender terms, and had his supply officers arrange to feed southern troops and their animals; Lee then surrendered and the fighting in Virginia ended. Several weeks later, Joseph Johnston would surrender to William Sherman in North Carolina, and the Civil War was over.

Arabi Pasha (Ahmad Urabi Pasha) (1839–1911)

An Egyptian army officer who led a revolt against foreign domination of Egypt. He became the embodiment of the growing spirit of Egyptian nationalism.

At age 17, Arabi joined an army in which Turks, Circassians, and Albanians held almost all senior positions; in 1880, there were only eight native Egyptian officers. The army was torn by strife because military administration was in the firm grip of foreigners, and promotions were almost impossible for Egyptians. Similarly, foreigners controlled civil administration. Europeans drew comfortable, regular annual salaries, while the bureaucracy labored under salary arrears.

Egypt was near bankrupt in 1876 due to khedive Ismail's ambitious development program and wasteful spending. To safeguard their financial investment in Egypt, the French and British forced Ismail's deposition in 1879, and replaced him with the ineffectual Tawfiq.

Before his deposition, Ismail had planned to increase the army to 60,000 men. The *firman* (Ottoman decree) that made Tawfiq khedive stipulated a reduction to 18,000, but the Anglo-French controllers insisted on further reduction, resulting in wholesale retrenchment of officers and men, mostly Egyptians.

The disaffected military elements organized under the leadership of Colonels Ahmad Arabi, Ali Fahmi, and Sami al-Barudi. In 1879, they drafted a manifesto to the khedive repudiating foreign influence, guaranteeing payment of debts, and demanding the return of railroad revenues to Egypt. Radicalized over time, Arabi and his colleagues demanded the right to debate the Egyptian budget in Parliament. The unwillingness of the European powers to grant this demand led to an impasse.

Riots broke out in Lower Egypt, and to restore order, preserve the European bondholders, and protect the Suez Canal (a European investment), the British bombarded Alexandria from 11 to 14 July 1882, landed an expeditionary force of 10,000 soldiers, and defeated Egyptian troops at the Battle of Tel-el-Kebir. Arabi and the leaders were court-martialed, tried, convicted, and on 26 December 1882, put on a train at the Kasr el-Nil barracks bound for Port Suez, en route to exile in Ceylon (Sri Lanka).

The British would remain a dominant military force in Egypt until the early 1950s.

Ardennes, Battle of (Belgium, 16–26 December 1944)

Last major German offensive on the western front during World War II. Nearly bedridden from the effects of the 20 July 1944 assassination plot, Adolf Hitler planned to regain the initiative against the Anglo-American forces on the western front. At the least, he hoped to stall the Anglo-American advance in time to fortify the West Wall; at best, he wanted to capture Antwerp and encircle a large number of enemy troops. Hitler believed that 30 divisions on the east front against the Russians would not matter, but in the west they could prove decisive.

The German offensive began on 16 December 1944 in the Ardennes Forest when 200,000 German soldiers of the newly created Sixth Panzer Army and the Fifth Panzer Army struck an area defended by 80,000 American troops. Dressed as American military police, Otto Skorzeny's German commandos spread confusion throughout the American rear areas. The following day, troops of the 1st SS Panzer Division murdered unarmed American prisoners of war at Malmedy.

Allied commander General Dwight Eisenhower grasped the immediacy of the situation, and ordered all reserves into the "Bulge." After holding a conference with his commanders, he ordered General Patton to drive his Third U.S. Army north to strike the southern pincer of the German advance.

After overrunning the outlying positions, the Germans encountered the stiff defense of the 101st U.S. Airborne Division in the crossroads town of Bastogne, Belgium. Muddy roads and insufficient supplies of gasoline hampered the German advance. On 20 December the weather cleared, allowing the Americans to utilize their superior airpower to destroy German tanks. Against the advice of his field commanders, Hitler did not permit retreat. On 26 December elements of Patton's Third Army arrived to break the German siege of Bastogne. Over the next several days, the American army drove the Germans back. A major Russian offensive launched on 12 January 1945 ended any possibility that the Germans would renew their offensive.

In all, the Germans suffered over 80,000 and the Americans 75,000 casualties; the loss of more than 300 tanks, however, proved the most devastating to the German army's ability to defend the Fatherland.

Argentine Dirty War (1976–1983)

Internal clash involving radical left factions and the military governments of Argentina. Argentina experienced internal strife as early as May 1969 when leftist groups clashed with government troops and police in the city of Cordoba. Some of the groups, such as the Montoneros, whose military wings included the Peronist Armed Forces and the Revolutionary Armed Forces, were loyal to former president Juan Domingo Peron. Another group was the Trotskyite People's Revolutionary Army. The radicals carried out a number of bank robberies, kidnappings, and murders as they sought to gain attention and support for their cause. The most famous of the early incidents was the kidnapping and murder of former president Pedro Aramburu. Peron returned to Argentina in 1973, was elected president, and the violence briefly subsided. His death in 1974 and the ineptness of his successor, his widow, Isabel Peron, opened the door to renewed strife.

When General Jorge Rafael Videla became president by overthrowing Isabel Peron in 1976, the antiguerrilla units of Argentine armed forces were unleashed. In a two-year period Videla’s regime used kidnapping, torture, imprisonment, rape, and exile as weapons to wipe out not only suspected terrorists but all political and intellectual opposition. Many victims simply disappeared without a trace. International attention was focused on the Dirty War by the Mothers of the Plaza de Mayo who assembled weekly in the central plaza of Buenos Aires to protest the disappearance of their children and grandchildren.

The Argentine military was discredited by its disastrous performance (except for the naval air arm) in the Falklands/Malvinas War of 1982. Argentina returned to civilian rule in 1983 with the election of Raul Alfonsón. Under Alfonsón, the National Commission on Disappeared People investigated the Dirty War, and some of the military officials responsible for the atrocities were later prosecuted. It is

estimated that more than 13,000 people lost their lives at the hands of military governments during the Dirty War, while the radical left killed approximately 200.

Armies: Organization and Tactics

The earliest wars have no written record; nor does the organization of the participants or their tactics. Fortifications at Jericho are evidence that the inhabitants needed to defend the city against attackers, but the details of the assaulting party are unknown to us. It is not until the middle of the second millennium B.C.E. that we begin to see the details of warfare.

Armies around 1500 B.C.E. consisted of masses of infantry, unprotected in terms of body armor, and armed variously with spears, axes, swords, or shields. This body of men was probably drawn from the poor element of society; in addition there were more specialist foot troops with ballistic weapons—archers and slingers. Finally, there was the elite of these armies: the charioteers, carried in horse-drawn, wheeled carts, armed again with ballistic weapons, the precursors of the present-day armored forces.

Chariots appeared in Sumer in about 2500 B.C.E., and were dominant in war until about 1200 B.C.E. Egyptian charioteers were armed with bows, Hittite charioteers with spears, and Assyrian charioteers—the real experts—used light vehicles for archers and heavier chariots for spear men. These were then superseded by cavalry, formed from the lesser nobles who had enough money to buy horses and to arm themselves. Cavalry took the measure of chariots because of one simple factor: greater mobility.

The organization of the warring groups—for they were not yet armies—was related purely to social standing, with chariot owners (the aristocracy) having the most say in deciding where and when to engage the enemy—or, by their ineptitude, when to run in the face of enemy surprise or superior force.

Tactics of the time revolved around the fact that operations of war were no more than raids upon neighbors (whether tribes or states) in which an area of land was overrun. The enemy, if defeated, was slaughtered to a man, settle-

ments were looted and burned, and slaves taken. There was little or no political motive at this time, just the elemental emotions of fear, envy, and greed.

Battles were primitive but some tactics seemed to work, and these were naturally repeated. Armies began a battle by approaching each other, with the infantry in the center and the chariots or cavalry on the flanks. Sometimes the infantry just clashed with their opposite numbers, and the slaughter began. On other occasions the mobile troops would advance through their infantry and attack the enemy infantry, often leading to the attacked infantry breaking, and the slaughter beginning again.

But warfare was a haphazard business until the Egyptians and then the Assyrians began to impose organization and discipline. One man in particular stands out: Philip II of Macedon (father of Alexander the Great). He created the first combined arms force in history, within which his heavy missile engines coordinated with cavalry and infantry to give a battle-winning formula. He also invented the light infantryman, or *hypaspist*, who was a disciplined soldier on the lines of the heavy infantry hoplite, but who combined this discipline with the mobility and flexibility of the irregulars.

At this time artillery appeared, and catapults and ballistae had accurate ranges of perhaps 200 yards, with a maximum range of 500 yards. Such siege engines also had their more mobile counterparts, when it became apparent that artillery could be used against men as well as walls. Defensively, walls of ever-increasing strength became necessary, creating the first strategic arms races. Naturally measures were developed specifically for use in siege warfare, such as siege towers, mural hooks, and battering rams.

Slowly but surely the various components of military force began to appear, and with the arrival of the Romans, military organization gained acceptability, for it won battles. Maneuver had already shown its worth, initially by chance, but later by design; however, the problem still remained of how to train the enormous mass of the Greek-type phalanx to turn, for its very size made it difficult to maneuver. The answer came in the Roman legion, designed to allow ease of movement in rough country.

Lessons taught by Hannibal and learned by Scipio soon refined the art of maneuver for a force that held sway throughout the civilized Western world for centuries. The heart of Roman tactics came from the discipline of the legion—a force consisting of officers who knew their job, seasoned veterans who always fought well, and a leavening of new recruits who learned from those who stood at either side of them in battle.

The legions were originally made up of Roman citizens who were well trained, highly disciplined, and commanded

by men who always took the offensive, if possible. They were almost always accompanied by legionary cavalry, which doubled as a reconnaissance force and as shock troops.

The Romans left a legacy of the national army. In some cases this was perpetuated, but there were still roving tribal bands, such as those of Genghis Khan, who practiced mobile warfare by means of mounted archers. The horse had enormous effect upon tactics in the first two millennia of the Christian era. Mounted bowmen evolved into mounted knights, whose armor and sheer weight on the battlefield were often a winning combination, although the Battle of Crécy (1346) saw a remarkable event.

The British earl Marshal Warwick was faced by the French on their advance not far from Abbeville. Warwick held his infantry in the center, his archers on his flanks. Heavy cavalry were held in reserve. The whole consisted of some 20,000 men. Against them was ranged nearly 60,000 French, including 12,000 heavy cavalry, 6,000 Genoese crossbowmen, and 17,000 light cavalry.

The battle started with the Genoese firing at the British, but their bolts fell short. The British archers then replied and destroyed the Genoese line with a storm of cloth yard arrows. Into the retreating Genoese moved the ponderous French heavy cavalry, who soon came within range of the longbowmen. Some 15 or 16 times, despite tremendous losses, the French cavalry continued to advance into the British fire. The result was utter defeat for the French, losing at least one-third of their total force. The British casualties amounted to about 200 dead and wounded.

From earliest times fortifications have been important, and no more so than during the period in Europe following the demise of the Romans. Wooden and then stone defenses sprang up everywhere, partly as a sign of increased social standing, but also as local strong points. The armies of the medieval period were raised by local barons who had the right to levy troops when needed, but the castles had permanent defenders raised from the immediate retinue of the local potentate.

The problems facing the attacker were simple: how to breach the walls or how to starve out the defenders. Engineering techniques developed whereby trenches were dug under castle walls to collapse the stone, and many subterfuges were practiced to either gain entrance or deprive the defenders of the will to fight. Sieges were part of the military art, and even the trench warfare of World War I can be seen as little more than a prolonged siege.

The feudal system allowed local lords to raise armies from their subjects, but one disadvantage to the state was that the lords also had to pay these armies, which they were loath to do at times of harvest. Further, winter warfare was

never popular, and most troops returned home at the end of the campaigning period. National armies, however, emerged in the seventeenth century, although there were isolated examples well before this.

As society developed and prosperity increased, more money was available from taxation to fund permanent armed forces. They began to be organized, normally on a territorial basis. At the same time firearms became more and more effective, although pikemen, archers, and similarly armed troops were still present on the battlefield until the late eighteenth century.

At the same time, as cannon were seen to be very effective against fortifications, fortress designers increased the sophistication of the plans, giving defenders better fields of fire and creating many more impediments to attacking forces.

Warfare came into its modern phase with the operations carried out by Napoleon and those who eventually defeated him. Maneuver became the chosen method, rather than mere head-to-head conflict. Napoleon successfully attacked his opponents piecemeal, and his rate of movement was a continual advantage against the more ponderous armies he was pitted against.

Napoleon also benefited from earlier developments by Gustavus Adolphus of Sweden, who trained his men in flexible tactics; and artillery benefited from the work of Gribeauval, who designed field artillery carriages that were also extremely mobile. In the final act, however, Napoleon was defeated by tactics that would not have been out of place 500 years previously.

Napoleon appeared to have left a legacy that maneuver was supreme in tactics. In the Boer War the British army was consistently outmaneuvered by the Boers, but weight of numbers told in the end. World War I, however, despite many technical advances in small arms, artillery, organization, and tactics before the war started, and the subsequent development of aircraft and tanks, resembled nothing so much as a protracted siege in Europe. Only in the Middle East was there some maneuver, but misconceived plans often led to failure until the Gaza campaign.

On the western front a four-year stalemate was interrupted by frontal, near-suicidal attacks until the Germans revived mobile infantry warfare in 1918.

It is startling to realize that throughout the operations planned by Field Marshal Haig the aim was to penetrate the enemy lines and then let loose cavalry for the pursuit. When this strategy failed, Haig settled down to win a war of attrition in which the nation with the last man standing would be the victor.

The arrival of tanks and aircraft on the battlefield created a school of thought that saw that, properly combined, these

two elements would be able to help mobile infantry break through enemy front lines and then exploit the rear areas, wherein lay the higher command centers, supply depots, and administrative elements of the modern field army.

The result of this thinking led the Germans to create a tactical air force and the panzer (armored) division. The combined effect of aerial bombardment in support of the ground forces, the penetrative effect of massed armor, and the backup of artillery made progress into the enemy rear areas relatively easy for the infantry, whose task was to support tanks against antitank weapons, but primarily to take and hold the ground, which none of the other elements of Blitzkrieg could do.

Germany's enemies learned from the early successes of the German army in World War II, and by 1944 the Allies were conducting a most sophisticated version of lightning war. Aircraft were on immediate call by ground forces, artillery fired tasks on request, tanks were supported by mobile infantry. The exceptional fighting machine that was General Patton's Third Army could only be stopped by fuel shortage, never by the inventors of the technique he practiced so ably.

Airborne warfare also came of age during this period, culminating in the air assault across the Rhine in 1945. In the east air resupply was fundamental to the Chindit operations, although German efforts to resupply the Sixth Army in Stalingrad failed. For such operations, command of the air is fundamental.

In the twentieth century, war had become three-dimensional, and operations by the Israelis in the Six-Day War (1967) show how important and decisive it is to eliminate the enemy air element. Similarly, in the Gulf War, the main threat to the coalition forces was the Iraqi air force, which surprisingly withdrew itself from combat. In the Falklands the most serious damage done to the British was with air-launched missiles from Argentinean aircraft.

The organization of armies has developed slowly, from the massed bands of prehistory via the legions of Rome, to the feudal forces with their time-outs for harvest and the winter. The size of national armies increased exponentially from the seventeenth century, culminating in the massive forces of World Wars I and II. Army groups, armies, and corps controlled divisions throughout the two world wars, and even in the Korean War large armies took part. The development of the air-land battle concept has, however, meant that smaller numbers can have much greater effect, especially in view of the increased power of air and land artillery (as well as supporting naval artillery when required).

In the third millennium it seems that most armies in NATO (North Atlantic Treaty Organization) will be engaged in low-intensity warfare, meaning that, with the aid of tech-

nology, fewer men will be able to do far more than their predecessors, who were always dependent upon sheer weight of numbers. This is undoubtedly as much the result of the exponentially rising costs of warfare and weapons as of strategic decisions.

Armor, Ancient and Medieval

In the early times, protection for soldiers was often limited to a helmet and shield with little use of armor to protect the body. The Standard of Ur, circa 2900 B.C.E., depicts Sumerian soldiers wearing pointed helmets probably of leather, and kilts and cloaks, the latter reinforced with circular metal plates. At roughly the same time, Egyptian soldiers were depicted in figurines, temple carvings, monuments, and other sources wearing only kilts and protected by long shields of animal hide with flat bottoms and pointed tops. The pharaohs were depicted helmeted in the Blue Crown of Egypt, or in the Crowns of Upper and Lower Egypt. Assyrians in the eighth century B.C.E., here following the lead of the Hittites, discovered the utility of iron for weaponry and armor. Their armor consisted of helmets and chain mail, or mail of overlapping iron scales.

Early Greek plate armor from the fifteenth century B.C.E. has been found at Dendra, near Mycenae, consisting of four or five large segments of bronze covering the lower face and reaching to the knees, with articulated shoulder pieces. Some sources in the Homeric and other periods refer to gold armor, but most armor was of bronze. By the ninth century B.C.E., Greek soldiers wore brass “bell” corselets, greaves, and Illyrian-style helmets, but by the eighth century B.C.E., the *hoplon* (which gave the heavy foot soldiers of Greece their name *hoplites*) had evolved. This was a large round shield with a wooden core and bronze facing that remained in use through the classical period (fifth and early fourth centuries B.C.E.).

Hoplites wore bronze “muscle” cuirasses or, more com-

monly, a *linothorax*, that is, a cuirass made of layers of linen or canvas glued together, and sometimes reinforced with metal plates or scales. The linothorax was cheaper, and its lighter weight allowed more freedom of movement. Hoplites also wore bronze greaves that protected the knees and calves. They covered their heads with bronze helmets of various styles, often with a decorative horsehair crest. Spartan soldiers also wore a characteristic red cloak that was laid aside in battle. Greek soldiers are sometimes depicted going into battle naked, protected only by a shield and helmet.

Early Roman armor (prior to the third century B.C.E.) was provided by each individual soldier, and varied from chain mail to breastplates, or square plates worn across the back and chest. Greaves were sometimes worn, and soldiers also carried a *scutum*, a four-foot-long shield of planks glued together with a binding of iron and covered in leather, with a wooden, bronze, or iron boss. Helmets were of bronze, and often of Etruscan or Greek style. Poorer soldiers were defended only by wicker shields, and perhaps a helmet.

By the second century B.C.E., Marius had reformed the legion, and each legionary was issued a mailed cuirass of either closed rings or open rings that were riveted shut. The groin was afforded extra protection by a belt, the *cingulum*, complete with a dangling apron reinforced by round metal plates. Soldiers wore bronze helmets, often of the Montefortino type, with hinged cheekpieces. Greaves remained in use only by centurions.

The chain-mail cuirass continued in use into the first century of the empire and beyond. For Roman soldiers, it was replaced by the *lorica segmentata*, an iron-segmented armor covering the shoulders, chest, and torso. It remained in use until the third century. Auxiliary troops continued to use chain mail, and muscled cuirasses were often seen, especially among officers, the Pretorian Guards, and wealthy officials. Toward the end of the second century, shields became more rounded, and continued in that shape until the end of the empire. By the time of Constantine the Great (d. 337), scale armor came into use among cuirassed Roman cavalry troops, the *clibanarii*, though it is unclear to what extent armor, other than the oval shield, was used among late imperial infantry.

Early medieval armor derived from armor of the late imperial period. In the eastern empire, soldiers were clad in chain mail and protected by round shields; cuirassed cavalry continued on armed horses as the *cataphractarii*. In the West, the barbarians had adopted Roman styles of armor, mixing it with their own, with scale armor of bronze, iron, or horn. Soldiers wore *spangenhelms* of iron, bronze, or horn plates attached to iron or bronze straps radiating from an apical point, with a nasal protecting the upper face. Soldiers also carried round or oval shields.

In the tenth and eleventh centuries, oblong Viking or Norman “kite-shields” were widely used, as were conical helmets fashioned of one piece of metal (rather than segmented like the spangenhelm), with nasals to protect the nose and face. Horned or winged Viking helmets have never been found. A mail coat (*byrnie*) falling to the knees was worn, and a chain-mail *coif* protected head and neck underneath the helmet.

By the twelfth century, while chain mail continued in use, the arm and hand came to be completely covered, and the coif was attached to the body armor. This type of armor came to be called a *hauberk*, rather than a *byrnie*. The helmet came to cover the entire head, with two eye-slits and small breathing holes in front. Unrecognizable in this armor, knights began to employ heraldic symbols so as to recognize friend and foe. The shield, no longer needed to cover the exposed face, became shorter and more triangular. It too was covered with heraldic symbols.

Chain mail, or scale armor, was used almost exclusively into the fourteenth century. Plate armor began to be used first to cover the chest, elbows, and knees. It was often riveted to strong fabric or leather, or tied together by leather straps. Later the entire body, including the arms and legs, were covered. Chain mail continued in use beneath the plate armor. Fully articulated armor covering the entire body made the shield superfluous, and it fell out of use in battle, though targes were used in tournaments. Helmet styles changed considerably, and various styles were used simultaneously, with the chain-mail coif often attached to the helmet itself. A hinged visor was attached to the helmet, which could be brought down to protect the face during combat, but kept up for better vision, and ventilation, when not needed.

By the late fifteenth and early sixteenth centuries, armor had become more ornament than protection. Artillery and handguns, as well as improved projectile weapons such as the crossbow, had rendered armor ineffectual. By then the helmet and breastplate were all the armor that remained in use on the battlefield, though highly ornamental tournament armor also remained.

Armored Fighting Vehicles

The armored fighting vehicle includes both tanks and other vehicles, but it is with the tank that the story begins. Stalemate in World War I had led to thousands upon thousands of deaths. Infantry were unable to penetrate barbed-wire obstacles protected by rifle, machine gun, and artillery fire, and the British in particular were desperate for a new weapon to break through the wire and its supporting weapons. The aim was to penetrate the German lines, get into the rear areas, and then, astonishingly, release the cavalry to mop up.

The first tanks (so called as a code name) were sent into operation near Bapaume on 15 September 1916. Only a few were capable even of getting into battle, and the results were not remarkable. However, surprisingly, this relatively ineffective beginning did spark further interest in the British army hierarchy, and on 20 November 1917 some 200 tanks broke through the German Second Army’s front, closely followed by infantry. The assault gained six miles, but as there were no armor reserves and few infantry to back up the breakthrough, the battle ended, as so many in that war, with partial withdrawal and then continued stalemate.

However, after World War I a few enterprising officers in Britain, France, and Germany saw the tank for what it really was: a highly mobile weapon that, if used in concentration, could smash through defensive positions in a way infantry alone could not. Further, it could break out into the enemy rear area and disrupt command and supply organizations. If also supported by discriminating artillery fire and well-trained infantry (to eliminate antitank threats), the tank could well be the weapon of the future.

Military establishments by their nature are conservative, and none was more so than the British army in the 1920s and 1930s. Cavalrymen saw themselves as the social superiors of mere infantry, and tank men were no better than mechanics. For this reason, tanks in the British army rarely fared well, and even to the end of World War II British tanks were undergunned (with the exception of the Firefly). For such minds, tanks were almost always seen as aids to infantry, and only in the western desert were they occasionally used properly.

Basil Liddell Hart and J. F. C. Fuller were the main propo-

nents of the tank in Britain in the 1930s, but they were hardly heeded. However, in Germany there were many avid readers of their works, including Heinz Guderian, who was instrumental in creating and using the German panzer arm. He saw the tanks as the spearhead of the future's mobile war. With air support, plus ground artillery, infantry, and combat engineers, the Germans brought the new scenario into being. Germany had lost World War I and was thus somewhat more willing than the victorious French and British to consider new weapons and tactics.

Surprisingly, until 1941 most German tanks were much lighter than their opponents' armored fighting vehicles (AFVs). It was Germany's tactical use that provided its early successes. The tanks operated as divisions, supported *by* infantry, rather than in small numbers, operating in support of infantry. The tanks thus brought a new pace onto the western front and into the North African desert. The same tactics were used in Russia, and only when the Russians learned to coordinate and control their operations did they begin to win tank battles against the Germans.

In the early part of the war the Red Army lost seven tanks for every German tank lost. Parity was not achieved until as late as 1944. But in 1943 the biggest tank battle the world has ever seen took place around Kursk in Russia. The Germans sought to cut the Soviet salient off and destroy the Russians with attacks from north and south. Delayed by Hitler, the attack took place only after the Soviets had prepared what was to be a deathtrap for the Germans. In the south, three SS panzer divisions attacked, and were, as in the north, ground to pieces against the Red Army's defenses and tanks. The end of the battle was also the end of German hopes for victory in the east. U.S. Army tank development got off to a late start, and the Americans had to make do with the Sherman (M-4), an adequate vehicle with the advantage of mechanical reliability and a powered turret, but which was always undergunned.

Since the war, the tank-versus-tank tactical problem has seen many technological solutions; but for every answer in the military art, there is soon another question. Tanks are mobile, but they need to be reliable. Tanks themselves are good tank-killers, but are vulnerable to enemy antitank weapons, so they need better defenses. Weight increases demand increased engine power; increased weapons performance requires either better crews or more crewmen.

In World War II antitank aircraft appeared, and they proved very effective. The Germans had the Ju-87 armed with 3.7 cm guns, and then the Henschel Hs 130B-2, similarly armed. The Allies flew against German armor in the Falaise pocket in France with rocket-armed fighter aircraft. In the last two decades tank-killing helicopters have arrived,

as well as the American A-10 antitank aircraft, armed with the formidable 30 mm Gatling-type rotary cannon.

The post-World War II years have seen tank battles on any scale only in the Middle East, with Israeli armor proving superior in nearly every instance. In the Gulf War (1991), Iraqi armor was so outclassed that the opposing coalition forces, singly and en masse, were totally victorious in each engagement.

Alongside the tank, there have been developments in armored reconnaissance vehicles, armored personnel carriers, and various other protected command, engineering, and support vehicles. Artillery is now armored, and the Multiple Launch Rocket System (MLRS) is fired from a tracked armored vehicle. The main battle tank may eventually prove an anachronism, like the battleship before it, but this will only happen when tanks are generally seen to be ineffective. Even in peacekeeping roles there is great morale effect in seeing a Challenger II or an Abrams tank supporting infantry, and for this reason alone it is doubtful if the end of the tank is yet in sight.

Arms Control

Limiting, usually by treaty, the number and types of nuclear weapons. As a result of the destructive power of atomic bombs, arms control became an increasingly important means of preventing nuclear war, particularly after the start of the Cold War and the subsequent development of thermonuclear weapons.

Arms control is a concept distinct from disarmament in that arms control efforts seek to reduce, but not necessarily eliminate, certain weapons. Disarmament seeks the elimination of all weapons of a specified type. In addition to the quantitative goal of reducing the numbers of nuclear weapons, arms control efforts served as an effective diplomatic communications tool, especially during the Cold War. Arms control agreements, particularly those between the United States and the Soviet Union, communicated the mutual goal of survival. The willingness to enter into arms con-

trol agreements continually emphasized the goal of avoiding nuclear war.

Arms control evolved with the twentieth century. Beginning with the Hague Conferences of 1899 and 1907, when arms control became recognized by international law, and continuing through the Treaty of Versailles and founding of the League of Nations, diplomatic efforts to control the number and types of weapons became the primary means of avoiding war. Aerial bombardment and the use of poison gas were prohibited in the earlier treaties. And the reasoning of the Versailles Treaty was that a Germany without arms could not start another war. The Washington Conference of 1922 provided for the scrapping of more battleships than had been lost in all the naval engagements to date. Yet World War I saw the extensive use of poison gas, World War II brought the horrors of aerial bombardment to scores of cities in Europe and Asia, and even the Washington Treaty battleship destruction paved the way for the far more destructive aircraft carrier. There were also attempts to outlaw the submarine, primarily because Germany had used this weapon with such success.

With the advent of nuclear weapons, the primary focus of arms control efforts shifted from controlling conventional weapons to restricting weapons of mass destruction. If nuclear weapons could be controlled, then the potential to wage a nuclear war would be lessened as well.

Because all countries are concerned with their survival, national security considerations dictate arms control agreements. Such agreements, to be effective, must be negotiated directly between nations, freely derived, and protect the rights and interests of the negotiating countries. Arms control agreements can prevent war, slow down an arms race, ease taxpayers' burdens, and, most importantly, promote trust between countries when negotiated in this fashion. Trust between countries, developed through the process of confidence building, is particularly effective in making strong arms control agreements. Early attempts to control nuclear weapons, such as the Acheson-Lilienthal and the Baruch plans, failed in large part because of national security interests. The Soviet Union, for instance, would not accept these early control plans because it did not yet possess nuclear weapons. Once the Soviet Union developed nuclear weapons, it was in a better security position to think about arms control measures. However, the intensity of the Cold War militated against such measures. Hence, the period beginning with the end of World War II and lasting to 1960 was marked by great hostility and reluctance to enter into any arms limitation agreements.

The Cuban Missile Crisis changed superpower relations. The very real threat of a nuclear exchange started both the United States and the Soviet Union down a productive arms

control path beginning with the installation of the hot line and a defense early warning system. These confidence-building measures led in no small part to the first major arms control agreement, the Partial Test Ban Treaty, which was signed in 1963. A decade later, the ABM (Antiballistic Missile) Treaty and the Strategic Arms Limitation (SALT) I Interim Agreement came into being. SALT I was particularly significant in that it was the first agreement limiting strategic weapons. Although never ratified by the United States Senate, the follow-on SALT II agreement was followed in practice and led to cuts in the strategic arsenals of both the superpowers. In 1987, the INF (intermediate-range nuclear forces) Treaty eliminated shorter-range missile systems, the first and only agreement to eliminate an entire category of weapons. In the late 1980s and early 1990s two new arms control agreements were negotiated: Strategic Arms Reduction Talks (START) I and II. These treaties provided for deep cuts across the entire spectrum of strategic nuclear weapons in both the United States and the former Soviet Union and set the stage for current nuclear arms control activities. The success in negotiating these treaties came about in large measure because of reduced tensions between the two superpowers. As the Cold War wound down, both the United States and the Soviet Union found it less and less necessary to maintain their mammoth stockpiles of nuclear weapons. Reduced political tensions drove arms control success in the Reagan and Bush years. When the Soviet Union broke up, this need, although not eradicated, lessened even further. Today, stockpiles of nuclear weapons remain, but in reduced numbers, with further reductions possible, one of the most promising developments since 1945.

With the end of the Cold War and the reduction of the number and types of nuclear weapons, arms control activities have turned from concentrating almost exclusively on such weapons to an increasing emphasis on chemical and biological weapons, which have the potential to be weapons of mass destruction. Such weapons are easy to construct and deliver and represent a growing threat, particularly because of the existence of rogue states and an increase in terrorism. Nuclear-weapons-production activities require an extensive infrastructure, making them easy to monitor by technical surveillance. Chemical and biological weapons do not. Such weapons and their production facilities can be easily hidden and disguised as innocent chemical facilities. Recognizing the destructive power of chemical weapons, the Chemical Weapons Convention was chartered in 1997 as an international legal body dedicated to ending all activity related to chemical weapons production. Similar work has been accomplished in the field of biological weapons, with the creation of the Biological Weapons Convention in 1972. Much more work needs to be done in this area.

The goal of arms control is the reduction, not necessarily the elimination, of weapons of mass destruction. Disarmament is the goal of the United Nations, but arms control efforts are important steps in this direction.

Arnhem (1944)

A failed Allied airborne operation. In the summer of 1944, as the Allied advance slowed to a crawl, the Allies launched the largest airborne operation of the war, to capture a series of key bridges across the Rhine River. The focal point of this operation of the war was the road bridge at Arnhem. With the capture of this bridge, the Allies could flank the Western Wall and advance in the Ruhr Valley. Operation MARKET GARDEN, under the command of Field Marshal Bernard Montgomery, called for a number of airborne drops. The British 1st Airborne Division was charged with the capture of the Arnhem bridge. Unlike most airborne attacks, the 1st Airborne Division would not drop on the target itself, but rather would drop eight miles away and advance as regular infantry. They were then supposed to hold the bridge until a linkup with American and British troops.

A somewhat rushed operation, MARKET GARDEN saw a failing of intelligence gathering. The 1st Airborne Division fell directly on the II SS Panzer Corps and faced much stiffer opposition than expected. The British forces fought valiantly, but suffered from a lack of heavy weapons and the failure of air-dropped supplies to reach the troops. After 10 days, the surviving British troops were evacuated. Of the 10,000 British troops who dropped on Arnhem, only 2,000 escaped. Montgomery later claimed that if he had been given all the resources he had requested, MARKET GARDEN would have worked and perhaps shortened the war. Arnhem pointed out the shortcomings of airborne troops, as they lacked the heavy weapons and fire support that regular infantry troops enjoyed.

Arnold, Benedict (1741–1801)

Colonial American field commander, tactical genius, and traitor. Arnold was born into a prominent family in Norwich, Connecticut, on 14 January 1741. He deserted both militia units to which he was assigned in the French and Indian War (perhaps revealing some of his future lack of character). From 1762 until 1775 he was a successful merchant and smuggler. He brought a company of Massachusetts militia into the Boston campaign on 29 April 1775 and was soon promoted to colonel. Despite the protests of Ethan Allen's Green Mountain Boys, who considered him too arrogant, Arnold accompanied Allen during the capture of Fort Ticonderoga on 10 May. As leader of the doomed 1775–1776 expedition to Quebec, he was promoted to brigadier general in January 1776. His tactics stalled the British at Valcour Island on 11 October and Split Rock on 13 October during the Lake Champlain campaign, and at Danbury, Connecticut, on 23–28 April 1777.

British lieutenant colonel Barry St. Leger, leading an expedition of regulars, Tories, and Mohawks from Oswego, New York, toward Albany that summer, threatened Peter Gansevoort at Fort Stanwix. Although American brigadier general Nicholas Herkimer stopped the Tories and Mohawks on 6 August at Oriskany, he suffered 75 percent casualties. Arnold, by now a major general, rescued Gansevoort on 23 August by a clever combination of tactics and guile.

Arnold's actions at Freeman's Farm on 19 September and Bemis Heights on 7 October won the Saratoga campaign for Horatio Gates, but Gates did not sufficiently appreciate or reward his skill and heroism.

After recovering from a serious leg wound suffered at Saratoga, Arnold became military governor of Philadelphia, where he married a Tory, Peggy Shippen, in April 1779. Court-martialed for consorting with the enemy, he was convicted and reprimanded in January 1780, but still retained Washington's trust. He plotted with his wife, Major John André, and General Sir Henry Clinton to desert to the British and deliver West Point to them, but was discovered and had to flee on 25 September. André was hanged as a spy on 2 October. As a commissioned British brigadier general, Arnold had minor successes in the 1781 Virginia campaign; committed several atrocities in his New London, Connecticut, campaign; then retired to London in December, where he died on 14 June 1801. Despite the unconvincing efforts of some "revisionist" historians, Arnold's reputation has remained so odious through the intervening centuries that the very name "Benedict" is rarely given in the United States.

Aroogee, Battle of (10 April 1868)

The key event of the British expedition to Abyssinia (modern-day Ethiopia). Theodore III, the Coptic Christian emperor of Abyssinia, had become emotionally unstable and erratic after the death of his first wife. Theodore had started as a petty Abyssinian chieftain named Kassa. He claimed royal blood and direct lineage to Solomon and Alexander the Great. This was not true, but he crowned himself Emperor Theodore of Ethiopia in 1855 after overrunning the territory of rival chieftains. His rule started out well and he reformed his country's legal and administrative policies while com-

peting with Egypt and other local powers for trade and political influence. He considered himself a crusader against the Muslims. Theodore was a man of personal charm, a ruler of talent, and a courageous warrior, but the ignorance and superstition of nineteenth-century Abyssinia surrounded him. He was a bestial, half-demented madman when drunk, which was often after the death of his first wife.

In 1862, Theodore wished to conclude a formal treaty with Queen Victoria—as one monarch to another. He sent a personal letter to Her Majesty that the Foreign Office read, filed, and failed to answer. After waiting two years for an answer, Theodore imprisoned his two British consuls along with other resident Europeans, a total of 58 hostages. A diplomatic cat-and-mouse game followed for three and a half years as Theodore alternately released and rejailed his hostages according to his mood swings, keeping them from leaving the country. Finally, after numerous exchanges of diplomatic letters, some signed by Victoria herself, the dignity of the British Empire demanded military action.

In August 1867, London gave orders for war. Lieutenant General Sir Robert Napier, commander of the Bombay Army of India, brought an Anglo-Indian army to the Red Sea port of Zula. Napier's army consisted of 44 elephants to carry the artillery, a portable railroad, telegraph lines, fresh water con-

densers, well-drilling equipment, hospital ships, and construction equipment for port infrastructure at Zula. Other modern equipment included new Snider-Enfield rifles, 6-pounder Hales's War Rockets, breach-loading 12-pounder cannon, steel 7-pounder mountain guns, and photography cameras. The famous explorer Henry Morton Stanley, the press, and military observers went along.

Sir Robert's force cornered Theodore deep in Abyssinia's interior on the Arooghee Plain, before the mountain fortress of Magdala. Of a total force of 37,000, a strike force of 5,000 made it to the Arooghee Plain. They faced Theodore's army of 7,000 warriors and some outmoded artillery. Theodore opened the battle with ineffective artillery and his battle force charged down from Magdala to attack the British. Napier's force quickly killed 700 and wounded 1,200 of the attackers, killing many of Theodore's battle chiefs. The survivors were driven off the Arooghee Plain with minimal British losses.

After this defeat, Theodore attempted suicide, released some hostages, and tried to bargain. Napier refused further bargaining attempts. On 13 April, the British shelled Magdala and seized it by a coup de main. Theodore shot himself—with a pistol originally given him as a gift from Queen Victoria—and his troops surrendered. All hostages were released and Stanley concluded, "Though a little war, it was a great campaign."

Arsuf, Battle of (Palestine, 7 September 1191)

Solidified military reputation of Richard I. After securing Acre, King Richard sought to regain Jerusalem. On 22 August 1191, his army, consisting mainly of the forces that he had brought from England, along with Hospitallers, Templars, and a French contingent, marched from Acre. It moved south along the coast road. This enabled Richard to protect one flank while being supplied by his fleet. Saladin's army traveled a parallel route and harassed the crusaders.

By 30 August 1191 skirmishes between the two armies had become more frequent. The crusaders continued their march, and Richard rode up and down the road encouraging

his army. Eventually Saladin forced the issue. He chose Arsuf, a wide plain with forests on both flanks, for a battle that began on the morning of 7 September 1191.

The crusader first line was composed of archers and crossbowmen, backed by infantry. The knights made up a third line. Knights Templar and Hospitallers held the right and left flanks. Richard held the center.

Around midmorning, Muslim infantry made an initial foray, which was followed up by continuous waves of Turkish horse archers. Despite the constant barrage of arrows, in which the left flank suffered the most, Richard was able to maintain his position.

The master of the Hospitallers asked to charge. Richard refused as he waited for more Turks to commit to battle, but the Hospitallers' discipline broke and they charged the enemy. The rest of the knights followed.

The heavy cavalry routed the Muslims. The victory enhanced Richard's prestige, but Arsuf was not decisive. Saladin still had an army and blocked Richard's march on Jerusalem.

Art in War

War art functions on two distinct but related levels. In wartime, state-sponsored images of war, such as propaganda posters, operate within a defined set of goals calculated to create emotions on the home front favorable to a war effort. These can serve to dehumanize the enemy and engender hatred, distort truth and reality, promote patriotism, and encourage recruitment. Napoleon saw art as a mechanism for manipulating the minds of the French populace and as a means of legitimizing his regime. The most famous example of this is Gros's *Napoleon at Eylau*, which sought to establish him as a great leader.

Other forms of art operate during wartime on a more mundane level, such as Norman Wilkinson's "dazzle" painting as camouflage on ships during World War I. Wars also create unique commercial opportunities for printmakers, an example being Currier and Ives, which capitalized on public

fascination with the American Civil War by producing numerous lithographs of the battles and the leaders. Frequently at odds with this kind of forced imagery are pictures by frontline soldiers themselves that paint a considerably different perspective of war, one usually not nearly so positive as that in the popular realm.

However, it is on the second level, in the art produced after the events, where we see the greatest visual evocation of war. This postwar art is the product of many different ideals and motivations, some of which mirror the wartime creations. Memory and recollection, national pride, class, racism, colonialism, political legitimacy, and commercial enterprise have all influenced the creation of war art at one time or another. In ancient times, the depiction of the leader as military hero served to define his or her rule and power over the masses. The larger-than-life representations of the pharaohs Rameses II and Seti towering over their enemies on the walls of their palaces in Egypt sent a clear message to their people as well as to any perspective enemies, as did *Trajan's Column in Rome*, which recounted that emperor's victories in the Dacian War. Louis XIV employed artists to highlight his martial successes in the late seventeenth century, while modern states have used images of war to cement their position and create national memory. Examples include John Trumbull's portrayal of battles and scenes of the American Revolution around the Rotunda of the Capitol in Washington, D.C., the *Galerie de Batailles* at Versailles created by Louis Philippe to enhance his position and ambition as natural successor to Napoleon, and Daniel Maclise's massive murals of Trafalgar and Waterloo on the walls of the Houses of Parliament in London, images befitting the Victorian colonial imagination. Similarly, Benjamin West's *Death of Wolfe* epitomized the supremacy of Britain and the power of the ruling class. Other artists have sought to condemn war through their art, the classic examples being Jacques Callot's *Miseries of War*, Goya's images of the Spanish massacres, Picasso's *Guernica*, and Otto Dix's vivid and cathartic images of the hell of the Great War.

In the twentieth century some of the most lasting war art has come, perhaps improbably, from official war artists, commissioned by their respective governments and taken into the military. These artists realized that the traditional heroic images of thundering cavalry charges and heaps of enemy dead in tasteful arrangement would be rejected by the contemporary public, and thus they concentrated on the everyday lives of the soldiers, even behind-the-scenes depictions of military engineers or supply lines, and on individual soldiers or small groups. Even Nazi war art emphasized individual or small-unit determination, rather than the movement's vile ideology. The Japanese seemed to be the only official war artists still to use triumphalist themes, showing,

for example, long lines of disheveled, surrendered Allied troops early in the war, marching off to become "guests of the emperor." Despite the dominance of still and motion-picture photography, the world's major armies still give an important place to war art. Whether the work of official or individual artists, war art continues to document and interpret humankind's closest approach to hell.

Artillery

One of the most effective and long-lasting weapons in military history. The earliest history of cannon and gunpowder is not certain, but cannon are first mentioned in a Florentine decree of 1326, and Walter de Milimete wrote in the same year of an early hand cannon. Again, in 1327 Edward III used "crackys of war" against the Scots, but these were probably more fireworks than explosive devices. Certainly cannon were used by the English against the French at the Battle of Crécy in 1346, the French having had cannon since at least 1338.

Antipersonnel use of cannon was superseded by the need for a means of defeating the extremely thick walled defenses of castles and other strong points of the time. This need led to the creation of the siege gun, an altogether cumbersome and weighty device. Tests had shown that thin barrels exploded when used, and so thick barrels were forged for these pieces.

Some early artillery pieces were actually breech-loaded, but the difficulty in obtaining a tight breech seal led to the majority of artillery designs being for muzzle-loading weapons. Because the whole barrel could then be cast as one piece, there were fewer weaknesses than in breech-loading systems. Breech-loaders, however, had a higher rate of fire, for the breech could be loaded as a separate part, and fitted to the gun when needed. So, a supply of breeches effectively became cartridges, loaded into the gun when needed, while empty breeches could be loaded away from the gun.

Early projectiles were arrows, and only later was shot (often round stone) fired. Stone was effective against fortifications, but gunners began to examine antipersonnel shells.

This consisted of a number of stones (the “langridge” shell) or of balls of iron or lead (“case” shot), which were loaded as a whole into the gun, and which burst on being fired at infantry or cavalry.

Artillery and its use were much more an art than a science in the early days of the weapon, but it was soon realized that by putting wheels on guns they were more mobile, and by 1542 Ralph Hogg was producing cast guns in Sussex. Henry VIII then created the post of master gunner, assisted by 12 gunners, based at the Tower of London. Artillery was coming of age, but the process was slow. Only in 1716 were guns, transport, drivers, and horses assembled, rather than being made up of civilians called upon when the need arose.

Artillery was still, however, a luxury; further, the absence of good roads and the heavy guns meant that artillery often failed to arrive in time for the battle. Even if it did, it took so long to get into position and prepare to fire that the guns were almost always ineffective tactically. The gunners persisted, however, and by 1680 gun limbers, a Prussian invention, were introduced into England. Limbers ensured that the gun was properly maneuverable, having a double set of wheels rather than merely the wheels upon which the gun was mounted. This in turn meant that more than one horse could be harnessed to pull the gun.

By 1700, ballistic tables were giving the performance to be expected from artillery pieces. However, despite the improved mobility of the guns following the introduction of the limber, artillery could still not be guaranteed to turn up in time for the battle. Siege trains consisted of about 100 guns, 60 mortars, and more than 3,000 wagons and 15,000 horses, plus gunners, drivers, and the myriad other hangers-on. And the length of the column was some 15 miles.

By 1770, however, it was realized that guns needed to be lighter to be more mobile, and by 1855 artillery had come of age. Guns were light in both weight and weight of shot, but a combination of the new mobility and infantry-artillery cooperation led to great advances in the science of gunnery. Certainly skillful use of field and horse artillery (field artillery is of a heavier caliber) and the esprit de corps of the British gunners in the face of repeated French cavalry attacks helped in gaining the victory over Napoleon.

The nineteenth century saw breech-loading guns, time fuses, air-burst shells, and, above all, rifled guns. By the beginning of the twentieth century, most European armies used breech-loading rifled artillery in a range of calibers. The mortar made a rejuvenated appearance in the form of the Howitzer—a gun designed to fire at high angles of fire, allowing the shell to penetrate deeply for greater effect, or to allow indirect fire over height obstacles between gun and target.

Field artillery, artillery that fought with the infantry, also benefited from the French development of pneumatic recoil systems. Previously the whole of the gun had recoiled on firing—barrel, trunnion, wheels. Now only the barrel recoiled, and was returned to the original firing position by means of the pneumatic recoil system. This made gunnery easier, and increased the rate of fire, especially when at full recoil the breech was opened automatically and the empty shell case ejected.

By the start of World War I in Europe, all armies knew the value of artillery and had a range of guns for different purposes. Howitzers fired at high angles to overcome walls and other fortifications, field artillery shot at enemy infantry and gun positions, coastal artillery took on shipping, and the guns were even moving in the mountains. But on the western front artillery and the machine gun proved supreme for most of the war. Shells were a problem, however, for as the mud deepened in France, the shells just sank below the surface and either created a shower of mud or simply did not explode.

The stalemate of World War I led to some careful thinking among gunners, and the outbreak of World War II should have seen artillery operating with complete maneuverability, able to put down fire at a moment's notice anywhere within range. In fact the guns were once more horse-drawn, although there were some few effective artillery tractors. The Germans, however, went a stage further in their thinking, and used their Junkers Ju-87 dive-bomber aircraft as artillery, the revelation that, in concert with their imaginative use of tanks, brought about defeats for Poland, France, and Great Britain on the Continent.

In Russia the effect of blitzkrieg seemed to be leading to defeat in 1941 and 1942, but the Soviet army, despite enormous losses of men and materiel, were the artillerymen of that war. They had lost some 40,000 guns and 60,000 mortars in the second half of 1941, and had concluded that the organization and tactics they (and the Germans) were using did not let artillery realize the power it possessed, so it concentrated artillery at army level and above. This meant that if a regimental commander needed artillery support he could (theoretically) have available to him the fire of up to two artillery divisions, a possible total of 72 or more heavy guns.

The Germans, in desperation at the losses sustained in tanks, began to install artillery into tank chassis, often using captured chassis for the purpose. This self-propelled artillery served well, and all the nations in the West adopted the principle. American self-propelled artillery gained a deserved reputation for being there with the shell whenever required. In the war against the Japanese, artillery was often used for bunker-busting at point-blank range.

The second half of the twentieth century saw a number of developments that were first used during World War II. One was the continued use of aircraft as artillery—what else is, after all, a bombing attack? Aircraft are used nowadays as flying guns and antitank weapons, as are helicopters. Rocketry, which started the whole process, evolved through the Russian *katyusha* and the German Nebelwerfer into the Multiple Launch Rocket System (MLRS), which proved of extreme value in the Gulf War in 1991. Artillery proper still plays a significant role in conventional and unconventional war.

Artillery has always been regarded as one of the three fighting arms, and there is little doubt that it will continue to be so for the foreseeable future. Aircraft and helicopters are extremely valuable antitank and antipersonnel weapons, but they do not have the endurance on the battlefield of the gun. Further, they are far more vulnerable to light antiaircraft fire than the gun is to small-arms fire. The artillery duels of the two world wars may never be fought again, but the ability to use field artillery on call is something no experienced battlefield commander will willingly dispense with.

Aryan Conquest of India (c. 1500 B.C.E.)

Invasions between 1500 and 1000 B.C.E. of the collapsing Harappan civilization by waves of Indo-European-speaking Aryans, leading to the emergence of India proper. The nomadic Aryans (nobles) migrated into the Punjab of west India and then into the Ganges River plain of north India, subjugating the Harappans into the Hindu caste system. The conquests described in the Vedic epics brought the Sanskrit language, Hinduism, horses, cattle, and chariots to India.

According to the Rig Veda, Harappan (*dasa*) warfare centered on citadels like Mohenjo-Daro and Harappa, from which infantry sallied forth armed with copper and bronze swords, axes, spears, and bows. The Aryans used chariot mobility and bow fire to defeat the Harappa in open battle. Aryan tribes moved slowly from the Afghan mountain passes onto the Punjab flatlands, deploying their *grama* or

wagon trains in a *samgrama* or circular war formation to protect them against marauding Harappan forces until the Aryan chariots could be put together and employed with devastating effect against the Harappans in the field. Although Harappan forces organized by village might number between 30,000 and 100,000, against as little as a few thousand Aryans organized by tribal units in grama formations, it appears Aryans rarely failed in open battle. In one undated battle, Aryan chariots completely crush and push the Harappan militia into the river, a favorite tactic employed by the Aryans.

Harappans eventually stayed inside their earth-and-timber-walled citadels (*puras*), but well-armed Aryan infantry utilized fire arrows and thunderous battering rams to break through. In some cases waterways were also diverted against Harappa strongholds. The Harappa king, Shambara, stiffly resisted Aryan expansion but eventually lost more than 100 citadels to the Puru Aryan tribe and was captured and thrown off a mountain. After the appearance of Aryan iron weapons further resistance by the Harappans was futile. In fact, initial Aryan expansion was slowed not so much by Harappan resistance as by the huge size of India, and by further waves of Aryans who then fought for control with earlier Aryan invaders.

The Battle of Ten Kings saw newly arrived Aryan tribes conquer existing Aryan tribes like the Puru. King Sumbasa led the heavily armored knights of the new Aryans against the chariots of older Aryan groups. Attempts to divert water channels against Sumbasa failed, and he crushed the existing Aryans, took seven of their citadels, and usurped their power in the Punjab.

Such infighting among the Aryans greatly delayed their eventual domination of India. It was the Hindu castes, and not warfare, that allowed for Aryan domination of west and north India by 600 B.C.E. in the form of small, Aryan, Gangetic kingdoms. This Hindu caste system was made up of incasts (priests, warriors, merchants, laborers) and outcasts (conquered Harappans). The warrior *varna*, or *kshatriya* caste, formed the hereditary military arm of Aryan society and developed the ability to incorporate invading groups into its eclectic military system during the Vedic period of 1500–600 B.C.E.

Aryans

A prehistoric people, also called Indo-Europeans, putatively ancestral to major Old World civilizations, whose existence has been extrapolated from the linguistic, literary, and cultural evidence of modern populations. Most reconstructions of Indo-European society based on linguistic evidence and on the earliest texts of Indic, Iranian, and Greco-Roman civilizations portray a patriarchal, tripartite social system of commoners, priests, and a war-oriented aristocracy. The prominence of horse- and wheeled-vehicle terms in the reconstructed common language is among the evidence for attributing to Indo-European speakers early mastery of horse-based warfare and wheeled mobility.

While language development is plausibly recoverable based on more than two centuries of scholarship, no substantive archeological remains are universally attributed nor can their original area of occupation be defined with any certainty. If the Aryans did exist as a definable entity from approximately 4500 to 2000 B.C.E., military significance would plausibly include extensive cultural transformation throughout Europe and southwestern Asia, horse-based military elites in “daughter” cultures, and perhaps a more militarized and patriarchal civilization in the West.

The apparent need to explain their success in the absence of material relics led to depictions of the Aryans as conquerors who swept from an unknown homeland to become an enduring elite in much of Eurasia. This hypothesis intersected with nineteenth-century political and social developments to produce the popular, scholarly, and political cult of *Aryanism* and the imagined superiority of their descendants, which was a core tenet of the racist and militaristic ideology of the Third Reich.

Much modern scholarship continues to attribute the expansion of Aryan culture to traits enabling greater success in war, but a minority view instead associates Indo-European languages with the Neolithic agricultural revolution and resulting population growth. While a plausible explanation for the dramatic expansion of one of many prehistoric language families, the latter requires a time depth not generally supported by linguistic analysis and does not address evidence of post-Neolithic cultural change.

Ashurnasirpal II (r. 883–859 B.C.E.)

King who forged Assyria into one of the dominant powers in the Near East. Though his annals are not in a good state of preservation, it is apparent that Ashurnasirpal II (Akkadian, Ashur-nasir-apli) campaigned continuously during his reign, directing his efforts to the north against the Aramean states of Bit Zamani, Bit Adini, and Neo-Hittite states located in Anatolia. All of these states, in one form or another, became vassals to Assyria. Moreover, Ashurnasirpal established a long line of fortresses to protect Assyrian trade routes.

At some point during his reign, Ashurnasirpal II crossed the Euphrates River and had his army ceremoniously wash their weapons in the Mediterranean Sea, and collected luxury items, exotic goods, and even native troops from the Neo-Hittite state of Carchemish, as well as the Phoenician and Aramean states. Ashurnasirpal even used many deportees from these campaigns to populate the new Assyrian capital of Kalhu. Ashurnasirpal’s palace at Kalhu exhibits finished relief sculptures that are influenced by Neo-Hittite and Phoenician artistic forms.

Ashurnasirpal restructured the Assyrian state and army (which had been weak for centuries), created a large bureaucracy, continued a policy of deporting conquered peoples, and claims in his annals to have used psychological warfare on his enemies by performing public displays of cruelty, mass executions, and the burning of disloyal vassal cities.

Assaye

The first and most hard-fought victory of Arthur Wellesley (later duke of Wellington). Eighteenth-century India witnessed the rise and decay of the Maratha Empire. The Maratha War of 1775–1782 had resulted in a humiliating defeat of the East India Company’s forces. The two major opponents of the British during the second Anglo Maratha War were Scindia, maharajah of Gwalior, and Bhoonsla, rajah of Berar. Arthur Wellesley’s force was part of an army assembled on the northwestern Mysore border. By early August,

negotiations with Scindia and Governor General Wellesley having failed, the latter moved against the two principal Maratha forces. After storming the city of Ahmednuggur, Wellesley's tiny army of 6,000 men advanced against Scindia's army of 50,000 men. (Scindia's infantry has been trained by European officers and was commanded by a German officer.) Early on 23 September, Wellesley received intelligence that the enemy were camped behind the Kaitna River, close to its junction with the River Joee. He decided to outflank the Indian camp and crossed the Kaitna to deploy in the V formed by the two rivers. Maratha and Mysore allied cavalry (of dubious loyalty) were left to face Scindia's cavalry on the southern bank of the Kaitna River. Maratha's reactions were swift and Wellesley's attack sustained heavy casualties in their frontal advance against Indian artillery. But because the front narrowed as the two rivers flowed toward their confluence, Maratha's troops were able to deploy only a fraction of their strength. The British initiative was checked for three hours before a devastating volley from the 74th and 78th Foot routed the regular Indian infantry.

By 6 P.M., the battle was over, but Wellesley's crippled army could not pursue the fleeing Marathas. Wellesley was later to contend that Assaye was his greatest victory and proportionally the bloodiest action he had ever witnessed. His casualties amounted to one-third of his force. The defeat of the Maratha army caused Scindia to sue for peace, but hostilities continued until 1805.

Assaye revealed Wellesley's potential as a field tactician and he was soon recalled in Europe to deal with less exotic opponents who more directly threatened Great Britain.

Assyria (c. 2000–612 B.C.E.)

The world's largest state during the early first millennium B.C.E. (c. 900–612 B.C.E.), ranging from Iran to Egypt and from Babylonia to Anatolia and the Mediterranean Sea. It originated from a Semitic-speaking people of what is today northern Iraq.

The early kings of Assyria (c. 1900–1750 B.C.E.) concentrated on mercantile activity (primarily with Anatolia), but apparently did not expand militarily. Military expansion began with Shalmaneser I (r. 1273–1244 B.C.E.), who went east and conquered Khanigalbat. Assyria again had command of

trade routes leading to Syria and Anatolia, adding rich agricultural land and prosperous cities to its territory, and a large population for military use. However, Shalmaneser's successor, Tukulti-Ninurta I (r. 1244–1208 B.C.E.), attacked Babylon, a continuous military effort that diverted Assyrian energies and resources from the task of securing other areas, and thus Assyria declined. Assyrian military prestige was reasserted by Tiglath-Pileser I (r. 1115–1077 B.C.E.), who made campaigns across the Euphrates River to fight against the Arameans.

Within a century, the Aramean tribes had begun to infiltrate the Assyrian state, once again forcing the Assyrians into an offensive militarism in order to survive. Ashurnasirpal II (r. 884–859 B.C.E.) directed many of his campaigns against the Aramean and Neo-Hittite states east of Assyria, reaching the Mediterranean Sea and forming a defensive ring to protect Assyrian mercantile activity. His successor, Shalmaneser III (r. 858–824 B.C.E.), was beset with internal problems because of the difficulties of keeping together Ashurnasirpal's conquests. He crossed the Euphrates River on at least two occasions to meet a large coalition of Syro-Canaanite states (including Ahab of Israel and Hadadezer of Damascus), apparently fighting to a draw, although Assyria continued to receive tribute from these regions.

Once again, Assyria collapsed from the weight of keeping such an enormous state and did not expand again until the reign of Tiglath-Pileser III (r. 745–727 B.C.E.), who defeated Urartu to the north and ended the Aramean state of Damascus. The next major successor, Sargon II (r. 721–705 B.C.E.), also fought against a Syro-Canaanite coalition, and completed the conquest of Israelite Samaria, deporting many of its citizens. He fought battles against Elam (in southwestern Iran) and Babylon, and took the throne of Babylon for himself. His successor, Sennacherib (r. 705–681 B.C.E.), suffered through a major revolt throughout the empire, culminating in his campaign in Syria and Judea in 701 B.C.E. The Babylonians (Assyrian vassals in southern Mesopotamia) rebelled against Assyria at Sennacherib's accession, culminating in Babylon's utter destruction by the Assyrians in 689 B.C.E. Sennacherib's successor, Esarhaddon (r. 681–669 B.C.E.), became the first Assyrian king to enter and conquer Egypt as far as Thebes (671 B.C.E.). Ashurbanipal (r. 668–631 B.C.E.), however, lost Egypt (655 B.C.E.) and endured a devastating civil war (652–648 B.C.E.) and economic destruction (after 631 B.C.E.). With the empire in disarray, the capital city of Nineveh was destroyed by a combined force of Medes, Chaldeans, and northern tribes in 612 B.C.E., ending the Assyrian state.

The Assyrian army was composed primarily of native agricultural workers, hillsmen, and seminomads. Foreigners were employed as royal bodyguards and in later periods in

infantry units. Both Assyrian kings and military commanders are known to have led the army into the field of battle.

The military strength of the army was due in part to its chariot force. By the ninth century, the Assyrians used a wooden-framed vehicle with a rear-wheel axis, allowing for more maneuverability. It contained an archer/lancer, a driver, and a shield bearer. The chariots were used in the center of attack as shock troops. Horses were used to draw chariots and for light cavalry who rode bareback. Since horses were not in good supply in northern Iraq, the Assyrians often raided the Iranian plateau to replenish their stock. The compound bow—effective over 250–650 meters—was a major weapon. Individual armor, usually metal links sewn on leather, and simple helmets were used for defense.

The army was fed on the march with travel rations or at provincial centers that supplied food. In enemy territory the army was trained to live off the land. Communication between units was by cavalry and runners. Even mountainous territory did not deter the Assyrian army; the annals describe in detail the movement of the army on rafts across rivers, and carts were used to transport heavy equipment in mountainous terrain.

Siege techniques were often employed by the Assyrians. A

ramp of piled-up earth was used to gain access to the upper walls of an enemy city or fortress. Battering rams were used to smash down gateways. Many of their sieges were very long; Israelite Samaria took nearly three years to overthrow.

Assyrian battle tactics were sophisticated, versatile, and anticipate classical Greek hoplite tactics. The annals describe a number of battles in detail. The Assyrians took advantage of topographic positions, tactical superiority, guerrilla warfare, and psychological terror tactics. The most enduring of their tactics was the policy of deportation, which caused as many as 5 million people to be uprooted during a period of three centuries (c. 900–612 B.C.E.).

Ataturk, (Mustafa) Kemal (1881–1938)

First president of the Republic of Turkey, and hero of Gallipoli. Ataturk was born in Salonika in 1881, the son of a customs officer. Moving quickly through the Ottoman Empire's military schools (where he gained the nickname Kemal, or "perfection"), Mustafa, who had rejected religious training to become an officer, developed a keen appreciation for foreign modernization and progressive reform, especially after seeing his country lose territory to Italy in 1911 and to Greece in 1912. Although chief of staff to the Young Turk army, which had taken over Constantinople from reactionaries, his rivalry with Enver Pasha caused him to be sent to outposts like Syria before becoming military attaché to the embassy in Bulgaria, where he carefully studied European armies. At the outbreak of World War I, Mustafa advocated neutrality, but performed brilliantly, holding Gallipoli against British attack in April 1915 by personally inspiring

the men with his bravery to hold their lines, even at great cost. Afterwards, he commanded a division on the Russian front, advancing to the rank of general, although he refused to take part in a German plan to attack Baghdad.

After the war, Mustafa did his best to encourage nationalist feelings and the secreting of weapons by the army, a plan that bore fruit as he helped to organize a rival legislature in Ankara and pushed this body to accept his National Pact, limiting the country to Turkish majority areas and a program of reform. In 1921, he was given supreme command of the Turkish army and successfully fought the Battle of Sakarya in August to push the Greeks out, followed by a coup de grace at Dumlupina in August 1922. In recognition of his role in the foundation of the Republic of Turkey as an independent nation, he was elected its first president in October 1923 and voted the name Ataturk, or "Father of Turkey." As a political leader, he advocated a program of literacy, women's rights, military and social Westernization, as well as secularism and state investment in infrastructure. (He even abolished the traditional fez male headgear as too redolent of the past.) He died, still in office, on 10 November 1938.

Atlanta, Battles Around (20–22 July 1864)

Battles that unhinged the Confederacy and paved the way for Sherman's "March to the Sea." In spring 1864, Union general William T. Sherman and Confederate general Joseph Johnston engaged in a classic and brilliant campaign of maneuver from the Tennessee-Georgia border to Atlanta. Johnston selected strong defensive positions in the mountains that ran roughly northeast to southwest, while Sherman mostly maneuvered by threatening to swing west and south and cut off Johnston's retreat. Sherman did test Johnston's defenses at Kennesaw Mountain and was repulsed with great loss of life. It took about 75 days for the Union armies to advance the approximately 100 miles between the two cities.

Sherman had divided his force into three for the final attack on Atlanta, and Johnston waited along Peachtree Creek (which was just north of the city) to strike at George Thomas's more isolated army. Before he could attack, Johnston was relieved, and John B. Hood attacked Thomas as the

Army of the Cumberland crossed Peachtree Creek on July 20. The attack was not well coordinated, Thomas's men held their good defensive positions, and Hood's men fell back.

Hood then retreated into Atlanta's inner defenses, and turned his attention to James McPherson's Army of the Tennessee on the Union left. Hood planned for an attack at daybreak on July 22, but Confederate infantry could not get to their assault positions until noon. Meanwhile, McPherson had sent reserves to strengthen his left, and the reserves held up the Confederate attack, which later threatened to break through only to be halted by massed Union artillery and the commitment of additional northern reserves.

When the battle ended, Hood realized he could no longer defend the city, and he sought to lure Sherman away by threatening to tear up the long northern supply line to Chattanooga and Nashville. Sherman refused to take the bait, and eventually decided on the famous March to the Sea to Savannah.

Atomic Bomb, Development of

The most expensive and complicated weapon development through 1945. The development of the atomic bomb spans several decades and extends across continents, starting in the late nineteenth century with a series of scientific discoveries, later followed by several political developments. The initial, scientific phase took place in Europe, primarily in Great Britain and Germany. The discovery by physicist J. J. Thompson of the electron, a subatomic particle with a negative charge, began the process. Based on this discovery, James Rutherford conceived of the atom as a sphere of a positive charge, with an equal amount of electrons scattered throughout to balance it. This allowed him in 1919 to create oxygen from nitrogen by shifting the number of electrons, then to speculate about the existence of the neutron the following year. The existence of the neutron was confirmed in 1932. A year later, Hungarian-born physicist Leo Szilard realized that if an element could be forced to emit two neutrons when it swallowed one (instead of a simple exchange with another element), then fission might occur. This idea

became the subject of a classified British patent in 1935. Other investigative strands included the discovery of artificial radioactivity by French and Italian research teams. In 1938, German scientists discovered that uranium could be fissioned.

The consequences of such a discovery were obvious: The huge amount of energy that could be released might lead to the devising of not only new power sources, but also weapons. In the United States, awareness of fission had been the subject of hundreds of articles, but there was only limited governmental involvement in such matters. Things changed when on 2 August 1939, Albert Einstein, informed by Leo Szilard that Nazi Germany had banned all exports of uranium, sent a letter to President Roosevelt warning him of the potential dangers a uranium-based bomb could pose. In light of the German threat, Einstein and Szilard asked the American leader to order the development of a counter-project.

The race to build the bomb thus became a contest between the United States and Nazi Germany, though neither nation was yet at war with the other. In Germany, the project was spearheaded by Werner Heisenberg, but the structure of Nazi bureaucracy and the budgetary appropriation process emphasized the need for weapons that could be developed quickly under war conditions. Thus, despite a clear interest in some circles, budgetary restrictions combined with certain theoretical mistakes slowed the German bomb effort. (Oddly, the German nuclear effort seemed to have centered around the need for a new method of electrical generation.)

The United States and the United Kingdom knew nothing of the slowed German pace. Consequently, committees were set up to study the feasibility of a bomb. The British MAUD committee (a code name later transformed into the acronym for Military Application of Uranium Detonation) concluded in 1941 that a uranium-based bomb was feasible. Meanwhile, in the United States Vannevar Bush, President Roosevelt's science adviser, led the Office of Scientific Research and Development (OSRD) until 1942 for the same purpose. He enlisted the assistance of several other high-level scientists, including Arthur Conant, future president of Harvard. The U.S. effort gained momentum when a copy of the MAUD report was obtained in 1942. That year, General Leslie R. Groves was appointed head of the Manhattan Engineer District (MED), later known as the Manhattan Project. In parallel, Arthur Compton oversaw the plutonium program, which, it was discovered, could have an even greater yield than uranium 235. In December, working in Chicago, scientist Enrico Fermi was to produce the first self-sustaining chain reaction.

The following year saw several developments at the polit-

ical and military levels. President Roosevelt and British prime minister Winston Churchill agreed on atomic policy that included the transfer of some 35 British scientists to the United States to work on the atom bomb project. Leslie Groves established the Oak Ridge National Laboratory in Tennessee, where the manufacture of the fissile matter began. Throughout 1943 and 1944, several procedures were tested for proper design and implementation of a chain reaction, including the firing of a portion of uranium into another (later implemented on the “Little Boy” A-bomb dropped on Hiroshima) and the implosion concept for plutonium (used in “Fat Man,” dropped on Nagasaki). The first test, however, was carried out in the New Mexico desert on 16 July 1945: The Trinity test was a success, and cleared the way for implementation of the atomic bomb operation.

President Truman, who had been informed of the Manhattan Project’s existence 13 days after taking office in April 1945, had a special Interim Committee formed on 9 May 1945 to advise him on the use of this weaponry. On 25 July, the president directed General Carl Spaatz to have the specially trained 509th Composite Group, flying modified B-29 bombers, deliver its first bomb on or after August 3. On 6 and 9 August, B-29s *Enola Gay* and *Bok’s Car* dropped bombs on Hiroshima and Nagasaki, respectively. The death toll exceeded 100,000 at the first target, while over 70,000 people died in the second bombing.

Attila the Hun (406?–453)

King of the Huns, invader of Europe with Germanic allies. At first ruled jointly with his elder brother Bleda, whom he murdered in 445. The brothers were quite unlike and had always detested each other. Attila, however nefarious, had the attributes of greatness, whereas Bleda’s principal occupation, so says Priscus of Panium, a contemporary Greek writer, was laughing at his court buffoon, a grotesque Moorish dwarf. The brothers were members of a dynastic lineage that had united previously separated Hunnic groups around

itself, together with many subject peoples (the majority Germanic) to create a substantial empire in central Europe, mostly north of the Danube. It is important to note here that Hunnic society was now much more sedentary than when described by Roman historian Ammianus Marcellinus several generations before, when the Huns avoided all permanent housing scrupulously.

Roman ambassadors, Priscus among their number, who tried to negotiate with Attila noted that even when gold was freely available the king himself still wore plain clothes, ate off wooden plates, and never touched bread. The ambassadors found Attila sullen, capricious, and arrogant, but as he was confronted with treachery on all sides, this moodiness is hardly surprising.

Under Attila’s rule the Hunnic empire occupied an impressive area. In the north it extended to the Baltic, where, according to Priscus, “he ruled all the islands.” It did not quite stretch to the Rhine, for the Franks and Burgundians lay in between, but Attila was said to rule “all Scythia.” He delighted in war, but after he had ascended the throne, his head, rather than his arm, had achieved the conquests toward the north. During this period the Romans had successfully bought off their formidable neighbors, but now injudiciously allowed their payments of tribute to fall in arrears.

In 441 and 443, Attila invaded the Balkan provinces of the eastern empire, defeating the Roman armies with deplorable ease. In 447, favored by recent earthquakes that had devastated Asia Minor, he marched on Constantinople itself. The walls had suffered severe damage. Fortunately for the eastern empire, the fortifications were repaired and strengthened just before the arrival of the Huns. Attila turned aside and drove south into Greece, and was only checked at Thermopylai.

His next campaign was that of 451, when he turned west and invaded Gaul; he was defeated at Châlons by Roman and allied forces under Aëtius. In the spring of the following year, he invaded Italy, sacking several northern Italian cities (Aquileia at the tip of the Adriatic was utterly destroyed), and was compelled to withdraw, short of Ravenna, only by a combination of famine and pestilence. He clearly intended to invade east again in 453, but died unexpectedly during the night after his marriage to a young girl called Ildico.

Attila was a charismatic and powerful figure who demonstrated considerable ability as a general, but his successes were limited. He could lay waste with fire and sword the Thracian and Illyrian provinces, but he could not penetrate further into the empire. His campaigns were thus pursued in support of a diplomatic policy whose main aim seems to have been the extraction of vast sums of gold as blackmail. In 443, when Roman armies had failed to stem his advance, Attila’s terms had had to be accepted. They

called for the immediate payment of 6,000 pounds of gold and future annual payments of 2,100 pounds of gold each.

On Attila's death, his realm was divided between his sons, but his Hunnic empire soon fell to pieces. The subject German peoples rebelled and defeated their overlords. The Huns broke up into small hordes and never regained the unity that had made them a serious menace to the Roman Empire, although they continued to be recognizable components of other steppe states into the sixth century and lineages continued to be traced back to the glory days of empire.

Aurangzeb (1618–1707)

Aurangzeb, the third son of Shah Jahan and Mumtaz Mahal, was the emperor of Mogul India between 1658 and 1707. He was an experienced military commander and administrator, and prior to his ascension to the throne had served on important appointments as the governor of the Mogul Deccan for eight years, as governor of Gujarat for three years, and as the commander of the Mogul armies for the Central Asian invasions of Balkh and the first two sieges of Kandahar Fort. He rose to power through a dramatic civil war, wherein he imprisoned his father and sentenced his brothers, son, and nephew to death. His rule provided his European portrait through the publication of Bernier's *Travels* in 1670.

Following tradition, Aurangzeb retained Shahjahanabad Delhi as his capital for the first 20 years of his reign. In this period, he was also preoccupied with safeguarding the northwestern frontiers of the empire against the attacks of the Persians and Central Asian Turks. Meanwhile, deep within the Mogul territories, the Maratha chief Sivaji twice plundered the great imperial port at Surat in 1664 and 1670, with little resistance. When reconciliation and agreement with such factions failed, Aurangzeb decided to completely change his approach. In the next decade, the grand encampment or tent city became the movable capital of the empire for Aurangzeb. The emperor campaigned actively in parts of Rajasthan and the Deccan. He added the word *Alamgir* (world-seizer) to his titles, and dedicated himself to foster-

ing a more conservative Islamic regime (versus the more liberal approach of his forefathers) and to an aggressive expansion of the empire's frontiers. The Hindus and the Marathas were no longer colleagues, but subordinates, and like several other southern Muslim kingdoms, were marked for annexation rather than containment.

Following this policy, Aurangzeb conquered the Deccan kingdoms of Bijapur and Golconda in 1686–1687. Also, he made efforts to quell the Maratha war, which included the capture and execution of Sivaji's son Sambhaji. Though the Maratha kingdom was broken up following these events, the guerrilla tactics of the Marathas had now spread throughout south India. The last years of Aurangzeb and his weary armies were therefore spent in laborious and fruitless sieges of countless forts in Maratha hill country.

Aurelian, Lucius Domitus (214–275)

Coarse but successful Roman emperor who expelled barbarians, subdued rebellious provinces, and reunited the empire. Aurelian is believed to have been born at Moesia, in the northern Balkans, around 214. Attracted to a military life, he joined the Roman army and rose through the ranks by virtue of skill, bravery, and single-minded determination. He served as a high-ranking cavalry officer under the emperor Claudius II (Gothicus) and distinguished himself in several victories over the Goths. When Claudius died of the plague in 270, Aurelian was elevated to the purple by his troops. He then disposed of several minor contenders before hastily transferring forces to Italy and fending off large incursions by the Juthungi and Alamanni. Having routed the invaders, Aurelian fortified Rome by erecting the famous walls around that city. By now his ruthless nature and relentless emphasis on military discipline had given rise to the nickname *Manu ad ferrum* ("Hand on hilt").

Aurelian's greatest challenge came in 272, when various eastern provinces of the empire declared their support for the celebrated Queen Zenobia of Palmyra. Accordingly, that year he assembled a large army in Asia Minor, and marched

south against the usurpers. He quickly vanquished Zenobia's dreaded heavy cavalry in two battles and besieged the capital of Palmyra. The Romans subsequently captured the queen, but Aurelian spared her along with the city. The following year, after successfully defeating the Goths and Carpi along the Danube, the emperor was incensed that Palmyra had revolted and had slaughtered the Roman garrison installed there. He then executed a well-conducted foray that surprised the defenders, captured Palmyra, and mercilessly razed it.

With affairs of the eastern empire secure, Aurelian turned his attention to the province of Gaul, which had been in revolt for over a decade. He easily defeated troops of the Gallic Empire at Châlons in 274, and spared the life of Tetricus, their leader. Tetricus and Zenobia were subsequently brought to Rome and featured in a magnificent triumph. Both were allowed to live out their lives in relative luxury. With the empire restored and a host of enemies vanquished, the senate and people of Rome hailed their burly peasant-emperor as Restitutor Orbis (Restorer of the World). He is regarded as the most successful of the Bar-racks emperors.

Determined to restabilize social conditions, Aurelian also displayed considerable skill as an administrator. He canceled debts, pardoned political crimes, openly distributed bread to the poor, and overhauled the currency. One of his last military acts was preparing a final, military showdown against the Persian Empire. En route to his destination, Aurelian was assassinated near Byzantium by his own officers in 275.

Austerlitz, Battle of (Moravia, 2 December 1805)

Decisive victory by Napoleon over the Austro-Russian armies. After Napoleon had defeated Karl Mack at Ulm (20 October 1805), Czar Alexander I and Emperor Francis II decided to renew the attack. Napoleon's forces, numbering 73,000, were grouped around Brünn.

On 27 November the 86,000 allied troops, mostly Russian, moved toward Brünn, hoping to turn Napoleon's right flank, cut him off from Vienna, and drive him against the

Bohemian mountains, despite allied commander Mikhail Kutusov's objections.

Almost throughout the entire battle, the initiative was wholly Napoleon's. The allied army disintegrated, suffering some 16,000–25,000 casualties. French losses numbered around 9,000. An armistice on 3 December between France and Austria led to the Peace of Pressburg (26 December), ending the Third Coalition.

Austerlitz was one of Napoleon's most extensively planned battles, reflecting the peak of his tactical skill. It was an excellent example of flexibility and meeting the unexpected, and it was perhaps his greatest tactical victory.

Australian Military

Australian troops at the opening of the twentieth century were heavily committed in the Boer War in South Africa; at the century's close they were heavily engaged in peace keeping in East Timor. It is a reflection of both the near-continuous overseas service and the changing emphasis of Australian army operations between the beginning of the twentieth century and its end.

When Australia federated as a nation in 1901, troops from the individual Australian colonies were already fighting in the Boer War in aid of Britain. The new federal government lost little time in raising an Australian Commonwealth Horse unit, eventually 4,000 strong, and dispatching it to South Africa in February 1902.

At federation, the army was 28,836 strong: composed of 1,500 permanent soldiers, 16,000 militia, and 11,200 volunteers. Britain had demanded that 9,000 troops be available for overseas imperial service, and Australia complied, but stipulated that Australian troops be always under Australian control, and that they only be committed overseas at Australian government discretion. These conditions were influenced by executions of Australians by the British army dur-

ing the Boer War, which caused such resentment that Australians in the military have never again been subject to capital punishment or generally subjected to non-Australian military discipline.

A perceived threat to Australia from Japanese and German naval expansion saw compulsory military training introduced for all Australian men in 1907. Australia was the first English-speaking nation to do so by law. All boys between 12 and 18 years were required to drill, and then subsequently complete two years of formal military training. In 1910 the military training age was extended to 26 years. By 1913 Australia had nearly 90,000 trained soldiers, 56,000 school-age cadets, and 48,000 army-sponsored Rifle Club members under arms. In 1911 the Royal Military College was established at Duntroon.

When Britain declared war on Germany on 4 August 1914, Australia responded with a promise to assist Britain to “the last man and last shilling.” However, the Defence Act did not allow the army to engage in overseas service, so a new expeditionary army, the Australian Imperial Force (AIF), had to be created from volunteers. This force eventually amounted to five divisions on the western front in 1919. Australians fought with distinction at Gallipoli in 1915, the tragic battles of the Somme in 1916, and Ypres in 1917; engaged successfully in the last great cavalry charge in history at Beersheba in Palestine in 1917; and were instrumental in the decisive final assaults against the Hindenberg Line in late 1918. Ultimately 330,000 Australians served overseas during World War I (nearly 7 percent of Australia’s total population), and of these 59,000 lost their lives and 152,000 were wounded. All had been volunteers, as the Australian people had twice rejected conscription during the course of the war. Many Australian veterans felt that the lives of their comrades had been squandered by incompetent British commanders, who tended to use the Australians as shock troops, and there was considerable rancor between the Australians and the British (“pommies”) well before the end of the war.

The interwar years saw the Australian army languish because of Britain’s policy of Asian defense from a strong Singapore naval base. Compulsory training was discontinued in 1929, and army strength fell to fewer than 28,000 men. Until World War II began, all equipment in use was World War I surplus.

Australia declared war on Germany on 3 September 1939, formed the Second AIF, and then dispatched the 6th Infantry Division to the Middle East, where it participated in the Libyan campaign against Italian forces in early 1940. It then fought in both Greece and Crete, suffering heavy losses of men and equipment. In 1941 the newly arrived 9th Australian Division comprised the main force in the successful

defense of Tobruk, while the 7th Division invaded Syria to prevent its coming under German control.

Japanese threats to Southeast Asia necessitated the newly formed 8th Infantry Division being posted to Malaya, while the still-equipping 1st Armoured Division remained in Australia. The rapid southward advance of the Japanese caused great concern and the 6th and 7th Divisions were recalled to Australia. En route, Churchill tried every pressure to have them diverted to Burma, but the Australian government refused. In 1942 the 8th Division went into captivity with the fall of Singapore, while the 9th Division remained in the Middle East and figured prominently in the El Alamein battles.

The Malaya-Singapore-Burma British-led military fiascos and the disastrous Japanese bombing of the northern town of Darwin led to a profound reorientation of Australian policy in the midst of war, from Great Britain to the United States. Australians noted that while the British fell apart before the Japanese, the Americans at least went down fighting in the Philippines. For a while, General Douglas MacArthur was about as popular in Australia as he was in the United States. Further, the vast military power of the United States military was obvious to all Australians by 1943, even though the Pacific was a secondary theater so far as Washington was concerned.

The Japanese advance in New Guinea over the Kokoda Track in 1942 was countered by brigade-level actions of militia units, until the 7th Division was dispatched in mid-1942. By 1943 five further divisions were in action in the Southwest Pacific theater, and operations in the Solomons, New Guinea, and New Britain culminated in large-scale amphibious landings on Borneo in the final months of the war. Australia pushed hard politically for an army corps to participate in the planned landings on the Japanese homeland, an event eventually made unnecessary by the atomic bomb attacks. Total Australian army casualties during World War II were 219,500, including 20,000 POWs.

At the end of World War II the Australian government set target establishments for the postwar army, but they were not met, and by 1949 strength was only 15,000 regulars and 23,000 reserves, reflecting on Australia being initially only able to contribute a single battalion to UN forces at the outbreak of the Korean War. In October 1951, under U.S. pressure, this combat commitment was increased to two battalions and subsequent Australian command of the Commonwealth Force. Commonwealth forces were rated by the UN Command as among the best troops in Korea. At the same time, conscription was introduced—but then allowed to lapse after the end of the Korean commitment.

A policy of forward defense in Southeast Asia led to commitment of Australian troops to Vietnam in 1962, first as advisers and then as combatants with the arrival of the Royal

Australian Regiment (RAR) in mid-1965. Participation peaked during 1968 and 1969 at three logistically self-supporting infantry battalions with armor support, which succeeded in repressing most Vietcong activity in Phoc Tuy province during the period. Australian combat troops had also been continuously committed alongside British forces in Malaya and Borneo since 1955 fighting Indonesian insurgency, and conscription had to be reintroduced to meet the added Vietnam commitment. Australian forces were eventually withdrawn from Vietnam in 1972 and conscription ended once again.

Since 1947 the Australian army has participated in 44 peacekeeping operations globally, and in 2000 deployed a substantial force to the former Indonesian province of East Timor during its transition to an independent nation.

Austrian Civil Wars (1934)

The authoritarian Austrian government's suppression of both a socialist and a national socialist (Nazi) uprising. One month after Hitler's seizure of power in Germany, the Christian Conservative government of Chancellor Engelbert Dollfuß dissolved on 4 March 1933. Weak in the interior, Dollfuß gave in to Mussolini's pressure to establish a pure authoritarian regime. Right-wing Socialists such as Karl Renner tried to avoid a clash with the government, while the left wing prepared for resistance. After dissolution of the socialist paramilitary organization *Schutzbund* (31 March 1933), semifascist formations within the government bloc tried to complete disarmament of their opponents and to provoke them. After an incident at Linz, fighting spread immediately to the industrialized areas of eastern Austria. Government forces dispatched about 100,000 soldiers against (in theory) 40,000 poorly armed *Schutzbund* members. The latter hardly stood a chance. Socialist appeals for a general strike as well as for the full mobilization of the *Schutzbund* failed totally. Police and army forces encircled their opponents in

workers' districts, and artillery fire even on civilian targets broke the last resistance on 15 February. Government forces suffered 42 dead and 123 wounded. More than 100 civilians were killed. *Schutzbund* casualties are estimated at more than 1,000. The Socialist party and trade unions were outlawed, their leaders imprisoned or driven into exile. Nine *Schutzbund* fighters were sentenced to death and executed. "February 1934" was a government-provoked action to complete the abolition of democracy.

Now it was the turn of the Austrian Nazis. Backed by their German comrades, they organized a coup d'état after various methods to abolish the Dollfuß regime, the main obstacle to the intended Anschluss to Germany, had failed.

On 25 July Viennese SS squads stormed the chancellery. Dollfuß was wounded and died. His death was the only success enjoyed by the badly organized rioters; not even all Nazi units participated. The army—contrary to the Nazis' calculations—stayed loyal to the government. In the capital, army and police regained control quickly. Fighting outside Vienna, different from events in February, concentrated on rural areas, especially in Styria and Carinthia, and lasted up to 27 July. Left without support—Italian troops at the border prevented German intervention—the Nazis' struggle was hopeless. This new civil war left 269 dead; 13 rioters were executed. German and Austrian Nazis had to change their tactics completely but time and the dividing of Austrians after two civil wars worked in the Nazis' favor when Anschluss—union with Germany—came in 1938 without resistance.

Austrian Succession, War of the (1740–1748)

A conflict that saw the emergence of Prussia as a great power. The War of the Austrian Succession was a series of smaller wars in the Habsburg-Bourbon feud and the first struggle for German hegemony between Austria and Prussia.

Charles VI, Holy Roman Emperor, was determined to avoid the same fate that had befallen the Spanish Habsburgs in 1700. His daughter and heiress, Maria Theresa, was disqualified from election as Holy Roman Emperor, but she could inherit the Habsburg lands in Austria, Bohemia, Silesia, and Hungary.

Charles drew up an agreement, the Pragmatic Sanction, and sought acceptance from the states of Europe for this solution. Most states agreed, but Bavaria and Saxony refused. When Charles died in October 1740, the German states began plotting with Austria's rival, France, on how to take advantage of the situation.

Frederick II, the new Prussian king, was an ambitious young man with a full treasury and a well-trained army. He coveted the resource-rich Austrian province of Silesia. On 16 December, Frederick invaded, completing his conquest in six weeks.

Austria also faced threats to its Italian territories from Spain and in southern Germany from France and the German states, but was saved thanks to Maria Theresa's courage and Frederick's pragmatism. The queen, her children in her arms, made a dramatic appearance before the assembly of Hungarian noblemen, winning their support. Frederick, satisfied in his ambition, agreed to peace with Austria. This left the Austrian armies free to tackle the French and Spanish threats.

By mid-1742, Great Britain, already at war with Spain over trade and colonial affairs, decided to play a more active role on the Continent. A combined British-Hanoverian-Austrian army defeated the French at Dettingen in June 1743 (the last battle in which a British monarch, George II, personally took part). The war might have ended at this point as Prussia was sated, Austria had secured the rest of its territories, and France was disillusioned by its German allies and war-weary.

The balance of power was upset in September 1743 when Sardinia joined the Anglo-Habsburg coalition. A Franco-Spanish expedition was sent to crush Sardinia, while France agreed to join Spain in its war against Britain. The French war effort concentrated on the Netherlands and northern Italy. The war in the Netherlands was successful, but the Italian campaign was marred by disagreements with the Spanish over objectives and protocol.

Supporters of Charles Stuart (Bonnie Prince Charlie) launched a rebellion in Scotland, but were defeated at Culloden (the last battle on British soil). The British also gained the French fortress of Louisbourg on Cape Breton Island, and captured New England militia.

The Treaty of Aix-la-Chapelle, which officially ended the war, settled nothing. Aside from the recognition of Prussia's conquest of Silesia, all else was returned to prewar status. The treaty was a truce, postponing the resumption of the Anglo-French and Austro-Prussian wars.

Austro-Swiss Wars (1315–1499)

Wars for Swiss independence and consolidation. The Austro-Swiss conflict, lasting nearly 200 years, resulted in the formation of the Swiss Confederation and eventual independence from Habsburg feudal rule. During this period, the Swiss fought against Habsburg Austria, imperial German cities, and Burgundy.

In 1273, Rudolf I, the Habsburg Holy Roman Emperor, attempted to reassert his family's authority over the cantons of Uri and Schwyz. Both regions had received letters of charter from the previous emperor, Frederick II.

In 1291, Uri and Schwyz were joined by the Canton of Unterwalden to form the Swiss Confederation. They pledged themselves as a military alliance to defend their charters within the empire, but to resist Habsburg rule.

In November 1315, Duke Leopold of Austria led an expedition to assert Habsburg authority. The Swiss of Uri and Schwyz fielded a small force of peasants armed mostly with halberds. These men occupied a defensive position at Morgarten. They had picked their place well: The Austrian army had to file along a narrow road, which the Swiss blocked. On the Austrian left was a steep slope, on their right the freezing waters of Lake Egeri.

Duke Leopold made no attempt to scout the defile ahead, and his mounted troops rode forward confidently. Without warning, Swiss soldiers swept down from the hills, swinging their terrible pole-arms. The mounted knights, hemmed in by their own numbers, could face certain death in the lake or an ugly yet just as certain death against the halberd. Leopold's army disintegrated and the Habsburgs grudgingly let the Swiss manage their own affairs.

Swiss expansion during the fourteenth and fifteenth centuries took the form of accepting new members into the Confederation. The Canton of Bern entered into a military agreement with the forest cantons of the Confederation. Bern's expansion brought it into conflict with its Burgundian neighbors, who launched a punitive expedition in 1339. At the Battle of Laupen, the Bernese, aided by other Swiss allies, won a decisive victory over mounted knights.

In 1386, the Swiss, confident in their fighting abilities, provoked a renewal of hostilities with the Habsburgs. The Battles of Sempach (1386) and Nafels (1388) broke the Habsburg effort to bring the Swiss back under imperial dynastic control. In fact, the growing Confederation secured a series of treaties in 1389, 1394, and 1412. This last treaty established peace between the Swiss and the Habsburgs for 50 years.

During this period of peace in the east, the Swiss became more embroiled in military adventures in Italy and Burgundy. They established their reputation for cohesion, aggressiveness, and disregard for death. Battles such as those at Arbedo (1422) and St. Jacob en Birs (1444) made the Swiss masters of the field against the traditional means of chivalric combat.

The Habsburgs could endure the situation no longer, and in 1469 Sigismund, duke of Austria, mortgaged the province of Alsace to Charles the Bold of Burgundy for 50,000 guilders. Sigismund hoped to fight his war against the Swiss by proxy. Unfortunately for Sigismund, Charles took advantage of his new obsession to expand northward toward the Netherlands. Sigismund backtracked and formed a league with the Swiss and the French to fight Burgundy. Once the Swiss marched into the theater along the Rhine, both Austria and France left the war.

The Swiss faced the full power of Burgundy, one of the strongest states in Europe at that time. Charles possessed a number of cannon, and he had in his army large contingents of men-at-arms and crossbowmen. Despite these advantages, Charles (also called “The Rash”) possessed little tactical skill or strategic sense. He lost three battles, Granson (1476), Murten (1476), and Nancy (1477). At Nancy, Charles fell mortally wounded into a frozen trench, a halberd gash splitting his head from temple to cheek.

After Nancy, the Habsburgs acquired Burgundy by marriage, but they never succeeded in reestablishing their authority over the cantons. In 1499 the Habsburgs made one last attempt, at the Battle of Frastenz. The Swiss prevailed because Maximilian of Austria failed to adequately guard a cliff that flanked his line. The Swiss charged up this cliffside and won their last desperate battle for independence.

The Treaty of Basel concluded nearly 200 years of conflict, and it ended in fact, as well as in theory, Habsburg hegemony over the Swiss. The Swiss had achieved their independence.

Austro-Turk Wars (1529–1739)

No fewer than eight wars fought between the Austrian and Ottoman Turkish Empires, 1529–1739. The Turks sought to expand into Europe proper and the Austrians stood in the way, while harboring expansionist dreams of their own.

The war of 1529–1533 was a direct result of the Ottoman defeat of Hungary in the Hungarian-Turk War of 1521–1526. The Hungarian king John Zapolya, now a subject of the Turk sultan Süleyman the Magnificent, requested help against the Austrians. The sultan took more than four months to move his huge army from Constantinople to Vienna, allowing the Archduke Ferdinand time to build his defenses. The unsuccessful siege lasted from 27 September to 14 October 1529. The sultan tried again in 1532 but a monthlong siege at the Austrian fortress of Guns failed. A truce was called because of the Turk-Persian Wars of 1526–1555 but this agreement did not stop the Turkish army from pillaging and plundering.

The sultan Süleyman, reacting to the attack by 24,000 Austrian and Bohemian troops on the Turk fort at Essek in 1537, renewed the war of 1537–1547. In 1543, issues of succession for the Hungarian throne led to a well-planned Turkish expedition that left Belgrade and captured the large forts of Stuhlweissenberg and Grau, then occupied Croatia as well as Buda and Pest, the capitals of Hungary. In 1545 Ferdinand offered a truce and an annual tribute of 30,000 ducats for Austrian Hungary. Again, the Turk-Persian Wars of 1526–1555 played a role in this 1547 truce being signed at Adrianople.

The war of 1551–1553 involved Austrian and Turk disputes over Transylvania. Ferdinand besieged its capital, Lippa, in 1551 while an Ottoman army captured three fortresses in the nearby Temsvar region, soon made into a new Turkish province. However, the Turks failed to take the fortress at Erlau (Eger), and the army was recalled for the Turk-Persian war, yet again! An armistice restarted the 1547 truce of Adrianople.

The war of 1566 saw Süleyman repulsed at Malta in 1565 by the Knights Hospitallers. The sultan, near the end of his life, sought one vindicating victory over the Austrians and their new emperor, Maximilian II. A Turkish army of several hundred thousand crushed the Croatian fortress town of Szigetvar but the sultan died of natural causes during the battle. And some 3,000 Turks were blown up when timed

powder bombs exploded as they breached the last defenses. The Turkish army returned with the body of Süleyman to Constantinople, effectively ending the war.

The “Long War” of 1591–1606 began with the defeat of the Bosnian Ottomans by Croatians at Sissek in 1593. The Porte (Ottoman government) suffered its worst losses against Vienna in the longest war between the two. The Porte lost much of Hungary, Romania, Moldavia, Walachia, and Transylvania both on the field and through defection to Vienna. Attacks by Dnieper Cossacks and losses of Esztergom and Giurgiu forced the sultan Muhammed III to take the field with the Prophet’s standard and rally his retreating infantry for an unlikely victory at Mezokersztes. Here 30,000 Germans and Hungarians died. Fortress and siege warfare became the norm, with the Austrians taking Raab but not Buda in 1598 and the Turks failing to take Varazdin and Pest in 1599 and 1603. The Turks regained lost territory in alliance with the Transylvanian prince Stephen Bocksay, and the fluctuating Long War ended in the Treaty of Zsitva-Torok of 1606, with the Austrians as clear winners over the Porte, now busy with yet another Turk-Persian war, 1603–1612.

The war of 1663–1664 stemmed from the success of the Turks in the Transylvanian-Turk War of 1657–1662. The Turks, led by Grand Vizier Fazil Pasha, were now seen as liberators by Wallachian and Romanian Christians against the Habsburg Austrian reformation and the Thirty Years’ War in Europe. Buda was captured in 1663, as was Neuhasel, a great victory for the Turks. After winter in Belgrade, the Turkish-led forces captured forts on the road to Vienna, forcing the Austrian Holy Roman Emperor Leopold I to start peace talks. Unfortunately for the Turks, during the final battle at the Raab River on 1 August 1664, flooding allowed only half of their army to cross the river, and that half was defeated by the Austrian cavalry under Montecuccoli. The Treaty of Vasvar, a 20-year truce, was signed afterwards.

The war of 1683–1699 began with renewed hopes by the Turks that the tide had turned against the Austrians. Some 70,000 Austrian and Polish troops under King Jan III Sobieski repulsed 138,000 Turks led by Kara Mustapha Pasha. This last invasion of Austria and siege of Vienna was a disaster for the Turks. Pope Innocent XI started a crusading Holy League in 1686, composed of the Holy Roman Empire, Venice, Poland, and Moscow, to combat the Turks. Buda was taken from the Turks in 1686, as was Transylvania in 1687. The sultan Süleyman II sent a Turk army that captured Serbia and Belgrade in 1690. Turk forces invaded Transylvania in 1691, but were decisively defeated. Austria became involved with France in the War of the Grand Alliance, and a fixed border between the Turks and Austrians remained stable for five years. In 1697, a large Ottoman Turk army left

Belgrade to invade Hungary and was met by the imperial army under Prince Eugene of Savoy. The Turks suffered a crushing defeat on 11 September 1697, at the Battle of Zenta. The war ended with the Treaty of Karlowits in 1699, as the Turks were now occupied with the Russo-Turk War of 1695–1700 and the Venetian-Turkish War of 1685–1699.

The war of 1716–1718 began with 60,000 troops under Eugene Savoy decisively defeating the Turks at the Battle of Peterwardein on the Danube River, on 5 August 1716. The Turks lost 6,000 men, 100 artillery pieces, and their grand vizier. Eugene then besieged Belgrade, the strongest city of the Turks in the Balkans. A large Turkish relief force was initially victorious, but was finally routed by Eugene’s cavalry charge, forcing the surrender of Belgrade. The Austrian forces then marched on Constantinople, and with most of the Balkans lost, the Sublime Porte sued for peace in 1718.

Avars

Central Asian nomads threatening Byzantium and Western Europe. The Avars were obscure before their emissaries first appeared in Constantinople in 558. Three years later, having absorbed Hun and other fragmented steppe groups long present in eastern Europe, they moved from the Ukraine into the Byzantine Balkans, from which they freely raided west and east, ultimately settling in the strategically located Hungarian plains. Adept horsemen and fierce warriors, they probably introduced iron stirrups to the West, giving their horsemen a considerable advantage, and carried swords, bows, and long lances. Enlisting conquered or vassal Slavic peoples to enlarge their forces, the Avars created a formidable army, capable of occupying lands and taking cities.

In 582, Avar chieftain Baian crossed the Danube in force, taking the city of Sirmium and menacing Thessalonica in 586. The Byzantine emperor Maurice (r. 582–602) drove the Avars out of the Balkans in 599, but this success was but a pause. In 611, when the Persian Empire launched a massive invasion of Byzantine Asia, the opportunistic Avars poured southward, reoccupying the Balkans and again besieging Thessalonica. Byzantium was embattled on two sides.

In 625, the Byzantines’ worst terror came true when the Sassanid shah made an alliance with the Avars. The follow-

ing year the two allies marched on Constantinople. For months, their forces encircled the Byzantine capital, but city defenses remained impregnable. Finally, abandoned by the Persians and exhausted by horrendous casualties, Avar forces disintegrated. Their army in ruins, the Avar state in the southern Balkans evaporated as embittered Slavs revolted or embraced Byzantine patronage. After 635, references to the Avars in Byzantine sources dwindle, but they remained an important enemy of the Franks, until their very rich state in Hungary was totally crushed by Charlemagne at the end of the eighth century. Surviving Avars were apparently absolved by local Slavs, Bulgarians, and Magyars.

'Ayn Jalut, Battle of (1260)

The battle ended Mongol expansion in the west.

Under Khan Möngke (r. 1251–1259), Mongol armies led by his younger brother Hüle'ü (d. 1265) reconquered Iran and advanced beyond, culminating in the capture of Baghdad in 1258. This brought the Mongols into close contact not only with the crusading world, but also with Mamluk Egypt, a direct competitor with the Mongols for control of Syria. The crusaders—lured by the image of Priestess John, the legend of a powerful Christian king who would come out of Asia to liberate the Holy Land from the Muslims once and for all, and well aware that the coming of the Mongols entirely changed political relationships in the Near East—submitted in some cases, or at least endeavored to enter into active negotiations with the conquerors, whose ranks did include Nestorian Christians. The Mamluks, on the other hand, potential victims of any Christian-Mongol alliance, decided to resist.

At this point Khan Möngke died, forcing Hüle'ü to redeploy his main armies back to Iran to safeguard his power base and to resist incursions by forces of the antagonistic Golden Horde. Left behind in Syria, which was overrun by the Mongols in 1260, was the Nestorian general Kit-buqa with a small force. It was this force that came into contact with Mamluk forces led by Qutuz at 'Ayn Jalut in Galilee on 3 September 1260. Details of the battle are sparse and the sources are contradictory but the result was total defeat of the Mongols, their first in the west, and the death of Kit-

buqa. The Mamluks or their allies reoccupied Syria, and although the war to control it went on almost to the end of Mongol rule in Iran, the Mongols were never again as strong a position in the extreme west as they were in 1260.

Aztecs

Warlike tribe situated in Mexico, also known as Tenocha or Mexica. The Tenochas were Nahuatl speakers, descended from northern wandering barbarian peoples given to skinning their sacrificial victims. Entering the Valley of Mexico in c. 1168, they became a formidable military power with great talent for engineering. Eventually they developed a large island at the marshy western end of Lake Texcoco by attaching chinampas, floating mud rafts of soil, to one another. These eventually took root, and from c. 1325, they built their city of Tenochtitlan (City of the Tenochas), dominated by temples and other structures, with several causeways connecting it to the mainland. Over two centuries, their control was extended over a substantial territory in central and southern Mexico. They had small hairless dogs, but no horses, mules, sheep, goats, or chickens. Their diet, poor in proteins, consisted principally of corn and beans with some fish and a few birds. They did have the maguey plant, which provided honey, sugar, sewing needles, parchment, vinegar, and pulque, a milky and fiery liquor. Their principal leader, known as Chief Speaker, presided over a council and a congeries of nobles, warriors, priests, and ordinary citizens. Ahuizotl, a tyrant king (r. 1486–1502), had doubled the size of the Aztec domain. His successor was Moctezuma Xocoyotzin (born c. 1468, r. 1502–1520), a son of Axayacatl (r. 1469–1486), Ahuizotl's predecessor. Moctezuma ruled between 5 and 15 million (estimates vary) Aztecs and client peoples. The Aztecs were more or less continually at war with their neighbors. Their objective was to secure sacrificial victims for their gods, principally the sun god and Huitzilopochtli, their war god. These deities were thought to require frequent offerings of human blood to defeat the powers of darkness. Wars were often provoked by the arrogance of Aztec emissaries, including merchants, or by Aztec demands that their deities be added to a neighboring state's panoply of gods. Conquered tribes were never absorbed into the Aztec state, but remained

subject peoples. They were expected to provide tribute, men, and supplies to help conquer other enemies of the Aztecs. Thus resentment of their Aztec overlords steadily grew. When wars were not being waged for cause, prearranged *xochiyaoyotl* (flower wars) were conducted with neighboring peoples so that each might capture sufficient sacrificial victims for their respective deities. The flayed skins of some prisoners were worn by priests or captors for ceremonial purposes. Weapons included bows and arrows, obsidian swords, spears and spear throwers, stone clubs, and lances. Iron weapons were unknown in pre-Columbian Mexico. Gourds filled with angry hornets were sometimes hurled at attackers. Armor consisted of thick cotton padding, shields of wood, hides, and sugarcane stalks. Helmets were made of various combinations of wood, animal hides, bone, reeds, feathers, paper, and cloth. Public education was geared to military necessity. Boys were taught the use of arms, tactics, and the elements of strategy. The Aztec nation was divided into four military quarters, made up of several *calpulli* (clans). Each quarter had its own captain-general. Armies, usually of about 8,000 men, were subdivided into corps, divisions, squadrons, and squads. Several armies, under a *tlacatecatcuhti*, or principal commander, would take to the field in wartime. A *calpixque* acted in a logistical capacity, supplying arms and food, and sent messengers to summon soldiers from other towns. He also counted remaining supplies after a battle. *Quachics* had charge of the rear guard in battle, and taught students how to

capture prisoners. There were several elite warrior elements, notably the Eagle, Arrow, and Jaguar units. Soldiers were not paid, but received prizes for battle performance. Outstanding warriors received land grants. Mobilization was swift, and near Tenochtitlan, could be accomplished within hours. There was no standing army, because the educational system and frequent military exercises prepared each man for his role in wartime. Discipline in battle was strong. Aztec warriors produced many council members, judges, governors, and tax collectors. When 555 Spanish conquistadors under Hernan Cortez landed at Vera Cruz in 1519, Moctezuma and others thought he might be Quetzalcoatl (Plumed Serpent), a semimythical personage, making his promised return. The Spanish conquest owed much to their initiative, modern arms, technology, and the horse. Most importantly, many subject peoples viewed the Spanish as liberators, and actively supported the Aztecs' overthrow in 1521.

Babur (Bäbr), Zahir ud-Din Muhammad Babur Mirza (1483–1530)

Conqueror of northern India and founder of the Mogul Empire. Babur, or “the Tiger,” was descended from Genghis Khan (c. 1162–1227) on his mother’s side and from Tamerlane (1336–1405) on his father’s. Babur spent his early career trying unsuccessfully to conquer the city of Samarkand in central Asia, controlled by the Uzbeks. Although the city had been the capital of Tamerlane’s empire, Babur was unable to hold it, and, after his third failed siege attempt in 1512, he turned, in frustration, to India. Beginning in 1519, Babur led a series of raids into northern India from his own capital in Kabul. During this period, Babur tried to take control of the sultanate of Delhi by making dubious dynastic claims on the basis of his lineage from Tamerlane, who had established the Sayyids as the ruling family of the sultanate. However, the sultan of Delhi, Ibrahim Lodi, had overthrown the Sayyids and refused to recognize Babur’s claim. Rather than continue to press the issue, Babur launched an invasion of northern India in an attempt to overthrow Lodi. On 21 April 1526, Babur led a small but highly mobile force against Lodi at Panipat, 80 kilometers north of Delhi. Despite the numerical superiority of Lodi’s forces, perhaps as much as ten to one, Babur won a crushing victory, largely through skillful diplomacy and the use of artillery and firearms, which completely surprised the sultan’s forces. Indeed, Babur was the first Muslim conqueror to employ such weapons. With significantly more military experience than Ibrahim Lodi, Babur deftly lured his opponent into an ambush, utterly destroying the sultan’s forces.

After his, Babur quickly moved to take Agra and Delhi, and, on 15 March 1527, turned against the sultanate’s primary rival in India, the confederation of Rajput states led by Rana Sangha of Mewar. Babur’s defeat of Rana Sangha at Khanua, roughly 150 kilometers south of Delhi, left him in

control of northern India. For the next three years, until his sudden death in 1530, Babur consolidated his control of the sultanate of Delhi and established the Mogul Empire. Although Babur was not fully a Mongol, the word *Mogul* is a Persian variation of “Mongol.” Babur left the Mogul throne to his farcical son, Humayan, who almost lost the empire.

Babur wrote a brilliantly detailed and candid narrative of his adventures in central Asia and India, the *Baburnama*.

Babylonian Empire (c. 1900–539 B.C.E.)

The preeminent civilization of southern Mesopotamia for nearly two millennia, with two periods of major political and military expansion (during the reigns of Hammurabi, c. 1792–1750 B.C.E., and Nebuchadnezzar II, 605–562 B.C.E.).

The city of Babylon (founded c. 2300 B.C.E.) did not become preeminent in southern Mesopotamia until the migration of the Amorites from the northwest (c. 1900 B.C.E.). The Amorite chieftain Hammurabi (or Hammurapi) was successful in consolidating control of central Mesopotamia, subduing the city-states of Larsa, Uruk, Isin, Mari, and Eshnunna. At his death, all of Mesopotamia proper was under the control of Babylon. The empire was short-lived, and the remaining rulers of the Old Babylonian kingdom (c. 1750–1595 B.C.E.) were little more than rulers of the city of Babylon itself.

The next major political dynasty of Babylon was that of the Kassites, an ethnic group of unknown origin who ruled Babylon for over four centuries (c. 1570–1155 B.C.E.). For most of this period, Babylon controlled much of southern Mesopotamia. The Kassites engaged in diplomatic relations and marriage alliances with other major powers of the Near East, including Egypt, Mitanni, Assyria, and the Hittites.

Although a series of relatively minor dynasties followed the Kassites, one ruler stood out as a military strategist, Nebuchadnezzar I (r. 1124–1103 B.C.E.) of the Second Dynasty of Isin. He avenged a previous sack of Babylon by the Elamites (a people from southwestern Iran), launching a surprise attack against Susa, the Elamite capital, and recovering the statue of the patron deity of Babylon, Marduk.

Babylonian political and military power was not again apparent until the rise of the Chaldeans, a tribal group that emerged as the dominant role player in Babylonia and competed with Assyria for control of central Mesopotamia. Although Mukin-zeri (c. 731–721 B.C.E.) and Merodach-

Baladan II (c. 721–703 B.C.E.) were successful in keeping Assyrian military presence out of Babylonia, Sennacherib of Assyria (r. 705–681 B.C.E.) sacked Babylon in 689 B.C.E. and destroyed the city. Assyrian annals describe many of these campaigns in some detail, but one does not get a clear picture of the nature of Chaldean military tactics, except that they often engaged in guerrilla warfare against their more powerful enemy to the north.

With the decline of Assyria (626–612 B.C.E.), the Chaldeans once again achieved political autonomy under Nabopolassar (r. 626–605 B.C.E.), who founded the Neo-Babylonian Empire. The Chaldeans and Medes were successful in ending the Assyrian state and destroying the city of Nineveh in 612 B.C.E. (in part by diverting the Tigris River into the city). However, in 605 B.C.E. Egypt marched through Judea to assist the remnants of the Assyrian army at Carchemish in northern Syria, where Nebuchadnezzar II (r. 605–562 B.C.E.), then Nabopolassar's crown prince, crushed the enemy and enlarged the Neo-Babylonian Empire from the borders of Iran in the east to the borders of Egypt in the west. The most famous military venture undertaken by Nebuchadnezzar II was the conquest of Jerusalem in 597 B.C.E. and its destruction 10 years later, an event that is described in detail both in the Old Testament and in later Jewish tradition. The Chaldean Empire lasted only a generation after the death of Nebuchadnezzar II, falling prey to the armies of Cyrus II of Persia in 539 B.C.E.

Bacon, Nathaniel (1647–1676)

Colonial rebellion leader. Born in England in 1647, Bacon was the son of minor English nobility who immigrated to Virginia in 1674 and became a successful planter. Bacon was ambitious, and through his relationship to prominent colonial leaders he became a member of the governor's council. He supported the growing dissent of colonial farmers toward Governor William Berkeley, whom they blamed for making restrictive treaties with the Indians, thus monop-

lizing land for the elite. Bacon became the leader of a faction that denounced the governor's policies and conducted unauthorized raids against the Indians. Berkeley branded Bacon an outlaw, though he had just been elected to the House of Burgesses. When Bacon went to claim his seat, he was captured and brought before Berkeley in shackles.

Bacon apologized on his knees and was pardoned, but still sought a commission legally to lead colonial forces against the Indians. Berkeley refused the commission and Bacon threatened Jamestown with an armed force, causing Berkeley to flee. Bacon issued a "Declaration of the People" to justify his rebellion. The conflict escalated as Bacon and Berkeley vied for control of the government. Bacon even besieged and burned Jamestown to deny its use as a fortification.

In October 1676 Bacon suddenly fell ill with typhus and died, leaving his rebel cohorts to be hunted by Berkeley and newly arrived English troops. Though some view Bacon as an early proponent of democratic reforms, others portray him as an opportunist who sought power, prestige, and wealth at the expense of the rights of the people, and who murdered Indians without compunction.

Badajoz, Siege of (16 March–6 April 1812)

A successful siege that paved the way to Madrid for the British. After securing Portugal for the British, Arthur Wellesley, the future Duke of Wellington, regarded the Spanish fortresses of Ciudad Rodrigo and Badajoz, both near the Portuguese border, as key to the liberation of Spain. He captured Ciudad Rodrigo from the French on 19 January 1812. With 32,000 men on 16 March, he laid siege to Badajoz, which Nicolas Jean de Dieu Soult had gained for the French by besieging it from 26 January to 11 March 1811. Twice previously, on 16 May 1811 and from 24 May to 19 June 1811, Wellesley and William Carr Beresford had failed to recapture it.

The garrison commander at Badajoz, Armand Phillipon, had 5,000 French and Hessians inside a reliable citadel with nine bastions, elaborate breastworks, ditches, salients, obstacles, and six strong outlying redoubts, three on each side of the Guadiana River. Phillipon was a crafty defender. On

19 March he sent a successful sortie against 3,000 British who were digging in around Fort Picurina, one of the redoubts.

By 6 April, sappers and heavy artillery had created three breaches. Believing that a French relief army was only two days' march away, Wellesley ordered an immediate assault. At about 10 P.M. the British stormed the fortress. Savage hand-to-hand fighting left 3,500 British and 1,400 French casualties. The British had already lost 1,500 before the assault itself. Phillipon tried to escape to the north bank of the Guadiana, but surrendered on 7 April.

Once inside the walled city, the victorious but exasperated British troops released their pent-up anger, looting, burning, murdering, and raping. Wellesley could not regain control of his drunk and riotous soldiers until 11 April.

Wellesley's victories at Ciudad Rodrigo and Badajoz prepared his way to crush Auguste Frederic Viesse de Marmont at Salamanca on 22 July, inflicting three times as many casualties as he suffered. He entered Madrid in triumph on 12 August.

Baghdad (1916–1917)

The penultimate operation of the ill-starred Anglo-British Mesopotamian Campaign, capped in a bitter victory with the capture of the preponderance of the remaining Turkish forces in the Near Eastern Theater.

After the British defeat at Kut-al-Amara at the end of April 1916, British military leaders conducted a top-down review of their overall drab performance. They deduced that the neglected Mesopotamian front required more detailed planning and devotion of better resources than originally presumed. The troops, two-thirds of whom were Indian, were poorly armed and equipped.

London took direct charge of directing operations and appointed Lieutenant General Sir Frederick S. Maude to re-

place the sickly General Nixon. Maude continued the buildup already begun and further developed a communications network and transportation facilities suitable to support an offensive deep into Mesopotamia.

In consequence of an expansion of the shipping capacity at Basra, the buildup accelerated during the summer and fall of 1916. Between April and November 1916 British engineers completed a major railway linking the northern approaches of Basra with Amara. In keeping with the revised, offensively oriented view of the army's role in Mesopotamia, London expanded the river fleet. Further strengthening the combined-arms approach, new aircraft were sent to the Royal Flying Corps squadrons, which had recently gained air superiority over the Germans in the theater. By late summer Maude had at his disposal two corps containing two divisions each, another division in the rear, and two cavalry brigades. Combat elements numbered 166,000 out of the total of 340,000 troops in Iraq, opposed by Khalil Pasha's 42,000-man Turkish Sixth Army.

On 13 December 1916, Maude began his methodical, resolute advance toward Baghdad, systematically eliminating Turkish detachments along both banks of the Tigris River. Early in February 1917, his joint army, navy, and air force retook Kut after a series of well-planned combined strikes against the fortress's 12,000 defenders. Later that month they captured Turkish defensive positions at Sanaiyat. The British gained the upper hand following several days of fighting along the Diyala River south of Baghdad and forced the Turks to withdraw during the second week of March. On 11 March, advance elements of the Black Watch regiment entered the town center on the heels of Arab looters and raised the Union Jack over Baghdad, taking 9,000 prisoners.

BAGRATION, Operation (23 June–29 August 1944)

Soviet offensive that destroyed German Army Group Center. Since Stalingrad (autumn 1942–spring 1943) and Kursk

(summer 1943), the Red Army's offensive momentum had been against German Army Group South. Soviet success resulted in a salient held by Field Marshal Ernst von Busch's Army Group Center (replaced by Field Marshal Model, 29 June, also commanding Army Group North Ukraine).

The front line was 15–60 kilometers east of Polotsk-Vitebsk-Orsha-Mogilev-Bobruisk-Pripiat Marshes-Kovel. Army Group Center and flank forces numbered 63 divisions and three brigades, totaling 1.2 million men, 17,000 guns, 1,500 tanks and assault guns, and 2,100 aircraft. Wehrmacht fortifications and defensive lines were built to a depth of 250–270 kilometers.

Soviet planning to destroy this force, Operation BAGRATION, began in April 1944. Soviet forces comprised 166 divisions, 12 tank and motorized corps, and 21 infantry brigades, totaling 1.5 million men, 31,000 guns, 5,200 tanks and assault guns, and 5,000 aircraft. The Red Army built up manpower and material superiority along the breakthrough sectors.

BAGRATION began with a massive partisan sabotage campaign (led by Byelorussian Communist Party secretary P. K. Ponomarenko), 19–22 June, to disrupt German logistics. Air strikes were launched against the German rear (21 June). The 1st Baltic Front (General I. Bagramyan) and 3d Byelorussian Front (General I. Chernyakhovskii) attacked Wehrmacht forces around Vitebsk as part of a deception regarding the main direction of attack (beginning 10 June on the Finnish border), and to encircle and destroy them.

On 23 June the assault groups/forward detachments of the 3d and 2d (General G. Zakharov) Byelorussian Fronts attacked to encircle and destroy Wehrmacht forces around Orsha-Mogilev and Bobruisk. The main offensive developed from 24 June as pincer movements by the 3d and 1st (General K. Rokossovskii) Byelorussian Fronts to capture Minsk (4 July).

The 1st Ukrainian Front (Marshal Konev) drove toward Lvov (13–27 July) and Lublin (18–23 July) to bar retreat of Army Group Center. The 2d and 3d Ukrainian Fronts (Generals Malinovskii and Tolbukhin) attacked Romania, capturing Ploesti (30 August) and Bucharest (31 August).

BAGRATION propelled the Red Army 550–600 kilometers (roughly, Tartu-Riga-Warsaw-Bucharest), destroying 17 German divisions and 3 brigades, reducing another 50 divisions to half-strength. While the Red Army halted its offensive to regroup and reinforce, the Wehrmacht stiffened its defense of Warsaw, the gateway to Berlin.

Baker, Newton D. (1871–1937)

American secretary of war during World War I. Born on 3 December 1871 in Martinsburg, West Virginia, the bookish Baker took a law degree from Washington and Lee University in 1894. After a brief period of legal practice, he served as private secretary for William Wilson, postmaster general under Democratic president Grover Cleveland. He returned to the bar in 1897 and moved to Cleveland, Ohio. A Progressive reformer, Baker was elected mayor in 1912.

In 1916 President Woodrow Wilson summoned Baker to Washington to serve as secretary of war. Wilson chose Baker, an outspoken pacifist, in order to appeal to those who opposed military preparedness. When America joined the Allies in World War I, Baker found himself in a difficult position. Criticized from all sides in the political arena, he proved unable to establish order in the War Department or to define the relationship between the chief of staff, General Peyton March, and the American Expeditionary Force under General John Pershing. To the dismay of the general staff, Baker frequently sided with Pershing. Baker fought to keep procurement of supplies in the hands of the War Department, but lost the battle when President Woodrow Wilson formed the War Industries Board under Bernard Baruch. Baker successfully oversaw the first American conscription. He believed that the draft would provide a socially democratic army, as well as avoid unnecessary wartime hysteria. To protect the men from the forces of vice, Baker appointed a commission to oversee moral conditions in army camps throughout the country.

Baker left office in 1921 when Warren Harding replaced Wilson as president. Baker returned to Cleveland where he practiced law as a corporate attorney. Although briefly mentioned as a presidential candidate for the Democratic Party in 1932, he never again entered politics. He died in Cleveland on 25 December 1937.

Balaklava (24–25 October 1854)

Allied repulse of Russian attack in the Crimean War. The Allies used the town of Balaklava on the Black Sea coast, eight miles southeast of Sevastopol, as a supply base during the siege of Sevastopol. Commanded by Lieutenant General Ivan Petrovich Liprandi, 25,000 Russian troops launched a surprise attack the night of 24 October 1854. Before dawn on 25 October they had routed the Turkish garrisons from six high-ground redoubts on and east of Causeway Heights. The Russians deployed on Causeway Heights, on Fedioukine Heights, and at the eastern ends of both the north and south valleys, mainly with cavalry and artillery. The Allies (6,000 British under General Fitzroy James Henry Somerset, Baron Raglan; 7,700 French under General François Certain Canrobert; and 4,000 Turks under British General Sir Colin Campbell) were scattered around the south valley, the western end of the north valley, and Sapoune Heights.

Attempting to reach the town and isolate the Allies, four squadrons of Russian cavalry charged into the south valley from the northeast. Campbell rallied the 93d Highlanders, ordered them into a line two ranks deep, and held fire until the last possible moment. His “Thin Red Line” of infantry stopped the Russian charge completely with only three volleys.

General James Yorke Scarlett perceived a column of 3,000 Russian cavalry about three miles long, heading west atop Causeway Heights north of Balaklava. Interpreting this movement as the first step of a second attempt to take the town, and oblivious to the danger of being drawn into the center and outflanked on both sides, Scarlett successfully preempted by leading “The Charge of the Heavy Brigade” uphill into the advancing Russians.

Bad communication created the disastrous “Charge of the Light Brigade” at midday. Just after the charge, the 4th Chasseurs d’Afrique attacked into the Fedioukine Heights, enabling the remnant of the Light Brigade, about 200, to escape.

Balkan War, First (1912–1913)

A conflict fought by the Balkan countries against the Ottoman Empire, for independence and aggrandizement. It increased European diplomatic tensions and, together with the Second Balkan War, is cited as the precursor of World War I.

Austria-Hungary's annexation of Bosnia-Herzegovina on 6 October 1908 caused concern among the Balkan nations and Russia. A coalition of Balkan nations, the Balkan League, was formed: Serbia, Bulgaria, Greece, and Montenegro. However, the agenda of the Balkan nations was not merely mutual protection against Austria-Hungary, but further dismemberment of the Ottoman Empire in Europe.

On 13 March 1912, Serbia arranged a treaty with Bulgaria. Greece concluded a military convention with Bulgaria on 29 May. On 14 August, Bulgaria dispatched a note to the Turks demanding that Macedonia be granted autonomy. The league ignored a joint Russo-Austrian declaration of 8 October, calling for restraint and condemning any disruption in the balance of power and the Balkan status quo. That day, Montenegro declared war on the Ottoman Empire. On 18

October the league followed suit. Allied strength was 750,000 men.

The Allies won a series of decisive victories over the Turks during the next two months, forcing them to relinquish Albania, Macedonia, and practically all of their other holdings in southeast Europe. In Thrace, the Bulgarians defeated the Ottoman forces at Kirk Kilise on 22–23 October, while the Serbs won the Battle of Kumanovo on 24 October, captured Bitola, and then linked with Montenegrin forces to enter Skopje. By 8 November, the Greeks captured Salonika/Thessaloníki and advanced on Ioánnina.

By the end of November, the Turks had been pushed back to the Tchataldja line on the outskirts of Constantinople/Istanbul itself. The only Ottoman holdouts were the garrisons of Scutari, Yanina, and Adrianople/Edirne.

An armistice was concluded on 3 December 1912. However, a peace conference in London could not bring about agreement and ended in failure.

On 23 January 1913 a coup by Enver Bey's Young Turks occurred, and war resumed. In the subsequent fighting the allies captured Ioánnina, and Adrianople/Edirne on 26 March. The Turks obtained an armistice with Bulgaria, Greece, and Serbia on 19 April 1913. Montenegro accepted the armistice a few days later. Another peace conference, with the major European powers again acting as mediators, met at London on 20 May.

The political questions to be resolved were: Serbia's and Montenegro's attempt to gain ports on the Adriatic, which

Austria-Hungary wished to prevent; the territorial composition of Albania, which conflicted with Greece and Serbia; Romania's sudden demand for compensation from Bulgaria; and Serb-Bulgarian rivalry over Macedonia.

By the terms of the Treaty of London, concluded on 30 May, the Turks ceded the island of Crete/Kríti to Greece and relinquished all territories in Europe west of the Enos-Midia line. Creation of an independent Albania was agreed upon but the issue of its borders was forwarded to a European commission. Romania was compensated with Silistria.

It was the issue of Macedonia that broke apart the Balkan partnership. Serbia and Greece formed an alliance against Bulgaria on 1 June 1913, which led to the Second Balkan War.

Balkans Campaign (1941)

One of the quickest, most one-sided victories in modern military history. By early 1941 Hitler was almost ready to invade Russia. Italy, his ally in Europe, had proved a weak link in North Africa and when Mussolini decided to show off the prowess of his forces in Albania, and then in Greece, the resulting debacle forced the Germans into planning an operation to clean up the Italian mess. The Germans did not want to divert troops to the Balkans who could be better used in the attack on Russia. However, Mussolini's incompetence and arrogance and Allied subterfuge drew the Germans into the conflict to protect their southern flank.

The Germans had to take over where Mussolini had failed, not only for sound military reasons, but also to back up their ally. The Italian attack had forced Greece to give up its neutrality, but the Germans could count on Rumania and Bulgaria for support, and believed that Yugoslavia too was on their side. However, the Yugoslavs were subjected to a coup d'état on 27 March 1941, and so the German high command now had to plan on an attack on Yugoslavia as well as on Greece.

Operation MARITA was aimed originally at occupying the Aegean north coast and the Salonika Basin, but events in Yugoslavia meant this country would also have to be attacked. The changed stance of Yugoslavia gave rise to German fears that not only would the Italian front collapse, but the opera-

tion against the Aegean north coast would fail because of the Yugoslavian threat to the German flanks and rear. As it turned out, the Germans had really no grounds for such fears.

The essential German aim was defensive, because any offensive operational plans were rendered impossible by the enormous manpower demands of the oncoming operation against Russia.

The plan as put into operation was a hasty one, and the Second Army, part of the German force, was thrown together in just 10 days. However hasty, nevertheless the plan worked. The invasion of Yugoslavia commenced on 16 April 1941, and by 17 April all resistance was over. On 6 April Greece was also invaded and despite valiant efforts by Greek forces, the Metaxas Lien was quickly reduced and German forces were fighting in central Greece by mid-April. The Greek army surrendered on 23 April, and British forces, which had been sent to Greece to support the Royal Hellenic Army, were forced to quit Thermopylae on 24 April, pulling back into the Peloponnesus for pickup by the Royal Navy.

The rapid reduction of both Yugoslavia and Greece released many of the troops involved for the next great operation, BARBAROSSA. However, German troops had to be left as occupation forces in both countries. Soon resistance forces were established that caused increasing problems to the Germans and to their Bulgarian and Italian allies. Yugoslavian and Greek resistance forces, increasingly aided by the Allies, made life more and more uncomfortable for the occupiers, and there were many atrocities committed by both sides through the rest of the war.

Ballistics

The science of projectiles. This science is divided into interior and exterior ballistics. Its aim is to improve the design of shells/projectiles so that increased accuracy and predictability are the result. It deals also with rockets and ballistic missiles.

Interior ballistics deals with the design of projectiles, their propellants, and the motion of the projectile within the gun or firing device. Propellant types, their composition, and their burning are part of internal ballistics, with the aim being to provide optimum internal gun pressure to move the

projectile along the barrel to the muzzle, or, in the case of rockets, sufficient speed to overcome inertia, gravity, and other external effects.

Exterior ballistics examines the effects of such matters as gravity, air resistance, wind, and sometimes earth rotation upon the shell/projectile. The projectile flight path is examined and in combination with propellant calculations this can be lengthened to increase range. The parabola of the shell in flight is tested, as is the stability of the shell/projectile to ensure accuracy on target.

Rifling or its absence (particularly nowadays) is examined to provide the projectile with the required spin on emergence to allow a good firing trajectory. The shell/projectile design is also studied, to ensure that the rifling can grip the body of the shell (to eliminate windage and to impart rotation), and to ensure that the required effect at the target is achieved, and at the same time to eliminate waste deposits in the barrel.

Modern artillery relies upon firing tables, which are the result of ballistics; the type and weight of the propellant charge, the type of projectile, and above all its accuracy are consolidated into range tables that are used by the gunners to organize their shoots. Much of the work is now done by field artillery fire-control computers, which allows the gunners to achieve optimum effect at the target for minimum ammunition expenditure.

Ballistics now includes rockets, missiles, and ballistic missiles. The trajectory is particularly important in fire-and-forget missiles, and with the aid of targeting computers extremely high accuracy can result.

All of the work of the ballistic scientists and the gunners can, however, be rendered useless without strict quality control and testing by manufacturers, something that increasingly needs strict supervision by governmental bodies. As weapons become more complex, quality control becomes ever more vital.

Major General Samuel Smith immediately strengthened the defenses of nearby Baltimore. When Ross landed 5,000 men at North Point, Maryland, on 11–12 September, Smith had more than 9,000 militia around Baltimore, including Major George Armistead's 1,000 troops garrisoning Fort McHenry and the Lazaretto Battery.

Brigadier General John Stricker's 3,200 Maryland militia opposed Ross's landing on 12 September. British artillery and frontal infantry assault carried the day, but at a cost of 340 British casualties to 215 American. Ross was among the British dead. Colonel Arthur Brooke assumed command and continued the march toward Baltimore, making headquarters on the Philadelphia Road on 13 September.

The British knew that they could not capture a well-fortified city of 40,000 armed and angry citizens unless they could first neutralize Fort McHenry. Admiral Alexander Forrester Inglis Cochrane positioned his fleet in the Patapsco River just out of range of McHenry's guns and lobbed about 1,500 mortar rounds, Congreve rockets, and other ordnance at the fort the night of 13–14 September. Only about 400 found their mark. Little damage to the fort occurred. The garrison lost only four killed and 24 wounded. As a last resort, Cochrane tried to land 1,200 regulars from barges southwest of Baltimore on 14 September, but artillery fire from shore batteries drove them back. When Brooke learned that the naval shelling and the amphibious attack had both failed, he retreated, took ship again, and on 14 October sailed for Jamaica.

American lawyer Francis Scott Key, temporarily detained aboard the American sloop *Minden* anchored amidst the British fleet, observed the entire naval bombardment and wrote on the back of an envelope the next morning a commemorative poem, "The Defense of Fort McHenry," later retitled "The Star Spangled Banner," which did not officially become the U.S. national anthem until 1931.

Ban Chao (31–101)

Restorer of Chinese control in Turkistan. After Wudi (141–87 B.C.E.), Chinese control over Turkistan was gradu-

ally lost and with it control over the lucrative Silk Route trade. Although Guangwudi (r. 25–57), founder of latter Han, rebuilt the power of the dynasty after the interregnum of Wang Mang (r. 9–23), he and his successors showed little interest in restoring Han power in Central Asia. This was in spite of a considerable weakening of China's northern rival, the Xiongnu, during the period. Largely to blame was the predominance of a "reformist" element within Chinese government that condemned the expensive forward position assumed in the north and west under Wudi.

This situation changed largely due to the efforts of a single individual, Ban Chao. Part of an army sent out under Dou Gu (died 88) against the Xiongnu, Ban was dispatched in 73 as an envoy to the kingdom of Shanshan, one of many small states located along the Silk Road. He not only fulfilled his mission successfully, but was able to intercept and destroy a Xiongnu embassy and return Shanshan to Chinese control. Buoyed by this success, Ban was sent out again with a force of about 30, this time to Khoten, which he was also able to return to Chinese obedience. His force expanded by local auxiliaries, Ban then proceeded to a general conquest not only of those areas claimed by the Chinese in the past, but many beyond. This accomplished, he went on to defend his new empire for almost a quarter of a century (until his return to China in 100 after 31 years of service along the frontiers and in Central Asia), largely single-handed, with little or no support from successive pacifist courts. This was an achievement unparalleled in Chinese history.

Banana Wars (1898–1933)

U.S. interventions in the Caribbean in the early twentieth century. After the Spanish-American War, 1898, the United States began to assert hegemony over the Caribbean and intervened militarily in nine countries on 34 separate occasions between 1898 and 1933. American military and naval contingents administered Cuba, the Dominican Republic, Haiti, Nicaragua, and Panama for extended periods. Costa Rica, Honduras, Guatemala, and Mexico experienced briefer interventions. These interventions were dubbed the Banana Wars by the marines, who were often deployed to carry them out.

The interventions were initiated by President Theodore Roosevelt, who declared his desire to make the Caribbean an "American Lake" and to build a canal somewhere in Central America. Strategic concern about protecting a transisthmian canal, while exaggerated, was the main reason for the interventions.

In 1903 Panama revolted against Colombia in a bid to become independent. Although the United States did not initiate the revolt, it ensured that the rebels were successful by sending the cruiser *Nashville* to Colon to prevent the transit of Colombian troops to Panama City. The United States soon negotiated a treaty with Panama that established the American Canal Zone, which subsequently was often used as a base to meddle in Panama's domestic affairs.

The Dominican Republic had long suffered corrupt government and larcenous public officials. As a result, the country was continually in economic and political chaos and threatened by its European creditors. In 1904 the U.S. Navy patrolled Dominican waters and briefly sent marines and bluejackets ashore. The policy of the Roosevelt and William Howard Taft administrations was to limit military intervention to providing order in customs collection. President Woodrow Wilson, on the other hand, directed longer interventions with the aim of restructuring the political systems along the lines of American democracy. In 1915 American marines occupied the Dominican Republic and did not leave until 1924. The marines were ordered to provide law and order and to train a Dominican constabulary. A similar policy was enacted in neighboring Haiti, which was also occupied in 1915. Haiti proved difficult to pacify and American forces did not withdraw until 1934.

Nicaragua was another troublesome country for the United States. In August 1912 President Taft, concerned about civil war in the Central American republic, ordered Major Smedley Butler and a battalion of 354 marines to restore order. Butler's marines completed their task in a few weeks but left a detachment of 100 marines at the American legation, a presence that would be maintained until 1933. In 1925 the marines were briefly withdrawn but soon returned as a result of civil war. Henry Stimson, President Calvin Coolidge's special envoy, brokered a settlement among the warring factions. However, one rebel, Augusto Cesar Sandino, rejected the deal and became the object of an extensive campaign by the marines. Sandino frustrated all efforts to subdue him and the marines withdrew on 1 February 1933.

The Mexican Revolution, which began in 1910, was the cause of two significant interventions, ordered by the Wilson administration. The first was the occupation of the port of Veracruz between April and November 1914. The second was the Mexican Punitive Expedition (March 1916–Febru-

ary 1917) led by General John Pershing in pursuit of the Mexican revolutionary and bandit Pancho Villa.

Other noteworthy interventions by the United States in the Caribbean include Cuba 1906–1909 and 1912, and Honduras 1907, 1911, and 1924.

The U.S. interventions in other nations' affairs in Latin America restored peace and, in the longer-lasting interventions, built up something of an infrastructure with railroads, roads, port facilities, telegraphs, water and sewage systems, and so on. And, of course, they provided security for the Panama Canal. But the canal meant nothing to Latin American peasants, and the American interventions did not begin to address the endemic poverty of these areas and fostered among the nationalist elites a deep resentment and, often for their own purposes, a convenient rallying cry against "Yanqui imperialism."

Bannockburn, Battle of (24 June 1314)

Decisive English defeat in Anglo-Scot wars of the fourteenth century. Following the death of Edward I in 1307, the new English king, Edward II, abandoned the war against Scotland. This respite allowed Robert the Bruce, king of the Scots, to consolidate power and slowly reduce the English garrisons north of the River Tweed. By 1314, only Berwick and Stirling Castle were still in English hands. Bruce laid siege to Stirling in the summer of 1314, and the castle's governor promised to surrender if not relieved by June 24. Stirling was an important strategic site, commanding access to

the Highlands. Edward was determined to relieve the castle and unfurled the royal standard at Newcastle. He quickly raised a force of approximately 3,000 armored knights and 15,000 foot, and marched north to do battle.

Bruce had a much smaller army. It numbered fewer than 8,000 men, including perhaps 500 mounted knights, but the Scottish king did have the advantage of choosing the site of the battle. He deployed his forces on a small rise overlooking Bannock burn (brook), a tributary of the Firth of Forth. His right flank was secured by a stream and his left anchored by a thick forest. The infantry, armed primarily with long spears, was organized into *schiltrons*, hollow, circular formations. The horsemen were kept as a mounted reserve. The larger English army would have to attack on wet, marshy ground, and would be hemmed in by the streams and by woodlands. This inhibited the charge of the English mounted troops and negated their numerical superiority.

On June 24, the English army crossed the Bannock burn in preparation for an all-out assault on the Scottish position. Bruce seized upon the disorganization of the enemy and ordered four of his schiltrons to attack the English flank. A fierce hand-to-hand battle ensued with neither side giving ground. Edward ordered his archers to flank the Scots on their left, but this movement was countered by Bruce. He ordered Sir Robert Keith to launch a charge with the mounted reserve, driving the English back in disorder. The Scots pressed their advantage, and the English front gave way and a rout ensued. Many of the English became bogged down in the marshy ground and were killed or captured. Others were drowned in the burn as they tried to flee the field. Edward himself barely escaped capture, fleeing with the remnant of his army to Dunbar. English losses included two earls, 60 barons, and perhaps 10,000 other ranks. Scottish losses were about 4,000.

The defeat at Bannockburn ended English hopes for conquering Scotland by military force. Subsequently, both Stirling and Berwick fell to the Scots, removing the remaining vestiges of English military presence. Edward II never recovered the prestige lost to the crown in this defeat, ultimately losing his throne and his life. Scotland and England would continue to fight incessantly until the unification of the thrones by the Act of Union in 1707.

Barons' War (1263–1285)

Barons led by Simon de Montfort press their call for reform in the field. The reign of Henry III was increasingly difficult for the English nobility to bear: Henry had begun his rule as a minor child under a regency, but as an adult proved to be a spendthrift and an incompetent, losing what was left of the Angevin Empire in France, engaging in a guerrilla war with Wales, and refuting the Magna Carta in 1232, before engaging in an expensive and foolish plan to make his brother Holy Roman Emperor, and his younger son king of Sicily. The leader of the resistance was the king's brother-in-law, Simon de Montfort, Earl of Leicester, a noted soldier and crusader who had been undercut in Gascony by Henry's favorites. In 1258, Parliament met at Oxford, armed and demanding a say in revenue spending and a redress of grievances, such as the violation of London's charter. In 1259, Henry III signed the Provisions of Westminster, guaranteeing court reform and representation, but by 1260 the barons were quarrelling and the king, prompted by his son, Edward, went to the French to intervene.

De Montfort led an army through England in response to the king's voiding of the Westminster agreement, and on 12 May 1264 caught the royal army at Lewes, where he routed them, after Prince Edward had left the field to chase a party of infantry. Unusually for the time, de Montfort deployed his army so that he had a "fourth" left in reserve. Now in control of the king and the country, de Montfort braced for an attack from France, and held a parliament in January 1265, which demanded that two knights from each shire be called regularly to advise the king and monitor spending.

Despite an alliance with the prince of Wales, de Montfort could not hold up against the defection of Gilbert de Clare to the king, nor the growing party of Prince Edward, who successfully kept the barons' forces away from supplies and reinforcement at Kenilworth. Moving to relieve them, de Montfort, probably exhausted, allowed himself to be trapped at Evesham, where, on 3 August 1265, he and his army were massacred by troops led by Prince Edward. After 1265, Edward, the future Edward I, ruled as acting king for his father, and repudiated the concessions made to the barons. Nonetheless, by 1267 he had approved the Statutes of Marlborough, which legalized reform along the lines of the baron's campaign, and Parliament began to meet regularly. Despite his defeat in the field, Simon de Montfort eventually became the father of the English Parliament and of representative government.

Barton, Clarissa ("Clara") (1821–1912)

"The Angel of the Battlefield," founder of the American Red Cross. Clara Barton, in full Clarissa Harlowe Barton, was born in Oxford, Massachusetts, on 25 December 1821, the youngest daughter of Captain Stephen Barton, a veteran of frontier conflicts in the 1790s under "Mad Anthony" Wayne and a comrade-in-arms of William Henry Harrison. Her family educated her at home to be a teacher. She taught for 18 years, eventually becoming principal of a free school in Bordentown, New Jersey, in 1852. When the townspeople objected to a woman holding such a position of authority, she resigned, moved to Washington, D.C., and in 1855 found a job in the U.S. Patent Office.

At the outbreak of the Civil War, she volunteered to help the U.S. Army Medical Department with logistics, arranging transport of medical supplies and soldiers' personal belongings. Although she had no training as a nurse, she attended

wounded at First Bull Run, Cedar Mountain, Second Bull Run, Chantilly, Harpers Ferry, and South Mountain. At Antietam, where U.S. Army surgeon James Dunn gave her the nickname, Angel of the Battlefield, a Confederate bullet tore through her sleeve and killed the man she was nursing. Undaunted, she continued her errand of mercy at Fredericksburg, Charleston, the Wilderness, Spotsylvania, and Petersburg. From 1865 to 1869 she led efforts to discover the fates of MIAs and POWs.

As she happened to be in Europe when the Franco-Prussian War began in 1870, she volunteered for the International Red Cross. After returning home in 1873, she lobbied for the United States to sign the Geneva agreements until President Chester A. Arthur did so in 1882. On 21 May 1881 she founded the American Association of the Red Cross, which she ruled arbitrarily as president for 23 years. She wrote several books, including *The Red Cross in Peace and War* (1899). After Congress chartered the American Red Cross in 1900, antiauthoritarian factions within the organization forced her to retire on 14 May 1904. She died in Glen Echo, Maryland, on 12 April 1912.

Basil II Bulgaroconus

(r. 10 January 976–15 December 1025)

His rule marked medieval high-water mark of Byzantine Empire. In almost 50 years, Basil II, beset by years of revolt and defeat at the start of his reign, destroyed the Bulgar state and reestablished the Byzantine Empire on the Danube and Drava for the first time in four centuries. With its position in southern Italy maintained, and Basil able to effect a series of annexations among the Caucasian kingdoms, the Byzantine Empire came into possession of a security unknown for hundreds of years.

Two episodes best illustrate Basil II and war. First, in April 995, the Aleppo Caliphate's attempt to recover Antioch

by taking advantage of imperial distraction in the Haemus resulted in one of the most remarkable victories in history. Basil marched an army from Constantinople to Antioch in 16 days, and on the seventeenth fell upon a Muslim army, not so much surprised as positively amazed by the imperial appearance: The distance between the two cities is over 770 miles. The second was the slow deliberation of the effort whereby the Byzantines destroyed the Bulgar state, and the cataclysmic defeat incurred by the Bulgars at Balathista (Kleidion Pass) on 29 July 1014. Basil secured his name, Bulgaroconus, "Slayer of Bulgars," from this victory. The battle resulted in the capture of some 14,000 Bulgarians. Basil blinded 99 in every 100 and, leaving the one man with a single eye, sent them back to Bulgaria. Csar Samuel of Bulgaria collapsed on seeing the survivors return. He died two days later. The Bulgarian war, which had lasted over two centuries, continued for another four years, but was a broken-back affair after Balathista.

Basil ruled the empire and commanded the army. Merciless in war, he was most moderate to his subjects in peacetime, but brutal in the suppression of corruption and the Anatolian aristocracy's attempts to promote its interests at the expense of the state. Unglamorous and one of the least attractive of all the emperors in terms of physical appearance, lack of cultural interests, and utter disdain for the trappings of power, he was trusted by army and subjects alike.

Bataan Death March (April 1942)

The 60-mile movement, under often deliberately horrific conditions, of 76,000 American and Filipino prisoners of war immediately following the Allied surrender in April 1942. In groups of between 500 and 1,000 men, the exhausted and disease-ridden prisoners were marched with little or no food and water to a prisoner of war camp under construction in central Luzon. Anyone who could not keep up was bayoneted or beaten to death. The slightest offenses, such as possession of unauthorized food or water, were met with draconian punishment, including many beheadings (an old Japanese military custom). Some who could not con-

American prisoners of war herded together by the Japanese at Bataan; about 10,000 died. (Hulton/Archive)

tinue the march were buried alive. In more studied cruelty Japanese guards amused themselves by forcing their prisoners to sit in the hot sun near sparkling artesian wells. Anyone who moved toward the wells would be shot or bayoneted.

Adding to the misery was the fact that most of the prisoners had already endured months of malnutrition and disease when they surrendered and were thus from the beginning in poor physical shape. Many had advanced cases of dysentery, with major cramping and diarrhea.

Predictably, the route of the march was littered with dead and dying, and all number of ghastly sights. As many as 10,000 men died as a result of the death march. Those who survived could look forward to continued similar treatment in hellish prison camps.

Some Japanese commanders after the war argued that the Japanese authorities had not expected nearly the number of prisoners who actually fell into their hands, and thus their arrangements for the feeding and transport of the prisoners broke down. This is a valid enough point, but the in-

tense, studied individual cruelties inflicted upon helpless Allied prisoners cannot be so easily excused.

Bay of Pigs Invasion (17 April 1961)

The United States sponsored the invasion of Cuba by expatriates with the hope of toppling the regime of Fidel Castro. Cas-

tro had seized power in January 1959, but the following year, the United States was increasingly opposed to Castro's policies and actions, which included show trials of supporters of his predecessor, dictator Fulgencio Batista, expropriation of U.S. property, condemnation of the Latin American policy of the United States, and friendly relations with the Soviet Union and other members of the Warsaw Pact. The United States broke diplomatic relations with Cuba in the waning days of the administration of Dwight D. Eisenhower.

When John F. Kennedy assumed the presidency, he was briefed on a Central Intelligence Agency (CIA) plan to oust Castro. Kennedy approved the plan but added the stipulation that U.S. forces not be directly involved. The American-trained invasion force of 1,300 men landed on the southeastern shore of Cuba in a swampy area but was soon overwhelmed by superior Cuban regular and militia forces personally commanded by Castro. The debacle resulted in 1,189 prisoners and 114 killed from the exile-manned Brigade 2506, while nearly 1,800 on the island lost their lives.

Several factors contributed to the invasion's failure: First, air strikes on 15 April failed to completely destroy the Cuban air force and alerted Castro to the impending attack. Second, U.S. naval and air support on the day of the invasion was withheld. Finally, U.S. intelligence failed to discern the popular support for Castro and underestimated the readiness of Cuban forces. The failure of the invasion greatly embarrassed the Kennedy administration and concomitantly strengthened Castro's hold on the island. Castro used his victory to openly declare Cuba a socialist state firmly aligned with the Soviet bloc. The Kennedy administration took the defeat as a personal offense and spent the rest of its term devising increasingly improbable, even bizarre, methods of disposing of the Cuban dictator. The Bay of Pigs fiasco also set the stage for the Cuban Missile Crisis of October 1962, the closest the world has come to nuclear war.

Bayinnaung (r. 1551–1581)

Third ruler of the Burmese Toungoo Dynasty, King Bayinnaung took up the sword at the beginning of his 30-year

reign and never put it down. He became king after the assassination of his brother-in-law Tabinshwehti (r. 1531–1550) by an ethnic Mon prince, and built an empire that extended far beyond the borders of modern Burma. Portuguese mercenaries with superior firearms played a major role in his conquests.

Bayinnaung retook the royal capital of Pegu in southern Burma from the Mons and captured the city of Ava (located near present-day Mandalay) in 1555 from the Shans, an ethnolinguistic group related to the Tais of Siam (Thailand). He subjugated their homeland, the Shan states (now in eastern Burma) in 1556, and gained the allegiance of the Tai state of Lanna (Chiang Mai, in northern Thailand); but found himself at war with another Tai polity, Luang Prabang, whose ruler repeatedly challenged Bayinnaung's ambitions in what are now Laos, Shan State, and northern Thailand.

Bayinnaung invaded Siam and captured its rich capital, Ayuthaya, in 1564. A Mon revolt that year necessitated his return to Pegu and he had to recapture Ayuthaya in 1569 from Siamese patriots, pillaging it thoroughly. He failed to crush the resistance of the Lao states, Luang Prabang, and Vientiane, though this goal preoccupied him through the 1570s. When he died in 1581, he was planning conquest of the kingdom of Arakan (now Burma's Arakan State).

Bayinnaung's empire, won by the sword, was short-lived, but he remains a symbol of Burmese imperial glory. The hard-fisted military regime that came to power in 1988, the State Law and Order Restoration Council, erected a statue of him in the border town of Tachilek. It is no coincidence that the sword-clad statue faces southward toward Thailand—his old enemy, Siam.

