BOBBY FISCHER

Born: March 9, 1943

Chicago, Illinois

American chess player

An eight-time United States chess champion, Bobby Fischer helped win over a new generation of chess fans with his famous 1972 victory over Boris Spassky (1937–). Fischer, a known recluse (a person who prefers to live shut out from the rest of the world), often receives criticism for his anti-Semitic and anti-American views.

Early years

Bobby Fischer was born in Chicago, Illinois, on March 9, 1943. His father was a physicist (scientist who studies matter and energy), and his mother, Regina Fischer, worked as a teacher and a nurse. His parents divorced when he was two years old, and he moved to Brooklyn, New York, with his mother and older sister in 1948. Fischer began playing chess at age six, when his sister bought a set and they both learned how to play. By age eight Fischer was competing and receiving lessons at the Brooklyn Chess Club.

Chess success

Fischer rose quickly through the junior ranks of chess players, and at age thirteen he won the United States Junior Championship, the youngest player to date to have taken the title. Competing against adults, Fischer won the United States Open Championship at age fourteen. He dropped out of Erasmus High School in Brooklyn at age sixteen to concentrate on chess. By the next year he became a challenger for the world title and the youngest player ever to receive the title of international grand master. But Fischer was often uncooperative and badly behaved. He would cancel out of matches unexpectedly, and he held grudges that lasted for years. He withdrew from international competition for five years during the 1960s.

By 1970 Fischer had made a comeback and had built up enough tournament credits to take on the current world champion, the Russian Boris Spassky. In 1972 the arrangements were made for the match to be held at Reykjavik, Iceland, and chess fans were excited about this historic challenge. As the event drew near, though, Fischer continued to behave so oddly that many worried he might not show up for the match. Even after his last-minute arrival, Fischer complained constantly and insulted the country and its people. Still, Fischer beat Spassky and became world champion.

Oddball beliefs

Fischer's life after that historic match was marked by a period of nearly twenty years during which few heard from him. He lost the world title after refusing to accept the challenge of Anatoly Karpov in 1975. In 1981 he was arrested because he looked like

a bank robber the police were chasing. After spending a night in jail, Fischer wrote a rambling pamphlet titled *I Was Tortured in the Pasadena Jailhouse*.

Fischer also demonstrated many offbeat beliefs. For example, though his mother was Jewish, Fischer maintained strongly anti-Semitic (opposed to Jewish people) views. He also distrusted doctors, thought that the Russian government was out to kill him, and, according to an article in *Maclean's*, he had his dental fillings replaced "because he feared that Soviet (Russian) agents might be able to transmit damaging rays into his brain through the metal in his teeth."

Later years

In 1992 Fischer agreed to take on Spassky again for \$5 million in prize money. The match was planned for the town of Sveti Stefan, in a region of the Yugoslav republic near the former republic of Bosnia-Herzegovina, which had recently been at war. At that time U.S. president George H. W. Bush (1924–) had imposed sanctions (the refusal to do business with a group in order to get that group to change its policies) on Yugoslavia. This meant that by playing in the match Fischer would be breaking the law. At a press conference, Fischer spat on a letter from the U.S. Treasury Department that threatened him with fines and imprisonment if he played. The match, which ended in fifteen draws, showed that Fischer was still a skilled player. When the U.S. government brought charges against Fischer in December 1992, he chose to stay in eastern Europe.

By the mid-1990s Fischer, the author of several chess books and the inventor of a chess timing clock, was living in Budapest, Hungary,

with a nineteen-year-old girlfriend, Hungarian chess star Zita Rajcsanyi. In 1999 he gave an interview to a Hungarian radio station in which he complained about Jews. In 2001 there were reports that Fischer was playing chess on the Internet under a different name.

ELLA FITZGERALD

Born: April 25, 1918

Newport News, Virginia

Died: June 15, 1996

Beverly Hills, California

African American singer

ELLA Fitzgerald was one of the most exciting jazz singers of her time and, because of the naturalness of her style, had a popular appeal that extended far beyond the borders of jazz.

A rising star

Ella Fitzgerald was born on April 25, 1918, in Newport News, Virginia, but she spent her youth just outside New York City in Yonkers, New York, and received her musical education in public schools. During elementary school she began singing at her local church, the Bethany African Methodist Episcopal Church. At fifteen her mother died and she was cared for by her aunt in Harlem, a black neighborhood in New York that was rich with jazz music.

When only sixteen, she received her first big break at the Apollo Theater in Harlem, when she won an amateur-night contest and impressed saxophonist-bandleader Benny Carter (1907–). He recommended her to drummer-bandleader Chick Webb (c. 1900–1939), who hired her in 1935. She soon became a recording star with the band, and her own composition “A-tisket, A-tasket” (1938) was such a smash hit that the song became her trademark for many years thereafter. When Webb died in 1939, Fitzgerald assumed leadership of the band for the next year.

“The First Lady of Song”

By 1940 Fitzgerald was recognized throughout the music world as a vocal wonder—a singer with clarity of tone, flexibility of range, fluency of rhythm, and, above all, a talent for improvisation (to make up without practice) that was equally effective on ballads and faster tunes. Although for a long time she had a better reputation among fellow musicians than with the general public, this changed soon after she joined Norman Granz’s Jazz at the Philharmonic (JATP) in 1946. She made annual tours with the group

and was always the concert favorite. Three of her unflinching show-stoppers were “Oh, Lady Be Good,” “Stomping at the Savoy,” and “How High the Moon.” Each would begin at a medium tempo and then speed up as Fitzgerald moved up-tempo and “scatted” (that is, sang harmonic variations of the melody in nonsense syllables). The huge JATP crowds always responded well.

By the early 1950s Fitzgerald’s domination of fans’s and critics’s polls was absolute. In fact, she won the *Down Beat* readers’ poll every year from 1953 to 1970 and became known as “The First Lady of Song.” In 1955 she ended her twenty-year recording relationship with Decca in order to record for Norman Granz’s Verve label. She proceeded to produce a series of legendary “Songbook” albums, each devoted to the compositions of a great songwriter or songwriting team, such as the Gershwins (George, 1898–1937; Ira, 1896–1983), Cole Porter (1891–1964), Irving Berlin (1888–1989), and Duke Ellington (1899–1974). The lush orchestrations allowed Fitzgerald to display the classy pop-singer side of herself. In the two-volume Ellington set, her jazzier self moved aside for the melodist in her.

Touring the world

Under Granz’s personal management Fitzgerald also began to play choice hotel jobs and made her first feature film appearance in *Pete Kelly’s Blues* (1955). In 1957 she worked at the Copacabana in New York City and gave concerts at the Hollywood Bowl. In 1958, in the company of the Duke Ellington Orchestra, she gave a concert at Carnegie Hall as part of an extended European and United States tour with the band. In the early

1960s she continued to work the big hotel circuit—the Flamingo in Las Vegas, the Fairmont Hotel in San Francisco, and the Americana in New York City. She also continued to tour Europe, Latin America, and Japan with the Oscar Peterson (1925–) trio, which was three-fourths of Granz’s JATP house rhythm section. In 1965 and 1966 she was reunited with Ellington for another tour and record date.

Fitzgerald was always blessed with superb musicians accompanying her, from the full orchestral support of Chick Webb and Duke Ellington to the smaller JATP ensembles. In 1968 she teamed up with yet another, the magnificent pianist Tommy Flanagan, who headed a trio that served her into the mid-1970s. In 1971 Fitzgerald had serious eye surgery, but within a year she was performing again. Her singing, however, began to show evidence of decline: the voice that was once an instrument of natural beauty and effortless grace became a bit thin and strained. Nevertheless, so great was her talent that she continued to excite concert audiences and to record effectively. She appeared after the mid-1960s with over fifty symphonic orchestras in the United States.

A large, pleasant-looking woman with a surprisingly girlish speaking voice, Ella Fitzgerald sometimes forgot lyrics. But the audiences loved it and delighted in her ability to work her way out of these potentially embarrassing moments on stage. Unlike some other great jazz singers, like Billie Holiday (1915–1959) and Anita O’Day, Fitzgerald avoided falling into drug addiction. She was married twice. The first marriage, to Bernie Korngay in 1941, was annulled

Ella Fitzgerald.

Reproduced by permission of Archive Photos, Inc.

(made invalid) two years later. The second, to bassist Ray Brown (1926–) in 1948, ended in divorce in 1952 (they had one son).

The legacy of Ella

Was Ella Fitzgerald essentially a jazz singer or a pop singer? Jazz purists say that she was often glossy and predictable and that she lacked the emotional depth of Billie Holiday, the imagination of Sarah Vaughan (1924–1990) or Anita O’Day, and the blues-based power of Dinah Washington (1924–1963). The criticisms sprang partly from her “crossover” popularity and ignored her obvious strengths and contributions: Fitzgerald

was not only one of the pioneers of scat singing, but, beyond that, she was a down-to-earth singer whose harmonic variations were always unforced. Plus, she was a supreme melodist who never let herself get in the way of any song she sang.

Fitzgerald died on June 15, 1996, at the age of seventy-eight. She left a legacy that will not soon be forgotten. In her lifetime she was honored with fourteen Grammys, the Kennedy Center Award, as well as an honorary doctorate in music from Yale University. In 1992 President George Bush (1924–) honored her with the National Medal of Freedom. Fitzgerald's impressive financial estate was left in a trust, including the \$2.5 million in proceeds from the sale of her Beverly Hills home.

F. SCOTT FITZGERALD

Born: September 24, 1896

St. Paul, Minnesota

Died: December 21, 1940

Hollywood, California

American author, novelist, and playwright

The American author F. Scott Fitzgerald, a legendary figure of the 1920s, was an extremely observant artist, a beautiful writer, and an exceptional craftsman. His tragic life was ironically similar to his romantic art.

Fitzgerald's younger years

On September 24, 1896, Francis Scott Key Fitzgerald was born into an Irish Catholic family in St. Paul, Minnesota. His mother was from a wealthy family, and his father, Edward, was a furniture manufacturer. After Edward's business failed, he was employed by Proctor and Gamble, and the family transferred to Buffalo, New York. The family lived for some years in Buffalo and Syracuse; but in 1908, when Fitzgerald's father lost his job, they returned to St. Paul. For the most part, Fitzgerald was privately educated; he attended Newman School in Hackensack, New Jersey, from 1911 to 1913 and worked on the school paper.

Fitzgerald enrolled at Princeton University in 1913. There, he worked on *The Princeton Tiger*, a magazine published by the university. He also wrote for Princeton's Triangle Club, which was a distinguished organization that put on musicals. Because of ill health and low grades, he left the university in 1915. He returned to Princeton in 1916 but left a year

later without a degree and joined the U.S. Army as a second lieutenant. Stationed in Alabama in 1918, he met Zelda Sayre, then eighteen years old; he would marry her a few years later. After he left the army he took an advertising job for a brief period. Back home in St. Paul, he finished his first novel, *This Side of Paradise*, which was published in 1919, and that same year he had remarkable success placing nine short stories in leading magazines.

First publications

Upon publication of *This Side of Paradise* (1920), Fitzgerald married Sayre in New York City. Of this period he later recalled riding up Fifth Avenue in a cab—young, rich, famous, and in love (he might easily have added handsome)—suddenly bursting into tears because he knew he would never be so happy again. He was right. Despite great earnings and fame, he and Zelda lived grandly and lavishly—but tragically.

A daughter was born in 1921 after the couple had spent some time in Europe. When Fitzgerald's second novel, *The Beautiful and the Damned* (1922), and a collection of short stories, *Tales of the Jazz Age* (1922), sold well, they rented a house on Long Island and ran into debt because of their reckless spending. Fitzgerald attempted to recover by writing a play, *The Vegetable* (1923), but it was unsuccessful. The Fitzgeralds went to Europe for over two years. The high points of this trip were publication of *The Great Gatsby* (1925) and the beginning of Scott's friendship with Ernest Hemingway (1899–1961). In 1927 Fitzgerald went to Hollywood on his first movie assignment. Afterward the Fitzgeralds again went overseas several times.

F. Scott Fitzgerald.

Zelda's first major nervous breakdown, in 1930, and her following treatment in a Swiss clinic became the basis for Fitzgerald's next novel, *Tender Is the Night* (1934). Zelda spent the rest of her life in and out of treatment centers, and Fitzgerald's own life ran a similar unfortunate course.

Analysis of the novels

This Side of Paradise (1920), an autobiographical (having to do with one's life story) novel, tells of the youth and early manhood of a Princeton undergraduate. The climax occurs when he shifts his devotion from football to literature, while at the same time he

grows in character. This work struck a nerve in the reading public, chiefly for its new type of heroine—the “flapper,” a young woman who goes against the idea that a woman must be stricter in her morals and behavior than a man. She smokes, drinks, dances, and is considered to be somewhat low in her character and conduct.

The Beautiful and the Damned (1922) deals with a couple who is concerned with only themselves. Tony Patch, grandson of a millionaire, and his beautiful wife live extravagantly on the expectations of Tony's inheritance, but the grandfather discovers Tony's alcoholism and wastefulness and disinherits him; however, after the grandfather dies, the will is broken. Ironically, the inheritance only worsens the destruction of Tony's morals. As with most of Fitzgerald's novels, the autobiographical elements are fairly obvious.

The Great Gatsby (1925) is an American classic, generally regarded as Fitzgerald's finest work. It contains the themes that pass through all of his fiction: the hardened indifference of wealth, the hollowness of the American success myth, and the sleaziness of the wealthy lifestyle. It is the story of Jay Gatz, a successful, vaguely disreputable man, who has a background of poverty and has altered his name to “Gatsby.” He emerges as morally superior to the people who take advantage of his parties and the reckless rich whom he so hopelessly imitates. Gatsby dies unrealistically attempting to reclaim his former love, Daisy. *The Great Gatsby* is a major contribution to the writing work of the twentieth century.

The theme of *Tender Is the Night* (1934; later restructured by Malcolm Cowley) is parasitism—the health of one person gained

through harm to the other—and the facts bear an unmistakable resemblance to Scott and Zelda's marriage.

The Last Tycoon (1941), published after Fitzgerald's death—after Edmund Wilson put it together from Fitzgerald's unfinished manuscript—is the story of a movie producer. Though Wilson calls it Fitzgerald's most mature work, it has received very little critical attention.

Short stories

Many regard Fitzgerald's short stories as his best work. The titles of his collections are a representation of the spirit of the times. *Flappers and Philosophers* (1921) contains “The Off-Shore Pirate” and “The Ice Palace.” *Tales of the Jazz Age* (1922) includes “May Day” and “The Diamond as Big as the Ritz.” The best-known pieces in *All the Sad Young Men* (1926) are “Winter Dreams,” a basic example of Fitzgerald's romantic vision, and “The Rich Boy.” Fitzgerald's final collection, *Taps at Reveille* (1935), includes “Babylon Revisited,” perhaps his most widely anthologized (stories written by different authors that are collected and published together) story.

Last years

Fitzgerald earned over four hundred thousand dollars between 1919 and 1934, but he and Zelda lived so expensively that they barely managed to cover their bills. When *Tender Is the Night* failed to excite interest, financial problems became critical; by 1937 Fitzgerald owed forty thousand dollars despite continued earnings from magazine stories. Zelda had been permanently returned to medical care in 1934; and the years from 1935 to 1937 saw Fitzgerald's

own decline—increasing alcoholism and physical illness—which he described with emotional openness in articles that appear in *Esquire* in the mid-1930s.

In 1937 Fitzgerald signed a movie contract at a weekly salary of one thousand dollars. His relationship with gossip columnist Sheilah Graham during the last three years of his life is described in her *Beloved Infidel* (1958). After two heart attacks Fitzgerald died on December 21, 1940. Zelda Fitzgerald died in a fire in 1947 at Highland Sanitarium, Asheville, North Carolina, leaving a novel, *Save Me the Waltz* (1932).

GUSTAVE FLAUBERT

Born: December 12, 1821

Rouen, France

Died: May 8, 1880

Croisset, France

French novelist and author

The French novelist Gustave Flaubert was one of the most important forces in creating the modern novel as a deliberate art form and in introducing this objective form of writing in France.

Flaubert's early years

Gustave Flaubert was born on December 12, 1821, in Rouen, France. His father, Achille-Cleophas Flaubert was a doctor and an important Rouen citizen, and his mother, Anne-Justine-Caroline Fleuriot, was a physician's daughter. He had an older brother, Achille, and a younger sister, Caroline, with whom he had a close relationship. Gustave began to develop his writing skills at an early age and wrote plays, which he put on for his family at the age of nine or ten. He loved to study history and was a wonderful reader. His sister died during childbirth when Flaubert was twenty-four. She left behind her daughter, Caroline Hamard, who was raised by Gustave and his mother. His mother would live with him until his fiftieth year.

As an adolescent of fifteen, Flaubert fell in love with an older married woman, Elisa Schlésinger, and remembered her ever after as a pure and innocent love. The young man was sent to Paris, France, to study law. He had easy access to prostitutes (people who receive money for performing sexual acts), and this led to venereal disease (a sexually transmitted disease) from which he never recovered.

Illness leads to writing career

In 1845 Flaubert had his first attack of temporal-lobe epilepsy (a brain disorder that causes seizures [a partial or complete loss of

Gustave Flaubert.

Courtesy of the Library of Congress.

consciousness that involves a loss of muscle control)). He was crippled by his seizures, which were terrifying for him and reappeared at intervals throughout his life. In 1846 he had to face the deaths of his father and his beloved sister. Flaubert decided to quit his legal studies, since any emotional excitement brought on an attack of his epilepsy. He felt he must become an observer of life and not a participant in it, so he devoted himself only to his writing.

Flaubert found peace in literature, for he had been slowly moving away from the idea of writing emotionally and moving toward the idea of writing as a detachment, which

easily balanced with his physical state. He began writing *The Temptation of Saint Anthony*. He completed the first version in 1849, but he was unable to get it published. This was a bitter blow, and during the next twenty-five years he would spend time revising the work.

After this failure Flaubert left immediately for a twenty-month journey through the eastern Mediterranean, accompanied by his lifelong friend Maxime Du Camp (1822–1894). He had studied Egypt and the Holy Land which he had described in his work *Saint Anthony*. He found that he was able to recognize places that he had only read about and described in his work. This proved to him that art could help to describe and envision reality. If a person has never viewed a particular location, they can see it through its description.

Madame Bovary

In 1851 Flaubert began writing *Madame Bovary*, on which he worked until 1856. It was published in 1857 and caused quite a disturbance; Flaubert in fact was unsuccessfully tried on the charge of contributing to public immorality (the state of doing wrong, and behaving in a way that is not socially acceptable). This novel analyzes the rural middle class, as well as tells of Emma Bovary, a girl that goes through life with romantic obsessions that she can not resolve. At the end of the novel, she finds her dream world in shreds around her, and she prefers death to accepting a world that does not meet with her fantasies, so she takes her own life.

Madame Bovary displayed a new technique for writing. Flaubert believed that writers must write from observed facts and events.

He wanted writers to be like scientists—objective, unprejudiced (fair), withdrawn, and impassive. Flaubert asked the writer to generalize his observations into an ideal, a type whose dynamic power becomes apparent through the artistry of its presentation.

Flaubert's next work, *Salammbô* (1862), recounted the revolt of the mercenaries (people who are hired to fight for a foreign ruler) against Carthage in the third century B.C.E. The novel is repetitious; however, Flaubert's accurate reconstruction of ancient times did influence later historical novels.

A Sentimental Education

In 1864 Flaubert started work on *A Sentimental Education*, which was published in 1869. His great Parisian novel, this work is considered the equal of *Madame Bovary* although less popular. Flaubert's *A Sentimental Education* suggests that unfulfilled dreams are always superior to reality, which destroys them.

The end of the 1860s and the start of the 1870s marked a period of disasters for Flaubert. He was stunned by the deaths of many of his closest friends. In 1872 he also lost his mother, the greatest of all his losses. Flaubert's depression shows in his next work, a revision (the third) of his earlier *Temptation of Saint Anthony* (1874). It summarizes his lifelong absorption with religion and proposes the beliefs that all religions are equally true and equally false, equally beautiful and equally a source of troubled emotion since they all must end.

Three Tales

Flaubert had brought up the orphaned niece of his beloved sister. His niece was

financially ruined in 1875, and he sacrificed his fortune in an attempt to help her. Bankrupt, unable to help her further yet worrying over both their situations, he turned to the writing of his *Three Tales* (1877): "A Simple Heart," "Legend of Saint Julian the Hospitaller," and "Hérodiades."

Flaubert began his uncompleted last work, *Bouvard and Pécuchet*, before the financial crisis of his niece; he continued it after he had finished the *Three Tales*. On May 8, 1880, Flaubert died from a brain hemorrhage (the bleeding from a broken blood vessel) after having spent his last years in anguish. He was sixty years old.

MALCOLM FORBES

Born: August 19, 1919

New York, New York

Died: February 24, 1990

Far Hills, New Jersey

American publisher

Malcolm Forbes.

Reproduced by permission of Archive Photos, Inc.

Millionaire Malcolm Forbes was the publisher of *Forbes* magazine from 1957 to 1990. He was a man known for his business sense and his lavish lifestyle.

The young Malcolm

Malcolm Stevenson Forbes was born on August 19, 1919, in Brooklyn, New York, to B. C. (Bertie) Forbes and Adelaide Stevenson Forbes. He was one of five children who grew up in an upper-middle-class family in Englewood, New Jersey. His interest in publications developed early as he wrote and printed a

household newspaper when he was eight years old. At the age of thirteen he obtained his first printing press and by the age of fifteen he had published papers for his household, the scouts, and school. He would spend time in the summers working at the *Forbes* magazine offices, which his father founded. He attended the private schools in Tarrytown, New York, and graduated with honors from Lawrenceville School, in New Jersey, in 1937. He continued his education at Princeton University, where he majored in political science.

Inherited wealth

A savvy businessman by all accounts, Forbes inherited his wealth from his father who established him at the *Fairfield Times* newspaper as owner and publisher only days after his graduation from Princeton. As he was fond of saying, he was loaded with “sheer ability, spelled i-n-h-e-r-i-t-a-n-c-e,” as quoted in *Forbes*. He went on to publish the *Lancaster Tribune* in 1942, and four years later, after a stint in the army on the European front of World War II (1939–45; a war in which England, China, the Soviet Union, and from 1941 the United States, fought against and defeated the forces of Germany, Italy, and Japan) he joined the staff at *Forbes* magazine. He was first an associate publisher, then publisher, editor, editor in chief, vice president, and, finally, president. As a politician, Forbes was less than successful; he said that he was “nosed out by a landslide” in a New Jersey race for governor in 1957.

Lavish lifestyle

Forbes did not like to put an actual figure on his income and holdings, though he published practically everybody else’s value.

Early in 1990, the *New York Post* estimated Forbes's holdings by totaling up his collections, houses, and publications, but as *Time* magazine reported it, the estimates were generous; "Malcolm is a billionaire, but only if you swallow an estimate of \$65 million for his flagship magazine's annual profits." *People* magazine listed eight houses, a palace in Tangier, Morocco, a chateau in Normandy, France, and the island of Lauthala in Fiji as his dwellings.

Forbes is characterized as a man who loved the spotlight, who shamelessly enjoyed the privileges his money afforded him, and who was always in pursuit of adventure. Forbes was a balloonist, a motorcyclist, and a sailor who took many trips on his huge yacht, the *Highlander*. He collected anything precious and beautiful—most famously, Faberge eggs.

Forbes was married for thirty-nine years to Roberta Remsen Laidlaw before their divorce in 1985. The couple had five children: Malcolm S. Jr., Robert Laidlaw, Christopher Charles, Timothy Carter, and Moira Hamilton. Malcolm S. Jr., known as Steve, ran for president in 1996.

Although not an obvious charitable contributor, Forbes did give millions of dollars each year to charities. He had been at a charity bridge tournament the day he died of a heart attack on February 24, 1990. "Malcolm Forbes was a giant of American business," said then-President George Bush (1924–), as quoted in *Forbes*: "His success in publishing reflected the tremendous vitality of our nation and served to inform and inspire a generation of successful business leaders. He was greatly admired and will be greatly missed." Former president Ronald Reagan offered a similar tribute: "Malcolm was truly a dear friend and

we will miss him sorely. We hold our memories of him close to our hearts and are thankful to have known him."

HENRY FORD

Born: July 30, 1863

Dearborn, Michigan

Died: April 7, 1947

Dearborn, Michigan

American automobile pioneer and industrialist

After founding the Ford Motor Company, the American industrialist Henry Ford developed a system of mass production based on the assembly line and the conveyor belt which produced low-priced cars that were affordable to middle-class Americans.

Ford's early years

The oldest of six children, Henry Ford was born on July 30, 1863, on a prosperous farm near Dearborn, Michigan. He attended school until the age of fifteen, at which time he developed a dislike of farm life and a fascination for machinery. He had little interest in

school and was a poor student. He never learned to spell or to read well. Ford would write using only the simplest of sentences. He instead preferred to work with mechanical objects, particularly watches. He repaired his first watch when he was thirteen years old, and would continue to repair watches for enjoyment throughout his life. Although he did not like working on the farm, he did learn that there was great value in working hard and being responsible.

In 1879 Ford left for Detroit, Michigan, to become an apprentice (a person who works for another to learn a specific skill or trade) at a machine shop. He then moved to the Detroit Drydock Company. During his apprenticeship he received \$2.50 a week, but room and board cost \$3.50 so he labored nights repairing clocks and watches. He later worked for Westinghouse, locating and repairing road engines.

Ford's father wanted him to be a farmer and offered him forty acres of timberland, provided he give up machinery. Ford accepted the proposal, then built a first-class machinist's workshop on the property. His father was disappointed, but Ford did use the two years on the farm to win a bride, Clara Bryant.

Ford's first car

Ford began to spend more and more time in Detroit working for the Edison Illuminating Company, which later became the Detroit Edison Company. By 1891 he had left the farm permanently. Four years later he became chief engineer. While at the Edison Illuminating Company he met Thomas A. Edison (1847–1931), who eventually became one of his closest friends.

Ford devoted his spare time to building an automobile with an internal combustion engine, a type of engine in which a combination of fuel and air is burned inside of the engine to produce mechanical energy to perform useful work. His first car, finished in 1896, followed the attempts, some successful, of many other innovators. His was a small car driven by a two-cylinder, four-cycle motor and by far the lightest (500 pounds) of the early American vehicles. The car was mounted on bicycle wheels and had no reverse gear.

In 1899 the Detroit Edison Company forced Ford to choose between automobiles and his job. Ford chose cars and that year formed the Detroit Automobile Company, which collapsed after he disagreed with his financial backers. His next venture was the unsuccessful Henry Ford Automobile Company. Ford did gain some status through the building of racing cars, which resulted in the "999," driven by the famous Barney Oldfield (1878–1946).

Ford Motor Company

By this time Ford had conceived the idea of a low-priced car for the masses, but this notion flew in the face of popular thought, which considered cars as only for the rich. After the "999" victories, Alex Y. Malcomson, a Detroit coal dealer, offered to aid Ford in a new company. The result was the Ford Motor Company, founded in 1903, with its small, \$28,000 financing supplied mostly by Malcomson. However, exchanges of stock were made to obtain a small plant, motors, and transmissions. Ford's stock was in return for his services. Much of the firm's success can be credited to Ford's assis-

tants—James S. Couzens, C. H. Wills, and John and Horace Dodge.

By 1903 over fifteen hundred firms had attempted to enter the new and struggling automobile industry, but only a few, such as Ransom Eli Olds (1864–1950), had become firmly established. Ford began production of a Model A, which imitated the Oldsmobile, and followed with other models, to the letter S. The public responded, and the company flourished. By 1907 profits exceeded \$1,100,000, and the net worth of the company stood at \$1,038,822.

Ford also defeated the Selden patent (the legal rights given to a company or person for the sole use, sale, or production of an item for a limited period of time), which had been granted on a “road engine” in 1895. Rather than challenge the patent’s legal soundness, manufacturers secured a license to produce engines. When Ford was denied such a license, he fought back; after eight years of legal action, the courts decided the patent was valid but not violated. The case gave the Ford Company valuable publicity, with Ford cast as the underdog, but by the time the issue was settled, the situation had been reversed.

New principles

In 1909 Ford made the important decision to manufacture only one type of car—the Model T, or the “Tin Lizzie.” By now he firmly controlled the company, having bought out Malcomson. The Model T was durable, easy to operate, and economical; it sold for \$850 and came in one color—black. Within four years Ford was producing over forty thousand cars per year.

Henry Ford.

During this rapid expansion Ford held firmly to two principles: cutting costs by increasing productivity and paying high wages to his employees. In production methods Ford believed the work should be brought by a conveyor belt to the worker at waist-high level. This assembly-line technique required seven years to perfect. In 1914 he startled the industrial world by raising the minimum wage to five dollars a day, almost double the company’s average wage. In addition, the “Tin Lizzie” had dropped in price to \$600; it later went down to \$360.

World War I

Ford was now an internationally known figure, but his public activities were less suc-

cessful than his industrial ones. In 1915 his peace ship, the *Oskar II*, sailed to Europe to seek an end to World War I (1914–18; a war fought between the German-led Central powers and the Allies: England, the United States, Italy, and other nations). His suit against the *Chicago Tribune* for calling him an anarchist (a person who desires to change the existing government) received unfortunate publicity. In 1918 his race for the U.S. Senate as a Democrat met a narrow defeat. Ford's worst mistake was his approval of an anti-Semitic (anti-Jewish) campaign waged by the Ford-owned newspaper, the *Dearborn Independent*.

When the United States entered World War I, Ford's output of military equipment and his promise to give back all profits on war production (which he never did) silenced the critics. By the end of the conflict his giant River Rouge plant, the world's largest industrial facility, was near completion. Ford gained total control of the company by buying the outstanding stock.

In the early 1920s the company continued its rapid growth, at one point producing 60 percent of the total United States output. But problems began to arise. Ford was an inflexible man and continued to rely on the Model T, even as public tastes shifted. By the middle of the decade Ford had lost his dominant position to the General Motors (GM) company. He finally saw his error and in 1927 stopped production of the Model T. However, since the new Model A was not produced for eighteen months, there was a good deal of unemployment among Ford workers. The new car still did not permanently overtake the GM competition, Chevrolet, and Ford remained second.

Final years

Ford's last years were frustrating. He never accepted the changes brought about by the Great Depression (a period in the 1930s marked by severe economic hardship) and the 1930s New Deal, President Franklin D. Roosevelt's (1882–1945) plan to help the United States recover from the Great Depression. He fell under the spell of Harry Bennett, a notorious figure with connections to organized crime, who, as head of Ford's security department, influenced every phase of company operations and created friction between Ford and his son Edsel. For various reasons Ford, alone in his industry, refused to cooperate with the National Recovery Administration, a 1930s government agency that prepared and oversaw codes of fair competition for businesses and industries. He did not like labor unions, refused to recognize the United Automobile Workers (UAW), and brutally restricted their attempts to organize the workers of his company.

Ford engaged in some philanthropic or charitable activity, such as the Henry Ford Hospital in Detroit. The original purpose of the Ford Foundation, established in 1936 and now one of the world's largest foundations, was to avoid estate taxes. Ford's greatest philanthropic accomplishment was the Ford Museum and Greenfield Village in Dearborn, Michigan.

A stroke in 1938 slowed Ford, but he did not trust Edsel and so continued to exercise control of his company. During World War II (1939–45; a war fought between the Axis: Germany, Italy, and Japan—and the Allies: England, France, the Soviet Union, and the United States), Ford at first made pacifist, or peace-minded, statements, but changed his

mind and contributed greatly to the war effort. Ford's grandson, Henry Ford II, took over the company after the war. Henry Ford died on April 7, 1947, in Dearborn.

FRANCIS OF ASSISI

Born: c. 1182

Assisi, Umbria, Italy

Died: October 1226

Assisi, Umbria, Italy

Italian religious leader

The Italian religious leader St. Francis of Assisi founded the religious order known as the Franciscans. He became renowned for his love, simplicity, and practice of poverty.

Early years

Francis was born Giovanni di Bernardore, but because his father called him Francis, so did everyone else. He was baptized shortly after his birth in the town of Assisi in central Italy in 1182. His father, Pietro di Bernardone, was a successful cloth merchant, and Francis grew up with a love of fine clothes and good times. He led the other young men of the town in enjoying good food and drink, singing, and dancing. He was educated in math, poetry, and music and learned to read and write while attending a school that was part of the Church of Saint Giorgio of Assisi. Francis was expected to become a cloth merchant like his father and did not plan to attend college.

Francis joined the forces from Assisi in their fight against Perugia, another town in Italy. When he was twenty, he was taken prisoner. A year later, sobered by jail and sickness, he underwent several religious experiences in quick succession. In one of these, while he was praying in the run-down chapel of Saint Damiano outside Assisi, he heard a voice from the crucifix telling him, "Francis, go repair my house, which is falling in ruins." Francis went quickly back to the city, sold his horse and some cloth from his father's shop, and came back to give the money to the priest at Saint Damiano.

Francis's father, furious that his son wasted his money on churches and beggars, took him before the bishop to bring him to his senses. When the hearing began, Francis calmly took off all of his clothes, gave them to his father (the astonished bishop quickly covered Francis with a cloak), and said that he was now recognizing only his Father in heaven, not his father on earth. He lived his life from this time on without money and without family ties.

His spirit

The thirteenth century was a time of troubadours, or poet-musicians, and Francis had the best of their characteristics. He was happy, he sang, he loved nature; he spoke to the birds and the animals as though they were his friends. In his “Canticle of Creatures,” also called “Canticle of the Sun” (a canticle is a religious song), he wrote about Brother Sun and Sister Moon. Once he was heard to beg pardon of his own body for its sins. Francis referred to his way of life as his marriage to Lady Poverty.

The thirteenth century was also a time when the Christian religion was taken very

much for granted, and Francis felt the need to return to the original spirit of Christ. This meant living without materialistic attachments, and it also meant loving other people. A number of the young men of Assisi, attracted by Francis’s example, joined him in his new way of life. In 1209 Francis and his companions went to Rome, Italy, where they presented their ideas to Pope Innocent III (c. 1160–c. 1216; the pope is the head of the Catholic Church) and received his approval. They found themselves influencing more and more people, including a lady named Clare, whom Francis helped to enter a monastery of nuns and who later began the “second order” of Franciscans, the order for women.

In 1212 Francis left for the Holy Land, or Palestine (the land in the Middle East where Christ had lived). His ship ran into bad weather, and he had to return to Italy. Two years later his adventurous spirit and missionary zeal drove him to seek the Moors, who were Muslim, in Spain, but sickness prevented him from completing the trip. He tried once more, in 1219, going to Egypt with the Crusaders (religious warriors who attempted to take control of the Holy Land). At the siege of the city of Damietta in Egypt, Francis boldly walked through the battle lines into the enemy camp and met the king of Egypt, who, apparently impressed with Francis’s ideas about brotherly love, gave him permission to continue on to the Holy Land.

Franciscan order

When Francis heard that trouble had started in Italy among some of his followers, now numbering in the thousands, he returned home. The force of his own personality had held the group together, but now Francis saw

BENJAMIN FRANKLIN

the need for a more practical guide to his kind of Christian life. He insisted that the new rule stress the poverty he felt was so important: the order could not possess money; all its houses must be simply furnished; and each Franciscan could have only a tunic and cord (Francis himself wore an old sack tied at the waist), a pair of pants, and, if really necessary, a pair of shoes. Francis went to Rome in 1223 to present the new rule to Pope Honorius III, who approved it wholeheartedly. It was during this visit that, according to tradition, Francis met Dominic, who had founded his own religious order. The Franciscan and Dominican religious orders have always felt a close relationship that dates back to the friendship between their founders.

A religious vision

Francis returned to Assisi and began to spend more and more time alone in prayer, leaving the decisions about his organization to others. While he was praying on Mt. Alvernia in 1224, he had a vision of a figure that looked like an angel, and when the vision disappeared Francis felt the wounds of the crucified Christ in his hands, side, and feet. He was careful not to show them, but several close friends reported after his death that Francis had suffered in his body as Christ had suffered on the cross. His last two years were lived in almost constant pain and near-blindness. He died in 1226. Two years later he was made a saint.

Born: January 17, 1706

Boston, Massachusetts

Died: April 17, 1790

Philadelphia, Pennsylvania

American scholar, diplomat, author, scientist, and inventor

Benjamin Franklin was a leader of America's revolutionary generation. His character and thought were shaped by his religious upbringing, the philosophy of the historical era known as the Enlightenment, and the environment of colonial America.

Youthful character

Benjamin Franklin was born on January 17, 1706, in Boston, Massachusetts, into a devoted Puritan household. (The Puritans were a religious group that stood against the practices of the Church of England.) In 1683 his family had left England and moved to New England in search of religious freedom. Franklin's father was a candlemaker and a mechanic, but, his son said, his "great Excellence lay in a sound Understanding, and solid Judgment." Franklin also praised his mother, who raised a family of thirteen children.

Young Franklin was not content at home. He received little formal schooling and by age eleven went to work making candles and soap at his father's shop. However, he hated this trade—especially the smell. Franklin eventually left his father's shop and went to work for his brother James, who was the printer of a Boston newspaper. While

learning the business Franklin read every word that came into the shop and was soon writing clever pieces that criticized the Boston establishment. He loved to read and even became a vegetarian in order to save money to buy books. When authorities imprisoned James for his own critical articles, Benjamin continued the paper himself. In 1723 at age seventeen Franklin left home and moved to Philadelphia, Pennsylvania.

By this time Franklin had begun to embrace the ideas of such Enlightenment thinkers as the physicist Sir Isaac Newton (1642–1727) and the philosopher John Locke (1632–1727). The Enlightenment, which began in the sixteenth century and lasted until the late seventeenth century, was a movement that promoted the use of reason to learn truth. During this time period, many important scientific advances and discoveries were made through the use of observation and experimentation.

Civil and scientific interests

In Philadelphia, Franklin began working as a printer. In 1724 he went to England, where he quickly became a master printer and lived among the writers of London. He returned to Philadelphia and started his own press, publishing a newspaper called the *Pennsylvania Gazette* and a publication called *Poor Richard's Almanack*, which contained advice and sayings that are still popular in America today. He then became clerk of the Pennsylvania Assembly and postmaster of Philadelphia. At the same time he operated a bookshop and developed partnerships with other printers. Franklin also became involved in community improvement in 1727. He organized the Junto, a club of tradesmen

whose activities included sponsoring a library, a fire company, a college, an insurance company, and a hospital.

Next, Franklin turned to science. Having already invented what became known as the Franklin stove (a metal stove used for heating a room), he now became fascinated with electricity. In a famous experiment he used a kite to prove that lightning is a form of electricity. The mysterious and terrifying natural occurrence now had an explanation. Franklin's letters concerning his discoveries and theories about electricity brought him fame. His invention of the lightning rod (a metal rod that is set on top of a building to protect it from being damaged if it is struck by lightning) added to his reputation.

Political career

Franklin's 1751 election to the Pennsylvania Assembly began his nearly forty years as a public official. He became a leader in the long-dominant Quaker political party, which opposed the Proprietary party (a political party made up of people who sought to preserve the power of the Penn family, the founding family of Pennsylvania). In the Assembly, Franklin created lawmaking strategies and wrote powerful statements defending the right of the people's elected representatives to regulate the government of Pennsylvania.

As a representative in the Assembly, Franklin was initially loyal to the British empire. He was on the side of the empire during the French and Indian War (1754–63; a war fought between France and Great Britain, which resulted in British control of land in North America east of the Mississippi River). In order to defend the British empire, he persuaded the Assembly to pass Pennsyl-

vania's first militia law, set aside budget money for defense, and appoint government representatives to carry on a full-scale war. For three decades or more Franklin had considered Britain a vital, freedom-extending country as dear and useful to its people in America as to those in England. Nevertheless, he was occasionally alarmed by British indifference toward the desires of people living in the colonies.

Franklin lived in England from 1757 to 1762, seeking aid in restraining the power of the Penn family in Pennsylvania. Returning to America for nearly two years, he traveled through the American colonies as deputy postmaster general for North America. In this position, which he held for twenty years, Franklin greatly improved the postal service. He also continued his aid to poorer members of his family and to the family of his wife, Deborah. They had two children, Frankie, who died at four, and Sally. Deborah Franklin also raised her husband's illegitimate son, William.

In 1764 Franklin lost his seat in the Pennsylvania Assembly. However, he returned to England as Pennsylvania's agent, with a special assignment to request that Pennsylvania be taken over as a royal colony. When the dangers of royal government began to increase, Franklin decided not to make the request.

More radical position

Franklin played a central role in the great crises that led to the Declaration of Independence in 1776. In 1765 the Stamp Act placed a tax on all business and law papers and printed materials in the American colonies. Many colonists opposed the tax as taxation without representation. After learning of the

*Benjamin Franklin.
Courtesy of the Library of Congress.*

violent protest against the Stamp Act, Franklin stiffened his own stand against the measure. In a dramatic appearance before Parliament in 1766, he outlined American insistence on self-government. Nevertheless, when the tax was removed Franklin again expressed his faith in America's prospects within the British empire.

Franklin was the foremost American spokesman in Britain for the next nine years. However, in 1775 his service in England came to an unhappy end. Against his instructions, his friends in Massachusetts published letters by Massachusetts governor Thomas Hutchinson (1711–1780) that Franklin had obtained on a confidential basis. Exposed as a

dishonest schemer, Franklin was reprimanded (scolded) by the British in 1774 and removed from his position as postmaster general. Although he was in danger of being jailed as a traitor, Franklin continued to work for better relations. Radical protests in America and the buildup of British troops there doomed such efforts.

The revolutionary

Franklin left England in March 1775. The American Revolution (1775–83; a war in which American colonies fought for independence from Great Britain) had begun on April 19, 1775, with the battles of Lexington and Concord in Massachusetts. During the next several months in America, Franklin enjoyed the surge for independence. In 1776 he helped draft the Declaration of Independence and was among those who readily signed his name to it. At the age of seventy he had become a passionate revolutionary.

Franklin's skill was most in demand as a diplomat (someone who is skilled at handling difficult affairs) to secure desperately needed aid in the American war for independence. In 1776 he was appointed as a representative to France. There he gained astonishing personal success, winning the admiration of French intellectuals and the Parisian society. However, Franklin's diplomatic tasks proved more difficult. Though France was anxious for England to be defeated, it could not afford openly to aid the American rebels unless success seemed likely.

In 1777 Franklin worked behind the scenes to speed war supplies across the Atlantic and win support from French political leaders who might help the United States. In December 1777 his efforts were rewarded

when France's King Louis XVI (1754–1793) entered into an alliance with the United States. As the leading American representative in Europe, Franklin helped get French armies and navies on their way to North America, continued his efforts to supply American armies, and secured almost all of the outside aid that came to the American rebels.

Peace commissioner

After the British surrender at Yorktown, Virginia, in 1781, Franklin made the first contact with representatives of the British government. During the summer of 1782 as the other peace commissioners, John Adams (1735–1826) and John Jay (1745–1829), made their way toward peace negotiations in Paris, Franklin set the main terms of the final agreement. These included independence, guaranteed fishing rights, removal of all British forces, and a western boundary on the Mississippi River. Franklin, Adams, and Jay made an ideal team, winning for the United States a peace treaty of genuine national independence in 1783.

Franklin returned to Philadelphia from France in 1785. He accepted election for three years as president of the Supreme Executive Council of Pennsylvania and was active in various projects and causes. Although ill, he also finished his autobiography.

Framing a new government

Franklin's most notable service at this time was his attendance at the Constitutional Convention during the summer of 1787. At the convention's close he asked each member, who like himself might not entirely approve of the Constitution, to sign the document to give it a chance as the best frame of

government that could be produced at the time. His last public service was to urge ratification (approval) of the Constitution and to approve the inauguration (swearing into office) of the new government under his old friend George Washington (1732–1799). Franklin died peacefully in Philadelphia on April 17, 1790.

The work of Sigmund Freud, the Austrian founder of psychoanalysis, marked the beginning of a modern, dynamic psychology by providing the first well-organized explanation of the inner mental forces determining human behavior.

Freud's early life

Sigmund Freud was born on May 6, 1856, in Freiberg, Moravia (now Czech Republic). Sigmund was the first child of his twice-widowed father's third marriage. His mother, Amalia Nathanson, was nineteen years old when she married Jacob Freud, aged thirty-nine. Sigmund's two stepbrothers from his father's first marriage were approximately the same age as his mother, and his older stepbrother's son, Sigmund's nephew, was his earliest playmate. Thus, the boy grew up in an unusual family structure, his mother halfway in age between himself and his father. Though seven younger children were born, Sigmund always remained his mother's favorite. When he was four, the family moved to Vienna (now the capital of Austria), the capital city of the Austro-Hungarian monarchy (the complete rule of Central Europe by Hungary and Austria from 1867 to 1918). Freud would live in Vienna until the year before his death.

Youth in Vienna

Because the Freuds were Jewish, Sigmund's early experience was that of an outsider in an overwhelmingly Catholic community. However, Emperor Francis Joseph (1830–1916) had liberated the Jews of Austria, giving them equal rights and permitting them to settle anywhere in the empire. Many

SIGMUND FREUD

Born: May 6, 1856

Freiberg, Moravia (now Czech Republic)

Died: September 23, 1939

London, England

Austrian psychologist, author, and psychoanalyst

Jewish families came to Vienna, as did the Freuds in 1860, where the standard of living was higher and educational and professional opportunities were better than in the provinces. They lived in an area that had a high concentration of Jewish people, called the Leopoldstadt slum. The housing was cramped and they had to move often, sometimes living with his father's family. By his tenth year, Sigmund's family had grown and he had five sisters and one brother.

Freud went to the local elementary school, then attended the Sperl Gymnasium (a secondary school in Europe that students attend to prepare for college) in Leopoldstadt, from 1866 to 1873. He studied Greek and Latin, mathematics, history, and the natural sciences, and was a superior student. He passed his final examination with flying colors, qualifying to enter the University of Vienna at the age of seventeen. His family had recognized his special scholarly gifts from the beginning, and although they had only four bedrooms for eight people, Sigmund had his own room throughout his school days. He lived with his parents until he was twenty-seven, as was the custom at that time.

Pre-psychoanalytic work

Freud enrolled in medical school in 1873. Vienna had become the world capital of medicine, and the young student was initially attracted to the laboratory and the scientific side of medicine rather than clinical practice. He spent seven instead of the usual five years acquiring his doctorate.

Freud received his doctor of medicine degree at the age of twenty-four. He fell in love and wanted to marry, but the salaries available to a young scientist could not sup-

port a wife and family. He had met Martha Bernays, the daughter of a well-known Hamburg family, when he was twenty-six; they were engaged two months later. They were separated during most of the four years which preceded their marriage, and married in 1887. Of their six children, a daughter, Anna, would become one of her father's most famous followers.

Freud spent three years as a resident physician in the famous Allgemeine Krankenhaus, a general hospital and the medical center of Vienna. He spent five months in the psychiatry (the area of medicine involving emotional and mental health) department headed by Theodor Meynert. Psychiatry at this time was rigid and descriptive. The psychological meaning of behavior was not itself considered important; behavior was only a set of symptoms to be studied in order to understand the structures of the brain. Freud's later work changed this attitude.

Freud, during the last part of his residency, received some money to pursue his neurological (having to do with the nervous system) studies abroad. He spent four months at the Salpêtrière clinic in Paris, France, studying under the neurologist (a person who studies the nervous system and treats people with neurological problems) Jean Martin Charcot (1825–1893). Here, Freud first became interested in hysteria (an illness in which a person complains of physical symptoms without a medical cause) and Charcot's demonstration of its psychological origins.

Beginning of psychoanalysis

Freud returned to Vienna, established himself in the private practice of neurology,

and married. He soon devoted his efforts to the treatment of hysterical patients with the help of hypnosis (the act of bringing about a change in a person's attention which results in a change in their bodily experiences), a technique he had studied under Charcot. Joseph Breuer (1857–1939), an older colleague (a partner or an associate in the same area of interest), told Freud about a hysterical patient whom he had treated successfully by hypnotizing her and then tracing her symptoms back to traumatic (emotionally stressful) events she had experienced at her father's deathbed. Breuer called his treatment "catharsis" and traced its effectiveness to the release of "pent-up emotions." Freud's experiments with Breuer's technique were successful. Together with Breuer he published *Studies on Hysteria* (1895). At the age of thirty-nine Freud first used the term "psychoanalysis," (a way to treat certain mental illnesses by exposing and discussing a patient's unconscious thoughts and feelings) and his major lifework was well under way.

At about this time Freud began a unique project, his own self-analysis (the act of studying or examining oneself), which he pursued primarily by analyzing his dreams. A major scientific result was *The Interpretation of Dreams* (1901). By the turn of the century Freud had developed his therapeutic (having to do with treating a mental or physical disability) technique, dropping the use of hypnosis and shifting to the more effective and more widely applicable method of "free association."

Development of psychoanalysis

Following Freud's work on dreams, he wrote a series of papers in which he explored the influence of unconscious thought processes

Sigmund Freud.

Courtesy of the Library of Congress.

on various aspects of human behavior. He recognized that the most powerful among the unconscious forces, which lead to neuroses (mental disorders), are the sexual desires of early childhood that have been shut out from conscious awareness, yet have preserved their powerful force within the personality. He described his highly debatable views concerning the early experiences of sexuality in *Three Essays on the Theory of Sexuality* (1905), a work that first met violent protest, but was gradually accepted by practically all schools of psychology (the area of science involving the study of the mind).

After 1902 Freud gathered a small group of interested colleagues on Wednesday evenings for presentation of psychoanalytic papers and discussion. This was the beginning of the psychoanalytic movement. Swiss psychiatrists Eugen Bleuler and Carl Jung (1875–1961) formed a study group in Zurich in 1907, and the first International Psychoanalytic Congress was held in Salzburg in 1908.

Later years

In 1923 Freud developed a cancerous (having to do with cancer cells that attack the healthy tissues of the body) growth in his mouth, which eventually led to his death sixteen years and thirty-three operations later. In spite of this, these were years of great scientific productivity. He published findings on the importance of aggressive as well as sexual drives (*Beyond the Pleasure Principle*, 1920); developed a new theoretical framework in order to organize his new data concerning the structure of the mind (*The Ego and the Id*, 1923); and revised his theory of anxiety to show it as the signal of danger coming from unconscious fantasies, rather than the result of repressed sexual feelings (*Inhibitions, Symptoms and Anxiety*, 1926).

In March 1938 Austria was occupied by German troops, and that month Freud and his family were put under house arrest. Through the combined efforts of many influential friends who were well connected politically, the Freuds were permitted to leave Austria in June. Freud spent his last year in London, England, undergoing surgery. He died on September 23, 1939. The influence of his discoveries on the science and culture of the twentieth century is limitless.

Personal life

Freud was an intensely private man. He read extensively, loved to travel, and was an avid collector of archeological oddities. Devoted to his family, he always practiced in a consultation room attached to his home. He valued a small circle of close friends to whom he was intensely loyal, and inspired loyalty in a circle of disciples that persists to this day.

BETTY FRIEDAN

Born: February 4, 1921

Peoria, Illinois

American women's rights activist, author, and organization founder

Betty Friedan is a leader of the feminist (women's rights) movement, author of *The Feminine Mystique*, and a founding member of the National Organization for Women (NOW), the National Abortion Rights Action League (an organization that supports a woman's right to end a pregnancy), and the National Women's Political Caucus. She helped spark the women's movement in the 1960s.

Following her mother's advice

Betty Naomi Goldstein was born on February 4, 1921 in Peoria, Illinois, the first of Harry and Miriam (Horwitz) Goldstein's three children. Her father worked his way up to become the owner of a jewelry store; her mother had to give up her job on a newspaper when she married. The loss of that career affected her mother deeply, and she urged young Betty to pursue the career in journalism that she herself was never able to achieve.

Betty went on to graduate from Smith College in 1942. She then studied psychology as a graduate student at the University of California at Berkeley. Like her mother, she did some work as a journalist, but unlike her mother she did not end her career to build a family. She married Carl Friedan in 1947, and during the years that she was raising their three children she continued to write articles. After her husband established his own advertising agency, the family moved to the suburbs. Although she continued to write, she felt unfulfilled by her role as wife and mother.

Others feel the same way

In 1957 Friedan put together a list of questions to send to her Smith College classmates fifteen years after graduation. She received detailed replies from two hundred women, many of which revealed that these women were also unhappy with their lives. Friedan wrote an article based on her findings, but the editors of the women's magazines with whom she had previously worked refused to publish it. Those refusals only made her more determined to share her findings with the world. She decided to investigate the problem on a much larger scale and publish a book.

Betty Friedan.
Courtesy of the Library of Congress.

The result of her effort was *The Feminine Mystique*, which became an instant success, selling over three million copies.

Friedan began her book by describing what she called "the problem that has no name." In words that touched a nerve in thousands of middle-class American women, she wrote, "the problem lay buried, unspoken, for many years in the minds of American women. It was a strange stirring, a sense of dissatisfaction, a yearning [that is, a longing] that women suffered in the middle of the 20th century in the United States. Each suburban wife struggled with it alone. As she made the beds, shopped for groceries . . . she

was afraid to ask even of herself the silent question—'Is this all?'" Attacking the notion that "biology is destiny," under which women were expected to devote their lives to being wives and mothers and give up all other pursuits, Friedan called upon women to do whatever it took to discover other meaningful activities.

Organizing for change

In 1966, three years after the book's publication, Friedan helped found the first major organization established since the 1920s devoted to women's rights. The organization was called the National Organization for Women (NOW), and Friedan became its first president. Under Friedan's leadership NOW worked for political reforms to secure legal equality for women. The organization was successful in achieving a number of important gains. It worked for the enforcement of Title VII of the 1964 Civil Rights Act, which prevented employers from discriminating (denying opportunities to or providing unequal treatment to) against workers on the basis of sex. As a result of the organization's efforts, the Equal Opportunities Commission ruled that airlines could not fire female flight attendants because they married or reached the age of thirty-five and that job opportunities could not be advertised as only for male or female applicants.

NOW also lobbied for passage of the Equal Rights Amendment (ERA), which had been introduced in Congress by Alice Paul (1885–1977) in 1923 but had never passed. In addition, the organization called for government-funded day-care centers to be established "on the same basis as parks, libraries and public schools." NOW also worked to

make abortion (a woman's right to end a pregnancy) legal and to preserve abortion rights. Friedan was among the founders of the National Abortion Rights Action League in 1969. Finally, in 1973, the Supreme Court legalized abortion.

In 1970 President Richard Nixon (1913–1994) chose G. Harrold Carswell (1919–) to sit on the Supreme Court. Friedan made a strong stand against the president's choice. She argued that Carswell had defied the Civil Rights Act by ruling that employers had the right to deny jobs to women who had children. Carswell's appointment did not go through. That same year, at the annual meeting of NOW, Friedan called for a Women's Strike for Equality, which was held on August 26—the fiftieth anniversary of the day women gained the right to vote. Women across the country marked the day with demonstrations, marches, and speeches in forty major cities. Friedan led a parade of over ten thousand down Fifth Avenue in New York City. The following year Friedan was among the leaders who formed the National Women's Political Caucus.

Still an important voice for women

As the women's movement grew and new leaders emerged with different concerns, Friedan's popularity decreased. Still, she remained an outspoken leader for many years. In 1974 she had an audience with Pope Paul VI in which she urged the Catholic Church to "come to terms with the full personhood of women." In 1977 she participated in the National Conference of Women in Houston, Texas, calling for an end to divisions in the movement and the creation of a new coalition (alliance) of women. Friedan

ROBERT FROST

continued writing, teaching, and speaking throughout these years. In 1976 she published *It Changed My Life: Writings on the Women's Movement*, which was followed by her 1981 book, *The Second Stage*. In that publication Friedan called for a shift in the feminist movement, one that would address the needs of families and would allow both men and women to break free of the roles they had been pressured to fill in the past.

Friedan remains an important voice in women's struggle for equality. Also, in 1993, she wrote *The Fountain of Age*, turning her attention to the rights of the elderly and aging. In the *New York Times* she said, "Once you break through the mystique [air of mystery] of age and that view of the aged as objects of care and as problems for society, you can look at the reality of the new years of human life open to us." Betty Friedan's genuine interest in helping others improve and enjoy their lives is as strong today as it was when she first began writing.

Born: March 26, 1874
San Francisco, California
Died: January 29, 1963
Boston, Massachusetts
American poet

Robert Frost was a traditional American poet in an age of experimental art. He used New England expressions, characters, and settings, recalling the roots of American culture, to get at the common experience of all.

The early years

Robert Lee Frost was born in San Francisco, California, on March 26, 1874. His father, William, came from Maine and New Hampshire ancestry and had graduated from Harvard in 1872. He left New England and went to Lewistown, Pennsylvania, to teach. He married another teacher, Isabelle Moodie, a Scotswoman, and they moved to San Francisco, where the elder Frost became an editor and politician. Robert, their first child, was named for the Southern hero General Robert E. Lee (1807–1870).

When Frost's father died in 1884, his will requested that he be buried in New England. His wife and two children, Robert and Jeanie, went east for the funeral. Lacking funds to return to California, they settled in Salem, Massachusetts, where his grandfather had offered them a home. Eventually Mrs. Frost found a job teaching at a school.

Robert Frost.

Transplanted New Englander

As a young boy, Robert loved his mother reading to him. Her influence introduced him to a large variety of literature, and from this he was inspired to become an excellent reader. He lacked enthusiasm for school in his elementary years, but became a serious student and graduated from Lawrence High School as valedictorian (top in his class) and class poet in 1892. He enrolled at Dartmouth College but soon left. He had become engaged to Elinor White, classmate and fellow valedictorian, who was completing her college education. Frost moved from job to job, working in mills, at newspaper reporting, and at teach-

ing, all the while writing poetry. In 1894 he sold his first poem, "My Butterfly," to the *New York Independent*. Overjoyed, he had two copies of a booklet of lyrics privately printed, one for his fiancée and one for himself. He delivered Elinor's copy in person but did not find her response to be enthusiastic. Thinking he had lost her, he tore up his copy and wandered south as far as the Dismal Swamp (from Virginia to North Carolina), even contemplating killing himself.

In 1895, however, Frost married Elinor and tried to make a career of teaching. He helped his mother run a small private school in Lawrence, Massachusetts, where his first son was born. He spent two years at Harvard, but undergraduate study proved difficult while raising a family. With a newborn daughter as well as a son to now raise, he decided to try chicken farming at Methuen, Massachusetts, on a farm purchased by his grandfather. In 1900, when his nervousness was diagnosed as a sign that he may possibly contract tuberculosis (a disease caused by bacteria that usually attacks the lungs but can also affect other organs in the body), he moved his poultry business to Derry, New Hampshire. There his first son soon died. In 1906 Frost was stricken with pneumonia (a disease that causes inflammation of the lungs) and almost died. A year later his fourth daughter died. This grief and suffering, as well as lesser frustrations in his personal and business life, turned Frost more and more to poetry. Once again he tried teaching, in Derry and then in Plymouth, New Hampshire.

Creation of the poet

In 1912, almost forty and with only a few poems published, Frost sold his farm and used

an allowance from his grandfather to go to England and gamble everything on poetry. The family settled on a farm in Buckinghamshire, and Frost began to write. Ezra Pound (1885–1972), another American poet, helped him get published in magazines, and he met many people in literature that helped to inspire and further expand his knowledge of poetry.

Frost published *A Boy's Will* (1913), and it was well received. Though it contains some nineteenth-century expressions, the words and rhythms are generally informal and subtly simple.

North of Boston (1914) is more objective, made up mainly of blank verse (poetry without rhyme) monologues (long speeches, plays, or entertainment given by a single person) and dramatic narratives (stories or descriptions of events). *North of Boston* added to the success of *A Boy's Will*, and the two volumes announced the two modes of Frost's best poetry, the lyric (a poem telling of love or other emotions) and the narrative. Although immediately established as a nature poet, he did not glorify nature. He addressed not only its loveliness but also the isolation, harshness, and pain its New England inhabitants had to endure.

A public figure

When the Frosts returned to the United States in 1915, *North of Boston* was a best-seller. Sudden fame embarrassed Frost, who had always avoided crowds. He withdrew to a small farm in Franconia, New Hampshire, but financial need soon saw him responding to demands for readings and lectures. In 1915 and 1916 he was a Phi Beta Kappa (an organization made up of college students and graduates who have achieved a high level of academic excellence in studies of liberal arts

and sciences) poet at Tufts College and at Harvard University. He conquered his shyness, developing a brief and simple speaking manner that made him one of the most popular performers in America and abroad.

In 1916 Frost published *Mountain Interval*, which brought together lyrics and narratives in his poetry. In 1917 Frost became one of the first poets-in-residence on an American campus. He taught at Amherst from 1917 to 1920, in 1918 receiving a master of arts, the first of many academic honors. The following year he moved his farm base to South Saftsbury, Vermont. In 1920 he cofounded the Bread Loaf School of English of Middlebury College, serving there each summer as lecturer and consultant. From 1921 to 1923 he was poet-in-residence at the University of Michigan.

Frost's *Selected Poems* and a new volume, *New Hampshire*, appeared in 1923. Frost received the first of four Pulitzer Prizes for the latter in 1924. Though the title poem does not present Frost at his best, the volume also contains such lyrics as "Fire and Ice," "Nothing Gold Can Stay," and "To Earthward."

Frost returned to Amherst for two years in 1923 and to the University of Michigan in 1925 and then settled at Amherst in 1926. In 1928 Frost published *West Running Brook*, in which he continued his use of tonal variations (changes in sound and rhythm) and a mixture of lyrics and narratives.

Frost visited England and Paris in 1928 and published his *Collected Poems* in 1930. In 1934 he suffered another painful loss with the death of his daughter Marjorie. He returned to Harvard in 1936 and in the same year published *A Further Range*.

Later work and personal tragedies

Because of Frost's weak lungs, his doctor ordered him south in 1936, and thereafter he spent his winters in Florida. Frost served on the Harvard staff from 1936 to 1937 and received an honorary doctorate. After his wife died of a heart attack in 1938, Frost resigned from the Amherst staff and sold his house. That same year he was elected to the Board of Overseers of Harvard College. In 1939 his second *Collected Poems* appeared, and he began a three-year stay at Harvard. In 1940 his only surviving son took his own life.

In 1945 Frost composed something new in *A Masque of Reason*, an updated version of the biblical story of Job. *A Masque of Mercy* (1947), was a companion verse drama (a dramatic poem) based on the biblical story of the prophet Jonah.

Frost's *Complete Poems* appeared in 1949, and in 1950 the U.S. Senate honored him on his seventy-fifth birthday. In 1957 he

returned to England to receive doctoral degrees from Oxford and Cambridge. On his eighty-fifth birthday the Senate again honored him. In 1961, at the inauguration of John F. Kennedy (1917–1963), Frost recited "The Gift Outright," the first time a poet had honored a presidential inauguration. A final volume, *In the Clearing*, appeared in 1962.

On January 29, 1963, Frost died in Boston, Massachusetts, of complications following an operation. He was buried in the family plot in Old Bennington, Vermont.

JOHN KENNETH GALBRAITH

Born: October 15, 1908

Iona Station, Ontario, Canada

Canadian-born American scholar and economist

John Kenneth Galbraith became a leading scholar and arguably the most famous economist in the second half of the twentieth century. His views are a severe criticism of the modern society that upholds personal achievement and material well-being over public interest and needs.

Galbraith's early years and education

John Kenneth Galbraith was born on October 15, 1908, in Iona Station, Ontario, Canada, on the shores of Lake Erie, to a farming family of Scotch ancestry. His father, William, was involved in the politics of their community, supporting a liberal (open to change) view, and started bringing William to political rallies when he was about eight years old. His mother died before William, his brother, and his two sisters were in their teen years.

William attended school but his education was interrupted occasionally so he could work on the farm. He graduated from high school and then went on to study agricultural (having to do with land and farming) eco-

John Kenneth Galbraith.
Courtesy of the Library of Congress.

nomics at the Ontario Agricultural College (then part of the University of Toronto; now, the University of Guelph) and graduated with honors in 1931. He went on to study agricultural economics at the University of California, receiving his doctorate in 1934. That same year he also began his long, though frequently interrupted, teaching career at Harvard University, where he eventually became an emeritus (a person who is retired but retains their title) professor.

Public service

Galbraith's academic career frequently gave way to public service. He worked in the

Department of Agriculture during the New Deal (President Franklin D. Roosevelt's [1882–1945] plan to help the United States recover from the Great Depression, a time of severe economic hardship in the 1930s) and in the Office of Price Administration and Civilian Supply during World War II (1939–45; a war between the Axis: Germany, Italy, and Japan—and the Allies: England, France, the Soviet Union, and the United States). From his wartime work emerged *The Theory of Price Control* (1952), which, though not widely influential, contained some of the ideas of his major works.

After the end of the war in Europe, Galbraith worked with the Office of Strategic Services directing research on the effectiveness of the Allies' bombing of Germany. In 1947 he was one of the liberal founders of the Americans for Democratic Action.

After working prominently as a speechwriter in the presidential campaigns of Senator Adlai Stevenson (1900–1965), Galbraith went on to chair the Democratic Advisory Council during Dwight D. Eisenhower's (1890–1969) Republican administration. In 1956 he visited India, where his fascination with the country inspired his later works. He campaigned for President John F. Kennedy (1917–1962), and after Kennedy's victory he was named U.S. ambassador to India in the early 1960s. An outspoken critic of U.S. involvement in Vietnam, he campaigned on behalf of the presidential campaigns of Senators Eugene McCarthy (1916–) in 1968 and George McGovern (1922–) in 1972. Later he worked in the campaigns of Congressman Morris Udall (1922–1998) in 1976 and Senator Edward Kennedy (1932–) in 1980.

Published over twenty books

Galbraith's major intellectual contributions lie in the trilogy (a series of three works that are related to one another, yet can stand on their own): *The Affluent Society* (1958), *The New Industrial State* (1967), and *Economics and the Public Purpose* (1973). Other than his main trilogy, and perhaps *The Theory of Price Control*, Galbraith's *American Capitalism: The Concept of Countervailing Power* (1952) stands out in importance. This book solidified Galbraith's position as a continuing spokesperson for the New Deal perspective in economics.

Along the way Galbraith published over twenty other books, including two novels, a coauthored book on Indian painting, memoirs (writings about one's personal experiences), travelogues (writings about travel), political essays, and several books on economic and intellectual history (the study of how creative thinking has influenced human development). He also collaborated (worked together) on and narrated (was the voice for the commentary) a Public Broadcasting System (PBS) television series, "The Age of Uncertainty."

The trilogy

Galbraith's breakthrough as a best-selling author came with *The Affluent Society*. It examined the need of prosperous societies to use and produce more and more goods. The widespread attention guaranteed some hearing of his opposing ideas in the economics profession. Indeed, he was eventually honored with the American Economic Association's respected presidency.

In *The New Industrial State* Galbraith expanded his examination of the role of power in economic life. *The New Industrial*

State not only provided Galbraith with another best-selling book, it also extended once again the currency of Institutionalist (the effect that institutions have on the economy) economic thought. *The New Industrial State* gave a convincing explanation of the power structure involved in generating the problems in the 1960s of economic, social, and environmental cost of corporate monopoly powers, and thus found a very receptive audience among the rising Americans who opposed traditional standards and political activists.

Economics and the Public Purpose, the last work in Galbraith's major trilogy, continued the characteristic insistence on the role of power in economic life and the inability of conventional economic thought to deal adequately with this power.

Later years

After the years Galbraith served in both the American and Canadian governments, he returned to scholarly activity, extensive travel, and writing, using Harvard University as his home base.

On August 9, 2000, President Bill Clinton (1946–) awarded a Presidential Medal of Freedom to Galbraith. The medal is the highest civilian honor and may be awarded only by a U.S. president to individuals who have made contributions "especially meritorious [something that should be honored or praised] to the security or national interests of the United States, to world peace or to cultural or other significant public or private endeavors."

GALEN

Born: c. 130

Pergamon, Asia Minor

Died: c. 200

Rome (now in Italy)

Greek physician, anatomist, and philosopher

The Greek physician Galen was one of the originators of the science of anatomy (the study of the structure of living things) and was probably the most important physician of all time. His surviving writings make up about half of all ancient writings on medicine.

Early life

Various birth dates for Galen, from 127 to 132, have been suggested, but 130 is generally accepted. He was born at Pergamon, Asia Minor, into a wealthy family that valued education. Galen's father, Nicon, was a mathematician, architect, astronomer, and lover of Greek literature. He was Galen's only teacher up to the age of fourteen and a strong role model. In his book *On the Passions and Errors of the Soul* Galen says he was "fortunate in having the most devoted of fathers," but of

his mother he says "she was so very much prone to anger that sometimes she bit her handmaids; she constantly shrieked at my father and fought with him."

Galen's education and training

In his fourteenth year Galen attended lectures given by many different philosophers (people who study and search for knowledge) in Pergamon. He learned something from all of them and thought it was wrong of people to blindly follow everything any one person might say. Later in life he urged physicians to take whatever is useful from wherever they find it and not to follow one school of thought, because that produces "an intellectual slave." Galen claimed to have studied day and night for four years. His first anatomy teacher was Satyrus, a pupil of Quintus, who through his students played a major role in the increase in activity in the field of anatomy that led to Galen's work.

Galen's father died in 150, and the following year Galen went to Smyrna (now Izmir, Turkey). While there he wrote his first treatise (argument containing facts and conclusions), *On the Movements of the Heart and Lung*. In 152 he went to Corinth and on to Alexandria, where he remained for four years studying with Numisianus, Quintus's most famous pupil. Although Galen admired Numisianus, he was not happy with the quality of the lectures or the abilities of his fellow students. During this time Galen produced a number of dictionaries of both literature and medicine. He also started a major work, *On Demonstration*. Unfortunately, no copy of this work survives.

Medical practice

In 157 Galen returned to Pergamon, where the next year he went to work as a physician to the gladiators (people who engaged in fights for public entertainment in ancient times). The injuries the gladiators suffered provided Galen with excellent opportunities to extend his knowledge of anatomy, surgery (operations to correct a disease or condition), and methods of treatment. While working among the gladiators, whose daily lives are described in his writings, Galen produced some of his most original work. In 163 he went to Rome, where his public anatomical demonstrations and his success as a physician made other Roman physicians jealous. Galen was only interested in passing on knowledge as widely and as publicly as possible.

Galen returned to Pergamon in 166. However, a severe outbreak of plague (a bacteria-caused disease that spreads quickly and can cause death) among the Roman troops in Aquileia in 168 caused the emperors Marcus Aurelius (c. 121–180) and Lucius Verus to send for him. In 169 Marcus made Galen physician to his son, Commodus (161–192). During this time Galen completed his major works, *On the Usefulness of the Parts of the Body* (in seventeen books) and *On the Natural Faculties*, as well as many other treatises. In 176 Galen returned to Rome permanently. He continued his writing, lecturing, and public demonstrations.

Later years

In the winter of 191 and 192 a fire destroyed most of Galen's library. Yet in spite of this loss, information about his writings remains because he wrote two treatises on his own books and their order of production.

Galen.

Courtesy of the Library of Congress.

Both works provide a wealth of information on his writings and are major sources of detail about his life. From 179 to his death around 200, Galen continued his medical research and writings, producing such major works as *The Method of Cure*. During his last years, however, he wrote more nonmedical works, such as *On the Equality of Sin and Punishment* and *The Slight Significance of Popular Honor and Glory*.

Galen's family name is unknown. Not wanting to cash in on the reputations of his ancestors, he used only his given name. Galen said of himself, "I have worked only for science and truth and for that reason I have

avoided placing my name at the beginning of my books.”

GALILEO

Born: February 15, 1564

Pisa, Italy

Died: January 8, 1642

Arcetri, Florence, Italy

Italian scientist, author, and astronomer

The Italian scientist Galileo is famous for his contributions to astronomy, physics (the science that deals with matter and energy), and scientific thought.

Early life

Galileo Galilei was born in Pisa, Italy, on February 15, 1564, the first child of Vincenzo Galilei, a merchant and a musician, and Giulia Ammannati. The family moved to Florence, Italy, in 1574. That year Galileo started his formal education in the nearby monastery (house for people who have taken religious vows) of Vallombrosa. Seven

years later he studied medicine at the University of Pisa.

In 1583 Galileo developed new interests and began his studies in mathematics and physics, which ended his medical studies. In Pisa at that time there was only one notable science teacher, Francisco Buonamico, who taught the ideas of Aristotle (c. 384–c. 322 B.C.E.). Galileo seems to have been an eager follower of Buonamico, as shown by Galileo’s *Juvenilia*, dating from 1584, which mostly describes Aristotle’s scientific ideas. Because of financial difficulties, Galileo had to leave the University of Pisa in 1585 before earning his degree.

Early work

Back in Florence, Galileo searched for a teaching position and continued to study mathematics and physics. He published two works that made his name well known. One was *The Little Balance*, describing the hydrostatic (relating to the forces produced by fluids at rest) principles of balancing; the other was a study of the center of gravity of various solids. His rising reputation gained him a teaching post at the University of Pisa in 1589. Galileo had to support his mother, brothers, and sisters after his father’s death in 1591, so he found a better position in 1592 at the University of Padua, part of the Venetian Republic. In 1604 Galileo declared that he was a supporter of the theory of Nicolaus Copernicus (1473–1543), who stated that the earth and other planets revolved around the sun.

In 1606 the publication of *The Operations of the Geometrical and Military Compass*, revealed Galileo’s skill with experiments. In this booklet he also defended himself against

criticism from several sources. In mid-1609 Galileo learned about the success of some Dutch eyeglass makers when they combined several lenses into what later would be called a telescope (an instrument for viewing distant objects). He went right to work, and on August 25 he presented to the Venetian Senate a telescope as his own invention. This led the University of Padua to give him a lifetime contract, but resentment followed when it was learned that Galileo was not the original inventor.

Astronomical works

Galileo's telescope had a magnifying power of about forty. Sometime in the fall of 1609 he turned the telescope toward the sky. Within a few months Galileo had gathered astonishing evidence about mountains on the moon, about moons circling the planet Jupiter, and about an incredibly large number of stars. In March of 1610 all these sensational items were printed in Venice, Italy, under the title *The Starry Messenger*, a booklet that took the world of science by storm. The view of the heavens changed greatly, and so did Galileo's life.

Galileo was very ambitious and decided to secure a position for himself as a mathematics expert in Florence at the court of Cosimo II. In 1610 he left his wife, Marina Gamba, and his family behind in Padua. In 1612 his *Discourse on Bodies in Water* was published. In it he revealed his discovery of the phases of the planet Venus, but this work was also the source of heated disputes. In 1613 Galileo published his observations of sunspots (dark spots that appear on the sun's surface from time to time), which led to bitter arguments with Christopher Scheiner (1573–

Galileo.

Reproduced by permission of Archive Photos, Inc.

1650) of the University of Ingolstadt, Germany, whose observations of sunspots had already been published in 1612.

Condemned by the Church

Galileo's real aim was to publish a complete description of the universe and of the new physics it required. A major problem was that many people believed that, according to the Bible, the sun and other planets moved around a motionless earth. With the help of some religious experts, Galileo produced essays explaining and defending his point of view in the form of letters, which ranked among the best religious writings of those

times. As the letters circulated widely, a showdown with Church authorities seemed certain.

In 1616 the Church ordered Galileo not to “hold, teach, and defend in any manner whatsoever, in words or in print” the theory of Copernicus regarding the motion of the Earth. Galileo obeyed the order partly to make life easier for himself and partly because he remained a devoted Catholic. In 1624, though, after meeting with Pope Urban VIII (1568–1644) and sensing that anger over his writings had lessened, Galileo decided to pursue his work again.

Galileo spent six years writing his *Dialogue Concerning the Two Chief World Systems*. Published in 1632, it contains criticism of the supposed perfection of the universe as claimed by Aristotle. It discusses how the rotation of the earth helps explain different occurrences in space. The orbital motion of the earth around the sun is also debated. The *Dialogue* was a huge success. The fact that some of his ideas opposed each other did not take away from the popularity of the work.

Condemned again

The *Dialogue* proved that Galileo held, taught, and defended the theories of Copernicus, so he was called back to Rome to appear before Church leaders. The proceedings lasted from the fall of 1632 to the summer of 1633. During that time Galileo was allowed to stay at the home of the Florentine representative to Rome. He was never subjected to physical threats. However, he was finally ordered to publicly renounce (state that he did not believe) the idea that the Earth moved.

Galileo was then confined under house arrest to his home in Arcetri, Italy. He was not

allowed to have any visitors nor have any of his works printed outside of Italy. Both orders were ignored. In 1634 a French translation of one of his old papers on mechanics (the study of forces and their effect on matter) was published, and in Holland the *Dialogue* was published in Latin in 1635.

Later years

In 1638 Galileo’s *Two New Sciences* was printed in Leiden, Holland. It gave a geometrical (relating to points, lines, angles, and surfaces) description of motion, partly because such an approach led to a close match with known data. Galileo believed that the universe was structured along the patterns of geometry, the product of a Creator who had planned everything according to weight, measure, and number.

This religious belief is possibly Galileo’s greatest quality. It was best stated in the *Dialogue*, when he described the human mind as being the most excellent product of the Creator because it could recognize mathematical truths. Galileo spent his last years partially blind. He died on January 8, 1642.

GEORGE GALLUP

Born: November 18, 1901

Jefferson, Iowa

Died: July 27, 1984

Tschingel, Switzerland

American professor, researcher, author, and organization founder

George Gallup was a pioneer in the field of public opinion polling. He developed methods for perfecting the selection of sample populations (a small group that resembles the population as a whole), interviewing techniques, and formulation of questions. He also was a teacher and a supporter of educational reform.

Life in Iowa

George Horace Gallup was born on November 18, 1901, in the small town of Jefferson, Iowa. He was the son of George Henry Gallup, a farmer as well as a real estate dealer in agricultural land, and Nettie Davenport. As a teenager, Gallup worked as the manager of a dairy farm and used his salary to start a newspaper at his high school. All of young Gallup's higher education took place at the University of Iowa, where he received a bachelor's degree in 1923, a master's in 1925, and a doctorate in 1928. On December 27, 1925, he married Ophelia Smith Miller. They had two sons, Alec Miller and

George Horace Jr., who carried on their father's polling organization; and a daughter, Julia Gallup Laughlin.

From teaching to polling

Gallup's career as a teacher began after he received a bachelor's degree and stayed to teach journalism and psychology from 1923 to 1929 at the University of Iowa. He then moved to Drake University at Des Moines, Iowa, where he served as head of the Department of Journalism until 1931. That year, he moved to Northwestern University in Evanston, Illinois, as a professor of journalism and advertising. The next year he moved to New York City to join the advertising agency of Young and Rubicam as director of research (later as vice president from 1937 to 1947). From 1933 to 1937 he was also professor of journalism at Columbia University, but he had to give up this position shortly after he formed his own polling company, the American Institute of Public Opinion (Gallup Poll), in 1935, where he concentrated on attitude research. He was also the founder (1939) and president of the Audience Research Institute.

Apart from these business positions Gallup was active in professional and public service groups. He was president of the International Association of Public Opinion Institutes, from 1947 to 1984, and of the National Municipal League, from 1953 to 1956, and chairman of the All-America Cities Award Committee, a jury which selects All-American cities on the basis of intelligent and effective citizen activity. He founded Quill and Scroll, an international honor society for high school journalists, and served as head of its board of trustees.

George Gallup.
Courtesy of the Library of Congress.

A pioneer in polling

By 1944 George Gallup was widely recognized as one of the major pioneers in public opinion polling and had participated in the creation of methods to achieve a high degree of accuracy in discovering the public's opinions on a wide variety of issues. Gallup had firm beliefs in the validity of polling. In fact, he believed that polls made a positive contribution to the democratic process.

Always an educator

George Gallup was best known for creating a business of discovering people's opinion

on issues. But he was also an educator—and this experience, plus his study of the attitudes of millions of people, led him to develop a set of basic principles of education which he described in *The Miracle Ahead* (1964). The collective views of people, he recognized, are usually sound and logical; people are not led by their emotions as some people claim. However, their thoughts about issues are not deep enough. To achieve greater and more rapid progress, a new education system must be created to enhance our mental powers. Gallup was particularly positive toward the case history method of teaching, which offers “perhaps the best method that mankind has yet found to transmit wisdom as opposed to knowledge.”

George Gallup was involved in his career right up until his death. He was traveling in Tschingel, Switzerland, when he suffered a massive heart attack on July 26, 1984, and died the next day. He was eighty-three years old.

INDIRA GANDHI

Born: November 19, 1917

Allahabad, India

Died: October 31, 1984

New Delhi, India

Indian politician and prime minister

Indira Gandhi, a prime minister of India, was the most effective and powerful politician of her day in that country. Considered a hero by her supporters and cursed by her enemies, who later assassinated her, Indira Gandhi paved the way for democracy in India during the twentieth century.

Early life

Indira Priyadarshini Gandhi was born in the northern Indian city of Allahabad on November 19, 1917. She was the only child of Jawaharlal Nehru, an important figure in the nationalist movement, a movement devoted to the improvement of culture within the nation. Later he became India's first prime minister. Because of many of his political beliefs, Jawaharlal, along with much of his family, was often jailed for supporting Mohandas Gandhi's (1869–1948) nationalist movement. Mohandas Gandhi (no relation to Indira) opposed the dominant rule of Great Britain over India. This association placed Indira at the center of India's struggle for freedom. Her family's fight for freedom made Indira's upbringing shaky. Her father was often absent from being jailed, and her mother was bed-ridden from tuberculosis, a terrible disease affecting the lungs and bones. Because of her father's stand against institutions run by the British government, Indira's early schooling was not consistent. For a while she was taught at home. Later she attended an academy run by a poet-philosopher.

Shortly after her mother's death in 1936, Indira enrolled at Santiniketan University and Somerville College, Oxford University, in England. She married Feroze Gandhi (also no relation to Mohandas Gandhi) in March 1942, despite both family's objections, as the

two were not part of the same social status or religions—he was a descendent of Iranian immigrants; she was Hindu. Feroze Gandhi became a lawyer and newspaper executive as well as an independent member of Parliament. Shortly after their marriage, they were both imprisoned for a period of thirteen months for their part in the nationalist political demonstrations against British rule. During her imprisonment Indira taught reading and writing to prisoners. Feroze Gandhi died in 1960. They had two sons, Rajiv and Sanjay.

Indian independence

On August 15, 1947, Great Britain released their control over India and the Indian Empire was quickly divided into two countries, today known as India and Pakistan. No longer under British control, India erupted into violence. Thousands of members of rival religious groups, the Hindus and the Moslems, were killed during riots. During this time Indira served as her father's hostess and housekeeper. Since her father had never remarried after his wife's death in 1936, Indira took charge of her father's large mansion and began helping him in political matters. Together they worked towards peace, arranging a meeting of Hindu and Moslem religious leaders in New Dehli, India.

Throughout the period of Indira Gandhi's political association with her father, she focused on social welfare work, particularly children's welfare. The Indian National Congress had led the country to freedom and had then become its major political party. She had joined the Congress in 1938, and later served as a member of its Youth Advisory Board and chairman of its Woman's Department. Prior to

Indira Gandhi.

assuming the presidency of the organization in 1959, Gandhi was named to its twenty-one-member executive Working Committee. She was elected with more votes than any other candidate to the powerful eleven-member Central Election Board, which named candidates and planned electoral strategy.

As prime minister

In June 1964, following her father's death, Gandhi became minister for information and broadcasting under Prime Minister Lal Bahadur Shastri (1904–1966), where she helped start an Indian television system. In January 1966, when Shastri died, Gandhi

was elected leader of the Congress Party in Parliament (the governing body of India) and became the third prime minister of independent India.

Gandhi assumed office at a critical time in the history of the country. A truce had ended the 1965 war between India and Pakistan only a week earlier. The nation was in the midst of a two-year drought, resulting in severe food shortages and a deepening economic crisis with rising prices and rising unemployment. The political situation in India was equally as affected. In the fourth general elections of 1967 the Congress retained majority control (and reelected Gandhi as its leader), but lost control in half the state legislatures. After twenty years of political dominance, the Congress Party was experiencing serious difficulty.

A government divided

Gandhi immediately set about reorganizing the party to make it a more effective instrument of administration and national development. Her goal was to achieve a wider measure of social and economic justice for all Indians. As her left-of-center policies (slightly liberal, or supporting civil liberties and social progress) became clear, the Congress Party split, with the younger, more liberal elements rallying around Gandhi and the older, more conservative party leaders opposing her. This division came to a head in July 1969 when she nationalized (brought under the control of government) the country's fourteen leading banks in a highly popular move meant to make credit more available to agriculture and to small industry.

The split was formalized when Gandhi's candidate for the presidency of India, V. V.

Giri, won over the party's official nominee. Although Gandhi took 228 members of Parliament with her into the New Congress, this was not a majority in the 521-member house, and she held power only with support from more liberal parties. In December 1970, when Gandhi failed to get the necessary support to abolish, or end, the privileges of the former Indian princes, she called on the president to dissolve Parliament. Midterm elections were set for March 1971, one full year ahead of schedule.

A coalition, or alliance, of three parties of the right and an anti-Congress socialist party opposed Gandhi, who made alliances with liberal parties as well as some regional parties. Her platform was essentially one of achieving social and economic change more rapidly in an effort to improve the quality of life of India's people. Her party won a massive victory with over a two-thirds majority in Parliament.

End of her career

Gandhi faced major problems in the areas of food production, population control, land reform, regulation of prices, unemployment, and industrial production. The problems were increased by the arrival in India of almost ten million refugees, who were uprooted as a result of the civil unrest in East Pakistan. In November 1971 Indian troops crossed into East Pakistan to fight Pakistani forces. A month later Gandhi announced recognition of the Bangladesh government set up by East Pakistani rebel leaders. On December 16 Pakistan's commander in East Pakistan surrendered to India.

In the state elections held in India in March 1972, Gandhi's New Congress Party scored the most overwhelming victory in the

history of independent India. However, her opponent accused her of violating election laws, and a high court supported the charge in 1975. Because of this development, as well as domestic unrest, Gandhi declared a state of emergency and postponed elections. In the 1977 elections Gandhi and her party suffered major defeats and Gandhi eventually lost her seat and the post of prime minister.

The following year Gandhi headed the Congress Party as she returned to Parliament. In 1979 she again became prime minister. In efforts to prove India's nonalliance in the global community, she visited both the United States and the U.S.S.R., the former Soviet Union, which consisted of Russia and several smaller states. Internally, riots broke out among Muslim, Hindu, and Sikh religious sects, or groups. Sikhs, looking to separate themselves from India, secured weapons within their sacred Golden Temple in Amritsar, and assumed religious protection. Gandhi ordered government troops to storm the temple, leading to many Sikh deaths. This led to her assassination at her residence on October 31, 1984, by her own Sikh security guards. In death, Gandhi remains a symbol of courage and democracy in one of the world's most populated countries.

MOHANDAS GANDHI

Born: October 2, 1869

Porbandar, India

Died: January 30, 1948

Delhi, India

Indian religious leader, reformer, and lawyer

Mohandas Gandhi was an Indian revolutionary and religious leader who used his religious power for political and social reform. Although he held no governmental office, he was the main force behind the second-largest nation in the world's struggle for independence.

Early years

Mohandas Karamchand Gandhi was born on October 2, 1869, in Porbandar, India, a seacoast town in the Kathiawar Peninsula north of Bombay, India. His wealthy family was from one of the higher castes (Indian social classes). He was the fourth child of Karamchand Gandhi, prime minister to the raja (ruler) of three small city-states, and Purlibai, his fourth wife. Gandhi described his mother as a deeply religious woman who attended temple (a place for religious worship) service daily. Mohandas was a small, quiet boy who disliked sports and was only an average student. At the age of thirteen he did not even know in advance that he

was to marry Kasturbai, a girl his own age. The childhood ambition of Mohandas was to study medicine, but as this was considered beneath his caste, his father persuaded him to study law instead. After his marriage Mohandas finished high school and tutored his wife.

In September 1888 Gandhi went to England to study. Before leaving India, he promised his mother he would try not to eat meat. He was an even stricter vegetarian while away than he had been at home. In England he studied law but never completely adjusted to the English way of life. He became a lawyer in 1891 and sailed for Bombay. He attempted unsuccessfully to practice law in Rajkot and Bombay, then for a brief period served as lawyer for the prince of Porbandar.

South Africa: the beginning

In 1893 Gandhi accepted an offer from a firm of Muslims to represent them legally in Pretoria, the capital of Transvaal in the Union of South Africa. While traveling in a first-class train compartment in Natal, South Africa, a white man asked Gandhi to leave. He got off the train and spent the night in a train station meditating. He decided then to work to end racial prejudice. He had planned to stay in South Africa for only one year, but this new cause kept him in the country until 1914. Shortly after the train incident he called his first meeting of Indians in Pretoria and attacked racial discrimination (treating a certain group of people differently) by whites. This launched his campaign for improved legal status for Indians in South Africa, who at that time suffered the same discrimination as black people.

In 1896 Gandhi returned to India to take his wife and sons to Africa and to inform his

countrymen of the poor treatment of Indians there. News of his speeches filtered back to Africa, and when Gandhi returned, an angry mob threw stones and attempted to lynch (to murder by mob action and without lawful trial) him.

Spiritual development

Gandhi began to do day-to-day chores for unpaid boarders of the lowest castes and encouraged his wife to do the same. He decided to buy a farm in Natal and return to a simpler way of life. He began to fast (not eat). In 1906 he became celibate (not engaging in sexual intercourse) after having fathered four sons, and he preached Brahmacharya (vow of celibacy) as a means of birth control and spiritual purity. He also began to live a life of voluntary poverty.

During this period Gandhi developed the concept of Satyagraha, or soul force. He wrote: "Satyagraha is not predominantly civil disobedience, but a quiet and irresistible pursuit of truth." Truth was throughout his life Gandhi's chief concern, as reflected in the subtitle of his *Autobiography: The Story of My Experiments with Truth*. Gandhi also developed a basic concern for the means used to achieve a goal.

In 1907 Gandhi urged all Indians in South Africa to defy a law requiring registration and fingerprinting of all Indians. For this activity he was imprisoned for two months but released when he agreed to voluntary registration. During Gandhi's second stay in jail he read the American essayist Henry David Thoreau's (1817–1862) essay "Civil Disobedience," which left a deep impression on him. He was also influenced by his correspondence with Russian novelist Leo Tolstoy

Mohandas Gandhi.

Reproduced by permission of AP/Wide World Photos.

(1828–1910) in 1909–1910 and by John Ruskin's (1819–1900) *Unto This Last*.

Gandhi decided to create a place for civil resisters to live in a group environment. He called it the Tolstoy Farm. By this time he had abandoned Western dress for traditional Indian garb. Two of his final legal achievements in Africa were a law declaring Indian (rather than only Christian) marriages valid, and the end of a tax on former indentured (bound to work and unable to leave for a specific period of time) Indian labor. Gandhi regarded his work in South Africa as completed.

By the time Gandhi returned to India in January 1915, he had become known as “Mahatmaji,” a title given him by the poet Rabindranath Tagore (1861–1941). This title means “great soul.” Gandhi knew how to reach the masses and insisted on their resistance and spiritual growth. He spoke of a new, free Indian individual, telling Indians that India’s cages were self-made.

Disobedience and return to old values

The repressive Rowlatt Acts of 1919 (a set of laws that allowed the government to try people accused of political crimes without a jury) caused Gandhi to call a general hartal, or strike (when workers refuse to work in order to obtain rights from their employers), throughout the country. But he called it off when violence occurred against Englishmen. Following the Amritsar Massacre of some four hundred Indians, Gandhi responded by not cooperating with British courts, stores, and schools. The government agreed to make reforms.

Gandhi began urging Indians to make their own clothing rather than buy British goods. This would create employment for millions of Indian peasants during the many idle months of the year. He cherished the ideal of economic independence for each village. He identified industrialization (increased use of machines) with materialism (desire for wealth) and felt that it stunted man’s growth. Gandhi believed that the individual should be placed ahead of economic productivity.

In 1921 the Congress Party, a group of various nationalist (love of one’s own nation and cultural identity) groups, again voted for a nonviolent disobedience campaign. Gandhi had come to realize that India’s reliance on

Britain had made India more helpless than ever. In 1922 Gandhi was tried and sentenced to six years in prison, but he was released two years later for an emergency appendectomy (surgery to remove an inflamed appendix). This was the last time the British government tried Gandhi.

Fasting and the protest march

One technique Gandhi used frequently was the fast. He firmly believed that Hindu-Muslim unity was natural and he undertook a twenty-one-day fast to bring the two communities together. He also fasted during a strike of mill workers in Ahmedabad. Another technique he developed was the protest march. In response to a British tax on all salt used by Indians, a severe hardship on the peasants, Gandhi began his famous twenty-four-day “salt march” to the sea. Several thousand marchers walked 241 miles to the coast in protest of the unfair law.

Another cause Gandhi supported was improving the status of members of the lower castes, or Harijans. On September 20, 1932, Gandhi began a fast for the Harijans, opposing a British plan for a separate voting body for them. As a result of Gandhi’s fast, some temples were opened to exterior castes for the first time in history.

Gandhi devoted the years 1934 through 1939 to the promotion of making fabric, basic education, and making Hindi the national language. During these years he worked closely with Jawaharlal Nehru (1889–1964) in the Congress Working Committee. Despite differences of opinion, Gandhi designated Nehru his successor, saying, “I know this, that when I am gone he will speak my language.”

World War II and beyond

England's entry into World War II (1939–45; when the United States, France, Great Britain, and the Soviet Union fought against Germany, Italy, and Japan) brought India in without its consent. Because Britain had made no political compromises satisfactory to nationalist leaders, in August 1942 Gandhi proposed not to help in the war effort. Gandhi, Nehru, and other Congress Party leaders were imprisoned, touching off violence throughout India. When the British attempted to place the blame on Gandhi, he fasted for three weeks in jail. He contracted malaria (a potentially fatal disease spread by mosquitoes) in prison and was released on May 6, 1944.

When Gandhi emerged from prison, he sought to stop the creation of a separate Muslim state of Pakistan, which Muhammad Ali Jinnah (1876–1948) was demanding. Jinnah declared August 16, 1946, a "Direct Action Day." On that day, and for several days following, communal killings left five thousand dead and fifteen thousand wounded in Calcutta alone. Violence spread through the country.

Extremely upset, Gandhi went to Bengal, saying, "I am not going to leave Bengal until the last embers of trouble are stamped out." But while he was in Calcutta forty-five hundred more people were killed in Bihar. Gandhi, now seventy-seven, warned that he would fast to death unless Biharis reformed. Either Hindus and Muslims would learn to live together or he would die in the attempt. The situation there calmed, but rioting continued elsewhere.

Drive for independence

In March 1947 the last viceroy, Lord Mountbatten (1900–1979), arrived in India

with instructions to take Britain out of India by June 1948. The Congress Party by this time had agreed to separation, since the only alternative appeared to be continuation of British rule. Gandhi, despairing because his nation was not responding to his plea for peace and brotherhood, refused to participate in the independence celebrations on August 15, 1947. On September 1, 1947, after an angry Hindu mob broke into the home where he was staying in Calcutta, Gandhi began to fast, "to end only if and when sanity returns to Calcutta." Both Hindu and Muslim leaders promised that there would be no more killings, and Gandhi ended his fast.

On January 13, 1948, Gandhi began his last fast in Delhi, praying for Indian unity. On January 30, as he was attending prayers, he was shot and killed by Nathuram Godse, a thirty-five-year-old editor of a Hindu Mahasabha extremist newspaper in Poona.

GABRIEL GARCÍA MÁRQUEZ

Born: March 6, 1928

Aracataca, Colombia

*Colombian novelist, short-story writer,
and journalist*

Gabriel García Márquez is a Colombian novelist, short-story writer, and journalist whose works have earned him the reputation of being one of the greatest living writers in Spain and Latin America.

Education and newspaper jobs

Born in Aracataca, Colombia, on March 6, 1928, Gabriel García Márquez was the oldest of Gabriel Eligio García and Luisa Santiaga Márquez Iguarán's twelve children. His father was a telegraph operator. The family was poor, and García Márquez spent the first eight years of his life with his maternal grandparents. They were the most important and influential people in his life, and he loved listening to them tell stories about Colombia's old days.

García Márquez received his early education from the Liceo Nacional of Zipaquirá, Colombia, from which he graduated in 1946. He then entered the University of Bogotá to study law. (He studied for several years but did not enjoy it and never finished.) He wrote his first story in 1947, and it was published in the newspaper *El Espectador*. Over the next few years he had several more stories published in newspapers. In 1948 civil war broke out in the country and García Márquez moved to Cartagena, Colombia, where he worked as a journalist for the newspaper *El Universal*. In 1950 he

moved to Barranquilla, Colombia, where he wrote for *El Herald*. In 1954 he returned to Bogotá and worked at *El Espectador* while writing short stories on the side.

Early works

Between 1955 and 1960 several published works had begun to establish García Márquez's fame in the Spanish-speaking world. *La hojarasca* (1955), a short novel, is set in the made-up town of Macondo in the swampy coastal area of northeastern Colombia known as the Ciénaga. The story reflects the changes the twentieth century brought to the life of this sleepy country town. Much of García Márquez's work centers around funerals. In *La hojarasca* mourners who knew the dead man in life think about the past, each from his own point of view. Three different people—an old colonel, his daughter, and her son—tell their story. The dead man, a doctor and former friend of the colonel, had committed suicide. The narrators do not entirely explain what happened, but in the course of each story much of the past history of the village of Macondo is revealed. A strong feeling of doom fills the novel.

Macondo and the Buendía family were further developed in *El coronel no tiene quien le escriba* (1961; *Nobody Writes to the Colonel and Other Stories*). The next collection of short stories, *Los funerales de la Mama Grande* (1962), strengthened García Márquez's growing reputation. The publication of *Cien años de soledad* (1967; *One Hundred Years of Solitude*) created a stir when it sold over one hundred thousand copies in fifteen editions in Buenos Aires, Argentina, in 1969.

The story of *Cien años de soledad* describes the rise and fall of a village as seen in

the lives of five generations of one family. It ends with flood and drought, which comes as the last living Buendía figures out the ancient predictions of doom and learns that “races condemned to 100 years of solitude did not have a second opportunity on earth.” The family is meant to represent Colombia, and through extension, both South America and the rest of the world. Pablo Neruda (1904–1973), the famous Chilean poet, praised *Cien años de soledad*, and it is generally considered García Márquez’s masterpiece.

Other works

García Márquez considered his next novel, *El otoño del patriarca* (1975; *The Autumn of the Patriarch*), “a perfect integration (combination) of journalism and literature.” García Márquez continued to write novels, short stories, essays, and film scripts. In 1982 he was awarded the Nobel Prize in Literature. In 1983 he wrote the film script *Erendira*, adapted from his 1972 novella (short novel) *La increíble y triste historia de la cándida Erendira y su abuela desalmada* (*Innocent Erendira and Her Heartless Grandmother*).

García Márquez’s other famous novel, *El amor en los tiempos del cólera* (*Love in the Time of Cholera*) was written in 1985 (with an English translation published in 1988). This novel is an exploration of love and the relationship between aging, death, and decay. After *Cholera* he published the novels *El general en su laberinto* (1989; *The General in His Labyrinth*, 1990), *Doce cuentos peregrinos* (1992; *Strange Pilgrims*, 1993), and *Of Love and Other Demons* (1994).

García Márquez’s fictional blend of history, politics, real social situations, and fantasy (something made up) has given rise to the term “magical realism.” The use of magi-

Gabriel García Márquez.

Reproduced by permission of AP/Wide World Photos.

cal realism was often imitated by other Latin American authors, especially Isabel Allende (1942–). García Márquez’s need to tell a story drives his writing. In the July 1997 issue of *Harper’s*, García Márquez writes, “The best story is not always the first one but rather the one that is told better.”

Later years

In 1999 García Márquez returned to journalism with the purchase of *Cambio*, a weekly newspaper in Colombia. He rolled up his sleeves and went to work trying to improve both the paper’s content and its sales. His duties ranged from interviewing

heads of state and business leaders to editing copy and photographs. García Márquez told the *New York Times* that he wanted his paper's young reporters "to tell a story, to go back to the time when a reader could know what happened as if he were there himself."

Later that year García Márquez was diagnosed with cancer and disappeared from public life. Rumors began to circulate that he was dying, aided by a poem appearing on the Internet supposedly written by him as a sort of farewell. In December 2000 García Márquez gave an interview in which he denied writing the poem and said that he had been keeping a low profile because he was busy writing his autobiography (the story of one's own life), which he decided to do after learning that he had cancer. In March 2001 García Márquez announced that he would never set foot in Spain again unless a new European Union rule requiring Colombian citizens to obtain visas (identification documents permitting travel into foreign countries) before entering Spain was withdrawn.

JUDY GARLAND

Born: June 10, 1922
Grand Rapids, Minnesota

Died: June 21, 1969

London, England

American actress and singer

Judy Garland starred in films, musicals, and on the concert stage. A superstar who never lost her appeal, she is best remembered for her performance in *The Wizard of Oz* and for the song "Over the Rainbow."

Becoming Judy Garland

Judy Garland was born Frances Ethel Gumm on June 10, 1922, in Grand Rapids, Minnesota. She was the last of three daughters of former vaudeville (traveling variety entertainment) actors Frank and Ethel Gumm. Judy began her show business career before she was three years old at her father's theater, the New Grand Theater. The family soon moved to Los Angeles, California, and to better climates than those found in remote northern Minnesota. By age six she was a veteran performer, appearing with her two older sisters in a vaudeville act. After her father's health declined, the sisters' act soon became the primary source of income for the family.

Mistakenly billed as "The Glum Sisters" in 1931, the sisters, at the suggestion of a fellow performer, changed their stage name to Garland (the name of a then-popular drama critic). Shortly thereafter, at her own insistence, Garland changed her first name from Frances to Judy (after a popular song of the day).

Blossoming career

In 1935 the head of MGM (Metro-Goldwyn-Mayer), a major Hollywood studio, heard Judy Garland sing and quickly signed her to a contract. There was some uncer-

tainty at the studio on how to use her talents. A year passed before she made her first MGM film, a two-reeler. Her first appearance in a feature did not come until 1937, when she was loaned to another major studio, Twentieth Century-Fox. That same year at an MGM party for its star Clark Gable (1901–1960), Garland was a hit singing a specialty number, “Dear Mr. Gable,” which was adapted from the well-known standard “You Made Me Love You.” As a result she and the song were used for the 1937 feature *Broadway Melody of 1938*. Again she earned praise within the industry.

MGM quickly put Garland into more films, each spotlighting her singing. In her next film, *Thoroughbreds Don't Cry* (1937), she was cast with another childhood star, Mickey Rooney (1920–), with whom she would later appear in eight films. MGM paired them in some of the Andy Hardy films, a series starring Rooney as an “average” American teenager. The duo performed in such movies as *Babes in Arms* (1939), *Strike Up The Band* (1940), *Babes on Broadway* (1941), and *Girl Crazy* (1943). Her most memorable film role, and the one that made her a household name, came in 1939 with *The Wizard of Oz*. She won a special Oscar as “best juvenile performer of the year” for her role as Dorothy. The film also provided her with the song with which she was identified for the rest of her life—“Over the Rainbow.”

During the 1940s Garland graced a number of outstanding musicals, including *Meet Me in St. Louis* (1944), *The Harvey Girls* (1946), and *Easter Parade* (1948). She was superb in a non-singing role in *The Clock*, a pleasant drama about a young girl and a serviceman on leave.

Judy Garland.
Courtesy of the Library of Congress.

Fall from grace

Garland's personal life, however, was less successful. She married music arranger David Rose in 1941, but that marriage ended long before their 1945 divorce. That same year she married director Vincente Minnelli (1910–1986), who guided Garland in some of her most notable films, including *The Pirate* (1948). Daughter Liza Minnelli (later a star in her own right) was born in 1946. This second marriage also failed and was over well before the 1951 divorce. All during the 1940s Garland was hampered by a lack of self-confidence,

strained by constant work, and slowed by weight problems. She became heavily dependent on pills and in the end broke down, trying to kill herself in 1950.

Once a professional talent and hard worker, Garland became a problem artist during the 1940s. The filming of *In the Good Old Summertime* (1949) was repeatedly delayed, as was *Summer Stock* (1950). A pattern had been set that would increasingly set back her career. She was replaced in a number of films and finally was fired by MGM in 1950.

Ups and downs

Sidney Luft, a successful promoter who later became her third husband (1952), started Garland on a career on concert stages. She was a smashing success at the Palladium in London, England, at the Palace Theatre in New York City, and elsewhere. The magnificent film *A Star Is Born* (1954) capped her comeback, and she earned an Oscar nomination. But faltering health, increasing drug dependency, and alcohol abuse led to nervous breakdowns, suicide attempts, and recurrent breakups with Luft, by whom she had two children, Lorna (1952) and Joseph (1955). The Lufts finally divorced in 1965 after years of legal wrangling.

Notwithstanding her troubles, Garland undertook a highly successful concert tour in 1961, which was capped by an enthusiastically received concert at New York City's Carnegie Hall. The live recording of that event sold over two million copies. That same year she earned an Oscar nomination for best supporting actress for her dramatic performance in the film *Judgment at Nuremberg*. She had another non-singing role in the British

film *A Child Is Waiting* (1963). Her last film role was in another British film, *I Could Go On Singing* (1963). Garland had made a well-received television debut in 1955 on the *Ford Star Jubilee* and had done well in other guest appearances. Unfortunately, her long-awaited television weekly series did not fare well, and CBS cancelled the variety show after one season (1963–1964).

Garland's personal and professional life continued to be a series of ups and downs, marked by failing performances, comebacks, lawsuits, hospitalizations, and suicide attempts. After divorcing Luft she married Mark Herron, a young actor with whom she had traveled for some time. The marriage lasted only months. Mickey Deans, a discotheque manager twelve years her junior, whom she had married earlier that year, found her dead in their London flat on June 21, 1969. Death came from an "accidental" overdose of pills. She is buried in Hartsdale, New York.

Judy Garland was a superstar who, as one critic pointed out, "managed the considerable feat of converting herself into an underdog." Despite all the lows in her life she remained immensely popular and had an appeal that was never entirely lost.

MARCUS GARVEY

Born: August 17, 1887

St. Ann's Bay, Jamaica

Died: June 10, 1940

London, England

Jamaican activist and African nationalist

Marcus Garvey, a black man from the West Indies, was the first to forcefully speak about the concept of African nationalism—of black people returning to Africa, the continent of their forefathers, in order to build a great nation of their own. His writings and ideas would inspire many leaders of the civil rights movement during the second half of the twentieth century.

Early life

Marcus Mosiah Garvey was born in St. Ann's Bay, Jamaica, on August 17, 1887, the youngest child of a stonemason (one who prepares stones for building). He went to the local elementary school, and at the age of fourteen became an apprentice (working to gain experience) in the printing trade. In 1903 he went to the capital, Kingston, to work as a printer. He soon became involved in public activities and helped form the Printers Union, the first trade union in Jamaica. In 1907 he took part in the unsuccessful printers strike, where organized workers refused to work unless certain demands were met. This experience influenced the young Garvey in both his political and journalistic passions. He soon began publishing a periodical called the *Watchman*.

In 1910 Garvey began a series of travels that transformed him from an average person concerned about the problems of those with less opportunity, to an African nationalist determined to lift an entire race from bondage. He visited Costa Rica, Panama, and Ecuador, and worked as an editor for several radical newspapers. After briefly returning home, he proceeded to England, where contacts with African nationalists stimulated in him a keen interest in Africa and in black history. In each country he visited, he noted that the black man was in an inferior position, subject to the ever-changing ideals of stronger races. His reading of Booker T. Washington's (1856–1915) "Up from Slavery" at this time had a great effect upon him. Also at this time Garvey met Duse Mohammed Ali, a Sudanese-Egyptian and strong supporter of African self-rule. Garvey began writing for Ali's small magazines and was introduced to other black activists.

On his return to Jamaica in 1914 from England, Garvey formed the Universal Negro Improvement Association and African Communities League (UNIA-ACL). These organizations were intended "to work for the general uplift of the Negro peoples of the world," and would become the centerpiece for his life's work.

Message in America

In 1916 Garvey went to the United States to raise funds to carry on the work of his Jamaican organizations. He was immediately caught up in the unrest of the times, and his voice thundered in the evenings on the streets of Harlem in New York City, New York. A New York branch of the UNIA was established, soon followed by branches in

Marcus Garvey.

other cities in the United States, in Central and South America, and in the Caribbean. The expansion of the UNIA was publicized by its official voice, *Negro World*, a newspaper published in English, Spanish, and French. Published in New York City from 1918 to 1933, the magazine was succeeded by the monthly *Black Man*, which ran through the 1930s, published after 1934 in London.

Negro World reached out to black communities all over the world. It even penetrated into the interior of Africa, even though the white rulers there had banned it. Garvey stressed the need for blacks to return to Africa for the building of a great nation, but he realized that until this was accomplished,

Africans needed to make themselves economically independent wherever they lived. He encouraged black people to start their own businesses—to take the business of their ghettos into their own hands.

Together with the American clergyman Archbishop George A. McGuire (1866–1934), Garvey formed the African Orthodox Church. This was in accordance with one of his basic principles, for he believed that each race must see God through its own racial eyes. The Black Christ and the Black Madonna were officially announced at the UNIA convention of 1924.

The movement stumbles

The Black Star Line shipping company and the Negro Factories Corporation were to be the commercial strengths of the Garvey movement. But it was the failure of the shipping venture that gave Garvey's enemies the opportunity to destroy him. Investments in the shipping line were lost, and in 1925 Garvey was imprisoned in the United States. After serving two years and ten months of a five-year sentence, he was deported, or forced out of the country, to Jamaica.

Previously, his plans for colonization in Liberia had been ruined by the colonial powers that brought pressure to bear on the Liberian government. As a result, the land that had been granted to the Garvey organization for the settlement of overseas Africans was given to the white American industrialist Harvey Firestone (1863–1938). And the expensive equipment shipped to Liberia for the use of Garvey's colonists was seized.

In Jamaica, Garvey attempted to enter local politics, but restrictions at the time did

not allow the vote to the black masses. He went to England and continued his work of social protest and his call for the liberation (freeing) of Africa. He died in London on June 10, 1940. Marcus Garvey was married twice. His second wife, Amy Jacques, whom he married in 1922, bore him two sons.

Garvey's legacy

The Garvey movement was the greatest international movement of African peoples in modern times. At its peak, from 1922 to 1924, the movement counted more than eight million followers. The youngest members of the movement were taken in at five years of age and, as they grew older, they graduated to the sections for older children.

Garvey emphasized the belief in the One God, the God of Africa, who should be visualized through black eyes. He preached to black people to become familiar with their ancient history and their rich cultural heritage. He called for pride in the black race—for example, he made black dolls for black children. His was the first voice to clearly demand black power. It was he who said, “A race without authority and power is a race without respect.”

In emphasizing the need to have separate black institutions under black leadership, Garvey anticipated the mood and thinking of the future black nationalists by nearly fifty years. He died, as he lived, an unbending leader of African nationalism. The symbols which he made famous, the black star of Africa and the red, black, and green flag of African liberation, continued to inspire younger generations of African nationalists.

BILL GATES

Born: October 28, 1955

Seattle, Washington

*American businessman, chief executive officer,
and software developer*

Microsoft cofounder and chief executive officer Bill Gates has become the wealthiest man in America and one of the most influential personalities in the ever-evolving computer industry.

Love of computer technology

William H. Gates III was born on October 28, 1955, in Seattle, Washington. He was the second child and only son of William Henry Gates Jr., a successful Seattle attorney,

and Mary Maxwell, a former schoolteacher. Kristi, his older sister, later became his tax accountant and Libby, his younger sister, lives in Seattle raising her two children. Gates enjoyed a normal, active childhood and participated in sports, joined the Cub Scouts, and spent summers with his family in Bremerton, Washington.

Although Gates's parents had a law career in mind for their son, he developed an early interest in computer science and began studying computers in the seventh grade at Seattle's Lakeside School. Lakeside was a private school chosen by Gates's parents in the hopes that it would be more challenging for their son's intellectual drive and curiosity. At Lakeside, Gates came to know Paul Allen, a classmate with similar interests in technology who would eventually become his business partner. Immediately, Gates and Allen realized the potential of the young computer industry.

Early experience

Gates's early experiences with computers included debugging (eliminating errors from) programs for the Computer Center Corporation's PDP-10, helping to computerize electric power grids for the Bonneville Power Administration, and founding with Allen a firm called Traf-O-Data while still in high school. Their small company earned them twenty thousand dollars in fees for analyzing local traffic patterns.

While working with the Computer Center's PDP-10, Gates was responsible for what was probably the first computer virus, a program that copies itself into other programs and ruins data. Discovering that the machine was connected to a national network of com-

puters called Cybernet, Gates invaded the network and installed a program on the main computer that sent itself to the rest of the network's computers, making it crash (became damaged). When Gates was found out, he was severely punished, and he kept away from computers for his entire junior year at Lakeside. Without the lure of computers, Gates made plans for college and law school in 1970. But by 1971 he was back helping Allen write a class scheduling program for their school's computer.

The article that started it all

Gates entered Harvard University in 1973 and pursued his studies for the next year and a half. His life changed in January of 1975, however, when *Popular Mechanics* carried a cover story on a \$350 microcomputer, the Altair, made by a firm called MITS in New Mexico. When Allen excitedly showed him the story, Gates knew where he wanted to be: at the forefront of computer software (a program of instructions for a computer) design.

Gates dropped out of Harvard in 1975, ending his academic life and beginning his career as a software designer. At this time, Gates and Allen cofounded Microsoft. They wrote programs for the early Apple and Commodore machines. One of Gates's most significant opportunities arrived in 1980, when IBM approached him to help with their personal computer project, code name Project Chess. Gates developed the Microsoft Disk Operating System, or MS-DOS. (An operating system is a type of software that controls the way a computer runs.) Not only did he sell IBM on the new operating system, but he also convinced the computer giant to allow others to write software for the machine. The

result was the rapid growth of licenses for MS-DOS, as software developers quickly moved to become compatible with (able to work with) IBM. By the early 1990s Microsoft had sold more than one hundred million copies of MS-DOS, making the operating system the all-time leader in software sales. For his achievements in science and technology, Gates received the Howard Vollum Award in 1984 from Reed College in Portland, Oregon.

Gates's competitive drive and fierce desire to win has made him a powerful force in business, but it has also consumed much of his personal life. In the six years between 1978 and 1984, he took a total of only two weeks vacation. But on New Year's Day 1994 Gates married Melinda French, a Microsoft manager, on the Hawaiian island of Lanai. The ceremony was held on the island's Challenge golf course, and Gates kept it private by buying out the unused rooms at the local hotel and by hiring all of the helicopters in the area to keep photographers from using them. His fortune at the time of his marriage was estimated at close to seven billion dollars. By 1997 his worth was estimated at approximately \$37 billion, earning him the title of "richest man in America."

The future for Microsoft

Many criticize Gates not just for his success, but because they feel he tries to unfairly—and maybe even illegally—dominate the market. As a result of Microsoft's market control, the U.S. Department of Justice brought an antitrust lawsuit (a lawsuit that is the result of a company being accused of using unfair business practices) against the company in 1998, saying the company had an illegal stronghold on the software industry.

Bill Gates.

Reproduced by permission of AP/Wide World Photos.

Gates maintained Microsoft's success over rivals such as Oracle and IBM was simply the result of smart, strategic decision making. U.S. District Judge Thomas P. Jackson did not agree, and in November 1999, he found Microsoft to be a monopoly (a company with exclusive control) that used its market power to harm competing companies. Because of the ruling, Gates faced the prospect of breaking up Microsoft.

On January 13, 2000, Gates handed off day-to-day management of Microsoft to friend and right-hand man Steve Ballmer, adding chief executive officer to his existing title of president. Gates held on to his posi-

tion as chairman in the reshuffle, and added the title of chief software architect.

In the spring of 2002 Gates himself was scheduled to testify on behalf of Microsoft. The final ruling on the fate of Microsoft has the potential to be a landmark decision on the future of the computer industry.

Gates as philanthropist

Aside from being the most famous businessman of the late 1990s, Gates also has distinguished himself as a philanthropist (someone working for charity). He and wife Melinda established the Bill & Melinda Gates Foundation, which focuses on helping to improve health care and education for children around the world. The foundation has donated \$4 billion since its start in 1996. Recent pledges include \$1 billion over twenty years to fund college scholarships for about one thousand minority students; \$750 million over five years to help launch the Global Fund for Children's Vaccines; \$50 million to help the World Health Organization's efforts to eradicate polio, a crippling disease that usually attacks children; and \$3 million to help prevent the spread of acquired immune deficiency syndrome (AIDS; an incurable disease that destroys the body's immune system) among young people in South Africa. In November 1998 Gates and his wife also gave the largest single gift to a U.S. public library, when they donated \$20 million to the Seattle Public Library. Another of Gates's charitable donations was \$20 million given to the Massachusetts Institute of Technology to build a new home for its Laboratory for Computer Science.

In July 2000 the foundation gave John Hopkins University a five-year, \$20 million grant to study whether or not inexpensive

vitamin and mineral pills can help save lives in poor countries. On November 13, 2000, Harvard University's School of Public Health announced it had received \$25 million from the foundation to study AIDS prevention in Nigeria. The grant was the largest single private grant in the school's history. It was announced on February 1, 2001, that the foundation would donate \$20 million to speed up the global eradication (to completely erase) of the disease commonly known as elephantiasis, a disease that causes disfigurement. In 2002 Gates, along with rock singer Bono, announced plans for DATA Agenda, a \$24 billion fund (partially supported by the Bill and Melinda Gates Foundation) that seeks to improve health care in Africa.

Although many describe Gates as cold and distant, his friends find him friendlier since his marriage and since the birth of his daughter, Jennifer, in April 1996. Further, he recognizes his overall contribution to both the world of technology and his efforts in philanthropy. In *Forbes* magazine's 2002 list of the two hundred richest people in the world, Gates was number one for the eighth straight year, coming in with a net worth of \$52.8 billion.

PAUL GAUGUIN

Born: June 7, 1848

Paris, France

Died: May 8, 1903

Marquesas Islands, French Polynesia

French artist, painter, and sculptor

The French painter and sculptor Paul Gauguin sought exotic environments, first in France and later in Tahiti. He frequently combined the people and objects in his paintings in novel ways, bringing to mind a mysterious, personal world in the process.

Early life

Paul Gauguin was born in Paris, France, on June 7, 1848, to a French father, a journalist from Orléans, and a mother of Spanish Peruvian descent. When Paul was three his parents sailed for Lima, Peru, after the victory of Louis Napoleon (1769–1821). His father died during the trip. Gauguin and his mother remained in Lima for four years. There the young Gauguin lived a comfortable life. Gauguin then returned to Orléans, and eventually found his way back to Paris. Next he attended a seminary (a school for religious studies). At the age of seventeen he enlisted in the merchant marine (people who work on commercial ships). In 1870 Gauguin began a career as a stockbroker (a person who buys and sells shares of companies) and remained in this profession for twelve years. He married a Danish girl, Mette Sophia Gad, and seemed destined for a comfortable middle-class existence.

Beginnings as an artist

Gauguin's hobby was painting, which he pursued enthusiastically. The Salon of 1876 accepted one of his pictures, and he started a collection of works by impressionist painters. The impressionists were a group of painters who concentrated on the general impression produced by a scene or object. They used unmixed primary colors and small strokes to simulate actual reflected light. As time went on, Gauguin's desire to paint became ever stronger. In 1883 Gauguin, now thirty-five, decided to give up business and devote himself entirely to painting. His wife took their five children to live with her parents in Copenhagen, Denmark. Gauguin followed her, but he soon returned with his eldest son, Clovis, to Paris. There he supported himself by pasting advertisements on walls.

In 1886, with Clovis enrolled in a boarding school, Gauguin lived for a few months in the village of Pont-Aven in the Brittany region of northwestern France. He then left for the island of Martinique, first stopping to work as a laborer on the Panama Canal. He returned to Pont-Aven in February 1888 and gathered about him a group of painters. Gauguin preached and practiced a style he called synthetism, which involved pure color patterns, strong, expressive outlines, and flat planes. The painters admired the local people for their simple lives and deep religious faith. They felt these qualities reflected a truth about humanity's basic nature, which was not reflected in the sophisticated world of Paris.

Pre-Tahitian paintings

Among Gauguin's masterpieces of this period are *Vision after the Sermon/Jacob Wrestling with the Angel* (1888) and the *Yellow*

Paul Gauguin.

Reproduced by permission of the Corbis Corporation.

Christ (1889). In both paintings Breton (residents of Brittany) peasants (farm laborers) are strong elements. In both paintings one sees Gauguin's usual bright colors and simplified shapes, which he treated as flat silhouettes. These paintings also show his use of symbolism (using one thing to represent another). Objects and events are taken out of their normal historical contexts.

In *Vision after the Sermon*, Breton women observe Jacob wrestling with a stranger who turns out to be an angel. This is an episode described in the book of Genesis in the Bible. Gauguin is saying that the faith of these women enabled them to see miraculous

events of the past as vividly as if they were occurring before them. In the *Yellow Christ* Gauguin used a yellow, wooden statue from a church near Pont-Aven as his model. He depicts Breton women as if they were in the presence of the actual death of Jesus Christ.

In October 1888 Dutch painter Vincent van Gogh (1853–1890) invited Gauguin to join him at Arles, France. Gauguin was a proud, arrogant, sarcastic, and sophisticated person. Van Gogh was open and strongly needed human companionship. They did not get along and Gauguin returned to Paris. There he resumed his bohemian (nontraditional and artistic) existence until 1891, when he left France and the Western (characterized by European and American ideals) civilization he had come to dislike and went to Tahiti.

Tahiti

Gauguin embodied the dissatisfaction with bourgeois (middle-class) Parisian existence felt by several postimpressionist painters. He achieved what was perhaps the most extreme break with that society when he left Europe for a non-Western culture. When Gauguin arrived in Tahiti, he did not settle in the capital, Papeete, because Europeans lived there. Instead, he lived with the natives some twenty-five miles away. He perceived Tahiti as a land of beautiful and strong people, who were unspoiled by Western civilization. He enjoyed the bright, warm colors there.

Gauguin became ill and returned to France in August 1893. There he found that he had inherited a small sum of money from an uncle. In Paris he lived with flair. An exhibition of his Tahitian work in November was

not successful financially. In early 1894 he went to Denmark and then to Brittany.

Tahitian paintings

Gauguin's Tahitian paintings celebrate the lushness and mysterious splendor of his new environment. At the same time they are seldom pictures of actual Tahitian life. They contain combinations of objects and persons taken out of their normal settings, as did several of his paintings done in Brittany. In *La Orana Maria* (1891) a Tahitian woman, her young son, and two women standing nearby are shown in the obvious poses of the Virgin Mary and the Christ child with attendant saints or worshiping angels. In *Where Do We Come From? What Are We? Where Are We Going?* (1898) Tahitian natives are portrayed in unusual and probably preplanned meditative poses with a foreboding (giving a warning) primitive idol.

Second trip to Tahiti

In 1895 an unsuccessful auction of Gauguin's paintings was held. He sailed for Tahiti that spring. He once again settled among the natives. His health grew poorer. An ankle he had broken in Brittany did not heal properly, and he suffered from strokes. The government authorities, for whom he showed contempt, harassed him. However, he had to depend on them for menial jobs (work that is beneath a person's skills) in order to support himself. In 1901 he moved to the Marquesas Islands. He died there, alone, of a stroke on May 8, 1903.

Gauguin is regarded today as a highly influential founder of modern art. He focused on color and line, and often created a profound sense of mystery in his work. His unusual com-

binations of objects and people can be seen as forerunners of the surrealist (using fantastic imagery) art of the 1920s and later.

KARL FRIEDRICH GAUSS

Born: April 30, 1777

Brunswick, Germany

Died: February 23, 1855

Göttingen, Germany

German mathematician

The German mathematician Karl Friedrich Gauss made outstanding contributions to both pure (studied for its own sake) and applied (studied in order to solve specific problems) mathematics.

Early life and education

Karl Friedrich Gauss was born in Brunswick, Germany, on April 30, 1777. He was the son of Gebhard Dietrich Gauss, a gardener and bricklayer, and Dorothea Gauss, the daughter of a stonecutter. Karl was an

Karl Friedrich Gauss.

Reproduced by permission of Getty Images.

extremely bright child, correcting his father's arithmetic when he was three years old. His intellectual abilities attracted the attention of the Duke of Brunswick, who sent him first to the Collegium Carolinum (1792–95) in Brunswick and then to the University of Göttingen (1795–98).

Theory of numbers

In 1801 Gauss published *Disquisitiones arithmeticae*, which is often regarded as the work that marked the beginning of the modern theory of numbers. It combined the work of past scientists with his own, and was presented in such an elegant and complete way

that it rendered previous works on the subject obsolete (out of date and no longer needed).

Gauss made many outstanding contributions to the theory of numbers, including research on the division of a circle into equal parts. This solved a famous problem in Greek geometry (the study of points, lines, angles, and surfaces), namely, the inscription (drawing inside) of regular polygons (closed figures bounded by straight lines) in a circle. First, Gauss proved that a regular polygon with seventeen sides can be constructed with a ruler and compass; he then showed that any polygon with a prime number (able to be divided only by itself or the number 1) of sides can be constructed with these instruments.

Gauss also gave three proofs for the idea—conceived by others but never proved—that every equation in algebra has at least one root. Gauss was the first to adopt a strict approach to the treatment of infinite (never-ending) series of numbers. He also opened up a new line of research by updating the definition of a prime number.

Astronomical calculations

The discovery by Giuseppe Piazzi of the asteroid Ceres in 1801 increased Gauss's interest in astronomy, and upon the death of the Duke of Brunswick, Gauss was appointed director of the observatory (a building whose purpose is to observe stars and planets) in Göttingen, Germany, where he remained for the rest of his life. Gauss successfully determined the orbit of Ceres and was able to predict its correct position. Gauss's success in these calculations encouraged him to develop his methods further, and in 1809 his *Theoria motus corporum coelestium* appeared. In it

Gauss discussed how to determine orbits from observed data.

In his calculation of the orbits of planets, Gauss used the method of least squares. This method is used to determine the most likely value of something from a number of available observations. In defense of the method, Gauss created the Gaussian law of error, which became known in studies of probability (chance) and statistics (the collection, study, and presentation of data) as the normal distribution.

Non-Euclidean geometry

Although he published nothing on the subject, Gauss was almost certainly the first to develop the idea of non-Euclidean geometry (disputing one of Euclid's [335 –270 B.C.E.] theories that through a given point not on a given line, there exists only one line parallel to the given line). As adviser to the government of Hanover, Gauss had to consider the problem of surveying (measuring and determining exact position of) hilly country. This led him to develop the idea that the measurements of a curved surface could be developed in terms of Gaussian coordinates (points). Instead of considering the surface as part of a three-dimensional (displaying depth) space, Gauss set up a network of coordinates on the surface itself,

showing that the geometry of the surface can be described completely in terms of measurements in this network. Defining a straight line as the shortest distance between two points, measured along the surface, the geometry of a curved surface can be regarded as a two-dimensional (lacking depth) non-Euclidean geometry.

Apart from his books Gauss published a number of memoirs (reports of his experiences), mainly in the journal of the Royal Society of Göttingen. In general, however, he was unwilling to publish anything that could be regarded as controversial (causing a dispute), and as a result some of his most brilliant work was found only after his death. Gauss married twice, but both wives died young. Of his six children, his youngest daughter remained to take care of him until his death on February 23, 1855.

reader's guide

U•X•L Encyclopedia of World Biography features 750 biographies of notable historic and contemporary figures from around the world. Chosen from American history, world history, literature, science and math, arts and entertainment, and the social sciences, the entries focus on the people studied most often in middle school and high school, as identified by teachers and media specialists.

The biographies are arranged alphabetically across ten volumes. The two- to four-page entries cover the early lives, influences, and careers of notable men and women of diverse fields and ethnic groups. Each essay includes birth and death information in the header and concludes with a list of sources

for further information. A contents section lists biographees by their nationality. Nearly 750 photographs and illustrations are featured, and a general index provides quick access to the people and subjects discussed throughout *U•X•L Encyclopedia of World Biography*.

Special thanks

Much appreciation goes to Mary Alice Anderson, media specialist at Winona Middle School in Winona, Minnesota, and Nina Levine, library media specialist at Blue Mountain Middle School in Cortlandt Manor, New York, for their assistance in developing the entry list. Many thanks also go to the following people for their important editorial contri-

butions: Taryn Benbow-Pfalzgraf (proofreading), Jodi Essey-Stapleton (copyediting and proofing), Margaret Haerens (proofreading), Courtney Mroch (copyediting), and Theresa Murray (copyediting and indexing). Special gratitude goes to Linda Mahoney at LM Design for her excellent typesetting work and her flexible attitude.

Comments and suggestions

We welcome your comments on the *U•X•L Encyclopedia of World Biography*. Please write: Editors, *U•X•L Encyclopedia of World Biography*, U•X•L, 27500 Drake Road, Farmington Hills, MI 48331-3535; call toll-free: 1-800-877-4253; fax to 248-699-8097; or send e-mail via www.gale.com.

HANS GEIGER

Born: September 30, 1882

Neustadt an-der-Haardt, Germany

Died: September 24, 1945

Potsdam, Germany

German experimental physicist

Hans Geiger was a German nuclear physicist (a person who studies the inner core of the atom) best known for his invention of the Geiger counter, a device used for detecting and counting atomic particles, and for his work in nuclear physics with Ernest Rutherford (1871–1937).

Early life

Johannes Wilhelm Geiger was born in Neustadt an-der-Haardt (now Neustadt an-der-Weinstrasse), Germany, on September 30, 1882. His father, Wilhelm Ludwig Geiger, was a professor at the University of Erlangen from 1891 to 1920. The eldest of five children, Geiger was educated first at Erlangen Gymnasium, from which he graduated in 1901. After completing his required military service, he studied physics (the study of the relationship between matter and energy) at the University of Munich and at the University of Erlangen, receiving a doctorate from Erlangen in 1906 for his study of electrical releases through gases.

Partners with Rutherford

Geiger moved to Manchester University in England, where he met Ernest Rutherford, head of the physics department. Rutherford and Geiger began a lifelong personal and professional friendship. They began experiments based on Rutherford's detection of the release of alpha particles (particles with "positive" electric charges) from radioactive substances (substances whose atoms give off particles of matter and harmful rays of energy).

Since alpha particles can penetrate thin walls of solids, Rutherford and Geiger presumed that they could also move through

atoms. Geiger designed a machine that would shoot alpha particles through gold foil onto a screen, where they were observed as tiny flashes of light. Counting the thousands of flashes per minute was a long, hard task. Geiger decided to try to invent an easier, more accurate way to count them. His solution was an early version of the "Geiger counter," an electrical machine designed to count released alpha particles.

In 1912 Geiger returned to Germany as director of the new Laboratory for Radioactivity at the Physikalisch-Technische Reichsanstalt in Berlin, Germany, where he invented an instrument for measuring not only alpha particles but other types of radiation (the giving off of energy and particles from atoms) as well. Geiger's research was interrupted by the start of World War I (1914–18; a war fought between the German-led Central Powers and the Allies—England, the United States, Italy, and other nations), during which he fought with the German troops. Crouching in trenches on the front lines left Geiger with painful rheumatism (stiffness and pain in the joints). With the war over, Geiger returned to the Reichsanstalt. In 1920 he married Elisabeth Heffter, with whom he had three sons.

Perfects the Geiger-Mueller counter

In 1925 Geiger became professor of physics at the University of Kiel, Germany. While there he developed, with Walther Mueller, the Geiger-Mueller counter, commonly referred to as the Geiger counter. The counter can locate a speeding alpha particle within about one centimeter in space and to within a hundred-millionth second in time. In 1925 Geiger used his counter to confirm

the existence of light quantum, or packets of energy.

Geiger left Kiel for the University of Tübingen in October of 1929 to serve as professor of physics and director of research at its physics institute. Installed at the Institute, Geiger worked constantly to increase the Geiger counter's speed and ability to detect. As a result of his efforts, he was able to discover bursts of radiation called cosmic-ray showers, and he concentrated on their study for the rest of his career.

Stands up to Hitler

Geiger returned to Berlin in 1936 upon being offered the chair of physics at the Technische Hochschule. He continued experimenting and improving the counter. He also became involved with politics after Adolf Hitler's (1889–1945) rise to power in Germany's National Socialist Party. Geiger and many other scientists did not want the government to interfere with or influence their work. He helped compose a position paper that was signed by seventy-five of Germany's most notable physicists. The paper was presented to Hitler's Education Ministry in late 1936. The document urged the government to keep its hands off science, complaining that there were too few new physicists and that students were avoiding the subject in Germany because of newspaper attacks on physics by National Socialists.

Geiger continued working at the Technische Hochschule through World War II (1939–45; a war fought between the Axis powers—Germany, Italy, and Japan—and the Allied powers—Great Britain, France, the Soviet Union, and the United States), although he was often confined to bed with

rheumatism. He had just started to show signs of improvement in his health when his home near Babelsberg, Germany, was occupied in June 1945. Geiger was forced to flee to Potsdam, Germany, where he died on September 24, 1945.

THEODOR GEISEL

Born: March 2, 1904

Springfield, Massachusetts

Died: September 24, 1991

La Jolla, California

American children's book author and illustrator

Theodor Geisel, better known as Dr. Seuss, wrote the popular children's books *The Cat in the Hat*, *Green Eggs and Ham*, *Horton Hatches the Egg*, and many more. As Dr. Seuss, Geisel brought a whimsical touch and a colorful imagination to the world of children's books.

Theodor Geisel.

Childhood and early career

Theodor Geisel was born on March 2, 1904, in Springfield, Massachusetts. His father owned a brewery until the onset of Prohibition, a time in the 1920s when buying and selling alcohol was made illegal. Geisel's father then took a job as superintendent of city parks, which included the local zoo. There, young Theodor spent many days drawing the animals and eventually developing his own unique style. Though Geisel would later gain fame because of his unique artistic style, he never once had an art lesson.

After graduating high school, Geisel went on to graduate from Dartmouth College

in 1925, and later studied at the Lincoln College of Oxford University in England. After dropping out of Oxford, he traveled throughout Europe, mingling with émigrés (those living abroad) in Paris, including writer Ernest Hemingway (1899–1961). Eventually returning to New York, he spent fifteen years in advertising before joining the army and making two Oscar-winning documentaries, "Hitler Lives" and "Design for Death," which he made with his wife, Helen Parker Geisel. He would also win an Oscar for his animated cartoon "Gerald McBoing Boing" (1951). Also at this time Geisel began drawing and selling his cartoons to national magazines, including *Vanity Fair* and the *Saturday Evening Post*. Later he worked as an editorial cartoonist for *PM* newspaper in New York.

First books

Geisel began writing the verses of his first book, *And to Think That I Saw It on Mulberry Street*, in 1936 during a rough sea passage. But success did not come easy for the young author, as *Mulberry Street* was rejected by twenty-nine different publishers before it was finally accepted. Published in 1937, the book won much praise, largely because of its unique drawings.

All of Geisel's books, in fact, feature crazy-looking creatures that are sometimes based on real animals, but which usually consist of such bizarre combinations of objects as a centipede and a horse and a camel with a feather duster on its head. Unlike many puppeteers and cartoonists who have capitalized on their creations by selling their most familiar images to big-time toy-makers, Dr. Seuss concentrated his efforts on creating interesting books.

In May 1954, after a string of successful books, Geisel published what would become his most famous book, *The Cat in the Hat*. Legend has it that *The Cat in the Hat* was created, in part, because of a bet Geisel made with a publisher who said he could not write a complete children's book with less than 250 words. *The Cat in the Hat* came in at 223 words. In 1960 Geisel published his second-most successful book, *Green Eggs and Ham*, which used only fifty words. In 1958, from the success of his children's books, Geisel founded Beginner Books, which eventually became part of Random House.

“Basically an educator”

Admired among fellow authors and editors for his honesty and hard work, the Pulitzer Prize-winning author, according to Ruth MacDonald in the *Chicago Tribune*, “perfected the art of telling great stories with a vocabulary as small as sometimes fifty-two or fifty-three words.”

“[Geisel] was not only a master of word and rhyme and an original and eccentric artist,” Gerald Harrison, president of Random House's merchandise division, declared in *Publisher's Weekly*, “but down deep, I think he was basically an educator. He helped teach kids that reading was a joy and not a chore. . . . For those of us who worked with him, he taught us to strive for excellence in all the books we published.”

Wrote for adults as well as children

Geisel's last two books spent several months on the bestseller lists and include themes that appealed to adults as well as children. “Finally I can say that I write not for kids but for people,” he commented in the

Los Angeles Times. Many of his readers were surprised to learn that Geisel had no children of his own, though he had stepchildren from his second marriage to Audrey Stone Dimond. To this fact he once said, “You make 'em, I amuse 'em,” as quoted in the *Chicago Tribune*. According to the *Los Angeles Times*, the author also remarked, “I don't think spending your days surrounded by kids is necessary to write the kind of books I write. . . . Once a writer starts talking down to kids, he's lost. Kids can pick up on that kind of thing.”

Before Geisel, juvenile books were largely pastel, predictable, and dominated by a didactic tone (a sense that the books were intended to instruct). Though Dr. Seuss books sometimes included morals, they sounded less like behavioral guidelines and more like, “listen to your feelings” and “take care of the environment,” universal ideas that would win over the hearts of youngsters from around the world. Geisel's 47 books were translated into 20 languages and have sold more than 200 million copies. Of the ten bestselling hardcover children's books of all time, four were written by Geisel: *The Cat in the Hat*, *Green Eggs and Ham*, *One Fish, Two Fish, Red Fish, Blue Fish*, and *Hop on Pop*.

Theodor Geisel died September 24, 1991, in La Jolla, California. To children of all ages, Dr. Seuss remains the most famous and influential name in children's literature.

GENGHIS KHAN

Born: c. 1155

Mongolia

Died: August 25, 1227

Kansu, China

Mongolian conqueror and ruler

Genghis Khan was the creator of the Mongol nation and the founder of one of the greatest empires the world has ever seen.

Early life

Genghis Khan, whose original name was Temüjin, was born near the river Onon in the northeast corner of present-day Mongolia. When he was nine years old his father Yesugei took him to another tribe to find him a wife. On the way back Yesugei was killed by the Tatars, who in the second half of the twelfth century had displaced the Mongols as the strongest tribe in eastern Mongolia. Yesugei's followers deserted his widow and children, who were then forced to live in conditions of great hardship. Temüjin survived by hunting and fishing.

Rise to power

Temüjin began to attract followers who liked how he handled himself in battle. He became a follower of Toghrlil, the ruler of a Christian tribe in central Mongolia. Toghrlil and a young Mongol chief named Jamuka helped Temüjin rescue his wife, who had been captured by the Merkits, a tribe in present-day Russia. Some of the Mongol princes named Temüjin as their ruler, giving him the title of Chingiz-Khan (Genghis Khan), or "Supreme Ruler of the Ocean." Genghis Khan and Toghrlil later helped North China in a successful battle against the Tatars.

Relations between Genghis Khan and Toghrlil worsened and eventually led to open warfare. Genghis Khan was defeated in the first battle and withdrew into a remote area of northeastern Mongolia. In 1203, however, he gained a complete victory over Toghrlil, who fled and was killed by the Naimans. Toghrlil's people were absorbed by the Mongols. Genghis Khan now turned against his enemies in western Mongolia, including the Naimans allied with Jamuka and the rest of the Merkits. The Naimans were defeated in 1204. Jamuka was soon given up by his followers and put to death by his former friend. In 1206 a group of Mongol princes proclaimed Genghis Khan supreme ruler of the Mongol peoples.

Conquest of China

Genghis Khan did more than just invade and conquer. He established a code of laws for the empire and a standard written language for his people, and he set up a kind of postal system to help different parts of the empire communicate with each other. His greatest skill, though, was as a military

leader. In 1211 the Mongols began a full assault on China by invading the entire region north of the Great Wall. In the summer of 1215 Peking, China, was captured. Leaving one of his generals in charge of further operations in North China, Genghis Khan returned to Mongolia to devote his attention to events in central Asia.

Küchlüg the Naiman, who had taken refuge among the Kara-Khitai, had overthrown the ruler of that people and taken over that kingdom. An army sent by Genghis Khan chased him into Afghanistan, where he was captured and put to death; the takeover of his territory gave the Mongols a common frontier with Sultan Muhammad, the ruler of Khiva, who after recent conquests had claimed all of central Asia as well as Afghanistan and the greater part of Persia.

Campaign in the West

It was only a matter of time before the two empires went to war; it began with the execution of some of Genghis Khan's supporters and merchants accompanying them at the town of Otrar. Genghis Khan set out for revenge in the spring of 1219. By April 1220 he had captured Otrar as well as the cities of Bukhara and Samarkand. Genghis Khan sent his two best generals in pursuit of Sultan Muhammad, who fled across Persia and was killed on an island in the Caspian Sea. Continuing westward, the generals defeated an army of Russians and Turks before rejoining their master on his journey homeward. Genghis Khan, in the meantime, had attacked and captured Termez in the autumn of 1220 and spent the winter in what is now Tajikistan.

Early in 1221 Genghis Khan destroyed the city of Balkh, in the Persian province of

Genghis Khan.

Reproduced by permission of the Corbis Corporation.

Khurasan. He sent his son Tolui (Tulë) to complete the takeover of that province, which has not fully recovered from the damage to this day. Genghis Khan advanced through Afghanistan to attack Sultan Jalal al-Din, the son of Sultan Muhammad, who had defeated a Mongol army near Kabul. He fought with Jalal al-Din on the banks of the Indus; the sultan escaped capture only by swimming across the river. Jalal al-Din's defeat concluded the campaign in the west, and Genghis Khan returned to Mongolia. In 1226 he resumed war with the Tanguts, a Tibetan people. He died, with the war still in progress, in the Liupan Mountains in Kansu on August 25, 1227.

J. PAUL GETTY

Born: December 15, 1892

Minneapolis, Minnesota

Died: June 6, 1976

London, England

American businessman

J. Paul Getty was a billionaire independent oil producer who founded and controlled the Getty Oil Company and over two hundred other related companies.

Childhood

Jean Paul Getty was born on December 15, 1892, in Minneapolis, Minnesota. His father, George Franklin Getty, was a lawyer, but in 1904 he moved his wife, Sarah Risher Getty, and his son to the Oklahoma territory to begin a successful career in the oil business. Two years later the family moved to Los Angeles, California, where young Getty attended private school before graduating

from Polytechnic High School in 1909.

After graduation Getty attended the University of Southern California and the University of California at Berkeley where he studied political science and economics. During the summers he worked on his father's oil rigs as a "roustabout," or unskilled laborer. In 1912 Getty enrolled in Oxford University in England, from which he received a degree in economics and political science in 1914. Afterwards he traveled around Europe before returning to the United States.

Striking oil

In 1914 Getty arrived in Tulsa, Oklahoma, determined to strike it rich as an oil producer. Although he operated independently of his father's Minnehoma Oil Company, his father's loans and financial backing enabled him to begin buying and selling oil leases in the red-bed area of Oklahoma. In 1916 Getty's own first successful well came in, and by the fall of that year he had made his first million dollars as an oil producer.

For the next two years Getty "retired" to the life of a wealthy bachelor in Los Angeles, but he returned to the oil business in 1919. During the 1920s he and his father continued to be enormously successful both in drilling their own wells and in buying and selling oil leases (renting out oil rigs), and Getty became more active in California than in Oklahoma. He amassed a personal fortune of over three million dollars and acquired a third interest in what was to become the Getty Oil Company.

Paul Getty became the president of the George Getty Oil Company after his father's death in 1930. During the 1930s his wells continued to produce, and profits poured in.

He also bought a controlling interest in the Pacific Western Oil Corporation, one of the ten largest oil companies in California. After a series of agreements with his mother, he obtained the controlling interest in the George Getty Oil Company. He also began real estate dealings, including the purchase of the Hotel Pierre in New York City.

The Getty Oil Company

After World War II (1939–45), Getty took a gamble on oil rights in the Middle East. In 1949 he secured the oil rights in Saudi Arabia's half of the Neutral Zone, a barren area between Saudi Arabia and Kuwait. He made major deals with King Saud (c. 1880–1953), which shocked the large oil companies. After three years and a \$30 million investment, however, Getty found the huge oil deposits that helped make him a billionaire. In 1957 *Fortune* magazine published a list of the richest men in America. Getty's name headed the list, and the publicity turned Getty into an object of public fascination and legend.

After 1959 Getty stopped living out of hotel rooms and established his home and offices at Sutton Place, a sixteenth-century, seven-hundred-acre manor outside London, England. The huge estate, with its gardens, pools, trout stream, and priceless furnishings, was also a near fortress with elaborate security arrangements. Giant Alsatian dogs had the run of the estate, and there were also two caged lions, Nero and Teresa.

Getty was a celebrity, and public interest, fueled by envy and admiration, focused on Getty's tragedies as well as his billions. The public seemed to like to read into Getty's life the lesson that money does not buy happiness. Getty was married five times and each

J. Paul Getty.

Reproduced by permission of AP/Wide World Photos.

marriage ended in divorce. He had five sons, two of whom died before him, and his relationship with each of them was difficult. His grandson, J. Paul Getty III, was kidnapped in Italy in 1973. Although he was returned for a ransom (exchanged for money), part of his ear had been cut off.

Jean Paul Getty died at Sutton Place on June 6, 1976. He is buried on his Malibu, California, estate.

KAHLIL GIBRAN

Born: January 6, 1883

Besharri, Lebanon

Died: April 10, 1931

New York, New York

Lebanese poet, author, and artist

Lebanese writer and artist Kahlil Gibran influenced modern Arabic literature and composed inspirational pieces in English, including *The Prophet*.

Childhood and early career

Kahlil Gibran, baptized Gibran Khalil Gibran, the oldest child of Khalil Gibran and his wife Kamila Rahme, was born January 6, 1883, in Besharri, Lebanon, then part of Syria and the Ottoman Turkish Empire. His childhood in a village beneath Mt. Lebanon included few comforts, and he had no formal early education. However, he received a strong spiritual influence from legends and biblical stories handed down through generations.

Seeking a better future, the family, except for his father, moved to the United States in

1895. There they joined relatives and shared an apartment in South Boston, Massachusetts. While registering for public school, Gibran's name was shortened and changed. His life changed when a local art teacher noticed his artistic skill and arranged for Gibran's introduction to photographer Fred Holland Day in December 1896. After discovering Gibran's talent for literature and art, Day declared him to be a "natural genius" and became his mentor, or teacher. Gibran soon designed book illustrations, sketched portraits, and met Day's friends. He then went to Beirut, Lebanon, in 1898 to attend Madrasat-al-Hikmah, a college where he studied Arabic literature and started a literary magazine.

An inspired career

Upon returning to Boston, Gibran resumed his art work and renewed his friendship with Day. In 1904 Gibran and another artist exhibited their work at Day's studio in Boston. Here Gibran met Mary Elizabeth Haskell, who became his patron (supporter) as well as his tutor in English for two decades. She aided several talented, needy people and was a major factor in Gibran's success as an English writer and artist.

From 1908 to 1910 Haskell provided funds for Gibran to study painting and drawing in Paris, France. Before going to France, he studied English literature with her and had an essay, "al-Musiqā" (1905), published by the Arabic immigrant press in New York City. Diverse influences, including Boston's literary world, the English Romantic poets, mystic William Blake (1757–1827), and philosopher Nietzsche (1844–1900), combined with his experience in Lebanon, shaped Gibran's artistic and literary career.

Gains fame

After “Spirits Rebellious,” an Arabic poem, was published in 1908, Gibran was called a reformer (one who seeks social improvements) and quickly became influential in the Arabic world. He soon became the best known of the “Mahjar poets,” or immigrant Arabic writers. His most respected Arabic poem is the “The Procession” (1919).

Gibran soon made his mark on the New York artistic and literary world as well. His first work in English appeared in 1918 when *The Madman* was published. The parables (stories that illustrate a moral or religious lesson) and poems on justice, freedom, and God are illustrated by three of Gibran’s own drawings.

In October 1923 *The Prophet* was published, and it sold over one thousand copies in three months. The slim volume of parables, illustrated with Gibran’s drawings, is one of America’s all-time best selling books, with its fame spreading by word of mouth. By 1931 *The Prophet* had been translated into twenty languages. In the 1960s it reached new heights of popularity with American college students.

Later career and legacy

Although in failing health, Gibran completed two more books in English—*Sand and Foam* (1926) and *Jesus, The Son of Man* (1928). After his death, earlier essays were compiled and published, and his Arabic work was translated into many languages.

Gibran was forty-eight when he died in New York City on April 10, 1931, of cancer of the liver. The Arabic world praised him after his death as a genius and patriot. A

large group greeted his body upon its return to Besharri for burial in September 1931. Today Arabic scholars praise Gibran for introducing Western romanticism and a freer style to strict Arabic poetry. “Gibranism,” the term used for his approach, attracted many followers.

The young emigrant from Lebanon who came through Ellis Island in 1895 never became an American citizen; he loved his birthplace too much. But he was able to combine two heritages and achieved lasting fame in widely different cultures. The following passage from *Sand and Foam* illustrates Gibran’s message:

Faith is an oasis in the heart which will never be reached by the caravan of thinking. How can you sing if your mouth be filled with food? How shall your hand be raised in blessing if it is filled with gold?

ALTHEA GIBSON

Born: August 25, 1927

Silver, South Carolina

African American tennis player

Althea Gibson is noted not only for her exceptional abilities as a tennis player, but for breaking the color barrier in the 1950s as the first African American to compete in national and international tennis.

Childhood in Harlem

Althea Gibson was born in Silver, South Carolina, on August 25, 1927. She was the first of Daniel and Anna Washington Gib-

son's five children. Her parents worked on a cotton farm, but when she was three years old the family moved north to the Harlem area of New York City. Gibson caused a lot of problems as a child and often missed school. Her father was very strict with her on these occasions, but he also taught her to box, a skill that he figured would come in handy in the rough neighborhood the Gibson family lived in.

Tennis success

When Gibson was ten years old, she became involved with the Police Athletic League (PAL) movement known as "play streets." PAL was an attempt to help troubled children establish work habits they would need later in life. In 1940 PAL promoted paddle ball (a game similar to handball except that it is played using a wooden racket) competitions in Harlem. After three summers of playing the game Gibson was so good that the Cosmopolitan Tennis Club sponsored her to learn the game of tennis and proper social behavior.

In 1942 Gibson began winning tournaments sponsored by the American Tennis Association (ATA), the African American version of the United States Lawn Tennis Association (USLTA). In 1944 and 1945 Gibson won the ATA National Junior Championships. In 1946 several politically minded African Americans identified Gibson as having the talent to help break down organized racism (unequal treatment based on race) in the United States. Sponsored by Hubert Eaton and Walter Johnson (1887–1946) and inspired by boxer Sugar Ray Robinson (1921–1989), Gibson was soon winning every event on the ATA schedule. In 1949 she

entered A&M University in Tallahassee, Florida, on a tennis scholarship and prepared for the difficult task of breaking the color barrier in tournament tennis.

Breaking the color barrier

The USLTA finally allowed Gibson to play in the 1950 Nationals when four-time U.S. singles and doubles (a two-person team) champion Alice Marble (1913–) spoke out on her behalf. Gibson lost her first match of the tournament, but the breakthrough had been made. Over the next several years Gibson worked as a physical education teacher at Lincoln University in Jefferson City, Missouri. She also continued playing tennis and rose up the USLTA rankings (ninth in 1952, seventh in 1953). After a year of touring the world and playing special events for the U.S. State Department, Gibson staged a full-scale assault on the tennis world in 1956. That year she won the French Open in both singles and doubles.

Over the next two years Gibson was the leading women's tennis player in the world. In 1957 and 1958 she won both the Wimbledon and U.S. National singles titles, becoming the first African American to win a Wimbledon singles title. In 1958 she wrote a book about her life called *I Always Wanted to Be Somebody*. After her 1958 victory at the U.S. Nationals, Gibson retired from tennis and played professional golf. She was elected to the International Tennis Hall of Fame in 1971.

Later years

In 1994 Gibson suffered a stroke that left her confined to her home. In February 2001 her picture was featured on a Wheaties

Althea Gibson.

cereal box as part of a special Black History Month package. Later that year tennis stars Venus (1980–) and Serena Williams (1981–) were honored at an Althea Gibson Foundation dinner that raised \$100,000 for scholarships and youth development programs. Through a spokeswoman, Gibson congratulated the Williams sisters for having grown into two of the best tennis players in the world.

DIZZY GILLESPIE

Born: October 21, 1917

Cheraw, South Carolina

Died: October 6, 1993

Englewood, New Jersey

African American musician and bandleader

Fifty years after helping found a new style of revolutionary jazz that came to be known as bebop, Dizzy Gillespie's music is still a major contributing factor in the development of modern jazz.

Difficult childhood

John Birks Gillespie was born October 21, 1917, in Cheraw, South Carolina, to John and Lottie Gillespie. The last of nine children, Gillespie's father was abusive and unusually strict and the youngest Gillespie grew up hard and strong.

When Gillespie was ten, his father died and left the family in terrible financial trouble. Around this time Gillespie's English teacher introduced him to music, and he soon joined the school band. At first he played the trombone, but switched to the

trumpet after borrowing a neighbor's and immediately falling in love with the instrument. Over the next several years Gillespie played with local bands—to both black and white audiences—until his family moved to Philadelphia, Pennsylvania.

In Philly and New York

Gillespie played with bands in Philadelphia from 1935 to 1937 before moving to New York City. In Philadelphia Gillespie earned his nickname for his unpredictable and funny behavior. When Gillespie was in the Frankie Fairfax band in Philadelphia he carried his new trumpet in a paper bag, an act that inspired fellow musicians like Bill Doggett to call him “Dizzy.”

In New York City the Teddy Hill Orchestra hired Gillespie for a European tour. By 1937—when he was only nineteen—Gillespie had already made a name for himself among New York musicians, who could not help but notice his radically fresh take on solo (single) trumpet playing. Gillespie made his first recordings with the Teddy Hill Orchestra just prior to leaving for Europe with “The Cotton Club Show.”

Gillespie joined the Cab Calloway (1907–1994) Orchestra in 1939 and stayed until 1941. Calloway played the Cotton Club and toured extensively. During this period Gillespie continued to play all-night jam sessions at Minton's and Monroe's Uptown House to develop his musical knowledge and style.

Gillespie joined the Earl “Fatha” Hines band in 1942, about the same time Charlie Parker (1920–1955) did. Although Parker became famous as an alto saxophonist, he was

playing tenor sax at that time. Gillespie first met Parker in Kansas City, Missouri, in 1940 when he was on tour with Cab Calloway. The two of them jammed together at the Booker T. Washington Hotel for several hours.

Bebop born on 52nd Street

A large part of the Earl Hines band departed in 1943 to form a new group headed by Billy Eckstine. Former Hines members who joined Eckstine included Sarah Vaughan (1924–1990), Gillespie, Parker, and others. Gillespie became musical director for Eckstine, whose backers got him a job on 52nd Street.

After leaving Eckstine, Gillespie substituted in the Duke Ellington (1899–1974) Orchestra for about four weeks, then formed his own group to play at the newly opened Onyx Club on 52nd Street. Gillespie had been playing bebop (a new, radically different form of jazz) whenever he could since 1940, the year he married Lorraine Willis. Now he was able to play it full time. 52nd Street became the proving ground for a new jazz style that had previously been played primarily at late night jam sessions. “The opening of the Onyx Club represented the birth of the bebop era,” Gillespie recalled in his book, *To Be or Not to Bop*.

Also in 1944 Gillespie received the New Star Award from *Esquire* magazine, the first of many awards he would receive in his career. Describing the new style his quintet played, Gillespie wrote, “We’d take the chord structures of various standard and pop tunes and create new chords, melodies, and songs from them.”

Gillespie’s quintet and the presentation of modern jazz reached its peak in 1953—

with a concert at Massey Hall in Toronto that featured Gillespie, Parker, Bud Powell (1924–1966), Max Roach (1924–), and legendary jazz bassist Charles Mingus (1922–1979). Billed by jazz critics as “the greatest jazz concert ever,” it was recorded by Mingus and later released on Debut Records.

Gillespie’s legacy

In 1989, the year he turned seventy-two, Dizzy Gillespie received a Lifetime Achievement Award at the National Association of Recording Arts and Sciences’ Grammy Award ceremonies. The honor—one of many awarded to the trumpet virtuoso—recog-

nized nearly fifty years of pioneering jazz performances. That same year he received the National Medal of Arts from President George Bush (1924–).

Not letting age slow him down, in 1989 Gillespie gave three hundred performances in twenty-seven countries, appeared in one hundred U.S. cities in thirty-one states and the District of Columbia, headlined three television specials, performed with two symphonies, and recorded four albums. The next year, at the Kennedy Center for the Performing Arts ceremonies celebrating the centennial of American jazz, Gillespie received the American Society of Composers, Authors, and Publishers' Duke Award for fifty years of achievement.

Although Gillespie's failing health was due to pancreatic (having to do with the organ that helps digestion) cancer, Gillespie continued to play the music that he loved late into his life. His last public appearance was in Seattle in February of 1992. Gillespie passed away quietly in his sleep on October 6, 1993, at the age of seventy-five.

RUTH BADER GINSBURG

Born: March 15, 1933

Brooklyn, New York

American Supreme Court justice and lawyer

Ruth Bader Ginsburg is the second woman ever to sit on the United States Supreme Court and is known as the legal architect of the modern women's movement. She, more than any other person, pointed out that many laws encouraged gender discrimination; that is, they led to better treatment of men than women instead of guaranteeing equal rights and opportunities to all as was intended by the United States Constitution.

The search for equality in the law begins

Ruth Joan Bader was born March 15, 1933, to Nathan and Cecelia (Amster) Bader in Brooklyn, New York. Her mother was a role model in Ruth's life at a time when women had to fight for the privileges and rights that men took for granted. "I pray that I may be all that she would have been had she lived in an age when women could aspire [seek to reach a goal] and achieve and daughters are cherished as much as sons," the *New York Times* quoted Ginsburg as saying of her mother after she was named to the Supreme Court. Cecelia Bader had once hoped to attend college but instead went to work in a garment factory to help pay for her brother's education. This was a sacrifice many women made in the early decades of the 1900s.

Ruth Bader loved to read and learn. Her interest in the law started in grade school,

when she wrote articles for her school newspaper about the Magna Carta, a document that represented the first step toward freedom in English-speaking lands. She attended Cornell University, where she graduated with high honors in government. She then married Martin Ginsburg, a law student. She went on to Harvard Law School, where she served on the Law Review.

In the male-dominated world of law, Ruth Bader Ginsburg was told that she and her eight female classmates—out of a class of five-hundred—were taking the places of qualified males. She transferred to Columbia University after two years when her husband, who would become one of the country's top tax lawyers, took a job in New York. Here she continued to encounter gender discrimination; although she graduated at the top of her class, law firms, which normally welcome talented graduates, refused to hire her.

Teaching and practicing law

After working for District Judge Edmund L. Palmieri in New York, Ginsburg joined the faculty of Rutgers University, where, in order to keep her job, she wore overly large clothes to hide the fact that she was carrying her second child. She was only the second female professor at Rutgers and one of only twenty women law professors in the country. In 1972, after teaching a course on women and the law at Harvard University, she was appointed the first female faculty member in the law school's history.

Ginsburg also served as a lawyer for the American Civil Liberties Union (ACLU), an organization that works to protect and ensure the constitutional rights of all persons and groups. She devoted most of her attention to

Ruth Bader Ginsburg.

women's rights. A former ACLU colleague was quoted as telling the *Legal Times*, "We were young and very green. She had it all so carefully thought through. She knew exactly what she needed to do." In a 1973 case before the Supreme Court, Ginsburg successfully argued against a federal law that gave more housing and medical benefits to male members of the armed services than to females. However, she did not argue only cases in which women were the victims of discrimination. She believed that the law must give equal rights to all groups. For instance, she convinced the court that a portion of the Social Security Act (a law that provides pro-

tection for people against loss of income due to old age, disability, or death) favored women over men because it gave certain benefits to widows but not to widowers.

After winning five of the six cases she argued before the Supreme Court, Ginsburg was named a judge on the United States Court of Appeals for the District of Columbia by President Jimmy Carter (1974–). She brought a cautious, thoughtful style to the court, and most people were pleased with her performance. Conservatives, who for the most part like things to stay as they are, agreed with her view that courts should only interpret laws and leave their creation to politicians. On the other hand, liberals, or people who are usually more open to change and reform, were pleased with her votes supporting broadcasting access to the courts.

Supreme Court justice

With the retirement of U.S. Supreme Court Justice Byron White (1917–) in 1993, President Bill Clinton (1946–) wanted a replacement with the intellect and the political skills to deal with the Supreme Court's top conservatives. He chose Ruth Bader Ginsburg. Court observers praised her commitment to the details of the law, her intelligent questioning of lawyers arguing before her, and her talent for using calm and sensible arguments to win over her fellow judges.

The Senate Judiciary Committee hearings to approve the choice of Ginsburg were unusually friendly. Committee Chairman Joseph Biden (1942–) said, according to the *Boston Globe*, that Ginsburg had “already helped to change the meaning of equality in our nation.” Ginsburg was confirmed by the Senate in a vote of ninety-six to three, becoming

the 107th Supreme Court Justice and its second female jurist after Sandra Day O'Connor (1930–). She was also the first justice to be named by a Democratic president since 1967. President Clinton said in a statement quoted by the *Detroit Free Press*, “I am confident that she will be an outstanding addition to the court and will serve with distinction for many years.”

Women in the judiciary

Since taking office, Ruth Bader Ginsburg has written thirty-five significant opinions (formal statements written by a judge), two important concurring (agreeing) opinions, and three selected dissenting (opposing) opinions. Ginsburg was seen as a stronger voice in favor of gender equality, the rights of workers, and the separation of church and state (the belief that neither the church nor the government should have any influence over the other) than many of the other judges on the Supreme Court. In 1999, she won the American Bar Association's Thurgood Marshall Award for her contributions to gender equality and civil rights.

As more and more women became judges throughout the country, Justice Ginsburg gave former president Carter credit for changing the judicial landscape for women forever. Appearing at a program entitled *Woman and the Bench* at the University of Pennsylvania Law School, she said, “He appointed women in numbers such as there would be no going back.” Ruth Bader Ginsburg deserves equal credit for surviving and fighting through the discrimination of the past to help bring about change.

WHOOPI GOLDBERG

Born: November 13, 1955

New York, New York

African American actress and comedian

The high-energy actress Whoopi Goldberg has appeared in such films as *The Color Purple*, *Ghost*, and *Sister Act*. She became the first African American woman to host the Academy Awards and only the second African American woman to actually win one.

Early years

Whoopi Goldberg was born Caryn E. Johnson in New York City around 1955 (some reports say 1949 or 1950), the first of Emma Johnson's two children. Her father abandoned the family, and Goldberg's mother worked at several different jobs, including as a nurse and teacher. Goldberg began acting in

children's plays with the Hudson Guild Theater at the age of eight and spent much of her free time watching movies, sometimes three or four a day. "I liked the idea that you could pretend to be somebody else and nobody would cart you off to the hospital," Goldberg explained to *Cosmopolitan's* Stephen Farber.

During the 1960s Goldberg dropped out of high school and became addicted to drugs. Finally she sought help, cleaned herself up, and, in the process, married her drug counselor. A year later Goldberg gave birth to a daughter, Alexandra. Less than a year after that, she was divorced. During this time she worked as a summer camp counselor and as a member of the choruses of Broadway shows such as *Hair* and *Jesus Christ Superstar*.

New start in California

In 1974 Goldberg headed west to San Diego, California, pursuing her childhood dream of acting. She performed in plays with the San Diego Repertory Theater and worked with a comedy group called Spontaneous Combustion. To care for her daughter, she had to work as a bank teller, a bricklayer, and a funeral home assistant. She was also on welfare for a few years. During this period she went by the name "Whoopi Cushion," sometimes pronouncing her name "ku-SHON" as if it were French. After her mother pointed out how ridiculous the name sounded, Goldberg changed it.

Goldberg moved north to Berkeley, California, in the late 1970s and joined the Blake Street Hawkeyes Theater, a comedy troupe. This helped her develop powerful acting and comedic abilities and led to the creation of seventeen different characters for a one-woman show that she called *The Spook*

Whoopi Goldberg.

Reproduced by permission of AP/Wide World Photos.

Show. She performed the show first on the West Coast, then toured the rest of the country and Europe in the early 1980s before ending up in New York City. These performances caught the attention of film director Mike Nichols (1931–), who offered to produce her show on Broadway in September 1984. In 1985 director Steven Spielberg (1946–) offered Goldberg the lead role in *The Color Purple*, her first film appearance. Goldberg received a Golden Globe Award and was nominated (her name was put forward for consideration) for an Academy Award for her performance.

Social work

Goldberg's fortunes continued to rise. In addition to her film awards, she won a Grammy Award in 1985 for her comedy album *Whoopi Goldberg* and received an Emmy nomination the following year for her guest appearance on the television show *Moonlighting*. The increased exposure, recognition, and acceptance allowed Goldberg to pursue social activities, focusing on issues that affected her when she required public assistance, which she has tried to call attention to since her early days in show business.

Beginning in 1986, along with Billy Crystal (1947–) and Robin Williams (1952–), Goldberg hosted the annual *Comic Relief* benefit that raises money for the homeless through the Health Care for the Homeless project. Goldberg also appeared before Congress to oppose proposed cuts in federal welfare, in addition to speaking out on behalf of environmental causes, the nation's hungry, acquired immune deficiency syndrome (AIDS; a disease that attacks the immune system), drug abuse awareness, and women's right to free choice. She has been recognized with several awards for her efforts.

This increased exposure, though, did not lead to increased success for Goldberg, as she went on to star in a series of poorly received movies, including *Jumpin' Jack Flash*, *Burglar*, *Fatal Beauty*, *The Telephone*, *Clara's Heart*, and *Homer and Eddie*. It seemed that as quickly as she had risen, she had fallen. Goldberg became the subject of gossip and rumors that Hollywood was ready to write her off. She remained steady, though, ignoring bad reviews and criticism. "I've just stopped listening to them," she told Paul Chutkow in

Vogue. "I've taken crazy movies that appeal to me. I don't care what other people think about it. If it was pretty decent when I did it, I did my job."

Ghost revives career

Goldberg needed to find the right film to highlight her comic approach in combination with social and humanitarian (promoting human welfare) elements. Her chance came with the 1990 film *Ghost*. Although not all critics liked the film, most critical and popular response was positive, especially regarding Goldberg's performance as the flashy but heroic psychic, Oda Mae. She had spent six months persuading studio executives that she was perfect for the part, and her hard work paid off: *Ghost* made more money than any other film released in 1990. In addition, Goldberg won an Oscar for her performance, becoming only the second black female in the history of the Academy Awards to win such an honor.

Goldberg's next role was in a drama, *The Long Walk Home*. She also continued her television work. Beginning in the 1988 and 1989 season, she appeared off and on as a crew member on *Star Trek: The Next Generation*, and in 1992 she hosted her own talk show. In 1992 alone Goldberg appeared in three films: director Robert Altman's (1925–) *The Player*; the comedy *Sister Act*, one of the biggest box-office hits of the summer; and *Sarafina: The Movie*, a film version of the musical about black South African teenagers' struggle against apartheid (South Africa's policy of keeping the races separate). Goldberg also appeared in *Made in America*, *Sister Act II* (for which she was paid eight million dollars), *Corrina, Corrina*, and *Boys on the Side*.

Academy Awards

Goldberg took a break from acting to host the Academy Awards in 1994 and 1996, becoming the first African American and first female to host the event solo. More than one billion people worldwide saw the awards show and critics praised her performance. In 1996 the academy faced public protest by the Reverend Jesse Jackson (1941–) regarding the lack of African American voters and award nominees. Goldberg joked that she would have worn Jackson's ribbon of protest, but she knew he was not watching.

In 1997, after appearing in a comedy called *The Associate*, Goldberg left Hollywood and returned to theater, starring on Broadway in a production of *A Funny Thing Happened on the Way to the Forum*. She continued to appear in films, including *The Deep End of the Ocean* and *Girl, Interrupted*, both in 1999, and on television on the game show *Hollywood Squares*. She hosted the Academy Awards again in 1999 and 2002. In 2001 she received the Mark Twain Prize for American Humor from the Kennedy Center for the Performing Arts in Washington, D.C.

William Golding.
Courtesy of the Library of Congress.

WILLIAM GOLDING

Born: September 19, 1911

Saint Columb, Cornwall, England

Died: June 19, 1993

Perranarworthal, Cornwall, England

English author

The winner of the 1983 Nobel Prize in Literature, William Golding is among the most popular and influential British authors to have emerged in the second half of the twentieth century. Gold-

ing's reputation rests primarily upon his first novel, *Lord of the Flies* (1954), which is consistently regarded as an effective and disturbing portrayal of the fragility of civilization.

Childhood and college years

Golding was born in Saint Columb Minor in Cornwall, England, in 1911. His father, Alex, was a schoolmaster, while his mother, Mildred, was active in the Women's Suffrage Movement (the movement for women's right to vote). As a boy, his favorite authors included H. G. Wells (1866–1946), Jules Verne (1828–1905), and Edgar Rice Burroughs (1875–1950). Since the age of seven, Golding had been writing stories, and at the age of twelve he attempted to write a novel.

Golding remained an enthusiastic writer and, upon entering Brasenose College of Oxford University, abandoned his plans to study science, preferring to read English literature. At twenty-two, a year before taking his degree in English, Golding saw his first literary work published—a poetry collection simply titled *Poems*.

After graduating from Oxford in 1935, Golding continued the family tradition by becoming a schoolmaster in Salisbury, Wiltshire. His teaching career was interrupted in 1940, however, with the outbreak of World War II (1939–45). Lieutenant Golding served five years in the British Royal Navy and saw active duty in the North Atlantic, commanding a rocket launching craft.

Lord of the Flies

Golding had enhanced his knowledge of Greek history and mythology by reading while at sea, and when he returned to his

post at Bishop Wordsworth's School in 1945, he began furthering his writing career. He wrote three novels, all of which went unpublished. But his frustration would not last long, when, in 1954, Golding created *The Lord of the Flies*. The novel was rejected by twenty-one publishers before Faber & Faber accepted the forty-three-year-old schoolmaster's book.

Initially, the tale of a group of schoolboys stranded on an island during their escape from war received mixed reviews and sold only modestly in its hardcover edition. But when the paperback edition was published in 1959, thus making the book more accessible to students, the novel began to sell briskly. Teachers, aware of the student interest and impressed by the strong theme and symbolism of the work, began assigning *Lord of the Flies* to their literature classes. As the novel's reputation grew, critics reacted by drawing scholarly reviews out of what was previously dismissed as just another adventure story.

The author's extremely productive output—five novels in ten years — and the high quality of his work established him as one of the late twentieth-century's most distinguished writers. This view of Golding was cemented in 1965, when the author was named a Commander of the British Empire.

Later works

After the success of *Lord of the Flies*, Golding enjoyed success with other novels, including *Pincher Martin* (1957), *Free Fall* (1959), and *The Pyramid* (1967). The author's creative output then dropped drastically. He produced no novels and only a handful of novellas (short novels), short stories, and other occasional pieces.

In 1979 Golding returned with the publication of *Darkness Visible* which received mixed reviews. The author faced his harshest criticism to date with the publication of his 1984 novel *The Paper Men*, a drama about an aging, successful novelist's conflicts with his pushy, overbearing biographer. Departing briefly from fiction, Golding wrote a book containing essays, reviews, and lectures. *A Moving Target* appeared in 1982, one year prior to the author's receipt of the Nobel Prize in Literature.

William Golding died in England in 1993. A year after his death, *The Double Tongue* was released, published from a manuscript Golding completed before he died.

SAMUEL GOMPERS

Born: January 27, 1850

London, England

Died: December 13, 1924

San Antonio, Texas

English-born American union leader and union organizer

The American labor leader Samuel Gompers was the most significant person in the history of the American labor movement (the effort of working people to improve their lives by forming organizations called unions). He founded and served as the first president of the American Federation of Labor.

Youth and education

Samuel Gompers was born on January 27, 1850, in east London, England, to Solomon and Sarah Gompers. His family was Dutch-Jewish in origin and had lived in England for only a few years. The family was extremely poor, but at the age of six Gompers was sent to a free Jewish school, where he received the beginnings of an education practically unknown to poor people in his day. The education was brief, however, as Gompers began to work, first making shoes and then in his father's cigar-making trade. In 1863, when Gompers was thirteen, the family immigrated to the United States and settled in the slums of New York City. The family soon numbered eleven members, and Gompers again went to work as a cigar maker.

Cigar-makers' union

Full of energy and naturally drawn to other people, Gompers joined many organizations in the immigrant world of New York. But from the start nothing was as important to him as the small Cigar-makers' Local Union No. 15, which he joined with his father in 1864. Gompers immediately rose to leadership of the group. At the age of sixteen he regularly represented his fellow workers when confronting their employers, and he discussed politics and economics with well-spoken workingmen many years older than himself.

This was a time of technological change in cigar making (as it was in practically every branch of American industry). Machines were being introduced that replaced many highly skilled workers. The cigar makers were distinguished, however, by the intelligence with which they studied their problems. The nature of their work—the quietness of the process of making cigars, for example—permitted and even encouraged discussion of economic questions, and this environment provided Gompers with an excellent kind of schooling. The most important influence upon his life was Ferdinand Laurel, a once prominent Scandinavian socialist (someone who thinks goods and services should be owned and controlled by the government), who taught Gompers that workingmen should avoid both politics and unrealistic dreaming in favor of winning immediate “bread and butter” gains in their wages, hours of work, and working conditions.

In fact, Gompers had many contacts with socialists, though from his earliest days he had little time for their ideas. Basing his own thinking about unions on a “pure and simple” concrete approach, he built the Cigar-makers' International Union into a functioning organization despite modern technology and unsuccessful strikes (an event in which a group of workers stop working in an attempt to gain rights from their employer).

American Federation of Labor

In 1881, with several other union leaders, Gompers helped to set up a loose organization of unions that, in 1886, became the American Federation of Labor (AFL). Founded during the height of the Knights of Labor, the AFL was different from the older

labor organization in nearly every way. Most importantly, the Knights wished for a society in which cooperation would govern the economy, whereas the AFL unions were interested only in improving the day-to-day material life of their members. The socialists' attempt to take control of the AFL in 1894 did succeed in removing Gompers from power for a year, but he was firmly back in control by 1895 and, if anything, more opposed to socialism in the unions than ever.

"Socialism holds nothing but unhappiness for the human race," Gompers said in 1918. "Socialism has no place in the hearts of those who would secure the fight for freedom and preserve democracy." Throughout his career he argued against the thriving Socialist Party. Although there were many reasons that socialist thought did not take root in American unions, Gompers's influence as the head of the labor movement for forty years was important.

Even if Gompers was hostile to the socialists, however, he was as devoted to the cause of unions as any other American labor leader before or since. He was the first national union leader to recognize and encourage the strike as labor's most effective weapon. In 1906 he defied a court order concerning a union activity and was sentenced to a year in jail, though he ended up spending only one night behind bars. The way in which Gompers spoke against greedy businessmen matched anything of his time. (Gompers first became known as a speaker and always delivered a speech well. He spoke widely for the cause of the AFL and, thanks to a quick mind, rarely lost in debate. However, none of his books was distinguished

Samuel Gompers.

except his autobiography, *Seventy Years of Life and Labor* [1925].)

A national figure

Although the leader of a movement that lacked social respect, Gompers had good relations with several presidents and became something of an adviser to President Woodrow Wilson. In 1901 he was one of the founders of the National Civic Federation (an alliance of businessmen willing to put up with unions and moderate union leaders), and Wilson found it politically useful and worthwhile to have the support of the AFL during World War I (1914–1918; a war that

involved many nations in Europe and that the United States entered in 1917). Gompers supported the war energetically, attempting to stop AFL strikes while the war was being fought and speaking out against socialists and pacifists (people opposed to war as a way of solving disagreements). He served as president of the International Commission on Labor Legislation at the Versailles Peace Conference and on various other committees.

During the 1920s, though in failing health, Gompers served as a spokesman in Washington for the new Mexican government that had overthrown the old one, considering himself key in gaining American recognition of the new government. Mexican President Plutarco Elias Calles (1877–1945) received Gompers with high honors in 1924. Realizing that the end was near for him, however, Gompers returned early from the trip to Mexico and died in San Antonio, Texas, on December 13. True to his character, his last words were: “Nurse, this is the end. God bless our American institutions. May they grow better day by day.”

What had begun as useful for Gompers—acceptance of the capitalist system (in which goods and services are owned and controlled by private individuals) and working within it—had become his guiding principle. Indeed, he was one of the creators of the modern institutions that he referred to in his last words—for capitalism he won the loyalty of labor, and for labor he won a part in business decision making.

JANE GOODALL

Born: April 3, 1934

London, England

English primatologist and scientist

Jane Goodall was a pioneering English primatologist (a person who studies primates, which is a group of animals that includes human beings, apes, monkeys, and others). Her methods of studying animals in the wild, which emphasized patient observation over long periods of time of both social groups and individual animals, changed not only how chimpanzees (a kind of ape) as a species are understood, but also how studies of many different kinds of animals are carried out.

Childhood

The older of two sisters, Jane Goodall was born on April 3, 1934, in London, England, into a middle-class British family. Her

father, Mortimer Herbert Morris-Goodall, was an engineer. Her mother, Vanna (Joseph) Morris-Goodall, was a successful novelist. When Goodall was about two years old her mother gave her a stuffed toy chimpanzee, which Goodall still possesses to this day. She was a good student, but she had more interest in being outdoors and learning about animals. Once she spent five hours in a henhouse so she could see how a hen lays an egg. She loved animals so much that by the time she was ten or eleven she dreamed of living with animals in Africa. Her mother encouraged Goodall's dream, which eventually became a reality.

When Goodall was eighteen she completed secondary school and began working. She worked as a secretary, as an assistant editor in a film studio, and as a waitress, trying to save enough money to make her first trip to Africa.

An African adventure begins

Jane Goodall finally went to Africa when she was twenty-three years old. In 1957 she sailed to Mombasa on the east African coast, where she met anthropologist Louis Leakey (1903–1972), who would become her mentor, or teacher. In Africa, Leakey and his wife, Mary, had discovered what were then the oldest known human remains. These discoveries supported Leakey's claim that the origins of the human species were in Africa, not in Asia or Europe as many had believed.

Leakey hoped that studies of the primate species most closely related to human beings—chimpanzees, gorillas, and orangutans—would shed light on the behavior of the human animal's ancestors. He chose Goodall for this work because he believed

Jane Goodall.

that as a woman she would be more patient and careful than a male observer, and that as someone with little formal training she would be more likely to describe what she saw rather than what she thought she should be seeing.

Living among chimps

In July 1960, twenty-six-year-old Jane Goodall set out for the first time for Gombe National Park in southeastern Africa to begin a study of the chimpanzees that lived in the forests along the shores of Lake Tanganyika. She had little formal training; still, she brought to her work her love of animals, a strong sense of determination, and a desire

for adventure. She thought at the time that the study might take three years. She ended up staying for more than two decades.

In her earliest days at Gombe, Goodall worked alone or with native guides. She spent long hours working to gain the trust of the chimpanzees, tracking them through the dense forests and gradually moving closer and closer to the chimps until she could sit among them—a feat that had not been achieved by other scientists. Her patience produced an amazing set of discoveries about the behaviors and social relations of chimpanzees.

Chimpanzees had been thought to be violent, aggressive animals with crude social arrangements. Researchers had given chimps numbers rather than names and had ignored the differences in personality, intelligence, and social skills that Goodall's studies revealed. Chimpanzees, Goodall showed, organized themselves in groups that had complex social structures. They were often loving and careful parents and also formed attachments to their peers. They hunted and ate meat. And they used simple tools—twigs or grasses that they stripped of leaves and used to get termites out of termite mounds. This discovery helped force scientists to give up their definition of human beings as the only animals that use tools.

In 1962 Leakey arranged for Goodall to work on a doctorate degree at Cambridge University, in England, which would give scientific weight to her discoveries. In 1965 she became the eighth person ever to receive a doctorate from Cambridge without having earned an undergraduate degree.

By 1964 the Gombe Stream Research Center had become the destination of choice

for graduate students and other scientists wishing to study chimpanzees or to learn Goodall's methods. The general public was also learning about Goodall's work through a series of articles in *National Geographic* magazine and later through *National Geographic* television specials. In 1964 Goodall married Hugo Van Lawick, a Dutch wildlife photographer who had come to Gombe at the invitation of Leakey to take pictures for the magazine. Goodall's son by that marriage, Hugo (more often referred to as Grub), was her only child.

New discoveries

The 1970s saw changes in Goodall's understanding of the chimpanzees and in the way in which research was carried out at Gombe. In 1974 what Goodall referred to as a "war" broke out between two groups of chimpanzees. One group eventually killed many members of the other group. Goodall also witnessed a series of acts of infanticide (the killing of an infant) on the part of one of the older female chimps. These appearances of the darker side of chimpanzee behavior forced her to adjust her interpretation of these animals as being basically gentle and peace loving.

In May 1975 rebels from Zaire, Africa, kidnapped four research assistants from the research center. After months of talks, the assistants were returned. Because of the continued risk of kidnappings, almost all of the European and American researchers left Gombe. Goodall continued to carry out her work with the help of local people who had been trained to conduct research.

A chimp's true friend

Later Goodall turned her attention to the problem of captive chimpanzees. Because

they closely resemble humans, chimpanzees have been widely used as laboratory animals to study human diseases. Goodall used her knowledge and fame to work to set limits on the number of animals used in such experiments and to convince researchers to improve the conditions under which the animals were kept. She also worked to improve conditions for zoo animals and for conservation of chimpanzee habitats (the places in the wild where chimps live). In 1986 she helped found the Committee for the Conservation and Care of Chimpanzees, an organization dedicated to these issues. She has even written children's books, *The Chimpanzee Family Book* and *With Love*, on the subject of treating animals kindly.

For her efforts Goodall has received many awards and honors, among them the Gold Medal of Conservation from the San Diego Zoological Society, the J. Paul Getty Wildlife Conservation Prize, and the National Geographic Society Centennial Award. In 2000 she accepted the third Gandhi/King Award for Non Violence at the United Nations. Much of Goodall's current work is carried on by the Jane Goodall Institute for Wildlife Research, Education, and Conservation, in Ridgefield, Connecticut. She does not spend much time in Africa anymore; rather, she gives speeches throughout the world and spends as many as three hundred days a year traveling.

BENNY GOODMAN

Born: May 30, 1909

Chicago, Illinois

Died: 1986

New York, New York

American musician, bandleader, and clarinetist

Benny Goodman was a great jazz clarinet player and the leader of one of the most popular big bands of the Swing Era (1935–1945). In fact, *Time* magazine dubbed him “the King of Swing.”

Early life

Benjamin David Goodman was born in Chicago, Illinois, on May 30, 1909, into a large, poor Jewish family. His parents, who had moved to the United States from Eastern Europe, were Dora and David Goodman. Benny formally studied music at the famed Hull House (a settlement house that was originally opened by Jane Addams [1860–1935] to provide services to poor members of the community), and at the age of ten he was already a skilled clarinetist. At age twelve, appearing onstage in a talent contest, he did

Benny Goodman.

an imitation of the popular Ted Lewis. So impressed was bandleader Ben Pollack that five years later he sent for Goodman to join his band in Los Angeles, California. After three years with Pollack, Goodman left the band in New York City in 1929 to make it on his own. In 1934 he led his first band on a radio series called "Let's Dance" (which became the title of Goodman's theme song). The band also played at dance halls and made a handful of records.

The turning point

In 1935, armed with songs developed by some of the great African American

arrangers, Goodman's band traveled the country to play their music. Not especially successful in most of its performances, the band arrived at the Palomar Ballroom in Los Angeles in a discouraged mood. The evening of August 21, 1935, began coolly. Then, desperate to wow the unimpressed audience, Goodman called for the band to launch into a couple of fast-paced crowd pleasers, and the reaction ultimately sent shock waves through the entire popular music world. Hundreds of people stopped dancing and massed around the bandstand, responding with enthusiasm.

That performance turned out to be not only a personal triumph for the band, but for swing music in general. Goodman's popularity soared; the band topped almost all the magazine and theater polls, their record sales were huge, they were given a weekly radio show, and they were featured in two big-budget movies. But an even greater triumph awaited—a concert at Carnegie Hall in New York that was to win respect for Goodman's music. The night of January 16, 1938, is now famous; the band outdid itself, improving on recorded favorites such as "King Porter Stomp" and "Don't Be That Way." The band finished the evening with a lengthy, classic version of "Sing, Sing, Sing."

Goodman the person

Two of the finest musicians ever to work with Goodman were pianist Teddy Wilson (1912–1986) and vibraphonist-drummer Lionel Hampton (1909–2002). However, they played only in small-group arrangements because of the unwritten rule that did not allow white musicians and African American musicians to play together. Goodman was the first white bandleader to challenge segrega-

tion (keeping people of different races separate) in the music business, and as the rules eased he hired other African American greats.

Many top-notch musicians joined and left Goodman's band over the years, more so than in other bands. Most musicians found Goodman an unfriendly employer. He was said to be stern and stingy with money. Moreover, Goodman was referred to in music circles as "the Ray," because of his habit of glaring at any player guilty of a "clam" or "clinker" (a wrong note), even in rehearsal. An outstanding clarinetist who was equally at home performing difficult classical music, Goodman was not very patient with anything that was not technically perfect.

Later years

After 1945 the clarinet was pushed into a minor role in bebop music, the new style of jazz that was becoming popular. Goodman struggled for a while to accept the new music, but in 1950 he decided to dissolve his band. From that time forward his public appearances were rare. They were mostly with small groups and almost always for television specials, recordings, or European tours. His most celebrated tour, however, was part of the first-ever cultural exchange with the Soviet Union. In 1962, at the request of the U.S. State Department, he went to the Soviet Union with a band. The trip was a smashing success and greatly helped American jazz become popular in Eastern Europe.

After his marriage in 1941, Goodman's home was New York City. His wife, Alice, with whom he had two daughters, died in 1978. Goodman maintained his habit of performing on occasion. In 1985 he made a surprise and, by all accounts, spectacular

appearance at the Kool Jazz Festival in New York. He died the following year of an apparent heart attack.

Goodman's ultimate contribution to jazz is still being debated. Much post-1940s jazz criticism has judged him to have been overrated compared to other jazz greats. Nonetheless, Goodman's technical mastery, polished tone, highly individual (and influential) solo style, and undeniable *swing* certainly have earned him a permanent place in jazz history.

MIKHAIL GORBACHEV

Born: March 2, 1931

Privolnoe, Russia

Russian politician and president

Mikhail Gorbachev achieved national recognition as member of the Communist Party, the dominant political party of the former Soviet

Mikhail Gorbachev.

Courtesy of the Library of Congress.

Union that believes in the common ownership of goods and services. In March 1985 the Soviet Communist Party elected him general secretary of the party and leader of the Soviet Union. He resigned in 1991 shortly after the fall of communism.

Early life

Mikhail Sergeevich Gorbachev was born into a peasant family in the village of Privolnoe, near Stavropol, Soviet Union, on March 2, 1931. As a teenager, he worked driving farm machinery at a local machine-tractor station. Gorbachev's experience here undoubtedly educated him well about the

serious problems of food production and political administration in the countryside. He also became familiar with the control of the KGB (the Soviet secret police), knowledge which would serve him well in his future career.

In 1952 Gorbachev joined the Communist Party and began studies at the Moscow State University, where he graduated from the law division in 1955. He also met and married fellow student Raisa Titorenko, in 1953.

With Soviet Premier Joseph Stalin's (1879–1953) death, the Soviet Union began a period of political and intellectual unrest which paved the way for a major restructuring of the Soviet Union's political system and economic administration. For young party activists like Gorbachev this was a period of exciting changes and challenges.

After his graduation Gorbachev returned to Stavropol as an organizer for the Komsomol (Young Communist League) and began a successful career as a party administrator and regional leader. In 1962 he was promoted to the post of party organizer for collective and state farms in the Stavropol region and soon took on major responsibilities for the Stavropol city committee as well. Party leader Leonid Brezhnev (1906–1982) rewarded his ability by appointing him Stavropol first secretary in 1966, roughly equivalent to mayor.

Climbing the party ladder

After gaining additional political training Gorbachev moved quickly to assume direction of the party in the entire Stavropol region. In 1970 he assumed the important post of first secretary for the Stavropol Territorial Party Committee. This position, which

is similar to a governor in the United States, proved a stepping stone to Central Committee membership and national recognition.

Gorbachev was assisted in his rise to national power by close associations with Yuri Andropov (1914–1984), who was also from the Stavropol region, and Mikhail Suslov, the party's principal ideologist. In 1978, at the request of Brezhnev, Gorbachev went to Moscow as a party secretary responsible for agricultural administration. Despite problems with agriculture in the Soviet Union at this time, Gorbachev gained a solid reputation as an energetic and informed politician. His activist style was just the thing to oppose most of the aging leaders in the Kremlin, a building in Moscow which houses the government.

The political rise of Yuri Andropov after the death of Leonid Brezhnev in January 1980 greatly strengthened the position of the up-and-coming Gorbachev as both men showed impatience with outdated practices and inefficiencies of the Soviet Union's economy. In October 1980, Gorbachev became a member of the ruling Politburo, the small group at the top of the Communist Party.

A new type of Soviet leader?

As he took power in March 1985, Gorbachev brought a fresh new spirit to the Kremlin. Young, energetic and married to an attractive, stylish, and educated woman, he represented a new generation of Soviet leaders, free from the direct experiences of Stalin's terror which so hardened and corrupted many of his elders.

Gorbachev's first steps as head of the party were designed to improve economic productivity. He began an energetic campaign

against inefficiency and waste and indicated his intention to "shake up" lazy and ineffective workers in every area of Soviet life, including the party. He also revealed an unusual friendliness. Shortly after taking power Gorbachev also moved to develop greater rapport with ordinary citizens, taking to the streets on several occasions to discuss his views and making a number of well-publicized appearances at factories and other industrial institutions.

U.S. relations

As Prime Minister Gorbachev also sought to establish better relations with the United States, which might allow some reduction in Soviet defense spending in favor of consumer goods. In November 1985 he met with President Reagan (1911–) in Geneva to discuss national and international problems. Little progress was made but both leaders agreed to hold another "summit" meeting in the United States in 1986.

When new tensions developed between the two powerful countries, the leaders agreed to hold a preliminary meeting at Reykjavik, Iceland, on October 11–12, 1986. But the clearest signs of improving Soviet-American relations came in 1988 when Gorbachev made a positive impression when he entered a crowd of spectators in New York City to shake hands with people. In May and June of the same year, President Reagan visited Moscow.

Internal conflicts

Within the Soviet Union, Gorbachev promoted great political changes. His most important measure came in 1989 when he set up elections in which members of the Communist Party had to compete against oppo-

nents who were not party members. Later that same year, he called for an end to the special status of the Communist Party guaranteed by the Soviet Constitution. He also ended the Soviet military occupation of Afghanistan.

Two issues, however, caused growing difficulty for Gorbachev. First, there was the problem of nationalities, as the Soviet Union consisted of nearly one hundred different ethnic groups. Many of these groups began to engage in open warfare against each other and even more serious, some ethnic groups, like the Lithuanians and the Ukrainians began to call for outright independence. Second, the country's economy was sinking deeper into crisis. Both industrial and agricultural production were declining, and the old system, in which the economy ran under centralized control of the government, no longer seemed to work.

While Gorbachev wrestled with these problems, a powerful rival began to emerge. Once considered an ally, Boris Yeltsin (1931–) became the country's leading supporter of radical economic reform (improvement). Yeltsin formally left the Communist Party in 1990, something Gorbachev refused to do, and was elected president of the Russian Republic in June 1991. Gorbachev, on the other hand, had been made president of the Soviet Union without having to win a national election. Thus, Yeltsin could claim a greater degree of popular support.

Fall from power

In August 1991 a group of Communist Party conservatives captured Gorbachev while he was on vacation in the Crimea and moved to seize power. Some of these men, like Prime Minister Valentin Pavlov, were individuals Gorbachev had put in power to balance

opposing political forces. But Yeltsin, not Gorbachev, led the successful resistance to the coup (takeover of the government), which collapsed within a few days. When Gorbachev returned to Moscow, he was overshadowed by Yeltsin, and there were rumors that Gorbachev himself had been involved in the coup.

By the end of 1991, the Soviet Union had fallen apart. The Ukraine and the Baltic states declared themselves as independent, and real power began to shift towards the leaders of those regions, among them Yeltsin, hero of the attempted coup and president of the Russian Republic. Gorbachev formally resigned his remaining political office on Christmas Day 1991.

In the spring of 1995, Gorbachev began touring factories in Russia, spoke to university students, and criticized President Yeltsin. He stopped just short of formally announcing his candidacy for the presidency in 1996. He wrote an autobiography, which was released in 1995 in Germany and in 1997 in the United States. Gorbachev's wife, Raisa, died of cancer in September of 1999.

On May 25, 2000, Gorbachev registered his Russian Social Democratic Party, saying he wanted to support liberal ideas. The party's registration by the Justice Ministry paved the way for it to contest future polls.

Like many historical figures, Gorbachev's role will be interpreted in varying ways. While a Russian factory worker stated in *Newsweek*, "He destroyed a great state . . . the collapse of the Soviet Union started with Gorbachev," some critics in the West saw the fall of Communism as "altogether a victory for common sense, reason, democracy and common human values."

BERRY GORDY JR.

Born: November 28, 1929

Detroit, Michigan

African American businessman, songwriter, and entrepreneur

Berry Gordy Jr. founded Motown Records in 1959. The record company grew into the most successful African American enterprise in the United States and was responsible for creating a new sound that changed popular music.

Early life

Berry Gordy Jr. was born on November 28, 1929, and was raised in Detroit, Michigan. He was not the first businessperson in the family; both parents worked for themselves, his father as a plastering contractor, his mother as an insurance agent. As a child Gordy was interested in music, and his song “Berry’s Boogie” won a talent contest. However, he did not

receive much formal training in music—only a little on the piano and merely a week on the clarinet. Gordy dropped out of Northeastern High School during his junior year to pursue a career as a boxer. Between 1948 and 1951 he fought fifteen matches, twelve of which he won, but his boxing career was cut short when he was drafted to serve in the U.S. Army during the Korean War (1950–53; a war between North Korea and South Korea during which the United Nations and the United States helped defend South Korea).

Enters the music business

When Gordy’s service in the army ended in 1953, he returned to Detroit and used the money he had saved from his military pay to open a record store called the Three-D Record Mart. His love for the jazz of Stan Kenton (1912–1979), Charlie Parker (1920–1955), and Thelonius Monk (1917–1982) influenced the records he tried to sell more than his customers’ requests and his business soon failed.

Gordy worked for his father for a short period and then on an assembly line at the Ford Motor Company. He did not find the work interesting, and as he worked he wrote songs in his head, some of which were recorded by local singers. The record company Decca Records bought several of his songs, including “Reet Petite” and “Lonely Teardrops,” and when Gordy compared the money he made for writing the songs to what Decca made from the minor hits, he realized that writing the songs was not enough. He needed to own them.

Hits the big time

At the suggestion of a friend, teenage singer William “Smokey” Robinson (1940–),

Gordy borrowed seven hundred dollars from his father and formed his own company to make and sell records. Motown Records was headquartered in a house on Detroit's West Grand Boulevard, where Gordy slept on the second floor and made records on the first. In time the company grew, with nine buildings on the same street housing its various branches, such as Jobete, music publishers; Hitsville, USA, a recording studio; International Talent Management, Inc.; the Motown Artist's Development Department (which showed Gordy's personal interest in his performers, as this was where they were taught to eat, dress, and act like professionals); and the Motown Record Corporation.

In 1960 Motown released the song "Shop Around," written by Smokey Robinson and performed by him and the Miracles. The song sold more than a million copies, and with that record Gordy's company launched the most successful and influential era in the history of popular music. What came to be called the Motown Sound was a musical form that combined classic African American gospel singing with the new rock-and-roll sound that was being shaped by Elvis Presley (1935–1977) and the British band the Beatles.

Motown Records made more than 110 number-one hit songs and countless top-ten records, including "Please Mr. Postman," "Reach Out, I'll Be There," "My Girl," "Stop! In the Name of Love," "For Once in My Life," "How Sweet It Is to Be Loved by You," "Heard It Through the Grapevine," "My Guy," "Dancing in the Streets," "Your Precious Love," "Where Did Our Love Go," "Baby Love," "I Hear a Symphony," "I Want You Back," and "I'll Be There." Just as good is the list of artists Gordy brought into the spotlight: Diana Ross (1944–) and the Supremes, the Jackson Five, Stevie Wonder (1950–), Smokey Robinson and the Miracles, the Four Tops, the Temptations, Gladys Knight (1944–) and the Pips, Tammi Terrell (1945–1970) and Marvin Gaye (1939–1984), the Marvelettes, Mary Wells (1943–1992), and Martha Reeves (1941–) and the Vandellas.

Troubles arise

By the mid-1970s, though, some of the Motown artists had begun to resist Gordy's tight control and began to break up Gordy's "family" of stars. The first to leave was Gladys Knight and the Pips. In 1975 the Jackson Five announced that they would be moving to Epic Records when their Motown contract

expired. Although Gordy kept Stevie Wonder at Motown by promising him \$13 million over seven years in the famous "Wonderdeal" of 1975, Gordy's public statements usually expressed disappointment that his superstars came to value money over loyalty. This was heard often from Gordy when, in 1981, Diana Ross announced her move to RCA Records.

Ross's move was especially surprising and bitter for Gordy because in 1972 he had moved his headquarters to Los Angeles, California, to begin a career in film, not only for himself, but so he could turn Ross into a movie star. His first film was the 1972 Paramount release *Lady Sings the Blues*, the story of jazz singer Billie Holiday (1915–1959) starring Ross. The picture was nominated for five Academy Awards and took in more than \$8.5 million at the box office. In 1975 Gordy directed Ross in *Mahogany*, the story of an African American fashion model's rise to fame. Although the film did well at the box office, it was not nearly the critical success of *Lady Sings the Blues*. Other Gordy films were *The Bingo Long Traveling All Stars and Motor Kings* (1976), *Almost Summer* (1978), *The Wiz* (1978) starring Michael Jackson (1958–) and Diana Ross, and *The Last Dragon* (1985).

Gives up his company

In June 1988 Gordy sold his company to MCA, Inc. He kept control of Jobete, the music publishing operation, and Motown's film division, but he sold the record company for \$61 million. He told the newspaper *Daily Variety* that he wanted to make sure that the history of Motown remained alive.

Esther Edwards, Berry Gordy's sister, was also interested in preserving Motown's history. The brick house in Detroit once

named Hitsville, USA, became the site of the Motown Museum thanks in large part to Edwards. She had saved hundreds of boxes of Motown items, including original music scores, posters, and photographs, and until 1988 most of them were stuck to the walls with thumbtacks. In an effort to have the collection preserved, Michael Jackson, whose ties to Berry were still strong in 1990, donated \$125,000 to the Motown Museum.

In late 1994 a plan was announced to make a tribute album to Gordy. Even though Gordy was oftentimes recognized as an entrepreneur, he was first and foremost a songwriter. Singers who signed on to sing some of Gordy's songs on the tribute album included Diana Ross, the Four Tops, the Temptations, and Smokey Robinson. In 2000, Gordy gave \$750,000 to the Rhythm and Blues Foundation in order to help those pioneers of rhythm and blues in need. Gordy's talents as a songwriter and entrepreneur and his huge contribution to popular music were recognized in 2001, when he was inducted into the Independent Music Hall of Fame.

**AL
GORE**

Born: March 31, 1948

Washington, D.C.

American vice president, senator, and congressman

Al Gore, U.S. representative, senator, and forty-fifth vice president of the United States, lost one of the closest presidential elections in history, in 2000, to George W. Bush (1946–). Gore is known for his strong interest in conservation and has spent much of his time in public office working to preserve and protect the environment.

A lot to live up to

Albert Gore, Jr., was born in Washington, D.C., on March 31, 1948. His father, Albert Gore, Sr. (1907–1998), served in the House and the Senate for nearly three decades. His mother, Pauline (LaFon) Gore, was one of the first women to graduate from the law school at Vanderbilt University. As the son of a senator, Gore learned at an early age what it was like to live in the public eye. This gave him a sense of caution that made him seem mature beyond his years.

Gore received a bachelor's degree, with honors, in government from Harvard University in 1969. He then served as an army reporter during the Vietnam War (1955–75; a civil war in which South Vietnam, with the help of the United States, was fighting against Communist forces in North Vietnam). During the war, on May 19, 1970, Al Gore married his college sweetheart, Mary Elizabeth "Tipper" Aitcheson. The couple eventually had four children.

After returning from Vietnam, Gore went on to work as a reporter in Nashville, Tennessee. He was also a home builder, a land developer, and a livestock and tobacco farmer. He went back to school, studying philosophy (the search for an understanding of the world and a human being's place in it) and law at Vanderbilt University.

Politics calls

In 1976 Gore decided to run for a seat in the U.S. House of Representatives. With his famous name, as well as running in the district that had sent his father to Congress for many terms, he beat eight other candidates in the primary election and went on to win in the general election. He ran successfully in the three following elections. Gore received some early attention in 1980 when he was assigned to the House Intelligence Committee studying nuclear weapons. He researched and wrote out a detailed plan to reduce the number of nuclear weapons, which was published in the February 1982 issue of *Congressional Quarterly*. He also focused on health- and environment-related matters. He stressed the future usefulness of new technologies and computer development. In 1984 Gore campaigned for a seat in the U.S. Senate and won by a wide margin.

In 1988 Gore decided to enter the race for the presidency. He was only thirty-nine years old. He was criticized for failing to develop a national theme for his campaign and for changing positions on issues. He had some early success in primary elections in the spring, winning more votes than any other candidate in southern states. However, he obtained only small percentages of votes in other states and withdrew from the race in mid-April. Two years later he won election to

a second term in the U.S. Senate. He chose not to run for the presidency in 1992 because of family matters. His son had been hit by a car and was seriously injured.

It was during this time that Gore wrote the book *Earth in the Balance: Ecology and the Human Spirit*, which expressed his concerns, ideas, and recommendations on conservation and the global environment. In the book he wrote about his own personal and political experiences and legislative actions on environmental issues. His feelings about the environment are best expressed in this statement from the book: “We must make the rescue of the environment the central organizing principle for civilization.”

Surprising turn of events

In the summer of 1992, Bill Clinton (1946–) selected Gore as his running mate (vice presidential candidate). The choice surprised many people because it ended a long-standing pattern of candidates choosing running mates to “balance the ticket,” that is, by choosing running mates of different ages or from different areas of the country. Both men were about the same age, came from the same region, and had similar reputations and political viewpoints. Clinton’s idea was to project a new generation of leadership as a campaign theme. Gore provided balance for Clinton with his experience in foreign and defense policy, his knowledge of environmental and new technology issues, and his image as an honest family man.

The highlight for many who followed the campaigns of 1992 was a series of debates, one of which involved Gore and his opponents, Republican Dan Quayle (1947–)

Al Gore.

Reproduced by permission of Archive Photos, Inc.

and Independent James B. Stockdale (1923–). The debates were marked by moments of comedy, as Quayle and Gore argued over the wording of Gore’s book *Earth in the Balance*. Stockdale admitted that he had turned off his hearing aid. Quayle attacked Gore’s record of environmental concerns, claiming Gore was placing endangered species (animals that are in danger of disappearing from the earth) over people’s jobs. Gore argued that a well-run environmental program would create jobs while preserving nature.

Clinton and Gore won the election, and Gore was inaugurated (sworn in) as the

forty-fifth vice president on January 20, 1993. At the age of forty-four, he became one of the youngest U.S. vice presidents in history. Clinton and Gore were reelected in 1996. During his time as vice president, Gore continued to focus on environmental concerns. In 1997 the White House launched an effort, initiated by Gore, to start producing a “report card” on the health of the nation’s ecosystems. (An ecosystem is made up of a community of plants and animals that share a certain area, and the non-living elements in that area, such as oxygen, soil, water, and sunlight.)

In 1997 Gore’s reputation was damaged when he admitted to making fund-raising telephone calls from the White House during the 1996 presidential campaign. Gore held a press conference to defend his actions, saying he had done nothing illegal. Gore was also criticized when, during a trip to China, he raised his glass and proposed a toast to an official named Li Peng (1928–). Li Peng had been involved with the Tiananmen Square Massacre of 1989, when soldiers killed thousands of students and workers who were demonstrating for democracy in Beijing, China.

Failed bid

Still, as Clinton’s second term was winding down in August 2000, the Democratic Party formally named Gore as its choice to run for president. Gore revealed a long-range economic plan that he claimed would balance the budget, reduce the national debt and keep interest rates low while creating new opportunities for the middle class. However, after a long campaign and legal challenges to the Florida

vote count that delayed the official result, Gore lost to Texas governor George W. Bush (1946–) in one of the closest presidential contests in American history.

Despite Gore’s loss in the 2000 presidential election, he continues to be an active and well-respected political figure. Many believe that the 2000 election was not Gore’s last attempt at the presidency.

**JAY
GOULD**

Born: May 27, 1836

Roxbury, New York

Died: December 2, 1892

New York, New York

American financier and businessman

American financier and railroad builder Jay Gould made a fortune by controlling the price of the stocks he bought as well as the stock market itself. He later became one of the shrewdest businessmen in American industry.

Early life

Jayson Gould was born in Roxbury, New York, on May 27, 1836, the son of John Gould and Mary More. His father was a farmer and a storekeeper, and Jay, as a small boy, grew up on a farm. He realized at a young age, however, that farm work was not to his liking. He received some education in a local school. Later, while working in his father's store, he taught himself surveying (mapping land) and mathematics at night. When he was just sixteen he started a survey business. Between the ages of eighteen and twenty-one he helped prepare maps of New York's southern counties. At twenty-one Gould invested five thousand dollars, and he and a partner opened a business tanning leather in northern Pennsylvania.

Gould then moved to New York City, where he became a leather merchant in 1860. Before long, however, he found his place on Wall Street, the financial center of the United States. In name he was a stockbroker (a person who buys and sells stocks for others), but really he was a speculator (a person who buys and sells stocks in hopes of profiting by correctly guessing their future prices). Gould quickly mastered the art of managing a business, of stock trading, and of manipulation (causing the price of a stock to change for personal gain). He traded in the stocks of his own companies, using banks he was associated with to finance his speculations, all the

Jay Gould.

while bribing legislators and judges. From 1867 to 1872 he was a power and a terror on Wall Street.

Erie war

In 1867 Gould was already on the board of directors (the controlling committee of a company) of the Erie Railroad, which was having financial difficulties. He set out to control the railroad and to push its lines westward as far as Chicago, Illinois, and to defeat industrialist Cornelius Vanderbilt's (1794–1877) effort to acquire this potential competitor. In the "Erie war" with Vanderbilt in 1868, Gould issued one hundred thousand shares of new

Erie stock, using illegal means. He then went to Albany, New York, to bribe legislators to “legalize” the action. Vanderbilt discovered he had met his match and settled, receiving \$1 million and leaving the Erie Railroad to Gould.

Gould then began to expand the Erie, which vastly increased its debt. Meanwhile, he traded in Erie stock and skillfully made a lot of money before the railroad had to go out of business because of financial problems in 1875.

Buying gold to sell wheat

As part of the Erie’s move westward, Gould obtained control of the Wabash, a railroad that carried wheat. To improve the fortunes of the Wabash, Gould hit on the scheme of pushing up the price of gold, thus weakening the value of the U.S. dollar, and thereby encouraging foreign merchants to buy more wheat.

In the summer of 1869 Gould secretly began buying gold on the free market—hoping the U.S. Treasury (the main financial institution of the federal government) would not sell its gold. He ran the price up to where it was on September 24, 1869, now known as Black Friday because it was a day that saw a serious financial emergency. Then the U.S. Treasury, realizing that Gould had tricked it, started selling gold, and the price dropped significantly. A panic hit Wall Street, sending the price of all stocks down. Gould had speculated not only in gold but also in stocks and he lost a fortune. In 1871 and 1872, however, he made another.

Once again a man of money, Gould moved his operations westward into the Wabash, the Texas and Pacific, the Missouri

Pacific, and the Union Pacific Railroads. His operations in the last two railroads demonstrate his methods well. He bought their stocks when their prices were low during the depression (a time when a country’s economy is unhealthy) of 1873, obtaining control of both railroads. He also acquired the stocks of other, smaller railroads he wanted to add to the two main systems. Then he forced up the prices of the two main railroads. When the stock market recovered from 1879 to 1884, he sold the railroad stocks at prices far greater than what he had paid for them, making yet another large fortune.

Manipulator turned businessman

Gould was forced out of the Wabash and the Union Pacific Railroads in the early 1880s. He then turned his complete attention to the Missouri Pacific Railroad (of which he had gained control in 1879) and built it into a great power. He acquired new railroad lines and independent companies, used stock-market profits for financing, and waged a relentless war on competitors. His biographer, Julius Grodinsky, wrote that Gould was changed “from a trader into a business leader of national proportions.” From 1879 to 1882 Gould added twenty-five hundred miles to the railroad at a cost of about \$50 million. Between 1885 and 1889 he again gained control of the Wabash and the Texas and Pacific Railroads, changed how they were organized, and tied them into his Missouri Pacific system.

At the same time Gould strengthened the other two elements that made up his wealth. One was the Manhattan Elevated Railroad of New York, which he created as a monopoly of New York City’s rapid transit system. The second was the Western Union Telegraph Com-

pany. Gould had bought the insignificant American Union Telegraph Company in 1879, joined it with Western Union in 1881, and seven years later added the telegraph network of the Baltimore and Ohio Railroad. By the end of the 1880s Western Union had no real competitor in the two important businesses of railroad telegraphy and sending Associated Press stories to member newspapers. Western Union was one of the most profitable companies in the country. Gould died in New York on December 2, 1892, leaving the management of his properties to his son George Jay Gould.

STEPHEN JAY GOULD

Born: September 10, 1941

New York, New York

Died: May 20, 2002

New York, New York

American paleontologist, scientist, and author

The American paleontologist (a scientist who studies fossil remains of life from long ago) Stephen Jay Gould was awarded the 1975 Schuchert Award by the Paleontological Society for his work in evolutionary (study of the process of change in the growth of a life group) theory. His work gave answers to the missing pieces in Charles Darwin's (1809–1882) transitional questions. He was also the author of several books popularizing current scientific issues.

Early life

Stephen Jay Gould was born on September 10, 1941, in New York City, the son of Leonard and Eleanor (Rosenberg) Gould. His father was a court reporter and part-time, unpaid naturalist (student of nature). Leonard Gould was a self-taught man who took his son to the American Museum of Natural History when the boy was five years old. It was here that the young Gould saw his first dinosaur, a *Tyrannosaurus rex*, and decided that he was going to devote his life to the study of geologic (the history of the earth based on the record of rocks) periods. With the support of his mother, an artist, and three well-remembered elementary school teachers, Gould was reading about evolution by age eleven. In high school he encountered the ongoing battle between creationism (a Biblical explanation of how life forms developed) and evolution as Darwin explained it. Darwin remained one of Gould's personal heroes.

After a summer at the University of Colorado in Boulder, Gould received his education at Antioch College in Yellow Springs, Ohio, graduating in 1963. He then moved on to graduate school in evolutionary biology and paleontology at Columbia University,

Stephen Jay Gould.

Reproduced by permission of the Corbis Corporation.

where he remained for two years. He married Deborah Lee, an artist, on October 3, 1965, then left to take a job in 1966 at Antioch College as professor of geology. The following year he moved to Cambridge, Massachusetts, to take an assistant professorship at Harvard University. In that same year he finished his doctoral work, completing his degree program from Columbia. In 1971 he was promoted to associate professor, and in 1973 to full professor of geology. He also became curator (a person who oversees an exhibit or show) of invertebrate (species without a backbone) paleontology at Harvard's Museum of Comparative Zoology. At Harvard he widened

his study of the speciation (the development of a new species) and evolution of land snails in the West Indies.

Scientific contributions

Gould was one of the founders of the school of evolution called "punctuated equilibrium." He argued that evolution proceeds quite rapidly at crucial points, with speciation occurring almost immediately. This could be due to quite sudden genetic changes. His favorite example was the panda's "thumb," a modification (adjustment) of the wrist bone that allows pandas to strip leaves from bamboo shoots. Such a transformation must have occurred all at once, he reasoned, or it would not have been preserved by natural selection (Darwin's explanation of how a species changes to meet its needs over centuries) since it had no useful function in a basic stage. This process would account for the lack of transitional (middle) forms throughout the fossil record, a problem Darwin grieved over but expected to be corrected by future paleontologists. Gould's scientific research and conclusions offer that solution.

Second career

In addition to Gould's work as a serious professional paleontologist, he spent much time trying to make science understandable to untrained readers as well as to scholars (trained students). As a popular writer and amateur historian of science, Gould concentrated upon the issues of science and culture.

In *The Mismeasure of Man* Gould gave an explanation of the misuse of intelligence testing. Gould admitted that human intelligence has a specific location in the brain and that it

can be measured by a standard number score. He argued, however, that any efforts to label groups as having inferior or superior intelligence based upon these measurements mark a misuse of scientific data and an abuse of the scientific process.

In 1981 Gould served as an expert witness at a trial in Little Rock, Arkansas, which challenged a state law ordering the teaching of creation science as well as evolution. Gould's testimony argued that the theories of creationism are contradicted by all available scientific evidence and therefore should not be considered scientific. Due to this testimony, creationism was recognized as a religion and not a science. During that same year, Gould was awarded a prose fellows award from the MacArthur Foundation.

Personal triumphs

In July 1982 Gould was told he had mesothelioma, a particularly deadly form of cancer. He recovered from his illness and the treatment, but found that he had to continue his work with a new sense of urgency.

Gould used his earned place in biology to argue against one of its central ideas—biological determinism (the belief that individual differences are biologically caused and therefore unchangeable)—and he used his literary skills to make the debate popular. He received important recognition for his work in both areas. In 1975 he was given the Schuchert Award by the Paleontological Society for his original work in evolutionary theory. For his book, *The Panda's Thumb*, he received two awards: the Notable Book citation from the American Library Association in 1980 and the American Book Award in Science for 1981. Likewise, he received two

awards for his other major work, *The Mismeasure of Man*: the National Book Critics Circle Award for general nonfiction in 1981 and the American Book Award nomination in science for 1982.

Gould was also a National Science Foundation grantee. He was a member of several scientific societies—American Association for the Advancement of Science, American Society of Naturalists, Paleontological Society, Society for the Study of Evolution, Society of Systematic Zoology, and Sigma Xi. In 1999 he assumed the presidency of the American Association of the Advancement of Science. His essay collection, *The Lying Stones of Marrakech*, was published by Harmony Books in April 2000.

As the author of more than two hundred evolutionary essays collected in eight volumes Gould was a publishing phenomenon, with topics such as evolution, his battle with cancer, Edgar Allan Poe, shells, why there are no .400 hitters in baseball, and the millennium (period of a thousand years). In an easy-to-read way Gould explained complex ideas in simple, understandable language that bridged the gap between scholars and nonscholars alike. After thirty years of writing for *Natural History* Gould said he was closing his writing career with his essay collection, *I Have Landed: The End of Beginning in Natural History*.

Gould lived in Cambridge, Massachusetts, with his wife and two children, Jesse and Ethan. He was a talented singer, with a love for Gilbert and Sullivan operettas (romantic, comic operas). His love of life was evident in *The Flamingo's Smile*: "I could not dent the richness in a hundred lifetimes, but I simply must have a look at a few more of

those pretty pebbles.” Stephen Jay Gould died of cancer in New York City on May 20, 2002.

KATHARINE GRAHAM

Born: June 16, 1917

New York, New York

Died: July 17, 2001

Boise, Idaho

American publisher

The renowned publisher Katharine Graham took over the management of the *Washington Post* after the death of her husband. She quickly guided the *Post* to national prominence while expanding her publishing empire.

Early life

Katharine Meyer Graham was born in New York City on June 16, 1917, the fourth of five children born to Eugene Meyer, a banker, and Agnes Elizabeth (Ernst) Meyer, an author and generous contributor to charity. In 1933, when Katharine was still a student at the Madeira School in Greenway, Virginia, her father bought the dying *Washington Post* for \$875,000. Already retired, Meyer

purchased the paper because he had grown restless and wanted a voice in the nation's affairs. His hobby turned into the capitol's leading paper.

From an early age Katharine Meyer showed an interest in publishing. At the Madeira School she worked on the student newspaper. In 1935 she entered Vassar College, but the following year transferred to the University of Chicago (Illinois), which she regarded as a more exciting campus. Her father mailed her the daily *Post* to keep her connected. The *Washington Post* was her summer job throughout college. Graduating with a bachelor's degree in 1938, she went to San Francisco, California, to take a job as a waterfront reporter for the *San Francisco News*. She returned to Washington a year later and joined the editorial staff of the *Post*, where she also worked in the circulation department (department in charge of keeping track of the number of papers needed for subscribers and routes).

Adulthood

On June 5, 1940, she married Philip L. Graham, a Harvard Law School graduate and clerk for Supreme Court Justice Felix Frankfurter. Her husband entered the army during World War II (1939–45; a war fought between Germany, Japan, and Italy—the Axis Powers—and Great Britain, France, the Soviet Union, and the United States—the Allies) and she gave up reporting to move with him from base to base. When he was sent overseas, Katharine returned to her job at the *Post*.

After his discharge in 1945, Eugene Meyer persuaded Philip Graham to join the *Washington Post* as associate publisher. Meyer,

who had a warm relationship with his son-in-law, turned the business over to the Grahams in 1948 for one dollar. Philip Graham helped his father-in-law build the business, acquiring the *Post's* competitor, the *Washington Times Herald*, in 1954. In 1961 he purchased *Newsweek* magazine for a sum estimated to be between eight and fifteen million dollars. He also expanded the radio and television operations of the company, and in 1962 he helped to set up an international news service despite his growing mental shakiness.

Tragedy to triumphs

In 1963 Philip Graham's mental illness led to his suicide. His public success had done little to help his mental illness. Katharine took over the presidency of the company. A recognized Washington woman who had devoted her time to raising her daughter and three sons, she had never lost her interest in the affairs of the family business. She studied the operations, asked questions, consulted with old friends such as James Reston (1909–1995) and Walter Lippmann (1889–1974), and made key decisions to bring in skilled journalists to improve the quality of the paper. She selected Benjamin C. Bradlee (1921–), the Washington bureau chief for *Newsweek*, as managing editor in 1965. (He later became executive editor.)

During the 1970s, Graham backed Bradlee when the *Post* began making news as well as reporting it. Graham was sincere in her commitment to provide accurate reporting. An example of this is her many visits to army bases during the Vietnam War (1954–75; a war in which the United States aided South Vietnam in a failed attempt to try and stop a Communist North Vietnam takeover). Her

Katharine Graham.
Courtesy of the Library of Congress.

commitment led to a controversy over constitutional rights in June 1971. The *Post*, along with the *New York Times*, struggled with the government over the right to publish sections of a classified Pentagon study of U.S. military involvement in Vietnam, which was compiled during President Lyndon Johnson's (1908–1973) administration. A court order to stop the publication of the documents led to a U.S. Supreme Court call for a decision. In a decision judged a major victory for freedom of the press, the Court upheld the papers' right to publish the "Pentagon Papers."

Further controversy followed in June 1972, when an investigative reporting team,

Carl Bernstein (1944–) and Bob Woodward (1943–), began to probe the break-in at the Democratic National Headquarters in the Watergate apartment complex. Their articles in the *Post* linked the break-in to a larger pattern of illegal activities, which led to the blame of over forty members of the Nixon administration and to the resignation of President Richard Nixon (1913–1994) in August 1974.

It was newsbreaks like these that granted Graham status as the most powerful woman in publishing. As chairman and principal owner of the Washington Post Company, she controlled the fifth largest publishing empire in the nation. In the period from 1975 to 1985 profits grew better than 20 percent annually.

Final years

In 1979 Graham turned the title of publisher over to her son Donald. But she remained active in all areas of the business, from advising on editorial policy (opinions the paper would stand behind) to making plans for not only the *Post* and *Newsweek*, but also the *Trenton Times*, four television stations, and 49 percent interest in a paper company. In Washington she was an impressive presence. Heads of state, politicians, and leaders in journalism and the arts gathered at her Georgetown home and for weekends at her farm in northern Virginia.

Under Graham's leadership the *Washington Post* grew in influence until it was judged as one of the two best newspapers in the country. It was read and consulted by presidents and prime ministers in this country and abroad and had a powerful influence on political life. At the same time the *Post*, which boasts a circulation (the number of copies sold or delivered) of 725,000, serves as a

hometown paper for a general audience who enjoyed the features, cartoons, and advice columns.

Graham also became an award-winning author in her later years. In 1997 she published her memoirs, *Personal History*, which earned her a Pulitzer Prize for Biography in 1998.

Katharine Graham was described as a "working publisher." Determined to preserve the family character of the business, she took up the reins after the death of her husband and worked hard not only to build but to improve her publishing empire. A forceful and courageous publisher, she knew when to rely on the expert advice of professionals and allowed her editors maximum responsibility. At the same time she strengthened her publications through her willingness to spend money to attract top talent in journalism and management.

On July 17, 2001, Katharine Graham died in Boise, Idaho, leaving the nation grieving for one of its best-loved female publishers. Katharine's impact on America was evident in the televised National Cathedral funeral watched by American citizens far and wide. She was eulogized (remembered after death) by a large array of public figures, ranging from former first lady Nancy Reagan (1921–) and former secretary of state Henry Kissinger (1923–) to Noor Al Hussein (1951–), queen of Jordan. The one quality that each highlighted in Katharine's life was her ability to maintain friendships despite holding a different viewpoint. Katharine Graham had a personal style that is rare in political circles.

MARTHA GRAHAM

Born: May 11, 1894

Pittsburgh, Pennsylvania

Died: April 1, 1991

New York, New York

American dancer, choreographer, and teacher

Martha Graham, American dancer, choreographer (one who creates and arranges dance performances), and teacher, is considered one of the major figures of modern dance.

Early life

Martha Graham was born in a suburb of Pittsburgh, Pennsylvania, on May 11, 1894, one of George and Jane Beers Graham's three daughters. Her father was a doctor who treated people with nervous disorders. When she was ten years old, and after one of her sisters developed asthma (a breathing problem), the family moved to California because the weather was better. Graham became interested in studying dance after she saw Ruth St. Denis (c. 1880–1968) perform in Los Angeles, California, in 1914. Her parents did not

approve of her becoming a dancer, so she enrolled in the Cumnock School, a junior college.

Graham's father died in 1914, after which she felt free to pursue her dream. After graduating from Cumnock, she enrolled in the Denishawn Studio, a dancing school operated by Ruth St. Denis and Ted Shawn (1891–1972). Graham had never had a dance lesson up to that point, but the small, quiet, shy, but hardworking girl impressed Shawn and toured with his troupe in a production of *Xochitl*, based on an Indian legend. In 1923 Graham left this company to do two years of solo dancing for the Greenwich Village Follies.

Becomes dance instructor

In 1925 Graham became dance instructor at the Eastman School of Music and Theater in Rochester, New York. She began experimenting with modern dance forms. "I wanted to begin," she said, "not with characters or ideas but with movement." She rejected the traditional steps of classical ballet; she wanted the dancing body to be related to natural motion and to the music. She experimented with what the body could do based on its own structure, developing what was known as "percussive movements."

Graham's first dances were performed on a bare stage with only costumes and lights. The dancers' faces were tight, their hands stiff, and their costumes short. Later she added more scenery and different costumes for effect. The music was modern and usually composed just for the dance. Isadora Duncan (1878–1927), the first modern dancer, had used music to inspire her works, but Graham used music to make her works more dramatic.

Martha Graham.

Courtesy of the Library of Congress.

Graham's process of creation usually began with what she called a "certain stirring." Inspiration might come from a classical myth, an event in American history, a story from the Bible, historical figures, current social problems, writings, poems, or paintings. She would then develop a dramatic situation or character to express the feeling or idea. She then found music, or asked for new music from her longtime collaborator (cocreator), Louis Horst, to maintain the inspiration while she created movements to express it. The purpose of Graham's dance was to bring about an increased awareness of life and a greater understanding of the nature of man. Dance was to her an "inner emotional experience."

Graham introduced a number of other new features to modern dance. She established the use of moving scenery, used props as symbols, and combined speech with dancing. She was also the first to integrate her group, using African Americans and Asians in her regular company. She replaced the traditional ballet folk dress with either a straight, dark, long shirt or the common leotard (a tight, one-piece garment worn by dancers). Using the stage, the floor, and the props as part of the dance itself, she produced a whole new language of dance. In 1926 Graham introduced this new language in her first solo recital in New York City. Her first large group piece, *Vision of the Apocalypse*, was performed in 1929. Her most important early work was a piece called *Heretic*.

Popular success

After Graham's performance as the lead role in composer Igor Stravinsky's (1882–1971) American premiere of *Rite of Spring* (1930), Graham toured the United States for four years (1931–35) in the production *Electra*. During this trip she became interested in the American Indians of the Southwest. One of the first products of this interest was *Primitive Mysteries*. Her increasing interest in the American past was seen in her dance based on the lives of American pioneer women, *Frontier* (1935), and in her famous *Appalachian Spring* (1944). In 1932 she became the first dancer to receive a Guggenheim fellowship (an award to promote artistic research and creation), and she danced for President Franklin Roosevelt (1882–1945) at the White House in 1937.

Graham founded the Dance Repertory Theater in New York City in 1930. She also

helped establish the Bennington School of Arts at Bennington College in Vermont, where her teaching made Bennington the center of experimental dance in America. With the later establishment of the Martha Graham School of Contemporary Dance in New York City, she taught a large number of modern dancers who went on to spread her ideas and style to the rest of the world.

Later years

Graham danced her last role in 1969, but she continued to choreograph. In 1976 she received the Presidential Medal of Freedom. A year before her death, in 1990, she choreographed *Maple Leaf Rag*, a show that featured music by Scott Joplin (1868–1917) and costumes by Calvin Klein (1942–). Her name is still linked with modern dance in many people's minds. Martha Graham died on April 1, 1991, known as one of the twentieth century's revolutionary artists.

CARY GRANT

Born: January 18, 1904
Bristol, England

Died: November 29, 1986

Davenport, Iowa

English-born American actor

Hollywood legend Cary Grant won audiences the world over with his charm and sophistication as an actor. Grant created a light, comic style that many have tried to imitate but none have surpassed. In seventy-two films made over four decades, Grant served as both a romantic ideal for women and a dashing role model for men.

Early life as Archie Leach

Cary Grant was born Archibald Alexander Leach on January 18, 1904, in Bristol, England. His parents, Elias and Elsie Leach, were poor, and they quarreled often as they struggled to raise their only child. Grant found escape from the family tension in the newly emerging "picture palaces." He recalled in a *Ladies Home Journal* (1963) interview that "those Saturday matinees free from parental supervision were the high point of my week."

At the age of ten Grant was told that his mother had left for a seaside resort. In reality she had been sent to a nearby mental institution for a nervous breakdown. She remained there for twenty years. Grant was an adult before he learned of his mother's true whereabouts. "There was a void in my life," Grant said of the lost time with mother, "a sadness of spirit that affected each daily activity with which I occupied myself in order to overcome it."

Decision to act

Through a scholarship Grant attended a secondary school called Fairfield Academy

Cary Grant.

in Somerset, England. While at the school he became interested in the theater and in theatrical lighting. It was at the Bristol (England) Hippodrome vaudeville (traveling variety entertainment) theater that Grant realized just how he would escape his worry-filled working-class environment. After being allowed backstage during a Saturday matinee, Grant decided to become an actor. "I suddenly found my inarticulate self in a land of smiling, jostling people wearing all sorts of costumes and doing all sorts of clever things," Grant remembered. "And that's when I knew! What other life could there be but that of an actor?"

Grant ran away from home and joined the Bob Pender Troupe of comedians and acrobats. He was soon forced to return home, when it was discovered that he had lied about his age and about having his father's permission to work. At thirteen Grant was a year too young to obtain a work permit to work legally. Undeterred, he waited until he turned fourteen and then got expelled from school so that his father might let him rejoin the group.

Grant learned comedy, gymnastics, and pantomime from Pender's group. His later skill at physical comedy and timing owed much to this early training. His travels with the troupe led him to New York, where he decided to stay and seek success. Using his vaudeville skills he worked Coney Island as a stilt-walker and eventually won roles in light musicals and plays. In 1932 Grant took the advice of a friend and went to Hollywood for a screen test. Paramount offered him a contract but insisted he change his name from Archie Leach. So the more glamorous Cary Grant was chosen—and a great film career began.

Trademark sophistication

Even in his earliest film roles, Grant demonstrated the elegant sophistication that is the very opposite of his working-class background. His credentials as a traditional leading man were established with his appearance opposite Marlene Dietrich in *Blond Venus*.

The perfect format for displaying Grant's verbal and physical agility was in the screwball comedies of the 1930s. In *The Awful Truth*, *His Girl Friday*, *Holiday* and *Bringing Up Baby*, Grant's deft comic touch is preva-

lent. His Oscar-nominated performances in *Penny Serenade* and *None But the Lonely Heart* show that Grant was a capable dramatic actor as well. Throughout his career Grant continued to successfully play the charming leading man, even as late as 1964, with the film *Charade*.

Drama with Hitchcock

Although Grant's comedies represent the majority of his best-remembered roles, his work with the director Alfred Hitchcock in several classic films offers a departure from his usual image. Hitchcock deliberately played against Grant's familiar persona by introducing psychological twists that are in startling contrast to the actor's smooth surface elegance.

Troubled marriages

Although Grant achieved tremendous success as an actor, his first four marriages ended in divorce. Grant speculated that this poor record was tied to the disappearance of his mother. His fifth wife, Barbara Harris, was at his side when he died of a massive stroke in 1986.

Today Grant's name remains a symbol of the stylish sophistication that was his trademark, and repeated viewings of his films reveal an actor whose ability to delight an audience is timeless.

GRAHAM GREENE

Born: October 2, 1904

Berkhamsted, Hertfordshire, England

Died: April 3, 1991

Vevey, Switzerland

English author, novelist, and dramatist

The works of the English writer Graham Greene explore issues of right and wrong in modern society, and often feature exotic settings in different parts of the world.

Childhood

Graham Greene was born on October 2, 1904, in Berkhamsted, Hertfordshire, in England. He was one of six children born to Charles Henry Greene, headmaster of Berkhamsted School, and Marion R. Greene, whose first cousin was the famed writer Robert Louis Stevenson (1850–1894). He did not enjoy his childhood, and often skipped classes in order to avoid the constant bullying by his fellow classmates. At one point Greene even ran away from home.

When Greene began suffering from mental and emotional problems, his parents sent

Graham Greene.

Reproduced by permission of AP/Wide World Photos.

him to London for psychotherapy (the treatment of a mentally or emotionally disturbed person through verbal communication) by a student of the famous Sigmund Freud (1856–1939). While he was living there, Greene developed his love for literature and began to write poetry. Writers Ezra Pound (1885–1972) and Gertrude Stein (1874–1946) became life-long mentors (teachers) to him before he returned to high school.

After graduating in 1922, Greene went on to Oxford University's Balliol College. There, Greene amused himself with travel as well as spending six weeks as a member of the Communist Party, a political party that

supports communism, a system of government in which the goods and services of a country are owned and distributed by the government. Though he quickly abandoned his Communist beliefs, Greene later wrote sympathetic profiles of Communist leaders Fidel Castro (1926–) and Ho Chi Minh (1890–1969). Despite all these efforts to distract himself from his studies, he graduated from Oxford in 1925 with a second-class pass in history, and a poorly received volume of poetry with the title *Babbling April*.

Writing career

In 1926 he began his professional writing career as an unpaid apprentice (working in order to learn a trade) for the *Nottingham Journal*, moving on later to the *London Times*. The experience was a positive one for him, and he held his position as an assistant editor until the publication of his first novel, *The Man Within* (1929). Here he began to develop the characteristic themes he later pursued so effectively: betrayal, pursuit, and death.

His next works, *Name of Action* (1931) and *Rumour at Nightfall* (1931), were not well received by critics, but Greene regained their respect with the first book he classed as an entertainment piece. Called *Stamboul Train* in England, it was published in 1932 in the United States as *Orient Express*. The story revolves around a group of travellers on a train, the *Orient Express*, a mysterious setting that allowed the author to develop his strange characters with drama and suspense.

Twelve years after Greene converted from Anglicanism to Roman Catholicism, he published *Brighton Rock* (1938), a novel with a highly dramatic and suspenseful plot full of sexual and violent imagery that explored the

interplay between abnormal behavior and morality, the quality of good conduct. *The Confidential Agent* was published in 1939, as was the work *The Lawless Roads*, a journal of Greene's travels in Mexico in 1938. Here he had seen widespread persecution (poor treatment) of Catholic priests, which he documented in his journal along with a description of a drunken priest's execution (public killing). The incident made such an impression upon him that this victim became the hero of *The Power and the Glory*, the novel Greene considers to be his best.

Later life

During the years of World War II (1939–45: when Germany, Italy, and Japan fought against France, the United Kingdom, the Soviet Union, and the United States [from 1941 until the end of the war]) Greene slipped out of England and went to West Africa as a secret intelligence (gathering secret information) officer for the British government. The result, a novel called *The Heart of the Matter*, appeared in 1948, and was well received by American readers.

Steadily, Greene produced a series of works that received both praise and criticism. He was considered for the Nobel Prize for Literature but never won the award. Still, many other honors were given to him, including the Companion of Honor award by Queen Elizabeth in 1966, and the Order of Merit, a much higher honor, in 1986.

In 1990 Greene was stricken with an unspecified blood disease, which weakened him so much that he moved from his home in Antibes, the South of France, to Vevey, Switzerland, to be closer to his daughter. He lingered until the beginning of spring, then

died on April 3, 1991, in La Povidence Hospital in Vevey, Switzerland.

WAYNE GRETZKY

Born: January 26, 1961

Brantford, Ontario, Canada

Canadian hockey player

Wayne Gretzky, known by hockey fans simply as “The Great One,” became the first player to win the Hart Trophy for eight years in a row and beat hockey legend Gordie Howe’s (1928–) all-time point record of 1,850.

Showed early talent

Wayne Gretzky was born on January 26, 1961, in Brantford, Ontario, Canada, of Russian and Polish descent. He was the first of five children born to Walter and Phyllis Gretzky. His father had hoped himself to become a hockey player but was discouraged because of his size. Gretzky received his first pair of skates when he was three years old

Wayne Gretzky.

Reproduced by permission of AP/Wide World Photos.

and displayed an early interest in skating. He learned to skate on the Ninth River near his grandfather's farm in Canning, Ontario, Canada, and at public rinks on weekends. But it was the rink his father built for him behind the little house on Varadi Avenue in Brantford that became known as the birthplace of his skating skills.

Gretzky was only six years old when he saw his first year in organized hockey. He scored one goal, the lowest yearly total of his career. Already Gretzky had mastered a unique skating stride. His dad's advice to "skate to where the puck's going to be" helped him score 196 goals in seventy-six

games at the age of nine. Gretzky's father pushed his son to succeed and told him that the years of hard work would pay off when he became a successful hockey player.

As a sixteen-year-old in the Junior "A" league, Gretzky continued his high scoring and packed the arenas with fans eager to witness his skills. He wore number 99, because number 9 was still being worn by his idol, Gordie Howe. His slight build led one junior coach to suggest he pick an offensive position, where he could avoid body contact. This was the beginning of Gretzky's trademark spot: behind the opponent's net.

In 1975 Gretzky moved to Toronto to play for the Young Nats, where he won the league's rookie of the year award. Two years later the Sault Ste. Marie Greyhounds drafted him, and he again won rookie of the year honors. Gretzky had gone to school in Brantford and continued high school classes in Sault Ste. Marie but left before graduating.

Turning pro

In 1978 Gretzky turned pro with the Indianapolis Racers of the World Hockey Association (WHA). Less than two months later the Edmonton Oilers of the same league purchased his contract, signing Gretzky to a twenty-one-year contract. In the 1979–80 season the Edmonton Oilers were admitted to the National Hockey League (NHL). In his first year in the NHL Gretzky scored fifty-one goals, eight more than he had scored in the WHA, and he made the second All-Star team. He won his first Hart Trophy for most valuable player, and he won the Lady Byng Trophy for his sportsmanship and skating ability. Taking the public by storm, Gretzky's polite charm was the perfect foil to the traditional

rough-edged hockey player. He went on to become the first player to win the Hart Trophy for eight years in a row, from the 1979–80 season through the 1986–87 season.

Despite Gretzky's talents, the struggling Oilers remained at the bottom of the league. In his second year he led the league in assists and points, made the first All-Star team, and won his second most valuable player trophy award, but the Oilers lost in the quarter-finals to the New York Islanders. During the 1981–82 season he continued to break records, including some of his own. He scored fifty goals in thirty-eight games, breaking Maurice Richard's (1921–2000) record. And on February 24, 1982, he broke Phil Esposito's (1942–) single season scoring record. But the Oilers had not yet made it past the first round of the playoffs. In the 1983–84 season, however, the Oilers won their first Stanley Cup. The two subsequent seasons ended with the Oilers taking the Stanley. In the summer of 1988 Gretzky was traded to the Los Angeles Kings. He quickly turned that weak team into one of the best.

Broke Howe's record

Gretzky, a left-handed shooting center, developed a style that was as distinctive as it was exciting to watch. Listed in the program as 6 feet and 170 pounds, he always stayed away from fights, preferring to drift and glide around the ice. Some fans believed that he viewed the rink as a chessboard and that he had the ability to sense where the puck was going to end up, thus skating to that position. Others believed that his greatest asset was his ability to move sideways across the ice at full speed. But it was his assists that made him especially valuable to his team. In becoming the leading scorer in

NHL history he set a new record for assists (more than thirteen hundred) in just twelve seasons. In 1989 he passed his idol Gordie Howe's all-time point record of 1,850.

Such achievement brought Gretzky numerous commercial endorsements for companies as different from one another as General Mills and Nike. Consumers found his personality appealing, and he only endorsed products he used. Advertising Age Magazine called him "an ideal athlete to endorse products."

Traded to the Blues

Gretzky continued breaking records and winning awards in the 1990s. Late in the 1993–94 season he broke another Howe record of 801 career goals, accomplishing this in 650 fewer games than Howe played. Gretzky began to get frustrated with the unsuccessful attempts of the Kings, and he wanted to be traded. Gretzky was traded to the St. Louis Blues in the 1995–96 season.

New York Ranger

Gretzky's career with the Blues was brief. He had not yet officially signed with the team when they lost the first two games in the play-off series. The coach and general manager of the Blues blamed Gretzky for the losses, but Gretzky had already decided not to sign with St. Louis. Instead, he signed with the New York Rangers for the 1996–97 season.

Gretzky retired from hockey in New York in April 1999. He left the game after twenty years as a professional in the sport, with sixty-one NHL records held or shared. His number 99 jersey was permanently retired at ceremonies during Gretzky's final game with the

Rangers. Gretzky was inducted into the Hockey Hall of Fame in November 1999.

The crowning achievement in Gretzky's hockey career came at the Winter Olympics of 2002 as executive director of Canada's hockey team. A Canadian ice worker embedded a lucky "loony," Canada's one-dollar coin, in the hockey arena's ice. Perhaps that's why the Canadian team won over the United States, 5 to 2. It was the most watched game in the history of hockey, with thirty-eight million homes tuned in. The final goal was scored with the sound of "O Canada," Canada's national anthem, in the background. Currently Gretzky is part owner of the Phoenix Coyotes. He lives with his wife and four children in the United States.

BROTHERS GRIMM

JAKOB GRIMM

Born: January 4, 1785
Hanau, Germany

Died: September 20, 1863

Berlin, Germany

German scholar and author

WILHELM GRIMM

Born: February 24, 1786

Hanau, Germany

Died: December 16, 1859

Berlin, Germany

German scholar and author

The brothers Jakob and Wilhelm Grimm were German scholars known for their fairy tales and for their work in the study of different languages, which included the creation of "Grimm's law."

Together from the beginning

Jakob Karl Grimm was born on January 4, 1785, in Hanau, Germany. His brother, Wilhelm Karl Grimm, was born on February 24 of the following year. They were the oldest surviving sons of Philipp Grimm, a lawyer who served as Hanau's town clerk. As small children they spent most of their time together; aside from a brief period of living apart, they were to remain together for the rest of their lives. Their even-tempered personalities made it easy for them to work together on projects. The main difference in their personalities seems to have been that Jakob, the healthier of the two, had more taste for research work, and it was he who worked out most of their theories of language and grammar. Wilhelm was physically weaker but was a somewhat warmer person

and more interested in music and literature. He was responsible for the pleasant style of their collection of fairy tales.

The brothers first attended school in Kassel, Germany, and then they began legal studies at the University of Marburg. While there, however, the inspiration of a professor named Friedrich von Savigny awakened in them an interest in past cultures. In 1808 Jakob was named court librarian to the King of Westphalia in Wilhelmshöhe, Germany. In 1816 he became librarian in Kassel, where Wilhelm had been employed since 1814. They were to remain there until 1830, when they obtained positions at the University of Göttingen.

“Grimm’s Fairy Tales”

The romantic movement in Germany (a movement in the arts that favored a return to nature and a greater focus on national culture, especially folk tales) awakened the Germans’ interest in the past of their own country. Although some work in the rediscovery and editing of medieval (from the Middle Ages, 500–1500) German literature had already been started in the eighteenth century, it was the poets and theorists of the next century who first focused national attention on the origins of German culture and literature. While most of the poets viewed medieval literature mainly as an inspiration for new writing, others turned their attention to the investigation of the past. The Grimm brothers were the most important of these early language and folklore romantic historians.

For some years the brothers had been in contact with the romantic poets Clemens Brentano (1778–1842) and Achim von Arnim (1781–1831), who were preparing a

*The Brothers Grimm.
Courtesy of the Library of Congress.*

collection of German folk songs. Following their own interests in folklore and legends, the brothers brought out their first collection of tales, *Kinder-und Hausmärchen* (Tales of Children and the Home), in 1812. These tales were collected by recording stories told by peasants and villagers. Wilhelm put them into written form and gave them a pleasant, childlike style. The brothers added many scholarly footnotes on the tales’ sources and different versions.

In addition, the Grimms worked on editing existing pieces of other folklore and early literature. Between 1816 and 1818 they published two volumes of *Deutsche Sagen* (Ger-

man Legends). At about the same time they published a volume of studies in the history of early literature, *Altdeutsche Wälder* (Old German Forests).

Language research

In later years their interest in older literature led the Grimm brothers to a study of older languages and their relationship to modern German. Jakob especially began to specialize in the history and structure of the German language. The first edition of his *Deutsche Grammatik* (German Grammar) was published in 1819.

The brothers, especially Jakob, were also working to document the relationship between similar words of related languages, such as the English *apple* and the German *Apfel*. Their creation of the rules for such relationships became known as "Grimm's law." It was later expanded to account for all word relationships in the Indo-European group of languages. The Grimm brothers were not the first to take note of such similarities, but they can be credited with gathering the bulk of linguistic (related to language) data and working out the details of the rules.

Later years

In 1830 the brothers moved to the University of Göttingen, where Jakob was named professor and head librarian and Wilhelm was appointed assistant librarian. As professor, Jakob held lectures on linguistics and cultural history. Wilhelm also attained the rank of professor in 1835. Both were dismissed in 1835 for political reasons. (They had joined in signing a protest against the King's decision to abolish the Hanover constitution.) They first moved back to Kassel but later obtained pro-

fessorships at Berlin, Germany, where they were to remain until their deaths.

The Grimm brothers' last years were spent in preparing a complete dictionary of the German language, tracing the origin of every word. The first volume, published in 1854, has 1,824 pages but gets only as far as the word *Biermolke*. Four pages are devoted to the letter A alone, which is termed "the most noble and primeval [ancient] of all sounds." The Grimms' dictionary was carried on by generations of scholars after the brothers' deaths, and it was finally finished in 1960. Its completed form consists of sixteen large volumes.

Wilhelm died in Berlin on December 16, 1859. Jakob continued to work on the dictionary and related projects until his death in Berlin on September 20, 1863.

WOODY GUTHRIE

Born: July 14, 1912

Okemah, Oklahoma

Died: October 3, 1967

New York, New York

American musician, songwriter, and singer

Writer and performer of folk songs, Woody Guthrie composed “This Land Is Your Land,” a song many call an unofficial national anthem. His music, which celebrates the good in people, includes messages of unity and brotherly love and remains the anthem of the poor and broken.

Early life

Woodrow Wilson Guthrie was born on July 14, 1912, in Okemah, Oklahoma, the third of Charles and Nora Guthrie’s five children. Guthrie’s grandmother was one of the first schoolteachers in the county. His father was a professional guitarist and prizefighter who regularly encouraged physical fitness and wrestling. Guthrie’s mother taught social awareness and folk music. His father’s message was to never be bullied, while his mother’s message was to try to see the world from the other person’s perspective. Despite a shortened high school education and no formal musical training, Guthrie’s eager reading and focus on music supported him throughout his life. All of the Guthrie children were brought up on blues and Native American songs, favored by their father, and folk songs, favored by their mother.

Guthrie led one of the most tragic lives of any famous American. A series of family tragedies overlapped with the nation’s slide into the Great Depression (a time of severe economic hardship in the 1930s). Two homes burned to the ground and another was destroyed. Guthrie’s mother became ill with Huntington’s chorea (a gradual, fatal disease of the nervous system), which she passed on to Guthrie. His father lost all of his businesses as the country struggled with the Stock Mar-

ket Crash (October 29, 1929; a day when investors sold over sixteen million shares of stocks because they feared the possible effects of a recently signed tax bill—many people lost everything, suicides were common, banks failed, and stores closed). Virtually orphaned at the age of fourteen, with his family falling apart, Guthrie developed a roaming way of life that he never entirely abandoned.

Traveling man

In the course of Guthrie’s travels he learned to perform folk songs, first those of others but later his own. He survived with odd jobs in settings as varied as hobo camps and barbershops. With a harmonica and the music of his parents he traveled the southwest, witnessing the devastation of both the Great Depression and the Dust Bowl (a time during the 1930s when thousands of people left their farms in a region of the Great Plains after overuse of land and a long period without rain caused massive dust storms and made farming in the area impossible).

In Texas Woody was given his first and only guitar. With a few chords under his belt he began writing songs, some to old tunes and some to new ones. In 1937 he got a hold of, through a cousin, the first of many radio jobs, singing and playing on a Los Angeles station. He also acquired permanent ties to the Communist Party (a political party that promotes a society in which all goods and services are divided equally between the people). In 1940 he arrived in New York City and was discovered by Alan Lomax, assistant director of the Archive of Folk Songs of the Library of Congress. Lomax recorded many of Guthrie’s songs for the library. He also promoted Guthrie’s career in other ways, such as

Woody Guthrie.

Courtesy of the Library of Congress.

by getting Victor Records to produce a two album, twelve record set of Guthrie's "Dust Bowl Ballads." (A ballad is a song that tells a story.) Though they did not sell, the ballads were to have a lasting influence.

Political connections

A witness to Hoovervilles (clusters of homeless people living in cardboard box villages named after President Herbert Hoover [1874–1964] who had promised better times) and migrant camps (temporary housing for families who get paid to harvest crops and move frequently to follow the harvest), Woody was drawn to people with a social

conscience (an awareness of less fortunate members of society). Actor Will Geer teamed up with him and toured both labor camps and farm worker strikes.

At the brink of America's entry into World War II (1939–45; a war in which the Allies—Great Britain, France, the Soviet Union, the United States [from 1941], and others—fought against the German-led Axis forces), Guthrie joined the Almanac Singers, a left-wing folk music group that included Pete Seeger (1919–), who eventually became a well-known member along with Guthrie. On February 14, 1942, the Almanacs gained their greatest exposure when they performed on a program called "This Is War," which was aired by four major networks. Except, newspaper stories about the group's Communist affiliations prevented the Almanacs from achieving commercial success. They dissolved within a year. Most of the members of the Almanacs were very anti-Nazi (German political party in rule during World War II that believed in the superiority of the white Aryan [German] race), and they enrolled in the U.S. military.

Guthrie supported the war too. "This Machine Kills Fascists" (people who support a centralized government ruled by a dictator with absolute power) was inscribed on his guitar. But he hoped to accomplish his goal at a distance. He tried in vain to avoid the draft (government selection for military service). To stay out of the U.S. military he served in the merchant marine, but it was a dangerous strategy—two of the three ships he served on were lost. In addition, he was drafted into service anyway. Upon his discharge from the army in 1946 he joined People's Songs, another radical (extreme) musical associa-

tion. It also failed because of the Communist connection, which was even more offensive during the Cold War (1945–89; a struggle for world power between the United States and the Soviet Union).

Pete Seeger organized a folk-singing group called The Weavers in 1948, and for several years it produced one hit record after another. Though Guthrie was not a Weaver, their success helped his music. His “So Long, It’s Been Good to Know You” became one of their most popular numbers. But The Weavers were soon blacklisted (labeled as Communists and therefore not given any financial or professional support), and the fashion for popularized folk music disappeared with them.

By this time Guthrie’s health was visibly failing. In 1952 he was diagnosed with Huntington’s chorea. He died of the disease on October 3, 1967, in New York City.

Legendary status

Though a poor musician and an inconsistent performer, Guthrie wrote an estimated one thousand songs, which have earned him a secure place in musical history. When he was discovered, folk music had few fans except radicals (extremists) and a handful of admirers and musicologists (music researchers). Guthrie and The Weavers were responsible for folk music’s brief popularity in the late 1940s and early 1950s, and they influenced the greater following it developed ten years later. Though

folk music became less popular, it continued to exist, and Guthrie’s legacy was very much a part of it. The year 2001 brought a revival of folk music mania after the release of *O Brother, Where Art Thou?*, a movie set in the 1930s that was rich with folk and hill music.

Guthrie’s legendary influence on folk music is hard to assess. He was famous among leftists (those wishing for change and reform) in the 1940s, and by the 1960s, though hospitalized and unable to speak, he had become a heroic figure. Bob Dylan (1941–), before he himself became famous as the leading composer of political songs, made a pilgrimage (a journey to show respect) to Guthrie’s bedside. Guthrie’s reputation was based on his authentic folk origins and hobo inclinations, his remarkable talents as a writer and composer, and a romantic appreciation of his politics.

ALEX HALEY

Born: August 11, 1921

Ithaca, New York

Died: February 10, 1992

Seattle, Washington

African American author

Alex Haley is the celebrated author of *Roots: The Saga of an American Family* (1976). By April 1977 almost two million hardcover copies of the book had been sold and 130 million people had seen all or part of the eight-episode television series. *Roots* is considered by many

critics a classic in African American literature and culture.

Early years

Alex Haley was born in Ithaca, New York, and raised in the small town of Henning, Tennessee. His father managed the family lumber business while his mother was a schoolteacher. Growing up, Haley became interested in his ancestry while listening to colorful stories told by his family. These stories, which traced seven generations, would become the source and inspiration for Haley's later work.

School records indicate that Haley was not an exceptional student, and at the age of

Alex Haley.

Reproduced by permission of the Corbis Corporation.

eighteen he joined the U.S. Coast Guard and began a twenty-year career in the service. He practiced his writing, at first only to cure boredom on the ship, and soon found himself writing love letters for his shipmates to send home to their wives and girlfriends. He wrote serious pieces as well and submitted them to various magazines.

A literary career

Upon retiring from the Coast Guard, Haley decided to become a full-time writer and journalist. His first book, *The Autobiography of Malcolm X* (1965), which he cowrote with Malcolm X (1925–1965), was well-

received by both critics and the public. The work sold more than five million copies and launched Haley's writing career.

Two weeks after the book was completed, Haley began work on his next project, *Roots*. The tale follows the life of Kunta Kinte, a proud African who was kidnapped from his village in West Africa. After surviving the middle passage (the brutal shipment of Africans to be sold in the Americas), he was made a slave on a plantation in the United States. Haley visited archives, libraries, and research repositories on three continents to make the book as authentic (real) as possible. He even reenacted Kunta's experience during the middle passage by spending a night in the hold of a ship (the storage room below deck) stripped to his underwear.

The impact of Roots

Haley himself described *Roots* as a "faction," a mixture of fact and fiction. Most critics agreed and evaluated *Roots* as a blend of history and entertainment. However, some voiced concerns—especially at the time of the television series—that racial tension in America would be aggravated by *Roots*.

Many activists viewed *Roots* to be an important part of the civil rights movement, where African Americans and other minorities fought for equality. Vernon E. Jordan (1935–), the executive director of the National Urban League, called the television series "the single most spectacular educational experience in race relations in America." Speaking of the appeal of *Roots* among blacks, Haley added: "The blacks who are buying books are not buying them to go out and fight someone, but because they want to know who they are. . . . [The] book has touched a strong, subliminal chord."

Barely two years after the book was published, *Roots* had already won 271 awards, and its television adaptation had been nominated for a record-breaking thirty-seven Emmys, the top awards for television programming. Over eight million copies of the book were in print, and the text was translated into twenty-six languages.

Backlash

In addition to fame and fortune, *Roots* also brought Haley controversy. In 1977 two published authors, Margaret Walker and Harold Courlander, accused Haley of plagiarizing (to steal and use as one's own) their work. Charges brought by Walker were later dropped, but Haley admitted that he unknowingly lifted three paragraphs from Courlander's *The African* (1968). A settlement was reached whereby Haley paid Courlander \$500,000.

Regardless of the controversies, the popularity of *Roots* is very clear. It is still widely read in schools, and many college and university history and literature programs consider it an essential part of their assigned reading.

Stardom took its toll on Haley, though. *The New Times* reported that on a trip to his ancestral village in Africa, Haley complained: "You'll find that people who celebrate you will kill you. They forget you are blood and flesh and bone. I have had days and weeks and months of schedules where everything from my breakfast to my last waking moment was planned for me."

Beyond Roots

Roots was so successful that the American Broadcasting Company (ABC) produced

a sequel, *Roots: The Next Generations*, a \$16.6-million production that ran for fourteen hours. The story line of *Roots II*, as it was called, begins in 1882, twelve years after the end of the *Roots I*, and it concludes in 1967.

In 1985 Haley was working on a novel set in the Appalachian culture that he had researched extensively. The novel was centered around the relationships among a mountain father, son, and grandson. Because this book was not about blacks but primarily about whites, Haley said of the project, "I think one of the most fascinating things you can do after you learn about your own people is to study something about the history and culture of other people."

Haley also researched his paternal heritage (his father's ancestry), which became the book *Queen*. But before he could finish the book, Haley died on February 10, 1992. (David Stevens would complete the work on *Queen*.) In 1993 *Queen* became a three-episode miniseries which aired on the Columbia Broadcasting System (CBS). Accusations surfaced about the historical accuracy of *Queen*, and critics questioned whether a romance had actually existed between Queen and her slave-owning master. According to Melinda Henneberger in the *The New York Times*, the tapes left by Haley did not mention a romance between his paternal great-grandparents. Producer Mark Wolper indicated "Haley had become convinced by his later inquiries . . . that his great-grandparents had actually been in love."

Haley also planned to write a book detailing the life of millionaire Madame C. J. Walker (1867–1919) and her daughter A'Lelia. Haley had signed a three-book contract with Ballantine for its new multicultural

publishing program, for which his first title was to be a history of his hometown—Henning. Those who knew Haley well say his research on Henning predated the writing of *Roots*. Haley was buried on the grounds of his Henning homestead.

ALEXANDER HAMILTON

Born: January 11, 1755

Nevis, British West Indies

Died: July 12, 1804

Weehawken, New Jersey

American statesman

The first U.S. secretary of the treasury, Alexander Hamilton was one of the leaders of the nation's first political party, the Federalists (a group who supported a strong central government). Hamilton remains a well-known figure in U.S. history. He is known not only for the great contributions that he made to the early United States but also for his famous duel with Aaron Burr (1756–1836) in 1804, which resulted in his death.

Birth and early life

Alexander Hamilton's birth date is disputed, but it is often listed as January 11,

1755. He was born on the island of Nevis, in the British West Indies, the illegitimate son (his parents were not married to each other) of James Hamilton, a Scotsman, and Rachel Fawcett Lavien, the daughter of a French physician.

Hamilton's education was brief. He began working between the ages of eleven and thirteen for a trading company in St. Croix, an island in the U.S. Virgin Islands. In 1772 he left to attend school in the American colonies. After a few months at an academy in New Jersey, he enrolled in King's College in New York City. Intelligent enough to master most subjects without formal instruction and eager to win success and fame early in life, he left college in 1776 without graduating.

American Revolution

The outbreak of the American Revolution (1775–83), when the thirteen British colonies in North America fought for their freedom, offered Hamilton the opportunity he craved. In 1777 he became a lieutenant colonel (an army officer who is above a colonel) in the Continental Army (the national army fighting for American independence) and assistant to commanding general George Washington (1732–1799). Hamilton became one of Washington's most trusted advisers. Although he played no role in major military decisions, Hamilton's position was one of great responsibility. He drafted many of Washington's important letters, he was sent on important military missions, and he wrote several reports on the reorganization and reform of the army. In December 1780 he married Elizabeth, the daughter of Philip Schuyler (1733–1804), a member of one of New York's most distin-

guished families. Hamilton eventually returned to New York. In 1782 he became a lawyer following a short period of apprenticeship (studying and learning a job from someone already in that position).

Hamilton's ideas on government and society had changed during the Revolution. Having been born in a foreign country gave him a different viewpoint from most people. Working for Washington had allowed him to observe how the weakness of Congress and how state and local jealousies were hurting the war effort. From this point on Hamilton believed in, and tried to work to bring about, a strong central government.

Confederation era

Attending the Continental Congress as a representative from New York from November 1782 through July 1783, Hamilton tried to make sure that the new government would have the powers it needed to deal with the problems it faced after it won independence from Britain. As one of the twelve delegates to the Annapolis Convention of 1786, he drafted its resolution (final decision or opinion) calling for a constitutional convention to make sure that interests of the union as a whole were placed over individual state and local concerns.

Hamilton was one of the representatives from New York to the Constitutional Convention, which was held in Philadelphia, Pennsylvania, from May to September 1787. In October 1787 he wrote a series of essays on behalf of the planned Constitution. First published in New York City newspapers as having been written by "Publius" and collectively titled *The Federalist*, these essays were designed to persuade the people of New York

Alexander Hamilton.
Courtesy of the Smithsonian Institution.

to ratify, or approve, the Constitution. Although others wrote for *The Federalist*, Hamilton wrote fifty-one of the eighty-five essays. They contain some of America's most original and important writing on politics and help explain some of the wording of the Constitution. At the New York convention in 1788, as a result of Hamilton's efforts, the Constitution was ratified.

Secretary of the treasury

In September 1789, some six months after the new government was established, Hamilton was named the nation's first secretary of the treasury. This was the most impor-

tant of the executive departments because the new government's most urgent problem was to find ways to pay the national debt—domestic and foreign—that had grown during the Revolution. Hamilton wrote many reports on the American economy, and many of his suggestions became law. Hamilton's ideas were not exactly original (they were similar to British policies), but they were sensible and took into account the needs of the new country.

Hamilton's importance during this period was not confined to his work as treasury secretary. As the “prime minister” of Washington's administration, he was consulted on a wide range of problems, foreign and domestic. In addition, he is considered the leader of the country's first political party. Hamilton himself disliked the idea of political parties. However, when the debate over his policies revealed disagreement among the members of Congress, Hamilton assumed leadership of the pro-administration group, known as the Federalists.

Well-known lawyer and army general

Hamilton retired from office in January 1795. He returned to his law practice to make money to support his growing family and soon became the most distinguished lawyer in New York City. His interest in public affairs continued, however, and he served as President Washington's adviser. He helped Washington write his famous “Farewell Address” (1796), in which Washington turned down a third term as president. Hamilton remained active in politics as well, speaking out in favor of candidates he liked and criticizing those he opposed.

While many held Hamilton in high regard, others neither liked nor trusted him.

During the presidency of John Adams (1735–1826), however, Hamilton continued to have considerable national influence; members of Adams's cabinet often sought and followed his advice. In 1798 they cooperated with George Washington to secure Hamilton's appointment—over Adams's strong opposition—as inspector general and second in command of the U.S. Army, which was preparing for a possible war against France. Since Washington chose not to assume active command, organizing and recruiting these troops fell to Hamilton. His military career came to an abrupt end in 1800 after President Adams sent a peace mission to France that achieved a settlement of the major issues.

Retirement and the fatal duel

Although his interest in national policies and politics was still strong, Hamilton's role in national affairs after 1801 became smaller. He continued to publish his opinions on public affairs in the *New York Evening Post*. In 1804 he took a stand against a rumored plot by New England and New York Federalists to break up the Union by forming a northern confederacy (a separate union). Hamilton believed that Vice President Aaron Burr (1756–1836), whom he referred to as “the most unfit and dangerous man of the community,” was involved with this plan. Hamilton also actively stood against Burr's bid for the New York governorship. After Burr lost the race, he angrily challenged Hamilton to a duel. Hamilton believed that his “ability to be in [the] future useful” demanded that he meet the challenge.

After putting his personal affairs in order, Alexander Hamilton met Burr at dawn on July 11, 1804, on the New Jersey side of the Hud-

son River. The two men exchanged gunshots, and Hamilton fell, mortally wounded. Many believe that he missed Burr on purpose, leaving himself an open target for Burr's bullet. Hamilton was carried back to New York City, where he died the next afternoon.

Theatrical roots

Oscar Greeley Clendenning Hammerstein II was born into a great theatrical family on July 12, 1895, in New York City. He was named after both famous grandfathers, Horace Greeley (1811–1872; famous anti-slavery newspaper publisher), and Oscar I, an opera promoter, as well as after the minister who wed his parents. His father, William, was the manager of *Victoria*, one of the most famous vaudeville theaters (involving a variety of acts) of its day. His uncle, Arthur, was a well-known producer. All were famous in their own right, but all of their success would be overshadowed by this new family member, Oscar II.

Oscar, or “Ockie” (his lifelong nickname), dabbled in theatrical activities as a youth, debuting in a Christmas pageant at his public school. At age nine he began his piano lessons. A happy childhood was marred by the death of his mother when he was just fifteen. When it came time for a career choice, Oscar's father pushed him away from the theater and toward law, through courses at Columbia University. His father's death in 1914 left him dependent on the more theatrically inclined family members. It was at Columbia that Oscar's career in theater began, when, at age nineteen, he joined the Columbia University Players as a performer in the 1915 Varsity review *On Your Way*. He participated heavily in the Varsity shows for several years, first as a performer and later as a writer. It was at Columbia that Oscar first met Richard Rodgers, who would later collaborate with him and with Lorenz Hart.

OSCAR HAMMERSTEIN

Born: July 12, 1895

New York, New York

Died: August 23, 1960

Doylestown, Pennsylvania

American songwriter

Oscar Hammerstein was perhaps the most influential lyricist and librettist (writer of opera lyrics) of the American theater. It was Hammerstein who reversed the process of musical writing, writing the lyrics first and then the score. Major musicals for which he wrote the lyrics

Oscar Hammerstein.

Courtesy of the Library of Congress.

Stage manager to librettist

After his first year of law school, the young Hammerstein convinced his uncle, Arthur, to hire him as an assistant stage manager on one of his upcoming shows. His uncle's one condition was that Oscar "not write one line" during this theater apprenticeship. Hammerstein complied, working his way up from scenery to production stage manager for all of Arthur's shows in 1919. In this position Hammerstein was able to do some writing and rewriting on scripts in development. Eventually he was writing musical comedies of his own. His first success as a librettist came in 1922 with *Wildflower*, written

with Otto Harbach. A more major success in 1924, *Rose Marie*, led to his collaboration with composer Jerome Kern. Kern and Hammerstein had both been concerned with the "integrated musical," a musical in which the book, lyrics, and score all grow from a central idea and all contribute to the story line.

Hammerstein and Kern developed what was later called musical plays. The musical play was distinguished from the libretto or musical comedy in its more natural, less poetic language. Their first example was an adaptation of Edna Ferber's sprawling novel about life on a Mississippi River boat. This became the landmark 1925 musical *Showboat*, with Kern composing the score and Hammerstein writing the book and lyrics. *Showboat* firmly established Hammerstein's success and reputation as a writer and lyricist.

Partnering with Rodgers

In 1929 Hammerstein divorced his wife of twelve years, Myra Finn, and married Dorothy Blanchard Jacobson. The next decade turned out to be a happy one for Hammerstein personally, but unhappy professionally. He spent much of his time in Hollywood, working on contract to various studios. He discovered that he did not work well under the rigorous time demands of the movie industry, having achieved his greatest success with *Showboat's* one year writing period. In 1942 he returned to New York with Dorothy and began leisurely work on an adaptation of Bizet's *Carmen*. Hammerstein adapted the lyrics and story to create the Americanized, all-black *Carmen Jones*. The opera received great acclaim.

When he had finished the libretto for *Carmen Jones*, Hammerstein was contacted by

an old Columbia acquaintance, Richard Rodgers, whose partnership with Lorenz Hart had recently dissolved. Rodgers had read Lynn Riggs's *Green Grow the Lilacs* and wanted to collaborate with Hammerstein on a musical adaptation for the Theatre Guild. Hammerstein had also read the play, and the two began work on the musical, tentatively titled *Away We Go*. Rodgers and Hammerstein worked toward the concept of the integrated musical, with Hammerstein writing most of the lyrics before Rodgers wrote the score, the reverse of the normal process. Robert Mamoulian was signed on as director, Agnes deMille as choreographer, and Terry Helburn as producer for the Theatre Guild.

When the musical, retitled *Oklahoma*, opened on Broadway on March 31, 1943, it was an enormous success, both critically and popularly. *Oklahoma* ran for 2,243 performances in its initial Broadway engagement, and in 1944 it received a special Pulitzer Prize. The team of Rodgers and Hammerstein was a success. They produced their own work and promising works by other artists and at one time had five of the highest grossing shows running at the same time on Broadway. They followed up their success with collaborations on *Carousel* (1945), *Allegro* (1947), *South Pacific* (1949), *The King and I* (1951), *Me and Juliet* (1953), *Pipe Dream* (1955), *Flower Drum Song* (1958), and *The Sound of Music* (1960), for which Howard Lindsay and Russell Crouse wrote the book, Rodgers composed the score, and Hammerstein wrote the lyrics. *South Pacific* won the Pulitzer Prize in 1950. *South Pacific*, *The King and I*, and *The Sound of Music* all won Tony awards for best musical. Most of the Rodgers and Hammerstein musicals have been adapted for the screen, with the greatest success going to *Oklahoma* and *The Sound of Music*.

Continued influence

Hammerstein's talents as a lyricist and librettist are undeniable. Countless productions of his musicals on Broadway, on tour, and in professional, amateur, and academic theaters around the world testify to the remarkable quality of his work. Hammerstein's influence on the next generation of lyricists and librettists was also direct and observable. Most notable was his influence on Stephen Sondheim, lyricist for such shows as *West Side Story*, *Sweeney Todd*, and *Sunday in the Park with George*. Sondheim was a close friend of the Hammerstein family from childhood and attributed his success in theater directly to Hammerstein's influence and guidance.

Oscar Glendenning Hammerstein II died in his home in Doylestown, Pennsylvania, on August 23, 1960, a victim of stomach cancer. He left behind three children, William and Alice by Myra Finn, and James by Dorothy Blanchard Jacobson. On September 1, 1960, at 9 P.M., the lights were extinguished on Broadway in memory of Oscar Hammerstein II, the "man who owned Broadway."

JOHN HANCOCK

Born: January 23, 1737

Braintree, Massachusetts

Died: October 8, 1793

Boston, Massachusetts

American statesman, politician, and governor

John Hancock signed the Declaration of Independence and was a leader of the movement toward revolution in the American colonies. He later served as a president of the Continental Congress, and he was elected governor of Massachusetts for nine terms.

Early life

John Hancock was born in Braintree, Massachusetts, on January 23, 1737. His parents were John Hancock, a Harvard graduate and minister, and Mary Hawke. After the death of his father when Hancock was seven, he was adopted by his uncle, a wealthy Boston merchant. Hancock graduated from Harvard in 1754, served for a time in his uncle's office as a clerk, and went to London in 1760 as the firm's representative. He spent a year there. In 1763 Hancock became a partner in his uncle's thriving business.

When his uncle died in 1764, Hancock inherited the business. He was one of many who was opposed to Great Britain's passing of the Stamp Act in 1765, since the act taxed the

kinds of transactions, or business dealings, his company was involved with. As a result, to avoid having to pay these taxes, Hancock ignored the law and began smuggling (bringing in secretly) goods into the colonies.

Hancock was elected to the Massachusetts General Court in 1766 at the suggestion of other colonists who were against British interference in the colonies. Hancock had attracted attention as something of a hero after one of his smuggling ships, *the Liberty*, was seized by the British. He received more votes than Samuel Adams (1722–1803), one of the most famous American Revolutionary leaders, in the next General Court election. Meanwhile, Hancock was threatened with large fines by Britain for the *Liberty* affair. Though the fines were never collected, Hancock never got his ship back.

Growing anti-British sentiment

Every time the British made a move that affected the American colonies, especially anything involving taxes, Samuel Adams and other anti-British agitators (people who stir up public feeling on political issues) spoke out against it. The Boston Massacre of 1770 (when British soldiers fired into a crowd of people who had been throwing snowballs and sticks at them, killing five) increased colonial anger toward Britain and established a tension that continued to grow. Hancock wavered for a time, but when the strength of public opinion became clear, he made the courageous announcement that he was totally committed to making a stand against the actions of the British government—even if it cost him his life and his fortune.

During the Boston Tea Party of 1773, Boston colonists disguised as Native Ameri-

cans dumped three shiploads of British tea into the harbor as a protest against the British government. After the Boston Tea Party, the British passed the Boston Port Bill of 1774. The bill ordered the closing of the port of Boston until the cost of the tea was repaid. Hancock's reputation grew during this time to the point where he became one of the main symbols of anti-British radicalism (extreme actions trying to force change). How much of this was planned by him, and how far he had been pushed by Samuel Adams, is uncertain. What is known is that when British General Thomas Gage finally decided to try to achieve peaceful relations with the colonies, Hancock and Adams were the only two Americans to whom he refused to even consider giving amnesty (a pardon).

Continental Congress

Hancock was elected president of the Continental Congress in May 1775 and married Dorothy Quincy in August of the same year. He hoped to be named to command the army around Boston and was disappointed when George Washington (1732–1799) was selected instead. Hancock voted for, and was the first representative to sign, the Declaration of Independence. Although Hancock resigned as president of the Continental Congress in October 1777, saying that he was in poor health, he stayed on as a member.

Hancock still wanted to prove himself as a military leader. However, when given the opportunity to command an expedition into Rhode Island in 1778, he did nothing to distinguish himself. Hancock was also embarrassed in 1777 when Harvard College, which he had served as treasurer since 1773, accused him of mismanaging university funds

John Hancock.

Courtesy of the National Archives and Records Association.

and demanded repayment. Hancock was forced to pay £16,000 (approximately \$22,000). In 1785 Hancock admitted that he still owed £1,054 (approximately \$1,500) to Harvard. This sum was eventually paid out of his estate after his death.

Elected to office

Like most public figures, Hancock had enemies. His opponents spread the word that he was a shallow man who lacked strong beliefs and was only interested in helping himself. Nevertheless, they could not prevent his election as the first governor of Massa-

chusetts, in 1780. He was reelected several times until retiring in 1785 just before Massachusetts went through a financial crisis. Although he claimed that his retirement was based on illness, Hancock's enemies claimed that he had seen the coming storm, which was caused in part by mistakes he had made in handling the state's money. After Shays's Rebellion (a 1786–87 uprising by farmers and small property owners in Massachusetts who demanded lower taxes, court reforms, and a revision of the state constitution), Hancock was reelected governor.

In 1788, Hancock was elected president of the Massachusetts State Convention to ratify, or approve, the new Constitution. He was approached by members of the Federalist Party (an early political group that supported a strong central government) who wanted a set of amendments added to the document. They supposedly hinted that if Hancock presented the amendments, they would help him to be named president if Washington declined the job. The truth of this story has never been confirmed. In the end, Hancock did offer the amendments, and Massachusetts ratified the Constitution. Washington accepted the presidency, and Hancock remained as Massachusetts governor, his popularity unchallenged. He died in office on October 8, 1793.

GEORGE FRIDERIC HANDEL

Born: February 23, 1685

Halle, Germany

Died: April 14, 1759

London, England

German-born English composer and organist

The dramatic English oratorios (lengthy choral works of a religious nature) of the German-born English composer (writer of music) and organist George Frideric Handel were the high point of the entire baroque (seventeenth-century ornate period) oratorio tradition. His Italian operas show a nobility of style and wealth of dramatic insight.

The young musician

George Frideric Handel was born on February 23, 1685, to Georg and Dorothea Händel in Halle, Germany. To study music he had to overcome his father's objections, and at the same time follow his father's insistence that he study law. But even before Handel had finished his law courses, he was devoted to pursuing a musical career. Although his father would not even allow him to have a musical instrument of his own, he managed to find ways to practice secretly. At about the age of seven he performed at the keyboard before the duke and his court at Weissenfels, Germany. As a result he became the pupil of Friedrich Wilhelm Zacchow, a composer and organist. Zacchow taught him composition as well as the organ, the violin, and the oboe, and by 1695 Handel was composing for these and other instruments. From 1696 until

1701 Handel composed many works. Unfortunately, the church cantatas (music that is written for one or more singers) and all but a few pieces of chamber music (music that is meant to be performed in a small space) that he composed at the time have disappeared.

Contact with German composer Georg Philipp Telemann, and a meeting shortly afterward with the composer Agostino Steffani, spurred Handel's operatic ambitions. In 1703 he resigned his post as organist at the Halle Domkirche and left the university, moving to Hamburg, where he joined the Goosemarket Theater as a violinist. But it was Handel's exceptional skill at the keyboard that brought him employment in the performance of operas.

First operas

Handel began his own operatic career with *Almira* (1704), which ran for some twenty performances—a very successful run. After several more successes, he sought richer operatic experience and left for Italy in 1706. He visited Florence, Venice, Rome, and Naples during the next three seasons, meeting almost all of the notable Italian musicians. His Italian journey resulted in two fine operas, *Rodrigo* (1707) and *Agrippina* (1709), several dramatic chamber works, and equally dramatic sacred compositions.

During a second visit to Venice, Handel met several persons interested in England who no doubt influenced his decision to try his luck as a freelance musician in London. A meeting with the manager of the King's Theatre furnished Handel with a chance to compose an opera. Within two weeks he produced the opera *Rinaldo*, which marked the high point of the London season in 1710 and 1711. Handel's course was set for the rest of his life.

Settling in England

As London became Handel's permanent home, he proceeded to compose a large amount of music for harpsichord, chamber ensembles, and orchestra, as well as various works for royal occasions. Handel's compositions so impressed England's Queen Anne (1665–1714) that she awarded him an annual salary of two hundred pounds. After Anne's death, George I (1660–1727) became king of England. In 1715 Handel provided music for a royal pleasure cruise for the King, his mistresses, and several barge-loads of courtiers (members of the royal court)—the famous *Water Music*. In 1719 Handel accepted an invi-

tation to join forces with the newly founded Royal Academy of Music. Handel's operas were numerous and well-received, but despite their success the academy did not prosper.

In 1726 Handel became a citizen of England and was appointed composer of music to the Chapel Royal. The season of 1727 saw the production of Handel's *Alessandro*. This marked the beginning of an intense rivalry between Faustina Bordoni and Francesca Cuzzoni, two prima donnas (leading female opera singers) whose hostility greatly harmed the cause of Italian opera in London. Other factors no doubt lent weight to the growing public disappointment, but this single event seemed to have caused opposition to Italian opera in London and introduced a succession of developments that led to its fall.

Apparently undismayed, Handel immediately formed the New Royal Academy of Music in partnership with a Swiss entrepreneur. After a whirlwind trip to Germany to audition new singers and to visit his mother, now blind and alone, Handel returned to London in time to open the new season. Thereafter his operas flowed forth on the average of two per year. In spite of the quality of these operas, Italian opera grew ever less popular in London. In April 1737 Handel suffered a stroke. He recuperated during the summer at Aix-la-Chapelle, returning to London in time to start the next season. Finally, with the miserable failure of *Imeneo* (1740) and *Deidamia* (1741), he at last gave up and wrote no more new operas.

The oratorios

Handel's ultimate failure with operas was offset by ever-increasing success with his oratorios. These provided a new vehicle, the

possibilities of which he had begun to explore and experiment with nearly a decade earlier. Indeed these established a new vogue (fashion), in which Handel fared better with London audiences than he ever had with Italian opera. As if to test a possible market for dramatic compositions in English, Handel revived past operas with revisions to the oratorio style, meeting with much success. Producing oratorios was a profitable business. As a direct consequence, the oratorio became a regular feature of each season, with Handel leading the field, as he had done previously with Italian opera.

It was obvious that the new form was on its way to becoming an established feature of English concert life. During the Lenten (the period of religious fasting for Christians) season in 1735, Handel gave no less than fourteen concerts, consisting mainly of oratorios.

Handel's personal health, however, continued to falter. In 1751 total blindness set in. From that time on he was limited to revising earlier works with outside assistance, and to improvising on organ and harpsichord in public performances. Handel's accomplishment during the last creative decade of his life seems almost miraculous when the Italian cantatas, several concertos, and a variety of other works are added to his twenty major works. He died in London on April 14, 1759.

Handel's creative genius

Surveying Handel's entire creative life, one gains a sense of spontaneous (instinctive) and incredibly abundant creative flow. This is confirmed by the marvelous collections of his work preserved at the Fitzwilliam and British museums in England, which reveal not only the enormous bulk of his creative achieve-

ment but also something of his uncompromising critical judgment. There is scarcely a page without deletions; frequently, he struck out whole passages. He obviously knew the art of heavy pruning, and his works profited greatly from it.

Handel's propensity to "write like the very devil" proved invaluable, in view of the demands imposed upon his time and energies in operatic composition throughout most of his career. Time after time he found it necessary to meet crises without much time for creative gestation (generation). Handel was at heart a dramatic composer for whom setting the scene and atmosphere and depiction of character thrust all other considerations into the background.

THOMAS HARDY

Born: June 2, 1840

Higher Bockhampton, Dorset, England

Died: January 11, 1928

Dorchester, England

English author, novelist, poet, and dramatist

The works of the English novelist, poet, and dramatist Thomas Hardy unite the Victorian (c. 1840–1900) and modern eras. They reveal him to be a kind and gentle man, terribly aware of the pain human beings suffer in their struggle for life.

Childhood

Thomas Hardy was born on June 2, 1840, in Higher Bockhampton in Dorset, England, which formed part of the "Wessex" of his novels and poems. The first of four children, Hardy was born small and thought at birth to be dead. He grew to be a small man only a little over five feet tall. Hardy learned to love books through his mother, Jemina, and was able to read before starting school. He was taught by his father, also named Thomas, to play the violin, and he often journeyed about the countryside playing for dances and storing up the impressions of rural life that make up so large a part of his work.

Hardy attended a private school in Dorchester, England, where he learned Latin, French, and German. In 1856 at the age of sixteen, Hardy became an apprentice (a person who works for someone in order to gain experience in a trade) to John Hicks, an architect in Dorchester. At this time he thought seriously of attending university and entering the Church, but he did not do so. In 1862 he went to London, England, to work. Also at this time, Hardy began writing poetry after being impressed by Reverend William Barnes, a local poet.

Early writings

In London Hardy continued to write poetry and began sending his poems to publishers, who quickly returned them. He kept

Thomas Hardy.

many of the poems and published them in 1898 and afterward. Back in Dorchester in 1867 while working for Hicks, he wrote a novel, *The Poor Man and the Lady*, which he was advised not to publish because it was too critical of Victorian society. Told to write a novel with a plot, he turned out *Desperate Remedies* (1871), which was unsuccessful.

Meanwhile Hardy had begun to work for Gerald Crickmay, who had taken over Hicks's business. Crickmay sent Hardy to Cornwall, England, where on March 7, 1870, he met Emma Lavinia Gifford, with whom he fell in love. Hardy could have kept on with architecture, but he was a "born bookworm," as he

said, and in spite of his lack of success with literature he decided to continue writing, hoping eventually to make enough money so he could marry Gifford. Their courtship is recorded in *A Pair of Blue Eyes* and in some of Hardy's most beautiful poems, among them "When I Set Out for Lyonesse" and "Beeny Cliff."

For *Under the Greenwood Tree* (1872) he earned 30 pounds and the book was well received. At the same time he was asked to write a novel for serialization (published in parts) in a magazine. In September 1872 *A Pair of Blue Eyes* began to appear, even though only a few chapters had been completed. *Far from the Madding Crowd* (1874), was published in magazines and was a success both financially and critically. Finally making a living from literature, Hardy married Gifford in September of 1874.

Later novels

Hardy preferred his poetry to his prose (nonpoetry writings) and thought his novels merely a way to earn a living. But his best novels—*The Return of the Native* (1878), *The Mayor of Casterbridge* (1886), and *Tess of the D'Urbervilles* (1891)—were much more than magazine fiction. The people were dominated by the countryside of "Wessex," Hardy's name for the area in southwest England where he set most of his novels, and the area is as memorable as the people.

Good or bad, Hardy's novels brought him money, fame, and acquaintance with greatness. With his wife he travelled in Germany, France, and Italy; he built Max Gate near Dorchester, where he lived from 1886 until his death; he frequently dined out, meeting poets Matthew Arnold (1822–1888), Robert Browning (1812–1889), Alfred, Lord Ten-

nyson (1809–1892), and others. Writer Robert Louis Stevenson (1850–1894) sought him out and visited him at Max Gate. It was a successful life and seemed happy enough, but he had a strained relationship with his wife.

Though Hardy's novels seldom end happily, he was not, he stated, a pessimist (taking the least hopeful view of a situation). He called himself a "meliorist," one who believed that man can live with some happiness if he understands his place in the universe and accepts it. He ceased to be a Christian, and he read the works of naturalist Charles Darwin (1809–1892) and accepted the idea of evolution, the theory that animals, including man, developed from earlier species. Later he took to reading philosopher Arthur Schopenhauer (1788–1860) and developed the notion of the Immanent Will, the blind force that drives the universe and in the distant future may see and understand itself.

Poetry and drama

Collecting new and old poems, Hardy published *Wessex Poems* (1898) and *Poems of the Past and Present* (1902). Then he began to publish *The Dynasts*, an immense drama of the Napoleonic Wars (a series of wars from 1792 to 1815 between France and different European powers) which depicts all the characters, even French emperor Napoleon Bonaparte (1769–1821), as a puppet whose actions are determined by the Immanent Will. The "epic-drama" evolved into nineteen acts and 130 scenes and was published in three parts in 1903, 1905, and 1908. Meant to be read, not acted, it is frequently called Hardy's masterwork.

Meanwhile Hardy continued to publish his shorter verse in *Time's Laughingstocks*

(1909). His most famous single volume of poems, *Satires of Circumstance*, appeared in 1914. It revealed the extremes of Hardy's emotional range in the short, bitter poems referred to in the title and the longer poems about his first wife, who died in 1912. *Selected Poems* (1916), *Moments of Vision* (1917), *Late Lyrics and Earlier* (1922), and *Human Shows* (1925) were published during the remainder of his life. *Winter Words* (1928) was published after his death.

Because in most cases Hardy published his poems years after he wrote them, the dates of when he wrote these pieces can be determined only by his references to them in *The Early Life of Thomas Hardy* or *The Later Years*. Because of this it is difficult to show Hardy's growth as a poet. In fact, he hardly grew at all. In almost all his poems Hardy uses Victorian diction (choice of words), regular meters (rhythm), and neat stanzas (divisions within a poem). These cause him to be called a Victorian poet, but he also uses everyday words. These, with his dark view of the human condition and his blending of humor and pity, rank him with modern poets.

In 1914 Hardy married Florence Emily Dugdale, who had been his secretary for several years. He continued to receive famous visitors at Max Gate and continued to visit London for special occasions. He died on January 11, 1928. His heart was buried in the churchyard at Stinsford, England, his ashes in Westminster Abbey.

STEPHEN HAWKING

Born: January 8, 1942

Oxford, England

English scientist, physicist, and mathematician

British physicist and mathematician Stephen Hawking has made fundamental contributions to the science of cosmology—the study of the origins, structure, and space-time relationships of the universe.

Early life

Stephen William Hawking was born on January 8, 1942, in Oxford, England. His father, a well-known researcher in tropical medicine, urged his son to seek a career in medicine, but Stephen found biology and medicine were not exact enough. Therefore, he turned to the study of mathematics and physics.

Hawking was not an outstanding student at St. Alban's School, nor later at Oxford University, which he entered in 1959. He was a social young man who did little schoolwork because he was able to grasp the essentials of a mathematics or physics problem quickly. At home he reports, "I would take things apart

to see how they worked, but they didn't often go back together." His early school years were marked by unhappiness at school, with his peers and on the playing field. While at Oxford he became increasingly interested in physics (study of matter and energy), eventually graduating with a first class honors in physics (1962). He immediately began post-graduate studies at Cambridge University.

Graduate school

The onset of Hawking's graduate education at Cambridge marked a turning point in his life. It was then that he embarked upon the formal study of cosmology, which focused his study. And it was then that he was first stricken with Lou Gehrig's disease, a weakening disease of the nervous and muscular system that eventually led to his total confinement in a wheelchair. At Cambridge his talents were recognized, and he was encouraged to carry on his studies despite his growing physical disabilities. His marriage in 1965 was an important step in his emotional life. Marriage gave him, he recalled, the determination to live and make professional progress in the world of science. Hawking received his doctorate degree in 1966. He then began his lifelong research and teaching association with Cambridge University.

Theory of singularity

Hawking made his first major contribution to science with his idea of singularity, a work that grew out of his collaboration (working relationship) with Roger Penrose. A singularity is a place in either space or time at which some quantity becomes infinite (without an end). Such a place is found in a black hole, the final stage of a collapsed star, where

the gravitational field has infinite strength. Penrose proved that a singularity could exist in the space-time of a real universe.

Drawing upon the work of both Penrose and Albert Einstein (1879–1955), Hawking demonstrated that our universe had its origins in a singularity. In the beginning all of the matter in the universe was concentrated in a single point, making a very small but tremendously dense body. Ten to twenty billion years ago that body exploded in a big bang that initiated time and the universe. Hawking was able to produce current astrophysical (having to do with the study of stars and the events that occur around them) research to support the big bang theory of the origin of the universe and oppose the competing steady-state theory.

Hawking's research led him to study the characteristics of the best-known singularity: the black hole. A black hole's edges, called the event horizon, can be detected. Hawking proved that the surface area (measurement of the surface) of the event horizon could only increase, not decrease, and that when two black holes merged the surface area of the new hole was larger than the sum of the two original.

Hawking's continuing examination of the nature of black holes led to two important discoveries. The first, that black holes can give off heat, opposed the claim that nothing could escape from a black hole. The second concerned the size of black holes. As originally conceived, black holes were immense in size because they were the end result of the collapse of gigantic stars. Hawking suggested the existence of millions of mini-black holes formed by the force of the original big bang explosion.