Bayonet

Metal blade or spike that, when affixed to a musket or rifle, facilitates its use in hand-to-hand combat. The adoption of the bayonet in the late seventeenth century allowed the elimination of the pike-armed infantryman who had theretofore been the only means of protecting musketeers against cavalry. The first plug bayonets were affixed by inserting the round wooden handle of a knife into the mouth of the gun barrel. Because the bayonet thus rendered the gun unable to

fire, it could not always be attached, leading to several instances in which infantry was overrun by cavalry while attempting to insert their plug bayonets. These difficulties were overcome by the introduction in the beginning of the eighteenth century of the obvious solution, the socket bayonet. Consisting of a metal spike instead of the earlier blade, the socket bayonet was affixed by means of a tubular sleeve that fit around the end of the barrel, allowing the musketeer to fire the weapon with the bayonet attached. Thus armed, the musketeer could both provide firepower and defend himself, and bayonet-armed musketeers quickly became the standard infantrymen throughout Europe. The final development of the weapon came about with the introduction in the early nineteenth century of the sword bayonet, which combined the functions of the bayonet and short sword carried by most infantryman of the time. The weapon was essentially a fully hilted short sword that could thus be used as a sidearm, the hilt of which attached to the firearm by means of a lug on the side of the barrel or the stock of a rifle. By the late nineteenth century almost all European armies were equipped with sword bayonets and the forces in both world wars used a shorter variation, the knife bayonet, which is still used by most modern armies.

Bazookas

Shaped-charge antitank and pillbox weapon.

The appearance of tanks on the battlefield created the need for antitank weapons. Artillery was the first antidote, closely followed by the antitank rifle. Antitank guns were designed in the 1930s and are still in use, despite the increasing use of antitank rockets.

The shaped charge was invented in the 1930s as well, and the Americans bought the knowledge from the Swiss. The bazooka was first designed in 1942 by an American army officer, who knew that there was a stockpile of shaped-charge projectiles looking for a weapon to fire them. He had already designed a mortar to fire these projectiles, which were launched with the aid of a small rocket stage. The American antitank rifle program was well under way, but was not doing well. A demonstration of the new weapon led immediately to further development work and adoption of the bazooka, as it was called, after a comic strip device.

The first bazookas were found to be effective, mainly due

to the shaped-charge effect, which concentrated all the explosive force of the charge forward in a tight stream, allowing a relatively small-caliber weapon to penetrate armor effectively.

Various versions appeared, and the weapon is still in use today with some armies. American troops found themselves at a near-fatal disadvantage during the early weeks of the Korean War, when their World War II-vintage bazooka rounds bounced harmlessly off the armor of Soviet-manufactured North Korean tanks. Postwar-model bazookas were air-rushed to the battlefield and began to score heavily against North Korean armor from their first use.

Beauregard, Pierre Gustave Toutant ("P.T.") (1818–1893)

Confederate field commander who captured Fort Sumter and shared credit for the victory at First Bull Run. Beauregard was born in St. Bernard Parish, Louisiana, on 28 May 1818. Graduating second in his class at West Point in 1838, he was assigned first to the artillery, then to the engineers. On Winfield Scott's staff in the Mexican-American War, he was brevetted twice and wounded twice. From 23 to 28 January 1861, he was superintendent of West Point, but was fired for his explicit southern sympathies.

As brigadier general of Confederate forces around Charleston harbor, he started the Civil War by ordering the bombardment of Fort Sumter on 12 April 1861. Although Joseph E. Johnston was his superior officer, they operated as equals at First Bull Run and together defeated Irvin McDowell. After 21 July 1861 Beauregard held the rank of full general.

Reassigned to serve under Albert Sidney Johnston in the Mississippi Valley, Beauregard took command when Johnston was killed at Shiloh on 6 April 1862. His hesitancy to consolidate his attacks that evening allowed Ulysses S. Grant and Don Carlos Buell to gain ground the next day. Henry W. Halleck pursued him to Corinth, Mississippi, and gradually forced him to abandon that important supply center. Braxton Bragg replaced him as commander of the Army of the Mississippi on 17 June 1862.

Thereafter Jefferson Davis allowed Beauregard only minor assignments. As commander of the Atlantic coastal defenses from South Carolina to Florida, he withstood attacks

on Charleston until April 1864. Commanding the Army of North Carolina and Southern Virginia from April to September 1864, he isolated and beat Benjamin Butler at Bermuda Hundred and harassed Union forces around Petersburg. At the end of the war, he was again Joseph Johnston's second-in-command.

Because he admired Napoleon's strategy and tactics, Beauregard was sometimes called "The Little Napoleon." He is supposed to have designed the familiar Confederate battle flag with 13 white stars inside a diagonal blue cross on a red field.

He died in New Orleans on 20 February 1893.

Beersheba (1917)

A severe Turkish defeat in World War I. A British force of 88,000 men, including Australian and New Zealand Army Corps (ANZAC) and Indian divisions under General Sir Edmund Allenby, attacked the Turkish force of 35,000 troops, commanded by Field Marshal Erich Von Falkenhayn, on the Gaza-Beersheba line at Beersheba on 31 October 1917. Motivated by its geographical and strategic location, Allenby chose Beersheba for its abundant water supply and because its location would be of service as a rendezvous point to develop the principal attack on Hareira, Sheria, and Gaza itself. Surprise and secrecy were of the essence, as success was predicated on the ability of the British forces to capture the city's wells; failure would mean the collapse of the mounted divisions and possibly the entire offense. The Turks, already predisposed to expect that Gaza would be the objective of the main attack, were further encouraged to maintain this view as the British embarked on an eight-day decoy bombardment of Gaza. Meanwhile British troops moved into position by night. Two mounted divisions took up their positions to the northeast, the east, and the southeast, and two infantry divisions marched to the west and southwest, while

a third infantry division covered the left of the main infantry attack. All day the battle raged, until dusk when a mounted ANZAC cavalry brigade charged through Turkish wire and trenches into Beersheba, capturing 1,100 Turkish prisoners and securing the coveted water supply. Those soldiers of the Turkish Seventh Army that had hastily evacuated Beersheba were pursued toward Jerusalem, while the Turkish Eighth Army evacuated Gaza and retreated up the coast. British and colonial forces sustained 1,200 casualties in the taking of Beersheba; the Turks sustained 64 casualties and 1,100 were taken prisoner.

Belgium, Invasion of (August–October 1914)

The forgotten campaign that disrupted Germany's Schlieffen plan. Belgium was a small country whose neutrality had been guaranteed by the European powers in 1839. The deployment of the six Belgian field divisions numbering fewer than 100,000 troops was ordered as early as 31 July 1914, with two divisions garrisoning fortifications, one facing England, one Germany, and two facing France. King Albert I, the greatest asset of the poorly trained and neglected Belgian army, understood very quickly that his country was to be invaded by vastly superior German forces. On 4 August, Von Kluk's First Army attacked the fortifications around Liège. The forts defended by General Leman slowed the German offensive until 15 August. This desperate resistance gave time for the field army to concentrate in the Antwerp area. The German cavalry advance guard faced a major setback at Haelen on 12 August that further slowed the invading forces. From 20 August to the end of September, the Belgian army defending the Antwerp fortified lines was a flanking threat to

the Germans now invading northern France. Two reserve corps had to be left to prevent any Belgian sally. On 25 August and 9 September, the Belgians tried to break through the besieging forces. These attacks forced the German high command to send reinforcements toward Belgium at a time when these troops were desperately needed in the first Battle of the Marne. They also had to divert their heavy artillery toward Antwerp to destroy methodically the two lines of forts.

In early October, the Germans launched 12,000 troops against the 7,000 survivors helped by 2,000 British marines. The king decided to retire his army along the coast to join the marching Allied armies that were spreading north in the "race to the sea." The Belgians left Antwerp on 9 October for the River Yser, 100 miles to the southwest. Then Albert ordered a halt to the retreat and a dug-in determination to keep at least a part of Belgium free. The Belgian legacy to the final victory is their unexpectedly stubborn defense of their country, which gave time to the French to redeploy their armies northward and brought the British into the war.

Belisarius (c. 505–c. 565)

Byzantine general and conqueror. Belisarius began his career as a bodyguard for Justinian I (r. 527–565) when the future emperor was himself commander of the emperor's guards. Belisarius is first mentioned as leading a raid against the Persians in 526 or 527. By 529 he was commanding the Byzantine army fighting the Persians, with the rank of *magister militum*, or commander of forces, when he won an important victory over the Persians at Dara. Upon the conclusion of peace with the Persians, he was recalled to Constantinople in 531.

In 532 he commanded troops loyal to Justinian I, and suppressed the Nika revolt. In 533 he was appointed to command an expedition to attack the Vandal kingdom of Africa. He defeated the Vandal king in two decisive battles, the Battle of the Tenth Milepost and the Battle of Tricamarium, thus completing the initial conquest of the province of Africa. In 534 he invaded Corsica, and, in 535, upon his return from the African expedition, he was granted a triumphal entry into Constantinople and made consul.

Late in 535, Belisarius invaded Sicily, the empire having

declared war upon the Gothic kingdom of Italy. On 31 December, the Byzantines took Syracuse. In 536, he crossed to the mainland, taking Reggio Calabria, and besieged Naples. In December 536 he entered Rome, which had been temporarily abandoned by the Goths, and began making preparations for a siege. The Goths attacked the city in March 537, and continued the blockade for an entire year, until March 538. As the Goths withdrew, Belisarius defeated their rear guard in battle at the Milvian Bridge. The Goths were forced to break the siege by Byzantine raiding parties, one of which occupied the town of Rimini, just 30 miles from the Gothic capital of Ravenna.

Gothic forces besieged Rimini, and the Byzantine forces, reinforced with troops brought by the eunuch Narses, marched to the rescue. A dispute between Narses and Belisarius led to a divided command, which resulted in the failure to rescue the besieged town of Milan before its fall in early 539. Belisarius continued to attack Gothic strongholds, aided by an opportune Frankish invasion, until he finally reached Ravenna. The city held out until April 540, when the Goths, in an attempt to suborn Belisarius, offered to acknowledge him as emperor of the West. This he refused, but by pretending to accept he persuaded the Goths to open the gates to the city. Once inside, he arrested the Gothic leaders and sent them to Constantinople, and took possession of the city in the name of the emperor.

A Persian invasion in 540 caused his dispatch to the east, where he fought indecisive campaigns in 541 and 542. Later, in 542, accused of plotting against the regime by the Empress Theodora, he was removed from office. Once restored to favor, he was sent, with the lower rank of Count of the Stables, to suppress a rebellion in Italy in 544. Although he relieved the sieges of several small towns, he was unable to rescue the city of Rome, which fell to the Goths in December 546. Although Byzantine forces quickly reoccupied the city, a stalemate was reached, and Belisarius returned to Constantinople in 549.

In 551, he headed a party of ambassadors appointed by Justinian I to negotiate with Pope Vigilius, then a prisoner in Constantinople, over ongoing theological disputes. This failed.

In 559 and 560, Belisarius defeated an invading force of Kutrigur Hun in Thrace. In 562, accused again of plotting against Justinian, he was deprived of his offices. Although he again returned to favor, he retired and died around 565.

Ben-Bella, Ahmed (1916–)

Algerian nationalist and guerrilla commander. Ahmed Ben-Bella was born on 15 December 1916, near the Moroccan frontier. After being conscripted in 1937, he served with distinction in the French army during World War II, rising to the rank of sergeant. Following the war, a politically active nationalist, he helped establish the headquarters of the groups preparing an armed revolt, out of which grew the National Liberation Front (FLN). The FLN began an armed revolt in November 1954, with Ben-Bella as the most prominent leader, by coordinated attacks on public buildings, military and police posts, and communications installations. In October 1956, while flying from Morocco to Tunis, the French secret services arranged for the pilot to land at Algiers in order to arrest Ben-Bella and four other rebel leaders. Consequently, Ben-Bella was incarcerated during the most intense period of the Algerian conflict. He was released from prison in March 1962 as an aspect of the Evian agreements and cease-fire, and immediately resumed active leadership. In September 1962, the provisional arrangements were ended and Ben-Bella formed the government of independent Algeria.

Ben-Bella began suppressing all opposing factions within and without the FLN, concentrating power on himself. His rigid policies and his suppression of opposition leaders led to his overthrow and imprisonment in June 1965. When finally released in October 1980, he left the country. After the liberalization of Algeria's regime, Ben-Bella returned to Algeria. Taking an extreme militant line, he tried, with very limited success, to rebuild a party of his own and a position of influence, but failed. Currently, at age 85, he resides in Switzerland.

Bennington (16 August 1777)

A fierce little battle in the American Revolution that frustrated British attempts to sever New England from the

remainder of the revolting British North American colonies.

In spring 1777, British general John Burgoyne had led an army southward from Montreal toward Albany, where he expected to connect with a supporting force coming across Lake Ontario and down the Mohawk River and the main British army moving northward from New York City. However, by late summer it was clear that the British in New York City were moving on Philadelphia, and the small force to the west had retreated to Canada. Burgoyne's own force was running low on beef, wagons, and draft animals.

In this situation, Burgoyne sent about 800 men on 11 August on a foraging expedition about 40 miles due east toward Bennington, Vermont (then a part of Massachusetts), which was an American supply point. Several days later, the group, mostly German troops commanded by Colonel Friedrich Baum, paused near Bennington to wait for reinforcements. Meanwhile, small groups of New England-area militia commanded by General John Stark, acting as if they were loyal to the Crown, worked their way around and behind the Germans' positions.

Without warning, the American militia turned on the surrounded troops, killing many of them and pursuing others into the woods. For two hours the battle raged, and eventually the Germans ran out of ammunition.

Around this time, reinforcements—another group of about 700 commanded by Lieutenant Colonel Heinrich von Breyman—were detached from Burgoyne's force and, as they entered the battle, Vermont militia arrived, and so the Hessian reinforcements suffered the same fate as the original foraging party.

As a consequence, the loss of so many men weakened Burgoyne and denied him needed food and supplies; the Americans were emboldened by their victory at Bennington. Eventually, fearing that he was outnumbered and could not retreat to Montreal before winter, Burgoyne would fight twice at Saratoga, and surrender. Burgoyne's capitulation was a triumph that impelled the French to cast off their cautious support for the Americans and to sign a treaty of alliance, which probably provided the margin for American victory.

Berezina River, Battle of (26–29 November 1812)

The Russian pursuit of Napoleon's Grande Armée, and its destruction during this engagement. Napoleon and 110,000 troops retreated from Moscow on 19 October 1812, retracing their path to the Nieman River. They dispersed on the march, abandoning their baggage and also their weapons. Russian forces continued to harass, giving battle at Malo-yaroslavets, Krasnoie, and Orsha.

Csar Alexander I directed Marshal Mikhail Kutuzov with 27,000 troops, Admiral Paul Chichagov with 24,000, and Prince Peter Wittgenstein with 34,000 to converge and prevent the French from crossing the Berezina River. On 22 November, Russian forces liberated Minsk, and destroyed French bridgeheads at Borissov on 24 November.

Napoleon conceived a ruse that kept Russian forces south of Borissov, allowing the emperor and 30,000 of his troops to cross the Berezina over two bridges his engineers had constructed at Studianka from 26 to 27 November. Fighting on both sides of the river continued through 28 November. On the morning of 29 November, Napoleon ordered the bridges burnt. A "second" French army of 30,000 stragglers and civilians was abandoned.

Within a week, the number of French effectives dropped to 13,000 as they marched the 160-mile distance from the Berezina River to Vilna. The Russians gave up the pursuit, except for advanced guard action and Cossack raids.

At Smorgoni (40 miles away from Vilna) on 5 December, Napoleon announced that he was leaving his troops to return to Paris. Marshal Murat assumed command of an army that reached Vilna on 8 December. The town had been prepared to feed 100,000 men for 40 days, but the army that arrived was in shambles. Murat could not keep the troops in formation or organized. They looted and pillaged while Russian advance guards and Cossacks threatened attack. Murat and 10,000 men evacuated Vilna on 10 December.

Meanwhile, Napoleon reached Warsaw on 10 December, Dresden on 14 December, Mainz on 16 December, and arrived in Paris before midnight on 18 December.

Approximately 5,000 of the original 600,000 Grande Armée recrossed the Neimen on 14 December (an additional 25,000 straggled across later).

Berlin, Soviet Drive on (16 April–2 May 1945)

The defeat of Germany through the capture of the administrative and military heart of Nazi power, by the Red Army. By the end of 1944 the Soviet-German front was along the Narew and Vistula Rivers and Carpathian Mountains. The initial success of Hitler's Ardennes offensive, launched 16 December 1944, prompted Churchill to ask Stalin on 6 January 1945 for Soviet assistance to relieve the pressure, by way of an immediate offensive. Stalin agreed to aid the Allies by launching the Soviet offensive prematurely despite bad weather conditions and incomplete resupply efforts.

Soviet operations toward Berlin began 12 January, as forces of Marshal Ivan Konev's 1st Ukrainian Front struck from bridgeheads at Sandomierz toward Silesia. Forces of Marshal Georgii Zhukov's 1st Belorussian Front and Konstantin Rokossovskii's 2d Belorussian Front followed on 14 January, from bridgeheads near Warsaw toward Berlin and just north of Warsaw on the Narew River toward Danzig, respectively.

The ruins of Warsaw were liberated (after the German crushing of the Polish uprising in the city) on 17 January, and on 19 January Zhukov's armored spearheads drove into Lodz. On 18 January, General Cherniakhovskii's 3d Belorussian Front attacked East Prussia, while General Petrov's 4th Ukrainian Front struck through the Carpathians. By the end of the first week, the Soviet offensive had been carried 220 kilometers deep and was 900 kilometers wide.

Hitler halted the Ardennes offensive, but redeployed the Sixth Panzer Army to Budapest, and did not evacuate 30 German divisions isolated in Courland. Hence, only 12 German armored divisions and 50 understrength infantry divisions defended a 1,500-kilometer front.

By 31 January, Zhukov's forces were at Küstrin on the Oder, 82 kilometers from Berlin. Budapest capitulated on 13 February.

From Vistula-Oder, the Red Army overcame six German defense lines and encountered fortified cities such as Königsberg, Breslau, Posen, and Torun, which held out as the Soviet offensive moved westward. Zhukov captured Posen on 23 February after nearly a month of siege; Königsberg surrendered 9 April to Marshal Aleksandr Vasilevskii, who replaced Cherniakhovskii as commander of the 3d Belorussian Front. Millions of Germans fled ahead of the So-

viet advance, and hundreds of thousands died in the winter cold. The Soviet offensive temporarily halted to allow Red Army logistics to reinforce the troops.

Vienna was captured by Generals Malinovskii's and Tolbukhin's troops on 13 April. Zhukov and Konev advanced from the Oder-Neisse Rivers on 16 April, overcoming Berlin's seven defense lines and encircling it by 25 April, the day Soviet and American forces met on the Elbe River.

Hitler committed suicide on 30 April, the Nazi central command dissolved, and Berlin capitulated on 2 May.

Bernadotte, Jean Baptiste Jules (1763–1844)

French field commander and diplomat, marshal of France, and founder of a Swedish royal dynasty. Born the son of a lawyer in Pau, France, on 26 January 1763, Bernadotte enlisted in the army in 1780. After affiliating with the Revolution in 1790, he rose rapidly through the ranks, becoming a brigadier general in 1793 and fighting with distinction at Fleurus in 1794 and Tagliamento in 1797. With Jacobin leanings, he remained neutral in the coup of 18th Brumaire in 1799. After holding a variety of civil and military offices, Napoleon made him one of the 18 original marshals of France in 1804.

Bernadotte commanded a corps at Austerlitz in 1805, but failed to engage as ordered at Jena in 1806. His victory over the Russians at Mohrungen on 25 January 1807 did not fully restore him to Napoleon's favor. After his inadequate generalship caused unacceptably high casualties at Wagram in 1809, Napoleon dismissed him on 24 September.

Turning against Napoleon and in command of an allied army in Germany in 1813, Bernadotte defeated Nicolas Charles Oudinot at Grossbeeren on 23 August and Michel Ney at Dennewitz on 6 September and commanded one of the three victorious allied armies at Leipzig. He participated in the push toward Paris in the spring of 1814, but did not oppose Napoleon in the Hundred Days.

Elected crown prince of Sweden in 1810 so that the childless Charles XIII could be peacefully succeeded, Bernadotte,

as King Charles XIV John, founded the Swedish royal line that survives into the twenty-first century.

Berthier, Louis-Alexandre, Prince of Neuchâtel and Valangin, Prince of Wagram (1753–1815)

Marshal of France, commander during the wars of the French Revolution and Empire. Berthier was born on 20 November 1753 at Versailles. He joined the French army as an engineer in 1766. During the American Revolution, he served on the staff of the Comte de Rochambeau. Thus by the outbreak of the French Revolution he had already served 20 years and risen to the rank of lieutenant colonel.

In the early part of the Wars of the French Revolution, Berthier served first on the staff of Rochambeau, and then as chief of staff, first to the Marquis de Lafayette, and then to Count Luckner. He was suspended from the army in 1792 at the outset of the Terror. Reinstated in 1795, he was promoted to *general de brigade* and made chief of staff of the Army of the Alps and Italy. He was promoted in June 1795 to *general de division*. When Napoleon Bonaparte assumed command of the Army of Italy, he retained Berthier as chief of staff.

Berthier would serve Bonaparte as chief of staff almost without interruption throughout the remainder of the Wars of the French Revolution and Empire, finally leaving Bonaparte at the end of the 1814 campaign.

Berthier thus made his reputation as a staff officer, rather than as a field commander. The staff of the French Army of the Consulate and Empire was a model of efficiency for the period and served as an example to be imitated by other European armies. In large part, this success was due to Berthier, who was one of the few individuals who could both reduce the rambling directives of Napoleon Bonaparte to a

coherent set of orders and supervise the subsequent execution of those orders.

On the two occasions when Berthier served separately from Napoleon, the results were far less fortunate. Left in command of the forces in Germany in 1809, Berthier proved incapable of responding to the Austrian offensive. Disaster was averted only by the timely arrival of Napoleon. At the conclusion of the 1812 campaign, Berthier was left as chief of staff to Marshal Murat, in command of the army after Napoleon's return to Paris. Berthier proved incapable of steadying the king of Naples, who quickly panicked, and eventually abandoned his command to Eugène Beauharnais.

As a result of his faithful service to the empire, Berthier was created prince of Neuchâtel and Valangin in 1806, and vice-constable of the empire. In 1809, he was created prince of Wagram. In 1814, he accepted the Bourbon Restoration, and was made a peer of France and commander of the Order of St. Louis. After Napoleon's escape from Elba, he, together with other marshals loyal to the Bourbons, accompanied the flight of Louis XVIII from Paris. He then went to Bavaria, where he died on 1 June 1815. Sources disagree on whether Berthier was murdered or committed suicide.

Bismarck, Otto von (1 April 1815–30 July 1898)

Master of Realpolitik, who unified Germany under the leadership of Prussia. Otto von Bismarck was a Prussian Junker, born at Schönhausen, conservative and monarchical in outlook. He was appointed Prussian delegate to the Frankfurt Diet on 15 July 1851, Prussian minister to St. Petersburg in 1859, and Prussian ambassador to Paris in 1862. From 1862 to 1890, Bismarck served as foreign minister and minister president of Prussia.

Bismarck was not a German nationalist; he led the process of German unification to ensure Prussian control of the outcome. His only concerns were to make Prussia great in Germany and make Germany great in Europe.

On 30 September 1862, Bismarck delivered his notorious speech, stating that debate would not solve the issue of German unification, but “blood and iron” would. He manipu-

lated European politics and became chancellor of a unified Germany under the leadership of King Wilhelm I after three wars: Schleswig-Holstein (Denmark), January–July 1864; Austro-Prussian War, June–July 1866; and Franco-Prussian War, July 1870–January 1871.

Bismarck restrained General Count Helmuth von Moltke after the Austrian defeat, and disallowed a Prussian military procession through Vienna or the levying of a war indemnity.

However, Bismarck did not act with similar prudence at the conclusion of the Franco-Prussian war. There was a Prussian military parade through Paris; a war indemnity against France of 5 billion francs; the occupation of northern France until the indemnity was paid in 1873; the proclamation of Wilhelm I as emperor of Germany in the Hall of Mirrors in Versailles; and, most galling for the French, the annexation of Alsace and Lorraine to Germany. War, the destruction of Metternich's Congress System, and the re-arrangement of the balance of power had made Germany a unified nation. From 1871 to 1890, Bismarck worked to ensure the survival of his creation within the new status quo.

Domestically, Bismarck consolidated Prussia's political, military, and economic dominance within Germany. He became the “honest broker of peace” in Europe, attempting to prevent war or otherwise to localize conflict. Bismarck did not wish to embroil Germany in a proxy war against Russia on Austria's behalf in the Balkans. Bismarck also strongly sought to avoid a two-front war involving Germany, against France and Russia.

Bismarck also promoted colonial expansion in Africa to ease tension in Europe by diverting attention from growing German influence and providing an outlet for the grandeur of France and England. He also staunchly believed that strong German-Russian relations would keep France isolated.

Bismarck's multiple priorities complicated his diplomacy, committing Germany in a series of alliance treaties. In these arrangements, Germany was “one of three so long as there are five great European powers.”

Bismarck was a diplomatic wizard; however, his successors were unable to maintain Germany's alliance web. The contradictory nature of Germany's multiple contractual ties, and its breakdown, was one of the causes of World War I.

As Prussian and German chancellor, Bismarck constantly empowered the army with state revenue and patronage. Force had created Germany and would defend it, but Bismarck ensured that the military remained subservient to the state.

Wilhelm I allowed Bismarck to rule Germany by proxy. Bismarck resigned in March 1890, because he was not granted the same privilege by Wilhelm II.

Black Patch War (1904–1909)

A conflict that broke out between tobacco farmers in the Black Patch region of Kentucky and Tennessee, and the American Tobacco Company (ATC) and other tobacco companies. The area had taken its name from the dark tobacco leaves produced for European markets. The tobacco market had increasingly come under the control of a few giant firms, led by the ATC, that had reached an understanding in order to avoid competition and reduce prices paid for tobacco. Prices had declined by 48 percent between 1874 and 1894. In order to defend themselves, farmers organized themselves into the Planters Protective Association (PPA) in 1904. The PPA, led by wealthy planter Flex Ewing and other elite landholders, sent organizers to educate and recruit other farmers in order to form cooperative pool crops, and withhold them from the market until better prices were offered. By 1907 PPA members had pooled 50,000 hogshead of tobacco and nearly caused the price the ATC paid for their crop to double.

The PPA ultimately had to resort to violence in order to ensure solidarity among tobacco producers. By 1905, some of the members of the PPA formed a secret organization called the night riders. They terrorized, whipped, and on occasion murdered farmers who sold their tobacco to the tobacco trusts and others whose interests stood in opposition to the PPA. With the silent support of law enforcement officials and private citizens, they even intimidated local courts. Their campaign culminated on 6 December 1907 in a raid by 500 masked men on the city of Hopkinsville, Kentucky, that resulted in more than \$200,000 worth of property damage when several tobacco warehouses were set afire. Major Erskine Birch and the town's militia pursued the vigilantes and engaged a small group of them, killing a teenager. In reaction, Kentucky governor Augustus Wilson sought to penetrate the vigilantes with informers and to send troops where they were needed. Yet, this strategy met with little success and Wilson then established a defensive strategy of placing troops near likely targets.

By 1908, the target of night riders' violence had begun to change. A second wave of violence was directed at black peo-

ple, as well as prostitutes, bootleggers, and others who offended community morals. The source of this second wave came not from the tobacco farmers but was led by local white ironworkers. Planters soon became concerned that these actions were driving off the laborers they needed. As the violence broadened and became more chaotic, Black Patchers turned against vigilantism. After threats about burning the town of Murray, Judge A. J. G. Wells asked Wilson to dispatch troops to guard Calloway County. State and local courts began to assert their authority and ended the lawlessness. Under financial strains, the PPA buckled and local militias ensured that order was maintained.

Blenheim-Höchstädt, Battle of (13 August 1704)

Marlborough's masterpiece. The year 1704 saw the rising star of both Marlborough and Prince Eugene de Savoie; Marlborough had decided to come and help the imperials in Bavaria. The strategic options were significant: the allies had to protect Vienna and a victory would give them Bavaria; a defeat meant a Franco-Bavarian invasion of Austria. On 21 May, Marlborough joined Eugene's army. Together they won a first battle at Donauwörth in early July. This victory gave them a base for further operations in Bavaria. The elector of Bavaria avoided any clash with the invading armies. He needed first to join Marechal de Tallard and his French army.

The month of July saw allied troops committing the Rape of Bavaria, as this period of burning and looting was known. Now the Franco-Bavarians tried to draw Marlborough and Eugene to battle, as their armies were separated by the Danube River. By a series of rapid marches, Marlborough came to help Eugene, which was withdrawing slowly to protect Donauwörth. Tallard and the elector thought they had achieved a strategic success in bringing Marlborough out of Bavaria. In Marlborough's mind, it was time for a decisive battle.

The Franco-Bavarian forces (60,000) were positioned east of Höchstädt. Their deployment was covered by the Danube on their right and by wooded hills on their left; the center was protected by a marshy river (the Nebel). Three

villages were occupied: left to right, Lutzingen, Oberglau, and Blindheim (Bleinheim). Marlborough's opponents were unaware of his position, and orders were given to send out foragers. At 6 A.M. on 13 August, nine allied columns (52,000) appeared out of the woods, heading toward the Nebel. Until noon, the two facing armies deployed for battle; the Franco-Bavarian army separated in two groups, the elector and Marechal Marsin on the left, and Tallard on the right. Their infantry had deployed in the three villages with cavalry on their flanks making the center of the line, between Oberglau and Blindheim, a weak spot. Marsin deployed to fight by the Nebel, trying to prevent any crossing; Tallard chose to hold a defensive line more than 500 yards further with Blindheim as a strong point. Marlborough ordered a general advance at 12:30, and Blindheim was assaulted by Lord Cutt's troops, who were repulsed with heavy losses. This attack was so fierce that the French general Clerambaut decided to move more infantry into Blindheim, cramming 27 battalions in the village. The French center was left in charge of the cavalry. Marsin and Eugene faced each other in a fight lasting until 4 P.M. When the Franco-Bavarians retired behind Lutzingen, Eugene's troops were too exhausted to go further. Marsin then tried to attack the flanks of Marlborough's cavalry squadrons and infantry lines advancing across the Nebel. The furious cavalry fight lasted with various degrees of success till a general charge led by Marlborough separated the French in two parts. Marsin escaped slowly into the night. Tallard was taken prisoner by Hessian cavalry he thought to be French. At 9 P.M., to the disgrace of France, more than 10,000 soldiers surrendered in overcrowded Blindheim. The Franco-Bavarian army was destroyed, as more than 30,000 were either killed, prisoners or drowned trying to cross the Danube.

Austria was safe, the allies overran Bavaria, and Louis XIV's army might belonged to the past.

Bloch, Jean de (1836–1902)

Industrialist, philanthropist, and antiwar activist, also known as Jan Gotlib Bloch and Ivan Stanislavovich Bliokh.

Born on 30 July 1836 in Radom, (Russian) Poland, Jean de Bloch amassed a very large fortune in the railroad, banking, insurance, sugar, bakery, and forestry businesses. An enlightened entrepreneur, Bloch proposed a pension plan for railway workers—over strong opposition from other business leaders, and even from established charitable and educational institutions. Bloch also wrote the first modern “systems analysis” of warfare. He was not without honor in his own country, and Czar Alexander II ennobled him and gave him the title State Councillor of the Empire.

Bloch also had a notable research and literary career, winning many gold medals at international expositions. He pioneered the use of research institutions to examine social and political questions, including a Statistical Bureau, which he founded in Warsaw, that employed prominent scholars and writers.

Bloch began to think about warfare while organizing railway supplies for the Russo-Turkish War. In 1888, he started work on *Memorial on the Defense of Warsaw*. With the encouragement of Josif Hurko, the czar's governor-general of Poland, Bloch began to write articles explaining the social and economic effects of war to officers, and the military aspects of war to civilians. Bloch's first studies on war were published in Warsaw's monthly *Biblioteka Warszawska* between March 1893 and September 1894. Translations of these chapters were published in Russian, French, and German journals.

In 1898, Bloch published his six-volume *Buduschaya voina [The Future of War from Its Technical, Economic and Political Points of View]* in which he argued that the modern technology of arms design substantially increased the lethality and power of defense. In particular, the magazine rifle, smokeless powder, flat trajectory bullet, smaller rifle bore, quick-firing artillery, and high-explosive artillery shells would create a 1,000-meter fire-swept zone, making a frontal assault against an entrenched defense suicidal. This zone could be crossed, but such a crossing would require the attacking forces to have a numerical advantage of eight to one, a number Bloch derived from his analysis of actual operations in the 1877–1878 Russo-Turkish War and of the 1870–1871 Franco-Prussian War, and of experiments of his own design conducted in Switzerland. The new weapons technologies, combined with mass conscription armies and railroad-generated strategic mobility, had transformed warfare into a long-term stalemate decided by attrition and the economic exhaustion of the continental powers. Bloch concluded that “under the military, social, and economic conditions of Europe at the present day, though it is quite possible that war may break out, it is almost impossible for it to be waged successfully.”

Bloch's deductions on tactics and logistics contained far more realistic insights than those of his contemporaries, and

he dealt with problems that no one else thought about. He alone questioned the effects of a long, drawn-out war on the ability of civilians to bear great privation and hardship and on the stability of the European social order. He also anticipated the concept of a “war economy,” or the relationship of commerce, industry, and agriculture to the military effort.

His six-volume work, *The Future of War*, was approved by the Russian censor and was published only after Bloch had an audience with Czar Nicholas II. *The Future of War* was translated into German and French in full, and into English in an abridged version. In the last three years of his life, Bloch worked tirelessly for the cause of peace, and his work helped inspire Czar Nicholas II to call for the 1899 Hague Peace Conference. Bloch died on 6 January 1902 in Warsaw, some 14 years before World War I proved so many of his predictions correct.

Blood River (Ncome) (16 December 1838)

Opened the Zulu kingdom to white settlement, and is still a potent symbol for competing Afrikaner and Zulu nationalism. In February 1838 hostilities erupted between the Zulu and the Voortrekkers, or emigrant farmers (Boers) from the Cape Colony, who had invaded the Zulu kingdom in search of new lands to settle, free from British rule. The succeeding months of inconclusive fighting showed that the normal Zulu tactic of enveloping their foe preparatory to closing in hand-to-hand combat with the stabbing spear could not succeed against a laager, or the Boer fighting formation of wagons drawn up end to end in a circle, and defended by muskets and cannon shooting in ordered rotation to keep up an uninterrupted rate of impenetrable fire.

In late 1838 a commando of armed horsemen under Andries Pretorius advanced east into Zululand, on 15 December laagering its 64 wagons on a spit of land between the Ncome River to the east and a dry watercourse to the south. The defenders, who consisted of 472 Boers, three white traders from Port Natal, and 120 Port Natal Africans under

Alexander Biggar, were thus allowed to concentrate along the west and north faces of the laager. Inside were some 700 oxen, 750 horses, 130 black wagon-drivers, and 200 grooms. The Zulu army of between 12,000 and 16,000 men under Ndlela kaSompisi Ntuli and Nzobo kaSobadli Ntombela advanced from the southeast before dawn on Sunday, 16 December. The left horn of 3,000 younger warriors came on precipitately in advance of the chest and right horn, crossed the Ncome south of the laager, and at about 6:30 A.M. charged it from the west and north. Repulsed by the defenders' fire, the left horn broke and fled, pursued some way by Boer horsemen. At about 8 A.M. the Zulu right horn, followed by the chest, attacked along the same route as the already defeated left horn, but were also unable to break through the Boer zone of fire. Some Zulu units began to withdraw in disarray at about 11 A.M. Pretorius and about 160 mounted men sallied out in a pursuit that lasted several hours. The Zulu army broke and fled in all directions. Their slaughter bloodied the waters of the Ncome, which the Boers renamed the Blood, or Blood River. Three Boers were wounded, but well over 1,000 Zulu were killed.

His army scattered, King Dingane was soon forced to cede the Boers half his kingdom.

Blücher, Gebhard Leberecht von (1742–1819)

Fiery hero of Prussia's war against Napoleon. Born 16 December in Rostock, Blücher grew up in Mecklenburg. Poorly educated, he volunteered in a Swedish Hussar regiment but was captured by Prussians in 1760. The regiment's colonel liked the youth and made him an adjutant. Blücher gained a reputation for gambling and drinking, often dueling to extricate himself from difficulties, but his behavior cost him a promotion in 1771. He appealed directly to Frederick the Great, who replied that “Blücher may go to the devil,” and cashiered him. For several years, he tended his small landholdings. After the death of the king, Blücher was reinstated as major in his former regiment. He was lieutenant colonel in 1788 and served with the duke of Braunschweig on the Rhine, where he led dashing charges against the French and earned the rank of colonel in 1794.

In 1801, he was named lieutenant general and governor of Münster where he was outspoken against Napoleon. He led the advance guard at Auerstädt in 1806, and subsequently, the army's rear guard. He surrendered at Lübeck, and following the Treaty of Tilsit, Blücher was military governor of Pomerania. When a Prussian contingent assisted Napoleon's invasion of Russia in 1812, Blücher's rage forced the king to exile him temporarily to Silesia. He returned after Prussia's alliance with Russia in 1813, and received 38,000 Prussians and Russian troops.

In May, he battled Mortier's Corps at Lützen, and he commanded the allied right wing at Bautzen. He protested the armistice in June, but when the war resumed in August, Blücher's Army of Silesia numbered 90,000 men. Moreover, Gneisenau became his chief of staff and held the general's unconditional trust. On 26 August, the Army of Silesia crushed Marshal Macdonald on the Katzbach, liberating Silesia. Refusing to abide conservative strategy, Blücher crossed the Elbe, eluded Napoleon, and approached Leipzig. Now a field marshal, Blücher defeated Marmont at Möckern on 16 October, attacked Leipzig on 18 October, but failed to block the French retreat. Blücher's army crossed into France at Kaub on 1 January, and "Feldmarshal Vorwärts" raced toward Paris.

Napoleon defeated the Prussians at Brienne, Vauchamps, and Craonne, but Blücher checked the emperor at Laon before advancing into Paris on 31 March.

In 1815, Blücher moved from the Rhine to join Wellington in Belgium. At Ligny on 16 June, Blücher was extricated from beneath his dead horse while Gneisenau ordered a withdrawal toward Wavre. That decision allowed the Prussians to fall on Napoleon's right flank at Waterloo two days later. The aging hero was celebrated throughout Prussia, but he fell ill and died on his property of Kriebowitz on 12 September 1819.

After the discovery of diamonds in the 1860s, British politicians decided that the best way to administer South Africa and protect their commercial interests was through confederation. Britain annexed the Transvaal in 1877 to accomplish this goal. Because of the poor state of the republic's finances and the Zulu military threat, they did not anticipate resistance. But the Boers rejected confederation and declared war. The British were ill-prepared to fight the First Boer War (1880–1881), having underestimated the ability and determination of the Boer horse commandos. With fewer than 3,500 troops in South Africa, and only half of these in the Transvaal, British forces were dangerously outnumbered. In the war's defining moment, 180 Boers climbed Majuba Hill at night, where nearly 600 British soldiers sat atop a seemingly impenetrable position. The Boers took them completely by surprise. British casualties approached 250; the Boers lost one man.

Majuba Hill was the last battle of the war. Rather than commit to a protracted struggle, the British sued for peace. The Pretoria Convention of 1881 returned self-government to the Transvaal, although the British maintained suzerainty over the republic's foreign affairs. The peace agreement, revised by the London Convention (1884), made little reference to this vague notion and the exact relationship of Great Britain and the Transvaal remained unclear for the next 15 years.

With the discovery of gold near Johannesburg and the influx of thousands of migrant workers, there was renewed interest in South Africa. Cecil Rhodes, prime minister of the Cape Colony, mining magnate, and imperialist, wanted to see a unified British South Africa. Rhodes attempted to physically encircle the Boer Republics, thus ensuring their economic dependency on British, who controlled railroads and ports. When this plan failed, he tried to overthrow the Transvaal government in the ill-conceived Jameson Raid (1895). The disastrous adventure heightened anxiety and deepened mutual distrust.

Tension increased with the establishment of a German colony in southern Africa, growing pressure from British capitalists to break up the Transvaal's economic monopolies, and the inability to solve the issue of paramountcy. As the Transvaal signed a military alliance with the Orange Free State and purchased weapons, the British focused on the issue of the Uitlanders (immigrant workers). Alfred Milner, the high commissioner, believed that this disenfranchised population of mostly British and British colonial subjects could gain control of the republic through democratic means. Milner made their right to vote, whether or not a legitimate concern of the British government, the central issue of all negotiations with Paul Kruger, the Transvaal president. When negotiations failed in the summer of 1899, the British

prepared an ultimatum. The Boers forestalled them, declaring war on 12 October.

The (second) Boer War (1899–1902) did not open well for the British, who seemed to have learned nothing from the First Boer War. Due mostly to political constraints, the army lacked numbers, equipment, and intelligence. To make matters worse, strategy had been determined by an angry

public. The Boers had invaded the Cape Colony and Natal, laying siege to Ladysmith, Kimberley, and Mafeking. The public demanded the immediate relief of these three towns. The British commander, Redvers Buller, complied and against his better judgment divided his forces. The result was December's "Black Week," in which three British armies were defeated at Stormberg, Magersfontein, and Colenso.

British forces were strengthened with the arrival of several divisions and the wide-scale recruitment of volunteers. Over the next year, Lord Roberts, the new commander, advanced through the Orange Free State and the Transvaal. Boer commandos refused to surrender and turned to guerrilla tactics, destroying railroads and telegraph lines and attacking isolated outposts. In 1901, Lord Kitchener, succeeding Roberts, employed controversial counterinsurgency techniques to break Boer resistance. To limit their movement, the British constructed blockhouses. To strip the Boers of their resources, the British scorched land, seized livestock, and relocated civilians.

Concentration camps eventually housed more than 150,000 men, women, and children. Poorly situated and maintained, they had an alarmingly high rate of mortality and 28,000 Boers and more than 14,000 black Africans died in them, leaving a lasting legacy of hatred for the British by the Boers.

Although Boer commandos managed to sustain a vigorous resistance in the guerrilla phase of the war, the plight of their civilians, the devastation of their lands, the growing fear of armed blacks, and the numerical superiority of the British forced them to the negotiating table. The Treaty of Vereeniging, 31 May 1902, ended the war on mild terms for the Boers.

Bogomils' Revolt (1086–1091)

A rebellion against the Byzantine Empire in what is now Bulgaria. The Bogomils were a dualist sect present throughout the Mediterranean world, variously known as the Paulicians in Anatolia, Bogomils in eastern Europe, and Cathars or Albigensians in western Europe. Although the heresy was poorly regarded officially, such was the Byzantine Empire's need for manpower that Alexius I Comnenus (r. 1081–1118) raised a unit of Bulgarian dualists from the area around what is now Plovdiv.

This unit proved unsatisfactory and was dismissed by

Alexius in 1085 or 1086. It promptly revolted, and was joined by coreligionists, as well as some Serb and Vlach freebooters.

The rebels seized the fortress of Beliatoba, where the Bogomils then invited Petcheneg nomads to join them. A force of Petchenegs crossed the Danube and marched toward the rebels. A small Byzantine force sent to stop them was defeated, but a second force compelled the Petchenegs to withdraw.

In 1087, a much larger Petcheneg force, numbering 80,000, crossed the Danube under Tzugal. Though this force suffered an initial defeat, a large number joined the Bogomils and camped near the town of Paradunavum. Alexius I Comnenus decided to retake the town and marched against them. At Dristra, the Byzantine army was mauled and Alexius forced to flee.

For the next three years, the Petchenegs and rebels raided throughout the western parts of the empire. In 1090, another Byzantine army was defeated and destroyed.

In the spring of 1091, Alexius persuaded the Cumans, the traditional enemies of the Petchenegs, to attack the rebellious force. The Cumans heavily defeated the Petchenegs and recrossed the Danube. Alexius settled the surviving Petchenegs in the area around Salonika. A number were enrolled into the Byzantine army.

Alexius did not proceed further against the dualist heretics until the last two years of his reign. At that time, under pressure from the Church to establish religious conformity, many Bogomils were forcibly converted, and their leaders either imprisoned or executed.

Bohemian Civil Wars (1448–1478)

Wars between various claimants for the Bohemian throne. The peace established by the Compacts of Jihlava (1436) was strained by the successive deaths of Bohemian kings Sigismund (d. 1437) and Albrecht (d. 1440), and the control exercised by Holy Roman Emperor Frederick III over Albrecht's infant son and putative heir, Ladislav Posthumous. Conflict between Catholic and Hussite factions resurfaced in the interregnum, culminating in an attempt by Catholic nobles of the League of Strakonice to seize Prague. It was frustrated by the Hussite George Podebrady (1448). In 1450,

Podebrady defeated the League at Rokycany, and then invaded Saxony to cut off the Catholic party from the support of Duke Frederick.

Having secured peace, Podebrady moved to protect the Catholics from Hussite reprisals, forcing the radical stronghold of Tabor to submit to his rule in 1452. In alliance with Count Cilli of Austria and János Hunyadi of Hungary, Podebrady forced Frederick III to release Ladislav in 1453; Podebrady was named regent for Bohemia in Ladislav's name.

While visiting Prague for his wedding in 1457, Ladislav became ill and died. The Bohemian estates rejected the claims of Ladislav's relatives, and elected Podebrady king. In 1458 Podebrady defeated an invasion of Moravia by Archduke Albert Habsburg of Austria, and induced William of Saxony to recognize his election, forwarded by the Congress of Cheb in 1459.

Though he sought to pacify the country, Podebrady could not completely satisfy the baronial party, nor would he meet the Catholics' demands to eliminate Hussitism. Encouraged by Pope Paul II and by Frederick III, Catholic barons formed the League of Zelená Hora, and, together with the cities of Pilsen and Breslau, revolted against Podebrady's rule in 1467. Moving quickly, Podebrady destroyed the forces of Breslau, subdued Lusatia and Silesia, and secured a truce with the league.

Offered the Bohemian crown by the pope, Hungarian king Matthias Corvinus invaded, and drove Podebrady out of Moravia in 1468. Podebrady counterattacked the following year, defeating Matthias and forcing him to withdraw. Matthias raided Bohemia in 1470 without result. Podebrady's death the following year led to the election of Vladislav II Jagiellon by the Bohemian estates, though Matthias refused to recognize the election, and continued his war against the Hussite party. Unable to gain ground in Bohemia, he held on to the dependent territories of Moravia, Silesia, and Lusatia. Placing his heavy forces in the towns, he used his light cavalry to devastate the countryside, forcing Vladislav to withdraw in a rare example of a besieged army starving the besiegers into submission. By the Peace of Olomouc (1478), Vladislav retained Bohemia proper and Matthias gained the dependencies, with both men sharing the royal title.

Full-length portrait of Simon Bolivar. (Library of Congress)

Bolivar, Simon

(24 July 1783–17 December 1830)

South American liberator. Bolivar was primarily responsible for freeing most of Latin America from Spanish rule. Bolivar was born into a wealthy Creole family in Caracas, Venezuela. Orphaned as a child, he was raised by an uncle and tutors. He completed his education in Europe, where he married a Spanish noblewoman. They returned to Caracas in 1802, but she died within a year. Bolivar returned to Europe where he systematically studied Enlightenment thinking. He witnessed Napoleon proclaim himself emperor as well. Returning to Venezuela, Bolivar joined the movement for independence after the Bourbon monarchy of Spain was deposed by Napoleon. In 1810, the ruling junta of Venezuela sent Bolivar to England to seek assistance. Unsuccessful in that mission, Bolivar returned to command the important fortress of Puerto Cabello. Some of his officers betrayed the fortress to royalists, leading to the collapse of the independence movement in Venezuela.

Bolivar vowed to continue the fight for independence. He retreated to New Granada (modern Colombia), where he

took command of a patriot army. He defeated royalists seeking to conquer New Granada, then invaded Venezuela in May 1813. Defeating the Spanish forces in six battles, Bolivar occupied Caracas on August 6. He was given the nickname El Libertador (Liberator), which he kept for the remainder of his career. Bolivar made himself dictator, but was soon overthrown by royalist forces. He fled again to New Granada, but was defeated there. Bolivar went into exile in 1815 to Jamaica and Haiti. During this time, he wrote his famous “Letter from Jamaica,” outlining his hopes for independence for Latin America.

With weapons supplied by Haiti, Bolivar returned to Venezuela. He was defeated and fled to the Orinoco region in 1818. There, Bolivar built a new army. He united the irregular cavalry of the region, the *llaneros*, with thousands of British and Irish mercenaries, veterans of the Napoleonic Wars. On 11 June 1819, Bolivar left his base with 2,500 men and marched through the Andes via the icy Pisba pass. The Spanish troops in New Granada were caught by surprise and defeated. On 10 August 1819, Bolivar captured Bogota and became president of newly independent Colombia.

In December 1819, Bolivar sponsored the declaration of Gran Colombia, a union of Venezuela, Colombia, and Ecuador. A truce forestalled hostilities during 1820, but Bolivar invaded Venezuela again in 1821. He defeated the royalists at the Battle of Carabobo on 25 June 1821, freeing virtually all of Venezuela. He quickly moved his army into Ecuador. A two-pronged invasion with General Antonio de Sucre freed Ecuador by the end of 1822. A secret meeting with Jose de San Martin, who had freed southern Latin America, resulted in Bolivar becoming the single head of the liberation army. He took over command of San Martin’s army in Peru and completed the liberation of that state. The region known as Upper Peru became a separate nation, and the grateful citizens named it Bolivia after the great liberator.

In 1826, Bolivar called a pan-American meeting, to sponsor unity between the newly independent states. It was sparsely attended and produced no lasting results. Bolivar’s last four years were occupied with civil war and dissent. He decided to go into voluntary exile in 1830, but died of tuberculosis before he could leave. Bolivar has another claim to fame, as one of only two persons in modern times to have a nation—Bolivia—named in his honor. (Cecil Rhodes and Rhodesia was the other—and that only temporarily.)

Bolshevik Revolution (1917–1921)

Political-military coup that imposed Marxist-Leninist communism on Russia from 1917 to 1991. In 1903, organizational, ideological disputes split the Marxist Russian Social Democratic Labor Party into two wings, Mensheviks and Bolsheviks. There were also numerous underground movements in exile; their divisions grew by 1917, but the dominant Bolshevik, Vladimir Lenin (né Ulaynoff), brooked no compromise with his version of Marxism.

In Russia itself, World War I privations exacerbated underlying socioeconomic tensions, which had first surfaced in the 1905–1907 Revolution. There was dissatisfaction in the countryside with the 1861 serf emancipation, and urban discontent with living conditions resulting from the 1890s’ industrial growth.

A bloodless February 1917 revolution overthrew Czar Nicholas II, leading to establishment of a provisional government (PG), a self-appointed body of prowar liberals and industrialists to rule until national elections could be held for a constituent assembly. The Petrograd Soviet, comprising Russia’s socialist movements, appeared, issuing Soviet Order No. 1 (1 March), declaring the Russian army’s democratization, gaining its support, and effectively controlling the PG’s actions, but it was not prepared to take power itself.

Lenin and his fellow revolutionaries returned from exile to Russia by the Germans in the famous “sealed railway car.” But on his arrival Lenin issued his “April Theses,” declaring no support for the provisional government and proclaiming the popular slogans “All Power to Soviets,” and “Peace, Bread, Land,” which separated the Bolsheviks from moderate socialists.

The provisional government postponed elections; and did not end the war, launching instead the disastrous June Kerenskii offensive. It also did not or could not improve urban conditions or pass land legislation. Nonetheless, moderate socialists joined the provisional government in July, and the Bolsheviks were driven underground after the “July Days” demonstrations.

General Kornilov’s failed right-wing military coup in August swung the pendulum back left, with grassroots Bolsheviks organizing railway workers. Red Guards prevented Kornilov’s forces from reaching Petrograd. Now with popular urban support, the Bolsheviks gained control of the Petrograd and Moscow soviets.

Without the peasant support necessary for a majority in

the constituent assembly elections and no majority guaranteed at the 2d Congress of Soviets in November, Lenin (in hiding) pushed a divided Bolshevik Party toward insurrection. A Military Revolutionary Committee was formed, through which Trotsky directed the seizure of power on 25 October (Old Style).

Despite holding Petrograd, Moscow, and other towns, the Bolsheviks had tenuous control of Russia. They quickly passed decrees satisfying soldiers, peasants, workers, and national minorities. Their calls for international peace were ignored by the Allies (who believed them to be a tool of the Germans). Lenin's new regime therefore independently signed a cease-fire with Germany in December and the harsh Brest-Litovsk peace in March 1918.

The Communist Party's "carrot" policies toward the peasants and others were accompanied by the "stick" of the All-Russian Commission for Struggle Against Counter-Revolution and Sabotage (CHEKA) formed December 1917 under Feliks Dzierzynski. CHEKA gained more powers as Bolsheviks intensified their "dictatorship of proletariat," deemed necessary to attain true socialism in the face of a hostile coalition of the imperialistic-capitalistic powers. The No-

vember constituent assembly elections gave the Social Revolutionaries 40 percent of the vote, against only 25 percent for Bolsheviks. This minority vote meant nothing to the Bolsheviks; the assembly met only once before Red Guards closed it permanently. All opposition parties—monarchist, liberal, socialist—were banned by mid-1918.

The Workers and Peasants Red Army (RKKA), formed in January 1918 to face the Germans, was replaced by the demobilized Czarist Army. Under Trotsky, the new Red Army was built around Latvian Rifles, Red Guards, partisans, and worker detachments to a force of 5 million by 1920, running the Soviet Union as a "one-armed camp" under "War Communism" during the subsequent Russian Civil War. His political control secured by the victorious civil war, Lenin reverted to a "New Economic Policy" that permitted some limited private enterprise. But he also continued the "temporary" wartime governmental measures, which included terror as a weapon and the stifling of all political opposition, thus preparing the way for Stalin's rise to power. Nonetheless, the Communist Party did not achieve control over the peasantry until Stalin's 1930s collectivization, which resulted in the deaths of millions. The Soviet state that emerged was not that initially envisaged by the Bolsheviks or their 1917 supporters, but a police state based around a military-industrial complex that allowed victory over Germany in World War II and nuclear Cold War competition with America afterwards, but which collapsed due to its own internal contradictions in 1991.

Bor-Komorowski, Tadeusz (1895–1966)

Polish commander. Born in 1895 near the city of Lwow in Russian-occupied Poland, Bor-Komorowski, while a student, was in Warsaw for the declaration of Polish independence in 1918. After enlisting in the cavalry to fight in the Russo-Polish War (1919–1921), he rose through the ranks to become an officer. Eventually he became an internationally known horseman, attending the Ecole de Guerre in Paris, and was

the commander of the Polish Cavalry School during the Polish Campaign of 1939. Promoted to major general, he became a commander of the Krakow region in the Polish Home Army (*Armia Krajowa*) and took the pseudonym “Bor” (forest). In July 1943 following the arrest of Major General Stefan Rowecki, Bor-Komorowski was promoted to lieutenant general and became the commander of the entire Home Army. In July 1944, he made the decision, with the consent of Prime Minister Stanislaw Mikolajczyk in London, to initiate a long-planned general uprising against the Germans in order to liberate Warsaw before the arrival of Soviet forces. Despite the presence of the Red Army across the Vistula from Warsaw, Stalin ordered that no assistance be given to the obviously noncommunist revolt. From 1 August to 2 October 1944, the Home Army and the people of Warsaw fought a valiant, but futile, battle against the numerically and materially superior German forces. By the end of the battle, the city of Warsaw had been leveled and nearly 250,000 soldiers of the Home Army and civilians were killed. Surrendering at the end of the battle, Bor-Komorowski was imprisoned at the Innsbruck concentration camp, from which he was liberated in May 1945. Condemned as a criminal by the Soviet Union, he refused to return to communist-dominated Poland following the war. After serving briefly as the prime minister of the Polish government-in-exile, he then worked for the Polish Welfare Association in London. He died on 25 August 1966.

Borno-Kanem Sultanate (9th–19th Centuries)

A late medieval Islamic regime that consolidated its power in central Africa during the early modern era through the adoption of gunpowder firearms. Sometime after 900, Kanuri-speaking herdsmen founded the Kanem kingdom on the northeast shore of Lake Chad. Although still pastoralists, their king (the *mai*) ruled as a secluded divinity, assisted by merchants, shamen, and female family members (especially the queen mother).

The ruling Sayfawa family embraced Islam sometime in the eleventh century, and established a capital at Njimi. Conversion to Islam opened the region to the caravan routes leading north to Egypt, and to the Tunis-Libyan coast. Sultan

Dunama I created a permanent standing cavalry during the mid-twelfth century, to keep the roads through the Fezzan safe from nomadic banditry. From Kanem, Mediterranean Muslim merchants wanted camels, salt, ostrich feathers, ivory, and especially slaves. Given these demands, the mai led annual slaving raids against the various settled peoples to the south and west.

Expanding his cavalry to 40,000 troops, Sultan Dunama II (1210–1248) gave Kanem an empire by annexing the oasis towns of Fezzan, and southwestward into the territories known as Borno. He imposed a provincial structure on his state, promoted Islamic scholarship, and compelled many of his subjects to become settled farmers and taxpayers.

In the 1300s and 1400s, the Kanem state endured tumultuous changes. Factional fighting within the dynasty led to assassinations and coups. A branch of the royal family, the Bulala, seceded, and regularly launched raids against Kanem. Northern territories slipped away, and, to the south, peoples like the So, routinely victims of Kanem slave raids, became more organized and fought back. Aridity and overgrazing undermined the domestic economy.

About 1390, Mai Umar ibn Idris relocated the capital from beleaguered Kanem to Borno. Here the Sayfawa spent decades forcing the Chadic-speaking Borno people to accept their rule and taxes. Popular resistance to Kunari domination claimed the lives of several mais during this painful transition. Nonetheless, access to the city-states of the Hausa people opened Borno to traffic in crafts, gold, and other new commodities, as well as to new slave raid zones.

Borno-Kanem reached the height of its power in the sixteenth century. Its armored cavalry, backed by a conscript infantry force, slaved aggressively throughout the region, and imposed tribute on Kano, Kebbi, and other Hausa city-states. Mai Idris Alawma (1571–1603) opened direct diplomatic relations with the Ottoman Empire. He persuaded Istanbul to provide him with Janissaries, and to train his own people in the use of firearms. In an environment where mobility decided battle, firearms did not significantly enhance his offensive power, but gunpowder weapons strengthened Idris’s hold on his own people and his neighbors. He imposed Islamic *shari’a* law on the realm, and made Borno a center of Islamic culture in the heart of Africa.

In 1667, Taureg nomad raiders devastated Borno territory and the empire shrank dramatically. Nonetheless, the Borno-Kanem sultanate survived to remain a significant regional power. During Africa’s eighteenth- and nineteenth-century jihadist movements, Muhammad al-Kanami (d. 1837) rejuvenated Borno, but in 1846, a resentful Mai Ibrahim tried to put down al-Kanami’s son, Shehu Umar (1837–1881). Umar defeated Ibrahim, executed him, and deposed the Sayfawa Dynasty. Despite Umar’s efforts, the de-

cline of Borno-Kanem accelerated. In 1893, Rabih ibn Fadlallah, seeking to rally the region against French imperialism, conquered Borno-Kanem and ended its millennium-long existence.

Borodino (5–8 September 1812)

Set-piece battle that Napoleon hoped would result in a total Russian defeat or capitulation. Appointed commander in chief of Russian forces on 20 August 1812, Mikhail Kutuzov had a mandate from Czar Alexander I to engage Napoleon before Moscow.

The battlefield lay 70 miles west of Moscow, between the new and old Smolensk-Moscow roads. Russian forces were spread over 5 miles. Barclay's First Army was positioned along the Kolocha River, the north end of the battlefield. Bagration's Second Army held the center (Borodino) with its fortifications: the 20-gun "Great Redoubt" held by Raevski, and three supporting batteries of 12 guns (flèches) held by Borozdin at Schevardino.

The French attacked at 4 P.M. and captured Schevardino by nightfall on 5 September, losing 2,000 men. The Russians lost 8,000.

On 6 September Napoleon repositioned his troops for a frontal assault. The infantry corps of Ney, Junot, and Davout were positioned 1.5 miles south of the Kolocha River, while Murat's cavalry and 20,000 Imperial Guards were held in reserve at Schevardino. One hundred thousand French infantry, 28,000 cavalry, and 590 guns faced 72,000 Russian infantry, 10,000 militia, 17,000 cavalry, 7,000 cossacks, and 640 guns.

Battle recommenced at 6 A.M. on 7 September. As 102 French guns fired, Eugène's Army of Italy attacked Borodino, while Davout attacked the flèches. Both sides reinforced, Napoleon concentrated 45,000 men and 400 guns. By noon, the Russians withdrew and regrouped closer to the Great/Raevski redoubt.

Kutuzov sent Urarov's I Cavalry Corps and Platov's cossacks to outflank the French at Borodino. Although unsuccessful, this force of 13,000 caused the French to reposition

16 regiments. Napoleon also decided to preserve the Guard (his reserve), using it neither as a shock force nor for pursuit, after the fourth attack upon the redoubt, which caused a Russian withdrawal behind the Kolocha at 1530. Russian losses were 44,000 men including 23 generals; French losses were 35,000 men including 43 generals.

Kutuzov ordered a retreat from the battlefield to Mozhiask, commencing at 3 A.M. on 8 September. The Russian rear guard of 10,000 infantry and 10,000 cavalry reoccupied the Great Redoubt, which the French abandoned, before retreating.

Bosworth, Battle of (22 August 1485)

The culmination of the English dynastic struggle known as Wars of the Roses. Bosworth was the last great battle of medieval England. Pursuant to this battle, the Tudor Dynasty took the throne and introduced the Renaissance to England.

In 1483 Edward IV died, leaving the throne to his son Edward V. The new king's uncle, Richard of Gloucester, seized the throne, claiming his nephews were illegitimate. The coup strained the power structure of the kingdom and provided an opportunity for the inheritor of the Lancastrian claim, Henry Tudor, Earl of Richmond, to return from French exile. On 7 August 1485 Tudor landed in Wales accompanied by a few hundred adherents and approximately 2,000 French mercenaries.

Tudor marched inland, gathering supporters. By 21 August he had approximately 5,000 soldiers, and approached Richard's forces. Richard had been awaiting reinforcements, but still outnumbered the rebels, having nearly 8,000 men. Both sides appear to have possessed some artillery support.

On 22 August 1485, Tudor's army closed the gap between the two armies, a bog causing some delay, as they attempted to gain the high ground. Richard was the more experienced commander, with the better position, but this was eventually outweighed by the intercession of new Tudor supporters.

Much conjecture remains concerning the actual course of the battle, and the popularity of fictional accounts has done little to enlighten researchers.

The outcome is clear: Richard was killed, and with his death his faction collapsed. The War of the Roses came to an end, and the Tudors instituted a policy of ensuring that no dynastic challenges could exist. In doing so they broke the spirit of feudal England and helped to create a national state.

Botha, Louis (1862–1919)

Boer field commander in the Second Boer War. Born near Greytown, Natal, on 27 September 1862, Botha settled near Vryheid, Natal, in 1884, where he became field cornet in 1894. As a member of Parliament in Transvaal after 1898, he abstained from voting to declare war on Britain in October 1899, but went on active duty as soon as war broke out. Commandant General Piet Joubert soon noticed Botha's tactical skills and made him second-in-command.

Botha distinguished himself at Talana on 20 October, and contributed to the bottling up of Sir George Stuart White in Ladysmith on 30 October. He jointly directed the siege of Ladysmith with Joubert from 2 November until 23 November, when Joubert was disabled by falling from his horse and Botha assumed full command. As commandant general of the Boers, he defeated Redvers Henry Buller at Colenso on 15 December, Spion Kop on 24 January 1900, and Vaal Krantz on 5–7 February, but lost to him at Tugela River on 17–18 February, Biggarsberg on 14 May, Bergendal on 27 August, and Lydenberg on 6 September.

Tactically superior, but outgunned and usually outnumbered, Botha thereafter waged expert guerrilla warfare in Transvaal and Natal, attempted to make peace with Horatio Herbert Kitchener at Middelburg on 28 February 1901, and accelerated operations in September to coincide with Jan Smuts's invasion of the Cape Colony. He defeated Lieutenant Colonel Hubert Gough at Blood River Poort on 17 September, but lost to Major A. J. Chapman at Fort Itala and Fort Prospect on 26 September. His exhausted troops never recovered from their Pyrrhic victory over Lieutenant Colonel G. E. Benson at Bakenlaagte on 30 October. He cosigned the peace treaty at Vereeniging on 31 May 1902. Honored as a war hero, praised for both strategy and tactics, and valued for his diplomatic genius, he was elected prime minister of

Boudicca's Rebellion (60–61)

The Iceni and Trinovantes, Celtic tribes that inhabited what are now East Anglia and Essex, joined forces in revolt against the Roman administration of Britain. Their leader was Boudicca, queen of the Iceni.

With the bulk of Roman forces on campaign in north Wales, the Britons faced minimal resistance. The provincial towns of Camulodunum (Colchester), Londinium (London), and Verulamium (St. Albans) were overrun and sacked, and part of *legio IX* ambushed and destroyed. The provincial governor, C. Suetonius Paullinus, marched south down Watling Street (modern A5 highway). At his disposal were *legio XX* and part of *legio XIV* and some auxiliaries, a total of some 10,000 men.

Elated by her earlier victories, Boudicca staked all on one battle. According to Tacitus, Suetonius drew up his forces along a defile—legionaries in the center with auxiliary infantry alongside and cavalry on the wings—with dense woodland protecting his rear. When the battle was joined, the legionaries discharged their *pila* into the oncoming Britons, then charged. Confident of victory, the Britons had brought along their womenfolk to watch the spectacle from wagons positioned behind the warbands. The Britons soon found themselves crushed against the wagons. Tacitus says 80,000 of the enemy fell, including many of the spectator women, for the loss of only 400 Romans. The whereabouts of the battlefield are unknown, although a case has been made for the village of Mancetter near Nuneaton in Warwickshire.

Soon after the battle Boudicca took her own life. Suetonius, now heavily reinforced by units from the Rhine frontier, concentrated his efforts against the Iceni and Trinovantes. Their territory was laid waste and a chain of forts constructed across East Anglia.

Boulogne, Siege of (1544)

Delayed final act of the Hundred Years War. Determined to press English claims on French territory, Henry VIII joined Habsburg emperor Charles V in 1544 in a combined invasion of France. Henry fixed on the city of Boulogne as his first major objective.

Henry's forces, consisting mainly of continental mercenaries, invested the city on 19 July, and the lower town and harbor were taken by assault on 21 July, but the upper town was assailable from only one side. Its French garrison of 2,000 held out until 14 September, when prolonged bombardment by the English artillery forced their surrender. This delay led Charles V to suspect that Henry was not serious about their plan for a joint march on Paris, and the emperor signed a separate peace on 18 September, leaving Henry to defend his new conquest against an army of 30,000 French.

Some 4,000 English and mercenaries repulsed a furious French assault on 9 October, and after this failure the French settled into a siege of the city that was conducted without enthusiasm. It continued until June 1546. During this period, Henry VIII invested large sums in building modern defenses for the city, an exercise that provided an excellent training ground for English military engineers such as John Rogers.

The standoff finally ended in June 1546, when the Treaty of Ardes sanctioned English possession of Boulogne for eight years. After that it was to be sold back to the French. In fact, it was returned in 1549, when King Henry II of France agreed to "ransom" the city for a substantial sum of money. Of England's once French empire, this left only Calais, and it was conquered in 1558, bringing the era of English adventurism in France definitively to an end.

Bouquet, Henry (1719–1765)

Swiss soldier of fortune, served with the British army in North America, won the Battle of Bushy Run (1763) during Pontiac's War, said to have saved western Pennsylvania. Born in Rolle, Switzerland, in 1719, Bouquet began his military career in April 1736, in the Swiss regiment of Constants, in the service of the Netherlands. Over the next 20 years Bouquet served in Swiss regiments in the service of Sardinia and the Netherlands. In early 1756, Bouquet accepted a commission in the British army's Royal American Regiment.

Henry Bouquet enjoyed a distinguished but unfortunately short career with the British army in North America. He began as the lieutenant colonel of the Royal American Regiment, but he quickly assumed more challenging duties. In 1758 he was second-in-command of Brigadier General John Forbes's successful attack on Fort Duquesne, at the site of present-day Pittsburgh. Because Forbes was often ill, Bouquet provided much of the leadership for the expedition. Bouquet went on to lead an expedition to northwestern Pennsylvania in 1760. He is best remembered for his victory at the Battle of Bushy Run, 5–6 August 1763, against aboriginal Americans during Pontiac's War, which ended the threat to western Pennsylvania. In 1764, Bouquet commanded an expedition against the Ohio tribes that led to peace in that region. Henry Bouquet was promoted to brigadier general and sent to British Florida, but he died there of yellow fever on 2 September 1765.

Bouquet's life illustrates the pan-European military world of the mid-eighteenth century. Bouquet seems to have been competent, but aloof. He successfully adapted to the conditions of warfare in North America, and he saved western Pennsylvania at the Battle of Bushy Run.

Boxer Rebellion (1900–1901)

An antiforeign uprising in China. The Boxer Rebellion occurred in the aftermath of an alliance of sorts between the Qing court and various anti-Qing, antiforeign, and anti-

Christian movements in China. It was a time of ferment and great change, and the so-called Boxers—more correctly, Yihequan or Righteous and Harmonious Fists—sought to stem this tide of change. A young emperor, guided by several brilliant Confucian scholars, tried a “Hundred Days Reform” in 1898 to help China resist the encroachments of the “foreign barbarians.” Previous efforts had failed and the Chinese envied the apparent ability of the Japanese to modernize and gain Western respect. But many in China opposed such dramatic and revolutionary change, and they made an informal alliance with the Boxers to demonstrate how to resist the foreigners.

By fall 1899, the Boxers, with tacit approval of the Qing court in Beijing, began moving against foreigners and, more importantly, Chinese Christian converts. Chinese Christians at that time had to forsake their Chinese names and adopt Western names, and hence appeared to be turning their backs on their culture and values; this set them at odds with the Boxers, who were very traditional. The Boxers began in more central China and then moved north to the capital.

The Boxers laid siege to the foreign legations in Beijing and Tianjin; they cut road and rail communications as well as telegraph lines between the two cities, isolating the foreigners—diplomats, their families, and troops—in the foreign legation area. Nearly 500 foreign troops helped to defend the legations against the growing mass of Chinese protestors. A careful study of these sieges makes clear that these Chinese conservatives (who believed that their philosophy enabled them to resist Western bullets) sought to destroy those sections of the various foreign legations where Chinese Christian converts were hiding.

Foreign troops resisted and matters settled down to siege warfare. The initial relief force only numbered some 2,000 marines and seamen; they could not force their way past Chinese defenses near the coast, and on 26 June 1900 they returned to their ships. Nonetheless, Chinese defenses were badly outdated, reflecting a level of military technology reaching back several centuries to the introduction of cannon and muskets into China. A combined international relief force in which the Japanese contingent was the largest took

Tianjin on 14 July 1900 and reached Beijing, the Qing capital, on 4 August. While French troops guarded the line of communications to the Gulf of Chihli, the international expedition gained control over Beijing 10 days later. The Chinese resisted a Japanese attack at one gate; but meanwhile a combined American-Russian force broke through at another portal, and a British force made it through a third gate; they drove through Chinese defenders to reach the British legation where the Westerners and their Chinese Christian converts were holding out. Eventually, the relief expedition gained control of the capital; the empress dowager, the emperor, and much of the court escaped to Xian; and the foreign troops generally sacked the Forbidden City, the Qing court section of Beijing. Interestingly, the relief force had no overall commander, and the commanders of each national contingent acted somewhat independently of the other forces, probably limiting the effectiveness of the overall relief expedition.

The Qing court appointed a well-regarded Chinese government official, Li Hongzhang, to negotiate a settlement, which included a large indemnity, increased foreign control over China, and punishment for many Chinese officials who had encouraged the Boxers to rebel. Indeed, the United States feared that as a major consequence of the failure of the Boxer Rebellion, the foreign powers involved would carve China into territories. To forestall this mutilation of China, the U.S. secretary of state issued his famous "Open Door" notes.

Boyne (1 July 1690)

Battle that ensured Protestant ascendancy in Ireland for more than two centuries. James II, having been replaced on the British throne by his daughter, Mary, and son-in-law, William of Orange, as part of the Revolution of 1688, had fled to exile in France, but with the support of Louis XIV returned to Ireland in March 1689. Although largely to restore James II to the throne, the campaign was also key in the plans of Louis XIV to divert William and the League of Augsburg from fighting in continental Europe. Under the earl of Tyrconnell, James had a Catholic army, which he de-

ployed first in Ulster against the city of Derry, which William relieved by sea on 1 August 1689. Unable to hold Ulster, the Jacobite forces retreated to winter quarters centered at Dublin, while the Williamite troops, augmented by contingents from Denmark, the Netherlands, and the German states, weathered the winter in Ulster.

James needed to defend Dublin, and chose the River Boyne as the only practical line of defense for the spring campaign. Taking a position at Oldbridge, Meath, with an army of 25,000, James was daring William into battle, a challenge that he accepted, arriving with 35,000 men on 30 June 1690 on the banks of the Boyne. With the advice of his general, Schomberg, William chose a frontal attack across the river at Oldbridge, supported by a flanking movement by one-third of the army upstream. After a daylong cannonade, the battle began at dawn on 1 July.

The flanking movement, arriving at 6 A.M., fought their way across the river, drawing men from Oldbridge as the Jacobites fought not to be turned and to secure a safe line of retreat. Meanwhile, William waited until 10 A.M. to begin the main attack at Oldbridge, waiting for the tidal river to ebb. The infantry fighting was harsh and both sides took heavy casualties, William himself losing the heel of his boot to a bullet. Tyrconnell and the French duke of Berwick attacked with cavalry, but were unable to break the Williamite lines. Eventually, with the Jacobite cavalry covering them with fierce fighting, the infantry began to retreat to Duleek, where the Williamite army ceased their pursuit. Rather than a great military battle, the Boyne was a political turning point, as James II once again chose to flee to France via Kinsale, leaving his Irish supporters badly disillusioned with Jacobitism and with the harsh Protestant ascendancy that followed.

Braddock's Defeat (9 July 1755)

A major British defeat in North America. In the 1750s France began to build forts in the Ohio Territory and fortified the forks of the Ohio with Fort Duquesne (Pittsburgh). Pleas for help from Virginia brought British major general Edward Braddock with the 44th and 48th Regiments. Benjamin Franklin intervened to help supply wagons and George Washington served as a civilian volunteer.

The army marched from Fort Cumberland, Maryland, and by 9 July was closing in on Fort Duquesne. The French garrison was desperate: too small to withstand a siege, they needed the help of the Ottawa, Chippewa, Huron, and other aboriginal bands who gathered there for supplies. At the last minute the Indians agreed, and a group of about 800 led by Captain Daniel Beaujeu moved out to ambush Braddock at the crossing of the Monongahela River. Arriving too late, the French and British collided.

The British advance guard formed a line and fired several volleys, killing Beaujeu. The French wavered, yet the Canadian militia and Indians began to hit the British flanks. The advance guard fell back as support came forward, intermingling units and breaking their formations. Unable to coordinate attacks, the English were caught in a crossfire from three sides.

The French and Indians worked their way around the British flanks, surrounding the whole army and spreading panic. Braddock organized several ineffective counterattacks, yet was soon wounded. After two hours the English collapsed in confusion.

A force of 1,800 had lost 900 men, an almost unprecedented casualty ratio. Braddock died a few days later. The French and Indians lost about 100. The battle gave experience to men such as Daniel Morgan, Horatio Gates, and George Washington.

Although a stunning defeat, the battle at the Monongahela was merely the opening of the Seven Years' War (French and Indian War in North America). The conclusion of the war would see France cede over to Britain almost all of its North American empire.

Bradley, Omar Nelson (1893–1981)

U.S. Army World War II commander. General Omar Bradley was born 12 February 1893 in Clark, Missouri. After graduating from West Point in 1915, Bradley served in various teaching assignments during the interwar period. In 1938 he was assigned to the general staff in Washington, where he quickly caught the eye of General George Marshall. In 1941,

Bradley became commandant of the Infantry School, and his reputation as an excellent training officer led to his command of the 82d and 28th Divisions.

During World War II, Bradley served with II Corps, first as assistant commander, then commander, during the North African and Sicilian campaigns. During the D day invasion, Bradley led the American forces on shore as First Army commander. Bradley commanded the Twelfth Army Group, as the American troops moved across France and the Rhine, eventually linking up with the Russians in Germany. During the drive across Europe, Bradley clashed with Field Marshal Bernard Montgomery about whether to concentrate on a single quick thrust or a broad advance into the German heartland.

During his campaigns in Europe, he earned the nickname "the G.I.'s general." Following the end of World War II, Bradley became administrator of the Veterans Administration. In 1948, he was named army chief of staff and became the first chairman of the Joint Chiefs of Staff in 1949. During his tenure in this position, he faced many challenges and played a key role in establishing America's early Cold War policy. Although not as colorful as his counterparts, Bradley was at the center of many pivotal decisions and was known as a stabilizer, or, as others believed, too cautious.

Bragg, Braxton (1817–1876)

Confederate field commander, excellent tactician and strategist, but a failure because of his indecision, harshness, and poor leadership. Bragg was born in Warren County, North Carolina, on 22 March 1817. Assigned to artillery after his graduation from West Point in 1837, he saw action against Indians until the Mexican War, when he distinguished himself at Monterrey and Buena Vista under Zachary Taylor. He retired as brevet lieutenant colonel to his Louisiana plantation in 1856.

As Confederate brevet major general of Louisiana militia in 1861, Bragg defended the Gulf coast between Pensacola and Mobile until promoted to regular major general in Albert S. Johnston's Army of the Mississippi in March 1862. He commanded the Confederate right flank at Shiloh, first under Albert Sidney Johnston, then under P. T. Beauregard. His performance there earned him promotion to full general on 12 April 1862. He replaced Beauregard as commander of the Army of the Mississippi on 17 June.

Coordinating with Edmund Kirby Smith, Bragg invaded Kentucky in September 1862, losing to Don Carlos Buell at Perryville on 8 October and to William S. Rosecrans at Murfreesboro. As victor over Rosecrans at Chickamauga, he failed to exploit his advantage and allowed the enemy to retreat to Chattanooga. Ulysses S. Grant and George H. Thomas routed him at Missionary Ridge, Tennessee, on 25 November. He was relieved of command on 2 December.

Bragg did not see field service again for more than a year, when, on 14 January 1865, near Wilmington, North Carolina, he lost yet another battle, this time Fort Fisher, to Admiral David Dixon Porter and Brigadier General Alfred H. Terry. He died in Galveston, Texas, on 27 September 1876.

Brandywine (11 September 1777)

Part of General William Howe's Philadelphia campaign during the American Revolution. The Battle of the Brandywine, 11 September 1777, illustrated the weaknesses of the American army, while nevertheless proving the wisdom of General George Washington's eventual plan to outlast the British and secure a "protracted victory." Howe planned to strike against the seat of the American rebellion, Philadelphia, and sent 15,000 troops to the head of the Chesapeake Bay. Once landed, they were to progress toward the rebel capital and rally loyalists to their side. For his part, Washington struggled to keep his improvised army of regulars and militia units intact following reassignment of thousands of troops to General Horatio Gates's Saratoga campaign. Regardless, he intended to thwart Howe's progress at Brandywine Creek, 26 miles west of the city, and stationed his 12,000 remaining troops accordingly. Howe sent his German units under General William von Knyphausen against the American center at Chadd's Ford, while the greater bulk of his forces under General Charles Cornwallis circled the American left flank in an envelopment maneuver. Washington struck against the Germans while holding the left at bay under Major General John Sullivan, but Howe's rapid advance across the Brandywine against Sullivan's command forced Washington to retreat. Skillful tactics employed by General Nathanael Greene during the American withdrawal enabled Washington to preserve his army intact. In all, the British lost 576 casualties and the Americans 1,000. Howe proceeded to occupy Philadelphia, but without inflicting a major injury to the American army.

Brant, Joseph (1742–1807)

Mohawk aboriginal leader. Known by the Indian name of Thayendanegea, Joseph Brant was born in 1742, the son of a

Mohawk chief. His sister Molly married British superintendent of Indian Affairs Sir William Johnson, who had a significant influence on Brant's life. He was enrolled in Moor's Indian Charity School (later Dartmouth College) in 1761 but left in 1763 to fight for the British during Pontiac's Rebellion. He later converted to Christianity and developed excellent translation skills, which earned him the position of secretary to the superintendent. By age 32 Brant had become a prominent and respected leader of the Mohawk Nation.

Brant's strong loyalty to Great Britain was rewarded with a commission as a captain in 1775. During the American Revolution he led devastating raids against the rebels in New York and Pennsylvania. He fought at Fort Schuyler and at the Battle of Oriskany in 1777. But Brant's loyalty was tested when the Iroquois nations split their allegiance during that conflict.

The American victory shattered Brant's world, and the Mohawks were forced to relocate to Canada. In 1785 Brant traveled to England to seek land grants near the Grand River in Upper Canada. For his loyal service, Brant was provided with an estate near Burlington Bay on Lake Ontario. For the remainder of his life, Brant worked for peace to protect the Grand River settlement. He died on 24 November 1807 in Brantford, Ontario.

Brant's unique loyalty to Great Britain, combined with political and military leadership, reflects a remarkable man who sought to reconcile two different cultures.

Brazilian Revolt (1893–1895)

Naval military revolt against the nascent Brazilian republic. In 1889 the Brazilian empire came to an end and was replaced by a republic. However, some elements of Brazilian society, especially the navy, longed for the return of the monarchy. The newly created republic soon experienced economic problems, which led to political unrest. In 1893, the navy, under the leadership of Admiral Custodio de Melo, revolted and demanded that a plebiscite be held to choose between a republic and a monarchy. The revolt gained strength when the respected commandant of the Naval Academy, Admiral Luis Felipe Saldanha da Gama, lent his support to the rebel cause. Another key demand of the naval rebels was the removal of President Floriano Peixoto, who

was also a marshal in the Brazilian army. In addition to the naval revolt, Floriano faced rebellion in the south from the Federalists led by Silveira Martins. Martins's Federalist army invaded the states of Santa Catarina and Parana and threatened São Paulo. At the same time the rebel navy prepared to bombard Rio de Janeiro.

The bombardment of Rio was avoided when commanders of warships from the United States, Great Britain, France, Italy, and Portugal intervened and declared their intention to protect their merchant ships as well as foreign-owned property in the capital. The Brazilian government appealed to U.S. president Grover Cleveland to provide additional protection. Cleveland dispatched more American cruisers, which positioned themselves between the rebel fleet and the harbor. The rebel admirals were unwilling to risk damage to the U.S. vessels and refrained from opening fire. Floriano then organized a loyalist fleet in Pernambuco and threatened to attack the blockade. In May 1894, the rebellious naval officers, realizing that their position was untenable, left their vessels and sought asylum on Portuguese warships. With the naval rebellion in hand, the Floriano government devoted full attention to subduing the Federalist rebels in the south. The last of the rebels surrendered in August 1895; the new Brazilian republic had weathered a significant challenge to its existence. For his steadfast determination to preserve the republic Floriano earned the sobriquet "the consolidator of the Republic."

Breda, Siege of (August 1624–June 1625)

One of Spain's last victories as a major military power. This siege was an episode in the struggle for Spanish political domination, but on another level a magnificent military contest between two of the seventeenth century's most outstanding generals. Genoese-born Ambrogio de Spinola (1569–1630), perhaps the most brilliant and humane general in Spanish history, laid siege with 60,000 men to the strategic United Provinces (Netherlands) city of Breda, which guarded the roads to Amsterdam and Utrecht. Spinola's adversary, Prince Maurice, Count of Nassau (1567–1625), was an equally remarkable general remembered for

the modernization and professionalization of his army. Nassau garrisoned Breda with 9,000 infantry, an excellent artillery defense, and ample provisions, but avoided direct confrontation and camped outside Breda. Spinola meanwhile constructed military masterpieces, batteries on raised platforms for sufficient range. Numerous sorties led to the defeat of relief operations headed by Peter Ernst von Mansfeld. To make matters worse, Nassau died on 23 April and was succeeded by his younger brother, Frederick Henry of Nassau (1584–1647). Upon the fifth try to relieve Breda a combined Netherlands and German supply convoy supported by an army of 12,000 men attacked the weakest of Spinola's points only to be defeated with appalling losses. On 1 June, Spinola established breaching batteries to the counter scarp of the moat surrounding Breda. Inadvertently becoming cognizant of the extreme privations of Breda's citizens and to avoid further bloodshed, Spinola offered unusually humane and very honorable terms and Breda capitulated on 5 June. The withdrawing army was allowed to keep their weapons and supplies, and Breda's survivors were not harmed. Four thousand men and 8,000 women and children died of hunger and privation during the 11-month siege.

Breitenfeld (17 September 1631)

Battle that marked the rising star of Gustavus Adolphus, King of Sweden, and reinvigorated the Protestant cause in the Thirty Years' War. Gustavus Adolphus began his campaign of intervention in Germany on the side of the Protestants in 1630 following a string of military disasters from Bohemia in 1620 to Denmark and the north German plains in 1626.

Gustavus landed on the Baltic coast in the fall of 1630 but made no overtly aggressive moves against the troops of the Catholic League, commanded by Jan Tzerklas, Count Tilly. The Swedish army instead concentrated to establish a secure base on the Baltic coast and down the Oder River valley.

Following the siege and sack of Magdeburg on 20 May 1631, Gustavus advanced toward the Elbe River and met the army of Tilly at Breitenfeld on 17 September. Tilly's army of nearly 40,000 men arranged themselves in the Spanish style of large squares known as *tercios*, consisting of a mix of pikemen and musketeers. The imperial cavalry formed up

on either flank. Tilly emplaced his two dozen artillery pieces directly in front of the center of his array.

Gustavus had fewer than 30,000 men in his army, plus a contingent of 15,000 Saxons. Arrayed in two lines, a mixed linear formation of cavalry/infantry held the right wing, infantry/cannon occupied the middle, and another cavalry/infantry formation anchored the Swedish left. Gustavus placed the Saxons on the extreme left.

Both sides opened the battle with artillery fire. Tilly's cavalry on the left prematurely charged and threw off his coordinated plan. Tilly, chagrined at his cavalry's impetuosity, advanced his four *tercios* and remaining cavalry against the Saxons. The Saxon corps melted away under the attack, but the imperial force now had a yawning gap between the infantry and left-wing cavalry. The Swedes finally repulsed the imperial cavalry and wheeled forward to envelop Tilly's exposed right flank. The king's cavalry overran Tilly's initial position, captured all his guns, and forced his *tercios* off the field with about 7,000 dead. Swedish losses amounted to fewer than 2,000 men.

The victory invigorated the Protestant cause and allowed Gustavus to penetrate deep into German Catholic domains of Swabia and Bavaria. This reversal of fortunes ensured the continuation of the Thirty Years' War.

Brian Boru, King of Ireland (940–1014)

Successfully resisted the Vikings and united Ireland. Youngest son of Kennedy, Dalcassian king of Thomond, Brian was educated by monks at Inisfallen, after his father was killed in 951 fighting off an attack by Danish raiders based at Waterford. Brian's childhood was dominated by the struggle between the feuding Irish dynasties, headed by the O'Neill, with and against the Danish settlers at Limerick, Waterford, and Dublin. After his elder brother Marthghamhain became king of Thomond, Brian led a campaign of harassment against the Danes, operating for 18 months in 962 in the wilds of Clare, before joining the regular forces, which besieged and sacked Limerick in 968 and secured the throne of Munster for Marthghamhain. This success unfortunately stirred Irish resentment, and in 976 Marthghamhain was

lured into a parlay by the king of Ui Fhithghinte and assassinated. Taking up the crown, Brian attacked not only the perpetrator, but also their Danish ally, Ivar of Limerick, at Inis Cathaigh, and the king of Desmond at Bealach Leachta. This, again, drew the attention of rival Irish kings, especially of Leinster, which Brian attacked, in the process sacking the Danish stronghold at Waterford, after disagreement over the cattle tribute.

This consolidation of power brought Brian into conflict with the O'Neill high king, Maoil-Seachlainn, who wasted some of Munster en route to attack Leinster himself, including uprooting the Dalcassians' (literally) family tree. While Brian assembled a fleet of longboats to harass Danish settlement on the Shannon, he and the high king engaged in a long-term war of maneuver for supremacy, Brian losing twice in battle, at Meath and Aonach Teide, between 992 and 994. Only the revolt of Sitric, the Danish ruler of Dublin, brought the two men together briefly in 999, when they jointly defeated Sitric at Gleann Mama, and looted Dublin. Having added Danish cavalry to his army, Brian finally challenged the high king at Tara in 1002, demanding and getting Maoil-Seachlainn's abdication. During the following decade of peace, Brian endowed monasteries, established schools, and married his children into Danish and Irish families, in an attempt to keep his position through diplomacy and to benefit from Scandinavian trade.

In 1012, probably provoked by his fourth wife, Gormlaith of Leinster, Brian deliberately humiliated Leinster with a new cattle tax, pushing the king into alliance with the Danes of Limerick and Dublin, who also invited Orkney Vikings and pirates to fight with them. With support from his son-in-law, Malcolm II of Scotland, Brian and his army, led by his eldest son, defeated the Danes and their allies at Clontarf in 1014. Brian himself was discovered in his tent by a fleeing party of Danes, and killed in the aftermath of the victory, robbing Ireland of its unifying leader and plunging it back into civil war.

British Dynastic Wars (1000–1066)

By the year 1000, the power of the English king Æthelred (“the Unready”) had been severely eroded by Viking invasions, despite a purge of nobles in 1002 to eradicate a sus-

pected fifth column of Viking supporters. In 1016, Cnut, the king of Denmark, defeated Æthelred's son Edmund Ironside at Ashingdon and became king of England, marrying Edmund's widow, Emma of Normandy, and murdering most of the royal family, sparing only the two young sons of Ironside. When Cnut died in 1035, his eldest son, Harthacanute, chose to stay in Scandinavia, leaving the younger, Harold “Harefoot,” as king of England. To cement his power, Harold invited Emma and Edmund Ironside's two sons, Edward and Alfred, back from exile in Normandy, but upon arrival, Alfred was tricked and assassinated by Earl Godwin of Wessex. Harold “Harefoot” died in 1040 and was succeeded by Harthacanute, who died the following year.

In this dynastic crisis, Earl Godwin and the *witan*, or council of nobles, turned to Edward, the surviving son of Ironside, and crowned him king in 1042. While marrying Godwin's daughter Edith, Edward also extended friendship to Normans, to whom he gave lands in an attempt to build a secure base of support against Godwin. In 1051, Edward attempted to oust Godwin from power, briefly succeeding in forcing him and his sons into exile. Godwin, with help from the Flemish, ravaged the Isle of Wight and intimidated Edward into returning him to favor, which included earldoms for all of his sons. Godwin's son Harold waged a successful war against Gruffydd of Wales, ending decades of border warfare. In 1064, Harold traveled to Normandy, where he met Duke William, perhaps to negotiate William's acceptance of Harold's succession to the English throne or to swear a pact of friendship, although later Norman chronicles suggest that Harold was there to offer the throne to William or to swear fealty.

When Edward the Confessor died in 1066, Harold Godwinson, with the accession of the *witan*, assumed the throne. William of Normandy assembled an invasion force to contest Harold's claims, but was delayed waiting for a south wind to sail across the channel, and was instead stuck in the mouth of the Somme River. Harold had no sooner dismissed his defense force in southern England than he received word that Harold Hardrata of Norway, accompanied by Harold Godwinson's own brother Tostig, whom he had outlawed in 1065 for mismanagement of his earldom, had landed in Northumbria and had taken the city of York. Harold marched north at a brutal pace, arriving five days later and defeating Harold Hardrata at Stamford Bridge. Meanwhile, William of Normandy finally sailed, arriving in England in late September.

Harold, accompanied by his surviving brothers, marched south, again on forced march, and on 14 October 1066, met William of Normandy at Hastings, where they were defeated. William, now the “Conqueror,” seized the throne of England and began a program of fortification, including the construction of the Tower of London, land confiscation, and set-

tlement by his Norman followers. The dynastic wars had weakened Saxon England, rendering William's conquest that much easier.

British Military, Twentieth-Century Organization and Structure

In the twentieth century, Britain's wars have been prosecuted on land by an army, the Royal Marines of the Royal Navy, and the Royal Air Force Regiment of the Royal Air Force.

At the beginning of the twentieth century the British army was administered by cabinet through a ministry, the War Office. This ministry was engaged in a committee system to ensure close coordination in planning and procurement, but was replaced in 1964 by a single Defense Ministry. As well, in 1914–1918 and 1939–1964, procurement for the army was handled by the Ministry of Supply.

Under the Directing Ministry, the army has been administered by an Army Council that advises the minister, consisting of members for Personnel, Training, and so on (precise membership having varied over the century), presided over by a chief of staff, title again varying. The chief sits on a Chief of Staff's Committee or, since 1964, a Defense Council including civil servants and ministers, presided over by a chief of the defense staff, while the members of the Army Council sit on their own committees with their equivalents in other services, and also in other ministries. For instance, through the interwar period the triservice committee on procurement was presided over by the president of the Board of Trade (a cabinet office). Various directors (for example, the director of Tank Development) report to the members, and often sit on interservice committees in their own right.

From 1870 to 1939, the British army was a small, professional "medium service" organization in which soldiers enlisted in the regular force for six to nine years, followed by three to six years in the reserves. Conscription was in force for most of the period of the world wars, and was continued into peacetime until 1956 as the National Service. Although expected to alleviate the army's traditional difficulty in recruiting infantry, it instead entailed a massive training bur-

den that was never satisfactorily addressed. In the periods of voluntary service, both parliamentary guidance and those same recruiting difficulties dictated that officers and men separate with a useful skill or trade, a requirement that dictated a training-centered personnel policy. For technicians and their officers in the first half of the century, this did not present a problem. They entered the army through various training schools, typically at the age of 16, some of which also served as central depots and even factories, such as Woolwich Arsenal. Infantry (and through the mid-1930s, the cavalry) presented more serious difficulties. These soldiers entered individual infantry regiments from the Royal Military Academy Sandhurst (for officers) or through regional depots and recruitment areas. Battalions of each regiment rotated in turn through an overseas tour, usually India or Germany, depending upon the period. However, the home-based force was designated for "expeditionary" duties closer to home, most notably the world wars and their troubled aftermath, the Falklands Conflict, Ireland in 1920–1922 and after 1967, and Palestine in 1936–1939. As in many armies, British infantry enlist in a specific regiment and are not normally liable for transfer to other regiments, a practice that promotes unit cohesion but which complicated manpower policy in overseas tours by comparison to the technical corps, which are formally single regiments and can practice individual rotation. In addition to the regular army, British land forces include various reserves, the volunteer "part-time soldiers of the Territorial Army, and colonial formations raised by local governments to support British garrisons. The British army also employs Nepalese mercenaries, the famous Gurkhas, in several regular battalions.

The field army has been organized into divisions of two to four brigades of two to four battalions each, supported by individual brigades (although for some of the Cold War period the division level was formally abolished in favor of the brigade group). The regiment is not used as a tactical formation, but for traditional reasons battalion-level artillery formations are known as regiments. The five "divisions" into which the United Kingdom is currently divided for recruitment purposes should not be confused with tactical divisions.

The principal corps of the British army include the Royal Artillery, Royal Engineers, Royal Ordnance and Artificers Corps, Royal Corps of Signals, Royal Armored Corps (incorporating the historic cavalry regiments and the battalions of the Royal Tank Regiment since 1938), Royal Electrical and Mechanical Engineers, and the Army Air Corps. Tables of organization often unhelpfully refer to these by their acronyms.

The Royal Marines were traditionally small contingents carried aboard navy ships for various duties, including as

landed infantry in formations of up to divisional strength. However, after 1940 the marines were organized into special-purpose reinforced battalion-size amphibious units, the Royal Marine Commandos. The RAF Regiment, although active from 1918, was only formally organized in 1942 to supply anti-aircraft, ground liaison support, and airbase security duties. Post-1945, the regiment has also operated anti-aircraft missiles in the field.

Britain raised many Special Forces formations during World War II. These survive today as the Commandoes, the battalions of the Parachute Regiment, the Special Air Service, and the Special Boat Service of the Royal Marines.

There are many elements of continuity in the contemporary British army. The British public remains adamantly opposed to peacetime conscription (as do those in the remainder of the Commonwealth and the United States) and it remains extremely difficult to recruit soldiers, particularly when the economy is good. As the only Allied power in both world wars to “see it through” from the beginning to the end, Great Britain paid a terrible price in blood and treasure. Raising a mass conscript army, as well as a first-class air force, and maintaining a great navy proved too much of a strain on its resources, and Great Britain had slipped from the rank of a world power by 1941.

Today, the British army is a highly regarded, mobile, well-equipped professional force, inspired but not bound by its traditions, and which has demonstrated its quality in various unconventional conflicts around the globe, including its policing of Northern Ireland, as well as in the Korean War, the Falklands conflict, and the Gulf War.

British-Indian Army

Red-jacketed, well trained, and campaigning on the north-west frontier, the British army in India remains the stereotypical image of nineteenth-century colonial armies.

The East India Company's first garrison of 35 English and 40 Indian soldiers at Madras in 1642 established the British army in India. Living in unhealthy conditions and limited in numbers (even in 1721 the total European mili-

tary contingent at company towns in India was only 245 men), these troops were of varying effectiveness. They remained active in a series of small campaigns against the Dutch, Portuguese, and local Indian warlords in a shifting pattern of commercially important alliances, sometimes locally reinforced by Royal Navy ships or shore parties when necessary.

Around 1749 the French instigated a campaign along the Coromandel coast, when powerful Indian warlords bolstered by French troops began a series of actions against the outnumbered British. The French were checked by clever diplomacy and British success in battle, but the face of military organization in India changed considerably. Although at this time the Europeans usually only numbered four or five hundred among the sometimes tens of thousands of troops of the Indian warlords, their discipline and well-drilled musketry became the deciding factor in battle, a situation that continued into the twentieth century. In 1756 native troops trained by, and attached to, the British army (named sepoy) were issued red uniforms, which created a very effective esprit de corps, and European-standard training and weapons were introduced readily to these units. The British forces were clearly separated into three East India Company entities by this time: the Bombay, Madras, and Bengal Armies, each with its own command and responsibilities. Some British army units were also present in the country, but the proportion of Indian to European soldiers remained high; at the time of the Indian Mutiny in 1857 the Bengal Army consisted of approximately 225,000 Indians and 40,000 Europeans.

In 1756 the Bengal Army commenced the subjugation of the Ganges River valley, seeking permanent influence for British trade. By then the Mogul emperors had patterned their armies more closely on European models, including the deployment of field artillery, and the Bengal Army fought a series of very difficult battles against Mogul forces as large as 40,000 men. In 1764, after its success in the Battle of Buxar, the British-Indian Army became the undisputed power in India.

Then followed a series of regional conflicts at the outer edges of the Indian territories. The Marathas seized power in the northwest of India in 1775. This move led to the Maratha Wars, 1776–1805, and permanent British reestablishment throughout Hindustan. An incursion into northern India in 1814 by the Nepalese was defeated by the Bengal Army and in 1816, Nepal was added to areas of British influence. Imagined Russian influence in Afghanistan in 1838 led to a preemptive campaign and elements of the Bengal and Bombay Armies and large forces of allied Sikhs, after hard fighting, captured Kabul. Later the Russians did advance into Afghanistan, and campaigning continued until a British-Russian treaty in 1895 stabilized the Afghan fron-

tiers. British troops were permanently withdrawn inside the Khyber Pass in 1899. In 1845, the Sikhs, who had remained independent, sensed British designs on the Punjab, and attacked Hindustan with a well-trained and organized army of 30,000, but by 1849 after two campaigns, their power was broken and the British annexed the Punjab. The British-Indian Army fought a series of campaigns in Burma lasting from 1823 until the entire country was occupied in 1886.

The Indian Mutiny of 1857–1858, when many Indian units (mostly of the Bengal Army) rebelled against the British presence in India, saw widespread campaigning with many desperate battles and eventual cruel retribution by the British army. As a result of the mutiny, the East India Company armies were entirely absorbed into the British army in India, and Indians were denied access to artillery and leadership training for many decades.

After 1900 the country remained generally peaceful and the army was gradually reorganized to reflect modern European structures. By 1921 the “Indianization” of politics saw the army declared a defense force rather than a tool of British imperial policy. The Indian army saw prominent service during World War II in North Africa, Italy, Malaya, and Burma. That all was not well with the Anglo-Indian army could be seen in the mutinies in the twentieth century, and in the modest success of the Japanese in recruiting Indian prisoners of war for service in the pro-Japanese Indian National Army after the fall of Singapore and Burma.

From 1922 onward Indian nationals began staff training in Britain and the Officer Corps became increasingly Indian before independence and partition, and separation into the Pakistani and Indian Armies in 1947, with both often-contending forces retaining many elements of their British heritage, including, in the case of India, the strict separation of the military from the civil authority.

Brunanburgh (September or October 937)

Vikings suffer grave defeat at hands of Anglo-Saxons. The site of Brunanburgh has not been satisfactorily identified.

The *Anglo-Saxon Chronicle* says the battle took place “ymbe Brunanburgh [around Brown’s fort],” and near the “Dinges mere [Sea of Storm].” Modern scholars suggest Bromborough in Cheshire, but popular tradition identifies Brunanburgh with Brinkburn in Northumberland.

Anlaf Guthfrithsson, King of Dublin, was seeking to exact revenge upon Æthelstan (r. 924/5–939), grandson of Alfred the Great, for ignominiously expelling his father from Northumbria 10 years earlier. He formed a coalition of the Danes of Ireland, Welsh, Strathclyde Birtons, and the Scots. Relying on Northumbrian hostility to Æthelstan’s rule, especially among the Anglo-Danish aristocracy, the aim of the alliance was to crush Æthelstan with the manpower of the Celtic peoples and of the British Viking settlements.

No primary source tells us how the members of the alliance combined their armies. The only apparently reliable fact, that they landed a fleet in the Humber, has been disputed. The coalition certainly established itself in Northumbria, and raided south of the Humber so as to disaffect Danish settlers in Mercia.

Eventually, the alliance was met by Æthelstan at the head of an army drawn from both Wessex and Mercia. Celts and Danes threw themselves against West Saxon and Mercian levies in a daylong battle, with savage hand-to-hand fighting in regular battle order (the famous “shield walls”). Victory was not to be theirs. According to the *Anglo-Saxon Chronicle*, the allies lost five kings and seven earls, and a son of the king of the Scots. The northern kings retired to their own lands with difficulty. Anlaf brought the mere wreckage of an army back to Dublin.

Brunswick, Frederick William, Duke of (1771–1815)

German general, hero of Napoleonic Wars. Born on 9 October 1771, he was set to inherit the title of duke when his father, Karl Wilhelm Ferdinand, died in 1806, but was denied the title by the Treaty of Tilsit (9 July 1807), which abolished his duchy and added the territory to the Kingdom of Westphalia. In Austria and desiring revenge against Napoleon, he set about organizing a corps of Brunswick infantry and cavalry (25 February 1809), which came to be called “the Black Horde” or “the Black Brunswickers” after the color of their uniforms. The corps fought alongside Austria at Saxony, par-

ticipating in the battles of Zittau (31 May 1809) and Borbitz (12 June 1809). The Austrians surrendered on 12 July of that year, but Brunswick's corps fought on, battling to the north German coast. They briefly occupied Braunschweig (Brunswick) on 31 July and skillfully escaped Westphalian forces to Elsfleth where they disembarked for England. Brunswick lived in England until 1813, when he was finally awarded his due title of Duke of Brunswick. He lived in Brunswick as duke until returning to the battlefield in 1815 as commander of Brunswick troops in the British army against Napoleon. He died from wounds inflicted during the Battle of Quatre Bras on 16 June 1815, just two days prior to the Battle of Waterloo.

Brusilov, Aleksei Alekseevich (1853–1926)

Probably the best Russian commander of World War I. Born in Tiflis, Georgia, of noble origins, Brusilov graduated from Corps de Pages Imperial Guard Academy (1872). He rose to command 15th Dragoon Tver Regiment in Russo-Turkish War (1877–1878), graduated from the St. Petersburg Cavalry School (1883), and taught there, becoming head of the school in 1902.

An intensely patriotic Russian nationalist, Brusilov became increasingly disillusioned with the czarist system, from the humiliation of the lost Russo-Japanese War (1904–1905) to the World War I debacles, publicly siding with the people in February 1917. He nonetheless served his country loyally, commanding Second Guard Cavalry Division (1906–1909); XIV and XVII Army Corps; and was Warsaw District Deputy Commander (1909–1914).

Brusilov proved to be the best Russian World War I commander, leading the Eighth Army in Galicia (1914), capturing Przemysl's fortress (March–April 1915), and threatening to break through the Carpathian Mountains to Hungary. His finest achievement came as commander in chief of the Southwestern Front from March 1916, when he masterminded the best Russian offensive of the war. Launched in June 1916 along a 300-mile front, the "Brusilov Offensive" pushed the Austro-Hungarians back 60–70 miles, capturing 375,000 men. This had immense consequences—the Western Allies' situation at Verdun and the Somme was eased, with Germany withdrawing troops to stop Brusilov. The sit-

uation on the Italian front also stabilized, Rumania joined the Allies, and two European imperial dynasties collapsed. Austria-Hungary never recovered, but the czarist army's disintegration began with the 1,000,000 casualties it suffered. An outstanding military operation, the Brusilov Offensive would have been more successful had Brusilov received necessary supplies and support from flanking Russian generals.

Brusilov next served as the provisional government's military advisor (February–May 1917); Russian army supreme commander (May–July 1918), and directed the June Offensive, which stalled due to supply shortages, prompting the czarist army's disintegration.

Removed in July 1918, Brusilov sat out the Russian Civil War, wanting no involvement. He did act as Red Army chief adviser against Poland (1920), which he saw as a national conflict. He then served as cavalry general inspector until 1924, when he was relieved by S. Budienny, and retired. Relatively unmolested by the Soviet government, Brusilov wrote his memoirs and died in Moscow.

Brusilov Offensive (June 1916)

An assault on the Austrian Galician front by the Russian commander, Aleksei Brusilov, in response to the Western Allies' pleas for relief. Perhaps the most successful of the Russian generals, Brusilov stressed training and tactical flexibility as a prerequisite to breaking the stalemate of trench warfare. He directed elements of five Russian armies, totaling 600,000 men, to assault the Austrian lines along a 250-mile front.

The combined Austro-German armies numbered roughly 620,000 men, most of them Austro-Hungarian units. The Austro-Germans held well-fortified positions, trenches, bunkers, and wire entanglements. The Austrians remained ignorant of the impending attack largely due to Brusilov's skill in deploying his armies and reserves and their own lax intelligence. Brusilov used aerial photography and sapper tunnels to improve his tactical position.

On 4 June 1916 the offensive began with a series of well-concentrated artillery bombardments to soften the enemy entrenchments. The weight of the attack fell upon the Austrians at Lusk where Brusilov held a considerable numerical advantage. At the Battle of Lusk the Austrians suffered a severe defeat their Fourth Army collapsed, allowing the Russians to achieve a breakthrough. Taking advantage of the gap, the Russians sent in reserves, outflanking the Austrians. The disintegrating Fourth Army fell back, followed by the First Army in the north. Russian attacks in the south against the Austrians at Czernovitz dislodged the Austrian Seventh Army from their fortifications. In the center, after a fierce counterattack, the German Sud Armee retired with the Austrians.

Within 10 days the Galician front had crumbled, the Russians eventually forcing the Austrians back to the Carpathian Mountains. The Russian offensive stalled due to the failure of the supporting Russian commands to coordinate

attacks with Brusilov. The summer victories encouraged Rumania to join the Allies on 27 August 1916.

But the casualties the Russians had suffered offset any gains. They were unable to mount any more strategic offensives for the remainder of the war and they failed to hold on to their gains, both factors playing into the eventual dissolution of the Russian army itself.

Budennyi, Semen Mikhailovich (1883–1973)

Russian Civil War and World War II Soviet commander. Of peasant origins, from the Don region, he joined the Russian army (1903), serving as a dragoon in the Russo-Japanese War. Graduating from the St. Petersburg Cavalry School (1908), Budennyi fought through World War I as platoon sergeant with the Caucasus Cavalry Division.

With the Bolshevik disbandment of the czarist army after the October Revolution he returned home, forming a Red partisan detachment, the first step toward becoming commander of the Red Army's First Cavalry Army, with whom he forged his reputation. He won victories over previously undefeated White Cavalry, halting Denikin's advance (1919) and playing a leading role in Denikin's and Wrangel's defeats (1920). However, in August 1920 he disobeyed orders to support Mikhail Tukhachevskii's western front, allowing the Polish counteroffensive that prevented a Soviet victory in the Polish-Soviet war.

A major figure in the Red Army "Tsaritsyn" clique, the military base with which Stalin backed his rise in the 1920s, and the purge of the Red Army hierarchy around Tukhachevskii in 1937, Budennyi was a judge in the trials. His lack of Marxist zeal concerned Stalin, but unswerving loyalty and a certain mental dullness allowed Budennyi to become a marshal of the Soviet Union (1935) and escape the purges.

Post-Civil War, Budennyi was initially associated with the Frunze group striving to create new revolutionary military doctrine, but became distanced by his continued belief in the supremacy of cavalry despite technological advances.

His appointment as Red Army cavalry inspector from 1924 to 1937 reflected this philosophy.

This misunderstanding of modern technological warfare was revealed in disasters in the Finno-Soviet War (1939–1940) and early in the Nazi invasion of the Soviet Union, when he was removed after poor command performances, forcing Stalin to create the post of Red Army cavalry commander for him (January 1943).

Government minister for horse breeding until 1953, Budennyi wrote memoirs and collected numerous decorations on the back of those meritoriously received during World War I and the Civil War. He died in Moscow in 1973.

Buena Vista (23 February 1847)

One of the most significant American victories of the Mexican War. Honoring the armistice he had signed, General Zachary Taylor and the U.S. Army of Observation had remained near Monterrey for weeks after the September 1846 battle. Meanwhile, General Antonio López de Santa Anna rebuilt the Army of the North. Taylor eventually moved southward, but 5,000 troops were detached to General Winfield Scott for his invasion from Veracruz to Mexico City.

The Battle of Buena Vista then took place as Santa Anna sought to hurry his poorly fed and undersupplied army to attack Taylor, now weakened by the detachment of many of his regular troops. Taylor learned of Santa Anna's advance and retreated three miles from Agua Nueva to the Hacienda Buena Vista, a better defensive position.

The Americans had taken a strong position in the rugged hills through which the river passed. Santa Anna demanded surrender (something that never crossed "Old Rough and Ready" Taylor's mind) and the fighting began at dawn on 23 February. The Mexicans had placed their artillery on a higher slope against the American left, and the Mexican right, although composed of many raw recruits, pressured the American left, which yielded. Mississippi and Indiana units in reserve pounded the charging Mexicans, drove off

the cavalry, resisted an infantry attack, and maintained the position. The artillery had saved the day, filling gaps in the line and subjecting the Mexicans to relentless pounding.

While the Americans expected the fighting to resume the next day, Santa Anna had retreated after suffering many casualties and desertions. He had thrown away his numerical superiority in a series of piecemeal and uncoordinated attacks.

Buffalo Soldiers

African-American soldiers of the U.S. late nineteenth-century regular army. On 28 July 1866, the United States Congress established two cavalry and two infantry regiments from African-American U.S. Civil War troops. The 9th and 10th U.S. Cavalry and the 24th and 25th U.S. Infantry became known as "Buffalo Soldiers" by their Cheyenne and Comanche adversaries, perhaps because of their usually thick, dark hair. Despite difficult assignments and both public and military discrimination, these units proved invaluable in engagements against Plains Indians, Mexican bandits, cattle rustlers, and other "undesirables" of the wild West between 1866 and 1944.

The 9th and 10th Cavalries were initially commanded by Colonels Edward Hatch and Benjamin Grierson, both white officers. The 9th was ordered to Texas in June 1867 to protect stagecoach routes, build forts, map the frontier, and install telegraph communications. After helping subdue Kiowa and Comanche in west Texas, the 9th and 10th moved to Arizona and New Mexico districts in the spring of 1876. There they fought against Arapaho and Apache raiders including Geronimo. The last action of the Buffalo Soldiers in the Indian Wars involved the Sioux Indians, Sitting Bull, and the Ghost Dance Campaign of 1891.

The 24th Infantry with James Morgan fought in the Battle of San Juan Hill during the 1898 Spanish-American War. The 9th and 10th Cavalries enforced neutrality laws on the Mexi-

can border and pursued the Mexican bandit Pancho Villa in the punitive expedition under John J. Pershing in 1916. Between World Wars I and II the 9th and 10th Cavalries became excellent horse and marksmanship service troops at the cavalry school in Fort Riley, Kansas. By World War II, cavalry had become obsolete and the units were disbanded in 1944. Buffalo Soldiers' officers were almost entirely white, and the troops were kept in the far West and away from population centers to avoid "disturbances." Although these were excellent troops by any standard, they did on occasion violently react to the unremitting racism they suffered. The worst case was in 1917 when troopers of the 24th shot up the city of Houston, Texas, killing 17 whites; 16 black soldiers were hanged before the end of the year in the largest single judicial execution in U.S. history.

The Buffalo Soldiers reflected America's racial mores of the time, and good soldiers that they were, such units have no place in the twentieth-century U.S. Army, which achieved racial integration a full decade ahead of U.S. civil society.

Bull Run, First/Manassas (21 July 1861)

Several months after the bombardment of Fort Sumter in the Charleston, South Carolina, harbor, President Abraham Lincoln felt compelled to order the undertrained and inexperienced army commanded by General Irwin McDowell to attack Confederate positions just south of the U.S. capital, near Manassas, Virginia.

McDowell had a simple but effective plan. He wanted General Robert Patterson in the Shenandoah Valley to occupy Joseph Johnston's Confederate forces. McDowell, in turn, would feint an attack directly at General P. G. T. Beauregard's units at Blackburn's Ford and then seek to march around to the west to turn the Confederate left flank.

Beauregard soon realized McDowell's turning movement—Union fixed bayonets glinted in the morning sun—

and he readjusted his position. Attacks by green troops were met by green troops, and the battle swayed back and forth around the Henry House. At one point, Confederate general Bernard Bee rallied his troops, pointing at a colonel whose men were fighting bravely: "Look! There is Jackson standing like a stonewall! Rally behind the Virginians!"—and a legend was born on the battlefield.

In the end, Johnston easily eluded Patterson (who, admittedly, showed little energy); his men boarded trains at Piedmont, debarked at Manassas, and marched to the battlefield. The appearance of rested Conference reinforcements turned the tide, and at about 4 P.M. the Union right flank began to crumble, Beauregard ordered an attack, and troops (and many spectators who wanted to watch the supposed "triumph") fled to Washington, D.C.

The key to the battle was the conclusions the two sides drew. Lincoln recognized it would be a long and costly contest; too many Confederates thought it wise to meet Union armies on every battlefield, hence engaging in a war of annihilation they ultimately could not win.

Bull Run, Second/Manassas Junction (28–30 August 1862)

A serious Union defeat in the American Civil War. Correctly judging that Union general George McClellan would do nothing after the so-called Seven Days' Battles, Confederate general Robert E. Lee sent half his army under Stonewall Jackson to destroy the Union army supply base at Manassas and thereby to entice Union general John Pope to attack. Lee feared that if he did not move quickly, eventually Pope and McClellan would unite, giving the Union generals overwhelming superiority in manpower and artillery.

Jackson on 28 August 1862 stationed his men along an unfinished railroad grade, and Pope, thinking Jackson vulnerable, launched a series of savage but unsupported attacks on 29 August. Late in the day, Lee and the remaining half of the Army of Northern Virginia under James Longstreet arrived and quietly took up positions on Jackson's right flank.

On 30 August 1862, after questionable actions by Union

general Fitz John Porter—although he probably had some idea that Longstreet was nearing the battlefield, Porter followed what would be erroneous orders to attack Jackson, exposing his own flank and that of Pope's entire army; Porter did not like Pope and perhaps that figured into his decisions—Confederate artillery fired a mass barrage, and 28,000 men under Longstreet crushed Porter's force, and drove the Union army past the old Bull Run battlefield.

Effective rearguard defense and the arrival of the vanguard of McClellan's army from Harrison Landing held off Lee's pursuing forces, and Lee then determined to invade the North, leading several weeks later to the Battle of Antietam/Sharpsburg.

Buller, Sir Redvers Henry (1839–1908)

British general. Buller was born in Devon 7 December 1839. He was commissioned in 1858 and fought in the Anglo-Chinese War of 1860. After several years of outpost duty in Canada, he served in the Red River campaign in 1870 and soon became a member of Sir Garnet Wolseley's "Wolseley Ring." Buller rapidly advanced in rank and experience, participating in the Ashanti War, the Kaffir War, the Zulu War (receiving the Victoria Cross), the first Anglo-Boer War, the Egyptian campaign of 1882, the Charles Gordon relief expedition, and then to the staff of the War Office. In 1886, he went to Ireland, first as a special commissioner to restore order, and then as undersecretary for Ireland. In 1887, he returned to the war office as quartermaster general and, in 1890, adjutant general. He held that position until 1897, working for army reform and creating the modern Army Service Corps. He then commanded the army training camp at Aldershot from 1897 to 1899.

In 1899, Sir Redvers Buller (he had received a knighthood in 1894) was sent to command the British forces in the second Anglo-Boer War. After severe problems, he was superseded by Lord Roberts, but he remained to command the Natal operations, where he was ultimately successful. In 1900, he returned to Aldershot, but two years later he was retired after an impolitic speech defending his military deci-

sions in Natal. He died 2 June 1908. Buller has been severely criticized for his actions in South Africa. Recent scholarship, however, revealing political intrigue and the public need for a scapegoat, has begun to judge him in a more favorable light.

sioned. Thereafter, they would use maneuver to avoid such heavy losses of valuable professional soldiers. (Although all of the fighting took place on Breed's Hill, for some reason, perhaps euphony, this battle has gone down in American history as the Battle of Bunker Hill. In fact, during World War II a fleet aircraft carrier, *USS Bunker Hill*, fought with great distinction in the Pacific.)

Bunker (Breed's) Hill

A minor American defeat of the American Revolutionary War that heartened the Americans by the large number of casualties inflicted on the British.

In the aftermath of the British march to and retreat from Concord and Lexington, American militia constructed defenses on Bunker Hill in Charlestown. Moving before the British could construct fortifications at the same point, the Americans fortified both Breed's Hill and Bunker Hill, which was above it, during the night of 16–17 June 1775. The Americans used this position and adjoining stone and rail fences to construct a defended position.

The British chose to attack head-on. Had they used their sea mobility and moved troops behind the narrow neck of land that defined then-Charlestown, they could have cut off the Americans. Instead, they wanted to demonstrate their professional superiority against irregular troops, and thought perhaps that such a frontal assault was the most humane way of dispatching them. This was an odd decision in light of the recent precipitous British retreat from Concord.

While British ships fired at the Americans, the British landed some 2,200 men on a hot and humid June day. The first two times the British attacked without firing but with fixing of bayonets. In each case, the Americans fired behind their fortifications and exacted a high toll. General William Howe realized the third attack must win the day, for he could not ask more of his exhausted men.

The third attack won the battlefield for the British. The Americans ran low on and then out of ammunition, and finally retreated after British troops forced their way into the breastworks. The British were too exhausted from the weather and the fighting to pursue.

The Americans lost only 440 men; the British suffered more than 1,000 casualties. Along with the tenacity of the American defenders, Breed's Hill meant that this would be a far more costly conflict than the British had initially envi-

Burgoyne, John (1722–1792)

British general and playwright blamed by critics for losing the American Revolution. Born in Sutton, Bedfordshire, and educated at the Westminster School, Burgoyne came to prominence for his victory over the Spanish at Valencia de Alacantara, Portugal, in 1762 during the Seven Years' War. The former member of the House of Commons (elected 1761, 1768), whose demand for an investigation of the East India Trading Company led to the Reforming Act of 1772, was appointed major general the same year and sent to Boston, Massachusetts, in May 1775. On June 17, he observed British troops at the Battle of Bunker Hill and returned to England in December concerned with what he had witnessed. Returning to North America in 1776 as second-in-command to Sir Guy Carleton in Canada, he was involved in the invasion of New York from Canada. After the seizure of Crown Point, New York, on Lake Champlain, disgust over Carleton's inactivity and leadership led him to return to England. Once home, he was able to convince British officials to back an ambitious plan for putting down the American rebellion in the northern colonies that became known as the Saratoga campaign. The plan called for British troops from Canada to march across New York, meeting troops coming up from the coast, causing New England to be cut off from the rest of the colonies.

Reoccupying Crown Point with 7,000 soldiers in June 1777, poorly equipped (although he burned his supply train with many wagons of his personal goods), and unprepared for warfare on the American terrain, he advanced near Albany, New York, and lost nearly 1,000 men near Bennington, Vermont. Expecting to link with British troops under Sir William Howe that never came, he found himself surrounded by American forces under General Horatio Gates. He surrendered in Saratoga, New York, on 17 October 1777,

and he and his army were held as prisoners of war until the close of hostilities. This defeat led France openly to aid American war efforts.

“Gentleman Johnny” Burgoyne ended his inglorious military career as commander of British forces in Ireland from 1782 to 1783 and died on 4 August 1792 in London.

Burgundians

Germanic invaders of Gaul. Originally from Scandinavia, the Burgundians first appeared on the Main River soon after 250, but had little contact with Rome until around 406, when they crossed the Rhine, and under King Gundichar established a kingdom in the province of Germania Prima. In 436, they tried unsuccessfully to occupy Belgica Prima, suffering an appalling defeat at the hands of Flavius Aëtius, leading an army of Huns, and only narrowly escaped destruction. This defeat later became the basis of legends retold in the twelfth-century Middle-High German epic *Nibelungenlied*.

The few Burgundian survivors fled to the territory surrounding Lake Geneva, in what is now Switzerland. Later, suffering invasion repeatedly, they moved to the valley of the Rhine and occupied eastern Gaul. Lugdunum (Lyon) became the capital of a new Burgundian kingdom. In 554, the Burgundians were attacked by their former allies, the Franks, and their kingdom was annexed.

Greatest of the Burgundian kings was Gundobad (r. 473–517). He formulated a law code (*lex Burgundinum*) for his people and later sponsored an even more significant law code (*lex Romana Burgundinum*) for his Roman subjects. The Burgundians were Arian Christians, but in 493 Clotilda, Gundobad’s daughter, who had embraced orthodoxy, married Clovis, and helped convert the Frankish king to the Roman Church.

Burma, Retreat from (1941–1942)

The longest retreat in British army history. In late 1941 Burma was poorly defended. Land invasion was considered unlikely, and only two regular British battalions, four Burmese rifle battalions, and some supporting units constituted the military garrison. The Royal Air Force had one fighter squadron and some light bombers based in Burma, and China had pledged a fighter squadron of the American Volunteer Group to protect the Burma Road, which was China’s only land link for supplies in its war against Japan.

The Japanese 15th Army (33d, 55th, and Imperial Guards Divisions and Tenth Air Brigade) was charged with the capture of Burma, and landed in Thailand on 8 December 1941, before rapidly moving northwestward to the Burmese border. In uncontested operations they captured the strategic airfields at Victoria Point, Mergui, and Tavoy along the Isthmus of Kra. They were then ordered to stand by as reserves for the Malayan Campaign.

Finally the 15th Army moved into Burma in strength in mid-January 1942. They first struck toward Moulmien, and then the Bilin River where the Indian 17th Division was ordered to hold them, in spite of the Sittang River being a much better defensive line. In the event, Japanese units quickly breached the Bilin position and reached the Sittang bridge before the 17th Division had withdrawn, and demolition was ordered with the bulk of the defenders still on the eastern side. The majority escaped by swimming, but most equipment and weapons were lost and the 17th Division was neutralized as a fighting unit. The Japanese rapidly advanced on Rangoon, capturing it on 8 March.

The Rangoon garrison joined with the newly arrived 7th Armoured Brigade, 1st Burma Division, and the depleted 17th Division to stage a fighting withdrawal up the Irrawaddy River valley into India. The Chinese 5th and 6th Armies commanded by Lieutenant General Joseph Stilwell began their withdrawal up the Sittang River valley into the northeast. Japanese reinforcements (18th and 56th Divisions) were shipped into Rangoon in mid-March to continue the momentum of attack, and the Chinese committed their 65th Army.

By 8 May the Japanese had captured Lashio, cut the Burma Road, pushed the Chinese back to Myitkyina, and nearly trapped the British and Indian forces on the upper Chindwin River. On 12 May the monsoon rains started, ending the fighting and allowing the British, Indian, and Chinese forces to retire into India and China, respectively. They left 50,000 Chinese, and 13,500 British, Indian, and Burmese casualties along the 900-mile-long battlefield.

Burmese Civil Wars (c. 1300–1599)

Mongol incursions into northern and central Burma during the late thirteenth century that contributed to the dismemberment of the Pagan kingdom. The Pagan kingdom had first unified the country in the mid-eleventh century. But the ensuing three centuries of disunity and war are often described by historians as a time of ethnic conflict between three major groups: the Burmans (Myanmars), Shans, and Mons. In fact, although differences in language, culture, and customs must have been keenly perceived, the notion of ethnic identity and ethnic politics in the modern sense was alien to the people of the time. Instead of clearly defined ethnic boundaries, borders were fluid, and members of one group rather easily assimilated into another.

Also, the Burmese lowland peoples, along with the Tais, shared a common Indo-Buddhist culture with elaborate legal-political concepts that had originated in ancient India and had been adopted in Burma by the Mons and Burmans. They included the definition of a state's legitimacy in terms of the sovereign's personal merit acquired over many lifetimes and through promotion of the Buddhist religion and other good deeds in this lifetime, and a unitary concept of power that assumed that it was accumulated by a meritorious king at the expense of his rivals. The triumph of one polity over another reflected the superior merit of the royal victor.

Thus, between the fourteenth and seventeenth centuries there was nearly continuous warfare between competing polities, including those in the neighboring kingdom of Arakan, in which victory involved the acquisition of prisoners of war (labor was perpetually in short supply), treasure, and above all prestige.

It is commonly believed that Shans entering central Burma in the twilight years of the Pagan kingdom adopted Mon/Burman culture and institutions and established Burman-style successor states at Myinsaing, Pinya, and Sagaing

after the Three Shan Brothers killed the last Pagan king in the early fourteenth century. Their descendant, Thadominbya (r. 1364–1368), founded an important power center at Ava in 1364 that flourished until it was sacked by the Shan usurper Thohanbwa in 1527.

In southern (Lower) Burma, Wareru, son-in-law of the Tai ruler of Sukhotai, established a state at Martaban in 1281. His successors, rulers of the Mons, governed a prosperous kingdom centered on Pegu (Hanthawaddy) until the Burman king of Toungoo, Tabinshwehti (r. 1531–1550), subjugated it in 1539. Tabinshwehti and his brother-in-law Bayinnaung (r. 1551–1581) established the second Burmese empire, after Pagan. Its unity was short-lived, however, breaking apart under attacks from rebellious royal princes, the Arakanese, and Siamese in 1599.

Burmese Civil Wars (1948–)

Ethnic diversity; an uncomfortable geopolitical location between India, Thailand, and China; the legacy of British "divide and rule" policies; and the influx of arms and armed gangs during World War II have ensured that Burma has not enjoyed internal peace since independence in 1948. The Communist Party of Burma (CPB), once part of the united front that ruled Burma after independence, went underground in March 1948. In early 1949 the Karen National Union (KNU), which sought an independent homeland for the Karen ethnic minority, took up arms. Communist and ethnic rebels occupied most of central and southern Burma, and the administration of Prime Minister U Nu, controlling little territory outside the capital, was nicknamed the "six mile Rangoon government." Thanks to the rebels' chronic disunity and loyal contingents of the Burma army commanded by General Ne Win, the government imposed its writ over most of the Burmese heartland by the mid-1950s, though it still had to fight Chinese Kuomintang irregulars who had fled Yunnan Province into Shan State.

The military regime established by Ne Win in March 1962 used armed force freely, including the brutal treatment of civilians in insurgent areas. During the 1960s, the focus of insurgency shifted from central Burma to the Border Areas,

and involved three overlapping categories of armed groups: noncommunist ethnic nationalists, a reinvigorated CPB generously backed by China, and apolitical local warlords in the opium/heroin trade. In the early 1980s, there were as many as 28 major communist, ethnic, and drug-dealing armed groups operating in the Border Areas. The Burma army received little or no foreign military aid between 1962 and 1988 when the armed forces received large shipments of arms from abroad, especially from China.

In early 1989 the CPB collapsed due to internal frictions, and the military regime—the State Law and Order Restoration Council (SLORC)—concluded cease-fire agreements with former CPB groups, granting them *de facto* autonomy. By 1996, 17 armed groups had signed cease-fires with SLORC, including Khun Sa's powerful Mong Tai Army. SLORC also succeeded in fostering divisions among the Karens, and captured their strongholds of Manerplaw and Kawmoorah along the Thai-Burma border in January–February 1995.

To date, Karen, Karenni, and Shan ethnic rebels continue their resistance. Drug-financed armies, especially the United Wa State Army, with large amounts of cash and arms, still pose a threat to the central government.

Burnside, Ambrose Everett (1824–1881)

Humble, genial, but usually incompetent Union field commander in the American Civil War. Burnside was born in Liberty, Indiana, on 23 May 1824. After graduating from West Point in 1847, he served as an artilleryman in the Mexican-American War and against the Apaches, then resigned in 1853 to run a firearms company in Rhode Island. He developed a breech-loading carbine in 1856, but (beginning his losing streak) lost his patent to creditors in 1857. This weapon was used during the Civil War.

As a volunteer colonel, Burnside raised a Rhode Island regiment in April and May 1861. His satisfactory command of a brigade at First Bull Run earned him his first star on 6 August and an assignment to invade the North Carolina coast. Setting sail in December with 13,000 amphibious troops in 80 ships, he captured Roanoke Island on 7 February 1862 and New Bern on 14 March. Promoted to major general on 18 March, he twice declined Abraham Lincoln's offer to replace George B. McClellan as commander of the Army of the Potomac. He commanded the Union right at South Mountain, Maryland, on 14 September and the Union left at Antietam, where his advance at the Stone Bridge was too sluggish to help the Unionists.

Even though he accurately recognized himself as unfit for high command, Burnside accepted Lincoln's third offer, probably so that it would not go to Joseph Hooker, and took over the Army of the Potomac on 9 November. After leading his troops to disaster at Fredericksburg, he was replaced by Hooker on 26 January 1863.

Reassigned to the Department of the Ohio, he had some success against John Hunt Morgan's cavalry raiders that summer but was bottled up in Knoxville, Tennessee, for most of the fall by James Longstreet. Back in Virginia in 1864 under Ulysses S. Grant, he fought poorly at the Wilderness, Spotsylvania, North Anna, Cold Harbor, and Peters-

burg, and failed miserably at the Battle of the Crater on 20 July. He resigned in disgrace on 15 April 1865.

Burnside served Rhode Island as governor from 1866 to 1869 and as senator from 1875 to 1881. He died in Bristol, Rhode Island, on 13 September 1881. From his bushy side-whiskers comes the word *sideburns*, perhaps Burnside's only claim to lasting fame.

Bushy Run, Battle of (5–6 August 1763)

British forces' defeat of aboriginal Americans near Bushy Run (south and east of present-day Pittsburgh), said to have saved western Pennsylvania in one of the few major engagements of Pontiac's War.

Pontiac's War, the biggest and most far-reaching uprising of aboriginal Americans against Europeans in North America, broke out in the spring of 1763. By midsummer only two of the British posts west of Fort Niagara still held out, Fort Detroit and Fort Pitt, and both were under siege.

Colonel Henry Bouquet served as British commander for western Pennsylvania. The only troops he had available were the understrength remnants of the 42d (the Black Watch) and 78th (Montgomery's) Highlander, many of whom were ill with various fevers as they had just returned from the siege of Havana, and some fragments of his own 60th (Royal American) Regiment. Bouquet spent the early summer reinforcing the posts along the military road into western Pennsylvania, leaving garrisons of the most ill soldiers behind.

On 4 August 1763 Bouquet left Fort Ligonier for Fort Pitt, which had been besieged for about four months. Bouquet had a convoy of about 350 packhorses carrying sacks of flour, about 450 regular soldiers, some 15 colonial rangers, and an unknown number of packhorse drivers. Bouquet in-

tended to relieve Fort Pitt, and he was also seeking battle with the aboriginal Americans. The next day he found it.

About a mile short of the way station of Bushy Run, Bouquet's advance guard encountered Shawnee, Delaware, Mingo, and Huron warriors on a ridgeline. The advance guard drove them off, but they returned and circled around to attack. That night, Bouquet had a small redoubt built with bags of flour to shelter the wounded. The first day's action had cost the British about 60 killed and wounded.

The next day, the aboriginal Americans tormented the British troops, who were short of water, for several hours by making brief rushes at the perimeter of the British defensive circle, firing a few shots, and then fading away back into the tree line when the British attempted to counterattack. After several hours of this, Bouquet devised a plan.

Two companies of light infantry moved over the crest of the hill, while the rest of the circular perimeter was shrunk. These movements were intended to simulate a retreat. Two other companies took up hidden positions within the perimeter. The aboriginal Americans fell for this ruse, and rushed the perimeter. As they did so, the first two companies sallied out and took them in their right flank. They were driven to their left, and into the fire of the other two companies. After this, the aboriginals withdrew.

Bouquet's forces suffered a total of 50 killed, 60 wounded, and five missing and he seems to have estimated that about 60 of his enemies had been killed.

Bouquet abandoned his supplies and moved on, with his wounded, to Fort Pitt, fighting a brief skirmish in the process. After this action the aboriginal American threat to Fort Pitt and to western Pennsylvania dissolved, and Pontiac's War began to dissolve as well. The victory at Bushy Run was widely celebrated at the time, and was seen as having saved western Pennsylvania.

Butler, Benjamin F. (1818–1893)

Controversial Civil War Union "political" general. Born in New Hampshire, Benjamin Franklin Butler had earned a prewar name as a controversial trial lawyer and Massachu-

setts politician. As a Democrat, and desiring to regain influence with the outbreak of the Civil War, Butler managed to parlay a brigadier's commission in the Massachusetts state militia into an active-duty role.

While generally successful as military governor in Baltimore and New Orleans, Butler kept order at the price of offending local elite opinion. This, and his reputation for corruption, overshadowed Butler's genuine achievements.

Butler also participated in the taking of New Orleans, the 1864 landing at Richmond (an operation of great potential value), and the assault on Fort Fisher. Having botched the latter two operations, Butler's reputation was so in ruins that his political talents could not save his military career, effecting his return to civilian life.

Byzantine Civil Wars (1322–1355)

Civil conflict erodes position of declining Byzantine Empire. In 1321, a family dispute within the ruling Byzantine created a rift between the reigning emperor, Andronicus II (r. 1282–1328), and his grandson, also named Andronicus. Subsequently, when Andronicus II attempted to expand the Byzantine armed forces, and imposed taxes upon the Byzantine nobility in order to pay for that expansion, he forfeited much popular support. As a result, Andronicus the younger proclaimed himself Emperor Andronicus III (r. 1328–1341). Although open violence was prevented, the empire was partitioned between the two claimants, and Andronicus III was excluded from Constantinople.

Open warfare began in 1328, when Andronicus III attempted to enter Constantinople and was refused. Andronicus III instead seized Salonika, the second largest city in the empire. Most of the Byzantine forces in the west declared for the younger Andronicus. In May, Andronicus III finally entered Constantinople, and forced the abdication of his grandfather.

Andronicus III fought successfully with Turks, Serbs, Genoese, and Bulgars, both adding territory to and occasionally losing imperial territory. He also finally defeated the

Despotate of Epirus, and reintegrated it into the empire in 1339 and in 1341. Andronicus III also forced the submission of the Latin barons in the Peloponnesus and took steps to reattach the empire of Trebizond to the Byzantine Empire.

Andronicus III died suddenly in 1341. As his heir, he left behind his nine-year-old son, John V (r. 1341–1391). Andronicus had proposed in his will that John Cantacuzinus, a wealthy noble from Thrace, competent soldier, and trusted confidant, be made regent. Although Cantacuzinus was a friend of the late emperor, he had made some powerful enemies in the imperial court, including the empress Anna; John Kalekas, the patriarch of Constantinople; and the governor of Constantinople, Alexius Apocaucus. Cantacuzinus thus found it expedient to decline an offer made by Apocaucus to become coemperor with John V, but did assume the title of coregent.

Cantacuzinus led an army against the Serbs to recover territory lost by Andronicus III. He also prepared a campaign to force further concessions from the Peloponnesian barons. Before he could effectively undertake this, his opponents in Constantinople deposed him in September 1341 and incited anti-Cantacuzine and antiaristocratic riots in Constantinople and Salonika. A revolutionary government in Salonika was then recognized by the imperial court.

Cantacuzinus fled to Serbia and proclaimed himself Emperor John VI (r. 1347–1354). In 1341 and 1342, both Serbs and Bulgars raided the empire, and Cantacuzinus made little headway against the new regency.

By 1343, with Serb support, Cantacuzinus overran most of Epirus, and began to advance into Thrace, besieging Salonika. By 1344, he held most of Thrace. In 1345, Cantacuzinus took Adrianople. The Serbs, in the meantime, had ended their support for Cantacuzinus, who responded by reaching agreement with a group of Turks led by Umur, the emir of Aydin. Also in 1345, Apocaucus was murdered by a group of nobles in Constantinople. This encouraged Cantacuzinus to attempt to enter the city, but he failed. In an effort to further strengthen his position, Cantacuzinus allied himself with the Ottoman Turks in 1346.

In 1346, Cantacuzinus was formally crowned emperor in Adrianople, but only in February 1347 was he able to reach an agreement with the supporters of John V. John VI was to administer the empire as the senior emperor. John V was married to a daughter of John VI. John VI was not only able to recover his estates in Thrace, but was also able to distribute large tracts of land to be governed directly by his sons. Matthew Cantacuzinus, the eldest son of John VI, received land in Thrace, while Michael Cantacuzinus received land in the Morea.

In 1351 or 1352, John V demanded a greater role in the government, and received instead the lands in Thrace held

by Matthew Cantacuzinus. Matthew, by way of compensation, received lands further east, around Adrianople. Border disputes between Matthew and John V led to renewed fighting between the Paleologoi and the Cantacuzines, and foreign powers were quickly drawn in. John V received help from the Serbs, while John VI received help from the Turks. Although John V enjoyed some initial success, his Serbian allies were defeated by the Turks at Demotika in October 1352.

John V escaped to the Island of Tenedos, held by Venice. From Tenedos, he attempted to seize Constantinople in March 1353. John VI declared John V deposed, and crowned Matthew coemperor in February 1354.

John V, meanwhile, sought aid from Genoa. Cantacuzinus, blamed for having brought the Turks into the empire, abdicated and became a monk. John V entered Constantinople in November 1354.

John V defeated Matthew in 1355, and forced him to relinquish his claims. He then sent Matthew to join his brother in the Morea. A subsequent attempt by John V to conquer the Morea failed.

As a result of the civil war, Byzantium lost much of its remaining territory. Serbia nearly doubled in size, and its ruler claimed the title of czar. The Ottoman Turks entered Europe and seized the Dardanelles. In the course of the war, the Byzantine economy and bureaucracy collapsed, and neither was ever properly restored.

Byzantine-Muslim Wars (633–1035)

A series of wars involving the Arab Muslim conquest of Byzantine territory in North Africa and the Near East, and the subsequent Byzantine recovery of some of that territory. In 629, the Byzantine Empire successfully concluded a long series of wars with Persia. As a result, the Byzantines recovered territory in Palestine, Lebanon, and Syria, but had little time to organize administration or defense there before the initial Moslem incursions.

An initial Muslim Arab invasion in 929 was defeated by Byzantine forces at Muta, but in 630, a Muslim expedition forced the submission of the town of Aqaba. A more earnest Arab effort at conquest began in 633 and 634, when the

caliph Abu Bekr sent four armies, perhaps totaling 20,000 men, into Syria. By the end of 634, the Arabs had won a series of victories at Ayn Ghami, Dathin, Anyadayn, and Scythopolis. In 635, the Muslim armies occupied Damascus and Homs for the first time, but were forced to abandon the cities in the face of a Byzantine counteroffensive. This counteroffensive came to an end on 20 August 636, when Byzantine forces suffered a catastrophic defeat at Yarmuk.

As a result of the defeat, Muslim armies overran most of Palestine and Syria, save only for a portion of Syria granted a one-year truce. This allowed Christian Arabs to flee into Byzantine territory before the resumption of hostilities. After the expiration of the truce, Muslim forces quickly overran the remainder of Syria and Palestine.

In December 639, Arab forces began an invasion of Egypt, and raided Cilicia and Anatolia. The deaths in 641 of the Byzantine emperors Heraclius (r. 610–641) and Constantine III (r. 641), and then the removal, through a coup, of the emperor Heraclonas (r. 641), created political instability in Constantinople. As a result, no effective aid was given to isolated Byzantine forces in Egypt. Arab armies were able to complete their invasion of Egypt, and moved on Cyrenaica in 642.

After these initial disasters, the Byzantines turned to positional warfare, attempting to hold the major cities while letting interior areas go. While this policy slowed the Muslim advance by forcing Arab armies to take the time to seize fortified points, in the long term the strategy was doomed to failure. The cities could not be held without also securing the agricultural hinterland that supplied them.

In 642, the Arab invasion of Armenia began. Within 20 years, despite constant Byzantine efforts to control Armenia, the Muslims had successfully converted the region into a client state. In 650, the Arabs invaded Cyprus. It later became a Byzantine/Arab codominion by treaty.

In the 650s, the Arabs turned attention to the Persian Empire, and to further conquests in North Africa. While raids remained frequent, the Byzantine Empire was able to gain control of the Taurus mountain passes leading into Anatolia. Further Arab conquests in there were thus blocked.

In 648, an initial Arab invasion of the Byzantine province of Africa was bought off by local officials. The year 654 saw further Arab assaults on Cyprus, Crete, and Rhodes. The emperor Constans (r. 641–668) reorganized the Byzantine army between 659 and 662 in a further effort to stop Arab advances. He continued the process whereby the remaining mobile armies were associated with a new type of province, called *themes*.

In 670, the Arab invasion of Africa began in earnest, but met with firm resistance. That same year, Arab naval forces raided the Sea of Marmora for the first time. In response, the

Byzantines prepared a fleet, which by 672 included the mysterious “Greek fire” in its arsenal. In 677, this improved Byzantine fleet won a major victory over the Arabs.

In 696, a second Arab expedition to Africa led to the seizure of Carthage. Byzantine efforts to recover the province proved unsuccessful, and this led to further political instability in Constantinople.

In 711, the Arabs breached the Taurus barrier and advanced into Anatolia. Unable to stop the Arab advance, the emperor Anastasius II (r. 713–715) began preparing the defenses of the capital. In 716, an Arab assault on Constantinople failed, but in 717 an Arab force of 120,000 men and 1,800 ships besieged the capital. The Bulgarians, hoping to take the city for themselves, attacked the Arabs, who were forced to build two sets of siege works, to contain the Byzantines on one side and to keep out the Bulgarians on the other. In September, the Arab fleet appeared, but was driven off by the Byzantines using Greek fire. The Arab army thus remained trapped in its siege works during an unusually harsh winter.

A fleet of 600 ships was sent to replenish the Arab forces. The ships landed near Chalcedon in order to avoid the Byzantine fleet. The crews of the Arab fleet, mostly Egyptian Christian, defected en masse to the Byzantines.

After an Arab reinforcing column was destroyed near Nicaea, and an epidemic had broken out among the Arab forces near Constantinople, the caliph Umar finally ordered a retreat on 15 August 718. The Arab retreat was not opposed, but surviving Arab ships were attacked, and the Arab fleet was further damaged by storms and by a volcanic eruption.

Between 718 and 741, a series of raids and counterraids ravaged Anatolia. In this period, Byzantine strategy embraced not only positional defense, but also a policy of intercepting Arab raids returning from plundering expeditions. These tactics proved moderately successful, and gave rise to a series of Byzantine epic poems and legends about border raiders and defenders. Of these the most famous was the epic poem *Digenes Akrites*.

In 741 Constantine V (r. 741–775) succeeded to the Byzantine throne. He gradually pushed the Byzantine frontier forward. This process was continued by his son, Leo the Khazar (r. 775–780).

Throughout the eighth century and the first part of the ninth century, Arab raids and conquests continued. In the 850s, the Arab Caliphate began to lose control of its border regions in the face of attacks by Paulician heretics in Anatolia and by local Byzantine governors.

In the tenth century, Byzantine defense efforts began to show real results. In 900, Leo VI (r. 886–912) invaded the emirate of Tarsus, defeated its army, and also invaded Armenia. Leo was able to recover much frontier territory.

In 926, Romanus Lecapenus (r. 920–944) renewed the attack upon the Arabs and sacked Melitene. In 927, the emir of Melitene submitted to the empire, and in 928 the city received a Byzantine garrison. This was initially driven out, but in 933 and 934 the Byzantines systematically occupied the fortresses around Melitene and around the city of Samosata. Melitene was taken and all non-Christians forced to leave. Samosata was taken and razed in 936.

In 942 and 943, John Curcuas, Grand Domestic, sacked a number of cities in Armenia and Mesopotamia, and besieged the city of Edessa, withdrawing only after the governor of the city had agreed to surrender the Mandilyon, a cloth said to bear the imprint of the face of Christ. The relic and Curcuas were accorded a triumphal entry into Constantinople.

Constantine VII (r. 913–959) assumed full power in 944, and, with his generals, Nicephorus Phocas, John Tzimiscas, and Basil the Grand Chamberlain, conducted a successful raiding war against the Arab leader Sayf al Dawlah. Byzantine efforts to recapture Crete, Sicily, and Italy were less successful, and Arab forces repeatedly defeated forces sent to those places. Constantine’s successor, Romanus II (r. 959–963), reorganized Byzantine forces in an effort to intensify the war against the Arabs. In 960, a massive expedition under Nicephorus Phocas landed on Crete. Phocas’s army killed 40,000 Arabs and besieged the principal city of Chandax from 960 until the spring of 962, when it finally fell. A raid into Syria by Sayf in that year was suppressed by Byzantine forces.

After capturing Chandax, Nicephorus Phocas attacked and defeated the emir of Tarsus and took several towns in Anatolia and Syria. Phocas then marched against Sayf al Dawlah in Aleppo. Sayf sent his army north to meet the Byzantines, and quickly raised a force of militia to defend the city. Phocas evaded the main Arab force, and fell upon the poorly prepared defenses of Aleppo, which he overcame. Sayf fled, pursued by Tzimiscas, and Phocas entered Aleppo after a three-day siege. Upon his return to Constantinople, Phocas found that Romanus II had died in a hunting accident, and assumed power.

Nicephorus Phocas (r. 963–969) continued the war against Sayf, taking the town of Mopsuestia, as well as Tarsus. Nicephorus also expanded Byzantine control of Armenia and cleared Cyprus of its Arab garrison. Sayf died in 967.

John Tzimiscas (r. 969–976) seized power in a coup. During his reign, Aleppo ceded control of its coastal territory to Byzantium; this remained permanently under Byzantine control. Byzantium now bordered the Fatamid Caliphate of Egypt and the Hamdanid emirate of Mosul, both of which were willing to expand at the expense of Byzantine or Arab

neighbors. Tzimisces thus found himself fighting against the Fatamids in 971 and in 975, and the Hamdanids from 972 to 974. Tzimisces was able, in the end, to subject most of Syria and Lebanon to either direct Byzantine government or tributary status. He died before these conquests could be followed up, and was succeeded by Basil II (r. 976–1025), the greatest ruler of medieval Byzantium.

Basil II faced civil disorder in the early part of his reign, but his Arab neighbors were too weak to take advantage of the situation. Basil was strong enough in the 990s to drive off Fatamid attacks upon the emirate of Aleppo, now a Byzantine client state.

Fatamid attempts at naval warfare were equally unavailing. An Egyptian fleet burned in 996 in a mysterious fire. A second fleet was defeated off of Syria by the Byzantines. The Fatamid caliph, al-Aziz, then died, and rebellions broke out over the succession.