Unified field theory

In the 1980s Hawking answered one of Einstein's unanswered theories, the famous unified field theory. A complete unified theory includes the four main interactions known to modern physics. The unified theory explains the conditions that were present at the beginning of the universe as well as the features of the physical laws of nature. When humans develop the unified field theory, said Hawking, they will "know the mind of God."

Publications

As Hawking's physical condition grew worse his intellectual achievements increased.

He wrote down his ideas in *A Brief History of Time: From the Big Bang to Black Holes*. It sold over a million copies and was listed as the best-selling nonfiction book for over a year.

In 1993 Hawking wrote *Black Holes and Baby Universes and Other Essays*, which, in addition to his scientific thoughts, contains chapters about Hawking's personal life. He coauthored a book in 1996 with Sir Roger Penrose titled *The Nature of Space and Time*. Issues discussed in this book include whether the universe has boundaries and if it will continue to expand forever. Hawking says yes to the first question and no to the second, while Penrose argues the opposite. Hawking joined Penrose again the following year in the creation of another book, *The Large, the Small, and the Human Mind* (1997). In 2002 he was likewise celebrating the publication of *The Universe in a Nutshell*. Despite decreasing health, Hawking traveled on the traditional book release circuit. People with disabilities look to him as a hero.

Honors and commitments

Hawking's work in modern cosmology and in theoretical astronomy and physics is widely recognized. He became a fellow of the Royal Society of London in 1974 and five years later was named to a professorial chair at Cambridge University that was once held by Sir Isaac Newton (1642–1727). Beyond these honors he has earned a host of honorary degrees, awards, prizes, and lectureships from the major universities and scientific societies of Europe and America. By the end of the twentieth century Stephen Hawking had become one of the best-known scientists in the world. His popularity includes endorsing a wireless Internet connection and speaking to

wheelchair-bound youth. He also had a special appearance on the television series *Star Trek*.

Though very private, it is generally known that Stephen's first marriage ended in 1991. He has three children from that marriage.

When asked about his objectives, Hawking told Zygon in a 1995 interview, "My goal is a complete understanding of the universe, why it is as it is and why it exists at all."

NATHANIEL HAWTHORNE

Born: July 4, 1804
Salem, Massachusetts
Died: May 19, 1864
Plymouth, New Hampshire
American writer

The work of American fiction writer Nathaniel Hawthorne was based on the history of his Puritan ancestors

and the New England of his own day. Hawthorne's *The Scarlet Letter* and *The House of the Seven Gables* are classics of American literature.

Childhood

Nathaniel Hawthorne was born in Salem, Massachusetts, on July 4, 1804, into the sixth generation of his Salem family. His ancestors included businessmen, judges, and seamen—all Puritans, a strict religious discipline. Two aspects of his background especially affected his imagination and writing career. The Hathornes (Nathaniel added the “w” to the name) had been involved in religious persecution (intense harassment) with their first American ancestor, William. Another ancestor, John Hathorne, was one of the three judges at the seventeenth-century Salem witchcraft trials, where dozens of people were accused of, and later executed for, being “witches.”

Nathaniel's father, a sea captain, died in 1808, leaving his wife and three children dependent on relatives. Nathaniel, the only son, spent his early years in Salem and in Maine. A leg injury forced Hawthorne to remain immobile for a considerable period, during which he developed an exceptional taste for reading and thinking. His childhood was calm, a little isolated but far from unhappy, especially since as a handsome and attractive only son he was idolized by his mother and his two sisters.

With the aid of his wealthy uncles, Hawthorne attended Bowdoin College from 1821 to 1825. Among his classmates were poet Henry Wadsworth Longfellow (1807–1882), and future U.S. president Franklin Pierce (1804–1869). At Bowdoin, Hawthorne read widely and received solid

Nathaniel Hawthorne.

instruction in English composition and the classics, particularly in Latin. His refusal to participate in public speaking prevented his achievement of an outstanding academic record, but he was in good standing. On one occasion he was fined 50 cents for gambling at cards, but his behavior was not otherwise singled out for official disapproval. Though small and isolated, the Bowdoin of the 1820s was an unusually good college, and Hawthorne undoubtedly profited from his formal education. He also made loyal friends.

Years in seclusion

Returning from Bowdoin, Hawthorne spent the years 1825 to 1837 in his mother's

Salem household. Later he looked back upon these years as a period of dreamlike isolation and solitude, spent in a haunted room. During these “solitary years” he learned to write tales and sketches that are still unique.

Recent biographers have shown that this period of Hawthorne’s life was less lonely than he remembered it to be. In truth, he did have social engagements, played cards, and went to the theatre. Nevertheless, he consistently remembered these twelve years as a strange, dark dream, though his view of the influence of these years varied.

Writing short stories

Most of Hawthorne’s early stories were published anonymously (without an author’s name) in magazines and giftbooks. In 1837 the publication of *Twice-Told Tales* somewhat lifted this spell of darkness. After *Twice-Told Tales* he added two later collections, *Mosses from an Old Manse* (1846) and *The Snow-Image* (1851), along with *Grandfather’s Chair* (1841), a history of New England for children. Hawthorne’s short stories came slowly but steadily into critical favor, and the best of them have become American classics.

By his own account it was Hawthorne’s love of his Salem neighbor Sophia Peabody that brought him from his “haunted chamber” out into the world. His books were far from profitable enough to support a wife and family, so in 1838 he went to work in the Boston Custom House and then spent part of 1841 in the famous Brook Farm community in hopes of finding a pleasant and economical home for Sophia and himself.

Hawthorne and Sophia, whom he finally married in 1842, resorted not to Brook Farm

but to the Old Manse in Concord, Massachusetts, where they spent several years of happiness in as much quiet living as they could achieve. Concord was home to Ralph Waldo Emerson (1803–1882), Henry David Thoreau (1817–1862), and Ellery Channing (1780–1842), and Hawthorne was in frequent contact with these important thinkers, though he did not take to their philosophical lifestyles.

Writing the novels

Facing the world once more, Hawthorne obtained in 1846 the position of surveyor (one who maps out new lands) in the Salem Custom House, but was relieved of this position in 1848 because of his political ties. His dismissal, however, turned out to be a blessing, since it gave him time in which to write his greatest success, *The Scarlet Letter*.

The period 1850 to 1853 was Hawthorne’s most productive, as he wrote *The House of the Seven Gables* and *The Blithedale Romance*, along with *A Wonder Book* (1852) and *Tanglewood Tales* (1853). During 1850 the Hawthornes lived at the Red House in Lenox in the Berkshire Hills, and Hawthorne formed a memorable friendship with novelist Herman Melville (1819–1912). The association was more important to Melville than to Hawthorne, since Melville was fifteen years younger and the much more impressionable (easily influenced) of the two men. It left its mark in dedication of his *Moby-Dick*, and in some wonderful letters.

Years abroad

In 1852 Franklin Pierce was elected president of the United States, and Hawthorne, who wrote his campaign biography, was appointed to the important overseas

post of American consul (advisor) at Liverpool, England. He served in this post from 1853 to 1857. These English years resulted in *Our Old Home* (1863), a volume drawn from the since-published "English Note-Books."

In 1857 the Hawthornes left England for Italy, where they spent their time primarily in Rome and Florence. They returned to England, where Hawthorne finished his last and longest complete novel, *The Marble Faun* (1860). They finally returned to the United States, after an absence of seven years, and took up residence in their first permanent home, The Wayside, at Concord.

Last years

Although he had always been an exceptionally active man, Hawthorne's health began to fail him. Since he refused to submit to any thorough medical examination, the details of his declining health remain mysterious. Hawthorne died on May 19, 1864. He had set off for the New Hampshire hills with Franklin Pierce, an activity he had always enjoyed, hoping to regain his health. But he died the second night in Plymouth, New Hampshire, presumably in his sleep.

Hawthorne once said that New England was enough to fill his heart, yet he sought the broader experience of Europe. Modest in expectations, he had nonetheless desired to live fully. Hawthorne's life and writings present a complex puzzle. A born writer, he suffered the difficulties of his profession in early-nineteenth-century America, an environment unfriendly to artists.

WILLIAM RANDOLPH HEARST

Born: April 29, 1863

San Francisco, California

Died: August 14, 1951

Beverly Hills, California

American publisher and editor

For almost half a century William Randolph Hearst was the American publisher, editor, and proprietor (business owner) of the most extensive journalistic empire ever assembled by one man. His personality and use of wealth permanently left a mark on American media.

Early years

On April 29, 1863, William Randolph Hearst was born in San Francisco, California. He received the best education that his multimillionaire father and his sophisticated schoolteacher mother (more than twenty years her husband's junior) could buy—private tutors, private schools, grand tours of Europe, and Harvard College. Hearst's father had been a keen geologist (student of the earth's history as recorded in rocks) and lucky gold miner during the 1849 Gold Rush. As

William Randolph Hearst.
Courtesy of the Library of Congress.

partner in some of the largest mines in America, George Hearst easily entered politics as a California Senator. To help him politically, he purchased the then failing *San Francisco Examiner*. Meanwhile, his son, William Randolph, was routinely being expelled from school due to pranks. He was even expelled from Harvard after sending engraved silver chamber pots (prior to indoor plumbing, people kept pots under their beds to use for relieving themselves at night) to his professors. But Hearst inherited his father's ambition and energy. William's mother, the cultured parent, took William on two art tours in Europe before he was sixteen years old.

Young Hearst's journalistic career began in 1887, two years after his Harvard expulsion. "I want the *San Francisco Examiner*," he wrote to his father, who owned the newspaper and granted the request.

When William's father died, he left his millions in mining properties, not to his son, but to his wife—who compensated by giving her son ten thousand dollars a month until her death. In turn the gray-eyed, soft-spoken William Randolph Hearst invested frantically and heavily.

Building a journalistic empire

The *Daily Examiner* became young Hearst's laboratory, where he gained a talent for making fake news and faking real news in such a way as to create maximum public shock. From the outset he obtained top talent by paying top prices.

To get an all-star cast and an audience of millions, however, Hearst had to move his headquarters to New York City, where he immediately purchased the old and dying *New York Morning Journal*. Within a year Hearst ran up the circulation from seventy-seven thousand to over a million by spending enough money to beat the aging Joseph Pulitzer's *World* at its own sensationalist (scandalous) game. Sometimes Hearst hired away the *World's* more aggressive executives and reporters; sometimes he outbid all competitors in the open market. One of Hearst's editors was paid twice as much in salary as the sale price of the *New York World*.

Hearst attracted readers by adding heated reporting of sports, crime, sex, scandal, and human-interest stories. "A Hearst newspaper is like a screaming woman running down the street with her throat cut,"

said Hearst writer Arthur James Pegler. Hearst's slam-bang showmanship attracted new readers and nonreaders.

During the last five years of the nineteenth century, Hearst set his pattern for the first half of the twentieth century. The *Journal* supported the Democratic Party, yet Hearst opposed the campaign of Democratic presidential candidate William Jennings Bryan (1860–1925) in 1896. In 1898 Hearst backed the Spanish-American War (1898; a war in which the United States aided Cuba in its fight for freedom from Spanish rule), which Bryan and the Democrats opposed. Further, Hearst's wealth cut him off from the troubled masses to whom his newspapers appealed. He could not grasp the basic problems the issue of the war with Spain raised.

Entering politics

Having shaken up San Francisco with the *Examiner* and New York City with the *Journal*, Hearst established two newspapers in Chicago, Illinois, the *Chicago American* in 1900 and the *Chicago Examiner* in 1902; a newspaper in Boston, Massachusetts, the *Boston American*; and a newspaper in Los Angeles, California, the *Los Angeles Examiner* in 1904. These added newspapers marked more than an extension of Hearst's journalistic empire, they reflected his sweeping decision to seek the U.S. presidency. Perhaps his ambition came from a desire to follow in his father's footsteps. His personality and fortune were not suited to a political career however.

In 1902 and 1904 Hearst won election to the House of Representatives as a New York Democrat. Except, his journalistic activities and his \$2 million presidential campaign left him little time to speak, vote, or answer

roll calls in Congress. His nonattendance angered his colleagues and the voters who had elected him. Nevertheless, he found time to run as an independent candidate for mayor of New York City in 1905, and as a Democratic candidate for governor in 1906. His loss in both elections ended Hearst's political career.

Personal life

In 1903, the day before his fortieth birthday, he married twenty-one-year-old Millicent Willson, a showgirl, thus giving up Tessie Powers, a waitress he had supported since his Harvard days. The Hearsts had five boys, but in 1917 Hearst fell in love with another showgirl, twenty-year-old Marion Davies of the *Ziegfeld Follies*. He maintained a relationship with her that ended only at his death.

When Hearst's mother died, he came into his inheritance and took up permanent residence on his father's 168,000-acre ranch in southern California. There he spent \$37 million on a private castle, put \$50 million into New York City real estate, and put another \$50 million into his art collection—the largest ever assembled by a single individual.

Hearst publications

During the 1920s one American in every four read a Hearst newspaper. Hearst owned twenty daily and eleven Sunday papers in thirteen cities, the King Features syndication service (organization that places featured articles or comics in multiple papers at once), the International News Service, the *American Weekly* (a syndicated Sunday supplement), International Newsreel, and six magazines,

including *Cosmopolitan*, *Good Housekeeping*, and *Harper's Bazaar*.

Despite Hearst's wealth, expansion, and spending, his popularity with the public as well as with the government was low. Originally a progressive Democrat, he had no bargaining power with Republican Theodore Roosevelt (1859–1919). Hearst fought every Democratic reform leader from Bryan to Franklin Roosevelt (1882–1945), and he opposed American participation in both world wars.

In 1927 the Hearst newspapers printed forged (faked) documents, which supported an accusation that the Mexican government had paid several U.S. senators more than \$1 million to support a Central American plot to wage war against the United States. From this scandal the Hearst press suffered not at all.

In the next ten years, however, Hearst's funds and the empire suddenly ran out. In 1937 the two corporations that controlled the empire found themselves \$126 million in debt. Hearst had to turn them over to a seven-member committee whose purpose was to save what they could. They managed to hold off economic failure only by selling off much of Hearst's private fortune and all of his public powers as a newspaper owner.

William Randolph Hearst died on August 14, 1951, in Beverly Hills, California.

WERNER HEISENBERG

Born: December 5, 1901

Würzburg, Germany

Died: February 1, 1976

Munich, Germany

German physicist

German physicist Werner Heisenberg was a leader in physics, winning the 1932 Nobel Prize in Physics for his discovery of the uncertainty principle, which states that it is impossible to specify the exact position and momentum of a particle (tiny piece of matter) at the same time.

Early life

Werner Karl Heisenberg was born on December 5, 1901, in Würzburg, Germany, the son of August and Annie Wecklein Heisenberg. As a boy Heisenberg began playing the piano early and was playing master compositions by the age of thirteen. It was his father's commitment to academic learning, however, that led him to pursue the science he loved. He graduated from the University of Munich, where his father was professor of Greek language and literature.

Heisenberg was also a regular hiker and an eager student of classical literature and philosophy. He amazed family and friends when he taught himself calculus (a method of computing in a special notation) and tried to publish a scientific paper as a teen. Even though his strongest interest in life was science, music was a lifetime companion for him. A hard worker, Heisenberg worked on a farm for three summers in order to pay for his tuition to the University of Munich. At the university, where he enrolled in 1920, Heisenberg soon established close contact with Arthur Sommerfeld, a chief figure in early modern physics. After more hard work he received his doctorate in Munich in 1923. From there Heisenberg, on a Rockefeller grant, went to the Niels Bohr Institute in Copenhagen, Denmark, where he eagerly studied the most creative and up-to-date thoughts on atomic (related to the smallest particles of mass) theory.

His landmark papers

The Bohr's institute was the perfect setting for young Heisenberg to have his knowledge and interests grow. No sooner had Heisenberg completed his stay in Copenhagen than he worked out a complete method of calculating the energy levels of "atomic oscillators" (devices for producing alternating [back and forth] current). The method brought about very good results. A fellow physicist had it sent to the *Physikalische Zeitschrift*, where it was immediately printed under the title, "On Quantum Mechanical Interpretation of Kinematic and Mechanical Relations." Heisenberg's paper earned him immediate fame and recognition. In 1926 he was appointed lecturer in theoret-

Werner Heisenberg.

ical physics (physics that exists only in theory) at the University of Copenhagen.

It was at Copenhagen that Heisenberg formulated the famous uncertainty principle, which states that it is impossible to specify the exact position and momentum of a particle at the same time. This was published in an article entitled, "On the Visualizable Content of Quantum Theoretical Kinematics and Mechanics." Heisenberg's "The Physical Principles of the Quantum Theory" is also considered a classic in this field. In 1927, at the age of twenty-six, he became professor of theoretical physics at the University of Leipzig. He received the Nobel Prize for physics in

1932. During this outbreak of academic activity, he married Elisabeth Schumacher. They eventually had seven children.

Questionable role in war

As a theoretical scientist, Heisenberg was initially held in low regard and was even considered suspect by the Nazi (German party in control from 1933–45 under the leadership of Adolf Hitler [1889–1945]) government. However, when World War II (1939–45; a war that pitted Great Britain, France, the Soviet Union, and the United States against Germany, Italy, and Japan) began, the government appointed him as director of the German uranium (a dangerous element) project, and he worked on developing an atomic bomb for Germany. Heisenberg was arrested and placed in captivity in England from April 1945 until the summer of 1946. His role during the war continues to be a source of great debate.

Later career

After World War II Heisenberg did much to reorganize scientific research. In the early 1950s he worked toward the formulation of a “unified [all-encompassing] theory of fundamental [basic] particles,” stressing the role of symmetry (having balanced size and features) principles. This theory was discussed at length at an international conference in 1958. He presented his thought on this subject in the introduction to the *Unified Field Theory of Elementary Particles* (1966).

In 1955 and 1956 Heisenberg wrote and published *Physics and Philosophy: The Revolution in Modern Science*. He also published the autobiographical (about oneself) *Physics and Beyond* (1971), as well as several books deal-

ing with the philosophical and cultural significance of atomic and nuclear physics.

Heisenberg retired in 1970. His health began to fail in 1973, and shortly thereafter he became seriously ill, dying on February 1, 1976, in Munich, Germany.

JOSEPH HELLER

Born: May 1, 1923

Brooklyn, New York

Died: December 12, 1999

East Hampton, New York

American author

Joseph Heller was a popular and respected writer whose first and best-known novel, *Catch-22* (1961), was considered a classic piece of literature in the second half of the twentieth century.

Childhood in Brooklyn

Joseph Heller was born in Brooklyn, New York, to first generation Russian-Jewish immigrants. His father, a bakery-truck driver, died after a surgical operation when Heller was only five years old. Many critics believe that Heller developed the dark, wisecracking humor that marked his writing style while growing up near Coney Island, a famous amusement park in Brooklyn. Heller recalled little childhood influence in the literary world except for *The Illiad* by Homer, an eighth-century B.C.E. poet.

Education and the military

After graduating from high school in 1941, Heller worked briefly in an insurance office, and in 1942 he enlisted in the Army Air Corps after America entered World War II (1939–45; a war in which France, Great Britain, the United States, and the Soviet Union fought against Germany, Italy, and Japan). Two years later he was sent to Corsica, an island in the Mediterranean Sea, where he flew sixty combat missions as a fighter pilot, earning an Air Medal and a Presidential Unit Citation. It is generally agreed that Heller's war years in the Mediterranean had only a minimal impact on the creation of *Catch-22*.

After Heller left the military in 1945, he married Shirley Held and began his college education. He obtained a bachelor's degree in English from New York University, a master's degree from Columbia University, and attended Oxford University as a Fulbright Scholar for a year before becoming an English instructor at Pennsylvania State University.

Catch-22

Two years later Heller began working as an advertising copywriter, securing positions

Joseph Heller.

Reproduced by permission of AP/Wide World Photos.

at such magazines as *Time*, *Look*, and *McCall's* from 1952 to 1961. During this time Heller was also writing short stories and scripts for film and television, as well as working on *Catch-22*. After the success of *Catch-22*, Heller quit his job at *McCall's* and concentrated exclusively on writing fiction and plays.

Catch-22 concerns a World War II fighter pilot named Yossarian who believes his foolish, ambitious, mean-spirited commanding officers are more dangerous than the enemy. In order to avoid flying more missions, Yossarian retreats to a hospital with a mysterious liver complaint, wrecks his plane, and tries to get himself declared insane. Various

defined throughout the novel, “Catch-22” refers to the ways in which officials in command control the people who work for them.

“I never thought of *Catch-22* as a comic novel,” Heller says in the *New York Times*. “[But] . . . I wanted the reader to be amused, and . . . I wanted him to be ashamed that he was amused. My literary bent . . . is more toward the morbid [gruesome] and the tragic. Great carnage [death] is taking place and my idea was to use humor to make ridiculous the things that are irrational and very terrible.”

Later works

While Heller’s place in twentieth-century letters is secured with *Catch-22*, he is also highly regarded for his other works, which present a comic vision of modern society with serious moral connections. A major theme throughout his writing is the conflict that occurs when individuals interact with such powerful institutions as corporations, the military, and the government.

Heller’s second novel, *Something Happened*, centers on Bob Slocum, a middle-aged businessman who has a large, successful company but feels emotionally empty. While initial reviews of *Something Happened* were mixed, more recent criticism has often deemed this novel superior to and more sophisticated than *Catch-22*.

Good as Gold (1979) marks Heller’s first fictional use of his Jewish heritage and childhood experiences in Coney Island. In *Picture This* (1988), Heller utilizes Rembrandt’s painting “Aristotle Contemplating the Bust of Homer” to draw parallels between ancient Greece, seventeenth-century Holland, and contemporary America.

Declining health

In the early 1980s Heller was stricken with a nerve disease, Guillain-Barre syndrome, that left him paralyzed for several months. Though the author became too weak to move and almost too weak to breathe on his own, he eventually regained his strength and recovered from the often fatal disorder. After completing *God Knows*, Heller began writing his first nonfiction book, *No Laughing Matter*, with Speed Vogel, a friend who helped him considerably during his illness.

Heller died of a heart attack on December 12, 1999, at his East Hampton, New York, home. After Heller’s death, Simon & Schuster published Heller’s final work, *A Portrait of an Artist, as an Old Man*, a collection of memoirs and essays by one of the world’s most influential writers of the twentieth century.

LILLIAN
HELLMAN

Born: June 20, 1906

New Orleans, Louisiana

Died: June 30, 1984

Vineyard Haven, Massachusetts

American playwright

Lillian Hellman, American playwright, wrote a series of powerful, realistic plays that made her one of America's major dramatists. She explored highly controversial themes, with many of her plays reflecting her outspoken political and social views.

Early life

Lillian Florence Hellman was born in New Orleans, Louisiana, on June 20, 1906, of Jewish parents, Max Hellman, a shoe salesman, and Julia Newshouse, whose family had made a small fortune in the banking industry. In 1910 her family moved to New York City, where she attended public schools. Her schooling was constantly interrupted by her father's frequent business trips to New Orleans, which would sometimes last up to six months.

Hellman went on to study at New York University (1923–1924) and Columbia University (1924). Her marriage to Arthur Kober in 1925, who was a writer for the *New Yorker*, helped Hellman get various jobs around New York City, including reading scripts for studios and working as a book reviewer for the *New York Herald Tribune*. The marriage ended in 1932.

Hellman worked as a manuscript reader for Liveright Publishers before becoming main play reader for producer Herman Shumlin. In 1930, ready to drop her idea of being a writer, she was talked out of quitting by Dashiell Hammett, who became her life-long mentor (teacher) and partner.

Major works invited controversy

After a “year and a half of stumbling stubbornness,” Hellman finished “The Chil-

dren's Hour” (1934), based on an actual incident in Scotland. The action of the play is triggered by a child's accusation of sexual relations against two female teachers, which leads to one woman's suicide (where a person takes his or her own life). The play reveals Hellman's sharp characterizations and clear, moral comment on a theme considered dramatically untouchable at the time.

“In Days to Come” (1936), a play of a crumbling family as well as of the struggle between union (an organization that fights for workers' rights) and management, Hellman's dramatic touch faltered. However, her next play, “The Little Foxes” (1939), ranks as one of the most powerful in American drama. Set in the South, it depicts a family almost completely engulfed by greed and hate.

During World War II (1939–45; a war in which France, Great Britain, the United States, and the Soviet Union fought against Germany, Italy, and Japan), Hellman wrote two plays. “Watch on the Rhine” (1941), which received the New York City Critics Circle Award, was a drama about an underground hero, and spoke out harshly against the Nazis (a radical political party that controlled Germany leading up to, and during, World War II). “The Searching Wind” (1944) championed the movement against fascism (a form of government characterized by leadership by one all-powerful ruler), criticizing the failure of influential Americans to halt the rise of Germany's Adolph Hitler (1889–1945) and Italy's Benito Mussolini (1883–1945).

In “Another Part of the Forest” (1946), Hellman again portrayed the Hubbard family of “The Little Foxes”; she also directed the play. “Autumn Garden” (1951) lacked the usual passion of her dramas but was a touch-

Lillian Hellman.

ing and revealing insight into a southern boardinghouse. The style of the play is sometimes compared to the Russian writer Anton Chekhov's (1860–1904) work. "Toys in the Attic" (1960), a devastating portrait of possessive love set in New Orleans, won her another New York Critics Circle Award.

Work outside of the theatre

Hellman demonstrated her versatility as an author with a witty book for the musical "Candide" (1956); adaptations of two plays, "Montserrat" (1949) and Jean Anouilh's "The Lark" (1956); and her departure from realism (realistic pieces) in the humorous play of

Jewish family life, "My Mother, My Father and Me" (1963). She also edited *The Letters of Anton Chekhov* in 1955.

Hellman published three memoirs (personal writings) dealing with her career, personal relationships, and political activities: *An Unfinished Woman* (1969), *Pentimento: A Book of Portraits* (1973), and *Scoundrel Time* (1976). These works included her sharp criticism of the House Unamerican Activities Committee headed by Senator Joseph McCarthy (1908–1957), which accused hundreds of politicians, artists, and other Americans of being communists, the political design where goods and services are owned and distributed by the government. There was much discussion at the time about whether the content of these memoirs was greatly enhanced by Hellman.

Hellman received honorary degrees from several colleges and universities. Her theatrical awards included the New York Drama Critics Circle Award (1941 and 1960); a Gold Medal from the Academy of Arts and Letters for Distinguished Achievement in the Theatre (1964); and election to the Theatre Hall of Fame (1973). She also received the National Book Award in 1969 for *An Unfinished Woman* and a nomination in 1974 for *Pentimento: A Book of Portraits*. Hellman died June 30, 1984, in Vineyard Haven, Massachusetts.

ERNEST HEMINGWAY

Born: July 21, 1898

Oak Park, Illinois

Died: July 2, 1961

Ketchum, Idaho

American author

Ernest Hemingway, American Nobel Prize-winning author, was one of the most celebrated and influential literary stylists of the twentieth century. His critical reputation rests solidly upon a small body of exceptional writing, set apart by its style, emotional content, and dramatic intensity of vision.

Childhood in the Midwest

Ernest Miller Hemingway was born in Oak Park, Illinois, on July 21, 1898. His father was a country physician who taught his son hunting and fishing; his mother was a religious woman, active in church affairs, who led her son to play the cello and sing in the choir. Hemingway's early years were spent largely in fighting the feminine influence of his mother while feeding off the influence of his father. He spent the summers with his family in the woods of northern Michigan, where he often accompanied his father on professional calls. The discovery of his father's apparent lack of courage, later

depicted in the short story "The Doctor and the Doctor's Wife," and his suicide several years later left the boy with an emotional scar.

Despite the intense pleasure Hemingway took from outdoor life and his popularity in high school—where he distinguished himself as a scholar and athlete—he ran away from home twice. However, his first real chance for escape came in 1917, when the United States entered World War I (1914–18; a war in which forces clashed for European control). Eager to serve his country in the war, he volunteered for active service in the infantry (foot soldiers) but was rejected because of eye trouble.

Hemingway then enlisted in the Red Cross medical service, driving an ambulance on the Italian front. He was badly wounded in the knee yet carried a wounded man on his back a considerable distance to the aid station. After having over two hundred shell fragments (parts of bullets) removed from his legs and body, Hemingway next enlisted in the Italian infantry, served on the Austrian front until the armistice (truce), and was decorated for bravery by the Italian government. Hemingway soon returned home where he was hailed as a hero.

Learning his trade

Shortly after the war Hemingway worked as a foreign correspondent in the Near East for the *Toronto Star*. When he returned to Michigan he had already decided to commit himself to fiction writing. His excellent journalism and the publication in magazines of several experimental short stories had impressed the well-known author Sherwood Anderson (1876–1941), who, when Hemingway decided to return to

Ernest Hemingway.

Reproduced by permission of the Corbis Corporation.

Europe, gave him letters of introduction to Gertrude Stein (1846–1946) and Ezra Pound (1885–1972)—two American writers living in Europe. Hemingway and his bride, Hadley Richardson, journeyed to Paris, where he learned much from these two well-known authors. Despite his lack of money and poor living conditions, these were the happiest years of Hemingway's life, as well as the most artistically productive.

In 1923 Hemingway published his first book, *Three Stories and Ten Poems*. The poems are insignificant, but the stories give strong indication of his emerging genius. With *In Our Time* (1925) Hemingway drew on his

experiences while summering in Michigan to depict the initiation into the world of pain and violence of young Nick Adams, a model for later Hemingway heroes.

Major novels

Hemingway returned to the United States in 1926 with the manuscripts of two novels and several short stories. That May, Scribner's issued Hemingway's second novel, *The Sun Also Rises*. This novel, the major statement of the "lost generation," describes a group of Americans and Englishmen, all of whom have suffered physically and emotionally during the war.

In December 1929 *A Farewell to Arms* was published. This novel tells the story of a tragic love affair between an American soldier and an English nurse set against the backdrop of war and collapsing world order. It contains a philosophical expression of the Hemingway code that man is basically helpless in a violent age: "The world breaks everyone," reflects the main character, "and afterward many are strong in the broken places. But those that it will not break it kills. It kills the very good and the very gentle and the very brave impartially. If you are none of those you can be sure that it will kill you too, but there will be no special hurry."

Hemingway revealed his passionate interest in bull-fighting in *Death in the Afternoon* (1932), a humorous and unique nonfiction study. Hemingway's African safari in 1934 provided the material for another nonfiction work, *The Green Hills of Africa* (1935), as well as two of his finest short stories, "The Short Happy Life of Francis Macomber" and "The Snows of Kilimanjaro."

In 1940 Hemingway published *For Whom the Bell Tolls*, his most ambitious novel. A wonderfully clear narrative, it is written in less lyrical and more dramatic prose (non-poetry writing) than his earlier work.

World War II

Following the critical and popular success of *For Whom the Bell Tolls*, Hemingway lapsed into a literary silence that lasted a full decade and was largely the result of his strenuous, frequently reckless, activities during World War II (1939–45; a war in which France, Great Britain, the Soviet Union, and the United States fought against Germany, Italy, and Japan). In 1942, as a *Collier's* correspondent with the Third Army, he witnessed some of the bloodiest battles in Europe. At this time he received the nickname of “Papa” from his admirers, both military and literary.

In 1944 while in London, Hemingway met and soon married Mary Welsh, a *Time* reporter. His three previous marriages—to Hadley Richardson, mother of one son; to Pauline Pfeiffer, mother of his second and third sons; and to Martha Gelhorn—had all ended in divorce. Following the war, Hemingway and his wife purchased a home, Finca Vigia, near Havana, Cuba.

Last Works

In 1952 *The Old Man and the Sea* was published. A novella (short novel) about an extraordinary battle between a tired old Cuban fisherman and a giant marlin, it was immediately hailed as a masterpiece and was awarded the Pulitzer Prize in 1953. A year later, Hemingway won the Nobel Prize for Literature.

Hemingway's declining physical condition and increasingly severe mental problems

drastically reduced his literary output in the last years of his life. A journey to Africa planned by the author and his wife in 1954 ended in their plane crash over the Belgian Congo. Hemingway suffered severe burns and internal injuries from which he never fully recovered. Additional strain occurred when the revolutionary Cuban government of Fidel Castro (1926–) forced the Hemingways to leave Finca Vigia.

After only a few months in their new home in Ketchum, Idaho, Hemingway was admitted to the Mayo Clinic to be treated for hypertension (high blood pressure) and depression, and was later treated with electroshock therapy, a radical therapy where an electric current is sent through the body. Made bitter by an illness that humiliated him physically and impaired his writing, he killed himself with a shotgun on July 2, 1961.

Many of Hemingway's unpublished and unfinished works were published after his death. Because of his amazing body of work, and his intense approach to life, Hemingway was arguably one of the most influential American writers of the twentieth century.

JIMI HENDRIX

Born: November 27, 1942

Seattle, Washington

Died: September 18, 1970

London, England

*African American musician, songwriter,
and guitarist*

Jimi Hendrix was one of the most original electric guitarists of all time, combining blues, hard rock, modern jazz, and soul into his own unmistakable sound. He was also a gifted songwriter.

Raised by his father

Jimi Hendrix was born Johnny Allen Hendrix in Seattle, Washington, on November 27, 1942, the son of Al Hendrix and Lucille Jeter. His father—a gifted jazz dancer who worked at a number of jobs, including landscape gardening—bore much of the responsibility of raising the boy and his brother, Leon, as did their grandmother and various family friends. This was due to the unreliability of Lucille, who drank excessively and who would disappear for extended periods. Al Hendrix changed his son's name to James Marshall Hendrix in 1946. Al and Lucille divorced in 1951; Al Hendrix won custody of his sons and exercised as much discipline as he could, but the boys—young Jimi especially—worshipped their absentee mother.

Jimi Hendrix wanted a guitar early on. Before acquiring his first real instrument, he “played” guitar on a broom and on a one-stringed ukulele. At last Al got his son a guitar, and the twelve-year-old Jimi began to teach himself to play. Jimi restrung the guitar upside down—as a left-hander, he was forced to turn the instrument in the opposite direction from how it is usually played, which left the strings at the bottom unless he rearranged them. He learned blues songs from records by greats like B. B. King (1925–) and Muddy Waters (1915–1983). The guitar rarely left Jimi's side, even as he slept. By his mid-teens, Hendrix had formed a band called the Rocking Kings. He played behind his back, between his legs, and over his head—as had many blues guitarists before him. Thus he became a favorite to audiences, if not to all musicians.

Reputation grows

After dropping out of Garfield High School in Seattle, Hendrix joined the army at age seventeen to avoid a jail sentence for riding in a stolen car. He volunteered as a paratrooper (a person who jumps from planes using a parachute) and was soon jumping out of airplanes. Eventually he sent for his guitar and continued playing whenever he could. He met another soldier, bass player Billy Cox, with whom he formed a band that entertained troops all over the region. After leaving the army, the two friends formed the King Kasuals and began playing regularly at a club in Nashville, Tennessee. Hendrix became known as the hottest guitarist in town. At the time he lacked confidence in his singing and was content to back other artists.

Over the next few years Hendrix toured with several different bands, often stealing

attention away from bandleaders who expected him to stay in the background. Hendrix's looks and on-stage behavior were influenced by the early rocker Little Richard (1932–). Hendrix played with the Isley Brothers, with saxophonist King Curtis, and later with friend Curtis Knight. In 1965 he signed a contract with Knight's manager, Ed Chalpin, receiving an advance of one dollar. He then formed his own group, Jimmy James & the Blue Flames, and moved to New York.

Jimi Hendrix Experience

In September 1966 Hendrix was brought to London, England, by Chas Chandler, a member of the rock group the Animals who wanted to be a manager. Chandler suggested changing the spelling of Hendrix's first name to Jimi and helped him form the Jimi Hendrix Experience with bass player Noel Redding and drummer John "Mitch" Mitchell. Recording began the following month. By December the Experience had released its first hit single, "Hey Joe." Hendrix amazed even London's biggest rock stars with his electrifying stage show. He once said, "I sacrifice part of my soul every time I play."

The Experience's first album, *Are You Experienced?*, was a huge success. Back in the United States, crowds were stunned by Hendrix's performances, which included the burning of his guitar. The band's next album, *Axis: Bold as Love*, showed Hendrix's growth as a songwriter, but he was unhappy with the way it sounded. He was also becoming tired of audiences who expected a "wild man" act. Hendrix tried to expand his musical range on *Electric Ladyland*, an album he had complete control over, and that was the greatest achievement of his brief recording career.

Jimi Hendrix.

Reproduced by permission of AP/Wide World Photos.

Management problems

At this point Ed Chalpin sued Hendrix over his contract with the guitarist, causing problems for several years. Hendrix's managers decided to build Electric Ladyland Studios, hoping to save money on recording costs. To help pay for the studio, Hendrix was forced into endless touring, which caused the Experience to break up. Hendrix then formed Band of Gypsies with his old friend Cox and drummer Buddy Miles. In 1969 Hendrix's famous performance of the "Star-Spangled Banner" at the Woodstock festival in New York captured the anguish of the Vietnam War era (1957–75; a war in which

the United States aided South Vietnam in their ultimately unsuccessful efforts to stop a takeover by Communist North Vietnam).

Band of Gypsies recorded only a live album before drummer Miles left. Mitchell returned, and Hendrix began recording tracks for a new album, to be titled *First Rays of the New Rising Sun*. Before it was finished, Hendrix died of an overdose of sleeping pills on September 18, 1970.

Jimi Hendrix was elected to the Rock and Roll Hall of Fame in 1992. The following year he received the Grammy Awards Lifetime Achievement Award. Many rock, rap, and blues artists contributed versions of his songs to the 1993 tribute album *Stone Free*. In 1999 Al Hendrix published *My Son Jimi*, a biography of his son's family life.

HENRY VIII

Born: June 28, 1491

Greenwich, England

Died: January 28, 1547

Westminster, England

King of England

Henry VIII was king of England from 1509 to 1547. He established the Church of England and strengthened the position of king. But much of Henry VIII's legacy lies in his string of marriages during a quest for a son who would one day take his throne.

From boy to king

The second son of Henry VII (1457–1509), Henry VIII was born on June 28, 1491, at England's Greenwich Palace. As a child he studied Latin, Spanish, French, and Italian. He also studied mathematics, music, and theology (study of religion). Henry became an accomplished musician and played the lute, the organ, and the harpsichord. He also liked to hunt, wrestle, and joust (to fight on horseback). He also mastered the craft of archery.

Upon his father's death on April 21, 1509, Henry succeeded to a peaceful kingdom. He married Catherine of Aragon (1485–1536), widow of his brother Arthur, on June 11. Thirteen days later they were crowned at Westminster Abbey.

Foreign policy

As king of England, Henry moved quickly on a pro-Spanish and anti-French policy. In 1511, together with Spain, Pope Julius II, and others, Henry formed an alliance called the Holy League, in an attempt to drive French king Louis XII out of Italy. Henry claimed the French crown and sent troops to invade France. The bulk of the work in preparing for the invasion fell to Thomas Wolsey

(c.1475–1530), who became Henry's trusted war minister. Henry's army won a great victory in France at Guinegate, and the capture of Tournai and Thérouanne.

Peace was made in 1514 with France as well as with the Scots, who invaded England and were defeated at Flodden (September 9, 1513). The marriage of Henry's sister, Mary, to Louis XII (1462–1515) sealed the French treaty. The marriage would secure a worthy alliance (partnership), but Henry longed for greater power. But not even the work of Wolsey, however, could win Henry the precious crown of the Holy Roman Empire. With deep disappointment he saw it bestowed in 1519 on Charles, the Spanish king. He tried to secure Wolsey's election as pope in 1523 but failed.

The search for a son

In 1525 Catherine turned forty, fairly old for someone in the sixteenth century. Her seven pregnancies produced only one healthy child, Mary, born May 18, 1516. Afraid of not having a legitimate (legal) male heir, Henry believed Catherine's inability to give birth to a boy was a judgment from God. Soon, Henry began an affair with Anne Boleyn (c.1507–1536), a servant to Catherine.

A period of great social improvements known as the Reformation (1500s religious movement that affected the society, politics, and the economy) was stalled by Henry's negotiations to nullify (to make void) his marriage. While Catherine would not retire to a nunnery, Anne Boleyn demanded marriage—and the throne. A court sitting in June 1529 heard the case to nullify the marriage. It didn't work. He tried to secure Wolsey's election as pope in 1523 in hopes of using the

Henry VIII.

Courtesy of the Library of Congress.

papacy (office of the pope) to nullify his marriage. This too failed and Henry removed Wolsey from office in 1527.

Henry's strategy to rid himself of his wife matured when Thomas Cromwell (c. 1455–1540) became a councilor and his chief minister. Cromwell forced the clergy (Church officials) to meet in 1531 and accept Henry's headship of the Church. This position would allow Henry to finally annul his marriage. Anne's pregnancy in January 1533 brought matters to a head. In a fever of activity Henry married her on January 25, 1533; secured papal approval in March; had a court declare his marriage to Catherine invalid in May; and waited for the

birth of a son. On September 7, 1533, Elizabeth was born. Henry was so disappointed that he did not attend her christening.

A third marriage

Anne's attitude and moody temperament did not suit Henry, and her failure to produce a male heir worsened their relationship. She miscarried (a premature birth which results in the baby's death) a baby boy on January 27, 1536. It was a costly miscarriage, for Henry was already interested in another woman, Jane Seymour. Now determined on a second divorce, Henry brought charges of treason (high crimes against one's country) against Anne for alleged adultery (having affairs outside the marriage). Henry had her executed on May 19 and married Jane ten days later.

Jane brought a measure of comfort to Henry's personal life. She also produced a son and heir, Edward, on October 12, 1537. But Jane died twelve days later. Henry was deeply grieved, and he did not remarry for three years. He was not in good health and suffered from headaches, a painful leg problem, and blockage in his lungs which made him temporarily speechless.

War and marriage

The course of diplomatic (political) events, particularly the fear that Spanish king Charles V (1500–1548) might attempt an invasion of England, led Henry to seek an alliance with the Protestant powers of Europe. To solidify this alliance, Henry married the Protestant princess Anne of Cleves on January 12, 1540. His realization that Charles did not intend to attack, coupled with his distaste for Anne, led to the annulment of his marriage to Anne on July 9, 1540.

Henry was soon introduced to the nineteen-year-old Catherine Howard. He married Catherine within three weeks of his annulment to Anne of Cleves and entered into the later years of his life. In 1542, Catherine was beheaded on charges of adultery. The same year, the Scottish war began as did plans for renewed hostilities with France. War with France began in 1543 and dragged on for three years, achieving a solitary triumph before Boulogne (1545).

Henry then married the twice-widowed Catherine Parr on July 12, 1543. Though she bore him no children, she made him happy. Her religious views were somewhat more radical than those of Henry, who had revised the conservative Six Articles (1539) with his own hand. During his last years he attempted to slow the radical religious tendencies which resulted from the formal break with Rome.

The king was unwell in late 1546 and early 1547, suffering from terrible fevers. Before he died on January 28, 1547, Henry reflected that "the mercy of Christ [is] able to pardon me all my sins, though they were greater than they be."

The legacy of Henry VIII

Henry came to the throne with great gifts and high hopes. His relentless search for an heir led him into an accidental reformation of the Church not entirely to his liking. His desire to cut a figure on the European battlefields led him into costly wars.

Though personally interested in education, Henry sponsored no far-reaching educational policies. However, his interest in naval matters resulted in a larger navy and a well-developed naval administration. He brought

Wales more fully into union with the English by the Statute of Wales (1536) and made Ireland a kingdom (1542). The great innovations came out of the Reformation Statutes, not the least of which was the Act in Restraint of Appeals, in which England was declared an empire, and the Act of Supremacy, in which Henry became supreme head of the Anglican Church.

Henry ruled ruthlessly in a ruthless age. He was a king who wished to be succeeded by a son, and for this cause he bravely and rashly risked the anger of the other rulers in Europe. That he did what he did is a testament to his will, personal gifts, and good fortune.

PATRICK HENRY

Born: May 25, 1736

Studley, Virginia

Died: June 6, 1799

Red Hill, Virginia

American revolutionary, orator, and lawyer

Patrick Henry, American orator (public speaker) and lawyer, was a leader in Virginia politics for thirty years. He became famous for the forceful and intelligent way he spoke that persuaded people to believe in, and act upon, his beliefs. He used this gift to help bring about the American Revolution (1775–83).

A slow start

Patrick Henry was born in Hanover County, Virginia. He was the second son of John Henry, a successful Scottish-born planter, and Sarah Wynston Syme. He received most of his education from his father and his uncle. After his failed attempt as a storekeeper, he married Sarah Shelton and began a career as a farmer on land provided by his father-in-law.

Henry's farm days were cut short by a fire that destroyed his home. He and his growing family were forced to live above a tavern owned by his father-in-law. He earned money by working in the tavern. By 1760 Henry had decided to become a lawyer. He educated himself for about a year and then was admitted to the bar, an association for lawyers.

Eloquent patriot

By 1763 Henry had realized two things: he wanted to help the common people, and he had a gift for public speaking. While defending the members of a church from a lawsuit filed against them by church officials, Henry criticized the church for pushing its members around. He also criticized the British government, claiming that it encouraged the church in its disrespectful behavior. These arguments made Henry very popular,

Patrick Henry.
Courtesy of the National Portrait Gallery.

and his supporters carried him victoriously out of the courtroom.

Two years later, as a member of the House of Burgesses (the elective lawmaking body in the British colony of Virginia), he made a powerful speech against the Stamp Act. This law, passed by Britain in 1765, placed a tax on printed materials and business transactions in the American colonies. Henry also supported statements against the Stamp Act that were published throughout the Colonies and made him even more popular. For ten years Henry used his voice and wide support to lead the anti-British movement in the Virginia legislature.

The Revolution

During the crisis caused by the Boston Tea Party (a 1773 protest against Britain in which Boston colonists disguised as Native Americans dumped three shiploads of British tea into the harbor), Henry was at the peak of his career. He traveled with George Washington (1732–1799) and others to Philadelphia as representatives from Virginia to the First Continental Congress. The First Continental Congress was a group of colonial representatives that met in Philadelphia, Pennsylvania, in 1774 to discuss their dissatisfaction with British rule. Henry urged the colonists to write in firm resistance toward Britain. “The distinctions between Virginians, Pennsylvanians, New Yorkers, and New Englanders are no more,” Henry said. “I am not a Virginian, but an American.”

Elected to the first Virginia Revolutionary Convention in March 1775, Henry made one of the most famous speeches in American history. Trying to gain support for measures to arm the colony, Henry declared that Britain, by passing dozens of overly strict measures, had proved that it was hostile toward the colonies. “We must fight!” Henry proclaimed. “Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it almighty God! I know not what course others may take; but as for me, give me liberty or give me death!” The representatives were greatly affected by Henry’s powerful speech and Virginia rushed down the road to independence.

In 1775 Henry led a group of soldiers that forced the British to pay for gunpowder taken by British marines from an arsenal (a place where military weapons and equipment are made or stored) in Williamsburg, Vir-

ginia. He commanded the state's regular forces in Virginia for six months, but he eventually decided that he was not suited for a military role. At the Virginia Convention of May–July 1776, Henry supported the call for independence that led to the signing of the Declaration of Independence by Congress on July 4, 1776. In that same year, Henry was elected as the first governor of Virginia.

Devoted to Virginia

In three terms as wartime governor (1776–79), Henry worked effectively to use Virginia's resources to support Congress and George Washington's army. He also promoted the expedition of George Rogers Clark (1752–1818); the expedition drove the British from the Northwest Territory. During the years Henry served as governor, the legislature passed reforms that changed Virginia from a royal colony into a self-governing republic.

Henry left his post as governor in 1778 after serving two one-year terms to focus on family matters. His first wife had died in 1775, leaving him six children. Two years later he married Dorothea Dandridge, who was half his age and came from a well-known family of Tidewater, Virginia. Beginning in 1778, Henry had eleven children by his second wife, and family life kept him distracted from public life.

Still, Henry continued to serve in the Virginia assembly, engaging in verbal battles with other public speakers and focusing on efforts to expand Virginia's trade, boundaries, and power. Henry also served two more terms as governor of Virginia (1784–86). He grew more and more opposed to a stronger central government and refused to be a repre-

sentative to the Constitutional Convention of 1787. He did not trust men like James Madison (1751–1836) from Virginia and Alexander Hamilton (1755–1804) from New York, fearing that they were too ambitious and too focused on the nation as a whole, overlooking the needs of individual states.

Peaceable citizen

At the Virginia Convention of 1788, Henry began a dramatic debate with Madison and his supporters. He called upon all his powers of speech to warn the representatives of the dangers that he felt would be created by the new Constitution. He feared that federal tax collectors would threaten men working peacefully on their own farms and that the president would prove to be a worse tyrant (a ruler who has absolute control) than even King George III (1738–1820) of Britain. Henry also insisted that the new federal government would favor British creditors (persons to whom money or goods are owed) and bargain away American rights to use the Mississippi River. Despite Henry's arguments, the Federalists (a political party that believed in a strong central government) managed to win a narrow victory. Henry accepted their victory by announcing that he would be "a peaceable citizen." He had enough power in the legislature, however, to make sure that Virginia sent anti-Federalist senators to the first Congress.

Once Henry's influence over Virginia politics began to weaken, he retired from public life. He returned to his profitable law practice, earning huge fees from winning case after case before juries that were impressed by his powerful pleas. He also increased his real estate holdings, which made him one of the largest landowners in Virginia. Although

he was offered many appointments—as senator, as minister to Spain and to France, as chief justice of the Supreme Court, and as secretary of state—he refused them all. He was in poor health and preferred to stay home with his family. On June 6, 1799, Patrick Henry died of cancer at his plantation in Red Hill, Virginia.

AUDREY HEPBURN

Born: May 4, 1929

Brussels, Belgium

Died: January 20, 1993

Tolochenaz, Switzerland

*Belgian-born British/Swiss actress
and humanitarian*

Audrey Hepburn was a popular movie actress who won an Academy Award in 1954 for her work in *Roman Holiday*. She also worked with the United Nations to improve the lives of the poor, especially children.

Her background

Audrey Hepburn was born in Brussels, Belgium, on May 4, 1929, the daughter of J. A. Hepburn-Ruston and Baroness Ella van Heemstra. Her father, a banker, deserted the family when she was only eight years old. Hepburn was attending school in England when the Germans invaded Poland at the start of World War II (1939–45; a war fought mostly in Europe, with Germany, Italy, and Japan on one side and the United States, Great Britain, France, and the Soviet Union on the other). England had promised to help Poland, which they did by declaring war on Germany. Hepburn's mother took her to live with relatives in Holland, thinking they would be safer there. The Germans soon invaded Holland, though, leading to the deaths of many of Hepburn's relatives and forcing her and her mother to struggle just to stay alive. Sometimes she had nothing to eat except flour. Still, as a young ballet dancer, she performed in shows to help raise money for the Dutch war effort.

Discovery and fame

Hepburn and her mother moved to England after the war, and she continued to pursue her dance career. She was cast in bit parts on stage and in films in both Holland and England before being discovered in 1952 by the French novelist Colette (1873–1954) in Monte Carlo, Monaco. Colette insisted that

Hepburn play the lead role in the Broadway production of her novel *Gigi*. Although Hepburn's lack of experience was a problem at first, she improved steadily, and reviews of the show praised her performance. She also won a Theatre World Award for her work.

Hepburn's nationwide exposure in *Gigi* also brought her to Hollywood's attention. She was given a starring role in Paramount Studios' *Roman Holiday*. Costarring Gregory Peck (1916–), the 1953 film tells the tale of a runaway princess who is shown around Rome, Italy, by a reporter who falls in love with her. He then convinces her to resume her royal duties. The role landed Hepburn an Academy Award for best actress at the age of twenty-four.

Hepburn was now highly sought after. Director Billy Wilder (1906–2002) signed her up in 1954 for his new film, *Sabrina*. The movie was about a chauffeur's (someone who is paid to drive a wealthy person's car) daughter whose education in France makes her the toast of Long Island, New York, society. Hepburn costarred with William Holden (1918–1981) and Humphrey Bogart (1899–1957), who was her love interests in the film.

Hepburn went on to share the screen with all of the top leading men of her time: Cary Grant (1904–1986), Fred Astaire (1899–1987), Rex Harrison (1908–1990), Mel Ferrer (1917–) (whom she married in 1954 and divorced in 1968), and Sean Connery (1930–). In 1959 she made her first serious film, *The Nun's Story*. Hepburn and Albert Finney (1936–) were applauded for their strong acting. Of Hepburn's twenty-seven films, quite a few have become classics. She was nominated (her name was put forward for consideration) for three other Academy

Audrey Hepburn.

Awards in addition to the one she won for *Roman Holiday*.

Works on behalf of children

After 1967's spooky *Wait Until Dark*, in which she plays a blind woman being pursued by a killer, Hepburn stopped working for a while. Acting became secondary in her life, as she bore a child at age forty during her thirteen-year marriage to Italian physician Andrea Dotti. Hepburn chose to spend her time with her two sons and work for the international children's relief organization UNICEF. "If there was a cross between the salt of the earth and a regal queen," actress

Shirley MacLaine (1934–) told *People* magazine, “then she was it.”

Hepburn made only four more movies between 1976 and 1989. The last, *Always*, featured her in a brief role as an angel. Money was not an issue; besides her own income, Hepburn lived in Switzerland with Robert Wolders, the wealthy widower of actress Merle Oberon (1911–1979), for the last twelve years of her life. Hepburn continued her work for UNICEF and was named the organization’s goodwill ambassador (representative) in 1988. Hepburn worked in the field, nursing sick children and reporting on the suffering she witnessed. Hepburn traveled to Somalia in 1992, and her sad but hopeful account focused worldwide attention on the famine and warfare that would eventually kill thousands in that West African country.

Shortly before her death in January 1993, Audrey Hepburn was given the Screen Actors Guild award for lifetime achievement. Unable to accept in person, she asked actress Julia Roberts (1967–) to accept the honor in her place. While Hepburn’s acting was highly appreciated in her lifetime, she would probably rather be remembered as UNICEF’s hard-working fairy godmother.

KATHARINE HEPBURN

Born: May 12, 1907

Hartford, Connecticut

American actress

For over fifty years Katharine Hepburn was a successful actress on the stage and on the screen, delighting audiences with her energy, her grace, and her determination.

Hepburn’s youth

Katharine Hepburn was born on May 12, 1907, in Hartford, Connecticut. Reports of the year of her birth date differ, but the years most frequently cited are 1907 and 1909. In her autobiography (1991) Hepburn stated her birth date as 1907. She was one of six children (three of each gender) born to a socially prominent, well-to-do, activist family. Her mother was a well-known and passionate suffragette (supporter of women’s right to vote); her physician father was a creative pioneer in the field of sexual hygiene. Her youth was filled with physical activity. Her social conscience was developed early in her life—she and her siblings formed a neighborhood performing group, sending the proceeds from one production to benefit Navajo children in New Mexico.

Educated by private tutors and at exclusive schools, Hepburn entered Bryn Mawr College in Pennsylvania in 1924. Upon graduating four years later, she immediately embarked on a successful career in the theater. Her critical success as an Amazon queen in the satire *The Warrior’s Husband* led to a

contract with the film studio RKO. In 1932 she made her film debut in that company's *A Bill of Divorcement*, playing opposite John Barrymore (1882–1942). She received rave reviews for her performance and achieved stardom overnight.

Screen career

Hepburn's screen career lasted for over fifty years and was based on a persona whose essentials included energy, grace, determination, trim athletic good looks, and obvious upper-class breeding (as indicated, among other things, by a clipped manner of speaking). This persona, when intelligently put to use by producers and directors, led her to four Academy Awards as "Best Actress" in the films: *Morning Glory* (1933); *Guess Who's Coming to Dinner* (1967); *The Lion in Winter* (1968); and *On Golden Pond* (1981). Hepburn also received an additional eight Oscar nominations over the years for the films: *Alice Adams* (1935); *The Philadelphia Story* (1940); *Woman of the Year* (1942); *The African Queen* (1951); *Summertime* (1955); *The Rainmaker* (1956); *Suddenly Last Summer* (1959); and *Long Day's Journey Into Night* (1962). Her role in the 1975 made-for-television film *Love Among the Ruins* won her an Emmy award.

Hepburn's career, however, was not without its setbacks, most notable of which occurred in the 1930s. A return to the Broadway stage in 1934 led to a role in a flop play, *The Lake*. In 1937 an important exhibitor placed an advertisement in a trade paper and described Hepburn, along with various other female stars, as "box office poison." RKO's indifferent response led Hepburn—at a cost to her of over \$200,000—to buy out her contract from the company. Shortly thereafter

Katharine Hepburn.

she was rejected for the role of Scarlett O'Hara in the film version of *Gone with the Wind*. (1939).

Hepburn, determined to re-establish herself, returned to the Broadway stage, playing the lead in a successful production of *The Philadelphia Story*. Having invested in the production, she controlled the screen rights, which she ultimately sold to Metro Goldwyn Mayer (MGM) in return for a tidy profit and the studio's guarantee that she would play the lead in the film version. She did, and the film was a critical and a commercial success. Her Oscar nomination was but one demonstra-

tion of the dramatic way she had re-established herself in Hollywood, California.

Hepburn and Tracy and other romantic interests

Hepburn's next MGM film brought Spencer Tracy (1900–1967) into her life, with whom she began a relationship that lasted over two decades, until his death in 1967. Although separated from his wife, Tracy never divorced her. His romance with Hepburn was a quiet, tender, and private affair. In the 1960s Hepburn interrupted her career to care for the ailing Tracy. They were a team professionally as well as personally. They made nine films together over a period of twenty-five years, including: *Woman of the Year* (1942); *Keeper of the Flame* (1942); *Without Love* (1945); *Sea of Grass* (1947); *State of the Union* (1948); *Adam's Rib* (1949); *Pat and Mike* (1952); *The Desk Set* (1957); and *Guess Who's Coming to Dinner* (1967). Not all of these films were commercially or critically successful, but whether comedies or dramas, they were provocative and interesting, especially for their emphasis on the personal interaction between the sexes. Both Tracy and Hepburn played strong characters in these films, but neither was forced to give in to the other.

Hepburn had been married in 1928 to the social and well-to-do Ludlow Ogden Smith, who had changed his name to Ogden Ludlow because she did not want to be Kate Smith. The marriage actually lasted about three weeks before the couple separated, but they were not divorced until 1934. They remained friendly afterwards. Among her other romantic attachments in the 1930s was the well-known businessman and millionaire Howard Hughes (1905–1976).

Later career

Hepburn was not particularly lucky in her choice of work after the beginning of the 1970s. Except for a few notable exceptions, such as *On Golden Pond* (1981), the roles did not make good use of her considerable talents. Her television debut in 1972 as the mother in a version of Tennessee Williams' (1911–1983) moving *The Glass Menagerie* was not favorable. While apparently a great deal of fun for the stars on location, a pairing with the rugged action star John Wayne (1907–1979) in *Rooster Cogburn* (1975) proved to be lifeless. She had some success playing the noted French designer Coco Chanel (1883–1971) in a Broadway musical that opened in 1969; *Coco* had a long run but did not make impressive use of her capabilities. Several later Broadway undertakings proved to be failures.

Although Hepburn suffered some significant injuries in a 1985 automobile accident, and illnesses usual to one of her years, she golfed, cycled, and swam in the sea into her nineties. Katharine Hepburn provided some new perspectives on her personality and the roles she played on stage and screen in her autobiography, published after she retired from performance. In it she stressed the important influence of her intellectual family, and her continued closeness with her siblings and their children.

Katharine Hepburn never conformed to the traditional star image, but there is no doubt that she was a super star as an actress in movies, on stage, and on television. A strong-minded, independent woman, she has lived her life and her career to suit herself. In the process she has entertained, delighted, and aroused millions, and she has done so without compromising her beliefs.

HEROD THE GREAT

Born: 73 B.C.E.

Died: 4 B.C.E.

Jericho, Judea

King of Judea

Herod the Great, king of Judea, was an example of a class of princes who kept their thrones by balancing the delicate relations with the Roman Empire. Herod's much-criticized relationship with Rome would keep Judea safe and establish a Jewish state.

Herod's rise to power

Judea was ruled by high priests of the Hasmonean dynasty, descendants of the leaders who had freed the country from Seleucid rule. The Seleucid dynasty (312–64 B.C.E.) began with Seleucus I, who created an empire from part of the area of southwest Asia that had been controlled by Alexander the Great (356–323 B.C.E.). Herod's grandfather and father held prominent political

offices in Judea and established close relations with the Romans, the unquestioned world power during that time.

In 47 B.C.E., when Roman Emperor Julius Caesar (100–44 B.C.E.) momentarily settled Palestinian affairs, he seems to have entrusted Herod's father, Antipater, with the effective civil government. Antipater named his eldest son, Phasael, governor of Jerusalem and his second son, Herod, governor of Galilee, where he won favor with the Romans by his success in dealing with hostile military groups.

In 46 B.C.E. Herod was appointed governor of Coele-Syria and Samaria by Caesar's representative. But with the death of Caesar and the arrival of the new emperor, Cassius (d. 42 B.C.E.), Herod quickly dismissed his loyalty to Caesar and won Cassius's favor. He also married Mariamne, a Hasmonean princess and granddaughter of the high priest Hyrcanus II.

A Parthian invasion in 40 B.C.E. brought another change: Antigonus, a rival Hasmonean, became king of Judea, and Herod had to flee. He left his family in the fortress of Masada and went to Rome. There, Roman leaders Antony (c. 81–30 B.C.E.) and Octavian (64 B.C.E.—14 C.E.), the future Augustus, accepted him, and the Senate named him king of Judea.

Herod as king

The Jews, of course, did not accept Rome's right to choose their king for them. Herod, with Roman help, had to conquer his own kingdom, which did not occur until 37 B.C.E. Antigonus and his chief followers were soon put to death, and Herod turned to the problem of the high priesthood, the most powerful religious office in Judea. Herod did

Herod the Great.

Reproduced by permission of Getty Images.

not have the correct ancestry to claim the office, and he needed a priest who could not rival him in power. But the Hasmoneans, even those connected to Herod by marriage, would not let go of their claims to the priesthood. By the end of this struggle, which raged for most of his reign, the priesthood had become only a temporary office held at the king's pleasure.

When Antony was killed, Herod found it relatively easy to shift his loyalty to Octavian. At the same time, Octavian saw no reason to look for another puppet to control in Judea and therefore stayed with Herod. Antony and

then Augustus supported Herod for a long time because he pursued a policy they thoroughly favored—bringing Judea into the Roman Empire. Herod consciously undertook to Hellenize (to copy the great culture of Greece) every aspect of life in his kingdom. Officials were given the titles and functions of royal ministers elsewhere, and non-Jews were given many of the highest posts.

Herod also brought his kingdom considerable prosperity. He stabilized the economy and reduced taxes. He encouraged trade and built the splendid port city of Caesarea. His city building had the further purpose of increasing Hellenization, for many of his cities, like Caesarea and Samaria (rebuilt and renamed Sebaste), were intentionally Hellenistic rather than Jewish, even to the extent of having a mostly non-Jewish population.

The end of power

During nearly his whole reign, Herod faced trouble within his own family. As early as 29 B.C.E. he had killed his wife, Mariamne, out of jealousy. As the years went by, the whole matter was further complicated by the question of who would replace him on the throne. Like many people with a strong will to power, Herod could not face the idea of losing it. Three of Herod's sons were put to death, and his brother "escaped death only by dying." When Herod finally did die in 4 B.C.E., two other sons had some claim to the throne. Augustus finally settled the matter by splitting the inheritance between these two sons and a third one, and not allowing the title of king to any of them.

In an age when the existence of the smaller states depended not on their own

strength but on the will of Rome, Herod kept Judea safe, secure, and prosperous. And yet, throughout his career Herod suffered from being caught somewhere between Jew and Gentile (non-Jew). He began the rebuilding of the Temple and acted as protector and spokesman for various Jewish communities scattered about the world. But despite his wish to strengthen the Jewish state, he still sought the favor of Rome, and this conflict would prove his ultimate failure.

WILLIAM HERSCHEL

Born: November 15, 1738

Hanover, Germany

Died: August 25, 1822

Slough, England

German-born English astronomer

The German-born English astronomer (scientist who studies stars and planets) Sir William Herschel discovered the planet Uranus, the motion of the sun in space, and the form of the Milky Way.

Early life

William (originally Friedrich Wilhelm) Herschel was born in Hanover, Germany, on November 15, 1738. His father, Isaac Herschel, was a musician in the Hanoverian guard, which William joined as an oboist (one who plays the oboe) at the age of fourteen.

After Herschel relocated with his brother to England in 1757, he conducted, copied, performed, and taught music to make his living. In Yorkshire he conducted a small military band, and from 1762 to 1766 he was a concert manager in Leeds, England. His notebook of 1766 has these entries: “Feb. 19. Wheatly. Observation of Venus” and “Feb. 24. Eclipse of the moon at 7 o’clock a.m. Kirby.” These are the first signs of Herschel’s future interests. By the end of 1766 he became organist at the fashionable spa town of Bath, England. In 1772 his sister, Caroline Lucretia Herschel, came to live with him at Bath. She worked with her brother on his studies of astronomy.

In 1773 there is a scientific entry of note in Herschel’s notebooks: “April 19. Bought a quadrant [an instrument for measuring the height of an object in the sky] and Emerson’s Trigonometry [the study of the properties of triangles].” That this entry marked the start of a new phase in his life is shown by the fact that it is followed by others of a similar nature: “Bought a book of astronomy . . . bought an object glass . . . bought many eye glasses . . . hire [rent] of a 2 feet reflecting tel-

William Herschel.

Courtesy of the Library of Congress.

escape.” These entries show that he was proposing to make his first (metal) telescope mirror. Joined by his sister, Caroline, Herschel began constructing reflecting telescopes.

Herschel’s career in astronomy

Obsessed with astronomy, Herschel progressed through cardboard and tin-tubed telescopes. When he tried to buy a much larger reflecting telescope in London, he could find nothing suitable or affordable. For this reason he began to build his own. By September 1774 he was observing the heavens with a Newtonian reflecting telescope with a 6-foot focal length of his own construction.

Meanwhile Herschel began to keep a record of what he saw in his observations from March 1, 1774. He observed the rings of Saturn, the moons of Jupiter, and the markings of the moon. In 1777 he began observations of a well-known but neglected star, Mira Ceti, which varies in brightness periodically. Soon he had the idea of determining the annual parallax of stars (the shift in what appears to be the positions of the stars as the earth goes around the sun). Whether the stars were so far away as to make this apparent movement unobservable was not then known. Herschel observed the compared positions of pairs of stars close together (called double stars). He measured hundreds of double stars, but in March 1778 he recorded his disappointment at finding “the stars in the tail of Ursa Major [the Big Dipper] just as I saw them three months ago, at least not visibly different.”

In recording double stars scientifically, on March 13, 1781, Herschel charted a pair of which “the lowest of the two is a curious either nebulous [body of space gas] star or perhaps a comet.” Four days later he looked for the object and found that it had moved. What he had discovered was the planet Uranus, as it is now known—the first planet to be discovered in historical times. Herschel was given the Copley Medal of the Royal Society and elected a fellow (member).

Herschel began writing, announcing his second great discovery, “Motion of the Solar System in Space”(1783). He carefully noted the proper motions of seven bright stars and showed that the movement in the intervening (time in between) time seemed to converge on a fixed point, which he interpreted correctly as the point from which the sun is retreating. Other discoveries followed,

including the first known map of the milky way's placement in the sky.

Later years

In 1788 Herschel married Mary Pitt, a wealthy widow, by whom he had his only son. Herschel was able to make a useful additional income by selling telescopes, and he invested money in building machines to help grind mirrors.

Herschel was knighted (honored by the king for his value) in 1816 and received honors from countries and academies the world over. He died in Slough on August 25, 1822.

THOR HEYERDAHL

Born: October 6, 1914

Larvik, Norway

Died: April 18, 2002

Colla Michari, Italy

Norwegian anthropologist, author, and explorer

Norwegian anthropologist (scientist of human beings—their culture, numbers, characteristics, and rela-

tionships) Thor Heyerdahl popularized ideas about common links among ancient cultures worldwide. He was well known for his ocean journeys on primitive rafts and boats that were recorded in books, films, and television programs.

Early love of nature

Thor Heyerdahl was born into an upper-class family in the coastal village of Larvik, Norway, in 1914. His father, Thor, was president of a brewery and a mineral water plant, and his mother, Alison Lyng Heyerdahl, was chairman of the Larvik Museum. His mother studied zoology (the branch of biology that studies animals), folk art, and primitive cultures. She influenced her son greatly. His father was an enthusiastic outdoorsman. By age seven young Thor had started his own animal museum, filled with specimens of seashells, butterflies, bats, lemmings, and hedgehogs. The collection was housed in an old outhouse at his father's brewery.

Heyerdahl and his parents spent summer holidays at a log cabin in the wilderness, where Thor made friends with a hermit (person choosing to live alone and away from society) and learned much about nature. By sled and ski he also went on many winter camping trips to remote locations with his schoolmates. Throughout his early life Heyerdahl was determined to live in a more primitive setting.

In 1933 Heyerdahl entered the University of Oslo, in Oslo, Norway, and specialized in zoology and geography. In Oslo he spent a lot of time at the home of a family friend, who had a huge library of Polynesian artifacts. With his girlfriend, Heyerdahl decided to

Thor Heyerdahl.

Reproduced by permission of the Corbis Corporation.

quit college and make an expedition (a trip made for a specific reason) to the South Seas. His father agreed to finance the trip. Heyerdahl was married on Christmas Eve in 1936, and the next day the couple set out for the Marquesas Islands. Here Heyerdahl discovered evidence that Peruvian (from Peru) aboriginal (the original citizens of an area) voyagers had visited the islands. The inhabitants told him stories of Kon-tiki, a bearded, white sun king who arrived over the sea.

Daring raft voyage

In 1938 the Heyerdahls returned to Norway and settled in a mountain wilderness

near Lillehammer. Then Heyerdahl did research among American Indian tribes in British Columbia (Canada) in 1939 and 1940, trying to support his theory that two waves of migration (moving from one area to another) from the Americas—one from the northern hemisphere (half of the earth divided by the equator) and one from the south—had settled Polynesia.

Heyerdahl found little acceptance of his ideas in academic circles. He planned a dramatic experiment to convince his critics that a voyage by ancient peoples from Peru to Polynesia was possible. In 1947 he and a crew traveled to Peru on a balsa raft, which they named the Kon-Tiki. Heyerdahl detailed the journey in *The Kon-Tiki Expedition*. The book was translated into dozens of languages and sold more than twenty million copies. Heyerdahl's documentary (having to do with recording real events as they happen) movie of the voyage won him an Academy Award in 1951. But while the Kon-Tiki voyage captured public attention, it was not met with any scientific respect.

Heyerdahl was among a group of scientists who believed that ancient cultures had come from a common source through land and sea migrations. The opposing scientists thought that civilizations had cropped up around the world independently of one another. The second theory has remained the popular one. Still, as writer Thomas Morrow noted in *U.S. News & World Report*, Heyerdahl "has turned up a surprising amount of convincing evidence suggesting sea contacts among remote [distant] ancient cultures, for which he gets little credit."

Explorations worldwide

In 1953 Heyerdahl went to the Galapagos Islands, off the South American coast.

There he and his companions found evidence that original people of South America had visited the islands long before the Incan Empire. In 1955 Heyerdahl led an expedition to Easter Island, the remote Polynesian island where enormous stone statues of unknown origin had been discovered in 1722. His team found a carving of a reed ship at the base of one of the statues and much other evidence that at least three migrations from South America had populated the island, the earliest in the fourth century.

In 1969 Heyerdahl organized a new expedition. In Egypt he and his crew built a papyrus (a tall grass that grows near the Nile River) reed boat that they named *Ra*, after the Egyptian sun god. They sailed across the Atlantic, a voyage of 2,700 miles, but the boat broke apart 600 miles short of Barbados. The next year Heyerdahl sailed the *Ra II* all the way from Morocco to Barbados in fifty-seven days. His account of these expeditions is found in his book *The Ra Expeditions*. To Heyerdahl the voyages were evidence that Egyptians or other sailors could have crossed to the Americas several thousand years before Christopher Columbus (1451–1506).

Later challenges

In 1977, at the age of sixty-two, Heyerdahl took up another challenge. He went to Iraq with a crew of eleven men and built a reed ship, the *Tigris*. They sailed it down the Tigris River, through the Persian Gulf, and across the Indian Ocean to the mouth of the Indus River in Pakistan, then westward to Djibouti at the mouth of the Red Sea on the eastern African coast. This 4,200-mile, five-month-long voyage was an attempt to show that the ancient civilizations of Egypt, the

Indus Valley, and Mesopotamia could have sprung from a single source. Political instability in the region brought an early end to this expedition.

In 1982 Heyerdahl and several archaeologists undertook an expedition to the remote Maldivian islands off the coast of India. There Heyerdahl was fascinated by stone statues that bore a striking resemblance to the monoliths (huge stone structures) of Easter Island. His discoveries led him to conclude that the Maldives also had been involved in prehistoric ocean trading and migration. Heyerdahl's 1986 book, *The Maldivian Mystery*, was hailed by some as a great detective story. It, too, was made into a film, as had his expeditions to the Galapagos and Easter Island.

Heyerdahl's voyages led him to become active internationally in fighting pollution of the oceans. In *Green Was the Earth on the Seventh Day*, Heyerdahl wrote about how his voyage on the *Kon-Tiki* had increased his awareness of threats to the environment.

Thor Heyerdahl died in Colla Michari, Italy, on April 18, 2002. He is remembered as one of the best-known explorer-adventurers of modern times.

EDMUND HILLARY

Born: July 20, 1919

Auckland, New Zealand

New Zealander explorer and mountaineer

Edmund Hillary was one of the greatest explorers and mountaineers of the twentieth century. His conquest of Mount Everest and the South Pole inspired generations of adventurers and dreamers.

Early years in New Zealand

Edmund Hillary was born in Auckland, New Zealand, on July 20, 1919. He spent his childhood in Tuakau, a rural area just south of Auckland where he went to the local primary school. Hillary was gifted with an active imagination and had a passion for reading adventure stories. Later he traveled daily to the city for secondary schooling, where he was a shy and awkward boy. As a child he helped in his father's beekeeping business and eventually quit school to work with his father full-time.

In 1935, during a ski weekend on a school trip to Mount Ruapehu, Hillary discovered his joy in the mountains and it never left him. He would often escape to the mountains to enjoy skiing and hiking, and he developed a love of climbing. A few years later he climbed his first mountain, the 7,500-foot Mount Oliver in New Zealand.

Hillary enlisted with the Royal New Zealand Air Force in World War II (1939–45), where New Zealand aided the Allied powers of America, England, and Russia in their war against the Axis powers of

Germany, Italy, and Japan. While serving as a navigator in the South Pacific, he was wounded in battle. Despite the physical setback, Hillary was determined to make a full recovery and resume mountain climbing.

Conquering Everest

During the 1940s, Hillary made many climbs in New Zealand, particularly in the Southern Alps. He quickly became recognized for his daring, strength, and reliability. Then came climbs in Europe that brought the invitation to join Sir John Hunt's expedition to Mount Everest, in the Himalaya Mountains in Nepal. For two years, Hillary joined Hunt in the Scottish Highlands to prepare themselves for Everest. The highest point on Earth, Mount Everest measures 29,028 feet high, roughly six miles. No one in history had successfully completed the climb, and many lives were lost during attempts. Famed climbers George Malloy and Andrew Irvine came close before they disappeared somewhere near the mountain's peak.

In March 1953, Hillary and Hunt, along with twenty other of the best climbers in the world, gathered at Everest. Their company also included 350 Nepalese workers carrying 10,000 pounds of food and equipment, as well as thirty-six Sherpas, people who are familiar with the rugged terrain and are invaluable guides for climbers.

With the party's base camp just 1,100 feet from the summit, Hunt sent a two-man team the rest of the way. They failed but returned to camp with valuable information about how to attack the summit. Next, Hunt chose Hillary and Sherpa guide Tenzing Norgay (1914–1986) to make an attempt. After a heroic and death-defying climb, the two

reached the summit on May 29, 1953, becoming the first two people to reach the top of the world.

The South Pole and beyond

After the Everest expedition, Hillary gained worldwide fame and a reputation as an adventurer. Vivian Fuchs, who later would be knighted, asked Hillary to become part of the Trans-Antarctic expedition in 1957 and 1958 that would cross the southern Atlantic Ocean to the South Pole. Hillary's job was to set up supply dumps from base camp towards the South Pole so that Fuchs's party could complete the crossing of Antarctica.

Hillary wanted to use the sophisticated Snow-Cats available to Fuchs, but he had to settle for Ferguson farm tractors for transport and hauling. When the last dump was established, Hillary made his own decision to head for the Pole, which he reached with his three tractors on January 4, 1958. He was the first person to travel there by land in forty-six years.

Through the 1960s and 1970s, Hillary continued to explore the Himalayas. He also led a renowned expedition by jet boat and on foot from the mouth of the Ganges River to its source. Like his other adventures, it was animated by his zest, good humor, and joy.

Adventurer to activist

Although Hillary had achieved world-wide fame for his adventures, he never lost touch with the Nepalese people and devoted much of his time to their environmental and social causes. Hillary built hospitals and schools in the mountains of Nepal by raising the money, buying the materials, and working on many of the buildings.

Edmund Hillary.

Reproduced by permission of the Corbis Corporation.

Hillary also expressed social concerns in New Zealand by commenting on public issues. His observations were noted for their simplicity and good sense. He was president of Volunteer Service Abroad and patron of an Outdoor Pursuit Centre and of the Race Relations Council. He was also active in the Family Planning Association and in conservation campaigns. He was strongly opposed to nuclear tests and to ocean dumping in the South Pacific or elsewhere.

Hillary's achievements were recognized internationally with the award of numerous decorations and honorary degrees, beginning with his knighthood in 1953. They

reflect the rare warmth and respect in which he was held. In 1985 he was appointed New Zealand high commissioner to India. He was also honorary president for New York's Explorers Club.

In 1975 Hillary's wife and teenage daughter were killed in an airplane crash. He later remarried, and after leading one last expedition in 1977, he retired to his bee farm outside of Auckland.

In retirement

Hillary remains an important voice in the sport of mountain climbing, even in retirement. He wrote the forward for a book by Helen Thayer titled *Polar Dream* (1993). In 1996 he reacted to the death of eight mountain climbers in a storm on Mount Everest with the comment to *Time's* David Van Biema, "I have a feeling that people have been getting just a little too casual about Mount Everest. This incident will bring them to regard it rather more seriously."

Hillary has also remained active in the region where he made his famous climb. The Sir Edmund Hillary Himalayan Trust provides funds and expertise to support reforestation, build schools and hospitals, and use technology such as solar power. He personally raised funds for the Nepalese people throughout the 1990s through public speaking engagements and lectures in the United States. In a 1995 interview with James Clash, Hillary said, "I think the most worthwhile things I've done have not been on the mountains or in the Antarctic, but doing projects with my friends, the Sherpa people. The twenty-seven schools we've now established, the hospitals—those are the things I would like to be remembered for."

S. E. HINTON

Born: 1950

Tulsa, Oklahoma

American author

Often considered the most successful novelist for the junior high and high school audience, S. E. Hinton is credited with creating realistic young adult literature. Her career began with the publication of her first book, *The Outsiders* (1967), at the age of seventeen.

Childhood and teenage novelist

Susan Eloise Hinton was born on July 22, 1950, in Tulsa, Oklahoma. Remarking that

there was little to do for a child growing up in Tulsa, Hinton turned to reading and writing at a very early age. The shy girl also had dreams of becoming a cattle rancher, until she abandoned this desire for a writing career.

As a teenager in Tulsa, Oklahoma, Hinton developed her love of literature but often found her options limited and boring. While she was a junior in high school, Hinton's father was diagnosed with cancer, a terrible and often fatal disease. To help her deal with her father's condition, Hinton turned to writing. During this time, Hinton completed a book she called *The Outsiders*.

Popularity of *The Outsiders*

Based on events that occurred in her high school in Tulsa, *The Outsiders* describes the rivalry between two gangs, the lower-middle-class "greasers" and the upper-class "socs" (for Socials), a conflict that leads to the deaths of members of both gangs. Narrated by fourteen-year-old Ponyboy, a sensitive, orphaned greaser who tells the story in retrospect (after the events occurred), *The Outsiders* explores the friendship, loyalty, and affection that lie behind the gang mystique while pointing out both the similarities in the feelings of the opposing groups and the uselessness of gang violence. Through his encounters with death, Ponyboy learns that he does not have to remain an outsider.

Initially regarded as controversial for its portrayal of rebellious youth, the novel is now recognized as a classic of juvenile literature as well as a unique accomplishment for so young a writer. *The Outsiders* was a major success among teenagers, selling more than four million copies in the United States alone. The book's popularity enabled Hinton to

attend the University of Tulsa, where in 1970 she earned an education degree and met her future husband, David Inhofe. However, gaining fame and fortune at eighteen was not without problems—Hinton had writer's block for several years.

Further novels

Eventually, however, Hinton produced a second novel, *That Was Then, This Is Now* (1971), a tale of two foster brothers, Bryon and Mark, who are drifting apart. One becomes more involved in school and girlfriends, the other moves deeper into a career of crime and drugs. In *Rumble Fish* (1975),

Hinton continued to explore the themes of gang violence and growing up. In this story a bitter young man, in a struggle to acquire a tough reputation, gradually loses everything meaningful to him. Hinton's next book, *Tex* (1979), which follows two brothers left in each other's care by their rambling father, likewise investigates how delinquent youths try to make it in a world shaped by protest, drugs, violence, and family disruption.

Movies

Hinton spent the ten-year interval between *Tex* and her next novel, *Taming the Star Runner* (1986), advising on the sets of several film adaptations of her books and starting a family. She also wrote the screenplay for the feature film version of *Rumble Fish* with director Francis Ford Coppola. In 1988 Hinton received the first Young Adult Services Division/School Library Journal Author Award from the American Library Association.

Hinton has not produced as much work as other young adult novelists, but that has not prevented her from becoming a consistent favorite with her audience. Two of the movies adapted from her books, *Tex* and *The Outsiders*, were filmed in response to suggestions from young readers.

Even though she is no longer a teenager involved in the world about which she writes, Hinton believes that she is suited to writing adolescent fiction: "I don't think I have a masterpiece in me, but I do know I'm writing well in the area I choose to write in," she commented to Dave Smith of the *Los Angeles Times*. "I understand kids and I really like them. And I have a very good memory. I remember exactly what it was like to be a teenager that nobody listened to or paid

attention to or wanted around. I mean, it wasn't like that with my own family, but I knew a lot of kids like that and hung around with them. . . . Somehow I always understood them. They were my type."

In 1995 Hinton published two books for younger readers, *Puppy Sister* and *Big David, Little David*, her first picture book. The intensely private Hinton lives in northern California with her husband and son, Nicholas David.

HIPPOCRATES

Born: c. 460 B.C.E.

Cos, Greece

Died: c. 377 B.C.E.

Larissa, Greece

Greek physician

The ancient Greek physician Hippocrates is called the father of medicine. He changed the course of Greek medicine with his certainty that disease was not caused by gods or spirits but was the result of natural action.

Early life

Hippocrates was born on the Aegean island of Cos, just off the Ionian coast near

Halicarnassus (island of Greece) during the end of the fifth century B.C.E. He is called Hippocrates Asclepiades, “descendant of (the doctor-god) Asclepius,” but it is uncertain whether this descent was by family or merely by his becoming attached to the medical profession. Legend likewise places him in the family line of the hero Hercules.

Son of Heracleides and Praxithea, Hippocrates’s family’s wealth permitted him to have a good educational beginning as a child. After nine years of physical education, reading, writing, spelling, music, singing, and poetry, he went to a secondary school, where he spent two years and had very thorough athletic training. It is likely that he went on to study medicine under his father in a form of apprenticeship (arrangement to learn a trade through work experience). This involved following his father and another doctor, Herodicos, from patient to patient and observing their treatment. It is believed that his training included traveling to the Greek mainland and possibly to Egypt and Libya to study medical practices.

Adult talents

Hippocrates is credited with healing many, including the king of Macedonia whom he examined and helped to recover from tuberculosis (disease of the lungs). His commitment to healing was put to the test when he battled the plague (a bacteria-caused disease that spreads quickly and can cause death) for three years in Athens (430–427 B.C.E.). It is also clear that the height of his career was during the Peloponnesian War (431–404 B.C.E.).

His teaching was as well-remembered as his healing. A symbol of the many students he encouraged is the “Tree of Hippocrates,”

which shows students sitting under a tree listening to him. In time he apprenticed his own sons, Thessalus and Draco, in the practice of medicine. The teacher and doctor role combined well in 400 B.C.E., when he founded a school of medicine in Cos.

Hippocratic Corpus

The body of writing attributed to Hippocrates, the *Hippocratic Corpus*, is a collection of roughly seventy works—the oldest surviving complete medical books. In ancient times some works in the *Hippocratic Corpus*, the first known edition of which are from the time of the emperor Hadrian (reigned C.E. 117–138), were recognized as having been written by persons other than Hippocrates. Modern scholars have no knowledge of his writing style to prove which of the works Hippocrates wrote. Nowhere in the *Hippocratic Corpus* is the entire Hippocratic set of guidelines found. Each subject was written with a particular reader in mind. Some books are directed toward the physician, some for the pharmacist, some for the professional physician, and some are directed more at the layman (person who is not an expert in the field).

In Hippocrates’s time doctors wrote treatises (written arguments) for the educated public, who in turn discussed medical problems with their doctors. The aim of these books was to teach the layman how to judge a physician—not to advise on self-treatment or even first aid in order to avoid seeing a doctor.

These medical treatises made up the *Hippocratic Corpus*. Modern readers can see that experimentation played its role in the Hippocratic view of medicine, because the individual approach to disease is nothing more than experimentation. It is obvious, too, that first-

hand experience played a part, since throughout the Corpus the plant ingredients of remedies are described by taste and odor. There are also instances of very basic laboratory-type experiments. *The Sacred Disease*, one treatise of the Hippocratic Corpus, describes dissections (the act of being separated into pieces) of animals, the results of which permitted comparisons to the human body to be drawn. Further, in their attempts to describe the body, the Hippocratics made use of external (outside) observation only. In *On Ancient Medicine* the internal organs are described as they can be seen or felt externally. It is most unlikely that dissection of the human body was practiced in the fifth century B.C.E.

Hippocrates favored the use of diet and exercise as cures but realized that some people, unable to follow such directions, would need medicine. His writings teach that physical handling could cure some physical troubles, like a dislocated hip, by the doctor moving it back into place. In *A Short History of Medicine* E. A. Ackerknecht summed it up: "For better or worse Hippocrates observed sick people, not diseases." This attitude is a timely solution to those who formerly insisted on the coldly scientific approach of the Hippocratic physician, who seemed to be so callous toward his patient.

Little is known of Hippocrates's death other than a range of date possibilities. Different sources give dates of either 374 B.C.E., the earliest date, or 350 B.C.E., the latest date. What lives on in modern medicine is his commitment to the treatment of disease.

HIROHITO

Born: April 29, 1901

Tokyo, Japan

Died: January 7, 1989

Tokyo, Japan

Japanese emperor

Hirohito was the 124th emperor of Japan. He reigned during a period of internal unrest, foreign expansion, international war, and national defeat. As the occupant of Japan's throne for sixty-three years, he was the longest living ruler in modern history.

Childhood and education

Hirohito was born on April 29, 1901. He was the first son of Crown Prince Yoshihito, who later became the Taisho emperor, and the grandson of Mutsuhito, the Meiji emperor. Following long-established custom, Hirohito was separated from his parents shortly after birth. He was cared for by a vice admiral in the imperial (of the empire) navy until November 1904, when he returned to the Akasaka Palace, his parents' official residence. Even after his return to the palace, he was only allowed to see his mother once a week and hardly ever spent time with his father.

From early on, Hirohito was trained to act with the dignity, reserve, and sense of responsibility his future role would require and he grew into a shy and serious young boy. In April 1908 he was enrolled at the Gakushuin (Peers School) in a special class of twelve boys. The head of the school was General Maresuke Nogi, a celebrated soldier of the Russo-Japanese War (1904–05; a conflict with Russia over Manchuria and Korea). He took a personal interest in the education of the young prince and attempted to introduce him to respect the virtues of hard work, the importance of devotion to the nation, and the practice of stoicism (the ability to ignore pleasure or pain).

In 1912 Mutsushito died and paved the way for Hirohito's father Yoshihito to take the throne. Hirohito then began an intense study of natural history. Under the guidance of his natural history tutor, he developed an interest in marine biology, a field in which he became an acknowledged expert.

Crown prince

On February 4, 1918, Hirohito became engaged to Princess Nagako, daughter of Prince Kuniyoshi Kuninomiya. The imperial wedding finally took place on January 26, 1924. The imperial couple later had five daughters, the first born in December 1926, and two sons, the first born in December 1933.

In March 1921 Hirohito, accompanied by a large group of attendants, set off for a tour of Europe. Never before had a crown prince of Japan visited countries abroad. Although Hirohito traveled in France, the Netherlands, and Italy, his visit to England made the deepest impression on him. He was attracted by the freedom and informality (without ceremony) of the English royal family.

Hirohito.

Reproduced by permission of Archive Photos, Inc.

On November 25, 1921, shortly after his return to Japan, Hirohito was appointed to serve as regent (acting ruler) for his father, who had begun to show increasing signs of mental instability. In December 1923 Hirohito escaped an attempt on his life by a young radical.

Emperor of a restless nation

Hirohito took the throne on December 25, 1926. He took as his reign name Showa ("Enlightened Peace"), and he was formally known as Showa Tenno. However, the choice of reign name would not hold true. Shortly after Hirohito became emperor, Japan's relations with the outside world began to fall apart.

In 1927 Japanese army officers, without the agreement of Emperor Hirohito, sparked conflict with Manchuria and later occupied parts of that country. Hirohito soon found his military deeply involved on the Asian mainland.

The Manchurian incident ushered in a period of serious unrest within Japan. Young military officers plotted a series of unsuccessful takeovers as well as a number of successful assassinations (secretly planned murders). They hoped to overthrow parts of the government in order to establish a military regime that could govern in the name of "direct imperial rule." In other words, Hirohito would still be called emperor and would be the head of the government, but the military would actually be in control. Hirohito, however, saw himself as part of the state rather than a sole ruler and believed that the leaders of government should be men of moderation and nonmilitaristic in outlook.

During the military revolt of February 26, 1936, elements of the First Division occupied large areas of downtown Tokyo, and assassination bands murdered many leading public officials. Emperor Hirohito urged swift end to the revolt and punished those involved. The uprising was crushed, and a number of ranking generals who were thought to have encouraged the rebels were forced into retirement.

Road to war

Nevertheless the country continued to drift toward war. In July 1937 hostilities with China broke out. During the late 1930s Hirohito's advisers in the palace urged him to stay away from direct involvement in politics or be forced to compromise the position of the imperial family. The emperor followed this

advice, and agreed to whatever policies the governments decided upon.

There is every evidence that the emperor felt uneasy about the unfolding of events, particularly after 1940. He did not favor the alliance with Germany and Italy in World War II (1939–45), but he made no effort to oppose it. Similarly, he had grown distrustful of the judgments of the military leaders who kept assuring him of a quick end to the war in China. But when the final decision on war with the United States was made on September 6, 1941, he barely opposed it.

During the war Hirohito refused to leave the imperial palace at Tokyo, even after air raids began to demolish the city and fires destroyed many buildings on the palace grounds. He wished to share the hardships of his subjects.

Japan defeated

By the summer of 1945 it was clear that defeat was at hand. But the decision to surrender did not come until after atomic bombs were dropped on the Japanese towns of Hiroshima and Nagasaki. At a historic imperial conference on August 9, 1945, the emperor made clear his opinion in favor of surrendering to the allied powers led by the United States.

Following Japan's formal surrender in September 1945, there was much discussion about whether Emperor Hirohito should be punished as a war criminal. Hirohito himself frequently expressed his willingness to step down as a token of his responsibility for the war. But the U.S. authorities, including General Douglas MacArthur (1880–1964), decided that it would better serve the goals of Japanese stability to let him remain as ruler. On January 1,

1946, however, the emperor once and for all gave up any claims to being a sacred ruler by issuing a law that denied his god-like status as a descendant of the sun goddess.

Emperor's life as a mortal

During the years of the occupation and afterward, every effort was made to “democratize” the throne by having the emperor mingle with the people. Even though he was personally distant and somewhat awkward in public, the emperor nevertheless became a popular figure. Pictures of the imperial family and stories of their activities became a steady part of weekly magazine and newspaper copy.

A respected marine biologist with a number of books on that subject to his credit, Emperor Hirohito lived a modest, sober, and retired life when not involved in official functions. In 1972 he traveled to Europe and was met with hostile demonstrations. A 1975 trip to the United States resulted in a more friendly reception. Hirohito died on January 7, 1989, at the age of eighty-seven. Symbolic of his interest in science and in modernizing his country, Hirohito reportedly was buried with his microscope and a Mickey Mouse watch.

ALFRED HITCHCOCK

Born: August 13, 1899

London, England

Died: April 29, 1980

Los Angeles, California

English film director

Alfred Hitchcock was a film director famous for well-made suspense thrillers such as *Strangers on a Train*, *Rear Window*, and *Psycho*. He was interested in showing the terror in everyday situations.

Early life and education

Alfred Hitchcock was born in London, England, on August 13, 1899, the youngest of William and Emma Whalen Hitchcock's three children. His father was a poultry salesman and an importer of fruit. Hitchcock was generally a quiet child; however, at five years old his father arranged to have him locked in a cell at the local police station for five minutes after he misbehaved. Hitchcock developed a lifelong interest in the subject of guilt, which was further developed during his time at the strict St. Ignatius College. He also attended the University of London, planning to pursue a career in electrical engineering. After leaving the university he worked with a telegraph company and in advertising.

Hitchcock soon became interested in motion picture production and found a job

Alfred Hitchcock.

as a title card writer with the British division of the Famous Players-Lasky Company, which later became Paramount Pictures. In 1923 he began writing scenes for the Gainsborough Film Studios. Hitchcock's first film as a director was *The Pleasure Garden*, which was filmed in Germany. His other early films included *The Lodger* (1925), an exciting treatment of the Jack the Ripper story, and *Blackmail* (1930), the first British picture with sound. Some think that Hitchcock's next films, *The Man Who Knew Too Much* (1934) and *The Thirty-Nine Steps* (1935), were responsible for the revival in British movie making during the early 1930s.

Goes Hollywood

In 1939 Hitchcock left England with his wife and daughter to settle in Hollywood, California. For the most part his American films of the 1940s were expensively produced and entertaining. These included *Rebecca* (1940), based on a best-selling suspense novel; *Suspicion* (1941), about a woman who believes her husband is a murderer; *Lifeboat* (1944), a study of survival on the open seas; and *Spellbound* (1945), a murder mystery. Less ambitious but more accomplished was *Notorious* (1946). Hitchcock's first ten years in Hollywood ended with two interesting failures: *The Paradine Case* (1947) and *Rope* (1948).

Beginning with the unusual *Strangers on a Train* (1951), Hitchcock directed a series of films that placed him among the great artists of modern film. His most important films during that time were *I Confess* (1953), *Rear Window* (1954), *To Catch a Thief* (1955), *The Trouble with Harry* (1956), *The Man Who Knew Too Much* (1956), *Vertigo* (1958), and *North by Northwest* (1959). Many of Hitchcock's films deal with the theme of an ordinary person caught up in situations beyond his or her control. Hitchcock himself also made a brief appearance (or "cameo") in one scene in each of his films.

Later years

Psycho (1960) was Hitchcock's most terrifying and controversial (causing dispute) film, and its most famous scene made an entire generation of moviegoers nervous about taking a shower. *The Birds* (1963), *Marnie* (1964), and *Family Plot* (1976) were Hitchcock's final and less brilliant films. Hitchcock also expanded his directing career into American television, with a series that featured mini-thrillers (1955–65). Because of failing

health, he retired from directing after *Family Plot*. He was knighted in 1979 and died soon afterward in Los Angeles on April 29, 1980.

Hitchcock's films enjoyed new popularity in the 1990s. After a restored version of *Vertigo* was released in 1996 and was surprisingly successful, plans were made to re-release other films, such as *Strangers on a Train*. According to *Entertainment Weekly*, as of 1997 plans were underway to remake as many as half a dozen Hitchcock films with new casts, an idea that met with mixed responses from Hitchcock fans.

ADOLF HITLER

Born: April 20, 1889

Braunau, Austria

Died: April 30, 1945

Berlin, Germany

German dictator and nationalist

The German dictator Adolf Hitler led the extreme nationalist and racist Nazi party and served as chancellor-president of Germany from 1933 to 1945. Arguably one of the most effective and powerful leaders of the twentieth century, his leadership led to the deaths of nearly six million Jews.

Early life

Adolf Hitler was born on April 20, 1889, in the small Austrian town of Braunau on the Inn River along the Bavarian-German border. The son of an extremely strong-willed Austrian customs official, his early youth seems to have been controlled by his father until his death in 1903. Adolf soon became rebellious and began failing at school. He finally left formal education altogether in 1905 and began his long years of aimless existence, reading, painting, wandering in the woods, and dreaming of becoming a famous artist. In 1907, when his mother died, he moved to Vienna in an attempt to enroll in the famed Academy of Fine Arts. His failure to gain admission that year and the next led him into a period of deep depression as he drifted away from his friends.

It was during this time of feeling rootless that Hitler first became fascinated by the immense potential of mass political manipulation (control). He was particularly impressed by the successes of the anti-Semitic, or anti-Jewish, nationalist Christian-Socialist party of Vienna Mayor Karl Lueger (1844–1910). Lueger's party efficiently used propaganda (spreading a message through literature and the media) and mass organization. Hitler began to develop the extreme anti-Semitism and racial mythology that were

to remain central to his own “ideology” and that of the Nazi party.

In May 1913, Hitler returned to Munich, and after the outbreak of World War I (1914–18) a year later, he volunteered for action in the German army in their war against other European powers and America. During the war he fought on Germany’s Western front with distinction but gained no promotion (advancement) beyond the rank of corporal (a low-ranking military officer). Injured twice, he won several awards for bravery, among them the highly respected Iron Cross First Class.

Early Nazi years

The end of the war left Hitler without a place or goal and drove him to join the many veterans who continued to fight in the streets of Germany. In the spring of 1919, he found employment as a political officer in the army in Munich with the help of an adventurer-soldier by the name of Ernst Roehm (1887–1934)—later head of Hitler’s elite soldiers, the storm troopers (SA). In this capacity Hitler attended a meeting of the so-called German Workers’ party, a nationalist, anti-Semitic, and socialist group, in September 1919. He quickly distinguished himself as this party’s most popular and impressive speaker and propagandist, and he helped to increase its membership dramatically to some six thousand by 1921. In April of that year he became Führer (leader) of the renamed National Socialist German Workers’ party (NSDAP), the official name of the Nazi party.

The poor economic conditions of the following years contributed to the rapid growth of the party. By the end of 1923, Hitler could count on a following of some fifty-six thousand

members and many more sympathizers, and regarded himself as a strong force in Bavarian and German politics. Hitler hoped to use the crisis conditions to stage his own overthrow of the Berlin government. For this purpose he staged the Nazi Beer Hall Putsch of November 8–9, 1923, by which he hoped to force the conservative-nationalist Bavarian government to cooperate with him in a “March on Berlin.” The attempt failed, however. Hitler was tried for treason (high crimes against one’s country) and given the rather mild sentence of a year’s imprisonment in the old fort of Landsberg.

It was during this prison term that many of Hitler’s basic ideas of political strategy and tactics matured. Here he outlined his major plans and beliefs in *Mein Kampf*, which he dictated to his loyal confidant Rudolf Hess (1894–1987). He planned the reorganization of his party, which had been outlawed and had lost much of its appeal. After his release, Hitler reconstituted the party around a group of loyal followers who were to remain the center of the Nazi movement and state.

Rise to power

With the outbreak of world depression in the 1930s, the fortunes of Hitler’s movement rose rapidly. In the elections of September 1930, the Nazis polled almost 6.5 million votes, and the party had gained undeniable popularity in Germany. In November 1932, President Hindenburg (1847–1934) reluctantly called Hitler to the chancellorship to head a coalition government of Nazis, conservative German nationalists, and several prominent independents.

The first two years in office were almost wholly dedicated to balancing power. With several important Nazis in key positions and

Hitler's military ally Werner von Blomberg in the Defense Ministry, he quickly gained practical control. Hitler rapidly eliminated his political rivals and brought all levels of government and major political institutions under his control. The death of President Hindenburg in August 1934 cleared the way for Hitler to remove the title of president. By doing this, Hitler officially became Führer (all-powerful ruler) of Germany and thereby head of state, as well as commander in chief of the armed forces. Joseph Goebbels's (1897–1945) extensive propaganda machine and Heinrich Himmler's (1900–1945) police system perfected the complete control of Germany. Likewise, Hitler's rule was demonstrated most impressively in the great Nazi mass rally of 1934 in Nuremberg, Germany, where millions marched in unison and saluted Hitler's theatrical appeals.

Preparation for war

Once internal control was assured, Hitler began mobilizing Germany's resources for military conquest and racial domination of central and eastern Europe. He put Germany's six million unemployed to work to prepare the nation for war. Hitler's propaganda mercilessly attacked the Jews, whom Hitler associated with all internal and external problems in Germany. Most horrifying was Hitler's installment of the "final solution" of imprisoning and eventually destroying all Jewish men, women, and children in Himmler's concentration camps.

Foreign relations were similarly directed toward preparation for war. The improvement of Germany's military position and the acquisition of strong allies set the stage for world war. To Germany he annexed, or

Adolf Hitler.

added, Austria and the German-speaking Sudetenland of Czechoslovakia, only to occupy all of Czechoslovakia early in 1939. Finally, through threats and promises of territory, Hitler was able to gain the neutrality of the Soviet Union, the former nation that was made up of Russia and other smaller states. Alliances with Italy and Japan followed.

The war

On September 1, 1939, Hitler began World War II with his quest to control Europe. The sudden invasion of Poland was immediately followed by the destroying of Jews and the Polish elite, and the beginnings

of German colonization. Following the declaration of war by France and England, Hitler temporarily turned his military machine west, where the light, mobile attacks of the German forces quickly triumphed. In April 1940, Denmark surrendered, soon followed by Norway. In May and June the rapidly advancing tank forces defeated France and the Low Countries. In the Air Battle of Britain, England sustained heavy damage, but held out after German naval operations collapsed.

The major goal of Hitler's conquest lay in the East. On June 22, 1941, the German army advanced on Russia in the so-called Operation Barbarossa, which Hitler regarded as Germany's final struggle for existence and "living space" (*Lebensraum*) and for the creation of the "new order" of German racial domination. However, after initial rapid advances, the German troops were stopped by the severe Russian winter and failed to reach any of their three major goals: Leningrad, Moscow, and Stalingrad. The following year's advances were again slower than expected, and with the first major setback at Stalingrad (1943), the long retreat from Russia began. A year later, the Western Allied forces of America, England, and Russia started advancing on Germany.

German defeat

With the German war effort collapsing, Hitler withdrew almost entirely from the public. His orders became increasingly erratic (different from what is normal or expected), and he refused to listen to advice from his military counselors. He dreamed of miracle bombs and suspected betrayal everywhere. Under the slogan of "total victory or total ruin," the entire German nation from young boys to old men, often barely

equipped or trained, was mobilized and sent to the front. After an unsuccessful assassination attempt on July 20, 1944, by a group of former leading politicians and military men, Hitler's reign of terror further tightened.

In the last days of the Nazi rule, with the Russian troops in the suburbs of Berlin, Hitler entered into a last stage of desperation in his underground bunker in Berlin. He ordered Germany destroyed, believing it was not worthy of him. He expelled his trusted lieutenants Heinrich Himmler and Hermann Göring (1893–1946) from the party and made a last, theatrical appeal to the German nation. Adolf Hitler committed suicide on April 30, 1945, leaving behind a legacy of evil and terror unequaled by any leader in the modern world.

HO
CHI MINH

Born: May 19, 1890
Nghe An, Vietnam

Died: September 3, 1969

Hanoi, Vietnam

Vietnamese revolutionary and president

Ho Chi Minh was the founder and first leader of the Vietnamese Communist Party. He led the movement for Vietnamese independence and unity through struggles with France and the United States. He also served as president of the Democratic Republic of Vietnam from 1945 until his death in 1969.

Early life

Ho Chi Minh was born Nguyen Sinh Cung on May 19, 1890, in Nghe An province in central Vietnam. Nghe An had been the center of resistance to the thousand-year Chinese control of Vietnam from 111 B.C.E. to 939 C.E. and the Ming Dynasty in the fifteenth century. Many of the leaders of the opposition to French control in the late nineteenth and early twentieth centuries also came from the province. Ho's father, Nguyen Sinh Huy, educated himself to pass the civil service exam and worked for the government. He eventually resigned in protest against French involvement in Vietnamese affairs. When Ho was ten years old, his mother died while giving birth. Ho had two older siblings, a sister named Thanh and a brother named Khiem.

Ho's opposition to colonialism (the rule of an area and its people by another country) began at the age of nine, when he worked as a messenger for an anticolonial organization. His father also introduced him to several revolutionaries. Ho went on to attend the National Academy in Hué, Vietnam. Dismissed from the academy after taking part in

protests against the French in 1908, he traveled to southern Vietnam in 1909 and worked briefly as a schoolteacher. Ho signed on as a cook with a French steamship company in 1911. At sea for two years, he visited ports in Europe, Africa, and the United States and began to develop his language skills, eventually learning Chinese, French, Russian, English, and Thai in addition to his native Vietnamese.

Committed to communism

During World War I (1914–18), Ho worked in London, England, and Paris, France. This is when his lifelong commitment to communism and Vietnamese independence began. Communism refers to a system in which the means of production (such as land, factories, and mines) are owned by the people as a whole rather than by individuals. Communists believe that such a system can be achieved only by revolution and government by a single party. In Paris, Ho adopted the name Nguyen Ai Quoc (Nguyen the Patriot) and attracted attention when he presented a written request to the Versailles Peace Conference demanding independence for Vietnam. Ho became a founding member of the French Communist Party in 1920. From 1920 to 1923, he was an outspoken leader of the Vietnamese community in Paris, participating in the Intercolonial Union formed under Communist sponsorship and publishing two anticolonial journals.

Ho was invited to Moscow, Russia, in 1923, where he studied at the University of Oriental Workers. In 1925 he was sent to China to organize a communist movement. He formed the Thanh Nien (Vietnamese Revolutionary Youth League), whose members

HO CHI MINH

Ho Chi Minh.

were mostly Vietnamese students in the southern Chinese port city of Canton. The league called for independence, redistribution of land, fair taxation, and equal rights for men and women. In 1927 Ho was forced to leave Canton after a Chinese government crackdown on local communists. During his absence, the league began to split into different factions, or groups. Ho returned to South China in early 1930 to unite the factions as a formal Communist Party, drawing its members from Vietnam, Cambodia, and Laos. He continued his organizing in Hong Kong and Shanghai but was arrested by the British in 1931 and imprisoned for two years. Released

in 1933, he spent the next several years in the Soviet Union.

Return to Vietnam

In 1940 Ho returned to South China and met with members of the Indochinese Communist Party (ICP). The following May, with most of Vietnam under Japanese occupation, he chaired a meeting of the party's Central Committee inside the Vietnamese border, marking his first return to Vietnam in thirty years. Ho and the ICP then announced the formation of the Viet Minh (League for Vietnamese Independence), an organization demanding independence from French rule and Japanese military occupation. From 1941 to 1945, although imprisoned again in China for more than a year, Ho led the ICP in seeking support for the Viet Minh, forming alliances with American diplomats and intelligence officers in South China, helping victims of a famine that killed over two million people in north and central Vietnam from 1943 to 1944, and building up the party's military forces.

In August 1945 Viet Minh forces attempted to seize power in Vietnam. On September 2, 1945, Ho Chi Minh, as president of the Democratic Republic of Vietnam, stood before thousands of supporters in the city of Hanoi. He proclaimed "that Vietnam has the right to be a free and independent country—and in fact is so already." At the end of World War II (1939–45), the French tried to regain control of Vietnam. Although Ho reached a settlement agreement with the French in March 1946, calling for the creation of a Vietnamese "free state" within the French Union, the French changed their minds. In December, war broke out between

Vietnamese and French forces. By 1954 the French had tired of war and sought a settlement at the Geneva Conference. In July an agreement was reached calling for a truce and division of Vietnam into a Communist north and a non-Communist south.

Later years

After 1954 Ho Chi Minh remained president of the Democratic Republic of Vietnam and chairman of the Communist Party but slowly turned over day-to-day responsibilities to others. Ho was active internationally, where he promoted Vietnamese interests within other countries and attempted to prevent a split between the Soviet Union and China. A land reform campaign from 1954 to 1956 was a major failure. Modeled on land redistribution plans developed by Chinese Communists, the reforms were very unpopular among Vietnamese peasants, some five thousand of whom were killed by Ho's government in its determination to make the plan work.

Ho also oversaw the formation of the National Liberation Front (NLF) in 1960, a movement of resistance against the non-Communist government in southern Vietnam. Clashes between that government and the NLF led the United States military to step in on the side of the South Vietnamese. As the American military commitment increased, with the arrival of American ground troops and the beginning of a heavy bombing campaign against northern Vietnam in 1965, Ho sought to maintain good relations with the Soviet Union and China in order to obtain military assistance and supplies from both Communist powers.

Beginning in the mid-1960s, Ho Chi Minh's health declined, and he made only

occasional public appearances. He never married, but he was widely viewed in North Vietnam as the father of his country and often referred to in his later years as Bac (Uncle) Ho. He died of a heart attack on September 3, 1969, almost six years before the U.S.-backed South Vietnamese government was defeated and Vietnam was unified. The city of Saigon was renamed Ho Chi Minh City in his honor.

THOMAS HOBBS

Born: April 5, 1588

Westport, England

Died: December 4, 1679

Hardwick Hall, England

English philosopher and political theorist

The English philosopher and political theorist Thomas Hobbes was one of the central figures of political thought behind the British Empire. His major

Thomas Hobbes.

Reproduced by permission of Archive Photos, Inc.

work, “Leviathan,” published in 1651, expressed his idea that basic human motives are selfish.

Childhood

Born prematurely on April 5, 1588, when his mother heard of the coming invasion of the Spanish Armada (a fleet of Spanish warships), Thomas Hobbes later reported that “my mother gave birth to twins: myself and fear.” His father, also named Thomas Hobbes, was the vicar (a clergyman in charge of a church) of Westport near Malmesbury in Gloucestershire, England. After being involved in a fight with another clergyman outside his own church,

the elder Thomas Hobbes was forced to flee to London, England, leaving his wife, two boys and a girl behind.

Thomas was then raised and educated by an uncle and studied at the local schools. By the age of six he was studying Latin and Greek. Also at this time, Hobbes became absorbed in the classic literature of ancient Greece. From 1603 to 1608 he studied at Magdalen College, Oxford, where he was bored by the philosophy of Aristotelianism (studying the works of Aristotle, a fourth-century B.C.E. Greek philosopher).

Scholarly work

The twenty-year-old future philosopher became a tutor to the Cavendish family, a well-known English family. This association provided him with a private library, foreign travel, and introductions to influential people. Hobbes learned to speak Italian and German and soon decided to devote his life to scholarly pursuits.

Hobbes, however, was slow in developing his thought—his first work, a translation of Greek historian Thucydides’s (died c. 401 B.C.E.) *History of the Peloponnesian Wars*, did not appear until 1629. Thucydides held that knowledge of the past was useful for determining correct action, and Hobbes said that he offered the translation during a period of civil unrest as a reminder that the ancients believed democracy (rule by the people) to be the least effective form of government.

In Hobbes’s own estimation the most important intellectual event of his life occurred when he was forty. While waiting for a friend he wandered into a library and came across a copy of Euclid’s (third century

B.C.E.) geometry. His interest in mathematics is reflected in his second work, *A Short Treatise on First Principles*, which presents a mechanical interpretation of sensation, as well as in his brief stint as mathematics tutor to Charles II (1630–1685).

For the rest of his long life Hobbes travelled and published many works. In France he met mathematicians René Descartes (1596–1650) and the Pierre Gassendi (1592–1655). In 1640 he wrote one of the sets of arguments to Descartes's *Meditations*.

Although born into the Elizabethan Age (c. 1550–1600; a time of great change in England), Hobbes outlived all of the major seventeenth-century thinkers. He became a sort of English icon and continued writing, offering new translations of Homer (an eighth-century B.C.E. Greek poet) in his eighties because he had “nothing else to do.” When he was past ninety, he became involved in controversies with the Royal Society, an organization of scientists. He invited friends to suggest appropriate epitaphs (an inscription on a tombstone) and favored one that read “this is the true philosopher's stone.” He died on December 4, 1679, at the age of ninety-one.

His philosophy

The questions Hobbes posed to the world in the seventeenth century are still relevant today, and Hobbes still maintains a strong influence in the world of philosophy. He challenged the relationship between science and religion, and the natural limitations of political power.

The diverse intellectual paths of the seventeenth century, which are generically called

modern classical philosophy, began by rejecting authorities of the past—especially Aristotle and his peers. Descartes, who founded the rationalist tradition, and Sir Francis Bacon (1561–1626), who is considered the originator of modern empiricism (political theory regarding the British Empire), both sought new methods for achieving scientific knowledge and a clear conception of reality.

Hobbes was fascinated by the problem of sense perception, and he extended Galileo's (1564–1642) mechanical physics into an explanation of human cognition (process of learning). He believed the origin of all thought is sensation, which consists of mental images produced by the pressure of motion of external objects. Thus Hobbes anticipated later thought by explaining differences between the external object and the internal image. These sense images are extended by the power of memory and imagination. Understanding and reason, which distinguish men from other animals, are a product of our ability to use speech.

Political thought

Hobbes explains the connection between nature, man, and society through the law of inertia (“bodies at rest tend to stay at rest; bodies in motion tend to stay in motion”). Thus man's desire to do what he wants is checked only by an equal and opposite need for security. Society “is but an artificial man” invented by man, so to understand politics one should merely consider himself as part of nature.

Such a reading is cold comfort as life before society is characterized by Hobbes, in a famous quotation, as “solitary, poor, nasty, brutish and short.” The equality of human desire is matched by an economy of natural

satisfactions. Men are addicted to power because gaining power is the only guarantee of living well. Such men live in a state of constant war, driven by competition and desire for the same goods. The important result of this view is man's natural right to seek self-preservation (protection of one's self) by any means. In this state of nature there is no value above self-interest because the absence of common power results in the absence of law and justice. But there is a second law of nature that men may surrender their individual will to the state. This "social contract" binds the individual to treat others as he expects to be treated by them.

In Hobbes's view the sovereign power of a commonwealth (England's power over its colonies) is absolute and not subject to the laws of its citizens. Obedience will remain as long as the sovereign (England) fulfills the social contract by protecting the rights of the individual. According to these laws Hobbes believed that rebellion is, by definition, unjust. However, should a revolution prove victorious, a new absolute sovereignty would rise up to take the place of the old one.

BILLIE HOLIDAY

Born: April 7, 1915

Baltimore, Maryland

Died: July 17, 1959

New York, New York

African American jazz singer

Billie Holiday was an African American jazz vocalist who perhaps showed the most expression of feeling of any singer in jazz history.

Early life

Billie Holiday was born Eleanora Fagan on April 7, 1915, in Baltimore, Maryland. (She borrowed the name "Billie" from one of her favorite movie actresses, Billie Dove.) Born to an unwed teenage mother, Sadie Fagan, Holiday's childhood was one of poverty. Her father, Clarence Holiday (later a jazz guitarist) married Sadie three years later. He never lived with the family, choosing his musical career over them. As a child Billie started working very young, running errands and cleaning a house of prostitution's (a place where sexual acts are traded for money) marble stoop. It was here that she first heard Louis Armstrong (1900–1971) and Bessie Smith (1894–1937) records through the open windows.

New York City

In 1928 Holiday moved to New York City with her mother, who began work as a housemaid, but the 1929 depression (time of low economic conditions with high rates of unemployment) soon left her mother without work. In 1932 Holiday auditioned for a singing job and was hired. For the next few

years she sang in Harlem clubs, then her career took off when Benny Goodman (1901–1986) used her on a record. But it was through a series of recordings made between 1935 and 1939 that her international reputation was established. During the late 1930s she was also a big band vocalist, first with Count Basie (1904–1984) in 1937 and then with Artie Shaw (1910–) in 1938.

Holiday's relationship with Basie's star tenor saxophonist Lester Young (1909–1959) is the stuff of legend. They were great musical coworkers and great friends for life. Young named her "Lady Day" (or simply "Lady"), and that title became her jazz world name from the mid-1930s on. She in turn labeled him "Pres" (the "President of Tenor Saxophonists").

Many successful tunes were recorded, interweaving Young's tenor saxophone with Holiday's voice. After the late 1930s they rarely recorded together, but to the end they remained soul mates. Holiday's career reached its peak in the late 1930s. In 1938 she worked a long engagement at Cafe Society. The following year she joined Benny Goodman on a radio broadcast.

Two songs of the period are noteworthy. The first, "Strange Fruit," is a detailed description of a lynching (an unjust killing because of race). Columbia record company considered it too inflammatory (exciting to the senses) and refused to issue it. A small record company, Commodore, finally released it in 1939. It became a big money-maker because of the tune on the record's other side, "Fine and Mellow," a blues song written by Holiday. Another tune always associated with her is "Gloomy Sunday," which spoke of such deep despair (misery) that it was kept off the airwaves for a time.

Personal tragedies

By the mid-1940s Holiday had been arrested many times for illegal drug use. After one arrest, at her own request, she was placed in a federal rehabilitation (having to do with recovery from drug or alcohol abuse) center at Alderson, West Virginia, for a year and a day. Just ten days after being released she gave a concert at Carnegie Hall in New York City.

Neither Holiday's first husband, Joe Guy, a jazz guitarist who she divorced, or Louis McKay, who survived her, seemed able to save Holiday from herself. By the 1950s alcohol and marijuana had strained her voice, so that it was unnaturally deep and grainy and

occasionally cracked during performances. Nevertheless, her singing was sustained by her highly individual style, the familiarity she projected, and her special way with the words of a song.

Holiday made her final public appearance in a concert at the Phoenix Theatre in New York City on May 25, 1959. She died in Metropolitan Hospital in New York City on July 17, 1959, of "congestion of the lungs complicated by heart failure." At the time of her death she had been under arrest in her hospital bed for illegal possession of drugs.

Holiday's early small-group recordings have been rereleased in several boxed sets under the general title *Billie Holiday: The Golden Years*. Her best later work is to be found in *The First Verve Sessions*, recorded in 1952 and 1954.

On March 6, 2000, Holiday was inducted into the Rock and Roll Hall of Fame in the Early Influences category. That category includes artists whose music predates rock and roll, but who inspired and had a strong effect on rock and roll music.

OLIVER WENDELL HOLMES

Born: August 29, 1809

Cambridge, Massachusetts

Died: October 7, 1894

Boston, Massachusetts

American physician, author, professor

American physician, teacher, and author Oliver Wendell Holmes contributed to the advancement of medicine and literature. He is also known for writing the famous poem "Old Ironsides."

Early life

Oliver Wendell Holmes was born in Cambridge, Massachusetts, on August 29, 1809, to a well-established New England family. His father, Abiel Holmes, was a reverend in the First Congregational Church. His mother, Sarah Wendell, daughter of a Boston merchant, came from a long line of Dutch ancestors who settled in New England. Although his father was a Calvinist (follower of John Calvin's study of religious faith, which strongly emphasized the supreme power of God and His foreknowledge of a believer's future) by training, he was very open to Christians of all faiths. He was a fair-minded man and a well-educated father, having a library of two-thousand books for his children to read. Oliver was the fourth of five Holmes' children, with three older sisters and one younger brother. Paul Bunyan's classic allegory (symbolic story) had a big impact on Oliver's lifetime religious views. He rejected many of the Calvinist ideas he was surrounded with in childhood, and this independence often leaned toward rebellion.

At age fifteen Oliver attended Phillips Andover Academy. He was instantly popular with his teachers his first year, when he translated Virgil's (70–19 B.C.E.) *Aeneid* from Latin into English. It is possible that Oliver's father thought the Calvinist focus at Andover would make a minister out of Oliver, but Oliver later wrote in *Life and Letters*, "I might have been a minister myself, if a [certain] clergyman had not looked and talked so like an undertaker."

Harvard man

Holmes continued his studies at Harvard University in 1825, graduating in 1829. Harvard's strong Unitarian (church stressing individual freedom of belief) influences only strengthened Oliver's rejection of Calvinism. This first time at Harvard was when he began to enjoy writing. Publishing poems in Harvard's *The Collegian* and later in the *New England Galaxy* and *Amateur* gave him quite a bit of pleasure. His writing did not keep him from being social, as he had many friends and joined Phi Beta Kappa (an honor society made up of American college students and graduates who have excelled in liberal arts and sciences). Holmes's joy in life was evident with his possession of a fast horse and buggy and several rowboats at the ready. Holmes was also a fan of the racetrack and boxing rings.

After Holmes graduated from Harvard in 1829, he studied at the law school for a year, during which time he wrote the popular poem "Old Ironsides". His pencil-written poem was about the destruction of a once useful warship, the *USS Constitution*.

Prose begins

A year after the publication of "Old Ironsides," Holmes started writing prose (literature

Oliver Wendell Holmes.
Courtesy of the Library of Congress.

different from poetry because of its irregular patterns and lack of rhyme) in the *New England Magazine*. This was a new publication and Holmes was an early contributor (one who writes for the magazine or newspaper), publishing "The Autocrat at the Breakfast Table" in the fifth month's copy. A year later he published another by the same title, and then five years later, in November 1857, he published an even longer version in the brand new *Atlantic Monthly*. He found the perfect place to express his very definite ideas in the pages of the *Atlantic Monthly*. In addition to these articles and his volumes of verse, he also wrote biographies: John L. Motley's (1814–1877) in

1879, and Ralph Waldo Emerson's (1803–1882) in 1885. Among his best-known poems are “The Deacon’s Masterpiece,” “The Last Leaf,” “The Chambered Nautilus,” “My Aunt,” “The Moral Bully,” and “Brother Jonathan’s Lament for Sister Caroline.”

In the same year of Holmes’s writing success, he decided to give up law in favor of a career in medicine. He started at the Boston Medical College and finished up at Harvard Medical School. He rounded out his training with two years of study in Paris from 1833 to 1835. France was considered the medical center of the world. Holmes was honored to work under the surgeon Larrey, reported to be Napoleon’s (1769–1821) favorite. Here he learned new techniques and approaches in medicine, reflected in two important early papers: “Homeopathy, and Its Kindred Delusions” in 1842, and “The Contagiousness of Puerperal Fever” (an unpredictable and often deadly difficulty of childbirth) in 1843. This was to be the medical work for which he is most remembered.

Holmes took his medical degree at Harvard in 1836. Although he began a general practice (active medical office) in Boston, it was his medical writings and teaching of anatomy that set Oliver Wendell Holmes apart. Nevertheless, Ralph Waldo Emerson encouraged his poetry. Due to the encouragement, Holmes published *Poetry*.

Lecturer

Continuing to balance both writing and medicine, in 1836 Holmes received the Boylston Prize from Harvard for a medical essay, as well as two more in 1837. From 1838 to 1840 he served as professor of anatomy at Dartmouth College. Despite his inability to

travel widely in the United States due to his asthma, Holmes delivered many lectures on the topics of both science and literature. His medical writing often became lecture material that only added to his popularity as a scholar and a public figure. Of his lecturing style students said, “He enters, and is greeted by a mighty shout and stamp of applause.” The other professors requested that Holmes teach the last of the five morning lectures, because they knew he could hold the students’ attention even though they were tired.

Both Holmes’s writings and his lectures showed an open-minded understanding that his readers and listeners were educated people and should be spoken to as such.

In 1840 Holmes married Amelia Lee Jackson, daughter of the Massachusetts Supreme Court justice, and returned to general practice. They had three children: Oliver Wendell Holmes, Jr., a future justice of the United States Supreme Court; a daughter, Amelia (the future Mrs. Turner Sargent); and Edward Jackson Holmes, a future Boston lawyer. In 1847 Oliver was appointed Parkman professor of anatomy and physiology at Harvard Medical School, where he served as dean from 1847 to 1853. Holmes remained at Harvard until 1882.

Life joys

Holmes’s hobbies included interest in photography and the study of the microscope. He is credited with the invention of the stereoscope (an instrument with two eyeglasses for helping the observer combine the images of two pictures to get the effect of depth). His writing showed just as much variety as his training and his hobbies. He even wrote several well-remembered hymns. He died at his

house in Boston on October 7, 1894, just two months after his eighty-fifth birthday.

Even though he was rebellious against some of his childhood religious training, he maintained a healthy relationship with his God. He once wrote in a letter to a friend, "There is a little plant called Reverence in the corner of my soul's garden." As a scientist, teacher, lecturer, author, and poet, Holmes left his mark on his time period, and many honors came to him both at home and abroad.

OLIVER WENDELL HOLMES JR.

Born: March 8, 1841

Boston, Massachusetts

Died: March 6, 1935

Washington, D.C.

American Supreme Court justice and legal writer

As a Supreme Court justice and a legal writer, Oliver Wendell Holmes Jr. was a key figure in the debate

concerning the role of law in a rapidly changing America during the early twentieth century. Not only did he personally contribute to the debate, but he also served as a symbol to a generation of legal and political thinkers.

Born into a celebrated Boston family

Oliver Wendell Holmes Jr. was born in Boston, Massachusetts, on March 8, 1841, into one of the city's most celebrated families. His father, Oliver Wendell Holmes, was a leader in the medical profession as well as a famous writer for the *Atlantic Monthly*, a popular political magazine in its time. His family life brought young Oliver into contact with many of Boston's leading intellectuals, including Ralph Waldo Emerson (1803–1882), America's most famous essay writer and lecturer during this period.

Harvard and the impact of the Civil War

Holmes entered Harvard College in 1857. There is little evidence that his college education was of great importance to him. Instead, Holmes's greatest learning experience was his part in the American Civil War (1861–65). The Civil War began as an attempt by the federal government of the United States to preserve the Union after eleven Southern states chose to leave and form an independent nation. The war also involved the issue of whether or not slavery would remain legal in parts of the country. After the federal government and the Northern states won the war, the Union was preserved and slavery was no longer allowed in any part of the United States. Holmes's participation in many battles resulted in three wounds, of which he was very proud. He left the military in July 1864.

Oliver Wendell Holmes Jr.
Courtesy of the Library of Congress.

The impact of the war on Holmes had less to do with the political issues over which it had been fought than with its demonstration of the importance of commitment to a higher cause. America was changing rapidly, and Holmes grew up in a world where many accepted beliefs were being challenged. Holmes responded by developing a belief in the importance of devoting oneself to a cause even if it was incomprehensible, or unable to be understood by everyone.

Furthermore, the war supported Holmes's belief that all of life is a battle, with victory going to the strongest. In this way he fully accepted the emphasis of his age on

“survival of the fittest.” Unlike many of his peers, however, he pointed out that the strongest force in a society was its majority, a belief he would stand by during his later career as a judge.

Legal career

After the war Holmes attended Harvard Law School and graduated in 1866. The following year he was admitted to the Massachusetts bar, an association for lawyers. After his first trip to England, he threw himself into his legal career. He eventually helped found the firm of Shattuck, Holmes and Munroe. The time that remained after law practice he used for law study. In 1872 Holmes married Fanny Bowditch Dixwell, the daughter of his former schoolmaster.

Between 1870 and 1873 Holmes edited the *American Law Review*, a distinguished law publication. Holmes also updated the publication of the classic work *Commentaries on American Law* (1873), written by Chancellor James Kent (1863–1847).

Throughout the 1870s Holmes was also researching the questions he would discuss in a set of lectures at the Lowell Institute in 1880. These, published the following year as *The Common Law*, brought him worldwide fame. The first paragraph of *The Common Law* contains what is probably Holmes's most famous sentence: “The life of the law has not been logic: it has been experience.” He goes on to argue that law is a series of responses to social problems, not simply a set of theories that are difficult to understand. His book contributed to the awakening interest in the United States in “sociological jurisprudence,” or the relationship between law and other social institutions.

Career as a judge

Holmes then became a professor of law at Harvard Law School. He had worked in this position for less than a year when he became an associate justice of the Supreme Judicial Court of Massachusetts on January 3, 1883. He was promoted to chief justice on August 5, 1899, and his reputation as a daring thinker began to grow. Many of Holmes's groundbreaking opinions upheld the right of the state to regulate the economy and other social issues.

Theodore Roosevelt (1858–1919) became president in 1901. The new president was eager to appoint men to the Supreme Court who would help change the role of government and would uphold the new laws he himself wanted to pass. Viewing Holmes as such a man, Roosevelt appointed him to the U.S. Supreme Court. Holmes took his seat on December 8, 1902, at the age of sixty-one.

Holmes's most important early opinions dealt with regulation of the national economy. His most famous opinion of the economy is probably *Lochner v. New York*. In this case, Holmes strongly disagreed when the Court struck down a New York law limiting the hours a baker could be made to work. He rejected the Court's social thinking. For him the key question was not whether or not this was right or wrong but rather "the right of a majority to embody their opinions in law."

Freedom of speech

Holmes became even more famous after World War I (1914–18) because of his opinions regarding the regulation of freedom of speech. Although his reasoning was not

always faultless, he used his superb writing skills to raise a powerful sense of the importance of civil liberties, or freedoms.

In *Schenck v. United States* (1919) Holmes upheld the conviction of a man who had encouraged people to resist the draft. (The draft was a federal law that ordered men to register with the military in case they would be needed in times of war.) Holmes's support of this conviction was not because the man ignored federal law, rather that he was a "clear and present danger" to the peace and order of society.

In *Abrams v. United States* (1919) Holmes wrote his most passionate defense of free speech. He argued that only a "free trade in ideas" could guarantee the truth and that defense of freedom of speech is essential.

The admired justice leaves the court

Tall, erect, and handsome in his youth, Holmes had grown into an even more imposing man, with a splendid handlebar moustache and white hair. As an elderly judge, he was surrounded often by admiring younger men and was, by all accounts, a lively figure. In his old age he was increasingly admired by many of those who would lead the next political generation. He left the Supreme Court on January 12, 1932, before it accepted his theories concerning its role in regulating the economy. (The Court would later accept them in the 1940s.)

Holmes died on March 6, 1935, in Washington, D.C. Oliver Wendell Holmes Jr. was a legal trailblazer who helped define the role of law in the twentieth century. His theories and ideas are as relevant today as they were when he wrote them.

HOMER

Born: Ninth century B.C.E.

Died: Ninth century B.C.E.

Greek poet

Homer, the major figure in ancient Greek literature, has been considered the greatest poet of classical antiquity (ancient times). He wrote both the *Iliad* and the *Odyssey*, two epic poems (long narrative poems) surviving in a surprisingly large number of manuscripts.

Portrait of Homer

It is not possible to supply a biography for Homer in the accepted sense of a life history. Since he lived before cultures began recording history, there is no authentic record of who he was, when and where he was born,

how long he lived, or even if he was actually responsible for the two epic poems for which he is known.

It is arguable that in one incident of the *Odyssey* the poet may be giving a glimpse of himself in the disguise of a bard (singing poet), whom he calls Demodokos and whom he introduces to the court of the Phaeacian king, where the shipwrecked Odysseus is generously entertained. This Demodokos is described as a “divine singer to whom the god gave delight of singing whatever his soul prompted him.” He is also described as being blind, which also supports the argument that Homer was portraying himself, because there was a belief that Homer was blind.

Evidence from the epics

This lack of any historical record of Homer’s life leaves only what can be taken from the poems themselves. On this task many scholars have attempted to draw conclusions about Homer, often without acceptable results.

The setting of the *Iliad* is the plain of Troy (an ancient Greek city) and its immediate surroundings. Details of the land are so precise that it is not feasible to suppose that their author created them out of his imagination. To be sure, there is the objection that not all of the poem’s action can be made to fit the present-day lands.

In the *Odyssey* the situation is in many respects quite different. The poet demonstrates that he knew the western Greek island of Ithaca (where the second half of the epic takes place) as well as the poet of the *Iliad* knew the plain of Troy. The *Odyssey*, however, also extends over many strange, distant

lands, as Odysseus's homeward voyage from Troy to his native Ithaca is transformed into a bizarre sea-wandering adventure.

Perhaps misled by the accuracy with which the Trojan plain is described in the *Iliad* and the island of Ithaca is pictured in the *Odyssey*, various modern commentators have tried to impose the same realism on Odysseus's astonishing voyage, selecting actual sites in the western Mediterranean Sea for his adventures. The true situation must be that the Homer of the *Odyssey* had never visited that part of the ancient world, but he had instead listened to the stories of returning Ionian sailors who explored the western seas during the seventh century B.C.E.

Theory of two authors

That the author of the *Iliad* was not the same as the author of these fantastic tales in the *Odyssey* is arguable on several levels. The two epics belong to different literary types: the *Iliad* is essentially dramatic in its confrontation of opposing warriors who converse like the actors in a tragedy (a play with struggle and disappointment), while the *Odyssey* is cast as a novel narrated in more everyday human speech. In their physical structure, also, the two epics display an equally obvious difference: the *Odyssey* is composed in six distinct parts of four chapters ("books") each, whereas the *Iliad* moves unbrokenly forward in its tightly woven plot.

Readers who examine psychological qualities see in the two works some distinctly different human responses and behavioral attitudes. For example, the *Iliad* voices admiration for the beauty and speed of horses, while the *Odyssey* shows no interest in these animals. The *Iliad* dismisses dogs as mere

Homer.

Reproduced by permission of Archive Photos, Inc.

scavengers, while the poet of the *Odyssey* reveals a modern sympathy for Odysseus's faithful old hound, Argos.

The strongest argument for separating the two poems is the chronology, or dating, of some of the facts in the pieces. In the *Iliad* the Phoenicians are praised as skilled craftsmen working in metal, and as weavers of elaborate, much-prized garments. In contrast, Greek feelings toward the Phoenicians have undergone a drastic change in the *Odyssey*. Although they are still regarded as clever craftsmen, the Phoenicians are also described as "tricksters," reflecting the invasion of Phoenician commerce into Greek markets in the seventh century B.C.E.

Oral composition

One thing, however, is certain: both epics were created without writing sources. Between the decline of Mycenaean and the emergence of classical Greek civilizations—which is to say, from the late twelfth to the mid-eighth century B.C.E.—the inhabitants of the Greek lands had not yet acquired from the eastern-most shore of the Mediterranean the familiarity with Phoenician alphabetic writing that would lead to classical Greek literacy (and in turn, Etruscan, Roman, and modern European literacy). Therefore it could be concluded that the epics must have been created either before the end of the eighth century B.C.E. or so shortly afterwards that the use of alphabetic writing had not yet been developed sufficiently to record long pieces of writing. It is this illiterate (unable to read or write) environment that explains the absence of all historical record of the author's two great epics.

It is probable that Homer's name was applied to two individuals differing in style and artistic accomplishment, born perhaps as much as a century apart, but practicing the same traditional craft of oral composition and recitation (to read out loud). Although each became known as "Homer," it may be (as one ancient source says) that "homros" was a word for a blind man and so came to be used generically to refer to the old and often sightless wandering reciters of heroic legends. Thus there could have been many Homers.

The two epics Homer is generally regarded as writing, however, have been as highly prized in modern as in ancient times for their vividness of expression, their keenness of personal characterization, and their lasting interest, whether in narration of action or in animated dramatic dialogue.

Other works

Later Greek times credited Homer with the composition of a group of comparatively short "hymns" (songs of praise) addressed to various gods, of which twenty-three have survived. With a closer look, however, only one or two of these, at most, can be the work of the poet of the two great epics. The epic "The Battle of the Frogs and Mice" has been preserved but adds nothing to Homer's reputation. Several other epic poems of considerable length—*The Cypria*, *The Little Iliad*, *The Phocais*, *The Thebais*, and *The Capture of Oichalia*—were also credited to Homer in classical times.

The simple truth seems to be that the name Homer was not so much that of a single individual but an entire school of poets flourishing on the west coast of Asia Minor (today, the area of Turkey). Unfortunately, we will probably never know for sure, since during this period the art of writing had not been sufficiently developed by the Greeks to permit historical records to be compiled or literary compositions to be written down.

SOICHIRO HONDA

Born: November 17, 1906

Iwata-gun, Japan

Died: August 5, 1991

Tokyo, Japan

Japanese businessman

An independent person in a country not known for its willingness to accept nonconformists (those that do not cooperate with customs), Soichiro Honda created an automobile giant despite the opposition of the Japanese government. One of his company's cars, the Accord, was a best-selling model in the American market.

Early life

The first son of blacksmith Gihei Honda and his wife Mika, Soichiro Honda was born on November 17, 1906, in rural Iwata-gun, Japan. In 1922 he graduated from the Futamata Senior Elementary School. Honda had little tolerance for formal education and jumped at every opportunity he had to work with his true love: motors. Throughout his life Honda never forgot the impression that was made on him when he sighted his first automobile.

After leaving school Honda began his career as an apprentice (a person who works to gain experience in a trade) auto repairman for Arto Shokai in Tokyo. In 1928 he returned to his hometown as a master mechanic and soon established a branch shop for the firm in Hamamatsu, Japan.

Building an empire

During this time Honda also participated in auto races and became interested in cars

and motorcycles. Soon he was experimenting with engines, and in 1928 he organized the Tohai Seiki Company to manufacture piston rings, some of which were sold to Toyota, a major Japanese car manufacturer.

Honda's first attempts at the personal motor business came in the mid-1940s when he designed and manufactured a small engine that could be attached to a bicycle to create a motorbike. The venture proved a great success.

Encouraged by his early success, in 1948 he organized the Honda Motor Company. The following year Honda manufactured a small motorcycle called the "Dream D" and prepared to enter the highly competitive Japanese market, which he did through effective advertising. Within a decade Honda was the leading motorcycle manufacturer in the world and had a larger share of the American motorcycle market than Toyota and Nissan (with its Datsun cars) had in automobiles.

Now Soichiro Honda attracted press attention, and, unlike most Japanese businessmen, he loved it. A small but talkative man, he was the opposite of what westerners imagined Japanese businessmen to be. For example, he promoted executives on the basis of performance rather than age, an unusual practice at large Japanese firms. Honda continued racing autos and motorcycles, dressed casually, and took pride in maintaining his independence from the Japanese business establishment. In addition, Honda openly voiced his admiration of American business practices and way of life.

Automobiles

This was at a time when the powerful Ministry of Trade and Industry (MITI) was

Soichiro Honda.

Reproduced by permission of AP/Wide World Photos.

trying to unite several small companies into a third large one to compete with Toyota and Nissan. MITI and the Department of Transportation tried to discourage Honda from adding to the number of companies, but he persisted. He won MITI's permission by coming out with a low-priced small sportscar, the S 500, which was different from anything produced by the other companies. He followed it up with other sports models. His company was still very small, producing only three thousand cars in 1966—half of what Toyota was turning out in a week.

Honda introduced the Civic to the American market in 1972. It got thirty-nine

miles per gallon (mpg) on the road and twenty-seven mpg in city driving, remarkably efficient for an automobile. The popularity of the Civic rose throughout the 1970s, and in 1980 Honda sold 375,000 cars in the American market—almost three times as many as Subaru and twice as many as Mazda, but still behind Toyota and Nissan. The reasons for this success were obvious: Honda combined high quality with efficiency and economy. But his small cars still appealed to a limited market.

Transforming Honda

In the late 1970s and early 1980s Honda expanded his car company overseas. In 1979 he opened a motorcycle plant near Columbus, Ohio, and an auto plant followed soon after, prompting other Japanese companies to follow his lead. In the late 1970s Toyota and Nissan sold one-third of their cars to the United States, while Honda sold half of his in that market.

Soichiro Honda did not directly supervise these introductions or the development of overseas plants in the United States and Europe. He resigned in 1973, but stayed at the company as “supreme adviser.” In 1988 he became the first Japanese carmaker to be inducted into the Automobile Hall of Fame. Honda died of liver failure August 5, 1991, in a Tokyo hospital. Honda's rise from humble beginnings to a powerful and influential businessman is one of twentieth century's most inspirational stories.

BELL HOOKS

Born: September 25, 1952

Hopkinsville, Kentucky

African American activist, educator, and writer

Writer, professor, and social critic, bell hooks is undeniably one of the most successful “cross-over” academics of the late twentieth century. Her books look at the function of race and gender in today’s culture.

Childhood

Born Gloria Jean Watkins on September 25, 1952, bell hooks was raised in Hopkinsville, Kentucky, a small, segregated (separated by race) town in rural Kentucky. She recalled her neighborhood as a “world where folks were content to get by on a little, where Baba, mama’s mother, made soap, dug fishing worms, set traps for rabbits, made butter and wine, sewed quilts, and wrung the necks of chickens.” She later explained how this community turned the hardships created by racism (the idea that one race is superior to another) into a source of strength. The neighborhood where she grew up provided young Gloria with her resistance to racism, but it also provided her

with the negative and positive experiences that would shape her feminism (support of equal rights for women).

Gloria was one of six siblings: five sisters and a baby brother. Her father worked as a janitor, and her mother, Rosa Bell Oldham Watkins, worked as a maid in the homes of white families. As a student at segregated public schools, hooks was taught by a dedicated group of teachers, mostly single black women, who helped to shape the self-esteem (satisfaction with oneself) of children of color. But the late 1960s Kentucky schools became desegregated. By the time she was ten, hooks had begun writing her own poetry and soon developed a reputation for her ability to recite poetry.

Learned to “talk back”

Although hooks was supposed to become a quiet, well-behaved young woman, she became instead a woman who “talked back.” This action, for which hooks eventually named a volume of essays, actually refers to the development of a strong sense of self that allows black women to speak out against racism and sexism.

Although young hooks continued to write poetry—some of which was published—she gained a reputation as a writer of critical essays on systems of domination. In order to do this work, she found that she needed to develop a different voice, a different name. She first used her pseudonym (assumed name)—her maternal great-grandmother’s name—for a small book of poems. She decided not to capitalize her first and last names in an attempt to place the focus on her work, rather than her name.

bell hooks.

Reproduced by permission of Pinderhughes
Photography, Inc.

Wrote first book at nineteen

After high school, hooks accepted a scholarship to Stanford University, in California. Despite her full-time studies she began *Ain't I a Woman* at the age of nineteen. She also took a job as a telephone operator. Finding time for her writing was a challenge, but hooks found that the job offered her something she did not have in school at the time—a community of working-class, black women.

The author went through several drafts of the manuscript over the next six years before she had one that satisfied her. It was at this moment that the persona of bell hooks truly rescued Gloria Watkins. At first hooks

had considerable trouble publishing her work, and eventually she was directed to her future publisher, South End Press, while giving a talk at a feminist bookstore in San Francisco. Once published in 1981, *Ain't I a Woman* became a central book in discussions of racism and sexism. Eleven years later, *Publishers Weekly* ranked it among the “twenty most influential women’s books of the previous twenty years.”

A career in higher education

While *Ain't I a Woman* made bell hooks an important name in feminist debate, she continued her work. After obtaining a doctorate degree in English literature, she began her teaching career. It was in her role as a teacher that hooks felt she was doing her most important work. She knew that for a people historically and legally denied the right to education, teaching was one of the most substantial forms of political resistance she could choose.

After holding various positions at the University of California in Santa Cruz, California, in the early 1980s, hooks left for Yale University in New Haven, Connecticut, when she had the opportunity to teach in African American Studies. In 1988 she joined the faculty at Oberlin College, in Ohio, where she would teach in Women’s Studies, a program that now offered the critique of racism that was absent during her undergraduate years.