Basil II turned his attention to Byzantine territories in Europe. He signed a 10-year truce with the Fatamids in 1001, which he renewed periodically for the rest of his reign. Basil refused to respond to Fatamid and Hamdanid attacks on Aleppo; the city fell to the Fatamids in 1015, only to be lost to them in a revolt in 1025.

At this point, Byzantine attentions became fixed elsewhere, with few exceptions. Romanus III (r. 1028–1034) forced the surrender of Edessa in 1031, and attempted to purchase the city of Aleppo. This offer was refused. The Fatamids renewed the 10-year truce in 1036, and the Byzantine frontier was secured by the presence of a client state, the Mirdanid emirate, in what is now modern Syria and Iraq. Though raids would occasionally continue, the initiative in Muslim expansion had passed from the Arabs to a group of Islamic mercenaries brought in by the Arabs, the Turks.

Constantinople in 1261, the Byzantine Empire was a mere shadow of its former greatness, controlling only the city of Constantinople, the western coast of Asia Minor, northern Greece, and part of the Peloponnesus (the Morea). Two autonomous territories, Trebizond and Epirus, also were Byzantine in culture, but not politically dependent on Constantinople.

In this weakened state, the Ottoman Turks, having threatened the empire for more than two centuries, advanced. The Byzantine Empire often had to rely on outside help, sometimes from western Europe, to protect itself, and that help was often tied to a union of the Orthodox and Catholic churches, a union that was briefly achieved at the Council of Florence and Ferrara in 1439.

Among the western aid the Byzantines received were Roger de Flor's Catalan mercenaries, hired by Andronicus II in 1302. Roger was murdered three years later, but the Catalans went on to set up their own independent state in Athens in 1311. In 1396, Pope Boniface IX called a crusade to assist Constantinople, which ended in the defeat of Duke John the Fearless of Burgundy and Jean Bouciquaut, Marshal of France, at Nikopolis (Nicolopol, Bulgaria). On 10 November 1444, the Last Crusade ended in defeat for King Ladislas of Hungary and Poland and his general, János Hunyadi, at Varna.

Western aid was to no avail, and in 1329 Sultan Orkhan I defeated Andronicus III at Maltepe and two years later captured the city of Nicaea. More than a decade later, Emperor John VI Cantacuzinus called on the Turks to assist him against the Serbian emperor Stephan Dushan, who threatened Constantinople. Turkish forces thus crossed into Europe in 1345, gaining a foothold in Gallipoli in 1354. In 1365, Sultan Murad I captured the important city of Adrianople and made it his capital. A year later crusades by Amadeus of Savoy and Louis of Hungary led to the temporary recapture of Gallipoli and the defeat of the Turks near Vidin, but these gains were short-lived.

In 1365, the Janissaries (literally "New Troops"), a corps of elite infantry composed of slaves, were established as a military corps by the sultan. This corps was to prove important in the remaining wars with the Byzantine Empire and in subsequent Ottoman politics into the nineteenth century.

The Turks continued reducing Byzantine power, taking Thessalonika in 1387 and again in 1430 after it had been recaptured by the Venetians and Byzantines. Epirus fell in 1430 also. Turkey invaded central Greece in 1397. In 1446, Constantine Paleologus (Constantine XI in 1448) attempted the recapture of central Greece but was repulsed.

Throughout the wars, the Ottomans besieged Constantinople itself. The first Ottoman siege lasted from 1391 to 1399. Sultan Murad II again besieged the city in 1422. Sultan

Byzantine-Ottoman Wars (1302–1461)

A series of wars ending in the Ottoman conquest of the Byzantine Empire. Following the fall of the Latin Empire of

Mehmet II the Conqueror (*Fatih*) besieged the city again in April 1453; it fell on 29 May after bitter fighting, during which Constantine XI was killed. Mehmet then made Constantinople the Ottoman capital, renaming it Istanbul.

The Morea held out seven more years, falling in 1460. Trebizond, the last remnant of the Roman Empire, was conquered in 1461.

Byzantine-Persian Wars (502)

A series of wars between the two great powers of western Eurasia defining the history of the sixth century. In 502, Sassanid shah Kavad I broke 60 years of peace with Byzantium in hopes of wringing money from Anastasius I (r. 491–518). Briefly dethroned during a period of domestic upheaval, and undergoing punishing raids by the White Huns on Persia's Asian borders, Kavad hoped to buy the raiders off. He felt that the wealthy Byzantines, at war in the Balkans and Arabia, would pay dearly to avoid a third front. But when Anastasius refused to contribute, Persian honor demanded action, so the shah invaded Byzantine Armenia and northern Mesopotamia. In response, the Byzantines assailed Persian Armenia. By 504, White Hun raids again distracted Kavad, and Anastasius bought peace for a token sum.

In 525, Emperor Justinian (r. 527–565) inattentively beguiled himself into an Armenian adventure. Christians in Iberia province, vassals of Persia, asked for a symbolic force to aid an independence scheme. Justinian's gesture provoked a massive Sassanid offensive. Byzantium sacrificed much blood, treasure, and three hard-fought years to restore the frontier.

In 530, Byzantine occupation of the Crimea gave Constantinople access to Asian nomads who might open an eastern front against Persia. Recognizing the risk, a new shah, Khusrau I, proposed a truce in 531. Justinian, fixated on re-creating the Roman Mediterranean empire, obliged.

The peace of 532 required a heavy tribute from Justinian, but Khusrau remained suspicious. Ostrogoth emissaries from Italy warned the shah that Justinian might turn eastward after subjugating them. Byzantine machinations routinely encouraged instability in Armenia. In 540, Khusrau's army rolled en masse toward Antioch, the "Third City" of Byzantium, sacking forts, looting towns, and demanding an enormous tribute. When Justinian refused, Khusrau viciously burned Antioch and took thousands hostage. Another weary stalemate followed, compounded by a horrendous epidemic.

Byzantine defeats in Armenia in 543 mirrored Persian failures before Edessa in 544. Increasingly preoccupied at home, the rivals renewed peace in 545. Although Armenia remained in a kind of proxy war, Justinian and Khusrau extended their treaty for 50 years in 560, with Byzantium sending an annual stipend.

In 572, Justin II (r. 565–578) arrogantly broke the peace. Indignant, Khusrau marched into Syria, capturing Dara, and into Armenia. In 578, Byzantine general Maurice staged counterattacks in Armenia and along the upper Tigris-Euphrates. In response, Hurmazd IV, Khusrau's son, encouraged the Avars to ravage the Balkans to draw Byzantine forces from the east. In 582, Maurice became Byzantine emperor (r. 582–602), confronting wars in Italy, the Balkans, Armenia, and Iraq. Victories over Hurmazd in 586 and 587 failed to knock the Persians out. In 588, Byzantium's eastern army erupted in a terrifying mutiny. Yet Persia, also staggering from the war effort, lacked the initiative and energy to exploit a historic opportunity.

Two years later, the Persian commander Bahram mutinied, overthrew Hurmazd, and tried to enthrone Hurmazd's son, Khusrau II. Khusrau instead fled to the Byzantines and appealed for assistance from Maurice. Ignoring his timid advisers, the emperor threw his weight behind the young aspirant. Their combined forces overcame Bahram rapidly. In 591, Khusrau and Maurice, now close friends, signed a peace that endured until 602.

C

Caesar, Julius (Gaius Iulius Caesar 100–44 B.C.E.)

Shrewd political and military strategist. Caesar accurately assessed and energetically defeated domestic and foreign foes. He brilliantly inscribed for posterity his exceptional achievements. Nonetheless, his pride and resulting incapacity to cement lasting personal alliances paved the way for his downfall and, with it, the transformation from Roman republic to empire.

Caesar's family was firmly established in Marius's popular reform camp. Virtually exiled for opposing Sulla's party, Caesar served as a military tribune in Asia, 80–78 B.C.E., where he received Rome's highest decoration, the *corona civica*. In 65 B.C.E., as *curule aedile*, he spent profusely on games and public building projects, and subsequently became *pontifex maximus* and praetor. As governor of Further Spain (embracing modern Portugal and much of western, central, and southern Spain), he demonstrated his military prowess in highly successful policing actions against the tribes of the area in 61–60 B.C.E. In 61 he obtained the province of Hispania Ulterior and on his return was elected consul. He then wisely came to terms with Pompey and Crassus and they jointly constituted the First Triumvirate in 60 B.C.E. He was given a five-year governorship, extended to 10 years in 55, of the provinces of Illyria on the eastern shore of the Adriatic Sea and of both Transalpine and Cisalpine Gaul (present-day northern Italy, France, Belgium, part of Germany, and the southern Netherlands).

During his tenure as governor, Caesar conquered Gallic territory up to the River Rhine. His defeat of Vercingetorix at Alesia was notable for Caesar's use of innovative field engineering techniques. He suffered only two setbacks in this period: a detachment of 15 cohorts was annihilated in the winter of 54, and his attack on the Gallic fortress-town of Gergovia in 52 ended in a costly failure. His piecemeal con-

quest of Gaul is attributable to judicious tactics, excellent reconnaissance, vigorous exploitation, rapidity of decision, and deterrence by terror. When his governorship ended in 49, Caesar was immensely wealthy and the leader of a highly efficient and fanatically loyal army.

His military success aroused the jealousy of Crassus and conservative factions in the Senate who felt threatened by Caesar's ostensible populism. Crassus's defeat and death at Carrhae left Pompey to deal with civil unrest entailing violent clashes among rival gangs, including Caesar's popular reform alliance. Seeking to reestablish law and order, the Senate elected Pompey sole consul in 52, a position that he exploited to have Caesar sacked from governorship in Gaul with a demand that he disband his army in that province. When Caesar refused and marched his loyal legions across the Rubicon River into Italy proper, Pompey, believing his army too meager, withdrew to the east to recruit more forces there. After entering Rome in triumph, Caesar led troops into Spain to crush threatening pro-Pompey troops. Having been declared dictator, he led a force to Greece where he defeated Pompey's much larger army at Pharsalus. Siding with Cleopatra (later his mistress) against her brother in an Egyptian dynastic struggle, he defeated the deceased Pompey's naval expedition sent against him. Caesar, pausing in Asia Minor to defeat the upstart Pharnaces of Bosphorus, returned to Rome where he continued his program of sweeping civic and legislative improvements. In the spring of 46 B.C.E. Caesar took an army to North Africa to eradicate Pompey's remnants there and thence to Spain for final mopping-up operations. He was assassinated upon his return to Rome by a cabal of patrician opponents.

Calais, Siege of (1558)

The end of English rule over any part of the European continent. After the Spaniards, allied with the English, had routed the French army under Montmorency at St. Quentin on 10 August 1557, Paris was at the mercy of Phillip II of Spain, but his hesitation to attack the capital gave the French monarch, Henri II, time to organize the city's defenses. In October, François de Guise, returned from the Italian war theater, was created lieutenant of the realm, and gathered together the French troops in northern France. Both sides were desperately short of money, but while the Spanish king disbanded his troops for the winter, the French monarch boldly planned a winter campaign.

In November, Henri determined to attack Calais to avenge the humiliation of St. Quentin, and to seize an important pledge for future peace negotiations. At the direct order of Henri, de Guise agreed to lead the winter expedition, although he was not convinced of its prudence. The English had not the vaguest suspicion of the French plans until the end of December 1557.

On 1 January, 2,500 unprepared English, spread among a dozen forts and in Calais itself, faced the assault of 20,000–22,000 French foot soldiers, 4,000 cavalry, and 30 artillery pieces. Only one day later, the fort of Rysbank surrendered, and from there the French bombarded the castle across the harbor for two days. After a breach had been made, several French companies seized the castle and held it against two English counterattacks. On 8 January, the English commander, Lord Thomas Wentworth, asked for terms. Five hundred English troops along with some of the town's inhabitants were permitted to leave for the Flemish border. After holding Calais for 220 years, England had lost its last territory on the European continent.

The Cambodian Incursion (30 April–15 May 1970)

A U.S.–South Vietnamese incursion into Cambodia during the Vietnam War. President Richard Nixon had a three-part plan to end the interminable Vietnam conflict: American troop withdrawal, an end to the draft, and Vietnamization of the war effort. To help provide time for the government of South Vietnam to prepare to defend itself, Nixon in March 1969 had authorized a secret and possibly illegal bombing campaign across the border in neighboring Cambodia. The bombing did not significantly reduce North Vietnamese supply capacity, and it threatened the stability of the Cambodian government itself as the Communists moved away from the borders to avoid the bombing.

Therefore, the South Vietnamese and Americans engaged in a limited crossing of the border into the so-called Parrot's Beak and Fishhook regions to destroy base areas. Communist forces abandoned their bases, and the allies captured a vast amount of weapons and ammunition. In a smaller operation, U.S. Army units crossed the border in the Central Highlands also to attack base camps near the Laotian–Cambodian–South Vietnamese border.

In an immediate sense, the spoiling attacks were successful, and the North Vietnamese had to wait two more years to launch the Easter 1972 offensive. However, the U.S. Senate repealed the Gulf of Tonkin Resolution and, combined with the unrelated killings on the Kent State University campus, the offensive strengthened the antiwar movement in the United States, something carefully noted by Hanoi.

Cambodian Wars (1970–1990s)

Although an indigenous Communist (Khmer Rouge) insurgency fought the central government from rural bases in the

late 1960s, Cambodia remained on the fringes of the Indochina War until Prince Sihanouk was overthrown in an 18 March 1970 coup d'état. Both Communist and non-Communist forces had ignored Sihanouk's policy of neutrality when it suited them, but it was only with the establishment of a new regime (proclaimed the Khmer Republic in October 1970) under Premier Lon Nol that the country became a major Indochina battlefield.

Cambodia's wars can be divided into three periods: (1) 1970–1975, when Cambodian and Vietnamese Communist forces fought the Khmer Republic, which received massive military and economic aid from the United States; (2) 1975–1978, when Democratic Kampuchea (DK), the revolutionary regime headed by the Khmer Rouge leader, Pol Pot, waged brutal class warfare, resulting in the deaths of 1–2 million Cambodians out of a total population of 7 million, and provoked a war with Vietnam; and (3) 1979–1990s, which opened with the January 1979 establishment of a pro-Hanoi regime in Phnom Penh, the People's Republic of Kampuchea (PRK), and witnessed protracted fighting between the PRK and the Vietnamese army on one side and the Khmer Rouge based along the country's western borders on the other (joined by Prince Sihanouk and a rightist politician, Son Sann, in a largely symbolic coalition government in 1982). This last phase, characterized by Vietnamese dry season offensives against mobile Khmer Rouge guerrillas, continued until Hanoi agreed to withdraw its forces in 1989, and the signing of the Paris Peace Accords on 23 October 1991. But some observers date its termination with the late 1990s internal collapse of the Khmer Rouge and the apparent suicide of Pol Pot in April 1998.

After the coup d'état, Lon Nol's Khmer National Armed Forces received new American equipment and expanded rapidly in personnel, but lost control of the countryside to the North Vietnamese army and a revitalized Khmer Rouge, which gained wide popular support by promising to restore the popular Prince Sihanouk to power. Two government offensives in 1970–1971, Chenla I and II, attempted to recapture the agriculturally rich northwestern region, but were stopped by North Vietnamese regulars.

Washington launched a devastating air war against the Communists, peaking in summer 1973 (Operation ARC-LIGHT), in which the U.S. Air Force dropped, according to some accounts, more tonnage of explosives on the small country than on Japan during World War II. The bombing shattered rural society, driving hundreds of thousands of Cambodians into Phnom Penh and other towns (they also fled Khmer Rouge atrocities), but failed to bolster Lon Nol or stop the Communists. Most North Vietnamese troops withdrew from Cambodia by 1972–1973, and the Khmer Rouge

built up their forces to 50,000 soldiers and captured Phnom Penh on 17 April 1975.

The Cambodia war was waged with untrammled brutality. The worst perpetrators tended to be adolescent or preadolescent soldiers, the mainstay of Pol Pot's army. Most older soldiers had been killed off and the young Khmer Rouges, cut off from their families, proved to be zealous instruments of revolutionary terror, lacking the socialization in traditional Cambodian values that might have moderated their behavior.

Democratic Kampuchea was no puppet of Hanoi. The DK regime singled out Vietnamese living in the country for especially harsh treatment and murdered hundreds of Vietnamese peasants in cross-border raids. Pro-Hanoi elements in the Communist Party of Kampuchea were purged and executed, even before 1975. In May 1978, the commander of the Eastern Region bordering Vietnam rebelled, but was defeated, and an estimated 100,000 people, labeled as having “Khmer bodies but Vietnamese minds,” were sent into the killing fields.

DK armed forces repeatedly provoked border clashes. Pol Pot apparently harbored the ambition of conquering the Mekong Delta, which before the seventeenth century had been Cambodian territory. In late 1977, Vietnamese forces counterattacked, occupying Cambodian territory, but withdrew in January 1978 (another motive for the incursion was DK's alliance with China, seen by Hanoi as a provocation).

In November 1978, the Vietnamese carved a “liberated area” out of Cambodian territory and proclaimed an anti-Pol Pot government in exile, the Khmer United Front for National Salvation (KUFNS). On Christmas Day, a 100,000-man infantry and armored force consisting of Vietnamese regulars and KUFNS auxiliaries launched a blitzkrieg, capturing Phnom Penh on 7 January 1979 and thrusting into the western provinces of Siem Reap and Battambang. Pol Pot and other DK leaders fled the capital just ahead of the Vietnamese, and established a guerrilla resistance in the hilly, thickly forested region around Cambodia's border with Thailand.

The third phase of the war (1979–1990s), like the 1970–1975 phase, was in large measure a proxy war between the great powers. Cold War geopolitics determined that the Soviet Union would back their Vietnamese allies and Hanoi's client state, the People's Republic of Kampuchea, while China and the Western powers refused to recognize the latter, denying the PRK a seat in the United Nations and much-needed economic aid. Beijing funneled military aid to Pol Pot's forces through a cooperative Thailand (this amounted to an estimated U.S.\$60–100 million a year in the 1980s). Although the Paris Peace Accord of October 1991 opened the way to United Nations–sponsored political and economic re-

construction, Cambodia's tragic quarter century of war showed how big powers could take advantage of local conflicts, using small countries for their own ends, with scant regard for the welfare of their populations.

Cambrai, Battle of (20 November–8 December 1917)

British offensive of World War I, noted for the first significant use of tanks. The Cambrai attack was planned to break the Hindenburg Line. Timing was critical. The Allies hoped to collapse the western front before arrival of troops released by Germany's victory over Russia.

Tanks had been used before, in small numbers. Because bombardment always preceded attacks, giving the Germans time to reinforce, the advantage of surprise was usually lost. General Douglas Haig, the British commander, laid different plans: no preparatory bombardment.

Haig gathered 476 tanks, placing most in the assault columns. The staff perfected tactics to cross trenches with armor, as infantry followed closely, providing protection and holding ground. Cavalry poised to exploit any gaps.

The assault began on 20 November 1917 as the tank corps plowed into German lines. After the first day, the British held most objectives, driving the Germans four miles back along a six-mile front. While they inflicted heavy casualties and took thousands of prisoners, the infantry could not keep up with the tanks. Communications failed; soon tanks and tankers began to break down as fatigue grew. The Germans reacted vigorously, stabilizing the front. Arrival of troops from the eastern front proved decisive. On 28 November, Haig halted. On 30 November, the Germans counterattacked; by 8 December they had captured half of the lost ground.

The results were mixed. Each side lost more than 40,000 men. Tanks demonstrated potential, but tactics were unsatisfactory. The Hindenburg Line was broken—and restored. The British took ground, but exhausted their army. The Germans reassigned divisions along the front, shoring up defenses and preparing for offensives in 1918.

Camden, Battle of (15 August 1780)

One of the most thoroughgoing military defeats in U.S. history. By 1780, five years after the outbreak of conflict, Great Britain had devised a new strategy to win the American Revolution. General Henry Clinton's army would invade the southern colonies/states, build on loyalist support, and reconquer each colony as it marched north. The invasion got under way with the fall of Charleston, South Carolina, in May 1780. Clinton then returned to New York, leaving Lord Charles Cornwallis in command.

The loss of Charleston and its army was a disaster for the Americans unmatched until the surrender of the Philippines in 1942, and General George Washington quickly dispatched reinforcements to the South under General Horatio Gates. Marching south, Gates hoped quickly to retake the area. Cornwallis had reached Camden, in central South Carolina, and was preparing to meet Gates. The armies marched on the same road during the night of 15 August, and the advance parties collided around 2:30 A.M. Just a few miles north of Camden both sides halted and waited for daylight.

Gates's battlefield performance was poor: He did not reconnoiter the ground, develop a plan for battle, or even know how many men he had. At sunrise the armies faced each other across an open field broken by tall pines. About 3,700 Americans faced 2,179 English, yet the British were primarily regulars, while Gates commanded mostly militia. While Cornwallis put his units into line, Gates decided to send his militia to strike the British right. The English regulars charged with bayonets, routing these green troops and leaving the continentals on the American right unsupported. Under General Johan DeKalb they fought well despite being surrounded and outnumbered. Nonetheless, Gates fell back with the retreating militia, and eventually retreated to Hillsboro, North Carolina, supposedly setting some sort of record for a long-distance mounted dash. For another hour the Maryland and Delaware continentals fought until they were overwhelmed, when they too broke and fled.

Gates probably lost more than 1,000 men, while Cornwallis's casualties numbered 324. The rout firmly established British control over the colony, forcing American militia to flee to North Carolina until the Patriot victory on Kings Mountain in October began to turn the tide of battle.

Campbell, Colin (1792–1863)

Perhaps the greatest British tactician and field commander of all time, noted especially for his deeds at Alma, Balaklava, and in the Indian Mutiny. Born the son of carpenter John M'Liver in Glasgow, Scotland, on 20 October 1792, Colin M'Liver enlisted in the British army in 1808 under his mother's maiden name, Campbell. He saw his first action in Portugal during the Peninsular War. From 1808 to 1813 he fought at Rolica, Vimeiro, Salamanca, Corunna, Walcheren, Gibraltar, Barossa, Tarifa, Vittoria, San Sebastian, San Bartholome, and Bidassoa.

In North America from 1813 to 1815, he fought under Sir Edward Pakenham in the British disasters at New Orleans on 8 January 1815. After serving in Gibraltar from 1816 to 1818, Barbados from 1819 to 1821, and British Guiana from 1821 to 1826, he remained in England as a major until 1832 and as a lieutenant colonel until 1842, when he led reinforcements to China for Sir Hugh Gough in the First Opium War. After Gough returned to India in 1843, Campbell remained in China, achieving the rank of brigadier general in 1844. Under Gough in India from 1846 to 1852, he fought at Ramnuggur, Chillianwallah, Gujerat, Kohat Pass, Panj Pao, and Iskakote.

As major general in command of the Highland Brigade during the Crimean War, he compensated for the errors of his superiors, almost single-handedly won at the Alma, prevented disaster at Balaklava, and led the reserves against the Redan in the siege of Sevastopol. Back in England, he became lieutenant general in 1856 and was appointed commander in chief of forces suppressing the Indian Mutiny in 1857. The tide turned after his arrival in Calcutta in August. Recognizing his value at Lucknow and Cawnpore, Queen Victoria created him First Baron Clyde of Clydesdale in 1858. He was promoted to field marshal in 1862, died on 14 August 1863 in Chatham, England, and is buried in Westminster Abbey.

Canadian Military

The military of Canada has been shaped throughout its history by the fact that the dominion is at one and the same time indefensible (because of its small population) and invincible (because of its vast landmass). It shares with Great Britain and the United States a dislike for professional military and has found it almost impossible to institute conscription even in time of war, let alone in peacetime. That English-speaking Canada's only experience of foreign invasion was the tragicomic U.S. incursion in the War of 1812 has also led to a refusal to take the military and national defense very seriously, except in time of war. In addition, the English-French divide has made it difficult in the past for the semiautonomous, officially French-speaking province of Quebec to see the necessity to “fight England's wars.”

Yet Canadians themselves have long been interested in things military. Canada's military traditions are based on the militia system, citizen soldiers who volunteered to defend the nation in time of need. Loyalists during the American Revolution raised some of the first Canadian militia units. The militia later defended Canada from invasion by the United States during the War of 1812. Once the danger had passed, the militia became sedentary. In 1840 the Canadian militia rolls still carried 426 local battalions with 235,000 officers and men. An active militia, maintained at government expense, was authorized in the Militia Act of 1855. Successive parsimonious governments kept military appropriations low, but public interest in the militia remained high. The number of authorized units grew steadily throughout the nineteenth century. When Great Britain went to war with the South African Boer republics in 1898, public pressure forced the Canadian government to offer a volunteer field force as a symbol of imperial unity.

The South African war exposed weaknesses in the Canadian militia. Administrative reforms established departmental and service units, functions that were previously supervised by British officers seconded to the Canadian militia. Authorization for engineer and army service corps companies came in 1901, quickly followed by the establishment of ordnance, intelligence, signals, medical, and pay branches. These units provided the Canadian militia with a permanent support system to meet the needs of an independent army.

In 1910, growing concern in Britain over the expansion of the imperial German navy resulted in the calling back to British home waters of a substantial portion of the Royal Navy's squadrons stationed in Canada. That, following the withdrawal of all but a handful of British troops, signaled the end of Britain's primary role in the defense of Canada.

When the British Empire went to war in August 1914, Canada had a permanent force of little more than 3,000 officers and men. On paper there was a reserve of more than 50,000 men, but most were poorly trained, poorly equipped, and at least half were unfit or unable to serve. The govern-

ment was quickly inundated with volunteers. To compound an already chaotic situation, the minister of militia and defense scrapped the existing mobilization plans and created an overseas army of 260 newly formed battalions with no relation to existing regimental designation or organization.

Despite initial difficulties, the Canadian Expeditionary Force became an effective overseas army, serving with distinction on the western front and winning the respect and admiration of both allies and foes. Canadian troops even served in the misbegotten Allied intervention in post-Revolution Russia. During World War I the ranks of the Canadian

military grew to an incredible 628,000 men, giving a sense of national unity. (One trooper, seeing entire Canadian divisions in formation preparatory to the Vimy Ridge operation, exclaimed that he had never seen so many Canadians together in any one place in his life, and didn't even realize that there were that many live Canadians.) But this sense of national unity was marred by the strong anticonscription sentiment and disorders in Quebec. In addition, the Royal Canadian Navy had over 5,000 serving personnel, and Canada's contribution to the British air services was in excess of 24,000 men, all from a country with a population that had just reached 8 million.

The end of the war signaled the return to the prewar regimental system. For Canada, the 1920s and early 1930s were described as a period of military economy but, more accurately, it was a period of military neglect. The Canadian militia existed, to a large extent, only on paper, with no tanks, no armored cars, no heavy or medium artillery, and no anti-aircraft guns. In 1922 there were only two ships in the Royal Canadian Navy and few flightworthy aircraft in the Canadian Air Force. Politicians maintained that Canada was invulnerable to military conflicts, often comparing it to a "fire-proof house." The government felt little need to concern itself with defense. As one Canadian prime minister asked, "Defense from whom?" (The Americans?) However, by the mid-1930s it was clear that not even Canada was isolated from disturbing events half a world away. Canadian defense budgets doubled from 1935 to 1939.

The year 1936 saw a dramatic change in the structure of the Canadian army. After an exhaustive review of Canada's military capabilities, resources, and shortcomings, major organizational changes were implemented: (1) the amalgamation (or uniting) of regiments; (2) the disbandment of regiments; and (3) the redesignation of regiments as artillery, armored (tank), motorized, or machine gun units.

The reorganization of 1936 reflected the changes in the way wars were fought. Before the reforms, the Canadian army, like most Western armies, was still geared for fighting World War I, and after 17 years of neglect was ill-prepared for modern warfare, as was being displayed in Spain and China. The reforms of 1936 and the increased military budgets provided Canada with the groundwork for an effective army and a command structure capable of putting that army in the field. Aside from a small Canadian contingent sacrificed at Hong Kong in the opening weeks of the war, and the botched Dieppe operation, Canadian troops did not go into action until 1943. But they fought their way up the "boot" of Italy, swarmed ashore on D day, serving in both the European and Pacific theaters of operation. By war's end more than 1,000,000 Canadian men and women were in uniform. Again, however, the divisive conscription contro-

versy flared, and Canadians were not conscripted until so late in the war that none made it to a combat zone before hostilities had ceased. (These Canada-bound conscripts were known derisively as "zombies.")

When World War II ended in 1945, a swift demobilization was of prime concern to the government and service personnel alike. Canadians did not relish being a part of an occupation army. By December 1946 only a few hundred Canadians were left in Europe. Wartime units were disbanded and the remaining regiments were consolidated into a regular army. Canadian troops were dispatched to Korea in response to a call from the United Nations, and again recruiting offices were swamped; although some one-third had second thoughts and deserted before leaving Canada, the remainder gave a very good account of themselves.

The 1960s found Great Britain preoccupied with a rapidly disintegrating empire. Canadians looked to the United States as their chief ally and defense partner. The Canadian government launched a campaign to cut redundancies in the military by forming a single unified service. By 1968 this sweeping reorganization replaced the Royal Canadian Air Force, Royal Canadian Navy, and Canadian army with specialist branches of the newly created Canadian Armed Forces, much to the disgust of more traditionally minded officers.

The Canadian forces assumed the role of peace keeper, supervising the withdrawal of U.S. troops from the Vietnam War and providing troops for numerous United Nations operations. No nation has so large a proportion of its military on peace-keeping duties. In 1975 the three services were tentatively reconstituted, supplemented by a logistics branch and communications command. With the end of the Cold War, the Canadian government reduced its international treaty commitments and has increasingly relied on American military assets for defense, leaving many Canadians to question their future military needs. Canadian nationalists have always been at some pains to differentiate their nation from the colossus to the south, but it must be questioned as to just how sovereign a country is that, by default, leaves its defense primarily in the hands of another nation, however friendly or benign that latter power might be.

Cannae, Battle of (216 B.C.E.)

The Battle of Cannae was the third and last major defeat the Carthaginian general Hannibal inflicted on the Romans, and certainly the most terrible. The Romans had assembled an army of 80,000 foot and 6,000 horse, roughly half of them Italian allies. They greatly outnumbered Hannibal, who had only about 40,000 foot and 10,000 horse at his disposal. The Roman force was under the command of the consuls L. Aemilius Paullus and G. Terentius Varro. It met Hannibal's army near the citadel of Cannae in Apulia.

Hannibal had encamped on the north bank of the river Aufidius (Ofanto). The Romans set up camp about a mile downstream and established a minor camp on the south bank. When Hannibal challenged the Romans to fight in the wide plain north of the river they refused, probably because Hannibal could use his superior cavalry there to outflank the Romans. However, the next day they engaged Hannibal on the south bank. There the Roman left would be protected by a range of hills, the right by the river.

As usual, the Romans deployed their own infantry in the center and their allies on the wings. However, they assumed a formation that was deeper and more closely packed than they normally did. The formation was covered by a line of skirmishers. The cavalry took positions on the flanks, prepared to hold the line against the superior Carthaginian horse.

Hannibal deployed his men carefully. Behind a light infantry screen he positioned a convex crescent-shaped line of Celtic and Spanish infantry. Their formation increased in depth toward the middle of the line. This part would be nearest to the enemy and would bear the brunt of the Roman attack. The points of the crescent touched two deep columns of crack African troops that were positioned behind the cavalry positioned on the flanks.

At first the light infantry of both sides engaged. The Carthaginian horse on the right attacked the Roman cavalry and quickly the latter were in sore straits. Immediately the Roman infantry was ordered to attack. They had to break the enemy center before the Roman cavalry would yield. The Celts and Spanish were pushed back until the crescent line

changed from convex to concave. Under the personal command of Hannibal they gradually and purposefully gave way, pulling their enemies into the crescent. If the Carthaginian center would break, the battle would be lost, but Hannibal's leadership prevented the gradual retreat from turning into a complete rout.

The Romans pushed themselves further and further into the sac until they had passed the columns of Africans on the wings. Then the latter attacked the Roman line in the flank and, having defeated the Roman cavalry on the left, the Carthaginian horse turned upon the Roman rear. The Roman army was completely encircled and a terrible slaughter ensued. The losses can be estimated at 50,000 men, almost two-thirds of the Roman force, among whom were the consul Paullus and some 80 senators. Hannibal's losses amounted to only some 7,000.

Cantigny (28–30 May 1918)

U.S. Army 1st Infantry Division attack in the Somme River region of northern France. In the midst of a series of German spring offensives designed to end the war, elements of the German Eighteenth Army held the key town of Cantigny. With the U.S. 28th Infantry Regiment in the lead, the division attacked the town and captured it on the first day, netting roughly 200 prisoners. The soldiers of the Big Red One then endured a total of seven German counterattacks but held fast. American artillery disrupted the first couple of German attacks, but the following attacks were blunted by a combination of artillery and infantry fire. The Americans suffered 1,603 casualties, including 199 killed in the battle. In the context of the overall situation on the western front, the victory at Cantigny was small, but it boosted Allied morale and served notice that American ground combat manpower would have a significant impact on the outcome of World War I.

Cape-Xhosa Wars (1779–1878)

Nine wars between white colonists from the South African Cape Colony and the Xhosa people of the eastern coastland, leading eventually to the subjugation of “Xhosaland” by British South Africa.

In the 1770s, land-hungry Dutch settlers from the Cape Colony and the exploding Xhosa populations of the South African coast converged and clashed in the frontier called Zuurveld. Unlike other southern African peoples, the Xhosa were more numerous, better organized, and no less adept at commando-style combat than the trekboer Dutch. In 1779, the first of the Cape-Xhosa wars erupted in a series of reprisals between militias of both sides. After two years, the hostilities sputtered out. This 1779–1781 conflict would be the first of nine Cape-Xhosa wars spread over the next century.

Throughout the next decade, Prince Ndambe sought to tighten control over the Zuurveld Xhosa. In 1793, Cape Boers, fearing Ndambe’s growing strength, tried to drive the Xhosa out of the Fish River zone. Instead, the Xhosa reacted strongly and drove out the white settlers. Cape governor H. C. Maynier rescued the settlers from total rout, but his 1795 treaty left the Xhosa in virtual control of the Zuurveld and let them keep plundered Boer farms and cattle. Infuriated, the Boers chased Maynier out of Cape Town but, before they could return to the Zuurveld, Great Britain seized and occupied the Cape. Catching the colony in turmoil, the Xhosa started the third war in 1799 and, by the truce of 1803, had proven their mettle to British forces. The Zuurveld remained under Xhosa domination.

In 1806, however, the British reinforced their position in the Cape. Among their goals was incorporation of the Zuurveld as an area for white settlement and the imposing of a fixed frontier between the colony and Xhosaland.

The 1811–1812 Fourth Cape-Xhosa War consisted of a direct invasion of the Zuurveld, driving Prince Ndambe and his people east across the Fish River. Xhosa Zuurveld refugees packed into the overpopulated Xhosa lands, caus-

ing a near civil war between Ndambe and another ruler, Ngqika. A religious visionary, Makana preached unity of the Xhosa in a divinely inspired war to drive out the whites, and his followers helped overthrow Ngqika, who had sought Cape help against his rival. When the Cape attempted to support Ngqika in 1818, Ndambe and Makana besieged Grahamstown, the key Cape fort in Zuurveld. The attack turned into disaster and the British drove the Xhosa further eastward from Fish River past the Keiskama River. At the end of this Fifth War (1818–1819), Britain created an open buffer zone between the colony and the Xhosa. However, the zone itself became an arena of conflict among illegal British, Boer, and African squatters.

In 1834–1835, land desperation drove the Xhosa to revolt again, the Sixth Cape-Xhosa War. Impressed by Xhosa fighting capabilities, the British at first pledged to contain white infiltration. Nonetheless, colonists continued to settle in Xhosa territory, causing new communal frictions. Finally, British demands on Xhosa border communities set off the 1846–1847 War of the Axe, the Seventh War. Again victorious, Cape authorities directly occupied Xhosaland, making Xhosa chiefs agents of the crown in the new Kaffraria colony. Heavy-handed magistrates, intrusive settlers, and prohibitions against various Xhosa customs provoked a massive uprising from 1850 to 1852. Drained by another defeat and by starvation, the exhausted Xhosa staged their last, doomed uprising, the Ninth War, in 1877–1878.

Caporetto (24 October–9 November 1917)

Austro-German World War I breakthrough that exposed the demoralization of the Italian army and demonstrated the effectiveness of new assault tactics.

Having endured 11 Italian offensives along the Isonzo River between June 1915 and September 1917, the Austrians had enlisted German help in driving the Italians back beyond the Tagliamento River. To counter the 53 German and Austrian divisions massed against his own 34, General Luigi Cadorna, the Italian commander, concentrated his troops in forward trenches, almost stripped intermediate lines, and

positioned his reserves too far back for effective use. His subordinate, General Luigi Capello, thinned his left wing from eight battalions per mile of front to two battalions so as to strengthen his right wing for a riposte on the flank of Austrian attackers. Cadorna countermanded this disposition and Capello's army was in transit when the attack came.

At 2 A.M. on 24 October, the Germans and Austrians began an intense two-and-a-half-hour gas and heavy mortar attack around Tolmino and Caporetto, horribly effective because of inadequate Italian gas masks and the crowding of troops in frontline trenches. At 6:30 A.M. the shelling resumed, targeting Italian command and communications, munitions, and artillery. Assault units jumped off at 7 A.M., bypassing strong points and infiltrating rear areas. German and Austrian divisions streamed through the 15-mile hole torn in the Italian defenses. Capello's army was split and retreated in confusion. Officers abandoned their troops and units surrendered en masse.

Cadorna improvised a defense on the Tagliamento, the original objective of the attack, but the Germans and Austrians, flushed with success, crossed the river on 2 November. A week later, their attack reached the Piave River, only 20 miles from Venice. In two weeks the Italians had lost 250,000 prisoners, 300,000 deserters, 40,000 killed and wounded, and had been pushed back 80 miles. And the Germans had gained valuable training and experience in breakthrough tactics that they would put to good use the following spring on the western front.

Carleton, Sir Guy (1724–1808)

British commander who laid the foundations of what eventually became the provinces of Upper and Lower Canada.

Guy Carleton was born at Strabane, Ireland, on 3 September 1724, and he joined the army in May 1742. In 1758 he was present at the successful siege of Louisbourg under Jeffrey Amherst, and the following year he fought under James Wolfe at Quebec. In light of his excellent service, Carleton gained appointment as governor of Quebec in 1766, and over the next decade he successfully reconciled the Catholic, French-speaking population with English rule.

When the American Revolution broke out in April 1775, Carleton ordered most of his garrison south to Boston. Ten months later he confronted and managed to defeat a much

larger American invasion force during Benedict Arnold's assault on Quebec, on 31 December 1775. Reinforced the following spring, Carleton slowly began pushing the invaders back and built a fleet on Lake Champlain to invade New York. His forces again defeated Arnold at Valcour's Island in October 1776, but the season was too advanced to continue. Carleton was eventually superseded by General John Burgoyne, and after the war ended in 1783, he directed the evacuation of British forces in New York City. He spent the next 13 years ably administering Canadian affairs before dying in Ireland on 10 November 1808.

Carlist Wars (1833–1876)

A struggle between absolutists and liberals but also a dynastic conflict. The First Carlist War, 1833–1839, commenced at King Ferdinand VII's death in 1833. He had revoked the Salic law prohibiting female inheritance of the Spanish throne so his daughter Isabella II (1830–1904) could become queen. Maria Cristina, Ferdinand's fourth wife and Isabella's mother, acted as regent and was supported by the Quadruple Alliance of Spain, Portugal, Great Britain, and France of 22 April 1834. This infuriated the former heir, Ferdinand's brother, Don Carlos, Maria Isidoro de Bourbon (1788–1855), an extremely conservative Sandhurst-educated traditionalist planning to revive absolutist monarchical traditions. With secret support from the papacy, he was proclaimed Charles V by the Catalans and the Basques, who envisioned him as crusading for the faith but also as a useful tool in their long struggle to maintain their ancient traditions and rights.

Initial Carlists successes were due to the superb tactics of General Tomas Zumalacarregui. But General Baldomero Espartero defeated Carlists at Luchana in 1836 with foreign aid. The 1837 Carlist offensive against Madrid failed, as did frequent attempts to attack Bilbao. Without Don Carlos's permission, commander Rafael Maroto compromised by signing the Convention of Vegara in 1839 in exchange for amnesty and liberal recognition of Basque legal privileges. No major city was won by the Carlists, despite brilliant guerrilla tactics led by Ramón Cabrera, who fought on until 1840. Executions, senseless reprisal killings, and unspeakable inhumanity characterized this civil war.

Don Carlos fled into exile in France and abdicated his pretensions in 1845 in favor of his son, Carlos Luis de Bourbon, whose abortive 1860 insurrection yielded nothing. His brother Juan became Carlist leader in 1867 but transferred his rights to his son Don Carlos III, Duke of Madrid. After inept and corrupt Isabella's deposition during the Spanish Revolution of 1868, Duke Amedeo of Aosta (1845–1890) became king. He abdicated in 1873, however, renewing Carlist military initiatives.

The Second Carlist War, 1873–1876, was a brutal conflict in which the Carlists seized Alcoy, Cadiz, Bilbao, Cartagena, Valencia, and Pamplona. By 1875 Carlists repeatedly lost savagely fought battles.

In 1876 Isabella's son Alfonso XII (1857–1885) became king and the fighting ultimately led to the Basques losing their independence. Don Carlos escaped to France and the Carlists were banished from Spain.

Carlists could not revive their movement until the 1930s. Then they slowly began to rebuild their organization because the church, their rallying point, was under great pressure from the new Spanish Republic. Carlists, naturally, joined the Nationalists Falange of General Francisco Franco, and fought with distinction in the Spanish Civil War (1936–1939). However, Franco made Bourbon prince Juan Carlos his successor in 1969, and in 1975 he ascended the throne. The Carlists, headed by Carlos Hugo, Duke of Bourbon-Parma, then withdrew to France.

Carnatic Wars (1744–1754)

In the middle decades of the eighteenth century, the Carnatic, encompassing the southeastern extremity of India, was ripe for conflict among a variety of interests. In 1638, the English East India Company had founded a trading “factory” at Madras. A century later, France established its own factory less than 200 kilometers to the south, at Pondicherry. Yet, while the First Carnatic War (1744–1748) paralleled the War of Austrian Succession (1740–1748), the conflict on the subcontinent did not represent the expansion of the Euro-

pean struggle into a global war. Indeed, when word arrived of the outbreak of war in Europe, Joseph Dupleix, Governor of Pondicherry, sought to maintain peace between the French and British traders. Conflict proved inevitable, however, when Commodore Curtis Barnett's squadron arrived to prey on French shipping in 1745, a move countered by the French in June 1746. In the battle of Negapatam, 25 July 1746, Count de la Bourdonnais's squadron successfully drove the British naval forces from the Indian coast, and, together with land forces under the command of Dupleix, captured Madras in September 1746.

In the meantime, the conflict had not been limited to European combatants. Indeed, as primarily trading interests, the French and the British companies needed Indian military assistance. Both Madras and Pondicherry lay within the province of Anwar-ud-din, the Nabob of Arcot, and with the outbreak of hostilities between the Europeans the nabob allied himself to the British. In the event, this was unfortunate for the nabob and of little assistance to the citizens of Madras. On 21 September 1746, 11 days after the fall of Madras, the nabob's relieving army of 10,000 cavalry was defeated by a force of little more than 500 Frenchmen. Despite the capture of Madras and the defeat of Britain's indigenous allies, the laurels of victory were not to be France's alone. In November 1746, Dupleix commenced the siege of Fort St. David, south of Pondicherry at Cuddalore. Eighteen months later, in April 1748, the French were forced to raise their siege with the arrival of a British squadron under the command of Admiral Edward Boscawen. Boscawen, with land forces under the command of Major Stringer Lawrence, moved against Pondicherry in August 1748. However, the able defense of Dupleix and the onset of the monsoon season forced the British to raise their siege in October. At the end of 1748 word of peace between Britain and France arrived and, with unforeseen implications for the empires of both countries, the exchange of the French fortress of Louisbourg, captured by American provincials in 1745, for Madras.

If the First Carnatic War had seen indigenous forces coming to the aid of Europeans, however ineffectively, the Second witnessed the renewal of European conflict in India through the vehicle of indigenous power struggles. It is both fitting and ironic, therefore, that the dates of the Second Carnatic War (1749–1754) lie between those of the War of Austrian Succession and the Seven Years' War (1755–1763). The death in 1748 of Nizam ul-Mulk, the nabob of Hyderabad, precipitated the Second Carnatic War. Taking advantage of the confused political situation, Chanda Sahib moved against the pro-British Nabob of Arcot, and with the aid of French forces under the Marquis Charles de Bussy, easily overthrew him. Chanda was then challenged by Mohammed

Ali, the slain nabob's son, who was in turn supported by the British. Through 1749 and 1750, Ali was supported by Nasir Jang, who had succeeded his father as nabob of Hyderabad. For his part, Chanda received the aid of Muzaffar Jang, Nasir's son, who in 1750 succeeded as Nizam after the murder of his father.

As the bloodshed within the palaces seemed to settle, matters came to a climax on the battlefield. In September 1751, Chanda laid siege to Ali at Trichinopoly, supported by 1800 Frenchmen under de Bussy. It was clear that if Ali fell, British interest in the region went with him. Yet it was equally clear that the British lacked the resources to break the siege. Ali therefore urged that what forces were available be used to attack Chanda's capital at Arcot, thus forcing him to lift the siege on Trichinopoly. On 22 August 1751, 200 Europeans, 300 sepoy, and three cannon, under the command of Robert Clive, set out from Madras. Arriving on 1 September, they found Arcot deserted by its garrison. It was not until 22 September that Chanda's son, Raza Sahib, arrived with 4,000 men, plus 150 Frenchmen, and opened a 50-day siege that failed to drive Clive from the citadel.

The loss of his capital inflicted great damage to the prestige of Chanda and his French allies. It likewise encouraged the British to go on the offensive. On 3 December, Clive, commanding a force of European and native troops, defeated superior numbers under Raza at the hard-fought battle of Arni. Chanda's forces were not entirely broken, however, and in February 1752 Raza besieged Madras. Though the British succeeded in holding the city, at Kaveripak (28 February) Clive only narrowly averted annihilation when his forces were ambushed by Raza. Despite this, it was only a matter of time before Chanda's forces were forced to withdraw from Trichinopoly, and his French allies were forced to surrender to the British at Srirangam (4 June 1752).

Defeat at Srirangam meant the end for Chanda Sahib. Captured shortly after the battle, Chanda was summarily strangled and beheaded. Though fighting would continue intermittently for the next year, with the recall of Dupleix to France in August 1754 both companies quickly agreed to end the war. Although with the end of the Carnatic Wars the British had secured their candidate as nabob of Arcot, and thus secured their position within the region, death for their protégé did not mean defeat for French interests in India. Thanks largely to the efforts of de Bussy, the French had secured their candidate (Muzaffar Jang) for the superior nabob of Hyderabad. While both European powers thus profited greatly from the conclusion of the Carnatic Wars, given the stakes involved, future conflict between them was inevitable.

Carnot, Lazare-Nicholas (1753–1823)

French soldier, engineer, scientist, and politician. Carnot, born in the French town of Nolay, entered the French army and the Royal Engineering School at Mézières in 1771. Upon completion of the course in 1773, he entered service as an engineer, and was posted to garrison towns in northeastern France. While on garrison duty, Carnot had ample opportunity for study, and also made the acquaintance of a rising lawyer, Maximilien Robespierre. Carnot wrote treatises on fortification and the motion of machines in this period.

The French Revolution of 1789 allowed him to become involved in politics. He was elected to the Legislative Assembly in 1791 and to the Convention in 1792. He voted for the execution of Louis XVI. In August 1793, he was brought on to the Committee of Public Safety by Robespierre to assist with military matters. He promoted talented officers, including Jourdan, Hoche, and Bonaparte, and set about reorganizing the French military, which had been greatly disordered by the Revolution. His scheme of reorganization included mass conscription, the amalgamation of untrained levies with former royal units, the introduction of systematic foraging into the army, and the development of permanent brigade, divisional, and corps structures. He also organized the creation of 14 armies to defend all parts of France. In 1796, he appointed Napoleon Bonaparte commander of the Army of Italy. Upon the fall of Robespierre, he was made a member of the Directory, and served until forced to flee to Switzerland as a result of the coup of the 18th Thermidor. Carnot remained in exile until Bonaparte's coup in 1799, when he was allowed to return.

Upon assuming power, Bonaparte made Carnot minister of war; Carnot resigned in 1800 after completing the organizational work for the Second Italian Campaign. As a dedicated antimonarchist, Carnot took no active part in the government of the French Empire. In 1814 he was appointed by Bonaparte as military governor of Antwerp and made *général de division*. He conducted an aggressive defense of the city, and surrendered it only after the Second Abdication of 1814 and the accession of Louis XVIII were confirmed.

During the Hundred Days, Carnot served as Bonaparte's minister of the interior, but had no time to bring an ambi-

tious plan for public education to fruition. Having voted for the death of Louis XVI, he was obliged to go into exile upon the restoration of Louis XVIII in 1815. He spent his remaining years studying and writing on physics and mechanical engineering, and died at Magdeburg, Germany, in 1823.

Carolingian Empire

The zenith of the Frankish Empire. Charles (742–814), who became known as Charlemagne, gradually extended Frankish power in western Europe. After the occupation of practically all of Gaul he succeeded in pushing back the Muslims well behind the Pyrenees. In eastern Europe he defeated the Bohemians, Avars, Serbs, and Croats. To secure his southern flank Charles attacked and defeated the Langobards in northern Italy, which gave him access to Rome. There, on Christmas Day 800, he was crowned emperor of the restored Roman Empire by the pope. Through this act the Holy Roman Empire, which dominated the history of central Europe until 1806, was born.

Charlemagne concentrated the largest territory under a single ruler in Europe since the fall of the Roman Empire. However, the Carolingian Empire still was largely a conglomeration of Gauls and Germanic and Slavic tribes in which the local dukes held the balance of power. Charles tried to overcome the traditional social structures. Standardized education, the codification of tribal laws, and the creation of a common language were some components of a universal and Christian empire in which the Frankish king as emperor was the unifying force. Even more important, however, was the introduction of a completely new territorial constitution based on counties instead of tribal duchies. The counts would be installed as imperial officials and accountable exclusively to the emperor. The counties were the basic military territorial and organizational units and the most important judicial structures. The counties situated in the endangered border territories had wider military competences. Unfortunately this administrative reorganization was never completed. Instead of replacing the old tribal structures it was co-opted by local dukes when they added the count's titles and perquisites to their own as a feudal right.

With Charlemagne's death the empire broke apart,

demonstrating just how much it was dependent on one strong man. With the Treaty of Verdun (843) Charles's heirs divided the empire into three independent kingdoms: the west to Charles II the Bald, the east to Louis II the German, and the central part to Lothair. Later this central part was shared out between the western and the eastern kingdoms, which eventually evolved into France and Germany respectively.

After the division, Frankish power withered away until in 887 Charles III the Fat was deposed as the last Frankish king. The concept of the Holy Roman Empire continued, however, taken over by Germanic Austrian kings and emperors.

Carrhae, Battle of (53 B.C.E.)

Parthians inflict a disastrous defeat on the attempted Roman invasion of Parthia headed by Crassus. Crassus commanded a force of seven legions: 28,000 heavy infantry, 4,000 cavalry, 1,000 Gallic auxiliary archers, and 4,000 peltasts (light infantry). He struck directly across the exposed arid plain of Mesopotamia, planning to reach Seleucia on the Tigris, by staging through Roman garrisons along the way.

Crassus was surprised by a force of 10,000 Parthian horsemen under Suren, chief general of the Parthian king Hyrodes. Crassus redeployed his force from the extended line to a heavy infantry square, allocating his inadequate cavalry and light infantry components equally among the four sides. Suren's Parthian cavalry archers, capitalizing on their excellent marksmanship with the powerful compound bow, incessantly inflicted casualties through coordinated high trajectory and direct fire.

In an effort to pin the elusive Parthians long enough for his heavy foot to engage, Crassus rested his men near the Balissus stream and sent his son Publius ahead with a combined force of 6,000 legionnaires, cavalry, and Gallic bowmen to where the enemy was thickest. A section of Parthian horse feigned retreat long enough to separate Publius from the main body. An attack of heavy lancers caused Publius to concentrate his men to receive cavalry, making a more com-

pact target for the mounted archers, who decimated the Romans, killing Publius.

Crassus's calculation that the Parthians were nearly out of arrows was dashed when he observed a camel supply train regularly replenishing the Parthian quivers. Crassus attempted an orderly nighttime withdrawal to the garrison at Carrhae. When his broken remnant reached the town walls, they learned that supplies were inadequate to withstand a lengthy siege. While attempting to negotiate with Suren, Crassus was murdered. Crassus lost 24,000 killed and some 10,000 prisoners.

Carus (Marcus Aurelius Carus)

(r. 283–284)

Soldier emperor who marched on Ctesiphon. Carus was from Gaul and served as Praetorian prefect for Probus (276–282). Elevated by the troops after Probus's murder, Carus announced to the Senate that he was filling the vacant throne.

Leaving his eldest son, Carinus, as caesar in the west, Carus led troops against Persia with Numerianus. The Sasanid king, Varanes, was considered weak. Factions within his court were vying for power. When Persian ambassadors came to the Roman camp, they found Carus seated on the ground enjoying the same rations as his soldiers. Carus curtly told them that unless Varanes acknowledged Rome as his master, Carus's army would render Persia as bare of trees as the emperor's own bald head.

True to his threat, Carus took Ctesiphon, and then penetrated beyond the Tigris. There he died suddenly and mysteriously, allegedly struck by lightning. An ancient prophecy had declared the Tigris the eastern frontier of the empire. Roman conquest was to go no further. Apparently filled with superstition, the army pressured the new emperor, the young Numerianus, to march out of Persia with victory almost within his grasp.

Cassino, Battle of (17 January–18 May 1944)

One of the most bitter and costly battles fought in Italy during World War II. The town of Cassino and Monte Cassino, site of the monastery founded in the sixth century by St. Benedict, anchored the German defensive Gustav Line that barred the Allied advance on Rome. German forces defending Cassino were under the command of General von Senger und Etterlin. In the first battle of Cassino the U.S. 34th Division fought bravely, only to be beaten back from the monastery walls. The Free French Expeditionary Corps, mostly colonial troops from North Africa, made some limited gains, at equally heavy cost. In the second battle, 15–18 February, it was hoped that the New Zealand Corps (2d New Zealand Division and 4th Indian Division) would be able to burst through the last few hundred yards. Its commander, General Bernard Freyberg, supported the requests of his divisional commanders to have Monte Cassino bombed, since all the troops were convinced that the Germans used the monastery as an observation post.

No event of the war caused more heated and lingering controversy than the Allied bombing of Monte Cassino on 15 February 1944. Critics have condemned the bombing as "a tactical mistake," "a criminal act," and "inexcusable." However, General von Senger himself had ordered that German defensive positions were to be made right up to the monastery walls if necessary. After the bombing, the elite 1st Parachute Division held the monastery ruins for three more months.

In May 1944 the Allies launched one of the great set-piece battles of the war that broke through the Gustav Line. Polish troops captured Monte Cassino on 18 May after taking almost 4,000 casualties. On 4 June the Allies liberated Rome.

Cassius (Gaius Cassius Longinus) (d. 42 B.C.E.)

Roman politician and soldier who participated in the conspiracy against Julius Caesar. Born into an illustrious senatorial family in the first half of the last century B.C.E., Cassius moved through the traditional *cursus honorum* of offices,

serving as quaestor in 54 B.C.E., tribune in 49, legate for Caesar in 47, and praetor in 44 B.C.E. He served on Crassus's command staff during his disastrous campaign against the Parthians, surviving the massacre at Carrhae in 53 and successfully organizing the defense of Syria.

Fighting for Pompey during the civil war, Cassius held a naval command, submitting to Caesar only after Pompey's death in 48 B.C.E. However, privately he remained opposed to Caesar and, with his brother-in-law Brutus, assassinated him in 44. Although initially supported by the Senate and awarded imperial authority, the conspirators were declared outlaws in 43 and pursued by their adversaries Antony and Octavian (Augustus). Cassius and Brutus obtained the loyalty of most Roman troops in the eastern provinces and moved their armies into Greece, where they were routed at Philippi and committed suicide in 42 B.C.E.

Castro Ruz, Fidel (1926–)

Cuban dictator. Born Fidel Castro Ruz on 13 August 1926 at the family plantation in Oriente province. Though his father was a Spanish immigrant from Galicia, he had amassed enough wealth to send Castro to the best Jesuit schools in Oriente and Havana. By 1945, Castro had enrolled in law school at the University of Havana. There he participated in the usual student activism, as well as gangsterism. The one political group with whom Castro associated was known as the Unión Insurreccional Revolucionaria. He was defeated in several student elections, but became known as a fine orator. In 1948, Castro became associated with and participated with those who made the Colombian *Bogotazo*. The Bogo-

tazo were a series of bloody riots in Bogota, ignited by the assassination of Liberal Party leader Jorge E. Gaitán. Though pursued by Colombian police, Castro escaped to the Cuban Embassy, whence he was able to effect his escape. Returning to the university, he became a follower of Eduardo Chibás, leader of the Partido Ortodoxo. The party's agenda was one that Castro favored—social justice, end to corruption, and economic independence. Castro was a candidate for the Cuban congress in 1952, when General Fulgencio Batista took power. Due to this coup, elections were never held.

Castro organized a group of his followers and on 26 July 1953 they abortively attacked the Moncada Barracks in Santiago de Cuba. For this he was sent to jail after uttering in his own defense that though he might be condemned here, “history will absolve me.” Given amnesty by the Cuban Congress in 1955, he traveled to Mexico to organize an expeditionary force to overthrow Batista. On 2 December 1956 he embarked for Cuba aboard the yacht *Granma* with about 80 men. After landing, they took to the Sierra Maestra mountains, which offered good shelter, and commenced guerrilla warfare against the inept Cuban government and army. By December 1958, the Batista regime was on its way out. Finally, on New Year's Eve Batista fled and Castro took power the next day. Castro never held elections, although he claimed that the vast majority of the Cuban people supported him, and embarked on a program of socialization of the island. Lavish Soviet subsidies, the equivalent of \$1 million per day, somewhat covered the numerous failures of the economy, as lines for everyday goods and food staples as well as rationing persisted. As in the Soviet Union, a privileged political class had access to those necessities either rationed or in very short supply to the bulk of the population. The collapse of the Soviet Union vastly exacerbated socialist Cuba's problems. In 1953, according to UN figures, Cuba had one of the highest per capita incomes in Latin America; after four decades of socialism, it had one of the lowest. Castro, of course, blamed these failures on the U.S. embargo clamped on the country since the early days of Castro's dictatorship. The aging dictator managed to retain some measure of popular support (as in the Bay of Pigs invasion early in his regime) by championing Cuban nationalism against the “bully to the north,” and by constantly warning of an invasion at any moment by the *yanquis*. But, far from being “absolved by history,” by the opening of the twenty-first century, history seems to have passed Castro's Cuba by.

Castro-Cuban Revolution (1959–)

The result of public frustration with the failures of Cuba's first 60 years of independence. Sugar was the major component of Cuba's economy, and, with the development of the island's railway network, big landowners and mill owners gradually came to dominate the industry. This trend accelerated with increased American investment in sugar growing. Cuba's small independent farmers were gradually reduced to a marginal existence. Because of diminished purchasing power, other industries failed to develop. From the 1920s on, income from sugar exports generally declined owing to growing foreign competition, despite some years of record production. Public disillusionment was compounded during several dictatorships led by Gerardo Machado (1925–1933) and Sergeant, later Colonel, Fulgencio Batista (1933–1944 and 1952–1958), which alternated with democratically elected but often corrupt political regimes.

American diplomatic meddling often complicated leadership struggles. Fidel Castro Ruz (born 1926), son of a wealthy farmer in northwestern Cuba, studied law at the University of Havana. From his midtwenties, he was involved in revolutionary activities against the Batista regime. He advocated land and educational reform, an end to government corruption and excessive arms expenditures, and a return to constitutional government, while hoping to avoid the mistakes made by previous administrations. His failed attack on the Santiago army barracks (July 1953) led to an 18-month prison term, during which publication of *History Will Absolve Me*, the speech Castro had given at his trial, brought him national recognition.

Freed in a general amnesty (1955), Castro landed in Oriente province in November 1956 with a small group of followers, some of whom were Communists. His supporters included Castro's brother Raul and Ernesto “Che” Guevara (1928–1967), an Argentinian-born physician and revolutionary. Although the operation was betrayed, the Castro brothers, Guevara, and a few others escaped to the Sierra Maestra mountains. There Castro's political strength grew, helped by a series of favorable *New York Times* articles by Herbert Matthews. Batista's increasingly brutal military repression brought Castro's guerrilla movement increased public support. By late 1958, Batista's unprofessional, poorly led, and unmotivated army was no match for Castro's much smaller force, led by Guevara. The United States ended its arms supply to Batista in March 1958. Lacking American

support, Batista failed in an attempt to put a puppet president in place using preprinted ballots. With Castro's *barbudos* (bearded ones) in the city's outskirts, Batista and some cronies fled the Cuban capital on 1 January 1959. Castro's forces entered Havana two days later.

Casualties, War in the Twentieth Century

War in the twentieth century has been characterized by appalling suffering and death, brought about by the weapons of mass destruction and the demands of "total war." One would have to go back to the seventeenth century's Wars of Religion to see parallels to the racial and ethnic hatreds that led to the wars of the twentieth century, and back even further to the times of the Mongol conquests to find comparable death totals.

The murderous ideologies of the twentieth century have made it fairly certain that the century will be remembered as the century of megadeath. The Nazi Holocaust claimed some 6 million Jews, as is well-known. But millions of Slavs, Gypsies, Poles, and other "subhumans" also died in German concentration camps during World War II. At the same time, Allied bombers killed hundreds of thousands of civilians in German and Japanese cities. (Some have calculated that a broad-based pyramid 100 feet high could have been constructed of the dead children alone immolated in the great Tokyo fire raid of March 1945.) The Japanese themselves slaughtered literally millions in their invasion of China between 1937 and 1945.

Yet many of the worst killings of the twentieth century were actually not the direct result of any wars or conflicts. The man-made famines in Ukraine in the early 1930s, China's 1960s' aberrant "Great Leap Forward," and the Ethiopian famines of the 1970s and 1980s were actually conducted in peacetime, to test academic agrarian reform theories. The theories did not work, and millions died. Stalin's incomprehensible blood purges are supposed to have cost

several million Soviet lives in the 1930s and 1940s. But tiny Cambodia has the dubious distinction of having suffered, per capita, more violent deaths than any other nation or people in the violent twentieth century; some 1 million of a population of a little more than 4 million, inflicted by the Marxist Khmer Rouge after the close of the second Vietnamese War. The danger is that humanity in general will grow callous to megadeath, the legacy of the twentieth century. In the words of one who practiced megamurder, Joseph Stalin, "One person's death is a tragedy, a thousand is a statistic."

Catapults

The artillery of ancient and medieval warfare. Catapults were among the earliest mechanically powered weapons. Based to some extent on the simple principle of a bow and arrow, initial examples were relatively straightforward attempts to increase the range and penetrating power of missiles by strengthening the bow and the stock that propelled them. The early *gastraphetes* of the Greek times, powered by the arm and stomach muscles of the warrior (hence the name), were in time replaced by the more powerful torsion catapults—the *euthytonon* (an arrow-shooting machine) and the *palintonon* (a stone-thrower). These made it possible to use larger and more lethal missiles over longer distances, aspects that were crucial to military expeditions, especially when cities were well fortified, and consisted of multiple sets of walls and moats.

The popular use of catapults by the Greeks and Romans is verified through the accounts of glorious war victories, including several by Alexander the Great, who employed these war machines even in his far-flung eastern expeditions. The art of building catapults survived through the Middle Ages, and was used efficiently at the Vikings, by Genghis Khan's massive Mongol armies, the crusader forces, and finally Tamerlane, who flung diseased carcasses of animals into fortified cities spreading death and destruction. By the sixteenth century the *trebuchet*, a modified catapult with a single pivoted arm, but with considerable force and a high trajectory, was the warring world's precursor to advanced gunpowder and ballistics.

Cavalry

The noble arm of battle.

The traditional horse-borne arm of mobility and shock from 2000 B.C.E., when chariots began to be used in organized warfare, till rapid-fire weaponry and mechanization swept the horse from the battlefield. While chariots were dominant in Bronze Age militaries across Eurasia, men rid-

ing directly on horses supplanted the inflexible chariot, beginning with the Assyrians in the seventh century B.C.E. This process reached its pinnacle in the army that Alexander the Great took to war. Integrating infantry and cavalry, using both missile weapons and shock action, to coordinated effect, this army remains a model for combined arms.

The tactical equation is that disciplined infantry can usually withstand cavalry seeking to break their ranks by main force and personal weapons (“shock action”), and Rome certainly epitomized this, despite the challenge of cavalry-dominated forces such as the Hellenistic armies of Hannibal and Pyrrhus or the Parthians. Due to many factors, though, Rome was overrun when its military machine broke down and it faced the challenge of the steppe horseman, starting with the Goths but epitomized by the Huns.

The Huns were not the first nomadic horsemen to make their mark on Western history, but they represented a factor that the Eurasian world would be contending with into the 1400s. With tough steppe-bred horses, the invention of the

stirrup, and recurved compound bows, all the hordes needed were leaders capable of pulling together disciplined armies capable of defeating more sedentary societies.

While the medieval period was the epoch of the hordes, the armored horseman was also coming into his own. In another creation of the Near East, the Romans attempted to deploy heavy cavalry as early as the time of Hadrian. This began a trend by which the Roman army became a force of cavalry regiments, as opposed to infantry legions, as a premium was placed on mobility. This process eventually led to the creation of the feudal knight and a whole new social order.

Both forms of horseman, the knight and the steppe nomad, remained dominant into the thirteenth century, when a number of forces began to erode their predominance, such as the return of disciplined infantry and improved missile weapons, though this only brought a certain balance back to the battlefield. Further, the mounted man-at-arms was as likely to fight afoot as a heavy infantryman, where his

weaponry and skill could bolster a battle line, despite the romantic image of the knight in single combat. It took the arrival of firearms simple enough to be used on horseback and capable of piercing all but the best armor to end the reign of the armored horseman. Once pistol-armed riders were capable of outmaneuvering the man-at-arms, the use of armor rapidly dwindled to near irrelevance by the end of the seventeenth century.

While firearms slowly eroded the cavalry's value as a shock arm on the battlefield worldwide, there was a compensatory trend in the creation of the dragoon in the seventeenth century, bodies of men capable of fighting as infantry or cavalry and useful for scouting, raiding, and "screening" purposes. Diverging over time into general-purpose cavalry and mounted infantry, such troops remained relevant into World War II, wherever terrain prevented the use of heavy forces and allowed freedom of maneuver. In fact, mounted troops have been used in antipartisan operations as late as the 1970s in Rhodesia and Portuguese Africa.

Having emphasized tactical considerations, it should never be forgotten that cavalry, be it the knight, the samurai, cavaliers, or sipahis, was the prestige arm of most armies. The expense of horses and the difficulty of mounted fighting generally reserved the role of cavalry for social elites, leaving a cachet that sustained that arm into the twentieth century. Even the tank was originally designed to break through trench positions—and allow the cavalry to get in among the enemy. Though now mounted in armored vehicles and helicopters, U.S. cavalry officers still wear spurs as part of their dress uniform.

CEDAR FALLS, Operation (January 1967)

A major allied offensive in the Vietnam conflict. The American strategy for the Vietnam conflict was to kill, wound, cap-

ture, or cause to desert more enemy than the enemy could reasonably replace. At the point the attrition rate went negative, so the reasoning in Washington went, the enemy would end its aggression. Thus, the U.S. command favored so-called search-and-destroy missions, in which U.S., South Vietnamese, and/or allied forces typically would land to establish a strong point or anvil, and then strike forces would land and drive—or hammer—the enemy to the anvil and destroy it and its base/resources.

A classic example was Operation CEDAR FALLS, which sought to clear out a long-standing Vietcong base area known as the "Iron Triangle," northwest of Saigon. The operation began on 8 January 1967 with the anvil forces (several U.S. and Vietnamese divisions) moving into position; then the so-called hammer (more U.S. troops) began to descend on January 9.

Unexpectedly, the Vietcong main force units, the object of the operation, eluded the hammer group and escaped into the jungle. Nineteen days later the operation ended, and the U.S. claimed to have seized large quantities of arms and equipment and to have destroyed the base area, including an extensive and amazing tunnel complex. In fact, the base area was not destroyed, and the Vietcong returned to launch attacks on Saigon. The operation illustrated the problems with a strategy that conceded the strategic initiative—that is, whether to fight or not—to the enemy and then to abandon territory that was seized after hard fighting.

Celts

The name applied by Greco-Roman writers (Keltai/Celtae, Galatai/Galatae, and Galli) generally to peoples occupying lands north of the Mediterranean, not all of whom actually spoke languages now identified as Celtic, and were thus culturally *Celtic*.

Greece and Rome mostly knew the Celts as invaders with a fearsome reputation for aggressiveness and, in the words of Strabo, "madly fond of war, high spirited, and quick to

battle.” There is no doubt that warfare played a central role in Celtic society. For the nobles, raiding offered an opportunity for wealth and prestige. Their retinues could only be maintained by actual fighting, and formed the nucleus for a tribal army primarily composed of all free tribesmen able to equip themselves. War bands based on clan, familiar, and settlement groupings made a man’s relatives witnesses to his behavior.

Body armor was rare. The combination of shield, long slashing-sword, and spear(s) formed the equipment of most warriors. The appearance of the individual, his size, expressions, and war cries, added to the din of clashing weapons and of the war trumpet (*carnyx*), was clearly intended to intimidate any opposition. If an enemy could be persuaded that he was going to lose, then a Celtic charge would drive all before it. As was common in tribal armies, Celtic warriors were poorly disciplined, and had no training above the level of the individual.

The highest-quality troops were the cavalry. Recruited from the wealthier nobles and their retinues, equipment was of good quality. It consisted of a shield, spear, sword, and often a helmet and mail armor. Added to this was the four-horned saddle, later adopted by the Romans, which provided a secure seat. The morale of these horsemen was usually very high, but discipline was normally poor.

In early encounters between Celt and Roman, it was the two-horse war chariot that drew the latter’s interest the most. The main use of the chariot was psychological, to cause panic. Charioteers would drive their vehicles in a rush against the enemy lines, the warriors throwing javelins. This, coupled with the speed and noise of the chariots, would be enough to unsettle the opposition. Once these preliminaries were finished, the warriors dismounted from their chariots and fought on foot, while the charioteers kept their chariots at the ready for a speedy retreat. Some 1,000 chariots took part in the battle of Sentinum (295 B.C.E.). At Telamon (225 B.C.E.), the chariots were stationed on the wings of the Gallic army. As the prowess and agility of their horsemen increased, the Gauls gradually gave up their chariots. They were no longer in fashion in the time of Caesar. He was surprised to find them still in use in Britain. Later, Tacitus mentions chariots in the Caledonian army at Mons Graupius.

Central American Federation Civil Wars (1826–1840)

Series of civil wars that led to the dissolution of the Central American Federation. The United Provinces of Central America, consisting of the present-day nations of Guatemala, El Salvador, Honduras, Nicaragua, and Costa Rica, gained independence from Mexico on 1 July 1823. From the very beginning, the fledgling nation suffered from a lack of cohesiveness and from deep economic, political, and social divisions, which resulted in various periods of civil war leading to the eventual dissolution of the federation.

In 1826 hostilities broke out between the Conservatives, led by President Manuel José Arce of El Salvador, and the Liberals, whose most prominent early leader was the Honduran Francisco Morazán. Morazán led his army to victory over federal forces in Honduras and El Salvador in 1828 and pacified Guatemala in early 1829. When Morazán became president in 1830, he initiated a reform program that was particularly harsh on the Catholic Church. In Guatemala, the Liberal governor Mariano Gálvez, with the encouragement of the federal government, confiscated church property, ended some religious feast days, and legitimized divorce. When the Liberal Guatemalan government instituted the Livingston Codes on 1 January 1837, a peasant revolt quickly ensued. The popular uprising soon found a leader in José Rafael Carrera, who organized the peasants and issued a manifesto demanding abolition of the Livingston Codes, the restoration of religious orders, reinstatement of the archbishop, end of the head tax, and recognition of his authority. Gálvez resigned his position and Carrera’s insurgents stormed into Guatemala City on 31 January 1838.

When Carrera’s movement joined forces with the Conservatives, Morazán was determined to crush the insurgent movement and restore federal control of Guatemala. In addition, there were conservative movements against the federal government in the other four provinces. The battle lines were clearly demarcated in 1838. Carrera and the Conservatives stood for autonomy; Morazán and the Liberals wanted to preserve the federation. In 1839 Morazán gained the upper hand and briefly reestablished federal power in much of Guatemala. However, Carrera renewed his campaign to defeat Morazán and to rid Central America of the Liberals. He adroitly formed alliances with conservative groups in Honduras and Nicaragua. He drove the liberal army from Guatemala, El Salvador, and Honduras and subdued the rebellious area of Los Altos. The final blow was delivered in March 1840 when Carrera defeated Morazán’s army at Guatemala City. Morazán evaded capture and fled to David in Panama. The United Provinces of Central America was dissolved and the five nations soon became independent republics. In 1842

Morazán made one last attempt to regain power with a revolt in El Salvador followed by an invasion of Costa Rica. His movement lacked popular support and he was captured, tried, and, on 15 September 1842, executed by firing squad. Carrera dominated politics in Guatemala, first holding the presidential chair from 1844 to 1848 and in 1854 declaring himself president for life. He died in 1865.

Central Intelligence Agency

Principal intelligence and counterintelligence agency of the U.S. government, founded 18 September 1947. The Central Intelligence Agency (CIA) grew out of America's wartime experience with the Office of Strategic Services (OSS) and the need to centralize the collection and dissemination of strategic intelligence.

In 1947, Congress passed the National Security Act, creating the National Security Council (NSC) and, under its direction, the CIA, which was to advise the NSC on intelligence matters pertaining to national security. During the time of the CIA's creation, the idea of a single intelligence service had given way to the concept of an "intelligence community" comprising the Defense Intelligence Agency (DIA), State Department Intelligence, National Security Agency (NSA), and others, with the CIA as overall coordinator.

The CIA has come to perform three major assignments: (1) foreign intelligence collection, evaluation, and communication; (2) counterintelligence operations overseas; and (3) secret political intervention, psychological warfare, and paramilitary operations in foreign areas.

It is the third area of responsibility where the CIA has earned not only its greatest successes and failures, but also an aura of controversy. In Italy, the CIA's financial and technical assistance was successful in aiding the Christian Democrats in defeating communist parties in the 1948 parliamentary elections. Another major covert operation was the toppling of Mohammad Mosaddeq as premier and the restoration of the shah of Iran in 1953.

Among the failures of the CIA was the 1961 Bay of Pigs

invasion of Cuba by CIA-supported anti-Castro dissidents. Finally, the CIA played a major role in the Kennedy administration's successful management of the Cuban Missile Crisis.

More recent years have given up convincing evidence of CIA law-breaking in the surveillance and manipulation of and experiments upon unwitting American citizens and the infiltration of dissident but legal domestic organizations. Because of these illegal activities and the failures noted above, the CIA has come under increasing scrutiny and control by the federal executive and Congress to the extent that some authorities now question its effectiveness.

Cerisolles, Battle of (11 April 1544)

Tactical lesson of the Italian wars. By 1544, the Italian wars had turned into a generalized European conflict. France had to fight in Italy, but at the same time against the imperialist army on its eastern borders and along its northern coast to prevent English incursions. In Italy, war raged for more than 40 years without decisive result. During the new campaign along the Po, the French main army, commanded by the 24-year-old Duke d'Enghien, faced a veteran army of Spanish and German soldiers led by the Marquise Del Guasto.

Strategic planning by Henry VIII and Charles V assigned an important role to Charles's army in Italy: It was to cross the Alps and take Lyon; while it did this Charles would invade Champagne, and Henry VIII, Picardy.

To prevent an attack on the French southern borders, d'Enghien decided to besiege Carignano with 14,000 soldiers. In order for Del Guasto to relieve the besieged town with 20,000 infantry, he had to cross the Po using a bridge held by the French. D'Enghien chose to face the imperialists with his back to the river, making retreat all but impossible.

At dawn on 11 April 1544, the French deployed their troops in three "battles," mainly infantry. On their right were 800 skirmishers led by Blaise de Montluc, positioned to slow any imperialist advance. At 7 A.M., sporadic fire erupted into a continuous fight as the imperialists encountered Montluc's men. Skirmishing lasted for four hours with no winner, but by noon the imperialists were unsteady and retiring

slowly. Noting this fact, Del Guasto launched his main force of 10,000 Landsknechten against the French center. With the help of artillery, the German mercenaries advanced without fear against their Swiss opponents, but the huge German column was taken in the flank by French fire and stalled. D'Enghien, unaware of the success of his left, ordered repeated charges against the Spanish, led personally by Del Guasto. Del Guasto then stopped the attack on the right, thereby leaving the left flank of the Germans unprotected. The French cavalry charged at once and routed the Landsknechten. The Spanish, alone now, held the French at bay as long as they had powders for their guns and then surrendered.

Imperialist casualties in the battle amounted to 12,000, with 3,000 prisoners, but the victory was without political consequence for France, which was still invaded in September, as previously agreed upon. But the invading forces had to face the victorious troops returning from Italy. The battle of Cerissoles foreshadowed the weakness of blocks of pikes and underscored the importance of flanking movement.

Cerro Gordo, Battle of (Mexican War, 17–18 April 1847)

A significant battle in the Mexican-American War that opened the way to an assault on Mexico City itself. Hoping to stop American general Winfield Scott as he passed through a long and narrow defile of the National Road, the Mexican commander, General Antonio López de Santa Anna, carefully placed artillery batteries and infantry to make the defile impassable, and assumed that no route around his position existed. Santa Anna established his strong defensive position at Cerro Gordo about three days' march inland from Veracruz.

Scott ordered a complete reconnaissance of the area, and several junior officers found a mule path, a mere trail, around and behind the Mexican left. Scott ordered the path widened to permit a large force to outflank the Mexican defenses.

The attack, beginning on 17 April, on the Mexican left and El Telegrafo hill was difficult. Scott had wanted a

demonstration straight up the National Road to fix the attention of the defenders while he sent a strong column around the widened mule path, but the demonstration began rather late. In the meantime, American troops had to drag heavy artillery up steep hills, cross various barriers, and fight against brave troops defending the key position on the left, the hill of El Telegrafo. But by the next day the hill was seized, and the Americans surged down at the remaining Mexican defenders, who engaged in a general retreat.

The Americans thereupon continued on to Jalapa and rested at Puebla as Scott wrestled with issues of terms of enlistment, troop numbers, and supplies, and as Santa Anna prepared the defenses of Mexico City for the expected attack.

Chaco War (1932–1935)

War between Bolivia and Paraguay for possession of a vast but desolate area, the Chaco Boreal, which both had claimed since gaining independence and saw as an important area for future development. Bolivia was also interested in gaining an outlet to the Atlantic by establishing ports on the Paraguay River. Both sides were ill-prepared and underestimated the formidable terrain where they had to wage war. The Paraguayans were able to mobilize faster and expanded their army from 3,000 to 60,000 men. Paraguay also found a competent leader in General José Estigarribia, who won the full backing of his government. Bolivia, on the other hand, failed to declare a general mobilization and the military command and civilian leadership bickered over strategy. Nevertheless, Bolivia advanced and quickly overran several small Paraguayan outposts. Estigarribia mounted a counter-attack on Fort Boquerán on 29 September 1932 and drove the Bolivians back, but both sides sustained more than 3,000 casualties.

The Paraguayan victory sent shock waves throughout Bolivia and resulted in the recall of General Hans Kundt, former head of the German military mission to Bolivia, who had helped modernize the army before World War I. Kundt ordered a general offensive against a string of Paraguayan forts starting in December. Kundt's yearlong offensive failed to dislodge the Paraguayan defenders and yielded only

heavy casualties, resulting in his being relieved of command. Having blunted Bolivia's attack, Estigarribia launched an offensive and gradually drove the Bolivians from many of their Chaco fortifications. By the summer of 1934, part of the Paraguayan army had driven into Bolivia proper. Estigarribia feared that his forces were overextended and ordered a gradual retreat. Bolivia pursued his army deep into the Chaco but in December 1934, a reinforced Paraguayan army encircled the Bolivians and took 6,000 prisoners. By early 1935, Paraguay controlled most of the disputed territory; however, Bolivia rallied and finally declared a general mobilization. The war had drained the national treasuries and manpower of both countries, and on 12 June 1935 a cease-fire was signed. In 1938 Bolivia and Paraguay signed the Treaty of Buenos Aires, formally ending hostilities. Paraguay gained three-fourths of the disputed territory, and Bolivia was granted access to the Paraguay River for use as an outlet to the Atlantic Ocean. The human toll was high: Bolivia lost 57,000 dead and Paraguay nearly 36,000.

Chadian Civil Wars (1960s–1984)

Chad, the fifth largest state in Africa, neglected by the French in colonial times, wedded an Arabic-speaking desert north to a French-speaking south, dependent on subsistence agriculture. In the 1960s, rebellions in the north left the inefficient national government, dominated by southerners, holding only four garrison towns in the north. A national liberation front, FROLINART, emerged to organize the rebellion. With French military and administrative assistance, the government stabilized the situation without improving it. A military coup in 1975 brought Félix Malloum to power. Unable to cope adequately with economic and social problems, he foolishly demanded the withdrawal of French troops even as FROLINART was growing more daring and powerful. With weapons and logistical support from Libya, the rebels were able to seize one of the northern garrison towns in 1977. Malloum took advantage of a split between rival FROLINART commanders, Goukouni Ouedeye and Hissene Habré, to create a National Union Government with himself as president and Habré as prime minister. Goukouni's forces

advanced on the capital, N'Djamena, until stopped just short of their goal by French troops fighting alongside government forces.

The National Union Government collapsed early in 1979, with forces loyal to Habré seizing the capital and welcoming Goukouni's troops. The Lagos Accord on 21 August led to the establishment in November of a new government that included all linguistic, tribal, geographic, and ideological factions. By 1980 the two northerners, Goukouni and Habré, were fighting for control of the capital and government, with the south sitting on the fence. Libyan military intervention consolidated Goukouni's power, but an unwise announcement that Chad and Libya were working toward unity brought a demand by the Organization of African Unity that Libya withdraw. As soon as the Libyans left in November 1981, Habré returned to the attack and seized power on 7 June 1982. He was dictator by 1984.

Chaeronea, Battle of (86 B.C.E.)

Roman legion use of field fortifications to defeat a numerically superior Greek force. Mithridates VI of Pontus, who had been steadily expanding his kingdom in Asia Minor, invaded the Roman client state of Bithynia in 89 B.C.E. He then overran the Roman provinces in Asia Minor and ignited a Greek revolt against Rome.

Rome dispatched Lucius Cornelius Sulla with an army of 30,000 to restore the situation. Delayed by the Roman Civil War (88–82 B.C.E.), Sulla's army did not arrive in Greece until 87 B.C.E. The Greek armies retreated into Athens, which Sulla invested and captured the following year. Sulla then marched his army north to seek battle with a new Greek army, recently reinforced by Mithridates.

Archelaus, who had escaped from Athens, had built this army in northern Greece to possibly 100,000 men, though many of them lacked significant military training or experience. Archelaus marched south, and the two armies met in Boeotia on the plain of Chaeronea. Faced with a force substantially larger than his own, Sulla had his troops erect palisades fronted by entrenchments to cover his flanks and awaited attack.

Archelaus began the battle with a cavalry charge, which Sulla's disciplined legions threw back in disorder from their secure position. Archelaus then launched his chariots at the Romans, and these fared even worse. Some of the chariots fled back through the Greek phalanx, throwing it into disorder. Sulla seized this opportunity and launched a counter-attack that shattered the Greek phalanx and drove it from the field.

Mithridates sent Archelaus more reinforcements and the war continued. It took another defeat and another Roman army to force Mithridates to make peace.

Chaeronea, Battle of (August 338 B.C.E.)

Battle in which the Macedonian king Philip II decisively defeated an alliance of Greek city-states, of whom the most important were Athens and Thebes.

When Philip had marched into central Greece to defeat the allies, the Greeks decided to fight on the defensive. They deployed their forces near the town of Chaeronea, the left flank protected by a range of hills, the right by the marshy bank of a stream. Their army, probably numbering between 30,000 and 35,000 men, consisted largely of heavy infantry (hoplites). The Athenian contingent was positioned on the left, the Theban on the right, and those of the minor allies in the center.

Philip's army consisted of 30,000 foot and 2,000 horse. Deploying his infantry in line and himself taking command over the guard infantry on the advanced right flank, he ordered his son Alexander (later called "the Great") to command the cavalry on the retarded left.

The Macedonians advanced in oblique order. Having approached the Greek right, Philip ordered his guard to fall back, feigning retreat. As the inexperienced Athenians enthusiastically pursued the Macedonians, the Greek line was disrupted and a gap appeared. Unhesitatingly Alexander charged ferociously at the head of the cavalry into the gap, rupturing the Greek line. Thereupon he turned upon the Greek right. In the meantime Philip halted the retreat of the guard and attacked the Greek left. Soon the allies broke and

fled, the Athenians leaving 1,000 dead on the field of battle, 2,000 being taken prisoner. Theban dead numbered at least 300, all members of the Theban elite unit called the Sacred Band. They fell where they stood. Macedonian casualties were probably few. This victory earned Philip control over the whole of Greece, with the exception of Sparta in the Peloponnesus.

Châlons, Battle of (Gaul, 20 June 451)

Coalition of Romans, Alans, and Visigoths under Aetius fought Attila's equally diverse army of Huns, Ostrogoths, and Gepids to a standstill. During his invasion of the western empire, Attila secured the Rhine, and then moved quickly into central Gaul. He laid siege to Aureliani (Orleans sur Loire), and had he prevailed would have been in a strong position to subdue the Visigoths of Aquitania Secunda, but Aetius had assembled a formidable coalition against him. The Visigoths and Alans, traditional foes of the Romans, joined Aetius's army out of common hatred for the Huns. Attila also had his friends, including the Vandal king Gaiseric, who had urged him to attack the Visigoths. The Visigoths, in turn, hated the Vandals. A generation earlier Gaiseric's son had married the daughter of Visigothic king Theodoric I, but in 442 the Roman emperor, Valentinian III, had agreed to a marriage between Gaiseric's son and his own daughter. The Visigoth princess was returned to her people, but with her nose and ears inhumanly mutilated. When Attila crossed the Rhine, the Visigoths joined Aetius. The Vandals stood aside.

Attila had not expected such vigorous action on the part of the Romans. Unwilling to allow his army to be trapped beneath the walls of Aureliani, he lifted the siege and withdrew north, to open country better suited to Hun horsemen.

The imperial army was drawn up with Romans on the left flank, and the Visigoths, under Theodoric I, on the right. The Alans, whose loyalty Aetius doubted, occupied the center. Attila stationed the bulk of his Germanic allies on the right wing of the Hun army, but the Ostrogoths took up a position opposite the Visigoths. The Huns themselves, the best of Attila's army, were positioned in the center.

The battlefield was a flat, open plain somewhere in what is now Champagne, northern France (perhaps closer to

Troyes than to Châlons). A large level area of some 300 acres, cut by a stream, rose sharply to a ridge. Precise details are lacking. The only surviving account is that of Romano-Gothic historian Jordanes. The battle apparently began when Theodoric dispatched his son Thorismund to occupy high ground overlooking the Hun left flank. Attila sent troops to drive away Thorismund, but these failed to gain the ridge, and were easily routed.

Attila then launched the rest of his forces straight at the imperial army, without first softening up the opposition with missile fire, the usual Hun tactic. According to Jordanes, Attila said the following to his men: "The Romans are poor soldiers, keeping together in rank and file. They are contemptible, the only worthy enemies are the Alans and the Visigoths."

The battle was hard fought. It lasted for most of the day with heavy casualties on both sides. Theodoric himself was among the slain. By nightfall the Romans were in possession of the field. Attila withdrew his exhausted and battered forces into a wagon laager, preparing for a fight to the death on the following day, but Aetius allowed him to withdraw unmolested. The Roman commander feared his Visigoth allies as much as the Huns, and was unwilling to remove a possible counterpoise to their power.

This battle has been reckoned as one of the most decisive in the world's history, but, even considering its violence, it decided very little. Attila retreated to his wooden capital in Pannonia. The next year he launched a major offensive into Italy.

Champlain, Samuel de (c. 1567–1635)

Established France as a power in North America, and founder of France's first permanent colony in Canada. Champlain was born around 1567, and saw service in the French Wars of Religion under Henry IV. In 1598, Champlain accompanied mercenary Spanish soldiers back to Spain, and unusually, served as a geographer on a Spanish voyage to Mexico, Havana, and Cartagena. Henry IV, his patron, had encouraged several trading settlements in France, but they had failed because of poor planning. In 1603, Champlain went to Canada under Grave du Pont and established a base at Tadoussac, taking care to establish friendly relations with the local tribes. Subsequent voyages explored the southern

coast of Nova Scotia and established Port Royal, where Champlain spent three years from 1605 to 1608.

In 1608, Champlain returned with a concession to found a permanent settlement and selected Quebec, insisting on full storage cellars and defensive fortifications. Champlain ventured out to meet the Hurons, Algonquins, and Montagnais, promising them aid against the Iroquois, although he was disdainful of their lack of military discipline. In 1609 and again in 1610, Champlain personally led them against the Iroquois armed with muskets, at Ticonderoga and Soul, and although disgusted by the torture he witnessed, arranged an exchange program whereby he took one of the Huron braves to Paris, while his men lived amongst the tribes.

The problems of the new settlement required Champlain's utmost skill as an administrator. The Jesuit missionaries quarreled with the Recollets (strict Franciscan monks), traders challenged agricultural settlers, and the search for a northwest passage petered out after exaggerated native reports proved false. Champlain faced a major disappointment in 1615, when the Huron, fortified in a palisaded compound at Syracuse, could not be defeated by Hurons with muskets because they would not obey Champlain's orders for organization. This conflict, made deadly serious by the introduction of muskets, later led to the Iroquois's extermination of the Huron and their allies.

Champlain died after a stroke in December 1635, not before establishing French power in North America, buttressed by Native American allies, and providing the government with detailed maps allowing further colonization of New France.

Chan Chan, Battle of (Inca Empire, 1468)

Crowning Inca conquest of the most powerful coastal state, Chimú. As the Inca Empire developed and expanded under the 33-year reign of Emperor Pachacutec Yupanqui, it transitioned from highland conquests to the hot, coastal deserts. The Inca collided here with the powerful Chimú state on the north coast of modern Peru.

Pachacutec developed the tactic of cycling in 20,000-man armies every two months in the hotter realms. This allowed

his troops to remain fresh and to mount constant pressure on the enemy. This tactic won over the Pachacamac region and then was used by Pachacutec's son Tupac to defeat the "Great Chimu" and capture the Chimu capital of Chan Chan after 1468.

The Inca defeated the superior metallurgical civilization of the Chimu by constant pressure, cutting off water supplies to the desert coast and removing tribute populations from the Chimu sphere of influence. Although the Inca never broke into the huge city of Chan Chan, they did manage to wear down the Chimu and cut off all resources. Eventually the Chimu leader was forced to surrender not because of battle losses but due to a lack of resource base, which had been denuded by the Inca strategy.

This use of economic warfare became the hallmark of Inca conquests as they used superior logistics to overcome military superiority by their enemies. The victory also marked the completion of the Inca transition from seasonal military systems under a single commander to a comprehensive grand strategy approach to empire with permanent armies, multiple campaigns, and numerous generals.

Chancellorsville, Battle of (30 April–6 May 1863)

One of the Confederacy's most brilliant, but costly, victories. In late April 1863, General Joseph Hooker conceived a brilliant idea for the newly revamped Army of the Potomac. Still facing Robert E. Lee and the Army of Northern Virginia at Fredericksburg, Hooker envisioned a gigantic turning movement: While John Sedgwick remained with up to 40,000 troops to occupy Lee, Hooker would take the bulk of the army north, cross the Rapidan and Rappahannock Rivers 40 miles upstream, and move behind Lee, threatening to cut his supply line and to trap him between two large Union forces. Either way, Lee would have to fight, retreat, or risk being trapped. At first, Hooker seized the initiative, moved out, crossed and secured several fords, and then proceeded east

Robert E. Lee with his soldiers in battle at Chancellorsville. (Library of Congress)

and south past Chancellorsville. Then, for reasons not entirely clear, Hooker seemingly lost his nerve and ordered his men to retreat to Chancellorsville.

At the same time, Hooker's advance clearly brought out the fighter in Lee. He divided his smaller command (he had about 60,000 compared to 125,000 for Hooker), leaving some 15,000 under Jubal Early at Fredericksburg, he moved some 45,000 to find Hooker. On the night of May 1–2, "Stonewall" Jackson proposed an audacious plan—to divide Lee's army yet again before a superior foe, and for Jackson to march around Hooker and attack his hanging flank from the rear. Lee agreed, and Jackson swung left with some 28,000 while Lee faced 75,000 Union troops with only 17,000 men.

Jackson's men were finally in position in late afternoon, and around 5:20 P.M., accompanied by a thunderous Rebel yell and noise from the startled wildlife, Jackson's men fell upon the Union rear guard commanded by General O. O. Howard. That night, while looking over the positions, Jackson was shot by his own men, and died the next day. Jeb Stuart assumed command and tried to continue the attack, and forced the Union position into a big bow, but superior Union numbers and artillery limited the Confederate victory. The cost was high to Lee—many casualties including his great right-hand man, Stonewall Jackson.

Chandragupta Maurya (r. c. 321–c. 298 B.C.E.)

Founder of the Gupta Dynasty. In the aftermath of Alexander the Great's invasion of northern India, Chandragupta Maurya, a regional landowner, about whose family and background little is known except that he came from a village of peacock tamers, began a war of "liberation" against the Greek rulers left behind to rule the farthest reaches of Alexander's conquest. Between 321 and 317 B.C.E., aided by Chanakya, the "Indian Machiavelli" and author of the political handbook *Arthashastra*, Chandragupta Maurya ousted the satraps of Punjab and Sindh and established himself as the founder of a new dynasty. To organize his empire, he created an elaborate centralized bureaucracy, including a state council, census takers, treasury department, and secret police

force to administer the areas he ruled directly and indirectly through local rulers. Large public works projects improved the empire's agriculture, and also provided militarily strategic highways, hospitals, and dams. The empire was in diplomatic contact with the Alexandrian successor states, as well as its Indian neighbors. The state revenues supported an enormous army and navy of 650,000, including elephant cavalry, a logistical branch, chariots, and riverboats.

In 305 B.C.E., Seleucus I Nicator invaded the Gupta Empire, hoping to regain territory, but was defeated so badly by Chandragupta that he abandoned plans for further reconquest and gave up most of modern Afghanistan, including its capital, Kabul. His daughter was married to Chandragupta to seal the treaty. In exchange, Seleucus received 500 war elephants and safe passage home. With a solid northern frontier and a wealthy empire, Chandragupta retired from power and ended his life as a Jain monk, and probably starved himself to death in religious devotions, leaving his empire to his son Bindusara, father of perhaps the greatest Gupta emperor, Ashoka Maurya.

Chaplaincy, Military

Military officers who tend to the spiritual, moral, and physical needs of troops. The military chaplaincy has a tradition dating back through many centuries, during which time representatives of the cloth have held some of the highest offices at almost every administrative level.

A number of Old Testament Hebrew prophets led troops in battle in the name of God, but the first recorded involvement of clergy in postbiblical times occurred in 430 when Bishop Germanus, as general officer commanding the army in Wales, successfully led a campaign against a united force of Picts and Scots. This function of a priest as a military commander in time of national emergency was by no means an isolated occasion. Prelates and priests were engaged in warlike activities during and following the reign of William the Conqueror. When Scottish armies attempted to invade England, military service was required from every guild. The clergy were not exempt.

Army chaplain giving communion to soldiers at the New York Port of Embarkation during World War II, c. 1942. (Library of Congress)

The year 1272 marked the end of the predominantly war-like role of the clergy when, for what may have been the first time in history, a “chaplain on the Pay Roll” was recognized as a noncombatant member of the English armed forces. Modern chaplains are still called staff preacher, preacher, padre, or chaplain, and are drawn from all recognized denominations.

Chaplains’ duties have altered over time and are dependent on a chaplain’s location and proximity to conflict. In peacetime, their official duties include the conducting of religious services, bible classes, prayer meetings, hospital visitations, and burials. With the number of married soldiers increasing dramatically, military chaplains now find themselves very much involved in the marital problems of their troops. In rear areas during periods of conflict a chaplain is required to visit the men, and provide such things as coffee stalls and sporting activities, sit-down dinners, games or song nights, and personal consultations. Frontline chaplains

are usually assigned to the battalion aid station, where they comfort the wounded and the dying and generally make themselves useful.

Chaplaincy can be dangerous work: 11 U.S. Army chaplains were killed in the line of duty during America’s relatively brief combat involvement in World War I, and the four chaplains of different faiths who gave up their life belts and their lives when their army transport was torpedoed in the frigid North Atlantic early in World War II have become legends.

Charlemagne (742–814)

Frankish conqueror, first ruler of the Holy Roman Empire. Charlemagne inherited half of the Frankish kingdom from his father, Pepin, in 768. The initial years of his rule were occupied with a civil war between himself and his brother Carloman until Carloman's death in 771. Now sole ruler, Charlemagne embarked on a series of actions that resulted in the expansion of his kingdom into an empire, consolidation of the continental Christian kingdoms above the Pyrenees, a new administrative framework to govern his realm, establishment of a relationship between the papacy and German emperors that would continue for a millennium, and creation of an environment for learning that would be unrivaled in western Europe until the rise of the universities.

Frankish consolidation of the Christian kingdoms was the triumph of Orthodox Christianity, as defined by the pope, over Arian Christianity. As part of the process, all other Christian kingdoms were brought into line with the Orthodox Roman view of dogma. Forced conversion of Frisians and Saxons was part of the process. Charlemagne's final solution to Saxon disaffection was wholesale slaughter of Saxon males and the forced resettlement of the remaining Saxons. It should be noted that the absorption, conversion, and repelling of pagan invaders were part of what Charlemagne regarded as his obligation as defender of the faith. So too was the establishment of a papal state. In recognition of his actions, Pope Leo III crowned him, in 800, emperor of the Romans.

Administratively, Charlemagne created frontier border districts, called marches, and deeded them to powerful warlords. The areas buffered by the marches were divided into provinces, and were ruled by various nobles. Charlemagne institutionalized commissioners (*missi*), transforming them

from periodic messengers into a corps representing the king's authority. Law was another area transformed and codified by Charlemagne. Throughout the empire, laws were divided into church administrative codes, local secular laws, and laws derived from the emperor.

In the end, Charlemagne's empire would not survive more than a generation and was divided by his grandsons. The strength of Charlemagne's vision and actions continues to the present. The intermingling in the West of religious and secular power in the person of the monarch, coupled with his ascension as Holy Roman Emperor, had far-reaching ramifications. First, it set up the basic constructs for dissension between the church and the state, which would later resolve itself into the disputes of the Guelfs and Ghibellines. Second, the question of investiture rights can be traced to Charlemagne's rule with two swords philosophy. Third, the resurrection of the Roman Empire and the unification of all Europe under a single government would be a recurring theme in European history.

Charlemagne's Wars (771–814)

Charlemagne extends Frankish Empire to its greatest extent. The death of Pepin the Short in 768 left his two sons, Charles and Carloman II, in uneasy control of the western and eastern Franks respectively, until the death of Carloman in 771. Charles then launched his career as king of the Franks, conqueror of a Frankish Empire, and eventual protector of the Roman Catholic Church as Holy Roman Emperor.

Charles first waged war against his father-in-law, Desiderius, king of the Lombards in the Italian peninsula, at the request of the besieged pope Adrian I. Charles first divorced Desiderius's daughter, and then captured the family of Carloman II, eliminating potential rivals to his own position, and of Desiderius himself. Charles then reaffirmed the donation by Pepin, who had served as overlord of the Lombard Empire, of papal lands controlled by the Church. Thus, by 774, Charles had eliminated all internal rivals and allied himself firmly with the powerful Roman Catholic Church.

Charles also waged war on the Saxons (772–804), the last independent Germanic people who often raided the rich

eastern Frank lands. A major Frank invasion in 775 was only partially successful, and Charles changed strategy, turning to annexation, fortifications, and missionaries. The Saxons got aid from Danes and Slavs, and turned to the leadership of the Westphalian Widukind. They caused Charles great difficulty from 777 to 785. In response, Charles mounted an increasingly cruel campaign against them, including annual invasions and replacement of Saxons with Franks. He once executed 4,500 Saxons after a Frankish defeat.

Charles fought his most famous war in his invasion of northern Spain (777–801). He led a large Frankish army to the city of Saragossa, where Umayyads were resisting the second Muslim Dynasty, the Abbasids. Charles destroyed several towns, including Pamplona, a Christian town apparently mistaken as Muslim. Charles was then recalled to deal with Saxon depredations, leaving behind a rear guard under his nephew Roland. The Christian Basques (Gascons), angered by the destruction of Pamplona, allied with Muslim forces to ambush the rear guard at Roncesvalles on 15 August 778, leading to the destruction of the entire Frankish force, including Roland.

Charles also carried out war (791–796) against the Avars, a Central Asian people who had settled in and plundered the Danube River area. Initially unable to pin down the mobile horsemen, his son Pepin finally defeated them in 796. The hidden treasury of the Avars was later captured and sent back to Charles at his capital in Aachen. They had been entirely subjugated by 805.

After Charles had reinvaded the Italian peninsula and put his son on the Lombard throne, he had himself crowned Holy Roman Emperor by the pope on Christmas Day in 800. Charles then waged a successful land and sea campaign against the Byzantines (803–810) to force them to recognize him as emperor of the west, and to gain control of Venice and Dalmatia on the Adriatic. The Byzantine emperor Nicephorus I, fully occupied with the Bulgarians, did so in 810.

Simultaneous with the Franco-Byzantine War, Charles fought other groups as well. He subdued the Saxons by 804, the Slavic Wends by 806, and fought the Danes as well. By 811, his capital at Aachen was the center of the only true medieval Christian empire, and Charles, then 62, set about passing on his legacy of a pan-European empire to his son Louis I, “the Pious.”

Charles Martel (689–741)

After the death of the Merovingian king Dagobert in 638, a number of military-supported magnates, especially the mayors of the palaces in Neustria and Austrasia, took power in the northern Frankish kingdoms. Charles Martel (Martel meaning “the Hammer,” for his military conquests) was the bastard son of Pepin II, the mayor of the palace in Austrasia. Shortly after Pepin’s death, in 714, Charles fought for Pepin’s title against another magnate, Ragamfred, and Ragamfred’s allies. Charles had only a small war band; however, after a small victory over Ragamfred and the obtainment of his father, Pepin’s, treasury, Charles had the resources ultimately to defeat his adversary. Charles, as the newest mayor of the palace in Austrasia, placed his own figurehead king on the throne, and spread his influence with military victories over the Saxons, Alamans, and Bavarians. As Charles continued his military successes he presented booty and confiscated lands, much of which had belonged to the Church, to his own supporters.

In 732, Charles came to the duke of Aquitaine with aid against the Arabs who had pushed north toward the towns of Poitiers and Tours. At Poitiers, Charles’s army defeated that of Abd al-Rahman and thwarted the Arab Muslim threat. After his victory, Charles invaded Burgundy and led a naval expedition against the Frisians. He implemented siege warfare to capture the city of Avignon; and, on the banks of the Berre River, he defeated an Arab force for the second time. Before he died in 741, Charles divided control of the lands in his sway between his two sons, giving Austrasia, Swabia, and Thuringia to Carloman, and Burgundy, Neustria, and Provence to Pepin. In only a quarter century, Charles Martel had built up what would become under his grandson, Charlemagne, the Carolingian Empire.

Charles the Bold, Duke of Burgundy (1433–1477)

Last reigning duke of Burgundy and great military reformer. Charles was the son of Philippe the Good, and inherited Burgundy and the Low Countries from him in 1467. He opposed the growing power of King Louis XI of France, and tried to free his duchy from its dependence on France, and restore it as a kingdom.

Charles's ambition was to create a kingdom stretching from the mouth of the Rhine to the mouth of the Rhône. He ruled Burgundy, Flanders, Artois, Brabant, Hainaut, Luxembourg, Holland, Zeeland, and Friesland. He needed Alsace and Lorraine to achieve his territorial goal. His struggle with the Alsatian towns (1473) and occupation of Lorraine alienated the Swiss cantons allied with the French. War broke out between Charles and the Swiss. Charles's armies were routed in 1476 at Grandson and at Morat. He himself was killed at the Battle of Nancy in 1477. His heiress, Mary, married Maximilian of Habsburg, the future Emperor Maximilian I.

Charles was the chief military innovator of the late fifteenth century. The organization of his armies shows clearly the beginnings of a transition between feudal levies and independent mercenary bands, and standing armies. He improved on the military ordnance of the previous dukes. The new ordnances followed the pattern of the ordnances of the king of France of 1445 (that is, a system of tax-supported regular soldiers, with uniform equipment and tactics).

The Burgundian army was the first in Europe to be placed on a largely regular footing. It included feudal levies (knights and men-at-arms), but also large numbers of mercenary specialists and a large field artillery park. Most of the mercenaries were grouped in units by weapon type (pikes, handguns, or crossbows).

Charles's military ordnances demanded strict discipline and regular drilling. The army that was to fight against the Swiss was composed of 15,000 regular soldiers from all over Europe. This fact provided a weakness, since Charles's multilingual army lacked the necessary cohesion. Charles also personally lacked the tactical skills needed to command against the ferocious Swiss.

Once powerful, Burgundy ceased to exist as a state after Charles's death. His impetuous gallantry earned him his surname, but his achievements were short-lived.

Charles XII (1682–1718)

The most daring and most hazardous general of his times. On 13 April 1700, Charles XII left his native city of Stockholm, where he was born on 27 June 1682, to fight the Danish troops on Zealand; he never returned. The short war against Denmark ended with the Treaty of Travendal but marked the beginning of the Great Northern War (1700–1721). In this conflict among Sweden, Denmark, Russia, and Saxe-Poland the small Swedish army under Charles defeated Russian troops at Narva (1700) and Grodno (1706). Both victories, as all those that were to follow, were due to superior Swedish cavalry. After the triumph over the Saxon army near Fraustadt (1706), Charles dethroned King Augustus of Poland in the Peace of Altranstadt and led his 25,000–30,000 battle-weary troops into winter quarters in Saxony.

He left the country in autumn 1707 and marched with approximately 40,000 troops on Moscow, planning to link up with a further 30,000 Swedish soldiers under Loewenhaupt coming from Livonia. On 28 September 1708, a Russian army under Peter the Great defeated Loewenhaupt at Lesnaya and captured all the Swedish supplies. Nevertheless, in May 1709 Charles besieged Poltava with a battered remnant of 20,000 troops. Czar Peter arrived there with his army on 4 June and set up entrenchments. On 28 June, Charles attacked the Russian position but was heavily defeated. This time his horsemen were of no use. Charles fled to Turkey where he spent the next five years.

In 1715 he returned to Sweden but never regained the initiative. He lost Stralsund in that very year and his life during the siege of Frederikshall in Norway on 11 December 1718.

Charleston, Siege of (April–May 1778)

One of the most severe reverses to American arms of the American Revolution. British general Henry Clinton decided to strike at the center of American and French strength in the American South with the siege of Charleston. In 1778, he withdrew the garrison from Newport, Rhode Island, and pulled back troops in New Jersey to New York City. The British navy commanded the American coast after the French withdrawal to the Caribbean, and Clinton could

move his men at sea far faster than General George Washington could send troops across largely unsettled terrain. Thus, Clinton was able to mass 14,000 men and a powerful navy for the siege of Charleston.

The British army and navy cooperated efficiently in this operation. The navy landed men on John's Island to the south of the city, and then moved up the Ashley River (Charleston was bounded by the Ashley and Cooper Rivers). As the British moved to surround the city by land and sea, Charleston's leaders insisted that American general Benjamin Lincoln concentrate on defending the city proper, with little room for defense in depth or opportunity to save his army.

The British conducted the siege in exemplary fashion, first cutting off the city by sea, constructing siege lines ever closer to the city, having the navy sail past lightly defended Fort Moultrie, and finally beginning the bombardment of the town. By 9 May, the bombardment set many of the wooden houses in the city on fire, and city elders, who had insisted on Lincoln remaining to defend the city in the first place, asked to surrender to save the community from further destruction. On 12 May 1780, General Lincoln surrendered the city and his entire force of 5,466 men. The capitulation at Charleston was the worst American defeat until the surrender of the Philippines in 1942.

Chateau Thierry/Belleau Wood (1–26 June 1918)

American attack, usually associated with the United States Marine Corps, in a heavily forested region approximately 50 miles east of Paris. In the late spring of the decisive year of 1918, the German army was desperately pushing toward Paris in an effort to put an end to World War I on German terms. In the first few days of June, the German vanguard occupied and fortified Belleau Wood, just east of the town of Chateau Thierry along the Marne. The Germans attacked American positions on 4 June but failed to exploit a gap in the American line.

At the time two large American formations were serving as part of the French XXI Corps. One day after the German

attack petered out, the French XXI Corps commander ordered the Americans to clear out this large patch of woods.

The 4th Brigade of the United States Marine Corps, attached to the army's 2d Infantry Division, was particularly eager to carry out this attack. With no reconnaissance and an almost complete lack of artillery support, the marines attacked the solidly dug-in Germans on 6 June 1918. The enemy inflicted massive casualties on the marines, who nonetheless pushed forward in rushes of small groups of survivors. The battle quickly degenerated into a maelstrom of hand-to-hand combat in the dense forest. By the end of the day the marines had suffered over 1,000 casualties but had held fast.

It took three more weeks for the marines and their comrades from the army's 7th Infantry Regiment to capture the woods. They did so without adequate artillery and logistical support. The American victory helped turn the tide of the war. Among the legacies of this battle was the rise of the Marine Corps in the American public's consciousness. Marine public relations officers did a masterful job of trumpeting their story to war correspondents, creating the impression that only marines fought in this battle, giving rise to a residue of interservice bitterness that would endure for many years.

Chattanooga, Battle of (23–25 November 1862)

A Union victory that opened the way for Union forces to the lower South. General Braxton Bragg and the Army of Tennessee continued the siege at Chattanooga from late September into late November 1862. Bragg divided his army, sending James Longstreet and his corps to Knoxville, although that action could not have a major effect on the outcome of fighting in the area.

In late October, President Abraham Lincoln appointed Ulysses S. Grant to command of the armies in the west, and Grant moved from Vicksburg to Chattanooga and began to reverse the situation.

Union troops were short of food, and Grant broke the blockade that Confederates had established with the so-called Cracker Line. With ample supplies for the men and horses, Grant moved General William Tecumseh Sherman and his four divisions in mid-November, and later General Joseph Hooker and his corps from the Army of the Potomac

(using the superb northern-rebuilt railway system). Grant was ready for action.

First, Hooker's corps attacked Lookout Mountain in the "battle above the clouds" on 23 November. The outnumbered Confederates had little choice but to concede the position on their extreme left flank. Grant then wanted Sherman's units to turn the Confederate right, Tunnel Hill, but the attacks failed the next day. Grant had little respect for George Thomas's Army of the Cumberland, which had been beaten so badly at Chickamauga, but he ordered a demonstration in the middle to distract the Confederates so that Sherman could try to take the right one more time.

Thomas's men had something to prove, and began marching up Missionary Ridge against orders. Confederate rifle pits atop the hill had been poorly constructed and were not particularly useful. The spectacle of the moving line of Union blue broke the morale of the Confederate defenders, who fled the heights, and streamed into Georgia. As a result Grant had opened the gateway to the lower South.

Cheka

Soviet secret police organs from 1917 to 1991. They included border troops and special troops that participated in the Bolshevik Revolution and World War II.

The Cheka, or *Chrezvychainaya Komissariat po bor'be s kontrarevoliutsiei i sabotazhem* (All-Russian Commission for Struggle against Counterrevolution and Sabotage; *cheka* is also the Russian word for "linchpin"), was established 20 December 1917 and numbered 30,000 members by the end of the civil war, with an additional 70,000 combat troops operating independently of the military chain of command. Cheka units crushed insurgent groups, referred to as *bandidits*, with the aid of the Red Army, and took part in the suppression of the Kronstadt sailors' mutiny near Petrograd (St. Petersburg/Leningrad) in March 1921.

Under its head, Felix Dzerzhinskii (Iron Felix), the Cheka launched the Red Terror in the years immediately after the Revolution, executing perhaps 50,000 people. Less sanguinary Bolsheviks called repeatedly for an end to the terror,

and the Cheka was finally disbanded by a decree of 6 February 1922. Its functions were transferred to the Narodnaya Komissariat Vnutrennikh Del (NKVD, People's Commissariat for Internal Affairs), under which an autonomous Gosudarstvennoe Politicheskoe Upravlenie (GPU, State Political Administration) fulfilled the functions of a political police organ.

The NKVD had been founded on 8 November 1917, and competed with the Cheka during the years after the Revolution, though Dzerzhinskii was a member of both bodies. Dzerzhinskii became head of both the NKVD and the GPU in 1919 and held these posts until his death in 1926. In 1923, the GPU became the OGPU (Unified State Political Administration) and was separated from the NKVD; the latter was abolished on 15 December 1930. The OGPU carried out the show trials of the 1920s and 1930s and operated the GULAG (Glavnoe Upravlenie Ispravitel'no-trudovykh Lagerei, Chief Administration of Corrective Labor Camps) in the early 1930s. Tens of millions of political prisoners were imprisoned in the Gulag and millions of them died. After an absence of several centuries, slavery had returned to Russia on a large scale.

The NKVD was reorganized on 10 July 1934 as an All-Union Commissariat, and the OGPU was subsumed into it. It was the NKVD that became infamous as the organ of repression at the height of the Great Terror of the late 1930s. In addition to its political police functions, it dealt with frontier security and the registration of civil acts (births, deaths, marriages, and so on). In 1941, it was divided into the NKVD and the Narodnaya Komissariat Gosudarstvennoi Bezopastnosti (NKGB, People's Commissariat for State Security) and in 1946 was reorganized yet again as the Ministerstvo Vnutrennikh Del (MVD, Ministry of Internal Affairs). Many of its security and secret police functions were taken over by the Komitet Gosudarstvennoi Bezopastnosti (KGB, Committee of State Security), when the latter was founded on 16 March 1956. (The reasons for all of these reorganizations and title changes are not always clear.)

During World War II, NKVD troops often took up positions behind Red Army troops and fired on them if they attempted to retreat or desert. It also operated filtration camps for Soviet POWs brought back from German captivity and Soviet citizens who had been in occupied territory. The NKVD also carried out the relocation of factories and wartime industries eastward ahead of the Nazis and exercised administrative control over partisan units.

The KGB was involved in multitudinous espionage and disinformation activities in the postwar decades.

Chemical and Biological Warfare

The deliberate use of chemical or biological agents against an enemy has a long history. In the Hebrew Bible book of Judges, Abimelech conquered and destroyed a city and poisoned the soil with salt. Beginning about 300 B.C.E., Persian, Greek, and Roman literatures describe instances of animal or human corpses dumped into water supplies. This tactic was later used by the Confederates in the American Civil War, and apparently in nineteenth-century European wars and the South African Boer War. In the Battle of Eurymedon in 190 B.C.E., Hannibal's forces catapulted clay jars full of poisonous snakes onto the king of Pergamon's ship. The Tatars attacking Kaffa (now Feodosia in Ukraine) in the fourteenth century launched the bodies of plague victims over the city walls, a tactic apparently used in many other medieval battles.

In 1763 in North America, biological warfare using a specific agent was attempted. Sir Jeffrey Amherst, British commander in chief, approved a suggestion by his ranking officer on the Pennsylvania frontier, Colonel Henry Bouquet, to put blankets used by infected soldiers at Fort Pitt into the hands of Native Americans who were threatening the fort. Amherst approved the scheme. Debate over its effectiveness continues today, but the French tried a similar tactic in their conflicts with Native Americans. Clothing infected with plague was used in Tunisia in the 1780s by native tribes against Christian attackers. In 1863 a Confederate surgeon was arrested as he attempted to smuggle clothing with yellow fever infection into the North.

Chemical warfare took a conceptual leap forward in 1854 during the Crimean War. British admiral Lord Dundonald had noticed decades earlier the death of plant and animal life near sulfur kilns. In the war Dundonald suggested using sulfur fumes against the Russians at Sevastopol; he estimated that less than 500 tons of the chemical and 2,000 tons of coke would be needed. Various committees considered Dundonald's proposal and turned it down, deciding the tactic was dishonorable.

The modern era of chemical and biological warfare began in 1899 with the Hague Gas Declaration. This document was the first treaty to deal with poison gas. Twenty-seven na-

tions signed it; the United States was not among them. The treaty banned delivery of gas by projectiles. The Germans ignored the declaration when they used chlorine from large canisters at the Battle of Ypres in 1915. Later in the war Germany used phosgene and mustard gas; these three agents killed or injured more than a million soldiers and civilians. German saboteurs allegedly infected mules, cattle, and horses in Argentina and the United States with anthrax and glanders; the worldwide flu epidemic of 1918 was even rumored to have been a deliberate German effort. But, overall, chemical warfare in world wars has been judged by historians to have been a clumsy affair, far less lethal than the machine gun.

The real and imagined acts of chemical and biological warfare during World War I led to the 1925 Geneva Protocol, which banned use of such agents in war. The United States did not sign this treaty until 1975. The Geneva treaty did not prevent nations from research on these agents or from developing systems to deliver them. In the late 1920s the Soviet Union began research into biological weapons. Before World War II, Japan began a massive effort in Manchuria to develop biological warfare agents such as plague, anthrax, typhus, and cholera. The Japanese built several factories that employed thousands of technicians and scientists, and eventually exposed more than 10,000 Chinese prisoners to numerous biological agents.

In 1941 the United States established the Chemical Warfare Service; the agency became the War Research Service the following year. During the war about \$60 million was spent investigating biological and anticrop agents. During World War II, the Allied nations were concerned that Germany would use chemical and biological weapons against them; however, unbeknownst to them, Adolf Hitler had terminated research on such weapons in 1939. Both sides refrained from such weapons in this most total of wars for fear of retaliation by the other side. Such considerations did not, of course, inhibit Germany from the use of Zyklon B gas to kill millions of Jews and others in the concentration camps, and late in the war, research on biological weapons was revived in those camps.

Since the end of World War II, charges of chemical or biological warfare have surfaced several times. During the Korean War in the early 1950s both North Korea and China made detailed accusations that United Nations forces led by the United States were using a number of chemical and biological agents spread by insects. Both the United States and the United Nations denied the charges, and current documentation shows convincingly that the whole episode was an act of national theater by China and North Korea. On the other hand, we also now know that the United States (and possibly other Western nations) was conducting chemical

and biological warfare research and experimentation with an abandon that would be deemed criminal today.

In the Second Vietnam War, 1965–1975, the United States charged North Vietnam with using a biological agent in the Laos campaign; like the Korean War allegations, these “yellow rain” claims were supported by weak evidence. Iraq began research into such warfare in 1974, and developed large stockpiles; chemical and nerve agents were used in 1982 and 1983 in its conflict with Iran. The Soviet Union is believed also to have used mustard gas in 1980 in its war in Afghanistan.

Between 1949 and 1960 the United States military conducted numerous tests of chemical and biological warfare agents on civilian populations in a number of locations in the country. These tests were designed to determine dispersal rates and population vulnerability. In 1968, some 6,000 sheep were killed in Utah in an accidental escape of nerve agents. The following year President Richard Nixon declared that the United States would stop research on offensive and biological weapons and destroy its stockpiles. In 1972 a multinational Biological Weapons Convention banned production of such agents.

In recent decades a new threat in this area has appeared: chemical or biological attacks by individuals or small groups. In 1982 seven people in the Chicago area died after ingesting Tylenol laced with cyanide. A salmonella outbreak in Oregon in 1984 was traced to members of the local Rajneesh commune. In March 1995 the Aum Shinrikyo cult in Japan released sarin gas in the Tokyo subway, with fatal results. That same year two members of a Minnesota militia were convicted for possession of ricin, which they had manufactured for use on local officials. Similar incidents have occurred around the world in the past decade.

Today, almost 20 nations are believed to have a biological weapons program. The ease of manufacture and use of these weapons makes them available to individuals and small groups as well as to nations. Research on chemical warfare no doubt continues in laboratories around the world. Over the centuries lack of capabilities or fear of severe reprisals has limited the wartime use of chemical and biological weapons, but as long as nations go to war, or there are disaffected groups or individuals, the temptation to develop them will continue.

Chemin des Dames (16 April–3 June 1917)

The bloodiest French defeat of the Great War. After the Verdun and Somme bloodshed, the western front seemed set for a time of reorganization. The Germans dug deeper and wiser, and the French changed the high command: Joffre was sacked and Nivelle was appointed commander in chief on 12 December 1916. He was known as the brilliant organizer of a victorious attack at Verdun in April 1916. Nivelle gained the political battle to force the army's viewpoint on a breakthrough. The chosen part of the front was a line of wooded rocky ridges paralleling the River Aisnes between Rheims and Soissons, called Chemin des Dames. Nivelle had at his disposal more than a million soldiers, most of them young conscripts known as the *bleuets* (cornflowers). The 66 opposing German divisions knew that the French would attack there, thanks to the efficiency of their military intelligence and the incredible confidence of the French high command casually spreading information to the government (and German spies). The French plan was to assault the ridges after 14 days of artillery bombardment. But the Germans simply took cover in the numerous caves in this chalky area and emerged as the bombardment stopped. On 16 April, the offensive was launched all along the line, from Berry au Bac (first use of French tanks) to Laffaux (40 kilometers farther west). After five days, only the first German line had been reached at a tremendous human cost: more than 100,000 casualties (on average, 20 dead every minute). Contrary to what had been explained to the soldiers and the government (no breakthrough, no more attacks), Nivelle again and again ordered attacks that gained little ground. Desperate field officers led the cornflowers to certain death out of the trenches. Informed secretly by high commanding generals, the government tried to persuade Nivelle to put an end to this bloodbath immediately. As he refused to follow this wise advice, he was sacked and replaced by General Pétain on 11 May. The situation was critical: As early as late April, troops mutinied (half of the frontline regiments of the French army), accepting holding the trenches but refusing to attack anymore. Pétain faced the worst nightmare of a commander: defeat and mutiny. He decided to punish the mutineers with limited harshness and to forbid any large offensive. He said he was waiting “for the tanks and the Americans.” The Chemin des Dames proved to be “a ridge too far” for the 271,000 fallen cornflowers.

Ch'i, Chi-kuang (Qi, Jiguang) (1528–1588)

One of the most innovative of Asian generals. In 1555, General Ch'i Chi-kuang was transferred to Chekiang, a coastal province and frequent target of Japanese pirates. To deal with the pirates, Ch'i organized a new army and developed new tactics. Among the tactics developed were fighting stances for the two-handed sword. He also developed a tactic called the Mandarin Duck Formation that was instrumental in defeating the pirates. The formation consisted of four soldiers wielding 12-foot lances, preceded by four soldiers, two carrying shields and two carrying bamboo trees complete with upper branches. The lancers were followed by two soldiers wielding tridentlike weapons from which arrows propelled by gunpowder could be fired. With support staff, the squad was made up of 12 men. Using such tactics, Ch'i inflicted a great defeat on the Japanese pirates (*wu-li*) at Taizhou in 1561, capturing the leader and 1,900 prisoners. By 1564, the pirate threat had ended.

In 1568 Ch'i became commander in chief at Chichou in North Chihli. This important command protected Peking and northern China against nomadic raiders from the steppe. Ch'i used this command to train conscripts. He demonstrated his skill in training troops in his book, *Ch'hsiao Hsin-shu* (1580). The book touched on recruitment procedures, pay, personnel assignments, combat formations, weaponry, military etiquette, and the general duties of officers and men, and other aspects of military life. In addition, Ch'i Chi-kuang designed banners for his armies, devised signals for use in combat, and issued orders on courts-martial.

At Chichou Ch'i also developed defensive tactics using "battle wagons"—oxcarts equipped with two pieces of light artillery and manned by 20 soldiers. He also built the first castlelike defensive towers along the Great Wall.

In 1583, Ch'i was appointed commander in chief of Kwangtung province and resigned a year later due to illness. He died 17 January 1588.

Chiang Kai-shek (1887–1975)

Nationalist Chinese general and political leader during the Chinese Civil War and World War II. Born 31 October 1887

Generalissimo Chiang Kai-shek and other officers standing in the field planning a military campaign, 1937–1943. (Library of Congress)

in China's Chekiang province, Chiang Kai-shek, son of a salt merchant, received a military education in his country's Paoting Academy and Japan's Preparatory Military Academy (1907–1909). Serving briefly in the Japanese army, he returned to China to participate in the successful revolution against the Ch'ing (Manchu) Dynasty (1911–1912). He subsequently joined Dr. Sun Yat-sen's Kuomintang, heading the movement's Whampoa Military Academy (1924) and emerging as its military and political leader (1926) following Dr. Sun's death in 1925.

During the late 1920s, Chiang sought to unify a politically decentralized China. To this end, he launched the Northern Expedition (1926–1928), subduing many of the regional warlords who had dominated much of China since the revolution and establishing a new national government at Nanking. He then turned against the Chinese Communists, undertaking five campaigns of extermination (1930–1935) that culminated in their epic Long March of 1934–1935.

As a military leader, Chiang achieved his greatest international prominence as commander of nationalist forces during China's eight-year war against Japan (1937–1945). Under his guidance, China—despite much of the country's occupa-

tion by the militarily superior Japanese and fighting alone for more than four years—avoided defeat and ultimately emerged, along with the United States, Great Britain, and the Soviet Union, a major victor of World War II.

Chiang's military and political fortunes deteriorated rapidly in the late 1940s when China descended into civil war (1946–1949) between the Kuomintang and Mao Zedong's resurgent Communist Party. Although nationalist forces held the initiative early, and would receive some \$2 billion in U.S. aid between 1945 and 1949, Chiang's inability to establish strategic priorities and his decision to attack in Manchuria where Mao's forces were strongest led to critical defeats in 1948 and Communist conquest of the entire mainland by 1949. The Nationalist Army and government were incompetent and corrupt, the nation racked by hyperinflation, and the Chinese masses seemed about as glad to welcome the Communists as to see off the discredited Nationalists.

Fleeing to the island of Taiwan with 2 million followers—and not at all welcomed by the Taiwanese, who remembered well that their 1947 protests against the Kuomintang had been harshly repressed—Chiang seemed doomed, but with the outbreak of the Korean War, the United States positioned a fleet between Taiwan and the mainland, and the Communists had to postpone their plans for an imminent invasion.

Chiang established the Republic of China, of which he was elected president five times. Chiang died in Taipei, 5 April 1975, having failed to fulfill his dream of reclaiming power on the mainland. Yet Taiwan today, bustling, emerging into democracy, and prosperous (at one time holding more gold reserves than the United States), might cause some historians to reevaluate Chiang's legacy.

Chickamauga, Battle of (18–20 September 1863)

A drawn but bloody battle, typical of so many clashes in the American Civil War. In early September, Confederate commander Braxton Bragg had abandoned Chattanooga, Tennessee, gateway to the Deep South, after a brilliant campaign of maneuver by Union general William Rosecrans. Soon

thereafter, General James Longstreet and his corps from Lee's Army of Northern Virginia joined Bragg's forces, and thus, unknown to Rosecrans, Bragg's Army of Tennessee would outnumber the opposing Army of the Cumberland—one of the very few instances in this war when the South had more men than the North.

The two armies faced one another at Chickamauga Creek in northern Georgia. After skirmishing on 18 September, Bragg wanted General (Episcopal Bishop) Leonidas Polk to turn the Union left, and he kept up the pressure the next day and then on to 20 September. Rosecrans kept moving units to his left to meet the strong attack from the Confederate right. Finally, unclear about dispositions, he ordered General Woods to move his division from the center-right side of his line almost at the same time as Longstreet's experienced corps attacked. With a loud Rebel yell and a great deal of energy, the Confederates drove through the opening, destroyed the Union right, and most of the remaining Union army fled, including Rosecrans, back to Chattanooga.

Bragg, rather than promptly following up the fleeing Union forces, instead sought to attack the remaining Union troops on Horseshoe Ridge at the Snodgrass House under General George "the Rock of Chickamauga" Thomas. Thomas and his men held the hill under fierce assault. That night, Thomas retreated in good order to Chattanooga, and Bragg appeared content to occupy the surrounding hills and wait.

Children and War

Histories of war generally include the stories of battles, commanders, politicians, and military equipment. However, the effect of war on children has been woefully neglected by academics, professionals, and humanitarian agencies, none of whom consider children an integral component of war. The problems engendered by schooling disruption due to war, for example, have eluded historical inquiry, scarcely being acknowledged or recognized. Yet, obviously, wars have profoundly affected children. The disruption that war causes in their lives is often irrevocable and long-term. War causes

family transformation, displacement, and ultimately a cessation of schooling that reverberates negatively throughout future generations.

According to UNICEF executive director Carol Bellamy, more children are involved in war and conflict now than at any other time in history. The most overlooked element of war is the role played by the loss of schooling. The term *schooling* defines prescribed years of formal academic and vocational programs taught by certified teachers through state-supported curricula. Education, on the other hand, is a lifelong experiential process. A child will be considered anyone up to age 18. One-sixth of the world's population consists of children and youths ages 10 to 19.

Throughout the twentieth century, but especially since 1945, political, religious, ethnic, and intrastate conflicts have become the catalyst for many educational problems. In the 1990s, more than 2 million children have died, nearly 5 million have been disabled, and over 1 million have lost or been separated from their parents; some 10 million children have been psychologically traumatized due to war.

Second only to separation from their parents is the loss or disruption of schooling.

First, the capture of the physical spaces of schooling takes place. Historically, school buildings are affected almost immediately. They are confiscated and used by the combatants as barracks, hospitals, or for administrative purposes. In Alsace Lorraine, for example, schools were used as barracks throughout World War I. And when the German High Command formally surrendered to the Allies in May 1945 in a Rheims, France, schoolhouse used as headquarters by the Supreme Allied Command, apparently no one wondered what the children of Rheims were using for schools. In most cases, however, school buildings are simply sabotaged or irreparably damaged, or are destroyed. In Mozambique's lengthy civil conflict more than 45 percent of children have been deprived of schooling because more than 50 percent of the schools were destroyed.

Teachers are removed, become forced laborers or soldiers, or are simply killed. In Posnan, Poland, during World War II, all the Jewish professors were removed and never

heard from again. Teachers are often replaced by untrained appointees of the new regime so that children can be indoctrinated. As the conflict continues, teacher-training programs are targeted so that new teachers learn to espouse the prevailing ideology. As well, resource deprivation such as lack of school supplies or the destruction of whole libraries (as in the case of the University of Sarajevo) and laboratories invariably impairs the quality of education available to children living through war.

Second, a number of social and cultural factors are associated with schooling disruption. Family and parents play an important role in schooling. Often a child's schooling ends if a parent or guardian dies or is deported. Elder siblings often have to provide for younger ones. Over half a million children between ages 7 and 16 in Zambia do not attend school because they need to look after their families. The paucity of food, lack of health and dental care, and the subsequent malnutrition lead to prolonged school absences, as can lack of transportation to the school. Children are forced to walk but they need to traverse bombed roads and land mines. On their way to school, girls are raped and both boys and girls are abducted. Consequently some parents keep their children home.

Third, cultural disruptions, such as the imposition of a new language, curricular changes, and training programs, can be profound. In many instances teachers are not trained in the victor's language, or if they are, they then become indoctrinated by the victors. Displacement from their once secure environment results in children becoming victims or combatants. About half of the approximately more than 700,000 displaced Kosovar refugees in 1999 were children. Other children become sex slaves or child soldiers. Some boys as young as age seven are forcibly recruited into armies. One young boy was forced to burn his hut and decapitate his parents. This type of horrendous trauma ensures that children will learn to distrust adults.

Schooling disruption due to conflict situations can last for years. In Europe during World War II, schooling by 1943 was at a standstill. In Korea, schooling was denied to many children from 1950 to 1953. In Afghanistan, 3 million school-aged children are deprived of their schooling. Somalia's organized system of learning ceased entirely. Nearly half of Mozambique's children have been deprived of their schooling. Nigerian schooling ceased in 1966–1967 and 1969–1970. In Kuwait formal schooling ceased from July 1990 to 26 February 1991 during the Iraqi occupation. At the end of the twentieth century in Kosovo, schooling for refugee children was nearly nonexistent.

Postsecondary schooling also ceases during conflict situations. In the Netherlands, Delft University, despite having students registered, closed as early as 1941 during the Ger-

man occupation, and remained so until World War II ended. Across the world, in Cambodia the Royal Phnom Penh University was closed for four years. The schooling disruption pattern thus is sadly obvious. The list of schools closed due to conflict is seemingly unending.

It takes at least two generations for an educational system to recover to where it stood before the conflict began. Some children never recover from their war experiences. Several generations of war-affected children have been written off by psychologists and psychiatrists as unstable, thus unable to lead normal lives.

One of the most destructive by-products of armed conflict, whether it is religious, ethnic, or political, is in the effects of involving generations of children in war either accidentally or purposely. The disruption of schooling and related violations of the rights of the child constitute a threat to global security. These actions need to be considered by military policy makers before a commitment is made to go to war. A proactive, child-centered approach should be in place to counter the disruption of schooling and the subsequent horrendous treatment of children. An addendum to the Geneva Convention, stating that disruption of schooling is a human rights violation and that schools should enjoy the same safety zone protection as hospitals, could be adopted by the United Nations. Such action might well be the single most important step to ameliorate the war on children.

Chillianwallah (1849)

The high point for the Sikhs in the second Sikh War of 1848–1849 when they fought the opposing British Army of the Punjab to stalemate. The local Sikh leader, Shere Singh, fought a series of blocking actions in late 1848 against the hastily formed British Army of the Punjab, commanded by Lord Gough, as it commenced crossing the Chenab River from the south. Gough delayed while waiting for reinforcements, but in January 1849 Sikh advances freed a force under Chuttar Singh to join Shere Singh. Gough then moved quickly northward toward the Jhelum River in pursuit of Shere Singh's army, hoping to force a speedy outcome to the campaign. Shere Singh positioned his force of 30,000 men and 62 guns in a line west of, and enveloping, the town of Chillianwallah, ready to surprise the British who he knew must halt at the wells there. On arrival, Gough was partly aware of the Sikh dispositions and intended to move his 12,000 troops and six batteries of guns into battle the next morning, 13 January 1849.

Some Sikh guns fired too early, before the British had fallen out, placing Gough in a very dangerous situation: either to advance immediately into an afternoon and night battle without reconnaissance, or attempt to withdraw in the face of an aggressive Sikh army four times his strength. He chose to attack the center of the Sikh line. His 12 infantry and two cavalry regiments lined up along a three-mile front but were still flanked by the Sikhs at both ends.

The British units attacked at a disadvantage through thick scrub. One infantry regiment was decimated, four others were repulsed, and a cavalry regiment routed, but by evening the Sikhs had withdrawn to the River Jhelum under pressure. Lord Gough had to withdraw to the wells for water, allowing the Sikhs to regain their ground during the night. However, heavy rainfall prevented further engagements, and Gough fortified his camp and awaited reinforcements.

Chindits

British raiding forces in World War II northern Burma. Their name being a corruption of a Burmese term for lion, the Chindits were originated by Orde Wingate, a British officer with a flair for unconventional warfare. Wingate was con-

vinced that a force could operate at will behind and in an enemy's perimeter while depending on radio links for coordination, and aviation for supply and transport, thus overthrowing the orthodoxy of the defending force enjoying interior lines of control.

This doctrine was put into action with LONGCLOTH, a brigade-sized operation intended as an accompaniment to a larger British counteroffensive against Japanese-occupied Burma. Though the larger operation was cancelled, LONGCLOTH went forward in February 1943, for morale-building purposes as much as anything else. Despite losing a third of his force outright, having to leave the wounded behind due to lack of transport, Wingate and his men were held up as an example of how British troops could defeat the Japanese on their own terms.

LONGCLOTH demonstrated enough success to mandate a corps-sized mission called THURSDAY. Mounted in 1944 with American and Chinese cooperation to reopen a land supply route to China, the so-called 3d Indian Division had its own air component in the form of the 1st Air Commando, providing more firepower and the ability to evacuate the wounded.

While THURSDAY succeeded in disrupting Japanese logistics during the Imphal-Kohima battles, the mission of reopening a road to China languished, as Allied strategy abandoned the idea of launching an invasion of Japan from the Asian mainland.

After Wingate's death in an air crash, the Chindits were placed under Joseph Stilwell's command, where excessive use as conventional infantry, while lacking the firepower of a regular infantry division, effectively destroyed the unit.

The Chindits' legacy is as a demonstration of air-ground cooperation granting operational flexibility, and an example of endurance in combat in some of the world's worst terrain. The actual contribution of the Chindits is still debated.

Chinese Civil War (1927–1949)

A long-running conflict that resulted in the victory of the Chinese Communist Party. On 4 May 1919, students in Beijing protested provisions of the Versailles Peace Treaty (to end World War I) that would award the former German concession in China to Japan; it was the beginning of modern

Chinese nationalism. The ensuing May 4th Movement helped revive the fortunes of the Nationalist People's Party, the Kuomintang, and helped start the Chinese Communist Party. For the next several years, the two groups pursued separate and not particularly successful paths. Several years later, Kuomintang leader Sun Yat-sen entered into an agreement with the Communist International (Comintern) through Michael Borodin. The two nationalist groups cooperated and received assistance from the Soviet Union and its agents.

In summer 1926, Chiang Kai-shek, who came to power in the Kuomintang after the death of Sun, led the Northern Expedition to smash warlords and reunify China. Chiang already was beginning to turn on the Chinese Communists while continuing to proclaim his support for the alliance with the Soviet Union. Then in April 1927, Chinese authorities raided the Soviet embassy, seized allegedly incriminating evidence, and on 12 April, Chiang and local criminal gangs in Shanghai turned on the so-called Urban Communists, and the resulting slaughter signaled the end to the alliance.

From 1927 to 1949, the Nationalists and Communists fought to control the mainland; there was something of a respite during the anti-Japanese resistance from 1937 to 1945, but the civil war began anew soon after Japan surrendered in September 1945.

There were four phases to this conflict.

Initially, Mao Zedong with Ju De established a refuge in the mountainous southeastern China. Mao established his Soviet *republic* on the border of provinces, recognizing that this permitted the governors of each province to blame the other for failing to attack the Communists. In late 1931, Chiang Kai-shek began the first of a number of extermination campaigns (the number varies since there were not always clear beginnings and endings to the campaigns). The first four campaigns did not succeed; Mao used sound guerrilla tactics to isolate Nationalist units, overwhelm them, escape around them, and generally frustrate their advance. In late 1933, Chiang, with the aid of German advisers, engaged in a *blockhouse* strategy: Before advancing, Nationalist troops would construct a series of blockhouses and connecting lines, all to limit Communist mobility, and gradually constrict the base area.

In October 1934, Mao and the Communists began the epic Long March. Chiang's blockhouse strategy worked, the Communist base area had shrunk too much to remain viable, and Mao determined to flee the southwest through warlord troops to escape the tightening net. For the next year, the Communists marched through southern and then southwestern China, through western and then northwestern China where few ethnic Chinese had walked before. It

was an incredible story of human fortitude and determination, and in October 1935, Mao's greatly reduced force had marched some 6,000 miles and fought more than 150 battles and skirmishes, and settled into caves in Yan'an near the Great Wall and nearer to the Japanese whose aggression had carried them from Manchuria into Outer Mongolia and China proper. The Long March was an epic story of human endurance, but it also was a great defeat. Mao began with 80,000 troops and entered Yan'an with fewer than 10,000, although many, to be sure, remained behind to foment rebellion in Nationalist-controlled territory. Also, if one tracks the Long March, Mao and his colleagues sought to turn in to China, especially South China, and Chiang's resolute pursuit forced them almost literally "off the board." However, if one employs the strategies of the ancient Chinese game of go, rather than the more Western game of chess, one controls the board by being in a secure position on its side, and hence Mao may have inadvertently actually strengthened his situation.

The third phase was the long war against Japan. Both the Nationalists and Communists carefully watched one another rather than devoting their entire energies to anti-Japanese resistance. When Chiang tried to force several warlord generals to engage in a final extermination campaign, they captured him at Xian and forced him to enter into a united front against the Japanese, but Chiang's agreement was more fiction than fact. The Communists used the facade of a national war of resistance to revolutionize the peasantry and expand against both the Japanese and Nationalists; the Communists would later claim great areas of control based on these foci of peasant resistance.

When the war ended, the Nationalists were located mostly to the southwest; the Chinese Communists claimed base areas throughout North China, and the Soviets had occupied Manchuria in a series of lightning thrusts against the greatly weakened shell of the once strong Japanese Kwantung Army. Advantages seemingly resisted with the Nationalists: an army of more than 3 million with many American-equipped, American-trained divisions; an air force; and a small navy. But the troops were at best uninspired and Chiang was determined to occupy Manchuria before the Chinese Communists; he created his own grand strategic trap. American air and naval power helped transport the best troops in the Nationalist army over and around Communist positions in North China to Manchuria. Mao and his military commanders moved into Manchuria, and forced hesitant Nationalist generals to retreat to the cities. Isolated, they were soon forced to rely on resupply by air. In October 1948, Nationalist garrisons in Manchuria surrendered to the Communists, and Mao's forces gained modern weaponry and munitions. The Communists continued the propaganda war

and took advantage of Nationalist corruption in the country's center. In January 1949, they won a grand victory at the Battle of Huai-hai, where they forced the Nationalist advance army to dig in and then went around that army to attack and destroy the slow-moving relief force, and then returned to the still-dug-in vanguard. Nationalist defeat was now inevitable. In January 1949 the Communists gained control of North China; in April they forced the crossing of the Yangtze River, which could and should have been better defended; and in May they entered Shanghai. Late in the year they had occupied southern, southwestern, and western China. Chiang and his remaining forces fled to the island redoubt of Taiwan.

The last act of the civil war has been delayed at least 50 years. As the Communists prepared to attack Taiwan in late spring 1950, North Korea invaded the south, the U.S. Navy entered the Taiwan Straits, and an independent Chinese government continues to exist on the island of Taiwan.

Chinese Imperial Wars (200 B.C.E. to 1800 C.E.)

Cycles of Chinese military power show alternating Chinese and barbarian control. During the 2,000-year history of imperial China prior to the coming of the West, there have been considerable differences in the ability of Chinese rulers to maintain an effective military and project power. While many of the stronger dynasties, including Qin (221–207 B.C.E.), Han (206 B.C.E.–220 C.E.), and Tang (618–906 C.E.), have not only maintained large and relatively effective armies, and advanced positions far beyond Chinese frontiers, such periods of Chinese power have alternated with periods of barbarian rule, and with periods in which even large and theoretically powerful Chinese dynasties have been forced to remain strictly on the defensive, usually for geopolitical reasons.

Chinese military power has thus fluctuated considerably over the centuries, but in general, strong dynasties and strong rulers have controlled the barbarians, while in other periods barbarians have controlled China. Overwhelmingly

these barbarians were peoples of Central Asia, with southern groups rarely playing a significant role. Thus, for obvious reasons, much traditional Chinese military activity focused on China's northern frontiers, a fact reflected, among other things, in the existence of the Great Wall. This is a Ming Dynasty (1368–1644) successor to a series of frontier fortifications whose origins date back well before the imperial period. Originally, such walls delineated territory within China, but they also came to mark the border between settled China and the pastoral nomadism of most of China's neighbors to the north and northwest.

Classically, Chinese dynasties sought to control foreign peoples indirectly, through threats, bribery, and turning one against the other (*yi yi zhi yi* [using the barbarians to govern the barbarians]), with direct military intervention usually a final resort, since most Chinese rulers were only too aware of the limitations of their power when it came to campaigning in the deep steppe. While the main goal of this policy was a secure northern frontier, Chinese imperial dynasties were also interested in trade. From Han times on, they wanted to reach out to the extreme northwest, to control as much as possible of the so-called Silk Road, the trade route for Chinese silk and other precious commodities, extending from China to the world of the eastern Mediterranean, to Rome and Byzantium, the Arab caliphates, and later the trade controlled by the Italian cities.

After uniting China in 221 B.C.E., the first emperor of China, Qin Shi Huangdi, constructed extensive frontier fortifications and fought with the Xiongnu and other Inner Asian peoples outside the new barriers. The Qin did not last long, and were soon succeeded by the Han Dynasty, which roughly parallels the era of and the achievements of the Roman Republic and Roman Empire. The Han engaged in the wars typical of the stronger Chinese dynasties. After a period of diplomacy, the Han actively fought the Xiongnu, and sought to divide and conquer them. Later the Han extended their power as far west as the Ferghana valley.

As the Han Dynasty weakened, the yang of Chinese imperial power yielded to the yin of barbarian reaction. Although the northern state of (Cao) Wei (221–264), and later the Western Jin Dynasty (265–317), were at first able to maintain an effective defense, starting in the early fourth century, northern barbarians overran much of northern China. For three centuries, barbarians dominated almost completely, and many Chinese moved south, to new lands and new ways of life, to escape the warfare and deprivation. Most important of the barbarian groups ruling states in the north were the Xianbei, founders of the Toba Wei Dynasty (386–534), which effectively united the north under a single set of rulers and dominated southern states as well. The Toba were the originators of the *fubing* system of mixed Chi-

nese and barbarian militias that later became the basis of early Tang (618–906) military power.

Almost inevitably, the pendulum swung back, and native Chinese power was restored under the Sui (589–618), which reunited China. It actively sought to control trade routes to the northwest and sent missions to Vietnam, Taiwan, and even reached out to Japan. It also invaded Korea, which led to its downfall.

In a pattern reminiscent of the transition from Qin to Han, in which a short, harsh, unifying dynasty fell quickly and was followed by a longer peaceful period, Sui was quickly succeeded by the Tang. This dynasty completely dominated its surroundings from its founding in 618 until the middle of the eighth century. While ultimately no more successful in Korea than the Sui, the Tang did make extensive conquests in Central Asia, and reached the Caspian Sea. In 751, the Tang suffered a major defeat by the Arabs on the Talas River in Central Asia, even as their supply routes were threatened by Tibetans and other barbarian groups in the rear. Shortly thereafter, the dynasty nearly collapsed in the wake of the great An Lushan rebellion.

An was a Sogdian general in Tang service and commanded an army largely composed of Turks and other barbarians. To suppress his rebellion other barbarian groups, including Uighurs and Tibetans, had to be mobilized, as the once strong *fubing* system inherited by the Tang disappeared entirely. Once again, the yang of Chinese power began to give way to the yin of barbarian power. By late Tang, the very survival of the dynasty was dependent upon one barbarian group, the Turkic Shato.

When the Tang finally collapsed in the early tenth century, there was another, but this time brief, era of disunity. Once again, China fell under the control of competing ruling houses, the majority of them of Turkic Shato extraction.

Although the Song (960–1279) managed to reunite China again in 960, the new dynasty was never able to establish effective control everywhere. The northeast, which had been ruled by separatist regimes during late Tang times, now fell under the control of the Khitan, who established their own dynasty, that of the Liao (907–1125). Almost simultaneously, the Tanguts, of uncertain ethnic affiliation, established their own separatist state in the northwest, later known as Xixia (destroyed 1227). These competing regimes robbed Song of defensible frontiers, to a large extent, and limited its access to urgently needed Central Asian warhorses. This meant that Song armies, often well armed technologically, including with the first gunpowder weapons, were overwhelmingly composed of relatively immobile foot soldiers, while its opponents mostly fielded cavalry.

Song economic, as opposed to military, power rested on the great medieval economic revolution, and the changed lo-

cus of Chinese power in the southeast where reliance on water and canals, a development from late Tang times on, frustrated the horse peoples of Inner Asia. Nonetheless, the Song lost control of the North China plain in the first third of the twelfth century, and retreated to the Yangtze basin. Henceforth the Tungus Jurchen, through their Jin Dynasty (1125–1234), controlled traditional northern China, and engaged in war and diplomacy with even more barbarian tribes to their north. As Jin power developed, Song China continued to rely on masses of foot soldiers and on fixed fortifications for its defense, but also developed an effective navy, operating both on the rivers and lakes of China and on the high seas.

In 1234 the great tide of Mongol power finally overwhelmed the Jin after conquering Xixia in 1227. Warfare between the Mongols and Song began almost immediately, and continued until 1279, when the last embers of Song resistance were crushed in the extreme south in the great naval battle of Yaishan, and China was finally reunited under Mongol rule. By this time Kublai Khan had established the Yuan Dynasty (1279–1368) in China, and in surrounding parts of Central Asia, including what is now Chinese Turkistan.

Under Kublai a Chinese dynasty, for the first time, conducted large-scale overseas expeditions, including two attacks on Japan, another into Vietnam, and another against Java. Such expeditions, carried out by fleets that were truly huge by the standards of the time, were unprecedented in Chinese history. Overland, the Mongols not only penetrated southern areas such as Yunnan, henceforth a Chinese province, and Burma, but united Tibet with China for the first time in its history, although the union was personal between the Mongol rulers of China and the principal Tibetan religious authority.

In 1368 Zhu Yuanzhang, a peasant from the south, finally defeated the Mongols and Chinese pretenders to power, and established the Ming Dynasty. Under Zhu and his immediate successors, once again the pendulum swung toward Chinese power, and the Ming regained control over all of China, as well as parts of Mongolia and Manchuria, although attempts to penetrate the deep steppe failed. Later one Ming emperor was even captured by the Mongols, who also threatened the later Ming capital of Beijing at one point. At sea, expansion continued as the eunuch admiral Zheng He explored the Indian Ocean all the way to East Africa and Southeast Asia.

Eventually the Ming weakened and internal rebellion threatened. At the same time a barbarian power, the Jurchen, who had once ruled the Jin Dynasty, later called the Manchus, sought to set up a Chinese-style regime in Manchuria. During this period China's response to its various foreign threats was one of the most massive efforts at the construction of frontier fortifications in world history, the Great Wall. It tied up huge resources and required an enor-

mous garrison, but still proved quite ineffective in preventing foreign attack.

Taking advantage of internal breakdowns, in 1644 the Manchus, by then the Qing Dynasty (1644–1911), seized Beijing, and soon thereafter defeated remaining Ming loyalists, including mounting a massive overseas expedition with the help of the Dutch to conquer Taiwan. It became a part of China for the first time in its history.

The Qing restored the power of China, albeit under foreign rule, and under the Kangxi emperor (r. 1662–1722) China negotiated successfully with the advancing Russians. It neutralized the Mongols, conquering all of Mongolia in the mid-eighteenth century, seized control over Tibet, and fought with the Vietnamese. However, with the death of Kangxi's grandson, the Qianlong emperor, in 1799, and the end of the Napoleonic Wars soon thereafter, China would face a century of foreign, Western-based imperialism, several decades of costly invasion and civil war, and now five decades of Communist control. Nonetheless, the history of Chinese imperialism continues to be of concern to the peoples on China's borders.

Chinese Military (Twentieth Century: History, Organization/Structure)

The twenty-first century's dominant Asian military power? Twentieth-century Chinese military history is the story of three separate forces: the Western-style army of the Qing Dynasty, the Nationalist or Kuomintang army, and the People's Liberation Army (PLA) that has developed out of the Communist revolution.

Defeat in the First Sino-Japanese conflict (1894–1895) finally forced the Qing Dynasty to create up-to-date forces capable of standing up to the Japanese and European armies, though time was running out for imperial rule in China. The armies survived the Qing, and when central authority collapsed in 1911 and the new Chinese republic proved unable to rule effectively, regional commanders struck alliances with local civilian elites, leading to the so-called War Lord period.

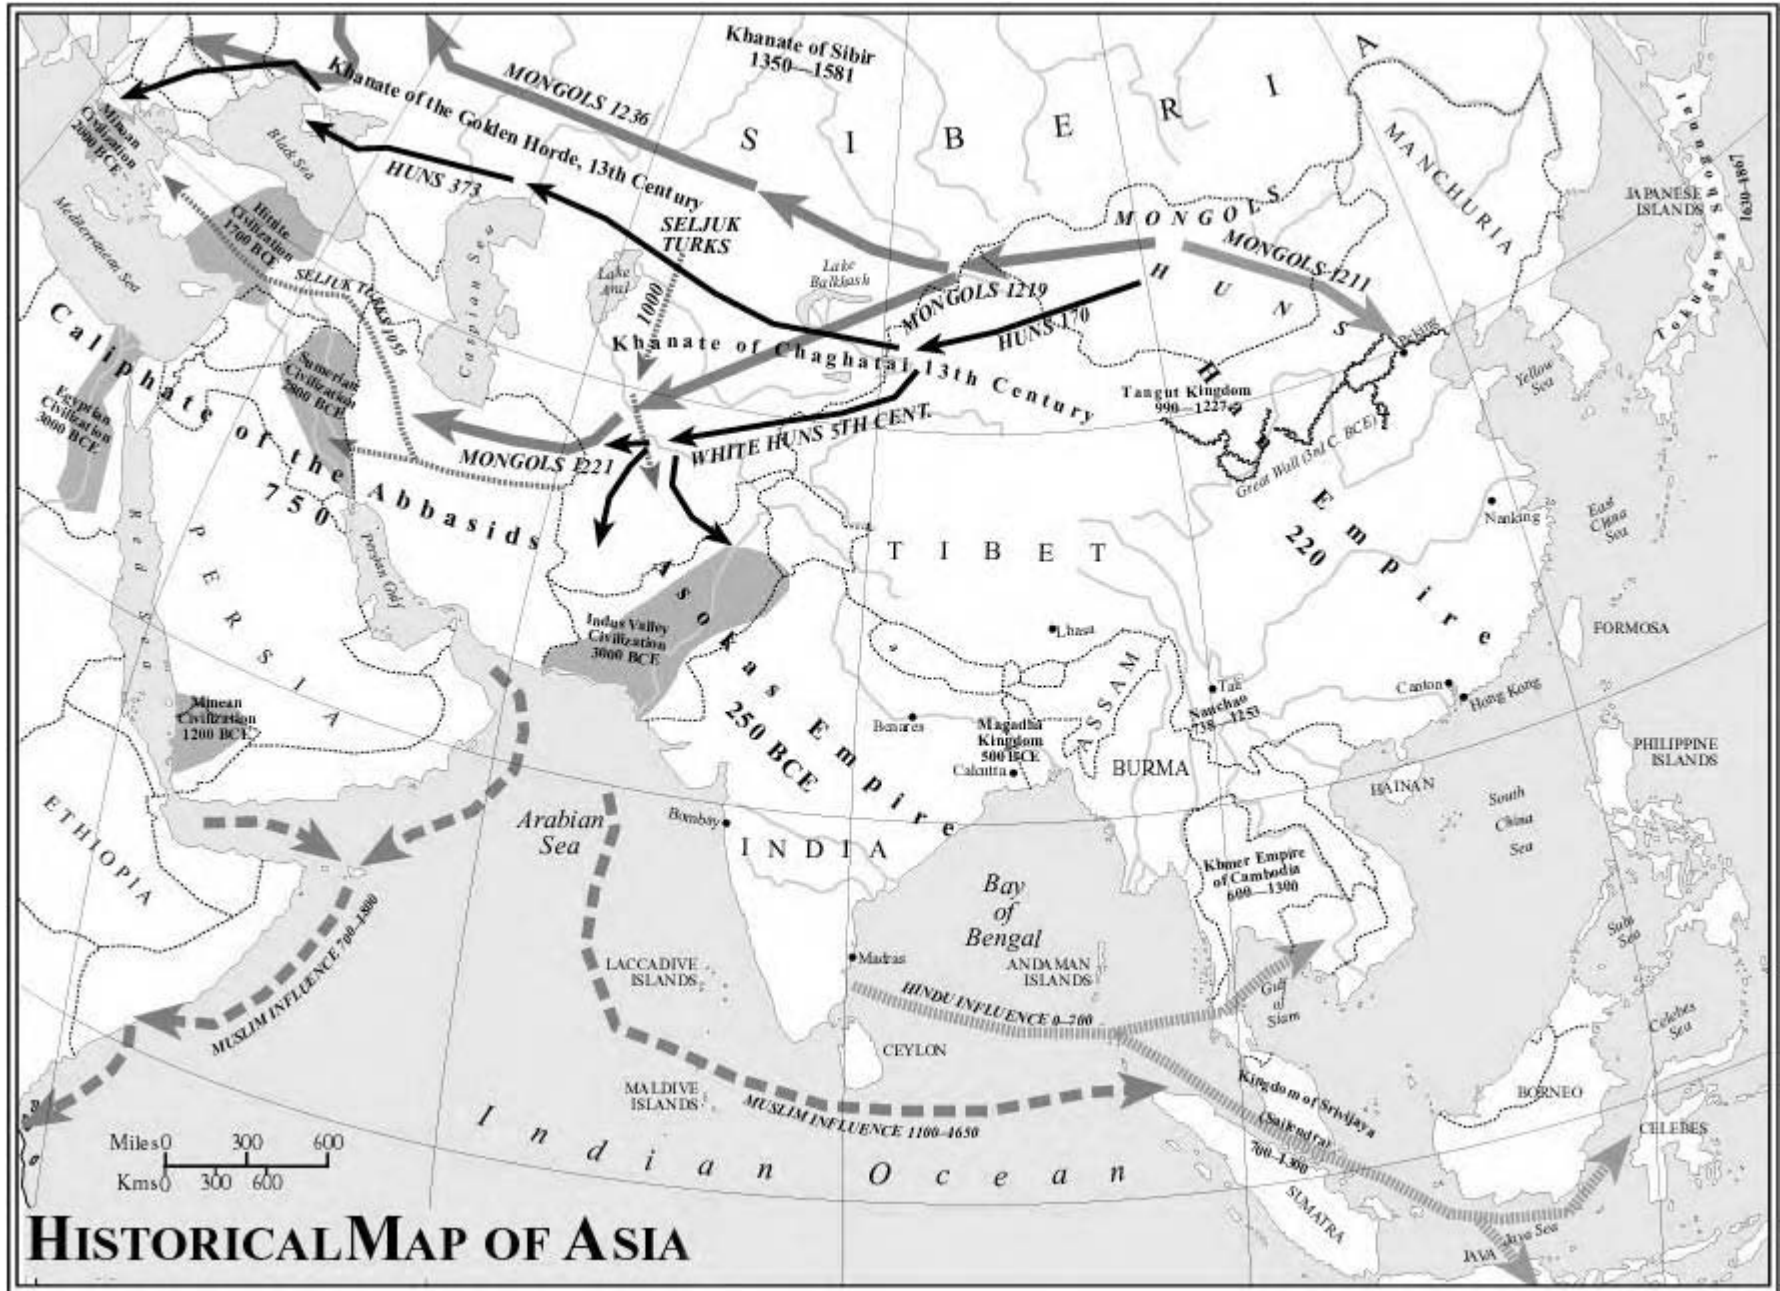

While the strongest leaders of the old military might have reunified the country—and one of them, Yuan Shikai, did, if briefly and superficially, before his death in 1916—this avenue of Chinese history had definitively been closed not later than the early 1920s. By that time, a series of wars had ensured that the Manchurian warlord, Zhang Zuolin, who enjoyed Japanese support, had predominance in northern China, but little influence outside it, where a stalemate between various local forces and foreign powers continued.

This situation allowed the revival of the political fortunes of the founder of the Chinese republic, Sun Yat-sen, and the creation of the Central Army of his Kuomintang regime. Like the warlord armies, the Nationalist army was modeled on Western and Japanese examples. The difference was that the new army created an ideologically motivated and loyal officer cadre via the graduates of the Whampoa military academy, under the direction of Chiang Kai-shek. This was the army that defeated the weakened northern regional forces and pursued the nascent Communist guerrilla forces to near annihilation.

Structural problems remained, though, even after the political victory following the Northern Expedition of 1926. Many of the old regional forces were only partially assimilated into the new army, and China remained so impoverished that the 2 million-man army fielded by 1937 lacked the heavy equipment to fight the Japanese army on equal terms. Chiang was also primarily concerned with eliminating the Communists, appeasing Tokyo in hopes that the Western powers would eventually confront Japan over its aggression.

Eventually, China's internal political dynamics generated sufficient pressure to force Chiang to confront Japan, leading to full-scale war in 1937. As expected, the Nationalist regime could only inflict serious wounds on the Japanese, not a repulse, and eventually fell back to Chungking. This allowed a resuscitation of the Communist movement.

An ally of the Kuomintang in the mid-1920s, the 1930s saw the transformation of the Chinese Communist Party's military from an urban workers' militia into a rural guerrilla force under the direction of Mao Zedong and his circle. While the Kuomintang did develop an internal ideology, tending toward authoritarianism, even fascism, Mao made

HISTORICAL MAP OF ASIA

ideological commitment the core of his military system, along with the belief that correct political and social practice could be a force multiplier. This was accompanied by the creation of an operational system conceptualizing how a revolutionary army could defeat a better-armed conventional force, based on locally raised part-time units.

As it was, neither the Kuomintang nor the Communists mustered the forces or the skill to score operational victories over the Japanese. Their armies remained forces-in-being while Anglo-American and Soviet forces defeated the empire.

With the return to civil war, Chiang's American-equipped forces were gradually defeated and exiled in 1950. Arguably, the PLA's victory stemmed from Chiang's rail-bound forces having reached a culminating point in their Manchurian offensive, and never regaining the initiative, as opposed to any inherent virtues of Mao's military system.

From there, the Chinese army committed to Korea was able to take devastating advantage of the United Nations force's operational overstretch. Still, quick tactical movement and strong morale were ultimately undone by serious limitations in logistics, professional expertise, and modern equipment. These faults and virtues remained in evidence until Mao's death, when serious reform of the PLA finally became possible.

The heritage of the PLA, like all the modern Chinese militaries, is to regain Chinese sovereignty and prestige. The common problem of all has been to overcome less-than-popular regimes, economic weakness, and the difficulty of confronting better-equipped and -trained opponents. This problem will persist into the foreseeable future.

ernment. The Manchu Dynasty that had ruled China since 1644 tottered to its end on 12 February 1912 when the young emperor, Hsuan T'ung, resigned. For some years there had been an increasing opposition to the Qing Dynasty; Chinese of all political persuasions were discouraged by Japan's apparent ability to leap to modernity and China's apparent inability to do the same, not to mention Japan's humiliating defeat of China in the war of 1894–1895. In particular, students and soldiers had organized a series of revolutionary study societies in central China, and Qing authorities discovered one of these groups of plotters on 9 October 1911. The next day, soldiers in Wuzhang, a city on the Yang-tzu River, mutinied and took control of the city. This mutiny, really caused by fear among the soldiers that they would be linked to the plotters and be executed as rebels, led to similar outbreaks across the country. Within a few weeks, provinces across China had declared their independence of the Manchus, now increasingly isolated in Beijing. Indeed, by early December, all of the southern, central, and even northwestern provinces had declared their independence; power was shared jointly by former government army officers and provincially selected political leaders. This decision to cast off the Manchu overlords was so broadly accepted that there was little need for fighting anywhere.

For a brief period of time it appeared there might be two contending centers of power or perhaps a conflict between them. The Qing turned to a senior military commander (and political adviser), Yuan Shi-kai. Yuan counseled them that the Manchu reign was over, and a hastily convened assembly elected him as prime minister of a provisional government. Yuan's troops, China's only real modern armed force, seized several cities from the rebels and ordered the rebellion to stop.

At about the same time, the real father of the Chinese Revolution, Sun Yat-sen, had been abroad in America and went to Great Britain seeking a loan or British help to prevent Japan from befriending the declining Qing Dynasty and thereby gaining control over China. After returning home, he was offered the position of provisional president and was inaugurated on 1 January 1912 at a provisional capital in Nanjing, farther away from Manchu and Yuan's power. However, Sun soon realized that, lacking an army and a secure base of support, he was vulnerable to Yuan and his dreams of power. So Sun offered to resign and give way to Yuan, assuming that Yuan would accept that he was subject to the power of the people through the provisional assembly.

Yuan soon gained control. While the rebels were stridently anti-Manchu, they were united on little else. They did fear rising Japanese imperialism, and did want a strong China to regain its stature in the world. And Chinese generally recognized Yuan's prestige and power. So Sun resigned,

the last Qing emperor abdicated, and the newly established National Assembly elected Yuan as provisional president and nominally leader of China, although, to be sure, he really was the first among a series of warlords of varying power and control.

Chippewa, Battle of (5 July 1814)

First American battle involving a majority of regular U.S. Army troops. British lieutenant general Sir Gordon Drummond commanded about 4,400 men around the western end of Lake Ontario in June 1814, defending the Niagara

peninsula against the expected American invasion. On 3 July, about 3,500 Americans under Major General Jacob Brown, including 1,400 under Brigadier General Winfield Scott, crossed the Niagara River, easily and bloodlessly captured Fort Erie, and marched north. In response to this threat, British major general Phineas Riall deployed 2,100 regulars, militia, and Indians in a strong defensive position north of Street's Creek, with the river on his left and woods on his right.

The Americans camped just south of Street's Creek the night of 4 July. Because Brown considered a frontal attack across Street's Creek unwise, he ordered volunteers under Brigadier General Peter B. Porter to take the forest on the British right. Porter met little resistance and had accomplished his mission by 4:30 P.M. on 5 July, but then encountered a regiment of British regulars, which he successfully handled until British artillery drove him back. Scott, meanwhile, was parading 1,500 men in full sight of the British, perhaps to intimidate them, but suddenly wheeled, crossed the creek under fire, redeployed on the north bank, reinforced Porter, and attacked. Riall, shocked by the precision and deadliness of Scott's extraordinarily well-drilled brigade, is supposed to have exclaimed, "Those are regulars, by God!" Scott's charge forced the British to retreat, losing

148 killed and 321 wounded, compared with 60 Americans killed and 235 wounded. Brown rewarded Scott with a brevet major generalship.

Chosin/Changjin Reservoir (1950)

A reservoir in the far north of Korea, site of a series of bitter engagements between U.S. X Corps and Chinese People's Volunteers forces. Despite Chinese Communist attacks on advanced Republic of Korea (ROK) units nearing the Yalu River in late October 1950, United Nations (UN) Commander Douglas MacArthur continued his northward offensive, and American and other forces replaced ROK units for the final drive to eradicate communist military power on the peninsula.

However, there was little contact between U.S. Eighth Army on the west and combined X Corps on the east side of the Korean peninsula. Chinese Communist divisions—nearly 300,000 men—had infiltrated UN lines and prepared to attack, although that possibility had been heavily discounted by MacArthur and others caught up in the euphoria of the moment.

The Chinese Communists struck beginning 24 November 1950. They sought to cut UN lines in two, and roll each of the lines up against the coasts and thereby annihilate them. As the Chinese attacked, the U.S. 1st Marine Division continued to advance northwestward as part of MacArthur's final offensive thrust. Then, on the night of 27 November, they were surrounded by three Chinese divisions. Meanwhile, supporting ROK forces were falling back under Chinese pressure.

The 10,000 marines were able to break out and march to the port of Hungnam. The marines had never previously retreated in the long proud history of the Corps, so (as they said), they attacked "in another direction." Ultimately they fought their way through and past seven Chinese divisions. Meanwhile a relief column drove through Chinese lines. U.S. airpower kept the Chinese under continuous attack while

dropping necessary supplies to keep the marines armed, fed, and clothed—indeed, airplanes even dropped bridging equipment. In the end, the marines escaped and later reentered the war farther south, but it was a retreat and a desperate one at that.

Churchill, Sir Winston (1874–1965)

British statesman and wartime leader. Churchill came from a family with a long military tradition (the Marlboroughs), and he was a professional cavalry officer, serving in India (1895–1899) before he resigned to enter politics, though he fought again for six months in France (1915–1916). It is, however, for his passages at the head of the Admiralty (1911–1915 and September 1939–May 1940) and as prime minister of wartime Britain (May 1940–July 1945) that he ranks among the greatest war leaders in British history. This does not mean that he is above criticism in that field: On the contrary, the continuous flow of books on the two world wars, as well as the never-ending stream of biographies of him, always submit his actions to the closest critical scrutiny.

There is nearly unanimous agreement on at least one point: The Gallipoli fiasco of 1915 almost ruined his political career—he himself believed he was "finished." The incompetence displayed was indeed appalling, but Churchill is not alone to blame. In fact, the affair showed a constant trait of his character: He seldom knew where to draw the line between perseverance (a virtue) and obstinacy (a fault), a not unusual trait among great war leaders. Some historians argue that he never forgot the lesson, which explains his prudence over the *second front* and the Normandy landings of the next war.

The complexity of the British political scene between 1918 and 1940 explains both why his talents were sometimes recognized—indeed used—and why he remained a maverick in the eyes of his peers, and also in public opinion. By 1939 he had become the archetype of the warmonger as opposed to the appeaser, and the declaration of war made his inclusion in the Cabinet inevitable, to show that it meant

business. “Winston was back” at the Admiralty, where disaster had again to be faced, in Norway in April 1940. One of the ironies of history is that this setback eventually gave Churchill the premiership, on 9 May 1940.

His obduracy (“We shall never surrender”) was now an undoubted asset, which galvanized the British population (“their finest hour”) and made it accept the full rigors of total war when Hitler’s final peace feelers were unambiguously rejected by his War Cabinet in July 1940. This is the period described as “Alone” in his memoirs, the period on which he probably imprinted his greatest mark, and the period in which he benefited from the largest consensual agreement in the population, beyond the old party divides. The vital priority was resisting invasion, and in these particular circumstances he admirably led the country to success. When he had to compromise with the Soviets, with the Indians, and later the Americans, from 1941, his old imperialist, anti-Communist, Edwardian streak was an obvious liability, and the most severe criticism in current Churchillian historiography is that behind the florid rhetoric of the Big Three he could not ignore the fact that at Yalta he was agreeing to a postwar settlement that made Britain lose the peace despite its hard-won place among the victors.

In sum, Churchill’s magnificent spirit braced the British people to their finest hour, for which most Britons would consider him to be their greatest leader of the twentieth century. But in hindsight, it can also be asserted that such spirit and such rhetoric masked Great Britain’s decline from major power status.

Cimon (c. 510–451 B.C.E.)

Athenian statesman and general who played an active part in building up the Athenian Empire in the period following the Greco-Persian Wars.

Cimon was the son of Miltiades, the architect of the victory at the Battle of Marathon against the Persians in 490. His impressive performance in the victorious sea battle against the Persians at Salamis in 480 led to his election as *strategos*, one of Athens’s 10 annual generals. In 478 he helped Aristides to secure the transference of the leadership of the Greek forces from Sparta to Athens and he became the principal commander of the Athenian-led alliance known as the Delian League.

Cimon’s first task was to drive out the Spartan general Pausanias—who had been dismissed on suspicion of treason—from Byzantium. He then removed Eion in Thrace from Persian hands (476–475 B.C.E.) and soon after this he won the island of Skyros for Athenian settlers and returned to Athens the supposed remains of Theseus, Athens’s legendary hero.

Cimon’s greatest triumph took place in 466 when, as leader of an allied fleet of 200 ships, he crushed the much larger Persian fleet near the mouth of the River Eurymedon in Pamphylia and subsequently defeated the Persian king’s forces on land. He then returned to the Aegean and drove the remaining Persians out of the Thracian Chersonese. When the rich island of Thasos seceded from the Delian League, Cimon besieged it and forced it to surrender (463).

In 461, Cimon was ostracized. On his return to Athens, he worked for peace with Sparta. When peace was achieved in 451, he once again mounted a big naval expedition against Persia in order to recapture Cyprus. During the siege of the city of Kition, however, he died of sickness or a wound.

Cincinnatus, Lucius Quinctius

(c. 519–430 B.C.E.)

Roman citizen called upon to save the early Republic during the fifth century B.C.E. Cincinnatus served as one of the two Roman consuls in 460 B.C.E. and as a member of the Senate composed of 300 men representing Rome’s aristocratic families. After his one-year term, during which he commanded the army and interpreted and enforced the law, he returned to his three-acre farm to plow the fields and provide for his family. Then in 458 B.C.E., the highland Aequi tribe, pushed by overpopulation down onto the slopes to the northeast of Rome, threatened the republic. The Senate appointed Cincinnatus as dictator with unlimited power to defeat the

Aequians. Upon hearing the news of the threat, Cincinnatus replied that he and his family might not have food the following winter but it was his duty to defend Rome. Leaving his plow behind, he led the Romans against the Aequi. Within 16 days he and his troops defeated the enemy. Hailed as a victor and still vested with unlimited powers, Cincinnatus might have abused his position, as the Roman plebeians feared. But after the victory he relinquished the office of dictator, putting their fears to rest. For his courage and leadership the Senate awarded Cincinnatus a golden wreath. After 60 days he turned over the reins of government and returned to his fields. Cincinnatus accepted the position of dictator again in 439 B.C.E., this time to deal with a plebeian uprising. After the immediate danger passed he once again relinquished the office. Cincinnatus remains a symbol of the virtuous farmer and exemplary citizen willing to defend his country.

Civil Affairs/Military Government

Reconstruction after the battle. Military government is the installation of a martial administration over a region that has been subjected to forcible occupation. Ideally this occurs under the auspices of the Hague and Geneva Conventions, as opposed to an exercise in sanguinary force, until the restoration of civil authority. More complicated is the question of civic action as a military function, the application of military resources to the reconstruction of a population and region traumatized due to war or natural disaster.

Having first been subjected to military government as a client, and inheriting the British distaste for the military, American military government was on an ad hoc basis until World War II. American soldiers acquired on-the-job training by exercising authority in Mexico, the occupied South during the Civil War and Reconstruction, and in the Philippine Insurrection. The question was raised as to whether military occupation could be an avenue to social and political improvement, instead of simply keeping a hostile population in check.

The golden age of military government and civil affairs occurred during World War II and the immediate Cold War period. With the rise of total war ideologies mandating a role

for all citizens and the threat of violent social revolution, even the United States began to try to “win the peace” by making over the fascist and authoritarian states defeated by the Allies in World War II into the liberal-democratic image of the victors. The Allies all had their own civil affairs/military governments, but only the United States and the Soviet Union had the resources to rebuild defeated societies in the victor’s own image. (German and Japanese *civil affairs* would be almost a contradiction in terms.)

Civil affairs transitioned into counterinsurgency when Soviet premier Nikita Khrushchev made the region an arena of ideological conflict. Edward Lansdale in the Philippines and Gerald Templer in Malaysia became successful pioneers of counterinsurgency. Here, civil action became an integral portion of defeating guerrilla armies, the theory being that the provision of grassroots economic and social services could be a means of winning disputed populations while separating them from the threatened government’s military opposition. While not totally original, the concept certainly received a higher profile, plus questioning as to whether this was simply another form of imperialism. Although the French enjoyed some success in Algeria, it was not sufficient to forestall independence for its former territory.

The climax of the strategy came during the Vietnam War where extensive (if shallowly applied) theories of civil action were administered by the American Office of Civil Operations of Rural Development Support (CORDS). Despite the ostensibly coordinated effort and some considerable success, the strategy could not be separated from the inadequacies of the Saigon government or the sheer destructive course of the war itself, making *nation building* a pejorative to the present day.

The irony is that in a world of failed states and transnational disaster, the requirement for military civil action seems as in demand as at the zenith of the Cold War. Civil affairs now revolve more around the mission of peace keeping as opposed to counterinsurgency or overt war. Civil affairs challenges of the early twentieth century include the calls for international coordination, including the role of nongovernmental organizations (NGOs), intense media focus, and the question of cultural imperialism.

Clark, General Mark Wayne (1896–1984)

Commander of the U.S. Fifth Army, the Fifteenth Army Group, in World War II and United Nations (UN) forces in Korea. A 1917 graduate of West Point, Clark was wounded as an infantry officer in World War I. As a decorated veteran of World War I and a keen military thinker, he caught the eye of General George C. Marshall in the interwar years and became one of a cadre of young officers—other notables were Omar Bradley and Dwight Eisenhower—slated for advancement at the outset of World War II.

After a stint with Army Ground Forces in Europe and as deputy chief of Allied forces in Northwest Africa, he was sent, clandestinely, into French North Africa in late October 1942 to negotiate a truce with Vichy French commanders in advance of the impending Allied invasion. Although he did not succeed in forestalling all resistance, he did eventually reach agreement with the French.

Clark assumed command of the Fifth Army in time for its invasion of Italy in September 1943. Here the trouble began. In hopes of achieving surprise, Clark elected to forego naval bombardment in advance of the Allied invasion of Salerno. The German defenders, surprised but unscathed from lack of bombardment, nearly pushed the Americans into the sea. Whether the fault of Clark or not, the ensuing Italian campaign was an arduous slugging match up the Italian peninsula, at great cost.

In January 1944, in the hope of relieving the embattled invasion force at Anzio, Clark ordered his troops to attack across the heavily defended Rapido River. He lost 2,100 men in the space of one day amid repeated assault orders. This bloody debacle provoked a congressional investigation. But Clark's greatest controversy came five months later after the Allied breakout from both Anzio and the Gustav Line. A brave but vainglorious man, Clark pushed the bulk of his forces toward Rome to liberate the first Axis capital, but at the cost of allowing the bulk of the German army in Italy to escape and survive to fight another day. They would hold out in northern Italy, and extract many Allied casualties, until the end of the war.

An adept self-promoter and bureaucratic infighter, Clark survived these controversies and rose to command United Nations forces in Korea in 1952–1953. After the war he re-

tired from the army and served as president of The Citadel Military College in South Carolina until 1965. To his dying day, Clark defended his reputation against all critics.

Clark, George Rogers (1752–1818)

“Conqueror of the Old Northwest” during the American Revolution. A prominent explorer in the western frontier of Virginia, in 1774 Clark served as captain of the Virginia militia in Lord Dunmore's War against the Shawnee Indians. At the outbreak of the American Revolution, Clark commanded the frontier militia and organized the defense of the Kentucky country. In 1778, he captured Kaskaskia, Cahokia, and Vincennes, but lack of reinforcements forced him to abandon plans to take Detroit. Between 1780 and 1782, Clark, now a brigadier general, defended Virginia against General Benedict Arnold's invasion. He also defeated the Shawnee at Piqua and Chillicothe, defended Cahokia and St. Louis against a British-Indian expedition, and recaptured Vincennes. Clark's campaign against Detroit again failed to materialize, but his victories preserved American claims to the Old Northwest at the end of the war. Clark was not paid for his service and spent the remainder of his life deeply in debt. He remained in the West as Indian commissioner until 1786 when a military campaign against the Wabash ended in failure. Clark's involvement in foreign intrigues in the West further clouded his reputation. He tried to recoup his fortunes through several abortive Spanish and French colonization schemes. In 1793, he accepted a French major general's commission to lead an expedition of American frontiersmen against Spanish Louisiana. The scheme, part of the Genet Affair, also failed. In 1798, Clark joined the French army to lead another attempt to conquer Louisiana that never materialized. In 1812, in belated recognition for his Revolutionary War service, the Virginia legislature granted Clark an annual pension of \$400.

Clausewitz, Karl Maria von (1780–1831)

Prussian general, one of the most influential military theorists of modern times. Born near Magdeburg, son of a civil servant and retired army officer, Clausewitz joined the Prussian army in 1792, was commissioned in 1793, and fought at Mainz (1793) and the Rhineland Campaign (1794) against France.

Clausewitz devoted time on garrison duties to self-education, graduated from the Berlin Military Academy, was appointed to General Staff (1803), and served as aide to Prussian ruler Prince Augustus (1804).

Clausewitz fought at Auerstädt and was captured at Prenzlau by the French in 1806. Repatriated with the Peace of Tilsit, he was employed on the Military Reorganization Commission from 1807 to 1811 under Gerhard von Scharnhorst, director of the Berlin Military Academy, working with August Wilhelm Gneisenau, Hans David Yorck, and Gebhard von Blücher, in modernizing the Prussian army to match that of Napoleon.

He resigned his army commission in 1812, protesting the Franco-Prussian alliance against Russia, and joined the Russian army in defensive campaigning, culminating in the Battle of Borodino. Clausewitz helped persuade Yorck to sign the Convention of Tauroggen, abandoning France for Russia.

He was Prusso-Russian liaison officer during the War of Liberation against Napoleon (1813) and corps chief of staff in Blücher's army in Napoleon's final defeat (1815).

But his 1812 resignation had blighted his career. King Frederick William III, to whom Clausewitz was military tutor (1807–1811), would not readmit him into the Prussian army until Napoleon's first abdication (1814). He did serve as director of the Berlin War College (1818–1830), an administrative post, giving little input to teaching, army reform, or future war planning.

Although Clausewitz never commanded in battle, he wrote of his war experiences, beginning in 1818. Ten volumes were published in unfinished form in 1832, the year after his death from cholera at Breslau (Wrocław). His most important work was *Von Kriege* [On War]. Revising this volume from 1827, only the first chapter was satisfactorily completed, and inconsistencies therefore appear. Industrial and military developments were rapidly bypassed in favor of tactics, but this was the first attempt to analyze practically every concept of war, including unconventional or partisan war together—analyzing conflict, how future war may develop, drawn from his Napoleonic War experiences, knowledge of military history, and Kantian philosophy.

Von Kriege's best-known section deals with “War as a continuation of politics by other means.” Clausewitz contended that “absolute” war, completely annihilating the en-

emy, gaining total victory, in reality could not always be achieved. Frictions—numerous diverse factors—limit war, the greatest friction being politics. Wars are fought for political goals, their scale determining the scale of war. Governments should oversee war, otherwise generals would set few if any limits. Political goals must be established at the onset of war.

Varying frictions make each war different, preventing the application of universal rules. Commanders must be quick to act and react, and be sure in their decisions, thus establishing good morale among the troops. The side with greatest morale (*élan*) will succeed. In that offensive action creates higher morale than defensive, decisive offensives should be mounted.

The enemy center of gravity should be identified: army, capital, army of stronger ally; these must be destroyed by concentration of superior forces in a decisive blow. This offense should be reduced to the least number of actions necessary to bring victory.

Thus, Clausewitz advocated the concentrated offensive to win. However, defensive war can be the stronger, in that it is easier to hold than to take. However, defense is negative in itself and should only be used to prepare for winning the counteroffensive.

Ignored until 30 years after his death, Clausewitz's writings were developed by von Moltke and used to great success in the Austro-Prussian War (1866) and the Franco-Prussian War (1870–1871), becoming seminal reading for mainland Europe's general staffs, but tended to be selectively employed.

Ignoring Clausewitz's argument that the defense was often stronger than the offense, but accepting his affirmation of *élan* and concentration of forces for decisive offensives, France and Germany adopted offensive doctrines that were thwarted by World War I defenses. Clausewitz also influenced “new” 1920s Soviet revolutionary doctrine.

Clausewitz's disregard of naval power produced an adverse reaction in Britain, with Basil Liddell-Hart insisting on the need for smaller, highly trained forces to be used sparingly with the major battle avoided by diplomacy—the “indirect approach.”

Clausewitz's writings had much to do with the debate between absolute continental notions of mass armies and the limited naval-based power epitomized by Great Britain. Unfortunately, the major European military powers attempted to do both, while adding mass airpower. The result was the self-discarding of the French military, the collapse of the Soviet Union, the bankruptcy of Great Britain, and the complete defeat of two German empires in two world wars. It would seem apparent that for the foreseeable future only the United States, which emerged from the twentieth century's

world wars far stronger than it entered, has the resources to deploy continental armies, dominate the sea lanes, and deploy war-winning airpower.

Clay, Lucius Dubignon (1897–1978)

U.S. military-political leader. Lucius Clay, youngest child of a U.S. senator from Georgia, entered the U.S. Military Academy at West Point and graduated twenty-seventh in his class in 1918. Assigned to the engineers (he would have preferred the artillery), he rose rapidly to captain, but reverted to first lieutenant in 1919, remaining in that grade for 17 years. With the coming of the F. D. Roosevelt administration, his career accelerated. Clay first worked capably with the Works Progress Administration and the Civilian Conservation Corps. He then served briefly as chief engineer in the Philippines and was then given responsibility for the Defense Airport Program for the Civil Aeronautics Authority. Though he desired combat duty during World War II, he was instead given charge of the logistics of war production for the army.

In June 1944, General Dwight D. Eisenhower asked that Clay come to Europe to resolve logistical problems at the vital French port of Cherbourg; Clay had it running smoothly within a month. Returning to Washington, he was named deputy to James Byrnes, director of War Mobilization and Reconversion. Returning to Europe, he oversaw problems of military government in Germany for several years, and was named both military governor and theater commander in the spring of 1947. Clay had to rely on his own judgment in great measure, having been given no precise guidance, and worked well with his State Department adviser Robert Murphy. His objectives, in the face of often difficult relations with Soviet and French authorities, were to restore a sound and denazified civil government, facilitating the creation of a new nation. He organized and oversaw the successful Operation VITTLES (Berlin Airlift) during 1948 and 1949 in the face of determined Soviet intransigence, and in this and other ways, earned the warm regard of the German people. Following his retirement in 1949, he was chairman and CEO of

Continental Can and then a partner in the Lehman Brothers banking firm. He was also active in the Republican Party and various civic enterprises.

Clive, Robert (1725–1774)

Regarded as the founder of British India. Robert Clive was born in Shropshire in 1725. In 1743, at the age of 18, Clive became a writer in the East India Company, the lowest clerical position available. Arriving in Madras in 1744, Clive lived the life of a loner and, in a display of the depression that would eventually claim his life, attempted suicide. Opportunity for the excitement that suited Clive's nature was not long in coming, however, for soon after his arrival Clive found himself immersed in the First Carnatic War (1744–1754). Clive's initial taste of war was not propitious. In September 1746, French forces under Joseph Dupleix captured Madras, and Clive and his fellow company employees found themselves prisoners of war. Internment was not to Clive's liking, however, and he shortly escaped to Fort St. David. There, while assisting in the defense of the settlement during Dupleix's 18-month siege, Clive received his ensigncy in the army of the East India Company (May 1747). In 1748, Clive took part in Admiral Edward Boscawen's abortive attempt to capture the French station at Pondicherry.

Though the First Carnatic War ended in 1749, peace did not immediately end Clive's military experiences. In 1750, then ranked lieutenant, he was given command of a small force ordered to assault the Maratha town and fort of Devikota. In the subsequent action, Clive would demonstrate the daring verging on rashness that would be a hallmark of his career. After a short return to civil employment, Clive returned permanently to the military line with an appointment as commissary to the European troops in Madras. With the outbreak of the Second Carnatic War in 1751, Clive was promoted to captain and dispatched to Trichinopoly. Soon besieged by French and Indian forces, it was Clive who brought to the council at Madras Mohammed Ali's recommendation that a diversionary assault be launched against Arcot, in order to relieve pressure on Trichinopoly. Com-

mand of this expedition was given to Clive, with the rank of captain. The capture of the city and its subsequent defense through a 50-day siege meant that when Clive returned to England in 1753, he met a hero's welcome. Returning to India in 1755, Clive was appointed governor and commander of Fort St. David with the local rank of lieutenant colonel. Shortly after his arrival, he joined with Admiral Charles Watson successfully to attack the Maratha fortress at Gheria, which fell a day before Siraj-ud-daula, nabob of Bengal, captured the British station at Calcutta (21 June 1756). When word of "the Black Hole of Calcutta" atrocity reached Madras in August, Clive was given command of a force of more than 1,500 men, which, sailing on 16 October 1756, recaptured Calcutta on 2 January 1757.

Clive effectively drove the French from Bengal, leaving him free to deal with Siraj. Though the latter soon sued for peace, Clive intrigued with Siraj's commanders to replace him with Mir Jafar. It was the success of this intrigue that to a large extent accounted for Clive's subsequent victory at Plassey (23 June 1757), where the weaknesses of Siraj's ill-organized army were fatally compounded by the treason of his commanders, among them Mir Jafar. However ignobly it was won, Plassey secured the British position in the Bengal while Clive received a lifetime annuity of 30,000 pounds sterling, and the rank within the Mogul hierarchy of *mansabdar*.

Clive next turned his attention to the Carnatic, where French forces under Thomas Lally had captured Fort St. David (2 June 1758) and had since December 1758 laid siege to Madras. Remaining in Calcutta, Clive dispatched a relief force under Colonel Francis Forde, which defeated Lally at Masulipatam on 25 January 1759. Ill, Clive returned to England in February 1760. Received even more enthusiastically than seven years before, Clive was created Baron Clive of Plassey in 1762, and a knight of the Bath in 1764. In the latter year he was also returned to Parliament as member for Shrewsbury, and it was partly through his political connections that he returned to India as governor of Bengal in 1764. Foremost among Clive's efforts during this period was the establishment of Dual Government, whereby the East India Company became, in Clive's words, "nabobs in fact, if not in name, perhaps totally so without disguise." Clive also sought to suppress what he saw as corruption among company officials. Given that Clive had benefited so greatly from the venality that was part and parcel of the British system, his critics perceived something perverse in his newfound morality. Clive's success, and the wealth that accompanied it, as well as his often turbulent personality, had made him many enemies in India and at home, within the East India Company and the House of Commons. This in large part accounted for the public rancor that met his third and final return to England in 1767, and which resulted in a public in-

quiry into his conduct in India. Though in 1773 Clive was acquitted of charges of corruption and nepotism, the six-year ordeal left him a broken man. Physically ill and gripped by the depression that marked much of his life, Clive committed suicide on 22 November 1774.

Coastal Defense

Defending a nation's sea coast from an enemy sea invasion or blockade. While often viewed as forts and large-caliber guns, coastal defense systems can also include coastal ships, torpedoes, mines, and aircraft. The concept of coastal defense has been around for hundreds of years, with its greatest popularity in the late nineteenth and early twentieth centuries. In that period, coastal defenses often consisted of a series of forts that could provide mutual support. These forts were often quite substantial, and made up a large part of the defense planning (and budget) of many nations. They were strategically located, such as the Spanish forts in Florida or the U.S. forts guarding Charleston and Savannah.

With the development of large and accurate breach-loaded guns in the late nineteenth century, coastal defense systems became much larger and more complex, something of a counterpart to the land-based forts of Belgium, France, and Germany. Many countries at this time also built coastal defense ships, such as Norway's *Norge* (1900), which mounted four 8.2-inch guns in two turrets, or Sweden's *Sverige* (1915), with four 11-inch guns in two turrets.

While the coastal fortification may have seemed vulnerable, they were in fact able to stand up to heavy attack and still fulfill their role in defense. The Charleston, South Carolina, forts, for example, foiled the assault of Union monitors in 1863.

Later coastal fortification guns often used one of two designs. The first was the disappearing carriage, which mounted the gun on a folding trapeze; the gun could be aimed and loaded below a parapet, raised to be fired, and then would *disappear* after firing, as the trapeze was designed to lower from the recoil. The second design was more complex, and involved mounting the gun on a railroad carriage that was protected in a hardened bunker, often with

blast-proof doors. The gun would be rolled out, fired, and then rolled back behind the heavy doors and reloaded in safety before counterfire could disable it.

The interwar period of 1919–1939 saw a great deal of coastal defense construction, such as the British complex at Singapore and the fortification of the Japanese islands in the Pacific. World War II was to see the decline of the traditional coastal fortification as sea-based airpower matured enough to allow large-scale attack from the sea. Singapore was outflanked by Japanese landings in the rear of Singapore, and Japanese fortifications, while tough to knock out, fell to a combination of ground troops, ship-based support fire, and ship-based aircraft. The Norwegian forts in the fjord near Oslo were able to sink the German cruiser *Blucher*. Although it was a shock to the Germans, the sinking did not repel the invasion.

World War II witnessed both the nadir and the apogee of coastal defense. The system was at its lowest when the Japanese basically marched into Singapore, whose great guns were designed to repel a seaborne assault. (It is an enduring myth that the guns “pointed the wrong way”; nonetheless, the British did not bother to fire their biggest pieces at the Japanese.) The American defenses of Manila Harbor, collectively called Corregidor after the main island forts, held out for five months, denying the harbor to the Japanese and upsetting their timetable of conquest. For those five months, the 14-inch guns of Fort Drum, the amazing army’s Concrete Battleship were the largest guns in action against any enemy of America on any front.

Coastal defense today can be seen as part of a larger and more complex defensive network that includes patrol aircraft, light warships, and land-based radar stations. The static coastal fortifications of the turn of the century are too vulnerable to air weapons to serve in any defensive capacity. Many of the coastal forts of the nineteenth and early twentieth centuries are historical parks and museums from another time and place.

Cochise (c. 1812–8 June 1874)

Chief of the Chirichua Apache in the southeastern area of present-day New Mexico and Arizona. He is best remembered for the war he waged against the United States from 1861 to 1872. The conflict began when Cochise and five other Apaches were questioned by Lieutenant George Bascom over a ranch hand’s missing child and some abducted cattle. Maintaining their innocence, a struggle ensued after Bascom tried to arrest them. Cochise was able to escape with three bullet wounds after one Apache died. In order to free the Apaches that had been taken prisoner over the incident, Cochise seized some whites to exchange them for the captives. Bascom stupidly and brutally retaliated by hanging six tribe members. Cochise and Mangas Coloradas now waged war against any nearby Americans. Due to the ferocity of the campaign and the departure of many U.S. Army personnel because of the Civil War, most settlers abandoned the region.

In 1862, General James Carleton and 3,000 California volunteers engaged the Apache at Apache Pass. The military’s howitzers gave the Americans the victory. Yet Cochise was able to escape with several hundred of his followers and eluded capture for more than a decade in the Dragoon Mountains. During this time, they used guerrilla tactics to raid travelers, ranches, miners, and homesteaders. Finally, General George Crook, through the use of Indian informants and scouts, was able to get Cochise to surrender in September 1871. He left the reservation in the spring of 1872 after a dispute over where his people would be located. He quickly surrendered again and spent his remaining years on the Chiricahua Reservation in Arizona.

Coehoorn, Baron Menno van (1641–1704)

Dutch general, author, and engineer. Lieutenant General Menno van Coehoorn, a member of a prolific Swedish-Dutch family, was a general, civil engineer, and military engineer. His name is often linked with Vauban as one of the two great fortress designers who dominated the so-called wars of reason. This oversimplifies the lively world of fortification theory in the early 1700s, but his books, *Versterckinge de Viffhoeks met all syne Buylenwerken* (Leeuwarden, 1682),

and *Nieuwe Vestingbouw op en natte of lage horizont* (Leeuwarden, 1685), were very successful and influential. The latter in particular appeared in many translated editions during the War of the Spanish Succession (1701–1714).

Coehoorn entered the Dutch army under the patronage of the Stadholder of Friesland, Casimir Hendrik, at the age of 16, taking part in several sieges. At Grave in 1673, he introduced his signature in attack, bombardment by multiple light trench mortars, called *coehorns* after him.

After the publication of his first book, Coehoorn was successively employed in reconstructing a series of Dutch fortresses. It was in this common endeavor that contemporary engineers made their reputations, and Coehoorn's redesigns impressed fellow professionals. In the subsequent War of the Grand Alliance (1688–1697), they proved very successful. Coehoorn served as a brigadier in the latter war, defending Namur against Vauban, and three years later retaking the fortress in the face of the improvements made by Vauban in the interim in a classic battle of talents. After the 1697 peace, Coehoorn became inspector general of fortresses.

In the War of the Spanish Succession (1701–1714) Coehoorn served as a corps commander and conducted several brilliant sieges, but given a field command, showed himself perhaps in over his head. He died of illness in March 1704.

Coehoorn was also involved in several large civil engineering projects, including reddyking the lower Scheldt and designing new barrages for the mouth of the Zuider Zee.

Coen, Jan Pieterszoon (1587–1629)

Founder of the colonial empire in the East Indies. Born on 8 January 1587, in Doorn, Holland (present-day Netherlands) and dying on 21 September 1629, in Batavia, Dutch East Indies (present-day Jakarta, Indonesia), he was the fourth governor-general of the Vereenigde Oost-Indische Compagnie

(VOC, Dutch East India Company), who supplanted Portuguese interests, excluded English commercial penetration of the Indonesian Archipelago through extreme military measures, and ruthlessly established the Netherlands' commercial superiority in Asia. The VOC was founded by the States General (parliament) in the United Netherlands in 1602 for two reasons: to protect their eastern trade routes and to aid the lengthy war of independence against Spain.

Coen was brought up as a strict Calvinist and became a forceful personality, ruthless, punitive, efficient with a mean streak, intent on securing a trade monopoly for the VOC. Appointed governor-general in October 1617, Coen's first aggressive act was to conquer Jakarta. He razed, fortified, and renamed it Batavia in 1619 and used it as his base to conquer the surrounding area. In 1621 he set his sights on the Banda Island, a part of Jakarta regarded as a feudal benefice by the sultan of Bantam. Coen strongly abhorred lax rules in commerce and his conquest was based on a flimsy pretext: lack of close adherence to commercial agreements. Through extremely widespread slaughter, even for that time, Coen largely exterminated the indigenous Bandas, keeping those who survived as slaves or soldiers. He paid little attention to the reprimand he received from the VOC. He then laid claim to the kingdom of Jakarta, using it as his own personal domain. In 1622 he sent a large expedition to the Chinese coast and established a Dutch settlement on Formosa, which provided a base for lucrative trade with China and Japan. Coen unsuccessfully attempted to attract Dutch settlers. He died in Batavia in 1629 while the city was under siege by the Javanese.

Cold Harbor, Battle of (31 May–12 June 1864)

After avoiding a potential Confederate trap at the North Anna River, Ulysses S. Grant continued the movement of the Army of the Potomac south and east to find the right flank of Robert E. Lee's Army of Northern Virginia.

Grant had sent cavalry under Phillip Sheridan with their new repeating carbine rifles to seize the crossroads at Cold Harbor. Sheridan's dismounted troopers withstood attacks

from Confederate infantry rushing to retake the vital cross-roads; other Confederates were entrenching as the bulk of Lee's army arrived. On 1 June, Union infantry assaults enjoyed some success, but two days later a much bigger attack resulted in wholesale slaughter among the Union II, XVIII, and IX Corps on the seven-mile front that reached from Bethesda Church to the Chickahominy River.

Grant regretted the assault, and the two armies faced one another until 12 June as Grant sought a way to break through Lee's lines or to turn his flank. The Union commander decided there were no reasonable opportunities for a breakthrough and determined to continue the advance toward Richmond. By 14 June, federal troops began crossing the James River, and Grant wisely decided to avoid the strong defenses of Richmond and rather threaten Petersburg to the south, through which communications to Richmond from the rest of the Confederacy passed. At this point, Grant and Lee began a long period of siege warfare around Petersburg and also Richmond; Lee's defenses were too strong for Grant to risk an attack, and he settled for stretching those defenses ever thinner by reaching around to cut rail and road communications to the south. By spring 1865, Grant

would soon be able to cut off Richmond, and Lee had first tried a futile attack on federal positions and then the desperate flight that ended with surrender at Appomattox Court House.

Cold War (1946–1991)

The so-called Cold War began at the end of World War II when the victorious allies were unable to come to amicable settlements for governing a divided Europe. Joseph Stalin, leader of the Soviet Union, aggressively sought to improve

the security of his nation by constructing a barrier of communist client states. The United States resented Stalin's blatant lies to allow elections, his anti-Western rhetoric, and the brusque manner in which the Soviets expanded their perimeter. Winston Churchill's famous "Iron Curtain" speech at Westminster College in Missouri in 1946 marked a recognition that Europe had become divided into two hostile camps, although many Americans, still mindful of the contribution and sacrifices of their Soviet ally in World War II, reacted unfavorably to the speech. But within a year the United States pledged with the Truman Doctrine to aid any country fighting communist aggression. It also spent billions of dollars through the Marshall Plan, a successful effort to bolster the European economy and undermine communist activities in France and Italy.

When the United States tried to reform the currency and economy of the British-American occupation German sector, the Soviets responded by blockading West Berlin in 1948. Unwilling to respond militarily, the United States conducted an airlift that supplied Berliners with food and fuel. Marking an emphatic end to joint occupation of Germany with the Soviets, the United States encouraged the creation of an armed and independent West Germany and welcomed the new nation into the newly formed North Atlantic Treaty Organization (NATO), a military alliance created in 1949 to prevent the Soviets from invading Western Europe. The Soviet construction of an atomic bomb in 1949 and enactment of a military draft by the United States further escalated tensions.

The fall of China to the Communist forces under Mao Zedong in 1949 marked a shift in the focus of the American-Soviet struggle from Europe to Asia. While Americans lashed out at each other in what became known as the Red Scare, Communist North Korea invaded South Korea on 25 June 1950. For two and a half years U.S. troops and their South Korean and United Nations allies battled the Communist Chinese and North Koreans to a standstill roughly along the 38th Parallel. By 1953 it was clear that the United States and the Soviet Union were locked in a bitter struggle that promised years of discord and conflict.

Throughout the 1950s and early 1960s the changing nature of global politics increased tensions as each side probed for some weakness in the other. In the United States, newly elected president Dwight Eisenhower enacted a policy of massive retaliation to any aggressive Soviet moves. Eisenhower hoped to reduce the military budget by building a cheaper atomic arsenal and airpower instead of conventional weapons. Eisenhower was also convinced that the United States could increase the allure of democracy and capitalism with a prosperous economy. Reducing the military budget was an important step in this plan.

Meanwhile, the Soviets increasingly exerted their domination of Eastern Europe. In 1955 they created the Warsaw Pact, a military alliance of their Eastern European client states. But in 1956 they brutally suppressed an uprising in Hungary that challenged the Soviet-backed Communist leadership. Finally, in 1961, Nikita Khrushchev, who succeeded Stalin as leader of the Soviet Union, ordered the construction of the Berlin Wall, one of the most provocative acts of the Cold War, primarily to keep skilled East German workers from escaping to the West. Not content to confine Soviet growth solely to Europe, Khrushchev aggressively backed and encouraged wars of national liberation in the decolonizing nations of Asia and Africa. The two most famous examples were Cuba and Vietnam. These two small nations dominated relations between the United States and the Soviet Union in the early to mid-1960s. Cuba, a mere 90 miles off the coast of Florida, enormously aggravated the American leadership, which regarded Communist presence in Cuba as a threat to national security. After a clumsy attempt by President John F. Kennedy to liberate Cuba by sponsoring the Bay of Pigs invasion by anti-Castro Cubans in 1961, Khrushchev authorized the deployment of Soviet nuclear missiles to the island. American U2 spy planes discovered the missiles in October 1962 and the world waited anxiously as the United States and the Soviet Union came the closest ever to nuclear war. The Soviets withdrew the missiles and Kennedy promised that America would not invade Cuba. Several months later the United States withdrew missiles from Turkey.

Ever since the French withdrawal from Vietnam in 1954, the United States had kept a wary eye on developments in Southeast Asia. President Dwight Eisenhower was suspicious of another American land war in Asia. Unlike Eisenhower's single approach to communist expansion, Kennedy adopted a policy of *flexible response*, meaning that each act of aggression would be met with a response in proportion to the threat. Accordingly, Kennedy incrementally increased assistance in both manpower and money to the pro-American government in South Vietnam and its efforts to fight rebels backed by communist North Vietnam. Fearful that Europeans would read any failure of the United States to honor its treaty commitments to South Vietnam as American unwillingness fully to support NATO, and seeing communist victory in Southeast Asia as a stepping-stone to the Philippines and Japan, the United States increased its commitment after the Gulf of Tonkin incident in August 1964. By 1968 the United States had the incredible number of more than 500,000 troops in South Vietnam. The war eventually proved unpopular at home, and protests spread throughout American college campuses. President Richard Nixon, elected in 1968, engaged in a policy of *Vietnamization*, or

turning greater amounts of responsibility for fighting the land war to the South Vietnamese. Although Nixon briefly expanded the war into Cambodia in 1970, he decreased the commitment of the United States to Vietnam. In 1973 he negotiated an end to the war. In 1975, the year after Nixon resigned, the north overran the south and unified Vietnam under a communist government.

Despite the war in Vietnam, the Cold War entered a new phase, *détente*, or peaceful coexistence. Relations between the Soviet Union and the United States improved for a number of reasons. First, the new leadership of the Soviet Union, headed by Leonid Brezhnev, sought to hold on to its power by improving the quality of life for Soviet citizens. Less committed to communist ideology than to maintaining their own bureaucratic rule, they desired to cut military spending and increase the supply of consumer goods. Second, other powers were rising to question the supremacy of the United States and the Soviet Union. Economically, Germany and Japan challenged the dominance of the United States in the realm of global trade. Politically, growing nations such as India played the United States and the Soviet Union off one another to the best of their advantage while refusing to take sides in the Cold War. In Europe, Charles de Gaulle of France spearheaded a movement to create a continent that was politically, militarily, and economically independent of the Cold War. He even pulled France out of NATO's command structure. In Asia and Africa, China challenged the Soviet Union for the leadership of the ongoing communist revolution. President Richard Nixon recognized the importance of China with his astonishing state visit there in 1972, thus beginning the end of the more overt stage of Sino-American hostility dating from the Korean War. Finally, resentment in the United States against the war in Vietnam created a climate more open to discussion with the Soviets.

Agreements between the United States and the Soviet Union to limit the spread of nuclear weapons best exemplified the spirit of *détente*. Treaties signed between 1963 and 1979 limited atmospheric testing of weapons, pledged nations that possessed nuclear weapons not to spread the technology to nonnuclear, banned the building of defensive weapons, froze the land-based and submarine-launched nuclear arsenals for five years, and limited the construction of missiles and bombers.

Détente came to a rapid end when the Soviet Union invaded Afghanistan in 1979. And the election of Ronald Reagan as president of the United States in 1980 marked a more militant mood in the U.S. Believing that the Soviet Union could not survive a renewed arms race, Reagan increased defense spending, deployed missiles in Europe, and ratcheted up the rhetoric by dubbing the Soviet Union an "evil empire." The Soviet gerontocracy proved unable to deal ef-

fectively with Reagan. In 1985 Mikhail Gorbachev became leader of the Soviet Union. A younger, committed reformer, Gorbachev instituted two programs, *Glasnost* and *Perestroika*, that opened the infarcted Soviet society and traditionally state-run economy. Gorbachev and Reagan hammered out several arms-control agreements that not only limited construction of new weapons, but also eliminated some stockpiled arms. As economic conditions in the Soviet Union continued to decline (as did many of its vital statistics), Gorbachev lessened the Soviet commitment to upholding the communist regimes of Eastern Europe. One by one, beginning in 1989, the communist governments of Eastern Europe fell to a tide of democracy. The infamous Berlin Wall fell to peaceful crowds on both sides. Unable to stem the tide, the Soviet Union itself fragmented into its 15 constituent ethnic republics. In 1991 the Soviet Union no longer existed and the Cold War drew to a close—peacefully—a denouement almost totally unforeseen by experts and general public alike.

Colenso, Battle of (15 December 1899)

British defeat during the Anglo-Boer War, 1899–1902. At the beginning of the war, General Sir Redvers Buller, British commander, began operations against the Boers with the initial goal of relieving Ladysmith. He launched his offensive near Colenso, on the Tugela River. His artillery fired into the Boer trenches along the river while his forces moved into position. The main attack was to come from the west, where

Major General Fitzroy Hart's 5th Brigade would strike the Boer flank. To the east, mounted troops under Lord Dundonald were to do the same. In the center, a force under Major General H. J. T. Hildyard was to make a general assault to keep the Boers from strengthening their flanks. Another unit was held in reserve. Also in the center, naval guns under Colonel L. J. Long were to fire into the Boer lines, keeping them down. Success depended upon each unit taking position and remaining out of Boer range until all were in place.

Before the action unfolded, General Hart to the west and Colonel Long in the center destroyed any hope of success, placing their men prematurely in range of Boer fire. Hart led his infantry in tight formation into a loop in the river, well to the east of their assigned position, where they received enfilade fire. Meanwhile, Long set up his guns too close, and they too came under fire. These mistakes spelled disaster. Hart's men were trapped, if not killed or wounded outright, and Long's men were also all down and the guns silenced. Sir Redvers quickly sent his reserve force to extract Hart, which they did.

Reaching Long proved impossible. All the gunners, including Long, were killed or wounded, and the guns had to be abandoned. Under such circumstances, Buller called off the entire attack on Colenso.

Coligny, Gaspard II de (1519–1572)

Leader of the French Protestants during the Wars of Religion. Coligny was born 16 February 1519. As the nephew of Anne de Montmorency, constable of France, Coligny was brought to court as a childhood companion for the future king Henry II. Distinguishing himself in Francis I's Italian campaigns, particularly the Battle of Cessarole in 1544, Coligny was promoted quickly to colonel general of the French infantry, and in 1552, became admiral of France. During this period, Coligny became interested in French colonization and sponsored three expeditions, in 1552 to Brazil, in 1562 to Port Royal in Carolina, and in 1564, where French settlers established Fort Caroline on St. John's River. Unfortunately, none of these settlements survived, and Fort Caroline was wiped out by the Spanish in 1565. As one of the defenders of St. Quinten in 1557, he prevented the Spanish from moving into France, but was taken prisoner and held until 1559.

Shortly after his release, Henry II was killed in a jousting match, an accident that destabilized France as the Guises es-

tablished control of the new king. Announcing his conversion to Protestantism through the influence of his brother, Francois d'Andelot, Coligny became the leader of the Huguenot forces, particularly after Conde was killed in action at Jarnac in 1569. Coligny became the military adviser to Henry of Navarre (later Henry IV of France), and although defeated at Moncontour, won at Arnay-le-Duc in 1570 and helped to negotiate the Treaty of St. Germain.

Once more acceptable at court, he became the tutor to the young king, Charles IX, from which position he advocated aid to the Netherlands against Spain, going so far as to give his daughter in marriage to William "the Silent" of Orange. Disliking Coligny and the Protestants, the Queen Mother, Catherine d'Medici, arranged for Coligny to be assassinated on 22 August 1572, but the attempt was botched. In the ensuing St. Bartholomew's Day Massacre, surrounding the wedding of Henry of Navarre and Margaret de Valois, Coligny was among the first located and killed by Henry de Guise, leading a party of German mercenaries.

Collins, J. Lawton (1896–1987)

U.S. Army commander. General J. Lawton Collins was born 1 May 1896 in New Orleans, Louisiana. He graduated from the U.S. Military Academy at West Point in 1917 and served as an instructor or student during most of the interwar period. When World War II broke out, Collins moved through a succession of staff positions as chief of staff of VII Corps and the Hawaiian Department. In 1942, he assumed command of the 25th Infantry Division and took the unit to Guadalcanal. During the Guadalcanal and New Georgia campaigns, Collins earned a Distinguished Service Medal, Silver Star, and Legion of Merit, in addition to the nickname Lightning Joe, a reference to the insignia on 25th Division's shoulder patch. In 1944, Collins was transferred to Europe to prepare for the Normandy invasion. He led VII Corps ashore on D day-plus-1 and commanded the corps throughout the remainder of the fighting in Europe, from the capture of Cherbourg to the linkup with the Soviets along the Elbe River.

Following the close of World War II, Collins held a series of high-level staff positions, serving as army chief of staff

from 1949 through 1953 during the Korean War, when he attempted to work with flamboyant Douglas MacArthur, Far East commander. Following this assignment, President Dwight Eisenhower asked him to stay on active duty to serve first as U.S. representative to NATO, and later as special representative in Vietnam with the rank of ambassador. In 1956, he retired from the army, and worked in the private sector and assisted numerous humanitarian causes. In his retirement years, he wrote a well-received history of the Korean War. Collins was known as an aggressive, confident, and enthusiastic commander—"a soldier's general."

Colombian Guerrilla War (1976–2000)

Continuing unrest and violence that threatened the very sovereignty of Colombia. In the mid-1960s three leftist groups began to organize in Colombia to stage low-intensity attacks on the government. The first group to emerge was the Fuerzas Armadas Revolucionarias de Colombia, or Colombian Revolutionary Armed Forces, commonly known by its Spanish acronym, FARC. Under the leadership of the insurgent Manuel Marulanda Vélez whose nom de guerre is Tirofijo, FARC took over areas of the Upper Magdalena Valley, drawing its support from peasants and settlers. A second group was the Ejército de Liberación Nacional (ELN, Army of National Liberation). ELN operated in the middle Magdalena Valley and was inspired by Fidel Castro's Cuban Revolution. Unlike FARC, ELN drew its support mainly from middle-class youths, intellectuals, and priests discontented with Colombian government and society. The third and smallest of the rural guerrilla groups was the Ejército Popular de Liberación (EPL, Army of Popular Liberation). In 1973, a fourth group, M-19 or Movimiento 19 de Abril (19th of April Movement), began to make its presence known. M-19 was an urban-based terrorist group with vague goals and ideology. All four groups have waged war on the Colombian government for nearly 30 years, and FARC and ELN have gained control over portions of Colombia.

The M-19 guerrilla group achieved spectacular success in some of its early actions, including the theft of Simon Boli-

var's sword from a Bogotá museum in 1974, the capture of a large cache of arms from the army in 1979, and takeover of the Dominican embassy during a diplomatic reception in 1980. In late 1985 M-19 seized the Palace of Justice seat of Colombia's Supreme Court. The group held the Supreme Court justices hostage. The army assaulted the palace, killing all of the terrorists including some of the key leaders of M-19. In 1990 the group demobilized after negotiations with the government and formed a legitimate political party.

The largest of Colombia's insurgent groups is FARC and it has always pursued a strategy to gain and hold portions of the countryside. In some regions and small towns it has achieved control for periods of two years or more. Although FARC has participated in several peace initiatives, it has always quickly withdrawn. While the Colombian army has struck some FARC-held strongholds, it has been unable to destroy the movement or force significant negotiations. Likewise ELN continues to be troublesome to the government with attacks on Colombia's oil pipelines. The EPL, on the other hand, negotiated with the government and demobilized in 1991.

An ominous development of the 1990s was the linkage between FARC and ELN and the drug cartels. In exchange for protection, narcotics traffickers provided large amounts of cash to the insurgent units, which enabled them to renew terrorist operations. Because of its interest in drug interdiction the United States has provided military assistance on a large scale to Colombia's armed forces.

Communications, Military

The application of various technologies to the transmission of military orders and intelligence. History's first known conqueror was King Sargon of Akkad (c. 2300 B.C.E.). We know this because he left inscriptions at various places that imperfectly record his conquests, for such were the limits of written communication in his era. Every advance in literacy made possible a like improvement in military communications, until fifteenth-century commanders such as Babur and Maximilian I could be known as sophisticated authors as well as conquerors. Yet up to 1800 the physical means of communication remained letters carried by muscle- and wind-powered means, and military needs strained to cross the twin barriers of space and time.

Distance was constant and particularly infuriating in the

sparsely settled regions and in overseas expeditions and colonial wars, but the time problem was related to administration and security. Letters had to be read and turned around, which depended on the size and efficiency of staffs, and secure letters had to be enciphered and then deciphered, something that could already be much delayed due to sophisticated codes as early as the Thirty Years' War.

The age of muscles ended about 1800 with the first advanced communications, the visual semaphore. By 1840 France had a nationwide semaphore network, and its general staff confronted for the first time the problem of administering a communications network. But the semaphore was subject to weather and visibility limitations.

Electrical telegraphs were already in operation by this time, but, based on ill-understood science, were underdeveloped and short-range. Yet they represented, for the first time, instantaneous communications not subject to weather conditions. In the latter half of the century the Maxwellians transformed the telegraph, even as railroads developed the capacity needed to support mass mobilizations. In the 1866–1872 German Wars of Unification, the telegraph transformed military communications, making it possible to fight a Napoleonic war of rapid movement in a shockingly short time. But even this early, commanders, particularly in the American Civil War, were heard to complain that they fought “tied to the end of a telegraph wire.”

But in the 1880s and 1890s, electrical engineers were preparing a new kind of war. Mobile telephone equipment, linked by spooled cable or even earth conductance, introduced electrical communications on a tactical level.

The first intimation of the transformational importance of the new technologies was the use of reconnaissance balloons. Semaphore and other visual means were the prime link between air and ground well into World War I, but a new invention, telephones, disseminated their information ever more quickly. By the decade before 1914, artillerymen realized that they would be able to fire on targets beyond visual range using telephoned information from air or advance ground observers. The next war would be a clash of fire, not of men, although men would die in unprecedented numbers.

Radio, invented in 1904, took a relatively minor place in World War I land warfare due to the crudeness of the technology. When it was used, there was little regard for security, even though electronic eavesdropping and jamming methods developed in 1904–1914. Russian radio security was noticeably poor, and may have contributed to the great loss at Tannenberg in 1914.

In the interwar period, automated encryption methods developed alongside much improved radios. By the end of World War II, radio communications extended down to platoon level, giving artillery and air support even greater tacti-

cal immediacy. Security was maintained by automated encryption and the use of narrow-beam microwave links. But as neither of these methods was perfect, cable-carried telephone and telegraph were used for greater security, while the dispatch rider and liaison officer survived, mounted on motorcycle and Jeep rather than horse or chariot.

In the postwar era, computer-mediated secure communications networks have proliferated at both the tactical and strategic levels. At one extreme, the modern Internet serves military uses, while at the other extreme tactical units developed into local area networks. Communications were becoming increasingly seen as a component of a larger entity, C3I, or command, control, communications, and intelligence. The enormous firepower of even the smallest units could be held back mainly by delayed information.

So important have communications become to early twenty-first-century military establishments that information warfare, that is, the jamming or disabling of the enemy's communications, is considered by military planners to be one of the most promising, or feared, future war scenarios.

Condé, Louis II de Bourbon, Fourth Prince de (1621–1686)

The typical military prince of the Baroque era. The princes de Condé were the heads of an important branch of the House of Bourbon; their enormous fortune was second only to that of the king. Louis received a strict religious and military education. He was known as Duc D'Enghien till his father's death in 1646. He was, all his life, a cultivated man, a patron of the arts. At age 19, he first saw battle at the siege of Arras. His birth and titles pushed him to higher command. He won his first great victory at Rocroi in 1643 over the Spaniards, the greatest French victory of the first half of the seventeenth century. He followed his victory with successes along the Rhine, and with Turenne he was victorious at Fribourg (1644) and Nordlingen (1645). This charismatic and ardent leader was the complementary element of the more

thoughtful Protestant Turenne. The Fronde civil war (1650–1659) was to change his destiny. After being loyal to the young king, he behaved with such arrogance as the government's savior that Mazarin (the king's main minister) had Condé arrested. The high nobility rebelled against the hated minister, and Condé was released. Condé then took the leadership of an open rebellion (1651) and allied himself with Spain. He made his way to Paris and was able to defy the royal troops under Turenne. But his position became politically and militarily untenable and he left Paris to become generalissimo of the Spaniards. With varying fortunes he opposed the royal troops but was finally soundly defeated by Turenne at the Battle of the Dunes (1658). After the Peace of the Pyrenees (1659) he reentered the king's good graces but, mistrusted by Louis XIV, he did not receive any command till 1668. During the short War of Devolution (1667–1668) he invaded the Spanish-held Franche-Comté in 15 days and added this province to the kingdom. Totally restored to Louis's favor, he was placed, with Turenne, in command of the main army. He won his last victory in 1674 at Seneffe in the Spanish Netherlands. He then retired to his Chantilly Palace, suffering from gout, and spent his late life surrounded by artists (Mignard, Le Brun) and writers (La Fontaine, Molière).

Conrad von Hötzendorf, Franz, Baron (1852–1925)

Chief of the Austro-Hungarian general staff during World War I. Conrad was born 11 November 1852 at Penzing near Vienna. Advancing rapidly in the monarchy's army and regarded as a brilliant strategist, he served as chief of general staff in 1906–1911 and 1912–1917. He mistrusted Austria's non-German nationalities and the expansionist tendencies of both Serbia and Austria's ally Italy, advocated preventive wars against them, and worked hard to strengthen Austria's military forces for the war that, in his opinion, was inevitably to come.

After the assassination of Archduke Franz Ferdinand at Sarajevo (28 June 1914), Conrad argued vigorously for war against the Serbs, holding them responsible for the murder as well as Slav agitation within the monarchy.

Lacking fighting experience, Conrad shared the short-

war illusions of his contemporary generals. He underestimated warfare on two fronts against Serbia and Russia. When war started, Conrad shifted troops from the Balkans to the east and failed to concentrate on one enemy. As a result Austria suffered defeat on both fronts. Serbia was finally subdued by the end of 1915, whereas the situation in the east in 1914 turned disastrous with enormous casualties. Later offensives in 1915 and 1916 against Russia and Italy, carried out with German aid, were successful but no decisive victory was obtained. Conrad's strategy was sound but he lacked a sufficiently large army to carry it out. Austria became increasingly subordinated to Germany.

The new emperor, Charles I, dismissed Conrad on 1 March 1917. He took over an army group on the Italian front. Retiring after 1918, he wrote several volumes of his memoirs. He died on 25 August 1925 at Mergentheim (Germany).

Conrad was a gifted but unlucky soldier, a hardliner advocating ruthless military solutions for problems of domestic as well as foreign policy. Caught in his extreme right-wing, anti-Semitic, and anti-Slav ideology, his plans failed because of lack of resources and neglect of human and political realities.

Conscription

Although the involuntary selection of men and women for military service has been practiced in various ages, large-scale modern conscription came into being with the *levée en masse* in Revolutionary France. (In tribal societies, of course, almost all young men are warriors, but they assume this occupation as a rite of manhood, and if any have doubts they are not likely to express them.)

The law of 23 August 1793 called all able-bodied men from the ages of 18 to 25 to the colors, instantly creating a military force sufficient to meet the pressures other powers were bringing to bear on France. Continued conscription on this scale provided 2.6 million men; France could keep the other powers at bay for more than two decades of almost continuous warfare. Despite this success, the other powers disdained conscription, except for Prussia, which adopted it in 1808. A comparatively small power, Prussia enacted the Defense Law of 3 September 1814 stipulating that every male at age 20 would be subject to three years of compulsory

army service, two years with the active reserve, and then a lengthy commitment to the civilian-supervised long-term reserve, the *Landwehr*. In 1815, the restored French monarchy ended conscription, but low levels of recruitment weakened the army unacceptably. Universal conscription was unpopular with economists, conservatives, and the French people as a whole, so in 1818 France adopted a conscription system operated by lottery in which some males would get a life exemption while others were called to seven years of active service, unless they could hire a substitute or otherwise buy their way out. Those who could not evade seven years of active service found themselves at a disadvantage in competing for civilian careers and often reenlisted, thus creating a long-service professional army, distanced from the population as a whole. The Prussian system blurred class distinctions, promoted a responsible patriotism, and fostered hygiene and education alike. Friedrich Engels believed that “compulsory military service surpasses general franchise as a democratic agency.” And the swift triumph of Prussia’s mass army (led by highly professional officers) over the smaller French semiprofessional army in 1870 was ample vindication of the military efficacy of mass conscription.

The new German Empire adopted the Prussian system, while France adopted a universal conscription system in 1872 and kept it until after World War I.

Some other nations, impressed by Prussia’s success against France, themselves instituted mass conscription. In 1873, for example, Japan decided to raise a mass army by conscripting males for two years of active service, 17 years in the reserve National Army, and further service in the First National Army, a sort of home guard. But other nations declined to follow suit. Great Britain’s centuries-long distrust of a standing army led it to avoid conscription until 27 January 1916, when the manpower stresses of World War I mandated a call-up of all males aged 18 to 41 who were not in occupations vital to the war effort. This wartime draft was reinstated by the National Service Acts of 1939 and 1941, the latter maintained until 1960. The United States and the Confederate States of America both resorted during the Civil War to an iniquitous conscription so unpopular, with its provisions for substitutes and cash deferments, as to have sparked the New York Draft Riots of 1863 in which hundreds died, and it was quickly abandoned at war’s end. The Confederate draft was, if anything, even more unpopular.

British conscripting German troops for service in America, eighteenth century. (Library of Congress)

The Selective Service Acts of 19 May 1917 and 16 September 1941 set up conscription for the two world wars, based, uniquely, upon unpaid local draft boards, which determined eligibility, and was generally accepted. After a hiatus in 1947–1948, a peacetime draft was adopted. It became highly unpopular and controversial during the Vietnam War for the same reason that the Civil War draft was detested: a general perception of unfairness because of exemptions. Students were exempt, as were those in certain occupations. And Americans reverted to their distrust and dislike of the military, questioning the necessity for a draft in the semiwar of the Korean and Vietnam conflicts. President Nixon made the abolition of this draft a campaign pledge, which he fulfilled in 1973. The dire predictions of those still favoring a peacetime draft—that an all-volunteer army would lead to a praetorianization of the U.S. Army, or that minorities would dominate the new force—never came true to any great extent, and the military triumph of the U.S. in the Gulf War (1990–1991) seemed to settle the question. A more intangible argument is that conscript national armies provide the one great common experience for young men, of whatever background of wealth, ethnicity, or race. Aside from the United States, the British Commonwealth, and Japan, most of the democracies have retained conscription.

Constantine V (718–775)

Byzantine emperor, fought Arabs and Bulgarians. The son of Emperor Leo III (r. 717–741), Constantine allegedly drew his name, Copronymus ("Named for Dung"), from an incident at his christening. Crowned coemperor by his father at age two, he became emperor in his own right in June 741, and began a campaign against the Arabs. His accession exacerbated divisions in the Byzantine military over personalities and over the role of icons within the Church. As a result, his first campaign ended immediately when his brother-in-law, Artabasdu, ambushed and defeated Constantine's army on 27 June 741. He fled to Amorium while Artabasdu marched to Constantinople and proclaimed himself emperor. In May 742, Constantine defeated Artabasdu at Sardis, and reentered Constantinople on 2 November 742.

In 746, Constantine invaded northern Syria and took the town of Germanica. He followed this up by defeating an Arab fleet from Alexandria. As a result of this campaign, he settled a group of Syrians in Thrace, and followed this up with a program of fortification building that would shortly have grave ramifications. In the meantime, the war against the Arabs continued until 750, when the defeat of the Umayyads of Damascus by the Abbasids of Baghdad allowed Constantine to turn his attention to the Bulgarian frontier of his empire.

In 756, the Bulgarians, offended by the resettlement of the Syrians near their territories and the construction of fortifications, invaded the Byzantine Empire. Constantine quickly defeated the invading force. This defeat sparked a civil war among the Bulgarians, and, against this backdrop, Constantine waged eight more campaigns against them. In 763 he won a major victory over Khan Teletz, and celebrated a triumphal entry into Constantinople. His campaigns in 773 and 774 were less decisive. During a campaign against the Bulgarians in 775, Constantine died on 14 September.

Constantine continued the policy of his father in strengthening troop units stationed near the capital, the so-called tagmatic forces; in the aftermath of the revolt of Artabasdu, he found it expedient also to reorganize and weaken the provincial or thematic troops. His continual victories over the Arabs and Bulgarians were sufficient to win the loyalty of his army, and the succession of his son was undisputed. At the same time, he was unable to prevent the loss of the Byzantine holdings in northern Italy to the Lombards.

Constantine the Great (280–337)

Reunified the Roman Empire, officially recognized Christianity. Born Flavius Valerius Constantinus, son of Constantius I Chlorus, Caesar to Augustus Maxentius in the West during the time of Diocletian, and his wife Helena. In 289 Constantine moved to the court of Diocletian with his father. In 305 Constantius rose to the position of coemperor. The following year, while both father and son were fighting in Britain, Constantius died. The troops, impressed with the

military skills of Constantine, proclaimed him coemperor, but he was unable to eliminate potential rivals until 324. Defeating the forces of Maxentius at Milvian Bridge after a dream that Christ would lead him to victory, Constantine consolidated his power over the western empire, and ordered toleration for all Christians in the Roman Empire through the Edict of Milan in 313. A struggle between Constantine and Lucinius, emperor of the east, for supreme authority over the entire empire ended in 324 with Constantine as the victor. His reorganization of the government separated civil and military affairs, resulting in the restoration of the Senate to a position of prominence. The reunification of the empire secured the continuation of Roman control over the eastern region. Ecclesiastical changes implemented by Constantine also strengthened the empire.

Constantinople, Siege of (717–718)

One of the most spectacular medieval sieges. Byzantium's endurance and the Umayyad Caliphate's failure had historic consequences. As the eighth century began, the balance of power in the Mediterranean east had moved dramatically away from the Byzantine Empire in favor of the Umayyad caliphs of Islam. Exhausted by internal upheaval, Balkan strife, and coups, Byzantium seemed vulnerable and crumbling. Thus, around 715, the Umayyads, led by the ambitious House of Abd al-Malik, resolved to seize Constantinople at any cost.

As Caliph Süleyman and his brother Maslamah, his commander, assembled their army and a huge supporting navy, civil war again engulfed Byzantium, but the war brought to power Leo III, a brilliant officer especially experienced in fighting the Arabs. In July 717, as Maslamah's troops encircled Constantinople, Leo's ships converged from every harbor in Byzantium and devastated the Umayyad fleet. The Arab forces were bedeviled by Bulgarian guerrillas, Constantinople's towering walls, and the worst winter in centuries; casualties and disease shrank their numbers daily. Süleyman himself died unexpectedly, campaigning in Anatolia.

In spring 718, a relief fleet from Egypt reached the Straits. Here, the sailors, largely Christian, mutinied against

the Muslims. Byzantine forces in Anatolia, meanwhile, savaged Umayyad reinforcements, forcing them back to Syria. Epidemics, storms, even a volcanic eruption at the port of Thera, pummeled the besiegers. Finally, the new caliph, Umar II, ordered the bedraggled survivors to withdraw home. Leo had broken the 13-month siege. Byzantium enjoyed a rebirth of power while, 30 years later, the discredited Umayyads collapsed in the face of the Abbasid revolution.

Constantinople, Siege of (1453)

Siege that ended the Byzantine Empire. By 1450 the once-mighty Byzantine Empire had been reduced to parts of the Peloponnesus, a few islands, and the area around the ancient capital of Constantinople. After years of warfare, Ottoman forces controlled all the surrounding countryside. A new sultan, Mehmed II, ascended to the throne in 1451 at the age of 21. Young and ambitious, he focused his energy on capturing Constantinople. Diplomatically isolating the Byzantine emperor, Constantine XI Palaeologus (r. 1449–1453), Mehmed II signed treaties with the Venetians and the Hungarians. He then ordered the construction of fortress Rumeli Hisar on the European side of the Bosphorus. With his forces controlling access to the Black Sea from Rumeli Hisar, and another fortress, Anadolu Hisar, six miles south of the city, Mehmed II cut off the Byzantines from all European assistance. Although the emperor petitioned the pope to call another crusade for the purpose of defending the city, no help arrived.

After the completion of the Rumeli Hisar, the emperor ordered the gates of the city closed, and the siege of Constantinople began in July 1452. For the next six months the Ottomans made preparations for the battle, including the construction of the heavy cannons to bombard the walls. In the spring of 1453 the sultan ordered his troops onto the plain of Adrianople. Ottoman forces numbering close to 150,000 men assembled, and began moving slowly toward the city. The sultan, camping near the Military St. Romanus Gate, positioned the cannons, concentrating his forces on the land side of the city where the fortifications included a triple wall. The emperor gathered his 7,000 troops around the same gate, where he expected the main assault to occur.

After the sultan had demanded the surrender of the city, with the promise of sparing the lives of the inhabitants, the

emperor refused and the Ottomans opened fire. The cannonade inflicted heavy damage, but the defenders repaired and protected the fortifications. On 20 April, four large European vessels carrying provisions for the city appeared on the Sea of Marmara and managed to fight their way past the Ottoman naval forces until they reached the Golden Horn. Mehmed II, after beheading his admiral, ordered the transport of several of his ships overland from the Bosphorus. Once the vessels reached the Golden Horn, his new admiral opened fire on the European ships, badly damaging them. Forty of the captured sailors were executed.

Having eliminated outside assistance, the Ottomans once again turned their attention to breaching the fortifications. On 7 and 12 May, Ottoman forces attacked heavily damaged sections of the walls. Then on 28 May they rested. The emperor, realizing that the final assault was imminent, ordered the religious icons and relics to be carried around the city in a procession as the church bells rang and the inhabitants prayed.

The final assault began just after midnight on 29 May. The first two waves consisted of the irregulars and the Anatolian troops of Ishak Pasha. The Byzantine emperor and his men successfully defended the narrow section of wall, but when the third wave, consisting of the Janissaries, attacked, the exhausted defenders collapsed. After the emperor was slain in battle, resistance faded quickly. Ottoman soldiers flooded into the city. Soldiers looted, massacred the inhabitants, burned buildings, raped the women, and enslaved the survivors. In the afternoon, the sultan finally entered the city and ordered the killing stopped. He then proceeded to Saint Sophia and decreed that it be turned into a mosque. As a result of the battle, Constantinople, later renamed Istanbul, was depopulated and the last remnant of the eastern empire destroyed.

Constantinople, Sieges of (674–718)

Between 633 and 642 the eastern empire's eastern provinces were overrun by Islamic forces, and the southern provinces were lost, never to be recovered. With the Sassanid Empire destroyed in 641, the eastern empire was subjected to repeated Muslim invasions and also to Bulgar encroachment in the Haemus (Balkans).

The first Saracen assault on Constantinople began between 670 and 672, when their naval units seized various coastal towns, including Cyzicus on the Sea of Marmara. In 674 the Muslims initiated what proved to be a siege of Constantinople spread over five successive summers. The fully walled capital, however, proved invulnerable to the massive siege engines and catapults that the Saracens put into their ships, while the Muslims had no answer to the threat presented by a mysterious new weapon, Greek Fire, with which imperial ships devastated their opponents. After the siege was abandoned, what remained of the Saracen fleet was destroyed off Syllaecum, in southern Anatolia, in a freak storm in 678.

In 712 a Bulgar raid reached but could not take Constantinople, but three years later the capital fell after a siege. In two of the numerous civil wars that litter these years Theodosius III first besieged and took Constantinople and then in March 717 was forced to abdicate in favor of Leo III. It has been suggested that the Saracens made no move lest Leo, whom they trusted to surrender Constantinople, was discredited by association. For his part Leo may have sought Muslim passivity in order to oust Theodosius, but never contemplated any meaningful arrangement with the caliphate. Muslim raids on the empire continued for many decades, but the very existence of the empire was never seriously threatened thereafter.

Córdoba, Fernandez de (1453–1515)

Prominent Spanish military commander. Fernandez de Córdoba was born on 1 September 1453 at the Castillo de Montilla in Córdoba. Upon his father's death, his mother sent him to Córdoba to be brought up by a relative. He served as page to the pretender to the Castilian throne, Don Alfonso, an infant. After Don Alfonso's premature death, de Córdoba was called to Segovia by Princess Isabel (Isabella) who had just married and was defending her claim to the throne.

After the death of the rightful monarch, Enrique IV, de Córdoba, at the start of the war of reconquest of Granada,

led 120 lancers of his elder brother's unit in the army of King Ferdinand and Queen Isabella. He gained renown at the battles for the taking of Loja in 1486 and in the siege of Granada in 1492.

He further distinguished himself in battle in Italy. When Charles III of France invaded the Italian peninsula, King Ferdinand sent Fernandez de Córdoba to aid his nephew, King Fernando II of Naples. De Córdoba was instrumental in liberating Calabria and obtaining the surrender of the French commander, General Aubigny, along with his 7,000 troops.

The Spanish warrior also came to the aid of Pope Alexander VI, retaking papal lands seized by a pirate force. Soon after, at the request of King Ferdinand, he was sent to help defend Sicily against the Turks. He battled Turkish and French forces for several years, and his bravery and mastery of military tactics brought him much acclaim. He became known as "The Great Captain" and was revered by his troops. He died in Granada on 2 December 1515.

Cornwallis, Sir Charles (1738–1805)

British general in the American Revolution, governor-general of India, viceroy to Ireland. Some men are remembered for a single failure rather than for a general record of achievement. Cornwallis enjoyed a highly successful military career, but a key defeat in the American Revolution ended Britain's hopes for victory in that war and tarnished his reputation ever since.

Charles Cornwallis received his first army commission at the age of 17 after studying at Eton and Claire College. Military studies at Turin gave way to service in the Seven Years' War in Europe, where the young officer rapidly achieved the rank of lieutenant colonel. His fast-paced career continued with his succession to the House of Lords in 1762.

Although he opposed measures against the American colonies, he took the rank of major general in the British army in America in 1775. He proved an active and capable commander in the campaigns of 1776 and 1777, playing a key role in the Battle of Brandywine. As commander of an army in the southern colonies in 1780 and 1781, however, he led British forces on an arduous campaign through difficult country, which culminated in the surrender of his entire army at Yorktown, Virginia, a loss that made it impossible for Great Britain to continue the war.

The failure at Yorktown was the result of poor coordina-

tion between senior army and navy commanders; although Cornwallis must share in the blame, particularly for his troubled relationship with his superior in America, the loss cannot be attributed to bad generalship.

After serving as an envoy to Prussia, Cornwallis became governor-general of India in 1786, and personally led military campaigns that brought British victory in the Third Mysore War.

After assuming a cabinet appointment in 1795, he led forces that defeated the 1798 Irish rebellion; as viceroy to Ireland, he was instrumental in the passing of the Act of Union in 1802.

He was again appointed governor-general of India, where he died in 1805.

Corregidor (December 1941–May 1942)

American coast defense fortifications in Manila Bay. Throughout the desperate American campaign to hold out in the Philippines in the spring of 1942, the island of Corregidor was the nerve center of resistance. The island served as a gateway to one of the finest natural harbors in the world, Manila Bay. Even though they had captured Manila by May 1942, the Japanese could not use its harbor until they neutralized Corregidor. After the collapse of Allied resistance on neighboring Bataan and most other locales in the Philippines, the Japanese redoubled their efforts to take Corregidor.

Garrisoned by about 14,000 American and Filipino troops, the tadpole-shaped island was dotted with forts, anti-aircraft batteries, and tunnels, and was supported by "The Army's Concrete Battleship." Fort Drum, with its battleship guns, in Manila Bay was also a part of the Corregidor defenses.

By May the garrison had endured months of disease, hunger, and bombardments. In late April the Japanese began hurling artillery at Corregidor and stepping up their air raids. Each day the intensity of the attacks increased. Meanwhile much of the garrison holed up in the Malinta Tunnel, living a molelike existence amid rats and dust. The combat troops scattered about the island took the brunt of the bombardment, however. On 5 May the Japanese landed troops on

the northern tip of the island. The ground fighting lasted little more than a day. Exhausted and with little other choice but to capitulate, Lieutenant General Jonathan Wainwright surrendered his forces to the Japanese. Just under three years later, in February 1945, United States Army Airborne troops assaulted Corregidor and recaptured it during the American invasion of the Philippines.

Cortez (Cortes), Hernando de (1485–1547)

Spanish conqueror and adventurer. Cortez was born at Medellín, the son of a retired soldier. He studied law at the University of Salamanca, but did not receive his degree. Cortez sailed to Santo Domingo in 1504 and worked as a farmer and notary public in Azua until 1511. He was secretary to Diego Velazquez during the latter's conquest of Cuba, and was appointed alcalde of Santiago. Cortez also mined gold and raised cattle in Cuba.

In 1518, Cortez persuaded Velazquez to let him lead an expedition to the Yucatán to rescue survivors of previous expeditions and to explore the land. He left Cuba on 19 February 1519 with 600 men, 16 horses, and 11 cannon. The expedition explored the coast of Yucatán, landing at Tabasco in March. Cortez defeated the Tabascans at Ceutla Plain and won them over as allies. Learning of the riches of the Aztec Empire, Cortez dismantled his ships and founded the town of Veracruz. Exceeding his original commission, Cortez led his expedition and Indian allies inland. Using a minimum of force, he formed alliances with local peoples, especially the Tlaxcalans, traditional enemies of the Aztecs. On 8 November 1519, the Aztec emperor Montezuma and his people welcomed Cortez as the incarnation of the god Quetzalcoatl to their capital, Tenochtitlán.

Cortez soon established himself as ruler of the empire. Meanwhile, Velazquez, concerned that Cortez would exceed his authority, sent an expedition under Panfilo de Narvaez to arrest him. Leaving 80 Spaniards and several hundred Indian allies in Tenochtitlán, Cortez returned to Veracruz and defeated Narvaez. Nearly all of Narvaez's soldiers then en-

listed with Cortez. By the time Cortez returned to Tenochtitlán, the Aztecs rebelled against Spanish rule. Montezuma was killed. On 30 June 1520, the Spaniards battled their way out of the city, losing many men and horses and much of their booty. The Aztecs attacked Cortez on 7 July at Otumba. Although the Spanish won, they suffered heavy casualties. Cortez had to await reinforcements and could not attack Tenochtitlán until 26 May 1521. He captured the city on 13 August, virtually destroying it. The new capital of Mexico City was built on the ruins.

Cortez sent out further expeditions to Guatemala, Honduras, and the Pacific coast. He was accused of malfeasance by his enemies and defended himself in Spain in 1528. Cortez served as governor of New Spain until 1540, when he returned to Spain for good. He died at his estate near Seville in 1547. Cortez had conquered the Aztec Empire, the largest in Mesoamerica, with only a few hundred men. He was a capable soldier with a good eye for opportunity and the boldness to take advantage of his opponents' weaknesses.

Corunna, Battle of (16 January 1809)

Costly British victory in the Peninsular War. Sir John Moore, in command of all 30,000 British troops in Portugal after September 1808, launched a 20,000-man offensive into northern Spain in December, marching northeast via Salamanca toward Burgos, where he hoped to engage Nicolas Jean de Dieu Soult. Napoleon, in Madrid since 4 December, learned of Moore's gamble and decided to lead 70,000 men across the icy Sierra de Guadarrama to cut Moore off from Lisbon and attack his rear. As soon as Moore heard about Napoleon's march, he retreated toward the nearest British fleet, 250 miles away at Corunna (La Coruña).

Moore fought successful rearguard actions against Napoleon at Sahagun on 21–22 December, Benavente on 26 December, and Castro Gonzalo on 28 December. Soult engaged Moore's rear guard at Astorga on 31 December. In Astorga on 2 January, Napoleon suddenly broke off pursuit and returned to Paris, disturbed by news of remobilization in Austria and intrigues against him in France.

The unusually cold and snowy weather hindered both

Moore and Soult. When Moore reached Corunna on 11 January, he had only 15,000 men left to face Soult's 24,000. Both armies were frozen and exhausted. Moore deployed 40 guns on high ground south of the city, near the village of Elviña, and began to embark his men. Confident in his superior numbers, even though he had only nine guns, Soult declined to maneuver. The morning of 16 January, he attacked frontally along the entire line. The battle seesawed across Elviña until evening, when the last of the British troops were rescued by sea. Each side lost about 900. Moore was among the British dead. Corunna was a British victory only in the sense that Moore was able to prevent Soult from annihilating his men before they could board ship.

and the Don Cossacks in 1670–1671, and Emelian Pugachev and the Ural Cossacks in 1773–1774, were against czarist rule in reaction to the loss of traditional Cossack autonomy.

The population in Cossack regions swelled as serfs fled and as peasant settlers attempted to relocate beyond czarist administrative control. Often Cossacks relocated themselves and in so doing became an instrument of Russian control in Siberia by setting up outposts from Tomsk in 1604 to Okhotsk in 1649. Cossacks were used to protect and patrol the frontier. During the Russian Civil War, 1918–1921, Cossacks supported both White and Red armies. During World War II, Cossack formations fought as part of the Soviet Army.

Today, the Cossack tradition and reputation are preserved in their ethnic dancing and singing, rather than in military prowess.

Cossacks

A social group with no single ethnicity, choosing a seminomadic lifestyle on the Eurasian steppe to escape slavery and poverty. At the end of the Mongol Golden Horde's occupation of the Rus' lands, 1237–1480, the nomadic peoples of the steppe gained the description Cossacks, rather than their specific ethnic or clan designation. Mongols, Tatars, Iranians, and Slavs formed communal groups and became identified according to their geographic location: Volga, Don, Zaporozhe, and so on.

Cossack societal organization exaggerated democratic structure and individual freedom. Exemption from formal inclusion within a state structure, institutions, or aspects of control and participation, such as taxation and conscription, enhances the myth that Cossack existence was carefree. Each Cossack region was ruled by a hetman.

Life on the steppe created equine proficiency and a reputation as tough fighters. During Ivan IV's expansion of Muscovy, Cossacks participated as allies of the Orthodox czar against the Ottoman Turks and Catholic Poles. They led peasant uprisings from the sixteenth to nineteenth centuries, but were also known for their brutality as czarist enforcement forces. The rebellions of Stepan "Stenka" Razin

Courtrai, Battle of (11 July 1302)

Feudal cavalry suffers decisive defeat at hands of militia. The Battle of Courtrai was a watershed in the history of western European warfare. A formed body of dismounted soldiers, acting as the principal rather than auxiliary force, utterly defeated a feudal mounted army. The outcome marked the beginning of the long road to irrelevance for feudalism and its mounted warrior elite.

In 1302, the Flemish townspeople revolted, threw off rule from Paris, and sent their militia to besiege Cassel and Courtrai, two towns occupied by the French. The French responded by sending a large relief army under the command of Count Artois, brother-in-law of King Philip IV. The Flemish Burghers resolved to meet the French at Courtrai; they would prevail or perish. A screen of crossbow marksmen stood in front of the militia phalanx, which was armed with spears and halberd-style weapons. Additionally, the Flemings occupied a strong position behind a small stream.

Count Artois recognized the strength of the Flemish posture, but he felt compelled to act before the Courtrai garrison surrendered, and therefore decided to attack. The Flemings at first recoiled from French javelins and bolts. Artois, hop-

ing to gain an advantage by bringing his cavalry forward to cross the stream, pushed his cavalry forward through his own crossbow men. His heavy horse became disrupted and stalled midstream. With the French momentum broken, the Flemings took heart and advanced rapidly, thrusting and hacking at the French. Trapped between the stream and the enraged Flemings, Artois attempted to surrender. His enemies pretended not to understand French, and cut him down along with all his mounted men.

The Flemings owed their victory to unique circumstances: the topography certainly favored the foot soldiers; the French knights, impatient to get on with their business, failed to allow the missile troops to take their toll on the stationary Flemings; and the aggressive leadership of the Burghers ensured they would fight to victory or death. Circumstances like these did not recur for another hundred years.

Cowpens (17 January 1781)

One of the most one-sided victories for American forces during the War for Independence. On 17 January 1781, American and British forces clashed at the Cowpens in western South Carolina. There were approximately 1,000 men on each side. General Daniel Morgan made brilliant use of his largely undertrained militia forces. He stationed some 50 sharpshooters on one hill and, taking advantage of the accuracy of their rifled muskets, he had them fire a round or two at the advancing British and then retire to their left. He had stationed about 400 better-trained militia on the next rolling hill 150 yards back with the same orders. On the third hill, he placed his 450 trained continental troops and his cavalry behind them and to the right.

The plan worked to perfection. The two lines of militia fired their rounds and retreated; the British took casualties but kept advancing. Serendipitously, as the British approached the line of Continentals, the militia had swung behind that line and reappeared with the cavalry on the right. As the British attacked, they were routed between the unplanned double envelopment.

In the end, virtually the entire British force was killed, wounded, or captured; the victory at Cowpens led to the bat-

tle at Guilford Court House, which reversed the tide of British victories in the South, leading later in the year to Lord Cornwallis's surrender at Yorktown.

Crazy Horse (1840–1877)

Native American chief and war leader Tasunke Witko, or Crazy Horse, was born near Bear Butte in the Black Hills of South Dakota. By then, the Plains Indians, like the Sioux, had adopted horse and gun and were effective, if unorthodox, aboriginal cavalry.

In 1866 Crazy Horse achieved notoriety by luring 80 soldiers from Fort Kearny into a trap set by the Lakota Sioux, Arapaho, and Cheyenne. All 80 soldiers were killed in the Fetterman “Massacre.” By 1876 Crazy Horse was Sioux war leader.

At the Battle of Rosebud, Crazy Horse and his warriors held George Custer and his Seventh Cavalry off and eight days later, the Lakota, Cheyenne, and Arapaho annihilated Custer and his Seventh Cavalry at the Battle of the Little Bighorn. This last Sioux victory caused the U.S. government to pursue a policy of starvation in the winter of 1877. In May 1877 Crazy Horse and his band surrendered at Fort Robinson in the Dakota Territory.

Later, a rumor suggested Crazy Horse was plotting against the government and he was to be arrested. He resisted and was stabbed to death with bayonets, probably by other Sioux serving as camp police, on 5 September 1877.

Crécy, Battle of (25 August 1346)

Decisive English victory of Hundred Years War. The renewal of the Hundred Years War in 1345 saw the French invasion of Gascony in 1346, and an English landing near Cherbourg. It was quickly followed up by the capture of Caen (27 July). Advancing on Paris and devastating French territory as it went, the English army forced the French to abandon their effort in Gascony, in order to oppose the English advance. Knowing that the French had abandoned their siege of Aiguillon and were advancing north, Edward III decided to cross the Seine and open a line of communication, and retreat, to Flanders. In response, the French destroyed all the bridges over the Seine below Paris. This forced the English army to advance almost to the French capital until they found a bridge, at Poissy, that could be repaired. There the English army crossed the river, a numerically superior French army

making no effort to prevent it. Once north of the Seine, the English army possessed the critical advantage of one day's lead over the French. This proved critical in enabling the English to ford the Somme just ahead of pursuing French forces.

Once north of the Somme, Edward III was prepared to give battle in Ponthieu. The position selected was at Crécy, where the English army would stand astride the road that the French would have to take as they came north. On the right flank was a river, and on the left, woods and the village of Wadicourt. Between the two, the English dug a series of ditches behind which they would fight in a double echelon. Estimates of English strength vary between 10,000 and 20,000 men, and of French strength between 28,000 and 60,000, the latter figure certainly being far too high. The main difference between the two armies, other than the English choice of ground on which to give battle, was that the English, who had Welsh and Irish in their ranks, were largely drawn from veterans of the Welsh and Scottish wars. The French, on the other hand, had no comparative experience of battle to draw upon, and did not possess the discipline within formations needed when battle was joined.

The French encountered the English late on the afternoon of 25 August, and immediately deployed their Genoese crossbowmen to the front to fire on the English line. The crossbowmen were decisively outranged by longbows, and the Genoese were first shattered by English fire, and then ridden down by French armored knights in the vanguard. Having to charge up a slope made slippery by rain, the French assault broke under a rain of arrows. Very few of the French reached the English line, and those who did were quickly repulsed. Thereafter a pattern imposed itself on the battle. Successive French formations, which did not deploy into line from their marching columns, and which did not support one another, sought to breach the English positions as night fell. It has been suggested that there were some 15 or 16 successive French assaults, all broken. The English stood at their positions throughout the night. The next day they found that the French army had abandoned the field. They left between 10,000 and 20,000 dead, estimated to have included over 1,500 members of the nobility.

Crécy is supposed to have been the first European battle in which gunpowder was used, but the real significance of the battle was twofold: it was a battle fought and won by infantry, and it was a decisive English victory that provided the psychological basis for English operations over the next 70 years. Nonetheless, the English lost any immediate advantage from the battle due to the outbreak of the Black Death, which after 1347 imposed a seven-year halt on proceedings.

Creek War (1813–1814)

Offshoot of the War of 1812, fought in Alabama by an alliance of Americans, Cherokees, and some Creeks against renegade Creeks armed by the British and supported by the Spanish. Inspired by stories of Tecumseh, several thousand young Creek warriors resisted assimilation into the agricultural lifestyle of the whites. One of their leaders, half-breed Peter McQueen, engaged Mississippi militia under Colonel James Caller at Burnt Corn Creek on 27 July 1813. Another

half-breed, William Weatherford, or Red Eagle, leader of the extremist “Red Stick” faction, massacred all 400 whites at Fort Mims on 30 August, sparing only the black slaves and losing about 300 warriors.

Tennessee rapidly mobilized against the Creeks, sending about 5,000 regulars and militia under Andrew Jackson, John Coffee, James White, and John Cocke south in October. Jackson established headquarters at Fort Strother. Coffee attacked and destroyed the Creek village of Tallushatchee on 3 November. Jackson did the same to Talladega on 9 November. Cocke and White, against Jackson’s orders, killed 60 friendly Creeks on 17 November. Mississippi militia under Frederick Claiborne and Georgia militia under John Floyd began in November to converge on the Creek “Holy Ground” near the juncture of the Coosa and Tallapoosa Rivers. Jackson fought at Emuckfau on 22 January 1814 and Enotachopco on 24 January. Floyd lost at Calibee Creek on 27 January. Hostilities were minimal after Jackson’s victory at Horseshoe Bend on 27 March. By the Treaty of Fort Jackson on 9 August, the United States had seized 20 million acres of Creek land, regardless of whether the inhabitants of that land had fought for or against the Americans.

Crete (1941)

After their completely successful Balkans campaign at the end of April 1941, the British troops that escaped from Greece were moved to Crete. They were joined by 12,000 reinforcements from Egypt and were also assisted by a 14,000-man Greek garrison. With the addition of the 15,500 men from Greece, the island boasted a defensive force of 41,500 men.

The strategic value of Crete meant that the Germans needed to capture it to secure their communications in the eastern Mediterranean, especially in view of the British presence elsewhere in the Middle East, particularly on the Suez Canal. Lieutenant General Kurt Student and 7th Airborne Division were placed with 5th Mountain Division in XI Airborne Corps, and ordered to capture the island.

The island defense was commanded by the New Zealan-

der, Major General Bernard Freyberg, who was given advance ULTRA signal intercept intelligence of German intentions. Nevertheless, when the first wave of paratroops landed on 20 May, his forces concentrated on defense, rather than attacking with their superiority in numbers.

The Germans held on, and on 21 May the rest of 7th (German) Parachute Division was dropped. Heavy fighting took place around Maleme airfield, Rethymnon, and Herakleion. Despite British command of the sea, the Germans managed to land reinforcements of 5th Mountain Division and further glider-borne troops. Freyberg was forced back to the south coast of the island, and during the fighting for Sfakia the Royal Navy managed to evacuate a number of troops, but Crete was lost to the Germans.

German casualties were so heavy that Hitler never again used mass parachute attack. During the parachute landings the defenders had cut the German paratroops to pieces, mainly because the landing was made piecemeal against heavily defended areas instead of being concentrated in a quiet area to allow forming up before attacking.

Crimean War (1853–1856)

War fought against Russia by Britain, France, Turkey, and several small Italian states to check Russian aggression against Turkey. Because it involved a theater of operations beyond just the Crimean Peninsula, the Crimean War would more accurately be called the Anglo-Russian War. The British had a Baltic Sea strategy as well as a Black Sea strategy, and one could argue that the British naval and amphibious threat to Cronstadt and St. Petersburg in 1855–1856 was more decisive toward ending the war than was the fall of Sevastopol in 1855. The conflict is termed the Crimean War because its bloodiest and most famous engagements were the major land battles in the 1854–1855 Sevastopol campaign.

Despite French naval superiority over Russia, the two greatest world powers in the early 1850s were Great Britain and Imperial Russia. Queen Victoria and Czar Nicholas I were playing the so-called Great Game for the control of Asia and the Near East. Constantinople, the Bosphorus, the Sea of

Marmara, and the Dardanelles were together a key strategic area in the Great Game, because whoever held them could either allow or deny Russian naval access to the Mediterranean Sea. Whether Russia in fact had a Mediterranean strategy is a moot point, but Britain thought it did. Her Majesty's government believed that maintaining the sovereignty of Turkey against any Russian incursion was in the British national interest. France, under the maritime-minded Emperor Napoleon III, also did not want Russian warships in the Mediterranean.

In January 1853, the czar, believing he had Austrian support, perceiving Turkish weakness, and hoping to stalemate France with diplomacy, began to lay naval and military plans to seize from Turkey the passage to the Mediterranean. From 2 March to 21 May, Russian prince Alexandr Sergeevich Menshikov, backed by a large force, was in Constantinople trying to bully concessions from Sultan Abdul Mejid I. Menshikov failed to intimidate the Turks, and angrily departed when the sultan refused to yield.

Saber-rattling continued after the Turks refused Menshikov's ultimatums. On 2 July, four Russian infantry and two Russian cavalry divisions under Prince Mikhail Dmitriyevich Gorchakov crossed the Prut River, occupied the Turkish Christian principalities of Moldavia and Wallachia (modern Romania), and threatened, once reinforced, to cross the Danube. Skirmishes broke out on all Turko-Russian frontiers. Austria stayed neutral and hosted a futile peace conference in Vienna. Britain and France managed to restrain Turkey from declaring war on Russia until 4 October.

Turks under Omer Pasha crossed the Danube on 23 October and won a minor victory over Gorchakov at Oltenitza, Wallachia, on 4 November. Moving out from his established headquarters at Shumla (modern Shumen, Bulgaria) in December, Omer Pasha checked the advance of 30,000 Russians on Cetate, Wallachia, in January 1854 and on Calafat, Wallachia, in February.

On 30 November 1853, the Russian navy annihilated the Turkish fleet off Sinope, Turkey. Britain and France mobilized, but continued negotiating with Russia. When the czar rejected their final demands to withdraw from Moldavia and Wallachia, France declared war on 27 March 1854; Great Britain followed suit the next day.

Gorchakov crossed the Danube at Galatzi, Moldavia, on 23 March. Under Gorchakov's orders, Prince Ivan Feodorovich Paskevich laid siege to Silistra, in modern Bulgaria, on 4 May. Silistra would be the key to Russian flank defenses if the allies were to invade in the vicinity of Varna, Bulgaria. The siege was unsuccessful, the Russians lost a battle at Silistra on 9 June, and on 23 June Gorchakov obeyed the czar's order to retreat. Under pressure from Austria and frustrated by Austrian treaties with Prussia and Turkey, Russia

withdrew from Moldavia and Wallachia on 8 August. Austria occupied the towns on 22 August.

A sharply divided British cabinet undertook to plan the overall strategy of the war. Some members wanted to secure the Turkish frontier in the Danube region and push the Russians back into Bessarabia and the Ukraine. Others wanted to fight an Asian land war to help the Turks push the Russians back into Georgia. Still others wanted primarily naval action in the Baltic and Black Seas. For reasons of home-front morale and propaganda rather than sound military logic, the cabinet decided on 28 June that their objective would be Sevastopol, jewel city of the Crimea and an important naval base.

When the British commander in chief, General Fitzroy James Henry Somerset, Baron Raglan, received the cabinet's dispatch a few weeks later at Varna, he knew that invading the Crimea would be a military blunder. The allies had insufficient intelligence, supplies, arms, and men to ensure victory. But Raglan also knew that he would be replaced with someone willing to attack Sevastopol if he did not treat the cabinet's advice as a direct order. Reluctantly, he persuaded the French to join the invasion.

The Allied landing began on 14 September at (the perhaps aptly named) Calamita Bay, just south of Eupatoria, 35 miles north of Sevastopol. Menshikov was prepared for land action around Varna or Odessa, but he did not expect the allies to invade the Crimea. Thus he was even less prepared than the allies. After routing the Russians at the Alma River on 20 September, the allies flank-marched to Balaklava to establish a supply base. The Russians attempted unsuccessfully on 24–25 October to recapture Balaklava, and made minor strategic gains.

Two battles were fought at Inkerman, a skirmish on 26 October and the major Russian offensive on 5 November, which resulted in total victory for the outnumbered British. Action around Sevastopol was then relatively quiet until April 1855. The French and British hoped to solidify their new friendship by taking Sevastopol on the fortieth anniversary of Waterloo, 18 June, but their massive combined assault that day failed. On 16 August the French lost only 1,800 as they inflicted 8,000 casualties on the Russians at the Tchernaya River.

After 11 months of brutal siege, the city of Sevastopol fell to the allies on 11 September. Thereafter the war was essentially over. The Russians captured Kars from the Turks on 28 November, but on 28 December, Austria threatened to enter the war on the side of the allies unless Russia made peace. The Treaty of Paris, 30 March 1856, ended the war. Russia returned what it had captured from Turkey, made other territorial concessions, and neutralized the Black Sea. On 15 April, Britain, France, and Austria signed a treaty regarding

any Russian renavalization of the Black Sea or any threat to Turkey as *casus belli*. The Crimean War has gone down in history as one of the most unnecessary of modern conflicts, its cases intricate and remote, its course inept, its settlement almost a restatement of the *status quo ante bellum*.

Croesus (fl. c. 560–546 B.C.E.)

Much of the information on Croesus, last king of Lydia and conqueror of Ionia, is shrouded in myth and fable. In the early sixth century, Croesus's father, King Alyattes, expanded the Lydian Empire to encompass most of western Asia Minor and Croesus served as a general during part of this time. After the death of Alyattes, Croesus won a short succession struggle over his stepbrother to gain the throne. He subjugated the coastal cities of mainland Ionia with the single exception of Miletus but he was forced to ally with the Ionian offshore islands because he lacked a navy capable of subduing them. He also made alliances with Egypt, Chaldea, and Sparta, hoping to form a bloc against the rising power of Persia under Cyrus the Great.

According to myth, Croesus often consulted the oracle at Delphi. On one occasion Croesus is supposed to have asked what would be the result of an invasion of Persia, and the oracle replied that it would destroy a great kingdom. Encouraged, Croesus proceeded with an invasion of Cappadocia, in eastern Anatolia in 547. After a battle with no clear victor at Pteria, Croesus retreated to his capital of Sardis to regroup. He was waiting for reinforcements from his Egyptian and Spartan allies when the smaller Persian army caught up and defeated him at Thymbra. Lydia became a province of Persia. This led to later conflict between the Greek cities of Ionia and Persia.

After his defeat, some accounts say that Croesus became attached to the Persian court and even became the governor of Barené. Others say Croesus was killed during the Persian conquest.

Cromwell, Oliver (1599–1658)

English military and government leader who established a military protectorate. Cromwell was born on 25 April 1599 in Huntingdon, England, and educated at Cambridge. At 29, he was elected to Parliament, but was dismissed along with the other representatives when Charles I ruled as a despot for 11 years. Under financial pressure, Charles had to reconvene Parliament in 1640. In the power struggle between the king and Parliament, Cromwell, a strong Puritan or Roundhead, returned home to raise a cavalry unit. He first led troops at the Battle of Edgehill on 23 October 1642. Over the next several years, he rose to the rank of lieutenant general because his strong disciplinary methods allowed him to control his men in battle. Between 1643 and 1646, he fought in numerous battles, the greatest being the Battle of Marston Moor, outside of York, on 2 July 1644. His cavalry performed valiantly, but Cromwell criticized faulty leadership on the parliamentary side. Almost impeached in 1644, he proposed in December that in the future no member of Parliament should be allowed to hold a command. Parliament agreed to a new army with Sir Thomas Fairfax in command. In the summer of 1645, Fairfax insisted that Cromwell be made second-in-command. At the Battles of Naseby and Langport, the last of Charles I's two field armies were destroyed. In January 1646, Cromwell's commission was renewed and he was financially rewarded for his service. He then joined Fairfax at the siege of Oxford. Soon after, Charles surrendered to the Scots and was turned over to Parliament.

In the aftermath of the Civil War, the Parliament and army came into dispute. Many in Parliament felt the army could not be trusted, ordered it to be disbanded, and hired a Scottish army to protect them. Feeling his fellow soldiers had been disgracefully treated, Cromwell joined them on 4 June 1647. In November 1648, Cromwell's soldiers removed 110 members of Parliament and another 160 members refused to take their seats in opposition. This new Rump Parliament dismantled the government and consolidated power to an executive Council of State and themselves. Cromwell's army defeated the radical Levellers at Burford, slaughtered 40 percent of indigenous Irishmen, transported the remaining Irish to County Connaught with the Act of Settlement in 1653, and defeated the Scottish Presbyterians at Dunbar in

1650 and Worcester in 1651. Cromwell even dissolved the Rump government on 21 April 1653. Two years later, he again dissolved Parliament and established a military-religious dictatorship, with himself as Lord Protector of the Commonwealth. On 3 September 1658, he died in London.

With delusions of monarchy, Cromwell had appointed his son, Richard, as his successor. But “Tumbledown Dick” was no Oliver, and soon the house of Stuart, in the person of Charles II, was on the throne once again, to genuinely joyous public acclaim. The remains of Oliver Cromwell and other deceased regicides were dug up and publicly execrated (Cromwell's head being attached to a pike overlooking the Tower of London), while living antiroyalists suffered agonizing deaths at the hands of a vengeful monarch. Much of the English (and, later, American) suspicion of the military derives from the strict military reign of Oliver Cromwell.

Crusades (1095–1272)

Attempt to recover Christian territory from Muslim occupation in a series of military expeditions by western European Christians. The Crusades are often divided into seven distinct campaigns, but the crusading movement was actually an ongoing process with expeditions intermittently coming and going. Most were directed primarily toward what is now known as the Middle East, but some crusades also targeted lands in Europe occupied by Moors, other non-Christians, or even Christian heretics.

The motivations behind the Crusades were complex. Piety was certainly a factor, as crusaders sought to reclaim Christian territory held by infidels. Crusaders were also pilgrims who vowed to visit the Holy Sepulcher in Jerusalem, and the Church rewarded crusaders with remission from sin for participation. Also motivating factors were pursuit of wealth, thirst for adventure, and the desire to expand European influence eastward.

In the decades before the crusading movement began, Muslim armies had been encroaching on Byzantine territory. In 1071, the Byzantine army was crushed by invading Seljuq Turks led by Alp Arslan at the Battle of Manzikert, and

stories of Turkish brutality against Christians began to appear in the West.

The crusading movement proper began in 1095 when Byzantine emperor Alexius Comnenus I, in a desperate attempt to stave off an approaching Muslim army, appealed to Pope Urban II for help. Urban in turn appealed to the European nobility in a famous speech at Clermont. He called on them to help their Byzantine brothers and regain Holy Lands that had been lost to the Muslims.

The resulting First Crusade (1096–1099) was the most successful of all crusades, culminating with a victory at Jerusalem in 1099. After this, the permanent outpost kingdoms of Edessa, Tripolis, Antioch, and Jerusalem (collectively known as the Outremer) were created.

Later crusades were not as successful as the First Crusade. On Christmas Eve 1144, Muslims led by Imad ad-Din Zengi captured Edessa, leading to renewed crusading fervor in the West and to the Second Crusade (1147–1148). The Second Crusade not only attempted to regain lands lost in the Middle East, but also strove to oust Moors from the Iberian Peninsula, and to convert non-Christian Wends in what is now northern Germany. The crusade to the Middle East failed miserably, but crusaders in Portugal were more successful and took Lisbon in 1147.

In 1187, Muslim forces led by a powerful new warrior named Saladin annihilated a crusader army at the Battle of Hattin. This resulted in the fall of Jerusalem, and the Third Crusade (1187–1193), which was led by Europe's most powerful monarchs, including King Richard I (better known as Richard the Lionheart) from England. Richard succeeded in regaining considerable portions of crusader territory, and defeated Saladin's forces at Acre, but ultimately failed to retake Jerusalem from the Muslims.

With Jerusalem still in Muslim hands, crusading zeal in the West continued. The Fourth Crusade (1201–1204) never reached the Holy Land at all. Diverted crusaders instead captured the Adriatic port of Zara on behalf of the Venetian government (for which they were summarily excommunicated by Pope Innocent III), and then took Constantinople itself, resulting in a short-lived Latin empire. Crusaders from the Fourth Crusade returned to Europe enormously wealthy and brought with them thousands of Holy Relics taken from the Byzantines.

The last crusades, the Fifth (1217–1221), Sixth (1248), and Seventh (1270), were directed toward Egypt, the center of Muslim power. Crusaders achieved negligible success, and ultimately returned to Europe as failures. In 1291, Mamluks led by Kalavun laid siege to Acre, the last bastion of Christian power in the Middle East. The crusader army was outnumbered seven to one, and Acre soon fell. This defeat led to a permanent end of the crusader presence in the Middle East.

In the Middle East, there were few long-term political consequences of the Crusades as all conquered territory was eventually lost, but the crusading movement had profound and lasting effects on European politics and culture. New military monastic orders, such as the Knights Hospitalers, Knights Templars, and Teutonic Knights, were born. Returning crusaders brought with them new military tactics and innovations, such as Greek Fire and advanced castle fortification techniques. Crusaders also imported Middle Eastern and Greek intellectual, mathematical, and philosophical ideas, which many believe helped open the door for an intellectual revival in the West.

Cuban Missile Crisis (October 1962)

The closest the world has yet come to nuclear war. After Castro seized power in Cuba on 1 January 1959, he set about reforming various facets of the Cuban economy and society. One of his major reforms was going to be in landownership. To this end the United States and Cuba began discussions on economic relations as early as April 1959. These did not go well, however, and Cuba seized American property in January 1960. This expropriation led to protests by the American ambassador and in October 1960 to an American embargo of all exports to Cuba except for medicine and food.

The situation went from bad to worse, and by January 1961 Cuba and the United States had severed diplomatic ties. In July 1962, Castro declared in one of his lengthy speeches that Cuba would soon have new defenses against American imperialism. On 29 August 1962, U-2 spy-plane photos verified surface-to-air defensive missiles (SAMs) in Cuba. After new reconnaissance photos revealed the possibility of offensive weapons in Cuba, President John F. Kennedy warned Soviet chairman Nikita Khrushchev not to place offensive nuclear missiles in Cuba. On 14 October 1962, U-2 spy-plane

photos showed that launch pads for medium- and intermediate-range ballistic missiles were under construction in Cuba. On 22 October, President Kennedy announced to the American public that Soviet missiles were being placed in Cuba and that a "quarantine," basically a blockade of Cuba, was in effect. Between this speech and 24 October, Soviet ships acknowledged the American blockade, and turned back while still in international waters. By the 26th and 27th, the Soviet Union and the United States had exchanged letters addressing the resolution of this crisis. On 28 October, Chairman Khrushchev agreed to remove the Soviet missiles if President Kennedy would pledge not to invade Cuba. Kennedy agreed (informally) and the last Soviet missiles were removed from Cuba by 20 November 1962. This agreement basically ensured Castro's continuation in power as it also prevented Cubans from leading filibustering expeditions from the U.S. in any attempt to overthrow Castro.

The United States was able to get its way in the Cuban Missile Crisis because of its great lead in nuclear weaponry and naval power. The Soviet leadership was determined that the nation would never again be put in such a humiliating position. Consequently, Khrushchev was removed from office in 1964 and the USSR embarked on a massive buildup of Soviet arms, the costs of which, in turn, helped lead to the collapse of the Soviet Union three decades later.

Cuban Ten Years' War (1868–1878)

Failed guerrilla independence war. The Cuban Ten Years' War started on 10 October 1868 after Carlos Manuel de Cespedes called for the uprising to start at his plantation, La Demajagua, in the eastern province of Oriente. His proclamation is known as the Grito de Yara. Though he planned for the revolt to begin at a later date, word of betrayal precipitated its start.

Coincidentally de Cespedes also freed all of his slaves, although this war was not fought for the ending of slavery. Instead, after many years of failed attempts at getting political and economic reforms from the Spanish government in Cuba and in Madrid, Cuban Creole sugar planters decided it was time to take matters into their own hands. Denouncing heavy taxation, the independence movement promised a representative form of government and suffrage for all men. The abolition of slavery would be slowly implemented. In addition to de Cespedes, some of the other leaders were Salvador Cisneros Betancourt, Francisco Vicente Aguilera, Bartolome Masó, Pedro Figueredo, Ignacio Agramonte, Máximo Gómez from Santo Domingo, and the eventual Cuban army chief. More than 40,000 supporters joined the rebel forces by the start of the 1870s.

The revolt, for the most part, was an eastern Cuban phenomenon. Efforts by de Cespedes and his junta to gain support in the western part of the island were in vain. Cuban troops were composed largely of poor farmers and freed slaves. This smaller, ill-equipped, and poorly trained force kept the Spanish army at bay for 10 years. Spanish troops, on the other hand, numbered well over 100,000 during the mid- to later 1870s. In the province of Camagüey, a ditch or *trocha* was constructed by the Spanish army to prevent the easy passage by the Cuban insurrectionists. Shortly after the start of the war, some of the leaders, such as de Cespedes, Masó, Figueredo, and a few others, petitioned American secretary of state William Seward to accept Cuba as a state, but were denied. The United States was not about to take on another slave state. A year after the start of the war, a constitutional assembly was held at Guáimaro.

During the 1870s the war became one of attrition. The more Spanish troops that were killed, the more were sent from Spain. But in 1877, Spanish general Arsenio Martínez Campos arrived to command Spanish forces. He brought many more troops and promises for reforms. After negotiations in early 1878, the Pact of Zanjón was signed and the war was effectively brought to an end.

Though some factions continued to fight, the bulk of the separatists' army disbanded. The pact granted general amnesty to all insurrectionists as well as unconditional freedom to all slaves and other indentured servants. One of the leaders who denounced this pact was General Antonio Maceo, who promulgated the Protest of Baragua and who would be one of the major figures of the Cuban War of Independence, 1895–1898.

Cuban War of Independence (1895–1898)

After the end of the Cuban Ten Years' War of 1868–1878, many of the top military figures went into exile. Generals Máximo Gómez and Antonio Maceo, as well as the poet, author, and philosopher José Martí, lived throughout South and Central America as well as the United States, mostly in New York. Though various political and economic reforms were instituted by the Spanish government after the end of the Ten Years' War, these were not radical enough for those who wanted Cubans to be the masters of their own fate.

Starting in October 1868, to escape the ravages of war, many Cuban families went into exile in Key West and Tampa, Florida, and other major cities of the United States, such as New York, New Orleans, Philadelphia, and Baltimore. Many of these families had prospered during their years in the United States. They would be a major source of financial and moral support to the Cuban Revolutionary Party. Another source of financial support was the various bandits that roamed the Cuban countryside. Mostly concerned with lining their pockets, they too were interested in separating from Spain. The most significant of these was Manuel García.

In April 1892, Martí officially established the Cuban Revolutionary Party in an attempt to unite all Cubans in the struggle for independence. On 24 February 1895, the “Grito de Baire,” a “call” for armed insurrection against Spanish rule, was made. Though mostly in the eastern end of Cuba, the revolution quickly succeeded in fielding an army of more than 3,000 men. In April 1895, Martí, Gómez, and Maceo landed in Cuba. In the meantime, Spanish general Martínez Campos was sent to Cuba to try to work out some agreement to avoid conflict. In May 1895, Martí was killed in a small skirmish with the Spanish. Shortly thereafter, Maceo and Gómez were able to cross the Trocha into Las Villas province. The Cuban Revolutionary Army was divided into six corps, one for each province in existence then. Each corps was subdivided into divisions, regiments, and other smaller military divisions.

By 1896, the war again became one of attrition. Spain continued to send troops while Gómez and Maceo's troops killed them. In early 1896, Gómez initiated the policy of burning sugar plantations and their crops because he felt that the proceeds from the harvest provided funding for the counterrevolutionary operations by Spain. Of course, this policy also caused much misery among the peasant sugar harvesters. The revolutionaries recognized that they needed ships to break the Spanish blockade, bring in supplies and recruits, and conduct raids. Although many efforts were made to acquire vessels from the United States, that nation maintained an anti-filibustering policy.

Spanish general Valeriano Weyler y Nicolau then initiated

the policy of *reconcentración*, by which Cubans in the outlying regions were concentrated in camps with barely enough food and water to stay alive. This policy, though somewhat effective in hindering the revolution, led to an even deeper hatred of Spain, and resulted in adverse publicity, fueled by exiled Cubans, in the United States.

In February 1898, the American battleship *Maine* arrived in Havana harbor on a goodwill visit. (By then, both Martí and Maceo had been killed in action.) Its visit was protested by both the Spanish and Cuban revolutionaries. Whether by Cuban revolutionaries or by the explosion of its own coal bunkers, the warship was destroyed by an explosion in Havana harbor. (Although the American yellow press screamed that the Spanish had blown up the warship, they would have had the least to gain by such a mad act, although it is possible that rogue Spanish nationalists, determined to avenge Spanish honor, were guilty, but no clue has ever emerged pointing in this direction.)

The mysterious explosion precipitated the entrance of the United States into the war, which ended with Spain's capitulation by August 1898. Unfortunately, the American entrance into the Cuban War of Independence helped to obscure the three years of Cuban fighting against Spain, and the war is remembered inaccurately as simply the Spanish-American War.

Culloden, Battle of (1746)

The last land battle fought on British soil. Having retreated into Scotland after a war council at Derby determined that an attack on London, without French aid or local support, would be disastrous, the Jacobite armies of Charles Edward

British troops firing on fleeing and dying soldiers who are being tended to by their women, on Culloden Moor. (Hulton/Archive)

Stuart wintered close to the ground and steadily moved to the northwest of Scotland. The prince himself, disappointed by the failure of the march on London, pressed for a direct engagement with the Hanoverian forces, which had followed from Derby under the command of the Duke of Cumberland and General George Wade. Many of the prince's advisers, however, counseled a sustained guerrilla campaign, hoping to gain something out of a negotiated peace. Ultimately, the prince insisted on meeting the Hanoverian army at Culloden, east of Inverness, on a field with several significant obstacles, including marshy ground. When the battle began around 1 P.M. the afternoon of 16 October, the Jacobite army of about 5,000 immediately found their line thrown into disarray because of the obstacles, with second-line units being brought up to fill the gaps. Both sides fired about 15 minutes of artillery, an action that greatly demoralized the Jacobites, whose own artillery did little damage. When the Jacobite attack came, it was as a Highland charge, advancing at a run, into the Hanoverian lines, with many of the Jacobites drawing swords. The Hanoverians, numbering about 9,000, countered the charge by changing over from ball to canister shot, which devastated the charge, killing a disproportionate number of officers leading "from the front." The Jacobites were thrown into disarray as the survivors made contact

with the front ranks of the enemy, who fired once, then used their bayonets.

While the Jacobites struggled to advance across boggy ground in the face of continuing fire, their right wings began to collapse and run, followed by many units from the left. At this moment, Cumberland sent the two troops of Cobham's 10th Dragoons in pursuit, followed by a general charge of the Hanoverian army, which turned the retreat into a rout. In a battle that lasted perhaps 40 minutes, the Jacobites had lost nearly 1,000 dead while the government lost only 50. Although the Jacobites claimed that their wounded were systematically butchered on the field, giving Cumberland his nickname "The Butcher," most survivors died in custody. The ruthlessness with which the government proceeded to end the rebellion, including the prohibitions of Highland traditions such as the bagpipes and plaid, as well as systematic road building and fortification, ended the Jacobite cause in all but romantic memory.

Cunaxa, Battle of (401 B.C.E.)

A battle in Mesopotamia that served as prelude to Xenophon's March of the Ten Thousand. Cyrus the Younger, second son of Darius II and viceroy of Asia Minor, contracted a force of 13,000 Greek mercenaries to help him dispute the succession of his brother, Artaxerxes, to the Persian throne in 401 B.C.E. In addition to the Greek contingent, commanded by Clearchus—who was murdered by treachery after the battle—Cyrus's force contained an unknown number of Asiatic light troops. Cyrus met the host of Artaxerxes on the Euphrates River near the town of Cunaxa. The Greeks stood in their phalanx order on the right flank, against the river. Cyrus, with a bodyguard of 600 horses, held the center, and his remaining infantry deployed on the left, with no cavalry or terrain obstacle to cover this flank. Ominously, the Persian force under Artaxerxes possessed such length that the center position overlapped Cyrus's exposed flank. Taking advantage of this situation, the Persian right wing promptly marched forward, attacked, and enveloped the rebels' left flank, while on the right, the Greek phalanx simultaneously scattered the light horse facing it and crashed into the Persian left. The Greeks crushed and pursued their opposite number for some distance. Seeing the success of his right flank and impending disaster on his left, Cyrus launched his companion force of horsemen straight at Artaxerxes. In the melee that followed, Artaxerxes was wounded, but Cyrus was killed. The news of Cyrus's fall quickly spread through both armies. The rebel Asiatics broke and fled; the victorious Persians pursued and plundered their enemy's camp. Clearchus and his Greeks rallied and re-formed their phalanx with their back to the river, obliging Artaxerxes to reverse direction and file back to face them. The Greeks advanced and fought their way clear of the battlefield. Finding themselves unemployed, betrayed, and deep in hostile territory, the Greeks nominated leaders for their vanguard and rear guard. They then began the long walk home to Greece.

Custer, George Armstrong (1839–1876)

Nineteenth-century American commander. Born on 5 December 1839 in New Rumley, Ohio, Custer was educated at the United States Military Academy, from which he gradu-

ated last in the class of June 1861. Commissioned a second lieutenant of cavalry, Custer was assigned to the Army of the Potomac and, during the first two years of the war, he found himself serving as a captain on the staffs of Generals Philip Kearny, George B. McClellan, and Alfred Pleasonton. In June 1863, Custer was promoted to brigadier general of volunteers and given command of the 2d Brigade (Michigan). He commanded the brigade during the Gettysburg Campaign, and then took command of the 3d Cavalry Division during Major General Philip Sheridan's campaign in the Shenandoah Valley. After commanding the 3d Cavalry Division during the final battles of the war, Custer was promoted to major general of volunteers and brevetted major general in the Regular Army.

Custer remained in the U.S. Army following the war and became a lieutenant colonel in the 7th Cavalry Regiment. After campaigning against the Sioux and Cheyenne in 1867, he was court-martialed and suspended for leaving his regiment without permission to visit his wife. Custer was subsequently restored to duty and commanded the 7th Cavalry during the Washita Massacre of Cheyenne in 1868. In 1876, following years of clashes with the Sioux and Cheyenne, the U.S. Army decided to crush them once and for all with a three-columned attack. Custer led one of the support columns, Colonel John Gibbon led the second support column, and Brigadier General Alfred Terry both commanded the main force and served as overall commander. On 25 June 1876, the 7th Cavalry (numbering only 655 men) located a Sioux and Cheyenne encampment, and Custer, unaware that there were approximately 3,000 Indian warriors present, disregarded his orders to wait for the other two columns before attacking. Believing that he could surround the encampment, he divided his troops and personally led about 260 men in a frontal assault, while Major Marcus Reno and Captain Frederick Benteen were given command of the two supporting columns. Custer's column encountered the numerically superior Sioux and Cheyenne, and was quickly cut off and completely surrounded. Despite a desperate fight, Custer and his men were all killed. Along with the Alamo, Custer's Last Stand has passed into American mythology. In many nineteenth-century saloons a large painting of the battle hung over the bar.

Custozza, Second Battle of (24 June 1866)

Second defeat at the same location that gave Venetia to Italy. After signing an alliance with Prussia on 12 May 1866, the Italian government (backed by the French) took advantage of Vienna's problems with Germany to declare war on 20 June. An Italian army under General Alphonso Ferrero, Marchese de la Marmora had gathered more than 200,000 soldiers, most of them untrained militiamen. The two Italian commanding officers were arguing about the forthcoming campaign: La Marmora favored an invasion from the River Mincio toward Verona; General Enrico Cialdini wanted a diversion on the Mincio and a main effort on the Po. Piedmont king Victor Emmanuel II chose to compromise; four corps (120,000) with La Marmora were to attack first, then Cialdini was to cross the Po with two corps to outflank the smaller Austrian army. The archduke Albrecht had only three corps (80,000) to defend Venetia, so he decided to deploy his troops in a central position. His cavalry was well aware of all the Italian moves and as soon as the Mincio was crossed (23 June), the main Austrian army marched to a line of steep hills north of Villafranca, covering their lines of communications and outflanking La Marmora's advance. The Italian general did not know where the Austrians had

deployed, and on 24 June, the poorly led Italian columns encountered the awaiting Austrians. The Battle of Custozza did not follow any form or plan on either side. The Italians attacked piecemeal; La Marmora's right flank was halted near Sommacampagna by a spirited, old-fashioned charge of Austrian lancers that the Italian troops repulsed easily. But panic-stricken teamsters and deserters fled and prevented any reinforcements from crossing the Mincio bridges. In this hilly and cultivated area, the two headquarters were unable to see any action, and Albrecht and La Marmora spent the day riding their horses here and there, attempting to gather information. The conduct of the battle was left to corps or even division commanders. The Italians proved unable to advance up the hills, and the village of Custozza became the main point of Italian resistance against Austria's advance toward the Mincio. Slowly, the Italian wings were sent back to the river; by 4 P.M. Custozza was surrounded by cautiously advancing Austrian forces. The village was eventually evacuated by Italian Elite troops at 5 P.M. The Italians retreated in disorder across the Mincio having lost more than 8,000 men. The Austrian army did not pursue and was shortly afterward withdrawn to protect Vienna against the Prussians. Yet Albrecht's victory (and the Austrian triumph at sea in the

Battle of Lissa) proved useless; by the treaty of Vienna, Austria had to cede Venetia to the Italians.

Cuzco, Battles of (Inca Empire, 1438, 1536)

The first battle established the Inca as the dominant Andean highland power. The second battle marked the final eclipse of the Inca Empire by the Spanish.

By the time of the seventh Inca emperor, Viracocha, three groups vied for control of the Andean highlands: the allied Quechua and Inca, and the Chanca. The aggressive Chanca were led by Hancohuallu and marched first on the Quechua capital of Antahuaiilla, capturing it around 1437. The Chanca then marched on the Inca capital of Cuzco in 1438 with an army of 30,000, forcing a showdown for control of the Andes highlands.

Viracocha's son, Yupanqui, was now in command of the Inca resistance, numbering 8,000 ethnic Inca. As the Chanca crossed the Apurimac River, Yupanqui decided to ambush them in the mountain passes between the river and the plains outside of Cuzco known as Yahuarpampa. Yupanqui, who had sent for help from Inca allies, then received word that 20,000 Quechua and other Inca allies were on the way. He changed plans and hid the growing reinforcements in the highlands next to the Yahuarpampa (blood-field), determined to engage the Chanca army with his Inca forces and then hit them with allied reinforcements as they arrived.

The Chanca and Inca armies joined battle two days later on the plain of Yahuarpampa within sight of Cuzco. After intensive morning fighting, Yupanqui hit the Chanca right flank with 5,000 allies hidden in the highlands. The Chanca recovered within two hours, only to find more Inca allies pouring onto the battlefield. In the late afternoon the Chanca found themselves surrounded in enemy territory, taking heavy losses, and Hancohuallu fled with the remnant Chanca forces.

Chanca losses numbered in the thousands, and many more were probably lost as they struggled home through enemy Quechua territory. The battle left the Inca in control of the Andean highlands, having played their more powerful neighbors against each other. Yupanqui was crowned Inca emperor Pachacutec, and developed the Inca Empire, con-

quering most of the Andean highlands and the powerful coastal Chimu kingdom, and establishing a regularized military system led by ethnic Inca trained in warfare.

The second battle of Cuzco at the start of 1536 marked the final attempt of the Inca to expel the Spanish from the Inca Empire lands. From 1535 to 540, the rebel Inca emperor Mancos, who studied and employed Spanish battle tactics, including the use of horse and pike, attempted to drive the Spanish out of the Inca Empire. Hundreds of Spanish soldiers were killed in empire-wide engagements, often ambushed in terrain unfavorable to Spanish horses.

Mancos launched his rebellion from his highland jungle-fortified city of Vilcambambos, with his grand strategy centered on regaining the highland Inca capital at Cuzco. At the start of 1536, he gathered a 100,000-man force to besiege Cuzco, protected by the brothers of Francisco Pizarro and a force of several hundred Spanish and Indian allies. Although the Spanish were sorely pressed in a series of pitched battles that lasted into the spring rains, they did not succumb. Much of Cuzco was burned to the ground but Mancos and his Inca-led forces failed to hold the huge fortification of Sacahuaman and this provided refuge for the Spanish over the harvest months. Spanish reinforcements in 1537 and 1538, from as far away as Cuba and Spain, finally put Mancos on the defensive, and he retired to Vilcambambos, never again truly to threaten Spanish control of the Inca Empire.

Cynoscephalae, Battle of (197 B.C.E.)

Following the inconclusive First Macedonian War (215–205 B.C.E.), Philip V of Macedon renewed his effort to dominate Greece. Responding to pleas from its Greek allies, Rome declared war on Philip in 200 B.C.E. and dispatched two legions under Lucius Quinctius Flaminius to Greece. Flaminius convinced many Greek states to ally with Rome, built up his army to almost 25,000 men, and advanced into Thessaly against Philip's roughly equally sized army. At Cynoscephalae the legion finally triumphed unambiguously over the phalanx.

The two armies maneuvered against one another across

the rugged countryside for several days, often in pouring rain. When their patrols blundered into one another in a dense fog, both commanders dispatched reinforcements and then committed their whole armies to the developing battle. The hilly, rocky terrain was hardly suited to Philip's phalanx, but he sensed he had a chance to destroy the Roman army before it had properly deployed for battle. Leading his right wing in person, he drove back the Roman left. For a time it looked like he might win the battle, but his successful attack had opened a gap in his line.

The Macedonian phalanx, virtually unstoppable from the front with its rows of serried pikes, was particularly vulnerable to flank attacks. The Macedonian left wing, still deploying for battle from march column, was driven back in confusion by Flamininus. Some of the advancing legionnaires from the Roman right poured through the gap in the Macedonian line, fell on the flank of Philip's advancing wing, and routed it from the field. The tactical flexibility of the maniple had proven superior to the vaunted Macedonian phalanx. The following year Philip renounced his claim to Greece.

Cypriot Wars (1955–1977)

Struggles between the incompatible desires of the Greek-Cypriot majority to reunite with Greece versus Turkish-Cypriot desires for security through partition. Although Great Britain annexed Cyprus from Turkey in 1914, the ethnic Greek drive for *enosis* (homeland reunion) ensures continued tensions. The National Organization of Greek Fighters (EOKA) was formed on 1 April 1955 under the guidance of Greek army colonel Georgios Grivas (1898–1974) to eliminate British rule and reunite Cyprus with Greece. A Turkish-Cypriot counter group, Vulkan (“volcano”), appeared in response, with a goal of *taksim* (partition). Although Greek-Cypriot community leader Archbishop Makarios III (Michael Mouskos, 1913–1977) called for passive resistance, EOKA attacks on British soldiers increased.

The British distanced themselves from hostilities while retaining basing rights through an April 1960 treaty; Britain, Turkey, and Greece were further authorized to intervene,

unilaterally if necessary. The treaty pledged three of seven Cypriot cabinet positions (Defense, Health, Agriculture) and 30 percent of government positions to Turkish Cypriots, aggravating the Greek Cypriots.

The constitutional debates continued until 1963, stumbling over each faction's prejudices or insecurities—protection of minority rights, for example, or the presence of still-armed EOKA elements. In December 1963, Makarios introduced constitutional changes reducing Turkish-Cypriot parliamentary presence. The resulting reigniting of communal fighting and paramilitary reprisals triggered United Nations Security Council Resolution 186 (4 March 1964, extended repeatedly) authorizing 7,000 peace-keeping troops.

Canadian troops arrived on 14 March 1964, with soldiers from Ireland, Sweden, Denmark, Finland, and Austria following over the next three weeks. Grivas's use of the Greek Cypriot National Guard (GCNG) to eliminate suspected terrorists ensured that violence continued. In August, for example, Turkish aircraft conducted rocket and napalm attacks against the GCNG to protect a Turkish enclave. Grivas was recalled to Greece following the April 1967 Colonel's Coup, but returned secretly in 1971 to form EOKA-B, a paramilitary group additionally targeting Greek Cypriots who were not sufficiently pro-*enosis*.

In an effort to break the political deadlock in July 1974, Makarios ordered the expulsion of 600 Greek military personnel, hoping that the Turkish side would reciprocate. However, the expelled Greek soldiers overthrew the Cypriot government on July 15. The immediate aftermath saw several days of atrocities committed against both Turkish and pro-Makarios Cypriots.

The Turkish military intervened on 20 July 1974 with air attacks against Cypriot shipping, an amphibious offensive along the northern coast, and a parachute assault, followed by heliborne commandos, onto the plains north of the capital, Nicosia. The beachhead and linkup through the Kyrenia Mountains was established within 48 hours. The Greek response was limited to 14 transport aircraft with soldiers, several of which were shot down by the GCNG, who had not been informed of their arrival, causing the remaining aircraft to return to Greece.

Through tenuous cease-fires, UN troops established a buffer zone between the Turkish-occupied northern 30 percent of the island and the remaining Greek-Cypriot south. Makarios resumed the presidency of the divided island until his death in December 1977. The Cyprus troubles, fueled by traditional Greek-Turkish enmity, show few signs of abating.

Cyrus II the Great (c. 600–530 B.C.E.)

Founder of the Achaemenid Dynasty of Persia, which lasted two centuries, and conqueror of a wide expanse from Central Asia to the Mediterranean Sea.

The sources for Cyrus's reign are diverse, ranging from his own inscriptions (e.g., the Cyrus Cylinder), contemporary Babylonian and biblical historical texts, and later classical writers, such as Herodotus, Xenophon, and Ctesias. Little is known about Cyrus's youth, although Xenophon wrote a largely unhistorical account of Cyrus's childhood and education.

Early in his reign (c. 550 B.C.E.) Cyrus defeated the rival Iranian king Astyages of Media, seized the Median capital of Ecbatana, and thereby became the king of the Medes and Persians, with his capital at Pasargade. He promptly began expansion in the west, where he met Croesus of Lydia at the Halys River in Anatolia, and fought to a draw. Soon thereafter, the Achaemenid king attacked Sardis, the Lydian capi-

tal, took the city, and became the undisputed master of nearly all of Anatolia, including a number of the Greek city-states on the western coast.

In 539 B.C.E. Cyrus crossed the Diyala River in Iraq and attacked the Chaldean Empire of Nabonidus. He defeated a Babylonian force at Opis, and sent a Persian army to capture Babylon itself. He declared his son, Cambyses II, king of Babylon, and then issued a decree allowing deported Jews to return to Judea to rebuild their temple.

Cyrus continued to campaign east of Iran in Central Asia, successfully subduing most of Afghanistan and southern Central Asia. However, he apparently died in battle in Central Asia against the Massagetae in 530 B.C.E. and was succeeded by Cambyses II. The Roman historian Arrian claimed that Alexander the Great restored Cyrus's tomb at Pasargade two centuries later.

Danish Wars with the Hanseatic League (1361–1370)

Hanseatic League deposes King Valdemar III of Denmark. The prelude to the Danish Wars with the Hanseatic League was a century of Danish civil war and the Black Death. The result was a complete breakdown of the Danish monarchy, and control of much of Denmark by the Holstein counts. Civil unrest continued until the counts were forced by a consortium of trading cities known as the Hanseatic League to impose peace in the Baltic. Valdemar III became king in 1340.

Valdemar wished to reestablish the control of the Danish crown over the territories it had once held. From the late 1340s to 1361, he pursued his policy of reacquisition with some success, until he attacked and conquered Gotland in 1361. Gotland's main town was the Hanseatic League member Visby. In response, the Hanseatic League entered into an alliance with Valdemar's enemy, Sweden. This alliance produced escalated hostilities, resulting in Valdemar's flight from Denmark, the conquest of Copenhagen in 1368 by the Hanseatic League, and the Treaty of Stralsund in 1370. The treaty gave the league control for 15 years of the Skaanon fisheries and three coastal forts, plus a formal veto over the Danish choice of king.

David (r. c. 1000–960 B.C.E.)

King of a unified Israelite kingdom, established Israel as a major power, and became the standard for all later Israelite kings. As there is no specific mention of David in extrabiblical sources, historical details concerning his rise to power are derived almost entirely from biblical sources.

David, apparently a high officer in Saul's army, was forced to flee to the Judean hills, heading a band of fugitives, mercenaries, and outlaws that raided Saul's kingdom, undermining Saul's authority, and hired out as mercenaries to the Philistines. At Saul's death David managed to wrest control of the southern tribe of Judah from Ishbaal, Saul's heir, and created a rival state. After Ishbaal's death, David claimed the throne of Israel, partly by virtue of the fact that he had married into Saul's family. He subsequently captured the Canaanite fortress of Jerusalem, making it his capital.

David triumphed in a series of bitter foreign wars against the Philistines, three states to the south and east of the Jordan River (Edom, Moab, and Ammon), and the powerful Aramean states to the north. He incorporated much of Philistine territory and all of the Transjordanian states into his kingdom. He subdued the Arameans to the north and allied himself with the coastal city-states of Phoenicia, which provided a lucrative economic relationship that continued during the reign of his successor, Solomon.