Taking a post with the City College of New York in 1995, hooks moved to the Henry Holt publishing company and came out with *Killing Rage: Ending Racism*, a book that calls for a more proactive approach (initiative) to solving the problem of racism in America.

Hooks lives in New York City and remains an important figure in the fight against racism and sexism in America. With the release of *Communion: The Female Search for Love* in 2002, hooks has more than twenty books to her name with more to come.

can board member of the Federal Communications Commission.

Many role models

Benjamin Lawson Hooks, the fifth of seven children, was born in Memphis, Tennessee, in 1925 to Robert B. and Bessie Hooks. Hooks's father and uncle ran a successful photography business. His grandmother, a musician who graduated from Berea College in Kentucky, was the second African American female college graduate in the nation. With such evidence of success and hard work as his personal examples, Hooks was encouraged to do well in his studies and to prepare for higher education.

Following the Depression of 1929, an economic slump in which millions of workers lost their jobs and homes, many banks failed, and many factories closed, the Hooks family's standard of living declined. With money so scarce during those years, African American clients could rarely afford wedding pictures or family portraits, therefore, business slowed down. Still, the family always had food, clothing, and shelter. Hooks's parents were careful to see that all of their children kept up their appearance, attitude, and academic performance.

Law student to civil rights worker

After high school, Hooks studied pre-law at LeMoyne College in Memphis. He successfully completed that program and then served in the army during World War II (1939–45) guarding Italian prisoners. He realized that in Memphis, these prisoners would have more rights than he did. When he left the army he continued his studies at Howard University and at DePaul University

BENJAMIN HOOKS

Born: January 31, 1925

Memphis, Tennessee

African American activist, executive director, and lawyer

Benjamin Hooks was an executive director of the National Association for the Advancement of Colored People (NAACP) and is the first African Ameri-

Benjamin Hooks.

Reproduced by permission of AP/Wide World Photos.

Law School in Chicago, Illinois—no law school in the South would admit him. He returned to the South to aid in the civil rights movement rather than establish a practice in Chicago. From 1949 to 1965 he was one of the few African Americans practicing law in Memphis. He recalled in *Jet* magazine, “At that time you were insulted by law clerks, excluded from white bar associations and when I was in court, I was lucky to be called ‘Ben.’ Usually it was just ‘boy.’” In 1949, Hooks met a teacher named Frances Dancy. In 1952 the couple were married.

In 1956 Hooks became a Baptist minister, and he joined the Southern Christian

Leadership Conference (SCLC; an organization that worked to gain equality for African Americans) of Reverend Martin Luther King (1929–1968). He also became a bank director and the cofounder of a life insurance company. After several attempts to be elected to public office, he was appointed to serve as a criminal judge in Shelby County, Memphis, in 1965. He thus became the first African American criminal court judge in the state of Tennessee. The following year he was elected to the same position.

Hooks took part in many civil rights protests. He served on the board of the SCLC and became a life member of the National Association for the Advancement of Colored People (NAACP). He was a leader of many NAACP-sponsored boycotts (protests in which organizers refuse to have dealings with a person, store, or organization in an attempt to get the object of the protest to change its policies or positions) and sit-ins in restaurants that refused to serve African Americans. In spite of his shyness Hooks became a skilled orator (public speaker) whose quick wit and sense of humor delighted audiences. He also served as the moderator (a person who presides over a meeting) of several television shows discussing issues of importance to African Americans.

Federal Communications Commissioner

Hooks was so often in the public eye that Tennessee senator Howard Baker (1925–) submitted his name to President Richard Nixon (1913–1994) for political appointment. Nixon had promised African American voters that they would be treated fairly by the broadcast media. Thus, in 1972 he named Hooks to fill an opening on the board of the

Federal Communications Commission (FCC). Benjamin and Frances Hooks soon moved to Washington, D.C. Frances Hooks served as her husband's assistant, advisor, and traveling companion, giving up her own career as a teacher and guidance counselor. She told *Ebony* magazine, "He said he needed me to help him. Few husbands tell their wives that they need them after thirty years of marriage, so I gave it up and here I am. Right by his side."

The FCC regulated television and radio stations as well as long-distance telephone, telegraph, and satellite communications systems. Hooks felt that his primary role was to bring a minority point of view to the commission. After noticing that only 3 percent of FCC employees were African Americans, and they were generally in low-paying positions, he encouraged the commission to hire more African American workers at all levels. By the time he left the agency, African Americans made up about 11 percent of the employee population. Hooks also urged public television stations to be more responsive to the needs of African American viewers by treating them fairly in news coverage and including programming directed toward them.

NAACP

In 1977 Roy Wilkins, who had been the executive director of the NAACP since 1955, retired. The NAACP board of directors wanted an able leader to take his place. They all agreed that Benjamin Hooks was the man. Hooks resigned from the FCC after five years and officially began his directorship on August 1, 1977.

When Hooks took over the organization, its membership had decreased from half a

million to just over two hundred thousand. Hooks immediately directed his attention toward rebuilding the base of the association through a membership drive. He also spoke out on behalf of increased employment opportunities for minorities and the complete removal of U.S. businesses from South Africa. He told *Ebony* magazine, "Black Americans are not defeated. . . . The civil rights movement is not dead. If anyone thinks we are going to stop agitating, they had better think again." Hooks's leadership of the NAACP was marked by internal disputes. He was suspended by the chair of the NAACP's board, Margaret Bush Wilson (1919–), after she accused him of mismanagement. These charges were never proved. In fact, he was backed by a majority of the sixty-four-member board and continued in the job until retiring in 1993.

Later years

Throughout his career, Benjamin Hooks has stressed the idea of self-help among African Americans. He urges wealthy and middle-class African Americans to give time and resources to those who are less fortunate. "It's time today . . . to bring it out of the closet. No longer can we provide polite, explicable [easily explained] reasons why black America cannot do more for itself," he told the 1990 NAACP convention as quoted by the *Chicago Tribune*. "I challenge black America today—all of us—to set aside our alibis."

After his retirement, Hooks served as pastor of Middle Baptist Church and president of the National Civil Rights Museum, both in Memphis. He also taught at Memphis University. In July 1998, nearly fifty years after Hooks first began practicing law in Memphis, Ten-

nessee governor Don Sundquist (1936–) asked Hooks, along with four others, to serve on a special state Supreme Court to oversee Tennessee's election and retention of appellate court judges. (Appellate courts consider appeals, or hearings to decide whether an error has been made and the decision of a lesser court should be reversed.)

BOB HOPE

Born: May 29, 1903

Eltham, England

American comedian and actor

In addition to his successes on radio, in movies, on television, and in live shows, Bob Hope entertained members of the American military all over the world and made many appearances to benefit different charities.

“Hopeless” childhood

Born in Eltham, England, on May 29, 1903, Leslie Townes Hope was one of Harry and Agnes Townes Hope's seven surviving boys. His father was a stonemason (a construction worker), and his mother had been a concert singer in Wales. By the age of four

Hope was a skilled mimic and loved to sing and dance. In 1908 the family left England and settled in Cleveland, Ohio. For Hope, who looked and sounded British, the adjustment was difficult. Neighborhood kids turned his name around to create the nickname “Hopelessly.” When he shortened his name to Les, they began to refer to him as “Hopeless.” As a result of all this teasing, Hope often got in fights. He developed into a boxer of some skill.

As a youth Hope sold two-cent newspapers on the streets of Cleveland to help his family out. On one occasion a man in a long, black limousine waited while Hope rushed into a nearby store to get change for a dime. When he returned he received a lecture about the importance of keeping change in order to take advantage of all business opportunities. The man in the limousine was John D. Rockefeller (1839–1937), founder of Standard Oil Company and one of the richest men in the world.

Enters show business

As a teenager Hope once said that he would rather be an actor than hold an honest job. He performed whenever possible, mainly dancing and telling the one-line jokes for which he later became famous. He gained experience in an act he formed with a comedian from Columbus, Ohio, named George Byrne. Using the name Lester, Hope went with Byrne to New York City in 1926. They performed in cities and towns throughout the state. They finally appeared in a New York City vaudeville (traveling stage entertainment featuring several different performers) production called “Sidewalks.” They were fired within a month, however.

Hope got his first chance to work as a solo act at the Stratford Theatre in Chicago, Illinois, in 1928. He changed his name to Bob because he felt that would be “chummier” and would look better on a theater sign. Hope always made his audience feel at ease and comfortable by making himself the subject of his humor. He worked hard and succeeded but soon left the Stratford to tour Midwestern cities. From 1920 to 1937 Hope performed in all kinds of shows both on and off Broadway, earning a reputation as a master of the one-liner (a short joke). By 1932 Hope was earning a thousand dollars a week during a time when millions of people were out of work. Still, he was not satisfied. He always wanted to improve and to become an outstanding comic in the business.

Hope and Crosby

Hope met actor and singer Bing Crosby (1904–1977) in 1932, and they started performing together in song and dance routines. Hope met actress Delores Reade in 1933 and later married her. In 1935 Hope joined the “Ziegfield Follies” and performed in cities outside New York. In January 1936 he opened in the “Follies” at New York City’s Winter Garden Theatre. The “Ziegfield Follies” was the musical highlight of Broadway, consisting of beautiful girls and costumes, witty dialogue between the actors and actresses, and music by such great composers as Vernon Duke (1903–1969) and Ira Gershwin (1896–1983).

Although Hope had acted in some short motion picture comedies as early as 1934, he began his feature-length movie career in Hollywood in 1938 with *The Big Broadcast of 1938*, which also starred comedian W. C. Fields (1880–1947). This was the beginning of an active film career for Hope. He went on to

Bob Hope.

appear in fifty-two movies, including six films in the *Road* series (including *The Road to Zanzibar* and *The Road to Rio*), which also featured Crosby and Dorothy Lamour (1914–1996).

Performed for the troops

Hope has always been strongly patriotic. On December 7, 1941, when Japanese attack planes bombed Hawaii’s Pearl Harbor, causing the United States to enter World War II (1939–45; a war in which Germany, Japan, and Italy fought against Great Britain, France, the Soviet Union, and the United States), Hope spoke out against the attack. During a radio broadcast on December 16, Hope declared his

love for his country: "There is no need to tell a nation to keep smiling when it's never stopped. It is that ability to laugh that makes us the great people that we are . . . Americans!"

In 1942 Hope was asked to make an entertainment tour of Alaskan army bases. Hope brought other performers along and put together a variety show for the troops stationed there. That was the beginning of a commitment on Hope's part that has never ended. Every year, especially during the Christmas season, he has led a drive to present shows to American men and women in the armed forces. At the Academy Awards in February 1941, Hope was given a special award for his many benefit performances. He also won honorary (awarded without meeting the usual requirements) Oscars in 1940, 1944, 1952, and 1965.

Later years

Some of Hope's charitable activities involve golf. Hope has played the game all of his life, including with several U.S. presidents. In 1964 he agreed to have the Palm Springs Classic golf tournament renamed The Bob Hope Desert Classic, which he has hosted ever since. Since the administration of Franklin Roosevelt (1882–1945), Hope has appeared many times at the White House. Hope's seventy-fifth birthday party, held in the Washington Kennedy Center, was attended by members of Congress and by many of Hope's acting friends. Another celebration was held at the Kennedy Center in 1983, when Hope turned eighty years old. This time President Ronald Reagan (1911–) and his wife, Nancy (1921–), hosted the celebration. At the celebration Hope showed no signs of slowing down.

In May 1993 NBC celebrated Hope's ninetieth birthday with the three-hour spe-

cial "Bob Hope: The First Ninety Years." The show featured tributes from every living U.S. president at that time. By then, according to *TV Guide*, Hope had made more than five hundred TV shows and seventy movies. Hope concluded his sixty-year contract with NBC in November 1996, when his final special, "Laughing with the Presidents," aired.

The Guinness Book of World Records called Hope the most honored entertainer in the world. By mid-1995 he had received more than two thousand awards, including fifty-four honorary doctorate degrees, *The Saturday Evening Post* reported. In 1998 Hope and his wife Delores announced that they would donate his personal papers and collection of almost 90,000 jokes to the Library of Congress. In June 2000 Hope spent six days in the hospital because of internal bleeding.

**ANTHONY
HOPKINS**

Born: December 31, 1937

Port Talbot, Wales

Welsh actor

Actor Anthony Hopkins worked on stage and in film for over thirty years before receiving his first Academy Award for his performance in *The Silence of the Lambs*.

Humble beginnings

Anthony Hopkins was born in Port Talbot, Wales, on December 31, 1937, the only child of Richard Hopkins, a baker, and his wife Muriel. Hopkins had a difficult childhood; he often felt isolated and lonely. Although he studied piano and could draw well, Hopkins did not excel at Cowbridge Grammar School. The famous actor and fellow Port Talbot native Richard Burton (1925–1984) inspired Hopkins. At the age of fifteen, after getting Burton's autograph, Hopkins decided he wanted to be famous.

Hopkins dropped out of school at age seventeen and enrolled in a drama class at a local YMCA. Skilled at the piano, he earned a scholarship to the Cardiff College of Music and Drama, where he studied for two years. After two years of military service, Hopkins worked in theater. In 1961 he received a scholarship to the Royal Academy of Dramatic Art in London, England. After graduating in 1963, Hopkins worked at several different theaters before applying to the famous National Theatre in 1965. He was invited to join the company and remained a member until 1973.

Personal troubles

As Hopkins's stage and film career began to take off in the 1960s, he became known for his temper—he walked out in the middle of a National Theatre performance of *Macbeth*—and his excessive drinking. Hopkins married actress

Petronella Barker in 1967, but by the time their daughter Abigail was eighteen months old, the couple had split. In 1973 Hopkins married Jennifer Lynton, a film production assistant. In 1974 they moved to New York City, where Hopkins appeared in the Broadway production of *Equus*, once stopping a performance to yell at late-arriving audience members. Hopkins, who continued to drink heavily, then moved to Hollywood, California. After waking up one day in a hotel room in Arizona with no idea how he got there, he quit drinking in 1975.

Hopkins began to accept whatever acting jobs he was offered. From 1975 to 1985 he appeared in over twenty-five movies made for either television or theatrical release. Although he earned two Emmy Awards (in 1976 and 1981), most of the movies he made during this time period, including *Audrey Rose* (1977), *International Velvet* (1978), and *A Change of Seasons* (1980), were less than memorable. In 1985 Hopkins moved back to London and returned to the stage. Over a seventeen-month period he appeared in two hundred performances of two different William Shakespeare (1564–1616) plays. In 1988 he received an honorary (achieved without meeting the usual requirements) degree of Doctor of Letters from the University of Wales. In 1993 he was knighted.

Fame and fortune

In 1991 Hopkins earned an Academy Award for best actor in *The Silence of the Lambs*. He played Dr. Hannibal “The Cannibal” Lecter, a killer known for eating his victims. Although he appeared in only twenty-seven minutes of the movie, this role finally made Hopkins a superstar. After *The Silence of the Lambs*, he acted in four films released in

Anthony Hopkins.

Reproduced by permission of AP/Wide World Photos.

1992 and five in 1993. His most noticed film was *The Remains of the Day* (1993), for which he was nominated (put forward for consideration) for another Academy Award for his role as Stevens, the reserved butler.

Hopkins also earned Academy Award nominations for his performances as two U.S. presidents: Richard Nixon (1913–1994) in *Nixon* (1995), and John Quincy Adams (1767–1848) in *Amistad* (1997). Hopkins was now earning over five million dollars per movie. After filming *Titus* (1999), he took a year off. In April 2000 he became an American citizen. In 2001 he returned to the role of Hannibal Lecter in *Hannibal*. He then

resumed his usual work pace, appearing in several films including *Hearts in Atlantis* (2001) and *Bad Company* (2002). He also volunteered to teach a class at the Ruskin School of Acting in Santa Monica, California.

Hopkins has changed little since his time in Port Talbot. He is still a loner, taking long trips in his car by himself to relax. He has continued to push himself, but he has also learned not to push too hard. He told *Vanity Fair* magazine, “It can’t get better than this. Years ago I wanted to be rich and famous, and it all happened to me. . . . They pay me a lot of money, more money than I ever dreamed of. It just cannot get better than this.”

LENA HORNE

Born: June 30, 1917

Brooklyn, New York

African American singer

Lena Horne is known as one of the most popular African American entertainers of the twentieth century. A woman of great beauty and commanding stage presence, she performed in nightclubs, concert halls, movies, and on radio and television.

Lena's early years

Lena Horne was born in Brooklyn, New York, on June 30, 1917. Her father, Edwin "Teddy" Horne, who worked in the gambling trade, left the family when Lena was three. Her mother, Edna, was an actress with an African American theater troupe and traveled extensively. Horne was mainly raised by her grandparents, Cora Calhoun and Edwin Horne. Yet, she still moved a great deal in her early years because her mother often took her with her on the road. They lived in various parts of the South before Horne was returned to her grandparents' home in 1931. After they died, Horne lived with a friend of her mother's, Laura Rollock. Shortly thereafter Edna remarried and Horne moved in with her mother and her mother's new husband. The constant moving resulted in Lena having an education that was often interrupted. She attended various small-town, segregated (separated by race) schools when in the South with her mother. In Brooklyn she attended the Ethical Cultural School, the Girls High School, and a secretarial school.

From an early age Horne had ambitions of becoming a performer—much against the wishes of her family, who felt she should have higher goals. The Hornes were an established middle class family, with several members holding college degrees and distinguished positions in organizations such as the National Association for the Advancement of Colored People (NAACP) and the Urban League (a group that worked to increase the economic and political power of minorities and to end discrimination based on race). Nonetheless, Horne pursued her own course and at age sixteen was hired to dance in the chorus at Harlem's famed Cotton Club. In

Lena Horne.

1934 Lena took voice lessons, and she also landed a small role in an all-black Broadway show *Dance with Your Gods*. In 1935 she became the featured singer with the Noble Sissle Society Orchestra, which performed at many first-rate hotel ballrooms and night-clubs. She left Sissle in 1936 to perform as a "single" in a variety of New York City clubs.

Experiences unequal treatment because of race

In 1937 Horne married minor politician Louis Jones, by whom she had a daughter, Gail, and a son, Edwin (they separated in

1940 and divorced in 1944). She gained some early stage experience in Lew Leslie's revues, *Blackbirds of 1939* and *Blackbirds of 1940*, and in 1940 she joined one of the great white swing bands, the Charlie Barnet Orchestra. But as the group's only black member she suffered many humiliations of racial prejudice, especially from hotels and restaurants that catered exclusively to whites.

Horne left Barnet in 1941. Her career received an immediate boost from entertainment manager John Hammond, who got her a long engagement at the famous Cafe Society Downtown, a club in New York City. It was at the Cafe Society that Horne learned about African American history, politics, and culture and developed a new appreciation of her heritage. She rekindled her acquaintance with Paul Robeson (1898–1976), whom she had known as a child. Horne's conversations with Robeson made her realize that the African American people were going to unify and make their situations in life better. She felt she needed to be a part of that movement. From that point onward, Horne became a significant voice in the struggle for equality and justice for African Americans in the United States.

Film career begins

In 1943 a long booking at the Savoy-Plaza Hotel, which brought Horne national coverage and a number of movie appearances, established her as the highest-paid African American entertainer in the United States. She was signed to a seven-year contract with the movie studio Metro Goldwyn Mayer (MGM)—the first African American woman since 1915 to sign a term contract with a film studio. She was not dark enough in color to star with many of the African American actors

of the day and her roles in white films were limited, since Hollywood was not ready to portray interracial relationships on screen.

Given these harsh limitations imposed on African Americans in 1930s and 1940s Hollywood movies, Horne's film career is impressive. After singing roles in *Panama Hattie* (1942), *Harlem on Parade* (1942), *I Dood It* (1943), *Swing Fever* (1943), and *As Thousands Cheer* (1943), she was given a starring role in an all-black story, *Cabin in the Sky* (1943), which also starred her idol, Ethel Waters (1900–1977). Another major role followed in *Stormy Weather* (1943) and then some nonspeaking roles in *Broadway Rhythm* (1944), *Two Girls and a Sailor* (1944), and a musical biography of Rodgers and Hart, *Words and Music* (1948). She refused to take on any roles that were disrespectful to her as a woman of color.

Works for civil rights

Horne, despite her great fame, continued to experience humiliating racial discrimination (wrongful treatment because of race), and in the late 1940s she sued a number of restaurants and theaters for race discrimination and also began working with Paul Robeson in the Progressive Citizens of America, a political group opposing racism. During World War II (1939–45; a war in which Germany, Italy, and Japan fought against France, Great Britain, China, the Soviet Union, and the United States), she used her own money to travel and entertain the troops. She also assisted Eleanor Roosevelt (1884–1962) in her mission for antilynching legislation (laws making it illegal to hang a person accused of a crime without a trial). After the war Horne worked on behalf of Japanese Americans who faced discrimination.

In 1947 she married a white bandleader, Lennie Hayton, a marriage that was kept secret for three years because of racial pressures. Until his death in 1971, Hayton was also her pianist, arranger, conductor, and manager.

In the mid-1950s Horne made a movie appearance in *Meet Me in Las Vegas* (1956) and recorded for the first time in five years. In 1957 she drew record crowds to the Empire Room of the Waldorf-Astoria, and in 1958 and 1959 she starred in a Broadway musical, *Jamaica*.

During the 1960s Horne was involved in the American Civil Rights Movement. She participated in the March on Washington in 1963, performed at rallies in the South and elsewhere, and worked on behalf of the National Council for Negro Women. During the same period, she was also very visible on television, appearing on popular variety shows and in her own special, *Lena in Concert*, in 1969. In 1969 Horne starred in the movie *Death of a Gunfighter*.

Personal tragedy and continuing success

Lennie Hayton's death in 1971, which followed the deaths of Horne's father and her son, plunged her into a state of depression from which she emerged seemingly more determined than ever. In 1973 and 1974 she toured England and the United States with Tony Bennett (1926–), and in 1979 she was billed with composer Marvin Hamlisch at the Westbury (New York) Music Fair.

In 1981 Horne had her greatest triumph, a Broadway show called *Lena Horne: The Lady and Her Music*, which was the talk of show business for fourteen months. It won a special Tony award, and the soundtrack won two Grammy awards.

In the 1990s Horne cut back on performing. She was drawn back from semiretirement to do a tribute concert for a long-time friend, composer Billy Strayhorn, at the JVC Jazz Festival. At age seventy-six she released her first album in a decade, *We'll Be Together Again*. In 1997, on the occasion of her eightieth birthday, Horne was honored at the JVC Jazz Festival with a tribute concert and the Ella Award for Lifetime Achievement in Vocal Artistry. In 1999 she was honored at the New York City's Avery Fisher Hall with an all-star salute.

Lena Horne is an amazing woman. Her pride in her heritage, her refusal to compromise herself, and her innate elegance, grace, and dignity has made her a legendary figure. Her role as a person who has helped to improve the status of African Americans in the performing arts has provided a permanent legacy.

HARRY HOUDINI

Born: March 24, 1874

Budapest, Hungary

Died: October 31, 1926

Detroit, Michigan

Hungarian-born American magician

Magician, actor, and stage personality Harry Houdini—The Great Houdini—was the greatest escape artist of all time. He often said, “No prison can hold me; no hand or leg irons or steel locks can shackle me. No ropes or chains can keep me from my freedom.”

Early life

Although Harry Houdini claimed to be born on April 6, 1874, in Appleton, Wisconsin, the fact was that Erich Weiss, born March 24, 1874, in Budapest, Hungary, was the youngest of three sons of Rabbi Samuel and Cecilia (Steiner) Weiss (who also had a daughter, Gladys). To find a better life, the Weiss family left Hungary and settled in Appleton. “Perhaps April 6 was the date Samuel Weiss arrived in Wisconsin,” remarked Ruth Brandon in her *The Life and Many Deaths of Harry Houdini*. Other moves took the Weisses to Milwaukee, Wisconsin, and New York.

Erich was devoted to his mother and sought ways to ease her hard life. At one point he took to begging for coins in the street. He hid the coins in his hair and clothing, then presented himself to his mother and said, “Shake me, I’m magic.” She did, and a flood of coins spilled out. The family remained poor, however. Erich began selling newspapers and shining shoes at the age of eight to help out.

Erich was also very interested in magic. After serving as a young circus acrobat (“Erich,

Prince of the Air”), he began to study locks and how to “pick” them, or open them using a tool other than a key. He worked as a necktie cutter in a garment factory to earn money to support his hobby. At age seventeen Erich entered show business, taking the stage name Houdini after the nineteenth-century French magician Robert-Houdin. (“Harry” was an Americanized version of Erich.) By age twenty Houdini had married Wilhelmina Beatrice Rahner (known as Bess), who became his partner onstage as well.

Show business success

As “Mysterious Harry and La Petit Bessie,” the Houdinis played amusement parks and music halls, and they even toured with a circus for a time. When response to their escape tricks and magic was poor, they performed a comedy act, stealing old jokes from magazines. During these early years, Harry would often perform his “Hindoo Needle Trick,” in which he appeared to swallow forty needles before drawing them from his mouth, all threaded together. Bess performed as a mind reader, using a code of numbers and letters known to her and Harry. In 1895, in Massachusetts, Houdini first thought up the idea of escaping not from his own handcuffs, but from those of the local police. These stunts brought free publicity, which increased Houdini’s popularity.

Houdini’s American tours were followed by successful appearances in Europe. With success came imitators, as anyone could buy a version of the Hindoo Needle Trick. (Houdini himself had purchased it.) Houdini worked hard to stay ahead of the pack. He began performing escapes from straitjackets, jails, coffins, handcuffs, and shackles (something

that confines the arms or legs). At each performance he invited police officials onstage to examine him and his props to make sure they were real. Except, with his skill as a magician, he was still able to hide things. As Brandon wrote, “When he had to strip naked, he sometimes hid a small pick in the thick skin on the sole of a foot—not a spot that would ordinarily be searched.” In 1908 Houdini began performing a trick in which he was locked inside a large iron milk can filled with water. He could escape within three minutes.

In June 1918 Houdini made his move into film, playing a character called the Master Detective. In this series of stories the detective, named Quentin Locke, saved women from danger through great stunts, and of course, great escapes. Both the stories and the performances were weak, but the films showed Houdini the way his public wanted to see him. Each magic routine or stunt was shown as “real,” with no camera tricks helping out the Master Detective.

The spirit world calls

Steve and Patricia Hanson related in a *Los Angeles* magazine article that Houdini became interested in “making contact with those who had gone beyond” after his mother’s death in 1913. His attempts in this area brought him into contact with writer Sir Arthur Conan Doyle (1859–1930), the creator of the Sherlock Holmes character. In 1908, as a publicity stunt, Houdini had written a letter to “Holmes,” asking for help in catching crooks who were stealing his tricks. By 1920 the two men had formed a friendship based on their talent and their grief—just as Houdini had lost his beloved mother, Doyle had lost his son, Kingsley, who had been killed in World

Harry Houdini.

Reproduced by permission of Archive Photos, Inc.

War I (1914–18; a war in which Germany, Austria-Hungary, and Japan fought against Great Britain, France, Russia, and the United States). Each man sought ways to make contact with the spirit world.

After a while the friendship began to weaken. Houdini was not as strong a believer as Doyle. Part of Houdini’s career was devoted to exposing fakes who pretended to be able to contact spirits. As the Hansons noted in *Los Angeles*, Houdini felt that Doyle was too blinded by grief to see clearly, and Doyle thought that Houdini was not open-minded enough and was too anxious to expose fraud. The two men’s friendship ended.

The passing of a legend

No evidence of real contact with Houdini's mother was ever recorded, but her death haunted Houdini until the occasion of his own passing. Even that event has since been clouded by the myths that always seemed to accompany him. For instance, a feature film of Houdini's life released in 1953 showed him dying in one of his own watery coffins during a performance. There were many other incorrect stories describing his death.

What really happened was that Houdini, while on tour in Montreal, Canada, was relaxing backstage where some college students came to see him. Houdini often challenged people to punch him in the stomach with all their strength, and he agreed to let one of the students take a swing. But the punch came while Houdini was lying on a couch, before he had prepared for the impact. An injury to the appendix resulted. Left untreated for several days, it turned into an infection that struck Houdini down during a performance in Detroit, Michigan. Rushed to a hospital, he held on for a few days before dying in his wife's arms on October 31, 1926—Halloween day.

Even in death Houdini knew how to create publicity. His widow made headlines by announcing that every year on the anniversary of his death she was going to try to make contact with his spirit. This went on for some ten years, and though Bess once claimed that contact was made, she later changed her story. Houdini continues to live on in the public's imagination. After a lifetime of pretending to have mythic talents, Houdini became a myth himself.

**GORDIE
HOWE**

Born: March 31, 1928
Floral, Saskatchewan, Canada
Canadian hockey player

Former professional hockey player Gordie Howe earned the fame of being the most durable player of all time, playing twenty-six seasons for five decades in the National Hockey League. During that time, he was one of the game's most productive scorers.

Howe's youth in Canada

Gordie Howe was born in Floral, Saskatchewan, Canada, on March 31, 1928.

He was the fifth of nine children. At three months of age his family moved to nearby Saskatoon, where his father worked as a mechanic, a laborer, and a construction worker to support his family. The family was poor, as were many of their neighbors during the Great Depression (a period in the 1930s where economic hardship led to a lack of jobs, and the majority of the people in the United States and Canada were living in poverty). As a result Gordie was often sick as a child because of poor nutrition. He was also painfully shy and awkward—a problem that he would face throughout his adulthood. Gordie's significant moment came when a neighbor sold a sack of used belongings to his mother for cash. When they opened the bag, the first thing that he saw was a pair of skates. Five-year-old Gordie had received his first pair of skates.

Devoted to hockey

Howe immersed himself in hockey, playing day in and day out throughout the year, using a puck, a tennis ball, or even clumps of dirt. He was a big boy but was clumsy in his youth. He did not make it the first time he tried out for a local youth hockey team. By the time he was twelve years old, however, Howe had developed into an excellent skater.

During the summers, Howe worked with his father at construction sites. He described it as “throwing concrete.” The heavy work helped him develop the exceptional strength that he would one day use to make himself one of the fastest shots in hockey. At the age of fifteen Howe was a 6-foot, two-hundred-pounder, very big at that time for a hockey player.

Pro tryouts

Howe had already caught the eye of the professional scouts (people who gather information about players not yet in professional sports). When he was fifteen, the New York Rangers invited him to a tryout camp. The camp director, though, was unimpressed. He felt Howe was too awkward and would not make it in the major leagues. Despite this rejection, Howe landed a tryout with the Detroit Red Wings the next year. Jack Adams, coach and general manager of the team, was definitely impressed by young Howe and signed him to a contract.

Howe, then seventeen years old, was assigned to the Red Wings' minor league farm team in Omaha, Nebraska. He had an excellent season, and the next year he was given a shot at making the major-league club. He made the Red Wings, and in his first game gave a sample of what was to come. He scored a goal, skated tirelessly, and had perfect control. His goal came in the second period, and he literally powered his way through the players from the blue line to make the goal.

It took Howe three seasons to “mature” as a professional. He scored a total of thirty-five goals those first three years. From that point on, Howe was a consistent scorer. Starting in 1949 and 1950, Howe was one of the NHL's top scorers, which he continued to be for two decades.

A serious accident

In 1950, though, Howe's career almost came to an abrupt end. In the first playoff game against the Toronto Maple Leafs, Howe collided with Toronto's Ted Kennedy and flew

Gordie Howe.

Reproduced by permission of AP/Wide World Photos.

head first into the sideboards. His skull was fractured and he suffered a concussion (a brain injury caused by a hard blow). He also had his cheekbone and nose broken. In the hospital, surgeons had to operate to relieve the pressure on his brain. He was in critical condition for days.

The next season Howe came back. The question was, would he still have the same fire and aggressiveness that he had before? Howe responded by playing in every game and by leading the NHL in goals, assists, and total points that season.

League leader

Leading the league in scoring became a regular occurrence for Howe. He won the scoring title six times. He was selected the NHL's Most Valuable Player six times. Howe's development as a star also led to his team's development as consistent winners. From 1949 to 1955 the Detroit Red Wings won the league title seven straight times, and they were Stanley Cup playoff champions four times.

In 1951 Howe met Colleen Joffa, and in 1953 the two were married. They would eventually have four children: Martin, Mark, Cathy, and Murray. The boys soon became involved in youth hockey.

Throughout his career Howe was a supporter of self-defense on the ice to avoid getting hurt. He was a feared figure on the ice. He had sharp elbows and a quick stick. Some thought him to be sneaky and players kept out of his way. Howe was everything one would expect the ideal athlete to be: he was intelligent, demanding, and hardworking. He was not a person to take any abuse from other players. If they tried to intimidate him, they ended up on the "short end of the stick." His number one goal was to play good, hard hockey.

With the flying elbows and flying pucks that come with hockey, and no helmets at the time, facial cuts and stitches were common in the game. Howe estimated that he had received three hundred stitches in his face.

Joined his sons

Howe surpassed Maurice "Rocket" Richard's (1921–2000) scoring record in 1963. By the time he retired from the Red

Wings in 1971 at the age of forty-three, he held the records for goals, assists, and total points. He also had the record for most games played. He accepted a job in the team's front office. But in 1973, when the Houston Aeros of the new World Hockey Association (WHA) signed his sons Marty and Mark, Howe asked about joining them. Playing on the same professional team as his sons had been a dream. He got himself back into shape and returned triumphantly, scoring one hundred points, winning the league's Most Valuable Player award, and leading his team to the WHA championship.

Howe continued to play in the WHA through 1977. He moved to the Hartford Whalers and when that team was combined into the NHL in 1978, he was back for a second tour of duty in his old league. Howe's autobiography, *And . . . Howe!: An Authorized Autobiography* was published in 1995. He continued to make special appearances playing in charity games well into the 1990s.

In September of 1997, at the age of sixty-nine, Howe announced he would play one game, the October 3 season opener, with the International Hockey League's Detroit Vipers. His one-shift stint made him the only professional hockey player to play in six different decades.

The Howes continue to be involved in charitable activities and live an active lifestyle. In 2001 the couple was honored when a school in Abbotsford, Canada, was named the Colleen and Gordie Howe Middle School. In January 2002 they carried the Olympic torch through Detroit, Michigan, for the 2002 Winter Olympics.

Best hockey player of all time?

When Gordie Howe broke Maurice "Rocket" Richard's National Hockey League (NHL) scoring record, the debate was whether Richard or Howe was the best player of all time. Years later when Wayne Gretzky (1961–) broke Howe's record, the debate was renewed—this time Gretzky versus Howe. The debate still continues.

JULIA WARD HOWE

Born: May 27, 1819

New York, New York

Died: October 17, 1910

Newport, Rhode Island

American author and reformer

Julia Ward Howe, American author and reformer, wrote the words for "The Battle Hymn of the Republic." She was also a ground-breaking activist in the pursuit of women's right to vote.

Julia Ward Howe.
Courtesy of the Library of Congress.

Growing up in New York

Julia Ward Howe was born Julia Ward in New York City on May 27, 1819. She was the fourth of seven children of a successful Wall Street banker. When Howe was five years old, her mother died. Because of her father's conservative nature, she was limited in her socializing. Eventually Howe was introduced to New York society, and her charm made her an instant favorite.

Shortly after Howe turned twenty, her father also died. She then moved to Boston in hopes of recovering from her loss. In 1843 she married Samuel Gridley Howe (1801–1876), a physician, pioneer teacher of the

blind, and reformer. Although some of her Boston friends included poet Henry Wadsworth Longfellow (1807–1882) and essayist Ralph Waldo Emerson (1803–1882), she found Boston society cold and uninviting. About the same time, Howe's views of a woman's role in society began to change. She became outspoken and oftentimes voiced her opinion, although it was not common for women to do so at the time.

A literary career

While in Boston the Howes edited the *Commonwealth*, an antislavery paper. Howe's first book, a collection of poems, was published in 1854. Afterwards she wrote many volumes of verse, travel descriptions, and essays. None was so popular as her patriotic song, "The Battle Hymn of the Republic," which she composed in a tent one night after visiting military camps during the American Civil War (1861–65; a war fought in the United States between the northern states and the southern states that resulted in the end of slavery in the country). During the war Howe was a strong supporter of the northern states and their antislavery stand. Because of the song she wrote based on her wartime beliefs, she became one of the best-known and most widely honored women in America.

Meanwhile other conflicts drove her to take action in support of peace. As a Francophile, or supporter of France, she was horrified by the Franco-Prussian War (1870–71; a war between France and Prussia, or states that made up what is today Germany). This antiwar view led Howe to become president of the American Branch of the Woman's International Peace Association in 1871.

The women's movement

After the American branch of the peace association failed, Howe began working to concern the nation's women on issues concerning the homefront. She helped found the New England Woman's Club in 1868. That same year she organized the New England Woman Suffrage Association and later the American Woman Suffrage Association. (Suffrage is the right to vote.) These two groundbreaking associations pushed for a woman's right to vote in America.

New York feminists (fighters for women's rights), led by Susan B. Anthony (1820–1906) and Elizabeth Cady Stanton (1815–1902), wanted the cause to embrace many social and political issues, from marriage questions to labor unions. More conservative Boston feminists, including Howe and Lucy Stone (1818–1893), focused on women's rights alone. The conservative Boston feminists encouraged men to join the movement, whereas the New Yorkers believed that men limited the organization's efforts. For more than twenty years these differences divided the movement into two organizations: the American Woman Suffrage Association and the Stanton-Anthony National Woman Suffrage Association.

Eventually the National came around to the American's point of view, and the two associations united in 1890 as the National American Woman Suffrage Association. Although Howe's careful strategy was adopted, it was another thirty years before women were given the right to vote under the Nineteenth Amendment to the Constitution, in 1920.

In 1908 Howe was the first woman elected to the American Academy of the Arts and Letters, an organization for famed artists and writers. She died on Oct. 17, 1910, in

Newport, Rhode Island. She is remembered chiefly for "The Battle Hymn," in some ways the least of her accomplishments. Yet there is justice in this. She wrote it to help free the slaves, and later it became the anthem of the women's suffrage movement. Even later it was used by civil rights workers. In 1968, when the funeral train for Senator Robert Kennedy (1925–1968) carried his body from New York City to Washington, D.C., "The Battle Hymn" was sung by mourners.

HOWARD HUGHES

Born: December 24, 1905

Houston, Texas

Died: April 5, 1976

Houston, Texas

American entrepreneur and inventor

Howard Hughes was a colorful and flashy businessman and inventor who used an inherited fortune to achieve a national reputation in the motion picture and aviation industries.

Childhood

Howard Robard Hughes was born in Houston, Texas, on December 24, 1905, the only child of Howard Robard Hughes and Alene Gano Hughes. His father earned millions by inventing special machinery for the oil industry. He attended private schools in California and Massachusetts and was very inventive as a child. At the age of twelve he made a radio transmitter out of an electric doorbell, and later he made a self-starting motor for his bicycle. At the age of fourteen he made his first airplane flight.

Hughes then attended the Rice Institute in Houston, and the California Institute of Technology. His mother died when Hughes was sixteen and his father just two years later, leaving him an orphan with an estate worth \$871,000 and a patent (right to ownership) for a drill bit used in most oil and gas drilling that brought large revenues to the family's Hughes Tool Company, manufacturers of the bit.

The movie business

Hughes left school to take control of the company, using its profits to finance a variety of projects, which he hoped would make him a legend in his own time. In 1925, at age twenty, Hughes married Ella Rice and moved to Los Angeles, California, (they separated in 1928). In 1927 Hughes entered the motion picture business and produced such films as

Scarface (1932), and *The Outlaw* (1941), and the box-office smash *Hell's Angels* (1930). He discovered actors Jean Harlow (1911–1937) and Paul Muni and made Jane Russell (1921–) a well-known star.

While living in Hollywood, California, the multimillionaire movie producer led a relatively quiet lifestyle. He lived in small apartments or rented homes and rarely participated in Hollywood's social world of the rich and famous.

Aviation

In 1928 Hughes obtained a pilot's license. His interest in aviation (flying) led him to found the Hughes Aircraft Company in Glendale, California, in 1932 and to design, build, and fly record-breaking airplanes. He set a world speed record in 1935, transcontinental (crossing a continent) speed records in 1936 and 1937, and a world flight record in 1938. Hughes was honored with the Harmon Trophy and a New York City ticker-tape parade after his world flight. He was awarded the Collier Trophy in 1939, the Octave Chanute Award in 1940, and a Congressional Medal in 1941.

In 1939 Hughes began work on an experimental military aircraft, and in 1942 he received a contract to design and build the world's largest plane, a wooden seaplane, later nicknamed the "Spruce Goose." It was supposed to serve as a troop carrier in World War II (1939–45).

Hughes suffered a nervous breakdown in 1944 and was critically injured in the crash of his experimental military plane in 1946, but he recovered and flew the huge seaplane the next year. As a result of these aviation activi-

ties, Hughes became a popular public figure because his image represented the traditional American qualities of individuality, daring, and imagination. He was named to the Aviation Hall of Fame in 1973.

The Hughes Aircraft Company became a major defense contractor after World War II. As the profits of the company increased, Hughes became obsessed with avoiding taxes and in 1953 created the Howard Hughes Medical Institute as a sophisticated tax shelter to which he transferred the profits of the aircraft company. In 1956 Hughes loaned \$205,000 to future President Richard Nixon's (1913–1994) brother Donald in a successful effort to influence an Internal Revenue Service (IRS) ruling on the medical institute. Hughes made secret contributions of \$100,000 to the successful Nixon presidential campaign in 1970 and was able to prevent enforcement of the Tax Reform Act against the medical institute. Hughes continued to use profits from the tool company for other ventures, including the creation of Trans World Airlines (TWA), in which he had begun investing in 1939.

Life in seclusion

In 1950 Hughes began a strange life of isolation, beginning a lifestyle which would ultimately turn him into a recluse (one who retreats from the world), although he did marry actress Jean Peters in 1957, divorcing her in 1971. Hughes refused to appear in court or even give a statement, and in a 1963 antitrust case over his ownership of 78 percent of TWA, his failure to appear resulted in a ruling that led him to sell his holdings in 1966. The \$566 million received from this sale was invested by Hughes in hotels, gambling casi-

*Howard Hughes.
Courtesy of the Library of Congress.*

nos, golf courses, a television station, an airport, and land in Las Vegas, Nevada. In 1972 the Hughes Tool Division, the basis of the Hughes fortune, was sold. The holding company was renamed Summa Corporation and its headquarters relocated to Las Vegas, where Hughes had moved his residence.

From this point on Hughes's career accomplishments were minimal. His obsession to control every aspect of his environment turned him into a recluse. He was seen only by a few associates and remained isolated from the operations of his company. In 1970 he left the United States, and moved from place to place—the Bahamas, Nicaragua, Canada, Eng-

land, and Mexico. He always arrived unannounced in luxury hotels and took extreme precautions to ensure privacy. Hughes saw only a few male aides, worked for days without sleep in a black-curtained room, and became emaciated (thin from starvation) from the effects of his diet and the excessive use of drugs.

Hughes's concern for privacy ultimately caused controversy, resulting in a scandal over his supposed memoirs (writings of personal experiences) by author Clifford Irving that sold for \$1 million before being proven to be fake. The Hughes conglomerate (a group of diverse businesses) became involved with the Central Intelligence Agency (CIA), and in 1975, built an undersea exploratory drilling ship which was actually used by the CIA to attempt to recover a sunken Soviet (Russian) submarine. The company retained a Washington, D.C., public relations firm that was also involved with the CIA, which led the Hughes corporation to become involved in the "Watergate" affair, a scandal that ultimately led to the resignation of President Nixon in 1973.

Hughes died on April 5, 1976, on an airplane that was taking him from Acapulco, Mexico, to a hospital in Houston for medical attention. Hughes was controversial even after his death. Several wills appeared, one of which was found in the Mormon church in Salt Lake City, Utah, but all were later declared to be forgeries.

LANGSTON HUGHES

Born: February 1, 1902

Joplin, Missouri

Died: May 22, 1967

New York, New York

African American poet and playwright

American author Langston Hughes, a moving spirit in the artistic movement of the 1920s often called the Harlem Renaissance, expressed the mind and spirit of most African Americans for nearly half a century.

Early life

Langston Hughes was born in Joplin, Missouri, on February 1, 1902, to Carrie M. Langston and James N. Hughes. His parents separated soon after his birth, and Hughes was raised mainly by his mother, his grandmother, and a childless couple, the Reeds. He attended public schools in Kansas and Illinois and upon graduating elementary school, Hughes was named class poet, although he had never even written a poem. That title sparked an interest in writing poetry.

Hughes graduated from high school in Cleveland, Ohio, in 1920. His high school companions, most of whom were white, remembered him as a handsome “Indian-looking” youth whom everyone liked and respected for his quiet, natural ways and his abilities. He won an athletic letter in track and held offices in the student council and the American Civic Association.

In high school Hughes was introduced to the works of poet Carl Sandburg (1878–1967), another poet from the Midwest. Also at this time, Hughes himself began writing poetry and developing his unique style. He began submitting his work to magazines, but all were rejected.

A career begins

Hughes spent the year after high school in Mexico with his father, who tried to discourage him from writing. But Hughes’s poetry and prose (writings) were beginning to appear in the *Brownie’s Book*, a publication for children edited by W. E. B. Du Bois (1868–1963), and he was starting work on more ambitious material for adult readers. The poem “A Negro Speaks of River,” which marked this development, appeared in the *Crisis* magazine in 1921.

Hughes returned to America and enrolled at Columbia University in New York City. Meanwhile, the *Crisis* printed several more of his poems. Finding the atmosphere at Columbia unfriendly, Hughes left after a year. He took on odd jobs in New York, and in 1923 he signed on to work on a freighter (a large ship). His first voyage took him down the west coast of Africa; his second took him to Spain. In 1924 he spent six months in Paris, France. He was relatively happy, pro-

Langston Hughes.

Reproduced by permission of AP/Wide World Photos.

duced some prose, and experimented with what he called “racial rhythms” in poetry. Most of this verse (poetry) appeared in African American publications, but *Vanity Fair*, a magazine popular among middle- and upper-class women, published three poems.

Later in 1924 Hughes went to live with his mother in Washington, D.C. He hoped to earn enough money to return to college, but work as a hotel busboy paid very little, and life in the nation’s capital, where racial tensions were fierce, made him unhappy. But he was able to write many poems. “The Weary Blues” won first prize in 1925 in a literary competition sponsored by *Opportunity*, a magazine

published by the National Urban League. That summer one of his essays and another poem won prizes in the *Crisis* literary contest. Meanwhile, Hughes had come to the attention of Carl Van Vechten, a novelist and critic, who arranged publication of Hughes's first volume of poetry, *The Weary Blues* (1926).

This book projected Hughes's lasting themes, established his style, and suggested the wide range of his poetic talent. It showed him committed to racial themes—pride in blackness and in his African heritage, and the everyday life of African Americans—and democracy (government ruled by the people) and patriotism (the support of one's country). Hughes transformed the bitterness which such themes generated in many African Americans of the day into sharp irony and humor. His casual, folklike style was strengthened in his second book, *Fine Clothes to the Jew* (1927).

A literary success

Hughes had resumed his education in 1925 and graduated from Lincoln University in 1929. *Not without Laughter* (1930) was his first novel. The story portrays an African American boy, Sandy, caught between two worlds and two attitudes. The boy's hard-working and respectable mother provides a counterpoint to his energetic, easygoing, footloose father. The mother is oriented to the middle-class values of the white world; the father believes that fun and laughter are the only things worth pursuing. Though the boy's character is blurred, Hughes's attention to the details of African American culture in America gives the novel insight and power.

The relative commercial success of *Not without Laughter* inspired Hughes to make his living as an author. In 1931 he made the first

of what became annual lecture tours. The following year he took a trip to the Soviet Union, the former country that today consists of Russia and other smaller nations. Meanwhile, he turned out poems, essays, book reviews, song lyrics, plays, and short stories. He edited five books of African American writing and worked with Arna Bontemps on another and on a book for children. He wrote some twenty plays, including "Mulatto," "Simply Heavenly," and "Tambourines to Glory." He translated Federico Garcia Lorca, the Spanish poet, and Gabriela Mistral (1889–1957), the Latin American Nobel laureate poet, and wrote two long autobiographical works (a biography about oneself).

As a newspaper columnist for the *Chicago Defender*, Hughes created "Simple." This enduring character brought his style to perfection and solidified his reputation as the "most eloquent [fluent and persuasive] spokesman" for African Americans. The sketches of Simple, collected in five volumes, are presented as conversations between an uneducated, African American city dweller, Jesse B. Semple (Simple), and an educated but less sensitive African American friend. The sketches that ran in the *Defender* for twenty-five years are varied in subject and remarkable in their relevance to the universal human condition. That Simple is a universal man, even though his language, habits, and personality are the result of his particular experiences as an African American man, is a measure of Hughes's genius.

Hughes received numerous fellowships (scholarships), awards, and honorary degrees, including the Anisfield-Wolf Award (1953) for a book on improving race relations. He taught creative writing at two universities;

had his plays produced on four continents; and made recordings of African American history, music commentary, and his own poetry. He was elected to the American Academy of Arts and Sciences and to the National Institute of Arts and Letters. His work, some of which was translated into a dozen languages, earned him an international reputation. Forty-seven volumes bear Hughes's name. He died in New York City on May 22, 1967.

VICTOR HUGO

Born: February 26, 1802
Besançon, France

Died: May 22, 1885

Paris, France

French author

The French author Victor Hugo, is regarded by many as the supreme poet of French romanticism (a style in the 1800s that emphasized a free form of writing and expressed strong emotions, experiences of common people, and imaginative expressions and passion). He is known for producing large amounts of work, the ability to easily write poetry or novels, and his incredible vision.

Hugo's early years

Victor Marie Vicomte Hugo was born in Besançon, France, on February 26, 1802, to Joseph Leopold Sigisbert Hugo and Sophie Trebuchet. He and his two older brothers, Abel and Eugène, lived with their mother in Paris, France, while their father, a general and the governor of the Italian province of Avelino, lived in Italy. Hugo's mother had a special friendship with General Victor Fanneau Lahorie, who became an enemy of the French government. She let him hide in their house, and it was during this time he became a teacher for the Hugo boys. The boys frequently traveled to see their father and these trips caused breaks in their education. As a young boy, Hugo showed an interest in writing poetry. When he was twelve years old, Victor and his brothers were sent to school at the Pension Cordier. There they studied the sciences and spent their leisure time writing poetry and plays. When Victor was fifteen, he won the poetry contest held by the Académie Française and the next year placed first in the Académie des Jeux Floraux's contest. Victor's

reputation as a poet developed early in his life, and he received a royal salary in 1822.

In 1822 Hugo married his childhood sweetheart, Adèle Foucher, one and a half years after the death of his mother, who had opposed their marriage. The couple later had four children. Their apartment in Paris became the meeting place for the ambitious writers of the Romantic Movement. In 1822 Hugo also published his first signed book, *Odes et poésies diverses*.

Development of romanticism

In 1824 a few of Hugo's friends began a group called Muse française. All were young writers who were beginning to break with neoclassicism (a style of writing that was based on the styles of ancient Greece and Rome in which logical, clear, and well-ordered writing was valued). After his visit to Alphonse de Lamartine (1790–1869) and his discovery of German balladry (putting stories to music in an artistic way), in 1826 Hugo published *Odes et ballades*, in which his rejection of neoclassicism was clear.

The years 1826 and 1827 were successful ones for the Cénacle, the name given to a group of young romantics who were supporters of Hugo and his poetry. They called him the “prince of poets.” Hugo stopped writing flattering odes (poems that express positive emotions and feelings about people or events) to King Charles X (1757–1836) and instead began praising Napoleon I (1769–1821). With the support and advice of friends, Hugo created the attitude of romanticism. This belief was expressed in the preface to his unproduced play, *Cromwell*, published in October 1827. He felt that poetry should follow nature, mixing the beautiful and the good

with the ugly and the displeasing. The Bible, Homer (c. ninth century B.C.E.), and William Shakespeare (1564–1616) were the inspirational sources of his new literature.

Convinced that romanticism must prove itself in the theater, Hugo followed *Cromwell* with a number of other plays. On February 25, 1830, the famous “battle of Hernani” took place, with Hugo's supporters out shouting the neoclassicists and antiromantics (people who opposed the romantic movement) who had come to show their disapproval for the play. *Hernani* was performed forty-five times (an unusual success for those days).

In 1831 Hugo published his novel *Notre Dame de Paris*, the work for which he is best known in the United States. In this he wished to convey the true spirit of the late Middle Ages through his creation of the Cathedral of Notre Dame and his characters: Frollo the archdeacon, Quasimodo the hunchback, and Esmeralda the gypsy girl. Although some readers were shocked that Frollo (who had taken holy orders) should fall in love with Esmeralda, the tale was a huge success.

Melancholy period

Also in 1831 Hugo published one of his most beautiful collections of poetry, *Les Feuilles d'automne*. Once again, Hugo wrote about private topics. This volume expressed the sadness he felt about events in his past as the poet approached his important thirtieth birthday. It was not only the fact that he was aging that made Hugo depressed; his wife, tired of bearing children and frustrated by the poet's immense selfishness, turned for comfort to the poet's friend, the critic Sainte-Beuve. The sadness of this double betrayal is felt in *Feuilles d'automne*.

Due to Hugo's loneliness from his wife's rejection, he fell in love with the young actress and prostitute (a person who receives money for performing sexual acts) Juliette Drouet. He took it upon himself to save her. He paid her debts and forced her to live in poverty, with her whole life focused entirely upon him. From this time on she lived solely for the poet and spent her time writing him letters, of which many thousands are in existence.

With the arrival of the July Monarchy, Hugo became wealthy and famous, and for fifteen years he was the official poet of France. During this period a large variety of new works appeared, including three plays: *Le Roi s'amuse* (1832), *Lucrezia Borgia* (1833), and the triumph *Ruy Blas* (1838).

In 1835 came *Chants du crépuscule*, which included many love lyrics (poems telling of emotion or love) to Juliette. In 1837 came *Les Voix intérieures*, a memorial of his father, who had been a Napoleonic general. *Les Rayons et les ombres* (1840) was another of his written works that was a statement of his personal emotions.

Political involvement

Hugo was now seized with a new ambition: he wished to become a statesman. When Louis Philippe was defeated in the Revolution of 1848, he allowed himself to be elected a deputy to the Assembly.

When Louis Napoleon began to achieve fame, Hugo supported him. But his enthusiasm for the new president was short-lived. He made a stirring plea for freedom of the press. At last, in 1849, he broke with Napoleon III (1808–1873).

Victor Hugo.

Louis Napoleon seized power on the night of December 2, 1850, and declared himself emperor. Hugo called for the people to fight back, and many were killed in this process. Hugo's involvement in the events put his life in danger. Juliette saved the poet, found him shelter, and organized his escape to Brussels, Belgium. From there he went to the British Channel islands of Jersey and Guernsey.

In November 1853 Hugo's anti-Napoleonic volume, *Les Châtiments*, was published in Belgium. Though banned in France, the books were smuggled in and widely distributed. The final edition of *Les Châtiments*, with numerous additions, was published in

1870, when Hugo returned to Paris after the fall of Napoleon III.

Hugo's mysticism

During Hugo's long absence from France, he explored the dark side of his personality. There were many séances (meetings of people attempting to contact the dead) in his home. He believed that he was communicating with famous spirits. The "visit" that touched him most was that of his favorite daughter, Léopoldine, who had tragically drowned in the Seine with her young husband in 1843.

Indeed, Hugo's family was doomed with many tragedies. While his life in England energized his poetry, his wife and children became depressed. They longed for their friends and the familiar surroundings of Paris. His daughter, Adèle, withdrew into a fantasy world until at last she ran away from home. Hugo continued his experiments with the supernatural until stopped by the fragile mental state of his son, Charles. Hugo's wife left him to live in Brussels, where she died in 1868. Only Juliette remained loyal during the seventeen years the poet spent in England.

In 1856 Hugo published *Les Contemplations*, a work described as the progression of life from infancy to its end, complete with all of the emotional experiences that happen to a person during this process. Many of these poems predict Hugo's next major work *La Légende des siècles* (1859), conceived as part of an enormous uncompleted work whose mission was to "express humanity." Hugo dreamed of an all-inclusive vast poem. It would show that man and his soul were basically good and that the human spirit would come out and away from its concern with material things.

In 1862 Hugo published *Les Misérables*, a major novel, the work of many years. His guiding interest was a social and humanitarian concern for the disadvantaged. The book was not just an adventure story but a love story and a mystery as well. It solidified Hugo's concern for people who were treated unfairly in society and once again amazed the reading public with the range of his literary powers.

When Victor Hugo died in Paris on May 22, 1885, he was a time-honored man, crowned with worldwide glory, still enthusiastic and emotionally devoted to the last.

ZORA NEALE HURSTON

Born: January 7, 1903

Eatonville, Florida

Died: January 28, 1960

Fort Pierce, Florida

African American author and folklorist

Folklorist and novelist Zora Neale Hurston was best known for her collection of African American folklore *Mules and Men* (1935) and her novel *Their Eyes Were Watching God* (1937), in which she

charted a young African American woman's personal journey.

Childhood

Zora Neale Hurston was born on January 7, 1903, in Eatonville, Florida, to Reverend John and Lucy Hurston. Zora's mother died when she was nine years old, and her father soon remarried. After her relationship with her stepmother rapidly declined, her father sent her to school in Jacksonville, Florida. Hurston greatly missed her mother and the warm, loving family atmosphere that she had grown up in. Hurston found herself being passed from relative to relative, while working as a nanny and a housekeeper.

When Zora was in her early teens she became a wardrobe girl in a Gilbert and Sullivan repertory company (a theatre company) touring the South. Eighteen months later, with the help of a former employer, she enrolled in Morgan Academy in Baltimore, Maryland, in 1917. She graduated a year later and went to Howard University, where she completed a year and a half of course work between 1919 and 1924. She secured a scholarship which allowed her to transfer to Barnard College, where she earned her degree in 1928. From 1928 to 1932 she studied anthropology (the study of human culture) and folklore at Columbia University under Franz Boas, a well-known anthropologist. In 1936 she was awarded a Guggenheim Fellowship for travelling and collecting folklore in Haiti and the British West Indies.

Early career

Hurston had a variety of jobs in addition to the writing recognition that brought her

fame. She worked as a secretary for writer Fannie Hurst (1889–1968), a writer for Paramount and Warner Brothers Studios, a librarian at the Library of Congress, and a drama coach at North Carolina College for Negroes. Hurston began her writing career while at Howard when she wrote her first short story for *Stylus*, a college literary magazine. She continued to write stories, and in 1925 won first prize in the Opportunity literary contest for "Spunk." In 1939 Morgan College awarded her an honorary doctorate degree. In 1943 she received the Annisfield Award for the autobiographical *Dust Tracks on the Road*, a book about her life, which she wrote.

Also in 1943 she was given an alumni award from Howard University.

Hurston's writings

Hurston's most famous work is her novel *Their Eyes Were Watching God* (1937), in which she created the portrait of an African American female, Janie, growing into adulthood searching for her identity. Through a series of marriages Janie comes to know and define herself in terms of her relationship with whites. For several years after the novel's publication critics saw this work as a sentimental love story. However, if the novel is read with the understanding that love was the traditional way in which a woman was supposed to find self-fulfillment (completing oneself), then love can be seen as the vehicle for emotional, spiritual, and intellectual development. The novel also portrays the awakening of a woman's sexuality. With the women's movement of the 1970s and the growth of female awareness that followed, many critics cited this novel as the central text in the canon (list of the best) of literature by African American women writers, specifically, and by women writers in general.

Hurston was also a famous folklorist who applied her academic training to collecting African American folklore around her hometown in Florida. This work produced two collections of folklore, *Mules and Men* (1935) and *Tell My Horse* (1939). All of her work is characterized by her use of African American folk idioms (regional speech), which are important to her character portrayals.

Hurston wrote three other novels: *Jonah's Gourd Vine* (1934), an autobiographical novel about her father's rise from an illiterate (unable to read or write) laborer to a respected Baptist

minister; *Moses, Man of the Mountain* (1939), which recreated Mosaic biblical myth in an African context; and *Seraph on the Suwanee* (1948), which is about a woman's search for selfhood within the confines of marriage to a man who sees all women as inferior.

Although Hurston worked all of her life at many jobs and was an extremely productive writer, money was always a serious problem. In the late 1940s she returned to Florida and worked as a maid in Riva Alto. After several efforts to restart her writing career, she died in poverty in Fort Pierce, Florida, on January 28, 1960.

SADDAM HUSSEIN

Born: April 28, 1937

Tikrit, Iraq

Iraqi president

Saddam Hussein, the socialist president of the Iraqi Republic beginning in 1979, is known for his political sharpness and ability to survive conflicts. He led Iraq in its long, indecisive war with Iran beginning in 1980. He was defeated in the six-week Persian Gulf War in 1990 at the hands of the United States after his invasion of Kuwait.

Early life

Saddam Hussein al-Tikriti was born in 1937 to a peasant family in a village near Tikrit, Iraq. His father died before his birth and his mother died in childbirth. He was raised by his uncles, particularly Khairallah Talfah, a retired army officer who served as a role model for Hussein. (In 1963 Saddam married Talfah's daughter Sajida.) In 1956 he moved into his uncle's house in Baghdad, where he became involved in the strong Arab nationalist movement sweeping Iraq in the wake of the Suez war that year. In 1957 he joined the Arab Ba'th Socialist Party, founded in Syria in 1947 and dedicated to Arab unity and socialism (a social system where goods and services are distributed by the government). From 1957 on Saddam's life and career were tied to the Ba'th Party.

In 1959 Saddam Hussein was one of the party members who attempted to carry out the unsuccessful assassination of the Iraqi dictator, Major General Abdul Karim Qasim (1914–1963). Although wounded, he was able to escape to Syria and then Egypt, where he remained until 1963. In Egypt he continued his political activities, closely observing the tactics, movements, and politics of Gamal Abdel Nasser (1918–1970).

In February 1963 a group of Nasserite and Ba'thist officers in Iraq brought down the

government of Qasim, and Hussein returned to his country. However, this Ba'th party did not remain in power for long. In 1966 Hussein became a member of the Iraqi branch's regional command and played a major role in reorganizing the Ba'th Party in preparation for a second attempt at power. It was in this period that Hussein acquired his reputation as a tough and daring member of the Ba'th Party.

The dual rule: al-Bakr and Hussein

In July 1968, after two attempts to overthrow the government, the Ba'th came back to power in Iraq, temporarily governing through the Revolutionary Command Council (RCC). Ahmad Hasan al-Bakr was elected president of the republic by the RCC and Hussein was elected vice president of the RCC in 1969. Between 1969 and 1979 Iraq was ruled outwardly by al-Bakr and behind the scenes by Hussein, who was a good manipulator and survivor.

In domestic affairs the Ba'th regime applied its socialist policy by bringing almost all economic activity under the control of the government. In 1972 Iraq nationalized (brought under government control) the foreign-owned oil company IBC, the first Middle Eastern government to do so. Hussein oversaw the rapid economic and social development of Iraq which followed the oil price increases of the 1970s. The country began to prosper, especially schools and medical facilities. A major campaign to wipe out illiteracy (the inability to write or read) was started in 1978 requiring children to attend schools. Women's social status was also greatly improved.

In international affairs, Iraq improved relations with the Soviet Union, a former country made up of Russia and other smaller

himself in various roles: a military man, a desert horseman, a young graduate. He carefully created an image of himself as a devoted family man, all in order to win the trust and love of the Iraqi people. He held the titles of secretary general of the Ba'th party and commander in chief of the armed forces.

Throughout 1979 and 1980 relations with Iran had fallen apart, as Iranian leader Ayatollah Khomeini (1902–1989) called on Iraq's Shi'ites, a large branch of Islam, to revolt against Hussein and the Ba'thist regime. Secret pro-Iranian organizations committed acts of destruction in Iraq, while Iranians began shelling Iraqi border towns in 1980. In September 1980 the Iraqi army crossed the Iranian border and seized Iranian territory thus beginning a long, costly, and bitter war that continued into the late 1980s.

With the continuation of the war, Hussein adopted a more practical stance in international affairs. Relations with conservative countries such as Kuwait, Saudi Arabia, and Egypt improved since they provided Iraq with either financial or military aid. Relations with the United States, cut in 1967 in protest against U.S. support for Israel in the Arab-Israeli conflict, known as the Six-Day War (June 1967), were restored in November 1984. However, Iraq did not change its friendly relations with the Soviet Union which, together with France, was the main source of its arms.

Tightening his grip

Saddam Hussein is a man with the reputation for ruthless crushing of his opposition. When he assumed power, he rid his party of officials and military officers due to an alleged Syrian plot to overthrow his government. He executed another three hundred

states that are now nations, and signed a treaty of alliance in 1972. At the same time Iraq distanced itself from the West, except for France. Iraq took a hard line on Israel and attempted to isolate Egypt after Anwar Sadat (1918–1981) signed the Camp David agreements with Israel's prime minister, Menachem Begin (1913–1992).

Saddam Hussein as president

On July 16, 1979, al-Bakr resigned and Hussein was elected president of the Iraqi Republic. One of the first things he ordered were posters of himself scattered throughout Iraq, some as tall as twenty feet, depicting

officers in 1982 for rebelling against his tactics in the war with Iran. In order to protect himself, Saddam surrounded himself with family and friends in positions of trust and responsibility in the government. After a family dispute, his brother-in-law “mysteriously” died in a helicopter accident. He ordered the murders of his sons-in-law after they fled to Jordan in 1996. His image of a devoted family man was shattered with these acts. On at least seven occasions unsuccessful assassination attempts were made against Hussein.

In 1990 Hussein brought the wrath and combined power of the West and the Arab world down upon Iraq by his invasion of Kuwait. The Persian Gulf War, which Iraq fought against U.S. military forces, lasted for six weeks and caused Iraq’s leader worldwide criticism. However, there are still a great many supporters of Hussein scattered throughout the world.

Since the Persian Gulf War, the United Nations (UN; a multinational body aimed at world peace) lowered many sanctions (laws) upon Iraq, including letting UN weapons inspectors into certain areas of Iraq to check for illegal possession of chemical warfare items. Despite the pressure by the UN (and Saddam’s reluctant acceptance of the sanctions), he has maintained absolute power over his country. In 1997 citizens of Baghdad feared to criticize Hussein, and rumors circulated that he had put his wife under house arrest after his son Uday was shot.

In autumn 1997 Hussein accused UN inspectors of being spies and forced them to leave the country. The situation improved in early 1998, but then after Iraq once again refused to let the inspectors do their jobs, the United States and Great Britain began four

days of air strikes against the country. Hussein then stated that Iraq would no longer cooperate with UN inspectors. The air strikes continued throughout 1999 because Iraq continued to fire on planes that were patrolling no-fly zones that had been put in place by the UN.

In September 2001, after terrorist attacks on the United States, which resulted in the deaths of thousands of people in America, Hussein stated that he refused to offer his sympathy to U.S. president George W. Bush (1946–) because he did not agree with U.S. policy toward Iraq. Early in 2002 Hussein made an offer to openly discuss the sanctions with the UN. He later claimed that Iraq was no longer producing weapons that were made for the purpose of mass destruction. Many people believed that Hussein’s comments were made in an effort to gain support from countries as President Bush indicated that Iraq could become one of the enemies in the U.S.-led war against terrorism.

Saddam Hussein remains a powerful strongman, in spite of an ongoing embargo (stoppage of trade) of his country’s oil, goods, and services.

LEE IACOCCA

Born: October 15, 1924

Allentown, Pennsylvania

American businessman and auto industry executive

After a thirty-two year career with Ford Motor Company, including eight years as president, Lee Iacocca engineered one of business history's greatest comebacks at Chrysler Corporation. His success, coupled with appearances in television commercials and his best-selling book, made him one of the nation's most known and admired businessmen.

Early life

Lido Anthony Iacocca was born October 15, 1924, in Allentown, Pennsylvania, the son of Italian immigrants Nicola and Antoinette. Iacocca grew up in comfortable surroundings learning the nuts and bolts of business from his father who worked as a cobbler, hot dog restaurant owner and a theater owner. Nicola was a businessman who taught his son about the responsibilities of money and the need for a strong drive and a great vision in order to build a thriving business. Nicola also ran one of the first car rental agencies in the country and passed on his love of the automobile to his son.

Iacocca's enlistment in the military during World War II (19139–45) was denied

because of his childhood battle with rheumatic fever, a terrible disease that can cause permanent damage to the heart. He earned an undergraduate degree in engineering from Lehigh University and later earned a master's degree from Princeton University. Even as a teenager, Iacocca decided that he was going to be an automobile company executive and focused his studies in that direction. He secured a much sought-after engineering trainee job at Ford Motor Company in 1946, but put off his start until he completed his master's degree at Princeton.

At Ford Motor Company

Joining Ford as an engineering trainee in 1946, Iacocca soon entered the fast pace of sales. In 1960, at age thirty-six, he sped into the vice presidency and general managership of the company's most important unit, Ford Division. In 1964, with others on his staff, he launched the Ford Mustang, which, thanks to brilliant styling and marketing, introduced a new wave of sports cars, set a first-year sales record for any model, gave its name to a generation, and landed its creator's picture on the covers of *Time* and *Newsweek*.

In 1960 Iacocca was named Ford's vice president of the car and truck group; in 1967, executive vice president; and in 1970, president. Pocketing an annual salary and bonus of \$977,000, the flashy executive also earned a reputation as one of the greatest salesmen in U.S. history. Of Iacocca, it has been said that he was always selling, whether products, ideas—or himself.

From Ford to Chrysler

Iacocca was let go from Ford Motor Company in June 1978 by Chairman Henry

Ford II for reasons Ford never revealed. Though bitter at being dismissed from Ford, Iacocca was not out of the car business for long. Five months after his dismissal, Iacocca was named president of Chrysler (becoming chairman in 1979) and began transforming the number three automaker from a sluggish moneymaker into a highly profitable business.

How was Chrysler turned around? By downsizing (to make smaller) expenses to a much lower break-even point; by winning approval of \$1.5 billion in federal loan guarantees; by selling off profitable units such as the tank division; and by introducing timely products. In addition, Chrysler welcomed, for the first time in U.S. corporate history, a union president to a board of directors. In 1984 the company posted profits of \$2.4 billion (higher than in the previous sixty years combined), and in 1985 it bought Gulfstream Aerospace Corporation for \$637 million and E. F. Hutton Credit Corporation for \$125 million.

In the early 1980s Chrysler issued the K-car and what would later become its best seller—the minivan. Just as the Mustang reestablished the sports car for Ford, the minivan would be loved by the young family in need of room and efficiency and revitalize Chrysler. In 1983 Chrysler paid the government back its loans and Iacocca became a star, a symbol of success and the achievement of the American dream.

Along with spearheading Chrysler's rise, Iacocca took leadership roles in many noteworthy causes, most notably the chairmanship of the President's Statue of Liberty-Ellis Island Centennial Commission, which was set up to raise funds for and to oversee

restoration of the two monuments in New York City. While Iacocca gained a worldwide reputation through business leadership, television commercials, and association with the Statue of Liberty, he gained much additional exposure through his 1984 autobiography (a book written by someone about their life). *Iacocca: An Autobiography*, the best-selling nonfiction hardcover book in history, had two million copies in print by July 1985.

Folk hero

By the mid-1980s Iacocca had achieved folk-hero status. The *Saturday Evening Post* described him as “the sex symbol of America” and *Reader’s Digest* as “the living embodiment of the American dream.” Talk of Iacocca-for-president became increasingly widespread, and a 1985 poll of 1988 presidential preferences showed that the cocky industrialist trailed Vice President George Bush (1924–) by only three percentage points (41 to 38 points).

The late 1980s and early 1990s were not as kind to Iacocca. His public image, like Chrysler’s earnings, began to fall. At a time when the American people, in the grip of a recession (a temporary slowing of the economy), criticized the huge paychecks of executives whose companies were hurting, Iacocca who had once achieved a publicity coup (takeover) when, for a time, he only accepted one dollar a year from Chrysler, was paid a 1987 salary of \$18 million. In addition, Iacocca, criticized Japanese trading practices, blaming them for the ills that American car manufacturers had suffered. Critics stated that the American public believed that Japanese cars were superior

Lee Iacocca.

Reproduced by permission of AP/Wide World Photos.

and instead of criticizing the Japanese, Iacocca’s car company should have competed with them. At the end of 1992, Iacocca retired. He remained a consultant to Chrysler, with a \$500,000 thousand a year salary and use of the company jet, until the end of 1994.

In 1995 Iacocca announced that he was taking Chrysler to court, claiming that it unlawfully blocked him from exercising \$42 million in share options that he had earned while he was the chairman. Chrysler claimed that Iacocca’s role as an adviser to Kirk Kerkorian, the investor who wanted to purchase the company, violated the share option

plan agreement. Although Kerkorian's bid failed to materialize because he was unable to raise the financial backing, Chrysler agreed to pay Iacocca \$21 million to settle the lawsuit. Iacocca continued to work as Kerkorian's consultant.

Iacocca and Mary McCleary were married in 1956 and had two daughters, Kathi and Lia. Mary died of diabetes (a blood disorder) in 1983, and in her memory, Iacocca donated his book earnings to diabetes research. Two later marriages, to advertising executive Peggy Johnson (1986) and restaurateur Darrien Earle (1990), ended in divorce. In 1999 Iacocca announced his latest venture, E-bikes. Iacocca believes these electronically motorized bikes will take the place of mopeds and other loud and polluting vehicles in crowded urban areas. Only time will tell if Iacocca's latest work will be as popular as his previous successes.

HENRIK IBSEN

Born: March 20, 1828

Skien, Norway

Died: May 23, 1906

Christiania, Norway

Norwegian playwright

The Norwegian playwright Henrik Ibsen made a tremendous impact on the course of Western drama. The best of his plays portray the real-life problems of individuals, with a skillful use of dialogue (conversation between individuals in a play) and symbols.

Early life

Henrik Ibsen was born on March 20, 1828, in Skien, Norway. His father was a successful merchant. When Ibsen was eight, his father's business failed, which was a shattering blow to the family. Ibsen left home at age fifteen and spent six years as a pharmacist's (one who prepares and sells drugs that are ordered by doctors) assistant in Grimstad, Norway, where he wrote his first play. In 1850 he moved to Christiania (Oslo), Norway, to study. In 1851 he became assistant stage manager of a new theater in Bergen, Norway, where part of his job was to write one new play a year. Although these plays were mostly unsuccessful, Ibsen gained valuable theater experience.

Ibsen returned to Christiania in 1857, where he spent the worst period of his life. His plays either failed or were rejected, and he went into debt. He left Norway in 1864, spending the next twenty-seven years in Italy

and Germany. He changed his appearance, his habits, and even his handwriting. He became distant, secretive, and desperate to protect himself from the real and imagined hostility of others.

Early plays

The main character in *Catiline* (1850), Ibsen's first play, is torn between two women who represent conflicting forces in himself. Ibsen's other early plays show him struggling to find his voice. The two plays he wrote during his second stay in Christiania were more successful: *Love's Comedy* (1862), which pokes fun at romantic love, and *The Pretenders* (1864), a historical and psychological (relating to the mind) tragedy (a serious drama that usually ends with the hero's death).

In the first ten years after leaving Norway Ibsen wrote four plays, including the immensely successful *Brand* (1866), about a man's attempt to understand himself. His next play, *Peer Gynt* (1867), made Ibsen Scandinavia's most discussed dramatist. *Peer Gynt* is *Brand*'s opposite, a man who ignores his problems until he loses everything, including himself. Ibsen called *Emperor and Galilean* (1873), a ten-act play, "a world-historical drama."

Plays about current issues

Inspired by the demands of critics that literature should address current problems of the day, Ibsen set out to develop a dramatic form in which serious matters could be dealt with using stories about everyday life. Ibsen did not invent the realistic (based on real life) or social reform play, but he perfected the form. In doing so he became the most famous dramatist of the nineteenth century. Still, Ibsen

Henrik Ibsen.

remained what he had always been, a man who disliked society and concerned himself only with the individual and his problems.

As used by George Bernard Shaw (1856–1950), a great supporter of Ibsen's work, the term "Ibsenite" describes a play that exposes individual and social hypocrisy (pretending to be what one is not). Examples are *Pillars of Society* (1877) and *A Doll's House* (1879), which point out how the conventions of society hinder personal development. In *Ghosts* (1881), however, the character of Mrs. Alving discovers that there are forces within the individual more destructive than the "dollhouse" of marriage and society. The last of the "Ibsen-

ite" plays, *An Enemy of the People* (1882), is one of Ibsen's finest comedies.

Later works

After 1882 Ibsen concentrated more on the problems of the individual. *The Wild Duck* (1884) shows how the average man needs illusions (unreal and misleading thoughts or ideas) to survive and what happens to a family when it is forced to face the truth. In *Rosmersholm* (1886) a man raised in a tradition of Christian duty and sacrifice tries to break with his past. *Hedda Gabler* (1890) is the story of an unhappy woman who attempts to interfere with the lives of others. There is much of Ibsen, as he saw himself at the time, in *Hedda Gabler*.

Many of Ibsen's last plays represent confessions of his sins. *The Master Builder* (1892), one of Ibsen's most beautiful dramas, is the story of an artist consumed by guilt over the wife and children he has "murdered" to further his ambition. *John Gabriel Borkman* (1896) is a study of a man who sacrifices everything to his vision and is killed by the forces in nature he has sought to control. Ibsen's last play, *When We Dead Awaken* (1899), is an artist's confession of his failure as a man and of his doubts about his achievement. Soon after this play Ibsen suffered a stroke that ended his career. He died on May 23, 1906, in Christiania.

IMHOTEP

Born: c. 3000 B.C.E.

Ankhtowe, Egypt

Died: c. 2950 B.C.E.

Memphis, Egypt

Egyptian magician, physician, scribe, sage, architect, astronomer, vizier, and priest

Imhotep was an ancient Egyptian genius who achieved great success in a wide variety of fields. Inventor of the pyramid, author of ancient wisdom, architect, high priest, physician, astronomer, and writer, Imhotep's many talents and vast acquired knowledge had such an effect on the Egyptian people that he became one of only a handful of individuals of nonroyal birth to be deified, or promoted to the status of a god.

Second in a long line of architects

Imhotep, or "he who cometh in peace," was born in Ankhtowe, a suburb of Memphis, Egypt. The month and day of his birth are noted precisely as the sixteenth day of Epiphi, third month of the Egyptian harvest (corresponding to May 31) but the year is not definitely recorded. It is known that Imhotep was a contemporary (living in the same time

period) of the Pharaoh, or king of Egypt, Zoser (also known as Neterikhet) of the Third Dynasty. But estimates of the era of his reign vary by as much as three hundred years, falling between 2980 and 2600 B.C.E.

Imhotep's father, Kanofer, a celebrated architect, was later known to be the first of a long line of master builders who contributed to Egyptian works through the reign of King Darius the First (522–486 B.C.E.). His mother, Khreduonkh, who probably came from the province of Mendes, is known today for having been deified alongside her son, an Egyptian custom.

Vizier under King Zoser

The office of the vizier in politics was literally described as “supervisor of everything in this entire land.” Only the best educated citizen could handle the range of duties of this position that worked closely with the Pharaoh, or king of Egypt. As vizier, Imhotep was chief advisor to Zoser in both religious and practical matters, and he controlled the departments of the Judiciary (court system), Treasury, War, Agriculture, and the General Executive.

There are no historical records of Imhotep's acts as a political figure, but his wisdom as a religious advisor was widely recognized after he ended a terrible famine (a severe shortage of food) that dominated Egypt during seven years of Zoser's reign. It is said that the king was failing in his responsibility to please the god Khnum, and his neglect was causing the Nile to fall short of a flood level which would support Egyptian farms. Imhotep, having a vast knowledge of the proper traditions and methods of worship, was able to counsel Zoser on pleasing

Imhotep.

Courtesy of the Library of Congress.

the god of the cataract (heavy rain), allowing the Nile to return to its usual flood level.

Architect of the famous pyramid at Sakkara

The Step Pyramid at Sakkara is the only of Imhotep's achievements that can still be seen and appreciated today. Its reputation is largely based on Imhotep's accomplishments as the pyramid's inventor and builder. This pyramid was the first structure ever built of cut stone, and is by far the oldest of the Seven Wonders of the World, the seven structures of the ancient world that were astonishing accomplishments for their time. It took twenty years to complete—not very long,

given the newness of the idea and the state of structural science in the Bronze Age (between 3000 B.C.E. and 1100 C.E.), the period of development where metals, particularly bronze, were used for the first time.

Imhotep wanted the tomb to accommodate the Pharaoh's rise into the heavens. To do this, he planned to improve upon the flat, rectangular mastabas, or built-in benches, which were the traditional tombal structures. The pyramid was raised on top of the base mastabas in five smaller steps, one on top of the other. He added a passageway on the north side issuing upward within the structure from a sarcophagus chamber (where the stone coffin holding the mummy is kept) seventy-five feet below ground. The total height of the pyramid and base is just under two hundred feet, unimaginably large for a single structure before Imhotep's design.

The project at Sakkara was designed in its entirety as a way for the deceased to perform the rituals of the jubilee festival, or Hebsed. The complex consisted of many other buildings, as well as ornamental posts some thirty-seven feet high. The protection of the king and his burial gifts—about thirty-six thousand vessels (containers) of alabaster, dolomite, aragonite, and other precious materials—was the other primary function of the burial site. The entire complex, about one-quarter by one-half mile in area, was enclosed within a stone wall about thirty-five feet high. Imhotep added several false entrances to throw off possible tomb raiders. As a final measure, the king's treasure was lowered through vertical shafts around the tomb into a long corridor one hundred feet below ground. The digging of just this corridor without machines of any kind is an amazing accomplishment by modern standards.

It is likely that Imhotep was the architect and master builder of many other projects completed during a forty-year period of the Third Dynasty, though none of them compare in size or stylistic influence to the burial site at Sakkara. Imhotep was also the author of an encyclopedia of architecture that was used as a reference tool by Egyptian builders for thousands of years.

Physician-magician, god of medicine

As a god of medicine, Imhotep was beloved as a curer of everyday problems who could “provide remedies for all diseases,” and “give sons to the childless.” Members of the cult of Imhotep in the Twenty-sixth and Twenty-seventh Dynasties (between 525 B.C.E. and 550 C.E.) would pay tribute to the God at his temple just outside Memphis. The temple also contained halls devoted to the teaching of medical methods, and to the preservation of the materia medica, which details the entirety of Egyptian medical knowledge which may actually have originated with Imhotep.

Imhotep's name was often grouped with such powerful deities as Thoth, God of Wisdom, Isis, the wonder-worker, and Ptah, a healer and the ancient God of Memphis. Although other humans were deified by the Egyptians, Imhotep is unique for being known by his own name as a god inferior in power only to Re (chief Sun-God). Imhotep was also a member of the great triad of Memphis, with Ptah, Imhotep's father among the gods, and Sekhmet, a goddess associated with childbirth.

It is a matter of debate today how much of Imhotep's reputation as a curer of disease stems from medical skill and how much comes from his command of magic and healing rituals.

WASHINGTON IRVING

Born: April 3, 1783

New York, New York

Died: November 28, 1859

Irvington, New York

American author

Considered the first professional distinguished writer in the United States with short stories like “Rip Van Winkle” and “The Legend of Sleepy Hollow,” Washington Irving was influential in the development of the short story form and helped to gain international respect for American literature.

Childhood

Washington Irving was born and raised in New York City, the youngest of eleven children of a prosperous merchant family. Named after President George Washington (1732–1799), Irving was fascinated by the upper class of New York City and would often sneak out of family prayer meetings to attend the local theatre.

*Washington Irving.
Courtesy of the Library of Congress.*

A dreamy and uninspired student, Irving apprenticed (worked to gain experience in a trade) himself in a law office rather than follow his elder brothers to nearby Columbia College. In his free time, he read avidly and wandered when he could around the misty, rolling Hudson River Valley. This area just north of New York City was steeped in local folklore and legend and served as an inspiration for his later writings.

Begins writing career

As a nineteen-year-old, Irving began contributing letters under the pseudonym (assumed name) Jonathan Oldstyle to a news-

paper owned by his brother Peter. His first book, *Salmagundi* (1807–08), was a collaboration with another brother, William, and their friend James Kirke Paulding. This highly popular collection of short pieces poked fun at the political, social, and cultural life of the city.

Irving enjoyed a second success in 1809 with *A History of New York, from the Beginning of the World to the End of the Dutch Dynasty*, a comical and purposefully inaccurate account of New York's Dutch colonization (settlement by a foreign nation) narrated by another pseudonym Diedrich Knickerbocker, a Dutch American.

Irving's carefree social life and literary successes were shadowed at this time, however, by the death of his fiancée, Matilda Hoffmann. For the next several years he floundered, wavering between a legal and writing career.

Life in England

In 1815 Irving moved to England to work in the failing Liverpool branch of the family import-export business. Within three years the company was bankrupt, and, finding himself at age thirty-five without means of support, Irving decided that he would earn his living by writing. He began recording the impressions, thoughts, and descriptions, which he reworked several times. These became the pieces that make up *The Sketch Book*. The volume was introduced under the pseudonym of Geoffrey Crayon.

The Sketch Book comprises some thirty parts: about half English sketches, four general travel pieces, six literary essays, two descriptions of the American Indian, three essentially unclassifiable pieces, and three short stories: "Rip Van Winkle," "The Legend of Sleepy Hollow," and "The Spectre Bridegroom." The varied material in *The Sketch Book* appealed to a

broad range of readers; the work received a great deal of attention and sold quickly. Irving found himself America's first international literary celebrity. In addition, the book's considerable profits allowed Irving to devote himself full time to writing.

Remaining in Europe for more than a decade after the appearance of *The Sketch Book*, Irving wrote steadily, and soon published *Bracebridge Hall; or, the Humorists: A Medley* (1822), which centers loosely around a fictitious English clan that Irving had introduced in *The Sketch Book*.

After 1824 Irving increasingly turned his attention from fiction and descriptive writing toward history and biography. He lived for several years in Spain, serving as a diplomatic attaché (a person who works for their government in a foreign country) to the American embassy in Spain while writing a life of Christopher Columbus (1451–1506) and a history of Granada, Spain. Irving served as secretary to the American embassy in London from 1829 until 1832, when he returned to the United States.

An American celebrity

After receiving warm praise from the literary and academic communities, Irving set out on a tour of the rugged western part of the country, which took him as far as Oklahoma. The expedition resulted in three books about the region, notably *A Tour on the Prairies* (1835), which provided easterners with their first description of life out west by a well-known author. Irving eventually settled near Tarrytown, New York, at a small estate on the Hudson River, which he named Sunnyside.

Among the notable works of Irving's later years is an extensive biography of George Washington (1732–1799), which he worked on determinedly, despite ill health, from the early 1850s until a few months before his death in 1859. As America's first literary star with stories like "Rip Van Winkle" and "The Legend of Sleepy Hollow," Irving established an artistic standard and model for later generations of American short story writers.

reader's guide

U•X•L Encyclopedia of World Biography features 750 biographies of notable historic and contemporary figures from around the world. Chosen from American history, world history, literature, science and math, arts and entertainment, and the social sciences, the entries focus on the people studied most often in middle school and high school, as identified by teachers and media specialists.

The biographies are arranged alphabetically across ten volumes. The two- to four-page entries cover the early lives, influences, and careers of notable men and women of diverse fields and ethnic groups. Each essay includes birth and death information in the header and concludes with a list of sources

for further information. A contents section lists biographees by their nationality. Nearly 750 photographs and illustrations are featured, and a general index provides quick access to the people and subjects discussed throughout *U•X•L Encyclopedia of World Biography*.

Special thanks

Much appreciation goes to Mary Alice Anderson, media specialist at Winona Middle School in Winona, Minnesota, and Nina Levine, library media specialist at Blue Mountain Middle School in Cortlandt Manor, New York, for their assistance in developing the entry list. Many thanks also go to the following people for their important editorial contri-

butions: Taryn Benbow-Pfalzgraf (proofreading), Jodi Essey-Stapleton (copyediting and proofing), Margaret Haerens (proofreading), Courtney Mroch (copyediting), and Theresa Murray (copyediting and indexing). Special gratitude goes to Linda Mahoney at LM Design for her excellent typesetting work and her flexible attitude.

Comments and suggestions

ANDREW JACKSON

Born: March 15, 1767

Waxhaw, South Carolina

Died: June 8, 1845

Nashville, Tennessee

American president and lawyer

Andrew Jackson (1767–1845) was the seventh president of the United States. He symbolized the democratic advances of his time, while strengthening the power of the presidential office in American government.

A young soldier

Andrew Jackson was born on March 15, 1767, in Waxhaw country, which is now part of North and South Carolina. His father, who died shortly before Andrew's birth, had come with his wife to America from Ireland in 1765. Andrew attended several academies in the Waxhaw settlement, but his education was incomplete and he never developed a taste for learning.

After the outbreak of the American Revolution (1775–83), where the American colonies fought to break away from British rule, Jackson, barely thirteen years old, served as an orderly (an attendant). Following a battle, Jackson and his brother were captured by the British and taken to a prison

JACKSON, ANDREW

camp. When Jackson refused to clean an officer's boots, the officer slashed him with a sword, leaving a permanent scar on his forehead and left hand. Jackson was the only member of his family to survive the war. Many believe that his harsh, adventuresome, early life developed his strong, aggressive qualities of leadership, his violent temper, and his need for intense loyalty from friends.

Lawyer and politician

After the war Jackson drifted from one job to another and from one relative to another. He wasted a small inheritance and for a time lived a wild and undisciplined life. Then, in 1784 Jackson left for Salisbury, North Car-

olina, where he studied law in a local office. Three years later, after earning his law license, he moved to the western district that eventually became Tennessee. Living in Nashville, Tennessee, Jackson soon became a distinguished lawyer. Within ten years he became one of the most important landowners in the state. He also achieved social status by marrying Rachel Donelson (1767–1828), the daughter of one of the region's original settlers.

In 1796 Jackson represented his county when the Southwest Territory (areas west of the Mississippi River) petitioned Congress for admission as a state to the Union, as the United States was known. Although he played a modest, or small, part in the proceedings, one tradition does credit him with suggesting the name of the new state: Tennessee, taken from the name of a Cherokee Indian chief.

After Tennessee was admitted as the sixteenth state of the Union, Jackson was elected to its only seat in Congress. The following year he became judge of the Superior Court of Tennessee. He resigned from the bench in 1804 to devote himself to his plantation, where he later built a graceful mansion called the "Hermitage."

Military career

Jackson's life would change when, once again, war erupted between America and Great Britain in the War of 1812 (1812–15). Jackson had achieved the rank of major general (an officer in the military who is above a brigadier general) of the Tennessee militia (a small military force that is not part of the regular army). He and his militia were ordered to overpower the Creek Indians in Alabama, who had massacred white settlers at Fort Mims. At the Battle of Horseshoe Bend

(1814) Jackson dealt the Creek a crushing defeat. During this battle Jackson's men recognized his toughness and strong will by nicknaming him "Old Hickory."

When the U.S. government heard rumors of a British attack of the South through one of the ports on the Gulf of Mexico, Jackson was ordered to block the invasion. The British attacked on January 8, 1815, and were easily defeated. More than two thousand British soldiers were killed, while only thirteen Americans were lost in battle. Jackson became a national hero overnight, for he had given Americans confidence in their ability to defend their new freedom.

When the war ended, Jackson returned to his plantation. However, he soon resumed military duty to successfully overpower Indian forces along the southern frontier of Spanish Florida. After President James Monroe (1758–1831) purchased Florida from Spain for \$5 million, Jackson served as governor of the Florida Territory. He quit after serving only a few months.

Running for president

His accomplishments served to increase Jackson's popularity throughout the country. Meanwhile his friends in Tennessee began talking about the possibility of making him a presidential candidate. First, he was elected to the U.S. Senate in October 1823.

The following year, four candidates sought the presidency, each representing a different section of the country: Jackson of Tennessee, William H. Crawford (1772–1834) of Georgia, John Quincy Adams (1767–1848) of Massachusetts, and Henry Clay (1777–1852) of Kentucky. It was a close election, and the House of Repre-

sentatives had to decide the winner. When John Quincy Adams was chosen president, Jackson was convinced the election was fixed and that there was a "bargain" between Adams and Clay. For the next four years Jackson's supporters attacked the Adams administration with the accusation of a "corrupt bargain."

"Old Hickory" as president

In the election of 1828 Jackson won an overwhelming victory. During the campaign, Martin Van Buren (1782–1862) of New York and John C. Calhoun (1782–1850) of South Carolina joined forces behind Jackson. Jackson and his supporters soon became known as the Democratic Party. Supporters of Adams and Clay were now called National Republicans.

Relations between President Jackson and Vice President Calhoun soon turned sour. The two argued over the important constitutional question of the nature of the Union. Calhoun strongly believed in a state's doctrine (official statement) of nullification, or the right of a state to undo any federal law that disagreed with the state's views. Jackson strongly believed nullification was wrong and could weaken the Union. Calhoun wound up resigning before the end of his term.

Reelection and the bank war

The presidential contest of 1832 revolved around the important political issue of the national bank, or the bank controlled by the national government. Jackson believed the Second Bank of the United States (established in 1816) was unconstitutional, or that it disagreed with the nation's rules. Also, Jackson maintained that the Bank had failed to establish a sound and uniform currency, or money that could be used across the country.

When the Bank applied to Congress to continue its work, Jackson vetoed (rejected) the bill. Although the bill would pass in the end, Jackson sent a strong message by saying how “the rich and powerful too often bend the acts of government to their selfish purposes.” With this message Jackson broadened presidential power by giving social, political, and economic reasons for vetoing the bill.

A second term

In the 1832 presidential election Jackson and vice presidential candidate Van Buren defeated Henry Clay. Jackson then informed Congress of his intention to pay off the national debt. This goal was achieved on January 1, 1835, thanks to income the federal government received from land sales and tariffs (import taxes).

Jackson supported a policy of “rotation” with respect to Federal offices. He declared that no one man has more right to office than any other man. Jackson also supported moving Native Americans west of the Mississippi River as the most humane, or fair, policy the government could pursue in dealing with the Native Americans. Jackson signed more than ninety treaties with various tribes, in which lands owned by Native Americans within the existing states, were exchanged for new lands in the open West.

Nullification ordinance

Another issue in Jackson’s second term was that of tariffs. The North called for high rates, but the South considered them a way of financially supporting northern manufacturers at the expense of southern businesses. With the passage of the Tariff of 1832, which reduced the import taxes but not enough to

satisfy southern states, South Carolina reacted violently. The state called on Calhoun’s doctrine of nullification and soon declared the tariffs of 1828 and 1832 null and void. The state then warned the federal government that if force were used to execute the law, the state would secede, or withdraw membership, from the Union. Jackson would not back down, and threatened the state with treason, or a high crime against one’s country.

A compromise tariff was soon hurried through Congress. Jackson had avoided a national crisis, and his actions during the controversy were masterful. Through the careful use of presidential powers and compromise, he preserved the Union and upheld the power of federal law.

At the end of his two terms in office, having participated in the inauguration of his successor, Martin Van Buren, Jackson retired to his plantation. He continued to keep his hand in national politics until his death on June 8, 1845.

JESSE JACKSON

Born: October 18, 1941

Greenville, South Carolina

African American political leader, religious minister, and orator

Civil rights leader Reverend Jesse Jackson has spent decades in the public eye in support of ending racial and class divisions in America. He is the founder of the Rainbow/PUSH Coalition, a group that works to improve the lives of people throughout the United States and the world.

Early life and education

Jesse Louis Jackson was born on October 18, 1941, in Greenville, South Carolina. He was the son of Helen Burns and her married next-door neighbor, Noah Robinson. Jackson was teased by his neighbors and classmates for being “a nobody who had no daddy.” Jackson developed a strong desire to succeed and an understanding of the oppressed (those who are treated unjustly). With advice from his grandmother, Jackson overcame his childhood problems, finishing tenth in his high-school class. He earned a football scholarship to attend the University of Illinois in Chicago. Jackson, eager to get away from the prejudice (dislike of people based on their race) and segregation (separation based on race) of the South, traveled north only to find both open and hidden discrimination (unequal treatment) at the university and in other parts of the city.

After several semesters Jackson decided to leave the University of Illinois. He

returned to the South and enrolled at North Carolina Agricultural and Technical College (A&T) in Greensboro, North Carolina, an institution for African American students, where he was elected student body president. As a college senior he became a leader in the civil rights movement. Jackson actively encouraged his fellow students to protest against racial injustice by staging repeated demonstrations and boycotts (protests in which, for example, organizers refuse to shop at a certain store in an attempt to get the store to change an unjust policy or position). Jackson graduated in 1964 with a degree in sociology and economics.

Civil rights movement

After graduation Jackson decided to attend the Chicago Theological Seminary. After two and a half years at the school, Jackson left the seminary (a place for religious education) in 1966 before completing his divinity degree (a degree in the study of religion). He also joined the Southern Christian Leadership Conference (SCLC), a civil rights organization led by Dr. Martin Luther King Jr. (1929–1968) that held nonviolent protests against segregation in the South. In April 1968 many of SCLC’s officers—including Jackson—were drawn away from other civil rights protests by a garbage collectors’ strike in Memphis, Tennessee. Tragically, King, in his attempt to prevent racial violence in that city, was killed by an assassin’s bullet while standing on the balcony of his hotel room.

Jackson later claimed on national television that he had been the last person to talk to King and that he had held the dying leader in his arms, getting blood all over his shirt. The other men present agreed that this was not

Jesse Jackson.

true—that Jackson had been in the parking lot facing King when the shooting occurred and had neither climbed the steps to the balcony afterward nor gone to the hospital with King. Whatever the truth of the matter may be, Jackson's appearance on national television the next day with his bloodied shirt brought the horror of the assassination into American homes, making him a well-known national figure. This publicity caused the media to refer to him as the new leader of the civil rights movement. In 1971 Jackson was suspended from the SCLC after its leaders claimed that he was using the organization to further his own personal goals.

After his suspension, Jackson founded Operation PUSH (People United to Save Humanity). Standing in front of a picture of Dr. King, Jackson promised to begin “a rainbow coalition of blacks and whites gathered together to push for a greater share of economic and political power for all poor people in America.” Jackson spoke out against racial prejudice and discrimination, military action, and class divisions in America. In 1976 Jackson created PUSH-Excel, a program aimed at encouraging children and teens to succeed. A fiery orator (public speaker), Jackson traveled from city to city delivering his message of personal responsibility and self-worth to students: “You're not a man because you can kill somebody. You are not a man because you can make a baby . . . You're a man only if you can raise a baby, protect a baby and provide for a baby.”

The rainbow coalition and bids for the presidency

Jackson became involved in international politics when President Jimmy Carter (1924–) approved his visit to South Africa. Jackson attracted huge crowds at rallies, where he denounced (criticized) apartheid, South Africa's political system that prevented the black majority of the population from enjoying the rights and privileges of the white minority. Later in 1979 he toured the Middle East, where he was criticized for embracing Yasir Arafat (1929–), the Palestinian leader who was considered a terrorist (a person who uses terror to force others to act in a certain way) by the American government. These international trips caused Jackson's fame and popularity to grow within the African American community.

As the 1980s began, Jackson was no longer a young man with long hair and gold chains but was instead a more mature figure seeking ways to change the Democratic Party from within. He continued to promote his "rainbow coalition" as a way for all Americans to improve the country. Jackson's support in the African American community also allowed him to influence both local and national elections. Possibly the most important campaign in which he was involved was the election victory of Harold Washington, the first African American mayor of Chicago, Illinois, in 1983. Jackson's ability to convince over one hundred thousand African Americans, many of them youths, to register to vote played a large part in Washington's victory.

Jackson decided to campaign in the 1984 presidential election as a Democrat. His campaign focused on social programs for the poor and disabled, reduced taxes for the poor, increased voting rights, effective programs to improve the job opportunities of women and minorities, and improved civil rights. He called for increased aid to African nations and more consideration of the rights of Arabs. Many senior African American politicians refused to support Jackson, believing that his candidacy would disrupt the Democratic Party and benefit the Republicans. However, many poor African Americans supported him. He received 3.5 million votes, and possibly 2 million of those voters were newly registered. Although his campaign was unsuccessful, Jackson had broken new ground while involving more African Americans in the political process.

After the 1984 election Jackson split his time between working for Operation PUSH in Chicago and his new National Rainbow Coali-

tion, which he began in 1985, in Washington, D.C. (The two organizations later joined together to form the Rainbow/PUSH Coalition.) He ran again for the Democratic presidential nomination in the 1988 election. Although his second campaign received much wider support, Jackson finished second to Massachusetts Governor Michael Dukakis (1933–), who went on to lose the presidential election. In 1992 he backed Democratic candidate Bill Clinton (1946–) during the presidential campaign. He used his influence to urge African American voters to support Clinton. These efforts helped Clinton win the election and return a Democrat to the White House for the first time in twelve years.

More recent activities

Despite criticism that he was simply a cheerleader for causes and represented style more than substance, Jackson continued to speak out for civil rights and to challenge others to improve themselves. In 1995 Jackson wrote in *Essence* magazine, "People who are victimized may not be responsible for being down, but they must be responsible for getting up. Slave masters don't retire; people who are enslaved change their minds and choose to join the abolitionist [antislavery] struggle. . . . Change has always been led by those whose spirits were bigger than their circumstances. . . . I do have hope. We have seen significant victories during the last 25 years."

In November 1999 Jackson came to the defense of six high-school students expelled for fighting in Decatur, Illinois. The Decatur school board expelled the students for two years for their involvement in a brawl during a football game in September 1999. Jackson met with the board to try to reach a compro-

mise that would allow the students to return to regular classes, but the board would only agree to reduce the punishment to one year and to allow the students to attend a different school. As a result, Jackson led a protest march at the school, where he was arrested for criminal trespassing.

Jackson received his master of divinity degree from the Chicago Theological Seminary on June 3, 2000. He had been only three courses short of earning his degree when he left the school more than three decades earlier. On August 9, 2000, President Bill Clinton awarded a Presidential Medal of Freedom to Jackson. The medal is the highest honor for civilians (nonmembers of military, police or fire-fighting units) in the United States. Jackson disappointed many of his followers when it became known in 2001 that he had fathered a daughter—who was twenty months old at the time of his announcement—with a woman other than his wife. “I fully accept responsibility, and I am truly sorry for my actions,” he said in a written statement. Despite this setback in his personal life, Jackson continues to be a successful advocate for human rights and social change.

MICHAEL JACKSON

Born: August 29, 1958

Gary, Indiana

*African American entertainer, singer,
and songwriter*

A performer since the age of five, Michael Jackson is one of the most popular singers in history. His 1983 album, *Thriller*, sold forty million copies, making it the biggest seller of all time. Through his record albums and music videos he created an image imitated by his millions of fans.

Career planned in advance

Michael Joe Jackson was born in Gary, Indiana, on August 29, 1958, the fifth of Joe and Katherine Jackson's nine children. The house was always filled with music. Jackson's mother taught the children folk and religious songs, to which they sang along. Jackson's father, who worked at a steel plant, had always dreamed of becoming a successful musician. When this failed to happen, he decided to do whatever it took to make successes of his children. He tried to control his children's careers even after they were adults. The struggle for the control of the musical fortunes of the Jackson family was a constant source of conflict.

The Jackson boys soon formed a family band that became a success at amateur shows and talent contests throughout the Midwest. From the age of five Michael's amazing talent showed itself. His dancing and stage presence caused him to become the focus of the group.

His older brother, Jackie, told Gerri Hershey in *Rolling Stone*, “It was sort of frightening. He was so young. I don’t know where he got it. He just *knew*.”

Discovered by Motown

The Jacksons’ fame and popularity soon began to spread. While performing at the Apollo Theater in New York City’s Harlem neighborhood in 1968, Motown recording artist Gladys Knight (1944–) and pianist Billy Taylor discovered them. Later that year singer Diana Ross (1944–) became associated with the boys during a “Soul Weekend” in Gary. With Ross’s support, the Jacksons signed a contract with Motown Records. Berry Gordy (1929–), the famous head of Motown, took control of the Jacksons’ careers.

By 1970 the group, known as the Jackson Five, was topping the charts and riding a wave of popularity with such hits as “ABC,” “The Love You Save,” and “I’ll Be There,” each of which sold over one million copies. The group also appeared on several televised specials, and a *Jackson Five* cartoon series was created. Gordy quickly recognized Michael’s appeal and released albums featuring him alone. These solo albums sold as well as those of the Jackson Five. The group managed to survive Michael’s voice change and a bitter break with Motown Records in 1976, but as the Jackson family they continued to fight with each other and with their own father.

In 1978 Michael Jackson appeared in *The Wiz*, an African American version of *The Wizard of Oz*. He sang the only hit from the film’s soundtrack album (“Ease On Down the Road”) in a duet with the star, Diana Ross. His success as the Scarecrow was a preview of what was to come in his videos, for Jackson seemed to care

Michael Jackson.

most about dancing. (He later dedicated his autobiography [the story of his one’s own life] to dance legend Fred Astaire [1899–1987], and the autobiography’s title, *Moonwalk*, refers to a dance that Jackson made popular.)

Unbelievable success

While working on *The Wiz*, Jackson met producer Quincy Jones (1933–). They worked together on Jackson’s 1979 album *Off the Wall*, which sold ten million copies and earned critical praise. In 1982 Jackson and Jones again joined forces on the *Thriller* album. *Thriller* fully established Jackson as a solo performer, and his hit songs from the album—“Beat It,”

“Billie Jean,” and “Thriller”—made him the major pop star of the early 1980s. The success of *Thriller* (with forty million copies sold, it remains one of the best-selling albums of all time) and the videos of its songs also helped Jackson break the color barrier imposed by radio stations and the powerful music video channel MTV. By 1983 Jackson was the single most popular entertainer in America.

In 1985 Jackson reunited with Quincy Jones for USA for Africa’s “We Are the World,” which raised funds for the poor in Africa. Jackson’s next two albums, *Bad* (1987) and *Dangerous* (1991), were not as hugely successful as *Thriller*, but Jackson remained in the spotlight throughout the 1980s and into the 1990s. In 1992 he founded “Heal the World” to aid children and the environment. In 1993 he was presented with the “Living Legend Award” at the Grammy Awards ceremony and with the Humanitarian (one who promotes human welfare) of the Year trophy at the *Soul Train* awards.

Rocked by scandal

Despite Jackson’s popularity and good works, he became the subject of a major scandal (action that damages one’s reputation). In 1993 a thirteen-year-old boy accused Jackson of sexually abusing him at the star’s home. Jackson settled the case out of court while insisting he was innocent. The scandal cost Jackson his endorsement (paid public support of a company’s products) contract with Pepsi and a film deal. His sexual preference was called into question, and his public image was severely damaged.

In 1995 Jackson was criticized following the release of his new album *HIStory: Past, Present, and Future, Book I*. One of the songs on the album, “They Don’t Care About Us,”

seemed to contain anti-Semitic (showing hatred toward Jewish people) lyrics (words). To avoid further criticism, Jackson changed the lyrics. He also wrote a letter of apology to Rabbi Marvin Hier, head of the Simon Wiesenthal Center for Holocaust Studies, who had protested the lyrics.

Marriage and fatherhood

In 1994 Jackson shocked the world when he married Lisa Marie Presley, daughter of the late (deceased) rock legend Elvis Presley (1935–1977). Many felt that the marriage was an attempt to improve his public image. In August 1996 Jackson and Presley divorced. In November 1996 Jackson announced that he was to be a father. The child’s mother was Debbie Rowe, a long-time friend of Jackson. They married later that month in Sydney, Australia. On February 13, 1997, their son, Prince Michael Jackson, Jr., was born in Los Angeles, California. The couple’s second child, daughter Paris Michael Katherine Jackson, was born in 1998. Rowe filed for divorce from Jackson in October 1999.

Jackson and his brothers were elected to the Rock and Roll Hall of Fame in Cleveland, Ohio, in 1997. Later that year another album, *Blood on the Dance Floor: HIStory in the Mix*, containing new versions of songs from *HIStory* along with five new songs, was released. The album received good reviews, and the world continued to be fascinated by the talent and career of Michael Jackson.

In 2000 Jackson’s promoter sued him for \$21.2 million for backing out of two planned concerts the previous New Year’s Eve. In 2001 Jackson, while delivering a lecture at Oxford University in England to promote his Heal the Kids charity, described his unhappy child-

hood and proposed a “bill of rights” for children that would provide for the right to an education “without having to dodge bullets.” Later that year Jackson was again elected to the Rock and Roll Hall of Fame, this time as a solo performer. Jackson also released a new album, *Invincible*, in October 2001.

REGGIE JACKSON

Born: May 18, 1946

Wyncote, Pennsylvania

African American baseball player

Baseball great Reggie Jackson was inducted into the Baseball Hall of Fame in 1993. Jackson's hard-hitting, fast-footed style helped him lead two teams to five World Championships in only seven

years. Jackson made headlines with his self-centered remarks, hot temper, and colorful manner.

The beginnings

Reginald Martinez Jackson was born on May 18, 1946, in Wyncote, Pennsylvania, to Martinez and Clara Jackson. Jackson was one of six children of African American and Spanish descent. When his parents divorced, young Jackson moved with two of his siblings to live with his father in Cheltenham, Pennsylvania. Although his father always provided food for the family, Jackson recalls that they often “felt poverty.” His father, a tailor and a dry cleaner, was once a semi-pro baseball player in the Negro leagues, and he was largely responsible for inspiring and encouraging his talented son to pursue a career in baseball.

Education and a career with the Athletics

Jackson was an all-star athlete in track, on the football team, in basketball, and in baseball by the time he entered his senior year at Cheltenham High School. Reggie accepted a scholarship from Arizona State University. In his sophomore year he was chosen to the All-American first team in baseball. His performance caught the attention of Charles O. Finley, owner of the Kansas City Athletics, who offered Jackson a \$95,000 bonus. He left college after his sophomore year and entered the world of professional baseball.

In 1968 Jackson moved with the Athletics to their new home in Oakland, California. In his first full season in the majors he hit 29 home runs and drove in another 74 runs. But he also made a dozen outfield errors and struck out a near record-breaking 171 times.

JACKSON, REGGIE

Reggie Jackson.

Reproduced by permission of AP/Wide World Photos.

The following season, in 1969, he again held a record number of strikeouts with 142, but he hit a fantastic 47 home runs and led the American League in scoring with 123 runs.

Trouble at home and on the field

After the end of that season Jackson's performance declined. The increasing pressures of trying to keep up with his own home-run pace, as well as troubles in his marriage to wife Jenni, contributed to his temporary decline. Further, he failed to bargain successfully with Finley for a high increase in pay. His average and his homers dropped and his continued poor perform-

ance caused him to be benched for a portion of that season.

In the winter of 1970 and 1971 Jackson went to Santurce, Puerto Rico, to work with Frank Robinson. Robinson, a veteran player-manager, helped Jackson to improve his play. Robinson's tutoring helped him to work on his aggressive playing style while keeping his temper under control.

Jackson bounces back

The following season Jackson bounced back. He helped lead the Athletics to the American League Western Division title in 1971 with 32 home runs. In 1972 the Athletics won the title again. In the playoffs the Athletics beat the Detroit Tigers, with Jackson sliding into home plate to score the winning run in the final game. But he tore a muscle in one of his legs, which forced him to sit out of the World Series. Jackson watched as the Athletics defeated the Cincinnati Reds.

Voted the American League's Most Valuable Player (MVP) in 1973, Jackson batted .293 and led the league with 32 home runs. That year the team went on to win the World Series over the New York Mets. Leading the league in runs, he was chosen MVP in the World Series.

Leaves the Oakland Athletics

The Athletics won the World Series in 1974, defeating the Los Angeles Dodgers, with Jackson hitting 29 homers for the season. Finally, in 1975, after winning the American League Western Division title, Jackson ended his nine-year career with the Athletics. Finley traded Jackson to the Baltimore Orioles and he stayed with them for one season.

In 1977 Jackson signed a five-year contract as a free agent with the New York Yankees for \$300,000 a year. Once again he led his team to a World Series championship. The night of October 18, 1977, was one of Jackson's greatest triumphs. In that game, he became only the second player in history to hit three home runs in one game. In the entire series, he hit five home runs, a World Series record. Jackson was named MVP of the World Series that fall. He followed that spectacular season with a second World Series win against the Dodgers in 1978. His walloping World Series hitting earned him the title "Mr. October," as he could always be counted on to pull his team to victory in the Fall Classic.

The Yankees won the American League pennant in 1981. Jackson hit his tenth and final World Series home run that year. The California Angels signed Jackson in 1982, and he reached the 500-homer mark in 1984. Jackson returned to the Athletics in 1987 and retired at the end of the season. He placed sixth on the all-time major league career home run list, with 563 home runs during his twenty-one-year baseball career.

Retirement

After retiring Jackson worked briefly as a sports broadcaster for the Angels before moving on to coach for the Athletics. He then took a job with the Upper Deck Company, handling sales of trading cards and sports collectibles. On August 1, 1993, Reggie Jackson became the 216th inductee into the Baseball Hall of Fame. His achievements run to both extremes: ten World Series home runs; five World Championships; eleven American League Championships with three different

teams; along with holding the major league record for lifetime strikeouts at 2,597.

The Yankees retired Jackson's number "44" baseball uniform. During the summer of 1993, Jackson returned to the Yankees as a special assistant and advisor to the general partners. Jackson continued his work in California for the trading card company, and he was made director of new business at a California-based computer company for which he was already a spokesman. He is also an avid car collector and runs a charity called the Mr. October Foundation for Kids. He has one daughter, Kimberly.

P. D.
JAMES

Born: August 3, 1920

Oxford, England

English author

Although British author P. D. James writes in the tradition of the British crime storyteller, because her stories also explore relationships, motivations

P. D. James.

Reproduced by permission of AP/Wide World Photos.

(reasons for behavior), and meanings of justice, some people think of her more as novelist than a mystery writer.

Early years

P. D. James was born Phyllis Dorothy James on August 3, 1920, in Oxford, England, the oldest of three children. Her parents, Sidney Victor, a tax official, and Dorothy May (Hone) James, moved to Cambridge, England, where Phyllis attended the Cambridge High School for Girls. Phyllis liked Cambridge and even used the city as the location for one of her books, *An Unsuitable Job for a Woman*.

Phyllis had to leave school at age sixteen to work. The family did not have much money and her father did not believe in higher education for girls. Dorothy worked in a tax office for three years. Later she found a job as an assistant stage manager for a theater group. In 1941 she married Ernest Connor Bantry White, an army doctor, and had two daughters, Claire and Jane.

When White returned from World War II (1939–45; a war fought mostly in Europe that pitted the Soviet Union, Great Britain, and the United States against Germany, Italy, and Japan), he suffered from a mental illness and was not able to get a job. James was forced to provide for the whole family until her husband's death in 1964. James studied hospital administration (management), and from 1949 to 1968 she worked for a hospital board in London, England.

Early novels

James was in her early forties when her first novel, *Cover Her Face*, was published in 1962. Her personal and professional experience helped to develop her powers of observation and thought. These aided her in both her description of police detective work and her portrayal of characters.

In 1968 James passed an examination that qualified her for a government job. She eventually worked in the Crime Department (1972–79) in London.

James's work served as a basis for her novels, giving them backgrounds for both medical and police procedures (official ways of working). The settings of several of her mysteries, including *A Mind to Murder* (1962), *Shroud for a Nightingale* (1971), and *Death of an Expert*

Witness (1977), are in medicine-related locations. In all of these novels she is just as interested in examining the relationships among people as she is in telling a mystery story.

James wrote some of her works in the tradition of the British crime storyteller as represented by such authors as Dorothy L. Sayers (1893–1957) and Agatha Christie (1891–1976). These are stories that have sometimes been referred to as “polite mysteries.” However, James also wrote about motivations, explored relationships between people, examined ideas about guilt and innocence, and questioned both the legal system and religion.

Experimentation with the mystery form

James’s work is distinguished (special) not only for its quality of plot, setting, and character, but also for its experimentation with the mystery form. Her first novel, *Cover Her Face* (1962), is similar to the stories written by Agatha Christie and Dorothy L. Sayers, but James began to experiment with new plots and new types of characters. She has written about questions of social privilege (special rights), politics, aesthetics (the theory of beauty and art), and theology (the study of religion). In her novel *The Children of Men* (1993) she experimented with science fiction.

Because James brought such new ideas to the mystery story, many people have chosen to classify James not as a crime author, but as a novelist. James herself says that she uses the detective story to comment on men, women, and society. In an interview published in the *New York Times* in 1986, she said that she would “sacrifice . . . the detective element” in her work if it would make a better novel.

Some critics are unhappy with James’s concern with the psychology (the science of

how the mind works) of her characters. These people would rather have a book that simply tells a basic detective story and gives the solution.

Even so, the qualities condemned by one group are prized by another. James is well respected and she has received many awards for her literary achievements.

Main characters

Most of James’s books involve one of two characters: Adam Dalgliesh, a police inspector in Scotland Yard (London’s police headquarters) and a published poet; and Cordelia Gray, a young private detective introduced in *An Unsuitable Job for a Woman* (1972). In addition to their own individual mysteries, Dalgliesh and Gray appear together in some of the books.

James today

To date P. D. James has published fourteen books and many short stories. She was awarded the Order of the British Empire (OBE) in 1983 and was made a baroness in 1991. She also served on the governor’s board of the British Broadcasting Company (BBC). She continues to have loyal fans who enjoy both a good mystery and a well-written novel.

THOMAS JEFFERSON

Born: April 13, 1743

Shadwell, Virginia

Died: July 4, 1826

Monticello, Virginia

American president, philosopher, and statesman

The American philosopher and statesman Thomas Jefferson was the first secretary of state, the second vice president, and the third president of the United States. As president, Jefferson successfully negotiated, or bargained for the terms of, the Louisiana Purchase, which nearly doubled the country's size. A man of broad interests and activity, Jefferson remains an inspiration, for both his political accomplishments and his vision for America.

Young Jefferson

Thomas Jefferson was born in Shadwell, Virginia, on April 13, 1743. His father had been among the earliest settlers in this wilderness country, and his position of leadership transferred to his oldest son, along with five thousand acres of land. Jefferson became one of the best-educated Americans of his time. At the age of seventeen he entered the College of William and Mary, where he got exciting first glimpses of "the expansion of science, and of the system of things in which we are placed." He read widely in the law, in the sciences, and in both ancient and modern history, philosophy, and literature.

Jefferson was admitted to the bar, or an association for lawyers, in 1767 and established a successful practice. When the Amer-

ican Revolution (1795–83) forced him to abandon his practice in 1774, he turned these legal skills to the rebel cause. Jefferson's public career began in 1769, when he served as a representative in the Virginia House of Burgesses, the nation's first elected body of government. About this time, he began building Monticello. Perched on a wooded summit, the lovely home would become a lifelong occupation. Monticello, like the many other buildings Jefferson designed over the years, was an original, personal creation.

His philosophy

Jefferson rose to fame as an effective spokesman during the American Revolution, and his political thought would become the centerpiece of liberalism, or a movement to develop freedoms, in America. In challenging the British Empire, Americans like Jefferson came to recognize their claims to an independent nation.

Jefferson's most important contribution to the revolutionary debate was "A Summary View of the Rights of British America" (1774). He argued that Americans possessed the same natural rights to govern themselves as their ancestors had exercised when they moved to England from Germany. Writings like Jefferson's, began to stir support for a revolution. Soon there would be no way of avoiding war with Great Britain.

The Declaration of Independence

The Revolutionary War (1775–83) had begun by the time Jefferson took his seat in the Second Continental Congress in Philadelphia in June 1775. The Congress brought together many of America's prominent political figures of the time. It was chiefly as a legislative drafts-

man, or legal writer, that Jefferson would make his mark, with his great work being the Declaration of Independence. Signed by most parties on July 4, 1776, the Declaration of Independence formally announced that the American colonies were separating from Great Britain. In June 1776 Jefferson was surprised to find himself at the head of the committee to prepare this paper. He submitted a draft to John Adams (1735–1826) and Benjamin Franklin (1706–1790), who suggested only minor changes.

Although many changes were made in the end, the declaration that emerged on July 4 bore the unmistakable stamp of Thomas Jefferson. The Declaration of Independence clearly set forth the problems with British rule and expressed a political philosophy and a national faith in only one paragraph. Here, for the first time in history, ideas were laid as the foundation of a nation. Natural equality, the inalienable (or not able to be taken away) rights of man, the freedom of the people, the right of revolution—these ideas gave the American Revolution high purpose.

In Virginia

Jefferson became Virginia's governor in June 1779 as the Revolutionary War had entered a new phase. The British decision to attack in the South would, if successful, have made Virginia the critical battleground. Jefferson struggled against huge odds to aid the southern army in defending its territory from the invading British.

Early in 1781 the British invaded Virginia from the coast, slashed through to Richmond, and put the government to flight. In May, General Charles Cornwallis (1738–1805) marched his army of British

Thomas Jefferson.
Courtesy of the National Portrait Gallery.

soldiers into Virginia, and the government moved to the safer city of Charlottesville, Virginia. The Redcoats, or British soldiers, followed, and Jefferson was chased from Monticello.

Wounded by the criticism of his retreat, Jefferson decided to quit public service. A series of personal setbacks, including his wife's death in September 1782, plunged him into gloom. It appeared the life he had sought in his family, farms, and books was suddenly out of reach. That November he eagerly accepted congressional appointment to the peace commission in Paris. He never sailed, however, and wound up in Congress instead.

Service in Congress

In Congress, from November 1783 to the following May, Jefferson laid the foundations of national policy in several areas. He drafted the first regulation of government for the western territory, where free and equal states would be created out of the wilderness. Jefferson also took a leading part in creating foreign policy. The American economy rested on foreign commerce, but only France was open to trade with America. In 1784 he was appointed to a three-man commission (with Adams and Franklin) to negotiate treaties of commerce with the other European powers. He then replaced Franklin as the representative to France and spent the next five years in Europe.

On Jefferson's return to America in 1789, President George Washington (1732–1799) appointed him secretary of state. For the next three years he was chiefly engaged in fruitless negotiations with the European powers. With Spain he sought to secure free navigation of the Mississippi River through Spanish territory to the Gulf of Mexico. With Britain he sought the removal of English troops from the Northwest and settlement of issues left over from the peace treaty.

Developing political parties

By 1793, relations between the Federalist and Republican parties worsened. When war erupted between France and Britain in 1793, the opposing views of the parties toward these nations threatened American peace. Jefferson attempted to use American neutrality. As a neutral country, the nation would support neither side during the war. By doing this he hoped to force cooperation from Britain and to improve relations between the nations of the Western world.

Soon relations with France grew poor and severely damaged Jefferson's political system.

Jefferson gave up his post at the end of 1793, again determined to quit public life. But in 1796 the Republicans made him their presidential candidate against John Adams. Losing by only a slim margin, Jefferson became vice president.

President of the United States

Republicans doubled their efforts to elect the "man of the people" in the unusually bitter campaign of 1800. Jefferson topped Adams in the election and became president on March 4, 1801, in the new national capital, Washington, D.C. In his inaugural address, or speech after being sworn in as president, Jefferson brilliantly summed up the Republican ideas and appealed for harmony among all political parties.

Reform, or improving American society, was the order of the day. Working effectively with Congress, Jefferson restored freedom of the press, scaled down the army and the navy, ended all internal taxes, and began paying off the national debt. The Jeffersonian reformation was based on the economic plans of the government by reducing the means and powers of government. The reformation sought to further peace, equality, and individual freedoms, and to help solidify the American way of life.

The president's greatest triumph came in foreign affairs. When Spain turned over Louisiana and the port of New Orleans to France in 1800, this action posed a serious threat to American security. Jefferson skillfully managed this crisis with the Louisiana Purchase (1803), in which America gained an uncharted region of some 800,000 square

miles, doubling the nation's size, for \$11.25 million. Even before the treaty was signed, Jefferson planned an expedition to explore this country. The legendary Lewis and Clark expedition (led by Meriwether Lewis [1774–1809] and William Clark [1770–1838]) explored the rugged land gained in the Louisiana Purchase, and the expedition became a spectacular product of Jefferson's vision of westward expansion.

The second term

Easily reelected in 1804, Jefferson soon encountered troubles at home and overseas. His relations with Congress weakened as Republicans quarreled among themselves. Especially damaging was when former Republican leader John Randolph (1773–1833) and former vice president Aaron Burr (1756–1836) mounted a revolt in the west. But Jefferson crushed this and, with difficulty, maintained control of Congress.

With tension between America and France reaching a boiling point, Jefferson avoided war by installing an embargo, or a suspension of trade, in December 1807. On the whole, the embargo was effectively enforced and reasonably successful, but the mounting costs at home led to its reversal by Congress near the end of Jefferson's presidency.

Active retirement

In retirement Jefferson became the "Sage of Monticello." He maintained a large correspondence (wrote letters) and remained interested in a broad variety of intellectual pursuits. Unfinished business from the Revolution drew his attention, such as revision of the Virginia constitution and the gradual emancipation, or freedom, of slaves. Jef-

erson was the master planner of the University of Virginia in all its parts, from the grounds and buildings to the university rules, teachers, and subjects taught. He died at Monticello on the fiftieth anniversary of American independence, July 4, 1826.

Jefferson remains a major figure in the development of the United States. His accomplishments, both large and small, and his beliefs, both political and personal, remain inspiring to Americans, especially through his masterpiece, the Declaration of Independence.

MAE
JEMISON

Born: October 17, 1956

Decatur, Alabama

African American physician and astronaut

Mae Jemison, a doctor, was the first African American woman to be selected for the National Aeronautic and Space Administration's (NASA's) astronaut training program and was the first African American woman to travel in space.

Early life and education

Mae Carol Jemison was born on October 17, 1956, in Decatur, Alabama, the youngest child of Charlie Jemison, a roofer and carpenter, and Dorothy (Green) Jemison, an elementary school teacher. Her parents were supportive and encouraging of all of their children's talents and abilities; Jemison's sister, Ada Jemison Bullock, became a child psychiatrist, and her brother, Charles Jemison, became a real estate broker. The family moved to Chicago, Illinois, when Jemison was three to take advantage of better educational opportunities there.

Throughout her early school years, Jemison spent many hours in her school library reading about all subjects related to science, especially astronomy. From a young age she was interested in space travel. During her time at Morgan Park High School, however, she became interested in pursuing a career in engineering. When she graduated in 1973 as an honor student, she entered Stanford University on a National Achievement Scholarship.

Jemison pursued a double major at Stanford, and in 1977 she received a bachelor's degree in chemical engineering and in African and Afro-American Studies. Just as she had been in high school, Jemison was very involved in outside activities, including dance and theater productions, and she served as head of the Black Student Union. Upon graduation she entered Cornell Univer-

sity Medical College to work toward a medical degree.

During her years at Cornell, Jemison found time to expand her horizons by visiting and studying in Cuba and Kenya and working at a Cambodian refugee camp in Thailand. When she obtained her degree in medicine in 1981, she received her on-the-job training at Los Angeles County/University of Southern California Medical Center and later established a general practice. For the next two and a half years, she was the area Peace Corps medical officer for Sierra Leone and Liberia, where she also taught and did medical research.

Following a dream

After her return to the United States in 1985, Jemison made a career change and decided to follow a dream she had had for a long time. In October of that year she applied for admission to NASA's astronaut training program. The selection process was delayed after the explosion of the space shuttle *Challenger* in January 1986, but when she reapplied a year later, Jemison was one of fifteen candidates chosen from a field of about two thousand. She became the first African American woman ever admitted into the astronaut training program.

After more than a year of training, Jemison became an astronaut with the title of science-mission specialist, a job that would make her responsible for conducting crew-related scientific experiments on the space shuttle. On September 12, 1992, with six other astronauts, Jemison flew into space aboard the *Endeavour* on mission STS-47. During her eight days in space, she conducted weightlessness and motion sickness experiments on the

crew and on herself before returning to Earth on September 20. Following her historic flight, Jemison noted that society should recognize how much both women and members of other minority groups can contribute if given the opportunity.

Honors and new challenges

In recognition of her accomplishments, Jemison received the 1988 Essence Science and Technology Award, was named Gamma Sigma Gamma Woman of the Year in 1990, received the Ebony Black Achievement Award in 1992, and received a Montgomery Fellowship from Dartmouth College in 1993. Also in 1992 a public school in Detroit, Michigan—the Mae C. Jemison Academy—was named after her. Jemison is a member of the American Medical Association, the American Chemical Society, and the American Association for the Advancement of Science, and she served on the Board of Directors of the World Sickle Cell Foundation from 1990 to 1992. She is also a committee member of the American Express Geography Competition and a board member of the Center for the Prevention of Childhood Malnutrition.

After leaving the astronaut corps in March 1993, Jemison established the Jemison Group, a company that seeks to research, develop, and market advanced technologies (scientific ways of achieving a practical purpose). She is also a professor at Dartmouth College, where she started the Jemison Institute for Advancing Technology in Developing Countries. Jemison also created The Earth We Share, a science camp for twelve- to sixteen-year-olds that helps improve students' problem-solving skills. She remains a popu-

Mae Jemison.

JESUS OF NAZARETH

Born: 4 B.C.E.

Bethlehem, Judea

Died: c. 29 C.E.

Jerusalem, Judea

Judean religious leader

Jesus of Nazareth, also known as Jesus Christ, was the central personality and founder of the Christian faith.

Early years

Jesus first came to general attention at the time of his baptism (religious ritual performed shortly after a child's birth), just prior to his public ministry. He was known to those around him as a carpenter of Nazareth, a town in Galilee, and as the son of Joseph (John 6:42). Matthew and Luke report that Jesus was born in Bethlehem, famous in Jewish history as the city of David. They further report that he was miraculously (something that occurs that cannot be explained by nature's laws) born to the Virgin Mary, although they both curiously trace his kinship to David through Joseph, to whom Mary was engaged. It is likely that Jesus was born not later than 4 B.C.E., the year of King Herod's death. (The term Christ is actually a title, not a proper name; it comes from the Greek *Christos*, meaning the anointed, or the one chosen by God; in the Bible it is the Greek equivalent for the Hebrew word *Messiah*.)

Little is known of Jesus' childhood and youth. The letters of Paul are the earliest biblical records that tell about Jesus. But the four biblical Gospels by Matthew, Mark, Luke,

and John, although written later, used sources that in some cases go back very close to the time of Jesus. But about the year 28 or 29 C.E. his life interacted with the career of John the Baptist. Jesus heard John's preaching and joined the crowds for baptism in the Jordan River. Following his baptism Jesus went into the desert for prayer and reflection.

Galilean ministry

Returning from the desert, Jesus began preaching and teaching in Galilee. His initial declaration was both frightening and hopeful. It told people not to cling to the past, that God would overthrow old institutions and ways of life for a wonderful new future. This future would be especially welcomed by the poor, the powerless, and the peacemakers.

Jesus attracted twelve disciples to follow him. They were mainly fishermen and common workers. Of the twelve it seems that Peter, James, and John were closest to Jesus. Peter's home in Capernaum, a city on the Sea of Galilee, became a headquarters from which Jesus and the disciples moved out into the countryside. Sometimes he talked to large crowds, with the twelve to teach only them, or he might go off by himself for long periods of prayer.

The miracles

The records concerning Jesus report many miracles (an event that goes against the laws of nature and has suggested divine influence). For centuries most people in civilizations influenced by the Bible not only believed literally in the miracles but took them as proof that Jesus had supernatural (something that is not normal, possibly with a spiritual influence) power. Then, in an age

of reason and distrust, men often doubted the miracles and exposed the reports as dishonest. However, usually the Gospels report the healings as signs of the power of God and His coming kingdom.

Teachings of Jesus

Jesus taught people in small groups or large gatherings; his lessons are reported in friendly conversations or in arguments with those who challenged him. At times he made a particularly vivid comment in the midst of a dramatic incident.

The starting point of Jesus' message, as already noted, was the announcement of the coming of the kingdom of God. Since this kingdom was neither a geographical area nor a system of government, a better translation may be "God's reign" (God being in existence everywhere).

The rest of Jesus' teaching followed from this message about the reign of God. At times he taught in stories or parables that described the kingdom or the behavior of people who acknowledged God's reign. At times he pronounced moral commandments detailing the demands upon men of a loving and righteous God. At times Jesus taught his disciples to pray: the words that he gave them in the Lord's Prayer are often used today.

To some people Jesus was a teacher, or rabbi. The healing ministry did not necessarily change that impression of him because other rabbis were known as healers. But Jesus was a teacher of peculiar power, and he was sometimes thought to be a prophet (a person who tells of things that have been made known to him or her by a divine power).

Jesus of Nazareth.

Passion week

On the day now known as Palm Sunday, Jesus entered Jerusalem, while his disciples and the crowds hailed him as the Son of David, who came in the name of the Lord. The next day Jesus went to the Temple and drove out the money-changers and those who sold pigeons for sacrifices, accusing them of turning "a house of prayer" into a "den of robbers." This act was a direct challenge to the small group of priests who were in charge of the Temple, and they clearly took offense to it. During the following days he entered into disagreements with the priests and teachers of religion. Their anger led them to plot to get rid of him, but they hesitated to

do anything in the daytime, since many people were gathered for the feast of Passover (a Jewish religious holiday).

On Thursday night Jesus had a meal with his disciples. This meal is now re-enacted by Christians in the Lord's Supper, the Mass, or the Holy Communion. After the meal Jesus went to the Garden of Gethsemane, where he prayed alone. His prayer shows that he expected a conflict, that he still hoped he might avoid suffering, but he expected to do God's will. There into the garden one of his disciples, Judas Iscariot, led the priests and the temple soldiers, who seized Jesus.

That same night Jesus' captors took him to a trial before the temple court, the Sanhedrin. Much evidence indicates that this was an illegal trial, but the Sanhedrin declared that Jesus was a blasphemer (a person who claims to be God or godlike) deserving death. Since at that time only the Roman overlords (supreme lords) could carry out a death sentence, the priests took Jesus to Pilate, the Roman governor of Judea.

Pilate apparently was reluctant to convict Jesus, since it was doubtful Jesus had disobeyed any Roman laws. Jesus, however, represented a threat to both the Sanhedrin and the Romans. Pilate thus ordered the crucifixion of Jesus. Roman soldiers beat him, put a crown of thorns on his head, and mocked him as a false king. Then they took him to the hill Golgotha ("the Skull"), or Calvary, and killed him. Pilate ordered a sign placed above his head: "King of the Jews." Jesus died and that same day (now known as Good Friday) was buried in a cave-like tomb.

The Resurrection

On Sunday morning (now celebrated as Easter), the Gospels report, Jesus rose from the

dead and met his disciples. Others immediately rejected the claim of the resurrection, and the debate has continued through the centuries.

The New Testament states very clearly that the risen Christ did not appear to everybody. Among those who saw Jesus were Cephas (Peter), the twelve disciples, "more than five hundred brethren at one time," James, and finally Paul. Other records tell of appearances to Mary Magdalene and other women and of a variety of meetings with the disciples. The four Gospels all say that the tomb of Jesus was empty on Easter morning. None of the records ever tells of an appearance of the risen Christ to anyone who had not been a follower of Jesus or (like Paul) had not been deeply disturbed by him.

The evidence is very clear that the followers of Jesus were absolutely convinced of his resurrection. The experience of the risen Jesus was so overwhelming that it turned their despair into courage. The disciples spread the conviction that he had risen, and they continued to tell their story at the cost of persecution and death. The faith in the resurrection (and later the rising up to the kingdom of God) of Jesus, despite differences in interpretation and detail, is a major reason for the rise and spread of the Christian faith.

JIANG ZEMIN

Born: August 17, 1926

Yangzhou City, Jiangsu Province, China

Chinese political leader

Hand picked by Deng Xiaoping (1904–1997) to be built up as China's future leader, Jiang Zemin became general secretary of the Chinese Communist Party in 1989.

Early years

Jiang Zemin was born on August 17, 1926, in Yangzhou city, Jiangsu Province, a small town on the banks of the Chang River west of Shanghai, China. Jiang's father and uncle were educated men and his grandfather was a well-known painter who also practiced Chinese medicine. His father was a Communist (a person who supports a political system in which goods and services are owned and distributed by the government) and was most likely killed by Chinese

Nationalists during the civil war that tore apart China for nearly twenty years. Jiang joined the Chinese Communist Party (CCP) in 1946 and graduated from the electrical machinery department of Jiaotong University in Shanghai the following year.

After the Communists took power in China in 1949, Jiang assumed several positions in Shanghai including the CCP committee secretary. In 1955 Jiang was sent to work as a trainee at the Stalin Automobile Factory in Moscow. After returning to China the following year, his career advanced steadily as an engineer and under the First Ministry of the Machine-Building Industry. From 1971 to 1979 he was appointed deputy director, later director, of the Foreign Affairs Bureau under the same ministry.

In 1982 Jiang was elected a member of the CCP Central Committee at the twelfth party congress. After 1985, Jiang's career improved greatly as he returned to Shanghai as its deputy party secretary, later secretary and mayor. In 1987 he entered the Politburo (top part of the Communist party) at the thirteenth CCP congress.

Positions under Deng Xiaoping

In June 1989, in the aftermath of the Tiananmen Square massacre, where hundreds of pro-democracy student protesters were killed by police forces, Jiang was appointed by Deng Xiaoping to the position of general secretary of the CCP. In November 1989 Jiang also took over the chairmanship of the Central Military Commission when Deng stepped down. Like Deng Xiaoping, Jiang supported economic reform (improvements), but did little where political reform was concerned.

After Jiang became party general secretary, he faithfully followed the new party line. For example, he blamed hostile outside forces for China's domestic political problems in the late 1980s. Likewise, he put a renewed emphasis on Communist loyalty over selecting and promoting party officials. He was prominently quoted in a *People's Daily* front-page commentary on June 24, 1990, as saying, "In choosing people, in assigning people, in educating people, we must take a revolutionary outlook as the prerequisite [required experience] to insure that party and government leaders at every level are loyal to Marxism." (Marxism, based on the ideas of Karl Marx [1818–1893] is the basis for communism.)

After Deng Xiaoping

Xiaoping officially retired in 1989, the same year of the Tiananmen Square massacre. Jiang did not have a base of support within the party or the army, and in 1990 still lacked leadership stature. But through his work as chairman of the CCP's Central Military Commission, Jiang eventually gained support and was named president of China in 1993.

Business ventures in China widened the class gap and only worsened the Chinese economy. In the 1990s, urban areas began experiencing increased crime and revolutionary groups sprang up. In the autumn of 1994, a militant group placed explosives on train tracks, derailing a train carrying troops from China's 13th Army. The explosion killed 170 and injured 190 people. Moreover, China's relationship with the rest of the world grew increasingly strained with widespread reports of human rights abuses, including prison labor and political imprisoning.

In April 1996, in an attempt to reestablish law and order, Jiang launched an anticrime drive, known as "Strike Hard" (Yanda in Chinese). Within six months Strike Hard had resulted in more than 160 thousand arrests and more than one thousand executions. Though many were critical of these actions, the government claimed it was well received by the Chinese citizens who were alarmed by the rising crime statistics. Jiang is also known for reclaiming the British colony of Hong Kong and attempting to convince Taiwan to follow.

In the spring of 2001, China-U.S. relations reached a fevered pitch, when a U.S. spy plane collided with a Chinese fighter jet. The U.S. plane was forced to land in China where the aircraft (loaded with highly secretive spy technology) and its crew were detained for eleven days. On July 18, 2001, Jiang met with Russian leader Vladimir Putin (1952–) in a summit (meeting) aimed at improving Russo-Chinese relations and slowing the United States' global influence. The two sides signed a statement to reduce missile defense, and improve trade between the two countries.

JOAN OF ARC

Born: c. 1412

Domrémy, France

Died: May 30, 1431

Rouen, England

French heroine

The French national heroine Joan of Arc led a troop of French soldiers and served as a temporary focus of French resistance to English occupation in the last phase of the Hundred Years War (1339–1453), a war with England which caused severe hardship in France. Joan of Arc's place in history was finally solidified in the twentieth century when she was declared a saint.

A restless France

In 1392 the insanity of the French king, Charles VI (1368–1422), had begun the struggle between two factions (rival groups) to control the kingdom, the Burgundians and the Armagnacs. The leader of the Armagnacs, John the Fearless (1371–1419), Duke of Burgundy, finally assumed control, as both sides appealed for help to England. Henry V (1387–1422) of England invaded France in 1415 and delivered a shattering defeat upon the French. The English and Burgundians entered Paris in 1418, and the murder of John the Fearless in 1419 strengthened Burgundian hatred for the Armagnac faction.

In 1420 Charles VI, Henry V, and Philip the Good (1396–1467) of Burgundy agreed to the Treaty of Troyes. The treaty said that Henry was to act as regent, or acting ruler, for the mad Charles VI, marry Charles's daughter, then

inherit the throne of France upon Charles's death. The treaty thus disinherited Charles VI's son, Charles VII (1403–1461). In 1422 both Henry V and Charles VI died, leaving Henry VI, the infant son of Henry, as king of both kingdoms. Henry VI, through his regent, the Duke of Bedford, ruled unchallenged in Normandy and the Île-de France. In the autumn of 1428 the English attacked Orléans, the key city to Charles's land. Charles, lacking in men and money, could do nothing. By the spring of 1429 the city appeared about to fall and with it the hopes of Charles VII.

Early life

Joan was born to a peasant family in Domrémy, France, a small town near Vaucouleurs, the last town in the east still loyal to Charles VII. "As long as I lived at home," she said at her trial in 1431, "I worked at common tasks about the house, going but seldom afield with our sheep and other cattle. I learned to sew and spin: I fear no woman in Rouen at sewing and spinning."

Some time in 1425 Joan began to have visions—"When I was thirteen, I had a voice from God to help me govern myself." The voice was that of St. Michael, who, with St. Catherine and St. Margaret, "told me of the pitiful state of France, and told me that I must go to succor [assist] the King of France." Joan twice went to Robert de Baudricourt, the captain of Vaucouleurs, asking for armor, a horse, and an escort to Charles VII at Chinon, but her request was denied both times. However, Joan was both persistent and persuasive, and when she went to de Baudricourt a third time he granted her request. She set out in February 1429, arriving eleven days later at Chinon.

JOAN OF ARC

Joan of Arc.

Reproduced by permission of the Corbis Corporation.

Joan of Arc was once described: “This Maid . . . has a virile [man-like] bearing, speaks little, shows an admirable prudence [carefulness] in all her words. She has a pretty, woman’s voice, eats little, drinks very little wine; she enjoys riding a horse and takes pleasure in fine arms, greatly likes the company of noble fighting men, detests [dislikes] numerous assemblies and meetings, readily sheds copious [many] tears, has a cheerful face. . . .” Joan appears to have been robust, with dark brown hair, and, as one historian remarked, “in the excitement which raised her up from earth to heaven, she retained her solid common sense and a clear sense of reality.”

In April 1429 Charles VII sent her to Orléans as captain of a troop of men—not as leader of all his forces. With the Duke d’Alençon and Jean, the Bastard of Orléans (later Count of Dunois), Joan relieved the city, thus removing the greatest immediate threat to Charles and for the first time in his reign allowing him a military triumph.

Her mission

Although Charles VII appears to have accepted Joan’s mission, his attitude toward her, on the whole, is unclear. He followed her pressing advice to use the relief provided by the success of Orléans to proceed to his coronation (crowning ceremony) at Reims, thereby becoming king in the eyes of all men. Charles VII was crowned at Reims on July 18, 1429. Joan was at his side and occupied a visible place in the ceremonies following the coronation.

From the spring of 1429 to the spring of 1430, Charles and his advisers were undecided on the course of the war. Joan favored taking the military offensive against English positions, particularly Paris. An attack upon Paris in September 1429 failed, and Charles VII entered into a treaty with Burgundy that committed him to virtual inaction.