Late in David's reign there were a number of internal revolts, including an attempted coup d'état by one of his sons, Absalom, and one by a Saul loyalist, Sheba, all unsuccessful. The line of succession to his son Solomon was also disputed by another son, Adonijah. David's united kingdom, which is reputed to have ranged from the border of Egypt to the Eu-

phrates River, lasted only until the death of his successor, Solomon (c. 960 B.C.E.).

If biblical accounts are to be relied on, David apparently oversaw the transformation and reorganization of the Israelite military from a militia-based organization to a standing army. Battles of volunteer champions, a feature of pre-Davidic warfare, were replaced by organized tactical mass charges, and logistics were regularized.

Davout, Louis-Nicolas, Duke of Auerstädt, Prince of Eckmühl (1770–1823)

One of Napoleon's most reliable field commanders, noted for his rigorous training, strategy, and reliability at crucial moments. Davout was born on 10 May 1770 in Annoux, Burgundy. He was commissioned in February 1788, but his devotion to revolutionary ideas led to his dismissal (15 September 1791). But a volunteer regiment elected him its lieutenant colonel. He fought at Neerwinden (18 March 1793) and rose to division general in July.

Cashiered as a former noble, Davout petitioned and was restored as a brigadier general of cavalry (21 September 1794). He served in the Rhineland (1795) under Charles Louis Desaix, who introduced him to Napoleon, and fought in Egypt with Desaix. Both escaped from Egypt and returned to France on 6 May 1800.

Named a marshal (19 May 1804), Davout held a virtually independent command during the march to Ulm. Then, after an incredible forced march, his corps played a major role at Austerlitz (2 December 1805). At Auerstädt (14 October 1806) Davout, heavily outnumbered, achieved a significant victory. Napoleon belatedly named him Duke of Auerstädt (28 March 1808). At Eylau (8 February 1807), Davout's right wing prevented a French defeat. He subsequently served as governor-general of the Grand Duchy of Warsaw.

In the campaign of 1809 Davout played a crucial role at Eckmühl (22 April). At Wagram (6 July) his leadership of the vital right wing secured victory. Napoleon then named him Prince of Eckmühl (15 August).

In the Russian campaign Davout led I Corps and later Prince Jerome's army too. At Borodino (7 September 1812) he unsuccessfully advocated a flanking attack instead of the bloody frontal assault Napoleon employed. Retreating from Moscow, Davout commanded the rear guard (26 October–3 November) but was relieved for lack of speed and failure to halt Cossack attacks.

Davout fought at Dresden (9–13 March 1813) and took and held Hamburg (30 May 1813–27 May 1814). During the Hundred Days he served Napoleon as war minister and governor of Paris. In surrendering he demanded and obtained an amnesty to protect his colleagues of the Hundred Days. Davout died in Paris on 1 June 1823.

De Wet, Christiaan Rudolph (1854–1922)

Boer general who inaugurated the guerrilla campaign during the Second Anglo-Boer War (1899–1902). Although a citizen of the Orange Free State (OFS) republic, De Wet joined the Transvaalers in their war of independence against Britain (1880–1881), and in the process revealed his courage and natural military talents.

When the Second Anglo-Boer War broke out in October 1899, De Wet joined as an ordinary burgher. As an acting commandant, De Wet defeated the British at Nicholson's Nek (30 October 1899) and in December 1899 was promoted to combat general on the Kimberley front. He was unable to stop Lord Roberts's advance and on 13 March 1900 the British forces occupied Bloemfontein unopposed. De Wet then disbanded the commandos, ordering them to reassemble on 25 March 1900. Those who returned truly believed in the Boer cause and were prepared to fight with renewed commitment. In the meantime, at a Boer council of war meeting at Kroonstad, it was decided to abandon the large

wagon laagers, and to concentrate on destroying the British lines of supply and communication.

De Wet, now in command of all the Orange Free State forces, inaugurated the guerrilla phase of the war by defeating a British force at Sannaspos (31 March 1900). He followed this up with victories at Mostertshoek (3 April 1900) and Rooiwal (7 June 1900). He succeeded in escaping the British encircling movement at the Brandwater Basin, falling back into the Transvaal (the first so-called De Wet Hunt, July–August 1900). His first attempt to invade the Cape Colony (November–December 1900) was thwarted (second De Wet Hunt), but in January 1901 he succeeded in crossing into that colony. What followed was the third (or great) De Wet Hunt, with 15,000 British troops chasing the Boers for 800 miles before De Wet broke back to the Orange Free State. On Christmas Day 1901 De Wet defeated the British at Groenkop. From January to May 1902 he successfully evaded Lord Kitchener's "new model drives." For most of the guerrilla phase, OFS president M. T. Steyn accompanied De Wet's commandos, and together they were the driving force behind the Boers' continued resistance. De Wet was a brilliant tactician, as well as a strict disciplinarian who sometimes used a whip against the weak-kneed.

Although De Wet favored the continuation of the struggle, he eventually bowed to pressure and signed the conditions of surrender as acting president of the Orange Free State. After the war, De Wet once again took up farming, was elected to the OFS Parliament in 1907, but in 1914 took up arms against the Union government in an effort to restore republican independence. He was captured and spent a few months in jail.

Death Squads

Clandestine and usually irregular organizations, often paramilitary in nature, that carry out extrajudicial executions and other violent acts against clearly defined individuals or

groups of people. Murder of this sort is their primary or even sole activity. They differ from other tools of repression in a number of significant aspects, notably in the way they mix state and private interests, and in the way they call into question the very legitimacy and substance of the state: Except in the rare case where an insurgent group forms them, death squads operate with the overt support, complicity, or acquiescence of government, or at least some parts of it. In many cases, government security forces have participated directly in the killing. Yet at the same time, death squads almost always involve the support and participation of elements outside of government, and develop considerable independence from their backers. Death squads are found all over the world today, and in just the last 30 years have been responsible for hundreds of thousands, perhaps millions, of deaths. Major examples of their use include El Salvador or Guatemala in the 1980s and 1990s, South Africa in the 1970s and 1980s, and Bosnia in the 1990s.

Delhi Sultanate, Wars of (c. 1200–1556)

Campaigns that made the Delhi Sultanate the principal Muslim regime in north India between the thirteenth and sixteenth centuries. This hegemony emerged as a result of the military campaigns of Muhammad of Ghur and his commander Qutb-ud-Din Aybak between 1175 and 1206, and in particular their decisive victories at the Battles of Taraori in 1192 and Chandawar in 1194.

For the first few years, until the death of Aibak in 1210, Lahore remained the capital of Muslim India, though the sphere of Ghurid control extended to include Delhi and its environs. This changed with Sultan Iltutmish (r. 1211–1236), who took over the kingdom after Aibak, seizing political power in a coup at Delhi. His first political move was to establish a permanent capital at Delhi, causing the Ghurid soldiers of fortune finally to sever their ties with Ghur. Aibak

also withdrew his forces from contact with the Mongol armies, now concentrating his resources toward consolidating control over the several urban centers of north India, and establishing control over the activities of the Hindu and Rajput kings of the region. It appears that beginning with Iltutmish, the center of the Indo-Muslim polity was no longer at Lahore, but moved to Delhi. This was partly to compensate for the growing threat of Mongol attacks on the northwestern territories of the empire. Delhi was a safer, more interior location, in comparison to Lahore, which was sacked in 1241. Iltutmish's death was followed by a period of factional strife and then stability under Balban (r. 1266–1267). Meanwhile, the resurgence of the widespread threat of Mongol invasions from the north between 1221 and 1258 was reason enough especially to pare the defenses of Delhi, leading to few campaigns in other areas of the country. The Khalji Dynasty (1290–1320), which followed Balban, provided relative stability to the Delhi Sultanate and made it an imperial power. The prolific Khalji king, Ala-ud-Din (1296–1316), greatly expanded the frontiers of the empire. He conquered the regions of Gujarat (1297) and Rajasthan (1301–1312), and created vassals out of some of the principal Hindu kingdoms in southern India (1307–1302). His forces also prevented strong Mongol onslaughts by the Chagatais of Transoxania into north India (1297–1306).

With the Mongol invasions now an event of the past, in the succeeding Tughluq Dynasty, Muhammad ibn Tughluq (r. 1325–1351) attempted to extend the Delhi sultanate's sphere of influence to the Deccan region of central India. His second capital at Daulatabad did little to create the much-desired new Muslim military, administrative, and cultural elite, save for a defiant Deccani military aristocracy—the remaining vestiges of the ambitious capital transfer. This aristocracy severed themselves from the overlordship of Delhi and set up a new Bahamani sultanate in 1347. Meanwhile the Central Asian powers had begun to show a renewed interest in the prosperous region of north India, and Muhammad's successor, Firuz Shah (r. 1351–1388), was so concerned about these invasions from the north that he paid little attention to reconquering the Deccan from the Bahamanis. In any case, despite his preparedness, Timur's sack of Delhi in 1398–1399 left the sultanate utterly devastated. During the reign of the Sayyids (1414–1451), who immediately followed this disaster, the Delhi Sultanate was a shadow of its former self, little more than a country power competing against petty Hindu and Muslim principalities. There was a relative recovery under the Lodi Dynasty (1451–1526), which encouraged significant immigrations from Afghanistan, mainly to swell recruitments into their large armies. The Delhi Sultanate also partly recovered its hegemony, only to be conquered by Babur—the last of the Central Asian

Timurids—at the First Battle of Panipat in 1526. The Afghan leader Sher Shah Suri briefly reestablished the sultanate at Delhi between 1537 and 1555, when it fell again to Babur's son and successor, Humayun, who had returned from exile in Persia. Humayun's death in 1556 coincided with the definitive victory by his son, Akbar, at the second Battle of Panipat. This decisive battle finally encompassed the remains of the Delhi Sultanate into the Mogul Empire.

Denain, Battle of (24 July 1712)

The battle that saved France and ended the "war of succession." By 1712, the French northern border was wide open to invasion. Prince Eugene with 130,000 soldiers (Dutch and imperials) had divided his army in two parts, one besieging Landrecies since 12 July, the other in a fortified camp near Marchiennes, which was linked by a fortification to the town of Denain, 12 kilometers south on the River Escaut. The second army was in charge of protecting the siege, and sending all the supplies through a fortified road called *le chemin de Paris*, as Landrecies was the last French fortified place to protect the capital. The French commanded by Villars had no less than 70,000 troops in a camp observing the siege.

The idea of the bold move that gave victory came from a judge, Le Febvre d'Orval, and was adopted by Villars. First, the French army advanced toward Landrecies to draw Eugene's reserve. Then, on the night of 23–24 July, with a forced march and a flanking movement, Villars crossed the Escaut and appeared before Denain. The Count of Albermarle commanding the Dutch in Denain immediately sent a message to Eugene calling for more soldiers. Thinking that the fortifications would be enough to stop the assaults and give time for reinforcements, Eugene said, "It is time for dinner" and went back to his headquarters. Around 2 P.M., he came back with troops to attack the French right wing. Albermarle had been left in inferior numbers behind Denain's walls. Villars formed an attack column of 40 battalions to storm the fortifications and deployed the rest of his army to prevent the

crossing of the river by Eugene's troops. In less than an hour, the town was taken and Albermarle surrendered. Eugene, with exhausted reinforcements, tried uselessly to prevent the French advance. Eventually he retired after the French commander destroyed the last bridge on the Escaut.

This French victory had enormous consequences. Eugene had to retire and give up all the fortified places previously taken. Moreover, all the opponents were exhausted by 10 years of war and looked for an honorable way to end it. Denain's victory gave the French a new pride and the Dutch a good reason to negotiate.

Denikin, Anton Ivanovich (16 December 1872–8 August 1947)

Czarist army general; White Russian civil war commander. Born near Warsaw, the son of a retired Russian army major, Denikin graduated from the Kiev Infantry Academy (1892), served as artillery brigade second lieutenant, graduated from the General Staff Academy (1902), and became colonel with the Transbaikal Cossack Division during the Russo-Japanese War.

In World War I, Denikin served in the Eighth Army, participated in "Brusilov Breakthrough" (June 1916), was appointed Eighth Army Corps Commander on Rumanian Front (September), and was promoted to lieutenant general.

After the February Revolution, he served as the provisional government's chief of staff (April–May 1917) and was Western Front commander in the disastrous June offensive, which hastened the czarist army's collapse.

Imprisoned after supporting General Kornilov's abortive rightist coup in August, he escaped in November, commanding the "volunteer army" from April 1918 upon Kornilov's death. He retreated to Caucasus strengthening his forces.

In January 1919, he became commander in chief of Armed Forces of South Russia, with Allied backing, and became the most effective White force of the Russian civil war, attacking in June 1919 with 100,000 well-equipped, well-armed troops, including 56,000 cavalry (Don and Kuban Cossacks). Despite capturing Orel (October 1919), 200 miles from Moscow, Denikin failed—in part because the Red Army matched him, especially in cavalry, but primarily through his own errors.

He ignored opportunities to combine with other anti-Soviet forces—Komuch, the Czechs, Krasnov in 1918; Kolchak in 1919—to launch combined attacks, instead seeking glory himself in his drive for Moscow. His vision of "Russia, One and Indivisible" alienated independence-seeking national minorities, and his returning of land to nobility alienated the peasant masses. Thus partisan activity, notably Nestor Makhno's Anarchist army, destroyed his rear.

Becoming Supreme White Commander (January 1920), Denikin retreated to Crimea under Red offensives (1919 and 1920). He departed Russia in April 1920, leaving Baron Wrangel in command.

Denikin wrote his memoirs in exile, in France until 1945, but he did not support the Nazis against the Soviet Union, in contrast to many White Russian émigrés. He moved to America and died in Michigan. He is buried in Detroit.

Dien Bien Phu (December 1953–7 May 1954)

The penultimate siege that ended French rule in Indochina. The war against the Vietminh in Indochina had been going badly for the French. By summer 1953, they controlled only the southern third of Vietnam, the coastline in the country's center, and the Red River delta in the north. The French people were tiring of the war, and depending on how one evaluated Vietminh irregular forces (compared to Vietminh main force units), the French and their Vietnamese allies were outnumbered and losing control.

General Henri Navarre, who had just taken command, felt he could find a solution, perhaps force a negotiated settlement, if he could lure the Vietminh into an open battle where he could defeat them. To tempt the Vietminh, Navarre eventually placed 12 battalions on a plateau—some 180 miles from French bases at Hanoi—in extreme northwestern Vietnam astride enemy supply lines to Laos. Vietminh general Nguyen Vo Giap took the bait and began concentrating more than 50,000 men—33 infantry and artillery battalions—to surround and isolate the French paratroopers at Dien Bien Phu. Giap, a logistical genius, managed to bring artillery where the French thought it difficult by breaking the big

guns down and dragging them up steep hillsides and re-assembling them in position, his men often using bicycles. As a consequence, he was able unexpectedly to besiege the French position.

The siege began in December. Giap surrounded the French position and spent several months bringing more troops, equipment, and supplies to the area. Finally, on 13 March, and after an intense artillery barrage, the Vietminh sent two battalions each against the French companies defending the outposts of Gabrielle to the north, Beatrice to the northeast, and Anne Marie to the northwest. Thereafter Vietminh artillery closed the airfield; the French would have to be resupplied by parachute drops, which as often fell to the enemy as to the increasingly desperate French defenders.

After a two-week pause to consolidate, Giap resumed the offensive on 30 March, and soon overran the outposts of

Eliane and Dominique to the east and Hugette and Claudine to the west. After a month of siege tactics—digging mines, exploding bombs under the French defenses, and constructing approach trenches ever closer to French lines—Giap launched the final attack on 1 May.

On 7 May 1954, the French surrendered. Casualties in this climactic battle were high: The Vietminh have never released casualty figures; the French admitted to 2,000 killed, 6,500 wounded, and 10,000 captured. The Geneva Conference on Indochina coincidentally began the same day and marked the end of the French empire in Southeast Asia.

Dieppe (19 August 1942)

A disastrous landing that nonetheless provided valuable experience for the Allies in amphibious landing techniques for their main landings in the invasion of northeast Europe. Operation JUBILEE was launched on 19 August 1942 with the declared objective of seizing a strongly defended French port. The majority of the 6,000 troops involved were Canadian (5,000), the rest being British, with 50 American rangers, supported by an inadequate number of destroyers and fighter squadrons. No preliminary bombing was provided because Bomber Command believed that it could not spare aircraft allocated to the bombing of Germany.

The frontal attack by Canadians on Dieppe proper was to be facilitated by the destruction of German peripheral defenses in surrounding villages, entrusted to the commandos. But a combination of bad previous reconnaissance, bad luck (which ruined the surprise effect), and poor timing and improper location of the initial landings, more than a 10-mile zone left German firepower largely intact. The main thrust on Dieppe beach at 5:20 A.M. led to heavy casualties. Only a few actually reached the town's streets, protected by only 15 tanks, and were almost immediately killed or taken prisoner. Retreat was ordered at 11:00 A.M. and by 1:00 P.M. all fighting had ceased. Almost 1,000 Canadians lost their lives in what remains one of the most controversial operations of World War II.

Very few historians would now support Churchill's argument in his memoirs that the heavy toll was worth paying for its "mine of experience." Common sense could have suggested the obvious: the need for a near-exact knowledge of enemy strength in the area, the decisive role of advance bombardment by sea and air, and the necessity of massive amphibious equipment. Possibly the only advantage of the operation was to make the Germans more alert to the possibility of cross-Channel invasion: although JUBILEE immobilized a number of German divisions in the west, it also ensured that they would not be caught completely unprepared on D day.

It could also be argued that Dieppe was too large to be a successful raid, and of course, far too small for an invasion force.

Diocletian (245–316)

Roman emperor (r. 284–305) responsible for the reorganization of the military, administration, and finances of the Roman Empire. Born in Dalmatia as Gaius Aurelius Valerius Diocletianus, he rose to power through the army fighting with Carinus against the Persians. During that campaign the murder of Carinus's brother and coemperor raised suspicions against the Praetorian prefect and provided an opportunity for Diocletian's troops to proclaim him emperor in 284. He exercised power in Asia Minor and Syria, where his troops dominated while Carinus continued to rule in the west. As the two armies converged against each other in the area around present-day Belgrade, soldiers assassinated Carinus, leaving Diocletian as the sole ruler of the empire. Recognizing that the vastness of the territory required an administrator as well as a military commander, Diocletian divided his power between himself and Maximian, an Illyrian, who suppressed revolts primarily along the German borders. Both men assumed the title of Augustus in 293. Responsibility was further divided when Diocletian decreed that Galerius and Constantius I Chlorus would be caesars, each one of them assigned to either Diocletian or Maximian. Militarily, during the reign of Diocletian the Roman legions suppressed revolts in Britain, Persia, Syria, Egypt, and along the Danube. The effectiveness of the military ushered in an era of peace. Domestic reforms initiated by Diocletian included the strongest persecution of Christians by any emperor. He also reorganized the offices of government by building a professional bureaucracy while reducing the power of the prefects, senators, and consuls.

Dionysian Wars (398–367 B.C.E.)

A series of four wars waged by Dionysius the Elder against Carthage for control of Sicily. Throughout the last half of the fifth century B.C.E., relations between the Carthaginians ensconced in western Sicily and the inhabitants of the Greek colonies throughout the island deteriorated as both sought to protect their commercial interests and expand their territories. Carthaginian armies mounted a series of bloody campaigns during the century's final decades, seizing important cities and allowing Athens to attack, albeit unsuccessfully, Syracuse (Siracusa, Italy), the foremost challenger to Carthaginian supremacy. In 406, a Carthaginian force invaded and threatened the few independent areas of eastern Sicily. Concurrently, Dionysius seized power at Syracuse and negotiated an armistice; its terms relegated free Greek possessions to the easternmost fringes of Sicily.

Fought between 398 and 392 B.C.E., the First Dionysian War marked the new tyrant's first attempt to wrest Sicily away from Carthage. Violating the truce, Dionysius sent troops in 398 to attack the seemingly impregnable stronghold at Motya (Mozia, Italy), which resisted its assailants until 397. Carthage retaliated, routing the Syracusan navy near Catana (Catania, Italy) and landing a mercenary force led by Himilco, which easily occupied the suburbs of Syracuse. Plague struck the Carthaginians in 395, permitting an opportunity for a successful counterattack by Dionysius, whose forces were reinforced with Spartan and mercenary contingents. Himilco escaped with a fraction of his army and committed suicide.

Carthage dispatched another invasion force under Mago in 393, starting the Second Dionysian War. Dionysius defeated Mago near Abacaenum (Tripi, Italy), but hurriedly demanded a treaty when his own soldiers mutinied unexpectedly in 392. The accord recognized Syracusan suzerainty over Sicily up to the Mazarus River, leaving only the westernmost sliver as a Carthaginian province.

In the Third Dionysian War, fought from 383 to c. 375 B.C.E., Dionysius took the offensive against Carthage, which formed an alliance with the remnants of the Italiote League in Calabria. On the latter front, a storm savaged his fleet while it attacked Thurii (Sibari, Italy), but his troops managed to take Croton (Crotone, Italy), consolidating Syracusan control of Calabria by 377. In Sicily that same year, his forces heavily defeated the Carthaginians at Cabala (location unknown), killing their leader Mago. However, 376 witnessed a reversal of Dionysius's fortunes, when Dionysius lost his army and his brother Leptines to the Carthaginians at Cronium (location unknown). The conflict ended with formal demarcation of Sicily into Carthaginian and Syracusan zones separated by the Platani River.

Dionysius made a final bid to dominate Sicily during the

Fourth Dionysian War. In 368, he besieged Lilybaeum (Marsala, Italy), which replaced Motya as the Carthaginians' main western garrison. However, the Carthaginians caught his fleet at Drepana (Trepani, Italy) and Dionysius ended the campaign, dying shortly thereafter. Dionysius II abandoned the strategic ambitions of his father and relations between Syracuse and Carthage remained quiet until the outbreak of Timoleon's War decades later.

Dionysius the Elder (c. 430–367 B.C.E.)

Greek ruler who briefly conquered most of Sicily. Born c. 430 B.C.E. into a wealthy family of Syracuse (Siracusa, Italy), Dionysius had a career that combined ruthless political opportunism and autocracy with brilliant, innovative soldiery. He entered public life through both intrigue and military service, participating in Hermocrates's abortive coup in 408 and fighting Carthaginian invaders in 406. After perfidiously convincing the Syracusan assembly that their generals were traitors, Dionysius became head of the Syracusan army and virtual ruler of the city in the next year. Immediately, he concluded a truce with the Carthaginians and brutally suppressed an aristocratic insurrection.

Three main opponents resisted Dionysius's expansionist policies: Greek colonists, Carthaginians, and the native Sicel population. His mercenaries vanquished the Greeks and Sicels of eastern Sicily in 399. During this campaign, Dionysius introduced the catapult and the quinquereme, a five-banked, oared warship, to Sicilian military practice. With little delay, he started the first of four Dionysian wars (398–367) with Carthage. By the close of the Second Dionysian War in 392, Sicily was his except for the westernmost segment. Dionysius then led his troops into mainland Italy in 390, crushing the Italiote League and gaining mastery of Calabria as far north as Thurii (Sibari, Italy) by 379. He founded colonies on the Adriatic coast of Italy and raided the Etruscan port of Pyrgi (Santa Severa, Italy).

After the mid-380s, Dionysius's fortunes declined somewhat. He became entangled in mainland Greek affairs, shifting his support from Sparta to Athens, the erstwhile enemy of Syracuse. Carthage defeated his armies during the final

two Dionysian wars, resulting in territorial losses and military stalemate in western Sicily. His son Dionysius II succeeded him upon his death in 367. In subsequent classical literature, the elder Dionysius epitomized tyrannical excess and egotism.

Disarmament

Just before dawn on the morning of 16 July 1945, the world's first atomic bomb was detonated over the desert sands (turning some of that sand to glass) of southern New Mexico. A few short weeks later, atomic bombs exploded over the Japanese cities of Hiroshima and Nagasaki, ending World War II. Less than a month before the first atomic test, the charter for the United Nations was signed in San Francisco. Recognizing the destructive power of atomic bombs, as evidenced by the devastation at Hiroshima and Nagasaki, the very first resolution adopted by this new international body created the United Nations Atomic Energy Commission. The commission was created to make recommendations for dealing with weapons of mass destruction, specifically to promote exchange of basic scientific information about atomic energy, advance ideas on the control of atomic energy, work toward the elimination of atomic weapons, and develop effective methods of inspection to monitor compliance with disarmament.

Disarmament is a generally accepted term that includes all aspects of arms regulation such as arms control, or arms limitation, as well as the elimination of nuclear weapons. However, disarmament is more often used to describe those efforts aimed at entirely eliminating weapons of mass destruction, whereas arms control is used to define activities related to treaties that reduce the number of weapons.

There have been several comprehensive attempts to limit or even eliminate certain types of weapons. But the only truly successful disarmament treaty was the Washington Treaty of 1922, which eliminated large numbers of battleships. The United Nations, where most disarmament work takes place, adheres to the concept that nuclear weapons disarmament is the long-term solution to international peace and security. In 1959, the United Nations declared, formally, that its ultimate goal was to achieve general and complete disarmament under international control.

The United Nations promotes two general activities in

working toward disarmament—education and the reduction and eventual elimination of nuclear testing. Education efforts center on such activities as expert studies to facilitate understanding of the many complex issues underlying disarmament. President Eisenhower's Atoms for Peace proposal was both a disarmament and an educational effort that planned to give more rather than fewer nations access to atomic energy. Education programs benefit smaller nations, who might not normally be allowed to participate in disarmament negotiations, but who have a stake in the world political process.

The majority of the United Nations's disarmament efforts center on promoting an end to weapon testing. Cessation of nuclear testing, it is believed, will prevent continued improvements of existing nuclear weapons and retard the development of new weapons. To this end, the United Nations facilitated a number of treaties to limit and, in some cases, ban nuclear testing in specific areas. These treaties include the 1963 Partial Test Ban, 1967 Outer Space Treaty, 1978 Non-Proliferation Treaty, 1971 Sea Bed Treaty, 1977 Environmental Modification Convention, and the 1979 Agreement on the Moon and Other Celestial Bodies. Of these treaties, the 1963 Partial Test Ban and the 1978 Non-Proliferation Treaty have been the most important vehicles for reducing both testing and proliferation of weapons. Other treaties, such as the Strategic Arms Limitation Talks (SALT) and Strategic Arms Reduction Talks (START) agreements, although more properly categorized as arms control efforts, have contributed to disarmament by the very act of reducing the number of total weapons in existence.

Despite the number of disarmament treaties that have been adopted in the international arena, disarmament proponents, including the United Nations, have not been able to get universal approval of the Comprehensive Test Ban Treaty (CTBT). Although now generally prepared to accept the treaty, India, Pakistan, France, and China tested nuclear weapons in the 1990s to improve their weapons, something the CTBT is trying to stop. The United States declined to ratify the CTBT in the late 1990s, although it has tacitly abided by the treaty and has not conducted a nuclear test since the early 1990s. The failure to achieve universal acceptance of the CTBT highlights the importance of national politics in any international effort that might curb national self-determination.

Disarmament activities have had limited success in the almost 60 years since Hiroshima and Nagasaki. Unlike arms control efforts, which can be counted, measured, and safeguarded to protect national security, disarmament is an ideal and cannot be quantified. Although nations support the ideal of disarmament, they find it difficult to accept in practice. By the early 1960s, it was widely recognized that

disarmament would be a very long-term goal at best. No satisfactory answer has been found to the basic question of how international relations would be governed in a disarmed world or how disputes would be settled if no agreement could be negotiated. The Cold War and its highly sensitive national security concerns, as an example, prevented significant movement to a disarmed world.

The end of the Cold War has rekindled hopes for general disarmament, despite the setback of not achieving universal acceptance of the CTBT. Reduced political tensions have allowed treaties, such as START I and II and the INF (intermediate range nuclear forces), to make deep cuts in nuclear stockpiles. The early commitment to general disarmament by the United Nations, although still the goal, has been replaced by an effort to approach the problem in stages. This incremental approach does not abandon disarmament as an ideal. Rather, it has been modified to emphasize work in smaller areas such as reducing the number of total weapons and preventing proliferation of fissionable material. With the breakup of the Soviet Union and the increase in terrorism, the disposition of fissionable material is of immediate and serious concern. Access to fissionable material is the most important prerequisite to building a nuclear weapon.

The key to any successful disarmament will be the continued improvement of the international political and economic systems. The end of the Cold War removed the most significant impediment to nuclear weapons disarmament—continual superpower confrontation. However, the end of the Cold War did not bring to an end national security interests. Nations still use arms to promote national self-interest. The number of nuclear nations and the number of near-nuclear nations have not yet diminished, although their increase in numbers has been far less than predicted. If the double threat of terrorism and the possible proliferation of fissionable material are not solved, disarmament will continue to be an ideal.

Dominican Civil War (1965–1966)

Fraternal conflict that brought in U.S. armed intervention. In

September 1963, a military coup removed freely elected president Juan Bosch after only seven months in office and replaced him with a three-man junta headed by Donald Reid Cabral, a prominent Dominican businessman. In less than two years the Cabral government lost popular support, due largely to widespread corruption. On 24 April 1965, disgruntled factions of the armed forces, led by Colonel Francisco Caamaño Deñó and supported by the Dominican Revolutionary Party (PRD) and some elements of the Christian Socialist Party, took over the government. Bosch's supporters, the Constitutionals, called for his return to the presidential palace, a move that had some popular support. However, the U.S. ambassador, William Tipple Bennett, opposed the return of Bosch, as did some factions of the Dominican armed forces, especially the air force.

General Elías Wessín y Wessín ordered the bombing of Santo Domingo by the Dominican air force and attempted to take control of the presidential palace in the colonial part of the capital. The Constitutionals resisted fiercely and soon appeared to have the upper hand. On 28 April U.S. president Lyndon Johnson ordered an intervention by 500 marines to protect American citizens. The marines reported that the country was on the verge of collapse and that the level of violence was higher than anticipated. Johnson then ordered 23,000 additional troops into the country to keep Bosch from returning and to prevent a possible communist takeover as had happened in Cuba.

Despite the U.S. intervention, the conflict between the Constitutionals and the Loyalists (supporters of Cabral) raged on. Johnson's actions and policies drew heavy criticism from Mexico and Chile (not to mention opposition in the U.S. itself). By July Johnson realized that Bosch had little chance of returning and he called for a peace-keeping force from the Organization of American States to enforce a ceasefire. Nicaragua, Honduras, Costa Rica, and Brazil sent troops to serve as peace keepers.

The Act of Dominican Reconciliation was agreed to on 31 August 1965, and an interim government was established. In 1966 Dr. Joaquin Balaguer was elected president. Balaguer brought a measure of stability to the island republic during two consecutive terms as president.

Don Juan de Austria (1547–1578)

Spanish general, admiral, and statesman. Don Juan de Austria commanded Christian forces at the last great galley battle of Lepanto. He was also Phillip II's regent in the Netherlands and made significant progress in putting down the Dutch revolt.

Don Juan was the natural son of Emperor Charles V and Barbara Blomberg. He was raised first by a peasant, then brought to Spain to live with a noble family under the name Geronimo. Charles V's will acknowledged Don Juan as his son, and he entered Phillip II's court. Don Juan received his first military command in 1568, when he commanded a squadron of galleys against Barbary corsairs. When Moriscos in Granada rose in revolt, Phillip named Don Juan to head the campaign against them in March 1569. In a small-scale and irregular war, Don Juan developed and executed a competent campaign against their isolated mountain villages. He successfully closed the war in 1570.

Don Juan's next command was as head of the Christian Holy League forces against Ali Pasha and the Turkish fleet in 1571. Spain, Venice, and other powers provided men and galleys to try to stop the Turks' expansion and reconquer Cyprus. The opposing forces met at Lepanto, in Greece, on 7 October 1571. It was the last great galley battle, which assumed many characteristics of land battles. The greater number of Christian soldiers, as well as the heavier construction of their galleys, won the day. More than 200 Turkish galleys were taken or destroyed and the Turks were never again able to pose such a threat to Christendom. As a follow-up, Don Juan recaptured Tunis from the Turks.

In November 1576, Phillip named his brother governor of the Netherlands. Don Juan's natural charisma and energy won back some Dutch, but negotiations proved fruitless. When the states-general raised an army of 20,000 men, Don Juan mobilized Spanish forces. He captured the town of Namur in the fall of 1577. On 31 January 1578, Don Juan routed and nearly destroyed the rebel army at Gemblours. Lack of resources prevented him from exploiting his victory, allowing the Dutch to rebuild. Don Juan died on 1 October 1578, at Bouges, after a brief illness. Rumors abounded that he had been poisoned, possibly by a paranoid Phillip II.

Dorian Invasion (c. 1200 B.C.E.)

The movement of peoples from the north of Greece into the Peloponnese, c. 1200 B.C.E. This has been considered by some scholars to be responsible for the destruction of the Mycenaean world. This migration is also called the Return of the Heraclids. According to myth, the sons of Hercules were expelled from the Peloponnese by Eurystheus, and after an unsuccessful attempt to come back, they settled in central Greece, until the Delphic Oracle informed them that the time had come for their return, whereupon they were divided into three groups, descended to the Peloponnese, and conquered most parts of it. Another version has them wandering until reaching Doris, a small region in the mountains of central Greece, where they settled on land given by the king, thus establishing a friendship with the Dorian people, who would later help them invade the Peloponnese. According to others and ignoring the myth, Doris was erroneously thought to be the Dorians' original homeland, but rather they emerged from Epirus in northwestern Greece and migrated south.

None of the ancient writers ever suggested that the Dorian migration was a destructive affair, and it was only after Schliemann's excavations in the nineteenth century that the picture changed. Schliemann found that the Mycenaean centers were suddenly and catastrophically destroyed, most probably by human hands, and immediately the Dorians were held responsible. Thus, in the nineteenth century the Dorian migration became the Dorian Invasion, and its date was synchronized with the fall of Mycenae, sometime between the end of the thirteenth and the end of the twelfth century B.C.E. The evidence, which suggests that a new population entered the Peloponnese, is mostly the appearance later on of the Doric dialect. In terms of archaeological evidence, the invasion of a foreign people can be attested by the appearance of new metal types: the bronze flange-hilted sword with a straight blade known as the Griffzungenschwert sword; the spearhead with flame-shaped blade and a complete cast socket; a type of flange-hilted dagger called the Peschiera dagger; a single-edged knife, with or without a curved blade; a type of lugged ax called the Armchenbeil; and the so-called violin-bow fibula (clasp), which was related to the use of thicker clothes. However, the evidence so far does not support the theory of an invasion, and most scholars do not accept it anymore. There is no distinctive material culture that would define the invaders, and most of what were thought to be new metal types actually appear long before the destruction. In addition, the destruction in the Mycenaean world occurred over quite a long period, and according to no geographical pattern that would imply an invasion. Innovations in burial practices (namely the frequent use of cyst graves) could imply the arrival of a new

population, but they appeared well after the destruction of the Mycenaean world. Therefore, there is a possibility that the “Dorian Invasion” was actually an infiltration of peoples into a half-empty land rather than a military invasion.

Dorylaeum (Eske Shehr), Battle of (Turkey, 1 July 1097)

First significant field battle between crusader and Muslim armies. After the forces of the First Crusade (1095–1099) had captured Nicea from the Seljuq Turks, they pressed on for the Holy Land. The route traveled required them to pass through the valley of Dorylaeum. There the Seljuq sultan, Kilij Arslan, awaited them.

The appearance of the crusaders had alarmed Kilij Arslan, forcing him to form an alliance with his rivals, the Danishmend Turks. The Turks, primarily light horse-archers, felt confident that they would defeat the crusaders in open battle.

The crusaders were marching in two divisions. The first, under Bohemund of Taranto, camped in a field not far from Dorylaeum. The following day at sunrise, the Seljuqs charged from the hills. Under direction by Bohemund, the knights dismounted and formed a protective barrier, with the noncombatants in their middle, where springs of water existed. Bohemund also sent a courier to the second crusader division.

The Turks rained a steady hail of arrows down on the crusaders. Surrounded, they faced destruction or slavery. Despite the constant barrage, the crusaders held out until midday, when the second crusader division arrived under Raymond of Toulouse. This second force surprised the Turks, who thought the crusaders were only a single body. As the crusader armies merged, they began to counterattack. The Turks struggled to withstand them, but their surprise turned to panic as a third crusader force appeared in their rear.

This force, led by Bishop Adhemar of Le Puy, had been detached by Raymond for this very purpose. The Turks were

routed and the camp of Kilij Arslan fell to the crusaders. Afterwards, the crusaders were able to continue to the Holy Land with minimum difficulty.

DOWNFALL, Operation (1945–1946)

Code name for the planned Allied invasion of Japan during World War II. Assuming that only the conquest of their home islands could compel Japanese leaders to surrender, Allied planners began creating invasion plans in 1943. By mid-1945 they envisioned two massive amphibious assaults, each commanded by Douglas MacArthur. The first, code-named OLYMPIC, was scheduled for 1 November 1945 against the island of Kyushu; the second, code-named CORONET, was slated for 1 March 1946 against the island of Honshu. Collectively code-named DOWNFALL, these attacks were designed to end the war by late 1946.

The Kyushu plan called for a 10-division assault landing supported by thousands of aircraft from the Marianas, Okinawa, and Iwo Jima, and by 32 aircraft carriers and thousands of support ships. U.S. forces would battle an estimated 350,000 Japanese troops in a campaign that planners believed could last well into 1946, and would be the largest military campaign in history.

After conquering Kyushu, Allied leaders hoped to launch CORONET on 1 March 1946. The largest amphibious landing in history, CORONET called for 17 assault divisions to drive on Tokyo, battling more than 1.2 million Japanese soldiers and at least 1,600 enemy planes along the way.

Casualty estimates for OLYMPIC and CORONET ranged from 250,000 to 1 million American dead, and proved decisive in President Harry Truman’s decision to drop atomic bombs on Japan. The destruction of Hiroshima and Nagasaki and the entry of the Soviet Union into the war against Japan compelled the Japanese to surrender, thus making DOWNFALL’s planned bloody assaults unnecessary.

Dresden, Battle of (26–27 August 1813)

French victory over Austria and Russia in the Leipzig Campaign of the Napoleonic Wars. The Austrian, Prussian, and Russian allies of the Sixth Coalition fought the French five times in the last week of August 1813, trying to liberate Saxony. On 23 August, Jean Baptiste Jules Bernadotte and Friedrich Wilhelm von Bülow defeated Nicolas Charles Oudinot at Grossbeeren. On 26 August, Gebhard Leberecht von Blücher defeated Jacques Étienne Joseph Alexandre MacDonald at the Katzbach and Dominique Joseph René Vandamme defeated Eugen von Württemberg at Pirna.

Three armies, led by Bernadotte in the north, Blücher in the center, and Karl von Schwarzenberg in the south, formed a semicircle around Napoleon's east, each independently threatening to push him toward the Rhine. Oudinot guarded the north, Michel Ney the center, while Napoleon patrolled both the south and the center. On 22 August, in order to prevent Schwarzenberg from capturing the French headquarters at Dresden, Napoleon abandoned his pursuit of Blücher and force-marched 100,000 men 120 miles in four days to defend Dresden. When he arrived, Schwarzenberg's 200,000 Austrians and Russians already held most of the high ground. The French attack prevailed by sheer tenacity, audacity, and desperation, not superior tactics. Napoleon himself commanded field artillery in the thick of battle and Joachim Murat used his cavalry expertly but recklessly. Schwarzenberg, with 6,000 killed, 8,000 wounded, and 24,000 missing or captured, ordered retreat after two full days of fighting. Napoleon lost 10,000 killed and wounded.

Dresden weakened Napoleon severely. Among the reasons that Schwarzenberg was able to beat him decisively in the Battle of the Nations at Leipzig on 16–19 October were Napoleon's general failure to profit from his victory at Dresden, his surrender of 7,000 trapped men to Schwarzenberg on 28 August, Vandamme's loss to Alexei Ivanovich Ostermann-Tolstoy and Friedrich von Kleist at Kulm-Priesten and Nollendorf on 29–30 August, and especially Ney's 15,000 casualties in his loss to Bernadotte at Dennewitz on 6 September.

Dreyfus Affair (1894–1906)

A uniquely French complex miscarriage of military justice. Captain Alfred Dreyfus (1859–1935), an independently wealthy Jew of German origins, a member of the General Staff since 1 January 1893, was charged with spying on the basis of a document known as the *bordereau* found at the German embassy. The staunchly anti-Semitic General Staff refused to provide Dreyfus access to the documentation used to try him in a court-martial in October 1894. He was found guilty and sentenced to degradation and imprisonment on Devil's Island. Lieutenant Colonel Georges Picquart realized that the *bordereau*, a memorandum, had been written by Major C. Ferdinand Walsin-Esterhazy, whose handwriting corresponded to other incriminating evidence. Picquart was quickly replaced by Commandant Joseph-Hubert Henry, who forged documents and upon discovery committed suicide. Esterhazy's court-martial completely absolved him of all charges.

Emile Zola's public letter "J'Accuse" on 13 January 1898 was partially responsible for a new trial at Rennes on 3 June 1899, where Dreyfus again was declared guilty but with extenuating circumstances. In 1903 the Supreme Court declared that the court-martial had been erroneous. Prime Minister Waldeck Rousseau offered Dreyfus a presidential pardon and he was reinstated on 22 July 1906 as a major and named Chevalier de la Légion d'Honneur. He served in World War I as a lieutenant colonel and retired in 1918.

The Dreyfus Affair was significant because the army knowingly allowed one of its own to be a sacrificial scapegoat because he was Jewish and partly because it would not admit its own duplicity. The mass hysteria engendered by the divisive affair reflected the current obsession in many quarters with Jewish and Protestant conspiracies, by those who put the "honor" of the French army above all else. September 1995 the French army finally admitted it had been wrong from the beginning in the Alfred Dreyfus affair.

Dudley, John, Duke of Northumberland (1502–1553)

Son of Henry VII's hated tax collector, Edmund Dudley, who was executed by Henry VIII as a public relations move. John Dudley quickly set about restoring the family's favor. During the pilgrimage of Grace, a rebellion against the Reformation Parliament, Dudley pacified the north of England. Appointed a vice admiral in 1537, he dispatched a small fleet against Flemish pirates and successfully cleared the channel, receiving the title Lord Lisle in return for his service. As warden of the Scottish Marches and commissioner to Berwick, Dudley improved fortifications along the border and played a key role in the Battle of Pinkie in 1547 against a larger

Scottish army, rallying his men to attack the Scottish right. Advancing to the title Earl of Warwick upon the accession of Edward VI, he joined the Privy Council and immediately clashed with the young king's guardian and uncle, the duke of Somerset, Edward Seymour.

Never a committed religious man, Dudley embraced the Reformation in order to strengthen his position at court, and invited criticism against Seymour, the Protector. When rebellion broke out in Norwich, started by peasants provoked by enclosure, Warwick was appointed to put it down, using an army of 7,500 men, with whom he seized the city of Norwich and defeated the rebel's leader, Robert Kett, at Dessingdale in August 1549. Meanwhile, Dudley, who became duke of Northumberland, engineered the disgrace and fall of Edward Seymour and took his place as Protector. The young king, without an heir and in poor health, would be succeeded by his sister Mary Tudor, a Roman Catholic, a situation that prompted Dudley to convince Edward VI to alter the line of succession and leave his crown to his cousin Jane Grey, whom Dudley had married to one of his sons. On Edward's death, Dudley proclaimed Jane queen and marched with an armed force to seize Mary, who eluded him and marched on London herself. Rallying the people, Mary deposed Jane and arrested Dudley. Judged guilty of treason for his unsuccessful attempt to seize the throne for his family, he was executed at the Tower of London in 1553.

Dunbar, Battle of (3 September 1650)

Victory over Scots demonstrates Cromwell's tactical skills. Following the 1649 execution of Charles I, his son Charles II landed in Scotland in June 1650, and raised his standard. In response, an English expeditionary force, consisting of 5,000 horse and 10,000 foot under the command of Oliver Cromwell, crossed the border on 22 July.

The Scottish commander, David Leslie, had an inexperienced, albeit larger, force, and avoided a direct confrontation with the invaders. Harassed, and with long supply lines, Cromwell was forced to halt his advance by late August, and pulled back to the port at Dunbar, which he fortified. On 2 September Leslie moved a force of approximately 22,000

men to the south of Dunbar, threatening Cromwell's positions. The rough ground did not favor their lines, but it appears possible that the movement was forced upon Leslie by political advisers.

Heavily outnumbered (disease had cut the size of his army to fewer than 12,000), Cromwell decided upon a surprise attack, and at 4 A.M. on 3 September his regiments launched their assault. The Scottish forces were caught unprepared, and a concerted effort on their right forced that wing to collapse. The Scottish center attempted to withdraw, but the rough ground prevented a safe escape, and it quickly became a rout.

It is estimated that Scottish casualties may have exceeded 3,000, with a further 10,000 taken prisoner; the English losses were negligible. This was perhaps Cromwell's most notable victory as it demonstrated his ability as a field commander. It also served as precursor to his final victory over the Scots, and allowed him to secure Glasgow and Edinburgh, as Leslie was forced to retreat.

steep dune, while below them Cromwell's Protectorate infantry struggled to storm the dunes. After much bloody fighting, the weight of the Protectorate arms prevailed, and the right flank of the Spanish army buckled. Although the Spanish cavalry of the left had some success, eventually they too were forced to withdraw, and a rout ensued. It is estimated that the Spanish army suffered as many as 6,000 casualties, many of them prisoners, while the Anglo-French alliance lost only 400.

This decisive victory ensured the French domination over the region. Although Britain gained Dunkirk as part of the alliance, it was sold to France in 1662. In addition, France captured a number of other towns in this campaign and forced Spain to sign the Treaty of the Pyrenees, all of which marked the end of a serious Spanish threat to northern France.

Dunes (14 June 1658)

Climactic battle of the French-Spanish conflict over the Lowlands, which helped to create the northern boundaries of modern France. In 1658, a polyglot Spanish army of 16,000 (including 2,000 followers of the exiled Charles II of England, Condé's French rebels, and a few regiments of Spanish regulars) marched to raise a siege of the coastal town of Dunkirk, which was surrounded by Turenne's Anglo-French expeditionary force of perhaps 21,000. Turenne's force was somewhat more homogenous but did include a leavening of 6,000 English infantry sent by Oliver Cromwell's Protectorate.

On 13 June, the Spanish force drew up their lines on the dunes north of the town, between the strand and a canal. Turenne met them the next day with 9,000 cavalry and 6,000 infantry, leaving the remainder of his forces to maintain the siege. The guns of a small Protectorate fleet covered the strand.

The principal action took place between the right of the Spanish line and the left of the French. There both wings were composed of British troops, the Royalists atop a tall

Dutch Colonial Wars (c. 1620–1949)

Colonial wars focused on the obtaining, retention, and loss of power throughout Dutch areas of economic and military power and influence. The Dutch fought with the Portuguese, the British, the Indians, and the Indonesians. The fighting mainly occurred through the auspices of the Dutch East India Company, founded in 1602, and the Dutch West India Company, founded in 1621.

The Dutch and Portuguese Colonial Wars from c. 1620–1655 were economically based and spread from Africa to Brazil. The Dutch West India Company seized Portuguese commerce in Brazil and Africa after successfully removing the Portuguese from India. Piet Heyn (1577–1629), who commanded 26 Dutch ships, seized Baha in 1624. Spain, which had annexed Portugal, retaliated with 52 ships, with 12,000 men led by Fadrique de Toledo, that removed Heyn, who, however, returned in 1627. Heyn's capture of a huge Spanish treasure in Cuba in 1628 resulted in his promotion to admiral. The newly wealthy Dutch West India Company

sent 67 ships and 7,000 men, who captured Pernambuco and Recife. The Portuguese inhabitants revolted in 1654, causing the Dutch to withdraw. However, Portuguese forts in Ghana, Luanda, and Brazil were attacked. The Dutch gained control over Ghana and the Gold Coast, and the Portuguese were also expelled from Molucca and Sri Lanka.

From 1655 to 1664 the Dutch had negative relations with the Manhattan and Algonquin Indians in present-day New York State. A dispute led to Pieter Stuyvesant (1592–1672) applying rules restricting movements of the Indians. However, Indian raids on Long Island led to Stuyvesant's intervention at the request of settlers. A palisade was built. Indian attacks occurred again in August 1658, leading to Stuyvesant's victory over the Indians. Renewed fighting occurred in 1663. The following year the Indians were forced to surrender.

The Dutch also fought three wars with England, from 1652 to 1654, 1664 to 1666, and 1672 to 1674. These wars were based on commercial rivalry but extended to the colonies. The English 1651 Navigation Act restricted non-British crews and ships from trading, severely harming Dutch maritime profits. Nine naval battles culminating in the Battle of Scheveningen on 31 July 1652 resulted in the death of Dutch commander Maarten Tromp (1597–1652). The 1654 Treaty of Westminster ratified the English victory after they had blockaded Holland in 1653. The Dutch West African ports that handled the profitable slave trade were also attacked by the English.

New Amsterdam was seized by the English in 1664. Prince James (1622–1701), brother of King Charles II, defeated Jacob Opdam's 100-ship fleet in 1665. But Admiral Michiel de Ruyter (1607–1676) raided the Thames River in June 1667, destroying 16 ships and causing the English to sue for peace. The Treaty of Breda granted Surinam to the Dutch but gave the English control over present-day New Jersey, Delaware, and New York. As the Dutch said of their final defeat by the British, "The mountain of iron [England] defeated the mountain of gold [Holland]."

The final war involved France's king Louis XIV (1638–1715) and his alliance with King Charles II (1630–1685) of England and their attempt to blockade Holland. Although the French were generally victorious, in order to avoid financial ruin Louis made peace with the 1678 Treaty of Nijmegen.

In 1652 the Dutch founded a colony at Cape Town in present-day South Africa. By the 1680s French Huguenots and Dutch Reformed had families settled in the area. They became known as Boers and came to speak Afrikaans, a variant of the Dutch language. The British seized the area in 1806; consequently many Boers participated in the Great Trek north where they founded their own republics. The di-

among discoveries in 1867 and the 1886 gold discoveries led to British encroachment in Boer territory. The Boers were defeated in the Boer War of 1899–1902, after a heroic resistance.

The final Dutch colonial war took place in the Dutch East Indies (contemporary Indonesia). The Dutch had governed their East Indies for nearly 300 years in a corrupt and ruthless manner that had little respect for the natives. The focus on trade and profit overwhelmed all other considerations. It is not surprising then that the Sarekat Islam (Islamic Union) was established in 1912 as a response to the Dutch Ethical Policy that divided Indonesian society into western educated haves and local have-nots. Some 2 million merchants created the Volksraad (People's Council). Although initially conciliatory in its approach, after the failed Communist-led insurrection in 1926 and 1927, the Dutch embraced a repressive policy. In response, the Partai Nasional Indonesia (Indonesian Nationalist Party, PNI) was established by Achmed Sukarno (1901–1970) and Muhammad Hatta (1902–1980), both of whom advocated complete independence. The PNI was banned and its leaders repeatedly arrested and exiled.

The Japanese occupation of Indonesia during World War II granted Sukarno and his followers political freedom. Although a repressive system, the occupation trained young men militarily throughout the Indonesian islands, a training that eventually created a postwar army of independence. The Japanese offered independence in October 1944 in exchange for support against the Allies. However, economic deprivations and the aggressive behavior of the Japanese produced considerable ill will toward the occupation. In short, the Japanese were behaving just like the former colonial masters, down to assertions of cultural and even racial superiority. But this ill will did not translate into support for the Dutch when they returned to the islands in the wake of the Japanese defeat in 1945. The surrender of the Dutch colonial forces and the general capitulation of all European authorities' empires in the Pacific and Asia to the Japanese early in World War II in the Pacific had led to a catastrophic loss of prestige and native deference to those regimes. Between 1945 and 1949, with the diplomatic aid of the United Nations, the Indonesians were able to resist the restoration of Dutch authority and to achieve independence.

By the middle of the twentieth century the Dutch had lost all of their colonial wars. This loss was due in part to reduced military power, the widespread independence movements, and the international condemnation of empires. Presently, only the Netherlands Antilles and Aruba are joined to the kingdom of the Netherlands.

Dutch War of Independence (1567–1648)

Better known as the Eighty Years' War or the Dutch Revolt, one of the longest struggles for national independence in history. The conflict began as a revolt by present-day Belgium and the Netherlands against the severe economic and religious oppression of the Spanish monarchy. The revolt was a bitter clash between ancient freedoms, absolutist tyranny, and differing ideologies, and converged into a religious and social revolution. The revolt further became entangled in the Thirty Years' War and ended with complete independence of the Netherlands from its Spanish overlords.

Burgundian rule over the present-day Netherlands and Belgium ended when in 1506 Charles V (1500–1558) inherited various territories from his grandparents. Serious problems emerged upon his abdication on 25 October 1555 when the prematurely worn-out, stately, but well-loved monarch bequeathed his empire to his son Philip II (1527–1598), an absolutist, narrow-minded fanatic Catholic. Philip appointed his conciliatory half sister Margaret of Parma (1522–1586) as regent in 1557. She governed through a reckless Council of Regency that excluded the local nobility and persecuted the sizable Protestant Calvinist faction that had arisen during the Reformation. In his bigoted obstinacy, Philip contravened many ancient privileges—one such was that no Spanish soldiers would ever set foot on Netherlands soil. Philip not only revoked that privilege but also championed Catholicism by increasing the number of Holy Sees. Through Antoine Perrenot Cardinal de Granvelle, Philip brought the Inquisition to the Netherlands. Properties

were confiscated, titles removed, and thousands of people charged with treason for minor infractions. The barbarous cruelty against the Calvinists aroused considerable hatred against Spanish rule, which Margaret was powerless to stop. Granvelle left the Netherlands in 1564 but the damage was done.

Anti-Catholic riots spread throughout the Netherlands in 1566. Calvinists responded to Catholic terror by ransacking churches and by destroying religious relics and art. Outraged, Philip sent the notorious Fernando Alvarez de Toledo, Duke of Alba, to crush the Calvinists, not only with 20,000 troops but also through the Council of Blood. His job was to return the Netherlands to the Catholic fold. Margaret resigned her position. Alba's dictatorial rule and punitive military campaigns from 1567 to 1573 were conducted with unusual carnage and terror, added to which a retaliatory tax of 10 percent on each transaction to pay for the occupation and the war crippled the mercantile sector.

Meanwhile, William of Orange (1533–1584), a German-born nobleman who had been raised in the court of Charles V, and who had converted to Catholicism to please Charles, was commander of his troops near the French border. He had served Philip as a diplomat, objected strongly to Spanish tyranny, and had reconverted back to Calvinism. His diplomatic skills and cautious demeanor earned the sobriquet William the Silent, and he gained the firm allegiance of many beleaguered nobles and the common people.

The Geux, a rebel group of converted Calvinist adventurers, pirates and guerrillas, supported by William from 1568, raided Spanish-held territories. They were crucially important to the advances of the revolt. Although losing at Heiligerlee and Jemmingen in 1568, the Geux still successfully blockaded the sea outlet to Brussels. In 1572 they seized Den Briel, which proved fatal to the Spanish. The Geux also gained control over the entrances to the provinces of Zeeland and Holland.

William's tactic was to avoid Alba's well-prepared forces. Instead, he exploited his knowledge of the landscape by aiding besieged cities. In Leiden in 1574, for example, he opened the dikes, scattering the Spaniards. William soon had the majority of the northern Protestant areas under his control and formed the Union of Utrecht in 1579, which melded the various provinces into one entity. These seven provinces later became the Dutch Republic.

Then in 1578, Alexander Farnese of Parma (1578–1592), son of Margaret, became governor of the Spanish Netherlands (Belgium). He defeated the Dutch in 1578 at the Battle of Gembloux and returned the Belgian provinces to the Catholic fold. With the 1579 Union of Arras the Belgians swore allegiance to Spain. The revolt had by now become re-

ligious. The Union of Utrecht proclaimed its independence from Spain in 1581. William governed judiciously, but was assassinated in 1584.

Maurice of Nassau (1567–1625), William's son from his second marriage, succeeded his father and proved to be the savior of the revolt. This brilliant military reformer realized the need for a strong, effective counteroffensive. He professionalized the officer corps by establishing the first military academy and a system whereby troops were paid regularly. He devised 500-man battalions whose units could move en masse or independently for greater maneuverability. He insisted on the best artillery and was brilliant at siege warfare. This strategic genius built a defensive zone of fortified towns that seriously obstructed the Spanish. Maurice nearly single-handedly revolutionized warfare through improved training, sound economic policies, and logistics; his was the most modern army in Europe.

Maurice was appointed captain general in 1588 and admiral of the United Netherlands. In 1589 he was recognized as stadtholder (governor) of the provinces of Utrecht, Gelderland, and Overijssel. He captured Breda in 1590; Zutphen, Deventer, and Hulst in 1591; and won the battles of Turnhout in 1597 and Nieuport in 1600, among others. Maurice's military success resulted in the Twelve Years' Truce, signed in 1609. Fighting resumed in 1621 when Maurice would not extend the truce. The Spaniards by this time were commanded by Ambrogio de Spinola (1569–1630) who bested Maurice with his numerically superior forces at the siege of Breda. Maurice died after a five-month illness on 23 April 1625, leaving no heirs.

Under Maurice's half brother Frederick Henry (1584–1647), a charming, tactful leader, the Dutch quest for inde-

pendence became enmeshed in the Thirty Years' War that began in 1618. With financial support from France he accomplished major and significant victories against the Spaniards at 's-Hertogenbosch in 1629, Maastricht in 1632, and Breda in 1637. His 1635 alliance with France and Sweden against Spain solidified his position, as did the marriage in 1641 of his son William (1626–1650) to Mary Stuart (1631–1660), daughter of King Charles I (1600–1649) of England.

A grateful Netherlands granted Frederick Henry's family hereditary rights to the stadtholder position, and they eventually became the royal family of the Netherlands. Upon his death in 1647 Frederick Henry was succeeded by his son William II, whose son William III (1650–1702), born eight days after his father's death, became joint monarch of England in 1688 along with his wife Mary Stuart, daughter of the deposed King James II.

The Spaniards were severely weakened by this time, and were forced to recognize the independence of the Netherlands at the Peace of Munster in 1648. The Eighty Years' War was the first European war in which independence was the desired objective. It would not be the last.

Economic Warfare

Compelling an enemy to capitulate either by direct action against its economic base or indirectly through blockade, boycotts, and so on. Joseph Goebbels, minister for Propaganda of the Third Reich, asked a group of German area leaders in 1943 whether they wanted total war. Their response was a resounding *Ja!* What lay behind the question was the fact that the German economy in 1943 was not yet fully mobilized for war, although it was at war with Russia and the Western Allies simultaneously.

Economic warfare can be tactical—denying a water hole by poisoning; burning a field of wheat—or strategic—destroying lines of communication necessary for the movement of raw materials and finished military and other products. Navies have often engaged in blockade to deny maritime trade, and in the twentieth century air forces have also been pressed into the battle.

In the siege warfare of the Middle Ages it was common to attempt to poison water supplies and to try to spread disease among the besieged inhabitants. In the Indian Wars in America, salting water holes or even leaving animal carcasses in water sources was a form of tactical economic warfare. On a larger scale, Stalin's order to burn all of Russia before the Germans was mainly a tactical, defensive form of this type of warfare, for the strategic factories had already been moved east to the Urals.

In World War I, the blockade of Germany eventually caused near-starvation, but did not destroy the German will to fight—the ultimate aim of economic warfare, coupled with the denial to the enemy of the means to fight. Economic warfare attacks the soldier in the field only indirectly, attacking instead his civilian counterpart, the maker of the equipment the soldier needs, as well as denying the civilian population the means to make that equipment, and causing morale to fall to such a level that continuation of the war is made impossible.

The advocates of strategic air bombing before World War II were sure that their bombers would always penetrate the defenses, and that the bombing would be so effective that countries would be obliged to sue for peace without land invasion. That this was a misconceived concept was made clear in the air campaign against Germany in World War II. The Royal Air Force switched to night bombing in the face of German antiaircraft defenses and the Luftwaffe fighter patrols, and then tried to justify random area bombing as economic warfare.

Heavy bomber advocates in Britain argued that bombing alone would bring Germany to its knees, but, basically, the bombing raids produced a stiffening of resistance in Germany—exactly as had happened in London during German air raids in 1940 and 1941.

The U.S. Army Air Forces made every attempt to carry out an economic air offensive against Germany. They attacked in daylight, with extreme courage and fortitude, dropping bombs on specific strategic economic targets such as oil refineries, U-boat yards, munitions factories, and aircraft production sites. The results only became clear in 1945, showing that despite their sacrificial efforts (and those of the RAF), air bombing could not win a war; it could only make it easier in the end for land forces to penetrate land defenses.

At sea, an extremely effective method of blockade is to sink the ships carrying materials needed to continue the war. In both of the world wars of the twentieth century, Germany used submarine warfare as its most effective economic assault on Britain. Supplies from the United States under the Lease-Lend agreement were fundamental to the continuance of British resistance. Admiral Karl Doenitz knew how effective the U-boats had been in World War I, and to make them even more so he created the wolf-pack. A group of U-boats would attack a convoy (previously the convoy system had defeated the U-boat campaign in World War

I), and by weight of numbers eventually render the Atlantic Ocean impassable.

Had Doenitz succeeded, there is little doubt that Britain would have had to sue for peace, but with the “Germany First” policy of President Franklin Roosevelt and the entry of the United States into the war, it was just a matter of time before the U-boats were rendered ineffective, as they were in May 1943.

The war in the Atlantic in both world wars is perhaps the single most significant example of economic warfare. It should be remembered that only by cooperation between the Allies was the U-boat menace defeated, despite every effort by British Bomber Command to ensure that RAF aircraft were not released for antisubmarine duties at a time when they were unable to find targets in Germany, let alone bomb accurately.

Economic warfare was used ineffectively in the Vietnam conflict because it was based on Western living standards; the North Vietnamese were capable of withstanding deprivation on a scale inconceivable to the affluent Americans. Further, it seems that the Agent Orange defoliant caused as much damage to U.S. troops as it did to the Vietnamese. In addition, bombing an enemy “back to the Stone Age” is only effective against an enemy living well above Stone Age levels.

Air attacks and blockades can severely damage the infrastructure of a warring nation, but they cannot defeat that nation, and economic warfare can only be effective in the longer term. In short-term campaigns such as the Gulf War, the solution is to use one’s air and sea assets against military targets.

Economic warfare thus has as its aim the denial to the enemy of the will and means to fight, but it is a two-edged sword that, unless planned meticulously and constantly evaluated, can lead to wasted effort and lives attacking targets that have no great value to the enemy.

Edgehill, Battle of (23 October 1642)

The first major battle of the English Civil War. King Charles I raised his standard and began recruiting soldiers on 22 August 1642 on Castle Hill at Nottingham. Seeking more re-

cruits, he marched west to the royalist region around Shrewsbury. By October, Charles felt strong enough to march on London, but his path was blocked by a parliamentary army under Robert Devereux, Earl of Essex.

Essex had about 20,000 men, Charles around 13,000. The royalists were poorly equipped, but superior in morale, especially among the cavalry. Essex’s soldiers were mostly members of the prewar “trained bands” of militia. Their morale was low, due to lack of training and pay. Many officers on both sides had military experience in the Dutch wars against Spain and the Thirty Years’ War. Charles’s chief military adviser was his nephew, the dashing Prince Rupert.

The two armies blundered into each other during the afternoon of 22 October. They formed for battle the next morning, with the royalists between Essex and London. Both sides placed their infantry in the center, with cavalry on both wings. The royalists took six hours to form their line. When Prince Rupert, the king’s nephew, objected to the earl of Lindsay’s dispositions, the angry earl resigned as royalist commander just before the battle. After skirmishing, Rupert’s cavalry on the right routed the opposing cavalry. The royalist troopers on the left quickly did the same, but both groups pursued their foes off the battlefield, a common battlefield error. The infantry then closed. After exchanging musket fire, the battle became a contest between pikemen. The eventual return of the exhausted royalist cavalry helped force a stalemate, but both sides had been roughly handled. They spent the night on the field. Both sides proclaimed victory, but Essex retreated toward reinforcements the next day. Charles declined a rapid advance on London and established his headquarters at Oxford. Essex was able to take up a blocking position and was reinforced by militia from the capital. When Charles finally marched on London in November, he was stopped at Turnham Green, ensuring that the war would not end quickly.

Edington (Wessex, May 878)

Defeat of Danes results in establishment of the Danelaw. In 876, the Great Danish Army, which had arrived 11 years before, advanced on Wessex. Unlike previous years, it did not leave Wessex after collecting tribute, but wintered there. Al-

though it retired again in August 877, the army was back again in January 878 in a surprise attack, demonstrating the Viking ability to raid even in the dead of winter. A serious attempt was now made to subjugate Wessex.

The army established itself at Chippenham (Wiltshire), and the *Anglo-Saxon Chronicle* records that the West Saxons submitted, “except King Alfred.” By March of that year he and his retainers had been forced into hiding, and the hope of the West Saxons seemed to be fading. Alfred continued to harass the Danes from a fort at Athelney in the Somerset fens as he secretly assembled an army. He met the Danes at Edington. “There,” according to the *Anglo-Saxon Chronicle*, “he fought against the entire host, and put it to flight, and pursued it up to the fortification [Chippenham], and laid siege there a fortnight.”

The Danes surrendered and their leader, Guthrum, agreed to vacate Wessex and to accept baptism. Alfred himself stood as sponsor. The baptism took place at Wedmore (Somerset) some weeks later. It eventually led to an uneasy peace and establishment of the Danelaw (Treaty of Wedmore). The following year the Danes settled in East Anglia, where Guthrum reigned (880–890) as their king.

Edward, the Black Prince (1330–1376)

Leading English general of Hundred Years War. Edward was born 15 June 1330 at Woodstock, Oxfordshire, England; died 8 June 1376 at Westminster near London; and was buried at Canterbury. By the time of his death he was Edward of Woodstock, Prince of Aquitaine, Prince of Wales, Duke of Cornwall, and Earl of Chester. Edward was the son and heir apparent to Edward III, although he never assumed the throne. He is widely considered one of the principal players and exceptional generals of the Hundred Years War, much of his reputation being based upon the lopsided victory in the Battle of Poitiers in 1356. His sobriquet is a reference not to brutality or tyranny, as is often assumed, but rather to the black armor that was his signature.

Edward's first campaign was under his father in northern France, where he fought at Crécy. He was granted an independent command in 1355, and used it to win the Battle of Poitiers the following year. After he was created prince of Aquitaine in July 1362, he attempted to restore Peter the Cruel of Castile to his throne in 1367. He won a famous vic-

tory at Najera on 3 April 1367, but at a high cost. This weakened Edward's position in Aquitaine, and he was unable to establish rule there after the nobles and prelates of the area tried to establish Charles V of France as suzerain in 1368. In an attempt to quell this revolt, Edward was forced to rely on mercenaries he could not pay, and eventually had to surrender his principality to his father in January 1371. He had no successor as the prince of Aquitaine.

Edward I (1239–1307)

Led unsuccessful effort to conquer Scotland, reformed England. Edward Longshanks was born 17 June 1239 in Westminster, Middlesex, England, and died 7 July 1307 at Burgh by Sands, Carlisle, Cumberland. He was the son of Henry III and king of England from 1272 to 1307.

England during Edward's reign was characterized by an increasing sense of nationalism, and one of his major goals as king was the unification of Britain under one rule. To that end, Edward managed to bring Wales under English authority, but was not able to achieve the same results with Scotland. The campaigns involved, along with regular battles with France and a crusade during his early career, marked his rule as one of constant fighting and border skirmishes, most of them successful. This made Edward I one of the most historically influential rulers in the formation of modern England.

Edward I was sometimes referred to as the Lawgiver and the Father of the Mother of Parliaments, since it was through his efforts that arbitrary abuse of power under fiefdoms began to crumble and a more stable and uniform system of administration was established. Edward experienced his first taste of combat during the 1254 uprisings in Wales led by Llywelyn ap Gruffydd. In 1270, Edward embarked on a crusade to the Holy Land, and was nearly killed by a poisonous dagger. He did not have a coronation until 2 August 1274, and after he officially came to power, he began systematically to punish feudal lords who abused their power. He expelled the Jews from England in 1290 on the grounds of usury, and set off on a conquest of Scotland. This last at-

tempt is perhaps the most well known, being the subject of the legends surrounding Robert the Bruce and William Wallace. The Scottish rebellions that began in 1295 were never fully resolved in Edward's favor.

Edward III (1312–1377)

Began Hundred Years War. Edward of Windsor was born 13 November 1312 at Windsor, Berkshire, England, and died 21 June 1377 at Sheen, Surrey. He was the eldest son of Edward II and Isabella of France, and was king of England from 1327 to 1377.

Early in his reign, Edward III tolerated the rule of his overbearing mother, Isabella, and his father's murderer, Mortimer, until he had the latter killed in 1330. In 1327, Edward led an army into northern England in response to continuing attacks by the Scots, but was not successful in quelling the Scottish rebels. In May 1328, under the Treaty of Northampton, the Scots were granted independence. Later, in 1332, Edward overthrew and later captured the Scottish king, David II, and won a major victory at Halidon Hill on 19 July 1333, restoring the Scottish throne to Edward Balliol, whom Edward supported.

Like his grandfather Edward I, Edward III was determined to claim the French throne, and revived his claim to it in 1337, marking the beginning of the Hundred Years War. After several years of minor skirmishing against the French king, Philippe VI, Edward won a major sea battle off the port of Sluys in Holland, a victory that prompted Edward to declare himself king of France. He finally reached a truce with Philippe in 1343, but this lasted only two years. The culminating battle between Edward and Philippe occurred at Crécy, near the Somme, on 26 August 1346, and Edward emerged victorious. After Philippe's death in August 1350, his son, Jean II, refused to acknowledge Edward's authority as king, initiating yet another series of battles that effectively ended with Edward's victory at Poitiers in September 1356.

Despite the glory of the victory, the pinnacle of Edward's reign was stained by the Black Death; the last half of his

reign was financially crippled by still more war with France under Charles V; and Edward's very capable son, the soldier Edward the Black Prince, turned against his father's policies. Edward died of stroke at Sheen Palace in June 1377.

Eichelberger, Robert L. (1886–1961)

Division, corps, and army commander under General Douglas MacArthur in the Pacific theater in World War II. Eichelberger knew MacArthur from his days serving on the latter's staff in the 1930s. Both of them had also been superintendents at West Point. In late 1942, when MacArthur's New Guinea campaign bogged down, he appointed Eichelberger to command the 32d Infantry Division, which was assigned the job of taking Buna, a key town on the northeast coast of New Guinea.

With MacArthur's order to "take Buna or don't come back alive" ringing in his ears, Eichelberger set about the task of restoring his division's morale and fighting spirit. The men suffered from lack of proper food, clothing, ammunition, and medical supplies. At any given time, almost one in three was stricken with malaria. In spite of these obstacles, Eichelberger's soldiers took Buna after bitter, close combat on 2 January 1943. Promoted to command I Corps, Eichelberger carried out a successful leapfrogging campaign on the north New Guinea coast for the next year and a half. He also functioned as MacArthur's unofficial troubleshooter. For example, when the Biak campaign stalled in June 1944, Eichelberger was brought in to turn the situation around, and did so.

In November 1944 he was promoted to lieutenant general and given command of the Eighth Army, the force spearheading the invasion of the Philippines. His troops carried out dozens of landings throughout the archipelago, and continued fighting until the end of hostilities. Eichelberger is remembered as an excellent, resourceful commander but probably never got his full due because he worked in the shadow of MacArthur, who went to great lengths to make sure that the spotlight shone only on his person.

Eisenhower, Dwight David (1890–1969)

American World War II military commander and postwar president. He is remembered for his ability to build a coalition among Allied forces in Europe during World War II, and historians in more recent years have come to appreciate the ability of the thirty-fourth president of the United States to use the same skills during the Cold War. His sometimes mangled and vague syntax is, somewhat improbably, seen

as a very clever means of confusing his political enemies and of buying time until an unwelcome problem went away naturally.

Dwight David Eisenhower was born 14 October 1890 in Denison, Texas. The next year his family moved to Abilene, Kansas. Upon graduation from the U.S. Military Academy in 1915 (“the class the stars fell on”) in the middle ranking of his class, he was assigned to Fort Sam Houston, Texas, and commissioned a second lieutenant. Promoted to captain and the brevet rank of lieutenant colonel by World War I, he was a training instructor at various military bases during the war. In 1922, he was assigned to the Panama Canal Zone for the next three years. After attending Command and General Staff School (1925–1926) and Army War College (1928–1929), where he compiled outstanding academic records, he was named assistant to the assistant secretary of War. In 1932 he was named aide to General Douglas MacArthur, holding that post until 1939. (Much later, he is reliably re-

ported to have remarked that he “studied dramatics under MacArthur for seven years.”) The Eisenhowers moved around between military postings until he was promoted to brigadier general in 1941.

After Pearl Harbor, Eisenhower has named assistant chief of staff in charge of war plans in Washington, D.C. In March 1942, he was given the rank of major general and named commander of U.S. forces in Europe. A month later, he was promoted to lieutenant general and was Allied commander in chief for the invasion of North Africa, Sicily, and Italy. Given the rank of general in February 1943, he was named supreme Allied commander in December. He oversaw Operation OVERLORD, the D day invasion of Normandy on 6 June 1944. In perhaps the greatest professional challenge of his career, Eisenhower had to make the decision as to the exact day to commence the invasion. His meteorologist had informed him of a window of a little more than 24 hours, after which the Channel would once again be subjected to tempestuous weather. With the tens of thousands of troops already loaded in their invasion craft and the paratroopers already taking off, “Ike” alone made the decision: “OK, let’s go.” He actually had a message in his pocket apologizing to the American public had the invasion failed. But his nerve never failed, and the invasion was a success. Promoted to five-star general in December, he directed the Allied campaign into the heart of Germany and accepted the unconditional surrender of the enemy high command at his headquarters, Rheims, France, at 2:41 A.M. local time on 7 May 1945.

In November 1945, he succeeded George Marshall as army chief of staff and resigned from the army in February 1948. Enormously popular in the postwar years, Eisenhower could have had the presidential nomination of either American political party for the asking in 1948. He declared himself a Republican in 1952, and was elected president in a landslide. “I Like Ike” was one of the most effective slogans in American political history.

Eisenhower’s administration revived peace talks and ended the Korean War the next year. Acting as a moderating influence, making peace even with his opponent for the nomination, the conservative senator Robert A. Taft, Eisenhower tried to forward his brand of “Modern Republicanism” and seemed more frustrated by the conservative wing of the GOP than by the Democrats, who won control of Congress in the 1954 elections and retained that control for the rest of his administration. He took satisfaction, however, in his administration’s building up of the nation’s nuclear deterrent, in a “New Look” that downplayed the role of the army, and which critics charged left no middle ground between inaction and nuclear Armageddon, leaving the Soviets free to nibble at the perimeters of America’s security interests.

Facing foreign crises in Hungary, Berlin, and Cuba, Eisen-

hower never came close to any overt clash with the Soviets, something he looked back upon with pride at the close of his administrations. To counter Soviet influence, his administration gave aid to Pakistan, Thailand, and the Philippines, and provided military advisers to South Vietnam.

He also promoted the Eisenhower Doctrine, which asserted that America would aid any country threatened by communism. Under this policy, he sent marines to Beirut, Lebanon, in 1958.

Another landslide confirmed Ike in office in 1956, but his last years in office seemed stale, a perception played upon by the youthful John F. Kennedy, his successor. In the last year of his administration, 1960, Eisenhower fumbled the U-2 spy plane incident, insisting that there had been no intentional violation of Soviet airspace, having been assured by his security people that the pilot of the offending spy plane had been killed—until Soviet prime minister Nikita Khrushchev produced a very much alive Francis Gary Powers in probably the nadir of the Eisenhower years.

Nonetheless, Ike remained one of the most popular American presidents to the day that he left office. His farewell speech is his most remembered, warning Americans about the growing “military-industrial complex” that he himself had done so much to shape. Dwight Eisenhower, one of the most acclaimed Americans of the twentieth century, in war and in peace, died of natural causes on 28 March 1969 at Walter Reed Medical Center, Washington, D.C.

El Alamein (July–November 1942)

The defeat that spelled the end of Axis hopes in North Africa, and one of the turning points of World War II. In late January 1942 General Erwin Rommel launched his German and Italian divisions eastward toward Egypt for the second time. By June they had reached Mersa Matruh, inside Egypt. Mussolini flew to Libya to prepare for a triumphant entry into Cairo; Roosevelt was briefed that the Suez Canal could fall within two weeks. Nonetheless, General Sir Claude Auchinleck skillfully husbanded the Allied forces into a mobile defense line at El Alamein, only 60 miles west of Alexandria.

On 1 July 1942 the German and Italian forces made their first attack on the El Alamein line, but found it too strong and reverted to a defensive stance. Auchinleck was replaced by General Harold Alexander, who had orders to commence offensive operations, and General Bernard Montgomery was appointed to command Eighth Army. The El Alamein offensive finally started the day after the first convoy of Operation TORCH, the American invasion of western North Africa, sailed directly from the United States for Morocco.

A heavy artillery barrage opened at 9:40 P.M. on 28 October, followed by infantry attacks by XXX Corps (9th Australian, 51st Highland, 2d New Zealand, 1st South African, and 4th Indian Divisions). X Corps (1st and 10th Armored Divisions) moved up to exploit a breakthrough. Facing them were Italian Bersaglieri, Trento, Bologna, and Brescia Divisions, bolstered with German 164th Light Division and Ramke Parachute Brigade. In reserve were the 15th and 21st Panzer, 90th Light, Trieste, Littorio, and Ariete Divisions.

A vicious war of attrition was fought for 10 days, but fierce attacks by 9th Australian Division gradually drew the Panzer divisions north, allowing 2d New Zealand Division to

force a salient between the German and Italian fronts by 2 November. Supported by 4th Indian Division, British armor raced into this gap and westward, and on 4 November Rommel ordered retreat.

The Allied cost was high—13,500 casualties, 500 tanks, and 110 guns—but the El Alamein victory directly contributed to the Axis capitulation in North Africa only 24 weeks later.

El Cid, Rodrigo Diaz de Vivar (1040–1099)

Spanish general. Raised at the court of Fernando I of Castile as a companion to the king's son Sancho, Rodrigo Diaz entered Sancho's service when Sancho became king of Castile. Until 1072, when Sancho was killed at the siege of Zamora, Diaz acted as the king's constable in Sancho's wars against his siblings, especially Alfonso, who had also received lands at Fernando's death. Now king, Alfonso demoted Diaz, and although he was allowed to marry into the royal family and campaign with the king against Navarre in 1077, Diaz never recovered his status at court. Falling out with Alfonso over tributes from the Muslim city of Seville, Diaz was banished from Castile and took service as a mercenary in Zaragoza from 1081 to 1086, serving under a Muslim king. Far from being a great Christian hero, as portrayed in later chronicles, Diaz was an opportunistic exploiter of the complex world of a Spain divided into warring factions of Christian nobles and Islamic rulers, who warred both with and against one another.

The arrival of an Almoravid army from North Africa, and its defeat of Alfonso at Sagradas in 1086, brought Diaz back to Castile with the extraordinary privilege of keeping any Muslim land he conquered. Immediately falling out with Alfonso over their failure to meet up en route to the siege of Aledo, Diaz was again banished and embarked on a tour to collect protection money from Muslim cities allied to the count of Barcelona. In an extraordinary battle against the army of Barcelona at Tevar, Diaz, in the mountains, defeated not only the troops advancing up the hillside, but also those who had secretly advanced into the hills above Diaz's lines, and secured a treaty giving him overlordship of the eastern coast of Spain, the Levant. After a raid into Castile to warn off Alfonso, Diaz began conquering the Levant, and in 1093 captured the city of Valencia, which he established as his own kingdom, securing it by defeating the Almoravid army at Curate and seizing nearby fortresses, like Murviedo in 1098.

Having established himself as an independent ruler, Diaz married his daughters into the dynasties of Barcelona and Navarre, and died in bed in July 1099. Unfortunately, his widow was unable to hold Valencia against the Almoravids' return, and evacuated the city in 1102.

Electronic Warfare

The use of the electromagnetic spectrum to gain knowledge of the presence and movement of an opposing force, and also to deny any opposing force the use of that spectrum.

Electronic warfare first emerged in World War II when the radio became an important form of communication. The emission of radio waves became a method of detecting enemy movement, based on Nikola Tesla's "electrical effect."

In the World War II naval theater, the Western Allies employed a networked system of Radio Direction Finding (RDF) devices to track German U-boats. The Allies developed a system that employed high-frequency radio direction finders called Huff-Duff (HF/DF). HF/DF devices were placed on Allied ships in 1942 in order to locate the German U-boats that had become a serious threat to the British Royal Navy, the British Merchant Navy, and allied shipping. Using triangulation (both sea- and land-based) the Allies were able to pinpoint the location of surfaced German U-boats by intercepting their radio communication. Unfortunately for the Allies, submerged submarines could not transmit radio signals, and consequently could not be traced with HF/DF. Another system was needed to track enemy objects moving below the waterline.

The British invented the first underwater listening device, called ASDIC (named after the Anti-Submarine Detection Investigation Committee), to detect submerged objects. From this evolved the more modern and commonly known American system of Sound Navigation and Ranging (SONAR). These listening devices, known as hydrophones, could either listen for underwater low-frequency noises (passive) such as a submarine propeller, or they could transmit pulses of sound energy through the water (active) and interpret the sounds and echoes that bounced back. World War II marked the beginning of electronic antisubmarine warfare (ASW).

Electronic warfare on land and in air also made its debut in World War II. Radio Detecting and Ranging (RADAR) had been under development prior to World War II in both Germany and Britain. By 1939 all of the major nations that would be involved in World War II—France, Italy, Japan, the Netherlands, Russia, and the United States—were working on their own radar research programs. The British program, however, was under greater pressure to develop a workable radar system, and their program was accelerated by the threat of Luftwaffe air raids.

The concept of radar is much like that of active sonar, which is to bounce radio waves off of objects to determine their shape and location. The British scientists most closely involved in the development of radar were P. M. S. Blackett, A. V. Hill, Professor Henry Tizard, H. E. Wimperis (a civil en-

gineer at the British Air Ministry), and Robert Watson-Watt of the Radio Research lab. In the face of sustained German bombardment Britain established a special committee under Sir Henry Tizard to develop and maintain a network of radar stations. This would later be called the Chain Home, which was an effective air defense Command and Control (C2) system composed of 51 linked radar stations built around the British coast to detect incoming German bombers. A second chain to detect low-flying aircraft was later incorporated to supplement the Chain Home radar net.

Germany also had its own radar net, which meant that World War II also saw the use of numerous radio countermeasures to avoid radar detection. These countermeasures involved the use of chaff, airborne active self-protection jammers (aircraft that used electronics to suppress enemy air defenses), and ground-based systems aimed at radio and radar bombing and navigation aids. Further developments were made during the war, such as the incorporation of Identification Friend-or-Foe (IFF) transponders. The transponder could identify a radar signal as originating from a friendly or hostile aircraft.

The advancement of radar was crucial to an Allied victory in both the air and sea battles of World War II. The developments of electronic warfare played a critical role in the survival of Britain as the sole Allied power in Europe by arming it against the crippling German U-boat campaign of unrestricted warfare and the destructive Luftwaffe bombing of Britain. The electronic warfare inventions of World War II would affect the future of warfare, as well as having many useful civilian applications (such as in civil aviation and in the sailing of ocean-going ships).

The major advancements that took place in electronic warfare after World War II came primarily from the addition of computer-processing power to radar. The basics of radar have not evolved since World War II; the signal received by World War II operators is similar to that received by modern radars. What the addition of digital processing to radar means is that the signals can be much more accurately interpreted, giving radar operators a much clearer image of what they are tracking.

The Cold War saw a rapid advancement in electronic warfare. Americans were shocked when the Soviet air defense system tracked and shot down Gary Power's U-2 high-altitude spy plane. The electronic warfare in the Vietnam conflict called for fighter-bombers to be individually equipped with radar warning receivers, chaff dispensers, and active radar jammers (these were known as Wild Weasels). New aircraft were developed, such as the Boeing E-3 Airborne Warning and Control System (AWACS) that provides high-and low-altitude surveillance from the air, and the 2-C Hawkeye Air-

borne Early Warning (AEW) command-and-control systems that provide situational awareness to coalition aircraft.

The 1991 Gulf War offered the first glimpse of what electronic warfare may resemble in the twenty-first century. Stealth aircraft and precision-guided weapons played an important role in that conflict. One of the main threats to the allies in the Gulf War was infrared (IR) radar and weapons, which first emerged in the 1950s. These have called for the development of a new breed of countermeasures in electronic warfare. It is most likely that electronic warfare will continue to develop rapidly through the foreseeable future.

Emilia Plater, Independent Women's Battalion (1943–1945)

First Polish cohesive, all-female combat unit, consisting of volunteers forcibly resettled in the USSR. Ironically named after a leader of insurrection (1830) against Russia.

Initially attached to 1st Tadeusz Kosciuszko Division, the battalion swore the oath of allegiance on 15 July 1943. It became directly subordinated to I Polish Corps on 19 August and to First Polish Army on 17 July 1944. Unlike women's auxiliary units in the West, it was not subjected to special military regulations. Its command personnel were men, its political officers women.

On 18 August 1943 the battalion consisted of command element; five companies (two infantry and one each of fusiliers, machine guns, and handheld antitank grenade launchers); and six platoons (mortar, reconnaissance, signals, medical, engineer, and logistics). In late 1943 a transport platoon was added. Personnel strength fluctuated as the battalion provided basic training to women assigned elsewhere.

The inability of some members to cope with very intensive training resulted in gradual transformation from a first-line combat unit to one assigned mainly sentry and military police duties. The organizational structure and training standards were maintained. The battalion's changed status likely reflected reluctance of senior commanders to expose women soldiers to the heavy personnel losses suffered alongside the Russians.

About 70 servicewomen were killed. In May 1945 the battalion's strength of roughly 500 members represented a small percentage of the total number of Polish women serving in the two Polish armies formed in the USSR, with estimates ranging from 8,500 to 14,000, including former members who had commanded all-male units.

Engineering, Military

The application of science and technology for military purposes, historically primarily civil engineering.

Since at least the beginning of the Neolithic era, human beings have manipulated their environment for economic and religious purposes. City walls are extant from a very early date in the Middle East, while very large-scale permanent field fortifications dating to the archaic period still exist in north China, where conditions favored their construction. It is questionable whether these works can be called the products of military engineering, but they do demonstrate the parallel development of civil engineering technology and agriculture. Today, it is often difficult to determine whether a historic moat, canal, railway, or even subway line was built for the reason of agricultural and civil improvement, or for military purposes.

The true history of military engineering may be said to begin with classical times, when the archaeological and written record of warfare was supplemented by a theoretical literature that tells us of the role of military engineers in siege warfare, artillery engine construction, and bridging operations. Persian, Greek, Hellenistic, and Roman armies all employed engineers in Middle East campaigning. In this dry climate, armies rarely had difficulties with narrow water barriers or weather damage to roads, but we hear of major pontoon bridges across the Hellespont and the Indus, sometimes built under the supervision of naval officers. In sieges, the major targets of attack tended to be masonry citadels on local eminences, and the usual mode of attack was escalate with ladders or more sophisticated devices supported by

muscle-powered artillery. Engineers were so closely associated with this technology that the very word is derived from the Greek for "machine." The fortresses that they attacked, however, were not of a very sophisticated engineering plan, their integrity depending more on geography than on design.

By the time the Roman legions left their own peninsula, they had formulated a particular national tradition of military engineering. Here we find the engineers combined with everyday tradesmen and specialists, particularly carpenters, not surprising given that Italy was significantly more heavily wooded than the Middle East and even Greece. The use of standing timber for military purposes became basic to Roman military practice. The lightly laden classical army, often accompanied by no heavier a burden than a pack mule, could easily employ a timber bridge or log road for rapid movement through wet areas, while fortifications often took the form of palisades or abatis. While Roman armies naturally adapted to more appropriate methods in the Middle East, when campaigning beyond the Alps in northern and western Europe, they found an even more heavily wooded and wetter region with heavy clay soils that resisted traditional Middle Eastern methods of earthwork construction and required the application of animal power along with the ax.

In China, the loess zone continued to present many opportunities for the use of extended field fortifications to hem in the largely cavalry armies that operated there. In the southwest, particularly in the Tang struggle with Tibet in 600–800, fighting in upland country drew out a different set of skills, while masonry fortifications began to replace earthworks around cities in the middle of the first millennium. Chinese imperial warfare was marked by a bifurcation between the light cavalry armies of the north, with relatively minor engineering requirements, and virtually amphibious forces operating in the southern river valleys, where engineering blended with naval architecture to provide mobility across and along river barriers. However, this engineering-intensive "southern" warfare was intermittent, for stable dynasties rarely faced military threats from the south, and defense toward the north took precedence. The southern Song Dynasty's war with the Mongols in the 1200s was the great exception, and it is perhaps not surprising that the Yuan-Song war supplies the first documentary evidence of gunpowder artillery, used to supply additional firepower for both besieger and besieged. Once peace was restored, there was little pressure to develop this technology in China, but Mongol armies may have helped disseminate it to the west and southwest. In China, military engineering technique tended to stagnate again until the Qing-Ming conflict of the seventeenth century.

In India and Southeast Asia, the early domestication of the elephant gave army engineers a draft animal of unique energy density. In the forest zone elephants allowed large armies to overcome jungle conditions, while in the drier east, elephant and war interacted to produce a landscape of cyclopean fortification, although the very low cost of gunpowder in the Indian subcontinent introduced a counter-vailing tendency to very artillery-rich armies.

The classical era in the Middle East ended with the widespread domestication of the camel around 400, freeing trade and armies from the roads. Subsequent armies were built up around cavalry and archery that made less use of engineering in siege warfare, and the art of fortification fell into relative neglect in the land of its birth.

In western Europe, in contrast, Roman-style urban civilization led to a proliferation of stockaded and diked cities and castles by c. 1000 Europe's relatively wet, flood-prone climate dictated fortifications (particularly lowland fortifications in contradistinction to previous fortified eminences) to protect from floods as much as from men. Fortification proliferated in Europe as nowhere else save southern China, and command pressure was heavy on military engineers, who soon adopted the Chinese innovation of gunpowder.

Responding to the increasing sophistication of artillery, gunpowder or not, European fortification achieved great intricacy in 1300–1700, with depth and geometric design superseding simple masonry walls. By 1700 a fortress city's defensive was often 100 meters deep or more, with fire zones stretching 300 meters farther out. This emphasis on control of territory in depth with earthworks and water barriers linked the revolution in fortification to contemporary improvements in agriculture.

Artillery also had significant implications for marching armies. European armies required more draft animals and carts. With artillery live loads reaching 12 tons, unprecedented pressures on roads and bridges soon brought the ancient technology of the timber footbridge and roads to their limits, leading armies to learn a whole technology of bridging and road building. Moreover, larger and heavier armies required careful surveying and planning. Some Venetian military engineers specialized as cartographic engineers in 1550–1650, mapping regions of real or potential conflict and producing march, quartering, and magazine plans. This activity formed one of the bases of general staff organizations, and military and state civil engineers tended to become a technocratic government arm charged with general responsibility for massive environmental intervention for economic purposes, notably in the taming of the Mississippi, the Po, and the rivers of Vienna.

Finally, the increasing importance and specialization of naval warfare led to the creation of professional permanent

navies in most European states after 1600. In western Europe this bifurcation had few consequences for military engineers, but in central Europe, navies and army pontoon (bridge laying) forces sometimes merged in the mid-eighteenth-century European continental wars. The result in at least the Austro-Hungarian case was the rise of a pioneer corps responsible for roads and bridges alongside the older fortress engineering corps.

In China, the classical impressively and efficiently fortified interior city was, by the 1700–1800 period, in profound neglect. When this trend was combined with lack of experience with the rapid evolution of artillery technique in Europe, China was left vulnerable to attack by imperialist armies in the 1800–1900 period. In the Middle East and India, meanwhile, the appearance of European armies, beginning with the Turks in 1500 and accelerating thereafter, led to regional traditions in military engineering merging with worldwide trends, although expensive timber continued to impose heavy hidden costs on fortification.

The nineteenth century saw military engineers assume responsibility for railroads, telegraph, and powered traction, but these separate disciplines of engineering soon formed independent corps, and the mechanical and electrical engineers are not now considered part of the continuity in military engineering. This tendency to split off new branches from the military engineers reached its culmination when air forces followed navies into independence, ensuring that technological change within the military engineering corps during the twentieth century was less profound than the general development of science and technology might lead one to expect.

Modern military engineers can install a bridge capable of supporting a live load of 70 tons in five minutes and bridge a river the width of the Euphrates in a half hour, but the general nature of their difficulties and the means used to overcome them would be recognizable to Xerxes.

English Civil War (1215–1217)

Barons force King John to sign Magna Carta. King John was neither loved nor respected by the majority of his countrymen during his 17-year reign (1199–1216). His military endeavors, which included campaigns in France, Scotland, Wales, and Ireland, necessitated high taxes. These financial burdens, combined with John's dictatorial and often unpredictable style of ruling, led to widespread disenchantment among many of his barons. During the summer of 1214 John made a determined but unsuccessful effort to regain his French territories, only to return to England, short of finances, to face a baronial rebellion.

Refusing John's offer of arbitration, the barons captured London in April 1215 without resistance, and John had to evade the baronial force of 2,000 knights for two months as it followed him around the south of England. On 15 June, the two sides met at Runnymede and negotiated the Magna Carta, a document that conceded most of the baronial demands and limited the king's exclusive right to govern. John had no intention of abiding by its terms. He viewed the charter as providing a breathing space while he assembled a more formidable military force. Heavily dependent on borrowed money and hired mercenaries, John resumed hostilities in September 1215.

John's problems were exacerbated when Louis, the French king's son and heir, arrived in England (21 May 1216) at the invitation of the rebel barons. In what must count for one of the least known events in English history, Louis was welcomed by the citizenry of London, and crowned king of England. Emboldened by such obvious domestic support, his large army, which is believed to have numbered 35,000 at its peak, began driving the royal forces westward.

Shortly afterwards, on 23 October 1216, John died at Newark and was succeeded by his nine-year-old son, Henry III, who proved a more popular figurehead than his father. The primary responsibility for conducting the war now fell on the two regents, William Marshal and Hubert de Burgh. Marshal proved himself a shrewd diplomatist and strategist, winning the allegiance of many of the dissident barons. When Lord Fitzwalter raised a rebel army of 600 knights and

20,000 French soldiers, Marshal astutely retreated to Nottingham and waited for reinforcements. When he enjoyed numerical superiority, he laid siege to the rebel stronghold of Lincoln Castle, and secured a decisive royalist victory (23 May). This defeat, combined with the repulsion of the French naval fleet off Sandwich in Kent, forced Louis to accept peace terms. In return for a payment of 10,000 marks, the French dauphin agreed to waive his claim to the English throne and to restore Normandy. Neither promise was fulfilled.

Although Henry went on to rule England until 1272, the issue of regal versus baronial rights was never satisfactorily resolved during his reign. The most enduring legacy of the civil war was undoubtedly the Magna Carta, which inspired supporters of individual freedom long after the memory of the rebel barons had faded.

English Civil War (1642–1649)

Also known as the Great Rebellion or the Puritan Revolution, the English Civil War was a conflict between King Charles I of England and his loyalists, known as Cavaliers, and his opponents, known as parliamentarians or Roundheads, that ended with the defeat and execution of the king and the establishment of a republican Commonwealth and Protectorate. The war centered on the constitutional issue of the divine right of a king and the privileges of Parliament independent of the crown.

The roots of the conflict lay in the king's need to raise money from Parliament. In 1638, Charles I attempted to enforce Anglican formulations on the Scottish church, which led to a march on Scotland in 1639, beginning what was called the Bishops' Wars (1639–1640). The king's forces were forced to leave Scotland without a battle due to lack of funds. Fearing French involvement, Charles mounted another expedition and convened Parliament to raise funds. An angry king dismissed Parliament after realizing that they were opposed to the invasion and wanted to argue grievances. Foiled by the Scots, the king was forced to call Parliament again in November 1640. On 4 January 1642, Charles failed to arrest five members of that body. The king left London and both parties began to stockpile military resources. Each had approximately 13,000 men, with the king's support mainly be-

ing found in the north, west, and Wales, and Parliament finding support in the more economically developed south and east.

The Royalists tried to end the war by marching on London but were met by Roundheads at Edgehill near Essex on 23 October. Although the battle was inconclusive, Charles was not able to march on London after meeting another force at Turnham Green, causing the king to withdraw to Oxford. In January 1643, parliamentary attempts to negotiate a peace were rejected by Charles. Over the next year, both sides seized each other's estates and fought several battles across England, including Cavalier victories at Adwalton Moor, Lansdown, and Roundway Down in June and July; an inconclusive battle at Newbury in September; and a Roundhead victory at Winceby on October 11.

The tide turned when Parliament drew up the Solemn League & Covenant, from which aid from the Scottish Presbyterians was obtained. In 1644, Parliament was able to take York with a major victory at Marston Moor on 2 July. Still, they lost at Lostwithiel and had to withdraw from Newbury after an inclusive battle. Led by Oliver Cromwell, Parliament reorganized the army into the New Model Army under the leadership of Thomas Fairfax. After another defeat at the hands of the Roundheads at Naseby on 14 June 1645 and unable to gain Irish aid, Charles surrendered to the Scots at Oxford in June 1646.

Charles was delivered to Parliament in 1647. Yet the army, alienated by Presbyterian rule, refused to disband. Fearing that the Parliament would negotiate with the king behind its back, Charles was removed to Hampton Court. When the army demanded 11 members of Parliament be arrested for secretly negotiating with the king, Parliament refused, and the army marched on London. As army discontent grew, Charles escaped to the Isle of Wight in November, where he tried to negotiate with both Parliament and the Scots. In December, he came to an agreement, known as the Engagement, with the Scots in which he would accept Presbyterianism in return for military support. The army led by Cromwell was able to defeat them at Preston on 17 August 1648. Parliament again tried to come to an agreement with Charles, but the army disposed of its enemies in Parliament in Pride's Purge in December. The remaining members, known as the Rump Parliament, tried the king for treason, and beheaded him on 30 January 1649.

The Rump Parliament established a Commonwealth, but in 1653 Cromwell and his army set him up as Lord Protector, with rights of succession.

Charles II, the king's son, was recognized as monarch in most of Ireland and in parts of Scotland. This uprising was crushed at the Battle of Worcester in 1651. The future king of England fled to the Continent, remaining there until 1660,

when the Protectorate ended with Cromwell's death and the monarchy was reestablished.

English Wars in Ireland (1688–1691)

War had broken out in Europe in 1688 between the French king, Louis XIV, and a league of European states led by William of Orange. Under King James, England had supported Louis, but when William ascended the throne, the state changed sides. This was a serious blow to France, but Louis hoped to offset it by keeping William and his army occupied in Ireland. In March 1689, James landed in Kinsale with 400 French officers and arms and ammunition for 10,000 men.

At first things went well for James and, with the exception of parts of Ulster, Ireland declared for him. Panic spread among Ulster Protestants. Thousands fled to Scotland, or to the only walled cities in Protestant hands, Derry and Enniskillen. In April, James marched to Derry to demand its surrender. The Jacobite army had no guns to batter down the walls, so they hoped to starve the city into submission. On 30 July, however, one ship, the *Mountjoy*, forced its way through, bringing the 105-day siege to an end. Soon after, Williamite Marshall Herman Schomberg landed near Belfast and took Carrickfergus, and gradually most of Ulster fell into Williamite hands.

Back in Dublin, James had summoned a Parliament, which removed all discriminatory laws against Catholics and restored lands confiscated by the crown. In June 1690, William landed at Carrickfergus and, on 12 July, his army of 34,000 defeated James's army of 22,000 at the Battle of the Boyne. The Irish commanders left in control of the Jacobite army fell back on the Shannon, and after a successful defense of Limerick a treaty was signed between the Irish leader, Patrick Sarsfield, and the Williamite commander, General Godard Van Ginkel. Under the terms of the Treaty of Limerick, Jacobite soldiers still in arms against William

might return to their homes, join William's army, or go to France. Sarsfield was anxious to protect the interests of Irish Catholics and secured for them a promise of religious toleration. King William was prepared to abide by the terms agreed upon in Limerick, but most of his supporters considered them too lenient, and as soon as the Irish were demobilized the provisions of the treaty were ignored.

Entebbe Rescue Raid (4 July 1976)

Legendary commando raid and hostage rescue. On 27 June 1976, four Palestine Liberation Organization terrorists hijacked 257 passengers and crew aboard Air France Flight 139 en route from Athens to Paris. After refueling in Libya,

the hijackers directed the plane to Entebbe Airport in Uganda, where they demanded the release of 53 convicted terrorists lest they execute their hostages.

Negotiation led to the release of 149 passengers, but leaving more than 100 Israelis and the French flight crew captive in Uganda. Further diplomatic efforts seemed hopeless because the increasingly unstable Ugandan dictator Idi Amin Dada supported the terrorists. Israeli officials therefore launched Operation THUNDERBOLT to free the hostages.

Under cover of darkness, Israeli paratroopers in four C-130 transports escorted by fighters and two Boeing 707 support aircraft surreptitiously landed at Entebbe on 4 July 1976. Utilizing half-tracks and jeeps armed with recoilless rifles and machine guns, they took the airport completely by surprise and freed all of the surviving hostages. The 90-minute operation included the destruction of airport communication and fuel equipment as well as Soviet-built Mig 17 and Mig 21 fighter planes, at a cost of three hostages and one paratrooper killed. In exchange, Israeli forces claimed all the terrorists and approximately 45 Ugandan soldiers dead. After reboarding their aircraft with five hostages and one wounded soldier, the strike force flew to Nairobi for fuel before returning safely to Israel.

International acclaim followed the surgical strike, which astounded military analysts by covering more than 5,000 miles from start to finish. The raid cemented Israel's reputation as a world leader in the fight against terrorism.

Enver Pasha (1881–1922)

Turkish general and politician who reformed the Ottoman Empire and was virtual dictator during World War I. Ismail Enver was born in Constantinople (Istanbul) in 1881 and received his commission as a lieutenant in the Turkish army in 1903 and additional training in the German army. He rose quickly in rank, becoming lieutenant colonel and then full colonel in 1913, playing a significant role in recapturing Edirne (Adrianople) from the Bulgarians. By the end of the year he attained the rank of brigadier general and, in 1914, the title Pasha.

In 1908, he was one of the three main leaders of the Young Turks, a group of army officers who revolted against the misrule of Sultan Abdul Hamid. Enver fought in Libya during the Italo-Turkish War (1911–1912), and in the Balkan Wars (1912–1913), and his dissatisfaction with Turkish losses during the Balkan Wars led him to bring Turkey into World War I on the side of the Central Powers.

In early 1914, Enver was named minister of War and commander in chief. During the war, he led several unsuccessful campaigns against the Russians on the Caucasian front. When the armistice was signed, Enver fled to Odessa, then Berlin, and finally to Turkestan (Russian Central Asia) where he was killed on 4 August 1922 leading an anti-Soviet revolt at Bukhara. His body was repatriated to Turkey in 1996.

Epaminondas (c. 410–362 B.C.E.)

Theban statesman and general of the fourth century B.C.E. Epaminondas was born to a noble Theban family and during his early adult life participated in the liberation of Thebes from Spartan occupation. In 371, when the Spartans invaded Boeotia once again, Epaminondas commanded the Theban army. At the Battle of Leuktra he showed his tactical brilliance by massing his fighting elite on the left of the Theban battle line, and not on the right as usual, in a great block 50 deep and possibly 80 wide. The Spartans attempted to change their formation but with no success, as the Theban Hieros Lochos (Sacred Band) crushed the Spartan elite. The battle ended with the Spartan king Cleombrotus dead and Sparta's supremacy in ruins. In its place, Epaminondas established the Theban hegemony, which was to last until 362.

In 370, Epaminondas led a massive invasion in Laconia. Although he failed to capture Sparta, he liberated Messenia and in 369 directed the foundation of Messene, its new capital. After a brief stay at Thebes, Epaminondas returned to the Peloponnese and attacked Corinth and its neighboring polis, leaving Sparta with no allies in the northeastern Peloponnese. However, due to subsequent diplomatic mistakes, Thebes gradually lost all its allies in the Peloponnese, giving the opportunity to Sparta to rise again.

Realizing that Thebes had lost control of the situation, Epaminondas led an army of about 30,000 men against a coalition of Spartan, Athenian, Elian, and Arcadian forces, numbering some 22,000 soldiers. The crucial battle was to be fought south of Mantinea in 362. The Theban army charged and cut through the Spartan line easily, but at the moment of triumph, Epaminondas fell. His death marked the beginning of the decline of the Theban hegemony.

Ethics of Warfare

Commentators on ethics note that its subject matter includes not only rules or principles but also the virtues, the characteristics of perfection or excellence. Opposed to these notions is the usual caricature of warfare that war is the

realm of necessity and horror in which anything is acceptable. "War is hell" and there is no good of any kind in hell. Some call this view of war *Realism*.

Various writings have survived from China and India of the sixth and fifth centuries B.C.E. in which Chinese writers such as Lao-tse and Sun-tzu offered moral guidance for generals regarding war and warfare. The Hindu *Book of Manu* also provided rules limiting violence similar to those that humanitarians support today.

Writings from the Jews, Greeks, and Romans established the foundational ideas of what is known as the Just War Tradition. For example, Deuteronomy 10:10–20 listed a variety of rules beginning with the requirement of offering peace to a city before fighting its inhabitants. Plato argued in *Laws* that war is necessary but that it is fought to obtain peace. In both *Nicomachean Ethics* (1277b6) and *Politics* (1256b25), Aristotle followed Plato's view and first used the term *just war*. Rome had explicit laws governing its commanders engaging in war. Cicero's *De Re Republica* 3, XXIII, provided a full discussion of the essentials.

The just war tradition became the work over the centuries of Christian thinkers, including Augustine, Aquinas, and Vitoria. Augustine (354–430) wrote no treatise on war or warfare, but did express in many places both remarks on war in general and specific recommendations to Roman leaders about their duties in war. Augustine's teachings served as the foundation for Western Christianity until the synthesis achieved by Thomas Aquinas (1225–1274) in *Summa Theologicae*. In *ST II-II*, Q. 40, A. 1, Aquinas established the basic principles of the just war. There must be a just cause. There must be proper authority. There must be a right intention. Centuries later, Spaniard Francisco de Vitoria (d. 1546) developed just war thinking in his *De Indis* and *De Jure Belli* as he criticized the Spanish conquistadors' treatment of the indigenous populations of South and Central America. He argued that the monarch's justification for war must meet objective standards held by wise and upright men. Also it is never lawful to deliberately slaughter innocents, that is, those not directly involved in the fighting.

Thus, the just war tradition proposes two sets of principles that specify the ethics of warfare. One set of principles, known as the *jus ad bellum*, answers the question: When is recourse to war morally licit? The second set, known as the *jus in bello*, answers the subsequent question: What means are morally allowed in warfare?

There are differing opinions within the tradition about which principles are to be included as the *jus ad bellum*. Indeed, there are ranges of understanding and questions of application in all these matters about which individuals may honestly disagree in their judgments despite agreeing on the principles in question.

All agree that there must be a *just cause*. States are entitled to defend themselves against armed aggression. Thus defensive wars are allowed. Similarly, if a great injustice has been perpetrated against a country, then it may be necessary to take up arms to rectify the injustice. There is also the debated view about whether a state may preemptively initiate a war when it has persuasive evidence that its enemies may attack soon.

There is general agreement over *proper authority*. Only the highest political authority may declare war. Thus, no one thinks that California could declare war on Nevada as that usurps the proper authority of the government of the United States of America. But this same principle has difficulties when a state is breaking up. What constitutes proper authority? Consider what happened recently in Yugoslavia as Slovenia, Croatia, and then Bosnia-Herzegovina became independent states, recognized by other European states and even the United Nations during 1991 and 1992.

Unlike just cause and proper authority, *right intention* has come under much scrutiny and debate. When proper authority existed in times of emperors and kings, right intention could focus on the leader and his intention. Proponents of this principle realize that a person can do something that is objectively good, that is, in all outward appearance seems to be unobjectionable; yet, that person could have an ulterior motive that subverts good into evil. At a later time, people could come to understand that what seemed good could in fact be part of a nefarious scheme and thus really evil.

So the judgment is about the war and the leader who declared war. It is not about those who in good faith carried out the war, as they were obliged to do. Soldiers in war do not bear the burden of moral blame in such matters. The purpose of this principle is to assign blame to those who deserve it, those who had the evil intention.

Thinkers who object to this principle of right intention argue that in times like today, dominated by nation-states, it is not clear whether "states" as an entity can have an intention. Moreover, whether a state or a leader has an intention, how can others ever claim to know what another's intention is? Thus some refuse to apply this principle, thinking that the real question is whether there was a just cause.

Certain thinkers address these issues by stipulating another principle, *declaration of war aims*. There is ordinarily a need to issue a formal declaration of war, or in the case of the United States, which has not issued a declaration of war since World War II, the need to state to its citizens the aims that it seeks in committing its military to battle.

Finally, there are several other principles that certain thinkers use in evaluating whether a war is just. They include *last resort*, *comparable justice*, *consideration of the costs*, and *probability of success*. All of these considerations

require some fair-minded judgment that there are additional good reasons why war is just in this case or unjust in that case. Perhaps there are other solutions to deal with the injustice. Or the enemy may have valid reasons that justify its position. Or the costs of the war, in both material and human/moral considerations, may outweigh the good that could be achieved by war. Or last, there may be a good reason not to go to war over a just cause, because there is little likelihood that ultimately the military will succeed in overturning the injustice.

If we turn to the *jus in bello*, two principles stand out: *discrimination* and *proportionality*. Discrimination is the principle of noncombatant immunity. It is wrong intentionally to target civilians, noncombatants. The principle of proportionality brings a moral weighing to particular acts of war: Will this act of war cause more evil than the good it accomplishes? (Does destroying a village to save it make moral sense?) Many just war thinkers find the principle of discrimination to be primary and prior to the application of the principle of proportionality, though others would allow judgments of proportionality to overcome that moral limit in times of military necessity.

These ethical considerations have become part and parcel of the training that military professionals receive in the United States and in many other developed countries. The military is a profession and has great concern to develop the professional ethics of its leaders. At one level, the United States has entered into international agreements, signed the various conventions, and established its Uniform Code of Military Justice and Rules of Engagement. Soldiers must follow these tenets. At another level, the military in the United States is entirely composed of citizen-soldiers. Officers who lead men into battle must demonstrate the characteristics of leadership, the military virtues, to develop not only their own morale and confidence, but also that of their subordinates. Finally, both the government and the military must obtain and retain popular support. Since the Vietnam conflict, the matters of the just war tradition have become slowly, but surely, the terms of presentation and approval of the policies regarding the committing of United States troops. For instance, on 28 January 1991, President George H. W. Bush explicitly used these principles of the just war to explain and defend the Persian Gulf War.

Eugene of Savoy (Eugene Prince of Savoy-Carignan) (1663–1736)

Austrian general, noted for his courage and strategic skill. Born in Paris, Eugene spent his childhood at the court of Louis XIV. In 1683 Eugene joined the Austrian army, distinguishing himself in the relief of Vienna, and participated in the capture of Buda (1686) and Belgrade (1688). Promoted to lieutenant general, Eugene was sent to Italy in 1689 to assist Savoy in the War of the Grand Alliance. After the defection of Duke Victor Amadeus, Eugene returned to Hungary to command the imperial army. His victory over the Ottomans at Zenta (1697) led to the Treaty of Karlowitz (1699).

In the War of the Spanish Succession, Eugene initially directed the Italian front, winning victories at Chiari (1701) and Cremona (1702), and inducing Savoy to abandon the French side. In 1703 he was made president of the Imperial Council of War. Eugene cooperated closely with the Anglo-Dutch commander John Churchill, First Duke of Marlborough, in planning and executing the Blenheim campaign (1704). Sent to Lombardy in 1706, Eugene outmaneuvered the French army, raised the siege of Turin, and drove the

French out of northern Italy. Returning to the Low Countries in 1708, he led the German forces at Oudenaarde, directed the siege of Lille, and commanded the right wing at Malplaquet (1709). After Marlborough's recall in 1711, Eugene assumed command of the allied army in the Netherlands. Defeated at Denain (1712) and without Anglo-Dutch support after the Treaty of Utrecht (1713), Eugene negotiated the Treaty of Rastatt (1714) with France, ending the war.

In the renewed Austro-Turkish War, Eugene defeated the Ottomans at Peterwardein and Temesvár (1716) and recaptured Belgrade (1717). Eugene took his last field command in the War of the Polish Succession (1733–1738). Greatly

outnumbered by the French, Eugene failed to prevent the capture of Philippsburg but managed to protect his own forces by skillful maneuvering. He died in Vienna on 20 April 1736.

Fabius Maximus Verrucosus “Cunctator” (c. 285–203 B.C.E.)

Fabius Maximus became famous through his delaying tactics in the Second Punic War. When this war began, Fabius was already of respectable age, having an impressive career behind him. He had won a triumph by defeating the Ligurians (233 B.C.E.) and in 222 B.C.E. he had been dictator. He may have been part of the delegation that declared war on the Carthaginians in 218 B.C.E., starting the Second Punic War.

Following the terrible Roman defeat at the hands of Hannibal at Lake Trasimene (217 B.C.E.), Fabius was appointed dictator again. Knowing that Rome was as yet incapable of defeating Hannibal in the field, he initiated a tactic of wearing Hannibal out, refusing him battle, and harassing him and undoing his political successes. At first Fabius’s strategy met with strong opposition, but after the terrible defeat at Cannae (216 B.C.E.) the Romans generally stuck to it. Avoiding battle with Hannibal, the Romans remained in his vicinity, obstructing supply, threatening potential renegade allies, and frustrating Hannibal’s attempts to gain widespread support in the Italian Peninsula.

Fabius had several commands during the war, during which he kept rigidly to his own tactics. In 215 B.C.E. Fabius was involved in harassing Capua, a renegade ally that had welcomed Hannibal, who encamped in its vicinity. Fabius pillaged the countryside and gave orders to occupy neighboring towns to defend them and keep them from defection. In 209 B.C.E. Fabius took Tarentum (Tarente).

Fabius’s strategy denied Hannibal the opportunity to win decisively in the first years of the war, giving Rome precious time to overcome its defeats. Therefore he was called the Shield of Rome, and in time his nickname Cunctator (the Delayer) became a title of honor. More aggressive generals like Scipio Africanus eventually brought decisive victory, yet

without Fabius’s conservative tactics Rome might not have survived to see it.

Falaise-Argentan Pocket (August 1944)

The decisive moment of the Battle of Normandy. After being penned into Normandy for the better part of two months, the Allies finally started to make solid gains, beginning in late July. Soon their advances developed into a full-fledged breakout. American forces under Lieutenant General George S. Patton swung to the west of the German armies in Normandy and then turned eastward, racing for the Seine River. After a German counterattack at Mortain failed by 12 August 1944, Hitler’s forces now faced the possibility of annihilation. At Mortain the Germans had hoped to punch through American lines, thus cutting off Patton’s lead elements and dealing the Americans a major defeat. Instead, the Germans now had little choice but to retreat eastward in a fight for their lives.

From the north, Canadian and British troops attacked southward, capturing the Norman town of Falaise by 16 August. In the south, Patton’s troops entered the town of Argentan. At this point only 14 miles separated the Americans and the Canadians. Closing the jaws of this giant pincer would destroy roughly 21 German divisions desperately trying to

escape to the east. The pocket for them was a hellish nightmare of Allied artillery and air attacks. In one of the war's most controversial decisions, Lieutenant General Omar Bradley, commander of the American Twelfth Army Group, ordered a halt on further northward movement. He cited concerns that American and Canadian troops might accidentally clash, but he may well have also worried about the possibility of a large German counterattack. The decision allowed some 20,000 of the German troops to escape the pocket. By the time the sack was officially closed on 21 August, the Germans had lost close to 100,000 men. The fact that any Germans had been allowed to escape, though, has dominated the postwar literature about the battle.

Falkenhayn, Erich von (1861–1922)

Prussian minister of War and chief of the German general staff. Falkenhayn was born on 11 September 1861, near Thorn in West Prussia. After attending cadet school, he enrolled in the War Academy, graduating third in his class in 1880. He joined the Prussian general staff in 1890. His pre-war service included a tour in China, where he taught at the Chinese Military School in Nankow and participated in the suppression of the Boxer Rebellion. In July 1913, he was promoted to major general and appointed Prussian minister of War, a post he still held at the outbreak of World War I. Falkenhayn's appointment as chief of the general staff coincided with the First Battle of the Marne and the failure of Germany's attempt to achieve a quick and decisive victory on the western front. For the next two years Falkenhayn oversaw German attempts to break the strategic stalemate in the war, which brought him into increasing conflict with the heroes of the eastern front, Hindenburg and Ludendorff.

Convinced that a strategy of attrition offered the best chance for German victory, Falkenhayn launched the German assault on Verdun in February 1916, the purpose of which was to "bleed France white," as he cold-bloodedly put it. Unfortunately the German army was also bled white at Verdun. By the summer of 1916, his failure to achieve victory, coupled with political intrigue, sealed Falkenhayn's fate

and he was replaced as chief of the general staff by Hindenburg and Ludendorff. In September 1916 Falkenhayn took command of the Ninth Army and oversaw the conquest of Rumania. In July 1917 he was sent to oversee operations in Palestine and Mesopotamia. In March 1918 he assumed command of the Tenth Army in Lithuania, where he ended the war. Falkenhayn retired in 1919 and died near Potsdam on 8 April 1922.

Falkirk, Battle of (22 July 1298)

English victory paves way for conquest of Scotland. After the Scottish uprising and victory over the forces of Lord Warenne at Stirling Bridge in 1297, and then the Scottish invasion of northeast England, Edward I invaded Scotland with what was "probably the largest single army that had been raised up until that time by an English government." It was an army that had been raised without the issuing of a feudal summons. The majority of the cavalry was not paid: The army appears to have been raised on the basis of personal loyalty to the king, and of acquisition due to right of conquest.

Edward I intended to invade Scotland in such numbers that the Scots would be forced to give battle, where they would then lose. The exact size of his army is disputed, but it would seem that both armies numbered between 25,000 and 30,000 men, with the English having some 10,000 cavalry to the 3,500 of the Scots. It was this advantage of numbers that enabled the English cavalry to drive the Scottish horse from the field. With the protection thus conferred, English longbowmen, employed for the first time outside Wales, then closed on the massed schiltrons of Scottish pikemen and systematically shredded them. With these formations gravely weakened, an English cavalry charge completed the annihilation of the Scottish army.

The defeat in effect cost Wallace his claims on the leadership of Scotland. Nonetheless, it was not until 1305 that he was captured and executed.

Falkland Islands War (2 April–20 June 1982)

Brief undeclared war between Argentina and Great Britain over a group of islands 300 miles east of Argentina; also called the Falklands War, Malvinas War, or the South Atlantic War. (The British call the islands the Falklands and the Argentineans call them the Malvinas.)

Conflicting claims to the islands go back to the eighteenth century. Armed conflict between the two broke out following the occupation of the Falklands by Argentine forces on 2 April 1982. The British government, under Prime Minister Margaret Thatcher, declared a 200-mile war zone around the Falklands and immediately began assembling a naval task force.

On 25 April, the British task force was steaming the 8,000 miles to the war zone. During this time the Argentine cruiser *General Belgrano*, just outside the war zone, was torpedoed and sunk by the British nuclear-powered submarine HMS *Conqueror* (the only use of a nuclear weapon since Nagasaki). Further battles led to the downing of a number of the land-based Argentine air force jets and the sinking of several British ships with French Exocet missiles.

While the naval-air battles were being fought, the British were utilizing their excellent Special Forces units to gather intelligence on the Argentine troops, reconnoiter for a landing site, and make life difficult for the Argentinean forces. As early as 18 April, members of the Special Air Service (SAS) and Special Boat Service (SBS) were in service and by the invasion, about 300 of them would be operating ashore.

One such operation was a raid against an airstrip on Pebble Island where several ground-attack aircraft were housed, along with large stores of ammunition, fuel, and a strategically important radar station. On 15 May 48 SAS men flew from HMS *Hermes* and began the first British land attack since the occupation. The 30-minute attack was a complete success, destroying 11 aircraft, the radar station, and the fuel and ammunition dumps.

The raids were a precursor to the amphibious assault at Port San Carlos. The site was adequate, but not ideal; it was small enough to offer protection from Exocet missiles

(though too small to allow ships to maneuver), it possessed a deep anchorage, it had a perimeter of hills for a safe bridgehead, and it provided three possible routes toward the capital of Port Stanley.

The British amphibious assault was very successful; except for the loss of 21 SAS personnel who drowned when a Sea King helicopter ferrying troops was struck by a rearing ship during takeoff and fell into the ocean. Other than the Sea King crash, most of the British casualties were a result of the Argentine air attacks on the vulnerable British ships in the confined waters. Over the next week, the British lost three ships, with several others damaged, and the Argentine air force lost more than 40 aircraft.

With the bridgehead secure, the focus of the conflict shifted to the army. The British approach to Port Stanley utilized the classic pincer movement, one hook going north and then east, the other going south and then east via Goose Green.

The 27 May assault on Goose Green involved 600 members of the 2d Battalion of the Parachute Regiment attacking 1,400 Argentine defenders. The British suffered 17 dead and 31 wounded while the Argentineans lost 250 dead and 121 wounded, with approximately 1,200 taken prisoner. It was a critical victory for the British, demonstrating the effectiveness of highly trained professional troops over a larger force of inadequately trained soldiers.

The siege of Port Stanley was short but fierce. Starting on 11 June, various units of British forces pressed the Argentine defenders. On the night of 13–14 June, heavy fighting took place at Mount Longdon (3d Battalion Paratroopers), Mount William (7th Gurkhas), Sapper Hill (Welsh Guards), and Mount Tumbledown (Scots Guards). The 3d Para was involved in what has been described as the heaviest fighting of the campaign against Argentine commandos. By midday, taking heavy casualties and retreating, Argentinean troops started hoisting white flags. By evening on 14 June, General Moore, overall commander of British land forces, was able to report that all Argentine armed forces on the island had surrendered.

On 20 June, Britain formally declared an end to hostilities. The British had captured more than 10,000 Argentine prisoners during the war. Argentina sustained 655 men killed, while the British lost 236.

Politically, the war helped to rejuvenate the flagging political fortunes of Margaret Thatcher (and led to her reelection) and brought down General Leopoldo Galtieri, who had cold-bloodedly hoped to improve his political situation by starting the war. Galtieri's quick resignation paved the road to the restoration of civilian rule in 1983.

Fallen Timbers (1794)

An American victory over a confederation of Indian tribes. In the years leading up to the battle, President George Washington and the Indian tribes of the Ohio region disputed the boundary between Indian lands and the new republic. Tensions simmered between American settlers and the Indian inhabitants for a decade until 1791, when General Arthur St. Clair led a disastrous and ultimately failed effort to “pacify” the Indians near Fort Recovery. St. Clair lost nearly 600 troops to the Indians, which produced a public outcry for the new administration to take more decisive steps to resolve the frontier question. Washington responded by placing General “Mad” Anthony Wayne in command of an expedition to the Ohio and Miami Rivers to establish the American claim on the region and to discourage British officials stationed in the Old Northwest from aiding and abetting the Indians.

In early 1794, Wayne marched north along the Miami and Wabash Rivers, against resistance from bands led by Chief Little Turtle of the Miamis. Retreating northward, Little Turtle organized a confederation that included Shawnee, Ottawa, Wyandot, and Delaware warriors, who determined to meet the American advance along the Maumee River in northern Ohio. Some accounts placed the legendary Chief Tecumseh in Little Turtle’s camp as well. Wayne’s advance guards discovered Little Turtle’s position near a grove of trees felled in a recent tornado, at a site along the Maumee River near present-day Toledo, and Wayne prepared for battle.

On 20 August, Wayne’s troops, some 2,600 men, including riflemen from Kentucky, formed lines before the “fallen timbers” and a firefight ensued. Fixing bayonets, the Americans charged the Indian warriors, who scattered amid chaotic, hand-to-hand combat. Both sides lost nearly 100 men, but the result was a decisive victory for Wayne and the United States forces. This military success stimulated negotiations that led to the Treaty of Greenville (1795), which composed affairs between the United States and key Indian nations of the Old Northwest, bringing a large portion of the Ohio River valley under American control. Washington’s administration

gained much-needed credibility among American citizens and was better positioned to extract favorable terms from Indian tribes of the Old Northwest through the remainder of the 1790s.

Ferdinand, Duke of Brunswick (1721–1792)

Commander in chief of the allied army during the Seven Years' War (1757–1762). When appointed commander in chief of the combined Hanoverian, Hessian, Brunswick, English, Saxe-Gotha, and Schaumburg-Lippe army in November 1757, the 36-year-old prince (born 12 January 1721 in Brunswick) had been serving with distinction in Prussian service under Frederick the Great. In his new position he showed both military leadership and political responsibility. Despite the numerical inferiority of his troops, he masterfully kept two French armies in check on the western theater of operations (Westphalia, Hesse, Hanover) year in and year out between 1758 and 1762. He did so by either occupying impregnable positions or giving battle, or using his famous light troops (under the command of Luckner, Freytag, and Scheither) in a very sophisticated manner. He led his army to victories over the French at Krefeld (1758), Minden (1759), Warburg (1760), Vellinghausen (1761), and Lutterberg (1762), each action or battle skillfully planned and carefully carried out. Minden particularly was a great success for the allies but it could have been an even more impressive one if Lord Sackville, commander of the cavalry, had not refused to advance his troops despite repeated orders from the prince.

After the war, Ferdinand became governor of the Prussian fortress of Magdeburg only to retire three years later, in 1766, because of severe differences of opinion with Frederick the Great. The Austrian queen, Maria Theresa, offered him the position of field marshal in her army. But the prince declined the offer as well as one from George III actually to lead the British forces in North America during the War of Independence. Ferdinand died at his country seat in Vechedle (Lower Saxony, Germany) on 3 July 1792.

Ferdinand, Karl Wilhelm, Duke of Brunswick (1735–1806)

German commander known chiefly for his command of the armies at both Valmy in 1792 and Jena-Auerstädt in 1806. Born on 9 October 1735 in the ducal palace at Wolfenbutter, Karl Wilhelm was the eldest son of Duke Karl I of Braunschweig. He earned acclaim early in his military career, serving in the Prussian service in the western theater of the Seven Years' War. Acceding to the throne of Braunschweig in 1780, he retained his position in the Prussian army. Raised to the rank of field marshal, he commanded the Prussian forces that subdued the Dutch uprising in 1787. In 1792 Karl Wilhelm declined a commission offered him by the French to lead their new revolutionary army, choosing instead to command the counterrevolutionary forces sent by Prussia and Austria to invade France later that year. After initial successes against the revolutionary citizen armies, Brunswick's advance was stopped at the Battle of Valmy in 1792. Though the allied forces were subsequently driven back, surrendering much of western Germany to the French, by December 1793 Brunswick's troops had succeeded in recapturing this lost territory. Frustrated by incompetent political and military intervention by King Frederick William II, however, the duke resigned his commission in January 1794, only returning under Frederick William III in 1797 to command an army of observation. With the outbreak of war against France again in 1806, Brunswick was named commander in chief and was charged with remobilizing and commanding the ill-prepared Prussian armies, a task for which he was not well suited. During the Battle of Jena-Auerstädt on 14 Octo-

ber, while leading a body of grenadiers in an assault on the latter village, he was shot through both eyes and later died of his wounds in Ottensee on 10 November.

Film and War

The images of Errol Flynn as George Custer, dressed in buckskin, standing bravely in the face of an avalanche of Indians; of Steve McQueen on a motorcycle in the midst of his great escape; and of Gary Cooper in his olive-drab World War I uniform as Sergeant York are some of the most ingrained images in American contemporary culture. Movies and films have influenced how society views and thinks about warfare. They impart cultural values and dispositions and provide propaganda for national causes. They sum up how certain segments of the public feel about internal events and can sway the larger population more efficiently than rational arguments. War movies led activist Ron Kovic and other young men during the Vietnam conflict era to join the services to “play John Wayne.” Richard Nixon insisted that his top foreign policy advisers watch *Patton* during a critical time in his Vietnam conflict policy, and Ronald Reagan imparted to moved audiences the dying words of a cinematic flyer who went down with his plane as if he were actually flesh and blood.

The power of the image to affect how a country views conflicts and combatants occurred long before film. Leaders like Napoleon commissioned the production of artwork to celebrate the completion of certain campaigns and victories to influence attitudes at home. Matthew Brady and other Civil War photographers took photographs that altered how the war was remembered and may, in fact, in their gruesome reality have influenced at least the American public away from a glorification of the battlefield. Yet films provided a unique forum in which images and stories could be related.

Film, by its very nature, tells stories and some of the most powerful are about war. In 1897, correspondent Frederic Villiers filmed the first real images of combatants in the Greco-Turkish War and a number of cameramen recorded the Boer

War and the Spanish-American War the next year. The cumbersome nature of the camera equipment, technological improvements in weapons, and the attitude of countries involved made filming of actual combat nearly impossible. This gave rise to the practice of faking war footage. The practice was so common that a 1900 press cartoon of the Boxer Rebellion shows it being stage-managed for the camera. Whether fake or real, war films drew large audiences. These images, coupled with sound effects, music, and commentary, were powerful vehicles of patriotism during the Spanish-American War, as in *Tearing down the Spanish Flag* (1898). A number of newsreels from companies like Pathe (France) and Rosie (England) supplied the world with footage during the first decade and a half of the twentieth century. In 1913–1914, Major T. J. Dickson lectured throughout the eastern United States showing audiences film on the mobile army. During this time the U.S. military began to take motion pictures as a serious means of instructing and entertaining troops. By 1915 more than 60 projectors could be found at the U.S. military and naval academies.

Due to limited technology and the high cost of production, war films as a genre did not begin until just before World War I. Although there were a number of smaller films, including *Washington at Valley Forge*, *France Marion: Swamp Fox*, *Soldiers of Fortune*, and *The Battle of Shiloh*, it was D. W. Griffith's epic *Birth of a Nation* (1915) that brought war films to a national audience. Centering on the Civil War and its aftermath, Griffith showed a hooded Ku Klux Klan army defending the South against mulattoes and blacks. This masterpiece was followed by Cecil B. DeMille's *Joan the Woman* (1916), a movie on Joan of Arc that served as a rallying point for the Allies. Even though Griffith's later epic *Intolerance* (1916) urged pacifism, nonetheless, facing a looming conflict in Europe, Hollywood released *Hearts of the World* and *To Hell with the Kaiser* (1918), which portrayed Germans as brutish thugs. Studios began gearing their advertising campaigns and films to support the war effort. The nation's greatest star, Mary Pickford, in *The Little American* (1917), was in the forefront of propaganda efforts. Other pictures like *The Unbeliever* (1918) made with the cooperation of the marines showed the gallantry of American troops. As the war progressed, the War Department increased its use of film for training and instructional purposes.

With the armistice and the American public's weariness with war, combat films entered a lull and bottomed in 1921, when only nine such feature movies were released. Starting in 1925, three films would revive cinematic battle stories. Reflecting the feeling of the “lost generation,” *The Big Parade* (1925) offered the viewing public a more realistic account of conditions in the trenches of France. The next year, another, Laurence Stallings's story *What Price Glory?*, was screened.

The depiction of the Battle of Belleau Wood was extremely realistic for this time. Finally, *Wings* (1927), the film to win an academy award, offered audiences their first glimpse of aerial combat.

Hollywood would continue to draw on World War I with the advent of sound. Erich Maria Remarque's novel *All Quiet on the Western Front* was screened in 1930. This antiwar film recounted the griminess of war from the German perspective. Millionaire Howard Hughes, using new camera techniques, shot realistic aerial dogfights in *Hell's Angels* (1930). Yet not all the Great War movies were so somber. *The Dawn Patrol* (1930) was an action film that told the story of the British Royal Flying Corps. While several military action-adventure movies were film, due to the Great Depression Hollywood turned to comedies and movies that were more light and airy.

The coming of World War II marked a new era for war films. From 1939 to 1947, American studios responded to the larger political environment as never before. They played a major part in the war effort and often worked hand-in-hand with the government in the form of the Office of War Information and the War Production Board. While much of the nation was isolationist in 1939, Hollywood's *Confessions of a Nazi Spy* (1939) is considered by film historians to be the first of many anti-Nazi films. The horrors of life in Nazi Germany were depicted in *Beasts of Berlin* (also 1939). Charlie Chaplin portrayed a buffoonish Adolf Hitler-like character in *The Great Dictator* (1940). Yet not only was Hollywood trying to alarm the nation to outside threats, but it had rallied around the Roosevelt administration and produced many patriotic films, such as *Sergeant York* (1941). Gary Cooper played the heroic Alvin York as the personification of national values. He is a peace-loving man who is religious, moral, and just, even to the point of refusing to cash in on his battlefield heroics. Hollywood's advocacy in this prewar era is shown clearest in *A Yank in the R.A.F.* (1941), an exciting story starring Tyrone Power as an American who became a flyer in England during the early stages of the war.

Patriotic musicals, such as the slam-bang classic *Yankee Doodle Dandy* (1942), *Cover Girl* (1944), *Pin-Up Girl* (1944), and *Anchors Aweigh* (1945), kept the American public encouraged and lightened spirits during World War II. Love was the cost for patriotism in the classic *Casablanca* (1942) and the audiences were reminded of the importance of sacrifice on the home front in movies like *The Human Comedy* (1943) and *Since You Went Away* (1944). *Wake Island* (1942), *Gung Ho!* (1943), *Action in the North Atlantic* (1943), *Bataan* (1943), *Guadalcanal Diary* (1943), *Destination Tokyo* (1943), *Sahara* (1943), *Immortal Sergeant* (1943), and *Thirty Seconds over Tokyo* (1944) depicted for the American people the heroic efforts of servicemen in the war. Grimmer and more

realistic war films like *They Were Expendable* (1945), *The Story of GI Joe* (1945), *Back to Bataan* (1945), and *A Walk in the Sun* (1946) made their way into theaters toward the end of the war.

After World War II, war films again went out of fashion. The films *The Best Years of Our Lives* (1946) and *The Men* (1950) depicted the struggles of servicemen adjusting to civilian life, while *Gentleman's Agreement* (1947), dealing with anti-Semitism, typically used returned servicemen as its protagonists. With the advent of the Cold War, Americans were again reminded of their patriotic duty and the bravery of servicemen in films like *Battleground*, *Sands of Iwo Jima*, and *Twelve O'Clock High* (all 1949). Yet for the most part, in the 1950s Hollywood released movies portraying the folly of war and the growing threat of nuclear war. The madness of the Korean War formed the backdrop for two of Samuel Fuller's films, *Fixed Bayonets* and *Steel Helmet*; the trauma and hardships of combat are detailed in John Huston's civil war drama *The Red Badge of Courage* (all 1951). The antiwar message was further spread by Stanley Kubrick's *Paths of Glory*, which recounted court-martialing of French soldiers during World War I, and David Lean's *The Bridge on the River Kwai* (both 1957). Gregory Peck, playing an army officer ordered to assault a strategically insignificant hill, shows the insanity of war in Lewis Milestone's *Pork Chop Hill* (1959). *The Burmese Harp* (1959) examines the horrors of World War II from the Japanese perspective. Other notable war movies during the 1950s include Billy Wilder's *Stalag 17*, which detailed life in a Nazi POW camp, and *The Man Who Never Was* (1955), about British intelligence use of a dead body to fool Germany about the location of the Allied invasion.

The 1960s brought a number of epic historical war dramas to the screen, including *The Longest Day* (1962), *In Harm's Way*, *The Battle of the Bulge* (both 1965), *Patton*, and *Tora! Tora! Tora!* (both 1970). Other action war movies like *The Great Escape* (1963), *The Dirty Dozen* (1967), and *Where Eagles Dare* (1969) were greeted favorably by audiences. Stanley Kubrick satirized the insanity of nuclear war in his dark comedy *Dr. Strangelove or: How I Learned to Stop Worrying and Love the Bomb* (1964). *M*A*S*H** and *Catch-22* (both 1970) were both comedic commentaries on the folly of warfare. With the exception of *The Green Berets* (1968), which was savaged by critics, patriotic combat films fell out of favor once the Vietnam conflict escalated.

On the other hand, the popular reenactment movement provided a ready and inexpensive background for literally scores of documentary war films, most made for television. Reenactors meticulously re-created in their persons every type of soldier from Roman centurion, to crusader, to English and American Civil War troopers, to World War I doughboys.

(One of the more improbable was a group portraying U.S. World War II GIs in England, reenacted by Englishmen who rode about in restored Jeeps and half-tracks, their pockets stuffed with Wrigley's chewing gum and Life Savers!)

By the late 1970s, Hollywood was finally able to address lingering feelings and attitudes about the Vietnam conflict in such films as *Coming Home*, *The Deer Hunter* (both 1978), and *Apocalypse Now* (1979). *The Killing Fields* (1984) showed the social upheaval caused by conflict. Director Oliver Stone struggled to make sense of the war in *Platoon* (1986). *Full Metal Jacket*, *Hamburger Hill* (both 1987), *84 Charlie Mopic*, *Casualties of War*, *Born on the Fourth of July* (all 1989), and *Heaven and Earth* (1993) also offered harsh commentary on the war. The unresolved issue of POWs received attention in *Uncommon Valor* (1983), *Missing in Action* (1984), and *Rambo* (1985), while Clint Eastwood's *Heartbreak Ridge* (1986) tried to return glory to the military with its tale of a green platoon in Grenada. But even epic films like Samuel Fuller's *The Big Red One* (1980) and *Gallipoli* (1981) spoke to the terror of war.

Yet war films have also been influential throughout the rest of the world. Though they have to deal with governmental oversight, some of the greatest epic war films have come from communist- or fascist-controlled countries. Even when these governments have been overthrown, the imprint can still be seen in filmmakers. Out of Russia, Grigori Chukrai shows warfare from the viewpoint of a young soldier moving in *Ballad of a Soldier* (1960). Elem Klimov, who had gotten himself censored for being the first Russian filmmaker to feature Rasputin, on regaining his artistic freedom detailed the evils of ethnic cleansing in the 1943 German invasion of Belorussia in *Come and See* (1986). Alexandr Askoldov lashes at anti-Semitism in *Commissar* (1967), his first and last film, a movie about a Red Army commissar who finds herself pregnant. Mikhail Kalatozov's *The Cranes Are Flying* (1957) shows the radical nature of Soviet cinema with its tale of a beautiful young woman confronted by the horrors of war. Famous poet Yevgeny Yevtushenko re-creates his childhood memories of the Nazis trying to seize Moscow during World War II in *Kindergarten* (1983). The epic *War and Peace* (1968) was directed by Sergei Bondarchuk and remains faithful to the Leo Tolstoy novel. Sergei Bodrov takes up another Tolstoy story in *Prisoner of the Mountains* (1996). Finally, Andrei Tarkovsky's powerful *The Mirror* (1975) uses documentary footage from the Spanish Civil War and the Soviet-Chinese confrontation.

From Bosnia comes Srdijian Dragojevic's provocative *Pretty Village, Pretty Fame*, which looks at the beginnings of the war in Bosnia in 1992. Czechoslovakian director Jiri Weiss comments on heroism in World War II in *The Coward* (1962). Fellow countryman Jan Sverak also comments on

human weakness during war from a child's point of view in *Elementary School* (1991). Hungarian cinema has produced the powerful and moving *Budapest Tales* (1976), *Cold Days* (1966), and *The Red and White* (1968). Also of interest is the Serbo-Croatian movie *Vukovar* (1994). Yet, surprisingly, it is Poland that has been the most prolific and offered the most powerful commentaries on war. Jerzy Hoffman looks at the seventeenth-century Polish-Swedish War in *The Deluge* (1973), which was nominated for Best Foreign Language Film in 1974. Andrzej Munk looks at the aftermath of Auschwitz in *The Passenger* (1963). Janusz Zaroski's *Mother of Kings* (1976) examines the worst moment of Poland's history from World War II and Stalinist times. Andrei Tarkovsky won the Golden Lion at the Venice Film Festival for his brutal depiction of war in *My Name Is Ivan* (1962). Yet it is Andrej Wajda who has directed the most renowned images of World War II in *Kanal* (1956), *A Generation* (1954), and *Ashes and Diamonds* (1958).

Losing World War II had a lasting effect on Japanese cinema. Shohei Imamura's *Black Rain* (1988) won a Cannes Film Festival award for his recounting of the bombing of Hiroshima. Similarly, Kon Ichikawa's *The Burmese Harp* (1956) and *Fires of the Plains* (1959) condemned warfare. Akira Kurosawa directed his most personal film on the fears of nuclear war in *Dreams* (1973) and covers similar ground in *Rhapsody in August* (1991). Masaki Kobayashi's *The Human Condition Part I (No Greater Love)* (1958) and Euthana Mukdasanit's *Sunset at Chapraya* (1996) are also pacifistic in tone. The most overlooked film for those interested in World War II aircraft movies is *I Bombed Pearl Harbor* (1960).

Another country dealing with the tragedy of its military past is Cambodia in H. M. Norodom Sihanouk's *Peasants in Distress* (1994). Three Australian productions examine the horrors of war in *Breaker Morant* (1980), *Gallipoli* (1981), and *Stories Our Mothers Never Told Us* (1995). German filmmakers try to make sense of their military losses in the two world wars in *Das Boot* (1981), *Germany, Pale Mother* (1979), *Gorilla Bathes at Noon* (1992), *Jacob the Liar* (1974), *Songs of Life* (1968), *Stalingrad* (1992), and *Westernfront 1918* (1930).

The home of many of the great epic war films is France. Abel Gance made the antiwar story *J'Accuse* (1918), which many critics place on par with D. W. Griffith's *Birth of a Nation*. Bertrand Tavernier examines the last days of World War I in *Capitaine Conan* (1996). Jean Renoir tells one man's story in a POW camp in *Elusive Corporal* (1962). Jean-Pierre Denis examines France's Napoleonic roots in *Field of Honor* (1987). Other French films of note include *The Green House* (1996), *Is Paris Burning?* (1968), *Grand Illusion* (1937), *For Ever Mozart* (1996), *Here and Elsewhere* (1974), *The Ogre* (1996), *Queen Margot* (1994), *La Silence de la Mer* (1947),

Underground (1995), *Uranus* (1990), and *Interred in a Prison*.

Finally, other war films of interest include the Welsh *Hedd Wyn* (1996), Spain's *The Hunt* (1966), Israel's *Siege* (1970), Italy's *Man with a Cross* (1943), *Night of the Shooting Stars* (1982), and *Le Soldatesse* (1964). Also noteworthy are Greece's *Ulysses Gaze* (1995), Sweden's *The Shame* (1968), Argentina's comedy *Funny Dirty Little War* (1983), a powerful commentary on the Falkland War in *Veronico Cruz* (1989), and Colombia's *Confessing to Laura* (1990).

In the late 1990s, Hollywood war movies made a comeback. Terrence Malick's epic *The Thin Red Line* (1998) provided thought-provoking images of the attack on Guadalcanal in World War II. Steven Spielberg won the Academy Award for best director for *Saving Private Ryan* (1998). Mel Gibson made three movies about the glory of war with *The Patriot* (2000), *Braveheart* (1995), and *We Were Soldiers* (2001). Audiences were even given a Soviet sniper as a hero in the World War II epic about the battle for Stalingrad in *Enemy at the Gates* (2001). With the opening of the twenty-first century, Hollywood is again recognizing the box office appeal of war stories. Given the historical record, feature films on the subject of war will remain popular with audiences worldwide for the foreseeable future.

Finances, Military

For most civilizations, the financing of military exertions has proved the crucial problem of governance. Among the river valley civilizations, financial administration and the government were inseparable. Governments were organized on hierarchical bases, with the rulers possessing control over military decisions. Taxes were paid in kind, which made it

more difficult to utilize the revenue for military campaigns over great distances. For these agricultural economies, supporting a large standing army was the principal expenditure item. The optimal size of an empire was determined by the efficiency of taxation, resource extraction, and its transportation system. The supply of metal and weaponry was seldom a crucial variable in its military success. Some changes were brought, however, by the use of cheap iron weaponry after about 1200 B.C.E.

These civilizations, nonetheless, paled in comparison with the military efficiency and economy of the Roman Empire. Military spending was the largest item of public spending throughout Roman history. During the first two centuries of the empire, the Roman army had about 150,000 to 160,000 men, in addition to 150,000 other troops, with soldiers' wages increasing rapidly. For example, in republican and imperial Rome military wages consumed more than half of the revenue.

During the Middle Ages, following barbarian invasions, a varied system of European feudalism emerged in which feudal, aristocratic lords provided protection for their communities. Prior to 1000, the command system was still preeminent in the mobilization of military resources, mostly on a contingency basis. It was not until the twelfth century and the Crusades that the feudal kings needed to supplement their ordinary revenues to finance their armies. Internal discontent in the Middle Ages often led to an expansionary drive as the spoils of war helped calm the elite. The political ambitions of medieval kings, however, relied on revenue strategies that catered to short-term deficits and military campaigns. Innovations in the ways of waging war, aided by the gunpowder revolution of the fifteenth century, permitted armies to attack and defend larger territories. These developments also made possible the commercialization of warfare in the fourteenth and fifteenth centuries as volunteer feudal forces had to give way to professional mercenary armies. Accordingly, medieval states had to increase their taxes to support the growing costs of warfare. The age of commercialization of warfare was accompanied by the rising importance of sea power, as European states began to build their overseas empires. States such as Portugal, the Netherlands, and England, respectively, became the "systemic leaders" due to their extensive fleets and commercial expansion. The early winners in the fight for European leadership were usually supported by the availability of inexpensive credit. This pattern can be discerned in the English case. In the period 1535–1547, the English defense share (military expenditures of central government expenditures) averaged 29.4 percent, with large yearly fluctuations. However, in the period 1685–1813, its mean defense share increased to 74.6 percent, never falling below 55 percent. The

newly emerging nation-states began to develop more centralized and productive revenue-expenditure systems, especially in the absolutist era. These systems also reflected the growing cost and scale of warfare: During the Thirty Years' War between 100,000 and 200,000 men fought under arms, whereas 50 years later 450,000 to 500,000 men fought in the War of the Spanish Succession. The participants of these wars became even more dependent on access to long-term credit. For example, Spain's decline in the seventeenth century can be linked to the lack of long-term credit and poor management of government finances. The new style of warfare, prominent in the Revolutionary Wars, and rapid population growth increased the European manpower and spending requirements in the eighteenth century. For example, the French army grew more than 3.5 times in size from 1789 to 1793, up to 650,000 men. Similarly, the British army grew from 57,000 men in 1783 to 255,000 men in 1816. The Russian army reached a massive size of 800,000 men in 1816.

This kind of mobilization, which became more or less permanent in the nineteenth century, required new sources of financing. The nineteenth century saw just such reforms: centralized public administration, reliance on balanced budgets, innovations in public debt management, and direct taxation. These reforms were also supported by the spread of industrialization and rising productivity, so that the burdens of military spending could be borne relatively easily. The nineteenth century, moreover, made possible the industrialization of war and armaments production, starting in the midcentury and gathering speed quickly. The economic consequences posed by these changes differed. In the French case, the mean defense share remained roughly the same in 1870–1913, around 35 percent, whereas its military burden (military expenditures of gross domestic product [GDP]) increased about 1 percent to 4.2 percent. In the British case, the mean defense share declined 2 percent to 36.7 percent in 1870–1913 compared to the early nineteenth century. However, the strength of the British economy actually enabled a slight military burden decline to 2.6 percent, a similar figure incurred by Germany in the same period. For most countries the period leading to World War I meant comparatively higher military burdens, easily borne. The United States, the new economic leader, had a meager 0.7 percent average military burden.

In World War I this military potential was unleashed in Europe, with a war of attrition causing, along with millions of casualties, property damage amounting to perhaps U.S.\$36 billion. In the interwar period, especially in the 1920s, public spending was static, plagued by budgetary immobility. However, although among democracies defense shares dropped noticeably, their respective military burdens

stayed either at similar levels to before the war or even increased—for example, the French military burden rose to a mean level of 7.2 percent. Also in Great Britain, the defense share mean dropped to 18.0 percent, yet the military burden mean actually increased, despite the Ten-Year Rule (no major war to be anticipated for the next decade). For these countries, the mid-1930s marked the beginning of rearmament. Nazi Germany increased its military burden from 1.6 percent in 1933 to 18.9 percent in 1938, a rearmament program aided by creative financing and promising both “guns and butter.” Mussolini was not quite as successful in his efforts, with military burdens fluctuating between 4 and 5 percent in the 1930s, but not giving the Italians much for their money. The Japanese rearmament drive was perhaps the most impressive, amassing a military burden as high as 22.7 percent in 1938.

In World War II, the initial phase from 1939 to early 1942 favored the Axis as far as their strategic and economic potential was concerned. After that, the war of attrition, with the United States and the USSR joining the Allies, made it impossible for the Axis to prevail. For example, in 1943 the Allied total GDP was U.S.\$2,223 billion (1990 prices), whereas the Axis accounted for only U.S.\$895 billion. It was sheer madness for the Axis to enter war with the Allies. The economic demands of the war were unprecedented, as for example Great Britain's maximum military burden of around 27 percent in 1918 was dwarfed by the over 50 percent level maintained throughout World War II. This war also brought with it a new military-political leadership role for the United States, especially within NATO, a formidable defense alliance formed among democratic countries in 1949. The USSR, rising to new prominence in the war, established the communist Warsaw Pact in 1955 to counter these efforts. The war also gave impetus to welfare states that brought the European social democracies' government expenditure average from under 30 percent of GDP in the 1950s to more than 40 percent in the 1970s. Military spending levels followed suit and peacetime spending peaked during the early Cold War. The American military burden increased above 10 percent in 1952–1954, and the United States retained a high mean value of 6.7 percent for the post-war period. Great Britain and France followed the American example. The Cold War embodied a relentless armaments race between the two superpowers, with the USSR, according to some figures, spending as much as 60 to 70 percent of the American equivalent in the 1950s. Other figures suggest an enduring yet dwindling lead for the U.S. even in the 1970s. Furthermore, the same figures point to a two-to-one lead in favor of the NATO countries over the Warsaw Pact. Part of this armaments race was due to technological advances that produced a mean annual increase in real costs of

around 5.5 percent. Yet, spending on personnel has remained the biggest fiscal item, as soldiers, at least in the democracies, demanded living standards comparable to those in civilian life.

The world military spending levels began a slow decline from the 1970s onward, with the exception of the Reagan years. In 1986, the American military burden was 6.5 percent, whereas in 1999 it had dropped to 3.0 percent, and conscription had been dropped in 1973. In France (1977–1999), the military burden has declined from the postwar period to an average of 3.6 percent. This reduction has mostly been triggered by the reduction of tensions between the rival groups and the subsequent collapse of the Soviet Union. The USSR continued to challenge the American military dominance until the mid-1980s, and the Soviet military burden remained high at 12.3 percent in 1990. In the successor Russian Federation, with a declining GDP, this level has dropped rapidly to 3.2 percent in 1998. Similarly, other nations have downscaled their military spending in this period. For example, German military spending in 1991 was more than U.S.\$52 billion, whereas in 1999 it had declined to less than U.S.\$40 billion. In the French case, the decline was more modest, with its military burden decreasing from 3.6 percent to 2.8 percent. Overall, there was a reduction of approximately one-third in real terms in world military spending in 1989–1996, with small gains again in 1999. In the global scheme, world military expenditure remains highly concentrated, with the 15 major spenders accounting for 80 percent of the world total in 1999. If there is one constant in military expenditures through the ages, it is that such spending is invariably the largest single item in the budget of any nation.

Finnish Civil War (1918)

A conflict that lasted three and a half months and claimed some 6,500 military casualties, and which established conservative supremacy in Finland. The explosive situation in newly independent Finland in January 1918 can be seen in the concentration of troops: up to 70,000 Russian soldiers were situated across Finland, as well as 40,000 White Civic Guards; the Red Guards numbered about 30,000 men. The first clashes occurred in the town of Viborg in late January. The headquarters of the White forces were assembled in the town of Vasa from mid-January on under the leadership of C. G. E. Mannerheim. The disarming of Russian soldiers in southern Ostrobothnia by the White forces and the revolution in Helsinki by the Reds occurred simultaneously on 27 January 1918. The Red Peoples Delegation concentrated its leadership in Helsinki.

The war started slowly and was uncoordinated on both sides. The frontier lines were more or less stabilized by the beginning of February, with the Reds controlling most of the industrialized south and Finland proper, whereas the Whites held the northern and central regions. The Reds achieved their first significant victory on 21 February, yet the initiative soon shifted to the White forces in the west. The Reds' attack on the western front was stopped on 25 February. At the beginning of March, the Reds suffered a major setback, as Soviet Russia was forced to sign the peace of Brest-Litovsk and to evacuate Finland.

On 12 March Mannerheim mounted a major offensive toward Tampere, Finland's biggest industrial center. The Reds' counteroffensives were largely unsuccessful, as were also the Whites' efforts to round up the retreating Red forces. The White forces also suffered heavy losses.

The final offensive began on 3 April, against heavy Red resistance. After bitter fighting, Tampere finally surrendered on 6 April, a crucial victory for the Whites. Afterwards, Mannerheim divided his forces into two operational units, the Eastern and the Western Armies.

German-trained Finnish troops, Jaegers, and German units were essential for the Whites. The Germans themselves

began landing early in April, signaling the beginning of the end for the revolutionary forces.

On 8 April, the Peoples Delegation was forced to flee to Viborg, and Helsinki surrendered on 14 April. With the Reds retreating but fighting fiercely, the White army began its eastern offensive on 23 April. Viborg fell into White hands, and the remainder of Red resistance withered quickly, with the last Red group surrendering on 5 May.

Firearms

The basic principle of the firearm is simple: a tube, closed at one end, has in it an explosive with a projectile above it, nearer to the open end of the tube. An ignition system fires the explosive charge, which forces the projectile along the tube by means of the gases from the explosion. Possibly one of the earliest examples is held in the Bernisches Historisches Museum in Switzerland, and consists of a length of wood with a short tube fixed at one end. Just behind the rear, closed end of the tube, is a spike. The spike was used to lessen the recoil of the weapon, because of its large caliber, by being pushed into the ground.

Handheld, man-portable weapons date from the discovery of gunpowder, the first propellant known to man. Gunpowder is a coarse mixture of saltpeter, charcoal, and sulfur. (Modern propellants are dealt with elsewhere, as is artillery, defined as not man-portable weaponry.) The earliest firearms were muzzle-loaded. The barrel of the weapon was a simple, smooth tube, with a small aperture near the closed end to allow the firing spark access to the gunpowder charge. It seems certain that firearms as light weapons developed from cannon. Cannon were available in the early part of the thirteenth century, but firearms were not common until about 1375. The earliest firing method was by means of the matchlock: simply a length of fuse held in a clamp that could be moved into the firing position by the musketeer when he chose. Naturally such a firing method required the musketeer to keep his fuse alight, not an easy task in rain or wind.

The next developed firing mechanism was the wheel lock, followed by the snaphaunce, the flintlock, and the miquelet. All worked on the principle of causing sparks to be generated by a flint that lit a powder train, the train in turn firing the main charge. In terms of time, from the development of the wheel lock to the development of the next stage of ignition—the percussion system—a period of 300 years elapsed.

Firearms were inevitably rough weapons until the middle of the nineteenth century, simply because every maker had his own standards and methods of measurement. This meant that calibers were erratic, even when makers were in the same town or even street. Further, bullet makers were equally nonstandardized, so it was lucky that the main projectile was the lead ball, which could be adjusted reasonably easily in the field. Private firearms, as opposed to military weapons, always exhibit a much higher standard of workmanship and finish, simply because the purchaser is able to pay for such refinement in a single weapon.

The nineteenth century saw a complete change in the technical aspects of firearms. The Rev. Dr. Alexander Forsyth patented the percussion system in 1807; this system still operated in a muzzle loader, but the ignition charge was sealed in a percussion cap that the firer placed over a nipple, which was connected to the main charge. When the trigger is pressed a hammer hits the cap, causing a high-pressure explosion that ignites the propellant.

Pistols developed in exactly the same way as muskets, and the caliber of all weapons up to the mid-nineteenth century were large in comparison with today's firearms. This was due to problems in barrel making, for no effective method had been found to make barrel steel capable of withstanding the propellant explosion except by thickness of the barrel; further, gunpowder was so weak in its explosive effect that large amounts were needed to propel the ball down the barrel and on to the target. This insoluble circle was broken with the invention of nitrocellulose powders in the nineteenth century, together with Whitworths standards and gauges and the invention of the cartridge and rifling.

The rate of fire of standard military firearms did not increase fundamentally until the same time. In 1812 Dean Pauly invented the first cartridge-loaded breech-loading rifle, then Emile Lefauchaux invented the pin-fire cartridge. At last the igniter, the propellant, and the bullet were combined into one unit. This was of fundamental significance to Samuel Colt when he invented the first repeating firearm, which enjoys great status today as the first true modern firearm.

So, by the second half of the nineteenth century, firearms were beginning to operate in the same way as they do today. The breech-loaded weapons were firing a unitary cartridge, and the barrels were rifled, enabling sights to become things

of accuracy rather than indicators of the possible final resting place of the projectile.

The next development was even more significant: single-shot rifles were standard issue until the bolt action was invented. Single-shot weapons were loaded by means of rolling blocks, falling blocks, or lever or breaking action. This meant that only a slow rate of fire was possible, although this was a much higher rate than that ever achievable by the muzzle loader. The bolt action, however, allowed the rifleman to reload his weapon by means of a mechanical device that would eject the spent cartridge from his last shot and load a fresh cartridge into the chamber from the magazine. In no time at all military rifles were capable of firing from five to fifteen aimed rounds per minute. That this was effective is shown by the German conclusion that the British army at Mons in 1914 must have had a lot of machine guns, so dense and effective was the fire directed at them. In fact British battalions at the time had only two machine guns; it was the British standard of 15 aimed rounds per minute per man that caused the misunderstanding.

Machine guns were another logical step; magazines provided rifles with increased rates of fire, but a continuous belt of ammunition and an automatic reloading mechanism brought about the next step. By the end of World War I it was well known that artillery and machine-gun fire had killed a generation by their effectiveness on the battlefield. A further development in World War I was the use of the shotgun firing solid shot for trench clearing, a use now continued by special forces for opening doors.

One of the earliest firearms that has seen ubiquitous use is the pistol. The small, often concealed, hand weapon is for local protection only, but it has a long history. Its technical development has mirrored that of the rifle to a very great extent, and so flintlock pistols marched side by side with flintlock muskets. By the early part of the twentieth century there were automatic pistols, however, that were well in advance of rifle technology of the time. It is an interesting fact that the machine gun also appeared at about the same time, yet semiautomatic and automatic rifles did not make a practical appearance until the era of the American Garand rifle and the Springfield carbine. World War II also saw the Germans issuing (in small numbers only) a very effective assault rifle that was semiautomatic. The reasoning behind the apparent failings of the semiautomatic rifle was simple: Infantrymen could not be trusted with such a weapon, and would fire all their ammunition ineffectively. There has always been a certain amount of truth in this argument, and many television images show that the opportunity to make a lot of noise with an automatic rifle is very tempting, even to Westernized infantry, especially if it can be done without showing any body parts to the enemy.

One aspect of the firearm that leads the way in develop-

ment is the cartridge. Since all-in-one cartridges were first invented, the caliber of the military round has diminished considerably. Snider-rifled muskets fired rounds of caliber 0.577 inch, the Martini rifle fired 0.45 inch. World War I saw weapons of calibers around 8 mm or about 0.3 inch. Nowadays the common cartridge is 5.56 mm, a caliber developed in America and now in common use by many European armies. The cartridge is small, the round seems almost too small, but the muzzle velocity is such that a single round will do just as much damage as the bigger .30 caliber of World War II.

Firearms development underwent a radical change in the twentieth century with the appearance of the submachine gun. This weapon was an offshoot of both pistol and machine-gun technology, and by 1930 formed a separate branch of firearm technology. One of the most famous sMGs was the Thompson, made in America, and favored supposedly by Chicago gangsters. Although bulky, it fired the 0.45-inch automatic cartridge pistol (ACP) round, which was undoubtedly a man stopper. Developments in Europe, however, settled on the alternative pistol round, the 9 mm parabellum.

Submachine guns have two advantages in warfare: They are light and easy to carry, and they are extremely valuable in close-quarter battle. The Germans issued many, of which the most famous were the MPs 38 and 40; the Americans stuck to 0.45-inch caliber with the slimmed-down Thompson (with a 20-round box magazine) and the truly utility sMG, the M3. The Russians, however, always willing to learn from the enemy, adopted the sMG as their own, issuing millions to infantry, cavalry, tank crews, vehicle crews, and rear area troops.

The combination of pistol, rifle, and machine gun is still available to all armed forces today. Pistols are becoming more rare, however, as are sMGs, for the reason that rifles are becoming smaller. Modern rifles are built on the bull-pup principle; this means that the magazine is behind the pistol grip of the weapon. This in turn means that the barrel length of the weapon is not severely shortened, but the overall length of the weapon is reduced.

The modern rifle is supported by the machine gun still; tactical field requirements are such that there is still a need for a rapid-firing weapon that will keep the enemy's heads down while the riflemen maneuver for assault positions. The machine gun itself is the subject of much debate. In Vietnam, although riflemen were issued with the M16 in 5.56 mm caliber, their machine gunners still carried the M60 machine gun in 7.62 mm caliber. Again, in Europe, although the British army has the light support weapon in 5.56 mm, it has not completely relinquished the general-purpose machine gun, also in 7.62 mm.

The ability of infantry to carry large amounts of ammunition has always been a military goal, but questions seem to

arise as to whether the 5.56 mm cartridge is sufficient to the general infantry task. It wounds and kills very effectively, but it is an extremely unmilitary round if it meets obstacles on its way to the target. The 7.62 mm NATO round will punch through a wall and still be lethal on the other side; the 5.56 mm round, however, has a tendency to disintegrate or deflect if it catches anything of substance on its way to the target.

But firearms are not just handguns. Artillery figures significantly in the field, as does rocketry. Artillery is merely a larger-caliber weapon, firing a variety of shells according to the task. Rocketry often has even greater range, but it has the same role as gun artillery.

Military firearms have always been influenced to a degree by the civilian products, but this is now less marked than before. The civilian firearm for hunting still demonstrates the classic arrangement of stock, receiver, and barrel, with often elegant furniture and delicate scrollwork decoration. Military firearms, however, are more functional, and recognize the need for ease of handling within vehicles, for troops are nowadays delivered to the battlefield in armored personnel carriers, from which they may have to fight. Further, military firearms need to be able to produce a heavier weight of fire, and so are often automatic or burst-firing weapons.

The firearm of the future will undoubtedly benefit from firing consumable cartridges—cartridges that are burned up in the firing process, removing the need for extraction.

Fleurus, Battle of (26 June 1794)

French defeat of an allied army that contributed to the end of the Reign of Terror. In the spring of 1794, as the domestic terror accelerated, members of the antirevolutionary coalition prepared to invade France from the east and northeast. Foreseeing this, the French prepared drives of their own toward the Rhineland and into Belgium.

The goal of Jean Baptiste Jourdan, commander of the 75,000-man Army of Sambre and Meuse, was to cross the Sambre River and seize Charleroi, which they captured on 25 June. An Austro-Dutch force of 52,000, commanded by the prince of Saxe-Coburg, moved against Jourdan. Believing himself outnumbered, on 25 June Jourdan entrenched in a large arc to cover Charleroi from the north.

Coburg actually began the battle about 3:00 A.M. on 26 June. It evolved into a series of relatively disconnected engagements. On the French left Jean-Baptiste Kléber held the allies and in the afternoon drove them back. The French right yielded, and the Austrian archduke Charles and Johann Beaulieu almost succeeded until stopped by François LeFebvre. In the center Jourdan began a retreat but then counterattacked and drove the Austrians back. The battle ended about 7:00 P.M. The French had suffered approximately 7,000 casualties, the allies 10,000. The Austrians, who could have continued the battle the next day, instead withdrew. A factor in the French victory was the use of an artillery observation balloon, the first use of aviation in warfare.

By the end of September the French had occupied Belgium, conquered Holland, crossed the Rhine, and were besieging Mainz. No threat of invasion from this quarter existed again until 1814.

Politically Fleurus had even greater consequences. By early summer of 1794 many French had wearied of the domestic terror. Its rationale of defeating the enemy at home was no longer credible. Now Fleurus shattered the enemy abroad and destroyed the military rationale. On 27 July (9 Thermidor) Maximillian Robespierre was overthrown and the terror declined.

Fleurus was the military fulcrum for this change in French politics.

Flipper, Henry Ossian (21 March 1856–3 May 1940)

First African-American graduate of the U.S. Military Academy at West Point. Although other African Americans had previously entered West Point, he was the first to complete his studies. The son of slaves, Flipper was educated in American Missionary Association schools after the Civil War. He received an appointment to West Point in 1873. Despite racism from other cadets, Flipper remained dignified and hardworking. He graduated fiftieth in a class of 64 on 14 June 1877.

Flipper was commissioned a second lieutenant in the

Tenth Cavalry, a black unit. He served in various frontier posts in Texas and the Indian Territory. Most of his time was spent on engineering projects, such as drainage of swamps and installation of telegraph lines. He earned a commendation for service in the 1880 campaign against the Apache Victorio.

In November 1881, Flipper was accused by Colonel William R. Shafter of embezzling commissary funds. A court-martial found Flipper innocent, but he was dismissed from the service on 30 June 1882 for conduct unbecoming an officer. He believed racism was the real cause of his dismissal and spent the remainder of his life trying to prove his innocence and seeking readmission to the army.

Flipper worked as an engineer in the West. He developed a fluency in Spanish and a knowledge of local land use and mining laws. His translations of Mexican and Venezuelan mining laws were regarded as standards for many years. During the 1920s, Flipper was an assistant to the secretary of the Interior. After his death, Flipper was granted an honorable discharge by the army in 1976. A bust of him was unveiled at West Point in 1977, and an award in his name was instituted to honor the cadet who best exemplifies the high personal standards displayed by Flipper.

Flodden, Battle of (9 September 1513)

Disastrous early sixteenth-century defeat for the Scots at the hands of the English. By August 1513, with Henry VIII engaged in war with France, King James IV of Scotland had seized control of the region south of the Rivers Tweed and Till from the English. Henry's commander in the north, Thomas Howard, Earl of Surrey, led an English army into the region to keep James from retreating back into Scotland. Surrey engaged in diplomatic exchanges with James that ended on 6 September when James agreed to a battle at noon three days later. Surrey's main army crossed the River Till, five miles north of the Scottish encampment, on the morning of 9 September, cutting off James's retreat. James's army settled at the edge of Branxton Hill near Flodden Field, maintaining a strategic advantage.

The brash James immediately engaged the English, and an artillery duel ensued. The Scottish army failed to find an

effective range. After four hours of being bombarded by gunstones and heavy rain, the Scots advanced. The Scottish 17.5-foot pikes and long swords were no match for the English 9-foot halberds or bills, which combined an axe-head and spearhead. When night fell, the battle came to a merciful end for the Scots. The English army lost about 1,700 of its near 26,000 troops. The Scottish army lost more than 5,000 of its 28,000-plus troops, including most of its nobility, and King James himself.

Foch, Ferdinand (1851–1929)

Marshal of France and World War I commander. Born in Tarbes, southwestern France, on 2 October 1851, Ferdinand Foch interrupted his education during the Franco-Prussian War to enlist in the army but did not see action and entered the École Polytechnique in 1871. Three years later he was commissioned a lieutenant in the artillery (1883). Foch attended the War College (1885–1887) and was assigned to the general staff.

In 1894 Foch taught at the War College, where he stressed the importance of the commander's will and the offensive. Promoted to brigadier general (1907), he then headed the War College (1908). Promoted to major general (1912), he commanded a division. He then commanded XX Corps (1913).

Foch distinguished himself early in World War I in the Battle of the Frontiers (August 1914), and French army commander General Joseph Joffre assigned him command of the new Ninth Army, which held a crucial sector during the Battle of the Marne (September). Joffre then appointed Foch his deputy commander in chief to coordinate operations in the northern wing of armies (October). He next commanded Northern Army Group (January 1915).

When Joffre was dismissed in favor of General Robert Nivelle (December 1916), Foch was transferred to an unimportant advisory post. But when General Henri Pétain became commander of the French army (May 1917), Foch returned to prominence as chief of the general staff, although command authority rested with Pétain. Premier Georges Clemenceau then appointed Foch to the military committee of the new Supreme Allied War Council (November 1917).

Foch's opportunity came in spring 1918 when the Allies, close to defeat during the Ludendorff Offensive, adopted unity of command. Clemenceau selected Foch to command the Allied armies, largely for his fighting spirit. Originally, he had power only to coordinate Allied operations, but soon he gained full control, and on 14 April he was named commander in chief of the Allied Armies, first on the western front, then over all Allied military operations.

As generalissimo of the Allied armies, Foch directed the defeat of the German offensive. When the German drive had spent itself, on 18 July he launched his own succession of offensives over the whole of the front to give the Germans no time to regroup. This continued until victory. In gratitude for that achievement, Clemenceau awarded Foch the rank of marshal of France in August 1918.

Foch headed up the Allied side in armistice negotiations with the Germans in early November, insisting on terms that would make it impossible for Germany to renew the war. During the 1919 Paris Peace Conference, he advocated a tough stance toward Germany. He later denounced the Treaty of Versailles, predicting that the Germans would invade France again within a generation.

Foch was elected to the Académie Française and was the only French general named a British field marshal. He also was made a field marshal of Poland. He died in Paris on 20 March 1929.

Fontenoy (1745)

Major engagement on 11 May 1745 between the French and a coalition of English, Hanoverian, Dutch, and Austrian forces during the War of Austrian Succession (1740–1748). The French, under the command of Maurice, Comte de Saxe, with about 50,000 men, had laid siege to the fortified city of Tournai in the hope of luring the Allied army into a position

where it could be successfully attacked. Marching to relieve the siege was the second son of King George II of England, the duke of Cumberland, with approximately 46,000 Allied troops. Responding to Cumberland's approach, Saxe placed his forces on a low plateau near the present-day Belgian town of Fontenoy. In addition, the experienced Saxe ordered defensive redoubts to be constructed along his lines.

To begin the battle, the inexperienced Cumberland chose a frontal attack. During this assault, the Allied forces were severely mauled by the French-held redoubts, greatly depleting Cumberland's available force. Although the initial Allied attack was able to break the French line, it did so at great cost. Furthermore, the Allied cavalry failed to appear in order to capitalize on the infantry's hard-earned success. While French cavalry squadrons maintained pressure on the Allied formations, Saxe reorganized his battered forces and launched a counterattack spearheaded by a great concentrated artillery barrage and supported by fresh troops and cavalry. In the end, the Allied forces under Cumberland were defeated, illustrating the advisability of a well-positioned defensive line, superior artillery, and the successful use of field fortifications and light infantry. The defeat of the Allied forces at Fontenoy allowed Saxe and the French to seize the key cities of Flanders—including Ghent, Antwerp, Brussels, Mons, and Namur.

Fontenoy en Puisaye, Battle of (France, 25 June 841)

Carolingian Empire permanently divided. Charlemagne's heir, Louis the Pious (814–840), had three sons. To avoid a succession dispute, Lothair was to receive the title of emperor, while Louis and Pepin (later, Pepin's son Charles) were to become kings. A civil war quickly erupted between the three brothers while Louis the Pious was still alive, and intensified after his death.

Lothair's plan was to defeat the forces of his brothers separately, but he forced them into an alliance against him instead. His forces now outnumbered, Lothair had to recognize his nephew, Pepin, as independent ruler of Aquitaine to gain support, and, with Pepin's help, field an army powerful

enough to defeat his two rivals. Marching to join forces with Pepin, who was advancing north from the Loire, Lothair was met by Louis and Charles. They offered battle in the Yonne Valley, near Fontenoy.

Charles's Franks and Louis's Saxons and Bavarians stood on a hill facing Lothair. Little else is known about the battle, but reinforcements of Burgundian troops under Count Warin may have helped repulse and then slaughter Lothair's right wing. Lothair's army was routed. Lothair fled, and Pepin returned to Aquitaine, bringing the civil war to an end.

Outstanding issues were settled in the Strasbourg Oath of 842, between Louis and Charles, and in the Treaty of Verdun of 843. The treaty officially divided the territories of Louis the Pious into three parts: Lothair was given Italy, Burgundy, and Lotharingia (a strip of land extending from the Swiss mountains to the North Sea, along the Rhine valley); Louis became king of Eastern Francia, the later Germany, and Charles of Western Francia, the later France.

Forrest, Nathan Bedford (1821–1877)

The most successful Confederate cavalry field commander in the western theater of the American Civil War. Forrest was born in Chapel Hill, Bedford County, Tennessee, on 13 July 1821. A self-made millionaire through planting, land deals, and slave trading, he enlisted as a cavalry private under Josiah H. White on 14 June 1861. Although Forrest had no previous military experience or training, Tennessee governor Isham Green Harris commissioned him lieutenant colonel in October and requested him to create a cavalry battalion. Forrest did this at his own expense.

Forrest's natural aptitude for tactics soon became apparent in his daring escape from Ulysses S. Grant at Fort Donelson on the night of 15–16 February 1862. He was wounded while commanding the rear guard on the retreat from Shiloh, Tennessee, to Corinth, Mississippi, in April. After his promotion to brigadier general on 21 July, his service was mostly as a raider. His attacks on federal supplies and communication lines gained territory in Tennessee, prevented a summer assault on Chattanooga, and stifled Grant's initial advance toward Vicksburg, Mississippi. He fought under Braxton Bragg at Murfreesboro and Chickamauga.

Promoted to major general on 4 December, he thereafter commanded all Confederate cavalry in the west. After capturing Fort Pillow, Tennessee, on 12 April 1864, and finding the surrendered garrison about half white and half black, he massacred in cold blood about 260 troops of the 11th Colored Troops and the 4th Colored Light Artillery.

One of Forrest's favorite tactics was to use cavalry as mounted infantry, thus combining the speed and mobility of horse with the power of foot. Although outnumbered two to one by Samuel D. Sturgis at Brice's Cross Roads, Mississippi, on 10 June, his dismounted soldiers achieved a decisive victory.

Forrest harassed William T. Sherman for most of the rest of the war. Promoted to lieutenant general on 28 February 1865, but outnumbered, he was defeated at Selma, Alabama, in April and surrendered in May.

After the war, Forrest helped to create the Ku Klux Klan and may have been its first Grand Wizard. He died in Memphis, Tennessee, on 29 October 1877.

Fort Donelson (11–16 February 1862)

The military operation that first brought U. S. Grant to public attention. During the winter of 1861–1862, Confederate general Albert Sidney Johnston had established a defensive line stretching across neutral Kentucky from the Appalachians to the Mississippi River; he had only about 45,000 men to maintain the cordon. One key point was at Fort Henry on the Tennessee and Fort Donelson on the Cumberland River in western Tennessee not far from the Ohio River.

Union general Ulysses S. Grant, working well with his naval counterpart, Flag Officer Andrew Foote, and his flotilla, began his offensive in early February. On 6 February, most of the defending Confederates abandoned Fort Henry (it sat on a poorly chosen site for defense—easily flooded and easily bombarded from higher ground across the river) and retreated to Fort Donelson. Several days later, Grant sur-

Battle of Fort Donelson: capture of General S. B. Buckner and his army, 16 February 1862. (Library of Congress)

rounded the fort, but Foote's flotilla could not bombard the fort into submission.

The Confederate commanders decided to break out, attacking south, to roll up Grant's besiegers and either threaten him or open the way to retreat safely. The unexpected attack worked well, but Grant's coolness under fire—he responded to an attack on his right by ordering an attack from his left against Confederate defenses—perhaps caused his opponents to lose their nerve. The Confederates retreated into the fort with its outer defenses compromised, and the two senior commanders fled. When Simon Buckner asked Grant for his surrender terms, Grant replied that “no terms except an unconditional and immediate surrender can be accepted” and at least for the moment a northern hero was born—“Unconditional Surrender” Grant.

Defeat at Henry and Donelson caused Johnston to concede Kentucky and northern Tennessee and to regroup further south, seriously compromising the Confederate position in this western theater of war.

Fort Duquesne, Seizure of (1758)

A significant British military success in the Seven Years' War (French and Indian War). In 1758, British prime minister William Pitt charged Brigadier General John Forbes with an objective that had eluded General Edward Braddock several years earlier. He was ordered to seize Fort Duquesne, and thereby gain control of the upper Ohio River valley and cut French Canada from French Louisiana. Forbes initially in-

tended to follow the same route of advance as Braddock, but decided to move westerly through Pennsylvania and therefore to have to hack yet another route through the wilderness. The advance went slowly.

By early September, the British army—about 25 percent regular troops and about 75 percent colonial militia—had moved to within 40 miles of Fort Duquesne. Several weeks later, an advance party ineptly attacked the fort, and most of the troops were captured. After a pause, Forbes decided to attack in early November. He disregarded advice of some subordinates who counseled going into winter quarters, and he ignored his own illness, which would kill him soon after he seized the fort. The French commander had sent away his Canadian militia and Native American allies because he did not have food and supplies for all of them for winter, and he assumed the British would retire to winter quarters as well. Faced with a larger foe, he decided to save his army, evacuated the fort, and retreated north toward the lakes and Canada. Control over the upper Ohio valley passed to the British, furthering the isolation of the French in Quebec.

Fort Sumter (12–14 April 1861)

Scene of the opening shots of the American Civil War. In the aftermath of the secession of seven Deep South states from the Union, most federal facilities in the South went over to the new Confederate States of America. One very visible facility held out—Fort Sumter in the middle of Charleston, South Carolina, harbor.

It was an intriguing situation. If the Confederate States of America could not gain control over the fort, it could hardly maintain its claim to be an independent nation; on the other hand, if President Abraham Lincoln tried to bring in reinforcements, the North might appear the aggressor and thus induce some or all of the remaining eight southern slave states to secede.

Lincoln sent a provisioning ship to Charleston to continue the stalemate. Southern gunners drove the ship away. On 10 April 1861, Brigadier General Pierre G. T. Beauregard called for surrender of the fort; the next day, negotiators rowed to Sumter but failed to reach agreement on the fort's evacuation. On 12 April at 4:30 A.M., bombardment of the

fort began; by midafternoon the next day Major Robert Anderson surrendered, being unable to resist the Confederate batteries along the harbor. Union forces evacuated the fort the next day.

As a result, Lincoln was able to argue that the South had attacked first; he kept four of the remaining eight slave states in the Union. The South, in celebrating its victory, may have drawn the conclusion that the war would be too easily won and the defense too easily conducted.

Regardless, Fort Sumter was a key to an impressive arrangement of forts and batteries protecting Charleston harbor that helped keep the port under Confederate control until February 1865.

Fort Ticonderoga

A fortress guarding the traditional invasion route either to or from Canada and the southern colonies and the United States.

To help protect approaches to the lakes leading to Montreal and the heart of Quebec colony, the French in 1755 constructed a fort 10 miles south of Crown Point by Lake George and called it by its Indian name of Ticonderoga. It was to serve as a Gibraltar of North America, and the French initially and the British during the American Revolution invested greatly in this fortress.

As part of the broader offensive of 1758 during the French and Indian War, Major General James Abercromby with a mixed force of regulars, militia, and some colonial rangers moved to attack Ticonderoga. On the night of 5–6 July, they landed on the west side of Lake George a few miles from their objective. Meanwhile, the Marquis de Montcalm had sent some reinforcements and supplies to the fort, and the French sought to strengthen defenses. An early battle on 6 July between advance forces on both sides led to high casualties and lowered morale among the attackers. Abercromby believed reports of large numbers of defenders—doubtful given the size of the fort—and left his artillery behind, which would have permitted him to engage in a punishing siege. Instead, on 8 July he attacked, and many intrepid troops died as they sought to climb over the barriers the French had constructed on the fort's approaches. The French assumed another attack the next day, but when the sun rose,

Capture of Fort Ticonderoga: Ethan Allen and Captain de la Place. (National Archives)

the attackers had left and Ticonderoga survived in French hands.

In July 1759, Major General Jeffrey Amherst renewed the offensive. He brought cannon and prepared for a siege. Unknown to him, the French were prepared to retreat to an inner defense ring to protect Montreal and the colony's heart. So the several hundred defenders blew up the stone fort and retreated north to Fort Saint Frederic. Amherst then spent two months rebuilding the stone fortress before continuing the offensive.

During the siege of Boston at the opening of the American Revolution, Americans had attacked and seized Fort Ticonderoga on 10 May 1775, capturing some 60 cannon, which they laboriously transported to Boston to strengthen their position. The introduction of these cannon caused British general Thomas Gage to withdraw from Boston to Halifax, Nova Scotia. And in the aftermath of the failed invasion of Quebec, the retreating Americans returned to Ticonderoga to recuperate, conceding Canada thereafter to the British.

Finally, in 1777 the British under Major General John Burgoyne once again seized Ticonderoga. Having constructed a small fleet for passage down the lakes, the British took Ticonderoga and then stumbled as they approached

Saratoga, leading eventually to Burgoyne's surrender and a turning point in the conflict. This was the end of Fort Ticonderoga's crowded military history.

France (1940)

One of the strangest defeats of modern times. When France mobilized in September 1939, it fielded some 5 million soldiers, 2.7 million of whom were stationed on the front lines. However, budgetary restrictions caused in part by construc-

tion of the Maginot line led to a limited supply of infantry rifles and anti-aircraft. On the other hand, French tanks outnumbered and even outclassed German tanks in the northern area, but lacked speed. Hence began what became known as the Phoney War (*Drole de Guerre*) characterized by sporadic air incursions and artillery fire between the Maginot line and the so-called Siegfried line. The Saar offensive of September 1939 had ended without any follow-up, thus leaving German troops to focus on Poland's demise. During that time, seeking to reinforce Allied commitments, France and Great Britain signed an agreement stipulating that neither side would seek a separate peace without consultation.

Heading the French general staff was the aging and monkish Maurice Gamelin, isolated in his headquarters, without even radio or wire communications, with his subordinate commanders. His instructions to his commanders remained vague and frustrated any initiative for action. Furthermore, he and the chief of the French government, Paul Reynaud, disagreed on what actions to take to check the German threat. This eventually led to the fall of the Daladier cabinet shortly before the German offensive.

Hence, the German offensive on 10 May 1940 took the Allies by surprise, as usual. Instead of invading through Belgium, which the French general staff was prepared to counter with Escaut and Dyle-Breda lines, the German army broke through the Ardennes. This rough mountainous and heavily wooded terrain had been deemed impenetrable by both sides, which is why the French Ninth Army, composed of mostly aged reservists, defended the northern sector. The French Second Army, covering the eastern area, failed to send reinforcements. Within days, General Alphonse-Joseph Georges resigned under the mental strain of the war. Paul Reynaud was recalled as prime minister. For several days, the high command showed no sign of decision, although Gamelin did offer a counteroffensive plan. On 19 May he was replaced by Maxime Weygand, who offered nothing new in terms of strategy. The Belgian army capitulated, and British troops, along with some French units, held off the Germans at Dunkerque long enough to board ships under intense German aerial attack and leave the battle. Furthermore, as conditions changed and German invaders cut deeper into French positions, the French high command was often unable to dispatch new orders due to the lack of radio communication with field commanders. The German blitzkrieg (lightning war) made it a point to attack communications and mobilization points by air and armor, making it almost impossible for the French high command to mount a coordinated counterattack.

As for the French air force, although offering impressive numbers on paper, it struggled to make up for delayed aircraft deliveries. It thus found itself unable to counter such threats as the tactics of German Stuka dive bombers. Many

French pilots did successfully engage and shoot down German fighters, but the exact number is hard to determine. Indeed, the official number of over 1,000 is likely a myth due to a combination of victory confirmation methods (confirmed participants in a joint victory were each credited with a full victory), the loss of records, and the spread of the strange notion of "defeat with honor" through the Vichy propaganda services as a means to motivate the remnants of a demoralized army.

On 10 June, Italy opportunistically launched its own attack against France. Even with the French *in extremis* militarily, Italian border penetrations were held to a few miles.

Weygand asked for permission to break the 28 March 1940 Franco-British agreement, which forbade negotiating a separate peace with Germany. He was overruled and refused to consider continuing fighting from North Africa. On 16 June, Paul Reynaud resigned and retired. The defeatist Marshal Philippe Pétain, the aged hero of Verdun, replaced him and wasted no time in calling on Germany for armistice terms. The armistice was signed on 22 June in the same railway sleeping car in which the Germans were forced to sign their armistice in 1918—a Hitler touch—and went into effect on 25 June. By then 120,000 French soldiers had died, another 250,000 were wounded (remarkably high numbers considering the briefness of the campaign), and close to 1.5 million were prisoners of war.

Meanwhile, General Charles de Gaulle, in exile in London, issued a call to resistance on 18 June that signaled a split of the French army between the future Vichy government forces and those that would join the Allies, some at once, others only in 1942.

On 10 July 1940, the French Third Republic was dissolved and a new government headed by Pétain, headquartered at Vichy and in control of southern France (also known as the Free Zone), began operations. Vichy was allowed to continue operating a small defense force of some 100,000 soldiers and 60,000 sailors, along with a small air force to help control French colonies. The French themselves described the armistice terms as "hard, but not unbearable." France was not dismembered, although Alsace and Lorraine went back to Germany, and, as noted, Vichy could keep a small defense force. But Hitler vowed privately that after the war he would "take care of France."

France and the American Revolution

Next to George Washington, the single most valuable asset of the Americans during the Revolutionary War. It is difficult to see how the United States could have won its independence without the help of France.

After its defeat in the Seven Years' War in 1763, France looked for *revanche* against Great Britain, and it carefully followed events of the American Revolution. The French foreign minister, the Comte de Vergennes, believed British power was based on trade and the loss of the American colonies would seriously weaken France's longtime foe.

At first, France carefully sought a balance between giving the rebellious Americans enough aid to keep fighting and not provoking the British into an attack on France or its remaining overseas possessions. Through the playwright Baron de Beaumarchais, the French arranged for clothing, arms, powder, and medicine for the new republic. Vergennes also permitted American privateers, which preyed on British commerce, to use French ports. And the large French fleet forced Britain to keep part of its fleet in home waters for defense of the British Isles.

After General John Burgoyne surrendered at Saratoga and in the wake of Washington's generally impressive performance in defeat at Germantown outside Philadelphia, Vergennes urged his king to enter into an outright alliance with the new United States to expand the war of attrition against Britain.

After Saratoga, the Franco-American alliance (and the later entry of Spain and the Netherlands into the conflict) ensured an American victory over Great Britain. The drain on British imperial resources was too great.

There were, to be sure, awkward moments in the alliance. The French did not necessarily respect their American allies. There also were difficulties in coordinating the movement of American troops across a largely primitive and undeveloped terrain with that of French naval forces fearing changes in the seasons and the sudden appearance of British fleets. Thus, a planned counterattack to retake Savannah was unsuccessful, and George Washington was never able to use French naval power to bottle up the British in New York and retake the city.

However, there was one moment of supreme triumph. In fall 1781, Lord Charles Cornwallis retreated down the Virginia tidewater to the York River, where he waited for clear orders and/or the appearance of a British fleet to transport

his men elsewhere. A French fleet drove off a British relief force; another French naval force helped transport French troops and a siege train from around New York City; and the Americans marched from New Jersey to Virginia. The result was the classic eighteenth-century European-style siege of Yorktown, the successful break through British defenses, and the subsequent British surrender, which ended fighting in North America and led to the Treaty of Paris in 1783, proclaiming the new United States of America. French sea power, along with French gold and French troops, had given the margin of victory.

Franco, Francisco (1892–1975)

Spanish soldier and dictator. Franco ruled Spain for nearly 40 years after defeating the liberals, socialists, and communists in the Spanish Civil War. Although his victory was made possible by the fascist states, he did not join them in World War II.

Franco was born at El Ferrol, the son of a naval officer. He attended the Infantry Academy in Toledo, graduating in 1910. He served against the Rif in Morocco from 1912 to 1916. Franco earned a reputation as a courageous officer and was quickly promoted. After being wounded in 1916, Franco became the youngest major in the Spanish army. He returned to Morocco in 1920 and helped organize the Spanish Foreign Legion. By 1923, he commanded the legion and was a lieutenant colonel. He defied government orders to withdraw from Morocco and led a brilliant assault on Alhucemas Bay in 1925.

Franco was Spain's youngest brigadier general ever at age 33 in 1926. He directed the Military Academy at Zaragoza until 1931, when the Republican government transferred him because of his monarchist sympathies. He served as governor of the Balaeric Islands for three years, then led the legion and Moorish soldiers in repressing a miners' revolt in Asturias. Franco's actions earned him the nickname "Butcher" and the enmity of the Left, but he became the conservatives' hero. After a year as commander in chief of the

army, Franco was posted to the Canary Islands by the new Republican government in February 1936.

Franco soon joined other officers in plotting to overthrow the government. He secretly traveled to Morocco, where he led the legion and Moorish troops in revolt on 17 July 1936. Securing his base, Franco used Italian planes to fly large numbers of soldiers to Spain by August. On 29 September, the rebels named Franco generalissimo and head of state. Franco's two fellow conspirators, Generals Sanjurjo and Mola, were killed in convenient airplane crashes, leaving Franco as the sole leader of the revolt. His advance on Madrid was stopped just short of the capital. The Spanish agony continued for another two years, as Spaniards killed some 600,000 of each other. He accepted large amounts of aid from Italy and Germany, but retained control over the war. Franco was a methodical commander. Although he used motorized units, his carefully paced campaigns against his enemies were more reminiscent of World War I. In March 1939, the Republicans surrendered, and Franco became caudillo, or absolute dictator, of Spain. Thousands of opponents were eliminated after the civil war, and Franco allowed no dissent. However, he gradually allowed greater freedoms to the Spanish people.

Franco sympathized with the fascists, but carefully remained neutral during World War II. After the war, the United Nations isolated Spain, but Franco successfully built a reputation as a strong anticommunist. In 1950, the United States reestablished diplomatic relations, and beginning in 1953 provided massive military and economic assistance in exchange for air bases in Spain. Franco promulgated a Law of Succession in 1947, making Spain a monarchy, but reserving the power to name a king to himself. In 1969, he named Don Juan Carlos de Bourbon future king of Spain. Franco died after a long illness in 1975, leaving a Spain that soon moved on to democracy.

brother, Otto I, "the Great." After Brun's death (965), Lothar's position deteriorated even further. Although his relations with Hugo Capet, the son of Hugo the Great and nephew of Brun, were generally amenable, he had only a tiny domain much distracted by feudal conflict. Also, a persistent desire to win back Lotharingia from the German allegiance was to bring disastrous consequences.

On Otto's death in 973, his son Otto II (955–983) was accepted without opposition as successor; already in 961 he had been crowned coregent king of Germany and Italy with his father. Six years later he was made coregent emperor as well. Although revolts in the realm were to occupy the early years of his reign, Otto was to continue his father's policy of promoting a strong monarchy in Germany, and of extending the Ottonian influence in Italy.

Lothar's backing a revolt in Lotharingia impelled Otto, who was also hampered by a rebellion in Bavaria at the time, to give lower Lotharingia to Lothar's refractory brother, Charles, in exchange for a pledge of fealty (976). A second invasion was mounted, and Lothair pillaged Aix, but advanced no further (978). It was during this campaign that Lothar also made a surprise attack on the imperial palace of Aachen, and nearly captured Otto in person. His troops occupied the palace, and as a symbol of their victory, they turned the bronze eagle fixed to the roof so that it faced eastward. Yet only three days later they withdrew.

Otto immediately responded with a punitive thrust into Francia that reached as far as the gates of Paris, but there it came to a halt. Otto, with an army reckoned at 60,000 strong, was forced to retreat because of a shortage of supplies. Otto's retaliatory attack on Paris satisfied honor, but little more. Lothar's renunciation of Lotharingia at Margut, near Sedan, was no more binding than those his predecessors had made (980). Still, the third invasion of the duchy, despite the sacking of Verdun, not only failed in its purpose, but determined the powerful Archbishop Adalbero of Reims to support Hugo Capet against Lothar (985). The following year Lothar was planning yet another expedition into Lotharingia when he died.

Franco-German War (978–980)

King of Francia fights for his independence against Ottonians. Lothar IV (r. 954–986) was dominated first by Hugo the Great, and then by his uncle Brun, archbishop of Cologne and duke of Lotharingia (Lorraine). Brun's support was invaluable, but he also used his influence in the interests of his

Franco-Prussian War (1870–1871)

The war that made Germany the major European power. As soon as the Austro-Prussian war ended in 1866, Napoleon

III worried about the growing power of Prussia and Bismarck's policy of German unification. Oddly enough, the spark that would start the war began in Spain. The queen had been deposed and the new monarch should have been a relative to the king of Prussia; France couldn't accept the possibility of a two-front war. French diplomacy persuaded King William to withdraw his support but Bismarck reworded a French official dispatch (Ems Telegram) in a way deemed to be insulting to the king. This machiavellian maneuver pushed France to declare war on 15 July 1870.

The German forces were made of Prussian and German state troops (Hanover, Bavaria, and smaller states); 400,000 men in three armies were to invade France following a well-directed plan of mobilization and troop concentration, using the railway net. German high command was given to King William but in fact to his expert chief of staff, Helmuth von Moltke.

The French army seemed to be a fierce opponent, but Napoleon had impetuously declared war before preparations had been completed, and confusion reigned. The eight army corps (225,000) remained behind the frontier without a war plan, transport was unorganized, munitions for the outstanding chassepot rifle (twice the Prussian gun range) were scanty, and units were understrength. Tactics were obsolete and relied on columns attacking with fixed bayonets and heroic cavalry charges à la the first Napoleon. French artillery consisted of muzzle-loaded cannon outranged by the breech-loaded Krupp German pieces. Moltke's carefully planned campaign against France had been drawn up years before and seemed to run like clockwork. The French were beaten at Spicheren and Froeschwiller on 6 August; in both cases every German division marched to battle as French corps waited for orders that never materialized, ensuring their defeat. The two main French armies were defeated one after the other: Bazaine was trapped in Metz after several drawn battles (Mars la Tour, Saint-Privat). Napoleon III's own army was crushed at the battle of Sedan on 1–2 September; the army surrendered and Napoleon himself was taken prisoner.

The capture of Emperor Napoleon was the end of the Second Empire; on 4 September a provisional "government of National Defense" declared France a republic. The German invasion was directed toward Paris but as it penetrated inland, all France flamed up in a patriotic fervor. Paris, already heavily fortified, was hastily garrisoned by untrained newly raised troops. Moltke besieged Paris from 19 September. Republican armies were raised but were no match for the seasoned German troops. Fighting continued through the winter, with pitched battles around Paris and Orleans, but also large-scale skirmishing against German lines of communication. Paris, its citizens almost starving, surrendered on 28 January 1871, a capitulation that put an end to the war.

The main result of the war was the founding of the German Second Empire at Versailles on 18 January 1871. Germany was united under Prussian domination; the king of Prussia became the emperor of Germany. France, humiliated, losing Alsace-Lorraine, burned with a demand for revanche well into the twentieth century.

Franco-Spanish War (1648–1659)

War within a war, part of the Thirty Years' War. Actually lasting about 50 years, the various wars were part of the European struggle for balance of power as well as religious freedom and hegemony. In 1648, Spain signed various treaties with the United Provinces of Westphalia that became known as the Peace of Westphalia. With this part of the struggle over, Spain was able to concentrate on its struggle against France. However, with the outbreak of the rebellion in France, known as the Fronde, the Spanish slowly began to lose ground. The Fronde rebellion first came about as a movement in the parliament of Paris against absolute royal authority, later spreading to encompass other areas of society. During this period, many of those in rebellion made separate peace treaties with Spain even as the Fronde took place.

However, in 1655 France began to enjoy success against the Spain. Additionally, France and England made various treaties of friendship from 1656 to 1657, which allowed France to concentrate on its struggle with Spain. On 7 November 1659 France and Spain signed the Peace of the Pyrenees, through which France obtained the city of Roussillon and was able to establish its borders with Spain along the Pyrenees. In effect, the Franco-Spanish War brought France to the forefront as a major power in Europe and in the newly discovered Americas, while Spain lost much of its worldwide hegemony.

Frankish Civil Wars (670–719)

Carolingians seize power from Merovingians. By the late seventh century, the Frankish Merovingians were in decline. Real power had passed to three mayors of the palace (in Neustria, Austrasia, and Burgundy), who had been able to acquire large territories for themselves. Civil war resulted as competing aristocratic clans, each claiming autonomy, tried to establish hegemony.

Ebroïn, mayor of the palace in Neustria, attempted to unify the kingdom, but met violent opposition, especially from Austrasia. Bishop Leodegar, eventually assassinated (c. 679), led resistance in Burgundy. In Aquitaine, Duke Lupus made his duchy an independent principality.

The murder of Ebroïn (c. 683) favored Austrasia and the Pepinids (or Carolingians). Pepin II defeated the Neustrians at Tertry (687), and made himself lord of the land between the Loire and Meuse. Austrasia and Neustria were reunited under a Merovingian figurehead, but Pepin II actually governed as mayor. Simultaneously, Pepin II partially reconsolidated the frontiers of northern Francia. He drove the Frisians north of the Rhine, and restored Frankish suzerainty over the Alamanni. Control over the south continued to elude him and his supporters. Aquitaine remained an autonomous duchy, while power in Burgundy was divided.

Pepin II's death in 714 jeopardized Carolingian hegemony. His heir was a grandchild, with his widow, Plectrude, regent. Neustria began the revolt. Eudes, Duke of Aquitaine, took advantage to increase his holdings, and allied himself with the Neustrians. Pepin's illegitimate son, Charles Martel ("the Hammer"), responded by seizing what he considered his birthright. Defeating the Neustrians at Amblève (716), Vincy (717), and Soissons (719), he became master of northern Francia, like his father before him. To gain legitimacy, he declared the Merovingian Chlotar IV king of Austrasia, keeping the office of mayor of the palace for himself.

The Merovingians had discouraged the growth of nobility within their ranks. They preferred to delegate administrative and military duties to directly appointed counts or dukes. This entailed honor, but few material rewards. It also failed to curb the ambitions of an unscrupulous subject and of his clan. Out of the confusion, a firm military and admin-

istrative hierarchy was gradually forged. The process began with Charles Martel; continued with his son, Pepin the Short; and finally came to fruition under his grandson, Charlemagne.

Frankish-Moorish Wars (718–759)

The First Franco-Moorish War (718–732) saw the Moors conquer the Visigoths in Spain, and then invade the Frankish kingdoms north of the Pyrenees Mountains. The Moors captured Narbone in 719, but were defeated at Toulouse in 721 and pushed back into Spain by Eudes. The Moors returned in 725 and conquered the Septimania region. A new Moorish offensive spearheaded by Abd-ar-Rhman, governor of Spain, defeated Eudes at Garonne and laid waste to Bordeaux and Aquitaine. The Moors advanced north past Poitiers in west-central France, forcing Eudes and other independent Frankish rulers to ask for help from Charles Martel of the Carolingian family. Charles utilized the army developed by his father, Pepin, to defeat the Moors at the Battle of Tours in 732. The Moorish advance into Europe ended, and Charles became known as "the Hammer." Eudes, now effectively subject to Charles, but free of the Moorish threat, kept the Moors in check across the Pyrenees.

The Second Franco-Moorish War (734–759) began with the death of Eudes and the rebellion of his sons against Charles Martel. Moorish raids increased up the Rhone River valley, but these were checked at Valence in 737 and Lyon in 739. After Charles died, his sons Carloman and Pepin the Short ruled jointly as mayors of the palace, until 747 when Carloman joined a monastery. Pepin the Short drove the Moorish raiders back into Spain as he annexed Septimania. Moorish raids north of the Pyrenees became sparse with Abbasid-Umayyad rivalries in Islam. This dynastic rivalry in the Islamic world also aided the Franks in establishing Christian kingdoms in the Iberian Peninsula of Spain. The kingdoms of Navarre and Asturias formed a buffer zone and would provide a launching point for Charlemagne's invasion of the peninsula.

Franklin, Battle of (30 November 1864)

Seeking to lure Union general William Sherman from Atlanta, Confederate general John Hood continued his invasion through Alabama into Tennessee. At Franklin he attacked a smaller army commanded by General John Schofield. Schofield wanted to hold his position on the southern edge of town to permit his supply wagons to retreat unhindered to the north. His men improved some defense works constructed in spring 1863 by northern troops.

Hood was convinced that timidity among his subordinates and troops had prevented a major victory a few days earlier at Spring Hill. He believed in seizing the initiative, and was determined to demonstrate its benefits. However, he also promised his men, who were war-weary, that he would not commit them to any more deadly frontal assaults against prepared positions.

Around 4:00 P.M. on 30 November, Hood launched an attack. Confederates assaulted the hastily constructed northern defenses before their artillery arrived at the battlefield—that is, they did what Hood had promised his men he would not order them to do. They charged 20,000 well-dug-in Union troops who held their fire until the southerners were well within firing range. The battle became a deadly clash that lasted well into the night, and Hood's Army of Tennessee lost about 25 percent of its effective strength. Schofield did have to retreat to Nashville, but he had bought time for Thomas's defense of Nashville.

Franks

Germanic conquerors of the former Roman province of Gaul. The Franks created the strongest and most stable barbarian kingdom in the west. The name *Franci* (bold, fierce) suggests an association with a coalition of Germanic tribes of the

middle and lower Rhine. It caused the Roman Empire much trouble, from around 260 until the end of the fourth century.

The Franks did not fully emerge as a people until the establishment of the Merovingian Dynasty by Clovis (r. 481–511). Clovis drove the Gallic Visigoths into Spain. He also absorbed much of the Burgundian kingdom and many Alamanni into his kingdom. Clovis converted to orthodoxy, an act that made him king of the Franks in the eyes of the Roman Church.

Agathias, the sixth-century chronicler, provides a graphic description of Frankish warriors. They had few horsemen, he says, but the Frankish infantry were bold and experienced in war. Disdaining body armor and rarely wearing a helmet, they preferred to fight bare-headed and with their chests exposed. Their weapons were a javelin with a long iron shank (*angon*, a throwing weapon similar to the Roman *pilum*) and a throwing-axe with a sharply swept head (*francisca*). Both could split a shield or penetrate armor at short range. Frankish shields were round, solidly constructed of wooden planks held by a single grip behind a heavy iron boss. Sidonius Apollinaris, fifth-century Gallo-Roman eyewitness to the Frankish invasion of Gaul, mentions the characteristic hairstyle of Frankish warriors, with side-braids, topknot, and the rear of the skull shaved. He also says they “hurl their axes and cast their spears with great force, never missing their aim . . . and rush on their enemy with such speed, they seem to fly more swiftly than their spears.”

Frederick I Barbarossa (1152–1190)

German king and Holy Roman Emperor. Frederick Barbarossa's reign as German king and Holy Roman Emperor was one of conquest and consolidation. He succeeded Conrad III as the elected king of Germany in 1152. Unlike Conrad, he was also crowned Holy Roman Emperor, as Frederick I, in 1155. Frederick had strengthened ties with both his Staufan and Welf lineages to gain their support for his election. In 1153, he campaigned in Italy and secured the papacy as an ally. In 1158, after his election, Frederick campaigned against the Normans of Sicily and the Byzantines in imperial northern Italy. He seized Milan and established his own direct rule over the region.

After the death of Pope Adrian IV in 1159, Frederick supported pro-imperial Victor IV against the anti-imperial

Alexander III as the new pope. After 1167, Frederick was opposed by the Lombard League formed by Alexander III, the Norman king, the Byzantine emperor, and the anti-imperial resistance in northern Italy.

In 1169, he secured the succession of the Staufen line with his son, Henry. In July 1177, to free himself for further consolidation in Germany, he negotiated a peace settlement in Venice. It gave part of northern Italy to Alexander III, and established a truce with the Lombard League and with the Norman king. In 1183, in the Peace of Constance, Frederick finally settled matters with the Lombard League, led by Milan. In his sixth and final Italian campaign, he strengthened his influence in Lombardy, and in the 1180s, Frederick again consolidated power in Germany. In May 1189, he left for the Holy Land on crusade, leaving his son, Henry VI, in control. After a victory over the Turks at Iconium, Frederick drowned in the River Salef on 10 July 1190.

Frederick II (1194–1250)

King of Sicily and of Germany, the last strong Holy Roman Emperor to clash with the papacy during the Middle Ages. Frederick expanded his authority through crusade to the Holy Land and threatening the conquest of the whole of Italy.

Frederick was born on 26 December 1194, at Jesi in the kingdom of Sicily. Frederick was the son of Holy Roman Emperor Henry VI of Germany and Constance of Sicily, attaining the latter crown by inheritance. After a lengthy struggle with his father's immediate successor, Otto IV, Frederick officially became the German king in 1211 and Holy Roman Emperor in 1220. In 1228, he led a crusade against the Muslims in the Middle East, acquiring Jerusalem from Sultan al-Kamil through diplomacy instead of combat.

After returning to Sicily, Frederick suppressed a rebellion by his oldest son Henry, whom he had made the new German king. Frederick created a bodyguard of loyal Saracens, locating them near his new arsenal at Lucera. He consolidated power in Germany and Sicily and invaded northern Italy. At the height of his power, Frederick defeated a Mi-

lanese army at Cortenuova in 1237, threatening the power of Pope Gregory IX. Frederick was excommunicated (for a second time), but he continued to press toward Rome despite multiple defeats. Pope Innocent IV deposed Frederick in 1245. After numerous campaigns and attempts at his life, Frederick died not in battle but of dysentery at Castel Fiorentino on 13 December 1250. He left the weakened empire to his second son, Conrad; Arles and Jerusalem to his third son, Henry; and Austria to his grandson, Frederick.

Frederick the Great, King of Prussia (1712–1786)

Brilliant Prussian king, statesman, and field commander. Frederick was born in Berlin on 24 January 1712 as Friedrich von Hohenzollern, son and heir of King Frederick William I of Prussia. The king systematically tormented and abused his son until 1732, when the two reconciled and Frederick became colonel of the Ruppín regiment of infantry. Frederick fought in the War of the Polish Succession in 1734 and ascended the throne as Frederick II on 31 May 1740. He immediately began to use the formidable army that his father and great-grandfather had built.

In the War of the Austrian Succession, Frederick captured Silesia in a swift December 1740 to January 1741 campaign, defeated the Austrians at Mollwitz on 10 April, invaded Bohemia on 5 February 1742, won at Chotusitz on 17 May, and achieved favorable terms in the Peace of Breslau on 11 June. He invaded Bohemia again on 17 August 1744; took Prague on 16 September; defeated Austria at Hohen-Friedberg on 4 June 1745, Soor on 30 September, Hennesdorf on 23 November, and Görlitz on 24 November; and successfully exited the war by the Treaty of Dresden on 25 December. Back home, he published his philosophy of war in 1747 and continued to enlarge his army.

Frederick's opening campaign in the Seven Years' War was an invasion of Saxony in August 1756. Usually outnumbered in battle, he compensated with clever tactics and precise maneuvers. He was thwarted at Pirna in September, but won at Lobositz on 1 October. Attacking Bohemia in April 1757, he won at Prague on 6 May, but lost at Kolin on 18 June and retreated to Silesia. His victories at Rossbach on 5 No-

ember and Leuthen on 6 December were decisive. He besieged Olmütz in May 1758, won at Zorndorf on 25 August, but lost at Hochkirch on 14 October, Kunersdorf on 12 August 1759, and Maxen on 20–21 November. Regrouping his exhausted and overextended forces, he won at Liegnitz on 15 August 1760, Berlin on 12 October, and Torgau on 3 November; retreated to Bunzelwitz in August 1761; and won at Burkersdorf on 21 July 1762.

Frederick spent most of the rest of his life restoring Prussia from the wreckage of the Seven Years' War, solidifying his territorial gains, adding to them through the 1772 partition of Poland, and making Berlin a European cultural center. He died at the Palace of Sans Souci in Potsdam on 17 August 1786.

Frederick William, Elector of Brandenburg (1620–1688)

German prince who created the first standing army in Europe. Born as Friedrich Wilhelm von Hohenzollern, Kurfürst von Brandenburg, on 16 February 1620 in Berlin, he attended the University of Leiden, Netherlands, from 1634 to 1637 and succeeded his father as elector of Brandenburg on 1 December 1640, in the midst of the Thirty Years' War.

Frederick William's greatest achievement was building Brandenburg into a European power after the devastation of the Thirty Years' War. Brandenburg gained some territory by the 1648 Peace of Westphalia, but its population was decimated, its farmland was wasted, and it was under constant threat of attack by Sweden and Poland. Frederick William realized that the only way to overcome this vulnerability was with a standing army. He created the noble Junker class of military officers, established military schools, and within 20 years had 30,000 rigorously disciplined and highly trained professional troops at his command. During this period of development, he had to be diplomatically careful to avoid preemptive strikes from his neighbors. He skillfully played

them off against each other in the Anglo-Dutch Wars of 1652–1654 and 1665–1667 and the first Northern War of 1655–1660.

During the 1672–1679 Franco-Dutch War, France prompted Sweden to invade Brandenburg in December 1674. Brandenburg lost to Viscount Turenne at Turckheim on 5 January 1675; but at Fehrbellin, just northwest of Berlin, on 28 June, 5,600 Brandenburger cavalry with 13 guns defeated Sweden's 7,000 infantry, 4,000 cavalry, and 38 guns. This news stunned all Europe, and turned France permanently against Brandenburg. Although still outnumbered by the invading army, Brandenburg defeated the Swedes at Stettin and Rügen in 1677; Stralsund in 1678; and Tilsit, Splitter, and Heydekrug in January 1679.

In 1685, Frederick William countered Louis XIV's revocation of the Edict of Nantes with the Edict of Potsdam, shrewdly welcoming hardworking Huguenots to Brandenburg. During his reign, Brandenburg's population rose from 600,000 to 1,500,000 and its territory increased by 40 percent.

"The Great Elector" died on 9 May 1688 in Potsdam. His creation of the first military secular state in modern Europe enabled his son, Frederick I, to become the first king of Prussia in 1701, laid the foundation of the military power of eighteenth-century Prussia, and eventually led to the unification of Germany in 1871.

Frederick William I, King of Prussia (1688–1740)

The "Soldier King" of Prussia, architect of a mighty military power in central Europe. Born in Berlin on 14 August 1688 as Friedrich Wilhelm von Hohenzollern, son and heir of Elector Frederick III of Brandenburg who became King

Frederick I of Prussia in 1701, Frederick William was always devoted to military life. He served under the duke of Marlborough in the War of the Spanish Succession and genuinely enjoyed fighting at Malplaquet. As soon as he ascended the Prussian throne on 25 February 1713, he resumed the militaristic policies of his namesake grandfather, the Great Elector of Brandenburg, which his father had allowed to fall into disarray. The treasury was empty, military manpower was about 25,000, and national morale was low.

Frederick William immediately ordered national austerity and poured all available resources into the military. He conscripted vagabonds; invited immigrant Protestants to enlist; reformed military and governmental bureaucracy; made sophisticated military education available to all male Prussians, even peasants; and paid special bonuses for tall or physically gifted recruits. The feudal nobility became a military hierarchy, as Frederick William encouraged noble sons to military careers. An absolute monarch, he enforced his personal Calvinist values of frugality, piety, severity, discipline, diligence, punctuality, efficiency, and obedience upon the whole nation. He was brutal, unforgiving, coarse, and often cruel. As Thomas Carlyle put it, he ruled like a “drill sergeant.”

Frederick William used his army only once during his entire reign, toward the end of the Great Northern War. He forced Sweden to cede Stettin to Prussia in 1715, and annexed Pomerania by the Treaty of Stockholm in 1719, with a small additional payment in 1720. He successfully disguised his growing military might by pretending to neighbor nations that he merely loved military parades. Austria, especially, was convinced that these frequent displays would have no relevance on the battlefield.

Frederick William I died in Potsdam on 31 May 1740 and bequeathed to his son, who became Frederick the Great, a bulging treasury, a magnificent army of 85,000, and a proud nation.

Fredericksburg (11–15 December 1862)

A bloody repulse for the Union. In early November 1862, President Abraham Lincoln had replaced George McClellan with Ambrose Burnside as commander of the Army of the Potomac; McClellan was too cautious and Lincoln understood that to win the North had to fight.

Burnside in mid-November moved the army quickly from camp near Warrenton, Virginia, to cross the Rappahannock River at Fredericksburg; he soon had his entire command at the rain-swollen river. He intended a quick series of marches to force the Confederates to fight for their line of communications to Richmond, but the lack of pontooning material caused the Union army to sit while Robert E. Lee concentrated the Army of Northern Virginia south of the town. Lee had placed his army in very strong defenses, anchored by a sunken road and a stone wall along Marye's Heights, behind stone walls and wood fences reaching down to Jeb Stuart's cavalry who anchored the Confederate right. Union artillery on Stafford's Heights could reach the town but not the Confederate emplacements, and vice versa. Any assault would be near suicidal.

On 11 December, Union engineers threw five pontoon bridges across the river under fire (Lee had some sharpshooters in the town to disrupt the engineers). Union troops crossed the river the next day and on 13 December charged the well-dug-in Confederates, with very high casualties—13,000—nearly three times as many as the Confederates suffered. Indeed, in some places, Lee had his men standing five deep to keep up a continuous, murderous volley of fire. Two days later, a shaken Burnside cancelled the offensive, and the men returned to the heights on the north side of the river.

French, John Denton Pinkstone, First Earl of Ypres (1852–1925)

British field marshal, first commander of the British Expeditionary Force (BEF) during World War I. French was born on 28 September 1852 at Ripple, Kent. He spent two years in the Royal Navy before entering the militia in 1870. Four years later French transferred to the army. After serving in Britain,

India, and Egypt, he achieved prominence with his successful performance as a cavalry commander during the Boer War. In 1912 French was appointed chief of the imperial general staff.

With the outbreak of World War I, French was selected to command the BEF. After being defeated at Mons in August 1914 he ordered a retreat. During these early operations French failed to coordinate closely the movements of the two corps under his command. Only General Sir Horace Smith-Dorrien's decision to fight a rearguard action at Le Cateau slowed the German advance. During the retreat French lost his nerve and decided to withdraw to the French port of Saint Nazaire. The intervention of the secretary of War, Lord Kitchener, was required before French agreed to participate in the Allied counteroffensive.

After the BEF was transferred to Flanders, French stalemated the German attacks at Ypres. He in turn launched several offensives designed to breach the German lines at Neuve Chapelle, Auber Ridge, Festubert, and Loos; all ended in failure.

Possessed of a mercurial personality, French blamed others for the setbacks in France and constantly quarreled with his subordinates. Amid concerns for his competence, French was forced to resign at the end of 1915.

Following his resignation, and to keep him out of trouble, French was assigned as commander in chief, Home Forces (1916–1919), and as lord lieutenant of Ireland (1919–1921). He died on 22 May 1925 at Deal Castle, Kent.

French and Indian War (1759–1763)

Known in Europe as the Seven Years' War, this conflict destroyed French power in North America. Three times previously the American colonists and the French in Quebec had fought as part of larger conflicts between the British and French Empires. And three times the gains and losses in North America were bargained away because of more important possessions in the West Indies, Africa, and India.

The last of these wars, the French and Indian War, would be different. The British prime minister, Sir William Pitt, chose to hire mercenaries to contain the French on the European continent while he concentrated British power on con-

quering French colonial possessions. Despite some fits and starts and perhaps less than ideal cooperation by American colonial governments and militia, the British ultimately secured a great victory over the French in North America, adding greatly to the British Empire, and perhaps inadvertently beginning the process that would lead to the American Revolution a decade later.

Pitt put the wealth of Britain into the war effort. He sent large armies transported by huge navies to the New World; he purchased supplies from colonial purveyors; he engaged colonial militia and rangers. And he kept his focus on the objective—winning Quebec.

The conflict started badly for the British in 1755. General Edward Braddock refused to compromise with the colonial terrain, and marched in rather traditional style from western Virginia toward Fort Duquesne at the junction of the Ohio, Allegheny, and Monongahela Rivers. His advance force was surprised by the French and their Native American allies, and Braddock's attack turned into a disastrous retreat. Braddock's defeat (and death) was compounded by failure to take Fort Niagara; New Yorkers more welcomed trade with the French and Iroquois than they favored supporting General William Shirley's plan to attack Niagara. The French continued their successes on Lake George, at Fort Oswego, and elsewhere.

Several years later, in 1758, the weight of British (and colonial) power began to be felt in the conflict. Pitt became prime minister, and he brought focus and determination to the conflict. The British under General John Forbes once again attacked Fort Duquesne, this time advancing from western Pennsylvania in the fall. The attack succeeded, the French retreated, and the British cut off Quebec from French Louisiana. Also that year, another offensive commanded by General Jeffrey Amherst sailed from Halifax, Nova Scotia, to attack Louisbourg, a French fort on Cape Breton Island, guarding the entrance to the Gulf of St. Lawrence and the St. Lawrence River, the route connecting Quebec and France. Amherst landed west of Louisbourg, brought up siege weapons, and the fort surrendered. However, an attack against Fort Ticonderoga on Lake George did not fare as well, and the British rather unexpectedly retreated whereas the French commander expected a continuation the next day and he, in turn, contemplated retreat.

The victories of 1758 were completed by greater victories in 1759. General Amherst gained control over Ticonderoga, which the French had blown up. Meanwhile, General James Wolfe sailed to Quebec, approached the city from the western side, engaged in the penultimate battle on the Plains of Abraham against the French commander, the Marquis de Montcalm, and the British compelled the surrender of the citadel. (Both Montcalm and Wolfe died in the battle.)

In 1760, Amherst compelled the surrender of Montreal,

and the French had lost their colony in Quebec. The war would drag on for another several years as the conflict expanded to include the Spanish, which made Cuba and Gibraltar areas of operation. The French and Indian War—the Seven Years' War elsewhere—was a great, but ultimately a costly, British victory.

French Army

The army of the French king was respected and feared in early modern Europe. It became the French army when the revolutionary government transformed it into a mass organization based on universal conscription and replaced most of the aristocrats in the officer corps with experienced non-commissioned officers. This revolutionary army was organized into divisions, each with infantry, artillery, and cavalry, to provide better command and control. Napoleon soon organized the divisions into corps to support more flexible tactics, ease problems of logistics, and speed marches by utilizing several simultaneous lines of advance. Combining these organizational changes with significant tactical advances, Napoleon harnessed the best ideas of military innovators to create the first modern army. The restored monarchy introduced limited conscription, which, combined with a seven-year term of service, produced a long-service army with high rates of reenlistment. This army fought numerous colonial campaigns, muddled through the Crimean War, and acquitted itself well in the bloody bayonet charges of the 1859 war against Austria, but was no match in 1870 for the Prussian mass army created with universal conscription and a carefully organized reserve system.

The French army of 1914, with 48 active and 37 reserve divisions, performed well against the German army whose 51 active and 67 reserve divisions had to defend also against Russia. Eventually, France mobilized 7.5 million troops, of which about 1.4 million were killed and up to 4.5 million

wounded or missing. Such heavy losses led some divisions to mutiny in 1917, and postwar military plans emphasized the defensive. After quick defeat at the hands of the Germans in 1940, the greater part of the army remained loyal to the collaborationist Vichy regime while some personnel and units joined the Free French forces on the Allied side.

After 1945, the French army bore the burden of homeland defense (in cooperation with the North Atlantic Treaty Organization nations after 1950) and the quashing of Indochinese and Algerian liberation movements. Failure in this latter enterprise ate at army morale, and in the late 1950s the rightist Secret Army Organization (OAS) attempted to force the government's hand in Algeria but the situation was defused by General Charles de Gaulle. In 1966, he withdrew France from military participation in NATO.

France's defense reorganization of 1997, aimed at more rapid deployment and more efficient operations outside France, created an army of nine brigades composed of four to seven battalions of infantry, artillery, and engineers; two logistics brigades; and one air mobile brigade. The force-level target for the year 2002 was 16,000 officers, 50,000 non-coms, 66,500 enlistees, 5,500 volunteers, 30,000 reservists, and 34,000 civilian employees.

As was the case with the British army, the French army had to undergo a wrenching adjustment to the postwar reality that France was no longer a major power. Perhaps because of the catastrophic 1940 defeat, the French army fought to hold French colonial possessions longer than did the British. But by 1962, with Algerian independence, France was at peace, its global *mission civilitrice* limited to economic and cultural aid to former colonies. In addition to various United Nations peace-keeping duties, the French army gave good service in the Gulf and Balkan Wars.

French Colonial Wars (1800–1939)

During the nineteenth century and the first part of the twentieth, the French waged small wars to acquire addi-

tional colonies. In 1830, they occupied Algiers and deposed the bey, ostensibly to solve the piracy problem. Resistance in the interior led to the appointment of General Thomas Bugeaud commanding 59,000 French troops. Seeing static blockhouse as ineffective in the face of Algerian raiding, Bugeaud developed light infantry and cavalry units, *voltigeurs*, *chasseurs*, *zouaves*, and *turcos*, and adopted an attacking infantry-square formation, the *bull's head*, to be employed with cavalry, the *bull's horns*. Using flying columns to destroy infrastructure, Bugeaud drove the opposition leader, Abd-el-Kadr, into Morocco and destroyed his army at Isly on 15 August 1844. The main resistance eliminated, intermittent pacification campaigns continued for nearly 40 years. This experience, from intervention on a pretext, to use of superior firepower by small swift units, to lengthy pacification efforts, provided the blueprint for subsequent conquests.

From trading posts developed in Senegal in the eighteenth century, France seized posts on the Ivory Coast in 1842–1843, and from them fought three wars against the Mandingos between 1885 and 1898 to establish a French protectorate over the area. Between 1854 and 1864, French troops fought their way gradually from Senegal to the upper Niger. From there, they launched operations between 1883 and 1890 along the Dahomey frontier and in two short wars in 1889 and 1892 annexed Dahomey. Columns from Algeria and Congo converged to conquer Chad in 1899–1900, with eastern Chad finally succumbing in a campaign lasting from 1909 to 1911. France exercised a protectorate over coastal areas of Madagascar from 1859 and a war from 1883 to 1885 extended the protectorate to the whole island. In 1895–1896, the capital was taken and the island was made a French colony. From bombarding Casablanca and occupying the Moroccan coast in 1907, the French proceeded to claim a protectorate over Morocco in 1911. Only after a joint French-Spanish force put down the Riff rebellion of 1925–1926 was the country fully in French control. In 1908–1909, the French conquered Mauretania.

In Southeast Asia, half a dozen years of clashes with the king of Cochin China led to French occupation of Tourane in 1858. After moving to Saigon, the French were besieged there while other French forces in the region joined the British in attacking Peking, from 13 May to 18 October 1860, in the Second Opium War. When the siege was lifted in February 1861, the French speedily conquered the three eastern provinces. In 1863 they claimed a protectorate over Cambodia, despite Siamese protests, and suppressed a Cambodian rebellion in 1866–1867. By 1873, French pacification of rebellions in Cochin China led to the conquest of the three southwestern provinces. Ten years later, the capture of Hanoi and Hué led to a French protectorate over all of Vietnam,

precipitating a brief war between France and China. Uprisings in Vietnam, Cochin China, and Tongking occupied the French from 1885 to 1895. In 1893, French gunboats threatening Bangkok compelled acceptance of a French protectorate over Laos and cession of western Cambodia.

The most intriguing episode of the French colonial wars was the attempt by Emperor Napoleon III to set the Austrian archduke Maximilian on the throne of Mexico. Intervening in a civil war in 1862, French troops marched on Mexico City. Maximilian wore the crown briefly before the project was abandoned in 1867 in the face of opposition from the United States.

In pursuit of its League of Nations mandates in the Middle East after World War I, French forces ejected the Emir Faisal out of Syria in 1920 and fought an insurrection by the Douses in Lebanon in 1925–1926.

In the post-World War II era of violent anticolonialism in the colonies and growing resistance to imperialism in the mother countries everywhere, the French fought a series of losing actions to retain something of their overseas empire. They progressively lost their holdings in northern Vietnam, Africa, and, finally, Algeria (the latter was actually considered a part of Metropolitan France). Although France enjoys strong cultural ties with some of its former colonies, particularly in Africa, its actual overseas holdings today consist of two tiny islands in the mouth of the St. Lawrence River.

French Foreign Legion

Legendary fighting force. King Louis-Philippe created the French Foreign Legion on 10 March 1831 to enlist foreign nationals who flocked to France during the 1830 revolution. Legionnaires served only *outside* France, which had the double advantage of providing France with troops and taking foreigners who might join revolutionary groups out of the country.

Over time the legion grew into a multinational, polyglot force whose composition mirrored instability around the world. Men joined to escape economic, social, or criminal problems in their own countries, their families, or simply to pursue adventure. They served under predominantly French officers in all of France's colonial wars, from Tonkin, Da-

homey, Madagascar, Morocco, and Mexico to service in France itself during World War I.

Along the way legionnaires became legendary for their bravery, and the legion developed an almost mythical reputation as a haven where men could reinvent themselves with new identities. Newspapers, magazines, and eventually films capitalized on these legends and myths, portraying legionnaires as colorful and violent characters with an exotic reputation for adventure.

Since World War I, the legion has added to its reputation for bravery, fighting in Algeria, Indochina, the Persian Gulf, Egypt, Chad, World War II, and throughout the French Empire. Legionnaires were involved in an abortive coup in 1961, but for the most part have served France with distinction by fighting the unpopular, dirty wars that French nationals are less willing to fight themselves.

French Revolutionary Wars (1792–1802)

A series of military conflicts between France and the European powers from the French declaration of war on Austria in April 1792 to the conclusion of the peace treaty of Amiens

between France and Britain in March 1802, which ended the Revolutionary period and ushered in the Napoleonic Wars.

From the outset, the French Revolution aroused the hostility of all European crowned heads who feared that the new ideas of liberty, equality, and fraternity could spread beyond the French frontiers and stir up upheavals among the people in their own countries. Likewise, the French émigré nobles abroad added fuel to the war fervor as they had long been trying to goad the European rulers to intervene and suppress the revolution. Friction with Austria intensified when King Louis XVI and his wife, Marie Antoinette, tried to flee abroad in June 1791 and join the enemies of the Revolution. Finally, the Pillnitz Declaration issued by the Austrian and Prussian rulers on 27 August 1791 made it clear that they would intervene in France and restore the power of King Louis if the rest of the European powers would join them. The French interpreted the declaration as an act of interference in the internal affairs of their country.

The push for war came from inside France. When Austria and Prussia concluded a military convention in February 1792, the Legislative Assembly responded by declaring war on Austria on 20 April 1792.

But soon the French troops suffered a series of military setbacks. Although the army had numbers and enthusiasm in 1792, it was nevertheless in a state of confusion and lacked discipline. The majority of the officer corps had either resigned or emigrated. Regulars and volunteers were amalgamated, but could not face a well-trained and disciplined allied army. An attempt to invade Belgium ended in complete disaster. Demoralized, the French soldiers turned against their officers, murdering them, while entire army units deserted to the enemy.

Meanwhile, the Austro-Prussian forces under the duke of Brunswick crossed the border and advanced toward Paris. On 25 July 1792, the duke issued the famous Brunswick Manifesto threatening to raze the capital if the royal family were endangered. The Legislative Assembly proclaimed France in danger. In Paris the revolutionaries accused King Louis of conspiring with the Austrians. Tension grew in the capital when a crowd of sans-culottes stormed the Tuileries palace on 10 August 1792 and arrested and imprisoned the royal family. In September, the new legislature, the National Convention, abolished the monarchy and proclaimed France a republic.

Two political parties dominated the Convention: the Girondins, a moderate republican group, and the Jacobins, a radical revolutionary faction. The immediate task of the Convention was the continuation of the war, which was going badly for France. Verdun surrendered on 2 September 1792, and Lafayette with his troops had already deserted to the Austrians.

The Convention decreed the enlistment of new volunteers. It reorganized and equipped the army and placed it under the command of Generals Charles Dumouriez and François Kellermann. Soon the republican army stopped the invaders and on 20 September 1792 won the first victory over the army of the duke of Brunswick at Valmy. The engagement, far from being an important military event, was nevertheless a victory of the revolutionary army and a turning point in the war against Austria and Prussia.

In the autumn of 1792 the French continued the offensive. The Prussians evacuated Verdun and General Adam Custine actually occupied Mainz and Frankfurt. Dumouriez defeated the Austrians at Jemappes, took Brussels, and occupied the Austrian Netherlands, roughly modern Belgium. French troops entered Savoy and Nice and their patriots requested annexation to France.

But there were sharp disagreements on the question of annexation. In the end, the Convention abandoned the *no conquest* formula and decided that France should achieve its “natural frontiers.” Far from acceding to the wishes of the liberated people, the Convention—which had proclaimed the right to intervene anywhere where the people aspired to regain their liberty—now took the first step toward conquest and annexation.

Meanwhile, the execution of King Louis in January 1793 and the annexation of Belgium and most of the Rhineland forced Britain to form the First Coalition against France. Russia, Austria, Prussia Spain, Holland, and Sardinia joined in.

France was now confronted by an almost universally hostile Europe. In response, the Convention boldly declared war on Britain, Holland, and Spain in February 1793. The Austrians pushed the French out of Belgium, defeated General Dumouriez at the Battle of Neerwinden, and a few weeks later he abandoned his troops and also defected to the Austrians. In southeastern France, the British besieged and captured the port of Toulon. The troops of the republic had suddenly once again been pushed back on all fronts.

In Paris, the Jacobins and a large crowd stormed the Convention on 2 June 1793, expelled the Girondin deputies, and took control of the government.

Once in power, the Jacobins faced a dangerous war situation and widespread antigovernment outbreaks throughout the country. To deal with the internal and foreign crises, the Jacobins set up the Committee of Public Safety and instituted the Reign of Terror to win the war efforts and to suppress the revolts of the Girondins, royalists, and Catholic clergy.

On 23 August 1793, the Convention issued a *levée en masse*—universal conscription of all single men, age 18 to 25, to defend France. The revolutionary army employed new military tactics, with heavy emphasis on the use of artillery

and rapid mobility of the cavalry. Promotion was based on merit. Patriotism animated the new citizen army. In December 1793 the republican army took the offensive against the Coalition armies, forcing them to retreat across the Rhine, while the young colonel of Artillery, Napoleon Bonaparte, helped wrest the city of Toulon from the British.

In Paris, control of the government passed from the realist Danton, the great patriot who had inspired the events of 10 August 1792, to the idealist and revolutionary Maximilien Robespierre, who would dominate the Convention until July 1794.

Robespierre was a fanatical follower of Rousseau, who dreamed of establishing the Republic of Virtue through the Reign of Terror. He cracked down on the Hebertists, the Paris group who wanted to carry the economic revolution further, and guillotined the Dantonists, who called for an end to the Terror. After General Jean Jourdan’s victory at Fleurus against the armies of the First Coalition in June 1794, when the initiative on the Continent favored France, terror seemed increasingly unnecessary. Finally, reacting to the excesses of Terror, the moderate faction in the Convention and Robespierre’s opponents in the Committee of Public Safety brought him down in July 1794 and beheaded him.

The rule of the Thermidorians, as the period from July 1794 to the autumn of 1795 was known, brought the dismantling of the apparatus of Terror, the abolition of the Paris Commune, and the closing of the Jacobin clubs. In 1795 the Thermidorians drafted a new constitution and set up the Directory (1795–1799)—a political body of five directors jointly responsible for conducting France’s domestic and foreign affairs.

In the war against the European Coalition, the army of the Directory under Charles Pichegru and Jourdan drove the Austrians out of Belgium and occupied Holland in December 1794. Prussia, financially exhausted, withdrew from the war and concluded the Treaty of Basel in March 1795. Soon Spain and Holland made peace. The Polish revolt forced Russia to leave the Coalition. Only Britain and Austria remained at war with France.

The war against Austria continued during 1796–1797. Jordan invaded southern Germany, while Napoleon attacked the Austrians in Italy. The campaign in Germany, however, ended in failure, and only that of Italy succeeded. In the Italian campaign, Napoleon defeated the Austrians at the Battles of Millesimo, Lodi, Castiglioni, Roveto, Bassano, and Arcola in 1796. He struck at the Sardinian army at Mondovi, knocked it out of the war, and occupied the fortresses of Mantua and Milan in January 1797. He advanced toward Rome, but the pope hastily signed the Treaty of Tolentino.

In April 1797, Napoleon crossed the Alps and forced the Austrians to conclude the armistice of Leoben. Six months

later, they signed the Treaty of Campo Formio. Austria ceded Belgium and the Rhineland to France, but retained Venice, Istria, and Dalmatia. The Italian campaign effectively ended the First Coalition, and Britain alone still remained at war with France.

Next Napoleon decided to strike back at Britain. He organized the expedition to Egypt, ultimately hoping to invade India and deprive the British of their most precious “pearl of the English crown”—a most unlikely prospect from the start in view of British sea power. In May 1798, he sailed for Egypt with 350 ships, more than 30,000 troops, and a corps of scientists. He defeated the native Mamluk cavalry at the Battle of the Pyramids near Cairo in July. Admiral Horatio Nelson, however, destroyed his fleet at the Battle of the Nile, cutting him off from Europe. In early 1799, Napoleon set out for Palestine and Syria, but failed to capture them. He returned to Egypt in May and smashed a Turkish force at the Battle of Abukir. This victory left him free to consider his return to France. In August he sailed from Egypt, leaving General Kléber in command of the French army.

In the European theater, Britain formed the Second Coalition (December 1798), which included Austria, Russia, Naples, Portugal, and Turkey. During 1799, the Coalition armies defeated the French at the Battle of Magnano, while at the Battle of Cassano, the Austrian general Melas and the Russian army under Marshal A. Suvorov won a major victory over General Jean Moreau. Suvorov overcame another French army under MacDonald at the Battle of Tribia in June, while at the Battle of Novi, he and Melas routed the French under Joubert. Only General André Masséna was successful over the Russians under General Aleksandr Korsakov, driving them out of Zurich, while General Guillaume Brune defeated an Anglo-Russian force in Holland.

But soon the Second Coalition began to fall apart. In October 1799, Russia withdrew from it and made peace with France when Czar Paul I changed sides and revived the Armed Neutrality against Britain.

Back from Egypt, Napoleon staged the coup d'état on 9 November 1799, toppled the Directory, set up the Consulate, and proclaimed himself First Consul. He offered peace to the Allies, but they rejected his overture.

At the beginning of 1800 Napoleon renewed his campaign in northern Italy against the Austrians. Marching through the most difficult snow-covered terrain, he crossed the St. Bernard Pass riding on a mule, attacked the Austrians, and took Milan. On 14 June, he faced the main Austrian army under General Melas. With a force of only 22,000 men against 30,000 Austrians, he fought an obstinate battle at Marengo, turning a likely French disaster into an Austrian rout. The Austrians then asked for an armistice, but it was only after Moreau's victory at Hohenlinden (December

1800) and MacDonald's and Brune's invasion of Austria (January 1801) that the emperor negotiated the Treaty of Lunéville on 9 February 1801. By its terms, France annexed Belgium and all southwestern German territory, while Austria recognized the Helvetian (Switzerland), Batavian (Holland), Ligurian (Genoa), and Cisalpine (Lombardia) *republics*, which in practice became French dependencies.

Britain still remained at war with France until 1802. But both countries were now eager for a breathing spell. On 27 March 1802, they negotiated the Treaty of Amiens, which ended Anglo-French hostilities.

For the first time after 10 years of costly and bloody wars, Europe was at peace. Yet the peace of Amiens proved to be merely a brief truce. A year later, the second round of wars, the Napoleonic Wars, would begin and would last until 1815.

French Wars of Religion (1562–1598)

During the first half of the sixteenth century, the French monarchy struggled to gain control of France and its nobles. The eight distinct civil wars known as the French Wars of Religion constituted part of the greater religious conflict engulfing Europe following the Protestant Reformation. However, the age-old struggle between kings and nobles over economics, dynastic power, and foreign expeditions now included a new religious division between Catholics and Protestants. Some of the major noble houses converted to Protestantism while others remained Catholic. Opposition to centralized royal power began under Henry II when three aristocratic families—the Guise (Catholic) and Montmorency and Bourbon (both Protestant)—maneuvered for control of royal policy. The fanaticism and brutality of the soldiers made it a struggle in which pillage, cruelty, and atrocities were normal.

The Valois king Henry II faced considerable opposition to his attempts to centralize royal authority. The death of Henry II in a jousting accident in 1559 began a long period of royal weakness that would not end until the Bourbon Henry of Navarre took the throne in 1589. Henry II's death brought to the throne his sickly 15-year-old son, Francis II,

who reigned only two years. His successor was his 13-year-old brother, Charles IX. The queen mother, Catherine de Médicis, served as regent during both reigns and continued to be influential in the reign of her third son, Henry III (1574–1589).

The duke of Montmorency, constable of France, had immense landholdings and a personal following of several hundred vassals. When the Huguenot Montmorency converted other major nobles of France to the new religion, they became a truly dangerous political threat to the weak Catholic Valois kings who were not strong enough to eliminate Protestantism from France the way the Spanish had—with blood and fire. However, state institutions like the law courts and the royal family remained resolutely Catholic.

In 1562, François de Guise attacked, butchered, and burned hundreds of Protestants worshipping at Vassy, sparking the first of the Wars of Religion. Between 1562 and 1598, eight religious wars split France (1562–1563, 1567–1568, 1569–1570, 1573–1574, 1576, 1577, 1579–1580, 1585–1598). Both sides committed atrocities in an effort to rid their communities of what each side considered a cancer. When Catholics and Protestants gathered in the capital to celebrate the marriage of the king's sister to the recently converted Henry of Navarre, the festivities ended in violence. The 1572 St. Bartholomew's Day Massacre of 3,000 Protestants in Paris, including Protestant leader Admiral Gaspard de Coligny, was only part of the larger pattern of violence in the period, but it did spark a new fanaticism in France. Henry of Navarre renounced his conversion and the wars continued.

Catholic extremists, led by the Guise family, formed the Catholic League in Paris, bound and determined to control the monarchy. When Henry III had the Guise brothers assassinated in 1588 at Blois, the Council of Sixteen, which governed Paris, called for tyrannicide. In desperation, Henry III allied with Henry of Bourbon, descendent of Louis IX and the Protestant king of Navarre, and made him his heir. Following Henry's assassination in 1589, Henry of Navarre judged Paris "worth a Mass" and reconverted to Catholicism, becoming Henry IV and establishing the Bourbon Dynasty on the French throne, which would reign until 1792. He allied with a moderate group of Catholics called the *politiques*, and together they put France's needs ahead of religious differences. Henry IV issued the Edict of Nantes in 1598, which allowed freedom of conscience and equality of rights, but allowed Protestants to worship only in locations where they had already established strong communities.

The long-term impact of the Wars of Religion is certainly as important as the wars themselves. Population losses were severe in areas where fighting had been fierce. However, Henry IV came to realize that he required absolutism to

maintain social order in France and keep all the nobility in check, contributing to the rise of a larger state. Further, French national consciousness began to take shape in this period of civil war in a form of a proto-nationalism tied to the person of the king.

Friedland (14 June 1807)

A battle in East Prussia between French forces, ultimately numbering 80,000, commanded by Napoleon Bonaparte, and Russian forces, numbering about 46,000 under Levin, Count Bennigsen. In June 1807, the Russian army under Count Bennigsen began operations designed to assist their Prussian allies, besieged in Danzig and threatened in Königsberg. Although Danzig fell before any practical relief could be given by the Russians, operations continued. Napoleon, in an effort to keep the Russians from Königsberg, attempted to move between the Russians and the city. This led to a desultory battle at Heilsburg on 10 June and a Russian retreat. In a further effort to prevent the Russians from reaching Königsberg along an indirect route, Napoleon sent the corps of Jean Lannes to occupy Friedland, along the path of the Russian advance. Most of the French army moved toward Königsberg. Bennigsen, learning this, resolved to attack and defeat Lannes before he could be supported by the French.

Friedland sits in an oxbow formed by the River Alle. The town is further divided in two by a stream and millpond. Russian forces arrived late on 13 June and drove off French reconnaissance parties. Bennigsen then undertook the construction of three pontoon bridges across the Alle to supplement the existing bridge over the river. These completed, the Russians deployed on both sides of the millstream.

Early on the 14th, the battle began in earnest as the Russians sought to drive Lannes's French out of two villages near Friedland. Bennigsen failed to press his early superiority in numbers, and Lannes, realizing his danger, called for and received reinforcements. Napoleon arrived around noon, and ordered an attempt to destroy the Russian army, now fighting with its back to a river. By 1700 Napoleon felt

confident enough to attack the Russians, first on the southern side of the millstream, then on the north. Napoleon thus ordered Ney and Victor to attack in the south, and to destroy at least two of the pontoon bridges. The French attack, initially hidden by woods, enjoyed considerable success. Russian efforts at a counterattack failed as the French brought up artillery to bombard Russian troops being driven into an increasingly constricted area. In an effort to relieve the pressure on his southern flank, Bennigsen ordered an attack on the north side of the millstream. This failed and only diverted Russian troops from the fight in the south.

By 8.30 P.M. Ney had entered Friedland, and the retreating Russians set fire to the town. This only increased the danger faced by Bennigsen's army as the fire burned down the pontoon bridges. Complete disaster was avoided only by the Russian discovery of a ford over the river. Russian losses were between 18,000 and 20,000 men. The French lost about 8,000. As a result of the Battle of Friedland, Czar Alexander I of Russia found it prudent to open negotiations with the French. These led to the Treaty of Tilsit and an end to the 1806–1807 war between France and Russia and Prussia.

Fronde, Wars of the (1648–1653)

Series of unsuccessful attempts by French judges, nobles, provincial parliaments, and workers to limit royal power. The several insurrectionist parties were collectively called the Fronde, from a French word meaning “slingshot,” a common weapon of the time among poor people. When Louis XIV ascended the throne in 1643 at the age of five, his mother, Anne of Austria, ruled nominally as regent, but power actually rested with her prime minister, Jules Cardinal Mazarin, an Italian. Anne and Mazarin withheld judges' salaries and imposed oppressive taxes on the working poor in order to finance French involvement in the Thirty Years' War in Germany. The Parlement de Paris rejected these decrees in July 1648, ruling that they were illegal during a regency, especially in that the regent and her minister were both foreigners. Anne and Mazarin retaliated by arbitrarily arresting

Parisian judges, including the popular Pierre Broussel, on 26 August, and placing Paris under martial law. The Parisian public openly supported its parliament and erected barricades on 27 August. Anne surrounded Paris with troops, intending to starve the dissidents into submission.

Revolt did not abate when the Peace of Westphalia ended the Thirty Years' War in October. The mob gradually gained the upper hand in Paris, kept Anne and Louis under virtual house arrest in the Louvre, and frightened her into fleeing to Saint-Germain-en-Laye on 5 January 1649. News of the execution of English king Charles I hardened her resolve to centralize power and establish her son's invulnerability to public discontent. She ordered Louis II de Bourbon, Duke of Enghien, known as Condé the Great, to invade Paris and put down the revolt by any means necessary. He obeyed with brutal efficiency and was entirely successful. The pro-royalist Peace of Reuil was concluded on 1 April.

Mazarin grew fearful of Condé's ambition and had him arrested on 18 January 1650. This blunder only galvanized anti-Mazarin sentiment among the nobles, who were already jealously trying to protect their traditional feudal privileges from central authority. Sparked by Condé's sister, the duchess of Longueville, the nobles rebelled, first in Normandy and soon all over France. Chaotic civil war raged throughout 1650. As the advantage seesawed, Mazarin released Condé in February 1651 and went into brief exile.

Eager for revenge, Condé played on the general hatred of Mazarin among all classes. With some help from Habsburg Spain and Cromwellian England, by September he had placed himself at the head of the combined armies of the Fronde. The duke of Luxembourg was among his lieutenants. Condé captured Bordeaux, won the allegiance of Orleans, lost to the Viscount of Turenne's royalist forces on 6–7 April 1652 at Bléneau, then marched on Paris. On 2 July he and the duchess of Montpensier took Paris by defeating Turenne at the Bastille. Mazarin went into exile again. Anne and Louis returned safely to Paris in October after Condé's arrogance had alienated the Parisians. Condé and Turenne faced each other on many battlefields before Turenne finally wore Condé down late in 1652. Condé defected to Spain. Mazarin returned on 3 February 1653 as the insurrection fizzled, though various protests continued until his death in 1661.

The defeat of the Fronde paved the way for Louis XIV and Louis XV to rule as absolute monarchs. The dictatorial power of French kings was not again seriously challenged until the excesses of Louis XVI and Marie Antoinette incited the French Revolution.

Frunze, Mikhail Vasil'evich (1885–1925)

Revolutionary, Russian Civil War commander, political actor, military theoretician. An army doctor's son, Frunze was born in Pishpek (later renamed Frunze), Kirghizstan. He attended St. Petersburg Polytechnic Institute (1904–1907), but was expelled for poor class attendance. He joined the Social Democratic Party in time to be active in the 1905–1907 Revolution, leading a militia uprising in Ivanovo-Voznesensk in December 1905. He was imprisoned on political grounds in 1907 and exiled to Siberia in 1914.

In 1916 Frunze headed the Bolshevik underground in Minsk, agitating among the Third and Tenth Russian Armies, before heading the militia of the same city after the February Revolution. In October 1917, he led a workers' detachment in the Moscow uprising. In 1918, he held Ivanovo-Voznesensk Party and Military Commissar posts before participating in suppression of Left SR uprisings in Moscow (July) and Iaroslavl (August); he then served as Iaroslavl Military District's military commissar between August and December 1918.

Mikhail Frunze made his military reputation during the Russian Civil War, on the eastern front in 1919, serving as Fourth Red Army commander (January–March), then Southern Group commander (March–July) and eastern front commander (July–August), where he coordinated the Red offensives against Kolchak, splitting Kolchak's forces and capturing the North and Central Urals. As Turkestan Front commander (August 1919–September 1920), he planned the defeat of Kolchak's Southern Group and captured the Southern Urals before securing the Soviet grip in Central Asia, taking Turkestan and Kazakhstan. He then served in political posts there before appointment as Southern Front com-

mander (September–November 1920), where he defeated the final White force under Wrangel' in the Crimea.

From December 1920 to March 1924 Frunze held Ukrainian and Crimean military and political positions, also heading the Ukrainian diplomatic delegation to Turkey (November 1921–January 1922).

Frunze held a succession of high military posts after the Civil War. He was appointed deputy chairman of Revvoensovet (RVS, Revolutionary Military Council) of the USSR, and deputy peoples commissar for Military and Naval Affairs (March 1924); then Red Army chief of staff, head of the Red Army Military Academy (renamed Frunze Military Academy, 1925) in April 1924; chairman RVS USSR and peoples commissar for Military, Naval Affairs (January 1925).

Mikhail Frunze died in Moscow while reluctantly undergoing an operation for stomach ulcers. The surgery was on Stalin's orders, lending suspicion as to the actual nature of his death. Later, in the following decade, Stalin would not need to resort to such a subterfuge to eliminate popular army commanders whom he deemed as somehow a threat.

Although lacking formal military training, Frunze was an immense contributor to Soviet military development, combining his Marxist revolutionary convictions with military knowledge acquired during World War I and the Russian Civil War maneuver warfare. He wrote military works, inventing the idea of a distinct Soviet unified military doctrine, developed by Marshal M. Tukhachevsky (later killed by Stalin) and others after his death.

Fuller, John Frederick Charles (1878–1966)

One of the most important interwar military theorists; highly influential writer on the tactics and operational employment of tanks. Born on 1 September 1878 in Chichester, England, Fuller entered Sandhurst as a cadet in 1897. After being commissioned in 1878, he served in Ireland, India,

and in the Boer War. The event most significant for his career as a writer and theorist was his transfer to the Heavy Branch (later Tank Corps) HQ at Bermicourt, France, in January 1917. Fuller realized that the tank was the solution to the deadlock on the western front; the success of the Tank Corps was in great measure due to Fuller's ingenious schemes and tactical concepts, principally as operations officer from April 1917 to August 1918. He was largely responsible for the planning of the first mass tank attack at Cambrai in November 1917; he wrote a memorandum, Plan 1919 (24 May 1918), now regarded as the first blueprint for the blitzkrieg-style operations of World War II.

From 1918 to 1922 he served in the War Office, and from 1923 to 1925 as an instructor at the Staff College, Camberley. During the 1920s he published widely on mechanized warfare in military journals. In books such as *The Reformation of War* (1923) and *The Foundations of the Science of War* (1926) he advocated that war be treated as a science, discussing also future warfare and proposing wide-ranging military reforms. Fuller summarized his thinking on tank warfare in *Lectures on F.S.R. III (Operations between Mecha-*

nized Forces) (1932), a work that indicates that he saw the tank as an operational weapon. There is little doubt he influenced German and Russian armor theory and doctrine in the 1920s. However, he enraged conservative military opinion in Britain and was retired in 1933, albeit with the rank of major general.

In 1934 Fuller joined the British Union of Fascists and turned increasingly to journalism. Playing no military role in World War II, he was a strong critic of strategic bombing against Germany. After 1945 he devoted himself almost exclusively to military history. He died in Cornwall on 10 February 1966, the author of nearly 50 books.

G

Gage, Thomas (1721–1787)

British general and governor whose policies toward and critical reports about colonists helped lead to the American Revolution. Born in Firle, Sussex, in 1721, he joined the army in 1741 and was aide to the duke of Albemarle in Flanders and Scotland. He went to Canada in 1754 under General Edward Braddock at the disastrous attack on Fort Duquesne. He later served under James Abercromby at Fort Ticonderoga, was promoted to brigadier general in 1758, and later found success in operations in Quebec in 1759–1760.

Made governor of Montreal in 1760, he was promoted to commander in chief of all British forces in North America in 1763. Stationed in New York, he was in charge of enforcement of the Intolerable (Coercive) Acts in 1774 after the Boston Tea Party. Instead of quieting their rebellious activity, American colonialists became more agitated with the quartering of British troops in private homes, the closure of Boston Harbor, and the loss of some political representation. Realizing the tense situation, Gage unsuccessfully urged King George to pressure Parliament to repeal some of the Coercive laws.

In 1774, Gage was named the military governor of Massachusetts and ordered 700 British troops to march on Lexington and Concord on the night of 18–19 April 1775 to seize ammunition stores and arrest Samuel Adams and John Hancock. Local militia met British forces at Lexington and eight rebels were killed. In Concord, the redcoats encountered 400 patriots, with similar results. On the retreat to Boston, ambushed along the way by more than 1,000 patriots, 73 British soldiers were killed and 174 wounded. Instead of this open show of force ending hostilities, it sparked the American Revolution. On 17 June, Gage ordered a frontal attack on rebel forces occupying Breed's Hill (Battle of Bunker Hill). After heavy criticism for casualties, he resigned and was succeeded by General William Howe in October 1775.

Returning to England, he died on 2 April 1787, five years after being appointed a full general.

Gallic Wars (58–51 B.C.E.)

From 58 to 51 B.C.E., Julius Caesar waged a series of campaigns to consolidate Roman power over Transalpine Gaul. These began when the Helvetii, pushed from their lands north of Lake Geneva by the Suebi, sought to cross Roman territory in Provincia (Provence) en route to a new home in southwest Gaul. While negotiating, Caesar threw up an earthwork from Lake Geneva to the Jura Mountains and brought five legions into northern Italy. Orgetorix nonetheless led the Helvetii west, so Caesar drove them northward, destroyed their rear guard while they were crossing the Arar (Saône) River, and defeated them at Bibracte (Mont Beuvray). He sent them back to their homelands, then marched northeast and pushed the Suebi back across the Rhine, clearing Gaul of Germans. The tribes of Belgic Gaul then combined to attack Caesar's camp on the Axona (Aisne) River in the summer of 57 B.C.E. When the attack failed, they tried to withdraw and were defeated piecemeal by the Romans. The strongest tribe, the Nervii, were subdued in a

closely fought battle on the Sabis (Sambre) River. Though the maritime Gauls made their submission at this time, they rebelled in 56 B.C.E. under the leadership of the Veneti Tribe in Brittany. This rebellion was put down only after a difficult campaign in which Roman galleys had to be used against stout Gallic sailing ships with crews thoroughly familiar with the rocky coastal area. Caesar decided to consolidate his gains in the north and west of Gaul and to romanize the region. In 55 B.C.E. he destroyed a group of Germans crossing the Rhine near the Meuse, then bridged the Rhine and menaced the Suebi with a reconnaissance in force to end German infiltration. Late in the summer, he transported two legions to Britain in 80 vessels and engaged the Britons by both arms and diplomacy. The following year, he returned with five legions plus cavalry and defeated King Cassivellaunus in the field. At this point his conquest of Gaul was complete except for the necessity of putting down several rebellions. The most serious of these was an uprising in central Gaul led by Vercingetorix that was crushed by the Roman capture of Alesia (Alise-Ste-Reine) after a bloody siege in 52 B.C.E., though the mopping up took another year.

Galliéni, Joseph Simon (1849–1916)

French field marshal. Born 24 April 1849, at St. Beat, Haute Garonne, Joseph Galliéni attended St.-Cyr, graduating from there in 1870. Commissioned in the French Naval Infantry (marines), he fought with distinction in the Franco-Prussian War and then served in the French Empire, most notably in Niger, Senegal, Tonkin, and Madagascar. Between 1885 and 1905 he wrote five books describing his colonial experiences.

Galliéni returned to France in 1905 to command first XIII, then XIV Corps. He joined the general staff in 1908 and served there until his retirement in 1914.

At the outbreak of World War I, Galliéni was recalled to active service. On 28 August 1914, he became military governor of Paris and designated successor to French army commander General Joseph Joffre. When Galliéni learned that the German First Army had turned southeast of Paris, making it vulnerable to a thrust by his Sixth Army and Paris garrison, he pressed upon Joffre the need for an immediate counterattack. Although Joffre had overall responsibility for this decision, Galliéni dictated both the site and timing of the action. On the afternoon of 5 September, Sixth Army

opened the Battle of the Marne. Certainly, Galliéni's efforts helped prevent a German victory in 1914.

Galliéni was minister of war from October 1915 to March 1916, until poor health and disputes with Joffre over the defense of Verdun forced his retirement. He died at Versailles on 27 May 1916. Galliéni, perhaps the only French commander in 1914 to have escaped severe criticism, was posthumously promoted marshal of France in May 1921.

Gallipoli (1915–1916)

Abortive Franco–British Empire attempt to force an Allied path to Istanbul. The battle, which consisted of two main offensives from April 1915 to January 1916, was fought between the Allies and the Turks under General Otto von Sanders along six beaches on Gallipoli Peninsula. The Allied forces, which initially consisted of British, French, Australian and New Zealand (ANZAC), and Indian divisions, were commanded by General Sir Ian Hamilton and later General Sir Charles Monro.

The aim of the campaign was to land ground troops on the Gallipoli Peninsula and destroy the Turkish batteries, thereby making way for the navy to capture Constantinople. The Turks would then be unable to prevent the Allies from joining the Russians in their fight against Austria, Hungary, and Turkey. This objective was to be achieved by landing the main British force of 35,000 troops on five beaches at Cape Helles, while a smaller ANZAC corps of 17,000 men were to land 13 miles farther north. The landings were accomplished, but at heavy cost.

Fighting began on 25 April 1915. The British forces at Cape Helles tried to take the high position at Achi Baba, yet without a divisional commander on hand—he was safely off shore on board his command ship. The troops were disorganized and ill prepared to meet heavy resistance from the Turks. By the end of the first day's fighting they had gained little ground. The ANZACs who landed at Ari Birun (now known as Anzac Cove), a mile north of their objective, moved up the rocky slopes toward the high position of Chunuk Bair, but Turkish resistance under the command of

A photograph taken from the deck of H.M.S. Cornwallis showing British stores from Gallipoli burning in the background, 1916. (Library of Congress)

Mustapha Kemal drove them back to the beaches by nightfall. Without these two critical heights the Allies remained pinned down on the beaches.

Hoping to break the deadlock, Hamilton mounted a second assault on 6 August 1915 during which the newly reinforced ANZACs were to embark upon a night attack to take the heights of Chunuk Bair and Sari Bair ridge. British troops at Helles were to pin down the Turks, while three new British reinforcement divisions were to be landed at Suvla Bay to the north. While the holding attack at Helles and the Suvla Bay landing were initially successful, failure by the British to move inland and pursue these initial gains gave the Turks valuable time to get reinforcements up to the front lines. The failure of the Suvla Bay landing was made the more tragic because of the heavy losses sustained by the ANZACs as they became bogged down in the dark. For months

the Allies remained on the beaches, unable to drive the Turks from their hillside positions.

The stalemate was relieved only by the appearance of Lord Kitchener, who, after having inspected the battlefields, was so appalled with the situation that he recommended the complete withdrawal of all Allied troops. On 20 December 1915 Suvla Bay and Anzac Cove were evacuated, as too was Helles on 9 January 1916. The evacuation was completed without loss of life. In the nine months of fighting the Allies gained a few hundred yards at a cost of 41,000 British killed, 78,500 wounded; 9,000 French soldiers killed, 13,000 wounded; and 100,000 French, British, and ANZAC soldiers ill. The Turks lost 66,000 men who were killed in action and 152,000 wounded. The western front itself would be hard pressed to produce so little gain at so high a cost.

Gamelin, Maurice (1872–1958)

The general who calmly led France to disaster in 1940. Born into a military family, Maurice Gamelin was the top cadet of St.-Cyr (France's preeminent military academy) in 1893. He served in Africa before going back to the prestigious Ecole de Guerre, where he proved to be one of the brightest students: clever, educated, and hardworking. In 1906 he was appointed aide-de-camp to General Joffre, who would be his mentor. Gamelin became Joffre's aide during the Battle of the Marne before being sent to the front as a brigade commander. As a general in 1916, he commanded an infantry division through 1918. After the war, he made his way, slowly but surely, up the military hierarchy. He was made chief of the French general staff (1931) and eventually chief of staff of National Defense (1938). As the highest commanding officer, he was responsible for global French strategy and the main military adviser of the numerous French governments of the 1930s. Gamelin was seen as a fine diplomat and a cautious general, always preferring playing for time, and treading carefully where government was concerned. He promoted the overly scrupulous French diplomacy of appeasing Hitler. During the initial period of inactivity in World War II, Gamelin was commander in chief of the French and British armies on the western front. He was responsible for the Wait and See military strategy that produced the Phony War of the 1939–1940 winter. Fearing reprisals, he forbade any offensive action against Germany (bombing of the Ruhr or mining of the Rhine river). Gamelin located his headquarters in the Chateau de Vincennes in a Paris suburb to stay as close as possible to the government. He rarely visited front units and engendered little popularity.

From the beginning of the German invasion (10 May 1940), he was overtaken by events and took cover behind front commanders. His most famous written order of the day began: "without being willing to intervene in the battle in progress." He was sacked on 19 May 1940. In 1942 Gamelin was court-martialed for his failure and was turned over to the Germans. Set free in 1945, he spent the rest of his

life trying to justify his actions. Gamelin was an outstanding field officer but a wretched commander in chief.

Garibaldi, Giuseppe (1807–1882)

The most prominent figure of the Italian Risorgimento (resurgence), Italy's unification during the mid-nineteenth century. Garibaldi was born in Nice, in Napoleonic France, on 4 July 1807 to a family of sailors and grew up on the Mediterranean. He enrolled in Giuseppe Mazzini's Young Italy in 1833 and joined the Piedmontese navy in a failed nationalist insurrection a year later. In 1835, Garibaldi fled to South America, where he led independence movements for, first, Rio Grande do Sul from Brazil and then Uruguay from the Argentine. Upon his return to Italy in 1848, Garibaldi joined uprisings against Austria for Italian unity and established a brief Roman Republic, which was ended by the French, who supported the pope. By 1860, Count Camillo di Cavour had organized the unification of the northern Italian states into a kingdom ruled by Victor Emmanuel II of Piedmont. Garibaldi made it his goal to unify southern Italy with the northern states.

In 1860, Garibaldi led just over 1,000 nationalists, known as The Thousand, into Sicily, where he defeated a Neapolitan army at Calatafimi, near Palermo. He captured Naples and won a major victory in October on the Volturno River, only to be bypassed by Cavour, who opposed a republic and united northern and southern Italy himself in November. Although Garibaldi did not want a kingdom, his nationalism won out over his republicanism. In March 1861, the kingdom of Italy, excluding Austrian Venetia and the region around Rome, was declared.

In 1862, Garibaldi led another failed uprising to annex Rome into Italy and was wounded at Aspromonte. After helping to obtain Venetia in 1866, Garibaldi again sought Rome but was ultimately defeated at Mentana in 1867. He nonetheless lived to see the final unification of the Italian peninsula in 1871. Garibaldi spent the rest of his life supporting political reform in Italy and died in Caprera on 2 June 1882.

Gates, Horatio (1728–1806)

Ineffectual American field commander in the Revolutionary War and supposed victor at Saratoga. Gates was born in England, probably in April 1728. Intending a career in the British army, he was commissioned in 1749, stationed in North America, and soon made captain. Serving under Edward Braddock in 1755, he made friends with George Washington and was wounded at the Monongahela on 9 July. He participated in Robert Monckton's 1761 invasion of Martinique, became a major in 1762, resigned in 1772, and, with Washington's help, settled down as a Virginia planter in 1773.

Washington recalled Gates to active duty on 17 June 1775 as a brigadier general. For distinguished service in the Boston campaign, he was promoted to major general on 16 May 1776. From June 1776 until 4 August 1777, Gates and Philip Schuyler jockeyed for command of American forces in northern New York, but after Schuyler lost Fort Ticonderoga to John Burgoyne, Congress decided in favor of Gates.

Against Burgoyne's march toward Albany from Canada, Gates fortified Bemis Heights. When the British attacked at Freeman's Farm on 19 September, the tactics and courage of Benedict Arnold and Daniel Morgan won the decisive victory, despite Gates's overcautiousness. When Gates failed to mention Arnold in his official report, Arnold protested, and Gates relieved him of command. During the second battle of Saratoga at Bemis Heights on 7 October, Arnold simply seized command, again won the day, and again Gates took credit for Arnold's heroism. Gates received Burgoyne's surrender on 17 October.

Gates may or may not have been involved in the Conway Cabal against Washington, but he certainly stood to gain if it succeeded. In July 1780 he took command of the American troops in the Carolinas. A laughingstock and a disgrace after he turned tail and ran from the field at Camden, he was replaced by Nathanael Greene in October. He served in the New York state legislature in 1800–1801 and died in New York City on 10 April 1806.

Gaugamela, Battle of (1 October 331 B.C.E.)

The third and decisive victory of the Macedonian king Alexander III the Great over the Persians, led by Darius III, took place near Gaugamela in present-day northern Iraq. Although we know that the Persian force was huge, mustered from all over the empire, their exact numbers are difficult to assess. However, it severely outnumbered Alexander, especially in cavalry. Relying on this advantage, Darius positioned a line of some 40,000 horse and his 200 scythed chariots in the front. In the middle of this line Darius himself took position with his guard infantry (2,000) and his Greek mercenaries (2,000). The rear line consisted of an unknown number of Persian infantry.

Alexander had some 40,000 infantry and 7,000 cavalry at his disposal. In the center he positioned his Macedonian pikemen, flanked on the left by cavalry and light troops, and on the right by the guard infantry, Alexander with the guard cavalry and additional horse and skirmishers. In the rear, Alexander positioned a second line of allied Greek infantry as a reserve.

Darius planned to use his numerical superiority in cavalry to outflank the Macedonians on both sides. The Macedonians marched in oblique order, the right wing taking the more advanced position. The Persian cavalry attacked this part of the Macedonian army first. They were repelled and Alexander, leading his guard, attacked the Persian line and broke through. Thereupon he rode immediately toward the Persian center, ferociously attacking Darius himself. As at Issus, the Persian king turned and fled.

In the meantime the Persians had not been without success. A detachment of horse circumvented the Macedonian left and attacked the Macedonian camp. Persian cavalry in the center took advantage of a gap in the Macedonian line and fought their way through, only to be repelled by the second line. However, Persian resistance did not survive the flight of the king. Following his example, the army routed, suffering heavy losses during the Macedonian pursuit. Macedonian losses were limited, perhaps a few hundred dead.

de Gaulle, General Charles (1890–1970)

The personification of twentieth-century France. After attending St.-Cyr military school, where he distinguished himself in his knowledge of tactics, history, and geography, de Gaulle graduated in 1912, and was assigned to the 33d Infantry Regiment under the leadership of then Colonel Philippe Pétain. Entering World War I as captain, de Gaulle fought at the front but was captured at Douaumont on 2 March 1916. He made several escape attempts (five or seven depending on the accounts), all of which failed.

Returning from the war, Captain de Gaulle was assigned, at his request, to face off against the Red Army in Poland by helping train Polish officers, in 1921. He then became a history professor at St.-Cyr. Between 1925 and 1931, de Gaulle was assigned various tasks, from working as a member of Pétain's war cabinet, where he stunned his colleagues with his amazing memory, to serving in Syria before returning to work with the National Superior Defense Council. During the interwar years, de Gaulle published no fewer than four books on the military arts, preaching the importance of tank units as offensive weapons. These works had a limited impact, for they criticized the notion of defensive strategies, which the French high command swore by, thanks to their success in World War I. De Gaulle's 1938 volume, *La France et son armée*, caused dissension between him and his mentor, Pétain, and prompted other opponents to nickname him "Colonel Motor," after his obsession with mechanized units.

At the beginning of World War II, de Gaulle was assigned to head the 4th Armored Division. Local successes in staving off German advances in 1940 granted him a temporary field promotion to the rank of general and he was named assistant secretary of war in the last cabinet of the French Republic on 6 June 1940.

De Gaulle's call of destiny came when he rejected the armistice France had asked of Germany and left for London, where on 18 June he broadcast on the BBC a call to all French to carry on the fight. He also formed a Committee for Free France, which relied on support from exiled French and some of the French Empire's possessions. However, distrust

between him and President Franklin Roosevelt prompted the United States to first deal with the collaborationist Vichy government under the aged Pétain, Admiral Jean-Louis Darlan, and General Henri Giraud after the American landings in North Africa. De Gaulle then moved to negotiate an alliance with the head of the interior French resistance, Jean Moulin, and used his own growing prestige to push Giraud aside. By 1944, de Gaulle was able to assume leadership of the provisional French government, in the teeth of American and British resistance to him, following the liberation of Paris in August.

Dissatisfied with political infighting, de Gaulle resigned his position in 1946 and formed the Assembly of the French People Party (RPF) which called for a reorganization of the Fourth French Republic and preparation for a third world war, which de Gaulle thought imminent. In the 1948 elections, the party collected some 40 percent of the vote, but three years later fell back to less than 20 percent, with the republic still alive and no world war.

By 1953, de Gaulle had retired from political life, but five years later, during a crisis over the French war in Algeria, a consensus was reached between both colonial and anticolonial parties that de Gaulle alone could resolve the troubles. De Gaulle then used his temporary full powers to force through a new constitution, approved in September 1958. He was then elected first president of France's Fifth Republic in December. Over the following four years, he initiated a series of economic measures to assist the country's recovery and reaped the benefits of several projects begun under the fourth republic, including the acquisition of the atomic bomb in 1960. De Gaulle also established new military programs to assert further French independence from NATO (which he termed the "machin" or "watchmacallit"). First removing the nation from NATO's Mediterranean command, de Gaulle then refused to stockpile NATO nuclear weapons. When the U.S. proposal of a multilateral force involving Germany in nuclear weapons decisions failed in 1966, de Gaulle seized the initiative and took France out of NATO's integrated command in 1966, keeping it in the Atlantic Alliance only in name. Following the student and worker movements of 1968 de Gaulle held a referendum on political reform the following year. The rejection of his proposals prompted him to resign from office and retire to write his memoirs. He did not complete them, dying of a ruptured artery in his home in 1969.

It would be difficult to imagine any Frenchman more French than Charles de Gaulle (down to his very name). An aide responded to several foreigners that they should not take the general's hauteur personally; de Gaulle himself didn't like the French either, and the French didn't like themselves!

Gempei War (1180–1185)

War fought between the Minamoto and the Taira clans for control of Japan. It ended in the defeat of the Taira, and the formal establishment of the first shogunate under Minamoto Yoritomo in 1192 at Kamakura. The name is derived from the Chinese reading of the names of the two clans (Genji, and Heike or Heiji).

In the mid–twelfth century, the Taira supplanted the Fujiwara as the leading noble family at court in Kyoto. In 1159, conflict between the Taira and the Minamoto clans led to the defeat of the Minamoto, during what is called the Heiji Disturbance (Heiji-no-ran), and the murder of the head of the Minamoto, Yoshitomo (1123–1160). The head of the Taira, Kiyomori Taira (1118–1181), was named chancellor (*daijō-daijin*), and the Taira came to dominate the political life of Japan. In 1180, Yoshitomo's son, Yoritomo, revolted against the Taira, arguing that they had usurped the power of the emperor, and that the Minamoto would restore the proper order. Prince Mochihito, second son of the cloistered (or retired) emperor Go-Shirakawa, issued a decree outlawing the Taira and authorizing the Minamoto to destroy them. This decree provided moral and legal justification for the Minamoto cause, though it was later rescinded by Cloistered Emperor Go-Shirakawa himself, who issued a counterdecree outlawing the Minamoto.

Yoritomo was initially defeated at the Battle of Ishibashi Mountain in Sagami Prefecture and fled into the Hakone Mountains, narrowly escaping capture. Making his way to Kamakura, he marched almost immediately against the Taira in Suruga Prefecture. There the Taira and Minamoto armies encamped across from one another along the Fuji River near Kajima. In the night, a member of the Minamoto army startled flocks of birds nesting in the marshes. The Taira, mistaking the commotion for a night attack by a vastly superior foe, fled back to Kyoto and abandoned the cam-

paign in eastern Japan, preferring instead to maintain control of the capital and western Japan. The Minamoto did not pursue, remaining instead in eastern Japan to build up an army of supporters against the Taira.

In 1183, Yoritomo's cousin and vassal, Yoshinaka, on his own initiative, attacked and defeated the Taira in Etchu Prefecture, pursued them back to Kyoto, and captured the capital. There another decree was issued giving Yoshinaka authority to attack the now-outlawed Taira. He also sought a decree outlawing Yoritomo. Yoritomo's brother, Yoshitsune, was sent to subdue Yoshinaka, whose independent actions now threatened Yoritomo's position. Yoshitsune broke through Yoshinaka's defenses and took Kyoto with surprising speed; Yoshinaka was killed attempting to flee.

Yoshitsune then launched an attack against the Taira, winning decisive victories in the battles of Ichinotani in Settsu Prefecture, at Yashima in Sanuki Prefecture (on Shikoku), and at the naval battle of Dannoura off the western tip of Honshu. This final battle ended in a crushing defeat for the Taira, brought an end to the war, and gave the Minamoto control of Japan.

General Order No. 100 (24 April 1863)

The first codification of the law of war. Issued at the direction of President Abraham Lincoln, and at the request of General in Chief Henry Halleck, it was the enactment of a report by Francis Lieber, a German-American law professor at Columbia College in New York.

Titled *Instructions for the Government of Armies of the United States in the Field*, it augmented the U.S. Army's Articles of War, written (with few modifications) in 1775 to maintain discipline among the troops. The new order went much further, setting uniform and humane standards for the treatment and exchange of prisoners, the freeing of slaves, the treatment of people and property in occupied territory, and the treatment of opposing combatants.

The Order was a success in America. With one exception—Sherman's bombardment of Atlanta without warning—the Union army generally followed its strictures. The U.S. Supreme Court adopted it in *ex Parte Vallandigham* (1863).

GO 100 also influenced international law. Translated into German by Johann Bluntschli, it formed the basis of his *Das Moderne Kriegsrecht* (1866). Indeed the Lieber Code was reprinted intact in most international law texts for the next 50 years. Its terms and ideas influenced the European powers at the first Geneva Convention (1864) to agree to standards of treatment for wounded prisoners of war. International conferences at the Hague in 1899 and 1907 codified much of the Code regarding the definition of combatants and treatment of neutrals into the international laws of war.

Geneva Conventions (1864–1949)

A series of international conventions that laid out mutually recognized rules of modern warfare. The horrors of the Crimean War (1854–1856) highlighted the need for some sort of rules protecting the wounded and those who tend them. This sentiment culminated in the Geneva Conventions as first established in 1864 and then modified and extended three more times through 1949. Although idealistic in nature, the conventions themselves remained grounded in reality. They never ask that a nation do more than it is willing to do in the light of military necessity.

The first convention stipulated that belligerents treat hospitals, ambulances, and all medical personnel as neutrals in war. It also mandated that wounded and sick soldiers were to be cared for regardless of nationality, and that those giving such care, including civilians, would be protected from harm. Furthermore, those too wounded to continue fighting might return to their nation of origin as soon as practicable. This convention, however, did not extend to maritime conflict.

The 1906 Convention extended earlier protections to those at sea. The neutrality provision became “respect and protection” but extended such protection to nonduty hours also. It also provided for the burial of the dead and notification of such to the family.

The 1929 Convention extended the protection clause to medical aircraft and authorized the use of the Red Cross emblem in peacetime activities. It also boldly declared the

conventions binding, even if all the belligerents in a war were not signatories. Most noticeably, it called for the humane treatment of all prisoners of war, not just the wounded.

The final convention in 1949 watered down the earlier protection clause to allow belligerents to hold medical personnel as POWs rather than return them to their nation of origin. Nevertheless, this convention extended the earlier agreements regarding treatment of wounded and sick to civilians. It stated that any victims of war, military or civilian, should receive the widest possible safeguards consistent with wartime conditions.

At least in open societies, with a vigorous political opposition, the Geneva Conventions act as a line that military commanders or their troops must consider before crossing.

Genghis Khan (c. 1162–1227)

Founder of the Mongol Empire. Temüjin, later Cinggis-qan, a title assumed by him after his election as Mongolian supreme *qan* in 1206, and familiar to us in the Arabic form Genghis Khan, was born some time toward the middle of the twelfth century, son of a minor Mongolian chieftain. He grew up under most difficult circumstances, including the poisoning of his father by Tartar enemies and the abandonment of himself, his brothers, and his mother on the open steppe by his father's former retainers, a virtual death sentence. Despite these setbacks, young Temüjin, in part drawing upon the resources of his father-in-law in a marriage arranged shortly before his father's death, not only survived but prospered and eventually built up a following. This was possibly as an ally of the Chinese Jin Dynasty in the steppe, but this aspect of his career is obscure in our sources, perhaps intentionally so since the Jin Dynasty was later the mortal enemy of the Mongols.

By 1205, Temüjin had defeated his rivals in years of brutal conflict and his movement had begun to penetrate outside Mongolia. Initially this was in the form of small raids into sedentary domains closest to Mongolia, but as time

passed, and as the experience of the already militarized Mongols grew, more ambitious advances were attempted. The most ambitious of these, ultimately taking the Mongols as far as Russia, first began in a pursuit of defeated enemies and then continued as a vast reconnaissance in force into what is now Turkistan and then north into what is now northern Kazakhstan. These advances laid the groundwork for a still more serious assault beginning in 1217 led by the *qan* himself. It quickly overran the entire Khwarezmian Empire. Further advances continued into Iran, from where a Mongol detachment led by Jebe and Sübötei (1176–1248) advanced into Armenia and Georgia, and then north into Russia before returning to Mongolia, through the steppes north and east of the Caspian. In the meantime, other Mongol armies, in some years with the personal participation of the great *qan* himself, had conquered most of north China. Genghis Khan died in 1227 while completing the conquest of the Xixia Empire. His descendants consolidated his conquests and carried his empire to the suburbs of Vienna, into the Sinai, as far south as Java, and to points in between.

German Army

Its history has been influenced by the role of Germany as a predominantly land power, the need to defend long and vulnerable borders, innovation in fighting methods and military planning, but also by a failure to grasp the political dimension of strategy and by a persistent underestimation of its enemies' power in alliance.

The real origins of the German army lie in the military policies of Frederick William, the Great Elector of Brandenburg, who by 1678 had an army of 45,000 men, made up of mercenaries, socially disadvantaged members of his state, and some Junker (landowner) officers. Frederick William I later completed the process of creating an officer corps in which the aristocracy dominated; in 1739 all 34 generals were aristocrats. In 1740, Frederick II inherited a Prussian army of 83,000, an indication of the economic priority that the army had been accorded, given the population of 2,200,000.

The defeat of Prussia at Jena and Auerstädt in 1806 led to the introduction of the military reforms advocated by Gerhard Scharnhorst, August Niedhardt von Gneisenau, and Hermann von Boyen, most notably compulsory military service and the end to exemptions for the middle class; by midcentury the other states in the German confederation had followed the Prussian example. Prussia also led the way with its general staff system, exploiting in particular the military applications of railways. The fruit of these reforms was obviously seen in Prussia's victorious wars of 1863, 1866, and 1870–1871. Its dominance was confirmed when, after the creation of the German army, consisting of 18 army corps (13 in Prussia, two in Bavaria, one in Württemberg, one in Saxony, one in Alsace-Lorraine), the king of Prussia and German emperor was given the supreme command of all army corps in time of war. On 27 April 1871, the first memorandum by the Prussian-German general staff on a two-front war against France and Russia was issued. Follow-

ing the Franco-Russian Alliance of 1894, military planning came to be dominated by fear of a two-front war, leading to the Schlieffen Plan of 1905.

During the course of World War I, the German army performed consistently more effectively than its opponents at both the tactical and operational levels, achieving some notable innovations in infantry and artillery tactics. However, the army leadership failed at the strategic level due to its unwillingness to give up exaggerated territorial goals in the East with a compromise peace.

Following the defeat in 1918, left with 100,000 men as a result of the Versailles Treaty, the German army (Reichsheer) was forced to conduct much of its general staff and field training in secret; air and armor training was conducted in Russia, another pariah nation of the time. During the 1930s, sections of the army were impressed by Hitler because he favored mechanization, introducing an ideological element into military reform and a split between younger officers and older, more traditional generals.

In 1939 the German army was not entirely ready for war, having been subjected to a rapid program of expansion during the 1930s. However, it studied the lessons of the Polish campaign closely, which contributed to its remarkable defeat of France in 1940. The successful campaigns of 1939–1942 were marked by innovative new tactics, particularly in the use of armored forces and aircraft in a ground-support role (blitzkrieg, lightning war). But the influence of the chief of the army general staff had been reduced by the creation of the Wehrmacht high command, and the army lost influence on the direction of the war at the strategic level. All major decisions came to be made by Adolf Hitler, and the German army was decisively overwhelmed on all fronts in 1944–1945. No better army ever fought in a worse cause.

The victorious Allies completely demilitarized Germany after the unconditional surrender of the Wehrmacht on 8 May 1945. (Its two highest commanders, Wilhelm Keitel and Alfred Jodl, were executed in 1946.)

But eventually two new German armies were founded in postwar Germany, reflecting the Cold War division of the nation. The Federal Republic of (West) Germany's armed forces (Bundeswehr) were activated on 11 November (of all dates!) of 1955. The German Democratic Republic's People's Army (Nationale Volksarmee) followed on 18 January 1956. In both armed forces, the army was numerically dominant; in the East more emphasis was placed on Prussian army traditions (including the odious goose-step). With the fall of the German Democratic Republic (GDR) on 3 October 1990, the People's Army was officially dissolved and its personnel and equipment taken over by the Bundeswehr.

Limited German forces were deployed in the Gulf War (1990–1991), but their presence was kept as almost a mili-

tary secret, in view of the memories still held by older generations about the German army.

German Colonial Wars (1884–1919)

A short-lived “place in the sun.” The young German Empire did not establish colonies until 1884, and then mostly in areas of little economic or strategic value. It took the expenditure of military resources both to found and to maintain Germany's place in the sun.

Beginning in 1884 the German flag was raised over several territories in Africa: Togo, Cameroon, German Southwest Africa (Namibia), and German East Africa (Tanzania, Rwanda, and Burundi). In the Pacific, Germany also claimed possession of northeast New Guinea and the Marshall and Solomon Islands, with the close support of the German navy.

The first military action was in Cameroon in December 1884, when a naval landing party of 350 men defeated the forces of a pro-British chieftain. One of the leaders of this party was Lieutenant Reinhard Scheer, later commander of the High Seas Fleet during World War I.

The creation of German East Africa brought about more conflict, both with the sultan of Zanzibar and with Arab slave traders. A blockade of Zanzibar harbor in 1885 established the German presence. A subsequent blockade of the entire coast, this time in conjunction with the British Royal Navy in 1888, was directed against the slave trade.

As control of German territories extended further inland, it became necessary for the Germans to create a permanent protection force, the Schutztruppen. The Schutztruppen was composed mainly of native troops led by German officers.

In 1904, a large revolt by the Herero tribe broke out in southwest Africa. The Hereros were upset at losing their traditional pastures, and German traders had forced many Hereros into debt through unscrupulous practices. The impassable wastes between the Atlantic coast and the settled regions made transportation difficult: the Germans relied on

a single narrow-gauge railway line that could support only one train per day. Through quick raids the Hereros were able to keep the Germans off balance.

The German public was shocked to hear of the revolt and were angry at the army's inability to defeat the natives. This outcry led to 10,000 troops being shipped to southwest Africa. However, most of these troops were used just in pacifying the countryside. The only real battle of the revolt, at Waterberg on 11 August 1904, was fought before they arrived. A subsequent revolt in late 1904 by the Hottentots took nearly three years to quell simply because the vastly outnumbered natives used guerrilla tactics and avoided pitched battles.

Meanwhile, another revolt in East Africa was subdued with far fewer German soldiers. A number of tribes were persuaded of the magical properties of a potion of water, castor oil, and millet seeds. This "maji-maji" was said to turn German bullets to water. The uprising broke out in central East Africa in late July 1905. However, without any coordination between the various tribes, no serious threat was posed to German settlers. When the maji-maji was proven to be no defense against guns, the rebels quickly gave up the fight.

An unfortunate feature common to both uprisings was the harshness of German reprisals. In southwest Africa, the Herero population plummeted from 80,000 in 1904 to 15,000 in 1911. In East Africa, the rebelling tribes were punished by having their crops destroyed; the resulting famine killed between 250,000 and 300,000 people, more than 10 times the number of natives who had taken up arms.

The empire was in no position to defend itself against Allied assault when World War I began in 1914. In Oceania, the German island chains were unprotected and easily taken by Australian and Japanese forces. The only resistance of note was by the port of Tsingtao, taken from China in 1897. Although a Japanese force laid siege at the outbreak of war, Tsingtao was not taken until 7 November.

In Africa, Togo was quickly overrun, Cameroon offered little resistance, and German Southwest Africa was taken by South African units. However, German East Africa posed an unexpected obstacle. The German commander, Colonel Paul von Lettow-Vorbeck, was a skilled jungle fighter. His Schutztruppen launched offenses against British-held Kenya. As well, the six-inch guns from a stranded German light cruiser were put to good use. The Schutztruppen in East Africa did not surrender until late November 1918 and the Armistice.

The German colonial empire produced no economic or political gain for Germany, rather the opposite when the costs of defense are weighed. Nevertheless, matters of honor dictated that Germans abroad should defend their newly acquired territories against both insurrection and foreign

invasion. In the end, the German legacy in these areas vanished.

German Wars of Unification (1864–1871)

Three Prussian wars against Denmark, Austria, and France, engineered by Prussian chancellor Otto von Bismarck, through which Germany was unified. Denmark's attempt to assert constitutional control over the duchies of Schleswig and Holstein in 1863, in violation of the London Treaty of 1851–1852, sparked a war with Austria and Prussia. An Austro-Prussian force of 57,000 under the command of General Wrangel, occupied Holstein without incident on 21 January 1864. However, the Danish force under General Christian de Meza refused to evacuate Schleswig. On 1 February, Wrangel's forces crossed the Eider River, stormed the Dannevirke fortifications, and forced Meza and 44,000 Danes to retreat. After a siege from 2–18 April, the Dybbol fortifications capitulated.

The war resumed on 26 June, after an armistice during the London Conference, and 24,000 Prussians landed on Als Island. The war ended 20 July, and Denmark relinquished claims to the duchies by the Treaty of Vienna on 1 October. According to the Treaty of Gastein, August 1865, Austria would administer Holstein while Prussia would administer Schleswig. At the conclusion of this, what became known as the first war of German unification, Prussia became the dominant regional power.

Prussian chancellor Otto von Bismarck realized that Austria would contest Prussia's growing dominance. Bismarck made diplomatic gestures to gain Europe's benevolent neutrality in case of an Austro-Prussian conflict. To this end, he prevented Prussian Poles from aiding Russian Poles in revolt during 1863.

In 1865, Napoleon III was given tacit Prussian support for French ambitions in Belgium and Luxembourg. A Prussian alliance with Italy was concluded in April 1866. In response, Austria mobilized and brought problems of joint administration of Schleswig-Holstein before the Frankfurt Diet. Bismarck took this opportunity to accuse Austria of

breaching the Gastein Convention and marched Prussian troops into Holstein. Hostilities began on 16 June when Prussia invaded Hannover, Saxony, and Hesse.

Although a quarter of the Austrian army was stationed along the Italian border, the remaining Austrian and southern German forces were still numerically superior to the Prussian army. However, the former lacked a coordinated strategy.

The expansion of railways 1840–1870 enabled the Prussian general staff to transport a mass army in a short period of time. The railway also reduced the loss of manpower and supply due to exhaustion from forced marches to the battlefield. The Prussian infantry was empowered by the Dreyse needle-gun, a breech-loading rifle that increased the rate of fire and made it possible for the soldier to load on the move. Firepower was also made more accurate by the advent of conical bullets. These two innovations forced enemy artillery to reposition to the rear.

Count Helmuth von Moltke, chief of the Prussian general staff 1858–1891, rapidly marched two armies into Bohemia; the army commanded by Prince Frederick Charles marched toward Muchengratz, and the army commanded by Crown Prince Frederick William, toward Trautenau-Nachod. Moltke's Austrian counterpart, Marshal Ludwig von Benedek, ordered a retreat to Sadowa after his generals Eduard Graf Clam-Gallas and Wilhelm Ramming were defeated. The Prussian armies linked on 30 June 1866. On 3 July, 280,000 Prussians with 900 guns defeated 245,000 Austrians and 25,000 Saxons with 600 guns at Königgrätz/Sadowa. Rather than numerical superiority, it was the Prussian technique of organization and mobilization as well as flanking attacks that won the battle.

However, Benedek and 150,000 troops escaped encirclement due to Prussian error, and Moltke could not resume the advance to Wagram until 18 July. The Austrians asked for an armistice on 21 July, and the Peace of Prague was signed on 23 August. Bismarck forbade a war indemnity, Prussian occupation, or a victory parade through Vienna, thus wisely avoiding Austrian revanchist feeling. The North German Confederation was formed between Prussia and the German states north of the Main River. The result of this, the second German war of unification, was that Prussia emerged as the dominant German power.

The prospect of a unified German entity was against French policy from the time of Cardinal Richelieu. However, Bismarck realized that only a common German patriotism would convince the independent southern German states to ally under Prussia's political and military leadership. Bismarck's opportunity arose when Prince Leopold von Hohenzollern-Sigmaringen was offered the Spanish throne after a military coup ousted Queen Isabella II in September 1868.

French ambassador Count Benedetti protested to Prussian king Wilhelm I on 9 July 1870, while that monarch was at spa in Bad Ems, and received assurances that Leopold would retract his candidacy, which indeed occurred on 12 July.

Seeking guarantees, Benedetti revisited Wilhelm, demanding that Leopold never renew his candidacy. Having already given his word, Wilhelm considered the matter closed and refused to discuss the matter. Bismarck received a telegram of this conversation on 13 July and released it to the press. The reaction of the German public was to condemn French snobbery, while the outcry of the indignant French forced their legislature to declare war on 19 July 1870.

The Prussians possessed a two to one advantage over French forces, and since 1866, Prussian mobilization time had improved from five weeks to eighteen days. The Prussians also possessed a better order of battle, their peacetime army being organized into divisions, corps, and armies; the French were not organized beyond regiment level. The French railway system was efficient, but the military (still dreaming of Napoleonic glories) did not spend much time with such modern impedimenta. The only strategic plan was a series of arrangements to form armies around Paris, Lyons, and Toulouse. In comparison, the Prussian general staff produced a war plan in 1867, with regular revisions.

While the French chassepot was accurate at 1,600 yards compared to the needle-gun's 600 yards, the Prussian Krupp breech-loading cannon was a superior and more widely distributed artillery piece than the French *mitrailleuse* (machine gun).

Moltke reasoned that the French would be unable to assemble more than 250,000 troops or interfere with the concentration of Prussian forces west of the Rhine at the mouth of the Lorraine River. This was the only path for either army, besides a route through Belgium, because the Belfort Gap had been fortified by the French. Assembling their troops around Metz and Strasbourg, the French forces were separated by the Vosges Mountains.

On 1 August, Marshal François Bazaine advanced 7 kilometers into the Saar, but fell back on 2 August. The same day Prussian armies attacked: General Karl Friedrich von Steinmetz and 60,000 troops marched through the Lorraine Gap, Prince Frederick Charles and his 131,000 troops advanced on the right flank, the Crown Prince and 130,000 advanced on the left flank. The French force of Marshal Patrice MacMahon encountered at Wört 5–6 August, retreated through the Vosges, reaching Neufchateau on 14 August. The main French army was pushed beyond Spicheren on 6 August; however Steinmetz and Charles had advanced too far too fast and were unable to effect encirclement.

The Prussians sustained greater casualties but advanced due to their well-organized artillery and Moltke's empower-

ment of battlefield commanders to make tactical decisions. The French imperial headquarters at Metz began to issue contradictory orders, further complicating their tactical situation. On 9 August, a decision was reached that all French troops east of Metz should halt their retreat and repair to Metz.

However, while Bazaine received the order and halted, MacMahon continued toward Paris. On 12 August, Napoleon yielded as supreme commander, to Bazaine. The Prussians exploited the chaos, dividing the French forces and encircling the larger contingent commanded by Bazaine, at Metz on 16–18 August. This occurred after the battle at Gravelotte/St. Privat, while Bazaine attempted to retreat from the Moselle to the Meuse River.

MacMahon gathered remaining French forces at Châlons and, accompanied by Napoleon III, left to relieve Metz on 24 August. MacMahon effectively outflanked himself and had to abort the relief effort on 27 August, attempting instead to retreat to Mezieres. French communications broke down completely, and MacMahon reissued orders on 28 August for resistance to organize at Sedan.

The battle began 1 September, and MacMahon was immediately replaced by General Auguste Alexandre Ducrot after being wounded. Ducrot issued an order to retreat to Illy, but before it could be carried out, he was reprimanded and superseded as commander in chief by General Comte Felix von Wimpffen. Later that evening, Wimpffen, Napoleon III, and 104,000 troops capitulated at Sedan.

In Paris, the Third Republic was proclaimed by General Louis Jules Trochu and Minister of the Interior Léon Gambetta. Paris mobilized its National Guard as well as 72,000 sailors, for a total force of 300,000 to defend the capital to which the Prussians laid siege on 17 September. The Prussian force numbered 147,000 men along 15 miles of siege lines.

On 29 September, Bazaine and 154,000 troops surrendered at Metz. On 19 January 1871, 90,000 French troops failed to break out of Paris, which capitulated on 28 January.

Meanwhile, William had been crowned German emperor in the Hall of Mirrors at Versailles on 18 January 1871. The Peace of Frankfurt concluded the Franco-Prussian War on 10 May. Germany required France to pay an indemnity of 5 billion francs, and northern France remained occupied until the sum was paid in 1873. France also was forced to cede Alsace and eastern Lorraine. The result of this, the third and final war of German unification, was the creation of the German Second Reich. But the Franco-Prussian War also caused a lasting French bitterness that led to the European alliance systems that, 43 years later, were a major cause of World War I.

Germantown (1777)

Drawn battle of the American Revolution. On 4 October 1777, General George Washington's American troops engaged British general William Howe at Germantown, west of Philadelphia, producing an indecisive outcome and a continuation of the American Revolution. In October 1777, General Howe marched through eastern Pennsylvania in his drive toward the rebel capital, Philadelphia, attempting along the way to draw George Washington's army into a general battle. Failing to entice Washington, Howe settled into Philadelphia and ordered the main part of his force to camp in the vicinity of Germantown.

Pressured by the Continental Congress to dislodge Howe, and infuriated by the Paoli Massacre, Washington planned a complex, four-column operation against the British encampment. His forces advanced on the British in a dense fog, enjoying early successes, but many troops lost contact with their commanding officers, and several units exchanged friendly fire. Meanwhile, British troops found their way to a stone house in the American rear, owned by loyalist Benjamin Chew, which diverted attention from the point of attack. Both sides suffered heavy casualties, with the Americans losing more than 1,000 and the British 534. Washington called on General Nathanael Greene to organize a retreat, which was performed with great skill. Given his losses, Howe declined to follow, enabling the Continental army to continue the rebellion, but only after Washington's harrowing winter at Valley Forge in 1777–1778.

Portrait of Geronimo, Apache chief, c. 1907. (Library of Congress)

Geronimo (c. 1827–1909)

Apache medicine man and war leader. Geronimo, born around 1827, was originally named Goyathlay (He Who Yawns) by his Chiricahua Apache relatives. When his family was killed by Mexican troops during the 1850s, he set out to avenge their deaths, raiding north and south of the border.

Killing and stealing, he honed his skills as a combat leader. His fierceness as a warrior struck fear into the Mexicans upon whom his band usually preyed. They named him “Geronimo.”

Never a true chieftain, Geronimo initially fought under the great Cochise, building a reputation among his people as the most skillful Apache tactician. Forced onto a reservation in 1877, Geronimo broke out in 1881 and again in 1885. General George Crook with thousands of troops corralled him the first time, General Nelson Miles and thousands more troops the second time. Geronimo and his small band of warriors, accompanied by their women and children, led the army on wild chases back and forth across the desert Southwest. In both cases, Geronimo was eventually coerced into returning to the reservation once it became clear that

his exhausted people simply could not forever outrun, outwit, and outfight the U.S. Army.

Geronimo's surrender to Miles in September 1886 essentially ended the Apache Wars. Geronimo and others from his tribe were transported to military incarceration in Florida, and later, in Oklahoma. Geronimo, who had captured the imagination of the American people, appeared at the 1904 World's Fair and rode in President Teddy Roosevelt's inaugural parade. His exploits as a warrior were legendary, but his military efforts were ineffective in turning back American control of the region. Geronimo died of pneumonia in 1909 on the Fort Sill reservation in Oklahoma, as widely admired by white Americans as by his fellow aboriginal peoples.

Gettysburg (American Civil War, 1–3 July 1863)

The greatest battle ever fought in the Americas and the turning point of the American Civil War. The situation for the Confederacy in summer 1863 had worsened from the previous summer. Ulysses Grant had a bear-hold on Vicksburg, which, if it fell, would cut the Confederacy in half; the chances for foreign recognition had lessened; and total war was extracting a terrible price in the South.

After the Battle of Chancellorsville, Confederate general Robert E. Lee felt he had no choice but to invade the North. He believed another Union general replacing John Hooker eventually would commence another offensive, further destroying the Virginia countryside and forcing Lee's army to depend ever more on the agricultural bounty of the Shenandoah Valley. He was committed to the idea of the offensive/defensive. He hoped that a successful offensive into Maryland and southern Pennsylvania might cut the railroad lines connecting the East and Midwest, revive the northern peace movement, or cause U.S. president Abraham Lincoln to recall Grant and his army from the siege at Vicksburg and relieve the threat there.

On 3 June, Lee's Army of Northern Virginia began moving from camps near Fredericksburg and retraced ground from its invasion of the previous summer. Lee used the

mountains to shield his movement in a broad cartwheel around Washington, D.C. In late June, Lincoln replaced Hooker and appointed George Meade as commander of the Army of the Potomac. By mid-June, Lee's units were nearing the Potomac River, and soon thereafter began to move into Maryland and then into southern Pennsylvania.

On 1 July, the vanguard of Lee's army was approaching the quiet Pennsylvania market town of Gettysburg from the northwest, where it ran unexpectedly into the vanguard of Meade's army coming from Frederick, Maryland; the southerners had heard rumors of a supply of shoes, always a problem for the South. First Ewell's men and later A. P. Hill's drove Union troops back through the town and eventually the Union army settled into a strong defensive position atop Cemetery Ridge to the southeast of Gettysburg while Confederates occupied Seminary Ridge as reinforcements for both sides streamed to the emerging battlefield.