From September 1429 to the early months of 1430, Joan appears to have been kept inactive by the royal court, finally moving to the defense of the town of Compiègne in May 1430. During a small battle outside the town’s walls against the Burgundians, Joan was cut off and captured. She was a valuable prize. The Burgundians turned Joan over to the English, who prepared to try her for heresy, or having opinions that conflict with the beliefs of the church. Charles VII could do nothing.

The trial

Joan's trial was held in three parts. Technically it was an ecclesiastical (involving the church) trial for heresy (having religious beliefs that are against those held by the church), and Joan's judges were Pierre Cauchon (1371–1442), the bishop of Beauvais, and Jean Lemaitre, vicar of the inquisitor of France, or the religious assistant to the top judge in France. Both were aided by a large number of theologians (those that study religion) and lawyers who sat as a kind of consulting and advising jury.

From January to the end of March, the court investigated Joan's "case" and questioned witnesses. The trial itself lasted from April to nearly the end of May and ended with Joan's abjuration, or renouncing her faith. The trial was both an ecclesiastical one and a political one. Joan was charged with witchcraft and fraud, or a willful cheating. She was tested by being asked complicated theological (involving religious teachings) questions, and finally condemned (found guilty) on the grounds of persisting in wearing male clothing, a technical offense against the authority of the Church.

Joan's answers throughout the trial reveal her presence of mind, humility, wit, and good sense. Apparently Joan and her accusers differed about the nature of her abjuration, and two days after she signed it, she recanted, or withdrew her previous belief.

The third phase of her trial began on May 28. This time she was tried as a relapsed heretic, conviction of which meant "release" to the "secular arm," that is, she would be turned over to the English to be burned. Joan was convicted and she was burned at the stake in the marketplace of Rouen on May 30, 1431.

Rehabilitation and later legend

From 1450 to 1456 a reinvestigation of Joan's trial and condemnation was undertaken by ecclesiastical lawyers. On July 7, 1456, the commission declared Joan's trial null and void, thereby freeing Joan from the taint of heresy. The Joan of Arc legend, however, did not gather momentum until the seventeenth century. In spite of her legend, Joan was not canonized (declared a saint) until May 16, 1920.

STEVE JOBS

Born: February 24, 1955

San Francisco, California

American business executive, computer programmer, and entrepreneur

Computer designer and corporate executive Steve Jobs is cofounder of Apple Computers. With his vision of

Steve Jobs.

Reproduced by permission of the Corbis Corporation.

affordable personal computers, he launched one of the largest industries of the past decades while still in his early twenties. He remains one of the most inventive and energetic minds in American technology.

Early life

Steven Jobs was born February 24, 1955, in San Francisco, California, and was adopted by Paul and Clara Jobs. He grew up with one sister, Patty. Paul Jobs was a machinist and fixed cars as a hobby. Jobs remembers his father as being very skilled at working with his hands.

In 1961 the family moved to Mountain View, California. This area, just south of Palo Alto, California, was becoming a center for electronics. Electronics form the basic elements of devices such as radios, televisions, stereos, and computers. At that time people started to refer to the area as “Silicon Valley.” This is because a substance called silicon is used in the manufacturing of electronic parts.

As a child, Jobs preferred doing things by himself. He swam competitively, but was not interested in team sports or other group activities. He showed an early interest in electronics and gadgetry. He spent a lot of time working in the garage workshop of a neighbor who worked at Hewlett-Packard, an electronics manufacturer.

Jobs also enrolled in the Hewlett-Packard Explorer Club. There he saw engineers demonstrate new products, and he saw his first computer at the age of twelve. He was very impressed, and knew right away that he wanted to work with computers.

While in high school Jobs attended lectures at the Hewlett-Packard plant. On one occasion he boldly asked William Hewlett (1931–2001), the president, for some parts he needed to complete a class project. Hewlett was so impressed he gave Jobs the parts, and offered him a summer internship at Hewlett-Packard.

College and travel

After graduating from high school in 1972, Jobs attended Reed College in Portland, Oregon, for two years. He dropped out after one semester to visit India and study eastern religions in the summer of 1974. In 1975 Jobs joined a group known as the

Homebrew Computer Club. One member, a technical whiz named Steve Wozniak (1950–), was trying to build a small computer. Jobs became fascinated with the marketing potential of such a computer. In 1976 he and Wozniak formed their own company. They called it Apple Computer Company, in memory of a happy summer Jobs had spent picking apples. They raised \$1,300 in start-up money by selling Jobs's microbus and Wozniak's calculator. At first they sold circuit boards (the boards that hold the internal components of a computer) while they worked on the computer prototype (sample).

Apple and the personal computer era

Jobs had realized there was a huge gap in the computer market. At that time almost all computers were mainframes. They were so large that one could fill a room, and so costly that individuals could not afford to buy them. Advances in electronics, however, meant that computer components were getting smaller and the power of the computer was increasing.

Jobs and Wozniak redesigned their computer, with the idea of selling it to individual users. The Apple II went to market in 1977, with impressive first year sales of \$2.7 million. The company's sales grew to \$200 million within three years. This was one of the most phenomenal cases of corporate growth in U.S. history. Jobs and Wozniak had opened an entirely new market—personal computers. Personal computers began an entirely new way of processing information.

By 1980 the personal computer era was well underway. Apple was continually forced to improve its products to remain ahead, as more competitors entered the marketplace. Apple introduced the Apple III, but the new

model suffered technical and marketing problems. It was withdrawn from the market, and was later reworked and reintroduced.

Jobs continued to be the marketing force behind Apple. Early in 1983 he unveiled the Lisa. It was designed for people possessing minimal computer experience. It did not sell well, however, because it was more expensive than personal computers sold by competitors. Apple's biggest competitor was International Business Machines (IBM). By 1983 it was estimated that Apple had lost half of its market share (part of an industry's sales that a specific company has) to IBM.

The Macintosh

In 1984 Apple introduced a revolutionary new model, the Macintosh. The on-screen display had small pictures called icons. To use the computer, the user pointed at an icon and clicked a button using a new device called a mouse. This process made the Macintosh very easy to use. The Macintosh did not sell well to businesses, however. It lacked features other personal computers had, such as a corresponding high quality printer. The failure of the Macintosh signaled the beginning of Jobs's downfall at Apple. Jobs resigned in 1985 from the company he had helped found, though he retained his title as chairman of its board of directors.

NeXT

Jobs soon hired some of his former employees to begin a new computer company called NeXT. Late in 1988 the NeXT computer was introduced at a large gala event in San Francisco, aimed at the educational market. Initial reactions were generally good. The product was very user-friendly, and had a

fast processing speed, excellent graphics displays, and an outstanding sound system. Despite the warm reception, however, the NeXT machine never caught on. It was too costly, had a black-and-white screen, and could not be linked to other computers or run common software.

Toy Story

NeXT was not, however, the end of Steve Jobs. In 1986 Jobs purchased a small company called Pixar from filmmaker George Lucas (1944–). Pixar specialized in computer animation. Nine years later Pixar released *Toy Story*, a huge box office hit. Pixar later went on to make *Toy Story 2* and *A Bug's Life*, which Disney distributed, and *Monsters, Inc.* All these films have been extremely successful. *Monsters, Inc.* had the largest opening weekend ticket sales of any animated film in history.

NeXT and Apple

In December of 1996 Apple purchased NeXT Software for over \$400 million. Jobs returned to Apple as a part-time consultant to the chief executive officer (CEO). The following year, in a surprising event, Apple entered into a partnership with its competitor Microsoft. The two companies, according to the *New York Times*, “agreed to cooperate on several sales and technology fronts.” Over the next six years Apple introduced several new products and marketing strategies.

In November 1997 Jobs announced Apple would sell computers directly to users over the Internet and by telephone. The Apple Store became a runaway success. Within a week it was the third-largest e-commerce site on the Internet. In September of 1997 Jobs was named interim CEO of Apple.

In 1998 Jobs announced the release of the iMac, which featured powerful computing at an affordable price. The iBook was unveiled in July 1999. This is a clam-shaped laptop that is available in bright colors. It includes Apple's AirPort, a computer version of the cordless phone that would allow the user to surf the Internet wirelessly. In January 2000 Jobs unveiled Apple's new Internet strategy. It included a group of Macintosh-only Internet-based applications. Jobs also announced that he was becoming the permanent CEO of Apple.

In a February 1996 *Time* magazine article, Jobs said, “The thing that drives me and my colleagues . . . is that you see something very compelling to you, and you don't quite know how to get it, but you know, sometimes intuitively, it's within your grasp. And it's worth putting in years of your life to make it come into existence.” Jobs has worked hard to translate his ideas into exciting and innovative products for businesses and consumers. He was instrumental in launching the age of the personal computer. Steve Jobs is truly a computer industry visionary.

ELTON JOHN

Born: March 25, 1947

Pinner, Middlesex, England

English singer, songwriter, and humanitarian

Once famous for his flashy clothes and string of hit records, English rock musician Elton John has more recently become a humanitarian (one who works to promote human welfare) with a particular interest in supporting acquired immune deficiency syndrome (AIDS; a disease that destroys the body's ability to fight infection) charities.

Early life

Elton John was born Reginald Kenneth Dwight on March 25, 1947, in the town of Pinner in Middlesex, England. An only child who was overweight and wore glasses, he was afraid of his father, a squadron leader (a ranking officer) with the Royal Air Force, whom he described as “very snobbish and sort of stiff.” His mother Sheila, on the other hand, brought home records that introduced him to rock music. John taught himself to play the piano at the age of four. He studied at the London Academy of Music but quit two weeks before graduation to pursue a musical career. He worked for a music publishing company and also played the piano in bars, later joining a band called Bluesology. He created his stage name as a combination of the middle name of Bluesology's singer, Long John Baldry, and the first name of the saxophone player, Elton Dean. Later in his life, John added the middle name Hercules.

Recording career begins

In 1968 John met Bernie Taupin (1950–), who became his long-term songwriting partner. John's first album, *Empty Sky* (1969), was a commercial failure. His second album contained “Your Song,” a hit in both the United States and England. In 1972 “Rocket Man” became his first number-one single in America. Other hits followed, including “Daniel” and “Crocodile Rock” from the album *Don't Shoot Me, I'm Only the Piano Player*. The album *Goodbye Yellow Brick Road* (1973) contained “Candle in the Wind,” written about actress Marilyn Monroe (1926–1962). That same year, John launched his own record label, Rocket Records.

John became famous for his oversize glasses and outrageous outfits. He was called the “Queen Mum of Pop.” He also enjoyed many expensive cars, large homes, and shopping sprees. In 1975 he starred as the Pinball Wizard in the film version of the rock opera *Tommy*. In 1976 a duet with Kiki Dee, “Don't Go Breaking My Heart,” became his first British number-one single. His popularity then began to decline after a series of less successful albums. Admitting that he was attracted to both men and women further damaged his popularity, and he began abusing alcohol and drugs.

Although John continued performing during the 1980s, his drug and drinking problems had caused him to lose his magic touch. While recording *Too Low for Zero* in 1983, John met Renate Blauel, a German-born, recording-studio worker. They were married on Valentine's Day (February 14) 1984. The British press attacked both the marriage and John, focusing on his sexual history. After less than five years, the couple agreed to divorce.

Elton John.

Decides to help others

In the early 1990s John received treatment for alcoholism, drug abuse, and bulimia (an eating disorder). He admitted he was a homosexual (a man attracted to other men) and began to devote his energies toward helping others. Starting in 1990 he donated all of the profits from the sales of his singles to charity, mostly those associated with AIDS. In 1992 he established the Elton John AIDS Foundation. In 1994 he was elected to the Rock and Roll Hall of Fame, and in 1995 he won an Academy Award.

In 1997 John was shaken by the death of his friend, Diana, Princess of Wales (1961–

1997), in a car accident. John performed a new version of “Candle in the Wind” at her funeral. It sold more than thirty million copies after being released as a single. John donated all of the profits (more than \$47 million) to the charity established in Diana’s name. He was knighted by Queen Elizabeth II (1926–) for his achievements in music and contributions to charity.

Honors and awards

In 2000 the National Academy of Recording Arts and Sciences honored John as Person of the Year for his charity work. Later that year, John and lyric writer Tim Rice wrote songs for the Broadway musical *Aida* (which won a Tony award) and the film *The Road to El Dorado*. John also sued the accounting firm (a company paid to verify and calculate business dealings) PriceWaterhouseCoopers and his former manager for \$29 million, claiming they had stolen money from him.

John won a Grammy Award for best musical show album for *Elton John and Tim Rice’s Aida* in February 2001. At the award show he performed with rap artist Eminem (1972–), angering homosexual rights leaders who had criticized Eminem for his antigay lyrics. Later that year John released *Songs from the West Coast*, which many praised as a return to his “1970s sound.”

JOHN PAUL II

Born: May 18, 1920

Wadowice, Poland

Polish pope

Karol Wojtyla, cardinal of Krakow, Poland, was elected the 263rd pope in 1978, the first ever of Slavic blood. He took the name John Paul II.

Childhood, education, and the priesthood

Karol Wojtyla was born May 18, 1920, in Wadowice, Poland, the second child of Karol Wojtyla Sr., an army sergeant, and Emilia (Kaczorowska) Wojtyla. His mother died when he was nine. After his mother died, Wojtyla became closer to his father, whom he credits as the source of his religious faith. His only sibling, a much older brother, Edmund (a physician), died four years later; and Karol Sr. died in 1942. These sorrows of early family life, along with the hard times that Poland experienced both prior to World War II (1939–45; a war fought in Europe, Asia, and elsewhere with Great Britain, the Soviet Union, France, the United States in 1941, and their allies on one side; Germany, Italy, and Japan on the other side) and throughout it, were bound to give an intelligent young man reason for serious thinking. Nonethe-

less, he has been remembered by his peers as a positive-thinking young man who was involved in sports such as soccer and skiing. In 1939 under Nazi (Adolf Hitler's [1889–1945] political party, which was in power in Germany from 1933 until 1945) occupation, he enrolled at Jagiellonian University in Krakow, and shortly thereafter he began secret studies for the priesthood. Publicly, however, he worked as a laborer in a quarry and a chemical factory.

After World War II, upon ordination to the priesthood on November 1, 1946, Wojtyla did pastoral work with Polish refugees in France and then did graduate studies at the Angelicum University in Rome. When he returned from these studies to his native Poland, Wojtyla was assigned to parish work and soon became well known for his successes in youth ministry. He was then assigned to teach ethics (the study of right and wrong) at the Catholic University of Lublin, and in 1958 he was officially named auxiliary bishop (member of the clergy who assists the bishop) of Krakow. In 1962, upon the death of Archbishop Baziak, Wojtyla became the vicar capitular, or administrative head, and in 1964 he became archbishop of Krakow. Paul VI made him a cardinal on May 29, 1967, in good part because of the fine impression he had made during the Second Vatican Council (1962–65).

Dealing with Communist Poland

In Poland Bishop Wojtyla was a rallying point for anti-Communist religious people. The bishop tended to show himself to be flexible, and his constant patriotism kept him from supporting any movements against the government that would cause the people or

JOHN PAUL II

Pope John Paul II.

Reproduced by permission of AP/Wide World Photos.

the land more harm than good. The Communist government came to look upon him as an enemy. First as bishop and then as archbishop and cardinal, Wojtyla fought for the Church's right to full religious practice and expression of opinion.

During the Second Vatican Council Wojtyla had contributed to the Catholic Church's increased appreciation of religious freedom, and he impressed many of the Church's leaders as a strong leader with first-hand experience of the possible effects of Communist rule.

When Pope Paul VI died in August 1978, and then scarcely a month later his successor, Pope John Paul I, died unexpectedly, the stage was set for a more dramatic occurrence. On October 16, 1978, on their eighth ballot, the cardinals assembled in Rome for the papal election chose Wojtyla as the first non-Italian pope in 455 years and the first Slavic pope ever. The new pope, who chose the name John Paul II in honor of his immediate predecessors (John XXIII, Paul VI, and John Paul I), quickly became a powerful figure.

Early years as pope

Pope John Paul II began a papal life of activity. In January 1979 he made his first trip abroad to Latin America. For nine days in June of 1979 he walked in the midst of Eastern Europe. At the end of September 1979 the pope flew first to Ireland and then to the United States, bringing his message of justice, peace, and the righteousness of traditional Catholic morality.

After these early trips Pope John Paul II became the most travelled pope in history. The personal danger of these trips became apparent to the world on May 13, 1981, when the pope was shot in Rome by a Muslim fanatic presumed to be employed by the Bulgarian Communist government. Not long after his return to health he began planning for future trips, telling his aides that his life belonged to God and the people.

The pope as teacher

Pope John Paul II's first encyclical (a letter that is written by the pope and addressed to the bishops of the church), *Redemptor Hominis* (Redeemer of Man), came in March

of 1979, only five months after his election. It was a piece that clearly expressed the pope's belief that the redemption (act of being saved) offered in Christ is the center of human history. The second encyclical, *Dives in Misericordia* (Rich in Mercy), appeared in December of 1980. Its theme was the mercy of God and the need for human beings to treat one another mercifully, going beyond strict justice to the love and compassion that human suffering ought to create.

The third encyclical, *Laborem Exercens* (Performing Work), appeared in September of 1981. This encyclical made it clear that the pope, for all his anti-Communism, is no friend of traditional capitalism. Moreover, the pope echoed the traditional Christian teaching that the goods of the earth come from the Creator God and are for all the Earth's people.

The pope's 1988 encyclical, *Sollicitudo Rei Socialis*, on social justice is thought to be one of his most substantial documents. It threaded a middle ground between capitalist and socialist positions, arguing for both proper economic development and placing the needs of the poor over the wants of the wealthy.

No compromise on moral issues

In 1992 the pope approved a new catechism. This was a detailed statement of belief meant to unite the Catholic Church. In October, John Paul published a large encyclical on moral issues somewhat inspired by the pedophilia (the sexual attraction of adults to children) crisis in the United States: *Veritatis Splendor* (The Resplendence of Truth), the burden of which was that the Christian moral life demanded heroism; certain traditional teachings never change; some acts (genocide, abuse of the innocent) are evil; and recent technical

developments in moral theology casting doubt on such traditional positions are unacceptable.

Pope embraced the people

John Paul departed from his customary encyclical, or papal letter, in 1994 to publish a book, *Crossing the Threshold of Hope*, which became an international bestseller. John Paul II reached out to the masses, the public responded, and *Time* magazine named him "Man of the Year." The book received wide critical acclaim for addressing today's major theological concerns and further established John Paul as a great intellect and teacher of our time.

John Paul issued a strong message in his 1995 encyclical, entitled *Evangelium Vitae* (Gospel of Life). He confronted the issues of abortion, assisted suicide, and the death penalty, making a plea to Roman Catholics to "resist crimes which no human law can claim to legitimize." A second encyclical, entitled *Ut Unum Sint* (That They May Be One), was released in 1995. In this letter, for the first time in Church history, he acknowledged and apologized for past sins and errors committed in the name of the Church. Admitting that painful things have been done that harmed Christian unity, he accepted responsibility and asked for forgiveness in the hope that Christians could have "patient dialogue."

Church business claimed John Paul's attention in 1996. Several major changes were instituted at his urging; for instance, he ruled that the next pope will be elected by an absolute majority (more than 50 percent).

In March 1998 John Paul issued "We Remember: A Reflection on the Shoah," or Holocaust—a papal apology for the Catholic

JOHNSON, LYNDON B.

Church's failure to act against Nazi atrocities during World War II. He also continued his travels despite the increased effects of Parkinson's disease. He was the first modern pope to enter a synagogue or to visit an Islamic country.

On March 12, 2000, John Paul asked for forgiveness for many of his church's past sins, including its treatment of Jews, heretics (those who deny fundamental beliefs of the church), women, and native peoples. This was believed to be the first time in the history of the Catholic Church that one of its leaders sought such a sweeping pardon.

LYNDON B. JOHNSON

Born: August 27, 1908
Stonewall, Texas

Died: January 22, 1973

Austin, Texas

American president

As the thirty-sixth president of the United States, Lyndon B. Johnson created new programs in health, education, human rights, and conservation. He was also aggressive in the fight against poverty, beginning what he called the "War on Poverty."

Early life

Lyndon Baines Johnson was born on August 27, 1908, in Stonewall, Texas. Johnson's father, Sam Ealy Johnson, Jr., had served in the Texas legislature. After he lost a large sum of money trading cotton, he struggled to raise his two sons and three daughters. Johnson's mother was a gentle woman who encouraged her children to love books and gave them a sense of duty and responsibility. Johnson graduated from Southwest State Teachers College in San Marcos, Texas, with a bachelor's degree. While in college, he had combined his studies with a job teaching Mexican American children.

In 1931 Johnson went to Washington, D.C., and worked as secretary to Texas congressman Richard Kleberg (1887–1955). Almost immediately Johnson's talent for attracting affection and respect became visible. He was elected speaker of the "Little Congress," an assembly of congressional secretaries on Capitol Hill. On November 17, 1934, he married Claudia (Lady Bird) Taylor (1912–) of Karnak, Texas. With her, Johnson found constant strength, love, and support. At age twenty-seven Johnson returned to Texas to become the state director of the National Youth Administration.

Rising through Congress

In 1937 the congressman from Texas's Tenth District died suddenly. When a special election was called to select a replacement, Johnson joined a race crowded with seven other candidates. To the amazement of many long-standing politicians, the twenty-eight-year-old Johnson won the race. In 1941 he ran for a Senate seat but lost by a small margin. That December he became the first member of Congress to enter active military duty in World War II (1939–45; a war in which the Allies—France, Great Britain, the Soviet Union, China, and from 1941 the United States—fought against the Axis powers—Germany, Italy, and Japan). He joined the navy and in 1942 received the Silver Star for his contribution to a bombing mission over New Guinea. When President Franklin D. Roosevelt (1882–1945) ordered all congressmen in the military back to the capital in 1942, Johnson reentered the House.

In 1948 Johnson finally won election to the Senate. The other senators soon recognized that he was not an ordinary first-term senator. He was knowledgeable about every item that was brought before the Senate. In January 1951 Johnson was named Democratic “whip” (assistant minority leader). In 1953, when the post of minority leader in the Senate opened up, Democratic senators chose Johnson to take charge. After the Democrats won a majority of seats in both houses in the congressional elections of 1954, Johnson became the youngest man ever to serve as majority leader.

At that time, Johnson's leadership became visible to the nation. He led the first civil rights bill in eighty-two years through

Lyndon B. Johnson.

Courtesy of the Library of Congress.

the Senate. Then in 1958, while representing the United States at the United Nations, he called for the peaceful exploration of outer space. He uncovered waste in defense spending and began an investigation. In 1960 Johnson briefly ran against John F. Kennedy (1917–1963) for the Democratic presidential nomination. Kennedy later chose Johnson as his vice presidential running mate. While some Kennedy supporters complained, experts later agreed that Johnson's tireless campaigning in Texas and the South led Kennedy to victory in the 1960 election.

JOHNSON, LYNDON B.

Serving as vice president

Johnson had many important assignments as vice president. One of his tasks was to improve the growing U.S. space program, which had been overshadowed by explorations and new discoveries that had been made by the Soviet Union. Regarding civil rights, as chairman of the President's Committee on Equal Employment Opportunity forces, he surprised many critics by putting constant pressure on American businesses. The committee had been created by President Kennedy in 1961 to enforce an executive order prohibiting discrimination (unequal treatment) based on race in government employment.

Then on November 22, 1963, President Kennedy was assassinated in Dallas, Texas. The next day, aboard the plane *Air Force One* at Love Field in Dallas, Johnson took the presidential oath of office. Giving orders to take off seconds later, the new president flew back to Washington to take command of the government while the nation grieved for its fallen leader.

Filling the presidency

Five days after taking office, President Johnson appeared before a joint session of Congress. Speaking firmly, he pledged, "We shall continue." The new president, meeting around the clock with staff, cabinet members, and congressmen, helped pass important legislation that had been put before Congress by President Kennedy but had been held up in various committees of both houses. Johnson especially pushed the passage of a civil rights bill that was much stronger than any that had come before, which had been of great importance to Kennedy. On July 2, 1964, Johnson

signed the Civil Rights Act, which prohibits discrimination (unequal treatment based on race) and segregation (separation based on race) in public places, employment, and voting, into law.

Six months after becoming president, Johnson announced his plan called the "Great Society." The areas he emphasized were health and education; urban problems such as pollution, housing, and transportation; civil rights; and preservation of natural resources. Johnson took his programs to the nation during his campaign for the 1964 election. Meanwhile, American involvement in the Vietnam War (1955–75; a war in Vietnam in which South Vietnam was fighting against a takeover by Communist North Vietnam) became an issue. Johnson's opponent, Senator Barry Goldwater (1909–1998), spoke against Johnson's approach to domestic problems and also suggested that the use of force against North Vietnam should be increased. Johnson traveled the nation and convinced voters that they could not afford to drive him from office. He won by the widest margin in any presidential election in American history.

Administration achievements

After his huge victory President Johnson began a massive legislative program. Between 1965 and 1968 more than 207 bills were passed by Congress. During Johnson's presidency education and health spending were increased. Within three years of the passage of the Voting Rights Act in 1965, which made discrimination in voting illegal, nearly one million African Americans registered to vote in the South. Most importantly, the Johnson presidency was the strongest era of national

prosperity (economic success), marked by more than eighty-five months of economic growth. The wages of factory workers increased, millions of workers were brought under minimum-wage protection, total employment increased, and the unemployment rate (the number of people who are unemployed) dropped to its lowest point in more than a decade.

The president also made important gains in foreign affairs. U.S. involvement in Cyprus and the Congo prevented the outbreak of wars in those countries. In the Dominican Republic, the threat of a Communist takeover was ended by an overwhelming show of force by the United States and Latin American countries. As a result, a democratic government and free elections were put back into place in the Dominican Republic, and U.S. troops left the country soon after. Talks on an outer space treaty with the Soviet Union were held, and in June 1967 the president met with Soviet leader Alexei Kosygin (1904–1980).

Vietnam problem

Johnson devoted the bulk of his time and effort to dealing with the Vietnam War. All three presidents that served before Johnson had declared that the security of the United States was involved in protecting South Vietnam from a communist takeover by North Vietnam. However, there was much disagreement in the United States over the way this problem should be solved. Some critics claimed the situation in Vietnam was a civil war, not an invasion, and they opposed U.S. involvement. In 1965 the United States increased its military support of South Vietnam and sent over more American troops. By 1968 many people who were against U.S.

involvement in the war were calling on the Johnson administration to remove U.S. troops from Vietnam.

Bothered by increasing criticism, yet determined to end the war and begin serious peace talks, President Johnson startled the nation and the world on March 31, 1968, by stating that he would not run for election to another term as president. Johnson said that it was so important to resolve the Vietnam situation peacefully that even his own political future should not stand in the way of this goal. He said that he would not seek reelection so he could spend the rest of his days in office working on a settlement. On May 11, 1968, it was announced that peace talks would begin in Paris, France. Then in November 1968 the president declared that all bombing of North Vietnam would end.

At the end of Johnson's presidency, he retired to his ranch near San Antonio, Texas, where he became interested in the care and sale of his cattle. On January 22, 1973, Johnson suffered a heart attack while lying down to take a nap, and he died later that afternoon.

Lyndon Johnson was one of America's most experienced and politically skilled presidents. He tried to improve the quality of life for people living in the United States and to help new and small nations develop their own forms of government without fear of invasion from their more powerful neighbors.

MAGIC JOHNSON

Born: August 14, 1959

Lansing, Michigan

African American basketball player

Magic Johnson was one of professional basketball's most popular stars. He won five championships with the Los Angeles Lakers in the 1980s before he was forced to retire after contracting the human immunodeficiency virus (HIV), the virus that causes acquired immune deficiency syndrome (AIDS), a disease that destroys the body's ability to fight off infection.

Early years

Earvin Johnson Jr. was born on August 14, 1959, in Lansing, Michigan, the fourth of Earvin and Christine Johnson's seven chil-

dren. His father worked at an auto factory during the day and hauled trash at night to make extra money. Earvin Jr. worked at several jobs, including helping his father, but his first love was basketball. In 1977 Johnson and his Everett High School team won the state championship. His passing and ball-handling skills won him the nickname "Magic." He then attended Michigan State University. In his second year, Michigan State won the national college basketball championship by defeating Indiana State University, a team led by future Boston Celtics star Larry Bird (1956-). Johnson scored twenty-four points and was chosen Most Valuable Player (MVP).

Immediate success

Johnson was selected first in the 1979 National Basketball Association (NBA) draft by the Los Angeles Lakers. He became the first rookie to start in an NBA All-Star game. The Lakers went on to defeat the Philadelphia 76ers for the NBA championship, and Johnson became the youngest player ever to be named playoff MVP. At six feet nine inches, Johnson became the first big man to excel at point guard, a position usually reserved for smaller players. He became one of the most popular players in the league.

During the 1981-82 season Laker head coach Paul Westhead designed an offense that featured center Kareem Abdul-Jabbar (1947-). The change upset Johnson, who asked to be traded. Westhead was soon replaced by Pat Riley, under whom Johnson became one of the league's best all-around players. In Johnson's first season with Riley, the Lakers won another championship, with Johnson again winning the playoff MVP award. In 1985 the Lakers won their third

NBA title, defeating Bird and the Boston Celtics. The Lakers also won championships in 1987 and 1988.

During Johnson's twelve years with the Lakers, the team won five championships. He was chosen playoff MVP three times. He was a twelve-time All-Star and the 1990 All-Star game MVP. He averaged 19.7 points per game in 874 games, pulled down 6,376 rebounds, and had 1,698 steals. During the 1990–91 season he broke Oscar Robertson's (1938–) assist record, finishing the season with a total of 9,921. In October 1996 he was named one of the fifty greatest players in the history of the NBA.

Tragic discovery

In November 1991, during a physical examination, Johnson found out that he was a carrier of the HIV virus, which causes AIDS. Johnson admitted that his lifestyle as a sports celebrity included many sexual encounters. However, he never suspected that he might contract HIV, which he thought was limited to gay, or homosexual, men (men who are attracted to other men). Doctors advised Johnson to quit basketball immediately in order to protect his health.

Johnson immediately became a voice for AIDS awareness. "I want [kids] to understand that safe sex is the way to go," Johnson told *People* magazine. "Sometimes we think only gay people can get it [HIV], or that it's not going to happen to me. Here I am. And I'm saying it can happen to anybody, even Magic Johnson." Johnson was appointed to the National Commission on AIDS by President George H. W. Bush (1924–) but resigned to protest what he considered to be the president's lack of support for AIDS research.

Magic Johnson.

Johnson also coauthored *What You Can Do to Prevent AIDS*.

Unable to let go

In January 1992 Johnson came out of retirement to play in the 1992 NBA All-Star game, scoring 25 points and being named the game's MVP. That summer Johnson went to Barcelona, Spain, as a member of the United States basketball team in the Summer Olympics. Referred to as the "Dream Team" by writers, the U.S. team, packed with NBA stars including Bird and Michael Jordan (1964–), easily won the gold medal. Fans were saddened, however, because they

believed the careers of both Johnson and Bird were over.

Johnson could not let go of basketball. He announced his return to the NBA shortly before the 1992 season; after five preseason games he retired again, saying he wanted to stay healthy for his family. Johnson remained active in basketball, purchasing an ownership share in the Lakers and forming a team that played games around the world to benefit charities. He became a vice-president of the Lakers and took over as head coach of the team for the end of the 1992–93 season. In early 1996 Johnson again returned to play for the Lakers. By May, however, he announced his retirement—this time for good.

Successful businesses

Johnson enjoyed all-star success as a businessman. He started paying attention to his money early in his career, after watching fellow teammate Abdul-Jabbar lose millions to crooked business advisers. By 1996 he had a net worth of more than one hundred million dollars. Like other star athletes, Johnson endorsed (appeared in ads giving support for) products and gave speeches for big fees. He led his Magic Johnson All-Stars around the world, playing exhibition games against foreign basketball teams for large profits. He also briefly hosted a television talk show.

One of Johnson's major investments was in large-scale property development. Among his successes were movie theaters and shopping centers in inner-city areas where no one else wanted to invest. In June 1995 Johnson opened the twelve-screen Magic Theatres in a mostly black section of Los Angeles. In 1997 Johnson opened another movie complex in Atlanta, Georgia. Magic movie houses were

under construction in other cities, including Brooklyn, New York, where the historic Loews Kings Theater was restored at a cost of \$30 million.

Living with HIV

In September 1991, just before Johnson learned he had HIV, he married longtime friend Earletha “Cookie” Kelly. They had a son in 1993 and adopted a daughter in 1995. Johnson also had a son from another relationship who spent the summers with him. Johnson continued to take medicine, eat right, and exercise. As recently as September 2002, his doctors said he is free of AIDS symptoms. Doctors credit Johnson's exercise habits and his use of powerful drugs; Johnson's wife Cookie has credited God, stating, “The Lord has definitely healed Earvin. Doctors think it's the medicine. We claim it in the name of Jesus.”

Johnson showed no signs of slowing down. He became the owner of several Starbucks coffee shops, started his own record company (Magic Johnson Records), and purchased Fatburgers, the popular Los Angeles hamburger chain. He also continued to speak out on AIDS and raise money for research. In 2002 he was elected to the Pro Basketball Hall of Fame.

SAMUEL JOHNSON

Born: September 18, 1709

Litchfield, Staffordshire, England

Died: December 13, 1784

London, England

English author and lexicographer

The writings of the English author and lexicographer (an author or editor of a dictionary) Samuel Johnson express a deep respect for the past combined with an energetic independence of mind. The mid-eighteenth century in England is often called the “Age of Johnson.”

Early life

Samuel Johnson was born in Litchfield, Staffordshire, England, on September 18, 1709, the son of Michael Johnson and Sarah Ford. His father was a bookseller, and Johnson owed much of his education to the fact that he grew up in a bookstore. Johnson was plagued by illness all his life. As a child he suffered from scrofula (an infection of the face that causes scars), smallpox, and partial deafness and blindness. One of his first memories was of being taken to London, England, where he was touched by Queen Anne (1665–1714) (the touch of the ruler was then thought to be a cure for scrofula).

Johnson was educated at the Litchfield Grammar School, where he learned Latin and Greek. He later studied with a minister in a nearby village from whom he learned a valuable lesson—that if one is to master any subject, one must first discover its general principles, or, as Johnson put it, “but grasp the Trunk hard only, and you will shake all the Branches.” In 1728 and 1729 Johnson spent fourteen months at Pembroke College, Oxford. Too poor and embarrassed by his poverty, Johnson could not complete the work for a degree. Johnson supported himself with teaching jobs after his father died in 1731. In 1735 he married Elizabeth Porter, a widow some twenty years older than him. Still trying to find a way to make a living, Johnson opened a boarding school, which had only three pupils. One of them was David Garrick (1717–1779), who would eventually become a famous actor.

Making his name

In 1737 Johnson went to London to work for Edward Cave, the editor of the *Gentleman's Magazine*. Parliament did not then permit reports of its debates, and Cave published a column called “Debates in the Senate of Lilliput”—the name is taken from the first book of Jonathan Swift's *Gulliver's Travels*—for which Johnson, among others, wrote re-creations of actual parliamentary speeches. Johnson also published *London, a Poem* (1738) and *The Vanity of Human Wishes* (1749), two “imitations” of the Roman writer Juvenal (c. 60–c. 140). In 1749 Johnson completed *Irene*, a play in verse, which was produced by Garrick and earned Johnson £300 (about \$436).

In the early 1750s Johnson, writing at the rate of two essays a week, published two

JOHNSON, SAMUEL

Samuel Johnson.

Courtesy of the Library of Congress.

collections, *The Rambler* (1750–52) and *The Adventurer* (1753–54). He also continued work on a dictionary of the English language, a project he had begun in 1746 with the help of six assistants. The project was finally completed in 1755. Although he received help from others, Johnson's *Dictionary* is probably the most personal work of its kind that will ever be put together. His own definition of *lexicographer* was a "writer of dictionaries; a harmless drudge," yet the work bears his personal stamp: it is notable for its precise definitions and for its examples, which draw on Johnson's reading of two hundred years of English literature.

Years of success and fame

Johnson's *Rasselas, Prince of Abissinia*, a moral fable (a mythical story that usually teaches a lesson about life) concerned with an innocent young man's search for the secret of happiness, appeared in 1759. The work was immediately successful; six editions and a number of translations appeared during Johnson's lifetime. In 1762 Johnson accepted a yearly pension of £300 from King George III (1738–1820). A year later he met James Boswell (1740–1795), the son of a Scottish judge. Boswell became Johnson's devoted companion and eventually wrote the great biography of his hero.

In 1765 Johnson met Henry Thrale, a well-to-do brewer, and in the Thrales' home Johnson found an escape from the solitude he had experienced since his wife's death in 1752. In 1765 Johnson published an eight-volume edition of the works of William Shakespeare (1564–1616). In 1773 James Boswell persuaded Johnson to join him in a tour of Scotland, and both men recorded their trip—Johnson's *A Journey to the Western Islands of Scotland* (1775) and Boswell's journal.

Johnson's last great work, the ten-volume *Prefaces, Biographical and Critical, to the Works of the English Poets* (better known as the *Lives of the Poets*), was completed when he was seventy-two. It is a series of biographical and critical studies of fifty-two English poets. Johnson was saddened in his last years by the death of his old friend Dr. Robert Levett, by the death of Thrale, and by a quarrel with Thrale's widow, who had remarried with, what seemed to Johnson, inappropriate haste. Johnson died on December 13, 1784, in his house in London, and he was buried in Westminster Abbey.

AL JOLSON

Born: May 26, 1886

Srednike, Lithuania

Died: October 23, 1950

San Francisco, California

Lithuanian-born American entertainer, vaudeville performer, actor, and singer

Al Jolson was a famous singer and film actor. He starred in the first all-sound movie, *The Jazz Singer*.

Early life

Al Jolson (Asa Yoelson) was born on May 26, 1886, in Srednike, Lithuania. Jolson's family came to the United States in 1894, settling in Washington, D.C. Several factors in

Jolson's youth influenced his career, including his religious Jewish upbringing, the death of his mother when he was ten, and his father's work as a cantor (a singer of religious music in a synagogue). Jolson acquired a love of singing from his father, but he did not want to use his voice in the synagogue. Instead, he and his brother Harry sang on street corners to earn money. Jolson also attended the theater whenever possible and discovered he loved to perform.

Develops his own style

In 1900 Jolson left Washington, D.C., for New York. His first theater job was in a show called *Children of the Ghetto*. He also sang in a circus before teaming up with his brother to play vaudeville (traveling stage entertainment consisting of various acts). They toured as Jolson/Palmer/Jolson (Palmer was the third member of the team) with an act called *The Hebrew and the Cadet*, in which Harry Jolson and Palmer did a comedy routine and Al Jolson sang. Jolson was best when he was alone on stage, where he could more easily relate to the audience.

Jolson then left his brother's act and spent several years playing small clubs in San Francisco, California. One day, to liven up his act, he went on stage in blackface (with his face made up to resemble an African American) and sang "Rosey My Posey" in a Southern accent. In 1909 he was given a job in producer Lew Dockstader's *Minstrel Show*, and in 1911 he was hired for Broadway producer Lee Shubert's new show, *La Belle Paree* (1911), in which he sang "I Want a Girl Just Like the Girl That Married Dear Old Dad." Jolson's singing and stage manner were different from anything the audience had seen. He took a song

Al Jolson.

Courtesy of the Library of Congress.

and applied to it a loose jazz rhythm, rolling his eyes with a sly grin on his blackened face. He also appealed to the feelings of the audience with his sentimental song deliveries.

Star power

Although Jolson did not receive star billing until 1914 in *Dancing Around*, the audiences clearly came to see *him*. The Shuberts knew this and signed Jolson for a seven-year contract at the Winter Garden Theatre on Broadway. He played to overflowing houses in such shows as *Robinson Crusoe, Jr.* (1916), *Sinbad* (1918), and *Bombo* (1921). Most of these shows had no script and no scheduled list of

songs. Jolson would come out on stage after the final act to talk to the audience and sing what pleased him. After each song he told the audiences, “You ain’t heard nothing yet.”

Jolson became known for songs like “Sonny Boy,” composer George Gershwin’s (1898–1937) “Swanee,” and especially “My Mammy.” In “Mammy” he would go down on one knee, and with tears in his eyes he would speak to “mother,” telling her he’d “walk a million miles” just to see her. At the end he would get up and sing the last chorus with his hands spread wide and his face tilted upward.

Goes to Hollywood

Jolson worked constantly, doing a tour of his one-man show, then a vaudeville tour, and then a Sunday theater series. Finally he went to Hollywood to make movies. In October 1927 Warner Brothers presented the world’s first talking-picture feature, *The Jazz Singer*. The film, the story of a rabbi’s son who becomes an actor against his father’s wishes, was a great success. People assumed the movie was based on Jolson’s own life, a myth that he encouraged.

Despite the popularity of the film and its follow-up, *The Singing Fool* (1928), Jolson did not succeed in film. He made several more films, but his personal appeal to an audience never really came through on the screen. His career declined in the 1930s, but he continued to perform on radio and entertained soldiers during World War II (1939–45; a war fought mostly in Europe between the United States, Great Britain, France, and the Soviet Union on one side, and Germany, Italy, and Japan on the other). He also campaigned for several presidents by singing at rallies. In 1946 *The Al Jolson Story*, a fictional version of his life, was released

and was an immediate success. In 1949 *Jolson Sings Again*, another smash hit, was released.

Jolson was married four times, and he had three children. He died of heart failure on October 23, 1950, the night before a planned radio taping with actor/singer Bing Crosby (1904–1977).

JAMES EARL JONES

Born: January 17, 1931

Arkabutla, Mississippi

African American actor

Award-winning actor James Earl Jones has acted on television, stage, and screen. He is best known for his deep bass voice.

Unhappy childhood

The only child of Robert Earl and Ruth Connolly Jones, James Earl Jones was born on January 17, 1931, in Arkabutla, Mississippi. Before his son's birth, James's father left the family to pursue a career as a boxer and later as an actor. Ruth Jones left soon after to

find work, leaving her separated from her son for long periods of time. This was during the Great Depression, a slowdown in the United States's system of producing, distributing, and using goods and services that caused millions of Americans to lose their jobs. Jones told *Newsweek* that being abandoned hurt him deeply. "No matter how old the character I play," he said, "those deep childhood memories, those furies, will come out. I understand this."

Jones lived at his grandparents' farm and hunted, fished, and performed various chores. He also attended church, where he watched his grandmother's dramatic displays of religious feeling. Eventually Jones's grandparents formally adopted him and took him north to Michigan. Jones struggled in his new surroundings. He developed a stutter and soon found communication so difficult that at certain periods during grammar school he could talk only to himself or his immediate family. The problem continued in high school, where an English teacher suggested he memorize speeches and enter speaking contests. This cured Jones of his problem.

Discovers acting

Jones attended the University of Michigan on a full scholarship (money given to a student to attend college), intending to study medicine. At first he took acting classes as a hobby, but he soon switched his major to theater. When he was twenty-one years old and a junior at Michigan, he traveled to New York City to meet his father for the first time. The relationship was strained by the many years they had been apart, but Jones's father encouraged him to pursue a career in theater. James graduated from Michigan in 1953 with a bachelor's degree in drama.

JONES, JAMES EARL

James Earl Jones.

Reproduced by permission of AP/Wide World Photos.

In 1953 Jones joined the army, serving in a ranger (a soldier who confronts the enemy at close range) training program in the Colorado mountains. He was set to reenlist in 1955 when his commanding officer suggested that he take a break before making a long-term commitment. Jones moved to New York City and enrolled in more acting classes. He lived with his father for a time, and the two earned extra money by polishing theater floors. In 1957 the younger Jones earned his first professional role in a production of *Wedding in Japan*. Although he was rarely out of work after that, his salary during the late 1950s averaged only forty-five dollars a week.

In 1959 Jones began a long stretch with the New York Shakespeare Festival, carrying a spear in *Henry V*. Before long he was given bigger roles, and in 1963 he played the lead in *Othello*, one of thirteen plays he appeared in that year. *Othello* ran for a year with Jones in the lead. He also found time to make one film appearance, in director Kubrick's (1928–1999) *Dr. Strangelove*. In the mid-1960s Jones became the first African American man to take a continuing role on a daytime soap opera when he played a doctor on *As The World Turns*.

Critical success

In 1967, while Jones was touring Europe in Eugene O'Neill's (1888–1953) *The Emperor Jones*, he was given a copy of a play titled *The Great White Hope*. The story of the life of boxing champion Jack Johnson (1878–1946), *The Great White Hope*, was scheduled for a possible Broadway run. Jones wanted the part badly. He began working out to build his muscles, working with boxing managers, and watching old footage of Johnson's fights. He won the part, and the show opened on Broadway in October 1968.

The Great White Hope was a success. Jones won a Tony Award for his performance, and he was nominated (put forward for consideration) for an Academy Award in 1970 when the play was made into a motion picture. Still, Jones told *TV Guide* that his work in *The Great White Hope* did not prove to be the career boost he thought it would. He blamed racism (unequal treatment based on race) for the inability of several of his projects, including a life story of civil rights leader Malcolm X (1925–1965), to be approved for production.

Many different roles

Jones returned to the stage, appearing in *Hamlet* (1972), *King Lear* (1973), and *Of Mice and Men* (1974). He also performed in a series of minor films, including *The Man* and *The Bingo Long Traveling All-Stars and Motor Kings*. Jones's most popular movie role of the 1970s and early 1980s was one in which only his voice was used. He gave a memorable level of evil to the villain Darth Vader in all three *Star Wars* films.

In 1982 Jones appeared in the film *Conan, the Barbarian*. To critics who questioned why he took roles in second-rate films, Jones had a simple reply: movies and television pay well, theater does not. "I can't afford to take a vacation unless I do some commercials when I'm in New York," he pointed out in the *Saturday Review*. "Money goes fast, and you can't get along doing only stage work." In 1991 Jones appeared in a series of television ads for the Bell Atlantic Yellow Pages.

Jones's work in the late 1980s and early 1990s was as varied as his early career. He played a writer in *Field of Dreams* (1990), a Central Intelligence Agency (CIA) chief in *Patriot Games* (1992), and a judge in *Sommersby* (1994). On television he starred as a private investigator in *Gabriel's Fire* and as a police officer in *Under One Roof*. He earned another Tony Award in 1988 for his portrayal of a Negro League baseball player in the play *Fences*.

Later years

In 1990 Jones announced that his age and health were forcing him to cut back his work in live theater. Jones stressed that he did not plan to retire from the theater completely; he

simply wanted to spend more time on other projects. In 1993 *Voices and Silences*, his autobiography (the story of his one's own life), was published. Jones and his second wife, actress Cecilia Hart, have one son. Looking toward the future, Jones sees no lack of opportunities in show business. "There are lots of wonderful cameos (roles in which only a brief appearance is made) and a lot of good lead roles out there," he concluded in the *Los Angeles Times*. "There are a lot of things I can do."

In September 2001 Jones was the first speaker at a service in York's Yankee Stadium to honor the victims of the terrorist attacks on the United States twelve days earlier. In January 2002 city officials in Lauderhill, Florida, invited Jones to speak at their annual Martin Luther King, Jr. (1929–1968) Day Celebration. A plaque was unveiled that mistakenly paid tribute to James Earl Ray, the man convicted of shooting and killing King, rather than James Earl Jones.

QUINCY JONES

Born: March 14, 1933

Chicago, Illinois

African American musician, composer, producer, arranger, and film and television executive

Quincy Jones has worked as a musician, composer, arranger, producer, and film and television executive. He also helped Michael Jackson (1958–), Oprah Winfrey (1954–), and many others become stars.

Early life

Quincy Delight Jones, Jr., was born in Chicago, Illinois, on March 14, 1933. His parents divorced soon after his younger brother, Lloyd, was born, and the Jones boys were raised by their father, a carpenter, and his new wife. She had three children of her own and three more with Quincy Jones, Sr. His birth mother, Sarah Jones, was in and out of mental hospitals, and it was not until his adult life that Quincy was able to enjoy a close relationship with her. When Jones was ten years old his family moved to Bremerton, Washington, a suburb of Seattle, Washington. He began taking trumpet lessons at school, and three years later he met a fifteen-year-old musician named Ray Charles (1932–). The two formed a band and played in local clubs and weddings, and soon Jones was composing and arranging music for the group.

Music career

After high school and a scholarship at Boston's Berklee College of Music, Jones was introduced to the life of a musician on the road. He toured with Dizzy Gillespie (1917–1993) in 1956 and Lionel Hampton (1909–2002) in 1957, and then he made his base in Paris, France. He studied with composer Nadia Boulanger (1887–1979), wrote for Harry Arnold's Swedish All-Stars in Stockholm, Sweden, and directed the music for Harold Arlen's production *Free and Easy*,

which toured Europe for three months, ending in early 1960.

After an unsuccessful tour of the United States with a band made up of eighteen musicians from *Free and Easy*, Jones worked as musical director at Mercury Records in New York. He became the first African American executive in a white-owned record company in 1964 when he was promoted to vice president at Mercury. He produced albums, sat in on recording sessions, and wrote arrangements for artists at Mercury as well as other labels. Jones wrote for Andy Williams (1928–), Peggy Lee (1920–2002), and Aretha Franklin (1942–), as well as arranging and conducting *It Might As Well Be Swing*, an album featuring Frank Sinatra (1915–1998) and the Count Basie (1904–1984) Band.

Film and television music

Jones's first venture into Hollywood came when he composed the score (the music that accompanies a movie) for the 1965 film *The Pawnbroker*. Jones won an Academy Award for his score for *In Cold Blood* (1967) and went on to write the music for over fifty films. In 1969 Jones signed a contract as a recording artist with A&M Records, and his first album with that label, *Walking in Space*, won a Grammy for best jazz instrumental (without vocals) album of 1969.

Television has also featured Jones's music, starting in 1971 with musical scores and theme songs for such shows as *Ironsides* and *Sanford and Son*. In 1973 Jones co-produced "Duke Ellington, We Love You Madly," a special for the Columbia Broadcasting System (CBS), featuring a forty-eight-piece orchestra conducted by Jones. The special was a project of the Institute for Black American Music, a foundation

formed by Jones and other musicians with the goal of increasing awareness of the African American contribution to American music and Duke Ellington (1899–1974) in particular. Jones also wrote the score for the successful 1977 television mini-series *Roots*.

Recording and producing

Burned out from producing film soundtracks, Jones stopped working for Hollywood in 1973 to explore his own music career as a vocalist. His singing debut was with Valerie Simpson on an album called *You've Got It Bad, Girl*. The title song from the album stayed at the top of the charts for most of the summer of 1973. Jones's next album, 1974's *Body Heat*, was an even bigger hit. Containing the hit songs "Everything Must Change" and "If I Ever Lose This Heaven," the album sold over a million copies. In 1974 Jones nearly died after suffering two aneurysms (irregular stretching of blood vessels) two months apart. After a six-month recovery he was back at work, touring and recording with a fifteen-member band, with which he released the album *Mellow Madness*.

After Jones's 1980 album *The Dude* won five Grammy awards, he signed a deal with Warner Brothers Records to create his own label, Qwest. It took Jones almost ten years to make his next album, *Back on the Block*. During that time he produced hit albums for other artists, including Michael Jackson's *Thriller* (1983), which is still one of the best-selling albums of all time with forty million copies sold. Jones also has one of the best-selling singles of all time, "We Are the World," to his credit. Another triumph for Jones in the mid-1980s was his production of *The Color Purple*, the film version of Alice

Quincy Jones.

Walker's (1944–) novel, which featured the first film performance of Oprah Winfrey.

Later years

In the early 1990s Jones worked on a huge, ongoing project, "The Evolution of Black Music," for which he had been gathering material for years. He was back in television as well; the Quincy Jones Entertainment Company produced the National Broadcasting Company (NBC) comedy *Fresh Prince of Bel-Air* and as a weekly talk show hosted by Jones's friend the Reverend Jesse Jackson (1941–). Jones also worked on a film biography of the black Russian poet Alexander Pushkin (1799–1837). Quincy Jones Broad-

casting and Time Warner bought a New Orleans, Louisiana, television station, WNOL, which Jones was to oversee.

Quincy Jones has been married and divorced three times, and his six children have only recently been able to spend time with and come to know their father. The 1990 documentary *Listen Up: The Lives of Quincy Jones* contains scenes in which Quincy discusses his difficult childhood, his mentally ill mother, and his strained past with his children. The film also contains interviews with Frank Sinatra, Michael Jackson, and others who describe Jones as a hard worker with a creative brilliance that has influenced popular entertainment since 1950. In 1993 Jones started *Vibe* magazine, a well-received African American music journal. In 1995 he released Q's *Jook Joint*, featuring the talents of many of his friends such as Ray Charles and Stevie Wonder (1950–). The album was a celebration of his fifty years in the music industry.

In May 2000 the Quincy Jones Professorship of African American Music was established at Harvard University in Massachusetts. In January 2001 Jones received the first Ted Arison Award from the National Foundation for Advancement in the Arts, named for the man who created the organization. Later that year Jones contributed a song to the *Ocean's Eleven* soundtrack, published *Q: The Autobiography of Quincy Jones*, the story of his life, and received a Kennedy Center Honor in Washington, D.C. In February 2002 *Q: The Autobiography of Quincy Jones* won a Grammy in the best spoken word album category.

BEN JONSON

Born: 1572

London, England

Died: August 6, 1637

London, England

English writer, playwright, and poet

Ben Jonson was an English playwright and poet best known for his satiric comedies (types of comedies that poke fun at human weaknesses). In many peoples opinion he was, next to William Shakespeare (1564–1616), the greatest dramatic genius of the English Renaissance (roughly the fourteenth through sixteenth centuries).

Early career

Ben Jonson was probably born in or near London, England, about a month after the death of his father, a clergyman (someone who works for the church). His father gained his position when King Henry VIII (1491–1547) ruled England, but lost it after Queen Mary (1516–1558) took the throne.

Jonson's mother then married a bricklayer. This may be why he did not continue his schooling. His stepfather made him work in the more practical business of bricklaying. Jonson also spent some time as a soldier and a traveling actor. He married sometime between 1592 and 1595.

Many people thought that English literature, and particularly drama, had already reached as high as it could when Ben Jonson began his career. But Jonson helped it gain even higher goals. Jonson's special gift was his strong sense of artistic form and control. Although an accomplished scholar, he could also write in the way everyday people spoke. It was because of this skill that he was liked by both people who were well read and by people who did not have an advanced education.

Major works

Jonson's first major play was *Every Man in His Humour*. It was performed by a theater group called the Lord Chamberlain's Men. William Shakespeare performed the lead role. This play is a model of what is called the "comedy of humors," in which each character's action is ruled by a whim (impulse) or affectation (artificial behavior meant to impress others). After this play Jonson wrote *Every Man out of His Humour* in 1599 or early 1600, followed closely by *Cynthia's Revels* (1601) and *Poetaster* (1601).

Jonson gained fame when he wrote *Volpone, or the Fox* in 1606. It was loved not only by the people in London but also by the scholars at the universities of Oxford and Cambridge. This was a major success for Jonson. After *Volpone*, Jonson wrote *Epicoene, or the Silent Woman* (1609), *The Alchemist* (1610), and *Bartholomew Fair* (1614).

Ben Jonson.

Courtesy of the Library of Congress.

Later years

After *Bartholomew Fair*, Jonson did not write very well. However, many young poets and playwrights considered him a hero and called themselves "sons of Ben" or the "tribe of Ben." He was always considered an impressive and respected figure.

Much of the information about Jonson's personal life comes to us after this last period of playwriting. He spent a lot of time with the Scottish poet William Drummond of Hawthornden (1585–1649) in 1618. Drummond wrote down all the conversations he had with Jonson. Drummond said that Jonson was "a great lover and praiser of himself, a contemner

[despiser] and scorner of others, given rather to lose a friend than a jest.” In other words, Jonson made many jokes about other people and considered himself superior to others.

Jonson also wrote many other nondramatic writings, including a grammar of English, a miscellaneous (made of many different parts) collection of notes, and reflections on various authors entitled *Timber, or Discoveries* (also printed in 1640). He also wrote a large number of poems, almost all of them written in response to particular events in the poet's experience. Most of his poetry was written in short lyric (songlike) forms, which he handled with great skill. Jonson's poetic style also tends to be simple and unadorned yet highly polished, as in the epigram (a short witty poem) on the death of his first daughter, which begins “Here lies to each her parents ruth [sorrow],/Mary, the daughter of their youth.”

After the death of King James I of England (1603–1625) in 1625, Jonson suffered a number of setbacks. His talents were not fully appreciated by the new king, and as a result Jonson was frequently short of money. He was paralyzed in 1628 due to illness and confined for the remainder of his life to his home in Westminster. He continued his scholarly study of the classics, which had occupied him throughout his active life.

Jonson died on August 6, 1637. Because he was considered one of the most accomplished writers of the time, he was given the special honor of being buried in Westminster Abbey, in England.

MICHAEL JORDAN

Born: February 17, 1963

Brooklyn, New York

African American basketball player

Basketball superstar Michael Jordan is one of the most successful, popular, and wealthy athletes in college, Olympic, and professional sports history.

Early life

Michael Jordan was born on February 17, 1963, in Brooklyn, New York, one of James and Deloris Jordan's five children. The family moved to Wilmington, North Carolina, when Michael was very young. His father worked as a General Electric plant supervisor, and his mother worked at a bank. His father taught him to work hard and not to be tempted by street life. His mother taught him to sew, clean, and do laundry. Jordan loved sports but failed to make his high school basketball team as a sophomore. He

continued to practice and made the team the next year. After high school he accepted a basketball scholarship to the University of North Carolina, where he played under head coach Dean Smith.

In Jordan's first season at North Carolina he was named Atlantic Coast Conference (ACC) Rookie of the Year for 1982. The team won the ACC championship, and Jordan made the clutch jump shot that beat Georgetown University for the championship of the National Collegiate Athletic Association (NCAA). Jordan led the ACC in scoring as a sophomore and as a junior. The *Sporting News* named him college player of the year for both years. He left North Carolina after his junior year and was selected by the Chicago Bulls of the National Basketball Association (NBA) as the third pick of the 1984 draft. Before joining the Bulls, Jordan was a member of the Summer 1984 United States Olympic basketball team that won the gold medal in Los Angeles, California.

Early pro years

When Jordan was drafted by the Chicago Bulls they were a losing team, drawing only around six thousand fans to home games. Jordan quickly turned that around. His style of play and fierce spirit of competition reminded sportswriters and fans of Julius Erving (1950–), who had been a superstar player during the 1970s. Jordan's incredible leaping ability and hang time thrilled fans in arenas around the league. In his first season he was named to the All-Star team and was later honored as the league's Rookie of the Year.

A broken foot sidelined Jordan for 64 games during the 1985–86 season, but he

Michael Jordan.

returned to score 49 points against the Boston Celtics in the first game of the playoffs and 63 in the second game—an NBA playoff record. The 1986–87 season was again one of individual successes, and Jordan started in the All-Star game after receiving a record 1.5 million votes. He became the first player since Wilt Chamberlain (1936–1999) to score 3,000 points in a single season. Jordan enjoyed personal success, but Chicago did not advance beyond the first round of the playoffs until 1988. Jordan concentrated on improving his other basketball skills, and in 1988 he was named Defensive Player of the Year. He was also named the league's Most

Valuable Player (MVP) and became the first player to lead the league in both scoring and steals. He was again named MVP in that year's All-Star game.

By adding such players as Scottie Pippen, Bill Cartwright, Horace Grant, and John Paxson around Jordan, the Bulls' management created a strong team that won the 1991 NBA title by defeating the Los Angeles Lakers. The next year, the Bulls repeated as NBA champions by beating the Portland Trail Blazers. In 1992 Jordan also played on the "Dream Team," which participated in the Summer Olympic Games in Barcelona, Spain. The Olympic Committee had voted to lift the ban on professional athletes participating in the games. The team easily won the gold medal, winning their eight games by an average margin of 43.7 points.

Unexpected retirement

In 1993, after a tough playoff series with the New York Knicks, the Bulls met the Phoenix Suns for the NBA championship. When it was over, Jordan was again playoff MVP, and Chicago had won a third straight title. That summer Jordan's father, James, was murdered by two men during a robbery attempt. Jordan was grief stricken, and his father's death, combined with media reports about his gambling, led him to announce his retirement from professional basketball in October. Jordan had won three straight NBA titles, three regular season MVP awards, three playoff MVP titles, seven consecutive scoring titles, and he was a member of the All-Star team every year that he was in the league. In just nine seasons he had become the Bulls all-time leading scorer.

In 1994–95 Jordan played for the Birmingham Barons, a minor league baseball team in the Chicago White Sox system. Although the seventeen-month experiment showed that he was not a major league baseball player, the experience and time away from basketball provided a much-needed rest and opportunity to regain his love of basketball.

Return to glory

When Jordan returned to the Chicago Bulls during the 1994–95 regular season, people wondered, "Could he do it again?" He played well, but he was obviously rusty. The Bulls were defeated in the playoffs by the Orlando Magic. After a summer of playing basketball during breaks from filming the live-action cartoon movie *Space Jam*, Jordan returned with a fierce determination to prove that he had the ability to get back on top. The 1995–96 Bulls finished the regular season 72–10, an NBA record for most wins in a season, and Jordan, with his shooting rhythm back, earned his eighth scoring title. He also became the tenth NBA player to score 25,000 career points and second fastest after Chamberlain to reach that mark. The Bulls went on to win their fourth NBA championship, overpowering the Seattle SuperSonics in six games. Few who watched will ever forget how Jordan sank to his knees, head bent over the winning ball, in a moment of bittersweet victory and deep sadness. The game had been played on Father's Day, three years after his father's murder.

The defending champions had a tougher time during the 1996–97 season but entered the playoffs as expected. Sheer determination took the Bulls to their fifth NBA championship. Illness, injury, and at

times a lack of concentration hurt the team. In the fifth game of the finals Jordan carried the team to victory despite suffering from a stomach virus. In the 1997–98 season the Bulls were again in the playoffs, and again they faced tough competition. As before, they were able to clinch the NBA championship, and Jordan claimed his sixth NBA finals MVP award.

Jordan's other professional life as a businessman was never off track. Profitable endorsements (ads in which he voiced his support for certain products) for companies such as Nike and Wheaties, as well as his own golf company and products such as Michael Jordan cologne (which reportedly sold 1.5 million bottles in its first two months), made Jordan a multimillionaire. In 1997 he was ranked the world's highest paid athlete, with a \$30 million contract—the largest one-year salary in sports history—and approximately \$40 million a year in endorsement fees.

Retired again

Jordan retired for a second time in 1999, ending his career on a high note just after the official end of a labor dispute between NBA players and team owners. Many people saw him as the greatest basketball player ever, and his retirement was called the end of an era. In 2000 Jordan became part-owner and president of basketball operations of the Washington Wizards. This made him only the third African American owner in the NBA. He also gained an ownership stake in the Washington Capitals hockey team. Also in 2000, Jordan celebrated the first year of his \$1 million grant program to help teachers make a difference in their schools.

In September 2001, after months of rumors, Jordan announced that he was ending his three-year retirement to play for the Wizards at age thirty-eight. At a news conference to discuss his comeback, he said, "Physically, I know I'm not twenty-five years old, but I feel I can play the game of basketball on the highest level." The Wizards, who had won only nineteen games the season before, improved with the addition of Jordan. After being voted to play in his thirteenth All-Star game (during which he missed a slam dunk), Jordan had the Wizards in the race for the playoffs until suffering a knee injury and missing the last part of the season. He was also distracted in January 2002 when his wife Juanita, whom he married in 1989, filed for divorce. (They have three children.) The next month the divorce was called off. Jordan said he planned to play one more season for the Wizards.

James Joyce.

Reproduced by permission of AP/Wide World Photos.

JAMES JOYCE

Born: February 2, 1882

Rathgar, Ireland

Died: January 13, 1941

Zurich, Switzerland

Irish author

James Joyce was an Irish author who experimented with ways to use language, symbolism (having one thing to stand for another), interior monologue (characters talking to themselves), and stream of

consciousness (the uninterrupted, continuous flow of a character's thoughts).

Early years

James Joyce was born on February 2, 1882, in Rathgar, Ireland, a suburb of Dublin, Ireland. His father had several jobs including a position as tax collector for the city of Dublin. His mother, Mary Jane Murray Joyce, was a gifted piano player. James's father was not very successful, and the family had to move fourteen times from the time James was born until he left Ireland.

Joyce was educated entirely in Jesuit (a Catholic religious order) schools in Ireland. He did very well in the study of philosophy (the study of humans and their relationship to the universe) and languages. After his graduation in 1902, he left Ireland for the rest of his life. After that he lived in Trieste, Italy; Zurich, Switzerland; and Paris, France, with his wife and two children.

Early fiction

Most of Joyce's fiction is autobiographical, that is, it is based on his own life experiences. Even though he left his native country, his work is based mainly on Ireland, family, and Roman Catholicism.

Joyce's *Dubliners* is a collection of fifteen short stories. He finished writing the work in 1904, but it could not be published until ten years later because the British government thought it contained things that offended the king. *A Portrait of the Artist as a Young Man*, published in 1916, is a semi-autobiographical (based on the author's own life) novel of adolescence (the teenage years). It is the story of Stephen Dedalus, a young writer who

rebels against the surroundings of his youth. He rejects his father, family, and religion, and, like Joyce, decides at the novel's close to leave Ireland. His name comes from Greek mythology (stories that tell of gods or explain natural occurrences). In the myth Dedalus made a maze to hold the Minotaur (a monster that was half man and half bull). He was jailed in the labyrinth with his son, Icarus. In order to escape, he made wings of feathers and wax, but Icarus flew too near the sun, which melted the wax causing him to die when he plunged into the sea. For Joyce and others after him, Stephen Dedalus became a symbol for all artists. Stephen appears again in *Ulysses*, perhaps Joyce's most respected novel.

Ulysses

Joyce published *Ulysses* in 1922. Many consider it Joyce's most mature work. It is patterned after Homer's *Odyssey*. Homer was a Greek poet who produced his works around 850 B.C.E. Each of the eighteen chapters is related to a part of the original Greek epic (long poem that tells a heroic story), but there are other sources, too. The action takes place in a single day, June 16, 1904. It tells the story of Leopold Bloom, his wife Molly, and Stephen Dedalus, and how the actions of each person touches the others during that day. *Ulysses* is considered one of the most important books in the development of the modern novel. To tell this story, Joyce used what he called the stream of consciousness. Using this technique Joyce permits the reader to enter the consciousness (thoughts) of his characters, listen to parts of conversations, experience what the characters feel, and relive their memories.

Finnegans Wake

Finnegans Wake is the most difficult of all of Joyce's works to understand. It was published in 1939. The novel has no real plot. Instead, it relies upon sound, rhythm of language, and puns (word jokes). These parts create a surface and the meanings are under that surface. Most people consider *Finnegans Wake* to be a novel, but others have called it a poem. The novel was not well-received, and Joyce relied on the help of friends for financial assistance after it was published.

Late life

Joyce knew his family was not safe in France when it was taken over by the Germans during World War II (1939–45; a war in which Germany, Japan, and Italy fought against France, Great Britain, the Soviet Union, and the United States). He borrowed money and fled to Switzerland with his family. Joyce died in Zurich, Switzerland, on January 13, 1941. He is considered one of the most important novelists of the twentieth century.

The modern novel owes much to James Joyce. His understanding of philosophy, theology (religious studies), and foreign languages enabled him to use the English language in exciting new ways. His novel *Ulysses* was brought to trial on charges of obscenity (being offensive) in the United States, but Joyce was found innocent. This marked a breakthrough on how subject matter and language could be used in the modern English novel.

BENITO JUÁREZ

Born: March 21, 1806

San Pablo Guelatao, Oaxaca, Mexico

Died: July 18, 1872

Mexico City, Mexico

Mexican statesman and president

Benito Juárez was a Mexican statesman and four-time president of Mexico. After resisting takeover by European powers, Juárez installed numerous social changes that would improve the lives of the Mexican people.

Early life

Benito Juárez was born in the small Zapotec Indian village of San Pablo Guelatao, Oaxaca, Mexico, on March 21, 1806. His parents, who were poor peasants, died when he was three years old. Juárez then lived with his grandparents and later with an uncle. He worked with his uncle until he was thirteen. Then he walked forty miles to the city of Oaxaca, Mexico, to move in with his sister. At the

time he could not yet speak Spanish (he spoke the language used in the Oaxaca tribe).

In Oaxaca, Juárez worked with Don Antonio Salanueva, a bookbinder, who basically adopted him. Helped by Salanueva and a local teacher, Juárez eventually learned to read and write. In 1827 he graduated from the Seminary of Santa Cruz, but later changed career paths and decided to study law. In 1831 he qualified to enter a local law office, but as the legal profession was already overcrowded, he began a second career as an antiestablishment Liberal politician with goals to change the Mexican government.

Early career

In 1831 Juárez entered politics as an official on the Oaxacan town council. In 1835 the city elected him as a Liberal deputy to the federal legislature. He carried forward his legal career, often serving as a representative of the severely poor Indian communities in their struggles to protect their landholdings. Honest and intelligent, he became one of Oaxaca's leading lawyers.

By this time, Mexico seemed on the verge of total collapse. Thirty years of violence had left the treasury bankrupt, communications disrupted, and the population unconfident. Two factions (rival groups creating conflict), defining themselves as Conservatives and Liberals, constantly fought to control Mexico. The Conservatives, represented large landholders, the Church, the army, and the large cities. The Liberals, who represented small merchants, some intellectuals, political leaders in rural areas, and the small ranchers of the west and south, wanted to modernize Mexico.

During the Conservative domination of Mexico between 1836 and 1846, Juárez largely avoided elective office but often accepted professional and political appointments from the Conservative state authorities. In 1841 the state government appointed him a federal court judge, a post in which he served with excellence. His local standing had increased through his marriage to Margarita Mazza, the daughter of one of Oaxaca's wealthiest families.

Governor of Oaxaca

In 1846 the Liberal party, led by former president Valentín Gómez Farías, took power throughout Mexico and Juárez returned to the Liberal faction. In 1847 and 1848, during Mexico's war with the United States over land in America's Southwest, he became Oaxaca's acting governor and then elected governor.

Juárez reduced corruption and built roads, public buildings, and schools. He reorganized the state national guard, and when he left office in 1852, the economy of Oaxaca was in good standing. His state government became renowned throughout Mexico for its honesty, public spirit, and constructiveness. He also served as a lawyer, often helping the poor.

In 1853 the Conservative party, led by the brilliant Lucas Alamán (1792–1853), seized power by a barracks coup, or hostile takeover. One of the revolt's leaders was Antonio López de Santa Ana (1794–1876), the corrupt general who had frequently dominated Mexico during the previous twenty years. Seeking to strengthen his power, Santa Ana immediately exiled (forced to leave) the leaders of the Liberal party, including Juárez.

Benito Juárez.

Return to Mexico

In Mexico, Santa Ana had run the country into further bankruptcy (complete financial ruin). Liberals launched a revolt and Santa Ana's government collapsed with little fighting. The Liberals again assumed power with Juan Álvarez as president. But the voluntary retirement of Álvarez in 1857 ended the Liberal hopes for a peaceful transformation of Mexico. The following period, known as the Three Year War (1857–60), proved to be one of the most bloody and wasteful in Mexican history.

The only positive result of these years was the emergence of Juárez as the undisputed leader of the Liberal party. At the same

time, the Conservatives had named one of their own the president of Mexico and sent their troops northward to crush Liberal resistance. Through the conflict, Juárez fled to Veracruz, Mexico. Three years later, the reorganized Liberal armies under Santos Degollado, Porfirio Díaz, and Jesús González Ortega took Mexico City. The Conservative armies fell apart, and their leaders went into exile. In 1860 the Mexican people elected Juárez president.

Verge of collapse

Juárez was determined to carry out national reconstruction, but he had staggering problems. The government, seeking to develop a large agrarian middle class, or a class of farm workers, tried to distribute the lands to those working them. However, the Liberals needed money to pay the army and the national debt. Pressed for funds, public officials allowed these lands to go to those who could pay for them immediately, mostly rich land developers and foreign investors.

On the verge of economic collapse, Mexico was at the mercy of foreign nations, in particular England, France, and Spain. The English and Spanish soon withdrew, but the French emperor, Louis Napoleon (1808–1873), attempted to establish a Mexican empire under the Austrian archduke Maximilian (1832–1867). Aided by small Conservative forces, the French took Mexico City in 1863. Once again, Juárez was forced to flee.

End of his career

The years between 1864 and 1867 determined the future of Mexico and the Liberal reforms. Juárez refused to serve in an imperial cabinet, a body of advisors under control

of a foreign empire. The imperialists controlled the cities, but the countryside remained in a state of revolt. Faced with mounting costs in men and money and the rise of Prussia, which was part of the German empire, the French withdrew from Mexico.

Juárez accomplished much in the remaining four years of his life. The government began to build railroads and schools, the military budget was cut, and the Church was stripped of its large landholdings. Most important, Mexico had its first effective government, based upon the Constitution of 1857, which guaranteed free speech, free press, right of assembly (right to organize), and the abolishment of special legal privileges.

On the negative side, Juárez refused to distribute authority and insisted, despite much opposition, upon his own reelection in 1871. He sincerely believed that he alone could govern Mexico, but many now saw him as a dictator, or an absolute ruler. Furthermore, he had failed to rid the country of internal tariffs (taxes) or to reduce large independent landholdings. In 1871 his army crushed the revolt of Porfirio Díaz, but the Liberal party had split into factions. On July 18, 1872, the president suffered from a stroke and died at his desk.

Juárez had many failings, but he was one of the greatest Mexican executives. He fought for and established a liberal constitution and stubbornly saved the country from foreign domination, although he did little to help the rural proletariat, or working class.

CARL JUNG

Born: July 26, 1875

Kesswil, Switzerland

Died: June 26, 1961

Küsnacht, Switzerland

Swiss psychologist and psychiatrist

The Swiss psychologist and psychiatrist Carl Jung was one of the major forces responsible for bringing psychological (having to do with the mind and its processes) thought and its theories into the twentieth century.

Jung's youth and personal life

Carl Gustav Jung was born on July 26, 1875, in Kesswil, Switzerland, the son of a Protestant minister. At the age of four, the family moved to Basel. When he was six years old, Carl went to the village school in Klein-Huningen. His father also started teaching him Latin at this time. During his childhood,

Jung preferred to be left alone to play by himself. He was happiest when he was in isolation with his thoughts.

As Jung grew older, his keen interest in a large variety of sciences, and the history of religion made the choice of a career quite difficult. However, he finally decided on medicine, which he studied at the University of Basel (1895–1900). He received his medical degree from the University of Zurich in 1902. Later he studied psychology (the scientific study of the mind and its processes) in Paris, France.

In 1903 Jung married Emma Rauschenbach. She was his loyal companion and scientific coworker until her death in 1955. The couple had five children, and lived in Küsnacht on the Lake of Zurich.

Career begins

Jung began his professional career in 1900 as an assistant to Eugen Bleuler (1857–1939) at the psychiatric clinic of the University of Zurich. During these years of his internship, Jung, with a few associates, worked out the so-called association experiment. This is a method of testing used to reveal affectively significant groups of ideas in the unconscious area of the psyche (the mind). These groups or “complexes” as Jung called them, would have a control over the affected person, and would encourage anxieties and inappropriate emotions.

When Jung read Sigmund Freud's (1856–1939) *Interpretation of Dreams*, he found his own ideas and observations to be basically confirmed and furthered. He sent his publication *Studies in Word Association* (1904) to Freud, and this was the beginning of their

Carl Jung.

Courtesy of the Library of Congress.

work together, as well as their friendship, which lasted from 1907 to 1913. Jung was eager to explore the secrets of the unconscious psyche expressed by dreaming, fantasies, myths, fairy tales, superstition, and occultism (belief in supernatural powers or forces). But Freud had already worked out his theories about the basic cause of every psycho-neurosis (an emotional problem that becomes known through physical symptoms or through feelings of anxiety, depression, or fear) and also his belief that all the expressions of the unconscious (the part of the mind that is not a usual part of a person's awareness) are hidden wish fulfillments. Jung felt more and

more that these theories were scientific presumptions (beliefs that are based on expected outcomes), which did not do full justice to the expressions of unconscious psychic life. For him the unconscious not only is a disturbing factor causing psychic illnesses but also is basically the source of man's creativeness and the roots of a person's consciousness. With such ideas Jung came increasingly into conflict with Freud, who regarded Jung's ideas as unscientific. Jung accused Freud of narrow-mindedness; Freud and his followers disapproved of Jung for his emphasis of the spiritual aspects of the psyche.

Jung's work after Freud

Jung was bothered by his break with Freud. He began a deepened self-analysis (an examination of oneself) in order to gain all the honesty and firmness for his own journey into discovering the mysteries of the unconscious psyche. During the years from 1913 to 1921 Jung published only three important papers: "Two Essays on Analytical Psychology" (1916, 1917) and "Psychological Types" (1921). The "Two Essays" provided the basic ideas from which his later work was developed. He described his research on psychological typology (the classification of personalities by studying their similarities and differences)—that there are two basic classifications, or "two types of personalities," in the way they relate to the world: introversion and extroversion. Introversion, in which one has the characteristic of being self-involved, withdrawn, occupied with one's "inner world." Extroversion, in which one relates to the world through social involvement and has interests outside of oneself and is "outgoing." He expressed the idea that it is the

“personal equation” which, often unconsciously but in agreement with one’s own typology, influences how an individual observes and interacts with their world.

Next to Jung’s typology, his main contribution was his discovery that man’s fantasy life has a certain structure. There must be subtle active centers in the unconscious which control natural behavior and free imagination. These combine to form Jung’s concept of archetypes. An individual will dream on impulse, and these dreams will have a theme or story similar to a fairy tale, or a myth, from a time long past, that are unknown to the person dreaming. To Jung this meant that archetypal symptoms (memories of experiences of people from the past that are present in every person’s unconscious mind) belong to human beings of all ages and from all times; they are the expression of a collective body of man’s basic psychic nature. Many neurotic sufferings have happened due to a feeling of self-estrangement (the alienation of oneself from oneself) because of man’s creation of a logical framework and control of his dependence on these “memories” of experiences that exist in the unconscious.

In order to study archetypal patterns and processes, Jung visited so-called primitive tribes. He lived among the Pueblo Indians of New Mexico and Arizona in 1924 and 1925 and among the inhabitants of Mt. Elgon in Kenya during 1925 and 1926. He later visited Egypt and India. To Jung, the religious symbols and phenomenology (a system of beliefs developed by studying peoples understanding and awareness of themselves) of Buddhism and Hinduism and the teachings of Zen Buddhism and Confucianism all

expressed differentiated experiences on the way to man’s inner world, a world which was badly neglected by Western civilization. Jung also searched for traditions in Western culture, which made up for its one-sided outgoing development toward reason and technology. He found these traditions in Gnosticism (belief that personal freedom comes through spiritual knowledge and understanding), Christian mysticism (the belief that instinct and spiritual feeling are the ways to find God), and, above all, occultism (knowledge or use of supernatural powers). Some of his major works are deep and clear psychological interpretations of alchemical (the ability and power to make common things special) writings, showing their living significance for understanding dreams and the hidden theme of neurotic and mental disorders.

Inner development and growth of personality

Of prime importance to Jung was the detailing of the stages of inner development and of the growth of the personality, which he termed the “process of individuation.” He described a strong impulse from the unconscious to guide the individual toward its most complete uniqueness. This achievement is a lifelong task of trial and error and identifying and uniting contents of the unconscious. It consists in an ever-increasing self-knowledge and in “becoming what you are.”

Jung lived for his explorations, his writings, and his psychological practice, which he had to give up in 1944 due to a severe heart attack. His career included the professorship of medical psychology at the University of Basel and the titular (title without the actual position) professorship of philosophy

from 1933 until 1942 on the faculty of philosophical and political sciences of the Federal Institute of Technology in Zurich. In 1948 he founded the C. G. Jung Institute in Zurich. Honorary doctorates were given to him by many important universities all over the world. Carl Gustav Jung died in Küssnacht on June 6, 1961.

FRANZ KAFKA

Born: July 3, 1883

Prague, Czechoslovakia

Died: June 3, 1924

Prague, Czechoslovakia

*Czech-born German novelist and
short-story writer*

The Czech-born German novelist and short-story writer Franz Kafka presented man's experience of total isolation or separation from the environment around him. In his works man finds himself in a maze that he will never understand.

Early life

Franz Kafka was born on July 3, 1883, the eldest of six children of a middle-class merchant. He grew up as a member of a minority (the Jewish community) within a minority (the German-speaking population) at a time when there was little or no communication between the two groups or with the mainly Czech-speaking citizens of Prague. Even though Kafka acquired a thorough knowledge of Czech and a deep understanding of its literature early in his life, he was not accepted. This alienation (the state of being rejected or turned away) was reflected in his writing, most notably in the protagonists (main characters) of his stories, who were for the most part outcasts constantly asking,

Franz Kafka.

Reproduced by permission of AP/Wide World Photos.

“Where do I belong?” or “Where does man belong?”

An even greater source of frustration for Kafka was his domineering father, a successful businessman who was a powerful, imposing (impressive) man. Conflict with his father overshadowed Kafka’s childhood and youth. It was from his mother that he inherited his sensitive and dreamy qualities. In his literary works, Kafka transformed this total lack of communication into the relationship between authority figures and man.

Even as a youngster Kafka must have wanted to write. For his parents’ birthdays he

would compose little plays, which were performed at home by his three younger sisters, while he himself acted as stage manager. He was also an avid reader. Kafka attended a German grammar school from 1893 to 1901, and the Karl Ferdinand University of Prague from 1901 to 1906. He started out studying German literature but changed to the study of law in his second semester. In June 1906 he graduated with a degree of doctor of jurisprudence (the science of law).

Early works

In October 1906 Kafka began his practice of law. In early 1908 he joined the staff of the Workmen’s Compensation Division of the Austrian government, a post he held until his retirement for reasons of ill health in July 1922. Here he came to know the suffering of the underprivileged workmen and wrote his first published works, “Conversation with a Beggar” and “Conversation with a Drunkard,” which were published in 1909. Kafka’s first collection of stories was published in 1913 under the title *Contemplation*. These sketches are polished, light impressions based on observations of life in and around Prague.

In September 1912 Kafka composed the story “The Verdict” in a single night. The story contains all the elements normally associated with Kafka’s world, the most disorderly universe ever presented by a major artist. In “The Verdict” a bedridden authoritarian (domineering) father passes judgment on his conscientious (highly principled) but guilt-haunted son. His next work, completed in May 1913, was the story “The Stoker,” later incorporated in his novel *Amerika* and awarded the Fontane Prize in 1915, his first public recognition.

His stories

The year 1913 saw the publication of Kafka's best-known story, *The Metamorphosis*. For the reader Kafka creates a world of psychotic delusion (absurd and extreme mental perception not based on reality) by means of an outrageous event: "When Gregor Samsa woke one morning from restless dreams, he found himself transformed in his bed into a monstrous insect." In spite of Gregor's gallant efforts to master his new situation, he dies.

In 1914 Kafka published a novella (short novel), *In the Penal Colony*. Several stories were published in 1919 in a collection dedicated to his father and entitled *The Country Doctor*. His story "The Hunger Artist" was published the following year, and a collection of four stories was published in 1923. Again, as in *The Metamorphosis*, it is the outsiders (outcasts of society), however sensitive and gifted, who fall into psychotic delusions—not the healthy realists, who always seem to survive the struggle for existence.

One of Kafka's most important writings is the one-hundred-page letter to his father. Written in November 1919, it is an attempt to explain his conscience (one's own ideals and sense of wrong or right) to his father and to declare his final independence from his father's authority.

His novels

Kafka's three great novel fragments, *Amerika*, *The Trial*, and *The Castle*, might have been lost to the world altogether had it not been for the courage of his friend Max Brod (1884–1968). Editing them after Kafka's death, Brod ignored his friend's request to destroy all of his unpublished manuscripts.

In *The Trial*, published in 1925, a man is arrested and convicted by a mysterious court. He tries to learn the nature of the guilt he feels, and the nature of the court, but he fails. He dies in ignorance. *The Castle*, published in 1926, presents a newcomer's futile (having no useful result) struggle to win acceptance and enter a castle in which an unknown supreme authority resides. *Amerika* is about the adventures of a teenage European immigrant in America.

During the years 1920 to 1922, Kafka's health was badly threatened, and he was forced to take sick leave. Kafka left Prague at the end of July 1923 and moved to Berlin-Steglitz, where he wrote his last, comparatively happy story, "The Little Woman." He returned to Prague three months before his death on June 3, 1924.

Franz Kafka is regarded as one of the major literary figures of the twentieth century. His works present a world that is both realistic and dreamlike. Individuals in it struggle with guilt, isolation, and fear. Kafka once said that all of his stories were intended to convey the message that "the incomprehensible [that which cannot be understood by the intellect] cannot be comprehended."

WASSILY KANDINSKY

Born: December 4, 1866

Moscow, Russia

Died: December 13, 1944

Neuilly-sur-Seine, France

Russian painter and graphic artist

The Russian painter and graphic artist Wassily Kandinsky was one of the great masters of modern art, as well as the outstanding representative of pure abstract painting (using only colors and forms) that dominated the first half of the twentieth century.

Early years in Russia

Wassily Kandinsky was born on December 4, 1866, in Moscow, Russia. His father was a tea merchant. When he was five years old the family moved to Odessa, Russia. The young Kandinsky drew, wrote poems, and played the piano and the cello. Because his family was fond of traveling, Kandinsky got to see the Italian cities of Venice, Rome, and Florence as a young boy. He was also influenced by the imposing Muscovite (from Moscow) buildings such as the Kremlin.

Between 1886 and 1892 Kandinsky studied law and economics at the University of Moscow. In 1889 he was a member of a team formed to study the life of the people in the Vologda district in northwestern Russia. He was highly impressed by their folk art and the interior decorations of the village houses. The use of forms and colors became an influence in his art. In 1893 he accepted a position on the university's law faculty.

Beginnings as an artist

It was not until 1896, when Kandinsky was thirty years old, that he decided to become an artist. His artistic development was shaped greatly by an exhibition of French impressionist painters that was shown in Moscow in 1895. The impressionists used values of color and light to show their subjects rather than painting in fine detail. The works of Claude Monet (1840–1926) attracted Kandinsky's attention. In Monet's paintings the subject matter played a secondary role to color. It was as though reality and fairy tale were intermixed. That was the secret of Kandinsky's early work, which was based on folk art, and it remained so even as his work became more complex.

The year 1910 was crucial for Kandinsky and for the art world. Kandinsky produced his first abstract watercolor. In that work all elements of representation (the actual look of a subject) seem to have disappeared. In continuing his early abstract works he used strong straight-line strokes combined with powerful patches of color.

Return to Russia

When World War I (1914–18; a war in which Germany, Austria-Hungary, and Japan fought against Great Britain, France, Russia, and the United States) broke out, Kandinsky returned to Russia. In 1917 he married Nina Andreewsky. During the Russian Revolution (1917), which overthrew the czar, the ruler of Russia, the artist held an important post at the Commissariat (government bureau) of Popular Culture and at the Academy in Moscow. He organized twenty-two museums and became the director of the Museum of

Pictorial Culture. In 1920 he was appointed professor at the University of Moscow. The following year he founded the Academy of Arts and Sciences and became its vice president. At the end of that year, the Soviet attitude toward art changed, and Kandinsky left Russia.

Years in Germany and France

In 1922 Kandinsky became a professor at the Bauhaus (a school of art, architecture, and design) in Weimar, Germany. His art from about 1920 to 1924 has been called his architectural period because the shapes he used were more precise than before. There are points, straight or broken lines, single or in bunches, and snakelike, radiating segments of circles. The color is cooler, and more subdued (softer, quieter).

Kandinsky became a German citizen in 1928. In 1929 Kandinsky held his first one-man show in Paris, France, and traveled to Belgium and the French Riviera. In 1930 he had another exhibition in Paris. In 1931 he produced wall decorations for a large architectural exhibition that was held in Berlin, Germany. When the Bauhaus closed in 1932, Kandinsky moved to Berlin. A year after that he moved to Paris.

From 1927 to 1933, Kandinsky's paintings were characterized by abundant use of pictorial (like real pictures) signs and softer color. This is called his romantic or concrete period. It led to the last phase of his art, spent in France, which was a synthesis (blending) of his previous periods. The paintings of his Paris period have splendid color, rich invention, and delightful humor. In 1939 Kandinsky became a French citizen. He died on December 13, 1944, in Neuilly-sur-Seine, France.

Wassily Kandinsky.

Reproduced by permission of the Corbis Corporation.

Kandinsky is still greatly admired today for his own paintings and for being the originator of abstract art. He invented a language of abstract forms with which he replaced the forms of nature. He wanted to mirror the universe in his own visionary world. He felt that painting possessed the same power as music and that sign, line, and color ought to correspond to the vibrations of the human soul.

IMMANUEL KANT

Born: April 22, 1724

Königsberg, East Prussia

(now Kaliningrad, Russia)

Died: February 12, 1804

Königsberg, East Prussia

German philosopher

The major works of the German philosopher Immanuel Kant offer an analysis of theoretical and moral reason and the ability of human judgment. He had a great influence on the intellectual movements of the nineteenth and twentieth centuries.

Childhood and education

The fourth of nine children of Johann Georg and Anna Regina Kant, Immanuel Kant was born in the town of Königsberg, East Prussia, on April 22, 1724. Johann Kant was a harness maker, and the large family lived a humble life. The family belonged to a Protestant religious group of Pietists (a German religious movement whose members strongly believed in religious experience and

biblical study), and a concern for religion touched every aspect of their lives. Although Kant became critical of formal religion, he continued to admire the “praiseworthy conduct” of Pietists. Kant’s elementary education was at Saint George’s Hospital School and then at the Collegium Fredericianum, a Pietist school, where he remained from 1732 until 1740. Here he gained a deep appreciation for the classics of Latin literature, especially the poet Lucretius.

In 1740 Kant entered the University of Königsberg. He became interested in philosophy, mathematics, and the natural sciences. The death of Kant’s father in 1746 left him without income. He became a private tutor for seven years in order to have enough time and money to continue his education. During this period Kant published several papers dealing with scientific questions. The most important was the “General Natural History and Theory of the Heavens” in 1755. In this work Kant concluded the origin of the solar system was a result of the gravitational (having to do with the force exerted between bodies of matter) connection of atoms (the smallest pieces of matter). In the same year Kant presented a Latin treatise, “On Fire,” to qualify for the doctoral degree.

Kant spent the next fifteen years (1755–1770) as a lecturer. In order to live he lectured between twenty-six and twenty-eight hours a week. Despite this enormous teaching burden, Kant continued to publish papers on various topics. He finally achieved a professorship at Königsberg in 1770.

Critique of Pure Reason

At the age of fifty-seven Kant published the first edition of the *Critique of Pure Reason*

(1781; 2d ed. 1787). This enormous work is one of the most important and difficult books in Western thought. The aim of the critique is to explain how experience and reason interact in thought and understanding. The *Critique of Pure Reason* is a methodology (a collection of methods and rules) of how “understanding and reason [the power of understanding] can know apart from experience.” This revolutionary proposal means that the mind organizes our experiences into the way the world appears and the way that we think about the world. Any experience is placed into one of these categories so that it can be understood. Kant also wrote that the mind can have knowledge of things that have or have not been experienced, but these are only possibilities. Kant does not say that the mind creates objects—only the conditions under which objects are noticed and understood. We can never know noumenal reality (theoretical objects or ideas that are understood by thought alone) with any certainty.

Kant suggests that the theories of God, freedom, and immortality (something that goes against ideas of right and wrong) are not proved or disproved through the use of reason, nor can the use of scientific methods prove or disprove their existence. The idea of them is beyond the realm of human experience. Kant expressed that faith in God, freedom, and immortality are rational beliefs because their existence makes an orderly and moral world a possibility.

Later works

In 1783 Kant restated the main outlines of his first critique in a brief, analytic form in the *Prolegomena to Any Future Metaphysics*. In

Immanuel Kant.

Reproduced by permission of Archive Photos, Inc.

1785 he presented an early view of the practical aspects of reason in *Fundamental Principles of the Metaphysics of Morals*. In 1788 he published the *Critique of Practical Reason*.

While theoretical reason is concerned with knowledge, practical reason is concerned with will, or self-determination. There is only one human reason, but after it decides what it can know, it must determine how it shall act. Thus the freedom of the will determines how one shall lead his life. And the basic, reasonable principle of a free morality (a morality that one is free to choose) is some universal and necessary law

which follows. This principle is called by Kant the “Categorical Imperative,” which states that a man should act in a way that is acceptable and applicable to all people. In questioning the outcome of man’s freedom, Kant insists that practical reason assumes the immortality of the soul and the existence of God as the conditions for true freedom.

In 1790 Kant completed his third critique, which attempts to draw these conflicting ideas together. The *Critique of Judgment* attempts to connect the concepts of nature with the concepts of freedom.

Although Kant continued to write until shortly before his death, the “critical works” are the source of his influence. Only a life of extraordinary self-discipline enabled him to accomplish his task. He was barely five feet tall and extremely thin, and his health was fragile. Toward the end of his life he became increasingly antisocial and bitter over the growing loss of his memory and capacity for work. Kant became totally blind and finally died on February 12, 1804, in Krönigsberg.

JOHN KEATS

Born: October 31, 1795

London, England

Died: February 23, 1821

Rome, Italy

English poet

The English Romantic poet John Keats stressed that man’s quest for happiness and fulfillment is thwarted (prevented from taking place) by the sorrow and corruption inherent (existing as an essential characteristic) in human nature. His works are marked with rich imagery and melodic beauty.

Early life

John Keats was born in London, England, on October 31, 1795, the first of Thomas and Frances Keats’s five children. Thomas was working as a stable manager for John Jennings when he met Jennings’s daughter, Francis. Thomas, known for his charm, energy, and respectability, crossed the social barrier and won Francis’s heart and the two were married. Both of John’s parents were affectionate and loving toward their children. John especially shared a close relationship with his mother. His father died in an accident in 1804. His mother, after a second marriage and divorce, died from a lung disease in 1810.

In 1811 Keats became an apprentice (worked for someone to learn a trade with little or no pay) to an apothecary (druggist) in Edmonton, England. There Keats first tried his hand at writing and produced four stanzas (short poems) entitled “Imitation of Spenser.”

These were inspired by the poem “Fairie Queene” by Edmund Spenser (c. 1552–1599).

On October 2, 1815, Keats started medical studies at Guy’s Hospital. He was a conscientious (careful) student, but poetry gained an increasing hold on his imagination. It is thought that Keats was influenced at this time by the boldness evident in a translation by George Chapman (c. 1559–1634) of the *Odyssey* by the Greek poet Homer (c. 850 B.C.E.). His first volume of poems was published in March 1817.

Publication of *Endymion*

Keats’s next work, *Endymion: A Poetic Romance*, was published in May 1818. Keats turned the story of Endymion, a mythical shepherd, into an allegory (a narrative in which abstract ideas are represented by people) of the romantic longing to overcome the boundaries of ordinary human experience. Endymion realizes that ultimate identification with transcendence (rising above the universe) is to be achieved through humble acceptance of human limitations and of the misery built into man’s condition. Keats’s letters reveal that at this time several of his friends were ill. His brother was very unwell, and he himself, after a bad cold, prophetically (foretelling) feared in October 1817 that “I shall never be again secure in Robustness (health and strength).”

In early 1818 Keats turned to straightforward narrative in *Isabella*, which is based on a story by Boccaccio (1313–1375). Its theme was connected with Keats’s more philosophical (pertaining to inquiry concerning the source and nature of human knowledge) pre-occupations—the beauty and greatness of tragic love.

John Keats.

Courtesy of the Library of Congress.

Later works

Keats started work on *Hyperion* in September 1818. An essential part of its purpose was to describe the growth of the Greek god Apollo into a true poet through ever deeper acceptance and understanding of change and sorrow. But Keats was unable to get ahead with it for a number of reasons, including impaired health, negative reception of *Endymion* by an influential critic, and the death of his brother, Tom.

In spring 1819 Keats turned once more to verse narrative. He first produced the opulent “Eve of St. Agnes” in deliberate revulsion (extreme displeasure) against what he now

saw as the “mawkish” (sickly sentimental) sentimentality of *Isabella*. This was followed by “La Belle Dame Sans Merci,” a simple narrative poem that tells of the mysterious seduction of a medieval knight by another of Keats’s elusive, enigmatic (mysterious), half-divine ladies. Each poem embodies an important trend in Keats’s poetry, a longing mixed with fear and diffidence (lack of self-confidence) for some experience beyond human mortality.

These were followed in the spring and summer of 1819 by the first of his great odes: “Ode to Psyche,” “Ode on a Grecian Urn,” and “Ode to a Nightingale.” These, together with the later “Ode on Indolence” and “Ode on Melancholy,” are acutely imaginative explorations of the intricate (complex) relation between sorrow and bliss, life and dream.

During the latter half of 1819 Keats wrote his only drama, *Otho the Great*. He also made his last attempt to define the function of the poet in *The Fall of Hyperion*. However, like the earlier *Hyperion*, it was never completed and remains a tantalizing (fascinating) fragment of cryptic (mysterious) beauty.

His last years

Significantly, the last long poem that Keats wrote was *Lamia*. This is a brilliantly ambiguous (likely to be interpreted in more than one way) piece which leads to the conclusion that both the artist and the lover live on deceptive illusions (a world of the imagination not based on reality and likely to mislead). His third and last volume, *Lamia, Isabella, The Eve of St. Agnes and Other Poems*, was printed in July 1820.

In September 1820, although his health had been declining for some time, Keats left for

Italy on an invitation from the poet Percy Bysshe Shelley (1792–1822). He died in Rome on February 23, 1821, at the age of twenty-five.

All of Keats’s poetry is filled with a mysterious yet uplifting sense of beauty and joy. His works explore many possibilities but do not insist on any one answer to the enduring problems of life. The experience of life, not its perfect understanding, was Keats’s major concern.

HELEN KELLER

Born: June 27, 1880

Tuscumbia, Alabama

Died: June 1, 1968

Westport, Connecticut

American activist for the physically disabled

Though both blind and deaf, American lecturer and author Helen Keller (1880–1968) traveled the world

over, fighting for improvement in the education and life of the physically handicapped.

Helen becomes deaf and blind

Helen Adams Keller was born in Tusculumbia, Alabama, on June 27, 1880. Her parents were Captain Arthur H. Keller and Katherine Adams Keller. Her father was a veteran of the confederate army (army that fought to separate from the United States during the Civil War, which lasted from 1861 to 1865). He also was the editor of the local newspaper, the *North Alabamian*. Helen was born a normal child. She started speaking when she was six months old. By the time she was a year old, she was able to communicate with her parents and she had also learned to walk. When Helen was eighteen months old an illness developed that the doctor described as brain congestion. She ran a high fever for many days, and then the fever was gone. Helen was left deaf and blind from the illness. Helen became a very wild, unruly child. She would scream and kick when she was angry and giggle and laugh when happy. She developed many of her own signals to communicate her needs with her parents.

Her early learning

When Helen was six, her mother contacted Dr. Alexander Graham Bell (1847–1922), whom she had heard was working on devices to help the deaf. Bell met with Helen and her parents and suggested that they contact the Perkins Institute for the Blind in Boston, Massachusetts. In March 1887 Anne Sullivan (1866–1936), a teacher at the institute, came to serve as Helen's teacher. Anne was twenty-one years old and had sight limitations of her own. One month after her arrival,

Sullivan had taught Keller the word "water." She did this by using her fingers to spell letters into Helen's hand. From this she understood that objects had names, and that her teacher spelled these names into her hand. This unlocked a whole new world of learning for Helen.

Anne Sullivan was with Helen day and night, constantly spelling into her hand the words and ideas of things going on around them. Helen was a quick learner. In only three years she learned the manual alphabet (sign language), the Braille alphabet (an alphabet created by Louis Braille [1809–1852] for the blind that relies on raised dots to communicate), and she could read and write.

Schools and education

Helen wanted to learn to speak, and in 1890 she began taking speech classes at the Horace Mann School for the Deaf in Boston. She worked diligently at learning to speak. After twenty-five years of hard work and practice, Helen was able to speak in a voice that others could understand.

From 1894 to 1896 Helen attended the Wright-Humason School for the Deaf. Here she continued to work on improving her communication, as well as her math, French, German, and geography. In this way Helen prepared herself for college and went on to Cambridge School for Young Ladies. Anne Sullivan attended every class with Helen and interpreted the lectures and books for her, as they were not in Braille. By the time she was sixteen, Keller had passed the admissions examinations for Radcliffe College; in 1904 she graduated cum laude (with honors). This was all done with the assistance of Anne Sullivan interpreting the lectures and texts.

Devotes life to helping others

As a young woman Keller became determined to learn about the world and to improve the lives of others. With insight, energy, and deep devotion to humanity, she lectured throughout the world, worked to forward her ideas in Congress, and wrote thousands of letters asking for contributions to finance efforts to improve the welfare of the blind. She visited hospitals and helped blind soldiers. She taught the blind to be courageous and to make their lives rich, productive, and beautiful for others and for themselves.

Keller associated with some of the greatest people of her time, including Alexander

Graham Bell, Mark Twain (1835–1910), Andrew Carnegie (1835–1919), John D. Rockefeller Sr. (1839–1937), and Presidents Grover Cleveland (1838–1908), Calvin Coolidge (1872–1933), and Woodrow Wilson (1856–1924). She authored such books as *Helen Keller's Journal*, *Out of the Dark*, *Midstream: My Later Life, My Religion*, *The Song of the Stone Wall*, *The World I Live In*, and *The Story of My Life*.

Sullivan served as Keller's counselor and companion. When Keller died in 1968 her name had become a worldwide symbol of what the human spirit can accomplish despite severe physical limitations.

GENE
KELLY

Born: August 23, 1912
Pittsburgh, Pennsylvania

Died: February 2, 1996

Beverly Hills, California

American dancer, actor, and choreographer

Although Gene Kelly established his reputation as an actor and a dancer, his contribution to the Hollywood, California, musical also includes choreography (creating dances) and movie direction.

Athletic childhood

Eugene Curran Kelly was born in Pittsburgh, Pennsylvania, on August 23, 1912, the middle son of five children. His father was Canadian-born and loved sports, especially hockey. Every winter Kelly Sr. would flood the family backyard and make an ice rink for hockey.

Kelly Jr. later credited hockey for some of his dance steps, which he described as “wide open and close to the ground.” At fifteen Kelly played with a semiprofessional ice hockey team. He also played football, baseball, and participated in gymnastics.

Turns to dancing

Kelly's other major influence was his mother, who loved the theater. She was the one who sent him to dancing lessons. At first Kelly did not want to continue with his dance lessons because the other students made fun of him. But then he discovered that the girls liked a boy who could dance, so he decided to stick with the lessons.

In 1929 Kelly left for Pennsylvania State College, but because of the Great Depression, his family lost their money. The Great Depression (1929–39) was a time of worldwide economic trouble that led to global

unemployment and poverty. Kelly had to move back home and attend the University of Pittsburgh in order to save the cost of room and board. While at the university, Kelly worked at a variety of odd jobs to pay his tuition: he dug ditches, worked at a soda fountain, and pumped gas. Kelly's mother began to work as a receptionist at a local dance school. She came up with the idea of the family running its own dance studio. They did and the studio was a big success.

After Kelly graduated from the University of Pittsburgh he taught dance for another six years. In 1937 he left for New York City. He believed that he was talented enough to find work and he was right. He got a job in theater his first week in New York. Kelly's big break came in 1940, when he was cast as the lead in the Rodgers and Hart musical *Pal Joey*.

Goes to Hollywood

Producers from Hollywood saw the show in New York and offered Kelly a contract with Metro Goldwyn Mayer (MGM). He worked for MGM for the next sixteen years. His first Hollywood film was *For Me and My Gal* (1942), in which he starred opposite Judy Garland (1922–1969). Garland was only twenty, but already a major star. She had seen Kelly's work and insisted that Kelly have the role. She tutored (taught) him how to act for the movies.

Kelly made a breakthrough with *Cover Girl* (1944). At one point in the film, his character dances with a mirror image of himself. It caught all the critics' attention. Kelly told *Interview* magazine, “[That is] when I began to see that you could make dances for cinema that weren't just photographed stage dancing. That was my big insight into Hollywood, and Hollywood's big insight into me.”

Gene Kelly.

Courtesy of the Library of Congress.

Experiments with film

Kelly's experiments with dance and with film technique included combining the two, as demonstrated in such films as *Anchors Aweigh* (1945), where he danced with a cartoon mouse, *An American in Paris* (1951), and *Invitation to the Dance* (1956). His first attempts at film choreography relied on the established formulas of the film musical. Later he developed a system of choreography made for the camera that took into account camera setups, movement, and editing. Many people believe that he was the major influence in creating a new form of American dance, one that was different from

the more formal and ballet styles of European dance. Kelly danced in a more energetic, athletic way.

Kelly often played a guy who felt that the best way to get what he wanted was to impress people. However, he learns that his brashness (self-confidence without politeness) offends people. In the end he succeeds by being himself. Kelly's characters had much of the "average guy" in them and this quality appealed to audiences. His characters seemed so natural that people who saw his films did not always realize how very sophisticated (complex) his dancing and choreography were.

Singin' in the Rain

Nowhere was Kelly more engaging than in 1952's *Singin' in the Rain*. One of the all-time great movie musicals, and perhaps the film most associated with Kelly, this comedy is about late-1920s Hollywood and the change from silent pictures to "talkies" (movies with sound). *Singin' in the Rain* showcased the considerable acting, singing, and dancing gifts of Debbie Reynolds (1932–) and Donald O'Connor (1925–), but it was Kelly who danced away with the movie. His dance to the title song has become an icon (something that is regarded as the ideal) of American entertainment. Kelly made a drenching rainstorm and umbrella his partners, and communicated the joy in movement at the heart of all of his performances.

Gene Kelly died on February 2, 1996, in Beverly Hills, California. He will always be remembered for his incredible contribution to the movie musical through dance performance, choreography, and photography.

EDWARD KENNEDY

Born: February 22, 1932
Brookline, Massachusetts
American senator

Edward (Ted) Kennedy, brother of President John F. Kennedy (1917–1963) and Robert F. Kennedy (1925–1968), entered the U.S. Senate at age thirty and has steadily gained political influence as he continues to win reelection.

Preparing for public service

Edward Moore Kennedy was born in Brookline, Massachusetts, on February 22, 1932, fourth son and last of nine children of Joseph P. (1888–1969) and Rose Fitzgerald (1890–1995) Kennedy. His father was a multimillionaire businessman. Because his family moved frequently, Kennedy attended several different private schools before enrolling in Milton Academy, near Boston, Massachusetts,

in 1946. Upon graduation from Milton in 1950 he enrolled at Harvard University. At the end of his freshman year, however, he was expelled for having another student take a Spanish exam in his place. Kennedy then enlisted for a two-year term in the army. His father's influence won him an assignment as a guard to Supreme Headquarters Allied Powers, Europe (SHAPE) in Paris.

After completing his time in the army, Kennedy returned to Harvard and graduated in 1956. He then enrolled in the University of Virginia Law School, where his natural talent for debate was sharpened. He received his law degree in 1959 and was admitted to practice in Massachusetts in the same year. In November 1958 Kennedy married Virginia Joan Bennett; they had three children.

While still a law student Edward Kennedy managed the successful Senate reelection campaign in Massachusetts of his brother John Kennedy. In 1960 he served as Western states coordinator for John's campaign for the Democratic presidential nomination. After his brother's victory in the 1960 election, Edward took a position as assistant to the district attorney of Suffolk County, Massachusetts. As preparation for running in 1962 for the remainder of John's unfinished Senate term, Edward traveled widely and made many speeches.

Becoming a national figure

At the age of thirty, Kennedy easily won election to the Senate in 1962 over Republican George Cabot Lodge (1927–). Kennedy's slogan was: "I can do more for Massachusetts." As a junior legislator, Kennedy spent most of his time watching and learning from his Senate seniors, surprising some

KENNEDY, EDWARD

Edward Kennedy.

Reproduced by permission of the Corbis Corporation.

observers who expected him to be more aggressive. A year after John Kennedy's 1963 assassination, Edward won election to his first full Senate term.

By 1967 Kennedy began to speak out against the Vietnam War (1955–75), a civil war in which U.S. forces helped South Vietnam fight against a takeover by Communist forces from North Vietnam. Kennedy focused mainly on the need for draft reform and the U.S. failure to provide for the Vietnamese war victims. After visiting South Vietnam in early 1968 he became even more critical, yet he managed to stay on good terms with the administration of President Lyndon Johnson

(1908–1973). Kennedy's life was strongly affected by the assassination of his brother Robert (1925–1968) in June 1968. After a period of withdrawal, he became more vocal in criticizing the Vietnam War and in pressing for selected social reforms. Though he denied interest in seeking the 1968 Democratic nomination, his actions clearly established him as heir to the "Kennedy legacy," and many expected that he would one day run for the presidency.

Presidential possibilities

The year 1969 began well for Kennedy, with his election as Senate majority whip (assistant leader) in January. Six months later, however, his career and reputation suffered a huge blow when, following a party, he drove his car off a narrow bridge on Chappaquiddick Island, near Massachusetts, resulting in the drowning of his companion, Mary Jo Kopechne (1940–1969). Kennedy's failure to report the accident for nearly nine hours was harshly condemned by press and public alike. In a televised speech a week later he asked the voters to advise him as to whether he should remain in office. The response was positive, as was the local court's verdict: Kennedy's sentence—for leaving the scene of an accident—was suspended.

Rumors about what really happened at Chappaquiddick did not burden him in the Senate. He was an outspoken critic of the administration of President Richard Nixon (1913–1994), opposing Nixon's antiballistic missile (ABM; a free-falling nuclear missile) installment proposal, backing various measures to end the Vietnam War, and leading the fight to lower the voting age to eighteen. Kennedy won an easy reelection in 1970,

however, he lost his majority whip post by a close vote in 1971. Freed from the responsibilities of his formal leadership post, he resumed his outspoken opposition to the Nixon administration with more energy than ever.

Many suspected that Kennedy would run for president in 1972, but he again denied any such ambitions. He refused the vice presidential nomination offered by Democratic nominee George McGovern (1922–). He turned his attention to other issues, such as handgun control and national health insurance. His 1972 book, *In Critical Condition*, was a sweeping criticism of the U.S. health care industry. In 1976 Kennedy announced again that he would not run for president even though polls showed that many people supported him. He continued to win reelection to the Senate and became chairman of its Judiciary Committee. He also loyally backed the Democratic foreign-policy programs of President Jimmy Carter (1924–).

Kennedy again emerged as the favorite in public opinion polls regarding the 1980 presidential nomination although he denied interest in the position. Finally yielding to temptation, he announced in November 1979 that he would challenge Carter for the nomination. However, his candidacy began miserably when he performed poorly in a televised interview (which revived the “Chappaquiddick issue”). The Iranian hostage crisis (an incident in which fifty-two Americans were held captive at the U.S. embassy in Iran by student protesters) and the Russian invasion of Afghanistan increased public support for Carter, at least temporarily. Carter locked up the Democratic nomination well before the party convention had even begun.

Kennedy, however, dominated the convention itself with one of his most stirring speeches.

A leader on national issues

When the Republicans gained control of the Senate in 1981, Kennedy lost his Judiciary Committee chairmanship and once again focused his energies mainly on social programs and labor issues. Kennedy emerged as an influential and constant critic of the domestic and foreign policies of President Ronald Reagan (1911–). In late 1982 Kennedy removed himself from competition for his party’s presidential nomination. He remained committed to an expanded federal role in pursuit of social and economic justice, yet he showed that he was clearly capable of sensible cost cutting when necessary.

Kennedy continues to work in the Senate to benefit the people of Massachusetts and the nation. He was an author of the 1996 Health Insurance and Portability Act, which allowed those who change or lose their job to maintain health insurance, and the 1997 Children’s Health Act, which increased access to health care for children age eighteen and under. To mark his contribution toward helping to fulfill the four essential freedoms for the world outlined by President Franklin Roosevelt (1882–1945) in 1941, Kennedy was given the 1999 Four Freedoms Award by the Franklin and Eleanor Roosevelt Institute.

JOHN F. KENNEDY

Born: May 29, 1917

Brookline, Massachusetts

Died: November 22, 1963

Dallas, Texas

American president

John F. Kennedy was the thirty-fifth president of the United States. He was the first president to reach for the moon, through the nation's space programs. He also was the first president since Theodore Roosevelt (1858–1919) with whom youth could identify. He made the nation see itself with new eyes. His assassination shocked the world.

Early life and family

John Fitzgerald Kennedy was born in Brookline, Massachusetts, on May 29, 1917. He was the second son of nine children born to the multimillionaire business executive

and financier Joseph P. Kennedy (1888–1969) and his wife, Rose Fitzgerald Kennedy (1890–1995). Joseph's father had served in the Massachusetts Legislature and in elective offices in Boston, Massachusetts. Rose's father, John Francis Fitzgerald (1863–1950), had been a state legislator, the mayor of Boston, and a U.S. congressman. Joseph himself had served as chairman of the Securities and Exchange Commission, chairman of the U.S. Maritime Commission, and ambassador to Great Britain (1937–40). Thus, the Kennedys were a wealthy family with a history of political and public service.

Education and the military

Kennedy attended the Canterbury parochial school (1930–31) and the Choate School (1931–35). One of his teachers later said that people in school liked him more for his personality than for his accomplishments. He was often ill during his childhood and spent much of this time reading. Kennedy enrolled at Princeton University in 1935 but illness soon forced him to withdraw. Upon recovery he went to Harvard University, where he majored in government and international relations. During his junior year at Harvard, he traveled in Europe and observed the events that were leading to World War II (1939–45; a war in which the Allies—France, Great Britain, the Soviet Union, China, and from 1941 the United States—fought against the Axis powers—Germany, Italy, and Japan). He used his observations for his senior paper, which later became the best-selling book *Why England Slept* (1940).

After graduating from Harvard with honors in 1940, Kennedy went to Stanford University for graduate studies. In April 1941 he

tried to enlist in the U.S. Army but was rejected for physical reasons (a back injury received while playing football). Months later, after his back strengthened through a regimen of exercises, the U.S. Navy accepted him. He then became an intelligence officer in Washington, D.C. After the Japanese attack on Pearl Harbor, a U.S. Navy base in Hawaii, on December 7, 1941, the United States entered World War II. Kennedy requested active duty at sea and was given this assignment in late 1942.

War hero

Following Kennedy's training with the Motor Torpedo Boat Squadron, he was shipped to the South Pacific to fight in the war against Japan. In March 1943 he was given command of a patrol torpedo (PT) boat, a small, fast boat armed with weapons, including torpedoes. In August his boat was sliced in two by a Japanese destroyer and two of his crew were killed. Kennedy and four others clung to the half of the PT boat that remained afloat. Six other men survived in the nearby water, two wounded. In a three-hour struggle Kennedy got the wounded crewmen to the floating wreck. When it capsized, he ordered his men to swim to a small island about three miles away. He towed one man to shore in a heroic five-hour struggle. Several days later, having displayed great courage, leadership, and endurance, Kennedy succeeded in having his men rescued.

House of Representatives

Returning to civilian life, Kennedy did newspaper work for several months, covering a United Nations conference, the Potsdam Conference, and the British elections of 1945. However, coming from a family devoted to

John F. Kennedy.

Courtesy of the Library of Congress.

public service, Kennedy desired a career in politics. In 1946 he became a candidate for the U.S. House of Representatives from the Massachusetts eleventh congressional district. Kennedy built a large personal organization for his campaign. On whirlwind tours he met as many voters as possible. He talked to the people in a direct, informal style about the topics that they were concerned with. In this campaign and in all the others, his brothers, sisters, and mother supported him. His brothers, Robert (1925–1968) and Edward (also called Ted; 1932–), acted as his managers, while his sisters and mother held social events to raise money for his campaigns.

Kennedy won the primary, the fall election, and reelection to the House in 1948 and again in 1950. He worked for better social welfare programs, particularly in the area of low-cost public housing (or affordable places for people to live). In 1949 he became a member of the Joint Committee on Labor-Management Relations. In this capacity, Kennedy was a strong supporter of labor, working for higher wages and better working conditions.

Kennedy supported the domestic programs of President Harry Truman (1884–1972), including social welfare programs, progressive taxation, and regulation of business. However, he did not follow Truman's policies in foreign relations. For example, he was against the fighting in Korea "or any other place in Asia where [the United States] cannot hold our defenses."

The Senate

In April 1952 Kennedy ran for a seat in the U.S. Senate against Henry Cabot Lodge, Jr. (1902–1985), a Republican liberal. Kennedy won by over seventy thousand votes. Lodge reeled under the impact. He had not run against a man, but a whole family. The Kennedy women alone had acted as hostesses to at least seventy thousand Massachusetts housewives. In 1958 Kennedy was reelected to the Senate.

Kennedy's political success was soon followed by high points in his personal life. On September 12, 1953, Kennedy married Jacqueline Lee Bouvier (1929–1994), daughter of a New York City financier, at Newport, Rhode Island. Arthur M. Schlesinger, Jr. (1917–) noted that "under a veil of lovely inconsequence" Mrs. Kennedy possessed "an

all-seeing eye and ruthless judgement." John and Jacqueline Kennedy had three children: Caroline Bouvier (1957–), John Fitzgerald (1960–1999), Patrick Bouvier (who lived only a few days after his birth in 1963); another child was stillborn in 1956.

Taking his Senate seat in January 1953, Kennedy continued to support key labor, economic, and foreign relations issues. He served on the Labor and Public Welfare Committee, the Government Operations Committee, the Select Committee on Labor-Management Relations, the Foreign Relations Committee, and the Joint Economic Committee. He also worked to pass several bills to aid the Massachusetts fishing and textile industries and to improve New England's economy.

A recurrence of his old back injuries forced Kennedy to use crutches during 1954. An operation in October 1954 was followed by another in February 1955. He spent his months of illness and recovery writing biographies of Americans who had shown moral courage at difficult points in their lives. These biographies became the best-selling book *Profiles in Courage* (1956), which won the Pulitzer Prize for biography in 1957.

Kennedy's back operations were not completely successful, and he was never again entirely free from pain. After recovering from his operations, he returned to his Senate seat in May 1955. He became a strong supporter of civil rights and social welfare legislation. The Kennedy-Douglas-Ives Bill (1957) required an accounting of all employee pension and welfare funds. Kennedy also sponsored bills for providing federal financial aid to education and for relaxing U.S. immigration laws.

Kennedy becomes president

Kennedy's record in elected office and the books and articles that he had written attracted national attention. After he lost the vice presidential nomination at the Democratic National Convention in Chicago in 1956, he decided to run for president. Formally announcing his candidacy in January 1960, Kennedy made whirlwind tours and won the Democratic primaries in New Hampshire, Wisconsin, Indiana, Ohio, Oregon, Maryland, Nebraska, and West Virginia. On July 13, 1960, Kennedy was nominated for president, with Lyndon B. Johnson (1908–1973) as his running mate.

“Jack in Walk” shouted the Boston Globe after Kennedy's nomination. But it would be no easy walk to win the White House against the Republican candidate, Vice President Richard Nixon (1913–1994). At that time, Kennedy was a controversial candidate because he was a Roman Catholic. Religious prejudice, or dislike of a person based solely upon his or her religion, probably cost him over a million votes in Illinois alone. Kennedy responded to the issue of religion in his “Houston speech” on September 11, 1960. He believed in the absolute separation of church and state (the belief that one body—church or government—would have no influence over the other). To him, this meant that no priest could tell a president what to do and no Protestant clergyman could tell his parishioners how to vote. In other words, Kennedy's religion would not affect the decisions he made as president.

A series of televised debates with Nixon was crucial to Kennedy's campaign. Many viewers believed Kennedy defeated Nixon with his style. Kennedy showed the American

people that he had a sense of humor, a love of language, and a sense of the past. On November 9, 1960, John F. Kennedy became the youngest man and the first Roman Catholic in American history to win the presidency. The 1960 presidential election was one of the closest in the nation's history. Kennedy won the popular vote by only 119,450 votes. On December 19, 1960, the electoral college cast 303 votes for Kennedy and 219 for Nixon.

At the inauguration on January 20, 1960, the first U.S. president born in the twentieth century was sworn into office. Kennedy's inaugural address included the challenge: “Ask not what your country can do for you, ask what you can do for your country.”

Bay of Pigs

In his short time in office, Kennedy faced many crises. The first of which involved Cuba, a country about ninety miles south of Florida. On April 17, 1961, fourteen hundred Cuban exiles, supported by the United States, invaded Cuba at the Bay of Pigs. On April 18 the Soviet leader Nikita Khrushchev (1894–1971) sent a note to Kennedy stating that his government would help the Cuban government resist an attack. By April 20 the invasion had failed. Although the plan for training Cuban exiles had actually begun during the presidency of Dwight D. Eisenhower (1890–1969), Kennedy took responsibility for it. He had first supported the plan but later refused to commit the necessary American troops. He was aware that if the Cuban people did not rise up and back the invaders, the United States could not force them to accept a new system of government. Although the Bay of Pigs invasion was a failure, it did prove Kennedy's ability to face a disaster.

Protecting civil rights

Kennedy continued to show skill and passion for issues at home, particularly civil rights. In 1961 the Congress of Racial Equality, a civil rights group, organized people to protest segregation, or the practice of separating people based solely on their race, on buses and trains. When the showdown came, “the Kennedys,” as the president and his brother Robert, the attorney general, were known, sent six hundred Federal marshals to Alabama to protect these “Freedom Riders.” In 1962 they sent hundreds of Federal marshals to protect the rights of the first African American student to attend the University of Mississippi.

Cuban missile crisis

On October 22, 1962, Kennedy announced to the nation that the Soviet Union had sent nuclear missiles to Cuba. In response the United States had blocked all shipments of military equipment into Cuba. The United States would not allow Cuba to become a Soviet missile base, and it would regard any missile launched from Cuba “as an attack by the Soviet Union on the United States, requiring a full [military] response.”

For a week the details of the situation had been “the best kept secret in government history.” Throughout the seven days, the Kennedy administration had maintained an outward appearance of normal social and political activity. Meanwhile, American military units throughout the world were alerted.

Messages were sent back and forth between Kennedy, Khrushchev, and Pope John XXIII (1881–1963), who was volunteering as a peacemaker. During this time

Soviet ships were moving toward the area of the blockade in the Atlantic Ocean. They slowed, then stopped. On October 28, 1962, the Soviet Union said it would remove its missiles from Cuba.

One result of the crisis was the nuclear test ban treaty with the Soviet Union, which Kennedy called “the first step down the path of peace.” The treaty was signed on July 25, 1963. A “hot line” for emergency messages was also set up between Washington, D.C., and Moscow, the capital of the Soviet Union.

Vietnam

Vietnam, a country in Southeast Asia, took up more of Kennedy’s time than any other problem. The Vietnam War (1955–1975) was a civil war in which anti-Communist forces in South Vietnam, supported by the United States, were fighting against a takeover by Communist forces in North Vietnam. In 1954 President Eisenhower had offered military aid to South Vietnam and funding, and advisors were sent to the country throughout the 1950s. Although Kennedy believed that a “full-scale war in Vietnam . . . was unthinkable,” he tripled American forces in the country. Senator William Fulbright (1905–1995) suggested that Kennedy put troops in Vietnam to prove to Khrushchev that “he couldn’t be intimidated.”

The President’s last day

Kennedy was well aware of the dangers of the presidency. “Who can tell who will be president a year from now?” he would ask. On the day of his arrival in Dallas, Texas, he said that if anyone wanted to kill a president he needed only a high building and a rifle with a telescopic lens.

That day—November 22, 1963—the president was assassinated. It is generally believed that Lee Harvey Oswald (1939–1963), using a rifle equipped with a telescopic lens, was the person who fired on the president's car. Others, however, believe more than one person was responsible. All of the United States—indeed, the world—was in mourning. In Indonesia, flags were lowered to half-mast. In New Delhi, India, crowds wept in the streets.

Kennedy's legacy

Kennedy once summed up his time as “very dangerous, untidy.” He lived through two world wars, the Great Depression (a period from 1929 to 1939 during which nearly half the industrial workers in the country lost their jobs), and the nuclear age. “Life is unfair,” he remarked. And so it was to Kennedy, heaping him with both glory and tragedy. Yet, he never lost his grace, his sense of balance, or his optimism.

What Kennedy accomplished was not as important as what he stood for. As the African magazine *Transition* expressed it, “murdered with Kennedy was the first real chance for an intelligent and new leadership in the world. His death [left] us unprepared and in darkness.”

JOHN F. KENNEDY JR.

Born: November 25, 1960

Washington, D.C.

Died: July 16, 1999

Martha's Vineyard, Massachusetts

American magazine publisher and lawyer

John F. Kennedy Jr., son of the late president John F. Kennedy (1917–1963), avoided politics and followed his own path as a magazine publisher. After attending his own father's funeral as a child, Kennedy, Jr., saw a series of early deaths in his family. He himself was claimed by a tragic accident in the prime of his life.

President's son

John Fitzgerald Kennedy Jr., was born on November 25, 1960, the son of John F.

KENNEDY, JOHN F., JR.

John F. Kennedy Jr.

Kennedy (1917–1963), who had just won election as the thirty-fifth president of the United States, and Jacqueline (“Jackie”) Kennedy (1929–1994). He was the first child ever born to a president-elect. The Kennedys gave the nation the closest model they had ever had to a royal family. John-John, as he became known, and his sister Caroline regularly made the news and helped to create an image of the Kennedys as an ideal American family.

While campaigning in Dallas, Texas, on November 22, 1963, the president was shot and killed. Just three months earlier, the family had grieved when new baby Patrick died two days after his birth. The death of John F.

Kennedy shocked the nation, and the image of the president’s three-year-old son at the funeral, wearing a short coat that revealed his bare knees, saluting his father’s coffin as it passed, was heartbreaking.

Always in the public eye

In 1964 Jackie Kennedy moved with her children to an apartment in New York City, where she hoped they might be able to avoid the media. The family would soon suffer another difficult loss. On June 6, 1968, the late president’s brother, Robert Kennedy (1925–1968), who had become a father figure to his nephew and niece, was assassinated in California while campaigning for the Democratic presidential nomination. Four months later, Jackie Kennedy married the wealthy businessman Aristotle Onassis (1906–1975).

The young Kennedy would sometimes get into fights with reporters and photographers who followed him and his sister around. The media criticized him for being self-centered and for his less than outstanding record at school. After high school he became more serious about his education. First, he studied environmental issues at a school in Africa. He would later return to Africa following his freshman year at Brown University in Providence, Rhode Island. While in Africa he worked with a mining firm in Johannesburg, South Africa, and met student and government leaders in Zimbabwe. During his college years he also worked with the Peace Corps in Guatemala to help earthquake victims.

After graduating with a bachelor’s degree in American history in 1982, Kennedy studied at the University of Delhi in India. When

he returned to the United States he went to work for the New York City Office of Business Development in 1984. In 1986 he entered New York University Law School, mainly to please his mother. At the 1988 Democratic National Convention he gave a speech to introduce his uncle, Senator Edward Kennedy (1932–), that earned him a two-minute standing ovation and led many to wonder if he was preparing to run for office. He passed his bar exam (a test that a person must pass before he or she is allowed to practice law) on the third try and was hired in August 1989 as an assistant prosecutor in the Manhattan office of New York district attorney Robert Morgenthau (1919–). He won all six of the cases that he prosecuted in court before leaving the position in 1993.

New ventures

In September 1995 Kennedy cofounded *George* magazine, which had the slogan “Not politics as usual.” He wrote essays and interviewed people for the publication. Some observers suggested that his magazine venture was a way for him to gain the public-affairs knowledge that he would need in order to run for office, but he denied that he was planning to enter politics. On September 21, 1996, he married Carolyn Bessette (1966–1999) in a private ceremony on Cumberland Island off the coast of Georgia. It was one of the few major events in his life during which he managed to avoid publicity. He and his wife appeared to be a happy couple as they made their home in New York.

On July 16, 1999, Kennedy, his wife, and her sister Lauren Bessette (1964–1999) were declared missing at sea after their plane crashed into the water near the coast of

Martha's Vineyard, Massachusetts. Kennedy was an amateur pilot who had earned his license in April 1998. All three bodies were eventually recovered from the wreckage and buried at sea on July 22, 1999.

ROBERT KENNEDY

Born: November 20, 1925

Brookline, Massachusetts

Died: June 6, 1968

Los Angeles, California

American statesman, senator, and attorney general

Robert Kennedy was a U.S. senator and the attorney general in the presidential administration of his brother John F. Kennedy (1917–1963). Like his brother, Robert was extremely charming and a popular political figure during the

KENNEDY, ROBERT

Robert Kennedy.

Courtesy of the National Archives and Records Administration.

1960s. Tragically, much like his brother before him, Robert's assassination would leave behind many questions as to what could have been.

Early life as a Kennedy

Robert Francis Kennedy was born on November 20, 1925, in Brookline, Massachusetts, to Joseph (1888–1969) and Rose (1890–1995) Kennedy. Robert enjoyed a privileged childhood and was surrounded by a loving and powerful family. Rose's father was the mayor of Boston. Joseph was a wealthy businessman and would later

become U.S. ambassador, or official representative, to Great Britain.

Kennedy's childhood was greatly shaped by his father's values. Joseph Sr. always wanted his children to try their hardest, no matter what they were doing. The Kennedys raised their children as Roman Catholics, and Robert was very religious throughout his young life and served as an altar boy. The seventh of nine children born to the Kennedys, Robert constantly sought the attention of his two older brothers, Joseph P. Kennedy Jr. (1915–1944) and John F. Kennedy. Although slightly smaller than his brothers, Robert would develop the good looks and charm that would help the Kennedys win over the American public.

The Kennedys lived in England during his father's ambassadorship and the family quickly became a favorite with the English press. In 1939, with the threat of war hanging over Europe, Joseph Kennedy sent his family back to America, fearing for their safety.

Student and soldier

Robert graduated from Milton Academy before entering Harvard. His college career was interrupted by the outbreak of World War II (1939–45), in which the United States led the Allied forces against Germany, Japan, and Italy. After his oldest brother, Joseph, was killed in combat, Robert joined the navy and was assigned as a lieutenant. Later, he was assigned to the destroyer *Joseph P. Kennedy Jr.*, which was named in honor of his brother.

In 1946 he returned to Harvard, where he played football, and he graduated in 1948. He then earned his law degree from the University of Virginia Law School and was admit-

ted to the Massachusetts bar (an association for lawyers) in 1951. While at school he met Ethel Skakel (1928–), his sister's college roommate. Robert and Ethel were married in June 1950. They would have eleven children together (the last one was born six months after Kennedy's death).

A political career begins

In 1951 Kennedy joined the Criminal Division of the U.S. Department of Justice. He resigned the following year to run John F. Kennedy's successful campaign for U.S. senator. In 1953 Robert was appointed one of fifteen assistant counsels, or advisors, to the Senate Subcommittee on Investigations under Senator Joseph McCarthy (1908–1957). At the time, McCarthy was leading a nationwide "witch-hunt" for Communists, or people who believe in a political system in which property and goods are owned by the government. McCarthy's movement gained momentum through America's fear of Communists living in the country. But later that year, Kennedy resigned when Democratic members of this subcommittee walked out in protest against McCarthy's forceful methods of investigation.

Kennedy rejoined the Senate's permanent Subcommittee on Investigations as chief counsel for the Democratic minority in 1954. The following year, when the Democrats reorganized this committee under Senator George McClellan, Kennedy became chief counsel and staff director. That year the U.S. Junior Chamber of Commerce elected him one of "ten outstanding young men." In 1955, at his own expense, Kennedy joined Supreme Court Justice William O. Douglas (1898–1980) on a tour of several Soviet

republics. (The republics were Communist states that made up the Soviet Union.)

Kennedy became chief counsel to the Senate Select Committee on Improper Activities in the Labor or Management Field organized under McClellan in 1957. His major accomplishment was the investigation of corruption, or dishonest activity, in the International Brotherhood of Teamsters, a powerful labor union. The hearings became front-page news, especially Kennedy's prosecution of the union's president, James Hoffa (1913–c.1975). Some union leaders believed these hearings were more like persecution, or a public harassment, of Hoffa. Later, Kennedy was also responsible for several additional investigations of labor and management abuses.

A Kennedy in the White House

In 1960 Kennedy managed his brother's successful presidential campaign. When John appointed Robert U.S. attorney general, many cried nepotism, the act of favoring family members. But Robert's role in his brother's cabinet was unique, and he was virtually the president's other self. Shoulder to shoulder, the brothers stood together. The Kennedy administration carefully waded through civil rights cases, the growing Vietnam War (1955–75; a civil war in which U.S. forces helped South Vietnam fight against a takeover by Communist forces from North Vietnam), and the Cuban missile crisis, when the nation held its breath as the president narrowly avoided conflict with Communist Cuba and the Soviet Union.

Tragically, the partnership would not last. John F. Kennedy was killed by an assassin's bullet in Dallas, Texas, in 1963. Distressed by the loss of his brother, Robert

soon resigned from the administration of President Lyndon Johnson (1908–1973). Kennedy ran successfully for New York State senator in 1964. Many wondered why Kennedy chose to run in New York instead of his native Virginia. Kennedy was thinking of the presidency by now, and Virginia was no power base. As a senator Kennedy achieved a splendid record, and his popularity began to grow and rival that of his brother's.

Presidential candidate and a tragic ending

Kennedy leaped into the presidential race in 1968. He was the perfect candidate to oppose Eugene McCarthy (1916–). Kennedy's entrance bitterly divided liberal Democrats (those in favor of change). Kennedy won the support of activists as he had come to sympathize with the African Americans' drive for "black power." He could reach and unite young people, activists, African Americans, and blue-collar Roman Catholics. Meanwhile, the white South hated him, big business distrusted him, and middle-class, reform Democrats were generally suspicious of him. Just after midnight on June 5, 1968, Kennedy was gunned down by an assassin. He died a day later.

Robert Kennedy's tragic death robbed the nation of one of its most dedicated and popular politicians. For most of his life, Kennedy fought for equal rights, improving education, housing the poor, and many other issues of the day. Robert had been no copy of his brother John. In some ways he was more intense and more committed than his brother had been. Yet he shared John's personal philosophy that one man could make a difference.

JOHANNES KEPLER

Born: December 27, 1571

Weil, Swabia, Germany

Died: November 15, 1630

Regensburg, Bavaria, Germany

German astronomer

The German astronomer Johannes Kepler's discovery of three basic laws governing the motion of planets made him one of the chief founders of modern astronomy (the study of the universe and its stars and planets).

Early life

Johannes Kepler was born on December 27, 1571, in Weil, Germany. He was the son of Heinrich and Katharina Guldenmann Kepler. His father was a mercenary (a soldier serving only for money). Although a member of the Protestant faith, his father helped put down a Protestant uprising in the Low Countries (Belgium, Holland, and Luxembourg).

Kepler's parents allowed him to watch the great comet of 1577 and an eclipse (passing into shadow) of the Moon. Kepler was a sickly child but an excellent student. At thirteen he entered a religious training school at Adelberg, Germany.

Following Kepler's graduation from the University of Tübingen in 1591, he became interested in astronomy, particularly the theories of Nicolaus Copernicus (1473–1543), who stated that the Earth moved around the Sun in a circle. The University of Tübingen recommended Kepler for the post of the "mathematician of the province" in Graz, Austria. He arrived there in 1594 and began composition of the almanac, in which the major events of the coming year were predicted. His first almanac was a success. The occurrence of two events that he had predicted, an invasion by the Turks and a severe winter, established his reputation. In 1597 Kepler married Barbara Muehleck. Of their five children only one boy and one girl reached adulthood.

Work in astronomy

Kepler sought the job of assistant to Tycho Brahe (1546–1601), astrologer (one who interprets the positions of stars and planets and their effect on human affairs) and mathematician to Rudolph II (1552–1612), in Prague, Czechoslovakia. Kepler took his new position in 1600. When Brahe died the following year, Kepler was appointed to replace him. His first job was to prepare Brahe's collection of studies in astronomy for publication, which came out between 1601 and 1602.

Kepler was also left in charge of Brahe's records, which forced him to make an

Johannes Kepler.

assumption that led to a new theory about the orbits of all the planets. A difference between his theory and Brahe's data could be explained only if the orbit of Mars was not circular but elliptical (oval-shaped). This meant that the orbits of all planets were elliptical (Kepler's first law). This helped prove another of his statements. It is known as Kepler's second law, according to which the line joining a planet to the sun sweeps over equal areas in equal times in its elliptical orbit.

Kepler published these laws in his discussion of the orbit of the planet Mars, the *Astronomia nova* (1609). The two laws were clearly spelled out in the book's table of con-

tents. They must have been seen by any careful reader alert enough to recognize a new idea of such importance. Still, the Italian astronomer Galileo Galilei (1564–1642) failed to use the laws in his printed works—although they would have helped his defense of Copernicus’s ideas.

New jobs and the third law

In 1611 Rudolph II stepped down from the throne, and Kepler immediately looked for a new job. He obtained the post of province mathematician of Linz, Austria. By the time he moved there in 1612 with his two children, his wife and his favorite son, Friedrich, were dead. Kepler’s fourteen years in Linz were marked by his second marriage to Susan Reuttinger, and by his repeated efforts to save his mother from being tried as a witch.

Kepler also published two important works while in Linz. In the *Harmonice mundi* (1618) his third law was announced. It stated that the average distance of a planet from the sun, raised to the third power, divided by the square of the time it takes for the planet to complete one orbit, is the same for all planets. Kepler believed that nature followed numeric relationships since God created it according to “weight, measure and number.” Kepler used the same idea in describing geometry (the study of points, lines, angles, and surfaces). Kepler’s second work, the *Epitome astronomiae Copernicanae* (published 1618–21), proposed a physical explanation of the motions of planets, namely, “magnetic arms” extending from the sun.

Kepler wandered over Europe in the last three years of his life. He was in Ulm, Germany, when his *Tabulae Rudolphinae* (1628)

was published. It not only added the positions of over two hundred stars to those contained in Brahe’s published works, but it also provided planetary tables that became the standard for the next century. Kepler died on November 15, 1630. He was a unique symbol of the change over from the old to the new spirit of science.

JACK KEROUAC

Born: March 12, 1922

Lowell, Massachusetts

Died: October 21, 1969

St. Petersburg, Florida

American writer

Jack Kerouac, an American writer, is best known for *On the Road*, (1957) which describes his travels into the American West. He is known as the father of the Beat Generation, younger intellectuals who rejected traditional values of society.

Early years

Born March 12, 1922, in Lowell, Massachusetts, Jean-Louis Lebris de Kerouac was the son of Leo Kerouac, a printer, and Gabrielle Levesque, a factory worker. Kerouac loved to read and wanted to be a writer from his earliest childhood. He did not speak English until he was five years old, using instead a combination of French and English used by the many French-Canadians who settled in New England. Kerouac's older brother Gerard died at age nine; he also had an older sister. At age eleven Kerouac began writing novels and made-up accounts of horse races, football games, and baseball games.

Kerouac received a football scholarship to Columbia University in New York City. At age seventeen he went to Horace Mann High School in New York City to improve his grades and increase his weight. In 1940 Kerouac arrived at Columbia but broke his leg in the second game of the season. After the injury he began to pursue his true passion—literature. Kerouac began to cut class regularly; he studied the style of writer Thomas Wolfe (1900–1938) and hung out on the New York City streets. In 1941 Kerouac had an argument with Columbia's football coach and left school.

Outside influences

Kerouac worked briefly at a gas station and as a sports reporter for a newspaper in Lowell. He then signed on to work aboard the *S. S. Dorchester* bound for Greenland. After that trip Kerouac returned to Columbia for a short stay. In 1943 he joined the Navy, but he was honorably discharged after six months. Kerouac spent the war years working as a merchant seaman and hanging

Jack Kerouac.

Reproduced by permission of Mr. Jerry Bauer.

around Columbia with intellectuals such as writers William Burroughs (1914–1997) and Allen Ginsburg (1926–1997). He wrote two novels during this time, *The Sea Is My Brother* and *And The Hippos Were Boiled In Their Tanks*, with Burroughs.

Kerouac married Edie Parker in 1944, but the marriage lasted only two months. In 1947 Neal Cassady, a car thief and ladies' man who was considered something of a genius, visited New York and asked Kerouac to give him writing lessons. When Cassady returned to Denver, Colorado, Kerouac followed. After a few weeks in Denver, Kerouac wandered into California, beginning a four-

year period of travel throughout the West. When not on the road, he was in New York working on his novel *The Town and The City*, which was published in 1950.

Most famous work

Now married to Joan Haverty, whom Kerouac proposed to after knowing her for only a few days, Kerouac began to experiment with a more natural writing style. He wanted to write the way he lived: once and with no editing. In April 1951 Kerouac threaded a huge roll of paper into his typewriter and wrote the single 175,000-word paragraph that became *On The Road*. The more than 100-foot scroll was written in three weeks but was not published for seven years. Sal and Neal, the main characters, scoff at established values and live by a romantic code born out off the West. They are described as “performing our one noble function of the time, *move*.” And to Kerouac, with movement comes wisdom and meaning.

In the time between writing *On The Road* and its publication, Kerouac took many road trips, ended his second marriage, became depressed and addicted to drugs and alcohol, and did his most ambitious writing. Kerouac often wrote complete works through all-night, week-long sessions. His other works include *Visions of Cody* (1952), *Dr. Sax* (1952), *Maggie Cassidy* (1953) (a romantic tale of his teenage days), *Mexico City Blues* and *Tristessa* (both 1955), and *Visions of Gerard*, *The Scripture of the Golden Eternity*, and *Old Angel Midnight* (all 1956).

Spokesman for a generation

When *On The Road* was published in 1957, Kerouac became instantly famous and

a spokesman for the Beat Generation, young people in the 1950s and 1960s who scorned middle-class values. Kerouac frequently appeared drunk, and interviews with him usually turned into arguments. In 1958 he wrote *The Dharma Bums*, a follow-up to *On The Road*. He then stopped writing for four years. By 1960 he was an alcoholic and had suffered a nervous breakdown. Kerouac died of massive stomach bleeding on October 21, 1969, with a pad in his lap and pen in his hand. He was buried with the rest of his family near Lowell.

CHARLES F. K E T T E R I N G

Born: August 29, 1876

Loudonville, Ohio

Died: November 25, 1958

Dayton, Ohio

American engineer

Charles F. Kettering, first as an independent inventor and later as head of research for General Motors Corporation, conducted research that established him as one of the most creative Americans of his generation.

Early years

Charles Francis Kettering was born on August 29, 1876, on a farm near Loudonville, Ohio, to Jacob and Martha Hunter Kettering. He was the fourth of five children. He was an excellent student who loved to read, and he also showed an early interest in trying to find better ways of doing things. His brother Adam, in Stuart W. Leslie's *Boss Kettering*, describes how young Charles tried "half the tools on the farm" to find the best way to pick potatoes. After high school graduation Kettering taught three years in country and small-town schools to make money to pay for college. Entering Ohio State University at age twenty-two, he dropped out in his sophomore year because of poor eyesight. Kettering worked for two years as a telephone lineman and then returned to Ohio State, graduating at age twenty-eight.

The NCR and Delco era

After Kettering received his degree he took a job as an experimental engineer with National Cash Register Company (NCR) in Dayton, Ohio. During his five years there he created a low-cost printing cash register; created an electric cash register, doing away with the hand crank; developed a system that tied charge phones to cash registers; and developed an accounting machine for banks. In 1905 he married Olive Williams of Ashland, Ohio. The couple had one son.

Having developed a better ignition (starting) system for autos while working "on the side" for NCR, Kettering, with the help of NCR's general manager Colonel Edward A. Deeds and others who put up money, organized Dayton Engineering Laboratories Company (Delco) in 1909. That year an order from Cadillac for eight thousand ignition systems led to the creation of an electric starter, first offered on Cadillac cars in 1912 and on many other makes the following year. Kettering and Delco also improved auto lighting systems and developed a dependable way to generate electricity on farms. Delco grew into a large manufacturing firm as well as a research site.

The General Motors years

In 1915 Colonel Deeds, a good man with business details, joined Delco, teaming up with Kettering, who preferred to devote himself to research. In 1916 Delco, in exchange for \$9 million, became a branch of United Motors Corporation, an automotive parts and accessories (objects adding to the appearance or performance of something) company. In turn, General Motors (GM) acquired United Motors in 1918. Kettering was invited to organize and direct the new General Motors Research Corporation, based in Dayton at the inventor's request. By 1925 the research labs had been transferred to Detroit, Michigan; Kettering and his wife lived in a hotel in the city until Kettering's retirement.

As head of GM research for 27 years, Kettering helped bring about the improvement of many products, acquiring 140 patents in his name. His most notable achievements included the development of "Ethyl" leaded gasoline to correct engine

KETTERING

Charles F. Kettering.

Courtesy of the Library of Congress.

knock; the refrigerant (cooling agent) “Freon”; and faster-drying and longer-lasting finishes for automobiles. He also created the lightweight diesel engine, which helped improve the moving power of railroads.

Helped the public good

Kettering, in addition to his success as a scientist and engineer, was highly regarded as a public speaker and social philosopher (seeker of wisdom). “I am for the double-profit system,” he said, “a reasonable profit for the manufacturer and a much greater

profit for the customer.” “I object to people running down the future,” he also remarked. “I am going to live all the rest of my life there, and I would like it to be a nice place, polished, bright, glistening, and glorious.” Kettering always regarded himself as a professional amateur. “We are amateurs,” he observed, “because we are doing things for the first time.”

Kettering retired from GM in 1947 but continued to serve as a director and research adviser until his death in Dayton on November 25, 1958. He received more than three dozen honorary (achieved without meeting the usual requirements) doctor’s degrees and dozens of awards, honors, and medals. His name lives on in the Charles F. Kettering Foundation, which he organized for medical research in 1927, and the Sloan-Kettering Institute for Cancer Research, founded by GM chairman Alfred P. Sloan Jr. in 1945.

AYATOLLAH KHOMEINI

Born: September 24, 1902

Khomein, Persia

Died: June 3, 1989

Tehran, Iran

Iranian head of state and religious leader

Ayatollah Khomeini was the founder and supreme leader of the Islamic Republic of Iran. The only leader in the Muslim world who combined political and religious authority as a head of state, he took office in 1979.

Early life and education

Ayatollah Ruhollah Musavi Khomeini was born on September 24, 1902, according to most sources. The title Ayatollah (the Sign of God) reflected his scholarly religious standing in the Shia Islamic tradition. His first name, Ruhollah (the Spirit of God), is a common name in spite of its religious meaning, and his last name is taken from his birthplace, the town of Khomein, which is about 200 miles south of Tehran, Iran's capital city. His father, Mustapha Musavi, was the chief cleric (those with religious authority) of the town and was murdered only five months after the birth of Ruhollah. The child was raised by his mother (Hajar) and aunt (Sahebeh), both of whom died when Ruhollah was about fifteen years old.

Ayatollah Khomeini's life after childhood went through three different phases. The first phase, from 1908 to 1962, was marked mainly by training, teaching, and writing in the field of Islamic studies. At the age of six

he began to study the Koran, Islam's holy book, and also elementary Persian, an ancient language of Iran. Later, he completed his studies in Islamic law, ethics, and spiritual philosophy under the supervision of Ayatollah Abdul Karim Haeri-ye Yazdi, in Qom, where he also got married and had two sons and three daughters. Although during this scholarly phase of his life Khomeini was not politically active, the nature of his studies, teachings, and writings revealed that he firmly believed in political activism by clerics (religious leaders).

Preparation for political leadership

The second phase of Khomeini's life, from 1962 to 1979, was marked by political activism which was greatly influenced by his strict, religious interpretation of Shia Islam. He practically launched his fight against the shah's regime (the king's rule) in 1962, which led to the eruption of a religious and political rebellion on June 5, 1963. This date (fifteenth of Khurdad in the Iranian solar calendar) is regarded by the revolutionists as the turning point in the history of the Islamic movement in Iran. The shah's bloody crushing of the uprising was followed by the exile (forced removal) of Khomeini in 1964, first to Iraq then to France.

Khomeini's religious and political ideas became more extreme and his entry into active political opposition reflected a combination of events in his life. First, the deaths of the two leading Iranian religious leaders left leadership open to Khomeini. Second, although ever since the rise of Reza Shah Pahlavi (1878–1944) to power in the 1920s, the clerical class had been on the defensive because of his movements away from certain

Ayatollah Khomeini.

Reproduced by permission of Getty Images.

religious policies. And third, the shah's granting of diplomatic privileges to the American military personnel in 1964 was viewed as insulting to the Iranian sense of national independence.

Founding the Islamic Republic of Iran

The third phase of Khomeini's life began with his return to Iran from exile on February 1, 1979, after Muhammad Reza Shah had been forced to step down two weeks earlier. On February 11 revolutionary forces loyal to Khomeini seized power in Iran, and Khomeini emerged as the founder and the supreme leader of the Islamic Republic of Iran.

From the perspective of Khomeini and his followers, the Iranian Revolution went through several "revolutionary" phases. The first phase began with Khomeini's appointment of Mehdi Bazargan as the head of the "provisional government" on February 5, 1979, and ended with his fall on November 6, two days after the capture of the U.S. embassy (the U.S. headquarters in Iran).

The second revolution was marked by the elimination of mainly nationalist forces, or forces devoted to the interests of a culture. As early as August 20, 1979, twenty-two newspapers that clashed with Khomeini's views were ordered closed. In terms of foreign policy, the landmarks of the second revolution were the destruction of U.S.-Iran relations and the admission of the shah to the United States on October 22, 1979. Two weeks later, Khomeini instructed Iranian students to "expand with all their might their attacks against the United States" in order to force the extradition (legal surrender) of the shah. The seizure of the American embassy on November 4 led to 444 days of agonizing dispute between the United States and Iran until the release of the hostages on January 21, 1981.

The so-called third revolution began with Khomeini's dismissal of President Abul Hassan Bani-Sadr on June 22, 1981. Bani-Sadr's fate was a result of Khomeini's determination to eliminate from power any individual or group that could stand in the way of the ideal Islamic Republic of Iran. This government, however, had yet to be molded thoroughly according to his interpretation of Islam. In terms of foreign policy, the main characteristics of the third revolution were the continuation of the Iraq-Iran war, expanded efforts to export the "Islamic revo-

lution,” and increasing relations with the Soviet Union, a once-powerful nation that was made up of Russia and several other smaller nations.

The revolution began going through yet a fourth phase in late 1982. Domestically, the clerical class had combined its control, prevented land distribution, and promoted the role of the private citizens. Internationally, Iran sought a means of ending its status as an outcast and tried to distance itself from terrorist groups. It expanded commercial relations with Western Europe, China, Japan, and Turkey and reduced interaction with the Soviet Union. Iran also claimed that the door was open for re-establishing relations with the United States.

After the revolution

In November of 1986 President Ronald Reagan (1911–) admitted that the United States had secretly supplied some arms to Iran for their war against Iraq. This controversy led to a lengthy governmental investigation to see if federal laws had been violated in what would become known as the Iran-Contra affair.

In 1988 Khomeini and Iran accepted a cease-fire with Iraq after being pressured by the United Nations, a multi-national, peace-keeping organization. On February 14, 1989, Khomeini sentenced writer Salman Rushdie (1947–) to death, without a trial, in a legal ruling called a fatwa. Khomeini deemed Rushdie’s novel “The Satanic Verses” to be blasphemous, or insulting to God, because of its unflattering portrait of Islam.

Before his death from cancer in Iran on June 3, 1989, Khomeini designated President

Ali Khamenei to succeed him. Khomeini is still a popular figure to Iranians. Each year on the anniversary of his death, hundreds of thousands of people attend a ceremony at his shrine at the Behesht-e-Zahra cemetery.

NIKITA KHRUSHCHEV

Born: April 17, 1894

Kalinovka, Russia

Died: September 11, 1971

Moscow, Russia

Russian Communist leader and Soviet premier

The Soviet political leader Nikita Khrushchev was a major force in world politics in the second half of the twentieth century. His leadership played a key role in the 1960s during the height of the Cold War, a four-decade standoff between the United States and the Soviet Union.

Nikita Khrushchev.

Reproduced by permission of AP/Wide World Photos.

Childhood and revolution

Nikita Sergeyevich Khrushchev was born in Kalinovka in southern Russia on April 17, 1894. As a child, Khrushchev attended a religious school where he learned to read and write. He also took a job taking care of cattle and continued until he was in his early teens. At the age of fifteen he became an apprentice (a student learning the trade) mechanic in Yuzovka, a growing town in the Ukraine, where his father was working as a miner. When his apprenticeship ended, he was employed as a machine repairman in coal mines of the region, where he worked for nearly a decade.

In 1918, at the age of twenty-four, Khrushchev joined the Communist Party, a political party that believes goods and services should be owned and distributed by the government. As a Communist, he enrolled in the Red Army to fight in the civil war then in progress. At the time, the Russian Revolution was storming the country. The Bolsheviks, led by Vladimir Lenin (1870–1924), were Communists that overthrew the czarist rule (rule by a czar, or king) of Russia. Communism took control of Russia in 1917. But not all of Russia agreed with the new government and soon civil war broke out between the Red Guards, who supported the Bolsheviks and the Whites, who opposed the new rule.

After nearly three years of service in the civil war, Khrushchev returned to Yuzovka and was appointed assistant manager of a mine. Soon thereafter, he entered the Donets Industrial Institute, a worker's school run by the Soviets, the new Communist ruling party. There he received additional instruction in the Communist Party. He became a political leader at school and was named the secretary of the school's Communist Party Committee. He graduated in 1925 and soon became a full-time party official as secretary of the Petrovsko-Mariinsk district of Yuzovka. There, he came to know Lazar M. Kaganovich, the secretary general of the Ukrainian Party's Central Committee and a close associate of future Soviet leader Joseph Stalin (1879–1953).

Khrushchev married in 1915, but his wife died during the famine (a severe shortage of food) which resulted from the civil war. In 1924 he remarried, this time to Nina Petrovna, a schoolteacher. The couple eventually had two children.

Entering politics

In 1929 Khrushchev attended the Industrial Academy in Moscow for training in industrial administration, leaving in 1931 to become secretary of a district party committee in Moscow. Within four years he became head of the party organization of Moscow, thus joining the highest ranks of party officials. There he used his industrial training as he helped to supervise the construction of the city's subway system.

When Stalin began eliminating those he mistrusted from the Communist Party's leadership, Khrushchev was fortunate to be one of the trusted. In 1938, when most of the chief party leaders in the Ukraine were gone, he was made first secretary of the Ukrainian Communist Party and at the same time was named to the Politburo, the ruling body of the Soviet Communist Party. As first secretary, he was in fact, though not in name, the chief executive of the Ukraine. Except for a short interval in 1947, he held on to his authority in that area until 1949.

During World War II (1939–45), where the Allies of Russia, America, and Great Britain fought the Axis of Germany, Japan, and Italy, Khrushchev served in the Red Army both in the Ukraine and in other southern parts of the former Soviet Union, and advanced to the rank of lieutenant general. He achieved all of this while still first secretary of the Ukrainian Communist Party.

In 1949 Khrushchev was summoned to Moscow to serve in the party's Secretariat, directed by Stalin. Then, after Stalin's death in 1953, Khrushchev was among the eight men in whose hands power became concentrated. In the distribution of the various spheres of power, the party was recognized as his sphere.

Within a few months he became first secretary of the Central Committee of the Soviet Communist Party—that is, its chief official.

Gaining power

By installing his supporters in important party positions and making some critical political alliances, Khrushchev gained power over the seven who shared power with him and by 1955 he was clearly the foremost political figure in the Soviet Union. Even that important status was enhanced three years later, when he became chairman of the Council of Ministers, succeeding Nikolai Bulganin (1895–1975). With that, he became the most powerful man in the country—as chairman of the Council of Ministers, he was head of the government and, as first secretary of the Soviet Communist Party's Central Committee, he was head of the party.

Instead of looking to equal Stalin by becoming a dictator, or someone who possesses supreme power, Khrushchev encouraged the policy of de-Stalinization, which the government had been following since 1953, for the purpose of ending the worst practices of the Stalin dictatorship. Although the Soviet Union under Khrushchev continued to be a one-party totalitarian state, where one party had complete political power, its citizens enjoyed conditions more favorable than had been possible under Stalin. The standard of living rose, intellectual and artistic life became somewhat more free, and the authority of the political police was reduced. In addition, relations with the outside world were generally improved, and the Soviet reputation began to gain favor.

Meanwhile, the onset of the Cold War (1945–91) began to escalate in 1960, when Khrushchev broke off talks with President

KING, B. B.

Dwight Eisenhower (1890–1969) after announcing an American spy plane had been shot down in the Soviet Union. Two years later, the United States and Soviet Union stood at the doorstep of nuclear war during the Cuban Missile Crisis in 1962, when America waited for Khrushchev to withdraw Soviet-owned nuclear arms from Cuba, the Soviet's Communist ally.

However, Khrushchev's fortunes in the Soviet Union eventually began to take a downward turn. Some of his ambitious economic projects failed and his handling of foreign affairs resulted in a number of setbacks. The de-Stalinization produced unrest in the Communist ranks of other countries. These developments caused concern among party leaders in the Soviet Union, many of them already fearful that Khrushchev might be planning to extend his power. In October 1964, Khrushchev was forced into retirement by other party leaders.

As a citizen, he lived a quiet life until his death on September 11, 1971, in Moscow. Although Khrushchev's legacy is still very much open to debate, no one can deny his attempts to de-Stalinize his nation that led to the improvement of everyday life in the Soviet Union.

B. B. KING

Born: September 16, 1925

Itta Bena, Mississippi

African American singer, musician, and songwriter

B. B. King is one of the most successful artists in the history of blues music. Today his ability as a blues guitarist remains unmatched.

Early years

Riley B. King was born on September 16, 1925, between Itta Bena and Indianola, Mississippi. His parents split up when he was a small child, and he lived for a few years with his mother in the Mississippi hills. She died when he was nine, and he was alone until his father, Albert King, found him a few years later. Working on a cotton plantation in Indianola, he earned \$22.50 a week. "I guess the earliest sound of blues that I can remember was in the fields while people would be pickin' cotton or choppin' or somethin'." King noted in a 1988 *Living Blues* interview cited in *Contemporary Musicians*. "When I sing and play now I can hear those same sounds that I used to hear then as a kid."

King sang gospel music in church and even performed professionally with the

Famous St. John Gospel Singers, but he was not allowed to sing the blues, which was considered “the devil’s music.” Still, he listened to recordings by early blues masters, especially Sonny Boy Williamson, on his aunt’s record player. King’s farm boss loaned him money to buy a guitar and sign up for music lessons, and King quickly developed as a blues player. Soon he was earning more singing and playing guitar on street corners on Saturday than he made all week on the plantation. King left Mississippi for Memphis, Tennessee, which promised the excitement and musical atmosphere he dreamed of. He settled there for good in 1948.

“Beale Street Blues Boy”

After serving briefly in the army, King moved in with his cousin Booker (Bukka) White, also a blues guitarist. King’s attempts to copy Bukka’s playing helped him develop his own style. He sought out Sonny Boy Williamson, who had a radio show on WDIA in West Memphis, and asked to play a song for him. Williamson was so impressed with King that he offered King his own radio show and a chance to play regularly at Miss Annie’s 16th Street Grill. King was able to advertise his upcoming concerts on the radio, and soon he and his trio had become popular. Known on the radio as the “Beale Street Blues Boy,” which was shortened to “Bee-Bee,” and then to his famous initials, King decided he wanted to make records.

King was signed to Bullet Records and in 1949 recorded four songs at the radio station, including “Miss Martha King” and “I’ve Got the Blues.” He also continued to perform in the area. Musician and talent scout Ike Turner (1931–) connected King with the Kent/Mod-

B. B. King.

ern/RPM record label, and King’s King’s 1951 single for his new label, “Three O’Clock Blues,” became a hit. He scored several other hits during these years, and by the mid-1950s he was playing about three hundred shows a year. He would maintain this schedule for over twenty years.

Once when King was playing at a dance in Twist, Arkansas, two men got into a fight and knocked over a heater, starting a fire that spread through the dancehall. King escaped the burning building, then remembered his sixty-dollar guitar and ran back in, nearly dying in an attempt to rescue it. When he discovered that the men who had started the blaze

were fighting over a woman named Lucille, he gave the name to his guitar—"to remind myself never to do anything that foolish."

Appreciated by rock audiences

Although King distanced himself from rock and roll when the new style emerged in the 1950s, he soon began to add some of the traits of early rockers like Little Richard (1932–) and Fats Domino (1928–) to his act. In 1962 he moved to the ABC label, and in 1965 he put out his first album, *Live at the Regal*. In 1968, after the assassination of civil rights leader Martin Luther King Jr. (1929–1968), King played an all-night blues benefit with fellow guitarists Jimi Hendrix (1942–1970) and Buddy Guy (1936–) to raise money for King's Southern Christian Leadership Conference.

During the late 1960s, praise for King from English rock musicians such as Eric Clapton (1945–) and Jimmy Page (1944–) led to renewed interest in the blues among U.S. audiences. King found himself playing concerts with bands such as Led Zeppelin, Black Sabbath, and Santana. As African American audiences moved away from the blues, King began to attract young white listeners. In 1969 "The Thrill Is Gone" was released; the song won a Grammy in 1971 and became King's biggest hit. In 1971, with attorney F. Lee Bailey (1933–), King founded FAIRR (the Foundation for the Advancement of Inmate Rehabilitation and Recreation), an organization dedicated to the improvement of prison conditions. King often gave concerts in prisons, one of which was recorded and released as *Live at San Quentin*.

A blues legend

By the 1980s King was recognized as a blues legend. He won a 1984 Grammy for best traditional blues recording for *Blues n' Jazz*; he appeared on the album *Rattle and Hum* with the Irish rock band U2; and he received a Lifetime Achievement Award at the 1988 Grammy awards ceremony. In the early 1990s King was inducted into the Rock and Roll Hall of Fame, received a Presidential Medal of Freedom from George Bush (1924–), and even earned a star on Hollywood's Walk of Fame. *Live at San Quentin*, released in 1990, earned him another Grammy. He was also the owner of B. B. King's Blues Club and Restaurant on Beale Street in Memphis.

King has been married and divorced twice. He has fifteen children and has often expressed regret that his heavy touring schedule prevented him from being around to see them grow up. He was faced with a heartbreaking situation in 1992 when he played at a jail in Gainesville, Florida; among the inmates there was his daughter Patty, who was serving time on drug charges. By the time he reached his late sixties, King had slowed down his performance schedule somewhat, though he still toured regularly. In 1994 he played a concert at the Hard Rock Café in Beijing, China. He was by now playing Lucille the Fifteenth. "We've spent 40 years together," he said to *Ebony*. "She likes younger men but puts up with me."

In December 1995 King received the 18th annual Kennedy Center Honors presented by President Bill Clinton (1946–). King said of the event, "Anytime the most powerful man in the world takes 10 to 15 minutes to sit and talk with me, an old guy from Indianola, Mis-

issippi, that's a memory imprinted in my head which forever will be there." In 2000 King was elected to the Mississippi Musicians Hall of Fame. The same year he received a Heroes Award from the National Academy of Recording Arts & Sciences. In February 2001 he won another Grammy in the traditional blues album category for *Riding with the King*, which he recorded with Eric Clapton.

BILLIE JEAN KING

Born: November 22, 1943

Long Beach, California

American tennis player

International tennis star Billie Jean King won a record twenty Wimbledon championships and helped win equal treatment for women in sports.

Encouraged by her parents

Billie Jean (Moffitt) King was born on November 22, 1943, in the southern Califor-

nia city of Long Beach. She was the first of Willard and Betty Moffitt's two children. Her father was an engineer for the fire department, and her mother was a receptionist at a medical center. Both she and her brother, Randy, who would become a professional baseball player, excelled in athletics as children and were encouraged by their parents. At fire department picnics, her father's coworkers always wanted Billie Jean to play on their softball team.

Billie Jean developed an interest in tennis at age eleven and saved money to buy her first racket. When she was fourteen years old she won her first championship in a southern California tournament. She began receiving coaching at age fifteen from Alice Marble, a famous player from the 1930s. The product of a working-class family, Billie Jean soon found herself caught up in a country club sport. Despite her success on the court, the fact that tennis was mainly geared toward men would prove a personal challenge to her in later years.

Tournament successes

In 1961 Billie Jean competed in her first Wimbledon tournament in England. Although she was defeated in the women's singles, she teamed with Karen Hautze to win the doubles (two-person team) title. She married attorney Larry King in 1965. In 1966 she won her first Wimbledon singles championship and repeated in 1967. That same year she also won the U.S. Open singles title at Forest Hills, New York.

In 1968 King won both the women's singles and doubles titles at Wimbledon. In 1971 she became the first woman athlete to win more than one hundred thousand dollars

KING, BILLIE JEAN

Billie Jean King.

Reproduced by permission of Archive Photos, Inc.

in a single year. It was 1972, however, that would be King's banner year. She won the women's singles title at Wimbledon, the U.S. Open, and the French Open. (These three tournaments plus the Australian Open now make up the "Grand Slam" of tennis.) For this feat, *Sports Illustrated* magazine named her "Sportswoman of the Year," and *Sports* magazine deemed her "Tennis Player of the Year."

In 1973 King again won Wimbledon's singles and doubles championships. It was then that she began to openly criticize the low prize money offered to women competitors. She noted that women were receiving far less than men for what she considered

equal ability and effort. Her statements on this issue led to the offer from a major U.S. drug manufacturer of a large sum of money to make the prize money at the U.S. Open equal for both men and women.

A victory for women's liberation

King's career coincided with the women's liberation (feminist) movement of the 1970s. Her working-class upbringing in southern California and the second-class treatment she received as a professional athlete made her a natural spokesperson for the movement. Her role as a leader in the feminist cause reached its peak in September 1973, when she faced the 1939 men's tennis champion Bobby Riggs (1918–1995) in a nationally televised match at the Astrodome in Houston, Texas. King easily beat the aging Riggs and emerged as the winner of what had been billed as the "Battle of the Sexes."

In 1975 King won her sixth Wimbledon singles championship, but she announced that she would no longer compete in major events because of injuries to her knees. In all she won a record twenty Wimbledon championships (including singles, doubles, and mixed doubles). Today, women competing in professional athletic contests owe much to Billie Jean King. With her outstanding play and forceful attitude, she earned them the right to compete for the same money as men.

Later years

King helped to found the Women's Tennis Association and served as its president from 1973 to 1975 and again from 1980 to 1981. After retiring from professional tennis in 1984, King and her husband have promoted coed (open to both men and women)

team tennis. King has also been active in charitable events. In 1995 she joined the Virginia Slims legends tour along with Chris Evert (1954–) and Martina Navratilova (1956–) to raise money for the fight against acquired immune deficiency syndrome (AIDS; a disease that destroys the body's ability to fight off infection). King is also an investor in Discovery Zone, a chain of children's "play lands" that promotes the equal athletic abilities of boys and girls.

King continues to be associated with the sport as a broadcaster, teacher, and coach. In 1999 and 2000 she coached the U.S. women's team, whose members included Venus Williams, Serena Williams, Lindsay Davenport, and Jennifer Capriati, to victories in the international Federation Cup tournament.

CORETTA SCOTT KING

Born: April 27, 1927

Perry County, Alabama

African American civil rights advocate

Coretta Scott King was the wife of civil rights leader Martin Luther King Jr. (1929–1968). She has gained an international reputation as an advocate (someone that supports a cause) for civil rights, nonviolence, international peace, and equal rights for women.

Early life and school

Coretta Scott was born on April 27, 1927, in Perry County, Alabama. Her parents, Obadiah and Bernice Scott, were farmers. The Scott family had owned land in the area since the American Civil War (1861–65). Even though the Scotts were more successful than most African Americans in the area, life for them and their three children was difficult. Coretta, along with her mother and sister, tended the family garden and crops, fed the chickens and hogs, and milked the cows.

Scott's early schooling was affected by the system of segregation, which kept people of different races apart. She walked six miles a day to and from school while white students traveled by bus to schools with better facilities and teachers. After completing six grades at the elementary school that "did not do much to prepare" her, Scott enrolled in Lincoln High School in Marion, Alabama. Lincoln "was as good as any school, white or black, in the area," said Scott. She developed an interest in music at Lincoln and, with encouragement from her teachers, decided to pursue a career in it.

Obstacles to overcome

In 1945 Scott graduated as valedictorian (the student having the highest grades) of her

KING, CORETTA SCOTT

Coretta Scott King.

Reproduced by permission of AP/Wide World Photos.

high school class and won a scholarship to Antioch College in Yellow Springs, Ohio. Eager to leave the South, Scott enrolled at Antioch only to discover that racism (a dislike or disrespect of someone solely based on his or her race) was very much alive there also. Being the first African American to major in elementary education at Antioch created problems for her. Such a major required a two-year internship, or training period—one year teaching in the Antioch private elementary school and the other in the Ohio public schools. The year at the Antioch school, where Scott taught music, went well. The Yellow Springs school board, how-

ever, refused to allow Scott to teach in its school system because of her race. The student body was integrated, meaning that it contained both black and white students, but the faculty (teachers and members of the administrative staff) was all white. Scott was given the option of going to Xenia, Ohio, and teaching in an all-black school or remaining at the Antioch private school for a second year. She chose to stay at the Antioch school.

Discrimination (unequal treatment based on race) made Scott more determined than ever. She joined the National Association for the Advancement of Colored People (NAACP) as well as a race-relations committee and a civil liberties committee. She later said, “I was active on all of them. From the first, I had been determined to get ahead, not just for myself, but to do something for my people and for all people. I took to my heart the words of Horace Mann [1796–1859], ‘Be ashamed to die until you have won some victory for humanity.’”

Scott’s years at Antioch were rewarding despite her unfortunate teaching experience. Her time there renewed and strengthened the values of giving and sharing that she had learned at home and at Lincoln High School. She learned to work toward excellence, crediting the school with helping lead her to believe “that individuals as well as society could move toward the democratic ideal of brotherhood.” At Antioch, Scott developed confidence that she could compete with “all people of all racial, ethnic and cultural backgrounds” on their terms or on her own. She claimed that “the total experience of Antioch” was an important element in preparing her for the role as wife of Martin Luther King Jr. and for her part in the civil rights move-

ment (the organized effort to gain full equality for African Americans in the United States) he led.

Marriage to Martin Luther King Jr.

While Coretta Scott was at Antioch she realized that she wanted to continue in music and to develop her voice to its fullest potential. She enrolled in the New England Conservatory in Boston, Massachusetts, graduating in 1954 with a bachelor's degree in music. It was in Boston that she met Martin Luther King Jr. They were married on June 18, 1953. Her decision to marry the young minister meant giving up her career as a performing concert musician.

In 1954 the Kings moved to Montgomery, Alabama, where they led the Dexter Avenue Baptist Church. It was in Montgomery that they were pushed into the leadership of the civil rights movement. Martin Luther King Jr. was recognized as the movement's leader, but Coretta Scott King was very much a part of it as well. She was actively involved in organizing and participating in the marches and boycotts (a form of protest in which organizers refuse to have dealings with a person, a store, or an organization until policies or positions are changed). She also gave "freedom concerts," in which she sang, read poetry, and gave lectures on the history of civil rights, to raise funds for the Southern Christian Leadership Conference (SCLC; an organization that was founded by Martin Luther King Jr. in 1957 to help local groups in their efforts to gain equality for African Americans) and for the civil rights movement. She also gave speeches all over the country, often standing in for her husband.

A worthy successor

After the assassination of Martin Luther King Jr. in Memphis, Tennessee, on April 4, 1968, Coretta Scott King continued to work for the civil rights movement. Four days after the violent murder of her husband, the grieving widow and three of her four children returned to Memphis to lead the march Martin had organized. In June 1968 she spoke at the Poor People's Campaign in Washington, D.C., a rally her husband had been planning before his death. Then, in May 1969 she led a demonstration of striking hospital workers in Charleston, South Carolina.

In addition to her role in the civil rights movement, King was active in the peace movement. She called the Vietnam War (1955–75; a civil war in which U.S.-backed forces in South Vietnam fought against a takeover by forces from North Vietnam), "the most cruel and evil war in the history of mankind." In 1961 as a representative for the Women's Strike for Peace, she attended a seventeen-nation arms-reduction conference in Geneva, Switzerland. Later, King was concerned with full employment (or providing access to jobs for all people who are able to work). She testified in Washington in favor of the Humphrey-Hawkins Full Employment and Balanced Growth Act of 1978, which was aimed at reducing both unemployment and rates of price increases. She also supported equal rights and justice for women.

King also led and worked on several national committees and continued to serve on the board of directors of the SCLC. She was president of the Martin Luther King Jr. Center for Social Change, located in Atlanta, Georgia. The Kings' youngest son, Dexter Scott King (1961–), took over as leader of the King Center in 1995.

KING, MARTIN LUTHER, JR.

Coretta Scott King continues to work in support of world peace, full employment, and social justice. Furthermore, her commitment to nonviolence is as strong as ever.

Born: January 15, 1929

Atlanta, Georgia

Died: April 4, 1968

Memphis, Tennessee

African American civil rights activist and minister

The minister and Nobel Peace Prize winner Martin Luther King Jr. (1929–1968) originated the use of nonviolent methods within the civil rights movement. He was one of the most important African American leaders of his time.

Early life

Martin Luther King Jr. was born on January 15, 1929, in Atlanta, Georgia. He attended Atlanta public schools and then went on to Morehouse College. After graduation from Morehouse in 1948, King entered Crozer Theological Seminary and graduated in 1951. He then received his doctorate (an advanced degree) in theology (the study of religion) from Boston University in 1955.

In Boston King met Coretta Scott, whom he married on June 18, 1953. Four children were born to the couple. In 1954, King became minister of Dexter Avenue Baptist Church in Montgomery, Alabama. In Montgomery, he became active with the National Association for the Advancement of Colored People (NAACP) and the Alabama Council on Human Relations.

Nonviolence: the bus boycott

In December 1955, Rosa Parks (1913–), a black woman, was arrested for violating a segregated seating ordinance (a law enforcing separation between African American and white people) on a public bus in Montgomery. Black citizens were outraged. At the time, many public places, including buses, were segregated. King, along with fellow activists, urged African Americans to boycott the segregated city buses. (In a boycott people refuse to use products and services provided by people, businesses, or organizations until policies and procedures are changed.) From this boycott, the Montgomery Improvement Association (MIA) was formed. The bus boycott lasted more than a year. Finally, the bus company agreed to the protesters demands and ended segregated seating. The U.S. Supreme Court later stated that

the bus segregation laws of Montgomery were unconstitutional, or went against the laws of the Constitution.

Overnight, Martin Luther King had become a national hero as a leader in the civil rights struggle. The victory had not been easy. As an elected president of the MIA, King's life was in constant danger. His home was bombed, and he and other MIA leaders were constantly threatened, arrested, and jailed.

Southern Christian Leadership Conference

In January 1957 approximately sixty black ministers assembled in Atlanta to form the Southern Christian Leadership Conference (SCLC) to continue the civil rights fight. King was elected president. In February 1958 the SCLC sponsored twenty-one mass meetings in southern cities as part of a "Crusade for Citizenship." The goal was to double the number of black voters in the South. King was now traveling constantly, speaking for "justice" throughout the country.

A year later the Kings visited India at the invitation of Prime Minister Jawaharlal Nehru (1889–1964). King had long been interested in nonviolence as practiced by Mahatma Gandhi (1869–1948). Yet, when they returned to the United States, the civil rights struggle had become much more intense. Violent resistance by whites to the nonviolent efforts of black demonstrators filled the newspapers with stories of bloody fights.

"Sit-in" movement

In February 1960 the "sit-in" movement started in Greensboro, North Carolina. African American students began this nonviolent form of protest by sitting at "white only"

*Martin Luther King Jr.
Courtesy of the Library of Congress.*

lunch counters in city stores. The movement quickly spread throughout much of the South. On April 15, 1960, the SCLC called a meeting of sit-in leaders to organize the movement. King urged the young people to continue using nonviolent means. Out of this meeting the Student Nonviolent Coordinating Committee (SNCC) emerged.

By August 1960 the sit-ins had succeeded in ending segregation at lunch counters in twenty-seven southern cities. In October 1960 the SCLC decided to increase their efforts to get African Americans registered to vote, use boycotts to gain fair employment, and work to end segregation in public places.

KING, MARTIN LUTHER, JR.

A popular department store in Atlanta, widely known for its policy of segregation, was the first goal in this renewed effort. When King and seventy-five students entered the store and requested lunch-counter service, he and thirty-six others were arrested. However, Atlanta's mayor worked out a truce and charges were dropped. But King was imprisoned for breaking the terms of his court supervision that resulted from a traffic offense conviction. John F. Kennedy (1917–1963), who at the time was campaigning for the presidency, made a telephone call to Mrs. King, and then worked to get King released.

Freedom riders

Soon the Congress of Racial Equality (CORE), SCLC, and SNCC joined together to form the Freedom Ride Coordinating Committee with King as chairman. The idea was to “put the sit-ins on the road” by having pairs of black and white volunteers board interstate buses traveling through the South. This would test a new federal law forbidding segregated bus stations. A great deal of violence resulted as resisting whites overturned and burned buses, assaulted the Freedom Riders, and attacked newsmen. Many of the arrested riders chose prison rather than pay fines. However, the protest worked, forcing the Interstate Commerce Commission to enforce laws against segregation.

The movement heats up

On May 2, 1963, some six thousand school children marched to demonstrate against school segregation. The next day, as volunteers gathered in a church, police blocked the exits, and turned fire hoses and police dogs on the teenage demonstrators.

Finally, there was a truce between the civil rights groups and the police. Then, the Ku Klux Klan (KKK; a group that believes the white race is better than all other races) bombed the home of King's brother and the motel where SCLC members were headquartered. Enraged black citizens rioted and Alabama state troopers moved in and set up undeclared martial law, or temporary rule by the military. King and SCLC personnel continued to urge nonviolence but more violence erupted when white racists refused to obey federal school integration laws. The worst came when a bomb thrown into an African American church killed four little girls.

“Let Freedom Ring”

The year 1963 continued to be eventful in the struggle for civil rights. In June King led 125,000 people on a “Freedom Walk” in Detroit, Michigan. On August 27, more than 250,000 black and white citizens gathered in Washington, D.C. for a mass civil rights rally. There, King delivered his famous “Let Freedom Ring” address. That same year he was featured as *Time* magazine's “Man of the Year.”

In 1964 King and his followers moved on to St. Augustine, Florida, one of America's most segregated cities. After weeks of nonviolent demonstrations and violent counterattacks by whites, a committee was set up to move St. Augustine toward desegregation. A few weeks later, the 1964 Civil Rights Bill, which made discrimination (unequal treatment) based on race illegal, was signed into law by President Lyndon Johnson (1908–1973). In December 1964, King received the Nobel Peace Prize.

Target: Alabama

In 1965 the SCLC concentrated its efforts in Alabama. The first target was Selma, where

only a handful of black citizens had been allowed to vote. King urged President Johnson to rush the Voting Rights Act and announced a march from Selma to Montgomery to demonstrate the black people's determination to vote. (The Voting Rights Act, which was passed on August 10, 1965, made it illegal for Southern states to prevent African Americans from voting and registering to vote.) Alabama Governor George Wallace (1919–1998) refused to permit the march, and the five hundred people who gathered to march were beaten by state troopers.

Nonetheless, the march continued, and Selma's black citizens were joined by hundreds of black and white protesters from other states. On March 21, 1965, more than ten thousand people followed King from Selma toward Montgomery. Only three hundred were allowed to make the full four-day march, but they were joined by another twenty-five thousand in Montgomery for the final leg to the Capitol to present a petition (a written demand) to Governor Wallace.

New issues: Vietnam War

In 1965 King made a "people-to-people" tour of northern cities. A growing number of black people were becoming aggressive in the struggle for their rights. Their position caused King to take another look at the non-violent civil rights movement that he had fathered. Although committed to nonviolence and civil rights, he was also troubled about the American involvement in the Vietnam War (1965–73; a war in Vietnam in which American forces supported South Vietnam in their fight against Communist North Vietnam). He soon found himself pushed toward leadership in antiwar groups.

In 1967 King began speaking directly against U.S. involvement in the Vietnam War, although many civil rights advocates criticized this position. Around this time, while serving a four-day sentence in Birmingham, which was a result of the 1963 demonstrations, that King and other activists began planning a "Poor People's March." The march was to be held in Washington, D.C. on April 22, 1968, to bring together the interests of the poor of all races.

Death to a dream

In February 1968 King led an antiwar rally in Washington, D.C. In March, King went to Memphis, Tennessee, to lead demonstrations against a wide range of complaints, including police brutality and poor school conditions. The march ended in a riot when some frustrated young African Americans began breaking windows, looting, and burning stores. The police reacted quickly and violently.

In Memphis on April 3, 1968, King addressed a rally. Speaking of threats on his life, he urged followers to continue the non-violent struggle no matter what happened to him. The next evening, as King stood on an outside balcony at the Lorraine Motel, he was struck by a rifle bullet. He died a few hours later.

A monument to King

In December 1999, a four-acre site near the Lincoln Memorial in Washington, D.C., was approved as the location for a monument to King. The site is near the place where King delivered his "I have a dream" speech in 1963. In September 2000, a design was selected. The monument will be the first to honor an individual African American in the National Mall area.

STEPHEN KING

Born: September 21, 1947

Portland, Maine

American author

Stephen King is a very popular author of horror fiction. In his works he blends elements of the traditional gothic (bleak and threatening) tale with those of the modern psychological (how the mind works) thriller, detective, and science fiction stories.

His early years

Stephen Edwin King was born on September 21, 1947, in Portland, Maine. When

he was two years old, his father left the family, leaving his mother to care for Stephen and his older brother, David. She took a series of low-paying jobs to support her children, and as a result the boys saw little of their mother.

As a boy King found a box of fantasy-horror fiction books and stories that had belonged to his father, and he read them all. By the time King was seven he had begun writing his own stories. He enjoyed watching science fiction and monster movies.

“Writing has always been it for me,” King indicated in a panel discussion at the 1984 World Fantasy Convention in Ottawa, Canada. Science fiction and adventure stories comprised his first literary efforts. King began submitting short fiction to magazines when he was twelve. He had no success at that time selling his stories, but he did win first prize in an essay competition sponsored by a scholastic magazine. In high school King authored a small, satiric (poking fun at human weakness) newspaper entitled *The Village Vomit*. He published his first story at eighteen in a magazine called *Comics Review*.

King graduated from high school in 1966. He received a Bachelor of Arts degree in English from the University of Maine in 1970. He married Tabitha Spruce, also a writer, the following year. They have three children.

After college

After graduating from college, King taught English at a high school in Maine and added to his income by holding a number of part-time jobs and by writing short stories for several popular magazines. He did not receive much money from the sale of his stories. Sometimes he was not paid at all but was

given extra copies of the magazine to show or sell to other people.

King's first novel was *Carrie*, published in 1974. It was a huge success, which allowed King to quit his other jobs and write full-time. With this book, King became one of the top writers of horror stories.

Popularity

King's fiction features everyday language, attention to the details of the story's surroundings, the emotional feelings of his characters, realistic settings, and an emphasis on modern problems. King's popularity comes from his ability to create stories in which evil occurs in ordinary situations.

Many of King's stories are semiautobiographical, meaning that they are taken in part from some of his own experiences. Many of the locations he writes about are based on the places he grew up in when he lived in Maine and other locations. Many of his stories deal with ordinary people who are faced with frightening events they have to try to understand and overcome.

A publishing marvel, King has nearly one hundred million copies of his works in print worldwide. He is the first writer to have had three, four, and finally five titles appear simultaneously (at the same time) on the *New York Times* bestseller list.

How King approaches writing

Some of King's works are variations (different ways of telling) on classic stories of fantasy and horror. *Salem's Lot*, for example, is a contemporary (modern) version of Bram Stoker's (1847–1912) novel *Dracula*, set in an isolated New England town. King's epic (long

Stephen King.

and large in scope) *The Stand* is close in structure to J. R. R. Tolkien's (1892–1973) *Lord of The Rings*. It tells of a battle between the forces of good and evil.

King used to write every day except for Christmas day, the Fourth of July, and his own birthday. Very often he would work on two or three stories at a time, switching from one to another as ideas came to him.

King has also admitted that during the period between 1977 and 1984 he wrote five novels under the pseudonym (a false name used to hide the identity of the writer) Richard Bachman. He did this to disguise the

true extent of his prolific (abundant, in great quantity) work. Also, his publisher believed that he had already saturated (filled to capacity) the market.

Scary

In his stories King also likes to write about how people relate to one another in scary situations. His characters are taken from both young and older people who come from many different backgrounds. King has said that he just wants to scare people. He likes to frighten his readers after he has made them love his characters. While stressing the importance of characterization (describing the qualities of characters), he regards the story itself as the most essential part of crafting fiction.

Even though he is very successful, King is modest. In an interview with *Yankee* magazine he said, "I'm leery [cautious] of thinking I'm somebody. Because nobody really is. Everybody is able to do something well, but in this country there's a premium [special value] put on stardom." He also said there is an "occupational hazard" (a danger based on a job) in being a successful writer, because of all the attention a writer can receive.

The accident

King had his own personal experience with horror on the afternoon of June 19, 1999. As he was walking near his summer home in Bangor, Maine, he was struck by a van. King had many operations to repair a collapsed lung and multiple fractures (small breaks) to his leg and hip. He then spent many months recovering in the hospital. King did get well but did not regain the same state of health he had before the accident.

The driver who hit King claimed the dog in his van distracted him. It was found he had several driving violations (acts of breaking the law). He was fined, but he did not go to jail, nor was his driver's license taken away.

Movies, television, and the World

Wide Web

Many of Stephen King's books and stories have been made into movies for both Hollywood and for television. These include *Carrie*, *Salem's Lot*, *The Shining*, *Christine*, *The Shawshank Redemption*, and *The Green Mile*.

In 2000 King's publisher, Simon & Schuster, published his novella (short novel) *Riding the Bullet* in electronic form. After that King became the first well-known author to self-publish on the Internet when he published several segments of a new book, *The Plant*, on the Web. In 2000 he also wrote *On Writing: A Memoir of the Craft*. In this book he tried to give advice to people who want to become writers based on his own experiences.

In early 2002 King announced his retirement from writing, saying that he has said everything that he set out to say.

Stephen King is regarded as a master of the horror story, developing this type of tale to a new level. The ideal format for horror tales used to be the short story, but King is one of the first to challenge that idea. He has written not just successful horror novels, but successful, long horror novels. His fans may take comfort in the fact that retirement is not always permanent.

RUDYARD KIPLING

Born: December 30, 1865

Bombay, India

Died: January 18, 1936

Burwash, England

English writer and poet

The English poet and story writer Rudyard Kipling was one of the first masters of the short story in English, and he was the first to use Cockney dialect (the manner in which natives of London, England's, East End speak) in serious poetry.

Early life

Joseph Rudyard Kipling was born on December 30, 1865, in Bombay, India. His father was professor of architectural sculpture at the Bombay School of Art. In 1871 Kipling was sent to England for his education. In 1878 Rudyard entered the United Services College at Westward Ho!, a boarding

school in Devon. There young "Gigger," as he was called, endured bullying and harsh discipline, but he also enjoyed the close friendships, practical jokes, and merry pranks he later recorded in *Stalky & Co.* (1899).

Kipling's closest friend at Westward Ho!, George Beresford, described him as a short, but "cheery, capering, podgy, little fellow" with a thick pair of spectacles over "a broad smile." His eyes were brilliant blue, and over them his heavy black eyebrows moved up and down as he talked. Another close friend was the headmaster, (the principal of a private school) "Crom" Price, who encouraged Kipling's literary ambitions by having him edit the school paper and praising the poems which he wrote for it. When Kipling sent some of these to India, his father had them privately printed as *Schoolboy Lyrics* (1881), Kipling's first published work.

Young journalist

In 1882 Kipling rejoined his parents in Lahore, India, where he became a copy editor (one who edits newspaper articles) for the *Civil and Military Gazette*. In 1887 he moved to the *Allahabad Pioneer*, a better paper, which gave him greater liberty in his writing. He published satiric (sharply or bitterly witty) verses, *Departmental Ditties* in 1886, and over seventy short stories in 1888 in seven paperback volumes. In style, these stories showed the influence of the writers Edgar Allan Poe (1809–1849), Bret Harte (1836–1902), and Guy de Maupassant (1850–1893). The subjects, however, were Kipling's own. He wrote about Anglo-Indian society, which he readily criticized with an acid pen, and the life of the common British soldier and the Indian native, which he portrayed accurately and sympathetically.

Rudyard Kipling.

Fame in England

In 1889 Kipling took a long voyage through China, Japan, and the United States. When he reached London, he found that his stories had preceded him and established him as a brilliant new author. He was readily accepted into the circle of leading writers. While there he wrote a number of stories and some of his best-remembered poems: "A Ballad of East and West," "Mandalay," and "The English Flag." He also introduced English readers to a "new genre [type]" of serious poems in Cockney dialect: "Danny Deever," "Tommy," "Fuzzy-Wuzzy," and "Gunga Din."

Kipling's first novel, *The Light That Failed* (1891), was unsuccessful. But when his stories were collected as *Life's Handicap* (1891) and poems as *Barrackroom Ballads* (1892), Kipling replaced Alfred, Lord Tennyson (1809–1892) as the most popular English author.

The American years

In 1892 Kipling married Caroline Balestier. They settled on the Balestier estate near Brattleboro, Vermont, in the United States, and began four of the happiest years of Kipling's life. During this time he wrote some of his best work—*Many Inventions* (1893), perhaps his best volume of short stories; *The Jungle Book* (1894) and *The Second Jungle Book* (1895), two books of animal fables that attracted readers of all ages by illustrating the larger truths of life; *The Seven Seas* (1896), a collection of poems in experimental rhythms; and *Captains Courageous* (1897), a novel-length, sea story. These works not only assured Kipling's lasting fame as a serious writer but also made him a rich man.

His imperialism

In 1897 the Kiplings settled in Rottingdean, a village on the British coast near Brighton. The outbreak of the Spanish-American War (1898; a short war between Spain and the United States over lands including Cuba and the Philippines) and the Boer War (1899–1902; a war between Great Britain and South Africa) turned Kipling's attention to colonial affairs. He began to publish a number of solemn poems in standard English in the *London Times*. The most famous of these, "Recessional" (July 17, 1897), issued a warning to Englishmen to regard their accomplishments in the Diamond Jubilee

(fiftieth) year of Queen Victoria's (1819–1901) reign with humility and awe rather than pride and arrogance. The equally well-known “White Man's Burden” (February 4, 1899) clearly expressed the attitudes toward the empire that are implied in the stories in *The Day's Work* (1898) and *A Fleet in Being* (1898).

Kipling referred to less highly developed peoples as “lesser breeds” and considered order, discipline, sacrifice, and humility to be the essential qualities of colonial rulers. These views have been denounced as racist (believing that one race is better than others), elitist (believing oneself to be a part of a superior group), and jingoistic (pertaining to a patriot who speaks in favor of an aggressive and warlike foreign policy). But for Kipling, the term “white man” indicated citizens of the more highly developed nations. He felt it was their duty to spread law, literacy, and morality throughout the world.

During the Boer War, Kipling spent several months in South Africa, where he raised funds for soldiers' relief and worked on an army newspaper, the *Friend*. In 1901 Kipling published *Kim*, the last and most charming of his portrayals of Indian life. But anti-imperialist reaction following the end of the Boer War caused a decline in Kipling's popularity.

When Kipling published *The Five Nations*, a book of South African verse, in 1903, he was attacked in parodies (satirical imitations), caricatures (exaggerations for comic effect), and serious protests as the opponent of a growing spirit of peace and democratic equality. Kipling retired to “Batemans,” a house near Burwash, a secluded village in Essex.

Later works

Kipling now turned from the wide empire as his subject to simply England itself. In 1902 he published *Just So Stories for Little Children*. He also issued two books of stories of England's past—*Puck of Pook's Hill* (1906) and *Rewards and Fairies* (1910). Like the *Jungle Books* they were intended for young readers but were suitable for adults as well. His most significant work at this time was a number of volumes of short stories written in a different style—“Traffics and Discoveries” (1904), “Actions and Reactions” (1904), “A Diversity of Creatures” (1917), “Debits and Credits” (1926), and “Limits and Renewals” (1932).

Kipling's later stories treat more complex, subtle, and somber (serious) subjects. They reflect Kipling's darkened worldview following the death of his daughter, Josephine, in 1899, and the death of his son, John, in 1915. Consequently, these stories have never been as popular as his earlier works. But modern critics, in reevaluating Kipling, have found a greater power and depth that make them among his best work.

In 1907 Kipling became the first English writer to receive the Nobel Prize in Literature. He died on January 18, 1936, and is buried in Westminster Abbey in London, England. His autobiography, *Something of Myself*, was published in 1937.

Rudyard Kipling's early stories and poems about life in colonial India made him a great favorite with English readers. His support of English imperialism (the policy of extending the rule of a nation over foreign countries) at first contributed to this popularity but caused a reaction against him in the twentieth century. Today he is best known for his *Jungle Books* and *Kim, a Story of India*.

HENRY KISSINGER

Born: May 27, 1923

Furth, Germany

German-born American government official

A leading expert on international relations since the 1950s, Henry Kissinger was secretary of state under Presidents Richard Nixon (1913–1994) and Gerald Ford (1913–). His impressive career also includes becoming the cowinner of the Nobel Peace Prize in 1973.

Early life and education

Henry Kissinger was born Heinz Alfred Kissinger on May 27, 1923, in Furth, Germany. He was the first of the two sons of Paula Stern Kissinger and Louis Kissinger. His father was a teacher who lost his job and career when the Nazis, carrying out the orders of Adolf Hitler (1889–1945), began

persecuting (causing people to suffer for their beliefs) Jewish people in Germany. (The Nazi party was in control of the government of Germany from 1933 to 1945.) As a boy Kissinger loved sports but was a better student than athlete. When German anti-Semitism (hatred of Jewish people) increased, the family decided to leave Germany in 1938, moving first to England and then several months later to the United States. The family settled in New York City, where Kissinger completed high school and began taking night classes at City College with the intention of becoming an accountant. While attending college he worked at a factory during the day.

During World War II (1939–45; a war involving the United States and many other countries in the world in which millions of people lost their lives) Kissinger joined the military and served in Germany, working in Army Intelligence. He also became an American citizen during the war. Following the war Kissinger remained in Europe as an instructor at the European Command Intelligence School in Germany. In 1947 he returned to the United States and enrolled at Harvard University. He graduated in the class of 1950 with a degree in government. He continued his studies as a graduate student, earning his master's degree in 1952 and his Ph.D. in 1954, while also teaching at the university.

An expert on international affairs

Between 1952 and 1969 Kissinger directed the Harvard International Seminar, a type of study in which advanced students, led by a professor, conduct research, share their findings, and contribute to discussions. The seminar was held during the summer months.

In this position, he was visited by many international figures with whom he would later deal as a foreign-affairs official. As part of the Council on Foreign Relations he published *Nuclear Weapons and Foreign Policy*, which added to his reputation as a leading expert on international relations and national defense policy. For eighteen months beginning in 1956 he was director of a Rockefeller Brothers Fund special studies project—a program developed to investigate possible domestic and international problems. In 1957 he became a lecturer (public speaker) at Harvard. He was promoted to professor in 1962.

Kissinger served as a consultant (one who gives professional advice) to the National Security Council, to the Arms Control Disarmament Agency, and to the Rand Corporation. From 1962 to 1965 he worked full time at Harvard. In 1965 he became a consultant to the State Department on Vietnam. He visited Vietnam several times between 1965 and 1967. Most of 1968 he spent working on the unsuccessful bid of New York Governor Nelson Rockefeller (1908–1979) for the Republican nomination for the presidency. In spite of Rockefeller's defeat by Richard Nixon, at Rockefeller's urging Nixon considered and appointed Kissinger to head the National Security Council.

Kissinger did not agree with the U.S. foreign policy toward the Soviet Union that had been developed under former presidents. He thought their positions had been inconsistent and too friendly. Kissinger viewed the Soviet Union as the main opponent of the United States in international affairs, but he had respect for the role of the Soviet Union as one of the superpowers. His attempts to ease tensions, known as *détente* (day-TAHNT),

Henry Kissinger.

Reproduced by permission of AP/Wide World Photos.

improved relations between the Soviet Union and the United States. As a result, one of Kissinger's early successes during this period of *détente* was the completion of talks on the Strategic Arms Limitations Treaty (SALT). SALT was an agreement between the Soviet Union and the United States to limit the number of nuclear weapons in each country. The discussions lasted for nearly three years and ended with the signing of an agreement in Moscow, Russia, by President Nixon and Soviet Communist Party Chief Leonid Brezhnev (1906–1982).

Kissinger also played an important part in the settlement of the Quadripartite Agree-

ment on Berlin, Germany, in September 1971. Berlin had been the source of problems between the East and West for many years, particularly after the creation of the Berlin Wall by the East German government in 1961 to prevent people from leaving the country. Through official negotiations (give-and-take discussions to settle an issue) handled by Ambassador Kenneth Rush (1910–1994), and secret negotiations directly involving Kissinger, an agreement was made to make it easier to travel between East and West Berlin. This agreement also improved relations between the United States and the former Soviet Union.

China, Vietnam, Middle East

Another of Kissinger's successes (and one that caught the media by surprise) was the organization of Richard Nixon's approach to China. The United States had refused to recognize the People's Republic of China following the civil war that left Communists under Mao Zedong (1893–1976). Communists believe in revolution to establish a system in which the means of production—land, factories, mines, and so on—are owned by all people in common. Early in Nixon's first term as president, efforts were made to allow interaction between China and the United States. Taking advantage of international conditions and moving secretly with the help of Pakistani President Yahya Khan (1917–1980), Kissinger flew to China and arranged for an invitation for Nixon to make an official state visit. Nixon's visit to China in 1972 provided guidelines for the establishment of U.S.-China relations. During his eight years in the National Security Council and State Department, Kissinger flew to China a total of nine times.

Kissinger was criticized most and forgiven least for his handling of the fighting in Southeast Asia. The U.S. involvement in the Vietnam War (1955–75) had driven President Lyndon Johnson (1908–1973) from office, and it had been the desire of the Nixon administration to seek "peace with honor." The Vietnam War was a war in which the government of South Vietnam, with U.S. assistance, fought against a Communist takeover by North Vietnam. Kissinger's approach was to negotiate from a position of strength. The direct U.S. involvement in Vietnam reflected this position, but the secret bombing of Cambodia—referred to as the "secret war"—was criticized as an excessive use of military strength to force U.S. opponents to agree to end the war. All U.S. involvement in Southeast Asia was an attempt to keep Vietnam, Cambodia, and Laos from becoming controlled by Communist groups. The secret bombing of Cambodia was eventually stopped by actions of Congress. Kissinger successfully negotiated a truce with his North Vietnamese counterpart Le Duc Tho (1911–1990) in Paris and shared the Nobel Peace Prize in 1973 with him.

Kissinger had gone along with the wishes of Secretary of State William Rogers (1913–2001) while on the National Security Council. Following his appointment as secretary of state in 1973, he changed his hands-off policy toward the Middle East. During the three years he was secretary of state, Kissinger conducted what became known as "shuttle" diplomacy (negotiations between nations). He served as the middleman in negotiations to restore peace among Middle Eastern nations. Kissinger would often fly from Egypt to Israel to Syria or elsewhere and back again as he worked to help develop

agreements to secure peace. In all, Kissinger made eleven “shuttle” missions, the longest lasting nearly a month.

Out of office

After leaving office following Ford’s loss to Jimmy Carter (1924–) in the 1976 presidential election, Kissinger was self-employed as the director of a consulting firm dealing with international politics. He received the Presidential Medal of Freedom, the nation’s highest award given to a civilian (nonmember of a military, police, or fire-fighting unit), in 1977. He also received the Medal of Liberty, an award that was given only once, in 1986, to ten foreign-born American leaders.

Kissinger produced two books of memoirs (accounts of his experiences) to explain events that had happened while he was in office. These explanations did not change the views of many critics, who believed that Kissinger had made major mistakes in developing U.S. foreign policy. In 1997 former Secretaries of State Kissinger and Alexander Haig (1924–) came under fire for their roles in helping U.S.-China trade. Some said that they stood to profit from contracts with the Chinese and that some of their dealings put the United States in a vulnerable (open to attack or damage) position. In 2001 Kissinger was named chancellor (president) of the College of William and Mary in Williamsburg, Virginia.

CALVIN KLEIN

Born: November 19, 1942

Bronx, New York

American fashion designer

One of America’s top fashion designers, Calvin Klein first made a name for himself by designing clean, uncomplicated sportswear. He kept his name popular with the public by creating sometimes shocking and always news-making advertising campaigns.

His early years

Calvin Richard Klein was born on November 19, 1942, in the Bronx, New York, where he spent all of his childhood. Klein was the second of three children born to Flo and Leo Stern. The family lived relatively comfortably. His grandmother was a seamstress and he acquired his love of sewing from her. His mother encouraged his love of art and fashion.

Klein attended the High School of Art and Design, which prepared students for

Calvin Klein.

Reproduced by permission of Archive Photos, Inc.

careers in advertising and drafting. As a youth, while others his age were playing sports, Klein was busy studying, sketching fashion designs, and sewing. Later he moved on to the esteemed Fashion Institute of Technology, graduating in 1962. He spent five years as an apprentice (a student working toward learning a skill) in a coat and suit house on Seventh Avenue in New York City, working long nights and weekends to perfect his own designs.

In 1968 Klein and close childhood friend Barry Schwartz created a Calvin Klein coat business. The first order was actually obtained by accident. A coat buyer from Bonwit Teller

(a large New York City clothing store) got off on the wrong floor of a hotel and wandered into Klein's workroom. She placed an order for \$50 thousand, which was a huge amount at that time. Encouraged by favorable reviews from the fashion press and the support of store executives, Klein expanded his line to include women's sportswear.

Klein's world soon included his couture (fashionable custom-made women's clothing) line, Calvin Klein Collection for men and women, CK sportswear for men and women, and CK jeans. He also licensed arrangements for his menswear, coats, accessories, intimate apparel, hosiery, swimwear, eyewear, furs, socks, and fragrances, all under his careful control and management.

Of the many categories licensed, denim jeans, along with fragrances, built a large following among consumers, who sought an affordable way to attain the Calvin Klein look. By 1997 sales of Calvin Klein Jeans approached half a billion dollars.

Marketing approach was never subtle

Advertising was the key to Klein's success. He kept the media talking about him by creating controversy (open to dispute). He was the first to design women's underwear that looked like men's jockey shorts. His television ads for jeans starred Brooke Shields (1965–), who proclaimed: "Nothing comes between me and my Calvins."

Klein developed a reputation for pushing the boundaries of acceptability in his campaigns. Ads of the mid-1990s featured young teenagers in provocative poses that many regarded as socially irresponsible. Klein eventually cancelled these ads, but not

before the accompanying publicity had made the Calvin Klein brand name a part of everyday conversation.

Klein's three major fragrances, Obsession, Eternity, and Escape, were huge successes, also due in part to sexually-suggestive advertising. Advertising for his fragrances, CK One and CK Be, continued to challenge the public. Some ads showed teens taking part in what some regarded as an idealized drug culture. At this time, President Bill Clinton (1946–) admonished the fashion industry not to glamorize addiction. Klein replied that these ads represented a departure from phony airbrushed images that were not connected to the reality of today's world.

Design philosophy affirmed

Klein's design philosophy is rooted in minimalism (extreme simplicity). He typically uses neutral colors or earth tones (browns), and designs separates (articles of clothing designed to be worn interchangeably with others to form various combinations) that work in many different ensembles, from day to night and season to season. At the same time his advertising for jeans and fragrances was being criticized, Calvin Klein clothing was receiving critical acclaim for its clean, modern lines.

Time magazine named Klein one of the twenty-five most influential Americans in 1996. Klein won the prestigious Coty Award three times in a row (1973–1975), becoming the youngest designer to ever have that honor. In 1982, 1983, and 1986 he also captured the Council of Fashion Designers of America Award. In addition Klein built a financially strong company with the continued advice and help of partner Barry

Schwartz, who guided the company through tough financial times in the late 1980s. Few designers have rivaled his worldwide empire.

Klein's personal life also weathered the times. He married Jayne Centre in 1964, but they divorced in 1974. They had one child, Marci. He married one of his design assistants, Kelly Rector, in 1986.

Klein is known for his "casual chic" clothing, stylish but casual designs created for active women. He is undoubtedly one of the most successful American clothing designers today.

KUBLAI KHAN

Born: 1215

Mongolia

Died: February 1294

Ta-tu (Peking), China

Mongolian emperor

Kublai Khan was the greatest of the Mongol emperors after Genghis Khan and founder of the Yuan Dynasty in

China. He was a wise ruler and was able to lead a vast empire of nations by adapting different traditions to his own government.

Early life

Kublai Khan was the fourth son of Tūlē and the grandson of Genghis Khan (c. 1165–1227), the founder of the Mongol Empire. Strong, brave, and intelligent, Kublai was Genghis's favorite grandson; he had accompanied his father, Tūlē, in battles as a child. By the age of twelve he was a skilled horseman, and his reputation as a warrior grew as he became older. Kublai was seventeen when his father died.

In 1251 Kublai was given control over Chinese territories in the eastern part of the empire after his brother, Mōngkē, became Great Khan of the Mongol Empire. Kublai organized a group of Chinese advisers to introduce reforms in his territories. Kublai was also put in charge of expeditions with the goal of unifying China under the Mongol emperor. In 1257, unhappy with the progress of the war against the Chinese Sung Dynasty, Mōngkē led an expedition into western China but was killed by the Chinese defense in August 1259. In 1260, supported by pro-Chinese groups, Kublai was elected as Mōngkē's successor, but his younger brother, Ariq Böge, disputed the election and proclaimed himself khan at Karakorum, Mongolia. In the following years Kublai fought his brother, defeating him in 1264.

Kublai Khan's administration

Under Kublai, the Mongols adopted divide-and-rule tactics. The Mongols and central Asians remained separate from Chinese life; in many ways life for the Chinese

was left basically unchanged. Kublai was also well known for his acceptance of different religions. The rule of the Mongol minority was assured by dividing the population of China into four social classes: the Mongols; the central Asians; the northern Chinese and Koreans; and the southern Chinese. The first two classes enjoyed extensive privileges; the third class held an intermediate position; and the southern Chinese, the most numerous of all, were practically barred from state offices. Separate systems of law were maintained for Chinese and for Mongols. Kublai also reorganized the government, establishing three separate branches to deal with civilian (non-military) affairs, to supervise the military, and to keep an eye on major officials.

Following this reorganization, a new capital city was constructed at present-day Peking, China, in 1267. First called Chung-tu, the city was renamed Ta-tu (or Daidu, "great capital") in 1272. In the eyes of Kublai, leaving some Chinese institutions and customs in place was a political decision. Outside the administration, much of the Mongol way of life still prevailed. The Mongols, especially the military, preserved their tradition as nomads (wanderers). Even within the administration, Chinese influence was controlled by the large numbers of Mongols and central Asians. Kublai Khan named his rule the Yüan Dynasty in 1271. By February 1278 he had destroyed the Sung dynasty and was the unquestioned leader of an empire that stretched across two continents.

Kublai was a great supporter of trade, science, and the arts. He introduced the use of paper money for the entire empire and ordered the creation of a new alphabet for the Mongol language that closely resembled Chi-

nese writing. Kublai also established a system of sea transport and developed inland river and canal routes to move grain from the fertile rice-growing Yangtze River basin to provide food for the growing population. The Grand Canal system was finally extended north to Peking from the Yellow River.

As emperor of China, Kublai demanded loyalty and gifts from other states within the empire. Some of these, such as Annam and Korea, cooperated. To others, Kublai sent messengers asking for payment and attacked if his demands were ignored. Many of these expeditions, however, ended in failure. Twice between 1274 and 1281 Kublai's armies against Japan were either destroyed by storm or crushed by the Japanese because of the Mongols' inability to fight sea battles and the poor quality of their naval forces. Kublai suffered a setback when he failed to conquer the Malay kingdom of Champa in Indochina after a long war (1283–87). Three expeditions to conquer Burma in 1277, 1283, and 1287 also failed. In 1293 near the end of his reign, Kublai launched a naval expedition against the Javanese kingdom of Majapahit, but the Mongol forces had to withdraw after considerable losses.

Contact with the West

Under Kublai, the opening of direct contact between China and the West was made possible by Mongol control of central Asian trade routes and aided by the presence of efficient postal services. In the early thirteenth century, large numbers of Europeans and central Asians made their way to China. The presence of the Mongol power also enabled many Chinese to travel freely within the Mongol Empire, all the way to Russia, Persia, and Meso-

Kublai Khan.

potamia. There were several direct exchanges of missions between the pope and the Great Khan. In 1266 Kublai entrusted the Polo brothers, two Venetian merchants, to carry a request to the pope for one hundred Christian scholars and technicians. The Polos met with Pope Gregory X (c. 1210–1276) in 1269 and received his blessing but no scholars.

Marco Polo (c. 1254–1324), who accompanied his father on this trip, was probably the best-known foreign visitor ever to set foot in China. It is said that he spent the next seventeen years under Kublai Khan, including official service in the administration and trips through the provinces of Yunnan and Fukien.

The accuracy of his descriptions of China was questioned, but the popularity of his journal generated great interest among Europeans for going east. Rabban Sauma, a monk born in Peking, crossed central Asia to the Il-Khan's court in Mesopotamia in 1278 and was one of those whom the Mongols sent to Europe to seek Christian help against Islam. Under Kublai, the first direct contact and cultural exchange between China and the West had occurred.

Kublai Khan's legacy

After a glorious reign of thirty-four years, Kublai Khan died in Ta-tu in February 1294. He is regarded as one of the great rulers in history. He was a shrewd and thoughtful ruler of a huge state. He was popular among the Chinese, and his achievements ranked him second to Genghis among the Mongol rulers. He showed great intelligence in using partial adoption of Chinese political traditions and divide-and-rule tactics to help in

the administration of a large empire. The main problem with his reign was that as he and his successors became more involved in Chinese traditions, there was a growing conflict between the Mongol rulers of China and those of the other khanates within the Mongol confederacy. They preferred to maintain their own character instead of looking toward China for leadership.

MARQUIS DE LAFAYETTE

Born: September 6, 1757

Auvergne, France

Died: May 20, 1834

Paris, France

French general

The Marquis de Lafayette was a French general who played important roles in two revolutions in France and volunteered his time and money to help the American cause during the Revolutionary War (1775–83).

Early life

Marie Joseph Paul Yves Roch Gilbert du Motier, Marquis de Lafayette was born on September 6, 1757, in the province of Auvergne, France. His father was killed while fighting against the British in the Seven Years' War (1756–63). His mother and grandfather died when he was thirteen, leaving him a wealthy orphan. After studying in the Collège du Plessis in Paris, France, Lafayette joined the French army in 1771. In 1773 he married Adrienne de Noailles. However, he was not ready to settle down to the life of a wealthy man. After the outbreak of the American Revolution, he volunteered to help the new country in its fight against France's historic enemy, England.

Marquis de Lafayette.
Courtesy of the National Portrait Gallery.

American Revolution

King Louis XVI (1754–1793) refused to allow Lafayette to go to America, but Lafayette sailed anyway, after buying a ship with his own money. In June 1777 he landed in North Carolina. The Continental Congress had given him a commission as a major general, but his actual duties were as assistant to General George Washington (1732–1799). He assisted in battles against the British in Pennsylvania and New Jersey and eventually was sent back to France in an attempt to obtain greater French support for the Americans.

Upon returning to his homeland in 1779, Lafayette was arrested for having dis-

obeyed the king, but all was soon forgiven. Although not all his proposals for aid to the Americans were approved, Lafayette returned to America in 1780 in command of French forces that were sent to help. In 1781 he was given command of the defense of Virginia with the rank of major general. He drew English commander Charles Cornwallis (1738–1805) into a trap at Yorktown, Virginia; Cornwallis was blockaded by the American forces and by French troops under Admiral de Grasse. Cornwallis's surrender was the high point of Lafayette's military career.

Return to France

When Lafayette returned to the French army in 1782, he was considered a hero. He became a leader in the movement against the French monarchy (absolute rule by a single person). In 1789 he took a seat in the Estates General, the French legislature. The adoption of the Declaration of the Rights of Man and the Citizen (loosely based on the Declaration of Independence) was his idea, and he was given the command of the Parisian National Guard, a force of citizen-soldiers created to defend the new constitutional monarchy. Lafayette favored a moderate course (a gradual rate of change) for the Revolution but found that many others were not so willing to wait. His popularity declined, and his command to his troops to fire on a mob in 1791 led to his dismissal as command of the guard.

However, the beginning of war against Austria and Prussia in 1792 returned Lafayette to military life as commander of the army of the Ardennes. In August he crossed over into Austria with a few fellow officers. He was captured and held as a prisoner of war until 1797, when Napoleon Bonaparte

(1769–1821) obtained his release from jail but did not permit him to return to France. Lafayette had become so politically powerless that when he did return in 1799 without permission, he was given a military pension and allowed to live quietly in Lagrange, France.

Last years

When Napoleon stepped down as emperor in 1814, Lafayette was elected to the Legislative Chamber and demanded that Napoleon be kept out permanently. The return to power of the monarchy in 1815 after the Hundred Days (Napoleon's brief second reign) returned Lafayette to a position as a leader of the opposition to Kings Louis XVIII and Charles X. In 1824 Lafayette visited America as a guest of the government on a tour that lasted fifteen months. Congress rewarded him for his efforts during the American Revolution with money and land. When he returned to France in 1825, he was known as the "hero of two worlds."

Lafayette did not regain political prominence until revolution broke out again in 1830. Named to command the reestablished National Guard, he supported the naming of Louis Philippe as a constitutional monarch. He was dismissed from the guard the following year and became a critic of the new king. When Lafayette died in Paris on May 20, 1834, he had few followers left. His biggest influence was as a living symbol—of friendship between France and America, and of the men who wanted a better world but could not accept terror and cruelty as the ways to bring it into being.

LAO TZU

Born: Sixth century B.C.E.

China

Died: Sixth century B.C.E.

China

Chinese philosopher

Lao Tzu is believed to have been a Chinese philosopher (a person who seeks to answer questions about humans and their place in the universe) and the accepted author of the *Tao te ching*, the main text of Taoist thought. He is considered the father of Chinese Taoism (a philosophy that advocates living a simple life).

Three Lao Tzus

The main source of information on Lao Tzu's life is a biography written by the historian Ssu-ma Ch'ien (145–86 B.C.E.) in his *Records of the Historian*. By this time a number of traditions or beliefs about the founder of Chinese

LAO TZU

Lao Tzu.

Taoism were going around, and Ssu-ma Ch'ien himself was unsure of their authenticity. The biography in fact contains an account of not one but three men called Lao Tzu.

The first Lao Tzu was a man named Li Erh or Li Tan, who came from the village of Ch'ü-jen in the southern Chinese state of Ch'u. Li Erh served as historian in charge of the official records in the Chinese imperial capital of Loyang. He was a peer of the famous Chinese philosopher Confucius (551–479 B.C.E.), and he is reported to have given an interview to Confucius when he came to Loyang seeking information on the Chou ritual.

Another man identified as the founder of Taoism was Lao Lai Tzu, who also came from

Ch'u. He is said to be a person of the same age as Confucius and is credited with a fifteen-chapter book explaining the teachings of the Taoist school. Nothing more is known about the second Lao Tzu.

According to a third account, the original Lao Tzu lived 129 years after the death of Confucius. This man went by the name of Tan, the historian of Chou. Actually, it is impossible to prove the historical accuracy of any of these accounts. Lao Tzu is not really a person's name and is only a complimentary name meaning "old man." It was common in this period to refer to respected philosophers and teachers with words meaning "old" or "mature." It is possible that a man who assumed the pseudonym (assumed name) Lao Tzu was a historical person, but the term Lao Tzu also was used as a substitute title to the supreme Taoist classic, *Tao te ching* (Classic of the Way and the Power).

According to Ssu-ma Ch'ien, Lao Tzu had been serving in the Chou capital for a long time. He became unhappy with the dishonest political situation and decided to go into retirement. As he was passing through the Hanku Pass west of Loyang, the gatekeeper stopped him and asked him to write down a book of his teachings. Lao Tzu then composed a book of five thousand sayings in two sections that described the theory of the *tao* and *te*. This book was then known as the *Tao te ching*.

Lao Tzu is frequently associated with the other famous early Chinese thinker, Confucius. There are numerous stories about debates that supposedly took place between these two great philosophers in which Lao Tzu was always the winner. These stories are undoubtedly anti-Confucian publicity circu-

lated by members of the Taoist school, perhaps as early as the fourth century B.C.E.

Tao te ching

Lao Tzu's *Tao te ching* itself is a collection of sayings describing the principal Taoist teachings. Most scholars now agree that Lao Tzu did not write this book, mainly because no one knows whether he was a historical person. The most convincing theory is that there were a large number of proverbs (wise sayings) that were part of the Taoist teaching. They were memorized and passed on from teacher to pupil. Eventually the best of these sayings were collected and edited into the book, which was then given the title *Tao te ching*. A study of the style and grammar of the work reveals that it must have been put together around the fourth century B.C.E.

Lao Tzu's *Tao te ching* has confused its readers for centuries. Its language is extremely short and unclear. Much of the text is rhymed. Although the work is divided into chapters, the passages in a chapter do not always refer to the same subject. Thus, it hardly qualifies as a well-organized book of philosophical teachings.

The most important concept developed in Lao Tzu's *Tao te ching* is *tao*. *Tao* literally means "road" or "way." In the *Tao te ching* it is portrayed as something that cannot be expressed, a concept beyond definition. "The way (*tao*) that can be told of is not the constant way." *Tao* is so indescribable that the term itself is often not used and is referred to only indirectly. *Tao* stands as the force behind the universe. There is even an indication that it is the universe itself.

An important quality of the *tao* is its "weakness," or "submissiveness." Because the *tao* itself is basically weak and submissive, it

is best for man to put himself in harmony with the *tao*. Thus, the *Tao te ching* places strong emphasis on nonaction (*wu wei*), which means the absence of aggressive action. Man should not strive for wealth or fame, and violence is to be avoided. This peaceful approach to life was extremely influential in later periods and led to the development of a particular Taoist way of living that involved special breathing exercises and special eating habits that were designed to maintain calmness and harmony with the *tao*.

RALPH LAUREN

Born: October 14, 1939

New York, New York

American designer

The name of American clothing designer Ralph Lauren has become associated with class and taste. In addition to clothing, he designs home deco-

Ralph Lauren.

Reproduced by permission of the Corbis Corporation.

rating products such as furniture, bedding, drapes, towels, rugs, china, and silverware.

Early life

The youngest of four children, Ralph Lifshitz was born in the Bronx, New York, on October 14, 1939. His father was a house-painter. Ralph became interested in clothes when he was in seventh grade. While attending DeWitt Clinton High School in New York, he worked part-time for New York department stores, saving his money to buy clothes. He changed his name to Lauren in the mid-1950s. After graduating from high school he worked as a salesman and began

studying business at night. He quit school after a few months, spent time in the army, and then looked for a job in fashion.

Creates popular fashions

In 1967 Lauren was hired by Beau Brummell Ties as a designer. His wide, colorful ties were the opposite of the narrow dark neckties common at the time; they sold well and started a new trend. Lauren started his own company and the next year launched a line of men's clothing, Polo, offering styles that were a mix of English and American styles and that expressed an image of class. Lauren's menswear was a success, and in 1971 he introduced his women's line. As the years went by he continued to branch out into children's clothes, colognes, footwear, home products, and other merchandise.

Lauren designed costumes for the films *The Great Gatsby* (1973) and *Annie Hall* (1978) that influenced the way millions dressed. Modestly describing his work, Lauren stated, "I believe in clothes that last, that are not dated in a season. The people who wear my clothes don't think of them as fashion.' Lauren's vision was to represent American style with a dash of British elegance and the comfort of natural fibers.

Lauren lived the image he projected, and he was often featured with his family in magazines devoted to lives of the rich and famous. He was also the first designer to appear in his own advertising. One of the secrets of Lauren's success lay in his attention to detail, always checking product quality and maintaining tight control over the brand image he crafted so carefully. Lauren's fashion formula earned many honors from his peers. He had seven Coty design awards and was

inducted into the Coty Hall of Fame in 1986. In 1992 he received the Lifetime Achievement Award from the Council of American Fashion Designers and a tribute for twenty-five years of impact on American style from the Woolmark Awards. The Council of Fashion Designers later elected him Designer of the Year in 1996.

Smart businessman

In 1971 Lauren opened his first retail store in Beverly Hills, California, building toward a total of 116 Polo-Ralph Lauren stores in the United States as well as 1,300 boutiques (small shops within department stores). In 1986 he made fashion retailing history with a large megastore housed in the elegant former Rhinelander Mansion in New York. John Fairchild, chairman of *Women's Wear Daily*, called it "The best boutique in America, probably the world." Consumers responded, spending over \$5 billion a year by 1997 to have the Lauren look and making him the best-selling designer in the world.

Two major new ventures begun in 1995 took Lauren into the highly competitive blue jean and mass-market women's clothing categories. Both took the Lauren name to a new customer at lower prices and were instant hits. In 1996 Lauren's Home Collection contributed about \$535 million in sales worldwide—more than any other designer. Paints were launched the same year, along with instruction videos and all the tools needed to create the living environment of one's choice. By 1997 investment bankers were fighting for the opportunity to help Lauren put his company on the stock market.

In 1998 Lauren announced that his company would donate \$13 million to the Smithsonian Institution in Washington, D.C., mainly to preserve the original American flag that inspired the writing of "The Star-Spangled Banner" in 1812. That same year he was honored for his efforts to raise money for research into a cure for breast cancer. In 2000 the company's Web site, Polo.com, was introduced, allowing online access to all Ralph Lauren products. Lauren's charitable contributions continued with the creation of the Polo Volunteer Program and the contribution of \$5 million to establish the Ralph Lauren Center for Cancer Prevention and Care at North General Hospital in Harlem, New York.

EMMA LAZARUS

Born: July 22, 1849

New York, New York

Died: November 19, 1887

New York, New York

American poet

Emma Lazarus.

Courtesy of the Library of Congress.

Emma Lazarus, an American poet, is best known as a spokesperson for the Jewish people. Her faith in America as a safe place for all the suffering people of the world is expressed in her poem inscribed on the Statue of Liberty in New York, New York.

Early life and writings

Emma Lazarus was born in New York City on July 22, 1849. She was the daughter of Moses and Esther Nathan Lazarus. Her father was a wealthy sugar merchant. Emma and her sisters were educated by private tutors and spent their summers at the

seashore in Rhode Island. Emma read many of the books in her father's library and quickly learned other languages, including Italian, French, and German. At the age of eleven she began writing poems with traditional romantic themes and translating the works of German and French poets.

When Emma was seventeen her father paid to have her first collection of poems printed. *Poems and Translations* (public edition 1867) was followed by *Admetus and Other Poems* (1871). These poems so pleased the writer Ralph Waldo Emerson (1803–1882) that he invited Lazarus to visit him, beginning a correspondence that lasted throughout her life. Lazarus also received support and advice from other male writers throughout her life, including the novelist Henry James (1843–1916).

Lazarus's work began appearing regularly in *Lippincott's Magazine* and *Scribner's Monthly*. In 1874 she published her first prose (a style of writing closer to normal speech than poetry), *Alide: An Episode of Goethe's Life*. Her five-act drama, *The Spagnoletto* (1876), which focuses on Italy in 1655, was not as well received as her poetry. Her translation of the German poet Heinrich Heine's (1797–1856) *Poems and Ballads* (1881) was considered the best version of Heine in English at the time.

Supporter of Jewish people

The turning point in Lazarus's life was the outbreak of violent anti-Semitism (hatred of Jewish people) in Russia and Germany during the early 1880s. When a writer defended these activities in the *Century Magazine*, Lazarus wrote the angry reply "Russian Christianity versus Modern Judaism" in the next

issue. From this moment on she began a private crusade for her people. Her verse took on a new tone of urgency, a call for Zionism (the movement for the creation of an independent Jewish state), particularly in *Songs of a Semite* (1882) and in her play of twelfth-century Jewish life, *The Dance to Death*. More importantly, she began to organize relief efforts for the thousands of Jewish immigrants crowding into the United States and to write a series of articles for the magazine *American Hebrew*.

Later years

In 1883 Lazarus sailed for England, where she was received with great enthusiasm for her work on behalf of Jewish immigrants. She made so many friends among the Zionists that she returned in 1885, spending the next two years traveling in England, France, and Italy. Cancer cut her career short. She returned to New York City shortly before her death from cancer on November 19, 1887. Lazarus's poem "The New Colossus" was engraved on the base of the Statue of Liberty in New York harbor before its dedication in 1886. The poem was a fitting tribute to her faith in American ideals.

MARY LEAKEY

Born: February 6, 1913

London, England

Died: December 9, 1996

Nairobi, Kenya

English archaeologist

Mary Leakey was a major figure in the uncovering of East African prehistory, best known for her excavations (digging for fossils) of some of the earliest members of the human family, their footprints, and their artifacts (any tools, weapons, or other items made by humans).

Early life

Mary Douglas Leakey was born Mary Douglas Nicol in London, England, on February 6, 1913. She was the only child of Erskine Nicol, a landscape painter, and Cecilia Frere Nicol. Much of her childhood was spent traveling abroad with her parents, except during World War I (1914–18; a war that involved many countries in the world including France, Great Britain, Russia, the United States, and their allies fighting against Austria-Hungary, Germany, and their allies) when her family spent the time in England. At the house of her mother's aunts and grandmother in London she was first introduced to dogs, marking the beginning of her strong affection for animals, an important part of her life. After the war, Mary's family resumed its annual cycle of European travel, followed by a return to London in summer to sell the paintings that her father produced on their travels.

Mary Leakey.

Reproduced by permission of AP/Wide World Photos.

Education and early career

Mary's early education was largely informal, although she did attend school in France for a short time. Her father taught her to read and some mathematics, and he also inspired her interest in the natural world and in archaeology (the study of ancient human life based on the things that were left behind). While living in the Dordogne region in France, near many prehistoric caves, Mary was exposed to Paleolithic (over 2.5 million years ago; the first period of the Stone Age, a time when stone tools were used by humans) archaeology which, combined with her artistic talents, formed the basis of her career. Her father died

in France in 1926. Mary and her mother returned to England, where she unhappily attended several convent schools in Kensington and Wimbledon. Mary was an independent person and was expelled twice from school for her spirited behavior.

Between 1930 and 1934 Mary took part in excavations at Hembury, Devon, and attended lectures in geology (the branch of science involving the study of the Earth) and archaeology at London University and the London Museum. She also began drawing stone tools for publication. She was introduced to Louis Leakey (1903–1972) as a possible artist for his book *Adam's Ancestors* and was hired. They were married in 1936 and had three children, Jonathan, Richard, and Philip.

Archaeological discoveries in Kenya

Mary moved to Kenya with Louis and worked with him in East Africa for much of her career. She introduced modern archaeological techniques to East Africa. Her initial East African excavations were the Late Stone Age sites at Hyrax Hill and Njoro River Cave, and she was the first person to describe the important dimple-based pottery from East Africa. She also worked at a number of other sites, including Olorgesailie, which was famous for its great number of middle Pleistocene (commonly known as the Ice Age) hand axes. She also worked with Louis on several East African ape sites, and she was instrumental in the recovery of many fossil ape remains. In 1951 Leakey studied and recorded the beautiful Late Pleistocene Tanzanian rock paintings that years later formed the basis of her book *Africa's Vanishing Art*. Although she is best known for her association with human fossil sites, she considered

her work on the rock paintings one of the highlights of her career.

In spite of Mary Leakey's primary interest in art and artifacts, Mary Leakey was best known for her amazing ability to find fossils and for her excavations at two of the most famous hominid (dealing with any of the primate families) fossil sites in East Africa—Olduvai Gorge and Laetoli, both in Tanzania. Beginning in 1960 she established a permanent base camp at Olduvai Gorge from which she directed excavations. The previous year Leakey had discovered the first hominid example from that site, “Zinjanthropus boisei,” whom she and Louis nicknamed the “nutcracker man” because of its huge jaws and molar teeth. “Zinj” is now recognized as the type specimen of *Australopithecus boisei*, an extinct (no longer in existence) side branch of the genus *Homo*. She soon found another hominid more closely related to modern humans, *Homo habilis* or “Handy Man,” providing evidence of coexisting hominid groups one to two million years ago in East Africa. Leakey's research at Olduvai lasted more than twenty years and in spite of many fossil finds focused mainly on the specific descriptions of the archaeology. She initially detailed the archaeology of Beds 1 and 2 and later, more recent levels, contributing greatly to the understanding of Pliocene-Pleistocene (an ancient time period) lifeways.

In 1974 Leakey began well-organized excavations at Laetoli, which produced australopithecine (relating to an extinct form of hominid) skeletal remains the same year. Two years later the first of several sets of bipedal (having two feet) hominid footprints were discovered at the site, proving skeletal evidence for bipedalism (the walking on two

feet) at a very early date. The footprints were made as australopithecines walked, in at least one case together, through an ash fall from a nearby volcano. These finds caught the attention of the world, as they “humanized” the discoveries of our distant relatives. Like many East African early hominid sites, Laetoli was well dated and provided evidence that full bipedal movement, a major human milestone, was achieved by 3.75 million years. While she never accepted the contribution of the Laetoli hominids to *Australopithecus afarensis*, she recognized them as the earliest definite hominid sample known at the time. Laetoli produced a number of skeletal elements of *Pliocene australopithecines*, but ironically, given Leakey's primary interest, no stone artifacts were ever found in these early beds.

Later life

Mary Leakey, in addition to her research, found herself assuming many of Louis's more public roles after she was widowed in 1972. She spent considerable time traveling to give lectures, raise funds, and receive many honors from institutions around the world. Although she always considered herself primarily an archaeologist, and her professional life was of greatest importance to her, she remained involved with her family and was very close to her children and grandchildren. In 1983 she retired to Nairobi, Kenya, to be nearer to her family. There, she continued to work on her manuscripts until her death in December of 1996.

BRUCE LEE

Born: November 27, 1940

San Francisco, California

Died: July 20, 1973

Hong Kong

American actor and martial arts master

Actor and martial arts expert Bruce Lee combined the Chinese fighting art of kung fu with the grace of a ballet dancer. He helped make kung fu films a new art form before his sudden and mysterious death in 1973.

The “strong one”

In 1939 Lee Hoi Chuen, a Chinese opera singer, brought his wife Grace and three children from Hong Kong to San Francisco, California, while he performed in the United States. On November 27, 1940, the Lees had another son. His mother called the boy Bruce because the name meant “strong one” in Gaelic. His first film appearance, at the age of three months, was in *Golden Gate Girl* (1941). Although Hong Kong was occupied

by Japanese troops, the Lees then decided to return home, where Lee’s film appearances continued, numbering around twenty by the time he graduated from high school.

As a teenager Lee was both a dancer, winning a cha-cha championship, and a gang member, risking death on the Hong Kong streets. To improve his fighting skills, he studied the Chinese martial arts of kung fu. He absorbed the style called wing chun, which was developed by a woman named Yim Wing Chun, and he began adding his own improvements. Lee’s film career continued, and he was offered a large contract. But when he got into trouble with the police for fighting, his mother sent him to the United States to live with friends of the family.

Teacher and actor

After finishing high school in Edison, Washington, Lee enrolled at the University of Washington, supporting himself by giving dance lessons and waiting tables. While teaching kung fu to fellow students, he met Linda Emery, whom he married in 1964. Lee developed a new fighting style called jeet kune do and opened three schools on the West Coast to teach it. He also landed a part in the television series *The Green Hornet* as Kato, the Hornet’s assistant. Kato used a dramatic fighting style quite unlike that which Lee taught in his schools. The show was cancelled after one season, but fans would long remember Lee’s role.

Lee went on to appear on shows such as *Longstreet* and *Ironside* and in the film *Marlowe* (1969), playing a high-kicking villain. Unhappy with the number and quality of roles available to Asian Americans in Hollywood, Lee and his family, including son Brandon and daughter Shannon, moved back to Hong Kong

in 1971. Lee soon released the movie known to U.S. audiences as *Fists of Fury*. The story, featuring Lee as a fighter seeking revenge on those who had killed his kung fu master, was not very original, but with his graceful movements, his good looks and charm, and his acting ability, Lee was a star in the making.

Sudden death

Fists of Fury set box-office records in Hong Kong that were broken only by Lee's next film, *The Chinese Connection* (1972). Lee established his own film company, Concord Pictures, and began directing movies. The first of these would appear in the United States as *Way of the Dragon*. Lee was excited about his future. He told a journalist, "I hope to make . . . the kind of movie where you can just watch the surface story, if you like, or can look deeper into it." Unfortunately, on July 20, 1973, three weeks before his fourth film, *Enter the Dragon*, was released in the United States, Lee died suddenly.

The official cause of Lee's death was brain swelling as a reaction to aspirin he had taken for a back injury. But there were rumors that he had been poisoned by either the Chinese mafia or powerful members of the Hong Kong film industry. Others said that Lee's purchase of a house in Hong Kong had angered neighborhood demons, who then placed a curse on him to last for three generations. This theory was revived on June 18, 1993, when Lee's son Brandon also died under strange circumstances. While filming the movie *The Crow*, he was shot by a gun that was supposed to contain only blanks (which produce the appearance of a gunshot but cause no bullet to be fired) but in fact had a live round in its chamber.

Bruce Lee.

Reproduced by permission of Archive Photos, Inc.

Bruce Lee's movies, though few in number, created a new art form. By the 1990s *Enter the Dragon* alone had earned more than \$100 million, and Lee's influence could be found in the work of many Hollywood action heroes such as Jean-Claude Van Damme, Steven Seagal, and Jackie Chan. In 1993 Jason Scott Lee (no relation) appeared in *Dragon: The Bruce Lee Story*.

SPIKE LEE

Born: March 20, 1957

Atlanta, Georgia

*African American filmmaker, actor,
and author/poet*

Controversial (arousing opposing viewpoints) filmmaker Spike Lee is known for powerful films such as *She's Gotta Have It* (1986), *School Daze* (1988), *Do the Right Thing* (1989), *Mo' Better Blues* (1990), *Malcolm X* (1992), and many others.

Lee's youth

Shelton Jackson Lee was born in Atlanta, Georgia, on March 20, 1957. He grew up in Brooklyn, New York. Lee's awareness of his African American identity was established at an early age. His mother, Jacquelyn, encouraged her children's enthusiasm for African American art and literature. She took her

children to galleries, plays, and museums. Her position as a teacher at a private school was often the only income the family had. His father, Bill, was an accomplished jazz musician. Spike would sometimes go with his father to the clubs where he played.

By the time Lee was old enough to attend school, the already independent child had earned the nickname his mother had given him as an infant, Spike—an indirect reference to his toughness. When he, his two younger brothers, and one younger sister were offered the option of attending the chiefly white private school where his mother taught, Lee chose instead to go to public school, where he would be assured the companionship of black peers. He graduated from John Dewey High School in Brooklyn. For college, Lee chose to go to the all-black college his father and grandfather had attended, Morehouse College, where he majored in mass communication.

Pursued film career

It was at Morehouse that Lee found his calling. Following his mother's unexpected death in 1977, Lee's friends tried to cheer him with frequent trips to the movies. He quickly became a fan of directors and movies of that time and discovered that he wanted to make films that would capture the black experience, and he was willing to do so by whatever means necessary.

Lee pursued his passion at New York University (NYU), where he enrolled in the Tisch School of Arts graduate film program. He was one of only a handful of African American students. Lee went on to produce a forty-five-minute film that won him the 1983 Motion Picture Arts and Sciences' Student

Academy Award, *Joe's Bed-Stuy Barbershop: We Cut Heads*. Although the honor improved his credibility as a director, it did not pay the bills. Lee worked for a movie distribution house cleaning and shipping film.

Scored a surprise hit with *She's Gotta Have It*

When Lee filmed *She's Gotta Have It* a year later, his determination to be a director paid off. After Island Pictures agreed to distribute the movie, it finally opened in 1986. A light comedy, *She's Gotta Have It* pokes fun at gender relations and offers an insightful spin on stereotypical macho male roles. It packed houses with African American audiences and with a crossover, art-house crowd. With the success of *She's Gotta Have It*, Lee became known in cinematic circles not only as a director, but also as a comic actor. He played a supporting role in the film and was tremendously popular as this character.

School Daze: a microcosm of black life

Lee next made a musical called *School Daze*. A film about color discrimination (treating people differently based on race, gender, or nationality) within the African American community, *School Daze* draws on Lee's years at Morehouse. He saw the lighter skinned African Americans as having the material possessions and polish that the southern, rural students did not have. This black caste (division of society) system, Lee explained to *Newsweek*, was not limited to just this collegiate set. Lee used it as a small sample of black life in general. *School Daze* created a commotion in the black community: while many applauded Lee's efforts to explore a complex social problem, others were offended by his

Spike Lee.

Reproduced by permission of AP/Wide World Photos.

willingness to “air dirty laundry.” Everyone agreed that the film was controversial.

Explored racial tensions in *Do the Right Thing*

Do the Right Thing, released in 1989, confirmed Lee's reputation as someone willing to seize controversial issues by the horns. A story of simmering racial tension between Italian Americans and African Americans in the Bedford-Stuyvesant section of Brooklyn, the film becomes a call to arms when violence erupts in response to the killing of an African American man by white police officers. Critical response to the film was both enthusiastic and wary.

Striking a balance: Mo' Better Blues

Lee chose a lighter topic for his next film—a romance. The saga is about a self-centered jazz trumpeter, Bleek Gilliam, whose personal life plays second fiddle to his music. The movie explores the different relationships this man has with friends, family, and women. Bleek's character was inspired by Lee's jazz-musician father, Bill Lee, who wrote the film's score. Although recognized for its technical mastery and snappy score, *Mo' Better Blues* received unenthusiastic reviews.

In *Jungle Fever*, Lee's next film, he looks at issues of race, class, and gender by focusing on community response to the office affair of a married, black architect and his Italian American secretary. Lee concludes that interracial relationships are often fueled by culturally based, stereotypical expectations.

Malcolm X

Sparking controversy from the beginning, the making of *Malcolm X* (1925–1965) became a personal mission for Lee, who had long been an admirer of the legendary African American leader. The film traces Malcolm X's development from his poor, rural roots to his final years as an activist. Lee worked hard to overcome many obstacles that threatened the creation of his masterpiece. His creative problem solving and dedication to the film were the forces behind its completion.

Although *Malcolm X* received no Oscars, the film played a significant role in the elevation of the black leader to legendary status; it also spawned a cultural phenomenon often referred to as "Malcolm-mania." Promotional merchandise for the film was marketed by Lee himself through Spike's Joint, a chain of

stores that comprise a portion of the director's growing business empire.

Lee is married

In mid-1993 Lee began shooting his seventh feature film, *Crooklyn*, a comic tribute to his childhood memories of life in Brooklyn in the 1970s. He managed to take a break from filming, however, to marry Linette Lewis. Lewis, a lawyer, had been romantically linked to Lee for a year prior to their wedding. *Crooklyn* was released in 1994 to mixed reviews and a mild reception at the box office.

Lee fared far better in 1995 with his next film, *Clockers*. It tells the story of two brothers who fall under suspicion of murder. One, a drug dealer, had been ordered by his supplier to kill the victim. The other, an upstanding family man, confesses to the crime, saying that he was attacked in the parking lot. The film won outstanding reviews, with some critics citing it as Lee's best work.

In 1996 Lee released *Get on the Bus*, which focuses on a diverse group of African American men riding a bus on their way to the Million Man March (a rally organized in 1995 to celebrate the strength of the African American community) in Washington, D.C. They learn to overcome their differences as they unite for the march. Lee followed that film with *4 Little Girls*, a documentary about the bombing of a Birmingham, Alabama, church in 1963, where four African American girls lost their lives.

Lee as a teacher

Lee works as an educator as well. He has taught at New York University and also at Harvard. In March of 2002 Lee became the

artistic director of NYU's Kanbar Institute of Film and Television. He works with students on their thesis projects and helps them to make contacts in the entertainment field. Lee enjoys working with the students and challenges them to work hard.

"Fight the power," the theme song to his 1989 film *Do the Right Thing*, could easily be Spike Lee's personal motto. From his earliest days as a student filmmaker to his \$33-million epic *Malcolm X*, Lee has shown a willingness to tackle prickly issues of significance to the African American community—and has enjoyed the controversy his films produce.

TSUNG-DAO LEE

Born: November 24, 1926

Shanghai, China

Chinese-born American physicist

Chinese-born physicist (specialist in the relationship between matter and energy) Tsung-Dao Lee was a co-winner of the 1957 Nobel Prize in physics. Lee and his colleague physicist Chen Ning Yang (1922–) developed a theory about behavior of the K-meson (a particle that is smaller than an atom), which resulted in major changes in the science of particle physics.

Early life

Tsung-Dao Lee was born in Shanghai, China, on November 24, 1926. He was the third child of businessman Tsing-Kong Lee and his wife Ming-Chang Chang. Lee attended the Kiangsi Middle School in Kanchow, China. After graduation he entered the National Chekian University in Kweichow, China. When Japanese troops invaded the area in 1945, Lee fled to the south, where he continued his studies at the National Southwest Associated University in Kunming, China.

Leaves for the United States

In 1946 Lee was presented with an unusual opportunity. When one of his teachers at Kunming, a physicist named Ta-You Wu, decided to return to the United States (where he had worked toward his doctorate degree), he invited Lee to accompany him. Lee accepted the offer but found himself in a somewhat peculiar position. He had only completed two years of college and found that only one American university, the University of Chicago, would accept him for graduate study without a degree. He decided to enroll there. Lee married Hui-Chung Chin (also known as Jeanette) in 1950, while they were both students at Chicago. The couple eventually had two sons.

LEE, TSUNG-DAO

Tsung-Dao Lee.

Courtesy of the Library of Congress.

In Chicago, after working under physicist Enrico Fermi (1901–1954), Lee was awarded his doctorate in 1950 for his study of the amount of hydrogen in white dwarf stars (stars of low brightness with a mass similar to that of the sun). Lee also renewed his friendship with physicist Chen Ning Yang, whom he had known in Kunming. The two began working together. In 1950 Lee went to the Yerkes Astronomical Observatory at Lake Geneva, Wisconsin, and Yang went to the Institute for Advanced Studies at Princeton University in Princeton, New Jersey. Lee then spent the next year as a research assistant at the University of California at Berkeley before

accepting an appointment at Princeton in 1951, again reuniting with Yang.

Revolutionary theory

Even after Lee left Princeton in 1953 for a post as assistant professor of physics at Columbia University, he continued to work with Yang. The two worked out a schedule that allowed them to continue meeting once a week, either in New York City or in Princeton. These meetings had begun to focus on a subatomic (smaller than an atom) particle known as the K-meson. Discovered only a few years earlier, the K-meson puzzled physicists, because it appeared to be a single particle that decayed in two different ways. The decay patterns were so different that physicists had become convinced that two different forms of the K-meson existed, forms they called the tau-meson and theta-meson.

The single difference between these two particles was that one form was conserving parity and the other form was not. Following a concept long held by physicists, if the properties of a particle and its mirror image are the same, it is said to be “conserving parity.” The problem that Lee and Yang attacked was that all other evidence suggested that the theta- and tau-mesons were one and the same particle. During a three-week period of work in 1956, Lee and Yang solved the puzzle by suggesting that, in some types of reactions, parity is not conserved. The decay of the (one and only) K-meson was such a reaction. They then created a series of experiments by which their theory could be tested.

The basic elements in the Lee-Yang theory were announced in a paper sent to the *Physical Review* in June 1956. Six months later another physicist, Chien-Shiung Wu, carried

out their suggested experiments, first at Columbia and then at the National Bureau of Standards. The Lee-Yang prediction was found to be correct in every respect. Less than a year later, the two friends were awarded the 1957 Nobel Prize in physics for their work.

Career after the Nobel Prize

After a promotion to professor (1956) at Columbia, Lee returned to the Institute for Advanced Studies in 1960. He then was appointed Enrico Fermi Professor of Physics at Columbia in 1963. In 1984 he was made University Professor at Columbia. In 1980 Lee created a program to give talented Chinese physics students the opportunity to earn graduate degrees in American schools, as he had. In 1989 he helped create the China Center of Advanced Science and Technology World Laboratory, and he continues to travel to China every year to encourage scientists there. In 1994 Lee became a member of the Chinese Academy of Sciences. In 2000 the *World Journal* (a Chinese newspaper in North America) included Lee in its list of the “Most Notable 100 North American Chinese of the Century.” The Nobel Prize winner continues to work as a professor at Columbia and is involved in a variety of physics research projects.

VLADIMIR LENIN

Born: April 10, 1870

Ulianovsk, Russia

Died: January 21, 1924

Moscow, Russia

Russian statesman

The Russian statesman Vladimir Lenin was a profoundly influential figure in world history. As the founder of the Bolshevik political party, he was a successful revolutionary leader who presided over Russia's transformation from a country ruled by czars (emperors) to the Union of Soviet Socialist Republics (U.S.S.R.), the name of the communist Russian state from 1922 to 1991.

Early years

Vladimir Ilich Lenin was born in Simbirsk (today Ulianovsk), Russia, on April 10, 1870. His real family name was Ulianov, and his father, Iliia Nikolaevich Ulianov, was a high official in the area's educational system. Because Lenin's father had risen into the ranks of the Russian nobility, Lenin grew up in fairly privileged circumstances. Although he would fight as an adult for a revolution by the working lower classes, he did not come from such a hard-working background himself.

Lenin received the typical education given to the sons of the Russian upper class. Nevertheless, as a young man he began to develop radical (extreme) political views in disagreement with the existing Russian form of government. Russia at this time was ruled by emperors known as czars who inherited their positions, and Lenin's shift to radical

views was probably fueled by the execution by hanging of his older brother Alexander in 1887 after Alexander and others had plotted to kill the czar. Lenin graduated from secondary school with high honors and enrolled at Kazan University, but he was expelled after participating in a demonstration. He retired to the family estate but was permitted to continue his studies away from the university. He obtained a law degree in 1891.

In 1893 Lenin moved to St. Petersburg, Russia. By this time he was already a Marxist—an admirer of the German writer Karl Marx (1818–1883). Marx (and his associate Friedrich Engels [1820–1895]) had believed in an international revolution (overthrow of the government) of the poor and lower-class workers (called the proletariat) who would lead the way to a new system of power. Under this new system, Marx argued, property would be owned communally (as a group) and work would be distributed equally. By 1893 Lenin had also become a revolutionary by profession. He wrote controversial papers and articles and tried to organize workers. The St. Petersburg Union for the Struggle for the Liberation of Labor, which Lenin helped create, was one of the seeds that started the Russian Marxist movement.

In 1897 Lenin was arrested, spent some months in jail, and was finally sentenced to three years of exile (forced absence from one's native country or region) in the remote area of Siberia. He was joined there by a fellow Marxist, Nadezhda Konstantinovna Krupskaya (1869–1939), whom he married in 1898. During his Siberian exile he produced a major study of the Russian economy, *The Development of Capitalism in Russia*.

Emigration to Europe

Not long after Lenin was released from Siberia in the summer of 1900, he moved to Europe. He spent most of the next seventeen years there, moving from one country to another frequently. His first step was to join the editorial board of *Iskra* (The Spark), the central newspaper of Russian Marxism at the time. After parting from *Iskra*, he edited a series of papers of his own and contributed to other journals promoting socialism (a version of Marxism). His journalistic activity was closely linked with efforts to organize revolutionary groups, partly because the illegal organizational network within Russia was partly based on the distribution of illegal literature.

Organizational activity, in turn, was linked with the selection and training of people who would work for the cause. For some time Lenin conducted a training school for Russian revolutionaries at Longjumeau, a suburb of Paris, France. Finding funds for the movement and its leaders' activities in Europe was also a problem. Lenin could usually depend on financial support from his mother for personal use, but she could not pay for his political activities.

Lenin's ideas

A Marxist movement had developed in Russia during the last decade of the nineteenth century. It was a response to the rapid growth of industry, cities, and the proletariat (a group of lower-class workers, especially in industry). Its first intellectual spokesmen were people who had turned away from relying on the peasants (rural poor people) of the Russian villages and countryside, and they placed their hopes on the proletariat.

They aimed for a revolution that would transform Russia into a democratic republic. Lenin's writings and work focused on the role of the proletariat as promoters of this revolution. However, he also stressed the role of intellectuals (people engaged in thinking) who would provide the movement with the theories that would guide the revolution's progress.

Lenin expressed these ideas in his important book *What's to Be Done?* in 1902. When the leaders of Russian Marxism gathered for the first important party meeting in 1903, these ideas clashed with the idea of a looser, more democratic workers' party that was promoted by Lenin's old friend Iuli Martov (1873–1923). This disagreement over the nature and organization of the party was complicated by many other conflicts, and from its first important gathering Russian Marxism split into two factions (opposing groups). The one led by Lenin called itself the majority faction (bolsheviki, or the Bolsheviks), while the other took the name of minority faction (mensheviki, or the Mensheviks). The Bolsheviks and Mensheviks disagreed not only over how to organize the movement but also over most other political problems.

In 1905 an uprising now known as the Revolution of 1905 occurred in Russia. Widespread revolt against the Russian czar's government spread throughout the country, but was eventually put to an end by the government. This revolt among the Russian people surprised all Russian revolutionary leaders, including the Bolsheviks. Lenin managed to return to Russia only in November, when the defeat of the revolution was practically certain. But he was among the last to give up.

Vladimir Lenin.

For many more months he urged his followers to renew their revolutionary enthusiasm and activities and to prepare for an armed uprising.

Bolshevism and Marxism

Over the next twelve years bolshevism, which had begun as a faction within the Russian Social-Democratic Workers party, gradually emerged as an independent party that had cut its ties with all other Russian Marxists. The process involved long and bitter arguments against Mensheviks as well as against all those who worked to reunite the factions. It involved fights over funds,

struggles for control of newspapers, the development of rival organizations, and meetings of rival groups. Disputes concerned many questions about the goals and strategies of Marxism and the role of national (rather than international) struggles within Marxism.

Since about 1905 the international socialist movement had begun also to discuss the possibility of a major war breaking out among European nations. In 1907 and 1912, members met and condemned such wars in advance, pledging not to support them. Lenin had wanted to go further than that. He had urged active opposition to the war effort and a transformation of any war into a proletarian revolution. When World War I (1914–1918; a conflict involving most European nations, as well as Russia, the United States, and Japan) broke out, most socialist leaders in the countries involved supported the war effort. For Lenin, this was proof that he and the other leaders shared no common aims or views. The break between the two schools of Marxism could not be fixed.

During World War I (1914–18) Lenin lived in Switzerland. He attended several conferences of radical socialists opposed to the war. He read a large amount of literature on the Marxist idea of state government and wrote a first draft for a book on the subject, *The State and Revolution*. He also studied literature dealing with world politics of the time and wrote an important book, *Imperialism: The Highest Stage of Capitalism*, in 1916. By the beginning of 1917 he had fits of depression and wrote to a close friend that he thought he would never see another revolution. This was about a month before the over-

throw of the Russian czar in the winter of 1917, which marked the beginning of the 1917 Russian Revolution.

Lenin in 1917

It took a good deal of negotiation and courage for Lenin and a group of like-minded Russian revolutionaries to travel from Switzerland back to Russia through the enemy country of Germany. The man who returned to Russia in the spring of 1917 was of medium height, quite bald, except for the back of his head, with a reddish beard. The features of his face were striking—slanted eyes that looked piercingly at others, and high cheek-bones under a towering forehead. The rest of his appearance was deceptively ordinary.

Fluent in many languages, Lenin spoke Russian with a slight speech defect but was a powerful public speaker in small groups as well as before large audiences. A tireless worker, he made others work tirelessly. He tried to push those who worked with him to devote every ounce of their energy to the revolutionary task at hand. He was impatient with any other activities, including small talk and discussions of political theories. Indeed, he was suspicious of intellectuals and felt most at home in the company of simple folk. Having been brought up in the tradition of the Russian nobility, Lenin loved hunting, hiking, horseback riding, boating, mushroom hunting, and the outdoor life in general.

Once he had returned to Russia, Lenin worked constantly to use the revolutionary situation that had been created by the fall of the czar and convert it into a proletarian revolution that would bring his own party into power. As a result of his activities, opinions in Russia quickly became more and more

sharply at odds. Moderate forces found themselves less and less able to maintain any control. In the end, by October 1917 power fell into the hands of the Bolsheviks. As a result of the so-called October Revolution, Lenin found himself not only the leader of his party but also the chairman of the Council of People's Commissars (equivalent to prime minister) of the newly proclaimed Russian Socialist Federative Soviet Republic (the basis for the future Union of Soviet Socialist Republics).

Ruler of Russia

During the next few years Lenin was essentially dictator (a ruler with unquestionable authority) of Russia. The major task he faced was establishing this authority for himself and his party in the country. Most of his policies can be understood in this light, even though he angered some elements in the population while satisfying others. Examples of such policies include the government's seizing of land from its owners and redistributing it to the peasants, forming a peace treaty with Germany, and the nationalization (putting under central governmental control) of banks and industry.

From 1918 to 1921 a fierce civil war raged, which the Bolsheviks finally won against seemingly overwhelming odds. During the civil war Lenin tightened his party's dictatorship and eventually eliminated all rival political parties. Lenin had to create an entirely new political system with the help of inexperienced people. He was also heading a failing economy and had to create desperate means for putting people to work. He also created the Third (Communist) International, an association of parties that promoted the spread of the revolution to other

countries and that enforced the Soviet system as a model for this movement. Meanwhile he had to cope with conflict and criticism from his own party colleagues.

When the civil war had been won and the regime firmly established, the economy was ruined, and much of the population was bitterly opposed to the regime. At this point Lenin reversed many of his policies and instituted a reform called the New Economic Policy. It was a temporary retreat from the goal of establishing socialism at once. Instead, the stress of the party's policies would be on economic rebuilding and on the education of a peasant population for life in the twentieth century. In the long run, Lenin hoped both these policies would make the benefits of socialism obvious to all, so the country would gradually grow into socialism.

On May 26, 1922, Lenin suffered a serious stroke (a loss of consciousness due to the rupture or blockage of an artery in the brain). After recovering from this first stroke, he suffered a second on December 16. He was so seriously ill that he could participate in political matters only occasionally. He moved to a country home at Gorki, Russia, near Moscow, where he died on January 21, 1924.

LEONARDO DA VINCI

Born: April 15, 1452

Vinci, Italy

Died: May 2, 1519

Amboise, France

Italian artist, painter, sculptor, architect, engineer, and scientist

Leonardo da Vinci was an Italian painter, sculptor, architect, engineer, and scientist. He was one of the greatest minds of the Italian Renaissance, and his influence on painting was enormous to the following generations.

Early years

Leonardo da Vinci was born on April 15, 1452, near the village of Vinci about 25 miles west of Florence. He was the illegitimate (born to unmarried parents) son of Ser Piero da Vinci, a prominent notary (a public official who certifies legal documents) of Florence, and a local woman, Caterina. Not much is known about Leonardo's childhood except that when he was fifteen, his father apprenticed him to Andrea del Verrocchio (1435–1488), the leading artist of Florence and the early Renaissance.

Verrocchio, a sculptor, painter, and goldsmith, was a remarkable craftsman. He had great concern for the quality of execution in expressing the vitality of the human figure. These elements were important in the formation of Leonardo's artistic style. It should be noted that much in Leonardo's approach to art originated from using tradition, rather than rebelling against it.

Assistant in Verrocchio's workshop

Leonardo, after completing his apprenticeship, stayed on as an assistant in Verrocchio's shop. His earliest known painting is in Verrocchio's *Baptism of Christ* (c. 1475). Leonardo executed one of the two angels as well as the distant landscape, and he added the final touches to the figure of Christ, determining the texture of the flesh.

Collaboration on a major project by a master and his assistant was standard procedure in the Italian Renaissance. What is special is that Leonardo's work is not a slightly less skilled version of Verrocchio's manner of painting, but an original approach which changed the surface effects from hard to soft, making the edges less cutting, and increasing the slight changes of light and shade.

Independent master in Florence

About 1478 Leonardo set up his own studio. In 1481 he received a major church commission for an altarpiece, the *Adoration of the Magi*. In this unfinished painting, Leonardo's new approach is far more developed. A crowd of spectators, with varied faces, looks at the main group of the Virgin and Child. There is a strong sense of continuing movement. Leonardo placed the Virgin and Child in the center. Traditionally in paintings of this theme they had appeared at one side of the picture, approached by the kings from the other side.

Earlier Renaissance artists had applied the rules of linear perspective, by which objects appear smaller in proportion as they are farther away from the eye of the spectator. Leonardo joined this principle to two others: perspective of clarity (distant objects are less distinct) and

perspective of color (distant objects are more muted in color). He wrote about both of these principles in his notebooks.

The *Magi* altarpiece was left unfinished because Leonardo left Florence in 1482 to accept the post of court artist to the Duke of Milan. In leaving, Leonardo followed a trend set by masters of the older generation who went to Venice and Rome to execute commissions larger than any available in their native Florence.

Milan (1482–1499)

Leonardo presented himself to the Duke of Milan as skilled in many crafts, but particularly in military engineering. He also produced remarkable machinery for stage set-ups. Both activities point to his intense interest in the laws of motion and propulsion (the movement or push forward), a further aspect of his interest in things and their workings.

Leonardo's first Milanese painting is the altarpiece *Virgin of the Rocks*. It makes use of a respected tradition in which the Holy Family is shown in a cave. This setting becomes a vehicle for Leonardo's interests in representing nature in dimmed light, which blends together the outlines of separate objects. He once commented that artists should practice drawing at dusk in courtyards with walls painted black.

The other surviving painting of Leonardo's Milanese years is the *Last Supper* (1495–1497). Instead of using fresco (painting on fresh plaster with special water color paints), the traditional medium for this theme, Leonardo experimented with an oil-based medium, because painting in true fresco makes areas of color appear quite distinct. Unfortunately, his experiment was

Leonardo da Vinci.

unsuccessful. The paint did not stick well to the wall, and within fifty years the scene was reduced to a confused series of spots. What exists today is largely a later reconstruction.

When the Duke of Milan was overthrown by the French invasion in 1499, Leonardo left Milan. He visited Venice briefly, where the Senate consulted him on military projects, and traveled to Mantua.

Florence (1500–1506)

In 1500 Leonardo returned to Florence, where he was received as a great man. Florentine painters of the generation immediately following Leonardo were excited by his

modern methods, with which they were familiar through the unfinished *Adoration of the Magi*. Leonardo had a powerful effect on the younger group of artists.

Leonardo even served a term as military engineer for Cesare Borgia in 1502, and he completed more projects during his time in Florence than in any other period of his life. In his works of these years, the concentration is mostly on portraying human vitality, as in the *Mona Lisa*. It is a portrait of a Florentine citizen's young third wife, whose smile is called mysterious because it is in the process of either appearing or disappearing.

Leonardo's great project (begun 1503) was a cavalry battle scene that the city commissioned to adorn the newly built Council Hall of the Palazzo Vecchio. The work is only known today through some rapid rough sketches of the groups of horsemen, careful drawings of single heads of men, and copies of the entire composition. Leonardo began to paint the scene but was called back to Milan before the work was completed. A short time thereafter, the room was remodeled and the fragment was destroyed.

Milan (1506–1513)

Leonardo was called to Milan in 1506 by the French governor in charge to work on an equestrian statue (a sculpture of a leader riding a horse) project, but he produced no new paintings. Instead he turned more and more to scientific observation. Most of Leonardo's scientific concerns were fairly direct extensions of his interests as a painter, and his research in anatomy (the structure of a living organism) was the most fully developed. Early Renaissance painters had attempted to render the human anatomy with accuracy. Leonardo

went far beyond any of them, producing the earliest anatomical drawings still followed today.

Leonardo filled notebooks with data and drawings that reveal his other scientific interests: firearms, the action of water, the flight of birds (leading to designs for human flight), the growth of plants, and geology (the study of earth and its history). Leonardo's interests were not universal, however. Theology (the study of religion), history, and literature did not appeal to him. All his interests were concerned with the processes of action, movement, pressure, and growth. It has been said that his drawings of the human body are less about how bodies are and more about how they work.

Last years

In 1513 Leonardo went to Rome, where he remained until 1516. He was much honored, but he was relatively inactive and remarkably aloof (apart) from its rich social and artistic life. He continued to fill his notebooks with scientific entries.

The French king, Francis I (1494–1547), invited Leonardo to his court at Fontainebleau, gave him the title of first painter, architect, and mechanic to the king, and provided him with a country house at Cloux. Leonardo was revered for his knowledge more than for any work he produced in France. He died on May 2, 1519, at Cloux.

Influence

Leonardo's influence on younger artists of Milan and Florence was enormous. Among these were Filippino Lippi (1457–1504) and Andrea del Sarto (1486–1531) who were able to absorb and transmit his message rather

than merely copy the unimportant aspects of his style.

On a more significant level, Leonardo influenced the two greatest young artists to come in contact with him. Raphael (1483–1520) came to Florence in 1504 at the age of twenty-one, and quickly revealed Leonardo's influence in his portraits and Madonnas. Also, about 1503, Michelangelo (1475–1564) changed from a sculptor of merely grand scale to one whose figures are charged with energy. This may be seen in the contrast between Michelangelo's early *David* and his later *St. Matthew*.

From this time on Leonardo influenced, directly or indirectly, all painting. However, most of Leonardo's scientific observations remained unproven until the same questions were again investigated in later centuries.

C. S. LEWIS

Born: November 29, 1898

Belfast, Ireland

Died: November 24, 1963

Oxford, England

Irish writer, novelist, and essayist

The Irish novelist and essayist C. S. Lewis was best known for his essays on literature and his explanations of Christian teachings.

Early life and education

On November 29, 1898, Clive Staples Lewis was born in Belfast, Ireland. He was the son of A. J. Lewis, a lawyer, and Flora August Hamilton Lewis, a mathematician (expert in mathematics), whose father was a minister. At four years old he told his parents that he wanted to be called "Jack" Lewis, and his family and friends referred to him that way for the rest of his life. Jack's best friend as a boy was his older brother Warren. They did everything together and even created their own made-up country, Boxen, going so far as to create many individual characters and a four-hundred-year history of the country.

Lewis's mother, who had tutored him in French and Latin, died when he was ten years old. After spending a year in studies at Malvern College, a boarding school in England, he continued his education privately under a tutor named W. T. Kirkpatrick, former headmaster (principal) of Lurgan College. During World War I (1914–18), which began as a conflict between Austria-Hungary and Serbia but eventually involved much of Europe, Lewis served as a second lieutenant in the English army, interrupting his career as a scholar that he had begun in 1918 at University College, Oxford. Wounded in the war, he returned to Oxford, where he was appointed lecturer at University College in 1924. In 1925 he was appointed fellow (performing advanced study or research) and tutor at Magdalen College, England, where he gave lectures on English literature.

C. S. Lewis.

Published works

In 1926 Lewis's first publication, *Dymer*, appeared under the pseudonym (fake writing name) Clive Hamilton. *Dymer* revealed Lewis's gift for satire (a work of literature that makes fun of human vice or foolishness). *The Pilgrims' Regress*, an allegory (an expression of truths about human existence using symbols) published in 1933, presented an apology for Christianity. It was not until the appearance of his second allegorical work, *The Allegory of Love* (1936), however, that Lewis was honored with the coveted Hawthornden prize.

The Screwtape Letters (1942), for which Lewis is perhaps best known, is a satire in

which the devil, here known as Screwtape, writes letters teaching his young nephew, Wormwood, how to tempt humans to sin. Lewis published seven religious allegories for children titled *Chronicles of Narnia* (1955). He also published several scholarly works on literature, including *English Literature in the 16th Century* (1954) and *Experiment in Criticism* (1961).

Although Lewis went on to publish several works involving religion, he had lost interest in it early in life and only later "converted" to Christianity, joining the Anglican Church. His autobiography (the story of his own life), *Surprised by Joy: The Shape of My Early Life*, fails to explain what happened in his childhood. His headmaster in boarding school, a minister who urged him to "think" by hitting him, may have contributed to this change.

Later years

Lewis went on to become a professor of English at Cambridge University, England, in 1954. Widely read as an adult, his knowledge of literature made him much sought after for his company and conversation. Lewis thoroughly enjoyed sitting up into the late hours in college rooms talking about literature, poetry, and religion.

In 1956, rather late in life, Lewis married Joy Davidman Gresham, the daughter of a New York Jewish couple. She was a graduate of Hunter College and had previously been married twice. When her first husband suffered a heart attack, she turned to prayer. Reading the writings of Lewis, she began attending church. Later, led by his writings to Lewis himself, she divorced her second husband, Williams Gresham, and married Lewis.

She died some three years before her husband. C. S. Lewis died at his home in Headington, Oxford, England, on November 24, 1963. A major collection of his works is held by Wheaton College in Illinois.

CARL LEWIS

Born: July 1, 1961

Birmingham, Alabama

African American track and field athlete

One of track and field's greatest performers, Carl Lewis in 1984 became the first African American athlete since Jesse Owens (1913–1980) in 1936 to win four gold medals in Olympic competition. He won nine gold medals in four straight Olympics.

A lifetime of dedication

Born on July 1, 1961, in Birmingham, Alabama, Frederick Carlton Lewis is the son of two star athletes who attended Tuskegee Institute. His father, Bill, ran track and played football; his mother, Evelyn, was a world-class hurdler (a runner who jumps over a series of hurdles) who represented the United States at the 1951 Pan-American Games. By the time Carl, the third of four children, was born, his parents were coaching young athletes in track and field events.

When Carl was still young, his family moved to Willingboro, New Jersey. There his parents worked as high school teachers and founded the Willingboro Track Club. Lewis was not as talented as his brothers and sister, and his parents encouraged him to pursue music lessons instead. He kept working and practicing the long jump in his back yard, determined to improve. Small and skinny, Lewis competed in track meets, losing far more than he won. Still, his dedication and confidence caught the eye of Jesse Owens himself at a meet in Philadelphia, Pennsylvania; Owens urged other children to follow the example of the “spunky little guy.” When he graduated from Willingboro High School in 1979, Lewis was the top-ranked high school track athlete in the country.

Continues to improve

In 1979 Lewis entered the University of Houston (Texas) on an athletic scholarship. He worked with coach Tom Tellez, who suggested improvements in Lewis's style of jumping. After just one year of college Lewis qualified for the 1980 Olympic team, only to see opportunity pass him by when former President Jimmy Carter (1924–) cancelled

LEWIS, CARL

Carl Lewis.

the United States' participation in the Games in protest of the Soviet Union's invasion of Afghanistan. Lewis kept his top national ranking in the long jump and the 100-meter dash at the 1981 National Collegiate Athletic Association (NCAA) indoor championships. He was the first athlete to win two events at an NCAA championship.

In 1982 Lewis left the University of Houston to work at the Santa Monica Track Club in California. Coach Tellez continued to work closely with him. By 1983 Lewis had become a winner in four categories: long jump, 100-meter run, 200-meter run, and 400-meter relay. He won three gold medals at

the track and field world championships in Helsinki, Finland, in 1983. During the early months of 1984 he set an indoor world record in the long jump. It appeared Lewis would return from the twenty-third Olympics covered with gold medals.

Backs up predictions

Lewis's announcement that he would win four events in Los Angeles, California, in the 1984 Summer Olympics was viewed by many as arrogant, but he backed up his talk. He won the 100-meter sprint with a time of 9.99 seconds. His long jump effort of twenty-eight feet earned him a second gold. For his third, Lewis set an Olympic record with a 19.8-second run in the 200-meter race. Finally, he led the 400-meter relay team to an Olympic record victory at 37.83 seconds. Rather than being praised, Lewis was mocked by writers as "King Carl" for his brash predictions and for showing up late to press conferences. An endorsement contract (agreement to promote a company's products in return for money) with Nike was cancelled, and Lewis received no others in the United States, although in Europe and Japan he became a hero. Lewis continued to participate in indoor and outdoor track meets.

In 1985 Canadian sprinter Ben Johnson (1961–) arrived on the scene, and he began to beat Lewis regularly in the 100-meter sprint. At the 1988 Olympic Games in Seoul, South Korea, Lewis ran second to Johnson, who won the 100-meter event in record time. Lewis was awarded the gold medal soon afterward when Johnson was found to have used steroids (illegal substances that improve athletic performance). Lewis earned a second gold in Seoul for the long jump, but his continued success did

little to improve his popularity. Worse, Lewis himself was charged with steroid use by a former opponent. Lewis denied the charges and sued the magazine in which they were published; he also agreed to submit to drug tests after races. Lewis has never been linked to drug use by anything but rumor.

Finally accepted

By 1992 Lewis had won eight world championship gold medals and had owned the long jump for ten years. Age began to take its toll on him, however. He watched Mike Powell break Bob Beamon's outdoor long jump world record at the 1991 world championships in Tokyo, Japan. Lewis made four personal best jumps at the same meet but still could not beat Powell. At the 1992 Olympic trials, Lewis failed to make the cut for the 100-meter and 200-meter sprints. He did qualify for the long jump and the 400-meter relay, and a week later he discovered that he had been suffering from a sinus (a cavity in the skull connected to the nostrils) infection.

Lewis experienced something at the 1992 Olympic trials that he had never received—total acceptance from an American crowd. He was given a standing ovation in New Orleans, Louisiana, as his second-place finish in the long jump qualified him for an Olympic berth. The admiration of fans came showering down in Barcelona, Spain, in 1992, when Lewis beat Powell in the long jump to earn his seventh gold medal and then anchored the 400-meter relay for his eighth.

One more time

Following the 1992 Olympics, Lewis's performance began to decline, and by 1995 he was being beaten regularly by younger

athletes. Still, Lewis participated in the 1996 Olympic trials and won a chance to compete in the long jump at the games in Atlanta, Georgia. He easily won his fourth straight gold in the event. With endorsement contracts from Panasonic, among others, and large personal appearance fees, he became a wealthy man and considered running for political office in Houston, Texas.

In 1999 Lewis was named one of the century's greatest athletes at the *Sports Illustrated* 20th Century Sports Awards ceremony. In 2000 he said he still felt he could compete at the Olympic trials but would not do so until the problem of athletes using drugs was addressed. He still attended the games in Sydney, Australia, participating in a ceremony to honor the McDonald's Olympic Achievers, young people from around the world chosen for their success in schoolwork, athletics, and community service. In December 2001 Lewis was elected to the National Track and Field Hall of Fame. He also tried acting, appearing in the 2002 television movie *Atomic Twister*.

Eight of Lewis's Olympic gold medals are still in his possession. The ninth—his first, for the 100-meter sprint—was buried with his father Bill in May of 1988. "My father was most proud of the 100," Lewis revealed in the *Philadelphia Daily News*. "More than anything, he wanted me to win that medal. . . . Now he has it and he'll always have it."

SINCLAIR LEWIS

Born: February 7, 1885

Sauk Centre, Minnesota

Died: January 10, 1951

Rome, Italy

American writer

Although Sinclair Lewis was one of the most famous American writers of the 1920s, today his popular, mildly satirical (poking fun at human folly) novels are valued mainly for their descriptions of social institutions and relationships of that time.

Early life

Harry Sinclair Lewis was born in Sauk Centre, Minnesota, on February 7, 1885, the third son of Edwin J. Lewis and Emma Kermott Lewis. His father, grandfather, and older brother were all small-town doctors. Lewis was a lonely, awkward boy who liked to read. He began writing while in high school, and some of his articles appeared in Sauk Centre newspapers. After high school Lewis left Minnesota to study at Yale University in Connecticut, interrupting his education in 1907 to work briefly at Helicon Hall, a New Jersey socialist colony (a group of people living and working together as equals for the benefit of all) set up by the writer Upton Sinclair

(1878–1968). After his graduation in 1908, Lewis spent several years doing newspaper and editorial work in various parts of the United States. His first four novels were all unsuccessful.

In 1920 Lewis achieved instant worldwide recognition with the publication of *Main Street*, the story of a gifted young girl married to a dull, considerably older village doctor who tries to bring culture and imagination to empty, small-town life. Next Lewis focused on the American businessman in *Babbitt* (1922), perhaps his major work. Lewis purposely wrote in a fantastic style, ignoring formal plot development or structure. The creation of George F. Babbitt, an intellectually empty, immature man of weak morals who nevertheless remains a lovable comic figure, is Lewis's greatest accomplishment. One critic remarked, "If Babbitt could write, he would write like Sinclair Lewis."

Later novels and the Nobel Prize

Lewis's next popular novel, *Arrowsmith* (1925), returned to the form of *Main Street* to portray a young doctor's battle to maintain his dignity in a petty, dishonest world. Despite its often simplistic look at science as a means of saving one's soul, *Arrowsmith* was offered the Pulitzer Prize. Lewis, however, immediately refused the honor because the terms of the award required that it be given not for a work of value, but for a work that presents "the wholesome atmosphere of American Life."

Elmer Gantry (1927), an extreme assault on religious hypocrisy (the false expression of the appearance of goodness), seems more concerned with the main character's morals than with the failings of organized religion.

Dodsworth (1929), a sympathetic description of a wealthy, retired manufacturer seeking happiness in Europe, is more successful. Here Lewis makes little effort to hide his liking of, and even admiration for, the values described earlier in *Babbitt*. In 1930 Sinclair Lewis became the first American to win the Nobel Prize for Literature, but this honor brought him little personal happiness.

Lewis produced a great deal of writing in the following years, but none of these works were as successful as his earlier efforts. *Ann Vickers* (1933) traces the career of an unstable woman who starts as a social worker and ends as the mistress of a politician; *Cass Timberlane* (1945) deals with an unhappy marriage between a middle-aged judge and his loving wife; *Kingsblood Royal* (1947) takes on the subject of racial prejudice; and *The God-Seeker* (1949) tells the story of a New England missionary's attempts to convert the Native American Indians of Minnesota in the 1840s.

Final years

Lewis spent his last years traveling throughout Europe, unable to find publishers for his work and aware that his impact on American literature was far less than his early admirers had led him to believe. Lewis was overshadowed by other American writers, including Ernest Hemingway (1899–1961) and William Faulkner (1897–1962), who had yet to appear when Lewis first attracted attention. Later critics also felt that the Nobel Prize Lewis had won in 1930 should have gone to the stronger novelist Theodore Dreiser (1871–1945) instead.

Married and divorced twice, in Lewis's last years he retreated almost completely from other people. Increasingly self-con-

Sinclair Lewis.

scious about his physical decline, he refused to be seen even by his few friends. He died on January 10, 1951, of a heart attack in a small-town clinic just outside of Rome, Italy. Although Lewis is not considered to have been a great writer, his place in the history of American literature is secure.

ROY LICHTENSTEIN

Born: October 27, 1923

New York, New York

Died: September 29, 1997

New York, New York

American artist, painter, sculptor, and printmaker

Roy Lichtenstein, American painter, sculptor, and printmaker, startled the art world in 1962 by exhibiting paintings based on comic book cartoons.

Early life

Roy Lichtenstein was born in New York City on October 27, 1923, the son of Milton and Beatrice Werner Lichtenstein. His father owned a real estate firm. Lichtenstein studied with artist Reginald Marsh (1898–1954) at the Art Students League in 1939. After graduating from Benjamin Franklin High School in New York City, he entered Ohio State University. However, in 1943 his education was interrupted by three years of army service, during which he drew up maps for planned troop movements across Germany during World War II (1939–45; a war in which Great Britain, France, the Soviet Union, and the United States fought against Germany, Japan,

and Italy). Lichtenstein received his bachelor of fine arts degree from Ohio State University in 1946 and a master of fine arts degree in 1949. He taught at Ohio State until 1951, then went to Cleveland, Ohio, to work. In 1957 he started teaching at Oswego State College in New York; in 1960 he moved to Rutgers University in New Jersey. Three years later he gave up teaching to paint full-time.

Early works

From 1951 to about 1957 Lichtenstein's paintings dealt with themes of the American West—cowboys, Native Americans, and the like—in a style similar to that of modern European painters. Next he began hiding images of comic strip figures (such as Mickey Mouse, Donald Duck, and Bugs Bunny) in his paintings. By 1961 he had created the images for which he became known. These included advertisement illustrations—common objects such as string, golf balls, kitchen curtains, slices of pie, or a hot dogs. He also used other artists' works to create new pieces, such as *Woman with Flowered Hat* (1963), based on a reproduction of a work by Pablo Picasso (1881–1973). He also created versions of paintings by Piet Mondrian (1872–1944), Gilbert Stuart's (1755–1828) portrait of George Washington (1732–1799), and Claude Monet's (1840–1926) haystacks.

Lichtenstein was best known for his paintings based on comic strips, with their themes of passion, romance, science fiction, violence, and war. In these paintings, Lichtenstein uses the commercial art methods: projectors magnify spray-gun stencils, creating dots to make the pictures look like newspaper cartoons seen through a magnifying glass. In the late 1960s he turned to design

elements and the commercial art of the 1930s, as if to explore the history of pop art (a twentieth-century art movement that uses everyday items). In 1966 his work was included in the Venice (Italy) Biennale art show. In 1969 New York's Guggenheim Museum gave a large exhibition of his work.

Tries different styles

The 1970s saw Lichtenstein continuing to experiment with new styles. His “mirror” paintings consist of sphere-shaped canvases with areas of color and dots. One of these, *Self-Portrait* (1978), is similar to the work of artist René Magritte (1898–1967) in its playful placement of a mirror where a human head should be. Lichtenstein also created a series of still lifes (paintings that show inanimate objects) in different styles during the 1970s. In the 1980s and 1990s, Lichtenstein began to mix and match styles. Often his works relied on optical (relating to vision) tricks, drawing his viewers into a debate over the nature of “reality.” The works were always marked by Lichtenstein’s trademark sense of humor and the absurd.

Lichtenstein’s long career and large body of work brought him appreciation as one of America’s greatest living artists. In 1994 he designed a painting for the hull of the United States entry in the America’s Cup yacht race. A series of sea-themed works followed. In 1995 the Los Angeles County Museum of Art launched a traveling exhibition, “The Prints of Roy Lichtenstein,” which covered more than twenty years of his work in this medium.

In a 1996 exhibition at New York City’s Leo Castelli gallery, Lichtenstein unveiled a series of paintings, “Landscapes in the Chi-

Roy Lichtenstein.

Reproduced by permission of the Corbis Corporation.

nese Style,” which consisted of delicate “impressions” of traditional Chinese landscape paintings. The series was praised for its restraint (control), as common Lichtenstein elements, such as the use of dots to represent mass, were used to support the compositions rather than to declare an individual style. Lichtenstein died on September 29, 1997, in New York City, at the age of seventy-three.

MAYA LIN

Born: October 5, 1959

Athens, Ohio

Asian American architect and sculptor

Maya Lin is an American architect whose two most important works in the 1980s were the Vietnam Veterans' Memorial in Washington, D.C., and the Civil Rights Memorial in Montgomery, Alabama.

Family and childhood

Maya Ying Lin was born on October 5, 1959, in Athens, Ohio, a manufacturing and agricultural town seventy-five miles southeast of Columbus. Athens is also the home of Ohio University, where Lin's mother, Julia Chang Lin, a poet, was a literature professor. Her late father, Henry Huan Lin, was a ceramicist (a person with expertise in ceramics). The couple came to America from China in the 1940s, leaving behind a prominent family that had included a well-known lawyer and an architect. Lin's family in America includes her mother and an older brother, Tan, who, is a poet like his mother.

During her childhood, Maya Lin found it easy to keep herself entertained, whether by reading or by building miniature towns. Maya loved to hike and bird watch as a child.

She also enjoyed reading and working in her father's ceramics studio. From an early age she excelled in mathematics, which led her toward a career in architecture. While in high school Lin took college level courses and worked at McDonalds. She considered herself a typical mid-westerner, in that she grew up with little sense of ethnic identity. She admits, however, to having been somewhat "nerdy," since she never dated nor wore make-up and found it enjoyable to be constantly thinking and solving problems.

Vietnam Veterans' Memorial

After graduating from high school, Lin enrolled at Yale University in New Haven, Connecticut, to study architecture. Her best-known work, the design for the Vietnam Veterans' Memorial in Washington, D.C., grew out of a class project during her senior year. In 1981 her entry was chosen out of a field of 1,421 unlabelled submissions in a design competition that was open to all Americans, not just professional architects. Lin was just twenty-one years old at the time.

In keeping with the competition criteria of sensitivity to the nearby Lincoln Memorial and Washington Monument, the inclusion of the names of all the dead and missing of the war, and the avoidance of political statements about the war, Lin's design was simple. She proposed two two-hundred-foot-long polished black granite walls, which dipped ten feet below grade to meet at an obtuse (greater than 90 degrees) angle of 130 degrees. The two arms were to point towards the Lincoln Memorial and Washington Monument, and they were to be inscribed with the names of the approximately fifty-eight thousand men and women killed or missing in Vietnam.

These names were to be listed chronologically, according to the dates killed or reported missing, instead of alphabetically, so that they would read, in Lin's words, "like an epic Greek poem." The memorial was dedicated in November of 1982.

After the Vietnam Memorial project, Lin returned to Yale for a master's degree. Her later projects included designs for a Philadelphia, Pennsylvania, stage set; a corporate logo; an outdoor gathering place at Juniata College in Huntington, Pennsylvania; a park near the Charlotte, North Carolina, coliseum; and a ceiling for the Long Island Railroad section of Pennsylvania Station. In addition, her lead and glass sculptures have been exhibited at New York's Sidney Janis Gallery.

Civil Rights Memorial

Maya Lin's second nationally recognized project was the design of the Civil Rights Memorial in Montgomery, Alabama, commissioned by the Southern Poverty Law Center. Lin's conception of the memorial grew out of her admiration of a line in Martin Luther King's (1929–1968) "I have a dream" speech, which proclaims that the struggle for civil rights (the basic rights given to U.S. citizens of all races) will not be complete "until justice rolls down like water and righteousness like a mighty stream." Water, along with this key phrase from the King years, became her theme. King's words stand out boldly on a convex (curved or bowed out), water-covered wall, which overlooks an inverted cone-shaped table with an off-center base. The surface of this table is inscribed with the names of forty people who died in the struggle for civil rights between 1955 and 1968, as well as with landmark events of the period. This element is

Maya Lin.

Reproduced by permission of AP/Wide World Photos.

also bathed in a film of moving water, which serves to involve the viewer sensually through sound, touch, and the sight of his or her reflection, while the words engage the intellect.

The two geometric elements of the Civil Rights Memorial are not completely without symbolic meaning. Lin has noted that the asymmetrical, or uneven, cone-shaped table looks different from every angle, a quality which implies equality without sameness—an appropriate view in a memorial to civil rights. Lin says this memorial will be her last, and notes that she began and ended the 1980s with memorial projects. She feels fortunate and satisfied to have had the opportunity.

In 1993 Lin created a sculptural landscape work called Groundswell at Ohio State University—a three level garden of crushed green glass. The glass used in the effort reveal Lin's environmentalist nature. Lin remains an active sculptor and architect. In 1997 she began work on a twenty-thousand-square-foot recycling plant. Lin currently lives in Vermont. She stays out of the public eye as much as possible. Still, so much of her work is so public and so creative that publicity is hard to avoid. Maya Lin has published several books and is currently working on different architectural and sculptural projects.

ABRAHAM LINCOLN

Born: February 12, 1809

Hodgenville, Kentucky

Died: April 14, 1865

Washington, D.C.

American president

The sixteenth president of the United States and president during the Civil War (1861–1865), Abraham Lincoln will forever be remembered by his inspirational rise to fame, his efforts to rid the country of slavery, and his ability to hold together a divided nation. Lincoln's Emancipation Proclamation, Gettysburg Address, and two outstanding inaugural addresses are widely regarded as some of the greatest speeches ever delivered by an American politician.

Starting life in a log cabin

Abraham Lincoln was born to Thomas and Nancy Lincoln on February 12, 1809, in a log cabin on a farm in Hardin County, Kentucky. Two years later the family moved to a farm on Knob Creek. There, when there was no immediate work to be done, Abraham walked two miles to the schoolhouse, where he learned the basics of reading, writing, and arithmetic.

When Abraham was seven, his father sold his lands and moved the family into the rugged wilderness of Indiana across the Ohio River. After spending a winter in a crude shack, the Lincolns began building a better home and clearing the land for planting. They were making progress when, in the summer of 1818, a terrible disease known as milk sickness struck the region. First it took the lives of Mrs. Lincoln's uncle and aunt, and then Nancy Hanks Lincoln herself died. Without Mrs. Lincoln the household began to fall apart, and much of the workload fell to Abraham and his sister.

The next winter Abraham's father returned to Kentucky and brought back a second wife, Sarah Bush Johnson, a widow

with three children. As time passed, the region where the Lincolns lived grew in population. Lincoln himself grew tall and strong, and his father often hired him out to work for neighbors. Meanwhile, Lincoln's father had again moved his family to a new home in Illinois, where he built a cabin on the Sangamon River. At the end of the first summer in Illinois, disease swept through the region and put the Lincolns on the move once again. This time it was to Coles County. Abraham, who was now a grown man, did not go along. Instead he moved to the growing town of New Salem, where he was placed in charge of a mill and store.

Entering public life

Life in New Salem was a turning point for Lincoln, and the great man of history began to emerge. To the store came people of all kinds to talk and trade and to enjoy the stories told by this unique and popular man. The members of the New Salem Debating Society welcomed him, and Lincoln began to develop his skills as a passionate and persuasive speaker. When the Black Hawk War (1832) erupted between the United States and hostile Native Americans, the volunteers of the region quickly elected Lincoln to be their captain.

After the war he announced himself as a candidate for the Illinois legislature. He was not elected, but he did receive 277 of the 300 votes cast in the New Salem precinct. In 1834, after another attempt, Lincoln was finally elected to the state legislature. Lincoln's campaign skills greatly impressed John Todd Stuart (1807–1885), a leader of the Whigs, one of two major political parties in the country at the time. Stuart was also an

*Abraham Lincoln.
Courtesy of the Library of Congress.*

outstanding lawyer in Springfield, Illinois, and soon took Lincoln under his care and inspired him to begin the study of law.

Lincoln served four straight terms in the legislature and soon emerged as a party leader. Meanwhile, he mastered the law books he could buy or borrow. In September 1836 Lincoln began practicing law and played an important part in having the Illinois state capital moved from Vandalia to Springfield. In 1837 Lincoln himself moved to Springfield to become Stuart's law partner. He did not, however, forget politics. In 1846 Lincoln was elected to the U.S. Congress. During these years Lincoln had become

engaged to Mary Todd (1818–1882), a cultured and well-educated Kentucky woman. They were married on November 2, 1842.

First failure

When Congress met in December 1847, Lincoln expressed his disapproval with the Mexican War (1846–48), in which American and Mexican forces clashed over land in the Southwest. These views, together with his wish to abolish, or end, slavery in the District of Columbia, brought sharp criticism from the people back in Illinois. They believed Lincoln was “not a patriot” and had not correctly represented his state in Congress.

Although the Whigs won the presidency in 1848, Lincoln could not even control the support in his own district. His political career seemed to be coming to a close just as it was beginning. His only reward for party service was an offer of the governorship of far-off Oregon, which he refused. Lincoln then returned to Illinois and resumed practicing law.