On 2 July, Lee decided to turn the flanks of Meade's army. He had agreed to a flamboyant cavalry raid by Jeb Stuart, thus denying himself the intelligence about the Union army he so desperately needed. And he seemingly forgot his ear-

lier promise to his senior subordinate, James Longstreet, that he would avoid a battle—particularly an attack—that would result in great casualties for the South. He felt the Union left might be “hanging” and Longstreet engaged in a roundabout approach to preserve secrecy, but he could not attack until about 4:00 P.M.; although the Union position was precarious, by nightfall Longstreet was unable to break the flank. Meanwhile, Richard Ewell attacked the Union right at Culp's Hill about the same time; again, when nightfall came, the Union position largely had held, for Meade had moved his reserves around well to meet the threats to his flanks.

The climax of the battle was on 3 July. Lee had decided on an artillery barrage by 160 cannon and then an attack by some 12,000 to 15,000 men right at the Union center. It was an awesome sight late in the afternoon as Confederate cannon fired—largely over Union positions—for two hours. Then troops from George Pickett's and James Pettigrew's commands crossed the 1,400 yards to the Union defenses. Union artillerymen and Union infantry poured shot and shell into the advancing Confederates. Lee lost more than 50 percent of his force, thus demonstrating the power of de-

fense, and as he watched his attack crumble, he turned to his subordinates, took complete responsibility for the failure, and asked them to help him save the army.

Fortunately for Lee, Meade did not follow up his victory by pursuing the retreating Confederates, and Lee was able to return to Virginia without much interference. The next day Pemberton surrendered to Grant at Vicksburg, and the war greatly worsened for the Confederacy.

The carnage at Gettysburg has never been surpassed in the Western Hemisphere: Of the 163,000 troops engaged, more than 6,000 died in battle, 22,000 were wounded, and an incredible 10,000-plus went missing.

western possessions in Iran fell in 1040 to the Seljuqs, and Sultan Ibrahim, who came to power in 1059 after a civil war, recognized Seljuq control of the west. Ibrahim reigned in Lahore for 40 years of relative peace. His son, Mas'ud III, revived the wars, seizing the Hindu town of Kanawj, but an accession dispute between his three sons after his death tore the empire apart. In 1150, the Ghurrids, another Turkish confederacy, captured Ghazna, virtually destroyed the city, and massacred or deported most of its people. Bahram-Shah, Mas'ud's heir, died in the wreck of his capital in 1157.

In 1163, the last of the Ghaznavid sultans, Khusraw Khan, was evicted from Ghazna and settled in Lahore as a Ghurrid vassal, but he and his sons were executed by the Ghurrids in 1190 after several sieges of the city.

Ghaznavid Empire (977–1180)

The Ghaznavids originated as a Turkish military force stationed by the Persian Samanid Dynasty in Ghazna on the eastern frontiers of Iran. Sebuktigin, their first notable leader, increased his autonomy through wealth raised by looting the Hindu cities of the Indus Valley. As the Samanid state declined, he put more lands under his authority, including Bactria and Baluchistan. A Sunni Muslim, he also raided the lands of the Ismaili Shia of Multan and Sindh.

His son, Mahmud, was probably the most significant figure of the dynasty. Taking control in 999, he spent much of his life campaigning on both his eastern and western frontiers. His forces expanded into Iran and into areas along the Oxus River. He took control of the Punjab and most of the lower Indus, founding mosques, schools, and other centers for propagating Islam, and raided into Sindh and the Ganges plain. He pounced on the temple city of Somnath in 1025–1026 and made off with 2 million dinars of gold and jewels, putting over 50,000 Hindus to the sword. Despite his distaste for those he called infidels and idolaters, Mahmud added Hindi infantry and elephant units to his Turkish cavalry, lancers, and bowmen. At his death in 1030, a number of Hindu rajahs in the Ganges had become his vassals.

The Ghaznavid Empire fell eventually to a combination of strong neighbors and internal disputes. The Ghaznavid

Gibraltar, Siege of (1779–1783)

Abortive attempt by French and Spanish to take the British stronghold. When France declared war on Great Britain in 1778, what had been a rebellion in the American colonies became a global war. France joined forces with Spain to attempt to unseat the British from one of their smallest but most strategic possessions, the fortress of Gibraltar at the mouth of the Mediterranean Sea.

This small but naturally strong bit of land joined to the southwestern tip of Spain was home to a well-fortified garrison; lacking natural resources, however, it had to be sustained from the sea. The French and Spanish allies recognized that it would be a straightforward operation to lay siege to the place and starve out the garrison, if they could prevent relief by Britain's superior navy.

Operations commenced in June 1779, with Spanish forces raising siege works on the landward side, and French and Spanish ships blockading the seaward approaches. The small garrison, commanded by General George Elliot, faced the cannonading and deprivation of supplies with dogged determination, and the besiegers themselves ran into many difficulties coordinating their forces. Twice, British fleets carrying provisions and reinforcements broke through the naval blockade, and in 1781 the garrison sallied out and destroyed many of the gun batteries on the landward side.

The attackers turned to technology to assail the harbor at Gibraltar. Knowing that the fortress could outgun normal warships, they constructed armored floating batteries, precursors to the ironclads of the next century. These gun platforms included elaborate water systems to douse heated shot from the enemy. Their complexity, however, caused lengthy construction delays. When they were finally hurried into service in a grand assault in September 1782, they were no match for the defenders' heavy guns; the floating batteries exploded with a fury that signaled the collapse of the will of the attackers. Soon after, the siege was broken by a large British naval force; possession of the Rock of Gibraltar was never again challenged by force.

Gierczak, Emilia (1925–1945)

Second lieutenant, platoon commander, 10th Infantry Regiment, Poland, World War II. Polish patriotism was an important element in Gierczak's upbringing. Her name, Emilia, was made famous by the legendary Emilia Plater, a leader of the 1830 Polish uprising against Russian rule.

She at first served in the Emilia Plater Women's Battalion, initially subordinated to Tadeusz Kosciuszko 1st Division created in the USSR in 1943. She was among the battalion soldiers trained at Infantry Officers' School in Riazan to command companies and platoons of the new Polish army, due to a drastic shortage of Polish male officers, many of whom had been killed by the Soviets at the Katyn Massacre, 1939–1940.

Gierczak distinguished herself during the fighting on the Pomeranian Rampart and fell on 17 March 1945 while leading an assault group in Kołobrzeg (former Kolberg).

Glendower's Revolt (1400–1413)

Revolt that seriously threatened English rule in Wales. The century after the defeat of the last Prince of Wales, Llewelyn the Great, by Edward I had not been kind to Wales. The black plague, combined with its attendant economic and social dislocation, only exaggerated tensions between the Welsh gentry and English neighbors in the Welsh marchland. Owain Glyndwr, descended from Welsh princely families on both sides, and with an English legal education, was only a well-to-do landowner with a fondness for bardic predictions of Welsh resurgence. A crisis within the English monarchy, the deposition of Richard II, who enjoyed support in north Wales, and his replacement by his cousin Henry IV, as well as Henry's heavy tax demands at his accession, stirred resistance.

Glyndwr's own participation stemmed from a longtime feud with Lord Grey of Ruthin over the borderland of their estates. Parliament, petitioned in 1400 by Glyndwr to hear the case, ruled for Ruthin. To make matters worse, Henry IV's eldest son had been installed as Prince of Wales, with authority vested in the hands of the Percy family of Northumberland, a slight to the Welsh lords. As early as September 1400, Glyndwr, supported by his retainers and family, proclaimed himself Prince of Wales and plundered Ruthin before being scattered by an English force. Henry IV, who might have ended the problem once and for all by redressing Welsh grievances, instead allowed Parliament to enact harsh anti-Welsh policies while focusing his attention on threats from France and Scotland. Spurred by their new grievances, Glyndwr and his followers began guerrilla attacks in the spring of 1401, evading an invasion into south Wales launched by the king in the fall of that year and capturing Caernarfon Castle. Glyndwr also defeated an English force at Bryn Glass in June, capturing Edmund Mortimer.

Glyndwr, needing help to continue his rebellion, played upon Mortimer's resentment that he had not been ransomed and his overlooked claim to the throne. Mortimer allied himself to Glyndwr and married his daughter to seal the agreement. Through this connection, Glyndwr negotiated with Henry Percy (Hotspur), Mortimer's brother-in-law, who declared his support in 1402. The king, although still engaged in Wales and chronically overstretched confronting the Scots and the French, forced Hotspur to a fight at Shrewsbury, which ended in Hotspur's death. Glyndwr attempted to organize a Welsh government and use Wales's difficult terrain and bad weather to hold off the English. He also drew on the support of the French to supply him by sea and the ships of Brittany-based pirates to harass the English coast.

In 1405, Henry IV captured the Scottish king. He believed that internal French politics would hinder intervention in

Wales, and with more generous financial resources granted by Parliament, he began a long-term campaign against the rebellion with his son at his side and with pressure on the Marcher lords to keep order in their lands. Slowly retaking Wales, the king captured Glyndwr's wife, two daughters, and three granddaughters in 1408 at Aberystwyth Castle. Although still a threat as raiders, Glyndwr and his followers were on the run, and in 1413 most of the rebels succumbed to Henry V's offer of a pardon and employment in his wars in France. Glyndwr himself retired to his daughter's lands and died by 1416.

Gneisenau, August Neidhart von (1760–1831)

Natural Prussian hero, founder of the modern general staff. Gneisenau was born at Schilda bei Torgau on 27 October to a lieutenant in the imperial army battling against Frederick the Great. He was raised in Würzburg and educated by Jesuits before returning to his father in Erfurt at age 13. After attending the university, he joined a mercenary Ansbach regiment, and arrived in Canada in 1783 just as the American colonists won their independence. Back in Europe, he applied in person to Frederick II to enter Prussian service. The poise and engineering skills of the handsome, brown-haired, blue-eyed lieutenant pleased the king. His battalion garrisoned Polish territory in 1793, and following a promotion to captain in 1795, he performed staff duties. After Prussia joined Russia against Napoleon in 1806, Gneisenau was wounded at Saalfeld, but he continued to command his battalion at Jena before the army's disastrous retreat. In early 1807, the major oversaw the defenses of Kolberg in Pomerania, where he gained fame for his heroic stand against the French.

The Prussian king promoted him to lieutenant colonel, and he served with Gerhard Scharnhorst, Karl Grolman, Wilhelm von Boylen, Carl von Clausewitz, and other reformers on the Military Reorganization Commission. These well-educated, liberal intellectuals envisioned a people's army to liberate Germany but foresaw the need for radical political social reforms. Napoleon watched these men closely until

1812, when he demanded a Prussian contingent for the invasion of Russia. Meanwhile, Gneisenau performed secret missions in Vienna, Riga, and Stockholm. In England, he procured aid—gold and weapons—from the prince regent. In Germany's War of Liberation in 1813, Gneisenau served as Gebhard Blücher's quartermaster general at Gross-Görschen and Bautzen, where he led a masterful retreat. During the armistice from June to August, he organized the *Landswehr* in Silesia. He was instrumental to Blücher's victory on the Katzbach and supported his superior's bold decisions, which precipitated the Battle of Nations at Leipzig in October. He supported Blücher's energetic offensive into France in 1814 and took personal command for two weeks after the defeat at Craonne.

In 1815, he and Blücher resumed their partnership against Napoleon. When the field marshal was incapacitated at Ligny on 16 June, Gneisenau ordered the army's retreat toward Wavre, which allowed the Prussians to join Wellington's left flank at Waterloo two days later. Gneisenau was named field marshal in 1825 and commanded during the Polish insurrection in 1831, but fell ill and died on 24 August.

Goethals, George Washington (1858–1928)

American engineer and builder. Born in Brooklyn, New York, Goethals attended the City College of New York before his admittance to the U.S. Military Academy at West Point. He graduated second in his class in 1880. As an engineer officer from 1882 until 1905, Goethals capably filled many assignments, including two tours as engineering instructor at West Point. In 1907, he retired as a lieutenant colonel when appointed third chief engineer for the Panama Canal project by President Theodore Roosevelt. Goethals supervised 44,000 men and resolved many critical engineering problems, including the construction of the lock system and recurrent

landslides. He also confronted innumerable logistical and sanitation challenges. The 40-mile canal was completed in August 1914. Goethals was appointed major general and first civil governor of the Canal Zone (1914–1916). Retiring in 1916, he was recalled to active duty as acting army quartermaster general in 1917. He worked to reorganize the corps as a purchasing organization, streamlining the supply and transport of troops. In April 1918, he was appointed director of the Purchase, Storage, and Traffic division of the army general staff. His efforts to impose vertically integrated logistical procedures were only partially successful, owing to staunch bureaucratic resistance. Awarded the Distinguished Service Medal, he again retired in 1919, and headed a private engineering firm. Despite his other considerable achievements, Goethals will always be associated with his greatest engineering triumph, the construction of the Panama Canal.

Goose Green, Battle for (28–29 May 1982)

First major land battle of the Falkland Islands War. Considered the decisive battle of the conflict, it was fought on the isthmus connecting northern and southern East Falklands Island.

The assault on Goose Green, by the 600-man British 2d Battalion of the Paratroops (2 Paras), was the first step in moving away from the Port San Carlos beachhead toward the capital of Port Stanley.

The British assault on Goose Green was plagued with intelligence errors, lack of artillery support, and supply problems. British intelligence reported that a weak battalion (less than 600 men) defended Goose Green. Instead, they found heavily fortified, reinforced positions. The British attacked at night, advancing rapidly until daylight when they were caught without cover and pinned down by Argentine troops.

However, through superior fighting ability, personal heroics, and timely air support the British were able to break Argentine resistance. The 2 Paras captured more than 1,200 Argentines. Casualties were heavy: the Argentines counted

250 dead and 121 wounded; the British 17 dead and 35 wounded. In the end, the British mistakes were more than countered by Argentine strategic and operational ground failures.

Gordon, Charles George (“Chinese” Gordon) (1833–1885)

British field commander. Gordon was born in Woolwich, England, on 28 January 1833, the son of a general. After four years at the Royal Military Academy, Woolwich, he was commissioned second lieutenant in 1852. Ordered to the Crimea in 1854 and arriving there in 1855, he was a trench warrior in the siege of Sebastopol. Bored by military surveying on the Russian/Turkish border from 1856 to 1858 and by the home front in 1859, he requested transfer to a combat zone. In China during the Second Opium War, sometimes called the Third Anglo-Chinese War, he saw action at Beitang on 1 August 1860, the Dagu forts on 21 August, and Beijing on 6 October. With permission from his British superiors, he remained in China as military adviser to the imperial Qing Dynasty, to help suppress the bloody Taiping Rebellion. In April 1863 Emperor Tong Zhi gave him command of the Ever Victorious Army (EVA), the Qing mercenary unit founded by the American adventurer Frederick Townsend Ward (1831–1862). He drilled the EVA into a crack fighting outfit, led it into battle with only a cane, won more than 30 battles, and became a legend in Britain as “Chinese” Gordon.

The British War Office acknowledged that Gordon was an excellent soldier, but suspicious of his eccentricities, Christian fanaticism, and alleged pedophilia, they were reluctant to place him in command of British combat troops. As a lieutenant colonel from 1865 to 1871, he commanded engineers in Gravesend, England. After a brief assignment in Romania, he was appointed governor of the southern Sudan (Equatoria) in 1873, then, under the khedive of Egypt, governor of Sudan in 1877. He resigned in 1880, accepted missions in England, India, China, Mauritius, and South Africa, then spent most of 1883 in Palestine studying the Bible. Early in 1884, he planned to become governor of the Belgian

Death of General Gordon at Khartoum. (Library of Congress)

Congo under King Leopold I, but instead, as a major general, returned to the Sudan at Prime Minister William Gladstone's request to quell the Mahdist uprising. At Khartoum, he and his Egyptian garrison were besieged for 10 months and were all killed during the Mahdi's final assault on 26 January 1885. Gordon's life resembles that of at least two other well-known British eccentric military commanders, Orde Wingate and Horatio Herbert Kitchener.

Goring, Hermann Wilhelm (1893–1946)

Nazi political and military leader. Goring was born in Bavaria on 12 January 1893. Educated at the cadet college in Karlsruhe, he served as an infantry lieutenant before transferring to the air force. In 1918 he assumed command of the air fighter squadron Jagdgeschwader Richthofen after the death of Manfred von Richthofen. He was awarded Germany's highest military decoration, the Pour le Mérite.

For some years after the war he flew as a civilian, and met Hitler in autumn 1922. He was wounded in the Beer Hall Putsch in 1923 and became addicted to morphine; there is some controversy as to whether he was able to shake off this habit.

In 1932 he became president of the Reichstag and was the Nazis' war hero, their man to be put on show. Rapidly promoted, he was given command of the new Luftwaffe in 1935. His life was henceforth one of luxury and decadence, and he grew obese. Like other Nazis, he was not averse to killing, nor to despoiling art treasures from the conquered countries.

In 1936 he was made a full general and took over economic control of the German War Plans. Simultaneously he made a vast fortune out of state-owned businesses.

In 1940 he became a Reichsmarschall, but his failure to defeat the Royal Air Force in the Battle of Britain resulted in his losing influence with Hitler and was the first of a string of blunders and miscalls. He had foolishly boasted that if one British bomb fell on Berlin, "then you can call me Meyer"—a common Jewish name. He also promised—and failed to make good on his promise—to supply by air the surrounded Sixth Army at Stalingrad. Later, he absolutely denied that any Allied fighter aircraft could fly to Berlin, and when one was reliably reported to have done just that, he asserted that it must have been "blown" there by high winds!

As Hitler's nominated successor, he made a naïve attempt to take control as the Third Reich disintegrated in April 1945, a final gaffe for which Hitler stripped him of all rank and titles. Captured by the Americans, his braggadocio failed to impress the judges of the International Military Tribunal at Nuremberg, and he was condemned to death. A trickster to the end, he cheated the hangman by ingesting poison on 15 October 1946, two hours before he was due to take what he had blithely termed "the high jump."

Gorlice/Tarnow (May 1915)

Led to the Austro-German conquest of Russian Poland. In order to relieve the beleaguered armies of Austria-Hungary, the German commander in chief, Erich von Falkenhayn, conceived a plan designed to cripple the Russian field armies. In a best-case scenario it could force them out of the war. He placed General August von Mackensen in command of the German Eleventh Army and the Austro-Hungarian Third and Fourth Armies. It would be the first time in the war that the Austro-Germans fought under a unified command. The attack was scheduled to begin along a 30-mile front between the Hungarian towns of Gorlice and Tarnow, where the Austro-Germans had a slight numerical advantage over the Russians. The Austrian armies served on the flanks of the German drive.

The preparatory battles began on 28 April, with the Austro-Germans assaulting Russian positions along the Biala River, the main Russian line of defense. The actual battle began on 2 May 1915. A massive artillery bombardment, which

included Austrian 30.5-centimeter howitzers, destroyed the Russian trenches and wire entanglements. The Russians were unable to halt the Austro-German advance and were forced to retreat from the Biala River and fall back to vulnerable interior lines. Tactically and strategically the offensive was a success. The Austro-German armies ruptured the Russian front within the first two days of the drive, and the Russian Third Army was destroyed. The Austro-Germans continued their penetrating drive into the Russian lines, eventually threatening the flanks and rear of the Russian armies in western Poland and the Carpathian mountains. By June the Russian front showed signs of disintegrating, the Russians having suffered more than 400,000 casualties.

The victories around Gorlice/Tarnow led to a general Austro-German offensive along the entire eastern front, which ended in a 300-mile advance into Poland.

Gothic War (534–554)

Part of Justinian's opportunistic scheme to conquer the western Mediterranean. The Gothic War demonstrated the strengths and weaknesses of the early Byzantine military system. Having conquered Vandal Africa, Belisarius took Ostrogothic Sicily (535), then Naples and Rome (536). Successfully defending Rome for three years against King Vitigis (r. 536–539), Belisarius next fought his way up the peninsula and occupied the former imperial capital of Ravenna (539). Unfortunately, this rapid conquest proved ephemeral. From the main Ostrogothic settlements north of the Po, King Totila (r. 542–552) quickly reconquered Italy and Sicily, except for a few coastal strongholds. Elsewhere, Persian attacks in the east left imperial armies in Italy starved of men and matériel.

Not until 550 were sufficient resources available for Italy. Narses's demands for sole command and full financial backing were met, and his army, 20,000 strong, became the largest Justinian sent west. It was primarily comprised of Narses's household troops (*bucellarii*), with a high proportion of Huns and Lombards.

Having destroyed the Ostrogothic fleet, Narses marched out of Illyria into northern Italy, using his own fleet to outflank the Ostrogothic river defense system (551). To cover Rome, Totila deployed at Taginae (552). Here the Ostrogothic cavalry failed to break the Roman center. Narses had strengthened his infantry line with dismounted cavalrymen. As a result, Totila's army was enveloped and overwhelmed by Narses's armored horse-archers. Totila was killed and his army shattered.

Ostrogothic resistance continued north of the Po. At Casilinum (554), Narses again used an enveloping tactic to destroy a supporting Frankish-Alamanni force, reputedly 80,000 strong. The Roman infantry in the center absorbed the ferocious Frankish charge, while the armored horse-archers on the wings closed the trap. Despite this success, it was not until 561 that Narses reduced the last Ostrogothic garrisons in northern Italy.

Infantry played only a minor role in the campaigns of Belisarius and Narses. Imperial infantry might be tasked to

garrison or lay siege to a city, but whenever serious fighting was called for it was up to the armored cavalry, who wielded both lance and composite-bow. They were equally well equipped for shock action or for fighting from a distance, as the situation required.

Although the campaigns of the Gothic War were ultimately successful, in the long term it proved difficult for the Romans to retain effective control of the old western provinces. Much of what had been gained was quickly lost to the invading Lombards only a few years after Justinian's death, and the imperials were never able to recover the lost ground. In the end, imperial resources proved sufficient for defense but utterly inadequate for sustained overseas conquest.

Goths

A Germanic peoples of ultimately Scandinavian origin, according to Jordanes. By the end of the second century, the Goths controlled large tracts of steppe north of the Black Sea. These were territories once belonging to the nomadic Roxolani, and it was from the Roxolani that the Goths learned the use of heavy cavalry. Invading Thrace and Greece in the mid-third century, they were evicted by Claudius II "Gothicus," but Aurelian, his successor, allowed some to settle in the former Roman province of Dacia, north of the Danube.

Toward the end of the fourth century, hard-pressed Goths sought the right to settle within the Roman Empire. They promised to serve in its armies to escape the Huns, who had overrun former Gothic steppe territories and were now pursuing the Goths themselves. Emperor Valens, preoccupied with Persia, tried to disarm the refugees before admitting them into Thrace. His officials, taking advantage of the situation, shamelessly exploited the starving refugees. The Goths rose in revolt, and Valens was obliged to take command of the situation himself. He died at Adrianople (9 August 378), along with most of his army, but the Goths, lacking both the skill and resources to storm fortifications, failed to overrun the empire. Valens's successor, Theodosius I, recruited Christian Goths to resist the newcomers. A treaty was finally made

in 382. The Goths were allowed to settle south of the lower Danube as a confederate people under their own chieftains (*foederati*) in return for military service.

Long before the arrival of the Huns, according to Jordanes, the Goths were already divided into two peoples, the Ostrogoths and Visigoths, but at the time that the Huns attacked, there were actually six or more Gothic tribes. It was the Hunnic attack itself that gave rise to the division of the Goths into two peoples. Those who entered the Roman Empire became the Visigoths. Those who remained behind became subjects of the Huns and were called Ostrogoths.

Gotthard Abbey (1664)

Conclusive battle of the Austro-Turkish War (1663–1664). In 1658 Ottoman grand vizier Ahmed Köprülü deposed Transylvanian prince György II Rákóczi, replacing him with Michael I. Apafi. When Habsburg emperor Leopold I was slow to recognize Apafi, Köprülü attacked Habsburg-controlled Hungary in 1663. Leopold's army under Count Raimundo Montecuccoli was unprepared for a major war and retreated before the invading Ottomans.

Köprülü took the fortress of Neuhausel (Nové Zamky) in September after a six-week siege and withdrew into winter quarters. In November 1663, Croatian Ban Miklós Zrinyi replaced Montecuccoli as Habsburg field commander. Throughout the winter Zrinyi conducted bold mounted operations in the Ottoman rear areas along the Mura River, disrupting supply lines but failing to recover any territory.

The following summer, Montecuccoli was again given command of the imperial armies, reinforced by a French contingent under the duke of Lorraine. When the Ottomans invaded Croatia, Montecuccoli refused Zrinyi's demands for reinforcements to relieve the siege of Zrinyi-jvr, which fell on 30 June. Instead, he withdrew to a position on the Raab River, where on 1 August he caught and defeated Köprülü's army at Szént Gotthard/Mogersdorf as it attempted to cross into Austria. Leopold used the opportunity of the victory to conclude quickly the Treaty of Vasvár, which established a 20-year peace and awarded the Ottomans an indemnity and

possession of Neuhausel. Leopold's neglect of Hungarian interests in securing the peace provoked a magnates' conspiracy against Habsburg rule, which was exposed and suppressed in 1670. Refugees from Habsburg reprisals fled to Transylvania, from which they launched *kuruc* raids into Hungary for the next decade.

The Battle of St. Gotthard was the only major confrontation of the Habsburg and Ottoman armies between the Fifteen Years' War (1591–1606) and the Second Siege of Vienna (1683).

Grand Alliance, War of the (1688–1697)

An indecisive European struggle over hegemony. The conflict was also known as Nine Years' War or War of the League of Augsburg. After reaching the top of its hegemonial power in 1680, the France of Louis XIV feared a counterstroke by other European states, especially after Austrian successes against the Turks, which led to the rise of Habsburg power. So Louis began a preventive war to secure his conquests of the past. In the autumn of 1688, the war began with a sudden French attack on southwest Germany, where serious atrocities were committed against the civilian population in the so-called devastation of the Palatinate. In 1689, a Grand Alliance between the emperor, the Netherlands, England, Spain, Savoy, and some minor German states, and later also some imperial circles, was formed to fight against the French predominance. The fighting took place mainly in Flanders, where the battles at Fleurus (1690), Steenkerke (1692), and Neerwinden (1693) ended in French victories. William III of Orange was preoccupied with securing the British Isles until 1690. After this, he could pay full attention to the war on the Continent.

The Upper Rhine region was successfully defended by the joint forces of the Swabian and the Franconian imperial circles under the command of Margrave Ludwig Wilhelm of Baden. Fighting also took place in Catalonia, in Italy, and in some colonial areas. The naval war saw the French victorious at Beachy Head (1690) and the English off La Hogue (1692). French privateers enjoyed some success against English trade. But none of these victories or defeats was decisive. All belligerent parties were exhausted after years of

fighting. The treaty of Rijswijk brought the war to an end in late 1697. The threat of French hegemony was successfully checked for the moment, but France was not beaten. It had to give some earlier conquests back to the former owners, but it secured the city and fortress of Strasbourg, which stabilized its eastern frontier.

Grandson and Morat, Battles of (Switzerland, 2 March and 22 June 1476)

Reemergence of “pike power” against cavalry. Austria needed a powerful ally against the Swiss Confederacy in the fifteenth century. To this end, Austria signed the Treaty of Saint Omer in 1474 with Charles the Bold. Charles received possessions in Alsace, bordering Switzerland, and the Burgundian war was the outcome of Charles’s subsequent attempt to establish a Burgundian Empire stretching from Netherlands to Italy.

In a first clash at Héricourt (13 November 1474), a Burgundian army of 12,000 was forced to retreat to avoid being overrun by Swiss pikemen. In 1476, Charles invaded Switzerland and advanced on Berne, intending to cut a path through the Confederation. Berne, well aware of the Duke’s plan and approach routes, had reinforced the garrison at Grandson. After a short siege, the Burgundians slaughtered all Swiss survivors. The massacre infuriated the regrouping Swiss.

On 2 March 1476, the armies blundered toward one another and Swiss leading elements came upon the Burgundian vanguard pitching camp. A short skirmish between Swiss handgunners and Burgundian archers gave time for the first Swiss battle corps to emerge from the wooded high ground. It deployed in a characteristic square of 10,000, with halberdiers and ensigns in the center, surrounded by a forest of 6-meter-long pikes. Charles intended to bombard the square with artillery and to finish it with cavalry charges. The Burgundians easily dispersed the Swiss skirmishers but were repeatedly repulsed by the impenetrable wall of pikes.

Charles tried to draw the Swiss square further forward into the low ground to expose its flanks. He ordered his troops to withdraw a short distance and moved archers and

artillery to the flanks. During this complex maneuver, the main Swiss column appeared and advanced on the disorganized Burgundians. A rout ensued and Charles’s panic-stricken army abandoned 420 pieces of artillery and his fabulously rich camp to the Swiss.

Casualties were incredibly low: 200 Swiss and fewer than 500 Burgundians. The Swiss failed to press their advantage and Charles’s army was soon ready again. He sent for reinforcements. Mercenaries were hired and a new artillery train assembled. The Swiss found new allies from Lorraine, Alsace, and Swabia, and their army was reinforced to a total of 25,000 foot and 2,000 cavalry. The Burgundians numbered only 12,000, most survivors of the Grandson disaster.

Charles decided to attack Berne from the west and besieged the small town of Morat on the shores of the lake of the same name. The Burgundian camp was protected by a wooden palisade called the Grünhag, one mile from the main camp. The Swiss divided their army into three pike blocks. The allied cavalry was to outflank the palisade one mile north. The Burgundians were completely unaware of Swiss preparations and had left only 3,000 men to guard their stronghold. The Swiss advanced in echelon toward the Burgundian camp on the afternoon of 22 June 1476. The northern attack was checked by artillery and archers, but the Swiss center column reached and overran the wooden palisade. Burgundian reinforcements were defeated in detail by the advancing Swiss while outflanking cavalry cut off the northern escape route. The Burgundians were slaughtered or drowned in the lake by the enraged Swiss. Their army suffered more than 8,000 casualties, to 410 Swiss. Charles the Bold lost his army and barely escaped with his life, only to lose it in his next encounter with the Swiss (Nancy, 5 January 1477). The fierce reputation gained by the Swiss in the battle gained them offers of foreign employment. Swiss infantry would be the “queen of battles” for more than a century.

Granicus, Battle of the (May/June 334 B.C.E.)

The first battle the Macedonian king Alexander III the Great fought after he had invaded the Persian Empire. It took place at the river Granicus (Kocabas) in northwestern Turkey. After Alexander had crossed the Hellespont, the Persian satraps (governors) of Asia Minor assembled an army to fight him, consisting of 20,000 horse and 20,000 foot, the lat-

ter largely Greek mercenaries. As Alexander was on the west bank of the river, the Persians awaited him on the other side in two lines. The first consisted of the cavalry positioned at the riverside. The Greeks formed the second line on a height some distance behind.

Although Alexander had an army of 37,000 men, he brought only part of it to the field at the Granicus, probably 13,000 infantry and 5,100 cavalry. He deployed his Macedonian pikemen in the center. The left flank was covered by cavalry. On the right wing the Macedonian guard infantry and the guard heavy cavalry took position, reinforced by light cavalry and skirmishers.

The Macedonians advanced to the riverside and an assault force crossed the river and attacked the Persian horse. Thereupon Alexander himself followed, leading his guard cavalry through the river into the Persian line. Slowly the Macedonians fought their way up the riverbank. In the meantime the Macedonian infantry also crossed the river. The Persian cavalry broke and fled under the pressure of the cavalry and the pikemen, whereupon the Macedonians turned upon the Greek mercenaries. Most of them perished;

2,000 were taken prisoner and enslaved. The Persian losses in cavalry were probably limited to about a thousand, but several important commanders were killed. The Macedonians counted only 120 dead.

Grant, Ulysses Simpson (1822–1885)

The most successful Union field commander in the American Civil War, twice elected president of the United States. Grant was born as Hiram Ulysses Grant in Point Pleasant, Ohio, on 27 April 1822. Through a transcription error, he was enrolled in the U.S. Military Academy at West Point in 1839 as “Ulysses Hiram Grant.” When “Hiram” was misread as “Simpson,” Grant accepted it. Nicknamed “Uncle Sam” and “United States” by his fellow cadets, he later became known as “Unconditional Surrender” after the terms he dictated at Fort Donelson. His friends called him “Sam.”

Graduated from West Point in 1843, Grant was commissioned in the 4th Infantry. He served in the Mexican-American War under Zachary Taylor at Palo Alto, Resaca de la Palma, and Monterrey, then under Winfield Scott at Veracruz, Cerro Gordo, Churubusco, Molino del Rey, and Chapultepec. He resigned as captain in 1854 and tried farming and several small business ventures, failing at all of them.

When the Civil War began, Grant volunteered for the militia in Galena, Illinois. He was ordered to the state adjutant general's staff, then promoted to colonel of the 21st Illinois Volunteer Infantry in June 1861 and brigadier general of volunteers in August, commanding the District of Southeast Missouri.

Eager to fight, he took the offensive on his own initiative. He captured Paducah, Kentucky, on 6 September, but lost at Belmont, Missouri, on 7 November. At odds with his superior officer, Henry Halleck, over both strategy and temperament, he acted on his own whenever he could. He took Fort Henry, Tennessee, on 6 February 1862 and won the war's first major Union victory when Simon Bolivar Buckner surrendered 14,000 men to him at Fort Donelson, Tennessee, on

16 February. These actions earned him promotion to major general in command of the District of West Tennessee on 21 February.

Albert Sidney Johnston surprised Grant in an unfortified position the first day at Shiloh while Grant was awaiting Don Carlos Buell's reinforcements. Union casualties were heavy as Grant hastily built a defensive line. He gained back all the lost ground through sheer doggedness on the second day. Halleck wanted to dismiss him for recklessness, but Abraham Lincoln would not allow it.

Lincoln replaced Halleck with Grant that summer. After Grant's new subordinate, William S. Rosecrans, won at Iuka and Corinth, Grant felt free to launch his Vicksburg campaign in November. It was Grant's only brilliant campaign. By combined amphibious and overland assault, victories at Jackson on 14 May and Champion's Hill on 16 May 1863, and a six-week siege, he captured Vicksburg on 4 July, coincident with George Gordon Meade's victory at Gettysburg.

Grant broke Braxton Bragg's siege of Chattanooga on 28 October and defeated Bragg at Lookout Mountain on 24 November and Missionary Ridge on 25 November. Lincoln promoted him to lieutenant general in command of all Union

armies on 12 March 1864. Thereafter he made his headquarters with Meade's Army of the Potomac.

Grant waged an unimaginative, horribly bloody war of attrition against Robert E. Lee. Staggering Union losses in the Wilderness and at Spotsylvania provoked the northern press to call him "Butcher." Grant's worst tactical mistake of this campaign was at Cold Harbor, where Lee's entrenched 60,000 massacred Grant's frontally attacking 110,000. Nevertheless, Grant's superior numbers eventually pushed Lee away from Richmond and Petersburg, outflanked him, and forced the Confederate surrender at Appomattox on 9 April 1865.

Elected president easily as a Republican in 1868 on the strength of his war record, Grant served two terms. Having mismanaged his money, betrayed by friends, he spent most of his retirement in poverty. In perhaps the most heroic campaign of his life, Grant raced to complete his memoirs before the cancer gnawing at his throat took him. He completed his memoirs just weeks before his death on 23 July 1885 in Mount McGregor, New York; they were among the finest of autobiographical works in American literary history and freed Grant's family from financial worry. Grant was buried in a mausoleum that soon became a New York City landmark.

Great Wall of China (16th Century)

An extensive defensive wall defining China's northern frontier. Chinese states and dynasties had built frontier walls from time immemorial. Such walls delineated frontiers for political and economic purposes. They could also serve as military barriers, although the costs of garrisoning a long wall along with the supporting bases and reserves necessary

View of the Great Wall of China at Nankow Pass. (Hulton/Archive)

to make it viable could prove prohibitive. Much of the foundation for the Ming wall was laid by Qin Shi Huangdi, the first emperor of China in the third century B.C.E.

The Great Wall of Ming times was built along what was perceived at the time as a fault line between China and its northern neighbors: Mongol groups as well as the Manchus that later were to create their own “Chinese” dynasty. The wall also governed movement between China and the north and funneled trade through barriers so that it could easily be taxed. Finally the wall was a military barrier, but only against the low-key raids that had troubled north China for centuries. Any serious attack was bound to get through unless met by a major mobilization, a lesson that the Ming ultimately forgot.

The present wall dates to that era after the capital had been moved to Beijing (1421) and the Ming government found itself increasingly unable to deal with the Mongols, who captured a Ming emperor in 1449. Gradually a linear complex of frontier fortifications was seen as the only solution and a massive effort was made in the sixteenth century, resulting in the wall as we now know it. The wall continued

to expand right down to the end of the dynasty but never provided effective resistance to any attack, not the Mongol Altan-qan in 1550, nor the Manchus in 1644.

Greco-Turkish War (1920–1922)

Conflict following World War I that established the republic of Turkey. At the end of World War I, the victorious Allies occupied much of the Ottoman Empire and began the process of dismembering that empire. Certain provinces, such as Palestine, were made into protectorates under the Allies. The Smyrna area of Anatolia, with a large Greek population, was awarded to Greece. In May 1919, a Greek army occupied that

city and its hinterland, resulting in conflicts with the Turks. The Greeks occupied a large area, up to the so-called Milne line. The Greek government was encouraged by their success, and with the approval of the British, they expanded their control further. Beginning on 22 June 1920, the Greeks marched on Panderma on the Sea of Marmara, and Bursa and Usak. Resistance by the Turks was limited. The Ottoman government of Sultan Muhammad VI Vahideddin in Istanbul was convinced that resistance was futile. The sultan signed the Peace of Sevres, which surrendered eastern Thrace to Greece, as well as control over the Smyrna area for five years, to be followed by a plebiscite.

Turkish resistance to such national amputation was led by Mustafa Kemal, later known as Kemal Ataturk. In 1919, Kemal became the leader of the Association of the Rights of Anatolia and Rumelia. He established a provisional government in Ankara and set up a nationalist movement to oppose both the sultan and the Greeks. He declared that Turkish borders were those existing on 11 November 1918.

In January 1921, the Greek commander in Anatolia, General Anastasios Papoulas, launched a reconnaissance in force against the important Turkish rail center of Eskisehir. Turkish troops repulsed them. The allies voiced growing dissatisfaction with Greek ambitions, but Papoulas attacked Eskisehir in greater force in March 1921 and suffered another defeat. Additional Greek troops were brought to Anatolia. They suffered from a lack of proper equipment and a poor supply situation. Still, by June 1921, Papoulas had more than 200,000 men. He began a general advance in June. His army quickly took Eskisehir and Afyon, another important rail center. The Greeks slowly pushed eastward toward Ankara. The Turks, commanded by Kemal in person, conducted a fighting retreat until they reached the Sakarya River, 70 miles west of Ankara. A three-week battle began on 24 August and ended on 16 September. The Greeks were defeated by a lack of supplies and equipment, as well as by the Turks. They retreated to a partially fortified line stretching from the Sea of Marmara, then east of Eskisehir and Afyon, and on to the Menderes River. Despite poor supply, the Greeks stayed in that position for the next 11 months. Kemal used the time to build up his forces. He was assisted by Soviet Russia, which provided military equipment left from its own civil war.

On 26 August 1922, Kemal launched a series of major attacks against the central and southern parts of the Greek front. Despite strong resistance, the Turks broke through. By 5 September, they had captured Bursa. On 9 September, they captured Smyrna. The collapse of the Greek army in Anatolia was followed by the slaughter of thousands of Greek soldiers and civilians by the enraged Turks.

A revolution broke out in Greece, which overthrew the government. Two prime ministers, three cabinet ministers,

and the last commander in Anatolia, General Georgios Hatzianestis, were all executed. The Peace of Sevres was replaced by the Treaty of Lausanne, which included everything Kemal had wanted. Eastern Thrace and all of Anatolia were returned to the Turks. Greeks living in areas controlled by the Turks were forced from their homes and exiled to Greece, and vice versa in Greece. Kemal abolished the sultanate, established a republican form of government, and served as the country's first president.

Greek Civil War (1944–1949)

A two-phase civil war (1944–1945 and 1946–1949) that had its beginning in the German occupation of Greece in 1941. In both phases, Communist forces staged an unsuccessful attempt to take over the country.

During the German occupation, two resistance forces emerged to oppose the Germans. One, the National Liberation Front–National Popular Liberation Army (known as the EAM-ELAS in Greek) was Communist controlled and directed; the other, the Greek Democratic National Army (known as the EDES in Greek), was Royalist.

During the German occupation, both groups fought against the Germans and, on some occasions, worked together. Due to the brutality of German reprisals, both sides worked to bide their time until the Germans left and the inevitable postwar struggle for power would begin. By 1944, when the Germans withdrew from Greece, the EAM-ELAS had removed all political and military opposition in Greece except for the EDES. They established a provisional government in the mountains of Greece and planned for a regime that would not include the king of Greece nor the government in exile in London.

The British had a presence in Athens and were able to cobble together a fragile coalition government between the EDES and the EAM-ELAS in October 1944. The agreement between the two sides failed over the issue of disarming the Communist forces in the field. On 3 December 1944, the EAM-ELAS launched an uprising in Athens, which the British suppressed only after great effort. The Communist

forces had been able to capture almost all of Greece but were finally defeated.

With their defeat, the Communists entered into talks and agreed to disarm at a meeting in February 1945. Part of the agreement was that in March 1946 a general election was to be held across Greece. When the elections came, the Communists sat it out and saw a Royalist government placed into power. In September 1946, the king of Greece was restored to the throne via a plebiscite.

All of this was rejected by the Communists, and full-scale civil war broke out in 1946. Britain, which since 1944 had been responsible for the defense of Greece, found that it was a burden it could no longer bear and transferred the task to the United States in 1947. By this time, the EAM-ELAS had established a provisional government in the mountains of the north of Greece. The United States issued the Truman Doctrine, stating that the U.S. would aid those nations struggling against outside-supported insurgency, and started to pour military and economic aid into Greece.

Over the next two years, supported by massive amounts of U.S. aid and military advisers, the Greek government was finally able to push the Communists back, and they abandoned the armed struggle, with many Greek Communists fleeing to Albania. The two phases of the Greek Civil War led to more than 50,000 battle deaths and the creation of over half a million internal refugees.

Greek War of Independence (1821–1832)

On 2 April 1821, lingering resentment against continuing Ottoman rule resulted in outright rebellion when Greek Orthodox cardinal Germanos led an uprising at Kalaviyta. The Turkish garrison and a large part of the Muslim population was massacred, which led to counteratrocities by occupation forces. Nevertheless, within months Greek forces had effective control of the peninsula. In the spring of 1822 Ottoman troops counterattacked by seizing the island of Chios and enslaving the population. The Greek extracted a measure of revenge on the night of 18–19 June 1822, when fire ships under Captain Constantine Canaries sank a Turkish flagship, killing an estimated 3,000 Turks. By January 1823, Turkish forces abandoned the siege of Missolonghi and it appeared that Greek independence had been won.

The news was certainly applauded by the governments of Western Europe, then undergoing a renaissance of classical Greek culture among its elite. Popular and political sentiment favoring Greek independence would prove decisive. *Greece* and *Athens* meant Homer, Aristotle, the highest culture, science, philosophy; the *Terrible Turk* seemed to stand for harems and galley slaves.

Unfortunately for the Greeks, they had no sooner expelled occupying forces than they quarreled amongst themselves and a period of civil war ensued. Sultan Mahmud II took advantage of this impasse by appealing to Mohammed Ali of Egypt for help, who dispatched his son Ibrahim and a large squadron of ships and troops. This infusion of Muslim strength caught the Greeks unprepared and they were slowly rolled back. Missolonghi was finally captured after a long siege, as was the Acropolis in Athens. Greek attempts to recapture this cultural landmark ended in failure, and by June 1827 nearly the entire peninsula was back under Turkish/Egyptian control. At this juncture fate intervened when the governments of Great Britain, France, and Russia demanded a Muslim withdrawal from Greece and de facto independence. When the sultan refused, all three nations dispatched heavily armed squadrons into the region.

On 20 October 1827, a combined allied fleet under Admiral Sir Edward Codrington entered the harbor of Navarino and anchored in full view of the Egyptian fleet. Their leader, Tahir Pasha, arranged his ships defensively in a large crescent formation and awaited events. A tense standoff ensued and negotiations were under way when a Turkish vessel suddenly fired upon a British dispatch boat, precipitating an all-out battle. In this duel between long lines of anchored warships, the allies, with larger vessels and heavier guns, completely defeated their Muslim opponents. They lost slightly over 500 casualties in this, the last pitched engagement between wooden warships, while Muslim losses totaled several thousand. Furthermore, this defeat, and the declaration of war by Russia against Turkey, finally induced the Ottomans to relinquish their grasp of Greece. After four centuries of Muslim dominance, Greek independence had been achieved and was confirmed by the 1832 Treaty of London.

Greek-Persian Wars (499–448 B.C.E.)

Series of unsuccessful attempts by the Persian Empire to subdue a loose coalition of Greek city-states. The Persian province, or satrapy, of Ionia, on the Aegean coast of Turkey, revolted against Persian king Darius the Great in 500 B.C.E. Aristagoras, the Greek tyrant of Miletus, led the revolt. Athens, Eretria, and a few other Greek city-states supported it. After Darius ruthlessly counterattacked in 499, Aristagoras fled to Thrace and died there in 497. Darius destroyed Miletus and deported its inhabitants to Mesopotamia in 494. With the rebellion crushed, Darius vowed to add all Greece to his empire to punish Athens for helping Ionia. In 492 he invaded from Thrace, conquered Macedonia, but had to abandon his plans when a storm wrecked his fleet.

In 490 Datis and Artaphernes jointly led Darius's second invasion force, estimated to be between 20,000 and 200,000, into Greece. Crossing the Aegean in 600 ships from Samos, Ionia, they easily subdued Euboea and moved into Attica. Athenian general Miltiades the Younger chose to fight them on the open plain at Marathon and there deployed his 20,000 Athenians and Plataeans to await the invaders. Hippias, a Greek, told the Persians that they could use their cavalry effectively on the plain and guided them to Marathon.

As Darius's army marched toward Marathon, the Persian Empire was at its height and included Libya, Egypt, Palestine, Turkey, Cyprus, Thrace, and Macedonia. With the Carthaginians friendly to the Persians, Greece was isolated. For Greece, everything was at stake.

As the Persians assembled in the center of the plain in September 490, Miltiades lured them toward his weak center and between his strong flanks. When the Persians had advanced far enough, both Greek flanks charged simultaneously at a dead run and soon surrounded their enemy. The mobility and versatility of hoplites in phalanx formation, enclosed in networks of shields to protect them from arrows and using their long spears like lances, completely frustrated the inflexible tactics of the Persians and won the day. Casualties were reported as 6,400 Persian and 190 Greek. The Persians retreated to Turkey.

Darius's son and successor, Xerxes the Great, was determined to avenge his father's loss in Greece. After suppressing a revolt in Egypt, he began in 483 to prepare an unprecedentedly massive assault against Greece. In 480 he built a pontoon bridge across the Hellespont with planks laid over 674 ships lashed together in two rows and thus brought his men, animals, wagons, and war machines from Asia to Europe. The Persian navy guarded the army's left flank.

The nearly contemporary Greek historian Herodotus is the main source of information about the Greek-Persian Wars, but scholars know that he exaggerated and sometimes

even lied. We must therefore be skeptical about some of his fantastic claims and huge numbers. Nevertheless, the size of Xerxes's invasion force has been reasonably estimated at between 2 and 5 million, including noncombatants and camp followers. The number of actual combatants may have been as low as 100,000. The sheer size of this unwieldy mass contributed to its undoing.

When the gigantic Persian host tried to squeeze through the small pass at Thermopylae in August 480, 300 Spartans and 700 Thespians under Leonidas held them for three days until a traitor, Ephialtes, showed the Persians a secret mountain path from which they could use archers against Leonidas's rear. The defenders were annihilated and the Persian march southward continued. After burning Athens, Xerxes returned home and left his army under the command of Mardonius.

Themistocles lured 800 large and clumsy Persian ships into the shallow bay at Salamis in September 480, then trapped and overwhelmed them with his 380 small, speedy, shallow-draft vessels. This decisive naval victory inspired the Greek land forces. They immediately massacred the Persian garrison on the island of Psyttaleia. The Greek army, led by Sparta, finally beat back the third Persian invasion at Plataea in 479. Mardonius was among the Persian dead. The same day, Athens won a decisive naval battle against Persia at Mycale.

About 478, Athens created the Delian League, or Attic Naval Alliance, a mutual defense bloc that relied upon Athenian sea power to prevent any future Persian aggression. Gradually the Delian League wrested Aegean coastal settlements from Persia and forced them to join the alliance. Athens was establishing its own empire. Both Sparta and Persia grew anxious about this Athenian expansion.

For the next 30 years most of the combat between Greece and Persia was naval, with Greece usually getting the best of it. The reign of Xerxes's son, Artaxerxes I, was generally peaceful except for sporadic minor revolts in far-flung provinces. Yet his empire eroded and he presided over its decline. Less and less able to resist Greek encroachment, Artaxerxes sought peace. Sparta concluded a five-year truce with Persia in 451. The Treaty of Callias ended conflict between Persia and Athens in 448.

Greene, Nathanael (1742–1786)

American field commander, perhaps the best strategist on either side in the Revolutionary War. Born a Quaker in Potowomut, Rhode Island, on 7 August 1742, Greene went into his father's business as an ironworker and from 1770 to 1772 served in the General Assembly of the Colony of Rhode Island. Devoted to the defense of liberty, he disappointed his family in October 1774 by rejecting the pacifist ideals of his religion and raising a company of militia. He became brigadier general of militia in May 1775 and brigadier general in the regular Continental army in June.

During the siege of Boston, Greene impressed George Washington with his strategic, tactical, and logistical plans. He garrisoned Long Island after 1 April 1776 and was promoted to major general on 9 August. He was ill and out of action for most of William Howe's invasion of New York but at-

Portrait of General Nathanael Greene. (Library of Congress)

tacked Staten Island on 12 September and participated in planning the final battle of that campaign, the loss of Fort Mifflin to the British on 26 September. He fought with distinction at Trenton, Brandywine, and Germantown and was with Washington at Valley Forge. Following the demise of the Conway Cabal against Washington, the commander in chief put his most trusted officers in key positions. Thus Greene, an expert field commander, became quartermaster of the Continental army on 2 March 1778. Commanding the right flank at Monmouth, he valiantly tried to retrieve Charles Lee's blunders. He further distinguished himself at (fittingly) Quaker Hill, Rhode Island, on 29 August.

In September 1780 he was assigned to replace Benedict Arnold in the Hudson valley after the latter's treason and defection, but after Horatio Gates failed at Camden, Washington appointed him commander of the Southern Department of the Continental army on 14 October.

Greene relieved Gates on 2 December and collaborated with Daniel Morgan, Francis Marion, and other partisan leaders, unlike many Continental commanders. He induced Charles Cornwallis to chase him through the backwoods of North Carolina toward Virginia, losing tactically at Guilford Courthouse but achieving strategic victory by overextending the British supply lines. Using a similar strategy, he lost at Hobkirk's Hill on 25 April, won at Augusta on 5 June, and lost at Ninety-Six on 19 June and Eutaw Springs on 8 September; but by the end of that campaign, the British could hold only Savannah and Charleston. Even after Yorktown, Greene continued to harass the British in the South until August 1783. He died at his estate given to him by a grateful state, near Savannah on 19 June 1786. Greene is remembered in scores of "Greene Counties," "Greenevilles," and "Greene Streets" throughout the eastern United States.

Grenada (October 1983)

The American invasion of the island nation of Grenada to rescue American students and end the Marxist regime. Grenada experienced a coup in March 1979 when Maurice Bishop, leader of the New Jewel movement, took advantage of Prime Minister Sir Eric Gairy's absence from the country. By 1983 the leaders of JEWEL, feeling that Bishop was not moving fast enough in implementing a Marxist ideology, staged their own coup. On 19 March 1983 the People's Revolutionary Army (PRA) killed Bishop and some 50 of his followers during the attack on Fort Rupert. By 23 October 1983 the U.S. had established Joint Task Force 120 under Vice Admiral Joseph Metcalf III to begin planning operations in Grenada to evacuate the 1,000 American citizens and other foreign nationals there. By 21 October the U.S. received a formal request by the Organization of Eastern Caribbean States (OECS) to help restore order. On 22 October 1983 American president Ronald Reagan approved the plan that was to commence by dawn on 25 October 1983.

Operation URGENT FURY took place on 25 October 1983 with simultaneous operations by the Army and Marine Corps. The airborne assault was carried out by members of the 75th Ranger Regiment and the 82d Airborne Division to secure the airport at Port Salines. After encountering some antiaircraft fire, the flight of C-130s carrying the rangers prepared for a low-level jump to secure the airport. Immediately after landing, the rangers cleared the runway of debris placed there to prevent its use. One ranger, under fire, used a commandeered steam roller to drive spikes into the runway. After the runway was secured by the rangers, the 82d landed to relieve them, allowing the rangers to proceed to St. Georges to release the American students there. Later that day the Caribbean Peace-keeping Force landed to assist the American forces on the island in keeping order after combat operations ceased.

On the other side of the island the U.S. Navy and U.S. Marine Corps conducted combat operations on Pearls Airport and the surrounding area. This operation began early on 24 October 1983 when a sea, air, and land (SEAL) team was inserted to check the feasibility of an amphibious assault. The SEALs' reconnaissance of the beach showed that the reefs would obstruct landing craft. The SEALs also determined the defenses of the Pearls Airport. The marines' helicopter assault on Pearls Airport encountered a resistance from a Peoples' Revolutionary Army militia platoon, which ceased when marine AH-1 helicopters fired on the PRA.

Another operation was the Delta Force's failure to secure the Richmond Hill Prison when the helicopters transporting them encountered heavy antiaircraft fire that downed one 101st Airborne helicopter. It was decided that any further at-

tempt to take the prison was futile. The navy SEALs, who were to rescue the governor-general, came under heavy fire. The siege of the SEALs was finally broken when Metcalf ordered aircraft from the USS *Independence* to bomb the area around the governor-general's residence. The ensuing attack led to the accidental bombing of a mental hospital. The hospital had been a military base known as Fort Matthew; the Americans did not know it had been converted to civilian use.

The second day of the operation saw the rangers secure the students at Grand Anse. This part of the operation was improvised because it was originally believed that all of the students were at the St. George's campus. By this time most of the combat operations involved mopping up the PRA's remaining resistance. The U.S. suffered 18 dead and 116 wounded; the Grenadian cost was 45 dead and 350 wounded. By December 1983 the U.S. forces were withdrawn and the Caribbean Peace-keeping Force took over.

Gribeauval, Jean Baptiste Vaquette de (1715–1789)

French military engineer whose developments of artillery contributed to Napoleon's successes. Born in a newly noble family, Gribeauval is the best example of promotion by merit. He entered the king's service at 17 years of age at the artillery school of La Fère. He was appointed artillery officer two years later and took part in the war of Austrian Succession (1740–1748). Gribeauval was sent to Prussia and Austria to study their artillery and fortification systems. He was lent to the Austrian army during the Seven Years' War (1756–1763) and distinguished himself in the siege of Schweidnitz, a fortified Silesian town he defended against Frederic II. Back in France he became general inspector of the artillery, and with Secretary of War Choiseul's support, he began the reform of the artillery. He separated the artillery into three categories: field artillery, to be used on campaign; siege artillery, for the attack on or defense of strongholds; and coastal artillery, to defend the numerous French ports. Gribeauval reduced the multiplicity of different-caliber field pieces to three: according to the weight of

the cannon ball, 4 pounds, 8 pounds, and 12 pounds. He reduced the length and weight of the field artillery. To obtain greater ranges with less powder, he used prefabricated, standardized powder and shot combinations. Gribeauval introduced interchangeable wheels and parts on lighter gun carriages and also an iron elevating screw for easier raising of the barrel. He improved the disposition of the draft horses, proposing double files of the animals instead of single file. This change improved greatly the pulling capacity and reduced the numbers of horses necessary in a team. The mobility and effectiveness of the French artillery was the best of the European armies at the end of the eighteenth century. The standardization of the Gribeauval system was adopted in 1785 after some resistance from the older artillery officers. The Gribeauval system was intensively used during the Wars of the Revolution and the Napoleonic Wars and was not replaced until 1825.

Grotius, Hugo (1583–1645)

Through his writings on natural and international law, established a framework for relations between states. Hugo Grotius (Huig de Groot) was born on 10 April 1583 in Delft, Holland, the son of a lawyer. He was a child prodigy, receiving his doctorate at age 15. Grotius served as *advocaat-fiscaal* (attorney-general) for the province of Holland and held a seat in both the provincial and United Netherlands legislatures but was imprisoned in 1618 during a religious controversy. Through the ingenuity of his wife, he escaped in 1621 to Paris. From 1634 until 1644 he was the Swedish ambassador to France.

Grotius was a prolific author, but his greatest contribution was his works on natural and international law. Grotius compiled the writings of ancient and medieval authorities and produced a series of principles about the *just war* rooted in the law of nature. In *De Jure Belli ac Pacis* (On the Law of War and Peace), written in 1625, Grotius argued that war was a legitimate means of settling one state's grievance with another, provided there was just cause. However, a just war must be waged within limits. This was a reaction to the lawless nature of wars in his era.

Grotius also argued that, as killing in wartime was not murder, the capture of private property was not robbery. This served as a legal justification for privateering on the high seas.

Grotius died on 28 August 1645 in Rostock, after falling ill on a sea voyage.

Guadalajara (8–18 March 1937)

Italian defeat during early stages of the Spanish Civil War (1936–1939). Early in March 1937, a division of 30,000 Italian troops under Fascist general Mario Roatta, supported by a mixed group of 22,000 Spanish Nationalists, legionnaires, and Moroccan troops, under General Jose Moscardo, moved south from their positions in northern Guadalajara Province. Their objective was the provincial city of Guadalajara, 34 miles northeast of Madrid. Both cities were held by the Loyalists. Accompanied by 2,400 Italian trucks, 80 light tanks, and 50 warplanes, Roatta's intention was to seize Guadalajara and extend the Nationalist encirclement of Madrid. Road conditions were wet and muddy. Roatta's less-experienced but more numerous Loyalist opponents (approximately 100,000 men) initially fell back. The town of Brihuega, halfway to Guadalajara, fell to the Italians on 10 March. Within several days, however, the Loyalist forces, made up of Spaniards, anti-fascist Italians, and many international volunteers, supported by some Russian tanks and aircraft, unexpectedly counterattacked. Surprised, Roatta's men retreated. The retreat turned into a rout, which carried along Moscardo's men. Brihuega was lost, together with many supplies. Roatta's casualties totaled some 6,500 men, of whom 2,200 were killed. Loyalist losses were roughly the same. Roatta was relieved by General Ettore Bastico. Though the Nationalists had gained some ground, their efforts to take Guadalajara were foiled, and the Loyalist cause heartened.

Guadalcanal (August 1942–February 1943)

One of the most bitter land, sea, and air campaigns of World War II in the Pacific. The campaign for Guadalcanal, one of the Solomon Islands, began in the aftermath of the naval battles of the Coral Sea and Midway. The Japanese wanted to continue their plans to take Port Moresby on the tip of New

Guinea and threaten the most direct shipping routes to Australia; their naval defeats placed increased importance on airfields in the Solomon Islands, including Guadalcanal. The United States decided to take the offensive and keep the Japanese off balance.

On 7 August 1942, navy forces began landing marines (1st Marine Division and a regiment of the 2d Marine Division) on Guadalcanal and nearby islands as part of Operation WATCHTOWER. Japanese forces on the island retreated, and the marines seized the airfield, which was under construction, and renamed it Henderson Field. Fearing exposure, Admiral Frank Jack Fletcher withdrew naval support forces, and the supply ships soon left as well. There were a series of night naval battles in the waters to the north, the so-called Slot near Savo Island, Cape Esperance, and nearby waters, and for many months these battles tested the night-fighting capabilities of the U.S. Navy, which had a lot to learn.

For the marines and U.S. Army forces that reinforced them, the fighting was difficult and the tropical conditions caused many to contract various diseases. For nine days after securing their positions, the marines prepared, and on 18 August Japanese troop reinforcements arrived. The Tokyo Express ran nightly, and beginning on 21 August there were fierce nighttime battles, sometimes ending in suicidal mass attacks on American positions. At night, a Japanese bomber with its engines out of synchronization, "Washing Machine Charlie," regularly flew over American positions, to deny U.S. troops needed rest. There were several noted battles—the Tenaru River on 21 August, Edson's Ridge on 12 September, and Henderson Field on 24 October.

By December, the Japanese effort lessened; their losses in troops, ships, airplanes, and pilots had all become too great. Indeed, a major effort to bring reinforcements in November resulted in the sinking of six troop transports. Meanwhile, American forces were strengthened. Finally, on 7 February 1943, the Japanese secretly completed the removal of their troops before U.S. forces realized what had occurred. More than 25,000 Japanese died on Guadalcanal, including about 9,000 from disease and primitive conditions; about 1,500 marines and soldiers died and about 4,800 were wounded or incapacitated by disease. One American veteran was supposed to have remarked that "Guadalcanal wasn't a battle, it was an emotion." Japanese survivors would undoubtedly have agreed.

Guatemalan Civil War (1954)

In 1950 Jacobo Arbenz, a 36-year-old army officer, was elected president of Guatemala and, soon after assuming office, moved Guatemala into a friendly relationship with the Soviet Union, much to the consternation of the United States. In addition, the Guatemalan Communist Party, known after 1952 as the Labor Party, gained greater influence. In 1952 the Agrarian Reform Law was passed and provided for the expropriation and redistribution of large land holdings in the country. The potential threat of expropriation of lands owned by the United Fruit Company and Guatemala's pro-Soviet position greatly alarmed John Foster Dulles, secretary of state in the Eisenhower administration. The U.S. ambassador to Guatemala, John E. Puerifoy, reported Arbenz's pro-Soviet actions to Washington and plotted with the Guatemalan armed forces to have him overthrown.

When the Arbenz regime received a shipment of small arms from Communist Czechoslovakia the United States decided to act by supporting Lieutenant Colonel Carlos Castillo Armas, a Guatemalan exile who had been organizing a guerrilla group in neighboring Honduras. The Central Intelligence Agency (CIA) oversaw Operation EL DIABLO, which consisted of shipping arms to Castillo Armas, providing air support, and equipping the rebels with radio transmitters to broadcast propaganda to Guatemala. Arbenz had lost some domestic support when he cut the military budget and allowed the Labor Party to assume too much power. The invasion was launched on 18 June 1954 when Castillo Armas and a band of around 200 guerrillas entered the country. CIA bombers attacked Guatemala City and, while doing little physical damage, caused panic in the Guatemalan high command, which ordered the armed forces not to resist the invasion. On 27 June Arbenz resigned and fled the country. In October, Castillo Armas became president of Guatemala and served until he was assassinated in 1957. Guatemala would be plagued by civil strife for the next four decades, resulting in more than 100,000 deaths.

For many, the U.S. intervention in Guatemala's internal affairs was a near-perfect example of the Colossus of the North's manipulating affairs in Latin America with scant regard for the people who live there, showing hostility to

agrarian reform groups, but supporting right-wing circles that represented the most exploitative elements in those nations. On the other hand, the Eisenhower administration argued that anything, including direct American involvement in the affairs of a sovereign nation, was preferable to a communist regime, and that, at any rate, the Soviets were certainly involving themselves across the board in Latin American affairs, and that many of those “agrarian reformers” were either communists or their dupes.

Guderian, Heinz (17 June 1888–14 May 1954)

Recognized as one of the military theorists and practitioners of blitzkrieg, involved in the defeat of Poland, France, and Operation BARBAROSSA during World War II. Guderian was born on 17 June 1888 in Kulm. He attended cadet schools and was commissioned second lieutenant on 27 January 1908. During World War I, Guderian served in technical and staff positions. On 1 April 1922, General Staff officer Guderian was transferred to the Motorized Troops Department of the Defense Ministry. Involved in tank development, he advocated the creation of independent armored formations with air and motorized infantry support.

Guderian’s intention was to increase battlefield mobility by rapid penetration of enemy lines, resulting in encircling movements. He requested that the army reorganize into divisions built around armor, publishing these views in *Actung! Panzer* in 1937. Hitler sanctioned the creation of three Panzer divisions to test Guderian’s ideas, and on 20 November 1938, Guderian was made general of Panzer Troops and chief of Mobile Troops.

During the Polish and French campaigns of World War II, Guderian commanded the Nineteenth Army Corps. In France, his success was more striking in that British and French tanks were in many respects superior to those of the Wehrmacht, but theirs were basically deployed as infantry support rather than in the Blitzkrieg format of independently acting armored divisions.

He led the Second Panzer Group (renamed Second Panzer Army) in Operation BARBAROSSA but was relieved of command on 26 December 1941 and cited for insubordination to General von Kluge of the Fourth Army.

On 1 March 1943, Hitler recalled Guderian, making him inspector general of Panzer Troops with the authority to establish priorities for armored vehicle production and their employment within a revised force structure.

Guderian became army chief of staff on 21 July 1944. He was dismissed on 28 March 1945 for contradicting Hitler’s idea of how to organize the defense of the Reich.

Guderian was not compelled to appear before the Nuremberg tribunal. He died on 14 May 1954.

Guernica, Bombing of (April 1937)

The most notorious atrocity of the Spanish Civil War. Hitler’s air force commander, General Hermann Goring, from July to November 1936 had built up gradually, and secretly, a 5,000-man air unit known as the Legion Condor to assist General Francisco Franco to win his civil war in Spain. The chief of staff of the Legion Condor was a career aviator and a cousin of the famous Red Baron of World War I fame, Lieutenant Colonel Manfred von Richthofen.

On 26 April 1937, about 18 bombers accompanied by 16 fighters struck the Basque town in seven waves. Three Savoia 79s with 36 50-kilogram bombs from the Italian Aviation Legion joined one Donier 17 with 12 250-kilogram high-explosive bombs. In the fourth through sixth waves, nine to twelve Junker 52s, the workhorse bombers of the legion, dropped their loads of incendiary bombs, inflicting the most destruction on the wood-built city. Fires burned for three days in unprepared Guernica, killing from 200 to 1,600 civilians. Later research showed that the attack damaged 721 buildings, of which nearly 500 were destroyed.

The reason for the disparity in the numbers killed is that news media and historians debated for 40 years the political, ideological, and strategic results of a raid that General Franco never admitted. The three officers most responsible for the experimental attack were Richthofen, working with Colonel Juan Vign, chief of staff to the commander of the Army of the North, General Emilio Mola. General Franco did

not repeat the technically successful experiment in terror-bombing an entire town or city. Mola's infantry captured Guernica from the retreating Basques on 29 April.

The bombing constituted an atrocity according to certain principles of international law enunciated at Geneva in 1925, which had attempted to outlaw the bombing of non-combatant civilians. Nonetheless, Guernica might have remained just another unhappy episode in the bloody Spanish Civil War were it not for Pablo Picasso's surreal depiction, drawn up in white heat, of the scene, the most famous painting of the twentieth century.

Guerrilla/Partisan/Irregular Warfare

Unconventional warfare is fought by relatively weaker combatants or through proxies by nations seeking to deny responsibility. Unconventional warfare has been conducted by guerrilla, partisan, and irregular formations throughout recorded history. In the west, at about the time Persian king Darius was being defeated by Scythian guerrillas (512 B.C.E.), the eastern warrior-philosopher Sun-Tzu was expounding the virtues of this indirect form of warfare (c. 500 B.C.E.). Thus, the utility of unconventional warfare developed independent of military or social cultures. This form of combat is usually considered unconventional by the norms and style of battle practiced by the ruling group's military doctrine. That is, a soldier sniping from a concealed position in a flanking wood line is deemed irregular if the contemporary tradition sees conventional fighting fought by tightly packed ranks of red tunic-clad soldiers firing volleys.

Guerrilla warfare may be defined as hostilities conducted by small, independent groups, often against larger regular

forces. Guerrillas often remain in the countryside, either in hiding or in relatively secure areas, until they attack. Usually the guerrillas will avoid committing themselves to large set-piece battles, where they tend to be at a disadvantage against the army forces. The term *guerrilla* (small war) was coined during Napoleon's Peninsula campaign due to the small-scale harassing tactics of the Spanish in support of Wellington's operations. The Vietcong conducted similar guerrilla warfare as part of the North Vietnamese campaign against the United States in Vietnam (1966–1975).

Partisans are named for the loyalty displayed toward their cause. For example, the French resistance "Gaullist Maquis" were General de Gaulle's partisans (1940–1945). Partisans are seldom uniformed, allowing them to slip back into regular society when not conducting operations. Some distinguishing mark, such as a particular armband or color, may be displayed, becoming more overt as the enemy weakens and the partisans gain strength.

Irregular warfare consists of uniformed regular military personnel utilizing nonstandard tactics to conduct irregular warfare against the enemy. This was seen in the airfield and logistics raiding of the British Special Air Service during the Desert Campaign (1941–1943). Irregular warfare also features regular military personnel assisting guerrilla and partisan operations, providing tactical expertise and logistics support. This is a primary role of the U.S. Special Forces.

Two often-conflicting roles of unconventional forces have been intelligence gathering and raiding enemy rear areas. Because an adversary denies access to their territory, information may often be gathered only through indigenous partisans or irregular "stay-behind parties" operating once the forward edge of the battle has passed, leaving them in the enemy's rear area. While higher headquarters use this information, the guerrilla's operational effectiveness, or even survival, depends upon awareness of the enemy's activities. The U.S. Confederate raider Colonel Mosby kept a force of Union soldiers at least twice his number occupied utilizing only locally acquired information during the early portion of the American Civil War (1861–1865). Information is easier to obtain when the enemy feels secure and becomes complacent. Naturally, this condition is difficult to obtain if the raiding threat remains high. However, raiding degrades enemy morale and forces him to assign combat troops for rear area security. This operational divergence became so great between the British Special Air Service (SAS) raids and the Long Range Desert Group's intelligence gathering that an arbitrary line had to be chosen in the North African desert dividing their respective areas of operations (1941–1943).

Fighting from a position of military or political weakness usually necessitates guerrilla, partisan, or irregular warfare. This is a common strategy during conflicts involving a foreign occupation or during independence movements. How-

ever, it also contributes to conventional warfare by providing either the initial response upon the outbreak of hostilities until regular forces can be raised or in conjunction with an ongoing conventional campaign. The British Layforce commandos marauding in post-Dunkirk France (1940) are an example of the former, while Colonel Mosby's raiders illustrate the latter. Guerrilla tactics are most successful when used in conjunction with a conventional military campaign. While there are exceptions, such as Castro's victory in Cuba (1956–1958), the North Vietnamese (1964–1975) and American Revolution's (1775–1783) guerrilla operations provide a common model. Fighting in conjunction with a regular force prevents the counterinsurgent elements from both forming smaller, more effective guerrilla-hunting units and focusing exclusively on defeating the conventional threat. Also, a regular army may bolster guerrilla forces with fire support or logistics, as seen when a complete Soviet airborne brigade moved by foot through the German lines to assist partisan operations after Smolensk had been overrun (1941). Conventional and unconventional forces benefit from cooperation regardless of motivation. From 1916 to 1918 British Lieutenant Colonel T. E. Lawrence's Arab force fought in the Palestine campaign. While Britain battled German ally Turkey, Arabs were fighting Ottoman rule. Nonetheless, Arab tactics played an integral part in General Allenby's conventional strategy of breaking through Turkish defenses through standard, methodical combat.

In countering guerrilla warfare, conventional armies face numerous constraints. Often it is simply a matter of relative size, in that the partisans may be only two or three individuals from a community of several thousands, or they may be operating within several hundred square miles of forested mountains. In either case, security elements face difficulty isolating these individuals, particularly given political constraints. The ruling faction may hesitate to acknowledge a rebellion, believing this may weaken their credibility or control. However, this allows the guerrillas to increase strength as their unchecked actions draw further popular support. Wartime constraints may be eliminated, as seen by the Gestapo hunting suspected partisans in occupied Europe. However, coercive military power may prove irrelevant, often counterproductive, in a strategy of "winning hearts and minds."

Western military results in countering unconventional warfare have varied, often due to conventionally educated commanders having difficulty adapting to nonstandard warfare. In 1942, for example, Japanese jungle warfare tactics forced the thoroughly unprepared British to abandon Burma and Malaya. English leadership held that the jungle was unsuited for war, and hence limited prewar training was conducted. Not only had the Japanese trained in jungle guer-

rilla warfare, they also exploited the Burmese dislike of the colonial British for intelligence purposes, a requirement when fighting at a numerical disadvantage. Some, however, such as British Major General William Slim, learned quickly. He insisted that all units, including medical sections, emphasize patrolling for security and intelligence. Commanders minimized long communications lines and frontal attacks; basically, a counter guerrilla force had to forget staff college training and fight as the enemy fought. A conventional war-planning view often focuses upon equipment and materiel strength, whereas guerrilla struggles emphasize military and civilian personnel. Countering guerrillas requires addressing the perceived injustices that provide recruits. Unconventional revolutionary warfare is seen as an instrument for realizing social, political, and economic aspirations of the underprivileged people. For a group to evolve from minor terrorist acts into a popular guerrilla movement requires sufficient oppression of the people to provide recruits. While successful counter guerrilla operations often include social change, a substantial commitment of troops is necessary to deny guerrilla victory while these changes occur. The successful French campaign in Algeria (1956–1962) reached a ratio of 18 soldiers/security personnel for each guerrilla, while in France's failed Indochina struggle (1946–1954), it seldom deployed in excess of 1.7 to 1. Thus, commanders must find an elusive balance between actions providing the guerrillas with more credibility and providing security necessary to govern effectively. These political factors became more significant during the twentieth century as several guerrilla campaigns, inspired directly or indirectly by the Soviet and Maoist Chinese examples, dominated the Cold War period. While many of the sabotage and subversion tactics remained unchanged, a new feature was the prevalence of political indoctrination. This provided increased motivation, especially necessary during protracted campaigns where simple tactics prove effective provided they are repeated sufficiently to wear down the opponent. Cold War politics provided increased awareness of these conflicts. A domestic struggle with little international significance would attract support because of the global powers' ideology. Covertly supporting guerrilla movements, fighting by proxy provides deniability to the patron nation. This has been further enhanced by the increased pervasiveness of media coverage, variously portraying an enemy as more oppressive and/or vulnerable depending on reportage sympathies. Thus the postcolonial struggles in Angola, for example, drew soldiers and weapons from the Soviet Union, China, Cuba, the United States, and South Africa, to name but a few of the protagonists (1961–1976).

Superpower nuclear constraints exacerbated by decolonizing and revolutionary struggles increased guerrilla warfare prominence in the second half of the twentieth century.

Standing armies established unconventional warfare doctrine and formations only since 1945. While lines of communications, being typical guerrilla targets, have usually been relatively exposed, the increased industrialized nature of modern conflict has increased the utility of striking these targets. Although the end of the Cold War has cast doubt upon various ideologies, ethnic tensions and socioeconomic desperation will ensure that unconventional warfare remains a viable method of conflict.

Guevara de la Serna, Ernesto “Che” (1928–1967)

Argentine-born participant in the Cuban Revolution of 1956–1959. Guevara was born on 14 June 1928 in Rosario, Argentina. Since he suffered from asthma as a child, he spent much of his youth in the mountains near Rosario. He was influenced in his early youth by the writings of Pablo Neruda, a Chilean communist. At 19 years of age, he entered medical school at the University of Buenos Aires. He cut his studies short to go on an adventurous trip across South America and then briefly to Florida. Afterwards, he returned to medical school. In 1953, he graduated with a degree of doctor of medicine and surgery. In 1954, after the overthrow of the Jacobo Arbenz regime, he fled Argentina and went to Mexico. He met Fidel and Raul Castro in Mexico and joined them in

Che Guevara smoking a cigar, 1964. (Library of Congress)

their expedition to Cuba in 1956. Supposedly an expert in guerrilla warfare, he assisted Castro in the Sierra Maestra. After Castro took power, Che became president of the National Bank as well as minister of industry. In 1960, Guevara traveled extensively throughout the Soviet bloc to seek economic aid.

Castro then dispatched Che to foment communist revolution throughout Latin America. The supposed “expert” in rural guerrilla warfare failed miserably and was reduced to haranguing uncomprehending indigenous peoples on their woes in his Argentinian Spanish. He was captured in Bolivia by Bolivian Army Rangers assisted by U.S. Army Special Forces and was executed by the former on 8 October 1967. With his death (which he apparently met bravely), Castro’s dream of a Latin America ablaze with indigenous insurgencies foundered.

Guilford Court House (15 March 1781)

A drawn battle in the American Revolution that had much to do with the British evacuation of the Carolinas and retreat to Virginia.

After the victory at Cowpens, American generals Nathaniel Greene and Daniel Morgan began a retreat across North Carolina to the Dan River into Virginia. Sir Charles Cornwallis destroyed much of his baggage and supplies and hurried his troops after them. Greene arranged to transport his men across rain-, sleet-, and snow-swollen rivers; Cornwallis arrived frequently to find boats destroyed. The further Cornwallis advanced, the more extended and weaker his forces became.

Finally, Greene fought at a field he had previously chosen at Guilford Court House. He sought to arrange his troops like Morgan at Cowpens, but the distances were too great to have the same effect. He placed two lines of militia in front—one behind a log fence and another behind a line of trees—and then his battle-tested Continentals with cavalry guarding their flanks. American casualties in the resulting battle were light and British losses were heavy—more than 630 out of 2,200 effective. Even though Greene abandoned the field,

Cornwallis soon retreated to Hillsborough, then Wilmington for supplies, and finally moved into Virginia, conceding the Carolinas.

Guinea-Bissauan War of Independence (1961–1975)

Conflict that led to the independence of Guinea-Bissau. Though conquered by Portugal in 1446, the inhospitable terrain of Guinea-Bissau in West Africa ensured that it never became a major center for European settlers, and it was only after World War I that Portugal established the territory's boundaries. In 1952, a constitutional amendment was introduced whereby Portugal's colonies were renamed overseas provinces, a thinly disguised device to evade international scrutiny.

In 1956, the African Party for the Independence of Guinea and Cape Verde (PAIGC) was founded by the nationalist and Marxist revolutionary Amílcar Cabral (1924–1973). Five years later, the PAIGC embarked on a protracted guerrilla war against the Portuguese colonial administration. The PAIGC succeeded in recruiting and training an armed force of some 7,000–10,000 fighters while the Portuguese forces reached a peak of 35,000 (a figure that includes 10,000 conscripted African troops). Despite its numerical inferiority, the PAIGC enjoyed many advantages, not least an intimate knowledge of the difficult terrain, which was ill-suited for conventional warfare. It also received crucial support from the Soviet Union and Cuba, which provided the PAIGC with money, arms, training, and practical assistance.

By 1965 the PAIGC controlled more than half of the countryside and as rural areas were liberated an alternative government was established. Eventually, Portuguese control was confined to the refugee-swollen capital, Bissau, a few small towns, and pockets in the northeast where the colonial authorities received cooperation from the more prominent Muslim Fula in an attempt to preserve traditional privileges.

The assassination of Cabral in Conakry, Guinea (23 Janu-

ary 1973) by PAIGC dissidents working with Portuguese intelligence officers did not alter the fortunes of the Portuguese. The intensification of its colonial wars had forced Portugal to take extraordinary measures, including conscription, and the government was forced to allot half of the national budget (6 percent of GNP) to military spending. Disillusioned, the commander in chief of the Portuguese forces in Guinea-Bissau, António Spínola, published a radical manifesto, *Portugal and the Future*, which gave conscripted soldiers a moral justification for refusing to fight in colonial wars. A successful coup d'état by professional soldiers (25 April 1974) dislodged the 48-year-old military dictatorship in Lisbon whose credibility had depended greatly on its ability to preserve the Portuguese Empire.

On 10 September 1974, the new Portuguese administration formally recognized the independence of Guinea-Bissau, although it delayed conferring the same status on the Cape Verde Islands until the following year. Despite initial moves toward unity under PAIGC guidance, Guinea-Bissau and Cape Verde remain separate states.

The PAIGC had been able to inflict about 300 Portuguese army casualties annually, while toward the end of the war, PAIGC fatalities were running at more than 1,000 a year. An estimated 15,000 people lost their lives during the conflict, of which about 10,000 were combatants, the remainder civilians.

Guiscard, Robert (1016–1085)

Norman adventurer in the south. The eldest son of Tancred de Hauteville, a minor Norman baron, by his second marriage, Robert had little chance of inheriting land or of making his name in northern Europe. Instead, he followed his elder brothers to southern Italy, where they had established themselves first as mercenaries, and then, in the competing spheres of Lombard, Muslim, and Byzantine cities, as warlords with fortified cities.

Robert arrived in 1046, and quickly succeeded as a freebooter in Calabria, earning the nickname “Guiscard” (clever) for tricking the monks inhabiting a strategic mountain

monastery into letting him in the gates by faking a funeral procession. In 1053, by then a member of the Norman establishment in southern Italy, he commanded the left wing of the victorious Norman forces at Civitate, fighting against Pope Leo IX's claims on the city of Benevento and papal power in the south of Italy.

In 1057, he inherited his brother Humphrey's city of Melfi and married Seichelgaita of Salerno, a Lombard noblewoman who frequently fought at his side in battle. When Robert and the new pope, Nicholas, reconciled in 1059, the pope granted Robert claim to Apuila, Calabria, and Sicily, which was still in Byzantine and Muslim hands. Aided by his brother Roger, newly arrived from Normandy, Robert invaded Sicily.

Always forced to leave Roger, ultimately Great Count of Sicily, in charge of the Sicilian invasion because of the constant rebellions and Byzantine invasions of his Italian possessions, Robert expended most of his resources subduing his neighbors and taking advantage of the contest between the pope and the Holy Roman Emperor to seize territory. In 1080, using the excuse of his daughter Helena's marriage to a son of the deposed Byzantine emperor Constantine X Ducas, Robert attacked Durazzo, using an ingenious solid blockade of ships, which defeated a Venetian fleet. He also defeated Alexius Comnenus, and the Byzantine army, on land.

Returning to quell a disturbance in Apuila, Robert aided the pope, Gregory VII, who had been evicted from Rome by an imperial army, by retaking the city, but then unfortunately he allowed his army to sack it. With the pope's authority reestablished, Robert returned to attack Greece, but after taking Corfu, he died in 1085 in an epidemic, probably typhoid, that was raging in his camps. Succeeded by his and Seichelgaita's son Roger Borsa, Robert also fathered Bohemond, one of the first and most successful crusaders, while his brother Roger founded a Sicilian dynasty of his own. Together they created the powerful Norman kingdoms in southern Europe.

Guise, François de Lorraine, Second Duke of (1519–1563)

French military commander. François de Lorraine, second duke of Guise, distinguished himself in various battles of the

wars of France against Charles V, especially at Metz in 1552. In 1557 he fought the Spanish in Italy and in 1558 he took Calais from the English. At court, he was the rival for power of Anne, duke of Montmorency. With the accession in 1559 of the youthful Francis II, who was married to the duke's niece, Mary Stuart, Guise and his brother Charles, Cardinal de Lorraine, were given control of the government. Guise and his brother gained great influence over the youthful Francis II and almost completely controlled the government during Francis's two-year reign. In that period the Guises directed the persecution of the Huguenots, becoming widely detested for their violent suppression of the Huguenot conspiracy of Amboise in 1560. Shortly afterward, however, the death of Francis II deprived the Guises of power. Catherine de Médici, mother and regent for the succeeding Charles IX, ousted the Guises from their position of influence. François subsequently joined the leadership of the Catholic party, opposing both the Huguenots and the tolerance of the regency. The massacre of the Huguenots at Wassy by Guise's soldiers in 1562 led to the French Wars of Religion (1562–1598) between Catholics and Protestants. He was assassinated while preparing to attack Orléans the following February. Though Guise has been charged with cruelty, his soldiers considered him a generous man and respected him for his military skill.

Gujerat (1849)

The final battle of the Second Sikh War (1848–1849). After the Chillianwallah battle on 13 January 1849, in which the British Army of the Punjab had been severely mauled by the Sikhs, the latter withdrew into hills along the Jhelum River. The British force, commanded by Lord Gough, remained in camp at Chillianwallah, awaiting further Sikh movement. On 2 February Shere Singh's army headed southeast into the fertile district of Gujerat to obtain supplies. Gough had anticipated such a move and, once alerted, ordered his force southward in pursuit. However Shere Singh, preferring to fight defensively, had halted immediately south of Gujerat and prepared to fight the next battle from a static position.

The Sikh position faced south and straddled two small gullies. Their cavalry was concentrated at each end of the line on the far sides of the gullies, with the infantry posi-

tioned between the two. No breastworks had been prepared for the 35,000 Sikh troops.

Gough had been reinforced by about 15 regiments so was able to field some 20,000 men with 96 guns. He planned a frontal assault on the left and center of the Sikh line and positioned half his force between the two gullies and half to the left of the left-hand one.

After a fierce and effective artillery barrage, British troops advanced according to plan. The Sikhs attempted a counterattack into a break in the British line along the dry left-hand gully but were broken up by artillery. By midday, although fighting strongly and maintaining order, they were in retreat. The British infantry advanced two miles, then left off the pursuit to the cavalry, who harassed the Sikhs 15 miles further.

The Sikh army was unable to organize or resupply effectively after the battle and finally surrendered unconditionally at Rawalpindi on 14 March 1849, ending the second Sikh War. But of all the indigenous peoples resisting British colonial incursion, they had put up the stiffest opposition.

Gulf War (2 August 1990–28 February 1991)

First major conflict of the post-Cold War period, fought between Iraq and an American-led international coalition. Known as one of the most decisively one-sided victories in military history, it has been described as a battle of Soviet equipment and tactics versus Western equipment and tactics. The conflict can be divided into two parts, DESERT SHIELD and DESERT STORM.

DESERT SHIELD was the U.S. reaction to Iraq's invasion of Kuwait, to deter Iraqi aggression into Saudi Arabia. In the process, it became the first time in history that a major com-

British troops and units from other coalition countries gather for review by King Fahd of Saudi Arabia. The units took part in an assembly of international coalition forces united against Saddam Hussein during Operation DESERT STORM. (Department of Defense)

bat army, consisting of coalition forces, was allowed time to build up and train, then bomb an enemy, without threat to its own ground forces.

Once the coalition bombs starting falling, on 17 January 1991, part two of the Gulf War had begun—DESERT STORM. There were two phases to DESERT STORM: first, the devastating five-week-long bombing campaign, and second, the ground assault. The coalition’s air campaign cut the Iraqi lines of communication and reinforcement, seriously degraded their military capacity, and vastly reduced morale. In short, the air assault prepared the Iraqis for the coup de grace—the ground war.

The coalition strategy, called Air Land Battle (ALB) Doctrine, was developed by NATO to fight a major land war against the Soviet Union. The crux of the combined-arms doctrine is to “look deep,” a hundred miles or more behind

the front. The philosophy celebrates deception and maneuver in the spirit of Robert E. Lee and Stonewall Jackson. The key to ALB is a combination of speed, surprise, and mobility, which protects one’s own forces and keeps the enemy off balance.

The strategy was ideally suited for the region’s terrain, the enemy’s strategy, and the military equipment available. The “left hook” took coalition troops 300 miles west of Kuwait to swing around Iraqi defenses and cut off reinforcement and retreat. The assault by the 101st Airborne is considered the largest air assault operation in military history.

The right flank of the coalition was intended to push up through the teeth of Iraqi defenses in Kuwait and draw the elite Republican Guard reserves down into the fray. With the Iraqis being pulled in two directions, the center, or “mailed fist,” was to slash through the gap. The mailed fist was made

up of American and British heavy armored units whose task was to find, engage, and destroy the Republican Guard formations.

Although political pressure ended the ground operation before the mailed fist could finish its job, the Iraqis lost more than 5,000 tanks and armored vehicles compared to 13 lost by the coalition. The Iraqi military lost some dead and wounded, compared to the coalition's dead and wounded. In spite of the experts' tales of a battle-hardened Iraqi army, no other twentieth-century large-scale war had proved as one-sided.

Gustavus II Adolphus (1594–1632)

One of the great captains, who advanced the institution of disciplined and professional standing armies. Gustavus Adolphus, known as the Lion of the North, established an enduring personal and military legacy during the seventeenth century. A devout and pious Lutheran, he was also an exceptional nationalist who took advantage of international instability to advance the cause of Sweden as a major power.

Born into the House of Vasa on 19 December 1594, he inherited his family's impetuosity and daring. In 1611, during a war with Denmark, Gustavus led a 500-man detachment that successfully bluffed its way into a Danish garrison and captured it without loss. In October that same year, Gustavus became heir to the throne following the unexpected death of his father, Charles IX. In an unprecedented move by the regency, who so regarded the young prince's intellect and boldness, 16-year-old Gustavus was formally recognized as king in December 1611.

Gustavus had the good fortune to ascend to the throne at a time of Swedish prosperity and strengthening nationalism. Sweden clashed with its neighbors Russia, Poland, and Denmark repeatedly during the early years of his reign. In these wars, the king learned invaluable lessons from his own direct experience as well as from soldiers who came into his service from the suspended conflict in the Netherlands.

From these veterans he learned the revolutionary advances in tactics, army organization, and finances pioneered by Maurice of Nassau.

Gustavus carefully crafted his military instrument, which he raised predominantly through national conscription. Upon this core of stout soldiery, Gustavus imposed strict discipline, a sense of uniformity, and meticulous drill. In fact, Gustavus most thoroughly completed the reforms envisioned by Maurice. His cavalry discarded the pistol and trained to charge with the sword; infantry learned rapid musket fire combined with articulated maneuver in smaller linear formations; and the Swedish artillery—light, mobile, and plentiful—became the bane of all of Sweden's enemies.

Gustavus spent the early years of the Thirty Years' War fighting against his Catholic uncle Sigismund, king of Poland. In 1630, Gustavus recognized an opportunity to intervene in the massive German conflict on the side of the Protestants, who had suffered terrible military and political setbacks. Subsequently, he landed his force on the Baltic shores of Pomerania and commenced a campaign that lasted nearly three years. During the first year of his campaign, Swedish arms conquered the Oder valley as far as the Catholic-held city of Frankfort am Oder. Gustavus won his first major field victory against the Hapsburg imperial army under Count Tilly at Breitenfeld on 17 September 1631. From that victory, Protestant hopes and resolve soared and the Swedes marched throughout central and southern Germany. After some inconclusive skirmishing in Bavaria, Gustavus felt compelled to return to Saxony to confront a second imperial army, this time commanded by Count Wallenstein. The two forces met at Lützen on 16 November 1632. The Swedes won the desperate battle, but only after the Swedish king fell from his charger, mortally wounded by at least three musket balls, while leading a cavalry attack. Gustavus earned his lasting rank as a great captain due to his relentless energy, keen tactical insight, and extraordinary leadership. He fully recognized the elements of early modern warfare: firepower, maneuver, and decisive shock action. He honed these elements to near perfection, and when married with his well-administrated army, he acquired the praise and fearful respect of ally and enemy alike.

H

Hadrian (Publius Aelius Hadrianus) (76–138)

Military reformer, Roman emperor from 117 to 138. Before becoming emperor, Hadrian had a long military career, serving in Spain, Pannonia, Moesia, Germany (with the XXII Legion, the *Primigenia Pia Fidelis*), and Parthia. During the First and Second Dacian Wars (102–103 and 105–106), Hadrian served variously as quaestor, legate, praetor, and commander of a legion. He became governor of Pannonia in 107, consul in 108, and governor of Syria in 114. Hadrian was in line to receive a second consulship in 118 when, upon hearing of the death of Emperor Trajan (d. 8 August 117), the armies of Syria proclaimed Hadrian to be emperor of Rome. Deeming Trajan's wars of expansion a waste of blood and treasure, Hadrian pursued a policy of imperial consolidation. In 122, preferring peace to war, Hadrian negotiated an armistice with the Parthians. Touring the empire and inspecting the provinces in order to make reforms, Hadrian established large-scale border fortifications, which not only protected the frontiers from Barbarian attacks, but also served as checkpoints for trade. The most famous of these fortifications, Hadrian's Wall, was erected between Tyne and the Solway Firth in Britain. Although he demanded rigid discipline, Hadrian's military reforms and personal inspection tours throughout the empire won the intense loyalty of his legions. Perhaps one of Hadrian's most significant reforms was the elimination of distinctions between the legions and the auxiliary corps, which meant that Roman citizens and noncitizens now served in the same units. Hadrian also reintroduced the tactical modification of the Macedonian phalanx, in which auxiliary troops led an attack followed later by a reserve of legionnaires. Hadrian's reign was generally marked by peace and sensible policies, except in Judea, where Hadrian's insensitivity provoked the Second Jewish Revolt (132–135).

Haig, Douglas (1861–1926)

British field commander in World War I. Haig was born into the famous family of distillers in Edinburgh, Scotland, on 19 June 1861. Educated at Oxford and graduating first in his class at Sandhurst in 1885, Haig was commissioned in the 7th Hussars and saw service in India, Africa, and on the home front. In the Nile Valley during the Mahdist War, he fought at Atbara and Omdurman. In the Second Boer War, with his superior officer, John French, and ambulance volunteer Mohandas K. Gandhi, Haig escaped Ladysmith by train just before the Boers surrounded it. In 1901–1902 he fought Jan Smuts's guerrillas in the Cape Province. He was promoted to major general in 1905 and to lieutenant general in 1910.

Again under French in 1914, he commanded the I Corps of the British Expeditionary Force at Mons and the Marne and in Picardy and Artois. He became commander of the First Army in February 1915. The Germans stopped him at Neuve-Chapelle from 10 to 13 March, at Festubert from 9 to 26 May, and at Loos from 26 September to 14 October. Haig replaced French in December and began to plan the great offensive of the Somme. After this offensive succeeded (at enormous cost), late in 1916, in reducing threats to the poilus at Verdun, Haig was promoted to field marshal.

Operating under Robert Nivelle, Haig made gains at Arras from 9 to 15 April 1917. After Henri Pétain replaced Nivelle

on 15 May, Haig improved the French position by attacking at Passchendaele from 31 July to 10 November. He contained Erich Ludendorff's offensives at the Somme and the Lys in March and April 1918, then counterattacked at Amiens on 8 August. He commanded the Flanders operation in Ferdinand Foch's final offensive from 26 September to 11 November. Created earl in 1919, he died in London on 29 January 1926.

Haig has come to symbolize the unimaginative head-on tactics on the western front that nearly destroyed a British generation in World War I.

Haitian Civil War (1806)

After independence Haiti was ruled by the despotic Jean-Jacques Dessalines, who proclaimed himself emperor. Dessalines, who had been born in Africa, discriminated against the mulattoes. Moreover, his regime was corrupt and stole most of the national treasury. In 1806 Dessalines was murdered and Haiti plunged into civil war. The civil war centered around two strongmen who vied to be master of Haiti. The first was Henri Christophe, a black man who had been one of Toussaint L'Ouverture's lieutenants in the war for independence from France. The other was Alexandre Pétion, a prominent mulatto who had led that segment of Haitian society in battles with the French and Haitian slaves. An assembly attempted to establish a national government with Christophe as president and Pétion as head of the legislature. Under this arrangement the mulattoes would dominate and Christophe would be a mere figurehead.

Christophe rejected the plan and attempted to seize power by marching on Port-au-Prince, but he was thwarted by Pétion's superior army, which was equipped with artillery. Christophe retreated and established a state in the northern portion of Haiti with the capital at Cap-Haitien. In 1811 he proclaimed himself King Henry I and built a magnificent palace. In order to maintain his personal power,

Christophe brought African warriors who formed his palace guard and were called Royal Dahomets.

Pétion established a republic in the southern portion of Haiti with himself as president for life. The division of Haiti into two distinct states resulted in clashes, but for many years neither section had the strength to defeat the other. Pétion pursued economic policies that rewarded the mulatto elite, but his racial policies were less discriminatory than those in Christophe's kingdom. Both states showed a marked contrast between the small wealthy ruling class and the balance of the population, which was impoverished.

When Pétion died in 1818 Christophe sought to unify the country under his leadership, a move that was rejected by the southern elite, who did not want a black leader. Instead, General Jean-Pierre Boyer was selected by the republican senate to be president. In 1820 Christophe suffered a severe stroke and later took his own life. Boyer then united the country and ruled until 1843.

Halleck, Henry Wager (1815–1872)

Union field commander and administrative officer in the American Civil War, known (and not with affection) as "Old Brains." Halleck was born in Westernville, New York, on 16 January 1815. Assigned to the engineers after graduating from West Point in 1839, he studied fortifications in Europe and wrote a book on military science, published in 1846. As brevet captain in the Mexican-American War, he saw little battle action but excelled at engineering. He resigned his commission in 1854 and became a lawyer in San Francisco.

Recalled to active duty upon the recommendation of Winfield Scott, Halleck was commissioned major general on 19 August 1861. He replaced John C. Frémont in command of the Department of Missouri on 19 November and straightened out the administrative mess that Frémont had made. After Ulysses S. Grant captured Forts Henry and Donelson in February 1862, Halleck, as Grant's commanding

officer, was rewarded on 13 March with command of all Union forces in the western theater.

Halleck's only field campaign was the march on the Confederate supply base at Corinth, Mississippi, in May and June. He was severely criticized for his creeping, mile-a-day advance, which allowed P. T. Beauregard and Braxton Bragg to escape and regroup after Shiloh. Abraham Lincoln relieved him of field command on 19 September and brought him to Washington, D.C. As general in chief from 11 July 1862 to 12 March 1864, and as chief of staff until 16 April 1865, he performed much better as an administrator than he had as a field commander.

After the Civil War, Halleck held commands in Virginia, the Pacific, and Kentucky. He died in Louisville, Kentucky, on 9 January 1872.

Hamilcar Barca

(c. 270–228 or 229 B.C.E.)

Carthaginian general during and after the First Punic War, and father of Hannibal and Hasdrubal. In 247 B.C.E. Hamilcar was sent to Sicily to take over command of the fleet. He raided the coast of Italy, hoping both to bring the Italian population to revolt against the Romans and to keep Roman forces occupied. When this remained ineffective he landed in Sicily with a force of mercenaries and started a guerrilla war. After he had captured the town of Eryx (244 B.C.E.) he succeeded in prolonging the war in Sicily until 241 B.C.E. The Carthaginians were defeated at sea near the Aegaeates islands. Hamilcar was given full authority to negotiate a peace treaty.

Due to the cost of the war effort Carthage was not able to pay its mercenaries, which were the bulk of its army. They revolted and besieged Carthage. Hamilcar assumed command of the Carthaginian army. As in Sicily he preferred a war of mobility and small-scale action rather than one of large battles. By cutting off the supply lines of the insurgents he forced them to raise the siege. The war was brought to an end in 237 B.C.E. by Hamilcar, sharing command with his political rival Hanno, in a battle near Leptis Minor.

After the revolt Hamilcar went to southern Spain to recover the territories Carthage had lost during the war with Rome. He campaigned in the peninsula until he drowned during the siege of Helice (near Alicante) on the east coast of Spain, where he was treacherously defeated by a local king. By that time he had reestablished Carthage's Iberian empire. As a result the city regained its position as a major power in the western Mediterranean. Hamilcar became the effective ruler of the province, a power base that he passed on to his house. With its resources his son Hannibal almost brought Rome to its knees.

Hamilton, General Ian Standish Monteith (1853–1947)

British soldier and author. Ian Hamilton was first noticed by Lord Roberts during the Second Anglo-Afghan War (1878–1880) and became his aide-de-camp in 1882. He saw action in South Africa during the Transvaal War of Independence (1880–1881) and was severely wounded and captured during the fateful battle at Amajuba (27 February 1881). He then took part in the Gordon Relief Expedition in the Sudan (1884–1885). At the time of the outbreak of the Anglo-Boer War (1899–1902) he was General George White's assistant adjutant general in Natal and was besieged with White in Ladysmith, playing a pivotal role in several battles, including Platrand (Wagon Hill and Caesar's Camp, 6 January 1900). After the relief of Ladysmith, Hamilton commanded Roberts's Mounted Infantry Division. He took part in Roberts's advance from Bloemfontein to Pretoria, saw action at Donkerhoek (Diamond Hill, 11–12 June 1900), but was unable to corner General Christiaan De Wet (August 1900). At the end of 1900, Hamilton accompanied Roberts back to England and became his military secretary at the War Office. He returned to South Africa in November 1901 to become Lord Kitchener's chief of staff but was soon ordered to command mobile columns in the western Transvaal during the final weeks of the antiguerrilla campaign. He defeated the Boers at Roodewal (11 April 1902) and was one of the few British commanders who emerged from the war with an enhanced military reputation.

During the Russo-Japanese War (1904–1905), Hamilton was a British observer in the field. He was adjutant general, 1909–1910, and became commander in chief of the Mediterranean Command in 1910.

When World War I broke out, he was given command of the Central Force for the defense of the United Kingdom and in March 1915 he was placed in command of the Dardanelles operation. However, lack of success (and heavy casualties) led to his recall in October 1915. He was not given another command.

Hamilton was the gifted author of several books, including *The Fighting of the Future* (1885), *A Staff Officer's Scrap Book* (2 volumes, 1905–1907), *Gallipoli Diary* (2 volumes, 1920), *Anti-Commando* (with A. Wools-Sampson, 1931), *When I Was a Boy* (1939), and *Listening for the Drums* (1944). He also published novels and poems. Hamilton was a confident and resourceful officer, but “The Happy Warrior” lacked the ruthless drive and single-mindedness that are prerequisites for a truly great commander. Nevertheless he was a rare phenomenon, an intellectual professional soldier with a keen interest in all the arts.

Han Wudi (r. 141–87 B.C.E.)

Chinese emperor of the Han Dynasty who maintained strong, forward positions against the Xiongnu Rising in the north. More or less contemporaneous with the unified Chinese empires of Qin and Han was the steppe state of the Xiongnu (possibly the ancestors of the Huns), which not only seriously threatened Chinese rule in north China but also prevented direct Chinese contacts with the wealthy Greek world of the distant west. Han rulers responded to the Xiongnu threat in various ways, but under Wudi a “modernist” school of administration insisted upon direct confrontation with their steppe enemies and the maintenance of

a forward position of military bases and border colonies to keep the Xiongnu as far away from China as possible.

Wudi's policy was a concerted attempt to “use the barbarians to control the barbarians.” This involved the encouragement of subversion within the Xiongnu, above all through substantial bribes to the right parties, a carefully controlled marriage policy, and a search for allies to support the Han cause. It was in support of this latter goal that the courtier Zhang Qian was sent west to establish contact with the Yuezhi, “moon clan,” traditional enemies of the Xiongnu. After harrowing adventures that brought the Chinese explorer as far as Sogdia and Bactria, whence the Yuezhi had moved, he returned with no alliance but with abundant information about the west and the roads leading there. Armed with this intelligence, Wudi's armies, which had already begun an advance into what is now Chinese Turkistan, quickly conquered the entire area as far as Ferghana in what is now western Turkistan. This advance not only outflanked the Xiongnu but brought China, for the first time, into direct contact with the west. This was the real beginning of the famous Silk Route.

Hancock, Winfield Scott (1824–1886)

Impeccable Union field commander in the American Civil War. Hancock was born in Montgomery Square, Pennsylvania, on 14 February 1824. After graduating from the U.S. Military Academy at West Point in 1844, he served under his namesake in the Mexican-American War and was brevetted first lieutenant at Churubusco. In the 1850s, he fought the Seminoles in Florida, the factions in Kansas, and the Mormons in Utah.

Stationed in California when the Civil War broke out, he returned east and was promoted to brigadier general of volunteers on 23 September 1861. After leading a masterful flank attack at Williamsburg, Virginia, on 5 May 1862, he was called “Hancock the Superb.” He fought at Seven Pines and Fair Oaks from 31 May to 1 June, at Frayser's Farm on 30 June, commanded a division at Antietam, and became major general of volunteers on 29 November. He attacked Marye's Heights at Fredericksburg and performed expert rearguard maneuvers at Chancellorsville.

On the first day at Gettysburg, Confederates under Henry Heth and A. P. Hill pushed him southeast to defensive positions on Cemetery Ridge. He held the Federal center left on the second day and the center the third day but was critically wounded on Cemetery Ridge as his forces brought George Pickett's famous charge to a halt. Returning to action six months later, he distinguished himself at the Wilderness and was brevetted major general in the regular army for his service at Spotsylvania. He failed at Cold Harbor only because of Ulysses S. Grant's error. Troubled by his Gettysburg wound, he deferred command at Petersburg and went on furlough. Hill and Wade Hampton dealt him an embarrassing defeat at Reams' Station, Virginia, on 25 August. Relieved of field command on 27 November, he finished the war commanding garrisons around Washington, D.C.

Hancock was the Democratic candidate for president in 1880. After losing to James A. Garfield, he returned to active military duty and died at his headquarters on Governor's Island, New York, on 9 February 1886.

Hannibal Barca (247–188 B.C.E.)

The greatest Carthaginian general during the Second Punic War. Hannibal was the son of the famous general Hamilcar Barca, who took him to Spain in 237 B.C.E. According to Roman tradition Hannibal was raised to hate Rome, swearing an oath forever to be its enemy. Although Hannibal became an implacable enemy of Rome, his reputation for cruelty, malice, and greed, attributed to him by biased Roman writers, is not backed by evidence.

In 220 B.C.E. Hannibal became commander of the Carthaginian army in Spain. After subduing the north of the peninsula he attacked the city of Saguntum (Sagunto) in 219 B.C.E. The Romans protested, claiming that the city was an ally,

and declared war. Hannibal immediately prepared for an invasion of Italy. His plan was based upon the assumption that if he attacked the Romans in Italy, many of Rome's allies would change sides. Having set out with an army of 50,000 foot, 9,000 horse, and some 40 elephants, Hannibal marched through the Pyrenees and southern Gaul. After a difficult march through the Alps he reached the Po valley and defeated the Romans at the Trebia (218 B.C.E.).

The following year Hannibal marched over the Apennines into Etruria (Tuscany), where he destroyed a Roman army at Lake Trasimene (217 B.C.E.). Again a Roman force marched to fight Hannibal. At Cannae (216 B.C.E.) two Roman armies were totally destroyed. Hannibal showed superior generalship and complete control over his troops.

Although Hannibal had won three major victories, things did not turn out as he expected. The Romans showed remarkable tenacity. Following the advice of Fabius Maximus, they dogged Hannibal's footsteps, denying him battle but undoing his successes behind his back. The delaying tactics wore Hannibal down, denying him the opportunity to win the war decisively.

Rome's allies also proved far more loyal than Hannibal had expected. Few of Rome's major allies came over to him. Moreover, as abandoning his newfound allies would negate any chances of more Italians joining him, Hannibal was forced to protect them. As the Romans set in on pushing renegade allies into line, Hannibal had to march regularly to their relief and had to use up valuable manpower on garrisons.

Despite Hannibal's initial successes, he received few reinforcements from Carthage partly because of significant political opposition. Moreover the Carthaginians deemed the protection of their empire in Spain more important than the war in Italy. An attempt by Hannibal's brother Hasdrubal to reinforce him with an army from Spain was foiled at the Metaurus in northern Italy (207 B.C.E.).

Hannibal campaigned in Italy until he was recalled to Africa in 202 B.C.E., when Carthage itself was threatened by Scipio Africanus. At Zama (202 B.C.E.), Hannibal was defeated decisively. Knowing that Carthage had lost the war, he advocated peace. For a while Hannibal was allowed to follow a political career in Carthage, but eventually he was forced to flee to King Prusias of Bythia in Asia Minor by Roman machinations. To avoid being extradited to the Romans, Hannibal committed suicide.

Harpers Ferry (American Civil War, 12–15 September 1862)

One of the greatest capitulations in American military history. After the Battle of Second Bull Run/Manassas Junction, Robert E. Lee and the Army of Northern Virginia “invaded” Maryland with plans to move into Pennsylvania. Using cavalry along the fall line of the mountains, Lee screened his movements from George McClellan, who moved cautiously.

When Lee learned that the Union garrison at Harpers Ferry, (West) Virginia, had not abandoned the munitions

and supply depot there, he ordered General Thomas J. “Stonewall” Jackson and three of Lee’s four columns to surround the town and compel its surrender.

The Union garrison under Colonel Dixon Miles held out until the Confederates placed artillery on the heights overlooking the town, which was in the valley at the confluence of three rivers. Miles surrendered his garrison of more than 12,000 men and the vital supplies to Jackson, who meanwhile sent his columns hurrying to join Lee at Antietam, where Lee had decided to make a stand against McClellan. The last of Jackson’s columns, under General A. P. Hill, was the last to leave and therefore the last to arrive at Antietam, blunting Burnside’s late afternoon assault.

Harrison, William Henry (1773–1841)

American frontiersman, field commander, politician, and president. Born on his father's plantation, Berkeley, in Charles City County, Virginia, on 9 February 1773, Harrison graduated from Hampden-Sidney College in 1790. His father, Benjamin Harrison, a signer of the Declaration of Independence and the governor of Virginia from 1782 to 1784, sent him to Philadelphia to study medicine under Benjamin Rush. When his father died in 1791, Harrison immediately abandoned medicine and received an ensign's commission in the 1st Infantry, which was stationed in Ohio with standing orders to patrol the Northwest Territory.

As lieutenant and aide-de-camp to "Mad Anthony" Wayne, Harrison fought with distinction at Fallen Timbers on 20 August 1794. Promoted to captain in 1797, he commanded Fort Washington, near Cincinnati, until he resigned in 1798 to become territorial secretary for the Northwest. He was territorial delegate to Congress in 1799 and governor of the newly created Indiana Territory from 1800 to 1812. A significant part of his duties was to maintain good relations with the natives of the territory and thus ensure safety for white settlers. He undercut his own efforts at peace by forcing a series of land-grabbing treaties on the Shawnee and other indigenous nations. Tecumseh and his brother, Tenskawatawa, organized native resistance against Harrison's policies.

On 7 November 1811, at the confluence of Tippecanoe Creek and the Wabash River, Harrison defeated Tenskawatawa and burned his village, losing about 180 of the 950 regulars and militia under his command. This battle destroyed the fragile coalition of natives in Indiana and made Harrison a national military hero with the nickname "Tippecanoe." Tecumseh led the remnants of the tribes into Canada, where they became staunch allies of the British during the War of 1812.

Appointed major general of the Kentucky militia in August 1812, Harrison relieved Fort Wayne and was commissioned brigadier general of regulars in September. Seeking to recoup the losses suffered by James Winchester in the west, Harrison built Fort Meigs and Fort Stephenson in Ohio and waited for reinforcements. Promoted to major general of regulars in March 1813, he marched north that autumn, recapturing Detroit on 29 September and decisively defeating

the British and Indians at the Thames on 5 October. His nemesis, Tecumseh, was killed in that battle. He resigned his commission in May 1814 and returned to Ohio.

Harrison represented Ohio in Congress from 1816 to 1819 and in the Senate from 1825 to 1828. He lost a four-way election for president to Martin Van Buren in 1836, but won the White House as a Whig in 1840. He died on 4 April 1841 from the pneumonia he caught while delivering his inaugural address a month earlier, the first American president to die in office.

Harsha (c. 590–c. 647)

Starting as the teenage ruler of a small Indian state, Harsha came close to recreating the mighty Gupta Empire. In 606, Harsha Vardhana became ruler of Thaneswar, a small state located in the Punjab between the northern Indus and northwestern Ganges Valley. He married into the neighboring Maukhar kingdom and relocated to the capital at Kanauj. In 618, Harsha invaded the Gauda kingdom with 50,000 troops, 20,000 horsemen, and 5,000 elephants. Centered in modern Bangladesh, Gauda was responsible for the death of Harsha's older brother. "The elephants were never unharnessed and the soldiers never unhelmeted" until Harsha made Gauda his tributary.

Generally, however, Harsha preferred to negotiate his neighbors into his empire as allies rather than use force. These tactics made the rulers of Sindh, Ghujarat, and Valabhi become vassals (Samantas), placing much of the Indus Valley and the Arabian Sea coast under his sway. However, Pulakeshin II, ruler of the Decca plains south of the Narmada River, spurned Harsha's diplomacy. In 633, when Harsha attempted to march into Pulakeshin's territory, the Decans forced him back across the Narmada. Three years later, he expanded his empire to the east, moving down from Gauda to annex more of Bengali coast.

Later foreign sources comment on the extent of Harsha's cavalry (100,000 horse and 60,000 elephants). Despite this great host, Harsha preferred a feudal-confederal decentralism over militaristic despotism. Patron of arts, culture, public charities, and scholarship, historical sources are kind to his memory. Nonetheless, Harsha was assassinated in 647 and his empire disintegrated almost immediately.

Harun al-Raschid (766–809)

Sultan of the Abbasid Empire. Member of the dynasty that had overthrown the Umayyads, and established themselves as the successors of Muhammad and rulers of a rich empire centered on Baghdad, Harun al-Raschid is primarily known as a patron of the arts and sciences. With extraordinary revenues from trade, Harun al-Raschid supported a spectacular court that inspired the *Thousand and One Nights* and perfected the pursuits of falconry, polo, and chess. He was one of the first sultans to make diplomatic contact with western

Europe, sending Charlemagne an elephant as a gift and establishing himself as the protector of Christian pilgrims to the holy land.

Nonetheless, Harun al-Raschid's rule was far from peaceful. Constantly on the alert against internal threats, he maintained an elaborate secret police network. His system of regional emirs contributed to constant revolts of Berbers, and Egyptians, as well as Khazars, who collaborated with the Byzantines. Public works projects such as hospitals and universities were offset by large-scale military fortress building on the borders, garrisoned by fanatical ghazis. The Byzantines were Harun al-Raschid's greatest enemy, although despite the use of Greek fire, there were few permanent gains for either side because of prisoner exchanges and truces. Unfortunately, the excesses of his court and the internal dynamics of his family guaranteed that the empire was plunged into destructive rounds of fratricide and civil war when Harun al-Rashid died.

Hasegawa, Yoshimichi (1850–1924)

Japanese field marshal who earned worldwide attention with his accomplishments during the Russo-Japanese War. Hasegawa was born in the Iwakuni subfief of the Choshu clan's territory, now the prefecture of Yamaguchi. When the Choshu joined with the Satsuma clan to overthrow the shogun and restore the emperor to power in 1868, Hasegawa participated in the fighting. When the new government established an army to replace the old clan armies, he joined as a captain in 1871. By the time of the Satsuma Rebellion in February 1877, he was a major and commanded a regiment. Hasegawa's regiment was among those sent to relieve Kumamoto Castle in April 1877, and he distinguished himself in the fighting. After the war, Hasegawa was sent to France during 1885–1886, to review military developments in that nation. When he returned, the army promoted him to major general.

Hasegawa's next war was the first Sino-Japanese War of 1894–1895. He commanded a brigade during the fighting in Korea. At the battle of Pyongyang on 15 September 1894, Hasegawa won distinction for his valor and for the performance of his brigade. During the fighting at Haicheng in December 1894 and January 1895, his unit once again was rec-

ognized. As a reward, Hasegawa was promoted to command of the Guards Division in General Kuroki's First Army during the Russo-Japanese War of 1904–1905. He led his division from its landing in Korea to the Yalu River. During the Battle of the Yalu (30 April–May 1904) Hasegawa was recognized for his aggressive drive against the Russian defenders; crossing the river, he forced them to retreat. In June 1904, he was promoted to general.

Hasegawa served as commander of the Korean Garrison Army from September 1904 to December 1908. He tried to exclude civilian authorities from his area of responsibility as much as possible. In 1912, he was promoted to chief of staff of the army and served until 1915. His disdain for civilians was made obvious in 1913, when he protested directly to the emperor regarding a plan to allow reserve officers to hold positions as service ministers in the government. Hasegawa was promoted to field general when his term as chief of staff ended.

Hastings, Battle of (14 October 1066)

Decisive battle between William of Normandy and Harald II Godwinsson. Hastings provided the final resolution to the Danish Wars of Succession and marked the end of the Anglo-Saxon kingdoms. It resulted in the administrative, legal, and social restructuring of England by William I, the Conqueror.

The events leading to the battle were the death of Edward the Confessor with no clear heir to the throne; election by the Witan of one of the claimants, Harald II Godwinsson, brother-in-law to Edward; and the battle of Stamford Bridge between two of the claimants, Harald Sigurdsson of Norway and Harald II Godwinsson of England. Immediately after Harald II Godwinsson's victory at Stamford Bridge (25 September 1066), word came of the landing of William's invasion force at Pevensey on 29 September 1066. Hoping to duplicate the tactics that had worked so well at Stamford Bridge—a surprise attack cutting the enemy off from his ships—Harald quickly returned to the south.

The speed of his forced march coupled with losses at Stamford Bridge meant that Harald arrived with depleted resources. Many of Harald's foot troops and archers were left behind. That, coupled with insufficient time to regroup and call up fresh reinforcements, played a significant role in Harald's subsequent loss of the battle to the Normans.

The opponents were positioned on two hills with an intervening valley. At 9 A.M. William's attack surprised Harald, forcing him to fight a defensive battle with largely unseasoned levies. Harald's housecarls took the front and flank positions of the tightly grouped Anglo-Saxon army. This was a good defensive stand. It also blocked the road to London.

William deployed his army into three main groups: Breton auxiliaries on the left, the bulk of Normans in the center, and a mixed group on the right. The van was comprised of light foot soldiers and archers, who were followed by more heavily armed infantry, and finally, squadrons of mounted knights. Initially, William's battle strategy was an uncoordinated series of attacks by infantry and cavalry. After the first waves were repulsed by Harald, William altered his strategy to combined attacks. Archers shot high to disable and occupy the defenders while the knights attacked to break the defense line. William was successful. Harald died in the blizzard of arrows, and the Anglo-Saxon line broke.

Hattin, Battle of (4 July 1187)

A severe defeat of the crusaders by the Muslims under Saladin. Sultan Saladin (Salah al-Din) organized forces to retake the Holy Land from the Christian kingdoms established in the Levant after the First Crusade. To counter this, King Guy of Lusignan organized an army of 15,000 at Sepphoris, near Nazareth. Against the advice of his advisers, Guy's army began their march into the arid region of the eastern Galilee on 3 July 1187 to relieve the Muslim siege of Tiberias.

The Christian army consisted of about 1,500 knights and 4,000 cavalry, the remainder being infantry. The march proceeded slowly as Muslim cavalry harassed the advanced units. By the afternoon the Christians were out of water and

growing weary. Guy decided to turn toward the springs at Hattin, overlooking the sea of Galilee. Two rocky outcrops, known as the Horns of Hattin, dominated the barren plain. As the Christian army camped that night Saladin encircled their position.

At dawn on 4 July the Christians resumed the march. Saladin's infantry lit brush fires that blew smoke toward the Christians. With the two armies arrayed, the Christian knights charged, driving back the Muslims. The Christians were unable to drive them off, however, and became more fatigued from lack of water, heavy mail, and the smoke. Some of the Christian cavalry broke through and escaped, the remainder of the army was mired near the rocky horns.

Saladin's forces attacked on all sides, and the exhausted Christians surrendered, with a remnant of the True Cross falling into Saladin's hands. The numerous bishops and noblemen captured along with King Guy were ransomed, while the foot soldiers were sold into slavery. Saladin took the rest of the region, eventually capturing Jerusalem.

Hawaiian Wars (1782–1810)

The three decades from about 1780 to 1810 that saw the Hawaiian Islands brought together into a unified kingdom for the first time by King Kamehameha “the Great” (c. 1752–1819). As in other parts of the world, this consolidation was made possible in the Hawaiian Islands in great part through the introduction of firearms.

When Captain James Cook was killed on the Big Island of Hawaii in 1778 by armed warriors of that island's primary chief, Kalaniopuu, the islands of Hawaii were far from a unified polity. Political power and control varied from island to island, with even the Big Island divided among rival chieftains. Yet within a generation the armaments and technology that Cook and other Western traders and explorers introduced would become decisive in that archipelago's unification. Soon after Chief Kalaniopuu's death in 1782 a rivalry ensued between Kalaniopuu's relations, including his sons Kiwalao and Keoua and his nephew Kamehameha, for control of the Big Island. But the rival chieftains and their bands of warriors were of relatively equal strength, and as a result their struggle persisted throughout the 1780s without conclusive results.

In 1790 an American trading vessel, the *Fair American*,

along with its guns and two English crewmen, fell into the hands of Kamehameha after it was attacked and seized as retaliation for losses suffered in an encounter with an earlier Western ship. Such trading vessels had begun to appear with increasing frequency in the islands, a convenient watering hole between China and the West Coast of the Americas. Kamehameha would use the two foreigners to manufacture Western handguns and train his men in Western fighting tactics.

Even before establishing his power on the Big Island, Kamehameha decided to attack the neighboring island of Maui, then under the control of the most powerful chief in the islands, Kahekili. In the narrow valley of Iao on Maui, Kamehameha, employing his two Englishmen and newly acquired guns, inflicted a decisive defeat upon an army led by Kahekili's son. Despite this victory Kamehameha returned to the Big Island, where fighting had erupted again in his absence. The renewed struggle on the Big Island was again indecisive until Kamehameha ambushed and killed his chief rival, Keoua, along with his retinue of warriors, after inviting him to meet at a newly constructed *heiau* (temple), dedicated tellingly to the god of war. With this death Kamehameha established himself as master of the Big Island of Hawaii.

Soon thereafter Kahekili sent a fleet of native canoes and special bands of warriors, along with his own Western vessel, to harass Kamehameha on his own turf. A sea battle was fought off the Big Island between the two rival chieftains' vessels, which proved sanguinary but indecisive. Kahekili died on his home island of Oahu soon afterward, his domains, like those of Kalaniopuu previously, falling into dispute between his various heirs. Only in late 1794 did Kahekili's son Kalanikupule emerge as victor, following the defeat on Oahu of his half brother, and primary foe, with the help of guns supplied by an English merchant. In January 1795 the victorious Kalanikupule decided to take his campaigns to the Big Island of Hawaii, hoping to defeat his father's rival Kamehameha. Now equipped with a plentiful supply of firearms and several Western vessels, his hopes of bringing the Big Island under his control were not farfetched. His luck did not hold, however, and the foreign crews of his ships, pressed into his service, mutinied and succeeded in driving Kalanikupule and his warriors overboard and back to Oahu in humiliation.

Kamehameha meanwhile had been colluding with the English. In 1794 he agreed to “cede” the Big Island of Hawaii to Great Britain and in return received English help in building a fighting ship. Eyeing his strategic opportunity, Kamehameha decided to move and in early 1795 seized Maui and the narrow island of Molokai, which lay just to its north. Despite the defection of one of his primary chiefs to Kalanikupule, Kamehameha proceeded with plans to attack Oahu

and landed on that island's southern coast near modern Waikiki. Kamehameha scattered his foe, driving many over the high cliffs of the pass, and with his victory, and the death of Kalanikupule, secured his control over Oahu.

The only island remaining outside Kamehameha's control was the far western island of Kauai. On Oahu Kamehameha received further British help in building a 40-ton ship with which to attack Kauai. Kamehameha and his forces set sail for Kauai in summer 1796, only to have his plans postponed at the last moment by an uprising on the Big Island. Perhaps the delay was fortunate. The uprising was soon subdued but plans for the invasion of Kauai were put on hold. The interval allowed Kamehameha time to consolidate his newly won domains and to set up efficient means of administration and communication. He set up governors on each of the islands, and like resourceful rulers before him, such as France's Louis XIV or Toyotomi Hideyoshi in Japan, he invited potential rivals to dwell with him in his capital. He also set about building a stronger navy, switching to innovative twin-hulled canoes rather than the traditional and less stable single-hulled ones. From the foreigners arriving in increasing numbers and with increasing frequency in the islands Kamehameha procured yet more armaments and foreign vessels.

In 1802 Kamehameha finally sailed again for Kauai, then ruled by the chief Kaumualii, with a fleet of nearly 800 vessels and an armed force of thousands. Kamehameha and his fleet tarried for some time on Maui, hoping unsuccessfully to threaten Kaumualii into submission, before continuing westward to Oahu. On Oahu in 1804 Kamehameha's efforts were struck an almost fatal blow, in the form of an epidemic that wiped out many of his troops, though it spared him. For several more years Kamehameha stayed on in Oahu, which was yearly growing in population and prosperity. At this point Kamehameha let it be known that he would be satisfied with the outward submission of his rival on Kauai, and gaining it would allow him to rule on there as his governor. The two rival chieftains were finally brought together in Honolulu in early 1810. The result was the formal inclusion of Kauai as a tributary island to Kamehameha with Kaumualii as its leader. It was a diplomatic terminus to almost two decades of conflict, and with it Kamehameha secured his control over all of Hawaii and effected the first unification of the islands in their history.

Hawkwood, John, Sir (c. 1321–1394)

English soldier and mercenary captain-general in Italy. The son of Gilbert Hawkwood of Essex, he fought under King Edward III in the Hundred Years War at the battles of Crécy (1346) and Poitiers (1356). Knighted after Poitiers, and unemployed after the Treaty of Bretigny (1360), he joined the mercenary White Company, so named for their brilliantly polished armor. While serving the Italian city-state of Pisa, Hawkwood was elected captain-general of the White Company in January 1354. He led the Pisan forces against Florence (1364), before committing his company to the service of Bernabo Visconti of Milan against Emperor Charles IV. Hawkwood was captured near Arezzo and held until ransomed in 1369. Entering the service of Pope Gregory XI in 1372, he fought in an indecisive war against Milan in 1374 and led papal forces during the War of the Eight Saints (1375). Leaving papal service, Hawkwood joined the antipapal alliances and served as captain-general of Florence from 1378 to 1381. He led Padua, an ally of Florence, to a decisive victory over Verona in the Battle of Castagnaro (11 March 1387). Hawkwood led the Florentine army in his last campaign during an inconclusive war against Milan in 1390–1392.

Hawkwood utilized the English longbow and tactics developed in the French war during his Italian service. He was renowned for his infantry tactics, unit discipline, and utilization of lighter armor and equipment to improve the rapidity of troop movements.

Hawkwood died on 16 March 1394 in Florence. King Richard II later had his body returned and reinterred in Hawkwood's native village.

Henry II, King of England (1133–1189)

Henry Plantagenet, king of England, conqueror, reformer. Henry was duke of Normandy from perhaps 1149, count of Anjou from 1151, and duke of Aquitaine through his marriage to Eleanor in 1152. He is best remembered for his quar-

rel with Archbishop Becket, for his troubled relations with his wife and sons, among them the future kings Richard I and John, and for his sweeping constitutional reforms in England. His contemporaries recognized him as a military leader without peer. On behalf of his mother, Mathilda, he organized the forces against Stephen of Blois in the civil war for the crown that followed the death of Mathilda's father, Henry I. On the Continent, he regularly subdued rebellious vassals, later including those supporting his sons, and established dominance over virtually all of the princes of northern France, as well as a cowed King Louis VII. While he marshaled the full feudal resources of his realms for major campaigns in Toulouse (1159), Wales (1165), and Ireland (1171), most of his career was spent besieging castles. Castles were both a symbol and a consequence of baronial power at the expense of overlords in the twelfth century.

Henry first besieged and leveled the castles of those refusing to accept his lordship, then strengthened and rebuilt his own castles to preserve order in his realms. His successful castle strategy avoided the necessity of expensive pitched battles. To accomplish this strategy, he increasingly relied on mercenary footmen trained and equipped for castle siege and defense, and not on his feudal levies.

Despite this, Henry was still a feudal king and his administrative reforms in England were marked by two significant initiatives in this capacity: the 1166 *Cartae Baronum* (Baronial Charters) and the 1181 Assize of Arms. The *Baronial Charters* were written statements from all of Henry's tenants-in-chief identifying feudal obligations to knight service, thus allowing the king to discover the full extent of his feudal military resources. The Assize of Arms identified and classified each vassal's obligation according to wealth, establishing a hierarchy of military obligation based on a single recruitment system. It would be the first of a series of such attempts that continued into the thirteenth century.

Henry V, King of England (1387–1422)

English king, victor at Agincourt. Henry V was born 16 September 1387, at Monmouth, Monmouthshire, Wales, and died 31 August 1422 at Bois de Vincennes, France, as Prince of Wales, duke of Cornwall, earl of Chester, prince of

Aquitaine, duke of Aquitaine, and duke of Lancaster. Henry was the eldest son of Henry IV, and he first fought alongside his father during the Welsh (against Owain Glyn Dwr) and English (against Henry Hotspur Percy and Edmund Mortimer) rebellions. Like his father, Henry wished to expand English influence in French territories, and his most famous victory at Agincourt on 25 October 1415 confirmed his place in British history. This battle, which resulted in the destruction of many of the most powerful French nobles, saw the loss of some 6,000 Frenchmen, but only 400 English. Not a decisive victory, Henry was forced to continue to push his way inland, finally capturing Normandy in the spring of 1419. Eventually, Henry signed the Treaty of Troyes with the Burgundians in May 1420, and this solidified his claim to the French throne.

Henry married Katherine, the daughter of the French king, and after a brief tour of the English countryside with his new bride, he returned to France and defeated the stronghold at Meaux in May 1422. It was during this time that Henry's health began to fail him, and he died prematurely of dysentery on 31 August 1422, at the young age of 34. His death was a major blow to the English, who had become quite loyal to him, and while he never saw his goal of conquering France come to fruition, he did leave his kingdom to a nine-month-old successor, Henry VI.

Heraclius (c. 575–641)

Byzantine emperor (r. 610–641) who managed to save the empire from defeat at the hands of the Persians and Avars. During the eight-year reign of Phocas I, responsible for a rule of mindless cruelty and terror, the eastern empire all but ceased to exist. Its position in the Haemus collapsed and Persian armies reached the Bosphorus in 608. With the empire in extremis, the exarch of Africa, Heraclius the Elder, raised the standard of revolt and a fleet commanded by his son made its way to Constantinople. There Heraclius the Younger overthrew Phocas and was installed as emperor.

The change of emperor brought no immediate improvement of the empire's position. Damascus fell in 613, Jerusalem in 614, Chalcedon, on the Marmara, in 616. The

loss of Egypt (616–619) followed. With Avar raids reaching the walls of Constantinople (617–619), Heraclius determined to abandon Constantinople in favor of the African provinces but was prevented by popular protests and a pledge by Church and people to defend the empire (619). From this time dated the militarization of the state: It underwent fundamental reform, which, over decades, gave rise to the creation of an Anatolian peasantry that held land in return for military service.

With these various changes in hand, in 622 Heraclius left Constantinople with an army to begin operations in Cilicia and Syria. The war was taken into Armenia and thence into Media and Mesopotamia: In 624 Istfahan was occupied. By 625 the Persian Empire, under obvious threat, allied itself with the Avars. Heraclius, returning to Constantinople, resorted to alliance with the Khazars in an attempt to divide Persian attention. Then, leaving Constantinople under the command of the patriarch, Heraclius returned to Armenia and the Caucasus.

Another Persian invasion of Anatolia reached the Bosphorus on 29 June 626 at the same time as an Avar army, of about 80,000 men, reached Constantinople's walls. There followed a climactic 10-day battle on land and at sea as the Avars sought to land forces inside the Golden Horn. The shattering of this attempt forced the Avars to abandon their effort: The Persians were left in Anatolia with a double threat in the mountains and Mesopotamia. Over the next two years the war was carried into the Persian heartland once more. In 628 a peace agreement restored all the eastern empire's lost possessions.

To have been responsible for such a feat of survival would have assured Heraclius of a place in history, but in the 13 years after his return to Constantinople in May 628 the eastern empire lost one-third of its territory. Between 634 and 640 Palestine and Syria were overrun once again; Egypt was lost for good between 639 and 640. Within 25 years of the death of Heraclius the empire had lost half of its territory and faced threats as grave as those that it had faced in 626.

Hideyoshi, Toyotomi (1537–1598)

Hideyoshi began his career as a peasant's son in Nakamura, Japan, but rose through the ranks of Oda Nobunaga's army

until he became a general. When Akechi Mitsuhide assassinated Nobunaga, Hideyoshi halted his attacks, returned to Kyoto, and executed Akechi. Hideyoshi then served as one of four regents to the grandson of Nobunaga in 1582. By 1585, Hideyoshi had established himself as the successor to Nobunaga's legacy and concluded several alliances, including one with Tokugawa Ieyasu. He then proceeded to unify Japan. Hideyoshi amassed an army of 200,000 men and invaded Chosokase in 1585. Then, in 1587, he assembled an even larger army of 280,000 men and took Kyushu.

By 1590, Hideyoshi, after the battle of Odawara, had successfully unified Japan. The key to his success was due more to his political acumen in arranging alliances than to military force. He did, however, possess the military might to enforce his alliances. Furthermore, in order to prevent rebellion, he arranged national sword hunts and disarmed all but the bushi, or samurai class.

Hideyoshi was not satisfied with the conquest of all of Japan but envisioned the conquest of China. He intended to march through Korea and then invade China from the north. After the kingdom of Korea refused him free passage, he invaded it in 1592. His army of 200,000 overran most of Korea but encountered the Ming Chinese army at Pyongyang. Negotiations began, but they eventually broke down. So another invasion occurred in 1597–1598 with another massive army but in the process Hideyoshi died.

Hideyoshi's greatest contribution was the unification of Japan. Furthermore, he was able to harness its nascent military ability and focus it away from deleterious civil war and into foreign ventures. The sheer size of his armies are testaments to Hideyoshi's organizational and logistical abilities.

Hill, Ambrose Powell (1825–1865)

Confederate general, tenacious fighter, and one of Robert E. Lee's most valued subordinates. A. P. Hill was born in Culpeper, Virginia, on 9 November 1825. At the U.S. Military Academy at West Point, he was a member of the class of 1847 and the roommate of future Union commander George B. McClellan. He fought as an artilleryman in the Mexican-American War and against the Seminoles. On 31 March 1861, he resigned from the U.S. Army as first lieutenant.

Commissioned colonel of the 13th Virginia Regiment in May, Hill was in reserve at First Bull Run. Promoted to brigadier general on 26 February 1862, he distinguished himself at Yorktown, Williamsburg, and Hanover Court House, Virginia, in May. He was made major general on 26 May and quickly assembled the famous Hill's Light Division, which became a key element in the peninsular campaign. Hill's setbacks during the Seven Days Battles were not through lack of either courage or tactical skill, but from the absence of the support he expected from Stonewall Jackson.

Hill and Jackson subsequently worked better together. At Cedar Mountain on 9 August they combined to rout Nathaniel Banks. Their cooperation helped the Confederates at Second Bull Run, Harpers Ferry, Antietam, and Fredericksburg. Hill accompanied Jackson around the Union right flank at Chancellorsville and took over command when Jackson was hit. Robert E. Lee promoted Hill to lieutenant general on 24 May 1863, hoping to replace Jackson.

Hill proved inadequate for corps command. His accomplishments after Chancellorsville never matched his earlier work. His III Corps was the first to attack at Gettysburg, but it did not perform well. His hasty attack on a superior Union force under Gouverneur Kemble Warren at Bristoe Station, Virginia, on 14 October without first gathering the necessary reconnaissance devastated his troops and thwarted Lee's offensive. He likewise failed to meet Lee's expectations at the Wilderness, North Anna, and Cold Harbor. He was killed in action at Petersburg on 2 April 1865.

Hindenburg, Paul von Beneckendorf und von (1847–1934)

World War I commander and president of the Weimar Republic. Hindenburg was born on 2 October 1847 in Posen. He entered the Prussian army in 1866 and fought in the last two wars of German Unification, the Austro-Prussian War (1866) and the Franco-Prussian War (1870–1871). From 1873 to 1876 he studied at the Prussian War Academy before entering the Prussian General Staff with the rank of captain. A solid officer, Hindenburg steadily rose through the ranks of the Prussian army and was even considered for the posts of chief of the general staff and Prussian war minister. Hindenburg commanded an army corps from 1903 to 1911, when, having achieved the rank of lieutenant general, he retired after a successful if not brilliant military career. World War I changed that.

On 22 August 1914, Hindenburg was recalled to active duty and given command of the Eighth Army in East Prussia. His chief of staff was Erich von Ludendorff. The careers and fortunes of both men would henceforth be inexorably linked. Sent to East Prussia to deal with the Russian threat, Hindenburg and Ludendorff inflicted two major defeats on the Russians at the battles of Tannenberg and the Masurian Lakes (August–September 1914). As a result of these spectacular victories, Hindenburg became the most famous and most popular general in Germany, a status that he was to keep for the remainder of his long life. In the wake of Tannenberg and the Masurian Lakes, Hindenburg was promoted to the rank of field marshal and appointed commander in chief on the eastern front in November 1914. In this position Hindenburg and his chief of staff Ludendorff came into increasing conflict with the commander in chief of the general staff, Erich von Falkenhayn, over the question of German military strategy. Moreover, Falkenhayn's inability to break the military stalemate redounded to Hindenburg's benefit, as many ordinary Germans now looked to the hero of the eastern front as Germany's savior. On 28 August 1916, Hindenburg replaced Falkenhayn as chief of the general staff, with Ludendorff serving as first quartermaster

general. In addition to their responsibilities for German military strategy, Hindenburg and Ludendorff were increasingly in charge of German domestic policy as well, which led to the creation of a “silent dictatorship.”

Domestically, Hindenburg and Ludendorff sought to place the German economy on a total war footing by enacting a massive munitions program, accompanied by an Auxiliary Service Law aimed at mobilizing German manpower. Yet they could do little about the food situation, brought about by the Allied naval blockade, and for several winters, turnips seemed to be about the only food available. This near famine is all the more remarkable considering that after 1917, Germany had control of the Ukraine, one of the world’s greatest food producers, as well as one of Europe’s most efficient railway systems to transport the wealth of the Ukraine to the Reich. Germany did exact huge reparations in specie from the defeated Russians, but the German people could not eat gold.

Hindenburg and Ludendorff were also instrumental in the downfall of Chancellor Theobald von Bethmann-Hollweg in July 1917 and his replacement by a string of weak chancellors who could be bent to the military’s will. In terms of military strategy Hindenburg and Ludendorff were responsible for the reintroduction of unrestricted submarine warfare in April 1917, which brought the Americans into the war; the annexationist peace treaties imposed on Rumania and Russia in 1918; and the final German effort on the western front in 1918. As grand strategists both left much to be desired.

Hindenburg retired from the army for the second time in 1919 but remained a popular figure in a postwar Germany bitterly resentful of the Versailles diktat. (Of course, the terms imposed by Germany on her defeated enemies were certainly diktats by any definition of the word.) In 1925 Hindenburg again emerged from retirement and was elected president of the Weimar Republic. Although a monarchist at heart, he was initially loyal to the republic. However with the onset of the Depression in 1929, the rise of Nazism after 1930, and his advancing age, he became increasingly dependent on a rightist camarilla determined to destroy German democracy. Under the influence of this rather unsavory circle, Hindenburg appointed Adolph Hitler chancellor on 30 January 1933. Relegated to the sidelines as a senile figurehead, Hindenburg died on 2 August 1934, at his estate in Neudeck, East Prussia. It was an ill day for Germany when Hindenburg was translated from his field command to political power.

Hiroshima and Nagasaki, Atomic Bombings of (1945)

Ended World War II and began the nuclear age. The Japanese cities of Hiroshima and Nagasaki were devastated by atomic bombs in August 1945. Their destruction culminated years of intensive research and the investment of \$2 billion into the Manhattan Project, the top-secret American effort to develop atomic weapons.

By 1944, American scientists believed they could produce an atomic chain reaction sufficient to generate an unprecedented explosion, and army leaders created the 509th Composite Bomb Group to develop tactics for utilizing the new weapon as a bomb. Colonel Paul Tibbets’s 393d Bombardment Squadron pioneered these tactics in the 509th, using modified B-29 Superfortresses to drop single bombs accurately from high altitudes and then climb, turn, and dive away at high speed to escape the shockwave generated at detonation. After training in Utah, Tibbets and his men flew to the Pacific island of Tinian and awaited delivery of atomic bombs for use against Japan.

Their delivery came closer on 15 July 1945, when scientists detonated the first atomic device at the Trinity test site, near Alamogordo, New Mexico. With an estimated yield of 15,000–20,000 tons of TNT, the explosion exceeded even the wildest expectations of Manhattan Project scientists, and President Harry Truman quickly approved the use of atomic weapons against Japanese cities. Hiroshima, Kokura, Niigata, and Nagasaki were the possible targets, chosen for their military value and because they had been relatively undamaged by previous raids.

Tibbets and crew began their mission to Hiroshima by boarding the *Enola Gay*, a B-29 named for Tibbets’s mother, on 6 August 1945. They carried a bomb nicknamed Little Boy, in honor of Franklin Roosevelt, which utilized a uranium 235 core to generate an atomic explosion. Tibbets dropped the device at 8:15 A.M. and it detonated 1,900 feet above Hiroshima with a force of 15,000 tons of TNT. It destroyed five square miles of the city, along with 140,000 people, who died from the initial explosion or from radiation and blast burns over the next several months.

On 9 August, the United States launched a second atomic strike, sending a B-29 named *Bock’s Car* commanded by Ma-

The atomic bombing of Nagasaki, Japan. (Library of Congress)

for Charles Sweeney to attack the city of Kokura. When clouds obscured the city, Sweeney switched targets and bombed Nagasaki at 11:02 A.M. with a plutonium bomb named Fat Man (after Winston Churchill). Though more powerful than Little Boy, Fat Man caused less damage because hills around Nagasaki contained the explosion. The bomb killed 73,884 people outright, injured 74,909, and destroyed 2.6 square miles of the city.

Historians and many concerned citizens still vehemently debate the wisdom and morality of dropping the atomic bombs and their role in compelling the Japanese surrender on 14 August 1945. The surrender came five days after the destruction of Nagasaki, but Japanese leaders were influenced by the entry of the Soviet Union into the war against them perhaps as much as by the power of atomic bombs. Their surrender made the invasion of Japan, the greatest

planned military operation in history, completely unnecessary.

History, Military

The study of the planning for and the use of organized armed force, either on behalf of some form of recognized

state authority or against it. It differs from other branches of history insofar as it calls upon knowledge of certain specialized areas, such as strategy and tactics.

Military history can be said to have existed since men began to write about armed conflict: The Hebrew Scriptures contain many accounts of battles and can be considered a military historical source. The Athenian Thucydides, whose history of the Peloponnesian War is often cited as an early example of military history, provided accounts of sea operations, clashes between armies, and the strategies of the opposing sides and did not demonize the opposing forces. But he also examined the nature of state power, the effects of war, and offers of peace, so much so that one of the first translators of the work, Thomas Hobbes, described its author as “the most Politick Historiographer that ever writ,” thereby highlighting a perennial problem of military history: deciding the point at which it overlaps so much with other areas that it becomes political or general history.

Nevertheless, throughout its development, military history has been marked by certain recurring characteristics. In particular, the motivation of authors and the functions that it has served can be identified as follows: to provide a record of heroic or sacrificial deeds for coming generations; to pay tribute to the achievements of those who fought soon after the conflict; to assist in the discovery of lessons for future wars; to satisfy the demand of the public for accounts of battles; to cover up mistakes by commanders or leaders by falsifying, omitting, or distorting events; to provide inspiration to soldiers and future soldiers; to act as a teaching tool for military instructors; to encourage feelings of identification within a group, community, or state; and to satisfy scholarly interest. Trends in military historiography have been largely defined by the interplay of these motivations.

While in many early accounts enjoyment in the destruction and slaughter can be clearly detected, before and during the early modern period the *genius* of the warlord played a central role in the writing of military history. Although the organization, equipment, and movement of armies were described, the commander was usually the monarch or nobleman and hence was honored through accounts of his campaigns. The function of this military history, though, was not simply to generate propaganda on behalf of the ruler: It was assumed that the performance of the commander was normally the factor that decided the outcome. It should also not be forgotten that in times of high illiteracy rates military history should also be considered to have included visual records, such as the Bayeux Tapestry, or the woodcut illustrations of the sixteenth and seventeenth centuries.

Two parallel developments at the beginning of the nineteenth century, however, ushered in important changes: the professionalization of historical research and writing at uni-

versities and of armies through the establishment of military academies and general staffs.

Even before the Franco-Prussian War, military history began to be systematized, with the use of battles to illustrate certain points of military operations and tactics. In Britain the first example was probably Major General Patrick MacDougall’s *Theory of War Illustrated by Numerous Examples from Military History*, published in 1856, followed by the more influential work by General Sir Edward Hamley, *The Operations of War Explained and Illustrated*, first published in 1866 and continually republished until 1922. Hamley’s work is interesting for the way in which it shows the blurred dividing line between military theory and military history. Hamley’s starting point was to complain that military history was written very much like novels, with the reader accepting uncritically the opinions of the writer. In fact, in the nineteenth century mainstream military history was dominated by the assumption that turning points in history were epitomized by decisive battles, an approach enshrined in Sir Edward Creasy’s *The Fifteen Decisive Battles of the World* (1851).

After the conclusion of the Franco-Prussian War, military history enjoyed a new period of popularity in Europe, with numerous illustrated and well-documented histories of that war appearing. The most significant development was arguably the emergence of official histories, the American Civil War being most memorably commemorated by the *War of the Rebellion: A Compilation of the Official Records of the Union and Confederate Armies*, consisting of an astonishing 128 volumes, published between 1881 and 1901. But most professional of the official military histories was the more manageable eight-volume history of *The German-French War of 1870–71*, undertaken by the Military History Section of the German General Staff; the first volume was published in 1874, the last in 1881. This work was the first official military history to be researched and written in conformity with the standards of the emerging history profession and was characterized by detail and analysis down to company level and up to panoramic descriptions of all the engagements. The first volumes won the prize for German History awarded by the Prussian Academy of Science in 1878, and their publication opened the era of professionally respectable military history.

With the expansion of staff work, so began an increase in the volume of documents left behind by wars; and as the official archives grew, so did the desire of armed forces to keep them under their own control. One of the few historians in Germany to challenge this monopoly was Hans Delbrück, an academic at Berlin University, who argued that the subject needed to broaden its focus, taking into account the political intentions of national leaders. His view that military history

ought to be conducted outside the general staff provoked bitter opposition.

The writing of the history of World War I saw the apogee of the dominance of official military history. Although the Red Army did not produce an official history of Russian operations 1914–1917, and the Americans contented themselves with the publication of documents, the voluminous British, German, and French historical undertakings were severely hampered by the determination of the military establishments to prevent damage to the reputation of commanders and their armies. The German official history, although published by the state archives, was written mainly by former officers who had not been accepted by the Reichswehr, the intention being to counteract the defamation of the military that followed the defeat in 1918. The British official history demonstrated a further problem: With the first volume appearing in 1922, and the final one in 1947, the slow progress put into question the value of such works for instructional purposes.

In Britain, a reaction occurred against self-serving military history in the 1930s, Basil Liddell Hart and J. F. C. Fuller in particular making influential contributions. Although their works on the American Civil War and World War I did not meet the standards of later academic monographs, they encouraged a more critical attitude to the use of sources and the official version of events.

As it turned out, the official British history of World War II far exceeded the quality of its predecessor. The U.S. histories were likewise of a high standard, the range of publications being particularly noteworthy. Only the Russian official histories of the “Great Patriotic War” can be criticized for omitting significant facts and for its propaganda. The history the Wehrmacht remains, however, the most problematic case study in the writing of the history of World War II. Many of the surviving German records were captured by the Western Allies, and the U.S. Army established an Operational History (German) Section in January 1946, employing 328 ex-Wehrmacht officers by June 1946. Its successor, the Control Group, survived in skeleton form until 1961. The studies conducted under American auspices assessed the war only within the narrow framework of “lessons learned,” yet they were not only the basis for many later published works, the results flowed into official U.S. military thinking. Mistakes and atrocities were almost always blamed on Hitler. No doubt as a reaction to this traditional concept, the first volumes of the Federal German official history of World War II (volume 1 was published in 1979) undertaken by the armed forces Military History Research Office adopted a wider and more critical approach. But by the close of the twentieth century the work was still uncompleted, illustrating that some of the problems of official history have remained.