War on the horizon

During the next twelve years, while Lincoln rebuilt his legal career, the nation was becoming divided. While victory in the Mexican War added vast western territory to the United States, then came the issue of slavery in those new territories. To Southerners, the issue involved the security and rights of slavery everywhere. To Northerners, it was a matter of morals and justice. A national crisis soon developed. Only the efforts of Senators Henry Clay (1777–1852) and Daniel Webster (1782–1852) brought about the Compromise of 1850. With the compromise, a temporary truce was reached between the states favoring slavery and those opposed to it. The

basic issues, however, were not eliminated. Four years later the struggle was reopened.

Lincoln’s passionate opposition to slavery was enough to draw him back into the world of politics. He had always viewed slavery as a “moral, social and political wrong” and looked forward to its eventual abolition. Although willing to let it alone for the present in the states where it existed, he would not see it extended one inch.

At the same time, Illinois Senator Stephen A. Douglas (1813–1861) drafted the Kansas-Nebraska Act, which would leave the decision of slavery up to the new territories. Lincoln thought the bill ignored the growing Northern determination to rid the nation of slavery. Soon, in opposition to the expansion of slavery, the Republican party was born. When Douglas returned to Illinois to defend his position, Lincoln seized every opportunity to point out the weakness in it.

Republican leader

Lincoln’s failure to receive the nomination as senator in 1855 convinced him that the Whig party was dead. By summer 1856 he became a member of the new Republicans. Lincoln quickly emerged as the outstanding leader of the new party. At the party’s first national convention in Philadelphia, Pennsylvania, he received 110 votes for vice president on the first ballot. Although he was not chosen, he had been recognized as an important national figure.

National attention began turning toward the violence in Kansas and the Supreme Court decision in the Dred Scott case, which debated the issue of slavery in the new territories. Meanwhile, Douglas had returned to

Illinois to wage his fight for reelection to the Senate. But unlike in earlier elections, Illinois had grown rapidly and the population majority had shifted from the southern part of the state to the central and northern areas. In these growing areas the Republican party had gained a growing popularity—as had Abraham Lincoln.

As Lincoln challenged Douglas for his seat in the Senate, the two engaged in legendary debates. During the Lincoln-Douglas debates, Lincoln delivered his famous “house divided” speech, stating “A house divided against itself cannot stand. I believe the government cannot endure permanently half slave and half free.” Lincoln proved his ability to hold his own against the man known as the “Little Giant.” In the end Douglas was reelected as senator, but Lincoln had gained national attention and his name was soon mentioned for the presidency.

The sixteenth president

In 1860 the Republican National Convention met and chose Lincoln as their candidate for president of the United States. With a divided Democratic party and the recent formation of the Constitutional Union party, Lincoln’s election was certain. After Lincoln’s election victory, parts of the country reacted harshly against the new president’s stand on slavery. Seven Southern states then seceded, or withdrew, from the Union and formed the Confederate States of America.

In his inaugural address he clarified his position on the national situation. Secession, he said, was wrong, and the Union could not legally be broken apart. He would not interfere with slavery in the states, but he would “hold, occupy, and possess” all property and

places owned by the federal government. By now there was no avoiding the outbreak of the Civil War.

The Civil War

From this time on, Lincoln’s life was shaped by the problems and fortunes of civil war. As president, he was the head of all agencies in government and also acted as commander in chief, or supreme commander, of the armies. Lincoln was heavily criticized for early failures. Radicals in Congress were soon demanding a reorganization of his cabinet, or official advisors, and a new set of generals to lead his armies. To combat this, Lincoln himself studied military books. He correctly evaluated General Ulysses S. Grant (1822–1885) and General William T. Sherman (1820–1891) and the importance of the western campaign. Thanks, in part, to Lincoln’s reshuffling of his military leaders, the Union forces would soon capture victory over the Confederates.

Afterward, Lincoln issued his Emancipation Proclamation. The proclamation called for the freeing of all slaves in territories still at war with the Union. Later, during his Gettysburg Address, he gave the war its universal meaning as a struggle to preserve a nation based on freedoms and dedicated to the idea “that all men are created equal.”

Lincoln was reelected in 1864. As the end of the Civil War appeared close, Lincoln urged his people “to bind up the nation’s wounds” and create a just and lasting peace. But Lincoln would never be able to enjoy the nation he had reunited. Five days after the Confederate army surrendered and ended the Civil War, Lincoln was shot by John Wilkes Booth at Ford’s Theater in Washington, D.C., on April 14, 1865. The president died the next day.

Although the reasons for Lincoln's assassination would be debated, his prominent place in American history has never been in doubt. His work to free the slaves earned him the honorable reputation as the Great Emancipator. His ability to hold together a country torn apart by civil war would forever secure his place as one of America's greatest presidents.

CHARLES LINDBERGH

Born: February 4, 1902

Detroit, Michigan

Died: August 26, 1974

Maui, Hawaii

American aviator

American aviator Charles Lindbergh became famous after making the first solo nonstop flight across the Atlantic Ocean. He was criticized for insisting that the United States should not become involved in World War II.

Early years

Charles Augustus Lindbergh was born on February 4, 1902, in Detroit, Michigan, the only child of Charles August Lindbergh and Evangeline Lodge Land Lindbergh. His father was a congressman from Minnesota from 1907 to 1917, and his grandfather had been secretary to the King of Sweden. Lindbergh spent a great deal of time alone while young, with animals and then machines to keep him company. After attending schools in Little Falls, Minnesota, and Washington, D.C., Lindbergh enrolled in a mechanical engineering program at the University of Wisconsin.

Lindbergh became bored with studying; he was more interested in cars and motorcycles at this point. He left Wisconsin to study airplane flying in Lincoln, Nebraska, from 1920 to 1922. He made his first solo flight in 1923 and thereafter made exhibition flights and short trips in the Midwest. He enrolled in the U.S. Air Service Reserve as a cadet in 1924 and graduated the next year. In 1926 he made his first flight as an airmail pilot between Chicago, Illinois, and St. Louis, Missouri.

Famous flight

Lindbergh wanted to compete for the \$25 thousand prize that a man named Raymond Orteig had posted for the first person to make a nonstop flight between New York and Paris, France. With money put up by several St. Louis businessmen, Lindbergh

had a plane called the *Spirit of St. Louis* built. On the first lap of his flight to New York, he traveled nonstop to St. Louis in fourteen hours and twenty-five minutes—record-breaking time from the West Coast.

On May 20, 1927, Lindbergh took off in his silver-winged monoplane (a plane with only one supporting surface) from Roosevelt Field in Long Island, New York, bound for an airport outside Paris. Better-equipped and better-known aviators had failed; some had even crashed to their death. But Lindbergh succeeded. He arrived on May 21, having traveled 2,610 miles in thirty-three and one-half hours. He immediately became a hero and received many honors and decorations, including the Congressional Medal of Honor, the French Chevalier Legion of Honor, the Royal Air Cross (British), and the Order of Leopold (Belgium). During a tour of seventy-five American cities sponsored by the Daniel Guggenheim Foundation for the Promotion of Aeronautics, he was greeted by wild demonstrations of praise.

In December 1927 Lindbergh flew nonstop between Washington and Mexico City, Mexico, and went on a goodwill trip to the Caribbean and Central America. During one tour he met Anne Spencer Morrow, the daughter of the U.S. ambassador (representative) to Mexico. They were married in 1929. The Lindberghs made many flights together. In 1931 they flew to Asia, mapping air routes to China. Two years later, in a 30,000-mile flight, they explored possible air routes across oceans.

Son murdered

In March 1932 the Lindberghs were shaken when their infant son was kidnapped. A \$50,000 ransom was paid, but the baby was found dead. The nation's concern and horror

Charles Lindbergh.

Courtesy of the Library of Congress.

resulted in laws that expanded the role of federal law-enforcement agencies in dealing with such crimes, including allowing the government to demand the death penalty for kidnapers who take victims across state lines.

The Lindberghs moved to Europe after the execution of their son's murderer in 1935. While in France Lindbergh worked with Alexis Carrel (1873–1944), an American surgeon (medical specialist who performs operations) and experimental biologist who had won the Nobel Prize in medicine in 1912. The two men perfected an "artificial heart and lungs," a pump that could keep organs alive outside the body by supplying blood and air to them.

Criticized for political opinions

In the late 1930s Lindbergh conducted various studies of air power in Europe. He toured German aviation centers at the invitation of Nazi (a political party that controlled Germany from 1933–45 and that attempted to rid the country of Jewish people) leader Hermann Göring (1893–1946), becoming convinced that the Nazi military was unbeatable. Also in the 1930s Lindbergh was on the Board of Directors of Pan-American World Airways. In 1939 he studied American airplane production as special adviser on technical matters. He also performed promotional work for aviation during this period.

Just prior to World War II (1939–45; a war fought between the Axis powers of Germany, Italy, and Japan and the Allies of England, France, the Soviet Union, and the United States), as a member of the America First Organization, Lindbergh warned that United States involvement could not prevent a German victory. He was criticized by President Franklin D. Roosevelt (1882–1945) for radio broadcasts urging America not to fight in “other people’s wars.” As a result, Lindbergh resigned his commission in the U.S. Air Force. After Japan attacked the United States in 1941, Lindbergh supported the American effort, serving as a technician for aircraft companies. After the war he once again became a technical adviser for the U.S. Air Force, and eventually he was again commissioned a brigadier general in the Air Force Reserve.

Later years

Lindbergh’s association with the Nazis had severely damaged his reputation, but the popularity of the books he and his wife wrote helped restore some of what he had lost. Lind-

bergh wrote several accounts of his famous 1927 flight. *We* (1927) and *The Spirit of St. Louis* (1953), for which he received the Pulitzer Prize for biography, are descriptions of his early life and accomplishments. With Carrel he coauthored *Culture of Organs* (1938), and in 1948 he wrote *Of Flight and Life*.

Lindbergh’s later works included *The Wartime Journals of Charles A. Lindbergh* (1970) and *Boyhood on the Upper Mississippi: A Reminiscent Letter* (1972). *An Autobiography of Values* (1977) was published after his death. Toward the end of his life Lindbergh grew increasingly interested in the spiritual world and spoke out on environmental issues. He spent his final years with his wife in a house they had built on a remote portion of the island of Maui. He died there on August 26, 1974.

After her husband’s death, Anne Morrow Lindbergh continued to publish books of her diaries and letters. She retired to Darien, Connecticut, where a series of strokes weakened her. In 1992 she discovered that a woman whom her children had hired to manage her affairs was stealing money from her. The state of Connecticut joined with the Lindbergh children in pressing charges against the woman.

CARL LINNAEUS

Born: May 23, 1707

Råshult, Sweden

Died: January 10, 1778

Uppsala, Sweden

Swedish naturalist

The Swedish naturalist (student of natural history) Carl Linnaeus established the binomial (two-name) system of describing living things and gave the first organization to ecology (the relationships between living things and their environments).

Early years and education

Carl Linnaeus was born on May 23, 1707, in Råshult, Sweden, the eldest of Nils and Christina Linnaeus's five children. Two years after his birth his father became the minister at Stenbrohult, Sweden. It was there that his father, who was a lover of flowers, introduced botany (the study of plants) to Carl at a young age. And at the age of five Carl had his own garden, which he later said, "inflamed my soul with an unquenchable love of plants." Carl was more interested in plants than in his studies while in grammar school. His mother hoped he would become a minister, but he showed no interest in that career. Johan Rothman, a master at the high school, encouraged Carl's interests in science

and suggested that he study medicine. Nils Linnaeus agreed, and Rothman tutored Carl for a year.

In 1727 Linnaeus entered the University of Lund. The science and medical instruction was very weak there, and after a year he transferred to Uppsala University, where things were not much better. Fortunately he attracted the interest of Olof Celsius, a religion professor who was interested in the plants of Sweden. Celsius gave Linnaeus free room and board and encouraged his study. The most important development in botany at the time was the study of the sexuality of plants. Linnaeus wrote an essay on the subject, which Celsius showed to one of the professors of medicine, Olof Rudbeck. Rudbeck was so impressed with Linnaeus that he appointed him lecturer in botany and tutor of his sons.

Linnaeus's travels

From 1732 to 1735 Linnaeus traveled throughout Sweden on behalf of the government to study the country's natural resources. Linnaeus then went to Holland to obtain a medical degree. In 1735, after a week at the University of Harderwijk, Linnaeus took the examinations, defended his thesis (a written statement containing original research and supporting a specific idea) on the cause of intermittent (not continuous) fever, and received his degree. He spent most of the next three years in Holland but also traveled in Germany, France, and England. He had many of his scientific papers published with the support of other naturalists and the wealthy banker George Clifford. Linnaeus concluded that in three years he had "written more, discovered more, and made a greater

Carl Linnaeus.

reform in botany than anybody before had done in an entire lifetime.”

Linnaeus returned to practice medicine in Stockholm, Sweden, and he was very successful. In 1739 he married Sara Lisa Moraea, with whom he would have six children. Linnaeus became professor of botany at Uppsala University in 1741. He taught botany, zoology (the study of animals), natural history, and other subjects, and he was very popular with his students. The love of his students and the value of his work ensured his widespread influence and brought him many honors. He was appointed chief royal physician in 1747 and was knighted in 1758; he then

took the name Carl von Linnæus. He retired in 1776 and died in Uppsala, Sweden, on January 10, 1778.

Binomial system and classification

Linnaeus is most widely known for creating systems for naming and classifying plants and animals. Realizing that new plants were being discovered faster than their relationships could be established, he first came up with a simple classification based upon the number of floral parts of each plant. This system remained popular into the nineteenth century. Gradually Linnaeus also developed a system of names in which each species of plant and animal had a genus (class or group) name followed by a specific name. For example, *Plantago virginica* and *Plantago lanceolata* were the names of two species of *plantain* (an herb). Botanists agreed in 1905 to accept his *Species plantarum* (1753) and zoologists (scientists who study animals) agreed to accept his *Systema naturae* (1758) as the official starting points for scientific names of plants and animals.

Pioneer in ecology

Linnaeus first discussed the subject of ecology as an area of investigation in a thesis in 1749. He discussed the importance of relationships among beings in nature, and he was one of the first naturalists to describe food chains. He also studied the different habitat (living space) requirements among species and the feeding habits of insects and animals with hoofs. He urged the use of biological knowledge not only in medicine but also in agriculture, believing that the effective control of agricultural pests must be based on a thorough knowledge of their life histories.

JOSEPH LISTER

Born: April 5, 1827

Essex, England

Died: February 10, 1912

Walmer, England

English surgeon

The English surgeon (doctor who performs operations) Joseph Lister discovered the antiseptic method, in which a germ-killing substance is applied to wounds during an operation. This represented the beginning of modern surgery (an operation to correct a disease or condition).

Early years

Joseph Lister was born in Upton, Essex, England, on April 5, 1827, the fourth of Joseph Jackson Lister and Isabella Harris Lister's seven children. His father was a wealthy wine merchant and student of Latin and

mathematics who also developed an achromatic (possessing no color) lens for the microscope. As a child Lister studied fish and small animals. He also did microscopic research, and his later acceptance of Louis Pasteur's (1822–1895) work may be related to his understanding of the process of fermentation (the chemical breakdown of a compound) in relation to the making of wine.

Lister knew at a young age that he wanted to be a surgeon, but his father made sure he completed his formal education first, just in case. As a teenager Lister attended schools at Hitchin and Tottenham, England, studying mathematics, natural science, and languages. In 1844 he entered University College in London, England, to study medicine. After graduating in 1852, he began a surgical career in Edinburgh, Scotland. In 1860 he became professor of surgery at the Royal Infirmary in Glasgow, Scotland.

Making surgery safer

With the introduction of anesthesia (something that causes a patient to lose sensation in a certain area of the body or the entire body) in the 1840s, operations had become more common. Except, many patients died from infection following surgery. Inflammation (swelling) and suppuration (pus formation) occurred in almost all accidental wounds after surgery, and more so when patients were treated at the hospital rather than at home by a visiting surgeon. The reason was unknown, but it was believed to be something in the air. As a result wounds were heavily dressed or washed with water to keep the air out; operations were a last resort. The head, chest, and stomach were almost never opened, and injured limbs were usually amputated (cut off).

LISTER

Joseph Lister.
Courtesy of the Library of Congress.

Lister's research centered on the microscopic changes in tissue that result in inflammation. When he read Pasteur's work on germs in 1864, Lister immediately applied Pasteur's thinking to the problem he was investigating. He concluded that inflammation was the result of germs entering and developing in the wound. Since Pasteur's solution of killing germs with heat could not be applied to the living body, Lister decided to try a chemical to destroy the germs.

That same year Lister read in the newspaper that the treatment of sewage (liquid waste matter from sewers) with a chemical

called carbolic acid had led to a reduction of diseases among the people of Carlisle, England, and among the cattle grazing on sewage-treated fields. In 1865 he developed a successful method of applying carbolic acid to wounds. The technique of spraying the air in the operating room with carbolic acid was used only briefly, as it was recognized that germs in the air were not the main problem. Lister perfected the details of the antiseptic method and continued his research. He developed the surgical use of a sterile (germ-free) thread for closing wounds and introduced gauze dressings. Antisepsis became a basic principle for the development of surgery. Amputations became less frequent, as did death from infections. Now new operations could be planned and executed safely.

Later years

In 1869 Lister returned to Edinburgh, and in 1877 he was appointed professor of surgery at King's College in London, England. He won worldwide acclaim, honors, and honorary (received without fulfilling the usual requirements) doctorates and was made a baron in 1897. After he retired from medicine in 1893 he became foreign secretary of the Royal Society (Great Britain's oldest organization of scientists), and he was its president from 1895 to 1900. He died at Walmer, Kent, England, on February 10, 1912. Although Lister's antiseptic method was soon replaced by the use of asepsis (keeping the site of the operation and the instruments used free from germs), his work represented the first successful application of Pasteur's theory to surgery and marked the beginning of a new era.

ANDREW LLOYD WEBBER

Born: March 22, 1948

London, England

English composer and musician

The English musician Andrew Lloyd Webber is the composer of such musical theater hits as *Joseph and the Amazing Technicolor Dreamcoat*, *Jesus Christ Superstar*, *Evita*, *Cats*, *Starlight Express*, *The Phantom of the Opera*, and *Aspects of Love*. His early successes brought him four Tony awards, four Drama Desk awards, and three Grammys.

Childhood inspirations

Andrew Lloyd Webber was born on March 22, 1948, in London, England. His father, William, was the director of the London College of Music, his mother, Joan Hermione, was a piano teacher, and his younger brother, Julian, is a cellist. Thus,

Lloyd Webber came by his musical ability naturally. Young Lloyd played the piano, the violin, and the French horn. Excerpts from his first musical composition, *The Toy Theatre*, were published in a British music magazine.

As a child, Lloyd Webber dreamed of becoming Britain's chief inspector of ancient monuments. He won a Challenge Scholarship to Westminster and in 1965 entered Oxford University as a history major. In the 1980s, after a long and successful career in music, he exercised his love for history through Sydmonton Court, his country estate, whose oldest section dates from the sixteenth century and where his compositions were tried out at yearly festivals.

Other childhood pastimes of Lloyd Webber's surface in his works and his approach to their staging. His keen ability to envision fully-mounted productions of even his most spectacular pieces may have stemmed, at least in part, from his experience as an eleven year old working with his elaborate toy theater, built to scale. Lloyd Webber's lifelong fascination with trains was exhibited in *Starlight Express* (1984). Some consider this his childhood fantasy gone wrong, a warped interpretation of the famous story of the little engine that could.

Lloyd Webber's formal education ended after only one term at Oxford. He left to begin work on the never-to-be-produced musical *The Likes of Us*, which is based on the life of British Dr. Bernardo, a well-known philanthropist, or one who raises money for charities. Lloyd Webber's career was closely linked with that of lyricist (writer of songs) Tim Rice, and their partnership began with this musical.

Andrew Lloyd Webber.

Lloyd Webber and Rice

The duo's next effort was *Joseph and the Amazing Technicolor Dreamcoat* (1968, extended 1972), at first a concert piece, then expanded into a two-act production. The score demonstrates what were to become the Lloyd Webber trademarks of shifting time signatures and styles, ranging from French cafe music to calypso (a musical style originating from the West Indies), country, jazz, and rock.

In *Jesus Christ Superstar* (1971), popular music was presented in classical operatic form. Developed first as a demonstration disc for Decca Records, it began the Lloyd Web-

ber-Rice tradition of recording first, then producing. The score boasts the hit single "I Don't Know How To Love Him." Tom O'Horgan, who gained fame by directing *Hair*, directed the 1971 version at Broadway.

When Rice became irritated with a proposed musical based on the works of writer P. G. Wodehouse (1881–1975), Lloyd Webber teamed up with British playwright Alan Ayckbourn on the unsuccessful *Jeeves* (1974). During this period, Lloyd Webber also composed the film scores for *Gumshoe* (1971) and *The Odessa File* (1973).

Again, Lloyd Webber and Rice were paired for *Evita* (1976), the story of the actress who married Argentinean dictator Juan Peron (1895–1975). Veteran Broadway producer Harold Prince was hired to direct the 1978 and 1979 productions on both sides of the Atlantic. *Evita* faced the criticisms that have consistently plagued Lloyd Webber's compositions. He was accused of "borrowing" songs and his work was called "derivative," "synthetic," and a "pastiche," or imitation of others.

Success in the 1980s

Lloyd Webber's next production, *Song and Dance* (1982), was the result of combining two of his earlier pieces: *Variations* (1978) and *Tell Me on a Sunday* (1979). *Variations* (1978) is a set of cello variations written for his brother, Julian, and *Tell Me on a Sunday* (1979) is the story of an English working girl who moves to New York City and goes through a series of relationships.

Cats (1981) marked the composer's personal and professional breakthrough. Based on T. S. Eliot's (1888–1965) volume of children's

verses, *Old Possum's Book of Practical Cats*, the production was staged by Royal Shakespeare director Trevor Nunn and its extravagant scenery was created by John Napier. Rice was called in to provide assistance on the lyrics for the now-famous "Memory," but his words were abandoned in favor of Nunn's.

Lloyd Webber found himself attracted at first vocally, then romantically, to performer Sarah Brightman. She was a castmember in *Cats*, and in 1983 he abandoned his first wife, Sarah Hugill, for her. He later married Brightman and she was cast as the female lead, Christine Daae, in *The Phantom of the Opera*.

With *Cats*, putting on an enormous display became the key to success both in London and on Broadway. It was only natural that a production like *Starlight Express* would follow on its heels. Lloyd Webber and Prince were paired again for the romantic 1986 production of *Phantom of the Opera*. Lloyd Webber's production *Aspects of Love* (1989) was in many ways a "retread." The score is filled with tunes retrieved from Lloyd Webber's past, reworked for the occasion.

Production

In the 1980s Lloyd Webber turned his attention toward his production company, Really Useful Theatre Group, Inc. In April 1990 he announced his intention to take a leave from writing musicals and to turn to moviemaking, perhaps even a film version of *Cats* with Stephen Spielberg (1947–).

In July 1990 Lloyd Webber announced his impending divorce from Sarah Brightman while she was completing her summer concert tour of *The Music of Andrew Lloyd Webber*. However, the couple planned to continue working together after their divorce, despite

Lloyd Webber's early marriage in London to Madeleine Gurdon.

Lloyd Webber went on to produce *Sunset Boulevard*, in London, 1993, and in Los Angeles and on Broadway, both in 1994. Besides *The Likes of Us* (lyrics by Rice), his other unproduced plays include *Come Back Richard, Your Country Needs You* (with Rice), and *Cricket*.

In 2000 Lloyd Webber bought Stoll Moss, one of Britain's top theater companies, for about 85 million pounds (\$139.4 million), which made him one of London's biggest theater owners.

ALAIN LOCKE

Born: September 13, 1886

Philadelphia, Pennsylvania

Died: June 9, 1954

New York, New York

African American educator and editor

Alain Locke, the distinguished African American intellectual of his generation, was the leading promoter and

LOCKE, ALAIN

Alain Locke.

interpreter of the artistic and cultural contributions of African Americans to American life. As a professor of philosophy (the study of knowledge), his theory of “cultural pluralism” valued the uniqueness of different styles and values available within a democratic society.

Locke's childhood

Alain LeRoy Locke was born on September 13, 1886, in Philadelphia, Pennsylvania, into a well-known family. Alain's father, Pliny Locke, had obtained a degree in law from Howard University, and then became a mail clerk in Philadelphia. Mary Hawkins, Alain's mother, was a teacher.

Pliny Locke and Mary Hawkins were engaged for sixteen years, not marrying until they were middle aged. Alain, their only child, was brought up in a cultured home environment. When Alain was just six years old his father died, and his mother supported her son through teaching. Alain attended the Ethical Culture School, which was a school with modern ideas about education, teaching moral principles and human values. Young Alain became ill with rheumatic fever early in his childhood. The disease permanently damaged his heart and restricted his physical activities. He dealt with his weak physical condition by spending time reading books and learning to play the piano and violin.

Locke attended Central High School, graduating second in the class of 1902, and then studied at the Philadelphia School of Pedagogy, where he was first in his class. He attended Harvard University and completed Harvard's four-year program in three years, graduating magna cum laude (second in his class) in 1907, being elected to Phi Beta Kappa (an honor society made up of high-ranking American college and graduate students in the subject of liberal arts and sciences), and winning the school's most distinguished award, the Bowdoin Prize, for an essay in English. It was a remarkable achievement for anyone, especially an African American during this highly segregated (separated because of race) era.

Locke was named a Rhodes Scholar (a person who receives a scholarship to Oxford University for two to three years), the first African American chosen for this award, and sailed to England in 1907 to attend Oxford University. In 1910 he received a bachelor's degree in literature. From Oxford he moved

to Germany for advanced work in philosophy at the University of Berlin from 1910 to 1911. This time in Europe helped to intensify his interest in modern art, music and literature.

Became an educator

In September 1912, Locke was appointed assistant professor of English at Howard University, an African American college, in Washington, D.C. Frustrated, because Howard's Board of Trustees would not approve courses on comparative race relations, Locke turned his attention back to philosophy. In 1916, he received a one-year appointment as an Austin Teaching Fellow at Harvard. Two years later he received his doctorate degree and returned to Howard as a full professor of philosophy. He would head this department until his retirement in 1953.

During these years Locke was a major contributor to *Opportunity: Journal of Negro Life and Survey Graphic*. He edited a special issue of the latter publication devoted to the Harlem Renaissance, the flourishing of African American art, literature, and music in New York City during the 1920s and 1930s. Expanding it into a book and shifting the focus from Harlem to overall African American cultural life, Locke authored *The New Negro: An Interpretation* in 1925. It was an outstanding collection of the leading African American fiction, poetry, drama, and essays written by himself and others describing the changing state of race relations in the United States.

Locke became the leading authority on modern African American culture and used his position to promote the careers of young artists. He encouraged them to seek out sub-

jects in African American life and to set high artistic standards for themselves.

Locke's cultural influence

Locke served as secretary and editor of the newly established *Associates in Negro Folk Education*. Between 1936 and 1942 this organization published nine "Bronze Booklets" written by leading African American scholars. Locke wrote two of these, *Negro Art: Past and Present* and *The Negro and His Music*, and edited a third, *The Negro in Art: A Pictorial Record of the Negro Artist and of the Negro Theme in Art*. The latter reemphasized his belief that African American artists should look to the works of their African ancestors for subject matter and styles to apply to modern painting and sculpture.

Locke continued his work in philosophy, actively promoting his theory of cultural pluralism (a society made up of several different cultures and their beliefs). This interest led to his pioneering 1942 social science anthology, coedited with Bernhard Stern, *When Peoples Meet: A Study in Race and Culture Contacts*, an examination of dominant and minority populations in various countries around the world.

In demand as a visiting scholar

By the middle of the twentieth century, Locke was a member of the editorial board of the *American Scholar* and, in 1945, the first African American elected president of the American Association for Adult Education, a mainly white national organization.

During the 1945 and 1946 academic year he served as visiting professor of philosophy at the University of Wisconsin. The following

year he was a visiting professor at the New School for Social Research in what had become his second home for many years, New York City, and held a similar appointment the next year at the City College of New York (CCNY).

After 1948 Locke began teaching at both CCNY and Howard. His final achievement was to secure a Phi Beta Kappa chapter at Howard in 1953, a major milestone in the history of African American education.

Locke retired later that year and was awarded an honorary doctorate (a degree given without the usual proceedings) by Howard. He moved permanently to New York City and continued working on his magnum opus (highest achievement), *The Negro in American Culture*, a definitive study of the contribution of African Americans to American society. Unfortunately his recurrent heart problems returned in the spring of 1954, causing his death on June 9, 1954, in New York City. His unfinished manuscript was completed by Margaret Just Butcher.

JOHN LOCKE

Born: August 29, 1632

Wrighton, England

Died: October 28, 1704

Oates, England

English philosopher and political theorist

The English philosopher and political theorist (a person who forms an explanation based upon studying and observing politics and politicians) John Locke began the empiricist tradition (the source of knowledge comes from experience and the senses) and thus started the greatest age of British philosophy (the study of knowledge). He attempted to center philosophy based on the study of importance and capabilities of the human mind.

Early years and school

John Locke was born on August 29, 1632, in Wrington, in Somerset, England, to Agnes Keene and John Locke, the elder. His mother died during his infancy, and Locke and his only brother, Thomas, were raised by their father, who was an attorney in the small town of Pensford near Bristol, England. John was tutored at home because of his delicate health and the outbreak of civil war in 1642. When he was fourteen, he entered Westminster School, where he remained for six years. He then went to Christ Church, Oxford. In 1658 he was elected a senior student at his college. As such he taught Greek and moral philosophy. In order to continue his work at the school he would have to have been ordained (officially consecrated) a minister. Instead he

changed to another study, medicine, and eventually received a license to practice. During the same period Locke met Robert Boyle (1627–1691), the distinguished scientist and one of the founders of the Royal Society, and, under Boyle's direction, took up study of natural science. Finally, in 1668, Locke was made a member of the Royal Society.

Political affairs

In 1665 Locke traveled to Europe as secretary to the English ambassador to the Brandenburg court. Upon his return to England he happened to medically treat Lord Ashley, Earl of Shaftesbury, and later lord chancellor of England. Their friendship and lifelong association drew Locke into political affairs. He attended Shaftesbury as physician and adviser, and Locke drafted *The Fundamental Constitutions of Carolina* and served as secretary to the Board of Trade. In 1676 Locke went to France for his health. An inheritance from his father made him financially independent, and he remained in Montpellier for three years.

Locke rejoined Shaftesbury's service, and when Lord Ashley fled to Holland, he followed. He remained in exile from 1683 to 1689. Most of his important writings were composed during this period. After the Glorious Revolution of 1688 (a revolution that overthrew King James II [1633–1701]) Locke returned to England and later served as a commissioner of trade until 1700. He spent his retirement at Oates, in Essex, and died there on October 28, 1704.

Major works

None of Locke's major writings were published until he was nearly sixty. In 1690

John Locke.

Courtesy of the Library of Congress.

he brought out his major works: *Two Treatises* and the *Essay Concerning Human Understanding*. The four books of the *Essay* were the result of twenty years of intellectual work. The aim of this work was “to inquire into the origin, certainty, and extent of human knowledge, together with the grounds of belief, opinion, and assent.”

The procedure used was what Locke called the “historical, plain method,” which consists of observations of external (outside of a person's body) sensations and the internal (within a person's mind) processes of thinking. This psychological definition of experience as sensation and reflection shifted

the focus of philosophy from an analysis of reality to an exploration of the mind. The new perspective was Locke's major contribution, and it dominated European thought for at least two centuries.

Theory of knowledge

Locke devoted the first two books of the *Essay* to developing a seemingly simple empirical theory of knowledge. Knowledge begins in the external and internal sources of sensation (use of the five senses) and careful thinking. The conclusion drawn in the *Essay* was that knowledge is relational; that is, it consists in the understanding "of the agreement or disagreement among ideas."

The third book of the *Essay* deals with words, and it was a pioneering contribution to the philosophy of language. Locke was a consistent nominalist in that for him language was a custom that was subject to judgement and words were things which "stand for nothing but the ideas in the mind of the man that has them."

The final section of the *Essay* deals with the sections of knowledge. In this view, with the exception of the self and God, all knowledge of existing things is dependent upon sensation. The shortage of real knowledge is fulfilled to some extent by human judgment, which assumes things to be true without actually being aware of the connections. And, according to Locke's commonsense attitude, the major limitations placed upon knowledge reflect that man's mental capacity is appropriate for his character and situation.

JACK LONDON

Born: January 12, 1876

San Francisco, California

Died: November 22, 1916

Glen Ellen, California

American author

American author and supporter of socialism (a system of social organization in which the government owns and manages the distribution and production of goods) Jack London wrote popular adventure stories and social tracts (pamphlets) based on unusual personal experiences. At their best, his works are powerful and moving stories.

Early life

Jack London was born John Griffith Chaney in San Francisco, California, in 1876, the son of Flora Wellman and Henry Chaney. Jack's parents were not married at the time of his birth. Flora married a widower, John London, the same year that her son was born. John was a loving stepfather, but undertook several business and agricultural enterprises that turned out to be unsuccessful. The family, which included Eliza and Ida, daughters of John London's first marriage, moved often.

Because the economic circumstances of Jack's family steadily declined, he held several jobs at the early age of ten. He delivered papers, worked on an ice wagon, and set up pins in a bowling alley, all while going to school. Almost all of the money he earned was turned over to his parents. At the age of thirteen he left school and continued to do odd jobs. He managed to buy a fourteen-foot skiff (small, flat-bottomed open boat) and frequently sailed out into the Oakland, California, bay, often bringing library books with him.

When Jack was fifteen, John was injured in an accident. Jack went to work in a cannery full time to support his family. The work involved bending over machines that had no safety guards. Jack worked the longest hours he could, often eighteen or twenty hours at a stretch. The pay was ten cents an hour.

Jack escaped from that job by becoming an oyster bed pirate in the San Francisco Bay oyster beds. At sixteen he joined the California Fish Patrol at Benecia. Just after he turned seventeen he signed aboard a ship, the *Sophia Sutherland*, as an able-bodied seaman and headed to the Pacific Northwest for a seal-hunting expedition. After returning from his sea voyage, Jack worked in a jute (fiber from certain tropical plants used to make rope) mill, and then a power plant.

Jack completed his high school education in a year and went to the University of California for a semester. He traveled to the Alaskan Klondike with the gold prospectors and, after returning to California, launched his writing career.

Survival of the fittest

London won national acclaim for his short stories about the brutal and vigorous

Jack London.

Courtesy of the Library of Congress.

life of the Alaskan Yukon, published as *The Son of the Wolf* (1900). Other writings in the same genre (type) followed. The best known is *The Call of the Wild* (1903), which describes how an Alaskan dog leaves civilization to join a wolf pack. *The Sea-Wolf* (1904) tells of the conversion of a civilized man to a simple way of living.

These books stress the primitive survival of the fittest. This stems from London's belief in the theories of evolution that Charles Darwin (1809–1892) wrote about. (Evolution is the theory that groups of organisms may change or develop over a long period of time.) Other tales that developed similar

themes are *White Fang* (1906), *The Strength of the Strong* (1911), *Smoke Bellew* (1912), and *The Abysmal Brute* (1913).

Influence of socialism

London was also influenced by the socialistic theories of Karl Marx (1818–1883). An early book, *The People of the Abyss* (1903), described slum conditions in London, England. Other books of the same type included *The War of the Classes* (1905), *The Iron Heel* (1907), *The Valley of the Moon* (1913), and *The Human Drift* (1917).

Two of London's best books are semi-autobiographical (based on his own experiences)—*Martin Eden* (1909) and *John Barleycorn* (1913). The former recounts his struggles as a writer; the latter tells about his long-lasting fight against alcoholism.

London's life and work hold many contradictions. He believed in socialism, and he believed in Darwin's idea of survival of the fittest. He felt his own success illustrated the concept of the superman who stands above the ordinary person and triumphs by force of will. Although his work is often regarded as adventure stories for young people, it also deals with the adult theme of environmental determinism, or the idea that the world shapes us in ways we are powerless to resist.

HENRY WADSWORTH LONGFELLOW

Born: February 27, 1807

Portland, Maine

Died: March 24, 1882

Cambridge, Massachusetts

American poet

The sentimental (appealing to the emotions) poems of the American writer Henry Wadsworth Longfellow made him an extremely popular author at home and in other countries in the nineteenth century.

Early life

Henry Wadsworth Longfellow was born in Portland, Maine, on February 27, 1807, into an established New England family. As the son of a prominent lawyer, Henry was expected to have a similar profession as an adult. He attended Portland Academy and then Bowdoin College, in Maine, graduating in 1825. He was an excellent student whose skill in learning foreign languages led the trustees (persons appointed to administer the affairs of an institution) at Bowdoin (of which his father was one) to offer the young graduate a professorship of modern languages. He

prepared himself further with study abroad (in Europe), at his own expense, before undertaking his duties. When he started his new position he had to create his own textbooks, because the study of modern languages was such a new field.

Young writer

During Longfellow's three years in Europe his lifelong harmony with Old World (European) civilization was firmly established. He returned home in 1829 and two years later married Mary Storer Potter. In 1833 he published *Outre-Mer: A Pilgrimage beyond the Sea*, a collection of picturesque (forming a pleasing picture) travel essays modeled after Washington Irving's (1783–1859) *Sketch Book*.

In 1834 Longfellow accepted a professorship at Harvard University in Cambridge, Massachusetts. He did not start his new job until 1837, after he had completed a tour of European and Scandinavian (northern European) countries. During this trip his wife died. While staying at Heidelberg, Germany, he came under the spell of the works of the German romantic poet Novalis (1772–1801). Novalis's moody, mystical (pertaining to a spiritual event) nocturnalism (pertaining to the night) struck a responsive chord in the grieving Longfellow.

In 1839 Longfellow published the sentimental prose romance *Hyperion* and his first volume of poetry, *Voices of the Night*. In *Hyperion* he rather indiscreetly (lacking sound judgment) told the story of his courtship of Frances Appleton, whom he had met in Europe soon after his wife's death. They were married in 1843. Her father, a wealthy Boston, Massachusetts, merchant, gave them

Henry Wadsworth Longfellow.

Craigie House as a wedding present. This house became a famous visiting place for Longfellow's admirers. It is now called Longfellow House and is a national historic site. It holds most of the original furnishings from Longfellow's time, including his personal library of over ten thousand books.

Early poetry

Longfellow's poem "Hymn to the Night," in *Voices of the Night*, conveys the poet's debt to Novalis and his romantic kinship with the "calm, majestic presence of the Night." However, "A Psalm of Life," one of the best-known poems from this first volume, reflects the influence of the famed German poet Johann

Wolfgang von Goethe (1749–1832). His forceful philosophy suggested to Longfellow the direction of his hymn to action: “Life is real! Life is earnest! / Be not like dumb, driven cattle! / Be a hero in the strife.” *Voices of the Night* was well received, and within a few years forty-three thousand copies had been sold. Longfellow’s audience as a popular writer was assured.

Longfellow’s next volume, *Ballads and Other Poems* (1842), contained two strong narrative poems, “The Wreck of the Hesperus” and “The Skeleton in Armor,” as well as the sentimental verses “Maidenhood” and “The Rainy Day” (“Into each life some rain must fall, / Some days must be dark and dreary”) and the moralizing (explaining in the sense of right and wrong) poem “The Village Blacksmith.”

After a trip to Europe in 1842 Longfellow published *Poems on Slavery* (1842) and *The Spanish Student: A Play in Three Acts* (1843). In 1845 two volumes of poetry appeared: the anthology (a series of chosen literary pieces) *The Waif*, to which Longfellow contributed the poem “The Day Is Done”; and *The Belfry of Bruges and Other Poems*. Several poems in this second collection reflect Longfellow’s deep attachment to the traditions of European culture. In addition, this volume contained the popular “The Old Clock on the Stairs,” “The Arrow and the Song,” “The Arsenal at Springfield,” “The Bridge,” and one of his best sonnets (traditional, fourteen-line poems), “Mezzo Cammin.”

Epic poems

Longfellow wrote several epic poems. An epic poem is a long poem that tells a story, typically about a hero, and centers on uncommon achievements and events. He

achieved a national reputation with the publication of *Evangeline* (1847), a highly sentimental narrative poem on the expulsion (driving out) of the French from Acadia. He wrote *Evangeline* in dactylic hexameters. Dactyls are poetic feet of three syllables, with the first syllable long or accented and the others short or unaccented. Hexameters are verses having six poetic feet. The book was enthusiastically received.

Longfellow next released the unimaginative romantic novel *Kavanaugh* (1849) and *By the Seaside and the Fireside* (1850), which contained the very popular nationalistic (designed to arouse pride in one’s country) poem “The Building of the Ship”: “Thou, too, sail on, O Ship of State! / Sail on, O UNION, strong and great!”

In 1854 Longfellow resigned his Harvard professorship to devote himself to his writing career. A year later he published *The Song of Hiawatha*, a narrative epic poem on the Native American. For this work Longfellow drew on Henry Schoolcraft’s books on Native Americans. He wrote in trochees or poetic feet of two syllables, the first long or accented and the second short or unaccented. In short order, he repeated the success of *Hiawatha* with *The Courtship of Miles Standish* (1858).

Major projects in later years

Following the tragic death of Longfellow’s second wife in a fire in their home in 1861, he busied himself with the *Tales of a Wayside Inn* (1863), in which various speakers, sitting around a fireplace, narrate stories. Other tales appeared in 1872 and 1873. Longfellow also translated poetry from eighteen languages. His most significant transla-

tion, published in 1867, was of a long poem by the medieval writer Dante Alighieri (1265–1321) called the *Divine Comedy*.

In the last phase of Longfellow's long career, he worked on another major project, *The Christus: A Mystery*. Completed in 1872, this work was concerned with "various aspects of Christendom in the Apostolic, Middle, and Modern Ages." The work came in three parts. An earlier work, *The Golden Legend* (1851), formed part II; part III, *The New England Tragedies* (1868), dealt with Puritan (a religious group in New England that stressed a strict moral code) themes; and, finally, part I, *The Divine Tragedy* (1871), concerned the life of Jesus Christ.

Several more volumes of Longfellow's verse were issued before his death on March 24, 1882, in Cambridge, Massachusetts. After his death, he became the first American whose bust (sculpture of one's head) was placed in the Poet's Corner in Westminster Abbey, London, England.

To the modern reader, Longfellow's sentimental and optimistic poetry often sounds old-fashioned. He used his wide knowledge of the literature of other countries as a source for both the form and content of many of his poems. Several of his poems are set in other countries including Italy, Spain, France, and Norway. It should be remembered that Longfellow wrote for the common man. In his elegant and clear style he presented popular American values, such as the family circle and heroism.

JOE LOUIS

Born: May 13, 1914

Lexington, Alabama

Died: April 12, 1981

Las Vegas, Nevada

African American boxer

African American boxer Joe Louis was world heavyweight champion from 1937 to 1948. He defended his title twenty times in four years.

Early years

Joseph Louis Barrow, born on May 13, 1914, was the seventh of eight children of Munroe Barrow and Lily Reese. His father was an Alabama sharecropper and died when Joe was four. His mother took in washing to support her family. Joe was close to his large family, particularly to his mother, from whom he inherited a deep religious sentiment. His mother married Patrick Brooks, with children of his own, when Joe was seven, and the family moved to Detroit, Michigan, in 1926.

LOUIS

Joe Louis.

Reproduced by permission of AP/Wide World Photos.

After Brooks lost his job, Joe and his brothers shined shoes, ran errands, and sold newspapers before and after school to help out the family. Joe also worked as an assistant to an ice-wagon driver. He later said that carrying heavy ice helped him to develop his big shoulder muscles.

As a teenager, Joe was the best boxer of his group. At nineteen he won the National Light Heavyweight Amateur Crown of the Golden Gloves in 1933.

Louis received his ring name from one of his managers, John Roxborough, who found the name Joe Louis Barrow too long. Jack Blackburn, a very knowledgeable boxing

man, was Louis's trainer. He taught Louis how to punch and worked with him to develop his body coordination.

Early matches

Before Louis became champion, he was beaten once, by Max Schmeling in 1936. The following year he defeated Jim Braddock for the championship. In 1938 Louis met Schmeling again and knocked him out in the first two minutes of the first round. Louis fought boxers including Billy Conn, Tony Galento, Rocky Marciano (1923–1969), and “Jersey Joe” Walcott (1914–1994). He won nineteen other title fights.

During World War II (1939–45; a war fought between the Axis powers: Germany, Italy, and Japan—and the Allies: England, France, the United States, and the Soviet Union) Louis was drafted, served faithfully, and fought two bouts for army and navy relief.

The curse of many victories in a short period of time was the accumulation of a heavy tax burden. For example, Louis won \$349,228 for his victory over Schmeling and \$591,117 for beating Conn. In his entire ring career he earned \$4,677,992. But his federal income taxes were \$1,199,000. When penalties were assessed, taxes became astronomical.

Business ventures

Another source of trouble for Louis was his partnership in a public relations firm. In the early 1960s this firm entered into a contract with Cuba for \$250,000 to promote tourism. Although this was not illegal, it was considered in poor taste to deal with a country with whom the United States did not maintain diplomatic relations.

Louis's other business ventures included the Joe Louis Food Franchise, a chain of food shops he opened in 1969 with his former ring rival Billy Conn. The former champ also served as a celebrity greeter at the Caesar's Palace Casino in Las Vegas, Nevada.

Final years

Unfortunately, drugs took a toll on the once indomitable (not able to be beaten) champion in his final years. In 1969, he was hospitalized after collapsing on a New York City street. While the incident was at first credited to "physical breakdown," Louis later admitted to cocaine use and fears of a plot against his life. The following year, Louis spent five months in the hospital suffering from paranoid delusions (irrational anxiety and fear toward others). Strokes and heart ailments caused his condition to worsen. He had surgery to correct an aortic aneurysm (abnormal widening of a blood vessel) in 1977 and was thereafter confined to a wheelchair.

Despite failing health, Louis still found time to attend major boxing events. On April 12, 1981, he sat ringside at the Larry Holmes and Trevor Berbick heavyweight championship bout at Caesar's Palace. Hours after the fight, Louis went into cardiac arrest (a heart failure) and died at the age of sixty-six.

In 1994, the bronzed boxing glove that Louis used to defeat Max Schmeling was donated to the city of Detroit by the Michigan Jewish Sports Hall of Fame. Dubbed "The Glove That Floored Nazi Germany," it was enshrined in a plexiglass case at the city's Cobo Center, a monument to Louis's enduring legacy.

GEORGE LUCAS

Born: May 14, 1944

Modesto, California

American director, screenwriter, and producer

American filmmaker George Lucas created some of the most profitable movies in history, including the *Star Wars* and *Indiana Jones* films. Lucas is also responsible for many new developments in filmmaking, especially involving special effects.

Early years

George Walton Lucas Jr. was born in Modesto, California, on May 14, 1944, the only son among George and Dorothy Lucas's four children. His father sold office supplies and equipment and owned a walnut farm. Lucas was not a good student; he enjoyed racing cars and owned a souped-up, high-powered Fiat (a brand of Italian automobile)

in high school. Shortly before graduating he was involved in a serious car accident, nearly dying from his injuries. After recovering from a three-month hospital stay, Lucas decided that he wanted to go to art school. His parents refused to pay for it, so he instead enrolled at Modesto Junior College to study social sciences.

Lucas became interested in photography and film and began making films with a small camera. While photographing a car race he met Haskell Wexler (1922–), a famous cinematographer (motion picture cameraman), who helped him get into the University of Southern California (USC) film school. Lucas produced eight student films, including *THX-1138: 4EB* (1965), in which he explored his vision of the future. After graduating Lucas worked as a cameraman (he filmed part of the famous 1968 Rolling Stones concert in Altamont, California, in which a man was stabbed to death) and as an editor for films produced by the United States Information Agency. While at this job he met Marcia Griffin, a film editor. They married in 1969 and adopted a child in 1981. The couple divorced in 1984, and Lucas later adopted two children on his own.

Early film career

In 1969 Lucas won a scholarship from Warner Brothers Studios, which allowed him on the set to watch the filming of *Finian's Rainbow*, which was being directed by Francis Ford Coppola (1939–). Lucas and Coppola became friends, and Lucas helped edit the film. Lucas also worked on Coppola's next film, *The Rain People*. Through Coppola's newly created film studio and production company, American Zoetrope, Lucas made

his first feature, *THX—1138*, based on the short film he made as a student.

In 1973 Lucas experienced his first real film success with *American Graffiti*, which focused on one summer night in 1962, following teenage boys and their cars. Lucas co-wrote the script and directed it, with Coppola serving as a co-producer. *American Graffiti* was filmed in less than a month for a little over \$750,000. Although Universal, the studio that had paid for the production, did not believe *American Graffiti* would make a profit, by several months after its release it had become the surprise hit of the year. It was one of the most profitable films of the 1970s and was nominated (put forward for consideration) for five Academy Awards.

Star Wars

Lucas next began working on the script for an original space story, *Star Wars*. He planned the story as a series of three related trilogies (series of three works); *Star Wars* was the first episode of the middle trilogy. The film included elements of westerns, soap operas, and other types of films as well. The Lucas-directed *Star Wars* was released in May 1977. It received very positive reviews. His very personal vision also appealed to a mass audience. The film smashed all box office records, and many people went to see it more than once.

Star Wars earned \$400 million worldwide in its first release. The experience of making the film, though, left Lucas exhausted, and he did not direct another film for twenty years. He had made a wise decision to turn down a director's fee (money that a director receives for making a film) for his work on the film in exchange for rights to merchandising (the ability to make money

from products, such as toys, related to the movie). He also retained the rights to the *Star Wars* sequels (follow-up films). Lucas made \$500 million between 1977 and 1980 from the sale of *Star Wars* merchandise, including books, toys, kits, and consumer items. He managed the merchandising through his company, LucasFilm Ltd., which was established in 1979. Lucas set up other companies to manage his film empire.

In 1980 the second film in Lucas's trilogy, *The Empire Strikes Back*, was released. Lucas was the executive producer (one who pays for the release of a movie) and wrote the story on which the script was based. Although some criticized the story, many noted that the special effects were better. Lucas returned to a more active role in 1983's *The Return of the Jedi*. He co-wrote the script and again served as executive producer. While the special effects were excellent, critics thought they took attention away from the characters and the story. Still, all three films together brought in \$1 billion. Sales of official merchandise brought in over \$3 billion.

Other successful projects

At the time Lucas began developing *Star Wars*, he had an idea for another series of films. The *Indiana Jones* series was developed as a tribute to adventure films of the 1940s. Lucas wrote the story and served as producer for the first *Indiana Jones* movie, entitled *Raiders of the Lost Ark*. His story again pleased both critics and audiences. Lucas was less involved in the next two *Indiana Jones* movies, *Indiana Jones and the Temple of Doom* and *Indiana Jones and the Last Crusade*. In 1992 he produced a television series, *The Young Indiana Jones Chronicles*, which lasted

George Lucas.

Reproduced by permission of Archive Photos, Inc.

for only one season. Throughout the 1980s and most of the 1990s Lucas worked mainly as a producer. Movies such as *Howard the Duck* (1986) and *Radioland Murders* (1994) were failures; others, such as *Tucker: The Man and His Dream* (1988) and *Willow* (1988), were more successful.

Lucas, with profits from his films and LucasFilm, Ltd., founded Skywalker Ranch, a production house (a place where a movie is edited for theatrical release) in California. Lucas based all of his companies there; one in particular changed the face of the film industry. Originally created to handle the special effects for *Star Wars*, Industrial Light and

Magic (ILM) improved film technology (applied science) through research and development. ILM branched out to do special effects for other movies, such as *Star Trek* and *E.T.: The Extra-Terrestrial*. ILM was also responsible for THX, an improved sound system found in many movie theaters.

Vision continues

Though many doubted the other two *Star Wars* trilogies would ever be made, in 1994 Lucas began writing the scripts for the first trilogy. To prepare audiences, “special edition” versions of the original *Star Wars* trilogy were released in theaters beginning in 1997. Using effects developed by his companies, Lucas fixed some of the errors in the first films and included new scenes, adding four and a half minutes to *Star Wars*.

In May 1999 Lucas released *The Phantom Menace*, the first installment of the first *Star Wars* trilogy. Lucas directed the film and wrote the script. In December 2001 Lucas donated several items used in the *Star Wars* films to the online auction firm eBay to raise money for relatives of the victims of the September 11, 2001, terrorist attacks on the United States. In 2002 the next *Star Wars* film, *Attack of the Clones*, was released.

PATRICE LUMUMBA

Born: July 2, 1925

Kasai, Congo

Died: January 18, 1961

Katanga, Congo

Congolese prime minister

Patrice Lumumba was the first prime minister of the Republic of the Congo. He was a leading figure in the Congo as that country established its independence from Belgium, which had controlled the Congo since the late nineteenth century. Lumumba's murder in 1961 has made him a symbol of struggle for champions of African nations' attempts to unite and to break free of the influence of the European powers that once colonized (held territory in) the continent.

Child of a village

Patrice Emery Lumumba was born on July 2, 1925, in the tiny village of Onalua in northeastern Kasai, a Congolese province (political unit or region). At the time of his birth, the Congo was still a colony (a territory governed by a foreign power) of Belgium. As a child, Lumumba attended Protestant and then Catholic schools run by white missionaries—that is, by people sent to do religious

or charitable work on behalf of their church. At the mission schools, Lumumba proved to be a fine student, even though the mud-brick house he lived in had no electricity and he could not study after dark. In addition, the mission schools were poorly equipped, with few textbooks or basic school supplies.

Nevertheless, Lumumba's teachers spotted his quick intelligence and loaned him their own books, encouraging him to advance. Some teachers also found that his intelligence caused them problems, feeling he asked too many troublesome questions.

Political leader

As a young man, Lumumba found a job as a postal clerk in the city of Stanleyville (now called Kisangani) in 1954. There he rapidly became a community leader and organized a postal workers' labor union. His activities were encouraged by local members of the Belgian Liberal political party.

In 1957, having been appointed to the position of sales director for a brewery, Lumumba left Stanleyville for the Congo's capital, Léopoldville (now called Kinshasa). There he soon became involved in an important political project. He helped to found the Movement National Congolais (MNC) political party, which aimed to represent all Congolese, rather than representing only the interests of a particular tribe or region. Lumumba's exciting personality and public speaking talents soon won him prominence in this party.

National figure

In 1959 the Belgian authorities announced a new plan for the Congo. They proposed

Patrice Lumumba.

Reproduced by permission of AP/Wide World Photos.

to hold local elections that would lead within five years to full Congolese independence. During that year, Lumumba gained recognition as the only truly national figure on the Congo political scene. His persuasive, attractive personality dominated the political meeting called the Luluabourg Congress in April 1959, in which all the political groups who favored a unitary form of government for the Congo—one that would unite tribes and regions into one nation—attempted to establish a common front. However, Lumumba's growing reputation and seemingly radical views caused hostility among other MNC leaders. The result of this disagreement was a

split in the party in July 1959. Most of the party's original founders supported Albert Kalonji as their representative, while Lumumba held onto the loyalty of most other party members.

Lumumba was briefly imprisoned in November 1959 on charges of encouraging the outbreak of riots in Stanleyville, but he was set free in time to attend the Round Table Conference in Brussels, Belgium. The Belgian government had called for this conference as a forum in which all Congolese political parties could discuss plans for their country's future. At the conference, Lumumba's dramatic presence stole the show from other Congolese leaders. His efforts throughout this period were directed more firmly than those of any other Congolese politician toward the organization of a nationwide movement for an independent Congo.

Head of government

In the May 1960 general elections, Lumumba and his allies won 41 of 137 seats in the National Assembly (the Congo's legislature). They also gained important positions in four of six provincial governments. As leader of the largest single party, Lumumba was somewhat reluctantly selected by the Belgians to become the Congo's first prime minister (and minister of defense) a week before independence. Lumumba's longtime political rival Joseph Kasavubu became president of the republic with Lumumba's apparent support.

During his brief time in office, Lumumba had to face an unusually high number of sudden emergencies. These included the revolt of the army and the secession (formal withdrawal from the Congo) of the provinces of Katanga and Southern Kasai, which had been

encouraged by Belgian interests and military forces. Lumumba turned to the United Nations (UN) for support, only to discover that it had no intention of accepting his definition of what was best for the Congo. It insisted on opposing the use of any force to alter the situation. Desperate for help, Lumumba asked for support from the Soviet Union to begin military action against the secessionist governments of Southern Kasai and Katanga. He was stopped in this attempt when President Kasavubu dismissed him from office in September 1960.

The National Assembly put Lumumba back in power as prime minister, but a small group from the army, led by Colonel Mobutu, took over the government instead. Lumumba was put under unofficial house arrest (confinement in one's home). Meanwhile, his political associates had gone to Stanleyville to organize a rival government. Lumumba slipped out of the capital and tried to make his way toward Stanleyville, but he was arrested by an army patrol and held prisoner in a military camp at Thysville.

Lumumba's death and legacy

Even after his imprisonment, Lumumba's reputation and the strength of his followers remained a threat to the unstable new rulers of the Congo. This was demonstrated when Lumumba nearly managed the incredible feat of persuading his military jailers to help him retake power. This incident only strengthened the conviction of authorities in the capital to get rid of Lumumba. They formed a plan to transfer him to either one of the secessionist states of Southern Kasai or Katanga (where he was sure to be executed) as a possible way of reconciling with these two breakaway regions.

MARTIN LUTHER

On January 18, 1961, Lumumba was flown to Elisabethville, the capital of Katanga. There, despite the presence of UN troops, he was picked up by a small group led by Katanga's interior minister and included white mercenaries (professional soldiers hired by a foreign army). He was taken to a nearby house and murdered.

The Katanga government made clumsy attempts to cover up the murder, but the shock waves caused by the killing traveled around the world. They created enough international pressure to cause the UN Security Council to permit the use of force as a last resort by UN forces in the Congo. This decision caused events that led to the restoration of a civilian government in Léopoldville and to the eventual end of all movements by regions to secede from the Congo. In addition, Lumumba's tragic murder caused him to be hailed as a hero and symbol for various causes after his death. However, he is best remembered as a passionate believer in the power of African nations to shape their own destinies and free themselves from colonial influence.

Born: November 10, 1483

Saxony, Germany

Died: February 18, 1546

Saxony, Germany

German reformer

The German reformer (one who works to change outdated practices and beliefs) Martin Luther was the first and greatest figure in the sixteenth-century Reformation. An author of commentaries on Scripture (sacred writings), theology (the study of religion), and priestly abuses, a hymnologist (writer of hymns [sacred songs]), and a preacher, from his own time to the present he has been a symbol of Protestantism (group of Christian faiths that do not believe in the supremacy of the pope, but in the absolute authority of the Bible).

Family and education

Martin Luther was born at Eisleben in Saxony, Germany, on November 10, 1483, the son of Hans and Margaret Luther. Luther's parents were peasants, but his father had worked hard to raise the family's status, first as a miner and later as the owner of several small mines, to become a small-scale businessman. In 1490 Martin was sent to the Latin school at Mansfeld, in 1497 to Magdeburg, and in 1498 to Eisenach. His early education was typical of late-fifteenth-century practice. To a young man in Martin's situation, the law and the church offered the only chance for a successful career. He chose to become a lawyer to increase the Luther fam-

ily's success, which Hans had begun. Martin was enrolled at the University of Erfurt in 1501. He received a bachelor of arts degree in 1502 and a master of arts in 1505. In the same year he enrolled in the instructors of law, giving every sign of being a dutiful and, likely, a very successful, son.

Religious conversion

Between 1503 and 1505, however, Martin experienced a religious crisis that would take him from the study of law forever. A dangerous accident in 1503, the death of a friend a little later, and Martin's own personal religious development had by 1505 changed his focus. Then, on July 2, 1505, returning to Erfurt after visiting home, Martin was caught in a severe thunderstorm and flung to the ground in terror; at that moment he vowed to become a monk if he survived. This episode changed the course of Luther's life. Two weeks later, against his father's wishes and to the dismay of his friends, Martin Luther entered the Reformed Congregation of the Eremitical Order of St. Augustine at Erfurt.

Life as a monk at Erfurt was difficult. Luther made his vows in 1506 and was ordained (officially given a religious position in the church) a priest in 1507. No longer in disagreement with his father, he was then selected for advanced theological study at the University of Erfurt.

Luther at Wittenberg

In 1508 Luther was sent to the University of Wittenberg to lecture in arts. He was also preparing for his doctorate of theology while he taught. In 1510 Luther was sent to Rome, Italy, and in 1512 received his doctorate in theology. Then came the second significant

turn in Luther's career: he was appointed professor of theology at Wittenberg. He was to teach throughout the rest of his life.

In 1509 Luther published his lectures on Peter Lombard (1095–1160); in 1513–1515 those on the Psalms; in 1515–1516 on St. Paul's Epistle to the Romans; and in 1516–1518 on the epistles to the Galatians and Hebrews. Besides instruction and study, however, Luther had other duties. From 1514 he preached in the parish church; he was regent (head) of the monastery school; and in 1515 he became the supervisor of eleven other monasteries.

Righteousness of God

The doctrine of justification, taking shape in Luther's thought between 1515 and 1519, drew him further into theological thought as well as into certain positions of practical priestly life. The most famous of these is the controversy (causing opposing viewpoints) over indulgences. A person who committed a sin would buy an indulgence from the church to avoid punishment—especially punishment after death. In 1513 a great effort to distribute indulgences was proclaimed throughout Germany. In 1517 Luther posted the Ninety-Five Theses for an academic debate on indulgences on the door of the castle church at Wittenberg. This was the customary time and place to display such an article. They were given widespread fame and called to the attention of both theologians and the public.

News of Luther's theses spread, and in 1518 he was called before Cardinal Cajetan, the Roman Catholic representative at Augsburg, to deny his theses. Refusing to do so, Luther returned to Wittenberg, where, in the

next year, he agreed to a debate with the theologian Johann Eck (1486–1543). The debate soon became a struggle between Eck and Luther in which Luther was driven by his opponent to taking even more radical theological positions, thus laying himself open to the charge of heresy (believing in something that opposes what is formally taught by the Church). By 1521 Eck secured a papal bull (decree) condemning Luther, and Luther was summoned to the Imperial Diet at Worms (meeting of the Holy Roman Empire held at Worms, Germany) in 1521 to answer the charges against him.

Diet of Worms

Luther came face to face with the power of the Roman Catholic Church and empire at Worms in 1521. He was led to a room in which his writings were piled on a table and ordered to disclaim them. He replied that he could not do this. Luther left Worms and was taken, for his own safety, to the castle of Wartburg, where he spent some months in privacy, beginning his great translation of the Bible into German and writing numerous essays.

Return to Wittenberg

In 1522 Luther returned to Wittenberg and continued the writing that would fill the rest of his life. In 1520 he had written three of his most famous tracts (written piece of propaganda, or material written with the intent of convincing people of a certain belief): *To The Christian Nobility of the German Nation*; *On the Babylonian Captivity of the Church*; and *Of the Liberty of a Christian Man*.

In 1525 Luther married Katherine von Bora, a nun who had left her convent. From

Martin Luther.

*Courtesy of the New York Public Library
Picture Collection.*

that date until his death, Luther's family life became not only a model Christian home but a source of psychological support to him.

Luther's writings continued to flow steadily. Among the most important are the *Great Catechism* and the *Small Catechism* of 1529 and his collection of sermons and hymns, many of the latter, like *Ein Feste Burg*, still sung today.

Debates with Theologians

In 1524–1525 Luther entered into a discussion of free will with the great Erasmus

(1466–1536). Luther's *On the Will in Bondage* (1525) remained his final statement on the question. In 1528 he turned to the question of Christ's presence in the Eucharist (communion with God) in his *Confession concerning the Lord's Supper*.

In 1530 Luther supervised, although he did not entirely agree with, the writing of Philipp Melancthon's (1497–1560) *Augsburg Confession*, one of the foundations of later Protestant thought. From 1530 on Luther spent as much time arguing with other Reformation leaders on matters of theology as with his Catholic opponents.

In 1539 Luther wrote his *On Councils and Churches* and witnessed in the following years the failure of German attempts to heal the wounds of Christianity. In the 1540s Luther was stricken with disease a number of times, drawing great comfort from his family and from the devotional exercises that he had written for children. In 1546 he was called

from a sickbed to settle the disputes of two German noblemen. On the return trip he fell ill and died at Eisleben, the town of his birth, on February 18, 1546.

reader's guide

U•X•L Encyclopedia of World Biography features 750 biographies of notable historic and contemporary figures from around the world. Chosen from American history, world history, literature, science and math, arts and entertainment, and the social sciences, the entries focus on the people studied most often in middle school and high school, as identified by teachers and media specialists.

The biographies are arranged alphabetically across ten volumes. The two- to four-page entries cover the early lives, influences, and careers of notable men and women of diverse fields and ethnic groups. Each essay includes birth and death information in the header and concludes with a list of sources

for further information. A contents section lists biographees by their nationality. Nearly 750 photographs and illustrations are featured, and a general index provides quick access to the people and subjects discussed throughout *U•X•L Encyclopedia of World Biography*.

Special thanks

Much appreciation goes to Mary Alice Anderson, media specialist at Winona Middle School in Winona, Minnesota, and Nina Levine, library media specialist at Blue Mountain Middle School in Cortlandt Manor, New York, for their assistance in developing the entry list. Many thanks also go to the following people for their important editorial contri-

butions: Taryn Benbow-Pfalzgraf (proofreading), Jodi Essey-Stapleton (copyediting and proofing), Margaret Haerens (proofreading), Courtney Mroch (copyediting), and Theresa Murray (copyediting and indexing). Special gratitude goes to Linda Mahoney at LM Design for her excellent typesetting work and her flexible attitude.

Comments and suggestions

DOUGLAS MACARTHUR

Born: January 26, 1880

Little Rock, Arkansas

Died: April 5, 1964

Washington, D.C.

American general

American general Douglas MacArthur attained widespread fame through his military activities in the Pacific region during World War II (1939–45) and the Korean War (1950–53). His military conquests were sometimes inspiring and other times highly criticized. Regardless, MacArthur

remains the key figure in the American victory in the Pacific during World War II.

Student to soldier

Douglas MacArthur was born in Little Rock, Arkansas, on January 26, 1880, the descendant of a long line of military men. His father, Arthur MacArthur, was a well-known general. Educated in a random fashion on the rugged Western frontier posts, Douglas MacArthur recalled, “I learned to ride and shoot even before I could read or write.”

An average student, MacArthur began to excel upon entering the military academy at West Point, New York, in 1899. Proud and convinced of his destiny as a military leader,

Douglas MacArthur.

Reproduced by permission of AP/Wide World Photos.

MacArthur graduated first in his class in 1903 with the highest scholastic average at the academy in twenty-five years. After graduation from the academy, MacArthur sailed to the Philippines for his first military assignment. In 1904 he was promoted to first lieutenant, and that October was ordered to become his father's aide-de-camp (secretary) in Japan. Shortly thereafter he embarked upon a tour of the Far East, which he later called the "most important preparation of my entire life."

Rising military career

Returning to the United States, MacArthur began his fast rise through the mili-

tary ranks. In 1906 he was appointed aide-de-camp to President Theodore Roosevelt (1858–1919) and in 1913 became a member of the general staff. He was appointed colonel of the Rainbow Division during World War I (1914–18), or the Great War, in which European powers, along with America and Russia, waged war over control of Europe. MacArthur emerged as a talented and colorful military leader. He returned from combat with many military honors.

Following the war, he became a brigadier general and superintendent of West Point, where he remained until 1922. After another assignment in the Philippines, MacArthur was appointed chief of staff of the U.S. Army in 1930, a post he held through 1935.

In between wars

The years between World War I and World War II were frustrating ones for professional soldiers, and MacArthur was no exception. In 1922 he married Louise Cromwell Brooks and divorced her in 1929. Soon afterward, the national economy bottomed out during the 1930s, as the Great Depression (a period from 1929 to 1939 during which nearly half the industrial workers in the country lost their jobs) consumed America. Gloomy about the social unrest of the 1930s, he warned a Pittsburgh, Pennsylvania, audience in 1932 about the presence of Communists (people who believed in communism, a political system in which goods and property are owned by the government). At a time of great uncertainty, MacArthur was able to stir fears that Communists were living in America.

In June 1932 thousands of ragged veterans of World War I marched on Washington,

D.C., to petition Congress for early payment of their war service bonuses. Camped with their wives and children, they were set upon by tanks, four troops of cavalry with drawn swords, and steel-helmeted infantry with fixed bayonets—all led by MacArthur. He argued that his actions narrowly prevented a Communist revolution. This would not be the last time MacArthur would favor extreme measures of force.

World War II

In 1935 MacArthur went back to military service when President Franklin Roosevelt (1882–1945) sent him to the Philippines to develop a defensive strategy for the islands. Only two years later, he married Jean Marie Faircloth and retired from the U.S. Army in 1937. His retirement would not last, though. With the heightening crisis in Asia, he was recalled to active duty as a lieutenant general and commander of U.S. forces in the Far East in July 1941.

Despite advance warning, the Japanese invasion of December 1941 badly defeated MacArthur's forces in the Philippines. MacArthur was determined to hold the Philippines but the situation was hopeless. He was ordered to withdraw to Australia to take command of Pacific operations. Reluctantly, MacArthur agreed, and accompanied by his wife and child he set out on a daring escape by patrol torpedo (PT) boat, a small, lightweight craft. Discouraged by the American defeat, he announced upon arrival, "I came through and I shall return."

Success in the Pacific

After the Philippine defeat, MacArthur began the long campaign to smash Japanese

military power in the Pacific during World War II. Slowed in the early months by shortages of men and supplies, MacArthur's forces eventually won major victories. Although his personal responsibility for the battles was exaggerated by the skillful news management of his staff, there can be little question of the general's success in New Guinea and in the Philippines.

In 1944 MacArthur convinced President Roosevelt that an invasion of the Philippines was necessary to ensure victory in the Pacific. In October 1944 MacArthur waded onto the invasion beach at Leyte and delivered his prepared address into a waiting microphone: "People of the Philippines: I have returned. . . . Rally to me." For MacArthur, as for millions of Americans, it was an inspiring moment, possibly even more inspiring than his acceptance of the Japanese surrender at Tokyo Bay on September 2, 1945.

With the end of World War II, President Harry Truman (1884–1972) appointed MacArthur supreme commander of the Allied powers in Japan. During this appointment, MacArthur successfully reduced Japan's military, helped restore the Japanese economy, and advanced religious freedoms and civil liberties in postwar Japan.

A new war

The outbreak of the Korean War, in which American-led forces aided South Korea in their fight against Communist North Korea, resulted in MacArthur's appointment as commander of the United Nations (UN) forces. In the first months of combat, MacArthur launched a brilliant attack at Inchon that severely hurt the North Korean armies.

MacArthur then advanced his troops to the Yalu River, the boundary between North Korea and China. Failing to consider the possibility of a Chinese attack, he assured his troops that they would be home in time for Christmas dinner. In November, however, massive Chinese armies sent the UN forces into retreat. Angered and embarrassed, MacArthur publicly called for the extension of the war to China. President Truman, who wanted to limit American involvement in the East, had repeatedly warned MacArthur not to express his own ideas of the war to the public. Truman finally relieved the general of his command in April 1951.

“Old Soldiers Never Die”

MacArthur’s return to the United States was greeted by massive public expressions of support for the general and criticisms from the president. On April 19, 1951, he presented his case to a joint session of Congress, attracting a tremendous radio and television audience. His speech ended on a note that stirred millions of Americans: “I now close my military career and just fade away.”

MacArthur became more active than he had predicted. He testified at great length before the Senate Armed Services and Foreign Relations committees. Then he traveled across the country criticizing the Truman administration, insisting they had sold out Asia to communism. In December 1952 President-elect Dwight Eisenhower (1890–1969) met with MacArthur to hear the general’s views on ending the Korean War. MacArthur supported a peace conference that, if unsuccessful, would be followed by “the atomic bombing of enemy military concentrations and installations in North Korea.” MacArthur also called for mili-

tary action to overthrow Communist China. As a result, MacArthur was not consulted again.

MacArthur then retreated to a life of out of the public eye. A soldier to the end, he died in the army’s Walter Reed Hospital on April 5, 1964. His wife, Jean, died on January 22, 2000, at the age of 101. Although controversial throughout much of his career, MacArthur is remembered as one of America’s great military leaders.

NICCOLÒ MACHIAVELLI

Born: May 3, 1469

Florence, Italy

Died: May 22, 1527

Florence, Italy

Italian statesman and author

The Italian author and statesman Niccolò Machiavelli is best known for *The Prince*, in which he voiced his political philosophy.

Early life

Niccolò Machiavelli was born on May 3, 1469, in Florence, Italy, of nobility, though by no means wealth. His parents, Bernardo and Bartolomea, had three other children, two daughters and a son. Bernardo was a lawyer and small landowner with a small salary. Machiavelli's education started at age seven. Some accounts say that Machiavelli spent the years from 1487 to 1495 working for a Florentine banker. A love of books was a family value that Machiavelli shared. His writings prove that he tirelessly read the classics.

In 1498 Machiavelli was named chancellor (secretary to a nobleman, prince, or king) and secretary of the second chancellery (chief executive officer) of the Florentine Republic (government in Florence whose leaders were voted for by citizens). His duties consisted chiefly of carrying out the policy decisions of others, writing diplomatic letters, reading and writing reports, and taking notes; he also went on some twenty-three diplomatic missions (formal visits by a representative of a nation to foreign countries to conduct discussions on international affairs) to foreign states. These included four trips to France and two to the court of Rome.

In 1502 Machiavelli married Marietta Corsini, who bore him four sons and two daughters. His grandson, Giovanni Ricci, is credited with saving many of Machiavelli's letters and writings.

In 1510 Machiavelli, inspired by his Roman history, was active in organizing a citizen militia (a body of citizens, who are not soldiers by career, called to duty in a national emergency) of the Florentine Republic. In August 1512 a Spanish army entered Tuscany and sacked Prato. In terror, the Florentines

Niccolò Machiavelli.

removed their leader Soderini, a man Machiavelli characterized as “good, but weak,” and allowed the Medici, a family formerly in power, to return. On November 7 Machiavelli was dismissed from his role as chancellor. Soon afterward he was arrested, imprisoned, and subjected to torture as a suspected schemer (one who plots or plans) against the Medici family. Though innocent, he remained a suspect for years to come. Unable to secure an appointment from the reinstated (reestablished) Medici, he turned to writing.

The Prince

Machiavelli had a passion for ancient history. He had a fierce desire to rebuild the gov-

ernment with a stronger political and moral foundation, similar to that of the Roman Republic (107–101 B.C.E.). He felt the biggest need of his day was a strong political and military leader who could bring together northern Italy, ridding it of French and Spanish influence. At the time that he wrote *The Prince* he pictured such a possibility while the restored Medici ruled both Florence and the papacy (system of government of the Roman Catholic Church of which the pope is the head). This hope is played out in the final chapter of *The Prince*. It is a heartfelt plea to his Medici patrons (people who support a specific cause, a person, or an establishment) to set Italy free from the “barbarians.” It closes with a quotation from Petrarch’s patriotic poem *Italia mia*: “Virtue will take arms against fury [anger], and the battle will be brief; for the ancient valor [courage] in Italian hearts is not yet dead.” No one listened to this plea in 1513, but it was to play a role three centuries later in the Risorgimento (a movement for Italian unification).

The chapters of *The Prince* are written in a clear and straightforward style. Earlier political writers had treated politics as a branch of morals. Machiavelli broke with this long tradition and treated politics on its own. Machiavellian politics described the world as it was, rather than what people imagined or were taught to believe. This was a big change in tradition.

Abandoning the Christian view of history as guided by God, Machiavelli viewed events in purely human terms. Often it is fortune that gives—or takes away—the political leader’s opportunity for significant (important and meaningful) action. Like others in the Renaissance, Machiavelli believed that

man had the ability to control his own fate. This was the opposite of the Middle Ages’ (period in Western European history that started with the end of the Roman empire and continued to the fifteenth century) concept of an all-powerful divine will (a higher soul or spirit that controls the destinies and actions of all) or the ancient Greeks’ crushing fate (inescapable downfall). Machiavelli’s *virtù* (artistry) in politics—unlike Christian virtue—is a useful combination of force and level-headedness.

Serious critics of Machiavelli sometimes forget that he attempted to describe rather than to invent the rules of political success. For him the state was greater than its citizens and their individual interests; its health consisted in unity, but even at its height its lifetime was expected to end at some point.

Other works

Certain passages in the *Discourses* (I, 11 and 12; II, 2) explained Machiavelli’s argument with the Church: by bad example, the court of Rome, Italy, had lost its devotion and religion; the Italian states were weak and divided because the Church, too weak politically to dominate them, had nevertheless prevented any one state from uniting them. He suggested that the Church might have been destroyed by its own corruption (deception and lies) had not St. Francis (c. 1182–1226) and St. Dominic (c. 1170–1221) restored it by founding new orders. However, Machiavelli gives a good comparison between the pagan (religion of many gods) religion of ancient Rome and the Christian religion.

As a historian, Machiavelli in his *History of Florence* did better than earlier historians, because he focused on the underlying causes

rather than the chain of events in the history of the Florentines from the death of Lorenzo de' Medici (1442–1492) in 1492. Medici was an Italian merchant prince who, without an official title, led the Florence government until his son took over.

Machiavelli stuck closely to his motto that a servant of government must be loyal and self-sacrificing. Nowhere did he suggest that the political morality (sense of right and wrong) of princes is a model for day-to-day dealings between ordinary citizens. His reputation as being evil and disloyal is largely undeserved; it began not long after his death. His works were banned in the first printed Index (1559). In Elizabethan England (England during Queen Elizabeth's reign, 1558–1603), Machiavelli was represented on the stage and in literature as evil. The primary source of this misrepresentation (incorrect presentation) was the translation into English by Simon Patericke in 1577 of a work popularly called *Contre-Machiavel*, which misrepresented Machiavelli and blamed his teachings for the St. Bartholomew Night massacre of 1572 (a night chosen by the Queen of Florence to rid the city of all non-Catholics). A poem by Gabriel Harvey the following year falsely blamed Machiavelli for four principal crimes: poison, murder, deception (the act of lying and cheating), and violence. Machiavelian enemies followed in works by other playwrights (writers of plays).

Machiavelli's values are represented in nineteenth-century liberalism (political philosophy based on belief in progress, the goodness of man, and individual freedom). Both Machiavelli and liberalism support government over religious power, the recruitment (the act of bringing together) of citizen

armies, the preference for a government with voting citizens and elected officials rather than a king or queen, and the ideals of honesty, work and society's responsibility overriding the lone citizen's.

Though he was unappreciated in his time and times thereafter, Machiavelli's influence lives on in the thinking of people worldwide. He died in Florence in June 1527, receiving the last rites of the Church that he had bitterly criticized.

DOLLEY MADISON

Born: May 20, 1768

New Garden, North Carolina

Died: July 12, 1849

Washington, D.C.

American first lady

Dolley Madison was the much-admired wife of the fourth U.S. president, James Madison (1751–1836). She was highly respected by some of history's greatest politicians, including President Andrew Jackson (1767–1845), who

Dolley Madison.

Courtesy of the National Archives and Records Administration.

once described her as a “national institution.” This was high praise during a time when women were expected to remain in the background and be seen but not heard.

Life in Philadelphia

Dolley Payne Madison was born on May 20, 1768, on a farm in New Garden, North Carolina. Her parents were John Payne Jr. and Mary Coles Payne, who were Quaker Virginians. (The Quakers were a religious society that was started in the seventeenth century.)

In 1783 after the Revolutionary War (1775–83), in which the American colonies fought for independence from British rule, her parents made the decision to sell their plantation. They freed their slaves and moved the family north when Dolley was fifteen years old. Her father used the money made from selling the plantation to set up a business in Philadelphia, Pennsylvania.

When Dolley was nineteen years old, the representatives to the Constitutional Convention (May 25–September 17, 1787) gathered in Philadelphia. Many important representatives attended the convention, which resulted in the creation of the U.S. Constitution. George Washington (1732–1799), Alexander Hamilton (1755–1804), and Benjamin Franklin (1706–1790) were among those who attended the convention. At this time Dolley saw for the first time a Virginian named James Madison, who was later called the “Father of the Constitution.”

Family tragedy

Dolley Payne grew into a beautiful and popular woman. At the age of twenty-one she met John Todd, a lawyer, and the two were married in January 1790. The couple eventually had two sons. Then, in August 1793, an outbreak of yellow fever (a deadly disease that is spread by mosquitoes) occurred. A great number of people died, including Dolley’s husband and her youngest son. Although she also became ill, she eventually recovered after a long, slow fight.

A new life

In the spring of 1794 James Madison requested a meeting with Dolley Payne Todd. Madison was an extremely ambitious man

who was well known in Philadelphia. He helped draft the Constitution, the document that represents the basic laws on which America is founded. He also was responsible for suggesting the Bill of Rights, the first ten constitutional amendments that safeguard an individual's civil freedoms. Within a few weeks after the two met, it was widely rumored that they were engaged. Although she denied this rumor, it proved to be true, as Dolley Payne Todd and James Madison were married in September 1794.

Over the next several years, Dolley and James observed and at times were directly involved in some of the most important events in the history of the United States. In 1797 they saw John Adams inaugurated as president. In 1801 Thomas Jefferson began the first of his two terms as president. At that time, James Madison was made secretary of state. In 1803 the United States bought the Louisiana Territory from France. As a result of this purchase (the Louisiana Purchase), the United States had suddenly doubled in size.

As first lady

When Jefferson decided not to run for a third term, James Madison was elected president of the United States. Madison began his first term in 1809, and Dolley Madison became the first lady. Some say she took on the job as if she had been born to fill it. She was widely known for her caring and loving nature, her fashion sense, and her graceful manners.

In 1812 James Madison was reelected and the War of 1812 (1812–14) began. The war was fought between Great Britain and the United States over Britain's disregard for American neutrality and their practice of

boarding American ships and forcing sailors to join the British navy. On August 24, 1814, British troops moved into Washington, D.C., and Dolley Madison was told that she should leave the city. She made certain that she saved her husband's important papers, the silver, and a portrait of George Washington. Madison narrowly escaped the British, who burned the Capitol Building and set fire to the President's House.

In the following years, Madison witnessed the end of the war and James Monroe's inauguration as president. After leaving office, the Madisons moved to Montpelier, Virginia. They found peace in Virginia during their retirement years. They spent their time improving James's beloved home, where Dolley Madison would remain for the next twenty years.

James Madison's death

James Madison died in 1836. He willed his papers to Dolley Madison so that she could make some money by having them published. The Madison papers were James's writings on the many years of significant historical events. After her husband's death, Dolley Madison moved back to Washington, D.C. She then sold some of her late husband's papers to Congress and received \$30,000 for them.

In the remaining years of Madison's life, she would see four different presidents enter office, the rest of the Madison papers sold to Congress, the laying of the first stone for the Washington Monument, and the introduction of the first telegraph (an early communication system). She had led a full, active, and productive life. On July 12, 1849, Dolley Madison died in Washington, D.C.

JAMES MADISON

Born: March 16, 1751

Port Conway, Virginia

Died: June 28, 1836

Orange County, Virginia

American president and founding father

James Madison, the fourth president of the United States, was one of the principal founders of America's republican form of government. As a Founding Father he helped plan and approve the U.S. Constitution and the Bill of Rights, two documents that laid the foundation for the American way of life.

Early life and schooling

James Madison lived all his life (except for his presidential years) in the beautiful county of Orange, Virginia, on a 5,000-acre plantation that produced tobacco and grains and was worked by perhaps one hundred slaves. After being schooled at home, Madison went to preparatory school and then to the College of New Jersey at Princeton. The young man took to his studies, which included learning Latin and Greek.

Madison was continually exposed to the Christian religion and was influenced by the new thought of the eighteenth century. He admired writers and thinkers like John Locke (1632–1704), Isaac Newton (1642–1727), Jonathan Swift (1667–1745), and others. Madison was a founding member of the American Whig Society, a debating club in Princeton. During his college career, waves of revolution rolled through the campus as protests increased against British policies.

American Revolution

Upon graduation, Madison's health was weakening and he was forced to live at home, where he continued his education. Once recovered, Madison served on the Orange County Committee of Safety for two years. By then, the American Revolution (1775–83) had erupted as American forces fought for independence from Great Britain.

In 1776 Madison was elected to the Virginia convention. The convention decided to move for independence from Britain and drafted a new state constitution, or a body of laws that formally lay out the structure of a new government. Madison's special contribution was in strengthening the articles on reli-

gious freedom to proclaim “liberty of conscience for all.” Elected to the governor’s council in 1777, he moved to Williamsburg, Virginia. For two years he dealt with the routine problems of the Revolutionary War. He also began a lifelong friendship with Virginia governor Thomas Jefferson (1743–1826).

Madison’s skill led to his 1780 election to the Continental Congress, which brought famous delegates to Philadelphia, Pennsylvania, to discuss the problems with British rule. During the first year he became one of the leaders of the so-called nationalist group. The group believed that success of the American Revolution was possible only under a strong central government. By the end of his service in 1783, the peace treaty with Britain was passed and the war ended. Madison was among the half dozen leading promoters of stronger national government and earned a reputation as a well-informed and effective leader. Madison spent three years in Virginia helping pass Jefferson’s bill for religious freedom and other reform measures.

The Constitution

In May 1787 Madison attended the Constitutional Convention, whose representatives gathered in Philadelphia, Pennsylvania. The convention brought together America’s leading politicians, including Benjamin Franklin (1706–1799) and John Adams (1735–1826). The convention would produce the Constitution, the document that embodies the principles on which America is founded. At the convention Madison supported the Virginia plan for giving real power to the national government. He guided George Washington (1732–1799) and other Virginia delegates to support this plan. In the

James Madison.

end, Madison became the most constructive member of the convention.

Madison’s basic contribution was the idea that an enlarged, strengthened national government was in fact the best way to protect freedom and expand self-government. In addition to taking part in the debates, Madison took notes on them. Published after his death, these give the only full record of the convention.

Establishment of the new government

Madison shared leadership in the ratification, or passing, of the Constitution with

New York representative Alexander Hamilton (1755–1804). Madison designed a strategy for the supporters of the Constitution (the Federalists) and wrote portions of the *Federalist Papers*, which were essays on political theory for the new country. In a dramatic debate with Senator Patrick Henry (1736–1799), Madison helped bring about the ratification of the Constitution in June 1788. Then, as Washington's closest adviser and as a member of the first federal House of Representatives, Madison led in establishing the new government. He drafted Washington's inaugural address, or first speech as president, and helped the president during his first term.

January 1790 marked the beginning of Madison's—along with Jefferson's—leadership of what became the Democratic-Republican party. Madison opposed the privileged position Hamilton gave to commerce and wealth. This attitude became the foundation of their political party. Madison also greatly opposed Jay's Treaty, which settled differences between America and Great Britain regarding trade. Madison felt that the treaty would align the United States with England in a way that would betray the nation's principles, or standards. Thus, the final ratification of Jay's Treaty (April 1796) over Madison's bitter opposition marked his declining influence in Congress. A year later he retired to Virginia.

The political frustrations of the years 1793 to 1800 were relieved by Madison's happy marriage in 1794 to Dolley (or Dolly) Payne Todd. Dolley, a widow, was a beautiful and respected woman. Later, when Madison was elected president, she would play an important part in shaping the role of first lady.

Secretary of state

Madison worked hard to secure Jefferson's election as president in 1800, and in response he was appointed secretary of state. Madison skillfully aided the president in the Louisiana Purchase, which acquired land west of the Mississippi River from France. The purchase would nearly double the country's size and begin a push westward to expand the young nation.

The renewed war between France and Britain, however, became a major crisis, as both powers inflicted heavy damage on American ships. Madison promoted the 1807 embargo, or stoppage, which barred American ships from the high seas. However, the nation's economy was fragile and heavily dependent on trade with Europe. The embargo did not last. Madison soon accepted its repeal at the end of Jefferson's administration.

As president

Elected president in 1808, Madison continued his struggle to find peace in a world at war. Unfortunately, ineffective policies, disagreement within his party, and Cabinet restructuring would weaken Madison's power as president. After relations with England fell apart, war was declared in June 1812. Many New England preachers and politicians opposed the war, and their lack of support severely slowed the war effort and added to the president's difficulties. He nonetheless was reelected easily in 1812.

Madison was hopeful for a swift victory in the new war. However, several military setbacks destroyed these hopes. When America won battles at sea in 1813, the tables seemed

to be turning. But problems mounted for the president. Chaos in American finance, problems with European allies, and another ineffective military campaign left Madison discouraged, and he suffered a nearly fatal illness in June 1813. The young government seemed to be failing apart due to the war.

The summer of 1814 brought to the American battlefields thousands of battle-hardened British troops. A small but well-disciplined British force defeated the disorganized Americans as Madison watched from a nearby hillside. His embarrassment was complete when he saw flames of the burning Capitol and White House while fleeing across the Potomac River. However, after he returned to Washington three days later, he was soon cheered by news of the British defeat in Baltimore Harbor. News also arrived that two American forces had driven back a powerful British force coming down Lake Champlain in Vermont. On Christmas Eve, 1814, a peace treaty was signed between Britain and America.

Years of retirement

In March 1817 Madison retired from public office and returned to his home in Montpelier, Virginia. During the next years, Madison practiced scientific agriculture, helped Jefferson found the University of Virginia, and advised President James Monroe (1758–1831) on foreign policy. He returned officially to public life only to take part in the Virginia constitutional convention of 1829. But his health slowly declined, forcing him more and more to be a silent observer.

By the time of his death on June 28, 1836, he was the last of the great founders of the American republic. After his death, Dol-

ley Madison published her husband's personal papers. The Madison papers offer wonderful insights into the politics of the new nation during a time of great historical significance.

MADONNA

Born: August 16, 1958

Bay City, Michigan

American singer, dancer, and actress

Singer, dancer, and actress Madonna is a sensational self-promoter who drove herself to stardom on the pop music charts, in concert halls, on film, and in music videos.

Early life

Born on August 16, 1958, in Bay City, Michigan, Madonna Louise Veronica Ciccone

Madonna.

Reproduced by permission of the Corbis Corporation.

was the third of six children in a Catholic family. Her father Sylvio, also known as Tony, was a design engineer for Chrysler/General Dynamics. Madonna's mother was of French Canadian descent. She died of breast cancer when Madonna was five years old. Tony Ciccone moved the family to Pontiac, Michigan, and he married one of the women hired to care for the Ciccone household. The adjustment was difficult for Madonna as the eldest daughter. She had considered herself the "lady of the house" and had received much of her father's affection and attention.

Madonna acted in school plays in her early school years. As a teenager she discov-

ered her love and talent for dancing, an activity she pursued under the direction and leadership of Christopher Flynn, her private ballet instructor. Madonna worked hard and played hard as well, something Flynn made easy by introducing her to the disco nightlife of Detroit, Michigan. Still, she cared for her younger brothers and sisters and worked hard in school. She graduated early from high school and was awarded a dance scholarship to the University of Michigan. She stayed two years before going to New York City in 1978 with thirty-seven dollars and a wealth of determination and ambition.

Pop music breakthrough

Madonna moved into an apartment in New York City's East Village, a poorer neighborhood filled with crime and drug problems. Her first jobs included figure modeling for artists and acting in low-budget movies. She danced briefly with the Alvin Ailey American Dance Theater and studied for a time with choreographer (one who creates and arranges dance performances) Pearl Lang before going to Paris, France, as a singer and dancer with French disco artist Patrick Hernandez. Madonna had developed a fascination with music. She played drums and sang backup in several small bands. When she returned to New York she wrote and recorded songs and hung out in popular Manhattan nightclubs. She was signed to a recording contract with Sire Records in October 1982.

The album *Madonna* was released in July 1983. Repeat club performances and radio airplay of several cuts from the album eventually earned her three huge hits with "Holiday," "Lucky Star," and "Borderline." A series of hit

songs, videos, concert tours, and films followed. A brief performance in the film *Vision Quest* resulted in the top-five hit “Crazy for You.” Her second album, *Like a Virgin*, released in 1984, produced two number one hits—the title track and “Material Girl.” In early 1985 she went on her first concert tour, which was so successful that she had to switch to larger locations to meet the demand for tickets. Thousands of teenage girls all over the country began tying lace bows on top of their heads, wearing underwear as outerwear, and walking the halls of schools and shopping malls as “Madonna wannabees.” Madonna’s appearance in the film *Desperately Seeking Susan* in 1985 led to another popular single and video, “In the Groove.”

Increasing popularity and criticism

Madonna married actor Sean Penn in 1985. In 1986 she released her third album, *True Blue*, from which three singles topped the charts: “Papa Don’t Preach,” “True Blue,” and “Live to Tell,” which also appeared in *At Close Range*, a film starring Penn. In 1987 a movie starring Madonna called *Who’s That Girl* was largely ignored, but the accompanying soundtrack and concert tour were successful.

The release of Madonna’s album *Like a Prayer* (1989) came at the same time as the breakup of her marriage. The video of the title song, showing Madonna confessing to a priest and then engaging in suggestive behavior with him, caused a stir in the Catholic Church. The controversy (dispute) resulted in a disagreement over a five million dollar endorsement (paid public support of a company’s products) contract with the Pepsi company. Controversy again surrounded Madonna in 1990 when the music video channel MTV refused to play the

racy video for “Justify My Love,” a new track from her greatest hits album *The Immaculate Collection*, before 11:00 P.M.

Other films featuring Madonna include *Shanghai Surprise* (1986), in which she co-starred with then-husband Sean Penn; *Dick Tracy* (1989), which was accompanied by a soundtrack of Madonna songs; and *Truth or Dare*, a feature-length collection of footage from her Blonde Ambition Tour of 1990–91. Madonna also appeared in *A League of Their Own* (1992) and *Body of Evidence* (1993). Each work kept the press and critics focused on her.

Money machine

By 1992 Madonna’s popularity stretched across the world, and she had established herself as a sharp, confident businesswoman. She signed a sixty million dollar contract with Time-Warner, which included her own record company (under the Maverick label) and called for her to make videos, films, books, merchandise, and more than six albums. The announcement of the deal was timed with the release of the album *Erotica*, an extended video, and an adults-only picture book called *Sex*, featuring black-and-white photographs in which Madonna appears mostly without clothes with everything from men and women (in all combinations, positions, and numbers) to chairs, dogs, and slices of pizza. She was even shown hitchhiking wearing nothing but high heels. The book was a best-seller across the country.

The 1994 release of *Bedtime Stories*, written mainly by Madonna, showed her with a softer image and more soulful sound. In the mid-1990s she set her sights on playing the leading role in Andrew Lloyd Webber’s

(1948–) movie musical *Evita*, and after repeated tryouts, she convinced producers that she would bring a unique understanding to the lead role of Argentine leader Eva Peron (1919–1952). In her personal life, Madonna settled into a relationship with Carlos Leon, a personal trainer. In 1995 she released her second greatest hits album, *Something to Remember*.

In 1996 Madonna gave birth to a girl named Lourdes Maria Ciccone Leon (Lola for short). Madonna described the event to *People* magazine as “the greatest miracle of my life.” She even traded in her pink Hollywood mansion for a home in a low-key suburb of Los Angeles, California. Meanwhile, her determination to play the starring role in *Evita* paid off, although her performance received mixed reviews. In 1997 the song “You Must Love Me” from the film’s soundtrack won the Academy Award for best song.

Balancing work and family

In 1998 Madonna released *Ray of Light*. The album reflected her study of the kabbalah (an ancient Jewish teaching) and interest in Far East Indian culture. Its electronic influence also kept Madonna in touch with modern dance culture, proving to critics that she still knew how to stay ahead of the pack. The album received rave reviews and was one of her best-selling records. It also won Grammy Awards for best dance recording, best pop album, and best music video (short form).

That next year, Madonna contributed the single “Beautiful Stranger” to the *Austin Powers: The Spy Who Shagged Me* soundtrack. The single won a Grammy Award for best song written for a motion picture, television or other visual media. Madonna co-starred in

the film *The Next Best Thing* in 2000. While the film got poor reviews, the soundtrack did moderately well. It contained two new Madonna songs, “American Pie” (a remake of the Don McLean classic) and “Time Stood Still.” It was Madonna’s first record for which she was the executive producer.

In August 2000 Madonna gave birth to a son named Rocco. The child was her son with British film director Guy Ritchie. Shortly after that event, Madonna released *Music*, which carried on the electronic element she introduced in *Ray of Light*. The album received mostly good reviews. In December 2000 Madonna and Ritchie had their son baptized in a thirteenth-century cathedral in Dornoch, Scotland. The next day, Madonna and Ritchie were married at Scotland’s nineteenth-century Skibo Castle.

Madonna, the Material Girl turned serious actress, singer, songwriter and mom, appears to have it all. She accepts it all—including the constant media attention—with calm, as if she were planning the next phase. She told *Time* magazine, “I never wish I had a different life. I am lucky to be in the position of power that I am in and to be intelligent.... It’s not my nature to just kick back.”

FERDINAND MAGELLAN

Born: 1480

Oporto, Portugal

Died: April 27, 1521

Cebu, Philippines

Portuguese explorer

While in the service of Spain, the Portuguese explorer Ferdinand Magellan led the first European voyage of discovery to circumnavigate (travel around) the globe. His voyage provided clear proof that the Earth is round.

Early life and travels

Ferdinand Magellan was born in Oporto, Portugal, in 1480. His parents were members of the Portuguese nobility, and the young Magellan found himself in the service of royalty at an early age. He was only twelve when he began serving the queen of Portugal as a page, a position of employment for youths in royal courts. As a young member of Queen Leonora's School of Pages in Lisbon (the Portuguese capital) Magellan was encouraged to learn subjects that would aid him greatly later, such as cartography (mapmaking), astronomy, and celestial navigation (learning how to steer a ship based on the positions of the stars).

Magellan joined the Portuguese service to sail with the fleet in 1505. He went to East Africa and later was at the battle of Diu, in which the Portuguese destroyed the Egyptian fleet's dominance in the Arabian Sea. He went twice to Malacca, located in present-day Malaysia, and participated in that port's con-

quest (the act of conquering) by the Portuguese. It is possible that he also went on a mission to explore the Moluccas (islands in Indonesia, then called the Spice Islands). Trading in spices brought great wealth to European nations at this time, and there was much competition among them to claim territories that were rich in spices, especially in Southeast Asia, called the East Indies. The Moluccas were the original source of some of the world's most valuable spices at that time, including cloves and nutmeg.

In 1513 Magellan was wounded in a battle in North Africa. But all of his services to Portugal brought him little favor from the Portuguese king, and in 1517 he went to Seville, Spain, to offer his services to the Spanish court.

Exploring for Spain

Spain and Portugal were both great powers at this time. They were in great competition over the rights to claim and settle the newly "discovered" regions of the Americas and the East. In 1494 the Treaty of Tordesillas divided the overseas world of the "discoveries" between the two powers, essentially splitting the globe in half from pole to pole. Portugal acquired everything from Brazil eastward to the East Indies, while the Spanish hemisphere (half-globe) of discovery and conquest ran westward from Brazil to an area near the Cape Verde Islands. The parts of this area that lay furthest east of Spain had not yet been explored by the Spaniards, and they assumed that some of the Spice Islands might lie within their half of the globe. They were wrong, but Magellan's scheme was to test that assumption. He decided that the best way to reach these islands was to sail in a westward

Ferdinand Magellan.

direction from Europe, thus traveling around the globe.

Other explorers had paved the way for Magellan by making key mistakes and discoveries. Christopher Columbus (1451–1506) had badly underestimated the distance between Europe and the East Indies, sailing westward from the European coast and “discovering” North America and the Caribbean islands (West Indies). Vasco Núñez de Balboa’s (1475–1517) march across the Panamanian isthmus had revealed the existence of the Pacific Ocean, which he had claimed for Spain. Thereafter, explorers eagerly sought northern and southern all-water passages

across the Americas to reach the spice-rich East. Magellan also sought such a passage.

Magellan’s great voyage

King Charles V (1500–1558) of Spain approved Magellan’s proposal, and on September 20, 1519, Magellan led a fleet of five ships out into the Atlantic. Unfortunately, the ships—the *San Antonio*, *Trinidad*, *Concepción*, *Victoria*, and *Santiago*—were barely adequate to sail, and the crew were not all firmly loyal to their leader. With Magellan went his brother-in-law, Duarte Barbosa, and the loyal and able commander of the *Santiago*, João Serrão. Arriving at Brazil, the fleet sailed down the South American coast to the San Julián bay in the region called Patagonia. They stayed there from March to August 1520. During this time an attempted mutiny was put down, with only the top leaders being punished. Afterwards, however, the *Santiago* was wrecked, and its crew had to be taken aboard the other vessels.

Leaving San Julián, the fleet sailed southward. On October 21, 1520, it entered what is now called the Strait of Magellan (the channel of water between the southern tip of South America and the island of Tierra del Fuego). The fleet proceeded cautiously, taking over a month to pass through the strait. During this time the master of the *San Antonio* deserted and sailed back to Spain, and so only three of the original five ships entered the Pacific on November 28. A long voyage northward through the Pacific followed, and it was only on March 6, 1521, that the fleet finally anchored at Guam.

Magellan then headed eastward to Cebu in the Philippines, where, in an effort to gain the favor of a local ruler, he became involved in a local war and was killed in battle on April

27, 1521. Barbosa and Serrão were killed soon afterwards. The remaining crew were forced to destroy the *Concepción*, and the great circumnavigation was completed by a courageous former mutineer, Juan Sebastián del Cano. Commanding the *Victoria*, he picked up a small cargo of spices in the Moluccas, crossed the Indian Ocean, and traveled around the Cape of Good Hope (at the southern tip of Africa) from the east. He finally reached Seville on September 8, 1522. In the meantime, the *Trinidad* had tried to head back across the Pacific to Panama but was finally forced back to the Moluccas. There its crew was jailed by the Portuguese, and only four men later returned to Spain.

Magellan's legacy

Magellan's project brought little in the way of material gain to Spain. The Portuguese were well established in the East. Their route to the east, by way of Africa, had proved to be the only practical way of getting by sea to India and the Spice Islands. Yet despite nearly destroying itself in the process, the Magellan fleet for the first time revealed in a practical fashion the full extent of the globe. As a scientific effort, it proved to be the greatest of all the "conquests" undertaken by the overseas adventurers of fifteenth- and sixteenth-century Europe.

NAJIB MAHFUZ

Born: December 12, 1912

Cairo, Egypt

Egyptian novelist

Najib Mahfuz is Egypt's most famous novelist and the first Arab to win the Nobel Prize in Literature.

Early life

Najib Mahfuz was born in Cairo, Egypt, on December 12, 1912. He was the youngest of seven children in a middle-class merchant family. When he was ten years old, his family moved to a more Westernized (reflecting the ideals of Europe and the United States) neighborhood of Cairo. Mahfuz became fond of reading detective stories, going to the movies, playing soccer, and listening to music with his friends. During his high school years he began to read the Arabic classics as well as the Western ones that he could find in translation.

Mahfuz studied philosophy (the study of the universe and man's place in it) at Cairo University, and after graduating in 1934 he began working as a civil servant (a person who works for the government). He contin-

Najib Mahfuz.

Reproduced by permission of AP/Wide World Photos.

ued to work until he retired as director of the Cinema Organization, after which he worked as an adviser to several cultural organizations within the Egyptian government. Mahfuz made frequent contributions to the daily newspaper *Al-Ahram*, where most of his writings appeared in serial form before being published in book form. He was married in his early forties and is the father of two daughters.

Develops as writer

Mahfuz's early writings are considered historical because he dealt with subjects inspired by ancient Egyptian history. In an

interview with the magazine *Al-Hawadess*, Mahfuz corrected this notion by saying that only one of the early three works—*Kifah Tiba* (The Struggle for Thebes, 1944)—was a true historical novel. With *Al-Qahira Al-Jadida* (New Cairo, 1945), Mahfuz then began a series of novels that dealt with more contemporary (current) subject matter and characters. Most of the novels after these bear names of the old-time areas of Cairo, such as *Khan Al-Khalil* (1946) and *Zuqaq al-Midaq* (1947).

Mahfuz's trilogy (series of three dramas), *Al-Thulathia* (made up of *Bayn al-Qasrayn*, *Qasr al-Shauq*, and *Al-Sukkariyya*), written between 1946 and 1952, traces the changes undergone by a family in Cairo and its leader, Ahmad Abd a-Jawad. Through his characters, Mahfuz skillfully describes the cultural and political problems that Egypt experienced in the early 1900s. *Al-Thulathia* was considered a major contribution to world literature and a unique contribution of Egyptian genius. It was awarded Egypt's highest literary honor in 1957.

In *Awlad Haritna* (Sons of Our Alley, 1967), Mahfuz questioned the relationship between God and man, good and evil, and life and death. His interest in the differences between *ilm* (knowledge) and *iman* (faith) appears throughout his later writings, such as *Alf Layla wa Layla* (A Thousand and One Nights, 1982). *Al'Ai'sh fi al-Hakika* (He Who Lives in Truth, 1985) was considered more of a historical novel than fictional writing.

Offends Muslim leaders

Mahfuz's novels have often gotten him into trouble with Arab leaders. *The Children of Gabalawi* (1959) was banned in Egypt because it was seen as offensive to the Islamic faith. In

the 1960s several of his novels were considered attacks on the administration of President Gamal Nasser (1918–1970). Because of Mahfuz's support for Egyptian President Anwar Sadat's (1918–1981) peace treaty with Israel in 1979, his writings were banned in many Arab countries during the 1980's, although most of the bans were later lifted.

In Mahfuz's Egypt, where literacy (the ability to read and write) is still not widespread, radio, movies, and television play a large role in education and entertainment. Many of Mahfuz's writings have been adapted to the screen and stage. This enabled him to become widely known and admired throughout the Arab world. In October 1988 Mahfuz was awarded the Nobel Prize in literature, the first Arab writer to be so honored. Asked about his plans for spending the \$300,000 prize money, the *New York Times* reported that he looked at his spouse and replied, "That is my wife's job."

It surprised many when, in a 1992 interview with the *Paris Review*, Mahfuz criticized fellow author Salman Rushdie (1947–), whose novel *The Satanic Verses* had led to the offer of a million-dollar reward for Rushdie's death by Iran's religious leader, the Ayatollah Khomeini (1900–1989). In 1994 a Muslim extremist (one who holds extreme political or religious views) stabbed Mahfuz. The attack damaged nerves in Mahfuz's arm. Mahfuz was a vocal critic of the September 2001 terrorist attacks on the United States, although he also stated that war was not a solution to the problem of terrorism.

In 2002 it was announced that a statue of Mahfuz would be built in west Cairo to honor his achievements. Although Mahfuz continues to write, his failing eyesight and

problems with his arm have caused him to restrict himself to mostly shorter pieces, such as a series of descriptions of his dreams that have been published in Egypt's *Nisf Al-Dunia* magazine.

NORMAN MAILER

Born: January 31, 1923
Long Branch, New Jersey
American author and director

Norman Mailer, American author, film producer, and director, wrote *The Naked and the Dead*, one of the most famous American novels about World War II (1939–45; a war in which Germany, Italy, and Japan fought against Great Britain, France, the Soviet Union, and the United States). Only in his later political journalism did he reach that level of achievement again.

Norman Mailer.

Reproduced by permission of Archive Photos, Inc.

Early life and education

Norman Kingsley Mailer was born in Long Branch, New Jersey, on January 31, 1923, the son of Isaac Barnett Mailer and Fanny Schneider Mailer. His father, an accountant, was originally from South Africa, having traveled to America by way of England. His mother's father was a rabbi (a leader of the Jewish religion). Mailer's family moved to Brooklyn, New York, when he was four. Mailer was an excellent student who loved to build model airplanes. At nine years old his mother encouraged him to write a story. Writing one chapter a day, the young Mailer completed a story that he called "An Invasion of Mars."

Mailer graduated from high school in 1939 and earned a bachelor of science degree in aeronautical (dealing with flight) engineering from Harvard University in Massachusetts. He won a college fiction contest, wrote for the *Harvard Advocate*, worked on two (unpublished) novels, and had a novella (longer than a short story, but shorter than a novel) published. Drafted into the army in 1944, he served in the Philippines in an infantry unit (a group of soldiers on foot) as both a clerk and a rifleman.

Writes popular war novel

In the army Mailer knew he was living the material for his third novel. From notes in letters to his wife, he composed a brilliant narrative around an army unit's taking of a Japanese-held Pacific island. Borrowing the natural writing style of writers such as John Dos Passos (1896–1970) and James Farrell (1904–1979), the use of symbols from Herman Melville (1819–1891), and the journalist's observations from Ernest Hemingway (1899–1961), Mailer described (in language that offended many) the war and the inner conflicts of American fighting men. Mailer insisted that *The Naked and the Dead* (1948) was not written about a specific war but of "death and man's creative urge, fate, man's desire to conquer the elements." The work was a popular success and won him critical praise.

After attending the Sorbonne in Paris, France (part of the University of Paris), Mailer returned to the United States in the mid-1950s and helped found the New York newspaper the *Village Voice*. His next novel, *Barbary Shore* (1951), is set in a Brooklyn rooming house and contains complaints

about the government of the United States. *The Deer Park* (1955), both the novel and the play Mailer adapted it from, focuses on two of Mailer's most memorable characters, Sergius O'Shaughnessy, former Air Force pilot, and Elena Esposito, broken-down dancer and actress. *An American Dream* (1965) shows Steve Rojack, trapped in an urban (city-based) nightmare of sex, murder, and despair, escaping with what remains of his soul to the jungles of Yucatán, Mexico. *Why Are We in Vietnam?* (1967), one of Mailer's least popular works, takes its eighteen-year-old hero on an Alaskan hunting trip that ends with his initiation into manhood. These books voiced Mailer's view of the problems that lay beneath the surface of American life.

Changes to nonfiction

Mailer began a second career in the mid-1950s as an essayist and journalist. He became a national personality with the publication of *Advertisements for Myself* (1959), a collection of earlier writings that included bitter attacks, personal interviews, cultural essays, stories, works in progress, and confessions of how Mailer reached the depths of his own state and found a "new consciousness" (awareness).

Although the 1960s were a time of personal conflict and public rebellion for Mailer, he wrote many works during that period that helped establish him as a leading writer of nonfiction. *The Presidential Papers* (1963) presented criticism of American politics and society that introduced a new Mailer, a public historian of the years when John F. Kennedy (1917–1963) was president. This work, along with *Cannibals and Christians* (1966), attempted to establish him as "self-appointed master of the Now." *The Prisoner of Sex*

(1971) contained a discussion of Mailer's various sexual relationships.

The peace march on Washington, D.C., in 1967 and the presidential conventions of 1968 gave Mailer some of his best material. Mailer, a skilled reporter, turned his notes into "non-fictional novels" using the style of New Journalism, in which real events are described with the addition of writing devices such as narrative, dialogue, and multiple points of view. The Washington experience became *The Armies of the Night: History as a Novel, the Novel as History* (1968), for which Mailer received a National Book Award and a Pulitzer Prize. The political conventions shaped *Miami and the Siege of Chicago* (1968). These works reflect Mailer's personality and controversial (causing dispute) opinions on historic events, creating sharp descriptions of the conflict between individual and collective power. Other works using New Journalism methods include *Of a Fire on the Moon* (1971), *The Executioner's Song* (1979), and *Harlot's Ghost* (1991).

In the late 1970s Mailer began receiving letters from a prisoner named Jack Henry Abbott, whom Mailer began to consider a promising writer. Mailer helped Abbott publish a book of letters, *In the Belly of the Beast* (1981), wrote the book's introduction, and spoke up on behalf of Abbott, helping him get released from prison in 1981. Two weeks later Abbott stabbed a man to death and went back to prison. Mailer was criticized for not recognizing Abbott's violent nature. (Abbott hung killed himself in prison in 2002.)

Later works

In 1987 Mailer directed his first film, *Tough Guys Don't Dance*. During the 1990s Mailer again turned his attention to biograph-

ical essays and novels. *Portrait of Picasso As A Young Man* (1995) and *Oswald's Tale: An American Mystery* (1995) received poor reviews. Many critics felt that Mailer had used questionable new sources for subjects whose lives had already been examined. Among the theories Mailer presents is that violence and death are at the heart of Pablo Picasso's (1881–1973) Cubism (art based on geometry, or the study of points, lines, and surfaces) period.

Not one to avoid challenging subjects, Mailer chose to write a novel about Jesus Christ in 1997. As noted in the *New York Times Book Review*, Mailer wrote not merely of Jesus's life, but a modern-day Gospel, *The Gospel According to the Son*, using the voice of Jesus Himself—a choice avoided by all surviving ancient Gospels and by almost all modern novelists. Still, as in many of his other works, critics pointed to “rare powerful moments of invention” and gave Mailer credit for his knowledge of religious texts.

Mailer continued observing and commenting on major social and political issues throughout the 1990s, often interviewing people whose ideas opposed his, such as the conservative (preferring traditions and opposed to change) politician and newscaster Patrick Buchanan (1938–). In 2002 Mailer appeared as Ernest Hemingway in several performances of a dramatic reading called “Zelda, Scott, and Ernest,” based on the friendship among Hemingway, the writer F. Scott Fitzgerald (1896–1940), and Fitzgerald's wife Zelda. “It's as close as I'll ever get to Hemingway,” Mailer told the *Washington Post*.

BERNARD MALAMUD

Born: April 26, 1914

Brooklyn, New York

Died: March 18, 1986

New York, New York

American author

Bernard Malamud is considered one of the most prominent figures in Jewish American literature, a movement that began in the 1930s and is known for its combination of tragic and comic elements.

Early life

Bernard Malamud was born on April 26, 1914, in Brooklyn, New York, the first of Max and Bertha Fidelman Malamud's two sons. His parents, whom he described as “gentle, honest, kindly people,” had come to the United States from Russia in the early 1900s and ran their own grocery store. They were not highly educated and knew very little

about literature or the arts. "There were no books that I remember in the house, no records, music, pictures on the wall," Malamud said. Malamud liked to read and to attend a local Yiddish (the language spoken by Jews in Europe) theater. He began to try to write stories of his own.

Malamud attended high school in Brooklyn and received his bachelor's degree from the City College of New York in 1936. After graduation he worked in a factory and as a clerk at the Census Bureau in Washington, D.C. Although he wrote in his spare time, Malamud did not begin writing seriously until hearing of the horrors of the Holocaust, when the Germans, led by Adolf Hitler (1889–1945), put six million Jewish people to death during World War II (1939–45; a war in which Great Britain, France, the Soviet Union, and the United States battled Germany, Italy, and Japan). Malamud also began reading about Jewish tradition and history. In 1949 he started teaching at Oregon State University. He left this post in 1961 to teach creative writing at Bennington College in Vermont, where he remained until shortly before his death.

First works

Malamud's first novel, *The Natural* (1952), traces the life of Roy Hobbs, an American baseball player. The book has mythic elements and explores such themes as initiation and isolation. Malamud's second novel, *The Assistant* (1957), tells the story of Morris Bober, a Jewish immigrant who owns a grocery store in Brooklyn. Although he is struggling to make ends meet, Bober hires an anti-Semitic (prejudiced against Jewish people) youth, whom he learns is homeless and

Bernard Malamud.
Courtesy of the Library of Congress.

on the verge of starvation. This novel shows the value of maintaining faith in the goodness of the human soul. Malamud's first collection of short stories, *The Magic Barrel* (1958), was awarded the National Book Award in 1959. Many of Malamud's best-known short stories were republished in *The Stories of Bernard Malamud* in 1983.

A New Life (1961), considered one of Malamud's most true-to-life novels, is based in part on Malamud's teaching career at Oregon State University. This work focuses on an ex-alcoholic Jew from New York City who becomes a professor at a college in the Pacific Northwest. It examines the main character's

search for self-respect, while poking fun at life at a learning institution. Malamud's next novel, *The Fixer* (1966), is one of his most powerful works. The winner of both the Pulitzer Prize and the National Book Award, this book is based on the historical account of Mendel Beiliss, a Russian Jew who was accused of murdering a Christian child. With *The Tenants* (1971), Malamud returns to a New York City setting in a contrast between two writers—one Jewish and the other African American—struggling to survive in an urban ghetto (the run-down part of a city).

Later years

In *Dubin's Lives* (1979), which took Malamud over five years to write, the main character, William Dubin, attempts to create a sense of worth for himself, both as a man and as a writer. Malamud's last finished novel, *God's Grace* (1982), studies both the original Holocaust and a new, imagined Holocaust of the future. The novel is a wild, at times brilliant, at times confusing, description of a flood similar to that in the Bible story of Noah's ark.

Malamud continued to place stories in top American magazines. Mervyn Rothstein reported in the *New York Times* that Malamud said at the end of his life, "With me, it's story, story, story." In Malamud's next-to-last collection, *Rembrandt's Hat*, only one story, "The Silver Crown," deals with Jewish themes.

Malamud's final, unfinished work, "The Tribe," concerns the adventures of a Russian Jewish peddler, Yozip, among the western Native American Indians. Malamud gave few interviews, but those he did grant provided the best insight into his work, as when he told Michiko Kakutani in the *New York Times*:

"People say I write so much about misery, but you write about what you write best." Bernard Malamud died on March 18, 1986.

MALCOLM X

Born: May 19, 1925

Omaha, Nebraska

Died: February 21, 1965

New York, New York

African American civil rights leader

African American civil rights leader Malcolm X was a major twentieth-century spokesman for black nationalism. Unlike many other African American leaders of this time, who supported nonviolent methods, Malcolm X believed in using more aggressive measures in the fight for civil rights.

As a boy

Malcolm X was born Malcolm Little on May 19, 1925, in Omaha, Nebraska. His father, a Baptist minister, was an outspoken

follower of Marcus Garvey (1887–1940), the black nationalist leader. (A nationalist is a person who promotes one nation's culture and interests over all others.) Garvey supported a "back-to-Africa" movement for African Americans. During Malcolm's early years, his family moved several times because of racism (dislike and poor treatment of people based on their race). They moved from Omaha, Nebraska, after being threatened by the Ku Klux Klan, a group that believes that white people are superior to all other races. While living in an all-white neighborhood in Michigan their house was burned. When Malcolm was six years old, his father was mysteriously murdered. The black community was convinced that white people had committed the crime. Three of Malcolm's four uncles were also murdered by white people.

By the 1930s the nation had fallen into the Great Depression, a decade-long period of great economic hardship. Work was scarce, and Malcolm's family struggled. For a time his mother and her eight children lived on public welfare. When his mother became mentally ill, Malcolm was sent to a foster home. His mother remained in a mental institution for about twenty-six years. The children were divided among several families, and Malcolm lived in various state institutions and boardinghouses. At thirteen Malcolm was charged with delinquency (behaving in a way that is against the law) and was sent to a juvenile detention home (a place where young people are held in custody). He dropped out of school at the age of fifteen.

A criminal life

Living with his sister in Boston, Massachusetts, Malcolm worked as a shoeshine

boy, a busboy, and a waiter. In Boston Malcolm began visiting the black ghetto (an area of a city where a minority lives) of Roxbury. There, he was drawn to the neighborhood's street life. He began wearing flashy clothing and jumped into a criminal life that included gambling, selling drugs, and burglary.

In 1942 Malcolm moved to New York City's Harlem neighborhood where he continued his unlawful lifestyle. He adapted well to the New York City street life and rose quickly in the criminal world. Malcolm became known as Detroit Red, for his red shock of hair. When the police uncovered his criminal activities, Malcolm returned to Boston.

Reformed in prison

In 1946, at the age of twenty, Malcolm was sentenced to ten years in prison for burglary. While in prison he began to transform his life. He began reading books on history, philosophy, and religion. In prison his brother Reginald visited him and told Malcolm about the Black Muslims. The Black Muslims were an Islamic religious organization whose official name was the Lost-Found Nation of Islam. The leader of the group was Elijah Muhammad (1897–1975).

Malcolm began to study Muhammad's teachings and to practice the religion faithfully. These teachings taught that the white man is evil and doomed by Allah to destruction. Also, the teachings stressed that the best course for black people is to separate themselves from Western, white civilization—culturally, politically, physically, and psychologically. The Black Muslim teachings also prohibited personal habits such as smoking, drinking, and the eating of pork. In addition

Malcolm X.

to finding his new religion while in prison, Malcolm began copying words from the dictionary and developed the vocabulary that would help him become a passionate and effective public speaker.

In 1952 Malcolm was released from prison, and he went to Chicago, Illinois, to meet Elijah Muhammad. There he was accepted into the movement and given the name of Malcolm X. Malcolm believed the “X” represented his “slave” name that was forever lost after being raised in a mainly white nation. Malcolm X became assistant minister of the Detroit Mosque, or Muslim house of worship. The following year he returned to Chicago to

study personally under Muhammad, and shortly thereafter was sent to organize a mosque in Philadelphia, Pennsylvania. In 1954 he went to lead the mosque in Harlem.

The message of Malcolm X

Malcolm X soon became the most visible national spokesman for the Black Muslims. As the voice of the organization he was a speech-writer, a philosopher, and an inspiring speaker who was often quoted by the media. His debating talents against white and black opponents helped spread the movement’s message.

At this time in the United States there was a major movement for racial integration, or bringing the races together in peace. However, Malcolm X and the Black Muslims were calling for racial separation. He believed that the civil rights gains made in America amounted to almost nothing. He criticized those African Americans who used nonviolent methods in order to achieve integration. Malcolm X called for self-defense in the face of white violence.

Malcolm X urged black people to give up the Christian religion. He preached that the high crime rate in black communities was basically a result of African Americans following the lifestyle of Western, white society. During this period Malcolm X, following Elijah Muhammad, urged black people not to participate in elections. These elections, the movement believed, meant supporting the immoral (against the ideas of right and wrong held by most people) political system of the United States.

In 1957 Malcolm X met a young student nurse, Betty Jean Sanders (1936–1997), in New York. She soon became a member of the

Black Muslims. They were married in 1958, and she became Betty Shabazz. The couple eventually had six daughters.

Losing momentum

By 1959 the Black Muslim movement had moved into the national spotlight. Racial tensions were reaching a boiling point, and white Americans grew fearful of Malcolm X and his message of black supremacy (the belief that the black race is better than all others). By 1960 Black Muslim membership had grown to more than one hundred thousand.

As the movement reached its peak, some observers felt that there were elements within the Black Muslim movement that wanted to oust Malcolm X, or force him from office. There were rumors that he was planning to take over leadership from Elijah Muhammad and that he wanted to make the organization political. Others felt that the personal jealousy of some Black Muslim leaders was a factor.

On December 1, 1963, Malcolm X stated that he saw President John F. Kennedy's assassination as a case of "The chickens coming home to roost." Soon afterward Elijah Muhammad suspended him and ordered him not to speak for the movement for ninety days. On March 8, 1964, Malcolm X publicly announced that he was leaving the Nation of Islam. He said he was starting two new organizations: the Muslim Mosque, Inc., and the Organization of Afro-American Unity. He remained a believer in the Islamic religion.

An international focus

During the next months Malcolm X made several trips to Africa and Europe and one to Mecca, a city in Saudi Arabia that is

the holiest city of the Islamic religion. Based on these trips, he wrote that he no longer believed that all white people were evil and that he had found the true meaning of the Islamic religion. He changed his name to El-Hajj Malik El-Shabazz.

Malcolm X announced that he planned to take the black struggle to an international audience by putting black people's complaints against the United States before the United Nations (UN). For this purpose he sought aid from several African countries through the Organization of Afro-American Unity. At the same time he stated that his organizations were willing to work with other black organizations and with progressive white groups in the United States. Together, these organizations would work on voter registration, on black control of community public institutions such as schools and the police, and on other civil and political rights for black people.

Malcolm X began holding meetings in Harlem at which he discussed the policies and programs of his new organizations. Then, on a Sunday afternoon, February 21, 1965, as he began to address one such meeting, Malcolm X was assassinated.

Since his death Malcolm X's influence on the political and social thinking of African Americans has been enormous, and the literature about him has only grown. Alex Haley's 1965 book, *The Autobiography of Malcolm X*, was written from several interviews conducted with Malcolm X before he died. It is now considered a classic in African American literature. Malcolm X Community College in Chicago, Malcolm X Liberation University in Durham, North Carolina, and the Malcolm X Society are all named for him.

DAVID MAMET

Born: November 30, 1947

Chicago, Illinois

American writer, playwright/dramatist, screenwriter, and director/producer

Playwright, screenwriter (a person who writes scripts for movies), and director David Mamet is known for his accurate use of American vernacular (the normal spoken form of a language), through which he explores the relationship between language and behavior.

Taught to love words

David Alan Mamet was born in Chicago, Illinois, on November 30, 1947, the only son

of Bernard and Leonore Mamet (they also had a younger daughter). His father was a labor lawyer who loved to argue and taught his children how to listen, question things, and express themselves as precisely as possible. Mamet spent many afternoons in his father's office, making phone calls and typing letters on the typewriter. Mamet's parents' high standards and their divorce when he was eleven made his childhood an unhappy one. He was very close to his sister, however. At fifteen he started working at the Hull House Theatre and discovered his life's direction. He went on to study literature and theater at Goddard College in Vermont (receiving a bachelor's degree in 1969) and acting at the Neighborhood Playhouse School of Theater in New York.

Successful plays

In 1971 Mamet began teaching drama at Goddard and wrote several plays. His first play to receive attention, *The Duck Variations* (1972), displays features found in much of his work: a fixed setting, few characters, a simple plot, and dialogue that captures the rhythms of everyday speech. *Sexual Perversity in Chicago* (1974) (later adapted for film as *About Last Night*. . . .) examines relationships between men and women. *American Buffalo* (1975), for which Mamet received the New York Drama Critics Circle Award, is set in a junk shop and deals with the efforts of three men trying to steal a valuable coin. The main character of *The Water Engine: An American Fable* (1977) creates a new engine but is murdered when he refuses to sell his invention for profit. Other plays from this period include *A Life in the Theatre*, *The Woods*, *Reunion*, and *Dark Pony* (all 1977), as well as *The Sanctity of Marriage* (1979).

Glengarry Glen Ross (1982), Mamet's most praised work, is the story of four Florida real estate agents competing to become their company's top salesperson by trying to cheat unsuspecting customers. The play was awarded both the New York Drama Critics Circle Award and the Pulitzer Prize in drama. *Edmond* (1982) involves a businessman who leaves his wife and wanders into a run-down area of New York City. After being beaten and robbed, he turns to violence and is imprisoned for murdering a waitress. *Prairie du chien* (1985) and *The Shawl* (1985) are companion pieces. The first play centers on an unusual murder, while the second concerns a psychic's efforts to obtain a client's inheritance. *Speed-the-Plow* (1988), in which pop singer Madonna (1958–) made her first performance on Broadway, is the story of a close male friendship that is threatened by the arrival of a strange woman.

David Mamet.

Reproduced by permission of AP/Wide World Photos.

Screenplays and other works

Mamet has also written several screenplays (scripts for movies). The first, *The Postman Always Rings Twice* (1981), is generally considered his least successful effort. In *The Verdict* (1982), based on Barry Reed's novel *Verdict* (1980), an alcoholic lawyer battles injustice to win a lawsuit for a woman who suffered brain damage during childbirth. Reviewers praised Mamet's dialogue, and the screenplay was nominated (put forward for consideration) for an Academy Award. He also made his first effort at directing with the 1987 film *House of Games* (for which he also wrote the screenplay), about a doctor's involvement with a con man.

In the latter half of the 1980s Mamet published two collections of essays, *Writing in*

Restaurants and Some Freaks. Both books are packed with Mamet's opinions on a variety of topics such as friendship, religion, politics, morals, society, and of course, the American theater. Mamet has also taught at The Yale Drama School and New York University. He often lectures to classes at the Atlantic Theater Company, and he was one of the company's founding members.

Later efforts

Mamet continues to direct films and write plays, essays, and screenplays. His recent film works include the 1994 film version of his play *Oleanna* (which was first pro-

duced on stage in 1992), *The Winslow Boy* (1999), *State and Main* (2000), and *Heist* (2001). In 1999 he wrote a book of essays, *Jafsie and John Henry. Wilson: A Consideration of the Sources*, a novel, was released in 2001. Mamet married actress Rebecca Pidgeon in 1991. They have two children. He also has two children from his first marriage to actress Lindsay Crouse.

NELSON
MANDELA

Born: 1918

Transkei, South Africa

South African president and political activist

Nelson Mandela is a South African leader who spent years in prison for opposing apartheid, the policy by which the races were separated and whites were given power over blacks in South Africa. Upon his release from prison, Man-

delo became the first president of a black-majority-ruled South Africa in which apartheid was officially ended. A symbol of hope for many, Mandela is also a former winner of the Nobel Peace Prize.

Youth and education

Nelson Rolihlahla Mandela was born in a small village in the southeastern region of South Africa called the Transkei. His father was chief of the village and a member of the royal family of the Thembu tribe, which spoke the Xhosa language. As a boy, Mandela grew up in the company of tribal elders and chiefs, which gave him a rich sense of African self-government and heritage, despite the cruel treatment of blacks in white-governed South Africa.

Mandela was also deeply influenced by his early education in Methodist church schools. The instruction he received there set Mandela on a path leading away from some African tribal traditions, such as an arranged marriage set up by a tribal elder, which he refused. After being expelled from Fort Hare University College in 1940 for leading a student strike, Mandela obtained a degree from Witwatersrand University. In 1942 he received a degree in law from the University of South Africa.

Joining the ANC

In 1944 Mandela joined the African National Congress (ANC), a South African political party. Since its founding, the ANC's main goal had been to work to improve conditions and rights for people of color in South Africa. However, its fairly conservative stance had led some members to call for less timid measures. Mandela became one of the ANC's

younger and more radical leaders as a member of the ANC's Youth League. He became president of the league in 1951.

The years between 1951 and 1960 were troubled times, both for South Africa and for the ANC. Younger antiapartheid activists (protesters), including Mandela, were coming to the view that nonviolent demonstrations against apartheid did not work, because they allowed the South African government to respond with violence against Africans. Although Mandela was ready to try every possible technique to destroy apartheid peacefully, he began to feel that nonviolent resistance would not change conditions in the end.

In 1952 Mandela's leadership of ANC protest activities led to a nine-month jail sentence. Later, in 1956, he was arrested with other ANC leaders for promoting resistance to South Africa's "pass laws" that prevented blacks from moving freely in the country. Mandela was charged with treason (a crime committed against one's country), but the charges against him and others collapsed in 1961. By this time, however, the South African government had outlawed the ANC. This move followed events at Sharpeville in 1960, when police fired on a crowd of unarmed protesters.

Sharpeville had made it clear that the days of nonviolent resistance were over. In 1961 antiapartheid leaders created a semi-underground (operating illegally) movement called the All-African National Action Council. Mandela was appointed its honorary secretary and later became head of Umkhonto weSizwe (the Spear of the Nation), a militant ANC organization which used sabotage (destruction of property and other tactics

Nelson Mandela.

Reproduced by permission of AP/Wide World Photos.

used to undermine the government) in its fight against apartheid.

Political prisoner

In 1962 Mandela was again arrested, this time for leaving South Africa illegally and for inciting strikes. He was sentenced to five years in jail. The following year he was tried with other leaders of Umkhonto weSizwe on a charge of high treason, following a government raid of the group's secret headquarters. Mandela was given a life sentence, which he began serving in the maximum security prison on South Africa's Robben Island.

During the twenty-seven years that Mandela spent in prison, his example of quiet suffering was just one of many pressures on South Africa's apartheid government. Public discussion of Mandela was illegal, and he was allowed few visitors. But as the years dragged on, he was increasingly viewed as a martyr (one who suffers for a cause) in South Africa and around the world, making him a symbol of international protests against apartheid.

In 1988 Mandela was hospitalized with an illness, and after his recovery he was returned to prison under somewhat less harsh conditions. By this time, the situation within South Africa was becoming desperate for the ruling white powers. Protest had spread, and international pressures for the end of apartheid were increasing. More and more, South Africa was isolated as a racist state. It was against this backdrop that F. W. de Klerk (1936–), the president of South Africa, finally responded to the calls from around the world to release Mandela.

Freedom

On February 11, 1990, Mandela walked out of prison. He received joyful welcomes wherever he went around the world. In 1991 he assumed the presidency of the ANC, which had been given legal status again by the government.

Both Mandela and deKlerk realized that only a compromise between whites and blacks could prevent civil war in South Africa. As a result, in late 1991, a multiparty Convention for a Democratic South Africa met to establish a new, democratic government that gave people of all colors rights to determine the country's future. Mandela and deKlerk led the negotiations, and their efforts gained them the

Nobel Peace Prize in 1993. In September 1992, the two leaders signed a document that created a freely elected constitutional assembly to draft a new constitution and to act as a transition government (a government that functions temporarily while a new government is being formed). On April 27, 1994, the first free elections open to all South African citizens were held. The ANC won over sixty-two percent of the popular vote, and Mandela was elected president.

Presidency and retirement

As president, Mandela worked to ease the dangerous political differences in his country and to build up the South African economy. To a remarkable degree he was successful in his aims. Mandela's skill at building compromise and his enormous personal authority helped him lead the transition to democracy. In an effort to help the country heal, he also backed the establishment of a Truth and Reconciliation Commission which offered amnesty (exemption from criminal prosecution) to those who had committed crimes during the apartheid era. This action helped to promote discussion about the country's history.

Mandela retired in June 1999, choosing not to challenge Thabo Mbeki, his vice president, in elections. Mbeki won the election for the ANC and was inaugurated as president on June 16, 1999. Mandela quickly took on the role of statesman after leaving office, acting that year as a mediator in the peace process in Burundi, where a civil war had led to the killing of thousands.

In late 2001, Mandela joined the outcry against terrorism when he expressed his support for the American bombing of Afghanistan after terrorist attacks against the

United States on September 11, 2001. By January 2002, however, Mandela had modified his support somewhat after South African Muslims criticized him for appearing to be insensitive to the sufferings of the Afghan people. As quoted by the Associated Press, Mandela called his earlier remarks supporting the bombings an “overstatement” and urged caution against prematurely labeling Osama bin Laden, the man suspected of plotting the attacks, as a terrorist.

ÉDOUARD MANET

Born: January 23, 1832

Paris, France

Died: April 30, 1883

Paris, France

French painter

The works of the French painter Édouard Manet influenced many other artists; their modern subject matter and more natural, less precise style were seen as revolutionary.

Early years

Édouard Manet was born in Paris, France, on January 23, 1832, to Auguste Édouard Manet and Eugénie Désirée Manet. Manet's mother was an artistic woman who made sure that Édouard and his two brothers took piano lessons. His father, an official at the Ministry of Justice, expected his son to study law and was opposed to the idea of him becoming a painter. It was decided that Édouard would join the navy, and at the age of sixteen he sailed to Rio de Janeiro, Brazil, on a training vessel. Upon his return he failed to pass the navy's entrance examination. His father finally gave in, and in 1850 Manet began studying figure painting in the studio of Thomas Couture, where he remained until 1856. Manet also traveled abroad and made many copies of classic paintings for both foreign and French public collections.

Early works

Manet's entry for the Salon (annual public exhibition, or show) of 1859, the *Absinthe Drinker*, a romantic but daring work, was rejected. At the Salon of 1861, his *Spanish Singer*, one of a number of works of Spanish character painted in this period, not only was admitted to the Salon but won an honorable mention and the praise of the poet Théophile Gautier. This was to be Manet's last success for many years.

Édouard Manet.

Reproduced by permission of the Corbis Corporation.

In 1863 Manet married Suzanne Leenhoff, his piano teacher. That year he showed fourteen paintings at the Martinet Gallery; one of them, *Music in the Tuileries*, caused a hostile reaction. Also in 1863 the Salon rejected Manet's large painting *Luncheon on the Grass*; its combination of clothed men and a nude woman was considered offensive. Manet elected to have it shown at the now famous Salon des Refusés, created by the Emperor to quiet complaints from the large number of painters whose work had been turned away by the official Salon. In 1865 Manet's *Olympia* produced an even more vio-

lent reaction at the official Salon, and his reputation as a rebel became widespread.

Supporters and admirers

In 1866, after the Salon jury had rejected two of Manet's works, novelist Émile Zola (1840–1902) came to his defense with a series of articles filled with strongly expressed praise. In 1867 Zola published a book that predicted, "Manet's place is destined to be in the Louvre." (The Louvre, in Paris, is the largest and most famous art museum in the world.) In May 1868 Manet, at his own expense, exhibited fifty of his works at the Paris World's Fair; he felt that his paintings had to be seen together in order to be fully understood.

Although the painters of the impressionist movement (a French art movement of the second half of the nineteenth century whose members sought in their works to represent the first impression of an object upon the viewer) were influenced by Manet during the 1860s, later it appeared that he had also learned from them. His colors became lighter, and his strokes became shorter and quicker. Still, Manet remained mainly a figure and studio painter and refused to show his works with the impressionists at their private exhibitions.

Late works

Toward the end of the 1870s Manet returned to the figures of the early years. Perhaps his greatest work was his last major one, *A Bar at the Folies-Bergère*. In 1881 Manet was admitted to membership in the Legion of Honor, an award he had long dreamed of. By then he was seriously ill, and walking became increasingly difficult for him. In his weakened

condition he found it easier to handle pastels than oils, and he produced a great many flower pieces and portraits (paintings of people, especially their faces) in that medium. In early 1883 his left leg was amputated (cut off), but this did not prolong his life. He died peacefully in Paris on April 30, 1883.

Manet was short, unusually handsome, and witty. He was remembered as kind and generous toward his friends. Still, many elements of his personality were in conflict. Although he was a revolutionary artist, he craved official honors; while he dressed fashionably, he spoke a type of slang that was at odds with his appearance and manners; and although his style of life was that of a member of the conservative (preferring to maintain traditions and resist change) classes, his political beliefs were liberal (open-minded and preferring change).

WILMA MANKILLER

Born: November 18, 1945

Tahlequah, Oklahoma

Native American community activist, tribal chief, and tribal legislator

Wilma Mankiller was the first woman elected principal chief of the Cherokee Nation. She works to improve the lives of Native Americans by helping them receive better education and health care and urges them to preserve and take pride in their traditions.

Early life

Wilma Mankiller was born in Tahlequah, Oklahoma, the capital of the Cherokee Nation, on November 18, 1945. Her father was Charlie Mankiller, a Cherokee, and her mother was Irene Mankiller, who was of Dutch-Irish ancestry. Wilma has four sisters and six brothers. Her great-grandfather was one of the more than sixteen thousand Native Americans and African slaves who were ordered by President Andrew Jackson (1767–1845) to walk from their former homes in the Southeast to new “Indian territory” in Oklahoma in the 1830s. The harsh weather, hunger, disease, and abuse from U.S. soldiers that the walkers experienced on what came to be called the Trail of Tears led to the deaths of at least four thousand of them.

The Mankillers were very poor in Oklahoma. Charlie Mankiller thought he could make a better life for them in California and accepted a government offer to relocate. However, promises that were made to the family were not kept, money did not arrive, and there was often no employment available, so their life did not improve after their arrival in San Francisco. The children were also homesick. As Mankiller recalled in her autobiography, called *Mankiller: A Chief and Her People*, “I experienced my own Trail of Tears when I was a young girl. No one pointed a gun at me or at

Wilma Mankiller.

Reproduced by permission of Wilma Mankiller.

members of my family. No show of force was used. It was not necessary. Nevertheless, the United States government, through the Bureau of Indian Affairs, was again trying to settle the 'Indian problem' by removal. I learned through this ordeal about the fear and anguish that occur when you give up your home, your community, and everything you have ever known to move far away to a strange place. I cried for days, not unlike the children who had stumbled down the Trail of Tears so many years before. I wept tears . . . tears from my history, from my tribe's past. They were Cherokee tears."

Political awakening

Mankiller finished high school and took a job as a clerk. She met and married Hector Hugo Olaya de Bardi in 1963, and they had two daughters. Wilma settled into the role of wife and mother. This was a time when there were many political and social movements taking place across America. In 1969 her life was changed. San Francisco State student and Mohawk Richard Oakes (1942–1972), along with other Native Americans of different tribes, occupied an abandoned prison on Alcatraz island in the San Francisco Bay to call attention to the mistreatment of Native Americans by the U.S. government. The invasion was seen as a historic event by many Native American people, Mankiller included. "When Alcatraz occurred, I became aware of what needed to be done to let the rest of the world know that Indians had rights, too. Alcatraz articulated [expressed] my own feelings about being an Indian," Mankiller stated in her autobiography. She began a commitment to serve the Native American people to the best of her ability in the area of law and legal defense.

In addition to wanting to help her people, Mankiller began to desire independence, and she began taking courses at a community college and later at San Francisco State. This caused a conflict with her marriage. "Once I began to become more independent, more active with school and in the community, it became increasingly difficult to keep my marriage together. Before that, Hugo had viewed me as someone he had rescued from a very bad life," she noted in her autobiography. In 1974 she was divorced and became a single head of the household.

Personal tragedies and health problems

In 1971 Mankiller's father died from a kidney disease in San Francisco, which she said "tore through my spirit like a blade of lightning." The family took Charlie Mankiller home to Oklahoma for burial, and then Wilma Mankiller returned to California. It was not long before she too had kidney problems, inherited from her father. Her early kidney problems could be treated, though eventually she had to have a transplant. Her brother Donald became her "hero" by donating one of his kidneys so that she could live.

In 1976 Mankiller returned to Oklahoma for good. She found a job as a community coordinator in the Cherokee tribal headquarters and enrolled in graduate courses at the University of Arkansas in Fayetteville. This required her to drive a long distance every day. She was returning home one morning in 1979 when a car approached her on a blind curve and, out of nowhere, another car attempted to pass it. She swerved to miss the approaching car but failed. The vehicles collided almost head-on. Mankiller was seriously injured, and many thought she would not survive. The driver of the other automobile did not. It turned out to be Sherry Morris, Mankiller's best friend. Mankiller had to overcome both her physical injuries and the guilt she experienced after the accident. Then in 1980 she came down with myasthenia gravis, a muscle disease. Again her life was threatened, but her will to live and her determination to heal her body with the power of her mind prevailed.

Becomes principal chief

In 1983 Ross Swimmer (1943–), then principal chief of the Cherokee Nation of

Oklahoma, asked Mankiller to be his deputy chief in the election. While campaigning she was surprised by the criticism she received—not for her stand on any particular issue, but simply because she was a woman. Swimmer and Mankiller won the election and took office in August. On December 5, 1985, Swimmer was nominated to head the Bureau of Indian Affairs in Washington, D.C. Mankiller was sworn in to replace him as principal chief of the Cherokee Nation. She focused on education and health care, overseeing the construction of new schools, job-training centers, and health clinics.

Mankiller overcame many tragedies to become a guiding power for the Cherokee people of Oklahoma and a symbol of achievement for women everywhere. Throughout her life, Mankiller has managed to not complain about how bad things were for herself, for her people, and for Native Americans in general. She instead has worked to help make life better. Although she declined to seek another term as principal chief in 1995 for health reasons, she remains in the public eye, writing and giving lectures across the country. She has stressed that if all the Native Americans who were eligible to vote actually did so, officials elected with those votes would be forced to address the problems of Native Americans. She also has called for an end to the increasing problem of violence against women. Mankiller was inducted into the Women's Hall of Fame in New York City in 1994 and was given a Presidential Medal of Freedom by then-president Bill Clinton (1946–) in 1998.

MICKEY MANTLE

Born: October 20, 1931

Spavinaw, Oklahoma

Died: August 13, 1995

Dallas, Texas

American baseball player

Baseball player Mickey Mantle (known as “the Mick”) won four home-run championships, a Triple Crown (highest batting average, most home runs, and most RBIs [runs batted in] in one season), and three Most Valuable Player (MVP) awards during his eighteen-year career with the New York Yankees.