Despite the dominance of World War II as the main subject for military historians throughout the 1950s and 1960s, the postwar period has seen a revolution in the writing of military history. The increasing numbers of military officers who take doctorates before assuming posts as historians has led to a remarkable improvement in research standards. The U.S. Army Command and General Staff College at Fort Leavenworth has been influential in promoting an expansion in the scope of combat studies, geographically and thematically. Equally important is the emergence of a new concern with the experience of battle, a trend confirmed by John Keegan’s innovative *The Face of Battle* (1973). Keegan’s book inspired many more studies of this kind, marking a decisive break with the operational narrative tradition, which usually excluded the horrors of battle. The new concern for the “ordinary soldier” (undoubtedly a reflection of the prevailing interest in the academic history establishment of “history from the bottom up”) expressed itself particularly effectively in studies of war in the trenches, such as Tony Ashworth’s *Trench Warfare 1914–1918: The Live and Let Live System* (1980). These works opened up new possibilities for historians to use microstudies to put official accounts to the test, showing how *the system* actually worked.

Beyond the experience of combat, other types of military history have been developing, most notably studies of armies in peacetime. Building on insights from sociology and organization theory and pioneering sociological studies of various officer corps, major studies have been published on military reform, military debates, and the dynamics of the introduction of new weapons. Well-researched monographs on the development of armored forces, 1919–1939, for instance, have not simply added to gaps in knowledge, they have improved awareness of the fact that poor battlefield performance can have doctrinal causes that stem from decisions taken during peacetime. They have also contributed to the development of methodologically pioneering works on military effectiveness, innovation, doctrine, and culture, a recent example being *Military Innovation in the Interwar Period* (1996), edited by Williamson Murray and Allan Millett.

The organizational approach in studies of armies has likewise led to significant improvements in understanding such subjects as war planning, mobilization, surprise attack, and failures in intelligence assessment. Indeed, the role of intelligence in both peacetime and wartime has emerged of late as a subject in its own right.

Perhaps the most important postwar trend in the writing of military history has been the body of literature that falls under the rubric of “war and society.” This school of thought, which became popular in the 1970s, seeks to examine the effects of warfare on political institutions, econo-

mies, popular culture, and postwar societies. It has assisted, for example, in encouraging study of the home fronts during both world wars and militarism in Wilhelmine Germany. The problem with this approach is that it lacks any clear theoretical or methodological underpinning, leading often to imprecise generalizations. Perhaps more stimulating have been those works that have examined specific aspects of warfare over several centuries, original studies such as Martin Van Creveld's path-breaking *Supplying War* (1977), which examined logistics since Gustav Adolphus, or William McNeill's *The Pursuit of Power* (1983), discussing the interaction of war, technology, finance, and society. One criticism that can be leveled against such works is that they tend to be bloodless accounts of a very bloody process: men with lice crawling over their testicles dying and being mutilated in very unpleasant ways.

In short, since 1945 the thematic and methodological scope of military history has widened dramatically, producing a concomitant trend of specialization within an increasing number of subdisciplines. The use of military history for instructional purposes has continued, but it has become more subject to academic scholarly standards than ever before, suggesting perhaps the fulfillment of Hans Delbrück's original demands.

Austro-German statesman, classic and supreme symbol of evil for the twentieth century. Hitler was born on 20 April 1889 to Alois, a focused, able civil servant of the multiethnic Austro-Hungarian Empire, and his much younger wife, Klara. Alois died in January 1903, after years of often-violent conflict with Adolf that apparently only taught the son to defy the father by rejecting everything that Alois stood for: thrift, discipline, work, a family life, and a measure of political tolerance. Hitler fully justified his father's fears when his mother allowed him to lead an idle life in the family home in Linz.

preparation, he returned to Linz to care for his mother during her long, painful death from breast cancer, moving to Vienna in February 1908. There, he wasted his mother's inheritance in lazy fantasy at the opera and reading a gutter press that intensified the pan-German nationalism and anti-Semitism he had absorbed as a child. By the winter of 1909–1910, he was homeless, seeking shelter in a men's hostel. Only then did he paint hack work routinely. In May 1913, Hitler received his father's inheritance and moved to Munich immediately afterwards. He refused service in the multiethnic Austro-Hungarian army during the Balkan War only to volunteer for service in August 1914 in the Bavarian army, eventually serving as a dispatch runner in the 16th Reserve Infantry Regiment.

A committed soldier, he was highly decorated, respected, and very odd: He seems to have had no lovers nor close friends even though his regiment may have been his first home since his mother's death. He vehemently disapproved of humanitarian considerations influencing military policy and reacted violently to defeatist comments. The mass killing of World War I apparently deadened Hitler's already numb emotions. In an era tainted by a pseudo-Darwinian emphasis upon combat as the ultimate test of nations, as

well as of men, he thought that the Jews had grown rich upon German suffering and defeat. Selected for army propagandist training in 1919, he created a theoretical framework for his obsessions; in September of that year, he first wrote of annihilating the Jews.

Hitler considered himself the drummer of Germany's *völkisch* right when he led an almost comical putsch in Munich on 8 November 1923. His trial for high treason transformed him into the right's national leader. Sentenced to five years' fortress confinement in Landsberg prison, he served only nine months, during which time he dictated *Mein Kampf* to his epigone, Rudolph Hess.

Like his father, Hitler preferred young, dependent women who could be manipulated and controlled. In 1929, he took as his lover his niece Geli Raubal, 19 years his junior. His insecurity permitted her no independence: the evidence points to her suicide, rather than murder, on 18 September 1931. Hitler claimed to be married to Germany and to every German woman. In reality, he simply could not permit a woman any standing of her own, even in the domestic sphere national socialism prescribed for women. Nevertheless, it is a mistake to stress Hitler's very real misogyny too much: However dim his view of German womanhood, he was also a catastrophe for German manhood.

Hitler and the Nazi Party did not seize power but received a majority of the votes cast in the Reichstag elections of July 1932. Despite defeat in the November 1932 elections, Hitler had mobilized the masses and so he was brokered into the chancellorship in January 1933 by conservative allies. However antidemocratic and authoritarian they were, they were also deeply divided amongst themselves about how to control him. On 23 March 1933, the Reichstag granted Hitler an Enabling Act, figuratively voting itself out of existence; on 30 June 1934, the Night of the Long Knives, Hitler crushed any internal Nazi opposition with the blessing of the German army.

By 1939, Hitler had stamped Germany with his personal insecurity and pseudo-Darwinian preference for conflict, often duplicating, even triplicating, traditional institutions with competing Nazi ones. The result was that even quite trivial decisions were referred to Hitler, which may have salvaged his ego but as policy was folly in peacetime and calamity in wartime. This subversion of bureaucratic power bases ensured confidants who would tell Hitler what he wanted to hear. Many Germans shared his racial views of Nordic superiority, Slavic inferiority, the necessity of exterminating the Jews, and cleansing the Germanic race. However, the increasing violence of Nazi rule was an extremely powerful motivation for *all* Germans to "work toward the Führer," on these matters. It was thus unnecessary for Hitler

personally to direct the extermination of Europe's Jews, the Final Solution, chosen during the Wannsee Conference in January 1942.

By nature a gambler, Hitler actively pursued war with Britain and France during the Polish crisis of August 1939. An unhealthy hypochondriac, he was convinced he would die young. He thought no one else could lead Germany down his path of annihilatory racism, endemic though racism and anti-Semitism were in German society. He was probably right: Hitler was a revolutionary, not a reactionary.

Insecure and undisciplined, Hitler surrounded himself with advisers who craved his favor, shared his racism, and could not contradict his flood of facts, half-truths, and outright lies masquerading as knowledge. Hitler deliberately created an environment for himself that made it impossible for him accurately to assess risks, strengths, and weaknesses in any given situation. His successes before 1941 made him utterly resistant to criticism. The pivotal events of World War II show this clearly.

Despite the advice of his armor experts, Hitler regarded the area around Dunkirk as unsuited to armored operations, and so he entrusted the destruction of Britain's only field army to the Luftwaffe in May and June 1940. Wary of the British navy until he had a blue-water fleet capable of defeating it, Hitler postponed the invasion of Britain, leaving it an unreduced fortress in his rear while he turned east.

Supported this time by his military staff, Hitler insisted that Germany could invade the Soviet Union on 21 June 1941 and defeat the Red Army in six weeks, a tacit admission that German victory depended upon defeating the Soviet Union within that time frame. On 10 December 1941, as German troops retreated from Moscow, Hitler, in an act of supreme folly, declared war upon the United States of America in the aftermath of Pearl Harbor. Once the Soviet Union was defeated, Hitler intended to turn upon Britain and crush its resistance. The Reich would then fight and defeat the U.S., which Hitler despised for its racial "impurity" and "weaknesses," despite its immense industrial resources.

As the war progressed, Hitler intervened at increasingly lower levels of military decision making. He had always mistrusted the army leadership, which accepted his bribes and decorations to keep faith with him during the war, only to blame him for their mistakes as well as his own afterwards. From the army's middle ranks came a series of assassination attempts motivated by compassion toward the conquered, a horror of retribution for German crimes, especially against the Soviets, and shame for what Germany had become. Rather than await the end of the war in relative safety, these men made a final attempt to kill Hitler and overthrow his regime on 20 July 1944. Few survived. Their gesture of

atonement only strengthened Hitler's belief that he was appointed by Providence to lead Germany to victory or doom. He would not countenance surrender.

Despite looming catastrophe, the German people greeted Hitler's survival with public expressions of relief. Although his personal popularity declined with approaching defeat, Hitler retained an amazing degree of loyalty from the common German, civilian or soldier, who often attributed misdeeds to party functionaries. To a great extent, Hitler was never a tyrant. It is true that the mechanisms of repression, selective breeding, and genocide were created for and first practiced upon the German people. However, many Germans supported Hitler's most extreme plans not only for the conquered, but also for Germany, including scorching German earth before the Allied onslaught.

On 29 April 1945, Adolf Hitler married his longtime mistress, Eva Braun, in Berlin. Although for many years the greatest desire of this unsophisticated young woman had been to become Frau Hitler, her lover obliged her only when it no longer mattered. They committed suicide the next day, rather than face their people and the enemy or assume responsibility by fighting to the death in the ruins of what had once been an imperial capital. Hitler left Germany utterly defeated, ground like grain between the Soviets and the Western Allies, in moral and physical ruins, soon to be partitioned, its rich cultural heritage almost effaced by twelve years of Nazism.

The profound cruelty Hitler inflicted on the world is not reducible to his anti-Semitism. The destruction of the Sixth Army at Stalingrad, the militarily useless sacrifice of poorly armed and trained troops, and the execution of thousands of German soldiers by their comrades are not comparable to the Holocaust, the vicious antipartisan warfare in Serbia, or the destruction of Warsaw. But all of these German crimes were part of a whole, rooted in German history and culture, as indeed any nation's actions must be, just as all serious German resistance to Hitler was fiercely reactionary, based on older, more humane values that were also authentically German. Hitler brilliantly understood his adopted country, and he shared its hopes and fears to an extraordinary degree, tremendously exaggerating them in his slaughterhouse heart.

Hittites (c. 2000–1100 B.C.E.)

A major Anatolian state during the late Bronze Age, rivaling New Kingdom Egypt in power. Hittite political and military history is known from the thousands of cuneiform texts from Anatolia in the late Bronze Age. Beginning with Hattushili I, approximately 15 kings are known to have ruled from Hattusha in the Old Kingdom (c. 1750–1600 B.C.E.). During the reign of Hattushili I (c. 1700 B.C.E.), the Hittites expanded into northern Syria and west into the land of Arzawa. Mursili I (c. 1600 B.C.E.) raided the city of Babylon (c. 1595 B.C.E.) and ended the First Dynasty of Babylon. However, the Hittites were unable to permanently expand into Mesopotamia, and Hittite control of eastern territories seems to have collapsed soon thereafter.

Hittite influence in western Asia Minor and northern Syria was reasserted by Tudhaliya II (c. 1420–1370 B.C.E.). The greatest expansion took place during the reign of Shuppiliuluma I and his immediate successors (c. 1350–1250 B.C.E.). The Hittites conquered the powerful Hurrian state of Mitanni, controlled all of Syria north of Damascus, and fought with the Egyptians in Syro-Canaan. Hattushili III (c. 1250 B.C.E.) made a treaty with Rameses II following Kadesh and gave him a Hittite princess in marriage. This treaty stayed in effect until the fall of Hittite power in 1180 B.C.E. Due to a number of factors, Hittite power began to decline during the reigns of the three monarchs following Hattushili III: Tudahiyah IV, Arnuwanda III, and Shuppiliuluma II. The rising power of Assyria in northern Iraq severely truncated Hittite power in Syria. Ahhiyawa (possibly the Hittite term for the Achaeans), a powerful kingdom to the west, threatened Hittite power in western Anatolia. The Hittites also had serious troubles with the rival Hittite kingdom of Tarhuntassha in the south.

What is not certain, however, is what brought about the fall of the Hittite capital, Hattusha. Invaders from the west, usually identified with the Sea Peoples in Egyptian sources, may have been the catalyst. Contrary to popular scholarly

tradition, Hittite power did not end with the fall of Hattusha; successor dynasties continued at Tarhuntassha and south-east at Carchemish on the Upper Euphrates. Smaller Neo-Hittite states continued in southeast Anatolia and Syria for at least the next 500 years (to c. 700 B.C.E.). These states were often in conflict with rival Aramean dynasties. Both Aramean and Neo-Hittite states were absorbed into the Assyrian world state. Passages from 1 Samuel and 1 and 2 Kings that mention the Hittites most likely refer to the Neo-Hittite states of Syria.

The Hittite king was the supreme war commander, and the Hittite annals imply that all kings were required to campaign on a regular basis. Their wars were a major source of tribute income and manpower that was used to maintain the agricultural base of the Hittite state. A Hittite king successful in war signaled the favor of the gods. The Hittites were also known to have performed purification and scapegoat rituals directed toward the enemy army before important pitched battles such as the Battle of Kadesh.

Ho Chi Minh (1890–1969)

Ho Chi Minh, who used at least 20 pseudonyms during his long and adventurous career (adopting his final most famous name only in 1944), drew upon Vietnam's millennia-old tradition of nationalist resistance to foreign rule and combined it with Marxist-Leninist doctrine to lead successful resistance against the Japanese, French, and Americans during the Pacific War and the two Indochina Wars. Originally named Nguyen Sinh Cung, he was born into a mandarin family in Nghe An Province in north central Vietnam, traditionally a center of rural unrest. His father and siblings were bitterly opposed to French colonial rule. After studying at the elite Quoc Hoc Secondary School in Hue, he began a career overseas, working first as a sailor aboard a French liner and not returning to his own country until 1941. From 1917 to 1923 he lived in France and became one of the founding members of the French Communist Party, established in December 1920.

In 1923, Ho journeyed to Moscow and the following year

attended the Fifth Congress of the Communist International (Comintern). Thus began his Bolshevik phase from 1924 to 1941, when he lived and worked in Soviet Russia, Europe, China, and Thailand. He organized revolutionary groups among overseas Vietnamese, of which the most important were the Revolutionary Youth League (1925) and the Indochina Communist Party (1930).

After the Japanese military occupation of French Indochina in late 1940, Ho Chi Minh's career took a fundamentally new turn, the "people's war" phase. In May 1941, he established the Vietnam Doc Lap Dong Minh Hoi (League for the Independence of Vietnam), or Vietminh, which made village-based guerrilla warfare an extension of revolutionary politics, abandoning urban-based Bolshevik methods, which were of limited relevance in a largely rural society. Influenced by Mao Zedong's military doctrines, the Vietminh operated in the mountainous China-Vietnam border region.

Ho and his comrades, including Vo Nguyen Giap, commander of the Vietminh's armed forces, established village-level networks of National Salvation Associations and Vietminh Committees, which assumed local governmental

functions and served as the “infrastructure” for guerrilla resistance. Ho’s united front tactics, his emphasis on peasant mobilization, diplomatic skills in winning Chinese and American support, and highly popular appeals to nationalism and anti-imperialism at a time when Vietnam suffered greatly from the Japanese occupation (including a famine that killed between 1 and 2 million people in the north) contributed to the rapid expansion of Vietminh “liberated areas” north of the Red River. On 19 August 1945, the revolutionaries entered Hanoi, and on 2 September Ho Chi Minh declared Vietnam’s independence. The Vietminh had to fight the American-backed French for nine more years before the independence of the North, following the brilliant victory at Dien Bien Phu, became a fact. Following the 1954 Geneva Conference, Ho became leader of the Democratic Republic of Vietnam (North Vietnam).

By 1955 Ho had embarked upon guerrilla warfare against the American-backed government of the Republic of (South) Vietnam. Again, it would be a long struggle, not ending for another two decades with the complete surrender of the South in 1975. The two Indochina Wars, against France (1946–1954) and against South Vietnam and its American backers (1959–1975), validated the “people’s war” strategy. Ho did not live to see the reunification of Vietnam in 1975. North Vietnamese regulars rather than guerrillas won the final victory in the South. It can be argued that the United States and the Republic of Vietnam had indeed won the war against the North after the disastrous Tet Offensive in early 1968, but by then Americans were sick of the war and gradually withdrew. The forces of the South, with some exceptions, could not match the discipline, organization, and dedication of Ho’s armies.

Hochkirch, Battle of (14 October 1758)

Rare defeat of Frederick the Great by the Austrians. Frederick the Great marched from East Prussia to defend Saxony from an Austrian advance. Weakened by the battle of Zorn-dorff (25 August), he could muster only 36,000 men compared to 80,000 Austrians under Field Marshal Leopold

Daun, which stood east of Dresden in broken country suitable for the defense. He hoped Frederick would attack his larger force. Frederick decided to maneuver Daun’s army from its position. On 9 October, after nearly a month of maneuver, Frederick encamped near the village of Hochkirch to resupply. His forces stretched from north to south with the center and right fortified by redoubts around Hochkirch and its prominent walled church.

Frederick assumed incorrectly that Daun would remain inactive. Instead, Daun, urged by his chief of staff Franz Moritz Lacy, attacked Frederick’s camp. At 5:00 A.M. on 14 October their army advanced in columns and completely surprised the Prussian right flank, overrunning tents with still-sleeping soldiers. As his army disintegrated at first Frederick dismissed the shouts of his men. Although Prussian cavalry attacks failed to stem the Austrian advance, it was halted by the walled churchyard. This delay allowed James Keith and Prince Moritz of Dessau to reform the Prussian center and counterattack. Both Keith and Moritz died as their desperate charge collapsed under the weight of Austrian numerical superiority. Frederick arrived on the scene, rallied his men, but knew the battle was lost when the his left flank collapsed. By 10:00 A.M. he had withdrawn his army toward the northwest.

Hochkirch resulted from Frederick’s underestimation of his enemy. It had little impact on the war. Nearly 9,000 Prussians were killed or wounded while Austria lost 7,000 dead and wounded, but Daun failed to derive any strategic advantage from his victory due to Frederick’s skillful retreat.

Holy Roman Empire (800–1806)

Greatest power in central Europe until the eighteenth century. Though unified under a single emperor, the empire was composed of lesser powers. As a result, aside from defense and an initial period of expansion, warfare served chiefly as a means for resolving frequent conflicts over territory and authority among them, and between them and the emperors.

Charlemagne’s empire (800–814) required annual campaigns to provide land and wealth to secure the allegiance of

lesser lords whose forces made up his army. This concentration of military strength in the hands of powerful subjects contributed to the fragmentation of the empire but provided a basis for the development of localized feudal hierarchies. These later proved effective against Viking and Magyar incursions of the ninth and tenth centuries.

The empire's initial avenue of military expansion was southwards into Italy. The papacy initially welcomed the imperial presence as a safeguard, but papal attitudes changed as the popes sought to establish their own authority against the emperors. The ensuing conflict contributed to the dissolution of central authority within the empire between the tenth and thirteenth centuries. Both lesser princes and rival emperors could justify their opposition to an excommunicated emperor.

The greatest expansion occurred in the east between the twelfth and fourteenth centuries into areas inhabited by Slavic peoples. This expansion included the conquest of Prussia and the Baltic provinces by the Teutonic Knights, but these territories did not come under imperial jurisdiction. By the end of the fourteenth century the empire had reached the limits of its growth.

Although the medieval empire had engaged in frequent wars with France over claims to territories lying between them, the most serious rivalry between the two came with the accession of Charles V (1516–1556). Charles was not only emperor, but also king of Spain, and France was now surrounded by Habsburg territories. French kings from Francis I (1515–1547) onward sought to undermine Habsburg power to prevent the encirclement of France.

Conflict with France further complicated the struggle for authority within the empire, particularly after the Protestant Reformation. Many territorial princes adopted Lutheranism and denied the authority of the Catholic Charles. Tensions culminated in the Schmalkaldic War between the Protestant princes (supported by France) and the emperor. Unable to confront both internal and external enemies simultaneously, Charles was forced to concede the existence of a rival Protestant religious power within the empire in the Peace of Augsburg (1555).

The tensions continued and later erupted into the Thirty Years' War (1618–1648). Attempts to consolidate imperial authority were finally defeated due to the support of resisting princes by Denmark, Sweden, and France. The Peace of Westphalia (1648) not only granted the princes autonomy and the ability to conclude military allegiances with foreign powers, but foreign intervention within the empire was constitutionally recognized. France and Sweden became guarantors of the peace and of religious equality.

From the end of the seventeenth century until the middle of the eighteenth, the empire had to confront the Ottoman Empire as well as the France of Louis XIV. The Ottomans

had controlled a large part of Hungary since the sixteenth century, but the high-water mark of Ottoman expansion into the empire was reached in the Siege of Vienna in 1683. A successful war of reconquest followed under the emperor Leopold I (1658–1705), leading the Holy League. This army combined imperial forces with those of other European nations in a new crusade declared by the pope, but tension between the emperor and the princes resurfaced. The latter resented the use of the imperial army to regain purely Habsburg territory (Hungary, like Prussia, was beyond imperial jurisdiction). When the French attacked the Rhineland in 1688, most of the princes withdrew to defend Germany. Further conflict in the east became a purely Habsburg affair.

Some of the larger territories, including Prussia, succeeded in establishing themselves as rivals to the Habsburg emperors. Frederick the Great's (1740–1788) victories in the War of Austrian Succession (1740–1748) and in the Seven Years' War (1756–1762) turned Prussia into a great power and a chief rival of the Austrian Habsburgs. The empire's final half century was marked by Austro-Prussian dualism as each sought to consolidate the allegiance of the lesser princes or gain control over them. Despite this, the princes resisted assimilation and clung to imperial traditions to defend their autonomy. As a consequence, it was only the conquest and consolidation of Germany by Napoleon that finally spelled the end of the empire.

Holy Roman Empire–Papacy Wars (1077–1250)

The conflicts between the Holy Roman Empire and the papacy were defining events during the eleventh through thir-

teenth centuries as the papacy became a formidable power in Europe. As part of these conflicts, Holy Roman emperors and popes, and their respective supporters, wrote countless documents debating such topics as the source of the emperor's power: Was it from election by the German princes or from the pope who crowned him? This war of words carried over into physical altercation. The emperors wished to consolidate power in northern Italy and, later, attain the kingdom of Sicily. The papacy, as the authority in central Italy, did all it could to repel this incursion.

The conflict began in the ambitions of Emperor Henry IV (1071–1106) and Pope Gregory VII (1073–1085). Gregory had continued the reforms of Pope Leo IX, influenced by monastic movements, which focused on such corruptions as lay investiture. Henry invested—that is, appointed—his own bishops in Germany, and Gregory excommunicated him. Henry begged for and received reconciliation from Gregory at Canossa in January 1077, but in March a number of German dukes rebelled against the emperor and elected another king. Henry, with military victories at Mellrichstedt, Flarchheim, and the river Elster, reasserted his claim to the throne.

Gregory excommunicated Henry a second time, only to be deposed himself by Henry in 1080. Henry placed his own pope in power, but neither that antipope nor his successors posed any major threat to the cardinal-elected popes. Between 1090 and 1092, Henry fought Matilda of Tuscany and Duke Welf of Bavaria, allies of Pope Urban II. On 31 December 1105, Henry's son, Henry V, forced his father to abdicate the throne. In 1122, Henry V and Pope Clement II reached an agreement concerning lay investiture at the Concordat of Worms, nominally ending lay investiture but allowing the emperor to veto the election of a bishop by refusing to accept feudal homage from him.

The larger papal-imperial conflict escalated with Frederick I (Barbarossa, 1152–1190). In 1159, Frederick tried to consolidate his power in northern Italy and to place his own pope in power. The cardinal-elected pope, Alexander III (1159–1181), the Norman king of Sicily, the Byzantine emperor, and the northern Italian resistance formed the Lombard League to keep Frederick at bay.

After six separate campaigns in Italy, Frederick finally withdrew, maintaining some influence in Lombardy. Frederick's son, Henry VI, succeeded him and conquered the whole of Italy, including Sicily and the Papal States. When Henry died in 1197, he failed to make the empire hereditary as the German princes reclaimed the right to elect the German king. Pope Innocent III (1198–1216) took advantage of the situation and chose another man as successor. Henry's son Frederick was too young; and when the German-elected king died in 1208, Otto IV, supported by the papacy, became Holy Roman Emperor.

Otto defied Innocent and revived imperial authority in

northern Italy. Innocent gained support from King Philip Augustus of France, accepted Henry's son, Frederick II (1215–1250), whom he had earlier bypassed as emperor, and, ultimately, stopped Otto. As emperor and as king of Sicily, Frederick II also turned against the papacy and continued the policy of invading northern Italy. He was excommunicated, first by Pope Gregory IX and then by Innocent IV as the conflict reached new heights; but he could not vanquish the papacy. After Frederick's death in 1250, subsequent Holy Roman emperors could not gain enough power to threaten the papacy, and the papal-imperial conflict faded away.

Honduran-Nicaraguan War (1907)

Honduras invaded Nicaragua in January 1907 on the pretext that Nicaragua was aiding Honduran rebels who were trying to overthrow President Policarpo Bonilla. Nicaraguan dictator Jose S. Zelaya denied involvement in the affair and offered to submit the dispute to an international tribunal. Negotiations were unsuccessful and both sides continued fighting until the Nicaraguan army defeated the invaders. El Salvador and Guatemala threatened to intervene and place former Honduran president, Terencio Sierra, in office. Mexico and the United States persuaded all five Central American nations to meet in Washington to resolve their differences.

The conference met from 14 November until 20 December and was noteworthy for the establishment of the Central America Court of Justice to resolve disputes between the five member states. In the summer of 1908, Nicaragua charged that Guatemala and El Salvador were supporting another attempt from Honduras to overthrow Zelaya and presented its case to the court. After an investigation, the court ordered all four nations to cut the size of their armies and to agree not to intervene in each other's internal affairs. All parties agreed and peace was restored, making this one of the first successful resolutions of war by an international tribunal.

Hong Xiuquan (1814–1864)

Charismatic founder of the Taiping movement and leader of the Taiping Rebellion. Hong was born as Hong Fuoxiu in Huaxian, Guangdong Province, on 1 January 1814, of a Hakka farming family.

At fifteen Hong passed the preliminary level of imperial examinations; he taught school from 1830 to 1843 but in four tries did not manage to pass the advanced civil-service examination. He received Christian pamphlets and, after falling dangerously ill, dreamt that he had been approached by God and by Elder Brother Jesus and exhorted to fight evil. After a brief period of Bible study in 1847, Hong joined Feng Yünshan, founder of the Society of God Worshippers, at Thistle Mountain in Guangxi Province and declared himself the Second Son of God. By 1850 he had about 20,000 militant anti-Manchu followers, mostly Hakkas and local miners. They rebelled in summer 1850. On 11 January 1851 Hong declared the new dynasty of Taiping Tianguo, with himself as the Heavenly King (Tian Wang). He achieved initial successes, but after 1856, mostly reverses. The military ineptitude of his own leadership was exceeded only by the fragmentation and unpreparedness of the imperial forces.

Increasingly debauched, withdrawn, and irrational, Hong continued to lead the revolution until April 1864 when he mysteriously fell ill. Trusting in divine providence rather than sound military policy as the Qing army besieged the Taiping capital, Nanjing, he died in his palace on 1 June 1864, possibly by suicide but more likely from disease.

Honors and Awards, Military

From earliest times honors have been bestowed on victorious warriors. Many of the earliest known pictographs illustrate the exploits of men in battle. Ancient grave sites reveal ritually buried warriors complete with their weapons and armor. Successful military leaders were showered with lands, riches, and the spoils of war. Even simple soldiers

shared in the treasure of conquest. There are stunning examples of Greek, Roman, Chinese, Egyptian, and Persian art displaying returning armies bearing captured arms and slaves from their vanquished enemies.

The ancient Greeks awarded arms and armor to victorious commanders. The Romans, who also crowned their successful generals with laurel wreaths of silver and gold, adopted this practice. Later they awarded large circular medallions, or phalerae, that were mounted on the breastplate of the recipient. These medallions were also awarded to entire Roman legions that distinguished themselves in battle. The phalerae, mounted on the legion flagstaff, served as a public symbol of distinction and a symbol of honor to the legion.

In time, medals, orders, and decorations were authorized to honor the heroism of individual soldiers. For military formations the banner or flag displayed the unit's collective honors. Flags served an important purpose in early warfare, providing the soldier with a point to rally in the confusion of battle. The first flags bore heraldic devices of the leaders for whom the soldiers fought. With the advent of body and horse armor in the Middle Ages, soldiers themselves wore these devices.

The armies of Spain under the royal flag and the banners of the church carried out the conquest of the Americas. The armies of Pizarro and Cortes had their own standards, as did the native armies they faced. At the Battle of Otumba (1520) the Aztec standard, known as Quetzalteopamil, composed of a dazzling representation of the sun surrounded by quetzal plumes, was lashed to the back of the Aztec general. The capture of this standard by a young conquistador, Juan de Salamanca, demoralized the Aztec troops and led to an overwhelming Spanish victory. The Aztec banner was incorporated into Salamanca's coat of arms.

The creation of modern, state-organized and supported European armies in the sixteenth and seventeenth centuries saw the size and function of military units stabilize. King Gustavus II Adolphus of Sweden recognized the value of experienced and cohesive military formation. His administrative and tactical innovations led to the establishment of the modern regiment. One of the key elements in creating a collective identity for a regiment was the regimental standard.

In England, the regimental system was introduced with the restoration of the monarchy in 1660. The years that followed were filled with both domestic and international strife. Between 1660 and 1747, British noblemen received royal warrants to raise and maintain regiments for use by the monarch. Some distinguishing badge was allowed on the regimental standard acknowledging the sponsor. In 1747, the crown forbade the use of these private badges on the standard. Regulations also stipulated that two flags would be

used by the regiment, the King's (or Queen's) First Colour, or the Great Union, and the regimental color. The regimental flag had as its background the same hue as the facings (collars, cuffs, and piping) on the regimental uniform.

King William III granted the 18th Regiment of Foot (the Royal Irish) the right to have the Lion of Nassau and the motto *VIRTUTIS NAMURCENSIS PROEMIUM* emblazoned on its regimental color in recognition of its valor at the Battle of Namur in 1695. This was the first battle honor granted by an English monarch.

In Britain, battle honors are the gift of the sovereign to particular regiments for distinguished service in a specific engagement. Honors may take the form of a badge, a motto, or, more often, a name embroidered on a ribbon sewn on the field of the regimental color. Only battles that are deemed victories are eligible as honors. Battles fought in civil wars, like the English Civil War and the American War of Independence, are not carried on the color. With well over 100 battle honors authorized for World War I, honors on a regimental color were limited to 10 from any single war. Army units that participate in almost every engagement, like the Royal Artillery, do not have individual battle honors. However, the badge and colors of the Royal Artillery both bear witness to its wide service through its motto, *UBIQUE* (Everywhere).

In the United States, militia regiments had their own standards or color before the establishment of the United States Army in 1775. After the revolution, two flags were authorized for each infantry regiment, a regimental standard of a blue field with the seal of the United States in the center, below which was a riband bearing the regiment's designation and a national color, the Stars and Stripes. Cavalry regiments had regimental color but did not carry the national color. They used a smaller flag, a guidon, similar to the national color, with 13 stripes and a blue field and no set pattern for the stars but cut like a swallowtail.

Shortly after the opening of the American Civil War, the War Department authorized the inscribing on its national color the names of engagements in which a regiment distinguished itself. It was hoped that units would regard their colors as representing the regiment's honor and rally to protect the colors in battle. To underscore the importance of the colors, the War Department also encouraged the award of the Medal of Honor to flag bearers who saved a regiment's flags from capture.

As battle followed battle, there was little room left on most regimental national colors for additional honors. The War Department authorized silver rings engraved with battle honors affixed to the staff bearing the regimental color.

Initially, the regiments themselves chose battles commemorated by honors. An inventory of honors was undertaken by the army in 1878 to verify and standardize the cri-

teria for their use. This process was not completed until 1919, when 76 battles were deemed suitable for recognition. The next year a new method of displaying honors was introduced: ribbon streamers in the colors of the appropriate campaign medal, embroidered with the name of the engagement and suspended from the finial of the staff bearing the regimental color. Today, the United States Army recognizes more than 172 battle honors.

A regiment's participation in a particular battle can also be incorporated into its regimental badge. The British Army's Royal Regiment of Wales was created through the amalgamation of several regiments, one of which was the South Wales Borderers. In 1879, that regiment, then known as the 24th Regiment of Foot, lost 599 officers and men in the Battle of Isandhlwana to Zulu regiments. Queen Victoria placed a wreath of immortelles on the regimental Queen's Colour and commanded that a silver replica of the wreath be carried on the flagstaff thereafter. The cap badge of the South Wales Borderers, and later the collar badge of the Royal Regiment of Wales, is surrounded by an unbroken wreath of immortelles to commemorate the queen's gesture.

It is interesting to note that two of the three Victoria Crosses awarded for Isandhlwana went to Lieutenants Melville and Coghill of the 24th Regiment, ordered to take the Queen's Colour to safety when it was obvious the column was doomed. Their bodies were later found in a nearby river alongside the Colour.

The distinctive insignia used by the regiments of the United States Army may also incorporate elements of a regiment's history and battle honors into their design. For example, the distinctive insignia of the 19th Infantry is a shield of azure with an infantry bugle of 1861 enclosing the numeral 19 with three white stars above the bugle. Below the shield is a riband bearing the unit motto. The bugle with the number is a reproduction of the 19th Infantry's Civil War insignia when it received the nickname "The Rock of Chickamauga," which also serves as its motto. The three stars represent service in the Civil War, the war with Spain, and the Philippine Insurrection.

In many of the world's armies, units may be awarded decorations for particularly meritorious service. The United States, the Philippines, and the Republic of Korea each have a Presidential Unit Citation, designed to honor entire units. Several regiments of the United States Army were awarded the French *Croix de Guerre* and *Medaille Militaire* in recognition of their service in the first and second world wars. The Soviet government often awarded orders and decorations to outstanding regiments during World War II.

Honors and awards are intended to recognize exceptional service and build loyalty. This is true of medals and decorations awarded to individual soldiers as well as battle honors,

flags, and heraldic devices bestowed upon military units. They bind the recipient to the government that grants the honor. In the case of military units, awards and honors create a bond between the soldiers in those units by paying tribute their common history, sacrifice, and spirit.

The greatest threat to the value of such devices and emblems is their occasional wholesale awarding and subsequent cheapening, as was the case when the U.S. Army after the Grenada incursion awarded more medals than there were troops involved! There is also the danger that they may be awarded to the unworthy, as in one-party states, where commanders can cover their chests with medals that bear little correlation with their actual battlefield experience. Wise government avoids this cheapening of their military awards and honors, and even the Soviet Union and Nazi Germany reserved special recognition devices that, at least in wartime, had nothing to do with a soldier's politics.

The physical cost of producing these bits of cloth and metal is infinitesimal. But such awards and honors repay their cost many times over in troop and unit efficiency, motivation, and morale.

Hood, John Bell (1831–1879)

Confederate general, capable at the brigade or division level, but unqualified to command larger forces. Hood was born in Owingsville, Kentucky, on 1 June 1831. After graduating from the U.S. Military Academy at West Point in 1853, he served with the infantry in Missouri and California until assigned to the Second Cavalry in Texas in 1855. He took a Comanche arrow in the left hand at Devils River, Texas, on 20 July 1857.

Hood resigned as first lieutenant from the U.S. Army on 16 April 1861 and was immediately commissioned captain in the Confederate cavalry. On 30 September he was named colonel of the 4th Texas Infantry and on 2 March 1862 brigadier general of the Texas Brigade, which soon became one of the Confederacy's toughest fighting forces. It excelled during the Seven Days' Battles, especially at Gaines's Mill on 27 June. Hood commanded a division of the Army of Northern Virginia, including his Texas Brigade, at Second Bull Run, Antietam, and Fredericksburg. His stellar performances earned his promotion to major general on 10 October.

His left arm was crippled near Little Round Top on the second day at Gettysburg, and he lost his right leg at Chickamauga. While recovering from the amputation, he was promoted to lieutenant general on 1 February 1864.

Hood served under Joseph Johnston trying to stop William T. Sherman's march to the sea. Jefferson Davis, dissatisfied with Johnston in this campaign, brevetted Hood full general on 18 July and placed him in command. Hood's immediate and reckless attacks on Sherman showed that Davis was mistaken. Beaten by Sherman, Hood retreated into Tennessee to disrupt Union supply lines. Crushed by John McAllister Schofield at Franklin, Tennessee, on 30 November and almost annihilated by George H. Thomas at Nashville on 15–16 December, he was relieved of command at his own request on 23 January 1865. Fleeing toward Texas, he surrendered in Natchez, Mississippi, on 31 May. He died in New Orleans on 30 August 1879.

Hooker, Joseph (1814–1879)

Aggressive, popular, and sometimes reckless Union field commander in the American Civil War. Hooker was born in Hadley, Massachusetts, on 13 November 1814. Assigned to artillery after graduating from the U.S. Military Academy at West Point in 1837, he fought in the Seminole Wars and, un-

der both Zachary Taylor and Winfield Scott, in the Mexican-American War. When the Civil War began he was colonel of the California militia.

After witnessing the Union loss at First Bull Run as a civilian and thinking that he could do better, he raised a brigade of volunteers and commanded a division at Williamsburg, Virginia, on 5 May 1862. Promoted to major general of volunteers, he fought well at Seven Pines, in the Seven Days' Battles, and at Second Bull Run and South Mountain. Wounded at Antietam, he was promoted to regular brigadier general on 20 September, led a corps at Fredericksburg, and replaced Ambrose Burnside as commander of the Army of the Potomac on 26 January 1863.

Uncharacteristic hesitancy made "Fighting Joe" the loser at Chancellorsville. His usual cockiness might have beaten Robert E. Lee, whom he outnumbered about 75,000 to 50,000. Abraham Lincoln replaced Hooker with George G. Meade three days before Gettysburg.

Serving under William S. Rosecrans and Ulysses S. Grant, Hooker achieved an important victory with the capture of Lookout Mountain, Tennessee, on 24 November. For this he was brevetted major general. Reassigned under William T. Sherman, he distinguished himself during the siege of Atlanta. Disgruntled when passed over for command of the Army of the Tennessee after James Birdseye McPherson's death on 24 July 1864, he asked to be relieved of field service and spent the rest of the war behind a desk.

Hooker was a man of intemperate morals and routinely allowed prostitutes to follow his camp. There is no truth to the prevalent notion that the slang term *hooker* for prostitute derives from his name, but the coincidence of his name with the preexistent word certainly helped to popularize it.

Hooker retired in 1868 when he suffered a stroke. He died in Garden City, New York, on 31 October 1879.

Horseshoe Bend, Battle of (27 March 1814)

Decisive battle in the Creek War. Andrew Jackson marched about 4,000 regulars, volunteers, and Cherokees south from

Fort Strother, Alabama, in March 1814 to seek and destroy the renegade "Red Stick" Creeks and their Spanish allies. Under Chief Red Eagle, alias William Weatherford, about 1,200 Creeks had fortified a small peninsula formed by a "horseshoe bend" in the Tallapoosa River northeast of Montgomery, Alabama. With earthworks across the neck of the thickly wooded peninsula, the Creeks were well equipped to withstand bombardment, assault, or siege.

The morning of 27 March, Jackson surrounded the Creek position and dispatched the Cherokees to swim the river and steal the Creek canoes. That done, he fired his only gun, a six-pounder, at the earthworks to signal attack. First, John Coffee's Tennessee militia attacked amphibiously on three sides in the stolen canoes while the six-pounder provided covering fire as rapidly as possible, then Jackson led about 600 regulars in a frontal assault against the earthworks. Because Coffee had already engaged the barricade's defenders from the rear, Jackson's infantry met little resistance.

About 700 Creek warriors died. Jackson's casualties were 111 wounded, including Sam Houston, and 26 killed. Red Eagle was not present. Jackson marched downstream toward the Creek "Holy Ground" near the confluence of the Coosa and Tallapoosa Rivers. When Red Eagle saw that his headquarters were doomed, he offered unconditional surrender and Jackson gave him a generous settlement. Living thereafter as Weatherford, Red Eagle became a peaceful Alabama planter.

Houston, Samuel (1793–1863)

American and Texan field commander and politician. Born near Lexington, Virginia, on 2 March 1793, Houston grew up in Blount County, Tennessee, and lived with the Cherokees from 1808 to 1811. Commissioned ensign in the regular army in 1813, he served under Andrew Jackson in the Creek War and was wounded in the left thigh and right shoulder during the assault on the earthworks at Horseshoe Bend. From 1815 until he resigned in May 1818, he was a military agent to the Cherokees, usually dressing like them and tak-

ing their side on almost all issues. He began practicing law in Nashville in 1818, became major general of the Tennessee militia in 1821, a member of Congress from Tennessee in 1823, and governor of Tennessee in 1827, but suddenly resigned in 1829, despondent when his wife, Eliza Allen, fled back to her father.

Houston went west and returned to the Cherokees, who called him “Big Drunk.” He lived in despair for three years, but in 1832, with his sense of purpose restored, he traveled to Washington to lobby for the Cherokees with the Jackson administration. He impressed Jackson by beating up an anti-Jackson congressman. Jackson pardoned him immediately after his conviction and sent him on a fact-finding mission to Texas late in 1832. Houston settled there and soon became an activist for Texan rights and separate statehood within the nation of Mexico.

In November 1835 Houston became commander in chief of the Texan army and on 2 March 1836 he cosigned the Texas Declaration of Independence. His battle plans and tactics crushed the Mexicans at San Jacinto and won independence for Texas. He was president of the Republic of Texas from 1836 to 1838 and from 1841 to 1844. After the United States annexed Texas in 1845, Houston represented Texas as a senator from 1846 to 1858 and served as governor from

1859 until he was overthrown in March 1861 for refusing to support secession. He died in Huntsville, Texas, on 26 July 1863.

Hue, Battle of (31 January–2 March 1968)

Major battle of the Tet Offensive during the Vietnam conflict. As part of the Tet Offensive, North Vietnamese and Vietcong main force units attacked the old imperial capital of Hue in northern South Vietnam. The effort to retake the city soon became the longest and bloodiest of all of the Tet Offensive fighting. To appease Vietnamese sensibilities, the old imperial citadel was off-limits to U.S. combat units, and the enemy quickly seized control. During the period of Communist control, cadres rounded up various “enemies of the people,” apparently conducted “people’s trials,” and murdered them in a bloodbath.

South Vietnamese and American forces quickly responded. The South Vietnamese 1st Division immediately counterattacked and requested U.S. support. Elements of the U.S. 1st Cavalry Division and 101st Airborne Division blocked off the city on the west to prevent possible enemy reinforcements. Still, General William Westmoreland limited reinforcements, believing that the siege at Khe Sanh potentially was a more critical situation and wanting to preserve his strategic reserve in the region. Meanwhile Army of the Republic of Vietnam (ARVN) troops and U.S. Marines engaged in block by block, house by house fighting to regain the old capital. The U.S. Marines took one casualty for every yard gained, and one combat reporter, Don Oberdorfer of the *Washington Post*, called it “quite possibly, the longest and bloodiest single action of the Second Indochina War.”

On 2 March, the Military Assistance Command, Vietnam declared the battle officially over. More than half of the city had been destroyed in the fighting to retake it; Communist military units had suffered more than 5,000 casualties, while

Vietnamese, U.S. Marine, and U.S. Army casualties combined exceeded 3,500 killed and wounded.

Hukbalahap Revolt (1945–1959)

One of the Philippines' periodic agrarian rebellions. The Hukbalahap revolt's roots were in the conditions of peasant distress before World War II, though the Hukbalahap (the term essentially meaning People's Army) came into being in 1942, when fragments of left-wing guerrilla units fighting the Japanese came together under Luis Taruc as their military commander. Centered in Luzon, these remnants grew into an army of 15,000 by the end of the war, despite competition with partisan forces organized by the U.S. Army.

Seen as little more than bandits by the newly established government of the Philippines, the Huks reformed their political organization and established plans to create a people's republic. This course of action was greatly assisted by the distressed state of the country in the wake of World War II and further abetted by the counterproductive fashion in which Manila fought. Against the backdrop of a kleptocratic government, occasional infantry sweeps of battalion strength were conducted with indiscriminate violence and looting, driving the population into the arms of the rebels. By 1949, 37,000 government soldiers faced a movement with a population base of a million supporters dominating half of Luzon. Very little held the Huks back except their own material weaknesses, and the occasional overreaching atrocity, such as the assassination of the revered widow of wartime president Manuel Quezon in a convoy ambush near Manila.

In 1950, the ascension of Ramón Magsaysay to the post of defense chief and the outbreak of the Korean War led to a change of fortune. It became possible to finance an expansion of the war while the necessary leadership was available to reform the Filipino military.

By increasing troops levels from 10 to 26 battalions, and providing adequate logistical and air support, enough forces were available to cover the affected region. These troops

mounted continuous patrols so as to give the guerrillas no sanctuary, while specialized units mounted deep-penetration missions to further add to the disruption. This went hand-in-hand with a civic action program designed to provide training and land for those in the areas most dominated by the Huks, beginning the process of winning the population back to Manila. Sophisticated psychological warfare also alienated the population from the Huks and made the rebels themselves doubt their cause. By 1953, the Huks had been reduced to 2,300 active fighters in uncoordinated bands, while Luis Taruc himself surrendered in 1954—and became a born-again Christian.

The suppression of the Huks was seen as a model of war in the postcolonial world. The essential problem was that the course of this campaign depended on the existence of exemplary leadership—Magsaysay and U.S. intelligence adviser Edward Lansdale were lionized; Magsaysay's death in a 1957 airplane crash was a near-catastrophe for the Philippines—a condition that did not obtain in the Vietnam conflict or in future Filipino insurgencies.

Hundred Years War (1337–1453)

Most important Anglo-French conflict of the Middle Ages. The war had complex roots. It was the last and more violent stage of an old conflict arising due to the fact that the English king was, at the same time that he was king of England, a vassal of the French king for Guyenne. By the early fourteenth century, there were many new areas of confrontation as well: who was to control Flanders (vital for the English wool market); the succession war of Brittany; the revival of the “Auld Alliance” between the Scots and the French that caught the English in a vise; who was to control the Channel and North Sea; and, from 1328, the French dynastic conflict.

The last son of King Philippe IV (“the Fair”) had died without heir. The closest male in a collateral line was Edward III of England, Philippe’s grandson through Philippe’s

daughter (Isabelle of France, who had married King Edward II of England). Edward III thus had a valid claim on the French crown, but French lords were unwilling to accept the idea that Edward might become their king. In order to reject his claim, French lawyers drew on old Frankish law (Salic law), which stated that property could not descend through a female.

Philippe VI de Valois, Philippe’s IV nephew, was consequently chosen as king. Despite the disparity in power (France was the most populous and wealthiest country in western Europe), England was ready to support the claim of its popular king. In 1337, Philippe VI seized Edward’s fiefs in France, marking the beginning of the war. The conflict can be divided in four phases.

During the first phase, 1337–1360, France suffered repeated military disaster (Sluys in 1340, Crécy in 1346, Poitiers in 1356). The 1360 Treaty of Brétigny gave England a third of French territory.

During phase two, 1360–1415, French armies gradually recovered lost territory. As a consequence, at the end of Charles V’s reign (1380), England had lost most of its holdings in the French interior, ending up controlling only a few ports. Neither France nor England was able to prosecute the war to its end due to internal difficulties. In France, the intermittent insanity of Charles VI (“the Mad,” 1380–1422) prompted a power struggle between the dukedoms of Orleans and Burgundy. This grew into a full-scale civil war, considerably weakening the kingdom. England also had to face internal instability, including the Wat Tyler uprising in 1381, but central authority was reestablished under Kings Henry IV (1399–1413), and Henry V (1413–1422).

During phase three, 1415–1429, Henry V seized the opportunity presented by French anarchy. Henry crushed the French royal army at Agincourt (1415). He conquered Normandy and used diplomacy (an alliance with the Burgundian party) to force Charles VI to sign the Treaty of Troyes (1420), which disinherited Charles’s son. Henry then married Charles’s daughter. His infant Henry VI was declared king of England, as well as of France (1422). But most of southern France remained loyal to Charles VII, the Dauphin, nicknamed “King of Bourges” (his tiny capital). England controlled northern France and had nearly rid itself of Charles VII when Jeanne d’Arc raised France’s spirits again.

During the years 1430–1453, the final stage of the Hundred Years War, English troops were regularly defeated by French armies (Orleans and Patay, 1429; Formigny, 1450; Castillon, 1453). In 1435, Charles VII signed the Peace of Arras with Burgundy, destroying the Burgundian-English alliance. France had rallied around the idea that it was a united nation and that the *goddons* (English) were foreign-

ers to be swept away. Between 1449 and 1453, England lost all his territories save for the tiny foothold of Calais. The Hundred Years War had definitively come to an end by 1475, when Louis XI of France prevented an invasion by bribing Edward IV into returning to England.

This Hundred Years War was a chaotic conflict between princes, with no definitive peace at its end. It led to political unrest (War of the Roses in England, War of the Public Good in France) but also gave birth to a protonationalism. Fewer than 20 major battles occurred. The real war was comprised of innumerable skirmishes. Towns were more often taken by surprise, or treason, than by sieges. English raids (five between 1339 and 1360) often had a greater psychological than physical impact. The employment of a scorched earth policy by French kings proved a useful deterrent.

The conflict had a disastrous impact on French wealth. The defeats of the fourteenth century, combined with the Black Death, paralyzed the economy. It was the middle of the fifteenth century before trade returned to the levels of 1300.

The war proved to be too costly for England's 3 million inhabitants as well. As long as the booty was flowing from France, English kings enjoyed the support of Parliament, but any setback could provoke a change of dynasty (Lancaster, in 1400; then York, in 1455). England failed to foresee the military vicissitudes of the fifteenth century.

During the entire war, the English relied on mobility and a powerful archery, but English mobility was checked by the hundreds of fortified places that a wealthy France could afford to build. Archery won battles as long as French knights looked for glory and fame, but the emergence of professional soldiers (1445), in a standing French royal army, resulted in tactical and technical superiority for the French.

French armies of the late war could choose when to give battle (Formigny or Castillon). The French standing army was paid by the first modern tax system. The French king no longer had to live from the proceeds of his estates. A permanent tax gave him the power to make policy. The idea of the nation and of a modern, centralized monarchy is the principal legacy of the Hundred Years War.

Hungarian Civil Wars (1526–1547)

Wars between rival claimants of the Hungarian throne, ending in the division of the country between the Habsburg and Ottoman empires and the dependent Principality of Transylvania. The death of Louis II at the Battle of Mohács (1526) left the Hungarian throne vacant. A majority of the nobles elected the Transylvanian Vajda János Zápolyai king in October 1526; a smaller number, joined by the chancellor, supported Austrian Archduke Ferdinand Habsburg, brother of Emperor Charles V. Reinforced by German mercenaries after Charles's conquest of Rome (1527), Ferdinand quickly drove Zápolyai out of the country.

Rather than abdicate, Zápolyai appealed to Sultan Süleyman I for aid. Süleyman recognized Zápolyai as the legitimate king and led an army into Hungary to reestablish his position. The Ottoman army easily pushed Ferdinand's forces out of central Hungary but failed to capture Vienna (1529). A second campaign by Süleyman against Ferdinand's capital in 1532 was stopped by the determined resistance of the town of Kőszeg (Gün).

In the following years, while the two kings' armies competed for control of the country, the Ottomans expanded their base in Hungary by occupying Slavonia and placing a garrison near Buda. As it became evident that the Ottomans alone stood to profit from the continued division of the kingdom, Ferdinand and Zápolyai worked to negotiate a settlement. By the Treaty of Várad (1538), Ferdinand recognized Zápolyai's claim and pledged to support him with imperial forces; in return, Zápolyai named Ferdinand his heir to the throne. At Zápolyai's death in 1540, however, his treasurer György Martinuzzi, bishop of Várad, refused to honor the agreement and had Zápolyai's infant son elected King János II. Ferdinand's forces were too small to occupy the kingdom and failed in two attempts to capture Buda.

In August 1541 Süleyman marched to the capital, declared himself János's guardian, and occupied the castle. He made Buda the administrative center of a new Ottoman pashalik and gave Transylvania and the lands east of the Tisza River to János to hold as a dependent principality.

After a failed attempt by Ferdinand to recapture Buda in 1542, Süleyman carried out another campaign in Hungary, conquering Siklós, Székesfehérvár, Esztergom, and Szeged (1543). Unable to break Süleyman's hold on the country, Ferdinand and Charles V, in the Treaty of Edirne (1547), finally extended de facto recognition of the Ottoman conquest of Hungary by agreeing to pay Süleyman an annual gift of 30,000 gold florins for possession of the northern and western portions of Hungary still in Habsburg control.

Hungarian Revolt (1956)

Popular uprising against the Soviet-backed Communist regime. Following the harsh imposition of Communist rule after World War II, the New Course of de-Stalinization, beginning in 1953, split the Hungarian Communist Party between conservatives and reformers and led to a loosening of political controls over public discourse. In the summer of 1956, conservatives attempted to placate the reformers by removing the unpopular party secretary, Mátyás Rákosi, and rehabilitating a number of victims of Stalinist-era purges.

Encouraged by this and the success of similar reform efforts in Poland, Budapest University students, joined by thousands of workers, marched to the Parliament building on 23 October with a list of demands for further change. Reform leader Imre Nagy addressed the crowd, which dispersed, but later in the evening protestors toppled the Stalin monument in the city park and seized the radio station. In response, the party appointed Nagy prime minister on 24 October, simultaneously announcing that it had requested Soviet military assistance to maintain order. The announcement provoked a general strike, followed by armed clashes between the Soviet troops and freedom fighters, who seized key positions in the capital.

Relative peace was restored after 28 October, when Nagy announced a cease-fire, amnesty, reorganization of the party, and the withdrawal of Soviet forces. Though willing to cooperate with the new government, the freedom fighters hesitated to disarm. A confrontation with security troops on 30 October led to a siege of the Communist Party headquarters and the lynching of a number of security personnel. The following day the Soviet army began to reoccupy strategic points. After receiving evasive replies from the Soviet government about their intentions, Nagy declared Hungarian neutrality and its withdrawal from the Warsaw Pact. To ward off a Soviet attack, the Nagy government attempted to quiet the revolutionary situation in the country, arranging the end of the general strike on 3 November.

On the night of 3–4 November, 16 Soviet divisions invaded Hungary and installed a new government under János Kádár. The Hungarian army was quickly disarmed and most of the country occupied within days. Fighting continued in Budapest until 11 November, while 200,000 refugees fled the

country. As many as 25,000 Hungarians were killed in the fighting between 23 October and 11 November; officially, Soviet losses were 700.

The blatant suppression by the Red Army of the relatively modest Hungarian demands led to worldwide condemnation, and communists left their national parties in numbers not seen since the Hitler-Stalin pact of 1939; many fellow travelers also were alienated. The Kádár government embarked on a program of economic reform but also brutally hanged Nagy and Hungarian army general Paul Maleter in 1958.

Hungarian War with the Holy Roman Empire (1477–1485)

War fought between Hungarian king Matthias Corvinus, and Holy Roman Emperor Frederick III, over possession of Lower Austria. In the early spring of 1477, Matthias sent his light cavalry on raids to distract and occupy Frederick's army, while his main force operated against the towns. Though he failed to capture Vienna, by the end of the year Matthias had gained possession of Styria and most of Lower Austria without fighting a single major battle, forcing Frederick to sue for peace. For the next four years, Matthias's Hungarian forces were occupied by the Hungarian-Turkish Wars, allowing Frederick to recover most of his losses.

After securing peace with Mehmed II of Turkey, Matthias again declared war against Frederick in 1482. To break Frederick's hold on Lower Austria, Matthias conducted a systematic campaign against the towns surrounding Vienna and Wiener Neustadt, capturing Hainburg (1482), Klosterneuburg (1483), and Bruck an der Leitha (1484), using light cavalry as before to harass Frederick's less mobile forces. Frederick's attempt to raise the siege of Kornenburg resulted in a disastrous defeat at Leitzersdorf (November 1484), destroying his field army and leaving the rest of his forces isolated in the towns without a chance for relief. The subsequent capture of Kornenburg by Matthias closed the ring around Vienna, which surrendered in May 1485.

The following year, Matthias completed his conquest of Lower Austria by taking Wiener Neustadt and forcing Frederick to recognize his claims. Matthias's success left him iso-

lated. He was unable to prevent the election of Frederick's son Maximilian I as Holy Roman Emperor (1486), nor was he able to consolidate his hold on Austria, which reverted to Maximilian at Matthias's death in 1490.

Hungarian-Turkish Wars (1437–1526)

Series of wars between the Kingdom of Hungary and the Ottoman Empire, beginning with the Ottoman occupation of Serbia (1438–1439) and ending with the collapse of Hungary in the Hungarian Civil Wars (1526–1547). The failure of Hungarian king Albrecht's crusade in 1437 introduced a new phase of the Ottoman wars of European expansion in the Balkans, which were now waged up to and across the borders of Hungary. To support deposed Serbian despot George Brankoviæ, Hungarian general János Hunyadi counterattacked into Wallachia in 1442. In the winter of 1443–1444 Hunyadi invaded Bulgaria, forcing Sultan Murad II to agree to the restoration of Serbia to Brankoviæ. Assured by the pope that promises made to infidels need not be honored, Hungarian King Ulászlo I broke the peace and launched another crusade in 1444. The crusading army was cut off and destroyed by Murad at Varna, where Ulászlo was killed. Hunyadi escaped but was defeated again at Kosovo Polje in 1448. A continuing succession crisis left Hungary too weak to intervene in the Ottoman conquest of Constantinople (1453). Hunyadi gathered sufficient forces to break the siege of Belgrade (1456), but the Hungarians were unable after his death to prevent the Ottoman conquest of Serbia (1457–1458).

Though Hunyadi's campaigns against the Ottomans ultimately failed to recover any territory, they did revitalize and provide leadership for the resistance of the Balkan peoples fighting against the Turks, encouraging Skander Beg (George Kastrioti) to renounce Ottoman suzerainty and launch the Albanian-Turkish wars for independence.

In 1463 Mehmed II invaded and occupied Bosnia, prompting a winter counterattack by Hunyadi's son, Matthias Corvinus, who recaptured the strategic fortress of Jajce. From 1464–1466 the Hungarians and Ottomans fought ineffectually in Bosnia, eventually dividing the kingdom between themselves.

Subsequently, Matthias focused on strengthening the line

of fortresses established by King Sigismund along the southern borders of Transylvania and Slavonia through Bosnia to the Adriatic while the Ottomans consolidated their Balkan conquests. The following 50 years were marked by repeated border incursions and raids from both sides, over time weakening the fortress system. A large raid by Ali Beg of Smederevo in 1479 was followed by a campaign by Matthias into Wallachia, Serbia, and eastern Bosnia in 1480, capturing Srebrenica and briefly restoring the frontier defenses.

After Matthias's death, the Hungarians successfully repulsed an attack on Belgrade in 1494, but by the first decades of the sixteenth century Ottoman raiders were penetrating deeper into the frontier zone and inflicting defeats on Hungarian counterattacks inside Croatia and Hungary, notably at Sinj (1508), Knin (1511), and Dubica (1520). The recurrent raids devastated the frontier regions, leaving the fortresses isolated and unsupported in the deserted land. Srebrenica was recaptured by the Ottomans in 1512, completing the Turkish conquest of Bosnia. The border defenses were fatally breached with the capture of Belgrade by Süleyman I in 1521 and the fall of Orsova and Knin the following year.

With the lower Danube firmly in his control, Süleyman invaded Hungary in force, defeating the Hungarian army in the Battle of Mohács (1526), at which King Louis II was killed. Louis's death marked the end of the medieval Hungarian kingdom, which was subsequently divided among the Ottomans, Austrian Habsburgs, and the dependent principality of Transylvania.

Hungarian-Venetian Wars (1345–1381)

Three wars between Hungary and Venice that took place during the reign of Hungarian king Louis I ("The Great," 1342–1382). At that time both the Hungarian kingdom and the Venetian republic were prosperous and major powers in southern Europe. Dalmatia was the major flash point between them. Louis sought to extend Hungarian power into the Balkans and, on the basis of dynastic right, to secure the throne of Naples. Louis's aspirations in Italy were unacceptable to Venice and to the papacy.

The first war was fought during 1345–1348, with Genoa on Louis's side. Doge of Venice Andrew Dandolo ordered the siege of Zara, under Hungarian rule, and a rival trading city to Venice on the Adriatic. The city was well fortified and resisted. In July 1348 Louis attacked the Venetian siege positions but was defeated. His army, which was principally of mounted knights, was unable to achieve any significant success against the Venetian fortified positions, and Louis decided to return home. The decision was also forced by the situation in Naples, where the king, Louis's younger brother, had been murdered. Zara continued to resist the Venetians but finally had to surrender in December. The first war ended with a cease-fire concluded on 5 August 1348, under the terms of which Hungary accepted Venetian rule in Dalmatia in return for which the trade and logistics routes between Hungary and Naples would remain open.

The second war occurred during 1356–1358. Peace talks started in Buda in 1349, but no agreement was possible because both parties wanted to rule Dalmatia. Louis began this second war in 1356. He divided his forces near Zagreb and sent the viceroy of Croatia to besiege Zara, while he led the main forces against the Venetian continental territories known as Terra Ferma. Following a few successful minor battles and sieges, in July Louis initiated a siege of Treviso. The city was close to capitulation when in November papal mediation brought about a cease-fire.

Louis's plan to attack Venice's mainland territories, where it could not use its formidable fleet, was brilliant, but the Hungarian forces lacked adequate siege equipment. Treviso pinned down the stronger Hungarian land forces, and they were unable to engage the Venetians in open battle.

Peace talks were again unsuccessful, and Louis changed his strategy. Instead of a large heavy force, he sent smaller cavalry units to raid the Venetian hinterland. He also ordered the viceroy of Croatia John Csuzi to carry out the same tactics in Dalmatia. These were successful, as the exhausted Dalmatian cities changed sides. The war ended with a peace agreement on 18 February 1358, with Venice giving up its claims to Dalmatia; Louis's forces departed Terra Ferma and freedom of the trade on the Adriatic was established.

In 1370 Louis acquired Poland from his uncle. The third war with Venice occurred during 1372–1381. Venice attacked Louis's ally Prince Francis Carrara of Padua in 1371, and the Hungarians came to his rescue in 1372. Carrara and the Hungarians defeated the Venetian forces at the Battle of Pieve di Sacco but failed to take Treviso. This led to a disadvantageous peace for Padua.

Hungary, Genoa, and Padua formed a new alliance against Venice in 1378, but after a Venetian victory at sea, the allies turned to the old strategy of raiding the Venetian land-supply lines. The year 1379 brought successes to the allies.

They defeated the Venetian fleet at Pola, and Charles of Durazzo, the new Hungarian commander in chief, besieged Treviso. Finally, the allied forces occupied Choggia, the "gateway to Venice." An exhausted Venice sued for peace, but the alliance broke up and Venice was able to retake Choggia.

The wars between Hungary and Venice ended by the peace of Turin on 8 August 1381. Its terms were advantageous to Hungary. Venice had to pay an annual tribute to Hungary and lost Dalmatia. But it had survived the war and maintained a leading role in Adriatic trade.

Huns

Pastoral nomads of uncertain origin threatening the Roman world. Appearing unexpectedly in the steppes north of the Black Sea around 370, the Huns pushed the Goths west, across the Danube into Thrace. In 395, the Huns themselves crossed the Danube, thereby coming into direct conflict with the Roman world.

Superb horsemen—Ammianus Marcellinus and Zosimus describe them eating, sleeping, and even performing bodily functions while on horseback—they rode the ill-shaped but hardy steppe breed of horse. Thus mounted the Huns fought with a reflex composite bow—with which they were highly skilled even when drawn from a galloping or wheeling horse—a small shield, and a spear. The stave of the composite bow was constructed of laminated materials, usually wood (core), sinew (back), and horn (front). When strung, the bow was opened back against its natural curve, and held that way by the bowstring. More powerful than the longbow, it could penetrate armor at 100 meters.

A Hunnic army is described by Ammianus as forming up, with much disorderly movement and savage noise, into wedge-shaped masses. Some of these would break up into scattered bands, which would rush around with surprising speed and apparent chaos, inflicting casualties with their shooting. Other bands would relieve the first to maintain an incessant barrage, until the enemy was sufficiently weak-

ened or demoralized. Each warrior would then charge at the gallop, regardless of risk to his own safety, to fight at close quarters with sword and spear. A Hun charge was executed with such speed and suddenness that it usually overwhelmed everyone and everything in its path. Huns terrified people by their outlandish appearance, but it was their very name that soon came to symbolize the epitome of swift, merciless destruction.

Hunyadi, János (c. 1407–1456)

Hungarian general and regent. The son of a Romanian noble granted the estate of Hunyad (Hunedoara) in Transylvania by King Sigismund, Hunyadi began his military career serving the king in Italy and in the Hussite Wars in Bohemia. Originally a supporter of Albert of Habsburg following Sigismund's death, Hunyadi later opposed the succession of Albert's infant son, Ladislas Posthumus. In 1441, Hunyadi led the army of Polish king Wladyslaw II Jagiellon to victory over Ladislas's guardian, Frederick III at Bătăszék, winning the throne for Wladyslaw, crowned Ulászló I of Hungary.

In 1443 Hunyadi led Ulászló's Hungarian-Polish crusade against the Ottomans, driving the Turks out of Serbia, Bosnia, and Bulgaria in a winter campaign. A second crusade in 1444 ended in disaster at Varna on the Black Sea coast, where Sultan Murad II surprised and destroyed the Christian army and Ulászló was killed. Hunyadi escaped to Hungary and headed a regency council that opened negotiations with Frederick for the return of Ladislas. From 1446 to 1453, Hunyadi served as governor of Hungary in the name of the still-absent king. His third crusade against the Ottomans resulted in another defeat at the Second Battle of Kosovo Polje (1448).

After Ladislas's return to the throne, Hunyadi continued to serve the king as chief captain and administrator of royal revenues. In 1456, Hunyadi and the Minorite monk Giovanni di Capestrano organized a popular crusade in Austria and Hungary for the relief of Belgrade, besieged by Ottoman sultan Mehmed II. Hunyadi's small army, consisting largely of peasants and townsfolk, cut the Ottoman supply lines, repelled a Turkish assault, and impetuously attacked and broke the Ottoman army. On 11 August 1456, two weeks after his

greatest victory, Hunyadi died in an epidemic that broke out in the Christian camp.

Hurrians (c. 2300–1100 B.C.E.)

An Upper Mesopotamian people who were the dominant ethnic group of the Mitanni state (c. 1600–1100 B.C.E.) that ruled much of the ancient Near East in the late first millennium B.C.E. The earliest attestation of the Hurrians are in Sumero-Akkadian sources from the reign of Naram-Sin in the late third millennium B.C.E. They are described as inhabiting the land of Subartu—the Upper Mesopotamian regions of the Khabur and Balikh river basins in Syria, as well as the Tigris River basin in northern Iraq. By the end of the third millennium B.C.E., north Mesopotamia was thoroughly Hurrianized, with well-established Hurrian states that continued until the rise of a powerful Hurrian-based kingdom of Mitanni (c. 1600 B.C.E.).

The kingdom of Mitanni was a confederation of Hurrian states in Upper Mesopotamia in the late second millennium B.C.E. Its capital, Washukanni, has not been located for certain; it may have been Tell Fakhariyah, a mound located near the headwaters of the Khabur River in Syria. By 1450 B.C.E., Mitanni was the most powerful state in the Tigris-Euphrates region, composed of confederate and vassal city-states, each with its own king. Although the state of Mitanni was dominated by Hurrians, there was a significant percentage of Indo-European West Semitic-speaking peoples, Hittites, and Assyrians.

Because of our fragmented sources, the military history of the Mitanni state can only be partially reconstructed. It appears that by 1500 B.C.E. Mitanni had expanded into most of Syria under the reigns of Paratarna and Saustatar. This newly formed confederation was likely in conflict with the expansionist policies of Thutmose III of Egypt (c. 1504–1450 B.C.E.). Later Mitanni kings are known primarily through the Amarna letters from Egypt (c. 1411–1350 B.C.E.), where the Mitanni kings engaged in diplomatic relations with the kings of Egypt. The marriage alliances between the two states may have been due to the rise of Assyria in northern Iraq and the Hittites in Anatolia, which severely threatened the Mitanni

state. Under Tushratta Mittani became somewhat fragmented and suffered defeat at the hands of the Hittite king Shuppiliuiluma. Thus, after c. 1350 B.C.E., the Hurrian state ceased to be a major role player in ancient Near Eastern politics. Mitanni continued to be a buffer between the Hittites and Assyria for at least the next two centuries, until the area was absorbed into the Assyrian Empire.

Hussein, Saddam al-Tikriti (1937–)

Iraqi dictator. Born 28 April 1937 near Tikrit, Saddam Hussein never knew his father and has spent his life seeking to

become the father of a new empire centered on Baghdad. He became involved with the Ba'athist Party and participated in a failed coup attempt in 1959 against Abdul-Karim Qassem. He fled to Egypt, where he was educated until he returned to Iraq. Following a coup in 1968, his cousin Ahmad Hassam al-Bakr became president. Saddam Hussein became the vice president of the Revolutionary Command Council, commanding internal security. Replacing his cousin, he took over Iraq in 1979.

Aiming to reestablish the dominance of Baghdad in the Arab world, Saddam Hussein studied and patterned himself after Joseph Stalin. Indeed, his regime continues to exist in large measure due to repeated purges of any whom Saddam Hussein suspects of harboring even thoughts of rebellion.

Iraq is an oil-producing country, but Saddam Hussein sought greatness through military adventures. He pursued the acquisition of nuclear, biological, and chemical weapons but was thwarted in developing a nuclear capacity initially by an Israeli air strike in 1981. His eight-year war with Iran failed to achieve its goals. Iraq emerged heavily in debt from that war with the fourth largest military in the world, numbering 1 million.

ond war, the invasion of Kuwait. His defeat, in one of the most one-sided conflicts of modern times, resulted in the decimation of Iraq's military, economy, and infrastructure. One of the world's most unsuccessful military leaders, he remains the president of Iraq.

Hussite Wars (1419–1436)

Religious wars and revolt of Bohemia against the Holy Roman Emperor. The Hussite revolt began as a religious reform movement with strong popular support. In 1415, the movement's doctrine was declared heretical and its leader, Ján Hus, was burned at the stake at the Council of Constance. King Václav (Wenceslas) IV failed to control the resulting unrest in Bohemia, which spread along both national and class lines.

The Hussites were predominantly Czech and included both a moderate, mostly bourgeoisie, and noble Utraquist party and the more radical Taborites, largely peasants and villagers. Their opponents drew support from the German-speaking inhabitants of the kingdom and the upper nobility.

When Václav died in 1419, his brother, Holy Roman Emperor Sigismund, claimed the throne over the objection of the Hussites, who held him responsible for Hus's death. With the support of Pope Martin V, Sigismund entered Bohemia with an army of German and Hungarian crusaders in 1420 but was defeated by the Taborite general Ján Žižka outside Prague and forced to retire. A Second Crusade by German princes in 1421 ended in the failed siege of Zatec. Separately, Sigismund reentered Bohemia from Hungary and captured Kutna Hora but failed to trap Žižka's army.

Žižka returned to attack Sigismund's forces in their winter quarters, destroying his army in a running battle from Nebovidy to Německý Brod (6–10 January 1422). After defeating a Third Crusade led by Frederick I of Brandenburg, the Hussites were split by tensions between the Utraquists, who sought a settlement with the Catholic Church, and the Taborites, who pressed for continued reform and resistance. Taborite victories under Žižka's command over the Utraquists at Strachov (August 1423) and at Malešov (June 1424) shortly before his death ensured the continuation of the war.

Under Žižka's successor, the Taborite priest Prokop the Bald, the Hussites defeated a German army at Usti and launched raids into Silesia and Austria, burning Landshut (October 1426) and defeating an Austrian army near Linz (March 1427). A Fourth Crusade against the Hussites ended with the aborted siege of Stófibro and Prokop's victory over the crusaders at Tachau (1427).

In the following years, Hussite armies continued their raids into Germany and Hungary and briefly aided the Poles in their war with the Teutonic Knights. The defeat of a Fifth Crusade at Domazlice (1431) led the Council of Basel to open negotiations with the Hussites, resulting in a settlement with the Utraquists (1433), which the Taborites rejected. Allied now with the Catholics and barons, the Utraquists defeated the Taborites at the Battle of Lipany (1434), in which Prokop was killed. A final agreement between the two sides was reached in the Compacts of Jihlava (1436), which permitted the Hussites the use of their own communion rite in return for recognition of the authority of the Catholic Church and Sigismund's kingship.

Hydaspes, Battle of the (May 326 B.C.E.)

Alexander's final major victory in Asia, in the Indus River valley. After the Macedonian king Alexander III the Great had conquered the Persian Empire, he crossed the Hindu Kush into India. A local king called Poros opposed him, holding the far bank of the river Hydaspes (Jhelum).

Poros's army consisted of 30,000 foot, 3,600 horse, 200 elephants, and 180 chariots. The elephants were deployed in a line in the center, with the infantry positioned behind them, opposing Alexander's cavalry, whose horses were terrified of the elephants. Poros's flanks were covered by cavalry and chariots. Alexander's force consisted of 5,000 cavalry and 10,000 infantry. The infantry were deployed in line, with the right flank covered by the majority of the cavalry. The remainder of the cavalry were deployed on the left, possibly shielded behind the infantry line.

Alexander left a holding force to keep Poros's army in place, while Alexander with the rest of his forces forded the river upstream and attacked the Indian king. Alexander ini-

tiated the battle by attacking the enemy cavalry with his own cavalry force on the right. As the numerically inferior Indian horse were under severe pressure, Poros ordered the cavalry on the other flank to reinforce them. Thereupon the Macedonian cavalry detachment on the left crossed the battlefield and attacked the Indian horse in the flank. The Indian horse were surrounded and destroyed.

Meanwhile the infantry lines had clashed. At first the Macedonians had a hard time with the elephants, but soon they opened gaps to let the panicked beasts through or turned them with their pikes, driving them back into the Indian line, then charged the disordered Indians. Twelve thousand Indians were killed, 9,000 captured. Their king fought heroically until he was persuaded to surrender. The Macedonians lost 1,000 men, a heavy toll for Alexander's depleted and weary troops.

Hydrogen Bomb, Development of (1942–1952)

The United States detonated the world's first hydrogen, or thermonuclear, bomb on 31 October 1952. This bomb, code-named Mike, stood three stories high and exploded with a force of 10.4 megatons, or over 10 million tons of TNT. The mushroom cloud from the explosion rose to a height of more than 100,000 feet and could be seen from a distance of 50 miles. A new era in nuclear weaponry began as the destructive power of such weapons increased from thousands of tons to millions of tons of TNT equivalence.

Nuclear weapons are of two basic types. Atomic bombs, such as those used in World War II combat against Hiroshima and Nagasaki, split atoms of the elements uranium or plutonium. Hydrogen bombs fuse atoms of the hydrogen isotopes deuterium and tritium. In both types of weapons, large amounts of energy are released in the form of blast waves and radiation. The very sudden release of this energy causes the enormous destructive power of nuclear weapons.

Edward Teller and Enrico Fermi first studied the possibility of a hydrogen bomb in 1942. Based on the research of

Hans Bethe, who pioneered studies of thermonuclear reactions in stars, Teller and Fermi believed that atoms of deuterium, an isotope of hydrogen, could be fused into helium with a simultaneous release of energy. Because such a process required stellar temperatures, then unobtainable on earth, Teller originally doubted that a hydrogen bomb could be built.

Despite his original doubts, Teller continued to study thermonuclear reactions and became convinced that a hydrogen bomb was possible. By this time, however, it had been decided that the United States would concentrate its World War II nuclear efforts on building a fission device at the Los Alamos Laboratory in New Mexico. A thermonuclear weapon would be too difficult to develop in time to assist the war effort. Despite the wartime concentration on the fission weapons, Fat Man and Little Boy, Teller and a small group of scientists did conduct some elementary research on the hydrogen bomb. In particular, Teller and his colleagues found that much less deuterium and tritium would be required than originally thought, thereby making a hydrogen bomb more realistic.

With the end of World War II, the United States demobilized. The wartime weapons laboratories, including Los Alamos, faced severe shortages of manpower as senior scientists returned to their prewar university positions and younger staff left to enter graduate school. As a result, very little research and development of the hydrogen bomb took place. Between 1946 through 1949, for instance, fewer than 12 theoretical physicists worked full time on the hydrogen bomb. Despite the shortage of scientist staff, work continued at Los Alamos during the late 1940s on the hydrogen bomb. Among the technical accomplishments during the late 1940s was the improvement of fission devices, the use of computers and computational modeling, and the development of cryogenic technology to produce the liquid deuterium required to make a hydrogen bomb.

The ultimate success of the United States' thermonuclear program rested on five accomplishments. First was the discovery of how to make such a device work. This discovery had to overcome a fundamental problem uncovered during early thermonuclear research. Thermonuclear systems lose as much energy as they create. Second, Los Alamos had to increase the size of its scientific staff significantly. The hydrogen bomb problem required complex interactions among the entire range of physicists, chemists, and metallurgists and their respective skills. Third, smaller and more efficient fission bombs were needed to start a thermonuclear fire. Fourth, computational ability had to be greatly enhanced. Fifth, the political will had to exist to marshal the resources necessary to accomplish the task in a complex technical and political environment.

The design adopted for the first hydrogen bomb did not come easily or quickly. Unlike fission weapons that are one of two types, scientists did not have a clear idea of the range of physical constraints governing thermonuclear weapon design. Extensive mathematical modeling and simulation were required before any kind of scientific judgment could be made. It took five years to discover the ultimate design.

The shortage of scientific staff, particularly theoretical and experimental physicists, also took five years to overcome. In the short term, the Los Alamos Laboratory used consultants such as university professors on leave. Many of these consultants had worked at Los Alamos during World War II and knew the nature of problems facing thermonuclear development. Eventually the pool of scientists grew as postwar university graduation rates increased. However, not enough can be said for the small cadre of scientists who stayed at Los Alamos after the war and advanced thermonuclear work under less than ideal conditions.

Because a hydrogen bomb requires extremely high temperatures to ignite the thermonuclear fuel, temperatures found only in stars, the only possible way to ignite a hydrogen bomb was by using an atomic bomb. For the development of the hydrogen bomb to go forward, fission weapons had to be improved. The two wartime fission devices, Fat Man and Little Boy, were crude prototypes and not capable of being adapted for use in a hydrogen bomb. A new class of fission bombs had to be designed, built, and tested. This process took years. The first testing of new fission devices did not take place until 1948, with more design improvements following in 1950.

Because all of the design work on a hydrogen bomb involved complex mathematical modeling and simulation, the need for better and better computers was compelling. During World War II, all computing at Los Alamos was done with desktop calculators and a variety of IBM business machines. Such machines were not capable of handling the complex modeling required for developing the hydrogen bomb. Beginning shortly after the war, true computers started to become available, beginning with the ENIAC, IBM's SSEC, and the National Bureau of Standards' SEAC. Because these machines were on the East Coast, many of the thermonuclear calculations actually took place far from Los Alamos. Although the first hydrogen bomb could have been developed without modern computers, such development would have been substantially delayed.

Finally, a political mandate was necessary to concentrate and focus the final development of the hydrogen bomb. By the late 1940s the Cold War had begun in earnest, and in 1949 the Soviet Union detonated its first atomic bomb. Concern arose in the national security establishment that the United States could be overtaken militarily by the USSR if

the U.S. did not develop thermonuclear devices. Fission bombs have a natural upper limit to the explosive power they could produce. Hydrogen bombs do not. By adding more fuel, thermonuclear bombs can be made ever larger. A Soviet Union with unchallenged thermonuclear capability was a sobering thought. Taking all of this into account, President Harry Truman directed an accelerated effort to develop the hydrogen bomb in January 1950.

Shortly after Truman's directive, hydrogen-bomb research began to bear fruit. Edward Teller and Stanislaw Ulam came up with a promising design, radiation implosion, which was translated by Richard Garwin into a working design. Once the design concept was reviewed and approved, work began on constructing the Mike device and planning for a full-scale test at the Pacific Proving Ground in the Marshall Islands. Every atmospheric nuclear test was a major undertaking. The first hydrogen bomb test was even more so, involving thousands of people, millions of dollars, and countless pieces of equipment and conducted in the remote reaches of the Pacific Ocean.

Mike was not a bomb in the combat sense of the word. Weighing more than 1 million pounds, standing three stories high, and using a cryogenic fuel, it was a stationary device. Work began immediately to make hydrogen bombs deliverable, first by aircraft and later by missiles. It took some two years after the Mike shot to reach this goal. This work involved moving away from the constraints of cryogenic to dry fuel and building devices based on the demands of air force and navy aircraft and the nose cones of ballistic missiles.

Atomic bombs ended World War II. As destructive as Fat Man and Little Boy proved to be, some governments thought a nuclear war might be won—albeit at great cost. Thermonuclear weapons destroyed this concept of survivability. In 1954, the United States tested its largest ever hydrogen bomb, Bravo, which exploded with the energy of 15 megatons. The Soviet Union, in the early 1960s, exploded a device of 50 megatons—the world's largest explosion. Capable of theoretically unlimited destruction, thermonuclear weapons could destroy not only entire cities, but civilizations as well. The testing of thermonuclear devices brought the United States and the Soviet Union to the bargaining table and a test moratorium. The consequences of a thermonuclear war were too terrible to ignore.

I

Ia Drang Valley (October–November 1965)

The first real test of North Vietnamese and U.S. regular armed forces in the deepening conflict in Vietnam. Although the Americans won, both sides drew important conclusions about strategy and tactics that would influence the course of the war.

In early 1964, the government in Hanoi had begun sending regular North Vietnamese Army main force units to augment Vietcong guerrillas in South Vietnam; a year later, the United States also began committing regular army and Marine Corps forces.

In October 1965, the North Vietnamese began attacking a U.S. Army Special Forces camp at Plei Me in the central highlands of South Vietnam. They were planning to destroy an expected South Vietnamese Army relief column. However, the U.S. Army's 1st Cavalry Division had arrived at Pleiku and was ready to test a new type of warfare, using helicopters to fly over enemy positions to deliver troops and firepower where needed. On 14 November, U.S. troops landed at a site some 14 miles east of Plei Me, which to their surprise was in the middle of a North Vietnamese Army (NVA) regiment, and a major two-day battle began. The Americans were supported by massive artillery and air strikes, including the first use of B-52 bombers in Vietnam, flying from Guam, each with payloads of 200 tons of 500-pound bombs.

The North Vietnamese eventually broke off contact and retreated across the Cambodian border. They had lost 2,000 killed and wounded; the Americans, 79 killed and 121 wounded. The NVA leadership concluded they could not fight another such battle; either they would have to select situations where they could overwhelm smaller and more isolated American units or else they would have to “hug” American forces, getting so close that the U.S. troops would not call in air strikes and artillery for fear of being hit themselves. Gen-

eral William Westmoreland concluded that the so-called air-mobile concept and his seizing of the tactical initiative (while conceding the strategic initiative) would work, and so the American phase of the protracted conflict proceeded.

Illyrian Wars (229–219 B.C.E.)

Two wars fought between Rome and the coastal kingdom of the Illyrians (modern Croatia). In the First Illyrian War (229–228 B.C.E.) the expanding Roman Republic clashed with Queen Teuta and her Illyrian pirates. The Illyrians had raided Greco-Roman shipping lanes, besieged the Greek port of Corcyra (Corfu), and killed Roman ambassadors in an ambush after attempts to negotiate with the aggressive Illyrians had failed. The Roman senate, seeking revenge, sent a Roman land and sea expedition to relieve the siege at Corcyra. Queen Teuta capitulated and agreed to give up land claims and pay reparations. Macedonia allied with Rome to form an additional counter to Illyrian aggression.

In the Second Illyrian War (219 B.C.E.) Demetrius of Pharos succeeded Queen Teuta as the Illyrian leader and renewed land intrusions into Roman protectorates and piracy against Roman shipping. The Romans acted quickly, perhaps because war with Carthage was imminent. Two Roman

armies besieged the fortified Illyrian cities of Dinale and Pharos, with the former falling in seven days and the latter in one day. Demetrius fled and the conditions of the first war were reimposed on the Illyrians.

Imjin River (April 1951)

Prominent river in Korea, scene of heavy fighting numerous times during the Korean War (1950–1953), most notably in

the spring of 1951 during the Communist Fifth Phase Offensive. The offensive, primarily carried out by the Chinese People's Volunteers, was designed to capture Seoul, the South Korean capital, which had already changed hands several times since the commencement of hostilities in June 1950. The Chinese commanding general, Teh-huai Peng, hoped to present Seoul to Premier Mao Zedong as a gift for the 1 May communist holiday.

Beginning on 22 April 1951, the Communists pushed southward across the entire expanse of Korea. Particularly hard hit were the positions of the British 29th brigade, especially the Gloucestershire Battalion, usually referred to as the Glosters. The Glosters held positions immediately south of the river. Troops from the Chinese Sixty-third Army fought desperately and repeatedly to ford the river in the area defended by the Glosters. Finding it impossible to breach the river in the face of the Glosters' deadly firepower, the Chinese pressed across in weaker, adjacent sectors. By 25 April, the Glosters were threatened with encirclement. Efforts to relieve them failed in the face of strong Chinese resistance. By

the end of the month, almost all of the battalion had been killed, wounded, or captured. These were the kind of losses the hard-pressed British could ill afford.

The annihilation of the Glosters had political, not just military, consequences. Striving to hold together its diverse coalition of United Nations forces, the United States sought to maintain the continued support of its British ally. General Mathew Ridgway, commander of all UN forces, even demanded a formal report on the loss of the Glosters. Although the destruction of the unit was blamed primarily on the size and ferocity of Chinese opposition, Ridgway took great care from that point forward to make sure that no similarly disastrous situations confronted British forces in Korea. The Communist offensive put a major dent in allied lines but came nowhere near capturing Seoul. This campaign was the last Communist offensive against non-ROK (Republic of Korea) United Nations Command (UNC) forces. The Communists had suffered terrible losses and were not willing to try matters again against the Americans, the Commonwealth Division, and so on, on a large scale. The Americans, for their part, were unwilling to invest the resources needed for victory in Korea while Europe, where in their eyes the main threat lay, remained basically unprepared for defense against Communist designs. Two months later, the Communist side called for negotiations and an armistice.

Imphal and Kohima (8 March–22 June 1944)

Critical World War II battles in the China-Burma-India theater, arguably the worst defeat suffered by Japanese ground forces in the war. Located in northeast India, Imphal and Kohima became focal points of one of World War II's most desperate campaigns when Japan's Fifteenth Army, commanded by General Mutaguchi Renya, invaded India (Operation U-Go) in late winter 1944. Mutaguchi's objectives included preempting a British invasion of Burma, establishing a foothold for the collaborationist Indian National Army (INA) in hopes of provoking an India-wide revolt against British rule,

and capturing large portions of Manipour and Assam provinces, both essential for the Allies' hump air route to China.

During the campaign's opening month, Mutaguchi's forces—three Japanese divisions and 7,000 troops from the INA—besieged both Imphal and Kohima, key supply bases for General William Slim's British Fourteenth Army. Bitter, attritional fighting occurred at both towns, the British demonstrating a resolve and skill not evident during their ignominious retreat from Burma just two years earlier or their aborted Assam offensive the year earlier. Ultimately a combination of combat skill, determination, quantitative superiority in men and equipment, air power, and Slim's command decisions proved decisive. The Fourteenth Army relieved both Imphal and Kohima in June and then drove the Japanese back into Burma in July.

At a cost of 17,000 casualties, British Fourteenth Army inflicted more than 50,000 casualties, destroying Japan's Fifteenth Army, eliminating the Japanese threat to India, and paving the way for the reconquest of Burma that followed between August 1944 and May 1945.

Inca Civilization

The Andean valleys of northern and western South America were populated from approximately 1200 B.C.E. by a succession of societies. The Chavin culture, first of the great civilizations in the region, was noted for its pottery, architecture, and sculpture, especially bas relief, and for their introduction of maize as a major food crop prior to the end of the eighth century C.E. Later societies added their own distinct contributions, many of which were later utilized by the Incas. The Nazca people were noted for their colorful ceramics and for developing irrigation systems for agriculture. The Mochica, a theocratic people, built temples, pyramids, and roads, engaged in metal work, and made ceramic portraiture, which explicated their life activities. The Tiahuanaco and Huari peoples developed a military state. Under the Chimú, urbanization increased. For several millennia, the llama was the principal beast of burden for all peoples. The polygamous Quechua-speaking Incas, originally humble mountain peo-

ple, arose near present-day Cuzco and borrowed heavily from the cultural, administrative, and military precedents set by their predecessors. They eliminated many elements of earlier civilizations and developed myths demonstrating the divinity of the Inca, their ruler, from which their society took its name. The *coya* (queen) was chief wife of the Inca ruler. The Inca (ruler) owned all land, and individual citizens through their local communes, the *ayllu*, merely had the use of it. Major Inca expansion began under Pachacuti Inca Yupanqui (r. 1438–1471), and their centralized feudal society, with its administrative districts and advanced social welfare system, exercised effective control over a widely dispersed population. Public buildings were constructed of stone, carefully cut and fitted so as to preclude any need for mortar. Wide, well-maintained roads, facilitating wars of conquest, stretched from Peru south to the town of Constitucion in modern central Chile. The Inca were almost unique in being a civilization that had no written language, but government runners, carrying *quipu*, a message system employing knotted strings, communicated essential intelligence throughout their far-flung empire. Their army operated as a form of agricultural militia. The government provided needed arms and armament. Tightly disciplined, Inca warriors fought en masse in battle. Principal weapons included slings, a six-foot-long spear and spear throwers, stone or metal-headed clubs, war axes, and double-edged wooden swords. Helmets were made of cane or wood, and their square shields were made of wood and animal hides. Body armor consisted of quilted cotton jackets. Under Pachacuti's successors, Topa Inca Yupanqui (1471–1493) and Huayna Capac (1493–1527), Inca power was consolidated. In 1527, the Inca leader Huascar succeeded, but during much of his six-year tenure, he was engaged in civil war with his illegitimate half brother Atahualpa. Huascar's forces were ultimately defeated by Atahualpa in 1532. Spanish conquistadors under Francisco Pizarro arrived shortly thereafter. Atahualpa met Pizarro at Cajamarca on 16 November 1532. His unarmed troops were slaughtered and Atahualpa captured. Despite having met Spanish demands for a substantial ransom, in return for which he had been promised his freedom, Atahualpa was publicly garroted at Pizarro's order on 29 August 1533. The Spanish conquest was completed by 1535.

Inca Empire Imperial Wars (1438–1540)

Wars that led to the Inca Empire becoming the largest of its day. The Inca Empire eventually dominated much of western South America, including the highland and coastal Andes areas. At the heart of this empire was its ability to use grand strategy to wage imperial wars against less organized, though often militarily superior, opponents. Although Spanish and native sources differ with archaeological data on exact dates, it is clear that Pachacutec Yupanqui deserves much of the credit. He ruled from 1438 to 1471 and developed a permanent military system and imperial grand strategy.

Significant wars were mounted against highland Andes chiefdoms like the Chanca and Lupaca after the Battle of Cuzco in 1438. Highland strategies involved the use of alliances, a complicated road network and supply system, fortifications, and llamas as backpack animals. Inca logistics was far superior and the empire infrastructure, based on labor taxes and movement of people, became the rival of any in the world. Considering the lack of draft animals, wheels, and iron metallurgy, the gain and consolidation of territory are even more astounding.

Coastal lowland wars were fought using rotating 20,000-men armies based on decimal units. During the war with the Chimú state, bronze weaponry became more common. Military schools trained ethnic Inca to lead loyal allied troops into battle. The Sapa Inca, or emperor, often appointed kin to command the rotating armies and eventually stayed in Cuzco to oversee all operations. By the time of Spanish invasions in 1531, the Inca had permanent standing armies, excellent logistics, and a tested grand strategy based both on military might and on management of human and natural resources that could be used to wage economic warfare.

After Pachacutec had established the empire, his son Topa Yupanqui continued conquests in the late fifteenth century and passed on the title of Sapa Inca to his son Hauna Capac, who conquered much of Ecuador and Columbia in the early sixteenth century.

Capac died of smallpox along with many other Andean Indians, and his sons Atahualpa and Hauscar fought a civil war in the early 1530s that devastated the empire further. At this point conquistador Francisco Pizarro and about 150 fellow Castillians had boldly invaded and taken control of the Inca Empire, executing Atahualpa, taking the Inca capital of Cuzco, and establishing a Spanish port capital at Lima. The royal Inca Paullu was established as a puppet ruler at Cuzco while his brother Manco carried on against the Spanish from the highland jungle fortifications of Vitcos and Vilcabamba, the legendary lost city of the Inca.

Between 1535–1540, Mancos, who studied and employed Spanish battle tactics—even riding a captured horse himself—organized huge rebellions that killed hundreds of

Spanish, mainly by ambushes in battles, and threatened to push the Spanish back into the Pacific. In 1536, he gathered a 100,000-man force to besiege Cuzco but failed to kill the brothers of Francisco Pizarro and his forces there. The battle centered around the monstrous Inca fort of Sacsahuaman, which was eventually retaken by the Spanish.

Although Manco's son, Tito Cusi, carried on the defense against the Spanish into the 1560s from Vilcabamba, the chance for regaining the empire had passed. A devastating epidemic in the 1570s killed millions more Andean Indians and ended all hope of future empire-wide rebellions.

Inchon Landings (15 September 1950)

The U.S. landings that changed the course of the Korean War, temporarily. For several weeks, Eighth U.S. Army and Republic of Korea forces had stubbornly held a perimeter around Pusan in extreme southeastern Korea. The Korean People's Army of North Korea had committed the bulk of its forces there and allied air attacks had limited supplies to the front. The North Koreans were stretched dangerously thin.

MacArthur overrode concerns by U.S. Navy and Marine Corps strategists about the dangers of assaulting Inchon by sea—Operation CHROMITE. High tides, a narrow shipping channel, and a very tall sea wall worried virtually every senior officer who reviewed the plans. MacArthur believed that the advantages, especially an attack along a line of least expectation, outweighed the concerns. And he ordered decoy attacks farther south along both coasts to distract the North Korean command.

The attack at Inchon went spectacularly well. U.S. Marines landed first and secured the port; U.S. Army units provided added punching power. After securing the port, the invasion force moved the short distance to Seoul by September 29. Meanwhile, United Nations (UN) forces in the Pusan perimeter scheduled a simultaneous breakout that linked up with the Inchon invading force on September 26 near Osan, site of the first American resistance to and defeat by the

North Koreans. The North Koreans were cut off and, by September's end, that army largely had ceased to exist as an organized force south of the thirty-eighth parallel. The Inchon landings have been held up through the subsequent decades as a near-perfect example of amphibious operations. Inchon was not the "desperate gamble" of legend, however; American forces had complete control of the air and seas and a substantial superiority in numbers. Still it was MacArthur's last victory and a most impressive operation.

Indian Border Conflicts (1962–1971)

The granting of Indian independence in August 1947 occasioned a series of long-standing border disputes with neighboring countries. Foremost of these was the Indian annexation of Kashmir to the north, despite its predominately Muslim population. Beyond Kashmir was the Jammu region adjacent to Tibet, then jointly claimed by both India and China. Prime Minister Jawaharal Nehru was intent upon maintaining friendly relations with the People's Republic, but as early as August 1958 he complained of Chinese border violations in the Longju and Ladakh regions. Troops were rushed in to enforce Indian claims, but in October 1962, the government of Chairman Mao Zedong launched a massive surprise attack to evict them. Through a series of lightning thrusts, Indian forces were handily repulsed from the disputed territories, at which point China declared a unilateral cease-fire. India, soundly trounced, had no recourse but to accept a truce.

In the spring of 1965 violence sprang up along the border with Muslim Pakistan over the issue of Kashmir, which also spilled over into the Indian state of Punjab. In August 1965 India commenced formal hostilities with a large-scale raid into Kashmir, which was followed by a major Pakistani thrust into the same region. The fighting was particularly intense and featured widespread use of aircraft against cities and large-scale tank battles. The result, however, was a

bloody stalemate and by September 1965 a United Nations–brokered cease–fire was enacted. Further border tensions with China also induced the Indian government to enter a 20-year Treaty of Friendship with the Soviet Union in exchange for large shipments of modern weapons. The Indian governments resolved to be fully prepared for the next round of fighting, when it occurred.

In December 1971, civil war erupted in the nominally Muslim state of East Pakistan, which was separated from West Pakistan by 1,000 miles of Indian territory. Rebels in East Pakistan were seeking autonomy and readily turned to Hindu India for help. The result was an increase of border tensions with West Pakistan, which goaded that country into launching a preemptive air strike against India on 3 December 1971. The Indians, however, were ready and easily parried the blow. Moreover, enjoying a threefold manpower advantage, their forces rolled into East Pakistan. The West Pakistani garrison there was hard-pressed, so as a diversion Pakistani forces also launched an unsuccessful diversionary attack into Kashmir. However, Indian numbers prevailed, and on 16 December 1971 they captured the East Pakistani capital of Dacca, which signaled the general collapse of resistance. Pakistan had been badly defeated, with losses of 4,000 dead and 10,000 wounded; Indian losses were half that. Moreover, a new state, Bangladesh, was created from the former East Pakistan, which effectively reduced West Pakistan's influence throughout the region. The Kashmir issue remains unresolved, and Indian and Chinese forces still dispute some of the most remote and elevated regions on earth.

Indian Mutiny (1857)

Violent uprising of the Indian Bengal Army, hailed by many Indians as a nearly successful revolution. The Indian army of the time was a mixture of 39,750 British officers and troops supervising 226,400 trained Indian soldiers. During the 1850s the British Indian Officer Corps had declined in numbers, quality, and experience and had begun to cause bitter resentment among Indian troops by widespread disrespect for their religious and ethnic beliefs.

In 1856 an Indian revolutionary movement began targeting Indian troops with stories of religious persecutions and blasphemies planned by the British. Although the movement

was not highly organized, the situation was aggravated by continued British acts of ignorance, and by 1857 an uprising was inevitable.

Rumors had been spread that cartridges for the new Enfield rifle, which required handling during loading, contained pig and beef fat, which was highly offensive to both Muslims and Hindus. On 8 May 1857, the mutiny was triggered when some Indian troops of the 3d Light Cavalry stationed in Meerut were forced to declare their individual position regarding the new cartridges; those renouncing use of them were court-martialed and jailed. The Indian garrison in Meerut mutinied and freed the prisoners on Sunday, 9 May, and with a growing civilian mob took over the town, which led to a massacre of local Europeans.

The mutineers then moved to Delhi, 40 miles distant. Delhi had symbolic importance as the former center of the Mogul Empire and was also the focus of British administration for the whole of northern India. The 54th Native Infantry Regiment in Delhi turned on its English officers and joined the 3d Light Cavalry in capturing the city, and most resident Europeans were slaughtered. Bahadur Shar, last of the line of Mogul rulers, was proclaimed head of a new Mogul Empire. Unfortunately for the rebels, he was ineffectual; a strong leader might have driven the British out of India entirely. (The Indians had a saying, "If we would all only spit together, the British would drown!")

British garrisons and civilian enclaves throughout central and northern India were aware of the danger but could only await events during May 1857. Regiments disarmed their Indian troops or retreated into semifortified positions. However, word of events in Delhi spread among the Indians and many local revolts occurred rapidly. Cawnpore was captured after a three-week battle, and Lucknow besieged. In most smaller towns Europeans were massacred before rebel troops moved on to join larger actions.

It took a series of campaigns lasting until March 1858 (when Lucknow was finally recaptured) to end the mutiny. Sir Henry Havelock led the first relief column from Allahabad to Lucknow via Cawnpore but was besieged in turn, and not until November were the surviving Europeans evacuated. Delhi was recaptured in September 1857 by British troops with help from Sikhs under John Lawrence. Sir Hugh Rose suppressed the mutiny in the central districts of India in a series of operations. As the details of the Cawnpore massacre became widely known, British treatment of rebels was brutal, and executions were indiscriminate—many captured rebels being blown from cannons.

After the mutiny, the British army replaced East India Company garrisons throughout India, and native troops were not trained in artillery specialties.

Indian National Army (1943–1945)

An “independent” Indian army established under Japanese tutelage in 1943 to overthrow British rule in India. Started by the Japanese, it came into its own with Subhas Chandra Bose as its leader. Bose had been elected president of the Indian National Congress in 1938 and was a political and ideological rival to Gandhi. He resigned when he was unable to gain Gandhi’s support after a bitter reelection. Arrested by the British in 1940, he went on a hunger strike that secured his release from prison. He evaded the British and fled in January 1941 to Berlin, via Moscow, to work for the Nazi’s Special Bureau for India in 1942. A year later, after Japanese advances into Southeast Asia, he traveled to Tokyo and proclaimed a provisional Indian government. He became leader of the Indian Independence Movement and set about building up a Indian National Army (INA, also known as the Azad Hind Fauj), many of whose troops were disaffected Indian POWs from the ignominious fall of Singapore to the Japanese.

In 1944, his army took to the field with Japanese troops, advancing through Rangoon, and then into India, across the national frontier on 18 March 1944. In rough fighting, the Indian National Army was unable to occupy Kohima and advance toward Imphal. The British under General William Slim were able to resist and the joint Indian National/Japanese Army force was driven back, due in large part to a lack of air support. The INA was able to maintain some semblance of legitimacy, of carrying the banner of Indian liberation, but waned as the Japanese were driven back by the Allies, and many troops deserted back to the British-Indian forces. When Japan surrendered, so did the Indian National Army. Bose died in a mysterious aircraft crash sometime in August 1945.

Indochina Wars (1945–1954)

When the Pacific War ended suddenly in September 1945, Great Britain arranged for the return of the French to their colonies in Indochina. During the war, the Japanese had taken advantage of the regime in Vichy to occupy Indochina, and later, in March 1945, to disarm and imprison French troops. When Chiang Kai-shek’s Nationalist forces left northern Indochina, it appeared the French had successfully reestablished that part of their empire.

It was not to be. During the long years of war a Vietnamese independence movement, dominated and led by Communist cadres, had arisen. Led by Ho Chi Minh, a charismatic leader, the so-called Vietminh had proclaimed Vietnamese independence in fall 1945 (the French had divided Vietnam into three units—Annam, Tonkin, and Cochinchina—and thus Indochina into five states). Nonetheless, the French had little difficulty in reestablishing control. They drove Ho and his colleagues out of Hanoi and established a nominally independent regime under the emperor Bao Dai, although all real power remained in French hands.

Until the Communists conquered southern China in late 1949, the French were able to maintain control. But with the Communists on Vietnam’s border, Ho’s guerrillas would benefit from more secure access to supplies and advice, and the tide of war began to turn slowly but increasingly against France. Within a couple of years the French largely controlled only the two major river deltas, the Red River in the north (centering on the port of Haiphong and the capital city of Hanoi) and the Mekong River in the south (centering on the one-time fishing village of Saigon), as well as a coastal strip connecting the two. Control over much of the countryside and, at night, even major transportation routes was ceded to the Vietminh.

By 1953, the Vietminh had the upper hand. The French commander, Henri Navarre, decided to reverse policy and establish a strong base in northwestern Vietnam at Dien Bien Phu, about 180 miles from French bases around Hanoi, to interdict Vietminh forces moving onto the strategic Plaine des Jarres in Laos. Dien Bien Phu is an isolated plateau, surrounded by mountains; the French gambled that they could bring in a large garrison, occupy the surrounding hills, and destroy the Vietminh when they came out onto the plains to attack the entrenched French.

The French had seriously miscalculated. The Vietminh commander, Nguyen Vo Giap, decided to concentrate against the French garrison. He moved at least 50,000 men into the surrounding hills; using gang labor, he brought up artillery and weapons the French believed they could not transport. Soon the French were caught in a trap of their own making. The siege began in December 1953. On 13 March, after an

intense artillery barrage, the Vietminh sent two battalions each against French outposts, and thereafter Vietminh artillery closed the airfield. Air dropping of supplies was haphazard and only added to the desperation of the French defenders. In late March, Giap's forces overran the other French outposts, and then a month of siege tactics ensued, followed by an attack on 1 May that led to the garrison's surrender on 7 May 1954. When the garrison surrendered, it seemed to mark an end to the French effort; the Geneva Conference on Indochina had begun, and the French withdrew. It would be America's turn next.

Indonesian War of Independence (1945–1949)

An internal conflict, that, with United Nations and United States aid, brought about the independence of Indonesia. As the Japanese were surrendering in World War II, Indonesian nationalists developed the Jakarta Charter, a plan for an independent, secular Indonesian state, which was proclaimed on 17 August 1945. Before Allied forces could intervene, Indonesian armed forces were formed and put to work crushing Muslim and Marxist revolutions in the north. British Indian troops finally arrived at Jakarta on 30 September. Violence erupted at Surabaya in East Java on 28 October. Hundreds of Indian troops were killed and thousands of Indonesians perished in British reprisals and Indonesian counterattacks. Convinced that they could not manage a military solution, the British urged talks between the Indonesians and Dutch. The Linggajati Agreement of 25 May 1947 provided for a Netherlands-Indonesian union, to which neither side was truly committed. Dutch forces, now numbering about 92,000, launched what they termed a “police action” on 21 July 1947, extending Dutch control to all of Java and Sumatra except the area around Jakarta. On 17 January 1948, the Renville Agreement recognized Dutch control of these areas but mandated plebiscites. Despite this, all Dutch-held areas were organized into a system of federated

republics. Outrage at the situation sparked a communist uprising in September, whose speedy suppression by loyal Indonesian forces led the United States to view a prospective Indonesian republic as a bulwark against communism. The U.S. could exert enormous pressure on the Netherlands because of the Dutch need for American economic aid in the wake of World War II. But the fact that the communist uprising had happened at all led the Dutch to think that the republican movement was about to fracture, and on 19 December they occupied Jakarta and imprisoned the republican leaders. Guerrilla activity intensified, and the United Nations Security Council demanded restoration of the republican leadership and a complete transfer of authority. On 27 December 1949 full sovereignty was transferred to the Indonesian Republic and the 15 Dutch-established states. By November 1950 the 15 had been absorbed by the republic, and Indonesian sovereignty was complete.

Infantry

Lightly armed ground troops. The backbone of any army is the infantry. Not only the most numerous of the fighting arms, but the only fighting arm that can take and hold ground. It has long been recognized that well-trained infantry would always beat mere masses of men. Further, if the well-trained men were also well armed, well led, and well equipped, they would be second to none.

The armies of Greece boasted the men of the phalanx; of Rome, the men of the legions. When led by great generals such as Philip of Macedon and Marius, Caesar, and Pompey, these infantry were capable of great feats of arms and endurance, achieved almost always by maneuver rather than face-to-face slogging. These were the forebears of all the infantry who have come onto the battlefield since, and their tradition of fighting with honor is perpetuated today.

Traditionally the infantryman has always been regarded as the “footslogger,” the soldier who gets about on foot, and this has been true until the twentieth century. The rate of advance of the Greek phalanx and the German army of 1914

were virtually identical. The need for mobility and maneuver was foreseen by Napoleon, and his troops were able to move quickly by forced march, but little could be done to bring true mobility to the infantry until the advent of the internal combustion engine. During the wars of the nineteenth and early twentieth centuries, just as before, the infantry had the task of advancing toward the enemy until contact was established. Once that had occurred, with or without support from artillery, and later armor, it was the infantry's task to bring the enemy to battle and to kill him. The great generals, of course, were those who outmaneuvered the enemy in these advances, catching the enemy in the flank or the rear rather than head-on.

World War I saw more massed infantry involvement than in any previous conflict. In the east, German infantry fought and beat Russian infantry after three years of war. In the west the so-called war of attrition lasted for more than four years. Despite every indication that frontal attack was not viable against barbed wire, entrenched defenders, machine guns, artillery, and gas, both sides continued to make frontal assaults at a cost in men that presents a sickening picture of classic military ineptitude at command and staff level.

The arrival of effective armor and air support, heralded by the German blitzkriegs of 1939 and 1940, preempted the expected stalemate, in both the west and the east. Hitler's highly mobile Panzer formations, supported in the main by infantry on foot, defeated the forces of Poland, France (and the static Maginot line), Great Britain, Belgium, Holland, Norway, Yugoslavia, and Greece.

Hitler then sent his army into Soviet Russia. Initially successful, the German infantry got to the gates of Moscow. Then, however, the Hitlerian exhortations to hold at all costs, avoid retreat, and fight to the last man and bullet led to ultimate defeat. Despite the many tanks and aircraft at their disposal, it was infantry who formed the heart of both the German and Russian armies.

Masses of infantry moving on foot were standard until motorization. Aside from the American and British forces, armies have only truly become motorized since World War II. The German army between 1939 and 1945 was still heavily dependent upon the horse, in both offense and defense. However, at the end of the twentieth century, most developed nations have equipped their infantry with armored transport, either wheeled or tracked, the aim of which is to deliver them as far forward in the battle zone as possible under protection and un-fatigued. Infantry, it has finally been recognized, need to be fresh and unharmed when they go into battle.

Modern infantry still have the prime role in land warfare—taking and holding ground. However, the modern infantryman has become a specialist. Regular infantry must

be expert in small arms, antitank weapons, signals, and field engineering, as well as able to cope with threats from nuclear, chemical, and biological weapons.

In the last decade of the twentieth century many infantrymen have become peace keepers, especially in the former Yugoslavia, as well as in some areas of Africa.

Today all entrants to land forces are trained initially as infantrymen. Infantry skills are indispensable to all soldiers, and every soldier, whether truck driver, cook, bandsman, artilleryman, and so on, must be prepared to fight as an infantry soldier. Skills taught include group training, such as drill, battle PT, and first aid. Further infantry skills are added and exercised throughout every man's career. Expertise in using rifles, machine guns, mortars, and antitank and anti-aircraft weapons; practice in field craft, battle craft, river crossing, mountain and arctic warfare, and warfare in wooded and built-up areas; and signals communications, infantry-tank, infantry-air, and infantry-artillery cooperation are all taught, practiced, and used. No longer is the infantryman just a body on the battlefield; he is, today, as skilled as any other specialist, and furthermore he is always at the sharp end.

Further infantry specialization has led to the formation of airborne troops (both parachute and air-mobile) and special forces. Airborne forces are projected behind enemy lines to capture and hold strategic points, where they hold on until relieved by troops advancing to relieve them. Special operations forces, such as Rangers or Special Forces, perform specialized tasks, often in aid of other governmental authorities. In war they destroy headquarters and other strategic targets by coup de main, raise insurgency warfare against unfriendly powers, or train friendly forces in counterinsurgency.

Infantry have benefited greatly from modern concepts and are rarely committed without armor, artillery, air, and logistic support. The infantry may still march on its stomach, but it fights as a combined team. The use of infantry is now part of the maneuverist approach, whether by land, sea, or air. Every modern generation has its experts predicting their war of tomorrow, push-button warfare, and so on, but almost all wars tend, finally, to come down to the infantryman in the mud.

Inkerman, Battle of the (5 November 1854)

Allied victory over Russia, regarded by Britain as a moment of glorious triumph in the Sebastopol campaign of the Crimean War. The British 2d Division under General Sir George De Lacy Evans, 3,000 strong, defended 18 field pieces on the rugged plateau east of Sevastopol between the Tchernaya River and Careening Ravine. It was a weak point in the allied lines because the position allowed concealed approaches through Careening Ravine to the west, Volovia Ravine to the north-northwest, Quarry Ravine to the north, St. Clements' Ravine to the north-northeast, and several adjoining gullies. Also, many of its key defenders, including General Sir Colin Campbell's 93d Highlanders, had been transferred south to defend Balaklava. The Light Division, 1,200 under General Sir George Brown, and the Guards, 1,300 under General H. J. Bentinck, were camped about a mile south. French and Turkish reserves, 23,000 under General Pierre Jean François Bosquet, were camped a few miles east and southeast.

On 5 November 1854 Prince Alexandr Sergeevich Menshikov ordered 19,000 men with 38 guns under Lieutenant General F. I. Soimonov to split the British army from the west, 16,000 men with 96 guns under Lieutenant General P. I. Paulov to attack from the north, 22,000 men with 88 guns under Prince Mikhail Dmitriyevich Gorchakov to prevent Bosquet from providing reinforcements, and 20,000 men under General P. A. Dannenberg to wait in reserve to the northwest. The Russians had to attack uphill and the British Minié rifles had twice the range of the Russian muskets, but the main reason that the British defense succeeded was because the Russian generals did not communicate effectively. British reinforcements broke through early in the day. Bosquet joined the battle much later.

In total, about 22,000 British and 20,000 French and Turks took part in the engagement. After eight hours of fighting, Russian casualties were more than 12,000, British about 2,500, and French and Turkish about 1,700. Inkerman was the last serious Russian attempt to destroy the allies in the Crimea. From then on, attrition and logistics decided the Sebastopol campaign.

Intelligence, Military

Military speciality that provides a commander and staff with the knowledge of enemy weather and terrain required for the planning and conduct of operations.

The requirement for information on an opponent has existed throughout recorded history. The Hebrew Scriptures and Sun Tzu's *Art of War* (c. 500 B.C.E.) refer repeatedly to aspects of intelligence, reconnaissance, counterintelligence, and awareness of weather and terrain. Although military espionage existed in the intervening period, it was not until the twentieth century that the importance of military intelligence was firmly established, with increased efforts made to formalize its processes. This change began during the industrialized stalemate of World War I. Sheer weight of arms often proved inadequate to force a military decision, thus providing impetus to fight more wisely. World War II's technological improvements, such as the interception and analysis of strategic communications, brought international consensus on the growing significance of intelligence. The threat of nuclear warfare by the five declared atomic powers, coupled with development programs in other countries, keeps postwar intelligence efforts robust. The main focus has been on acquiring information on weapons characteristics and seeking warnings of potential nuclear attacks.

The emphasis on military intelligence operations continued beyond the end of the Cold War as targeting shifted to other concerns, such as terrorism and narcotics. Concurrently, traditional war fighting interests of military intelligence have been expanded by the concept of *information operations*, which envisages attacking an adversary through electronic and information systems technology. The span of options include traditional psychological operations or tactical radio jamming as well as attacking an electronic banking system or those computers that control the dams that keep an enemy's country from flooding. In all of these, intelligence provides the knowledge of the adversary's vulnerabilities and a follow-on assessment of the operation's success. There is naturally a concomitant requirement to defend one's own exposed infrastructure.

Intelligence will often occupy a separate appointment among the headquarters staff. Within Western armies the four key appointments are G1-Personnel Administration, G2-Intelligence, G3-Operations, and G4-Logistics, although the letter may vary; for example, J2 for Joint Staff Intelligence or A2 for Air Staff Intelligence. The Prussian General Staff popularized this practice of separate staff appointments in the nineteenth century; hence, G for General Staff. Specific appointments occurred as the functions became sufficiently specialized that the tasks required dedicated expert personnel. An additional benefit is that the division between operations and intelligence reduces the likelihood

that the intelligence product will be skewed to fit a preconceived operational plan. During Operation MARKET GARDEN in 1944 Holland, repeated cancellations of airborne operations due to the rapid Allied advances proved frustrating to the senior paratroop officers. Thus significant indications of German tank formations in the vicinity of the farthest objective, Arnhem, were ignored in order to ensure that the operation was approved.

The general focus on enemy, weather, and terrain provides awareness sufficient to conduct most war-fighting operations. The elements of strategic intelligence are generally accepted as collection, analysis, counterintelligence, and covert action. However, in a military context the latter is a Special Operations Forces responsibility, notwithstanding their distinct military intelligence requirements.

Collection refers to the gathering of information for intelligence staff assessment. Information sources can be divided roughly between technical and human means. The former will include signals intelligence (SIGINT), gained from intercepting radio and radar emissions; aerial and satellite photo and radar imagery (IMINT); and capabilities and weaknesses determined from examining captured equipment or intercepted telemetry (TECHINT). Human intelligence (HUMINT) traditionally meant spies. Within a military intelligence context, however, reconnaissance troops and questioning prisoners of war or refugees provide HUMINT. Humanitarian operations with the attendant nongovernmental organizations throughout a theater of operations are further potential information sources. Finally, open source information from readily accessible publications and broadcasts provides much data.

Analysis is the process of turning information into intelligence. Interpreting often fragmentary or ambiguous information requires reasoned assessment through comparison with other details, either known facts or previous assessments of how an adversary traditionally operates. This process generates three types of intelligence: basic intelligence, such as the enemy force strength and composition (order of battle, or ORBAT, information); current intelligence, providing awareness of an adversary's current activities and specific indicators and warnings (I&W); and estimates or forecasts of the enemy's future activity. Military intelligence estimates are often prepared with a view toward the enemy's most likely and most dangerous courses of action. These intelligence types are interrelated. For example, IMINT and national-level ORBATs indicate that the enemy has a tank division on the far side of a river (basic intelligence). A captured soldier and intercepted radio communications indicate that the enemy division is preparing to attack (current intelligence). The intelligence staff assesses that the enemy will likely attack where the river is narrowest,

but could attack downstream where the terrain would provide the defenders with difficulty counterattacking. The commander may then choose to reinforce the downstream site before the attack, but concentrate on defending at the river's narrowest point.

The focus of counterintelligence (CI) is different from, but complementary to, traditional intelligence. CI protects information and a military's intelligence system rather than aiming to collect and analyze information, thus providing similarities with a police function. The two subsets of CI are security and counterespionage. Because security aims to keep information from those not authorized access, coverage often falls upon physical security: locks, fences, and security sweeps. In a tactical situation, field security would be concerned with keeping soldiers from carrying unit identifiers or operational plans into battle. Counterespionage previously emphasized apprehension or neutralization of an enemy's information-collection agents. However, in a technical environment, human spies are no longer an overarching counterespionage concern. Much information previously acquired through spying can now be gathered through technical means, such as monitoring the electronic emanations from computers rather than stealing their documentary product. Additionally, neutralizing an enemy's collection efforts can be accomplished through deception operations. These aim to provide an enemy intelligence service, and hence their commander, with false or misleading information. Deception operations will be more effective if they are fed through multiple channels, thus appearing to provide confirmation, and if these messages reinforce an enemy's preconceived notions. This was the case during the World War II Normandy invasion when false radio traffic, mock-up vehicles, and the physical isolation of the southeast coast of England from German espionage all indicated that a First U.S. Army under General Patton was poised to strike at Calais, a point already believed by Hitler to be the assault objective.

A number of factors make intelligence failure or surprise practically inevitable. In the previous example an attack is expected, but because of active deception and inclement weather, the intelligence picture indicated a different location and time. A more damaging surprise occurs when intelligence provides no warning of enemy assault, as seen with the Japanese naval attack at Pearl Harbor. Surprise may also result from having adequate information misinterpreted through faulty understanding of an adversary's doctrine. During the Korean War (1950–1953), Chinese light infantry dispersed away from the main highways, unlike North Korea's mechanized army. This differing doctrine negated the American air superiority, allowing the Chinese initially to rout the allied forces. Intelligence failures are therefore a

problem of active deception (Normandy), information not being available in a clear and timely manner (Pearl Harbor), or mirror-imaging (blinding) analysts to the significance of different enemy doctrine (North Korea).

The breadth and depth of information requirements will vary with the strategic versus tactical level of operations. For example, in a conventional war, knowing an enemy's strategic oil reserves is of little interest to a platoon commander holding a ridgeline against enemy attack. Conversely, the difference between that attacking enemy possessing three tanks or twenty is of little interest to the National Command Authority. However, nontraditional conflicts falling outside of conventional war, such as humanitarian relief operations or those missions conducted by Special Operations Forces, pose different demands upon military intelligence. An on-scene commander may need intelligence on the religious beliefs of a particular village or cleared routes to a neonatal care facility rather than the range of a particular antitank weapon system. In these operations, political and economic concerns, previously the purview of strategic-level staffs, are required at the tactical level.

Military intelligence will remain focused upon the basics of enemy, weather, and terrain for the foreseeable future. However, changes in technology, doctrine, and forms of conflict will continue to force military intelligence evolution.

Interventions in Civil Unrest, Strikes, Military

Around the world, there remain many regimes in power only by the intervention of the military within that country. In China, the picture of the man and the tank from Tiananmen Square speaks volumes. The demise of the Soviet Empire and the Warsaw Pact began when Prime Minister Mikhail Gorbachev refused to use troops in the Baltic countries or to support regimes such as East Germany.

In the United States, military intervention in civil unrest is the exception, not the rule. However, the drawing up of the Constitution of the United States drew impetus from the failure of the national government under the Articles of

Confederation to aid Massachusetts in suppressing Shays's Rebellion in 1786. Thus the nation ratified a constitution that authorized the federal government to use military force in civil disorders, first to enforce federal authority, and second to assist states when they were unable to restore domestic tranquility.

The first use of military intervention under the Constitution occurred in response to the Whiskey Rebellion of 1794. President George Washington called out militia from four states to march on western Pennsylvania to suppress the tax revolt. President Washington set a precedent for presidents acting with great restraint in matters regarding military intervention into civilian life.

For the next 80 years, slavery and abolition provided most of the occasions for military intervention. Federal troops were sent to Boston in the 1850s to quell demonstrations against the enforcement of the Fugitive Slave Law. Similarly they were dispatched to "Bloody Kansas" in the late 1850s. Of course, federal troops quelled the "rebellion" in the southern states, 1861–1865.

One exceptional case in 1857–1858 saw the use of 2,500 regulars under the command of A. S. Johnson to enforce federal law and court orders in Utah Territory regarding the Mormon Church.

After the Civil War, the main use of U.S. troops in domestic affairs was in the widespread activities of the Freedmen's Bureau, established to aid the newly freed blacks in the South, headed by an army general whose policies were carried out throughout the South by regular troops and black state militias. Although the Freedmen's Bureau carried out many good works (providing the South with its first tax-supported public school system, for example), it was detested by white southerners, who liked military government no more than Americans from any other section of the nation.

The U.S. military was also involved in industrial strikes and disturbances in the postwar decades, and often reserve or state militia troops were involved, rather than regulars. Five times in 1877, President Hayes sent in troops to assist states, although he denied four other requests. In 1894 President Grover Cleveland sent regular troops to Chicago during the railroad strike. At the beginning of the twentieth century, President Theodore Roosevelt exercised greater reticence in responding to similar requests. However, both Presidents Woodrow Wilson and Warren Harding sent in troops in 1914 and 1921, respectively.

In most of these cases, when federal troops arrived, calm was restored quickly with no loss of life. Aside from the Civil War, one of the worst incidents was the Ludlow Massacre, in which 13 women and children died in 1914.

Since World War II, urban and racial disturbances have occasioned most military interventions. Detroit (1943, 1967), Los Angeles (1965, 1997), and the numerous riots that occurred upon the assassination of Martin Luther King Jr. (1968) were the most prominent. Regular troops and National Guardsmen were also deployed to enforce federal court desegregation orders in the 1950s and 1960s.

In general, the United States military has had little desire or preparation for military inventions in civil disorder. During most of the history of the United States, the military operated only under direct orders of the commander in chief. The one exceptional period occurred during 1917–1920, when the newly created Military Intelligence Division (MID) of the Army General Staff engaged in its own domestic surveillance and even arrest of various labor radicals deemed Bolsheviks.

At present, guided by their oath “to support and defend the Constitution of the United States against all enemies, foreign and domestic,” the military is much more interested in confronting foreign enemies. It is glad to leave the decision to intervene militarily in any civilian turmoil in the hands of the civilian leaders. The marked American distaste for the military, despite the nation’s propensity for individual firearm violence, has made military intervention in civil life all the more rare.

A few other democratic states have had to use the military in a far more direct role than was the case in the United States. Canadian military forces deployed into the streets of Quebec’s cities in 1970, arresting and holding citizens without warrant in the wake of Separatist violence, and British troops have policed Northern Ireland since the early 1970s. The German, Japanese, Italian, French, and Scandinavian governments have, on the other hand, refrained since the end of World War II from using their militaries to intervene in civil disturbances.

Iran Hostage Rescue Attempt (24–26 April 1980)

Failed attempt by the U.S. Armed Forces to rescue American hostages being held in the American embassy in Teheran. The rescue attempt was made after Iranian “students” seized the embassy on 4 November 1979 and seized most of its staff. Shortly after the seizure a joint task force (JTF) was established to begin planning a rescue. The JTF’s plan was complex, involving members of all of the armed services and calling for several C-130s to land at a site in the Iranian desert code-named Desert One. The aircraft would transport the highly secret special operations unit, Delta Force, and other support troops to the site and refuel the RH-53 helicopters that would transport the commandos to Teheran to rescue the hostages. Almost immediately after landing at the site, trouble occurred when a bus full of Iranians was detained on what was supposed to be a remote road. The helicopters encountered the weather phenomenon known as a *haboob*, a dust cloud, which delayed their arrival at Desert One. During refueling at the site one of the helicopters suffered a hydraulic failure, leaving the mission with five helicopters when six had been determined as the mission minimum. The decision had already been made to abort the mission when one of the helicopters collided into a C-130. The ensuing explosion killed eight flight crew members.

The failure of this mission led to the establishment of the Special Operations Command and the U.S. 160th Special Operations Aviation Regiment and to an upgrading of all American special operations assets by the incoming Reagan administration.

Iran-Iraq War (1980–1988)

The longest war between Third World countries since the end of World War II, and Saddam Hussein’s first war. On 22 September 1980, Iraqi divisions crossed the Iranian border. In eight days Iraqi troops reached six to twenty-five miles deep into Iran, including the outskirts of the oil port cities Khorramshahr and Abadan on the Shatt al Arab.

The causes of this war were political, economic, and religious. In 1975 Iran and Iraq agreed over their border along the Shatt al Arab. In 1980, now ruling Iraq, Saddam Hussein

claimed complete control of the Shatt al Arab to gain clear access to the Persian Gulf for oil export. Similarly, Iran, now under the rule of the Ayatollah Khomeini, had sought to undermine the Iraqi regime by instigating rebellion by both the Shiites in the south and the Kurds in the north. Also random Iranian artillery fire and air strikes struck towns and oil facilities in Iraq.

The initial success led Saddam Hussein to call for negotiations, which Khomeini rebuffed. In November 1980, Iraqi troops took Khorramshahr.

However, from then on, Iran gained the military advantage. Iranian volunteers, many of them teenagers, formed the Revolutionary Guards Corps. Also, Iran had the better air force, striking Iraqi air bases and oil facilities with impunity. By the end of the first year, losses were estimated to be 38,000 Iranians and 22,000 Iraqis.

Military tactics stressed entrenchments and the husbanding of valuable equipment. Iranian tactics relied on World War I–style frontal assaults. Iraq introduced chemical weapons on occasion against Iranian troop concentrations, Iranian cities, and Kurd civilians. Both sides used surface-to-surface missiles (SAMs) to attack each other's cities. Eventually, Iran regained its lost territory and entered Iraq, threatening Basra.

In early 1984, both sides escalated the war into the Persian Gulf (the Tanker War). Iraq's best weapon was the Super-Etendard jet using Exocet missiles against tankers carrying Iranian oil. As the flow of oil became hampered, the United States sent its naval forces to protect shipping. In 1987 the United States reflagged Kuwaiti tankers to provide direct protection. Although U.S. activities tended to favor Iraq, the U.S. surreptitiously sold 4,000 target on wire (TOW) and additional spare parts to Iran (Iran-Contra Affair).

In 1987 two Iraqi Exocet missiles struck USS *Stark*, killing 37 U.S. sailors. In 1988, USS *Vincennes* inadvertently shot down an Iranian airliner, killing 290 civilians.

An Iraqi offensive with the greatly expanded Republican Guard recaptured lost territory, returning the frontlines to nearly the original borders. Both sides then agreed to a cease-fire 20 August 1988, after some 262,000 Iranians and 105,000 Iraqis had died. As the interminable war finally ended, Iraq was militarily strong but economically crippled and in massive debt to Kuwait and Saudi Arabia.

Irish Easter Uprising, War for Independence, and Civil War; The Easter Rebellion (1916–1923)

The first of a series of events that culminated in the independence of 26 of Ireland's 32 counties. The Irish Republican Brotherhood (IRB) had patiently waited for a chance to stage a rebellion against British rule, and World War I provided an opportunity to achieve their stated goal of an independent Irish republic. Confused by the contradictory orders emanating from the leadership, most of the rural volunteers failed to rise and only 1,600 republicans were engaged in the fighting in the capital, Dublin, throughout Easter week. Without the expected German arms what little hopes the conspirators may have entertained of victory evaporated: 550 were killed, 2,000 wounded, and £2.5 million of damage caused. Initially, the Irish response to the rising was hostile, but the mindless executions of 15 leaders fundamentally altered the political landscape.

The War for Independence

The conflict with Great Britain that won the independence of the 26 counties in the south of Ireland. Sinn Fein, the political arm of the Irish Republican Army (IRA), won the vast majority of seats in Ireland during the British general election of November 1918 and proceeded to establish an independent parliament in Dublin, which Britain refused to recognize. At the same time the IRA began a guerrilla war against British forces. According to IRA leader Michael Collins, the organization's effective fighting strength never exceeded 3,000. The British, however, used enough force to alienate Irish and international (particularly American) opinion, but never enough to suppress the IRA. On 11 July a truce between British forces and the IRA came into force, the terms of which allowed both sides to retain their arms. Negotiations followed, during which the British delegation, led by Prime Minister David Lloyd George, employed the threat of war to ensure that the Sinn Fein delegation accepted a treaty that fell well short of its demands.

Civil War

The treaty, which left the issue of Northern Ireland unresolved, led directly to civil war. An oath of fidelity to the British monarch, the constitutional status of the new Irish Free State, and the partition of the country were among the

issues that brought erstwhile comrades into mutual armed conflict. Large-scale engagements were confined to the early stages of the war. The assassination of pro-treaty IRA leader Michael Collins on 22 August 1922 strengthened the hand of those who sought a more rigorous campaign. Seventy-seven republicans were executed and 12,000 were interned. By April 1923, most of the IRA's original leadership was either dead or in prison, and during the following month it announced that it was dumping its arms. As a result, Northern Ireland (Ulster) remained an integral part of the British Isles, and the Irish Free State (Eire) an independent nation.

Irish Rebellion, Great (1641–1649)

A free-for-all between disunited factions of Scots Protestants, Old English Catholics, Irish Catholics, English Protestants, and the forces of Charles II. Under the “thorough” and ruthless administration of Thomas Wentworth, Earl of Stafford, the Old England and Old Irish were increasingly alienated from the English Crown. After Stafford was executed in London at the wishes of Parliament in 1641, the Ulster Irish exploded in rebellion, attacking English and Scottish Protestant settlers. This attack, beginning October 1641, was chaotic

and bloody and quickly focused on the Protestant towns such as Dundalk, Dungannon, and Newry, which fell to the Irish one by one. Because Wentworth's army had been disbanded at his death, the Protestant Earl of Ormond raised a defense force and waited for reinforcement from England, while the Old English, angry at being blamed for the rising alongside the Irish, confederated themselves at Kilkenny and declared their loyalty to the king and to the rebellion.

In the spring of 1642, a Scottish Covenanter army arrived and began to retake Antrim and Down. Faced with a complex and bizarre civil war, the beleaguered King Charles I demanded that Ormonde reach a truce with the rebels in 1642 so that Irish troops could be used in England against Parliament. Although Ormonde offered generous terms in 1646, the papal nuncio threatened to excommunicate Catholics who accepted, so the fighting continued. At Benburn, on the River Blackwater, Owen Roe O'Neill, a professional soldier who had served in Spain, led the Catholics to defeat Ormonde, but then retreated to Kilkenny and did not move on Dublin. To confuse matters further, Parliament sent a Roundhead army under Colonel Michael Jones later that year, while O'Neill campaigned in Munster and Ormonde briefly resurfaced as the leader of royalists in Cork and was defeated by parliamentarians in August 1649 at Rathmines.

With Charles I dead at the hands of Parliament, Oliver Cromwell turned his attention to the chaotic situation in Ireland and arrived with an army. At Drogheda, he set a pattern for the conquest of Ireland: surrender or be brutally sacked. Unlike the 1641 atrocities, which were disorganized and the result of personal animosity, Cromwell's were object lessons in the futility of defiance, and the major fortresses capitulated, including Wexford, Dundalk, and Trim. O'Neill, who escaped from Kilkenny before it surrendered to Cromwell, died in November 1648 trying to hold the Old English and Irish together, while Ormonde, who had failed to hold Drogheda, joined Charles II in Scotland. Satisfied that Ireland was under control, Cromwell returned to England, leaving behind his son-in-law, Henry Ireton, who oversaw the surrender of Limerick in 1651.

Cromwell's triumph over his enemies on behalf of Parliament led to the annexation of Ireland by the Protectorate and a harsh program of repression and land redistribution.

Irish Uprising (1798)

One of the very few Irish Protestant resistance movements. Heavily influenced by the ideals proclaimed in the American and French Revolutions, the United Irishmen was founded in 1791 by Irish Protestants who sought to ally themselves with the native Catholic majority in an effort to establish an Irish republic, independent of Britain, which had ruled the country with varying degrees of success since 1169. The United Irishmen was a secret oath-bound organization with a peak membership of about 300,000.

Bedeveled by informers, its leadership arrested or in exile, and bereft of expected French military assistance, the United Irishmen rebellion of 1798 ("The '98") was largely a collection of isolated battles. Though large in numbers, the Irish mainly fought with pikes against smaller contingents of well-trained British professional soldiers backed with heavy artillery. A tiny French force of 1,100 arrived on 22 August and with Irish peasant support enjoyed some initial victories before being defeated by a much larger British force at Ballinamuck. Approximately 30,000 died during the rebellion. Reflecting the marked imbalance in military might, only 3,000 of these were killed by Irish insurgents.

Having destroyed the most serious military threat to emerge in Ireland for more than a century, British rule was consolidated and institutionalized by the Act of Union (1801), which established the United Kingdom of Great Britain and Ireland.

Iroquois-French Wars (1609–1697)

A war over control of the fur trade by aboriginal tribes in North America, which soon led to a war between the Iroquois League and the French. Some historians trace its roots to when a Huron band of warriors led by Samuel de Champlain in July 1609 killed two Iroquois chiefs, but more likely it was an outgrowth of the ancient hostility between the tribe of the Iroquois League (Mohawk, Oneida, Onondaga, Cayuga, and Seneca) and the Algonquin tribe allied with the French. As the beaver trade flourished, the Iroquois depleted

the populations in their area. The Iroquois in all likelihood did not want to fight the French but rather to displace tribes such as the Illini and Hurons as middlemen in the pelt trade and take over more plentiful lands. They were given the resources to do this when the Dutch traders in the Hudson Valley of New York in 1610 began to trade steel knives, tomahawks, powder, guns, and ammunition for pelts. While the French were not their primary target, they continued raids and engaged in hit-and-run warfare against them in the St. Lawrence Valley and southern Ohio.

The Iroquois began to expand their area to take over lands controlled by the Neutrals and Erie Indians south of the Great Lakes. By 1655, they had also defeated the Nipisings and Hurons, but they could not overcome the Ottawa, located in the western Great Lakes. They were also defeated the next year in warfare with the Chippewas and Illini. Not giving up, a war party of 500 Iroquois and 100 of their allies prepared to attack an Illini village of Kaskaskia, near what is today Peoria, in September 1680. While most of the Illini warriors and Chief Chassagoac were at Cahokia attending a religious ceremony, the remaining Illini warriors attempted to ambush the advancing Iroquois between the Illinois and Vermillion Rivers before they reached the village. They met with some success, and French representative Henri de Tonti tried to negotiate a peace treaty with them. Iroquois warriors stabbed him, causing him to retreat to Lac du Illinois. After eight days of fighting, the Iroquois laid siege to the village. Surviving Illini fled down the Illinois River while captives were killed and mutilated. The Kaskaskia, Cahokia, Chinkoa, Omouahoa, Coiracoentanon, Moingwena, Chepoussa, and Peoria all left the area, while the Iroquois killed or captured 700 members of the tribes remaining at the mouth of the Illinois.

The main body of Illini tribesmen came back to Kaskaskia but were soon confronted by the news that the Iroquois were about to return. They turned to the French Fort St. Louis, located near present-day La Salle, Illinois, under the command of de Tonti. Informed that the fort was too small to protect them, the Illini fled. The Iroquois, finding their enemy gone, attacked Fort St. Louis. After firing on the fort for several days, the Iroquois tried to assault the walls but were beaten back by cannon and musket fire, leading them to retreat. Shortly after this, Tonti and 200 warriors joined a large contingent of Canadian soldiers in an invasion of what is now upper New York, destroying several Iroquois villages along the Mohawk River. By 1696, the Iroquois, with the exception of northern Pennsylvania and eastern Ohio, had retreated to their traditional homelands. In 1687 the French attacked Seneca and Onodaga villages on Iroquois land, and in August 1689 a massive warrior party of 1,200 Iroquois at-

tacked Lachine, near Montreal, killing 200 French settlers. The next year, the French and their Indian allies attacked Schenectady and in retaliation the Mohawk attacked the Sokoki at St. François in 1690 and 1692. The French then launched three campaigns under Louis Frontenac from Quebec between 1693 and 1696 on Iroquois villages. Yet it was smallpox that brought the Iroquois to the peace table. Although they were unable to work out a peace, the Treaty of Ryswick in 1697, which ended the war between England and France, also placed the Iroquois under British protection. Worrying that any conflict with the league would bring another conflict with the British, the French agreed to mediate any disputes between the Iroquois and the Algonquin.

Isandlwana (South Africa, 22 January 1879)

The greatest Zulu victory of the nineteenth century over the forces of colonialism and one of the heaviest defeats ever suffered by British troops during the small wars of the Victorian era. Paradoxically, Isandlwana sealed the fate of the independent Zulu kingdom, for in order to reassert their paramountcy in southern Africa, it became imperative for the British to avenge their defeat, crush the Zulu army in battle, and impose a peace settlement entirely on their own terms.

On 20 January 1879 the British Number 3 Column under Lieutenant General Lord Chelmsford encamped at the eastern base of Isandlwana hill. The next day Chelmsford despatched a reconnaissance-in-force under Major J. G. Dartnell toward the southeast to seek out the Zulu army and to establish the column's next campsite. During the night, Chelmsford strongly reinforced Dartnell, leaving the depleted garrison at Isandlwana under the command of Colonel H. B. Pulleine. For the whole of 22 January Chelmsford skirmished with Zulu irregulars, who, in accordance with Zulu strategy, steadily drew him away from his camp.

Colonel A. W. Durnford reinforced the camp midmorning of 22 January with men from Number 2 Column and immediately moved out northeastwards to intercept Zulu reportedly threatening Chelmsford's rear. One of his mounted pa-

trols stumbled upon the Zulu army concealed in the Ngwebeni valley only nine miles from the camp.

Undetected by the British, the Zulu army under Chief Ntshingwayo kaMahole Khoza and Chief Mavumengwana kaNdlela Ntuli had reached their bivouac by the early hours of 22 January. Their plan to divide the British forces had succeeded, and they were preparing to fall on the British camp held by 67 officers and 1,707 men, about half of whom were African auxiliaries.

At about 12:15 P.M. the British formed an extended skirmishing line about half a mile in advance of the camp, both to command the dead ground and to support Durnford's horsemen and other detached units as they fell back before nearly 20,000 Zulu. The Zulu center was pinned down by British fire, but the horns extended to outflank the British line and raced around to enter the rear of the camp. (Without their realizing it, the Zulu leaders had achieved every Eu-

ropean commander's dream: a "Cannae," an encirclement of an enemy.) Realizing they were being enveloped, at 1:00 P.M. the British precipitately fell back on their camp, losing all cohesion in hand-to-hand fighting with the Zulu. Though harried, a few mounted men broke southwestwards through the Zulu encirclement to escape over the Mzinyathi (Buffalo) River at the aptly named Fugitives' Drift. Many of the infantry conducted a fighting retreat in the same direction but were all cut off and killed before they reached the Manzimyama stream one and a half miles away. The Zulu pillaged the camp and retired at nightfall when Chelmsford and his force finally marched back in battle order.

No less than 1,000 Zulu died in the encounter. The British lost 52 officers and 739 white troops, 67 white NCOs, and close to 500 of the Natal Native Contingent.

Isonzo, Battles of the (1915–1917)

Series of no less than 12 battles fought between the Austro-Hungarians and the Italians along the Isonzo River. On 23 June 1915 the Italians attacked Austria across the Isonzo with superior numbers. The Italian generals failed to supply forward units with enough arms, ammunition, and artillery. As the Austrians rushed troops to defend the inadequately held frontier, the Italians made three more bids to break through. The second (July–August), third (October–September), and fourth (November–December) battles of the Isonzo were as inconclusive as the first, and the customary trench warfare ground into an even more bitter contest along the frozen Alpine mountain tops.

Here the soldiers of both sides endured the horrors of fighting in the trenches; however, dizzying heights, the constant cold, flash floods in the valleys, poor supplies, rudimentary medical attention and sanitation, and poor shelter compounded the suffering troops endured. The fifth bid by the Italians to break through began on 11 March 1916, but an Austrian offensive in the Trentino sector offset the small gains the Italians made. A sixth bid to break the river barrier began in August 1916; this time the Italians managed to seize the town of Gorizia but failed to achieve a breakthrough. The seventh, eighth, and ninth battles, September–November 1916, developed along the same patterns as the first six battles. In May 1917 the tenth Isonzo began as the Italians joined the overall allied spring and summer offensive. In particularly brutal fighting, 125,000 casualties achieved scant gains. The Italians followed this with the eleventh battle in August and at last achieved a limited breakthrough at Bainsizza, once again at a heavy price. The Battle of Caporetto (twelfth Isonzo), where the Germans led their Austrian allies in a major drive against Italy, offset all the summer gains, forcing the Italians off the frontier and back to the Piave River.

Israeli Military

Israel's armed forces have evolved from prestate vigilante bands to the paramount strike force in the Middle East. In 1908 Jewish settlers formed an ad hoc society of armed sentinels, called Ha-Shomer, or Guardsmen, to replace mercenary, untrustworthy hired Arab watchmen in thwarting robbery, cattle-rustling, and poaching. The Jewish farm laborers on the settlements (the Shomrim would not protect farms with an Arab or mixed workforce) comprised a reserve to assist the patrol cadres, who were equipped with a motley collection of obsolescent firearms. Another armed band, the Jaffa Group, provided security for the Jews of that community and Tel Aviv.

These organizations kept a low profile during World War I, as the Turks (and Palestine) were formally allied with Germany, and Jewish loyalties were suspect. Nevertheless, the Palestine-based spy ring NILI—an acronym for the Hebrew verse *Netzah Yisrael Lo Yeshaker* (The strength of Israel will not lie [1 Sam. 15:29]), which served as its password—comprised of a former Zionist youth corps, worked for British interests, while other Palestinian Jewish adolescents were conscripted into the Turkish army. Zionists expelled from Palestine by the Turks formed the Zionist Mule Corps, providing logistic support in the Gallipoli Campaign. Veterans of the Mule Corps created the nucleus of new all-Zionist battalions, the British 38th and 39th King's Fusiliers, which met the test of fire in Allenby's Palestine Campaign, 1917–1918.

All of these ventures provided valuable military experience for a proficient cadre, which returned to postwar Palestine, now under the British Mandate, whereby a Jewish homeland was to be established alongside an Arab nation. The British high commissioner encouraged the Zionist administration in Palestine to set up an executive framework under the auspices of the formally sanctioned Jewish Agency for Palestine. Independent of but allied to these was the Histadrut, nominally a populist labor society, but in reality the linchpin of Zionist industrialization and agricultural expansion in Palestine.

Established by the labor mainstream, Histadrut, after the murderous Arab riots in 1920, set up the Hagganah (self-defense force), which rapidly became a country-wide Jewish

army as Jewish immigration swelled to a flood upon the rise of Hitler, and Palestinian Arab resistance hardened in response. Armed defense organizations were illegal under the mandate, so Hagganah had to organize, train, and procure weapons covertly. The organization even managed to establish a backyard armaments industry producing bullets and crude submachine guns and mortars.

After the Arab riots of 1929, Hagganah was transferred from the authority of Histadrut to the quasi-governmental Jewish Agency, which had formerly spurned any connection with outlawed clandestine groups. This progression entailed splitting Hagganah high command into left and right political factions. Although illegal, every Jewish town and neighborhood in Palestine was affiliated with a district command of Hagganah. Elements of the conservative wing split from the labor-left mainstream and allied themselves with Zeev Jabotinsky's Revisionist Party, the foundation of today's Likud, thereby forming the renegade National Military Party, or Etzel (alternately, Irgun). The latter, at most consisting of 250 firebrands, were ruthless in their attacks on Arabs, while Hagganah counseled restraint so as to forestall unwelcome British attention.

The Palestinian Arab Revolt of 1936–1939, largely directed at the British Mandatory government, brought a measure of unusual cooperation between the colonial counterterrorism effort and specially constituted Jewish Supernumerary Police, developing commando expertise under the able direction of the New Testament Zionist Orde Wingate. In 1938 and 1939, Hagganah benefited by the appointment of a nonpartisan nationwide commander and the establishment of a professional military general staff to coordinate the formerly diversified elements.

During World War II, Hagganah and segments of the Irgun collaborated with the British authorities in fighting the Nazi menace; however, a renegade sector of the Irgun, Lehi, informally the Stern Gang, rashly attacked British and Arab civilians. (The British high commissioner for Egypt was assassinated by Jewish terrorists in 1944.) Also during the war, the left wing of the Hagganah formed an elite strike force, or Palmach, sanctioned because it would embody a potential guerrilla resistance to Rommel's advancing Afrika Corps. In addition, 30,000 Palestinian Jews gained invaluable experience serving with the British armed forces, including a Jewish Brigade Group. Hagganah meanwhile developed a field corps, a medical service, a signals corps, an arms industry, and an intelligence section, the last assisting illegal immigration of Holocaust refugees. Intelligence became paramount in the postwar years when Hagganah conducted an effective insurgency campaign against British military and police logistics, while the Irgun and Stern groups focused on terrorizing British individuals.

During the 1948 Israeli War of Independence, Israeli political leader David Ben-Gurion remodeled Hagganah as the national defense force of the newborn state. Early in the war, Irgun was forcefully integrated into the Israeli Defense Forces (IDF), the new designation for the armed forces of Israel. In the course of desperate fighting, the patchwork geographical structure of company-sized lots amalgamated into battalions, then regiments, which nonetheless retained their regional identification. Makeshift aviation and naval assets were likewise "born in battle" and integrated into the whole. The IDF would win every one of its subsequent conflicts against its hostile Arab neighbors, and such success would be studied in some detail by military academies around the world (with the conspicuous exception of Arab military academies). But the reason for the IDF success, aside from the numerous Arab military deficiencies (lack of coordination, unprofessional officers, untrained troops, etc.), came down to a simple point: Israel had no alternative to victory. Defeat meant literal death.

Israeli-Arab Wars (1948–1999)

A series of wars between Israel and its Arab neighbors that saw the establishment of the Jewish state.

1948, War of Independence

After Britain announced it would withdraw from its mandate in Palestine, the United Nations (UN) passed a partition plan on 29 November 1947 that divided Palestine along existing settlement lines between the Arab and Jewish populations, which the Jewish authorities accepted and the Arab leaders rejected. Civil war soon broke out between the Arabs and Jews. The Jewish leadership declared the independent state of Israel on 14 May 1948, an announcement followed immediately by a declaration of war by the Arab states of Egypt, Iraq, Lebanon, Syria, and Transjordan. Coop-

vary) fled Israel as a result of the war. Their fetid camps became a breeding ground for generations of young Arab fighters against the “Jewish entity.”