Early years

Mickey Charles Mantle was born on October 20, 1931, in Spavinaw, Oklahoma, to Elvin (“Mutt”) and Lovell Richardson Mantle. A former semi-pro (professional but independent of Major League Baseball) baseball player, Mutt Mantle named his first child after Detroit Tigers catcher Mickey Cochrane. Mickey was barely out of diapers before he was practicing baseball with his father. Mutt taught his son to be a switch-hitter: Mickey would use his natural right-handed swing

against his left-handed father and then turn around and bat left-handed against his right-handed grandfather.

Mantle played baseball, basketball, and football at his high school in Commerce, Oklahoma. During one game, however, he was kicked in the leg and developed osteomyelitis, a bone disease that would later affect his baseball career. Mantle attracted the attention of New York Yankee scout Tom Greenwade, who signed him to a contract of \$140 a week with a \$1,500 signing bonus.

Quick rise to the majors

Mantle reported to the Yankees’ minor league team in Independence, Kansas, in 1949 as a shortstop. After two years in the minor leagues, the Yankees invited him to their major league training camp. He earned a place on the roster, and the New York media soon began comparing him to Babe Ruth (1895–1948) and other past Yankee greats. Only nineteen years old and two years out of high school, Mantle did not immediately live up to the hype. He started slowly in his new position—right field—and was sent back to the minor leagues. Mantle’s difficulties continued when, in 1952, his father died of Hodgkin’s disease, a form of cancer, at the age of thirty-nine. Mantle had been very close to his father, and he took the death hard.

Mantle was moved to center field when Joe DiMaggio (1914–1999) retired from the Yankees following the 1951 season. He began to adjust to big-league play, and in 1952 he batted .311 with 23 home runs and 87 RBIs. That season Mantle began to establish himself as one of baseball’s best home-run hitters. During one game against the Washington Senators, Mantle hit a ball completely out of

Griffith Stadium in Washington, D.C. Measured at 565 feet, it is believed to be the longest home run ever hit. The New York Yankees won the World Series during each of Mantle's first three seasons, from 1951 to 1953. During the 1952 World Series against the Brooklyn Dodgers, Mantle batted .345 with two home runs. In the 1953 Series, again against the Dodgers, he batted only .208 but hit two more home runs.

Continued success

Mantle's talents led the Yankees as they ruled throughout the late 1950s. They won the American League pennant each year from 1955 to 1958, taking the World Series in 1956 and 1958. Mantle became a genuine superstar in 1956 when he won baseball's Triple Crown, with a .353 batting average, 52 home runs, and 130 RBIs. He was also selected the American League's MVP. In 1957 he hit .365 and was again named the league MVP.

Mantle's success at the plate continued as the Yankees remained strong well into the 1960s. After losing the pennant to the Chicago White Sox in 1959, the team came back to win it the next five seasons, joined by new stars such as Tony Kubek, Bobby Richardson, Bill Skowron, and Roger Maris. Mantle captured the home run title again in 1960, and he led the competition for the title again in 1961—one of the most dramatic home run seasons in the history of the game. By early August Mantle already had hit 43 home runs, while Maris, his teammate, had 42. The record for home runs in a season was held by Babe Ruth, who had blasted 60 in 1927. Although Mantle ended the year with 54 home runs (his all-time high), Maris hit 61 homers and established the new all-time

Mickey Mantle.

Reproduced by permission of Archive Photos, Inc.

record (later broken by Mark McGwire in 1998, then Barry Bonds in 2001).

Mantle continued to excel even though his legs hurt most of the time from the osteomyelitis and other injuries. In 1962 he was named American League MVP for the third time. Although the Yankees continued to win pennants, their days of glory were coming to an end. They lost the 1963 World Series to the Los Angeles Dodgers and the 1964 World Series to the St. Louis Cardinals. By 1965 the Yankees's run was over. Mantle became unhappy with his pain and with his many strikeouts. During the 1965 season he said, "It isn't any fun when things are like this.

I'm only thirty-three, but I feel like forty." Mantle continued to play through the 1968 season; he announced his retirement in the spring of 1969.

Later years

Mantle left the Yankees with many great achievements. In addition to hitting 536 lifetime home runs, he led the American League in homers four times and was chosen as its most valuable player three times. He is one of only a few players to win a Triple Crown. He played on twelve pennant-winning and seven World Series-winning teams. He still holds the all-time record for home runs in World Series play (18) as well as numerous other World Series records. Mantle was a symbol of the Yankees and their greatness. In 1974 he was elected to baseball's Hall of Fame in his first year on the ballot (a list of players who are eligible to be voted into the Hall of Fame).

After retiring from baseball, Mantle pursued a business career, opening a restaurant and working in public relations for a casino in Atlantic City, New Jersey. He also made appearances to sign autographs and play in golf tournaments. His experience in television commercials and small film roles led to a job as a broadcaster for televised Yankees games. His career and personal life was marred by alcoholism, however.

Mantle had married Merlyn, a bank employee, in the 1950s, and they had four sons. Mantle was absent for much of their childhood, however, and he had a reputation for his all-night drinking. He and his wife separated in 1988. Their son Billy died of heart failure in March 1994 after being treated for Hodgkin's disease, the same illness that had taken Mantle's father and grandfa-

ther. Earlier in 1994 Mantle learned that his years of heavy drinking had left him with hepatitis (a swelling of the liver) and liver cancer. Although he received a liver transplant in June 1995, the cancer had spread to other organs, and Mantle died on August 13. His outstanding abilities and courage in the face of pain made him a hero to a generation of youngsters and adults alike.

MAO ZEDONG

Born: December 26, 1893

Shaoshan, Hunan, China

Died: September 9, 1976

Beijing, China

Chinese statesman

Mao Zedong was a Chinese statesman whose status as a revolutionary in world history is probably next only to that of Vladimir Lenin (1870–1924). More than anyone else in recent history, Mao Zedong helped to reshape the social and political structures of his ancient and heavily populated country.

Early years

Mao Zedong was born in Shaoshan, Hunan, China, on December 26, 1893. Mao had two younger brothers and one younger sister. His father, Mao Jensheng, had started out as a poor peasant but eventually paid off his debts, became a landowner, and started a business trading rice. A devoted follower of the religion of Buddhism, his mother, Wen Ch'i-mei, wanted her son to have a religious career. Mao did not venture outside his home province (state) until he was twenty-five. Up to then, his formal education was limited to six years at a junior normal school where he acquired a limited knowledge of science, learned almost no foreign language, but developed a clear written style and a considerable understanding of social problems, Chinese history, and current affairs. However, Mao inherited the practical traditions of Hunan education with the hope that somehow it would help him find ways to strengthen and improve his country.

Mao's brief time in Peking, China, in 1918 broadened his view. Although his life there was miserable, he was working under the chief librarian of Peking University, who was one of the pioneer Marxists of China. (Marxists are those that believe in a social system created by Karl Marx [1818–1883] that gives the control to the working class. This system ultimately leads to communism, where goods and services are owned and distributed by the government.) On his return to Hunan in the following year, Mao was already committed to communism. While making a living as a primary schoolteacher, he edited radical (extreme) magazines, organized trade unions, and set up politically oriented schools of his own. With the rise of the

Mao Zedong.

Reproduced by permission of the Corbis Corporation.

Chinese Communist Party (CCP) in 1921, of which Mao was one of fifty founding members, these activities were pursued with added energy and to a greater depth.

Meanwhile, the major political party, the Kuomintang (KMT), was reorganized, and a coalition (partnership) was formed between the KMT and CCP. Mao's main task was to coordinate the policies of both parties; however, he was unable to prove himself in this position due to his lack of academic and social standing. In 1925 when the coalition ran into problems, Mao was sent back to Hunan to "convalesce," or recover.

Champion of the peasants

An unfortunate result of this setback was that Mao was completely left out of the nationwide protests against Japan and Britain in the summer of that year, during which many of his comrades made their mark as leaders of the trade union movement or party politics. Out of his “convalescence,” Mao discovered the revolutionary potential of the peasants, the poor farm workers whose great numbers had been treated poorly by the warlords. From then on Mao switched his attention to this vast underprivileged class of people.

Mao’s newly acquired knowledge and experience enabled him to play a leading role in the peasant movement led by both the KMT and CCP. By 1927 he was in a position to support a class substitution in the Chinese revolution. Mao proposed that the poor peasants fill the role of revolutionary vanguard (the most important positions). Shortly after the publication of his *Report on the Peasant Movement in Hunan*, the KMT-CCP coalition broke up and the Communists were forced underground.

Establishment of soviets

Some survivors of the party went underground in the cities, to continue their struggle as a working-class party; the rest took up arms against the government and eventually established rural soviets (small governments) in central and northern China. One of these soviets was Mao’s Ching-kang mountain base area between Kiangsi and Hunan, where he had to rely chiefly on the support of the poor peasants.

The soviets threatened to disrupt the unity of the revolutionary movement, because it was thought that it would break it up into small pockets. The center of the CCP,

located underground in Shanghai, China, therefore took on the task of strengthening its leadership and party loyalty. A successful revolution, in its view, had to take the course of a series of urban uprisings under proletarian (working-class) leadership. In its effort to achieve this, the center had to ease the growing powers of the soviet leaders like Mao. Its effort gradually produced results: Mao first lost his control over the army he had organized and trained, then his position in the soviet party, and finally even much of his power in the soviet government.

The Long March

The years of this struggle within the party coincided with Chiang Kai-shek’s (1897–1975) successes in his anti-Communist campaigns. Eventually Chiang was able to drive the Communists out of their base areas on the Long March (a year-long, six-thousand-mile journey through the hills of Shensi). The loss of nearly all the soviets in central China suffered by the Communists proved the weaknesses of central party leadership.

When the revolutionary movement slowed and the hardships of the Long March were felt, those who might have challenged Mao for leadership fell by the wayside. By the time the Communists arrived at Yen-an, China, the party had gained a measure of unity, to be further consolidated (brought together) after the outbreak of the Sino-Japanese War in 1937, where China and Japan fought over land in China. This was the first truly nationalist war China had ever fought, in which the nation as a whole united to face the common foe of Japan.

By early 1941 the unity between the KMT and CCP had come to exist in name

only. This new situation called for the emergence of a Communist leader who could rival Chiang in case a civil war broke out. Mao was such the person, and soon his popularity began to grow.

Leader of the Chinese Communists

The personality cult (a community of worship) of Mao grew until his concepts were written into the party's constitution of 1945 (the constitution would outline the party's rules and principles). Under Mao's brilliant leadership the party fought from one victory to another, until it took power in 1949. Mao's concepts now guided the Communists in their way of thinking, their organization, and their action. In giving their faith to Mao's belief, they found unity and strength, and an understanding of the nature, strategy, and tactics of the revolution.

But Mao's concept had very little to say about the modernization and industrialization of China. Therefore, after 1949 the CCP was left to follow the example of the Soviet Union, with Soviet aid in the years of the cold war, the four-decade period of sour relations between Communist and free-world powers.

Mao launched the Socialist Upsurge in the Countryside of 1955 and the Great Leap Forward in 1958. The essential feature of these movements was a reliance upon the voluntary spirit of the people motivated by a new moral discipline, rather than upon money. The failure of the Great Leap Forward hurt Mao's power and reputation even further.

Cultural revolution

At this time, the worsening relations with the Soviet Union made its fatal impact.

Withdrawal of Soviet material aid practically all but ended China's attempt to copy the Soviet model. In the midst of this, Mao began his comeback.

During the famous Cultural Revolution of 1966 through 1969, Mao organized the army and young students into the Red Guards. With their help, Mao began to reorganize the CCP. Soon there was no Chinese thought beyond the extent of Mao's thought. By this Mao hoped to create enthusiasm of the Chinese masses to work harder while enduring a quiet and uncomplicated life. This may be the only way for a poor and heavily populated country like China to afford rapid transition into an industrialized country.

Last years

By the time Mao was in his late seventies, his life's work was essentially done, although he retained power until the end. Physically weakened, suffering from a lifetime of effort and Parkinson's Disease (a brain disorder), Mao's ability to rule in new and innovative ways to meet the demands of China's modernization grew increasingly weak. One of his final major acts was to reopen contact with the United States.

On September 9, 1976, Mao died in Beijing, China. Mao was undoubtedly the key figure in China in the twentieth century and one of the century's most important movers and reformers. He had devoted his life to the advancement of a peasant class terrorized for centuries by those in power. However, in pursuit of his own goals, Mao himself could be a violent and overpowering ruler.

ROCKY MARCIANO

Born: September 1, 1923

Brockton, Massachusetts

Died: August 31, 1969

Des Moines, Iowa

American boxer

Boxer Rocky Marciano held the heavyweight boxing title for four years during the 1950s. He is the only boxing champion to ever retire undefeated.

His younger years

Rocky Marciano was born Rocco Francis Marchegiano on September 1, 1923, in Brockton, Massachusetts. His father, Pierino, worked at a shoe factory. His mother's name was Pasqualena. Rocky would spend much of his life making sure she would not live in the poverty he had known growing up. He worked many different jobs to help his family, including as a dishwasher, in a candy factory, as a gardener, and in a shoe factory.

As a youngster Rocky played baseball and football and dreamed of a professional career in one of those sports. He got into many fights when he thought he or his friends had been insulted, but he did not take up boxing until after 1943, when he was drafted into the army. He took the sport up because it helped him avoid "KP" ("kitchen police," soldiers who assisted the cooks) and other less desirable activities. He showed a natural ability and fought as an amateur following his discharge from the army in 1946. He won twenty-seven of his thirty fights.

Baseball dreams

In 1947 Marciano had a chance to fulfill his dream of being a baseball player. He was given a tryout with the Chicago Cubs as a catcher. He did not make the team, because he could not accurately throw from home plate to second base due to an arm injury he received in the army. It was the end of his baseball dreams. The following year he turned professional in the boxing ring.

By the spring of 1949 Marciano's boxing skills had received attention, after he knocked out his first sixteen opponents. The people he fought were not up to his level, but he learned much about the sport during this period. The quality of his opponents improved over the latter half of 1949 and 1950. Marciano continued to beat all opponents, knocking out most of them.

Proved doubters wrong

There were those who thought not much good would come from the 190-pound heavyweight from Brockton in the early days. Goody Petronelli, who was a famous fight trainer, saw one of Marciano's early fights. In

a story for *Sports Illustrated* he said, “I never thought he’d make it. He was too old, almost twenty-five. He was too short, he was too light. He had no reach. Rough and tough, but no finesse [refinement].” The hometown folks believed in him, though. They traveled in groups to Marciano’s fights in nearby Providence, Rhode Island, and yelled “Timm-berrr” when Rocky had an opponent ready to go down.

Boxing technique

Charley Goldman was the trainer who taught Marciano his trademark technique, which would serve him well as champion. Marciano was shorter than many of his opponents and his arms were not as long. Goldman taught him to use these characteristics to his advantage. He told him to make himself smaller by bending his knees almost into a deep knee squat. This gave his opponents less targets on his body to hit. He learned to punch from that position, coming straight up almost from the floor with amazing power. Even with what seemed like a physical disadvantage, because of his training and will to win, Marciano turned out to be one of the best-conditioned athletes in sports.

Marciano defeats Joe Louis

By October 26, 1951, Marciano had thirty-seven wins and thirty-two knockouts under his belt. That was the day Marciano faced his most formidable (challenging) opponent—former heavyweight champion Joe Louis (1914–1981). Louis was past his prime, his best fighting years, and Marciano knocked him out in the eighth round. Marciano had such mixed feelings about beating a man he had considered his hero that he

Rocky Marciano.

cried in Louis’s dressing room after the fight. The fight established Marciano as one of the most famous fighters in the heavyweight division, and assured him of a chance to box for the title before too long.

Takes the Belt from Jersey Joe

After another five fights he got the chance to go for the title. Jersey Joe Walcott was the defending champion and Marciano was the challenger when the pair met in Philadelphia on September 23, 1952. Marciano won a victory that is remembered as typical of his tough-guy, never-say-die style. Marciano was behind on points and strug-

gling all night. He would not give up and finally caught Walcott with a short, overhand right to the jaw in the thirteenth round. Walcott was knocked unconscious and Marciano won the championship belt.

His years as champion

Marciano defended his title only six times, but some of those fights are considered classics by boxing fans. He knocked out Walcott in the first round of their rematch in 1953. He then knocked out challenger Roland La Starza later that year.

Marciano won a decision against Ezzard Charles in 1954. He almost lost his title in their rematch later that year. In the sixth round Charles cut Marciano's nose so badly that his cornermen (the people who Marciano had in his corner of the ring) could not stop the bleeding. The ring doctor watched the cut closely and considered stopping the fight, but Marciano came back forcefully against Charles in the eighth round and knocked him out.

Marciano defended his title against Don Cockell in 1955 by a knockout. It was later learned that organized crime tried to get him to throw the fight.

Marciano's last fight was September 21, 1955, the third time he defended his title in Yankee Stadium. He knocked out Archie Moore in the ninth round. Over four hundred thousand North American viewers watched the bout on closed-circuit television.

Retired from boxing

On April 27, 1956, Marciano retired from boxing. He was thirty-one. "I thought it was a mistake when Joe Louis tried a come-

back," he told the *New York Times* in an interview. "No man can say what he will do in the future, but barring poverty, the ring has seen the last of me. I am comfortably fixed, and I am not afraid of the future." He said he wanted to spend more time with his family. Some people have said that he also was upset because he had to pay half of his earnings to his manager.

The last years

After Marciano retired he made money from personal appearances. He was frugal (very careful with money). He preferred getting rides from friends who had private planes, even though he could usually be given paid transportation to and from any of his personal appearances.

On August 31, 1969, the day before his forty-sixth birthday, he died in a private-plane crash near Des Moines, Iowa. He was survived by his wife of nineteen years, Barbara, and his two children, Rocco Kevin and Mary Anne.

Marciano was never among the top boxers of all time in terms of skill, speed, or power, but he knew how to use the skills he had developed and his fans recognized his grit. One sportswriter commented that if all the heavyweight champions of all time were locked together in a room, Marciano would be the one to walk out.

FERDINAND MARCOS

Born: September 11, 1917

Sarrat, Philippines

Died: September 28, 1989

Honolulu, Hawaii

Filipino president and politician

Philippine president Ferdinand Marcos began his career in politics with the murder of Julio Nalundasan in 1935, and ended it after the murder of Benigno Aquino Jr. in 1983. Some believe his entire life was based on fraud, deceit, and theft, and his time as president has come to represent one of the prime examples of a corrupt government.

Youth and family

Ferdinand Edralin Marcos was born on September 11, 1917, in Sarrat, a village in the Ilocos North region of the island of Luzon in the Philippines. His parents, Josefa Edralin and Mariano Marcos, were both teachers from important families. In 1925 Mariano Marcos became a congressman, surrounding the young Ferdinand in a political atmosphere at an early age. Mariano also had a strong influence on what was to become Ferdinand's competitive, win-at-all-costs nature. Mariano and Josefa pushed Ferdinand to excel at everything, not only his studies at school, but also at activities such as wrestling, boxing, hunting, survival skills, and marksmanship (skill with a gun or rifle). In college, Marcos's main interest was the .22-caliber college pistol team.

Marcos's real father was not Mariano but a wealthy Chinese man named Ferdinand

Chua. (Marcos would claim that Chua was his "godfather.") Chua was a well-connected judge who was responsible for much of Marcos's unusual good luck as a young man. Among other things, Chua paid for young Marcos's schooling and later managed to influence the Philippine Supreme Court to overturn the young Marcos's conviction for murder.

On September 20, 1935, Julio Nalundasan was at home celebrating his congressional election victory over Mariano Marcos when he was shot and killed with a .22-caliber bullet fired by the eighteen-year-old Ferdinand Marcos. Three years later, Ferdinand was arrested for Nalundasan's murder. A year later, after having graduated from law school, he was found guilty of the crime. While in jail Marcos spent six months writing his own appeal for a new trial. When the Supreme Court finally took up Marcos's appeal in 1940, the judge in charge (apparently influenced by Judge Chua) threw out the case. Marcos was a free man. The next day, he returned to the Supreme Court and took the oath to become a lawyer.

Wartime activities

Throughout Marcos's childhood, the Philippines had been a colony (a foreign region under the control of another country) of the United States. However, the Philippines had been largely self-governing and gained independence in 1946. This occurred only after fierce fighting in the country during World War II (1939–45), the international conflict for control of large areas of the world between the Axis (Germany, Japan, and Italy) and the Allies (United States, Great Britain, France, the Soviet Union, and others). During

Ferdinand Marcos.

Reproduced by permission of AP/Wide World Photos.

World War II, the Philippines were invaded and occupied by the Japanese, while U.S. forces and Filipino resistance fighters fought to regain control of the country.

Marcos emerged from World War II with a reputation as the greatest Filipino resistance leader of the war and the most decorated soldier in the U.S. armed forces. However, he appeared to have spent the war on both sides, lending support to both the Japanese and the United States. In early 1943 in Manila (the capital of the Philippines), Marcos created a “secret” resistance organization called Ang Mga Maharlika that he claimed consisted of agents working against the Japanese. In fact,

the group consisted of many criminals—forgers, pickpockets, gunmen, and gangsters—hoping to make money in the wartime climate.

At the war’s end, Marcos took up the practice of law again. He often filed false claims in Washington, D.C., on behalf of Filipino veterans seeking back pay (wages owed) and benefits. Encouraged by his success with these claims, he filed a \$595 thousand claim on his own behalf, stating that the U.S. Army had taken over two thousand head of cattle from Mariano Marcos’s ranch. In fact, this ranch never existed, which made Washington conclude that the cattle never existed.

Political career

In December 1948 a magazine editor published four articles on Marcos’s war experiences, causing Marcos’s reputation to grow. In 1949, campaigning on promises to get veterans’ benefits for two million Filipinos, Marcos ran as a Liberal Party candidate for a seat in the Philippine House of Representatives. He won with 70 percent of the vote. In less than a year he was worth a million dollars, mostly because of his American tobacco subsidies (financial assistance to grow tobacco), a huge cigarette smuggling operation, and his practice of pressuring Chinese businesses to cooperate with him. In 1954 he formally met Imelda Romualdez (1929–) and married her.

Marcos was reelected twice, and in 1959 he was elected to the Philippine Senate. He was also the Liberal Party’s vice-president from 1954 to 1961, when he successfully managed Diosdado Macapagal’s (1911–1997) run for the Philippine presidency. As part of his arrangement with Marcos, Macapagal was supposed to step aside after one term to allow Marcos to run for the presidency. When

Macapagal did not do this, Marcos joined the opposition Nationalist Party and became their candidate in the 1965 election against Macapagal and easily won. Marcos was now president of the Philippines.

In 1969 Marcos became the first Philippine president to win a second term. However, not all Filipinos were happy with his presidency, and the month following his reelection included the most violent public demonstrations in the history of the country. Three years later, facing growing student protest and a crumbling economy, Marcos declared martial law, a state of emergency in which military authorities are given extraordinary powers to maintain order. Marcos's excuse for declaring martial law was the growing revolutionary movement of the Communist New People's Army, which opposed his government.

During the next nine years of martial law, Marcos tripled the armed forces to some two hundred thousand troops, guaranteeing his grip on government. When martial law was lifted in 1981, he kept all the power he had been granted under martial law to himself. Meanwhile the economy continued to crumble while Ferdinand and Imelda Marcos became one of the richest couples in the world. As Marcos's health began to fail and U.S. support for him lessened, opposition to Marcos grew in the Philippine middle class.

Final years

The Marcos regime began to collapse after the August 1983 assassination (political killing) of Benigno S. Aquino Jr. (1933–1983), who had been Marcos's main political rival. Aquino was shot and killed when he arrived at the Manila airport after three years in the

United States. The killing enraged Filipinos, as did authorities' claim that the murder was the work of a single gunman. A year later, a civilian investigation brought charges against a number of soldiers and government officials, but in 1985 none of them were found guilty. Nevertheless, most Filipinos believe that Marcos was involved in Aquino's killing.

Marcos next called for a "snap [sudden] election" to be held early in 1986. In that election, which was marked by violence and charges of fraud, Marcos's opponent was Aquino's widow, Corazon Aquino. When the Philippine National Assembly announced that Marcos was the winner, a rebellion in the Philippine military, supported by hundreds of thousands of Filipinos marching in the streets, forced Ferdinand and Imelda Marcos to flee the country.

Marcos asked for U.S. aid but was given nothing more than an air force jet, which flew him and Imelda to Hawaii. He remained there until his death on September 28, 1989. The Marcoses had taken with them more than twenty-eight million cash in Philippine currency. President Aquino's administration said this was only a small part of the Marcoses' illegally gained wealth.

MARCUS AURELIUS

Born: April 26, 121

Rome (now in Italy)

Died: March 17, 180

Vindobona (now Vienna, Austria)

Roman emperor

The Roman emperor Marcus Aurelius (121–180) was a Stoic philosopher. Stoicism was a complex philosophy that advised people to find happiness by living in harmony with the universe and by doing their part to better the world—without worries about fate or about things they were unable to control. When Marcus Aurelius became emperor there was widespread celebration that Plato’s dream of a philosopher-king had become reality at last.

Born into privilege

Born Marcus Annius Verus on April 26, 121, of a noble family, Marcus Aurelius Antoninus grew up close to the center of power. When he was a child, the emperor Hadrian (76–138) noticed him and made a word play on his name, Verus (meaning “true”), by calling him Verissimus (meaning “truest”) for his strong sense of morals. Hadrian had difficulty choosing an emperor to follow him, but placed Marcus on the path to

rule. When he adopted Marcus’s uncle by marriage, Antoninus Pius (86–161), he arranged for Antoninus to adopt Marcus Aurelius along with the young Lucius Verus (130–169).

Marcus Aurelius had an extraordinary education. Among his tutors was Diognetus, a painter and Stoic philosopher. Marcus studied subjects such as poetry and law, and generally was an excellent student. But philosophy was Marcus’s main interest. Under Diognetus’s influence, young Marcus became a Stoic at the age of eleven and remained a dedicated follower of stoicism for the rest of his life.

Rise to emperor

Antoninus Pius, only a year after he became emperor, had the title Caesar placed on Marcus in 139. His daughter Faustina probably married Marcus in 140. Throughout the reign of Antoninus (ruled 138–161), Marcus worked closely with him.

When Antoninus died and Marcus became emperor, he insisted that Verus also be given full power. Thus, for the first time, Rome had two equal emperors. The reason this arrangement did not produce conflict between lifetime equals was due in large part to the good nature of Verus and his acceptance of Marcus’s seniority in years and judgment.

Foreign wars

When Verus and Marcus first became joint emperors of Rome they faced the problem of war in the East. Parthia (located in present-day Iran) was always a rival for power in Armenia, and in 162 Parthia attacked. Marcus Aurelius remained in Rome and sent Verus to take charge of the war.

Although Verus was not a trained soldier, the war carried on smoothly. But in late 165 a plague, or very contagious disease, broke out among the Roman troops. They carried it back with them and the plague killed a quarter or more of the population of the Roman Empire. Rome recalled its armies from Parthia, defeated but not conquered. Nevertheless, Marcus and Verus celebrated a great triumph.

The Parthian War had ended none too soon, for the German War had already begun. In 167 a group of tribes crossed the Danube River, destroyed a Roman army, and successfully conquered a city in Italy. The danger was critical, for the plague was raging, particularly in the army camps. Also, the Roman treasury, always short of money, was worse off than usual.

Marcus raised new armies and funds and in 168 went with Verus to the battlefield. Verus died in early 169, and Marcus was left to face the war alone. The Germans were driven back, but the war dragged on, with Marcus mainly at the battlefield. Gradually the Romans gained the upper hand. But by 175 Marcus had to call off the war because of the revolt of Avidius Cassius in the East.

Revolt of Avidius Cassius

After his service in the Parthian War, Avidius Cassius, a Syrian, had been made governor of Syria and held great power. In 175 Marcus grew sick and it was rumored that he was either dying or dead. Partly for this reason Avidius was hailed emperor and accepted by most of the East. Marcus had to break off the war in Germany and hurry eastward.

Marcus Aurelius.

Cassius was murdered three months later and his body was sent back to Rome in late 176. The German War started again in 177, and Marcus returned to the battlefield. Once again he was winning the war. However, Marcus died on March 17, 180—never to see the final victory over the Germans.

The Meditations

Marcus Aurelius is most remembered for the collection of his thoughts or reflections usually entitled *The Meditations*. Apparently written down from time to time, the thoughts form no organized system of philosophy. Rather, they are the record of a person whose principles were noble, who had a warm love

of humankind, and who had a philosophy similar to religion. To Marcus, happiness was to be achieved by living “according to nature,” in harmony with the principle that ordered the universe; the peace of mind of such a person could not be affected by life’s difficulties.

MARIE ANTOINETTE

Born: November 2, 1755

Vienna (now in Austria)

Died: October 16, 1793

Paris, France

French queen

Marie Antoinette was the queen of France at the outbreak of the French Revolution (1787–99). Her extravagant lifestyle, which included lavish parties and expensive clothes and jewelry, made her unpopular with most French citizens. When the king was overthrown, Marie Antoinette was put in jail and eventually beheaded.

A royal marriage

Marie Antoinette was born on November 2, 1755, in Vienna (now in Austria), the capital of the Holy Roman Empire. She was the eleventh daughter of the Holy Roman emperor Francis I (1708–1765) and the empress Maria Theresa (1717–1780). In 1770 she married Louis XVI (1754–1793). Louis was the French dauphin, or the oldest son of the king of France. He became king four years later in 1774, which made Marie Antoinette the queen.

The personalities of the two rulers were very different. Louis XVI was withdrawn and emotionless. Marie Antoinette was happy and careless in her actions and choice of friends. At first the new queen was well liked by the French citizens. She organized elegant dances and gave many gifts and favors to her friends. However, people began to resent her increasingly extravagant ways. She soon became unpopular in the court and the country, annoying many of the nobles, including the King’s brothers. She also bothered French aristocrats, or nobles, who were upset over a recent alliance with Austria. Austria was long viewed as France’s enemy. Among the general French population she became the symbol for the extravagance of the royal family.

The queen intervenes

Marie Antoinette did not disrupt foreign affairs as frequently as has been claimed. When she first entered France she interrupted an official German greeting with, “Speak French, Monsieur. From now on I hear no language other than French.” She sometimes tried, usually without great success, to obtain French support for her homeland.

The queen's influence on domestic policy before 1789 has also been exaggerated. Her interference in politics was usually in order to obtain jobs and money for her friends. It is true, however, that she usually opposed the efforts of reforming ministers such as A. R. J. Turgot (1727–1781) and became involved in court scandals against them. Activities such as the “diamond necklace affair,” where the queen was accused of having an improper relationship with a wealthy church official in exchange for an expensive necklace, increased her unpopularity and led to a stream of pamphlets and articles against her. The fact that after the birth of her children Marie Antoinette's way of life became more restrained did not alter the popular image of an immoral and extravagant woman.

The last days of the monarchy

In the summer of 1788 France was having an economic crisis. Louis XVI yielded to pressure and assembled the Estates General, which was a governmental body that represented France's three Estates—the nobles, the church, and the French common people. Marie Antoinette agreed to the return of Jacques Necker (1732–1804) as chief minister and to granting the Third Estate, which represented the commoners, as many representatives as the other two Estates combined. However, after such events as the taking of the Bastille on July 14, 1789 (French citizens overran a Paris prison and took the weapons stored there), Marie Antoinette supported the conservative court faction that insisted on keeping the royal family in power.

On October 1, 1789, the queen attended a banquet at Versailles, France, during which the French Revolution was attacked and insulted. A

Marie Antoinette.
Courtesy of the Library of Congress.

few days later (October 4–5) a Parisian crowd forced the royal court to move to Paris, where they could control it more easily. Marie Antoinette's role in the efforts of the monarchy to work with such moderates as the Comte de Mirabeau (1749–1791) and later with the constitutional monarchist A. P. Barnave (1761–1793) is unclear. But it appears that she lacked confidence in them. On June 21, 1791, the king and queen were captured at Varennes (a border town in France) after trying to escape. Convinced that only foreign assistance could save the monarchy, the queen sought the aid of her brother, the Holy Roman emperor Leopold II (1747–1792). At this time, many French military officers left the country. Thinking that

France would be easily defeated, she favored a declaration of war against Austria in April 1792. On August 10, 1792, a Paris crowd stormed the Tuileries Palace and ended the monarchy.

The queen is dead

On August 13, 1792, Marie Antoinette began a captivity that was to end only with her death. She was jailed in various Parisian prisons. After a number of unsuccessful attempts to escape, Marie Antoinette appeared before the Revolutionary Tribunal. She was charged with aiding the enemy and inciting civil war within France. The tribunal found her guilty and condemned her to death. On October 16, 1793, she went to the guillotine. (The guillotine was a machine used during the French Revolution to execute people by beheading them.) Marie Antoinette aroused sympathy by her dignity and courage in prison and before the executioner.

MARK ANTONY

Born: c. 83 B.C.E.

Rome (now in Italy)

Died: 30 B.C.E.

Alexandria, Egypt

Roman politician and general

The Roman politician and general Mark Antony was the chief rival of another prominent Roman politician, Octavian (63 B.C.E.–14 C.E.), seeking leadership of the Roman Empire. Both men desired to assume power after the assassination (political murder) of Julius Caesar in 44 B.C.E. The man who came out on top of this struggle would go on to become perhaps the most powerful figure in the world at that time.

Youth and family

Mark Antony (in Latin, Marcus Antonius) came from a distinguished Roman family. His grandfather had been one of Rome's leading public speakers, and his father, Marcus Antonius Creticus, had died in a military expedition against pirates when Antony was young.

As a young man from a distinguished family, Antony received an appropriate education. His studies focused on skills that would be useful to him later in politics, such as the art of public speaking and the ability to think about a question or situation objectively and from many angles. All his life, however, he was known for mixing such activities with a love of less serious pleasures. At an early age he became known for the personality traits he showed later as an adult: he was brave, loyal to friends, athletic, and attractive, but he was also reckless, occasionally lazy, fond of drinking and carousing, and involved in love affairs.

Career with Caesar

Antony received his first overseas experience in the eastern portion of the Roman Empire, when, during 57 to 55 B.C.E., he served with the Roman governor of Syria, which was a province (territory) of Rome. From there he went to serve with Caesar (100–44 B.C.E.) in Gaul (a region of Europe that included what is now modern-day France, as well as parts of modern-day Germany, Belgium, and Italy). Caesar conquered Gaul for Rome, and Antony assisted him in suppressing local rebellion against the Romans. In 50 B.C.E., after returning to Rome, Antony was elected a tribune, an office that represented the people's interests. Tribunes were expected to stand up for the rights of individuals and for those who were not members of the highest classes of Roman society. By contrast, the Senate, Rome's primary governing and advisory body, was composed primarily of members from a small hereditary aristocracy (political upper class).

Antony came into the office at a critical time. Caesar's command in Gaul was coming to an end, and a group in the Senate was set on bringing Caesar to trial for what they saw as his misuse of his power. Caesar depended upon the tribunes to look after his interests in Rome, and Antony did so when he vetoed a decree that required Caesar and the men he commanded to lay down their arms. However, when the Senate gave its officers special powers to "preserve the state," Antony felt that the measure would be used against him and he fled to Caesar. By doing so, he gave Caesar the opportunity to assert his power, because he could claim he was defending the people's representatives—the tribunes—against the power of the Senate.

Mark Antony.
Courtesy of the Library of Congress.

A series of civil wars followed that pitted Caesar and the armies and politicians loyal to him against the forces of Pompey (106–48 B.C.E.), the leader of the Senate faction. Under Caesar, Antony was given several important military assignments and distinguished himself. After Caesar defeated Pompey, Antony returned to Italy as Caesar's second in command. In 45 B.C.E. Caesar designated him as consul (a one-year position that was one of the most powerful in Roman government) for 44 B.C.E.

Once again Antony found himself in a key position at an important time. Caesar was rapidly moving in the direction of a govern-

ment in which he would hold king-like powers. As a result, a plot formed to eliminate Caesar. On March 15, 44 B.C.E., he was assassinated. Antony was spared on the grounds that the aim of the plot was to remove an illegal ruler, and that killing the consul, who was the chief legitimate officer of the Roman state, would reflect poorly on the cause.

Second Triumvirate

With Caesar's death, Antony was forced to fight a two-front war. One front was against those who had plotted to kill Caesar. The other was with Caesar's supporters, who were undecided on how to avenge Caesar and as to who would lead them. Antony might have ensured his leadership without difficulty if the young Octavian, nephew of Caesar, had not appeared, claiming to be Caesar's adopted son and heir and also demanding to be given Caesar's political power.

Antony tried to strengthen his position by attempting to gain a new five-year command in Gaul, but Octavian skillfully lured some of Antony's legions (the largest unit in the Roman military) to his side. In the clash that followed, Antony's forces attacked Decimus Brutus (a leader of the plotters), but he was in turn attacked by the armies of Octavian and the consuls. He was defeated and forced to retreat north.

In the following months Antony strengthened himself with the armies of the western Roman Empire; while Octavian, realizing that the Senate was trying to use him, began to establish an alliance with Antony. The result was the formation of the Second Triumvirate of Antony, Octavian, and Lepidus (c. 90–13 B.C.E.), another of Caesar's for-

mer officers. As a triumvirate (consisting of three governing officials called triumvirs), they assumed absolute authority for ruling the empire, although Antony and Octavian soon edged Lepidus out of power. Unlike an earlier triumvirate consisting of Caesar, Pompey, and the politician Crassus (c. 115–53 B.C.E.), which was a mere political alliance, the Second Triumvirate became a constitutionally established body for ruling the state. Octavian assumed control in the west, Antony in the east, and Lepidus (for a time) in Africa.

Antony and Octavian now moved eastward to face the army of those who had killed Caesar. The two forces met at Philippi, Greece, in 42 B.C.E., where Antony's military skill led to victory.

Antony and Cleopatra

After this battle Antony's career entered its most famous period. While Octavian returned to Italy, Antony went east to put affairs in order in the eastern provinces. He also prepared a war against Parthia (located in present-day Iran), and, needing Egyptian support, he met with Cleopatra, queen of Egypt, in 41 B.C.E. An immediate romance followed. This was interrupted when the news arrived that Antony's brother and wife were openly defying Octavian in Italy. Antony moved back west and peace was patched up in 40 B.C.E. with Antony's wedding to Octavian's sister, Octavia, after the death of Antony's first wife.

Antony soon went east again, beating back the Parthians. In 36 B.C.E. he again took up his affair with Cleopatra, becoming involved with her both romantically and politically. Cleopatra saw her alliance with

Antony as a wonderful opportunity to revive the past glories of the Ptolemies, the royal family line from which she was descended. What Antony's ideas were is not clear. He was certainly was dependent on Cleopatra for money, and he did cede (give) territory and grant titles to Cleopatra's family.

Octavian's triumph

At the close of 33 B.C.E. the Second Triumvirate legally came to an end. At the same time the crisis between Octavian and Antony was reaching a climax. Antony still had support in Rome. Octavian turned public opinion against Antony, however, doing so by announcing Antony's divorce of Octavia for Cleopatra, reading Antony's will (in which his strong ties to Cleopatra were stressed), and starting rumors against Antony.

Octavian gathered support in Italy, while Antony's Roman friends had mixed emotions about waging war on the side of the Egyptian queen. The two men and their armies met off at Actium, Greece, on September 2, 31 B.C.E. In a confused battle Antony's fleet was defeated. He fled back to Egypt with Cleopatra. Upon Octavian's arrival in Egypt, Antony committed suicide. Octavian went on to become the first emperor of Rome, taking the name Augustus.

THURGOOD MARSHALL

Born: July 2, 1908

Baltimore, Maryland

Died: January 24, 1993

Bethesda, Maryland

African American Supreme Court justice and lawyer

Thurgood Marshall was an American civil rights lawyer, solicitor general, and the first African American to serve as associate justice of the U.S. Supreme Court. During his decades-long law career, Marshall worked for civil rights for all Americans.

Early life and schooling

Thurgood Marshall was born on July 2, 1908, in Baltimore, Maryland. He was the second child born to Norma Arica Williams, an elementary school teacher, and William Canfield Marshall, a waiter and country club steward. His family enjoyed a comfortable, middle-class existence. Marshall's parents placed great emphasis on education, encouraging Thurgood and his brother to think and learn. Whenever Thurgood got into trouble at school, he was made to memorize sections of the U.S. Constitution. This well-intended punishment would serve him well in his later legal career.

Thurgood Marshall.

Courtesy of the Library of Congress.

Marshall attended Lincoln University in Pennsylvania, working a number of jobs to pay his tuition. He became more serious about his studies after being suspended briefly in his second year. After receiving his bachelor's degree, he enrolled in the law school at Howard University in Washington, D.C., in 1930 and graduated in 1933. While at Howard he was influenced by Charles Houston (1895–1950) and other legal scholars who developed and perfected methods for winning civil rights lawsuits.

Civil rights lawyer

Passing the Maryland bar exam (an exam that is given by the body that governs law

and that must be passed before one is allowed to practice law) in 1933, Marshall practiced in Baltimore until 1938. He also served as counsel for the Baltimore branch of the National Association for the Advancement of Colored People (NAACP). In 1935 he successfully attacked segregation (separation based on race) and discrimination (unequal treatment) in education when he participated in the desegregation of the University of Maryland Law School, to which he had been denied admission because of his race. Marshall became director of the NAACP's Legal Defense and Education Fund in 1939. A year earlier he had been admitted to practice before the U.S. Supreme Court, the U.S. Circuit Court of Appeals for the fourth, fifth, and eighth circuits, and the U.S. District Court for the Eastern District of Louisiana.

After winning twenty-nine of the thirty-two civil rights cases that he brought before the Supreme Court, Marshall earned the reputation of "America's outstanding civil rights lawyer." During the trials, he and his aides were often threatened with death in the lower courts of some southern states. Some of the important cases he argued became landmarks in the ending of segregation as well as constitutional precedents (examples to help justify similar decisions in the future) with their decisions. These include *Smith v. Allwright* (1944), which gave African Americans the right to vote in Democratic primary elections; *Morgan v. Virginia* (1946), which outlawed the state's policy of segregation as it applied to bus transportation between different states; and *Sweatt v. Painter* (1950), requiring the admission of an African American student to the University of Texas Law School. The most famous was *Brown v. Board of Edu-*

ation (1954), which outlawed segregation in public schools and more or less ended the practice once and for all. In addition, the NAACP sent Marshall to Japan and Korea in 1951 to investigate complaints that African American soldiers convicted by U.S. Army courts-martial had not received fair trials. His appeal arguments led to reduced sentences for twenty-two of the forty soldiers.

Presidential appointments

President John F. Kennedy (1917–1963) nominated Marshall in September 1961 for judge of the Second Court of Appeals. Marshall was confirmed by the Senate a year later after undergoing extensive hearings. Three years later Marshall accepted an appointment from President Lyndon Johnson (1908–1973) as solicitor general. In this post Marshall successfully defended the United States in a number of important cases concerning industry. Through his office he now defended civil rights actions on behalf of the American people instead of (as in his NAACP days) as counsel strictly for African Americans. However, he personally did not argue cases in which he had previously been involved.

In 1967 President Johnson nominated Marshall as associate justice to the U.S. Supreme Court. Marshall's nomination was strongly opposed by several southern senators on the Judiciary Committee, but in the end he was confirmed by a vote of sixty-nine to eleven. He took his seat on October 2, 1967, becoming the first African American justice to sit on the Supreme Court. During his time on the Supreme Court, he remained a strong believer in individual rights and never wavered in his devotion to end discrimination. He was a key part of the Court's progressive

majority that voted to uphold a woman's right to abortion (a woman's right to end a pregnancy). His majority opinions (statements issued by a judge) covered such areas as the environment, the right of appeal of persons convicted of drug charges, failure to report for and submit to service in the U.S. armed forces, and the rights of Native Americans.

Later years

The years when Ronald Reagan (1911–) and George Bush (1924–) occupied the White House were a time of sadness for Marshall, as the influence of liberals (those open to and interested in change) on the Supreme Court declined. In 1987 Marshall negatively criticized President Reagan in an interview with *Ebony* as “the bottom” in terms of his commitment to African Americans. He later told the magazine, “I wouldn't do the job of dogcatcher for Ronald Reagan.” Marshall viewed the actions of the conservative (those interested in maintaining traditions) Republican presidents as a step back to the days when “we (African Americans) didn't really have a chance.” Marshall was greatly disappointed when his friend and liberal colleague (coworker), Justice William J. Brennan Jr. (1906–1997), retired from the Supreme Court because of ill health. Marshall vowed to serve until he was 110; however, he was finally forced by illness to give up his seat in 1991. He died in 1993 at the age of eighty-four.

Justice Marshall had been born during the administration of Theodore Roosevelt (1858–1919) but had lived to see African Americans rise to positions of power and influence in America. To a great degree, the progress of African Americans toward equal opportunity was aided by the legal victories

won by him. By his death, he was considered a hero. His numerous honors included more than twenty honorary degrees from educational institutions in America and abroad. The University of Maryland Law School was named in his honor, as were a variety of elementary and secondary schools around the nation. During his life he received the NAACP's Spingarn Medal (1946), the Negro Newspaper Publisher Association's Russwurm Medal (1948), and the Living Makers of Negro History Award of the Iota Phi Lambda Sorority (1950). His name was inscribed on the honor roll of the Schomburg History Collection of New York for the advancement of race relations. He enjoyed family life with his second wife and their two sons, who themselves pursued careers in public life. Dignified and solemn in manner, but blessed with a sense of humor, Marshall's career was an example of the power and possibility of American democracy.

KARL MARX

Born: May 5, 1818

Trier, Germany (formerly in Rhenish Prussia)

Died: March 14, 1883

London, England

German philosopher and political leader

The German philosopher, revolutionary economist (one who studies the use of money and other material funds), and leader Karl Marx founded modern “scientific” socialism (a system of society in which no property is held as private). His basic ideas—known as Marxism—form the foundation of Socialist and Communist (an economic and government system characterized by citizens holding all property and goods in common) movements throughout the world.

Early life

Karl Heinrich Marx was born in Trier, Rhenish Prussia (present-day Germany), on May 5, 1818, the son of Heinrich Marx, a lawyer, and Henriette Presburg Marx, a Dutchwoman. Both Heinrich and Henriette were descendants of a long line of rabbis (masters or teachers of Jewish religion). Barred from the practice of law because he was Jewish, Heinrich Marx converted to Lutheranism about 1817. Karl was baptized in the same church in 1824 at the age of six.

Karl attended a Lutheran elementary school but later became an atheist (one who does not believe in the existence of God) and a materialist (one who believes that physical matter is all that is real), rejecting both the Christian and Jewish religions. It was he who coined the saying “Religion is the opium [drug that deadens pain, is today illegal, and comes from the poppy flower] of the people,” a basic principle in modern communism.

Karl attended the Friedrich Wilhelm Gymnasium in Trier for five years, graduating in 1835 at the age of seventeen. The gymnasium’s program was the usual classical one—history, mathematics, literature, and languages, particularly Greek and Latin. Karl became very skillful in French and Latin, both of which he learned to read and write fluently. In later years he taught himself other languages, so that as a mature scholar he could also read Spanish, Italian, Dutch, Scandinavian, Russian, and English. As his articles in the *New York Daily Tribune* show, he came to handle the English language masterfully (he loved Shakespeare [1564–1616], whose works he knew by heart), although he never lost his heavy German accent when speaking.

Young adult years

In October 1835 Marx enrolled in Bonn University in Bonn, Germany, where he attended courses primarily in law, as it was his father’s desire that he become a lawyer. Marx, however, was more interested in philosophy (the study of knowledge) and literature than in law. He wanted to be a poet and dramatist (one who writes plays). In his student days he wrote a great deal of poetry—most of it preserved—that in his mature years he rightly recognized as imitative and

Karl Marx.

Courtesy of the Library of Congress.

unremarkable. He spent a year at Bonn, studying little but partying and drinking a lot. He also piled up heavy debts.

Marx’s dismayed father took him out of Bonn and had him enter the University of Berlin, then a center of intellectual discussion. In Berlin a circle of brilliant thinkers was challenging existing institutions and ideas, including religion, philosophy, ethics (the study of good and bad involving morals), and politics. Marx joined this group of radical (extreme in opinion) thinkers wholeheartedly. He spent more than four years in Berlin, completing his studies with a doctoral degree in March 1841.

Forced to move on

Marx then turned to writing and journalism to support himself. In 1842 he became editor of the liberal (open to new ideas) Cologne newspaper *Rheinische Zeitung*, but the Berlin government prohibited it from being published the following year. In January 1845 Marx was expelled from France “at the instigation [order] of the Prussian government,” as he said. He moved to Brussels, Belgium, where he founded the German Workers’ Party and was active in the Communist League. Here he wrote the famous *Manifesto of the Communist Party* (known as the *Communist Manifesto*). Expelled (forced out) by the Belgian government, Marx moved back to Cologne, where he became editor of the *Neue Rheinische Zeitung* in June 1848. Less than a year later, the Prussian government stopped the paper, and Marx himself was exiled (forced to leave). He went to Paris, but in September the French government expelled him again. Marx finally settled in London, England, where he lived as a stateless exile (Britain denied him citizenship and Prussia refused to take him back as a citizen) for the rest of his life.

In London Marx’s sole means of support was journalism. He wrote for both German- and English-language publications. From August 1852 to March 1862 he was correspondent for the *New York Daily Tribune*, contributing a total of about 355 articles. Journalism, however, paid very poorly; Marx was literally saved from starvation by the financial support of friend and fellow writer, Friedrich Engels (1820–1895). In London in 1864 Marx helped to found the International Workingmen’s Association (known as the First International), for which he wrote the

inaugural (opening) address. Thereafter Marx’s political activities were limited mainly to exchanging letters with radicals in Europe and America, offering advice, and helping to shape the socialist and labor movements.

Personal life

Marx was married to his childhood sweetheart, Jenny von Westphalen, who was known as the “most beautiful girl in Trier,” on June 19, 1843. She was totally devoted to him. She died of cancer on December 2, 1881, at the age of sixty-seven. For Marx it was a blow from which he never recovered.

The Marxes had seven children, four of whom died in infancy or childhood. He deeply loved his daughters, who, in turn, adored him. Of the three surviving daughters—Jenny, Laura, and Eleanor—two married Frenchmen. Both of Marx’s sons-in-law became prominent French socialists and members of Parliament. Eleanor was active as a British labor organizer.

Marx spent most of his working time in the British Museum, doing research both for his newspaper articles and his books. In preparation for *Das Kapital*, he read every available work in economic and financial theory and practice.

Marx’s excessive smoking, wine drinking, and love of heavily spiced foods may have been contributing causes to his illnesses. In the final dozen years of his life, he could no longer do any continuous intellectual work. He died in his armchair in London on March 14, 1883, about two months before his sixty-fifth birthday. He lies buried in London’s Highgate Cemetery, where his grave is marked by a bust (sculpture of a person’s head and shoulders) of him.

His works

Marxism achieved its first great triumph in the Russian Revolution (1917–21; when the lower class overthrew three hundred years of czar rule), when its successful leader, Vladimir Ilich Lenin (1870–1924), a lifelong follower of Marx, organized the Soviet Union as a proletarian dictatorship (country ruled by the lower class). Lenin based the new government on Marx's philosophy as Lenin interpreted it. Thus, Marx became a world figure and his theories became a subject of universal attention and controversy (open to dispute). Marx wrote hundreds of articles, brochures, and reports, but only five books.

His ideas

Marx's universal appeal lies in his moral approach to socio-economic problems, in his insights into the relationships between institutions and values, and in his ideas about the salvation (to save from destruction) of mankind. Hence Marx is best understood if one studies not only his economics, but also his theory of history and politics. The central idea in Marx's thought involves two basic notions: that the economic system at any given time determines the current ideas; and that history is an ongoing process keeping up with the economic institutions that change in regular stages.

To Marx, capitalism (an economic system characterized by private or corporate ownership of goods) was the last stage of historical development before communism. The lowest social or economic class of a community, when produced by capitalism, is the last historical class. The two are fated to be in conflict—the class struggle, which Marx wrote of in the *Communist Manifesto*—until

the lower class inevitably wins. The proletarian dictatorship, in turn, develops into communism, in which there are no classes and no inequalities. The logical suggestion is that with the final establishment of communism, history comes to a sudden end. This Marxist interpretation has been criticized in the non-communist world as historically inaccurate, scientifically weak, and logically ridiculous. Nevertheless, Marx's message of an earthly paradise (a classless society) has provided millions with hope and a new meaning of life. From this point of view, one may agree with the Austrian economist Joseph A. Schumpeter that "Marxism is a religion" and Marx is its "prophet."

MARY, QUEEN OF SCOTS

Born: c. December, 1542

Linlithgow, Scotland

Died: February 8, 1587

Northamptonshire, England

Scottish queen

Mary, Queen of Scots was queen of France and Scotland. She was also a claimant (someone who has a legal claim to be the lawful ruler) to the throne of England. She represented a great hope to Catholics in England who wanted a Catholic ruler on the throne. This hope failed when Mary was unable to unseat her cousin and rival, Elizabeth I (1533–1603), the Protestant English queen.

An infant queen

The relations of England, Scotland, and France in the mid-sixteenth century were strongly based on religious loyalties and conflicts. Protestant rulers prevailed in England, while the Catholic powers of France and Scotland became allies.

Mary Stuart (the future Mary, Queen of Scots) was the third child of King James V (1512–1542) and Mary of Guise, the rulers of Scotland. Both of her brothers had died before she was born at Linlithgow Palace in Linlithgow, Scotland, in December of 1542. Her father died only a week after her birth, and the infant princess became Mary, Queen of Scots. The period following the death of James V was an unhappy one for Scotland. In 1547 an English invasion led to the military occupation of the country. One of the chief results of this action was Scotland's tighter alliance with France. As a result, when Mary was five, the Scottish court arranged for her marriage to the four-year-old dauphin (heir to the throne) of France, the future King Francis II. She was sent to France immediately.

In France, Mary grew up with her future husband. The two children became close friends, though she was the more outgoing

and energetic of the two. Mary was educated with the dauphin and the other French royal children. She appears to have been a quick and able student whose charming personality had a great impact on all around her.

Meanwhile, Mary's home country of Scotland was under heavy French influence. Mary's mother, Mary of Guise, was appointed regent (the title given to someone who rules when the legal king or queen is absent, too young, or too ill to take the throne). Her government placed many Frenchmen in positions of power. Encouraged by Protestants in that country, a feeling of resentment against the French grew in Scotland.

Queen of France

In April 1558, at age fifteen, Mary married Francis. In November of the same year the Queen of England, Mary Tudor, died. Mary Stuart made a claim to the English throne, basing the claim on the fact that she was the great-granddaughter of the English king Henry VII and on the grounds that Elizabeth had been declared illegitimate (the child of an unmarried couple).

Mary's claim had no effect, and Elizabeth became queen (taking the title Elizabeth I) without opposition in England. However, Mary and Francis assumed the royal titles of England and Ireland, calling themselves the rightful rulers of those countries. They continued to use these titles when they became the rulers of France in July 1559. After taking the throne, Mary's husband, Francis II, ruled in France for only a little over a year, dying in December 1560. In 1561, Mary returned to Scotland, attempting to reassert her power there. Protestants had gained power in Scotland while Mary was absent, but she

intended to renew Catholic influence in her county.

Rule in Scotland

Elizabeth I's policy toward Mary was confusing. She saw that Mary was a threat, but she was unwilling to question the authority of another legitimate ruler (a king or queen who has a clear legal claim to the throne). Her policy shifted between attacking Mary when she was strong and aiding her when she was weak. For some seven years Mary held her position as queen of Scotland, but her permanent success in this position was unlikely, since Mary was clearly in conflict with important elements in Scotland.

In July 1565 Mary married for political purposes, rather than love. Mary became the wife of Henry, Lord Darnley, a move which strengthened her claims as heir to the throne of England, since Darnley was related to the English royal line. However, the marriage had somewhat different political results from those Mary hoped for. The Protestant lords of Scotland rebelled, led by the Earl of Moray and with support from Queen Elizabeth.

Mary was able to halt this threat by military force, but she could not prevent the harm done by the unpleasant personality of Darnley himself. She turned for comfort to her Italian secretary, David Riccio. Darnley, in turn, formed an alliance with the Protestant lords. On March 9, 1566, Darnley and the nobles dragged Riccio from Mary's room and murdered him. Within a short period, Moray and the other exiled rebel leaders had returned.

Mary, Queen of Scots.

Darnley's murder

Though Mary gave birth to a son (the later James VI of Scotland and James I of England) in June 1566, she was never close to Darnley again. Instead, she secretly became close to one of the Protestant lords, the Earl of Bothwell. In February 1567 Darnley was murdered when the house in which he had been staying was destroyed by a violent explosion, and evidence suggested that Mary and Bothwell had plotted Darnley's death.

Suspicious against Mary were strengthened when she did little to investigate the murder, allowed herself to be kidnapped by Bothwell, and then married him in May

1567. The events led to a Scottish civil war, during which Mary was captured and forced to abdicate (give up the throne). After close to a year of confinement, she escaped and once again raised a group of supporters. After these supporters were defeated at the Battle of Langside (May 13, 1568), Mary crossed the border into England on May 16, 1568. She was now a refugee from the Scotland she had tried to rule.

Elizabeth and Mary

Mary's move had placed Elizabeth in an awkward position. Elizabeth was not in favor of having the Catholic claimant to the English throne so close. But she also did not want to use English military force against the Scottish Protestants on Mary's behalf, and she did not wish Mary to take refuge in some Catholic court in another country. Elizabeth was also troubled by her own feelings about the divine nature of a monarch (the belief that a legitimate king or queen's power was a "divine right" to rule given by God). If Mary could be robbed of her divine right to rule, that seemed to suggest that Elizabeth could be removed from the throne by force as well.

Elizabeth decided, in a sense, to sit in judgment on Mary's case. A English commission met and ruled that the rebel government of Moray in Scotland was to remain in place for the time being, and that Mary was to remain in England.

Mary lived in England for the rest of her life and was virtually a prisoner there. Soon after her arrival, she became the center of Catholic plots to unseat Elizabeth. Although she was closely watched by the authorities, she continued to plan with her Catholic allies to escape and take the English throne. In

some cases Mary played a direct part in these plans; in others she was simply the cause for which the rebels gathered. However, in 1586 the English government uncovered the details of yet another plot, with evidence that included a letter from Mary that consented to the assassination (murder) of Elizabeth. Orders were given for Mary's trial, and she was found guilty in October 1586.

Parliament (the English houses of government) demanded Mary's execution, and she was put to death on February 8, 1587. Although Elizabeth seemed greatly displeased by this event in public, realistically she knew that the action was necessary. With Mary's death, the center of Catholic plotting against Elizabeth was removed.

COTTON
MATHER

Born: March 19, 1663

Boston, Massachusetts

Died: February 13, 1728

Boston, Massachusetts

American historian and clergyman

Cotton Mather was a Puritan (a member of a group that broke away from the Church of England in the sixteenth and seventeenth century) preacher, historian (recorder of events and culture of the times), and the youngest man to graduate from Harvard College. Of the third generation of a New England founding family, he is popularly associated with the Salem witchcraft trials (1692–93; trials that took place in Salem, Massachusetts, in which nineteen women were accused, tried, and executed and several others imprisoned for what juries determined was witchcraft).

Early life and education

Born in Boston, Massachusetts, on March 19, 1663, Cotton Mather was the eldest son of Increase and Maria Mather and the grandson of Richard Mather, the first minister of Dorchester, Massachusetts, and of John Cotton, probably the most learned of first-generation American theologians (a specialist in the study of faith and religion). Cotton's father, Increase Mather, was minister to the Second Church in Boston, agent of the colony to England, and nonresident president of Harvard College from 1685 to 1701. Cotton knew he was expected by both his parents to follow in his father's footsteps. That tall order prompted him to be a very serious child whose fear of failing showed up in a stutter when he spoke. It took Cotton years of practice and prayer to overcome this speech problem.

Cotton Mather, having made remarkable progress under his father's training, was admitted to Harvard College at the age of twelve. He had begun studying Hebrew and showed great interest in philosophy (the study of knowl-

Cotton Mather.
Courtesy of the Library of Congress.

edge) and science. His father presented Mather's first degree at the age of sixteen. Mather soon took up the study of medicine and, as a young man, attended meetings organized by Increase for scientific experimentation and discussion. At nineteen he received his master's degree. He was made a fellow of Harvard College in 1690 and was involved in the affairs of the college throughout his life. One of his bitterest disappointments was that he was never asked to be its president.

Personal life

Disappointment and grief marked Cotton Mather's life. In 1686 he married Abigail

Philips; they had nine children. She died in 1702. In 1703 he married the widow Mrs. Elizabeth Hubbard; they had six children. She died in 1713. His last wife, Mrs. Lydia George, whom he married in 1715, went insane. Of his fifteen children, only six lived to adulthood and only two outlived him. Three widowed sisters depended largely on him, and he was burdened by severe money problems.

Anxiety and depression contributed to Mather's already impossibly high expectations of himself. But he was a deep thinker. When very young he began to read the Bible daily and to develop habits of prayer. His efforts to do good work and to achieve Christian attitudes lasted a lifetime. His early bitter criticisms of other churches later gave way to a spirit of acceptance. In 1685 Mather was ordained at the Second Church. He served as assistant minister until his father's death in 1723, when Mather became minister.

Witchcraft Trials at Salem

One of Massachusetts governor Sir William Phips's (1651–1695) first acts in office was the establishment of a court to try the suspected witches recently arrested at Salem, Massachusetts. Mather had attempted to show the reality of spirits (bodiless, but sometimes visible supernatural beings, ghosts), particularly evil spirits, in his study *Memorable Providences, Relating to Witchcrafts and Possessions ...* (1689). Although he had urged strong punishment of the devil's work, he suggested much milder punishment than death for those found to be guilty of witchcraft (the use of magic). Mather's approach was both religious and scientific. He separated himself from the trials as such and in fact warned the judges against "spectral

[ghostlike] evidences," but his advice went unheard. In his *Magnalia Christi Americana* (1702) Mather declared his disapproval of the methods used in the trials. But while they were going on, he had not entered public protest.

Other church controversies

A combination of forces diminished Increase and Cotton Mather's influence. A new breed of more open-minded men gathered in the recently established Brattle Church. These, with others, made sure of the removal of Increase from the presidency of Harvard in 1701. The House of Representatives appointed Cotton president, but the voting members of the college overruled their action and passed him by. Cotton then directed his attention to Yale College. But when Yale's president resigned, Cotton, apparently, refused the invitation to replace him. This was Cotton's last opportunity for high office.

Pioneer scientist and intellectual

Although the Mathers maintained clear but hard attitudes toward many cultural and church changes, they were in the intellectual front line of the Colonies. Cotton regularly wrote letters to men of learning around the world. In 1710 he was awarded a doctorate of divinity (highest degree awarded for study of in this case Christianity) by the University of Glasgow (Scotland). In 1713 he had the great honor of being elected to the Royal Society of London. He and Increase were among the first in the Colonies to support vaccinations against smallpox (very contagious disease giving a person sores on the skin, usually fatal) and were threatened for so

doing. With courage (even though a bomb was thrown through the window of Cotton's house), the Mathers, with Dr. Zabdiel Boylston (1679–1766), successfully put the project into effect.

Career as a writer

Despite unpopularity, Mather's activities continued. He wrote in seven languages and also mastered the Iroquois Indian language. In his lifetime three hundred eighty-two of his works were published. These took many forms: history, sermons, biography, fables, books of practical faith, religious and scientific essays, and poetry. Often very educational, his writing could also be straightforward and practical. Mather saw teaching as the main job of good writing.

In the *Psalterium Americanum* (1718) the talented Mather translated the Psalms and adapted them to music. His *Bonifacius, or Essays To Do Good* (1718) gave practical directions for personal faith. A very popular book, Benjamin Franklin (1706–1790) called it the work that most guided his youth.

Probably Mather's greatest work was his *Magnalia Christi Americana* (1702). Primarily a history of New England, it is composed from many of Mather's other writings. The seven sections tell of the settlement of New England, the lives of its governors and ministers, and the story of Harvard College and of the Congregational Church. The *Magnalia* provides a detailed statement of the Puritan mind.

Decline of power

Cotton Mather recorded the passing of an era. The Massachusetts Bay Colony had been an extreme, Bible-based community of "saints," whose existence as an example to

the rest of the world was to be safeguarded till Christ's second coming. In Mather's lifetime the separation of church and state and the development of the frontier and of a society absorbed in business and profits made the people's interest in church lessen. American-born colonists turned to nature and to reason for the sources of their new identity.

Cotton Mather outlived his father by only five years, dying on February 13, 1728, in Boston. Later American writers, Ralph Waldo Emerson (1803–1882), Henry Thoreau (1817–1862), Harriet Beecher Stowe (1811–1896), James Russell Lowell (1819–1891), Nathaniel Hawthorne (1804–1864), and Henry Wadsworth Longfellow (1807–1882) all acknowledged their debt to him.

HENRI
MATISSE

Born: December 31, 1869

Le Cateau-Cambrésis, France

Died: November 3, 1954

Cimiez, France

French painter and sculptor

The French painter and sculptor Henri Matisse was one of the great initiators of the modern art movement, which uses the combination of bold primary colors and free, simple forms. He was also the most outstanding personality of the first revolution in twentieth century art—Fauvism (style of art that uses color and sometimes distorted forms to send its message).

Childhood and art education

Henri Matisse was born on December 31, 1869, in Le Cateau-Cambrésis, France. After the war of 1870–71 his family moved to Bohain-en-Vermandois, France. Matisse's father was a corn merchant, his mother an amateur painter. Matisse studied law from 1887 to 1891 and then decided to go to Paris, France, to become a painter. He worked under Adolphe William Bouguereau (1825–1905) at the Académie Julian in Paris, but he left in 1892 to enter the studio of Gustave Moreau (1826–1898) at the École des Beaux-Arts, where he studied until 1897. Moreau was a liberal teacher who did not interfere with the individuality of his pupils. He encouraged his students to look at nature and to paint outdoors, as well as to frequently visit the museums. Matisse copied paintings in the Louvre and painted outdoors in Paris.

Begins with impressionism and moves to Fauvism

About 1898, under the influence of impressionism (an art form using dabs of

paint in primary colors to create an image representing a brief glance rather than a long study), the colors Matisse used became lighter, as in his seascapes of Belle-Île and landscapes of Corsica and the Côte d'Azur (coast of France on the Mediterranean Sea). Although impressionist in character, these early works of Matisse already showed a noticeable emphasis on color and simplified forms. Matisse married in 1898 and visited London, England, in the same year to study. On his return to Paris he attended classes at the Académie Carrière, where he met André Derain (1880–1954). Matisse created his first sculptures in 1899.

From 1900 Matisse struggled financially for years. In 1902 the artist, his wife Amélie, and their three children were forced to return to Bohain. In 1903 the Salon d'Automne was founded, and Matisse exhibited there. From 1900 to 1903, under the influence of Paul Cézanne (1839–1906), Matisse produced still lifes and nudes. In 1904 he had his first one-man show at the gallery of Ambroise Vollard in Paris and spent the summer in Saint-Tropez, France. In 1905 Matisse painted with Derain at Collioure; the works Matisse created there are excellent examples of Fauvism in their bright colors and flat patterning.

Fauve period

Matisse's Fauve period extended from 1905 to 1908, during which time he completed a brilliant series of masterpieces. At the 1905 Salon d'Automne these paintings, known as the Fauves, made their first public appearance. In 1906 Matisse's *Joie de vivre* was exhibited at the Indépendants; the painting gained him the title of the "King of the Fauves."

Matisse made his first trip to North Africa in 1906. His *Blue Nude, or Souvenir de Biskra* (1907), is a memento of the journey. In this painting he experimented with *contrapposto* (an S-curve pose), and he used the same form in the sculpture *Reclining Nude I* (1907). He had established a studio in the former Convent des Oiseaux in 1905; this became a meeting place for foreign artists. He developed into the leader of an international art school with mainly German and Scandinavian pupils who spread his ideas. His “Notes of a Painter,” published in *La Grande revue* in 1908, became the artistic handbook of a whole generation. Matisse was a pleasant man who looked more like a shy government official than an artist. He never accepted any fees for his teaching so that he was not obligated to staying in one place. He did not want commitments to interfere with his creative activity.

Change in style

Between 1908 and 1913 Matisse made journeys to Spain, Germany, Russia, and Africa. In Munich, Germany, he saw an exhibition of Islamic art (1910), and in Moscow, Russia, he studied Russian icons (1911). Russian collectors began to buy his paintings. He produced five sculptures—heads of Jeanette—during 1910 and 1911, which show a resemblance to African masks and sculptures. His Moroccan journey of 1911–12 had a positive influence on his development, which is seen in *Dance, Music, the Red Fishes*, and the series of interiors recording his studio and its contents. They show a stern and compact style with blacks and grays, mauves, greens, and ochers (brown tones). Great Matisse exhibitions were held in 1910, 1913, and 1919.

Henri Matisse.

By 1919 Matisse had become an internationally known master. His style at that time was characterized by the use of pure colors and their complex interplay (harmonies and contrasts); the two-dimensionality of the picture surface enriched by decorative patterns taken from wallpapers, Oriental carpets, and fabrics; the human figures being treated in the same manner as the decorative elements. The goal of Matisse's art was the portrayal of the joyful living in contrast to the stresses of our technological age. Between 1920 and 1925 he completed a series of *odalisques* (female slaves), such as the *Odalisque with Raised Arms*; this period has been called an oasis of lightness.

Last years

In 1925 Matisse was made chevalier, the lowest ranking member of the Legion of Honor, and in 1927 he received the first prize at the Carnegie International Exhibition at Pittsburgh. After a visit to Tahiti, Matisse was a guest at the Barnes Foundation at Merion, Pennsylvania, and accepted Dr. Barnes's commission to paint a mural, *The Dance* (1932–1933), for the hall of the foundation. During the next years he produced paintings, drawings, book illustrations (etchings and lithographs), sculptures (he made fifty-four bronzes altogether), ballet sets, and designs for tapestry and glass. In 1944 Pablo Picasso (1881–1973) arranged for him to be represented in the Salon d'Automne to celebrate the liberation of Paris from Nazi rule.

Matisse considered the peak of his life-work to be his design and decoration of the Chapel of the Rosary for the Dominican nuns at Vence, France (1948–1951). He designed the black-and-white tile pictures, stained glass, altar crucifix, and vestments (ceremonial robes). At the time of the consecration (declaration of sacredness) of the Vence chapel, Matisse held a large retrospective exhibition (a look back at the work he created) in the Museum of Modern Art in New York City.

The ultimate step in the art of Matisse was taken in his papiers découpés, abstract cutouts in colored paper, executed in the mid-1940s, for example, the *Negro Boxer*, *Tristesse du roi*, and *Jazz*. The master died on November 3, 1954, in Cimiez, France, near Nice.

MAYO BROTHERS**CHARLES
MAYO**

July 19, 1865

Rochester, Minnesota

May 26, 1939

Chicago, Illinois

American physician

**WILLIAM
MAYO**

June 29, 1861

Le Sueur, Minnesota

July 28, 1939

Rochester, Minnesota

American physician

Brothers and outstanding surgeons (doctors who perform operations) William Mayo and Charles Mayo, along with their father William Worrall Mayo, founded the world-famous Mayo Clinic in Rochester, Minnesota, one of the nation's first efforts at group practice of medicine.

Family practice

William James Mayo was born in Le
Sueur, Minnesota, on June 29, 1861. His

brother, Charles Horace, was born four years later in Rochester, Minnesota, on July 19, 1865. They were two of William Worrall Mayo and Louise Abigail Wright Mayo's five children. Their father had come to the United States from England in 1845 and settled in Rochester, Minnesota, as a country doctor. William and Charles studied Latin, art, and the classics at the Rochester Training School. At home their mother taught them botany (the study of plants) and astronomy (the study of the Sun, the Moon, and the stars). Their father gave them instruction in chemistry (the study of simple substances and their physical make-up), anatomy (the study of the structure of living things), and laboratory methods. Both parents taught their children about the evils of prejudice and war and the benefits of working together.

The Mayo brothers frequently accompanied their father on professional visits, observed his diagnoses (identifications of a disease through observation of its symptoms) and methods of treatment, and helped with operations. It is no wonder that they both chose to study medicine. William graduated from the University of Michigan Medical School in 1883 and also took degrees at the New York Post-Graduate Medical School and Hospital in 1884 and at the New York Polyclinic in 1885. He joined his family in practice at Rochester, as did Charles after his 1888 graduation from the Chicago Medical School (later Northwestern University Medical School). William was quiet and reserved; Charles was lively and friendly, with a love of practical jokes. They were known as "Dr. Will" and "Dr. Charlie."

In 1889 the Sisters of Saint Francis opened Saint Mary's Hospital in Rochester

Charles Mayo.

and asked the Mayo brothers and their father to help in planning the hospital and in attracting the services of skilled doctors. The three Mayos named their part of Saint Mary's the Mayo Clinic in 1903. It began as a surgical clinic but became a full medical center in 1915, and the brothers began to attract other famous physicians from all over the world. At that time they also founded the Mayo Foundation for Medical Education and Research as part of the University of Minnesota.

Work during wartime

William Mayo was commissioned as a first lieutenant in the army medical reserve

corps in 1912. During World War I (1914–18; a war in which the Allies of England, Italy, the United States, and other nations fought against the German-led Central Powers) he served as chief adviser for the surgical services in the office of the army's surgeon general. Charles was a colonel in the army medical corps and alternated with William as the associate chief adviser for all army surgical services. When President Woodrow Wilson (1856–1924) organized the Committee of American Physicians for Medical Preparedness in 1916, William was named its chairman and Charles one of its members. When the committee became the General Medical Board of the

Council for National Defense, William was made a member of its executive committee and Charles his alternate.

During World War I, the Mayo Clinic was very busy. There were draftees to examine and war training classes to run for new members of the medical corps. William and Charles designed courses to bring doctors up to date on the latest scientific and surgical developments. Also, before the war the United States had relied heavily on Germany for medical equipment and materials. When the German supply was cut off, American medical workers found it hard to adjust to the poorer quality of American-made medical equipment. Then, in 1918, an outbreak of the flu put extra pressure on the clinic. A hotel next door to the hospital was remodeled and used to handle the overflow of patients.

The two brothers divided their time between the Mayo Clinic and their duties in Washington so that one of them would always be in Rochester. The strain of their war service, added to the effort needed to keep the Mayo Clinic functioning, affected the health of both men. Charles contracted pneumonia (an infection in the lungs) during one of his posts in Washington, and William came down with a severe case of jaundice (a yellowing of the skin) in 1918, which kept him off duty for more than two months. In William's absence Charles filled his post in Washington, making this the first time that the brothers were both absent from the clinic for any extended period.

Postwar prejudice

After the war ended, the prejudice it had stirred up remained. For many years American medical students had taken for granted

that part of their training would take place in Germany and Austria, in the classes and laboratories of the European masters of surgery and medical science. But after the war anti-German feelings led many to question the belief that German medical knowledge was the best. German scientists and physicians were accused of stealing ideas from British and American thinkers.

While William and Charles Mayo were not very fond of the Germans, they were not willing to see such feelings translated into action against individuals. When the 1918 meeting of the American Surgical Association suggested that the German and Austrian honorary (achieving a title without having to meet the usual requirements) members be removed from the group, William strongly opposed the idea, insisting that political and military conflict should not extend into the world of science. The resolution banning the Germans and Austrians failed to pass at that session but was adopted at the next one, when William was not able to attend.

Later years

War service gave many physicians their first taste of teamwork in medical practice. Many did not like it, but increasing costs, decreasing numbers of patients, and unpaid bills led many to follow the example of the Mayo Clinic. The story of the clinic and the Mayo Foundation for Medical Education and Research made the Mayos nationally famous. The national news services printed stories such as the one about the millionaire with a superior air who, seeing William, ran up to demand, "Are you the head doctor here?" "No," William replied with a straight face, "my brother is the head doctor. I'm the belly doctor."

In 1919 William received the U.S. Distinguished Service medal, which Charles was also awarded in 1920. Both brothers continued to practice medicine and perform surgery until they were well into their sixties. William retired in 1928, and a series of strokes brought Charles's career to an end a year and a half later. They are best remembered as a team whose greatest achievement was the clinic built upon their partnership. The famed physicians who had worked together so closely died within a few months of each other in 1939—Charles Mayo on May 26 and William Mayo on July 28.

WILLIE MAYS

Born: May 6, 1931

Westfield, Alabama

African American baseball player

During the twenty-one seasons in his major league career, Willie Mays hit more than six hundred home runs. Besides being a solid hitter, Mays also has been called the game's finest defensive outfielder ever and perhaps its best baserunner as well.

Baseball childhood

William Howard Mays Jr. was born on May 6, 1931, in Westfield, Alabama, the son of a steelworker who played center field for the local Birmingham Industrial League semi-pro (a professional league independent of Major League Baseball) team. Mays's mother, Ann, had been a high school track star, and it was clear from a very early age that Willie had inherited his parents' athletic gifts. According to his father, William Howard Mays Sr., young Willie learned to walk at the age of six months, and soon thereafter the two center fielders were playing catch with each other, father instructing son in the basics of the game that would one day make him famous.

The parents of Willie Mays were divorced when he was only three, but Willie continued to live with his father, which meant that he continued to play baseball. It was not long before Mays realized that baseball offered him a way out of the steel mills, and he later admitted that when given the choice he always preferred playing ball to doing schoolwork. Not only did Mays play ball constantly, he would sit in the dugout with his father's Industrial League teammates and listen to baseball strategy and technique, absorbing the game's finer points and learning to be at his ease in a competitive environment. By the age of thirteen, he was playing on a semi-professional team called the Gray Sox.

Negro Leagues

So gifted was Mays as a teenager that he began playing for the Birmingham Black Barons, the local entry in the Negro Leagues, which was then the major leagues for African American players. Playing center field, Mays was paid a salary of \$250 a month to play with the Black Barons, far more money than he could have earned at part-time jobs. He eventually finished high school, but he did so as a professional baseball player.

By the time Mays had secured for himself the center fielder's spot on the Black Barons, legendary ballplayer Jackie Robinson (1919–1972) had broken the color barrier in major league baseball (African Americans were not allowed to play in the major leagues until Robinson joined the Brooklyn Dodgers in 1947), and the Negro Leagues were being scouted heavily by the newly integrated (consisting of players of all races) professional teams. One such scout for the New York Giants came to a Black Barons game to watch a teammate of Mays, but it was Willie Mays who captured his attention; the scout raved to his supervisors in the Giants' organization about him. The Giants had already signed a number of black baseball players, and it was not long before they offered Mays a \$4000 bonus and \$250-a-month salary to play for their minor league team (team controlled by a major league club to develop the talent of its players) in Iowa.

The talk of New York

Through the 1950 and the beginning of the 1951 season Mays tore through the minor leagues and was promoted to the Minneapolis Millers, a AAA club, the last stop before the major leagues. Mays's success was

highly unusual at the AAA level, and his name quickly became familiar to Leo Durocher (1905–1991), the manager of the New York Giants. The Giants were suffering through a poor season in 1951, and Durocher saw no reason to delay the elevation of Mays to the major league level. On May 25, 1951, Mays became the starting center fielder and number-three hitter in the New York Giants' lineup.

By mid-August of the 1951 season, neither the Giants nor their young star appeared to be going anywhere. Mays showed flashes of brilliance but he was still only a rookie, and the Giants remained thirteen and one-half games behind the Brooklyn Dodgers in the National League pennant race. The Giants went on to sweep a three game series with the Dodgers, however, and after winning sixteen games in a row they managed to catch their rivals on the last day of the regular season to force a play-off—three games that would decide the winner of the league championship. In one of the most famous episodes in baseball history, the Giants won the third and deciding game of the play-off. In the World Series, the Giants faced their crosstown rivals, the New York Yankees, and after a fine series the Giants lost in seven games. In recognition of his 20 home runs and .274 batting average during the season Mays was named the National League's Rookie of the Year for 1951.

After a stint in the U.S. Army, Mays returned in 1954, when he led the Giants to a world championship while hitting .345, with 41 home runs, and winning the Most Valuable Player (MVP) Award. Mays led the league in batting average, and in the first game of the World Series he made an over-

Willie Mays.

the-shoulder catch of such remarkable skill that it has ever since been known simply as "The Catch." Giants' management rewarded Mays with a fat new contract, and he entered the 1955 season as a superstar.

Doing it all

It should not be forgotten that 1954 was Mays's first full season in the big leagues. What is especially remarkable is that the promise shown by his 1954 season would later be confirmed in season after season of excellence, beginning with the 51 homers he clubbed in 1955.

After the 1957 season the Giants left New York for San Francisco, where Mays found it difficult to fit in. Mays eventually learned the tricks of life out west, however, winning over the fans with his routine brilliance on the field and with the bat. In 1962 he led the Giants back to the World Series with a career-high 141 runs batted in; and in the following year he joined an exclusive club by smashing his 400th career homer. It seemed possible that Mays might one day catch Babe Ruth as the all-time leader in home runs.

The only question remaining for Mays was Babe Ruth's (1895–1948) record of 714 career home runs. Mays passed the records of many of the game's all-time greats until at last he trailed only the Babe, by 170 home runs. Mays's many years of continuous effort had taken their toll, however, and after the 1966 season his home runs and batting average both began to drop. But by the time he wound up his career with the New York Mets in 1973, he had made a strong case for himself as the greatest all-around player in baseball history.

The record of his accomplishments is long—the combination of his twenty-four straight All Star Game appearances, his more than 3,000 career base hits, and his first-year election to the baseball Hall of Fame with 94.6 percent of the possible votes was unparalleled—but Mays is remembered as much for the wonderful effortlessness of his play as for the numbers he racked up.

JOSEPH MCCARTHY

Born: November 14, 1908

Grand Chute, Wisconsin

Died: May 2, 1957

Bethesda, Maryland

American senator

Joseph McCarthy, a U.S. senator from Wisconsin, became a national figure in a highly publicized pursuit of a Communist “conspiracy.” Because of him, the term *McCarthyism* became a synonym for a public “witch-hunt” intended to destroy the victim's political standing and public character.

Life in Wisconsin

Joseph McCarthy was born on November 14, 1908, on a farm in Grand Chute, Wisconsin. The family was part of the Irish Settlement, a small group surrounded by farmers mainly of German and Dutch descent. His parents were devoted Catholics, literate but uneducated. The fifth of nine children, Joseph seems to have grown up shy and awkward, often rejected by his peers but favored by a protective mother. At the age of fourteen, after finishing grade school, he took up chicken farming, at which he was briefly successful.

McCarthy moved to the nearby town of Manawa and managed a grocery store. When he was almost twenty he enrolled in high school, graduating in only a single year. After two years as an engineering student at Marquette University, he went to law school and was president of his class. Soon afterward, McCarthy was admitted to the bar, an association for practicing lawyers.

In 1935 McCarthy tried practicing law in several Wisconsin towns, earning a reputation as a fierce gambler along the way. He also began playing the game of politics. After an unsuccessful bid as Democratic candidate for district attorney, he shifted his focus and became the Republican candidate for circuit court judge. He won, and at the age of twenty-nine he became the state's youngest circuit court judge. This victory also hinted at his later methods: He had lied in his campaign literature about his opponent's age (adding seven years to it) and about his own (moving his birth date back). By now, his basic personality was well shaped—clever and ambitious but lacking moral judgment, or the ability to distinguish between right and wrong.

World War II

During World War II (1939–45; a war involving many countries in the world in which the United States participated from 1941 until the end of the war), McCarthy served with the U.S. Marines as a ground officer in the Pacific. He took part in many battles and won several medals for “courageous devotion” while on duty. In 1944, while still in the Marines, his friends in Wisconsin put him on the ballot for the U.S. Senate. He lost the election but placed second and earned more than a hundred thousand votes. Soon afterward McCarthy left the Marines.

Joseph McCarthy.

Reproduced by permission of Archive Photos, Inc.

In 1945, after returning to Wisconsin, he was reelected as circuit court judge. A year later he ran for senator against Robert M. La Follette (1895–1953) and won. McCarthy had been a poor judge, being involved in at least one suspicious case. He had altered his war record to make it look more heroic, and he again cut moral corners in his campaigning. But he was a fitting candidate for the particular mood and cultural mix of Wisconsin at the time.

McCarthy finds an enemy

McCarthy's first years in the Senate were thoroughly average and at least slightly dis-

honorable. As a number of his past adventures, including some questionable tax returns, began catching up with him, he needed an issue that would distract attention from his affairs. On January 7, 1950, he asked three dinner companions to suggest an issue he could base his campaign on. They suggested communism, a political system in which property and goods are owned by the government and distributed among the people. The timing was perfect, as many in the changing nation feared the presence of communists living among them. Communism would give McCarthy a target. Now he needed to rally support.

In a speech in Wheeling, West Virginia, on February 9, 1950, McCarthy claimed to have in hand a list of 205 people in the State Department known to be members of the American Communist Party. In later speeches and interviews he kept changing the figures, depending on his audience and his mood. On February 20 he held the Senate floor for six hours in a stormy session in which other senators tried to get solid facts from him.

In the 1950 elections McCarthy secured the defeat of several Democratic senators who had dared question and oppose him. He spread terror even among his peers. His fellow Republicans were torn between fear of his skill and willingness to use his attacks on President Harry Truman (1884–1972), Secretary of State Dean Acheson (1893–1971), and former Secretary of State George Marshall (1880–1959).

Takes on the army

In 1952 McCarthy was reelected. He then used his investigative subcommittee as his point of support. He also used the press

and television as his playing field. He even tried to develop a counterintelligence unit of his own inside the administration's agencies. McCarthy finally turned his aim on the army in the Fort Monmouth hearings.

The Army-McCarthy televised hearings ran from April 22 to June 17, 1954, and turned the tables on McCarthy and his committee counsel, Roy Cohn (1927–1986). Evidence proved that they had sought special favors for G. David Schine (1927–1996), a subcommittee staff member, as an army inductee (a person who signs up for training or service in the military). It is hard to guess why McCarthy attacked the army, when he must have known that his anti-Communist views could not stand a chance against the distinguished army officers. The intense response of the army's legal representative, Joseph Welch (1890–1960), to McCarthy's attack on a member of Welch's firm marked the end.

In December the Senate passed a vote of censure, or an official disapproval, on McCarthy. He died three years later, on May 2, 1957, a broken man whose end had really come at the army hearing, when the nation recoiled from him and his power to inspire terror was halted.

McCarthy and society

Scholars have debated whether McCarthy's views expressed a basic appeal to the majority of Americans. He was often called a fascist, or one who seeks complete control, by liberals and the left. His support came mainly from a desperate group on the right (conservatives) who saw their world threatened by a mysterious conspiracy and were willing to see extreme methods used against it.

McCarthyism came into the nation's history at a moment when Americans were uncertain about their future in a changing world. McCarthy gave this fear the name of communism. He turned communism into a simple target for their hostility. He also came at a time when the cold war and the nuclear arms race had brought on a need for secrecy that led to a paranoid feeling of being surrounded by enemies within.

HATTIE MCDANIEL

Born: June 10, 1898

Wichita, Kansas

Died: October 26, 1952

Hollywood, California

African American actress and singer

Hattie McDaniel's portrayal of the "mammy" figure in the film *Gone with the Wind*, for which she

received an Academy Award for best supporting actress in 1940, is still widely seen as a role that could only have been played by her. She was the first African American to receive an Oscar.

Hattie's youth

Hattie McDaniel was born on June 10, 1895, in Wichita, Kansas, the youngest of thirteen children in a family of performers. Her father, Henry McDaniel, was a Baptist minister, carpenter, banjo player, and minstrel showman, eventually organizing his own family into a minstrel troupe. Henry married a gospel singer named Susan Holbert in 1875 and moved their growing family to Denver, Colorado, in 1901.

Hattie was one of only two black children in her elementary school class in Denver. Racial prejudice (an unfair judgment based on race) was less hostile in the West than elsewhere in the United States. For her talents as a singer and reciter of poetry, McDaniel became something of a favorite at the 24th Street Elementary School, where mainly white students attended. McDaniel sang at church, at school, and at home; she sang so continuously that her mother reportedly bribed her into silence with spare change. Before long she was also singing in professional minstrel shows, as well as dancing, performing humorous skits, and later writing her own songs.

In 1910 Hattie left school in her sophomore year at East Denver High School and became a full-time minstrel performer, traveling the western states with her father's show and several other troupes. The minstrel shows were usually performed by black actors, but were also sometimes performed

Hattie McDaniel.

Courtesy of the Library of Congress.

by whites in blackface. The shows presented a variety of entertainment that poked fun at black cultural life for the enjoyment of mostly white audiences.

When Hattie's father retired around 1920, she joined Professor George Morrison's famous "Melody Hounds" on longer and more publicized tours. She also wrote dozens of show tunes such as "Sam Henry Blues," "Poor Wandering Boy Blues," and "Quittin' My Man Today."

Broke into radio and film

McDaniel's first marriage ended brutally in 1922, when her husband of three months,

George Langford, was reportedly killed by gunfire. Her career was much better, including a first radio performance in 1925 on Denver's KOA station. McDaniel was one of the first black women to be heard on American radio.

In 1929 McDaniel was left without a job due to the Great Depression (a time in the late 1920s and 1930s of economic hardship that resulted in unemployment for many), so she went to Milwaukee, Wisconsin, and found work at Sam Pick's Club Madrid—as a bathroom attendant. Eventually she became a performer there and remained at the Club Madrid for about a year. Next she went to Hollywood, California, where her brother and sister lived. Sam and Etta McDaniel had already played small roles in a number of motion pictures. Sam McDaniel had a regular part on the KNX (Los Angeles, California) radio show "The Optimistic Do-Nuts" and was able to get Hattie a small part, which she promptly turned into a big opportunity. McDaniel eventually became a hit with the show's listeners.

A big break came for McDaniel in 1934, when she was cast in the Fox production of *Judge Priest*. In this picture McDaniel was given the opportunity to sing a duet with Will Rogers (1879–1935), the well-known American humorist. Her performance was well received by the press and her fellow actors alike.

In 1935 McDaniel played "Mom Beck" in *The Little Colonel*. A number of African American journalists objected to Hattie's performance in the film. They charged that the character of Mom Beck, a happy black servant in the Old South, implied that black people might have been happier as slaves than they

were as free individuals. This movie marked the beginning of McDaniel's long feud with the more progressive elements of the African American community.

Won Oscar for *Gone with the Wind*

Once established in Hollywood, McDaniel found no shortage of work. In 1936 alone she appeared in twelve films. For the decade as a whole her performances numbered about forty—nearly all of them in the role of maid or cook to a white household. McDaniel won the role of “Mammy” in *Gone with the Wind* over several rivals. Her salary for *Gone with the Wind* was to be \$450 a week, which was much more than what her real-life counterparts could hope to earn.

McDaniel's performance as Mammy in *Gone with the Wind* was more than a bit part. It so impressed the Academy of Motion Picture Arts and Sciences that she was awarded the 1940 Oscar for best supporting actress, the first ever won by an African American. McDaniel's award-winning performance was generally seen by the black press as a symbol of progress for African Americans, although some members of the National Association for the Advancement of Colored People (NAACP) were still displeased with her work. At the least, her Oscar was a symbol of possible conciliation (the act of settling a dispute) between the races.

Feuds with NAACP

McDaniel spent much of 1940 touring the country as Mammy, and in the following year she appeared in three substantial film roles, earning no less than \$31,000 for her efforts. She was married, for a third time, to James L. Crawford in 1941.

The mid-1940s brought trying times for McDaniel, who experienced a heart-wrenching false pregnancy in 1944 and soon after became the victim of racist-inspired legal problems. The actress found herself in a legal battle over a system in Los Angeles that limited the land and home ownership rights of African Americans. Having purchased a house in 1942, McDaniel faced the possibility of being thrown out of her home. She was one of several black entertainers who challenged the racist system in court, however, and won.

Still, throughout the 1940s a growing number of activists viewed McDaniel and all she represented as damaging to the budding fight for civil rights. NAACP president Walter White pressed both actors and studios to stop making films that tended to ridicule black people, and he singled out the roles of Hattie McDaniel as particularly offensive. In response McDaniel defended her right to choose whichever roles she saw fit, adding that many of her screen roles had shown themselves to be more than equal to that of their white employers.

Renewed success in radio

By the late 1940s McDaniel found herself in a difficult position. She found her screen opportunities disappearing even as she suffered insults from progressive blacks. After her third marriage ended in divorce in 1945, she became increasingly depressed and confused as to her proper path.

McDaniel could still use her vocal talent on radio. In 1947 she won the starring role of “Beulah” on *The Beulah Show*, a CBS radio show about a black maid and the white family for whom she worked. When Hattie

McDaniel took over the role as Beulah, she became the first black performer to star in a radio program intended for a general audience. The program was generally praised by the NAACP and the Urban League, along with the twenty million other Americans who listened to it every evening at the height of its popularity in 1950.

McDaniel's last marriage, to an interior decorator named Larry Williams, lasted only a few months. In 1951 she suffered a heart attack while filming the first few segments of a projected television version of *The Beulah Show*. By summer she was diagnosed with breast cancer. McDaniel died in Hollywood, California, on October 26, 1952. She will always be remembered as Mammy of *Gone with the Wind*.

JOHN MCENROE

Born: February 16, 1959

Wiesbaden, Germany

American tennis player and television commentator

John McEnroe was one of the most successful and high-profile players in the history of tennis. Throughout his career, McEnroe won seventeen Grand Slam titles, seventy-seven career single titles, and seventy-seven doubles titles.

Childhood on the court

John Patrick McEnroe Jr. was born on February 16, 1959, in Wiesbaden, Germany, where his father, John McEnroe Sr., was serving in the United States Air Force, and his mother, Kay McEnroe, was a surgical nurse. He was the oldest of three sons. In 1963 his family moved to Queens, New York, where he was raised. At an early age he showed advanced hand-eye coordination and athletic ability. According to his father, when John Jr. was only two years of age, he could strike a ball with a plastic bat, and at age four he could hit it a considerable distance.

It soon became obvious that McEnroe possessed a great deal of natural ability on the tennis court. Oddly, although he won several junior tournaments, and moved steadily upward in rank, he was never rated number one on the National Junior circuit. In 1970 McEnroe began training with Tony Palafox, a former Davis Cup (an international team tennis tournament) player for Mexico, and Harry "Hop" Hopman, a former Australian Davis Cup coach, at the Port Washington (Long Island) Tennis Academy.

McEnroe attended Trinity School, a well-known and expensive Ivy League preparatory school in Manhattan, where he was known to be funny, witty, and rowdy. He did above average scholastically—although by his own admission, he could have done better if it weren't for his many sports activities: four

years of soccer and tennis as well as two years of basketball.

Youngest win in Wimbledon finals

In 1977, after McEnroe graduated from high school, he was given the opportunity to play in Europe, where he won the French Juniors Tournament. Aiming for the Junior's title at Wimbledon, he had to pull out of the event when he qualified for the men's senior competition. Not only did he qualify for this important tournament, but he advanced to the semi-finals, where he was beaten by the more experienced Jimmy Connors (1952–), who won in four sets. At that time, McEnroe became the youngest man ever to reach the Wimbledon semi-finals. He also solidified his reputation as one of tennis's "bad boys" along with Jimmy Connors and Ilie Nastase (1946–). His disturbing, emotional outbursts were directed at linesmen, opponents, and himself. Although McEnroe played somewhat inconsistently for the remainder of the year, he was voted *Tennis* magazine's Rookie of the Year for 1977.

That fall McEnroe attended Stanford University in Palo Alto, California, on a tennis scholarship. He led the school's tennis team to the NCAA Championship in 1978. After his freshman year he decided to turn professional. In the summer of 1978 McEnroe was eliminated in the first round at Wimbledon but reached the semi-finals of the U.S. Open. By the end of that year, he was ranked sixth in the world in singles and fifth in doubles.

Temper tantrums and superstardom

As McEnroe's talent came to public attention, so did his "superstar" personality. At no tournament did his comments and dis-

John McEnroe.

Reproduced by permission of the Corbis Corporation.

ruptive actions stand out more than they did at Wimbledon, which was run by the traditional All England Club. Whether there was any truth to his claims or not, McEnroe believed that the Wimbledon umpires were out to get him. Although McEnroe lost in the fourth round at the 1979 Wimbledon tournament, later that year he bounced back and won his first U.S. Open Championship, defeating fellow New Yorker Vitas Gerulaitis. McEnroe became the youngest player to win the U.S. Open since 1948.

At Wimbledon in July 1980 the world watched as one of tennis's greatest rivalries developed between McEnroe and Bjorn Borg

(1956–). The highlight of the match took place in the fourth set, which went into a tiebreaker. It took twenty-two minutes and thirty-four points for McEnroe to finally win the set. But Borg emerged victorious (1–6, 7–5, 6–3, 6–7, 8–6). It was Borg's fifth consecutive Wimbledon title, but it also showed the world that McEnroe had the endurance and mental toughness to be a top player. The rivals met again at the U.S. Open, where McEnroe found himself defending the title against a determined Borg, who had yet to win the Open. In a match with as many games as their famous Wimbledon final, McEnroe emerged the winner (7–6, 6–1, 6–7, 5–7, 6–4).

The 1981 Wimbledon tournament saw McEnroe and Borg once again in the final. This time McEnroe ended Borg's five year reign as he won in four sets (4–6, 7–6, 7–6, 6–4). That same year, in September, McEnroe defended his U.S. Open title once again against Borg (4–6, 6–2, 6–4, 6–3). Borg, perhaps feeling that his reign was over, retired after this defeat. McEnroe became the only man since Bill Tilden (1893–1953) to win three consecutive U.S. Open titles.

McEnroe's decline and comeback

In 1984 McEnroe won eighty-two of eighty-four matches, including his fourth World Championship of Tennis final, his third U.S. Pro Indoor Championship, and his second Grand Prix Masters title. He captured his third Wimbledon title, soundly defeating Connors (6–1, 6–1, 6–2), and his fourth U.S. Open title (beating Ivan Lendl 6–3, 6–4, 6–1). This victory was to mark the last major title of his career.

In 1986 McEnroe took time away from tennis and married actress Tatum O'Neal, his

girlfriend of two years (after the birth of their first child, Kevin), and retreated to his Malibu, California, home. His break from tennis did not last long as he came back in August to face Boris Becker in a tournament in Stratton Mountain, Vermont. The match invited comparisons to the earlier Borg-McEnroe rivalries. Unfortunately, his comeback never fully took shape. He continued as a Davis Cup player and his successes in Cup play earned him more press than his occasional singles titles. McEnroe, who has four children, divorced O'Neal in 1992. He married singer Patty Smyth in April of 1997. The couple has two daughters.

Sports broadcasting and charity work

In 1995 McEnroe began to call matches with the USA Network's coverage of the French Open. This began his present broadcasting career. He is a network television commentator for both NBC and CBS at Wimbledon, the French Open, and the U.S. Open. He currently competes in a select number of tournaments and special events, largely for charity. In 1999 McEnroe was inducted into the International Tennis Hall of Fame and was named captain of the Davis Cup team.

Although McEnroe's lack of single-minded devotion may have brought his tennis career to a halt, his charitable activities have brought to the public eye a side of him that was not seen during his reign as champion. An avid rock fan and guitar player, McEnroe occasionally plays at charity events. His interest in art led him to open the John McEnroe Art Gallery in New York City, which features up-and-coming young artists.

TERRY MCMILLAN

Born: October 18, 1951

Port Huron, Michigan

African American writer

Terry McMillan, an African American novelist and short story writer, describes in her works the experiences of urban (city-dwelling) African American women and men.

Early life

The oldest of five children, Terry McMillan was born on October 18, 1951, in Port Huron, Michigan, a mostly white, working-class factory city. Her father, Edward Lewis McMillan, was a blue-collar worker (a person who works somewhere, like a factory, where a uniform or protective clothing is needed). He suffered from tuberculosis (a disease of the lungs) and was confined to a sanitarium (an institution for sick people to rest and recover) during most of McMillan's childhood. He also drank too much and beat his wife. McMillan's parents divorced when she

was thirteen. In order to support the family, her mother, Madeline Tillman, held various jobs as a domestic worker, an auto worker, and a pickle factory employee.

At age sixteen McMillan got a job shelving books in a local library to help her mother provide for the family. There she discovered the world of the imagination. She became a devoted reader, enjoying the works of Nathaniel Hawthorne (1804–1864), Henry David Thoreau (1817–1862), Ralph Waldo Emerson (1803–1882), and Thomas Mann (1875–1955). Reading the works of these great writers led McMillan to believe that the world of literature was a white one. Upon seeing a book by James Baldwin (1924–1987), she was astonished to learn that African Americans also wrote books.

Starts writing in California

When McMillan was seventeen, she left Port Huron and moved to Los Angeles, California, where she worked as a secretary and took a class in African American literature at Los Angeles City College. This course introduced her to the works of such writers as Richard Wright (1908–1960), Zora Neale Hurston (1891–1960), Jean Toomer (1892–1967), and especially Ann Petry (1908–1997), whose novel *The Street*, with its honest and natural account of an African American woman living in a brutal city environment, would greatly influence McMillan's early fiction.

It was during this period of McMillan's life that she started to write. A love poem—the result of a failed relationship—was her first attempt. As she stated in an interview: “That is how it started. It kept going and it started turning into this other stuff, started turning

Terry McMillan.

Reproduced by permission of Marion Ettlinger.

into sentences.” McMillan continued her interest in writing and her education by moving to northern California, where she studied journalism at the University of California at Berkeley. While at Berkeley she took a workshop with novelist and critic Ishmael Reed. Reed was excited by McMillan’s writing and encouraged her to continue. He published “The End” (1976), her first short story, in *Yardbird Reader*.

First novels

After McMillan graduated with a bachelor’s degree from Berkeley, she left California and moved to New York City. She joined the Harlem Writers Guild and went to artists’

colonies such as Yaddo in upstate New York and MacDowell in New Hampshire. At MacDowell she finished the first draft of what would become *Mama*, her first novel. Based on her own life, *Mama* (1987) explores the grim and humorous situation of an African American family in a large city. Set in Point Haven, Michigan, and in Los Angeles, the novel revolves around the lives of Mildred Peacock and her five children. Mildred’s oldest daughter, Freda, is sexually abused at fourteen, and her only son, Money, becomes a drug addict who winds up in prison. Despite the sad state of affairs that the Peacock household experiences, Mildred continues to fight to raise her family. Although critics felt the book lacked the focus of novels written by other African American women writers of the time, McMillan’s work was generally greeted with praise.

Disappearing Acts (1989), McMillan’s next novel, charts the love affair between Zora Banks, a junior high school music teacher who dreams of being a singer, and Franklin Swift, a high school dropout and often-unemployed carpenter and construction worker. Told in the first-person narrative voices (a type of storytelling where the narrator is the person engaged in the activity being retold) of Zora and Franklin and set in Brooklyn, New York, the novel is a powerful study of their relationship and the problems that prevent them from finding happiness together. While some reviewers applauded McMillan’s creation of the character of Franklin, many critics cited the novel’s use of slang as a major distraction. “The language that I use is accurate,” McMillan later said in her defense. “That’s the way we talk. And I want to know why I’ve never read a review where they complain about the language that male writers use!”

In 1990 McMillan edited *Breaking Ice: An Anthology of Contemporary African American Fiction*, a collection of stories by other African American writers. Her third novel, *Waiting To Exhale* (1992), describes the lives of Robin, Bernadine, Gloria, and Savannah, four educated African American women living in Phoenix, Arizona, who have an ongoing discussion about their problems in finding and keeping lovers. The book was greeted with tremendous critical and commercial success. By the end of 1996, more than 700,000 copies of the hardcover version and three million copies of the paperback had been sold. The film version, which grossed (earned before subtracting film production costs) \$67 million in its first year, also proved there was a largely untapped African American female audience eager for movies and novels. Critics praised the work as further evidence of McMillan's bold writing talent.

Continued success

Although *Waiting to Exhale* had been very popular, McMillan enjoyed even greater commercial success with her next novel, *How Stella Got Her Groove Back*. The novel had a first printing of 800,000 copies, a huge number for an African American female author, and film rights were sold immediately for a six million dollar advance. Again, McMillan based the story on her own experience, this time focusing on a middle-aged woman who falls for a twenty-year-old while on vacation in Jamaica. As Evette Porter pointed out in an interview with McMillan that appeared in the *Village Voice*, there are many similarities between the novel and its author, including a young Jamaican boyfriend, Jonathan Plummer, who McMillan met on the island. (They were mar-

ried in 1998.) Critics pointed out that the book's similarity to real life should not blur the novel's larger message about exercising personal freedom in the way one chooses to live.

There was no question in the late 1990s that McMillan, a former writing professor at Stanford University, in California, and the University of Wyoming, had established herself as a major novelist and pioneer in a new type of fiction—the African American urban romance novel. As other writers began to publish books with similar themes in an attempt to cash in on the success of McMillan's work, she turned back to the subject of family for her next novel, *A Day Late and a Dollar Short* (2001), which is somewhat similar to her earlier *Mama*.

AIMEE SEMPLE MCPHERSON

Born: October 9, 1890

Ingersoll, Ontario, Canada

Died: September 27, 1944

Oakland, California

Canadian-born American evangelist

Aimee Semple McPherson.
Courtesy of the Library of Congress.

Aimee Semple McPherson, American evangelist (one who preaches Christianity), symbolized important traits of American popular religion in the 1920s and 1930s. She was one of the first female evangelists, the first divorced evangelist, and the founder of the Foursquare Gospel church.

Early life

Aimee Kennedy was born on October 9, 1890, near Ingersoll, Ontario, Canada. Her father, James Morgan Kennedy, was a struggling farmer. Her mother, Mildred “Minnie” Pearce was a former member of the Salvation

Army (1865; founded by William Booth [1829–1912] as a religious organization with military structure for the purpose of bettering life for the poor and evangelizing the world). Soon after Aimee’s birth, her mother took her to the Salvation Army and dedicated her to God’s service. Aimee’s training was particularly geared toward religious work.

When Aimee was in high school, she began to question her religious beliefs. At the age of seventeen she went to a religious meeting and experienced Pentecostal (a branch of Christianity that supports individual religious experience and evangelism) conversion under the guidance of Scottish evangelist Robert Semple. In 1908 she married Semple and followed him to China as a missionary (one who travels to spread religious teachings). He died soon after arriving in China, leaving her pregnant and penniless. After the birth of Roberta Star, she returned home and continued her Pentecostal work. She also worked with her mother for the Salvation Army.

Travels

Semple married a New York grocery clerk, Harold S. McPherson, in 1913; this marriage ended in divorce five years later. Thereafter she set out as an untrained lay evangelist to preach a Pentecostal-type of revivalism (a religious practice focused on restoring the spirit of God into people) to the people of Ontario, Canada.

Physically attractive and possessing a dynamic personality and the instinctive ability to charm crowds, Aimee Semple McPherson gradually perfected her skills. By this time professional revivalism had achieved a distinctive style and organization; McPherson was in the forefront. Though she initially lived an almost

hand-to-mouth existence, following the route of traveling evangelists from Maine to Florida, success meant a move to larger cities in America, England, and Australia. In the cities audiences were often immense, with ten thousand to fifteen thousand people deliriously applauding her. "Speaking in tongues" and successful efforts at faith healing—both practiced by Pentecostal churches—were a part of her ministry. (Pentecostals believe that the sounds made by people while "speaking in tongues" are biblical messages that can be interpreted by another worshipper.)

Her own temple

By 1920 McPherson was permanently established in Los Angeles, California. In 1923 she and her followers dedicated Angelus Temple. She called her new breed of Christian church the Foursquare Gospel, a complete gospel for body, soul, spirit, and eternity. Seating over five thousand people, this served as her center of activity. Backed by a sharp business manager (her mother), McPherson developed a large group of devoted followers. She also became a community figure in tune with the publicity-oriented life of Los Angeles, the film capital of the world.

A popular evangelist, McPherson thrived on publicity and sensationalism (causing an intense and/or unnatural emotional reaction). The most astounding incident occurred in 1926, when McPherson, believed to have drowned in the Pacific Ocean, "miraculously" reappeared in the Mexican desert. Some challenged her tale of kidnapping and mistreatment, claiming she had been in hiding with one of her male followers. The resulting court battle attracted national attention.

McPherson continued her unconventional ways by engaging in a slander suit (when a person is taken to court for telling lies that damaged another's reputation) with her daughter, publicly quarreling with her mother, and carrying on well-publicized vendettas (intense and lengthy fights) with other religious groups. Aimee Semple McPherson died of a sleeping pill overdose in Oakland, California, on September 27, 1944. The Foursquare Gospel church continues to thrive in America today.

MARGARET MEAD

Born: December 16, 1901
Philadelphia, Pennsylvania
Died: November 15, 1978
New York, New York
American anthropologist

The American anthropologist (a scientist who studies human beings and their origins, distribution, and relationships) Margaret Mead developed the field of culture and personality research and was a leading influence in introducing the concept of culture into education, medicine, and public policy.

Early life

Margaret Mead was born in Philadelphia, Pennsylvania, on December 16, 1901. She grew up in a free-thinking intellectual home. Her father, Edward Sherwood Mead, was a professor at the Wharton School of Finance and Commerce and the founder of the University of Pennsylvania's evening school. Her mother, Emily Fogg Mead, was a sociologist (a scientist who studies social group behaviors) and an early supporter of women's rights. Margaret's grandmother, Martha Ramsay Mead, a child psychologist (a scientist who studies the mind and its behavior), played an active role in the lives of Margaret, her three sisters and her brother. It was her grandmother who first taught Margaret to watch the behavior of the younger children to figure out the reasons behind their actions.

Mead's childhood school days were unusual in that she only attended one year of half days in the fourth grade and six total years at various high schools. This "formal" education was very much supplemented by all of the educators in her family. Mead loved tradition and ritual, so she joined the Episcopal church at the age of eleven. This faith would be her strength throughout her life. Mead at first wanted to be a painter when she grew up, but such intellectual role models led her to college thinking of English as a field of study.

Mead thrived on change outside of her religious beliefs. In 1919 Mead transferred from DePauw University, in Indiana, to Barnard College, in New York City, where she majored in psychology. Her senior year anthropology course with Franz Boas (1858–1942) was the most powerful event in her life, since it was then that she decided to become an anthropologist. She graduated from Barnard in 1923. In the same year she married Luther Cressman and entered the anthropology department of Columbia University.

Academic life

The Columbia department at this time consisted of Boas, who taught everything, and Ruth Benedict (1887–1948), his only assistant. The catastrophe of World War I (1914–18; a war between the Central powers—led by Germany—and the Allies: England, the United States, Italy, and other nations) and the displacement of people that followed had its impact on the developing study of anthropology. Anthropologists began to ask how their knowledge of the nature of humankind might be used to clarify current problems. At the same time the influence of Sigmund Freud (1856–1939) was beginning to affect all of behavioral (human action) sciences. The atmosphere in the Columbia department was charged with excitement, and whole new perspectives for anthropology were opening up.

Early fieldwork

Mead completed her studies in 1925 and set off for a year of fieldwork in Samoa in the face of opposition from older colleagues (people in the same area of interest) worried

about sending a young woman alone to a Pacific island. She was going to study the life of adolescent girls. She learned the native language (one of seven she eventually mastered) and lived in a Samoan household as “one of the girls.” She found that young Samoan girls experienced none of the tensions American and European teenagers suffered from, and she showed the kind of social arrangements that make this easy transition to adulthood possible.

On returning from the field Mead became assistant curator (one in charge of the museum) of ethnology (the science of classifying mankind into races) at the American Museum of Natural History, where she remained, eventually becoming curator and, in 1969, curator emeritus (honorary title). Her goal in going to the museum was “to make Americans understand cultural anthropology as well as they understood archaeology [study of material remains, fossils, rocks, of past human life and activity].”

In 1928, Mead left for New Guinea, this time with Reo Fortune, an anthropologist from New Zealand whom she had married that year. Her project was the study of the thought of young children, testing some of the then current theories. Her study of children’s thought in its sociocultural (having both social and cultural elements) context is described in *Growing Up in New Guinea* (1930). She later returned to the village of Peri, where this study was made, after twenty-five years, when the children she had known in 1929 were leaders of a community going through the difficulties of change to modern life. She described this change, with flashbacks to the earlier days, in *New Lives for Old* (1956).

Margaret Mead.

Reproduced by permission of AP/Wide World Photos.

New field methods

Mead’s interest in psychiatry had turned her attention to the problem of the cultural context of schizophrenia (a mental disorder whose symptoms are a detachment to one’s environment and a breakdown of one’s personality—thoughts, feelings, and actions). With this in mind she went to Bali, a society where going into a trance (the state of complete unconscious) and other forms of dissociation (an escape from the outer world into an inner one) are culturally approved and encouraged. She was now married to Gregory Bateson, a British anthropologist whom she had met in New Guinea. The Balinese study

was especially noteworthy for development of new field techniques. The extensive use of film made it possible to record and analyze significant details of behavior that had escaped the pencil-and-paper recordings. Of the thirty-eight thousand photographs which Mead and Bateson brought back, seven hundred fifty-nine were selected for *Balinese Character* (1942), a joint study with Bateson. This publication marks a major change in the recording and presentation of ethnological data and may prove in the long run to be one of her most significant contributions to the science of anthropology.

Largely through the work of Ruth Benedict and Mead, the relevance of anthropology to problems of public policy was recognized though somewhat belatedly. When World War II (1939–45; a war between the Axis powers: Japan, Italy, and Germany—and the Allies: England, France, the Soviet Union, and the United States) brought the United States into contact with peoples just coming from colonialism (a control of a group of people or area by a foreign government), the need to understand many lifestyles became obvious. Mead conducted a nationwide study of American food habits prior to the introduction of rationing (process in war time of conserving goods for soldiers by portioning them out sparingly to citizens). Later she was sent to England to try to explain to the British the habits of the American soldiers who were suddenly among them.

Rooted in psychology

Mead drew heavily on psychology, especially learning theory and psychoanalysis (type of treatment for emotional disorders in which a patient talks through childhood

experiences and looks at the significance of dreams). In return she contributed significantly to the development of psychoanalytic theory by emphasizing the importance of culture in personality development. She served on many national and international committees for mental health and was instrumental in introducing the study of culture into training programs for physicians and social workers.

Mead was a dominant force in developing the field of culture and personality and the related field of national character research. Her theoretical position is based on the assumption that an individual matures within a cultural context which includes an ideological system (ideas), the expectations of others, and techniques of socialization (methods of fitting in with one's social environment) which affect not only outward responses but also the inner mental structure.

Mead was criticized by certain other social scientists for neglecting quantitative (measuring) methods and for what has been called "anecdotal" (relying on short stories of interesting incidents for proof) handling of data. She was also accused of applying concepts of individual psychology to the analysis of social process while ignoring historical and economic factors. But since her concern lay with predicting the behavior of individuals within a given social setting and not with the development of institutions, the criticism does not hold much weight.

There is no question that Mead was one of the leading American intellectuals of the twentieth century. Through her best-selling books, her public lectures, and her well-read column in *Redbook* magazine, Mead popularized anthropology in the United States. She

was also a role model for American women, encouraging them to pursue professional careers previously closed to women while at the same time championing their roles as mothers.

Margaret Mead died on November 15, 1978, in New York City and was later awarded the Presidential Medal of Freedom.

CATHERINE DE' MEDICI

Born: April 13, 1519

Florence, Italy

Died: January 5, 1589

Blois, France

Italian-born politician

Catherine de' Medici was married to the French King Henry II (1519–1559) and was mother and regent

(one who governs a kingdom in the absence of the real ruler) of three other kings—Francis II (1544–1560), Charles IX (1550–1574), and Henry III (1551–1589). She had great influence over her sons and is thought by some to have authorized the famous Massacre of St. Bartholomew's Day in 1572.

Early life

Catherine was born in 1519 to a powerful Italian prince from the Medici family. Her mother died a few days after giving birth, and her father died a week later. Her father's relatives, among them popes Leo X (1475–1521) and Clement VII (1478–1534), took over her care. At the time of her birth, the Reformation was beginning with Martin Luther's (1483–1546) criticism of the Roman Catholic Church. It soon spread throughout Europe. Protestants, as they came to be called, sought a truer form of their faith than that offered by the political and often corrupt (engaging in unlawful activity) Catholic Church. French Protestants were known as Huguenots, and the rapid growth of their numbers soon made them a powerful force in French affairs.

In 1533 Pope Clement arranged the marriage of fourteen-year-old Catherine to fourteen-year-old Henry, the duke of Orleans and younger son of King Francis I (1494–1547) of France. Catherine eventually gave birth to ten children, beginning in 1543. The death of her husband's older brother in 1536 made Henry and Catherine next in line for the throne. Catherine's husband, now Henry II, had been cared for at age eleven by Diane de Poitiers, who was twenty years his senior. Despite this age difference, they became lovers, and throughout most of Henry's reign as king of France, which began in 1547,

Catherine de' Medici.

Reproduced by permission of the Corbis Corporation.

Diane had more influence over him than Catherine did. Diane was even given responsibility for raising Catherine's children.

Teenage kings

The Catholic leaders of France and Spain made peace in 1559 partly because they needed money but also so they could unite against Protestantism. The treaty was sealed by the marriage of Philip II (1527–1598) of Spain to Elisabeth, the teenage daughter of Catherine and King Henry. At the joust (a fight on horseback) held during the wedding celebrations, however, King Henry was injured by a lance that pierced his eye and

entered his brain. Henry's death a few days later brought his and Catherine's oldest son, sixteen-year-old Francis II, to the throne.

Sensing an opportunity, Huguenot leaders quickly organized a plot to take over the court of Francis II. Their plan failed, and the royal army arrested the leaders, executing fifty-seven of them. This did not end the conflicts in France; from this time forward, the Huguenot Navarre family and the Catholic Guise family began a long struggle. The death of Francis II the following year made Catherine regent for her second son Charles, who became King Charles IX at the age of ten. Through much of the 1560s, the two religious groups were at war while Catherine and Charles tried to avoid siding completely with either camp. Catherine tried to keep the country running smoothly in the face of this constant tension. The feud between the Navarre and Guise families became worse when the Huguenot leader Admiral Gaspard de Coligny (1519–1572) ordered the assassination of the duke of Guise in 1563.

The Peace of St. Germain

The signing of the Peace of St. Germain in 1570 brought a temporary end to a decade of war. Among the treaty's provisions were the decisions that Catherine's daughter Marguerite would marry Henry of Navarre (1553–1610), the Huguenot leader, that the Huguenots would be given several territories throughout France, and that Coligny would return to his position in the royal court. Catherine hoped he might act to calm his fellow Huguenots while she played the same role among Catholics. But Coligny quickly moved to become a friend and adviser of King Charles IX, leading many to believe he was planning another takeover.

Catherine decided to dispose of Gaspard de Coligny once and for all. She accepted an offer from the Guise party to have him assassinated, hoping that it would lead to revived power for her own party. The assassin shot Coligny but failed to kill him. After talking to Catherine and his younger brother Henry, Charles finally accepted their claim that Coligny was using him, that Coligny planned to overthrow the whole Catholic court, and he and the other Huguenot leaders should now be finished off. According to his brother Henry's diary, Charles at last shouted, "Kill the Admiral if you wish; but you must also kill all the Huguenots, so that not one is left alive to reproach (oppose) me. Kill them all!"

Massacre and more conflict

At two in the morning on August 24, Saint Bartholomew's Day, 1572, Catholic troops moved to kill the injured Coligny and other Huguenot leaders. Eventually all sense of order broke down; looting and fighting broke out across Paris, and over two thousand men, women, and children wound up dead. Catherine was reported to have ordered the attacks, but this has never been completely proved. Another civil war began, but by a strange turn of events, leadership of the Huguenot party now fell to Catherine's youngest son Francis, duke of Alençon. Placing himself at the head of the Protestant forces and dreaming of a crown, he declared that his older brother Henry, who had just been elected to the throne of Poland, was no longer available to rule France.

The departure of Catherine's third son, Henry, to take over the throne of Poland prompted another Huguenot uprising. With her usual energy, Catherine organized forces

to stop it, and with her usual decisiveness, she witnessed the executions of its leaders. She also witnessed the death of her son King Charles, aged twenty-four. She recalled her favorite, Henry, to take over as king. Henry III was crowned in 1575 and married, but he had no children who might eventually assume the throne. He also had disagreements with the Guise family, which complicated things. Catherine urged Henry to settle his differences with the Guise family for the sake of national and Catholic security.

Catherine remained politically active until the end of her life, touring France on Henry's behalf and trying to maintain the loyalty of its many war-torn territories. She also built up a huge collection of books and paintings, and she built or enlarged some of Paris's finest buildings. In 1589 she became ill while dancing at the marriage of one of her granddaughters. She died on January 5, living just long enough to hear that Henry's bodyguards had murdered Guise, which she saw as a rejection by her son of all that she had worked for. Later that year, Henry III was assassinated. In another twist, it was the Huguenot prince Henry of Navarre who took over the throne; he was unable to sit upon it until he adopted the Catholic faith in 1593 with the famous remark, "Paris is worth a Mass."

GOLDA MEIR

Born: May 3, 1898

Kiev, Ukraine

Died: December 8, 1978

Jerusalem, Israel

Israeli prime minister, Zionist leader, and political leader

Golda Meir served as Israel's foreign minister from 1956 to 1966 and became its fourth prime minister in 1969. By the end of her life, she had become a hero as one of the first women to head a nation in the modern era. Meir was a leading figure in the movement called Zionism, the movement to create a Jewish state in Palestine, the area the Jews regarded as their historical home. The Zionist movement helped lead to the founding of Israel.

Childhood and early interests

Golda Meir was born the daughter of Moshe and Bluma Mabovitch in Kiev, Ukraine, on May 3, 1898. She moved with her family to Milwaukee, Wisconsin, in 1906. The Mabovitch family had fled their home in part to escape pogroms (mob attacks) that had been carried out against Jews in Russia at the time. Meir later recalled that her childhood terror of anti-Semitic (anti-Jewish) violence strongly influenced

her later commitment to establish Israel as a safe, secure Jewish state.

After attending high school, Meir went to the Teachers' Training College in Milwaukee in 1917. She had attained her school-teacher's training over the objections of her parents, who had felt that girls should be married, not pursue a profession. Meir did both, marrying Morris Myerson in 1917 (later she modified her name to Meir). In 1921 they left for Palestine. This Middle Eastern region, which included the territory of modern-day Israel and the West Bank, was at that time under the administration of Great Britain and largely populated by Arabs.

After arriving in Palestine, the Myersons joined a kibbutz (a communal settlement) where after some training they were put in charge of the chicken farm. However, Golda's husband became ill, and the couple decided to move to Tel Aviv. The couple eventually moved to Jerusalem where their two children were born. In Jerusalem, Golda found work as treasurer of the Office of Public Works of the Histadruth, a labor organization that included kibbutz workers and that became the most important economic organization in the Israeli state.

Birth of Israel

From 1928 Golda Meir was the secretary of the Working Women's Council in Palestine and served as its representative on the leadership of the Histadruth. She also represented the council at a number of international labor meetings and was a delegate to its sister organization, the Pioneer Women, in the United States. After 1929 she was elected a delegate to most meetings of the World Zionist Organization. This was the real beginning

of her Zionist political activity. In 1940 she was appointed head of the political department of the Histadruth. As such, she fought against the British White Paper of 1939, which limited Jewish immigration to Palestine. Meir organized illegal Jewish immigration to Palestine at this time, when Jews faced danger in Europe because of World War II (1939–45) and persecution by the German Nazi regime.

When the Palestine Administration (the main British governing body) imprisoned the leaders of the Jewish Agency, a Zionist organization, in June 1946, Meir was appointed acting head of the Jewish Agency's political department. Originally picked to replace the arrested Moshe Shertok-Sharett (1894–1965) in this position, she continued in this role until the proclamation of the independence of Israel on May 14, 1948. Early in 1948 she visited the United States to organize an emergency fund campaign for Palestine, with very successful results. On May 14 she was, as a member of Israel's Provisional Council of State, among the signers of its Declaration of Independence.

Israeli leader

Meir started her political career in Israel as its representative to the Soviet Union. With her election to the first Israeli Parliament (governing body), she returned to Israel and was appointed minister of labor and social insurance. While in this office, she worked to solve the most important internal problems of Israel: housing and employment for the new mass Jewish immigration. Still known by her married name, she engineered what became known as the "Myerson Plan," which allowed for the construction of more

Golda Meir.

Reproduced by permission of AP/Wide World Photos.

than thirty thousand units of one-room housing. She also oversaw the construction of some two hundred thousand low-income apartments to house Israel's newly immigrated families.

In 1956, Israeli prime minister David Ben-Gurion (1886–1976) called Meir "the best man" in his cabinet and named her to replace Shertok-Sharett as foreign minister, among the most important government jobs in the nation. It was now, as a result of Ben-Gurion's desire to have all Israelis bear Hebrew names, that she reluctantly altered her name to Meir, while keeping it as close as possible to Myerson.

In 1966, tired and ill, Meir resigned as minister of foreign affairs. However, soon after, under pressure from her political party, she agreed to take over the leadership of Israel's Labor Party. Over the next two years, she succeeded in reuniting three main labor groups that had split, the Mapai, the Achdut Ha'Avodah, and the Rafi, into one political party. The merger took place on January 2, 1968, and in August she retired from political activity. However, after the death of Prime Minister Levi Eshkol (1895–1969), when it looked as if conflict might arise within the Labor Party in the effort to find his replacement, Meir again came out of retirement to assume the post of Israel's prime minister on March 17, 1969.

Prime minister

Though elderly and in poor health, Meir proved her abilities to the country during her initial nine-month term. As a result, her Labor Party won the 1969 elections. Meir thus gained her own four-year term as prime minister. This period was marked by Meir's efforts to gain U.S. aid in the form of military and economic assistance. The assurances she won from U.S. president Richard Nixon (1913–1994) helped her open peace talks with the United Arab Republic in 1967, during which one of the several conflicts between Israel and its Arab neighbors (known as the Arab-Israeli Wars) had occurred.

Meir sided with radicals in her government who felt that the territories captured during the 1967 war should be settled by Israelis, yet she also retained the support of moderates who favored giving up land claims in exchange for peace. However, in 1973 and 1974, Israel's unpreparedness for another of the Arab-Israeli Wars, known as the Yom

Kippur War, brought demands for new leadership. After the 1973 elections, Meir was still able to form a new government, but divisions only increased and on April 10, 1974, she resigned as prime minister.

Even in retirement, Meir remained an important political presence in Israel. Her autobiography, *My Life*, helped assure her place in the public's imagination as the kindly grandmother who had risen to greatness in her nation's hour of need. Meir died in Jerusalem on December 8, 1978.

RIGOBERTA MENCHÚ

Born: January 9, 1959

Chimel, Guatemala

Guatemalan human rights activist

Rigoberta Menchú has been a passionate spokesperson for the rights of indigenous peoples—people who belong to an ethnic group that is native to a

region, such as the Mayan peoples of Central America. She won a Nobel Peace Prize in 1992 for her work on behalf of the indigenous groups of Guatemala, her native country. However, her work has made her a leading voice for the rights of indigenous peoples throughout the Western Hemisphere.

A hard childhood

Rigoberta Menchú was born on January 9, 1959, in Chimel, a village in the Quiché province (political unit or region) in the mountainous northwest region of Guatemala. Her mother was a midwife (a person who assists women in giving birth) and traditional healer. Her father, Vicente, was a day laborer (someone who is hired and paid to work on a daily basis) and community leader. Both her parents belonged to one of the many indigenous groups of Guatemala, the Quiché Maya. They spoke little Spanish, the language of those in power of Guatemala since its conquest by Spain in the sixteenth century. Instead, they spoke Quiché. Young Menchú herself spoke only Quiché until she was nineteen.

Menchú's difficult childhood is an example of how hundreds of thousands of Indian (indigenous) children grow up in Guatemala. Every year she followed her parents to the southern coastal plantations (large farms), where they spent months as laborers picking cotton and coffee. Two of her brothers died on the plantations, one after being poisoned by insecticides (chemicals used by farmers to kill insects) and the other because of malnutrition (poor diet). Menchú started working on the plantations when she was only eight, and at age thirteen she experienced her first close contact with people of Spanish culture

Rigoberta Menchú.

when she worked as a maid for a wealthy family in Guatemala City. At this time, Menchú also experienced discrimination against Indians practiced by Latinos (people of Spanish culture). Her employers made her sleep on the floor on a mat next to the family dog—which, she later recalled, was treated better than her.

Guatemala's troubles

Menchú's political beliefs were shaped by Guatemala's troubled history. In 1954, a left-wing civilian president was removed from power by a coup d'état (the overthrow of a government by a small group of people

who have held positions of power) that was supported by the U.S. Central Intelligence Agency. After this coup, the country was ruled by military officers. They ruled the country harshly, tolerating little protest or disagreement. When a guerrilla movement (a movement in which small groups use surprise tactics and attacks to harass or overthrow those in power) opposed to the military rulers began in 1962, the government responded violently. They arrested and killed not only the guerrillas, but also those who supported them or were believed to support them, especially in the countryside.

Political violence began again in the 1970s, when government pressure was applied so widely and harshly that U.S. president Jimmy Carter (1924–) halted economic aid to Guatemala after repeated warnings to the government to stop human rights (basic rights and freedoms to which all people are entitled) violations. Guatemala's Indians, who made up 60 percent of the population, were forced to move into "model villages" and to serve in the military. In this environment, movements to benefit the conditions of Indians were viewed as part of a communist plot by the government.

Political activities

Menchú became politically active, inspired in part by her religious beliefs. Like many others in Central America, she was influenced by Liberation Theology, a movement that believes the Bible should be read through the eyes of the poor and that Jesus Christ had a special message of freedom for poor people.

Another important influence was Menchú's father, Vicente, who was active in

the Peasant Unity Committee, a group that fought to obtain land for peasants and to protect the land they held from being seized by wealthy landowners. Rigoberta Menchú joined the committee in 1979, and was asked to organize the country's twenty-two Indian groups against exploitation (being treated unfairly by those in power). Later that year her teenage brother was tortured and then killed by the army. The following year she lost her father when Vicente Menchú, along with other representatives of indigenous groups, occupied the Spanish embassy in Guatemala City as part of a protest activity. The army attacked the embassy and burned it, killing thirty-nine people, including Menchú's father.

International campaign for rights

The next year Menchú's mother was kidnapped, tortured, and killed by the Guatemalan army, and two of her sisters joined the guerrillas. Life in Guatemala had become too dangerous, and Menchú fled to Mexico in 1981. There she began an international crusade to represent the hardships of the Guatemalan Indians and joined the United Nations Working Group on Indigenous Populations.

In 1983, while Menchú was in Paris to promote her cause, she dictated (spoke out loud to be copied down) her life story to Elizabeth Burgos. The result was the widely read book *I, Rigoberta Menchú: An Indian Woman in Guatemala*, which was translated into more than a dozen languages. It brought her worldwide attention and helped her to become the foremost spokesperson for indigenous peoples.

Peace in Guatemala

In 1988, Menchú's first attempt to return to Guatemala ended badly when she was threatened and put in jail. However, she later visited her country again for short periods of time. It was during one such visit in October of 1992 that she learned she would be given the Nobel Peace Prize for her work on behalf of the rights of indigenous peoples. She was only thirty-three.

In June 1993, during a political crisis in Guatemala, Menchú played a key role in the events that brought to power a new president, Ramiro de León Carpio, a human rights advocate. International pressure also helped force the government to ease up on military violence and violation of people's rights, and in 1995 many refugees who had fled from Guatemala to Mexico began to return.

The following year, the Guatemalan government and rebel leaders signed a cease-fire agreement to end their forty-two-year conflict, Latin America's longest civil war. It was a war that Menchú and her family had fought hard to end.

World figure

Menchú's actions and statements have been considered controversial. Conservatives have accused her of being associated with communist groups, and the story of her life in *I, Rigoberta Menchú: An Indian Woman in Guatemala* was questioned by journalist David Stoll in 1998. In his own book, *Rigoberta Menchú and the Story of All Poor Guatemalans*, Stoll argued that Menchú had distorted key facts in her autobiography.

Nevertheless, Menchú remains an active voice for those who lack representation. In

2000 she filed charges in a Spanish court against several officials in Guatemala's former military governments, accusing them of genocide (mass murder), torture, and state terrorism against some two hundred thousand people who had been killed in her country during the 1980s. Menchú has also been a vocal opponent of the effects of globalization, or the increasing dominance of multinational corporations in the world's economy. In early 2002 she was among the most celebrated speakers at the World Social Forum, a gathering of antiglobalization protesters in Brazil that was timed to coincide with the World Economic Forum, a meeting of politicians and corporate officers that was held at the same time in New York, New York.

FELIX MENDELSSOHN

Born: February 3, 1809
Hamburg, Germany

Died: November 4, 1847

Leipzig, Germany

German composer

Felix Mendelssohn was a German composer (a writer of music), conductor (the leader of a musical group), pianist, and organist. He developed a basic classical approach to musical composition with fresh romantic harmonies and expressiveness.

Childhood

Felix Jakob Ludwig Mendelssohn-Bartholdy was born in Hamburg, Germany, on February 3, 1809, the son of Abraham and Leah Mendelssohn and the grandson of the famous Jewish philosopher Moses Mendelssohn (1729–1786). In later years Felix's father humorously referred to himself as "formerly the son of my father and now the father of my son." In 1812 the family moved to Berlin, Germany, where Abraham established himself as a banker, converted to Protestantism (a branch of Christian religion), and changed the family name to Mendelssohn-Bartholdy.

Felix and his elder sister, Fanny, received their early piano instruction from their mother. In 1816, on a visit to Paris, France, he studied with the pianist Marie Bigot. The next year he began formal studies in composition with Carl Friedrich Zelter, a composer greatly admired by the poet Johann Wolfgang von Goethe (1749–1832). Also as a child, Mendelssohn took a keen interest in drawing and painting and took lessons in foreign languages.

Mendelssohn's first public appearance occurred at the age of nine. Famous musi-

cians gave concerts every Sunday at his father's house; in addition to broadening the musical horizons of the gifted boy, they enabled him, as a budding composer, to test many of his works as he wrote them. In 1819 he entered the Singakademie, a music academy, and from that time on compositions flowed steadily from his pen. In 1820, for example, he produced two piano sonatas (pieces for one instrument), a violin sonata, songs, a quartet for men's voices, a cantata, and a short opera.

First appearances

The first public presentation of Mendelssohn's works took place in 1822. That year he also wrote his official op. 1, a Piano Quartet in C Minor. All these works were well received. He had a private orchestra, for which he wrote the work now known as Symphony no. 1 in C Minor. He also continued with other work, such as the Piano Quartet in F Minor (1823).

In 1824 the famous pianist Ignaz Moscheles (1794–1870) arrived in Berlin from London, England, and for a time Mendelssohn studied piano with him. The following year Mendelssohn visited Paris, where he met many famous composers and performed his Piano Quartet in B Minor, dedicated to Goethe. Back in France he wrote with mature craftsmanship the celebrated *Midsummer Night's Dream Overture*.

In 1827 Mendelssohn's only opera, *Die Hochzeit des Camacho* (*The Marriage of Camacho*), based on *Don Quixote* by Cervantes (1547–1616), was presented in Berlin. More successful was the Octet for Strings, one of Mendelssohn's freshest and most original works. The same year he became acquainted

with Anton Thibaut, a professor of law and a gifted amateur writer of music who was concerned with revitalizing interest in old church music. Through him, Mendelssohn came to know the masterpieces of the Renaissance (a period of great artistic awakening during the fourteenth to sixteenth centuries) and early baroque choral music, an elaborate style of music popular in the eighteenth century. In 1828 appeared the Goethe-inspired overture *Calm Sea and Prosperous Voyage*.

Gaining popularity

On March 11, 1829, a great musical event occurred: Mendelssohn conducted the Singakademie in the first complete performance of Johann Sebastian Bach's (1685–1750) *St. Matthew Passion* since the composer's death. The work was a huge success, and the performance was of great importance to all later German composers for it marked the beginning of the revival of Bach's works. Later that year Mendelssohn visited England, where he conducted a concert of the Philharmonic Society. He took a long trip through Scotland, where he sketched the now famous Hebrides, or Fingal's Cave, Overture. On his return to Berlin he was offered the post of professor of music at the university but turned it down.

After writing the Reformation Symphony (1830) Mendelssohn began a series of visits to various European cities that lasted for almost three years. After a short stay with Goethe at Weimar, Mendelssohn went to Rome, Italy, where he began both the Scottish and the Italian symphonies. In the autumn he returned to Germany and played his newly composed Piano Concerto in G Minor in Munich, Germany. In 1832 he left for Lon-

Felix Mendelssohn.
Courtesy of the Library of Congress.

don, where he conducted the Hebrides Overture and the Piano Concerto in G Minor with great praise. That same year his first book of *Songs without Words (Lieder ohne Worte)* was published.

In 1835 Mendelssohn became director of the Gewandhaus concerts in Leipzig, Germany. He made Leipzig into a musical center of European significance because of his gifts as conductor, his creativity, and his all-encompassing (including all) musical education. He featured many contemporary (modern) compositions, such works as the C Major Symphony of Franz Schubert (1797–1828), newly discovered by Robert Schu-

mann (1810–1856), and selected compositions of J. S. Bach. The only sadness he experienced was the death of his father in 1835. A year later he met Cécile Jeanrenaud, whom he married in 1837. Five children were born of this marriage.

Later years

Upon the urging of the king of Prussia, Mendelssohn was appointed music director of the Academy of Arts in Berlin. Until 1845 he worked only occasionally in Berlin without giving up his post at Leipzig. His schedule was marked with several trips to London, with performances of his works in London and Birmingham, England.

In 1843 Mendelssohn founded the Leipzig Conservatory of Music, the first of its kind in Germany. He completed the Scottish Symphony, the Violin Concerto, and other major works of his maturity in Leipzig. In 1844 he conducted five Philharmonic concerts in London, and in 1846 he gave the first performance of his *Elijah*, written for the Birmingham Festival of that year. His chief occupation was still as conductor of the Gewandhaus concerts, but he also functioned as director of the Leipzig Conservatory, teaching piano and composition as part of his duties.

Mendelssohn's health began to fail in 1844. Three years later he was literally devastated by the death of his beloved sister, Fanny, on May 14. From then on his health fell apart drastically, and although he went on a short summer trip to Switzerland for his health, finishing the String Quartet in F Minor, he returned exhausted to Leipzig, where he died on November 4, 1847, at the age of thirty-eight.

KWEISI MFUME

Born: October 24, 1948

Baltimore, Maryland

African American civil rights activist, city councilman, congressman, and professor

Kweisi Mfume has been an active leader in the civil rights struggle for many decades. As a congressman, Mfume became one of the most well-known African American politicians in Washington, D.C. Believing that he could achieve more for civil rights by working for the National Association for the Advancement of Colored People (NAACP), Mfume eventually left Congress to become president of the organization.

“Things spun out of control”

Kweisi Mfume was born Frizzell Gray on October 24, 1948, in Baltimore, Mary-

land. His stepfather, Clifton Gray, was a truck driver, and his mother, Mary Elizabeth Gray, took odd jobs, but the family was often short of cash. Mfume was a good student who was protective of his three younger sisters. When Mfume was eleven, Clifton Gray abandoned the family. Then, when Mfume was sixteen, his mother discovered that she had cancer and soon died. He told *U.S. News and World Report*, “After she died of cancer, things spun out of control.” Mfume quit high school during his second year and went to work to help support his sisters. At times he worked as many as three different jobs in a single week.

Mfume also began hanging out on street corners drinking with friends. As he recalled in *U.S. News and World Report*, “I was locked up a couple of times on suspicion of theft because I happened to be black and happened to be young. And before I knew it, I was a teenage parent, not once but twice, three times, four times, five times.” Mfume’s life changed on a July night in the late 1960s. He had been drinking with his friends when suddenly he began to feel strange. “People were standing around shooting craps [playing dice] and everything else, and something just came over me,” he remembered in *Business Week*. “I said, ‘I can’t live like this anymore.’ And I walked away.” Mfume spent the rest of the night in prayer, then proceeded to earn his high-school diploma and pursue a college degree.

A new name

In an effort to connect with his African background, Mfume adopted a new name early in the 1970s. His aunt had traveled to Ghana and suggested the name when she

Kweisi Mfume.

Reproduced by permission of AP/Wide World Photos.

returned. “Kweisi Mfume” is a phrase that translates as “conquering son of kings.” Mfume went to work at a radio station in Baltimore. He began as an unpaid volunteer and eventually became an announcer. He also earned a bachelor’s degree with honors from Morgan State University in 1976. When that college opened a radio station, Mfume was hired as program director. Mfume became one of the strongest voices in Baltimore’s black community. His growing popularity convinced him to try his hand at politics.

In 1978 Mfume ran for a seat in the Baltimore City Council. After an advisor recom-

mended that he start wearing suits and ties, he won the election by only three votes. Mfume became a constant critic of then-Baltimore mayor William Donald Schaefer (1921–), accusing Schaefer of ignoring poor neighborhoods. The two men almost came to blows on several occasions. Gradually Mfume became aware that politics was a game of compromise and building coalitions (temporary alliances). He learned the art of negotiation (give and take to settle an issue) and even developed a friendly relationship with Schaefer. Mfume told *Business Week* of his former enemy, “We could go to our graves battling each other, or we could get things done.”

A congressman with clout

In 1986 Mfume became a candidate for Congress from the Seventh District. His opponents attacked him by reminding voters that Mfume had dropped out of high school and fathered many children without marrying the mothers. Still, he won the election and took his seat in Congress in 1987. When he found himself on the House Committee on Banking, Finance, and Urban Affairs, he taught himself about banking issues and economics. When the map of his district was changed to include more rural regions of Maryland, he studied farming and zoning laws to be able to represent his new constituents (members of his district). Mfume told the *Washington Post*, “I wanted people to get used to me real quick because I didn’t plan on leaving.”

Mfume established himself as a liberal who supported an increase in federal aid to inner cities. He returned to Baltimore nearly every week to deal firsthand with his constituents, many of whom lived in the city. “I

keep coming back to these communities and the lessons I learned here because that’s what got me where I am,” he told the *Washington Post*. “When I can’t get anything moving in Washington I can always come back here. . . . Whatever I’m doing in Washington, if it doesn’t matter here, it doesn’t matter.”

By his fourth term, Mfume had enough influence to become chairman of the Congressional Black Caucus, a group in Congress that supports the interests of African Americans. Soon after his election as chairman, Mfume and the Caucus presented a list of demands to President Bill Clinton (1946–), most of them having to do with federal aid to cities and the poor. “Not too many brothers or sisters would say ‘no’ to the president,” NAACP executive director Benjamin Chavis (1948–) was quoted as saying in *Emerge*. Mfume told *Business Week*, “We are going to be taken seriously. . . . If that means killing an important piece of [leadership-backed] legislation, then that will be the case.”

A better opportunity

On February 20, 1996, Mfume left his seat in Congress to become the president of the National Association for the Advancement of Colored People (NAACP). He said that he could do more for civil rights as NAACP president than in Congress. After one year of leadership, Mfume had erased the NAACP’s \$4.5 million debt. However, many questioned whether he would be able to restore the association to its former place of leadership in the civil rights movement. He also faced the task of trying to change the image of the association in an effort to increase appeal among younger African Americans.

After one year on the job, Mfume said that his term as president had “gone by in the blink of an eye because the workload was so high and the challenges were so great and the possibilities were so unlimited. I’m a workaholic by nature, so the fact that all this kind of coincided together was good for me in the sense that it challenged me.” With the group’s financial problems behind him, Mfume told members that the NAACP still had a long way to go. Among the issues he intended to address were affordable health care, conservation, voting reform, and hate crimes. In January 2000, NBC Television struck a deal with the NAACP to find more minorities to write, produce, and direct television shows after NAACP complaints about the “virtual whitewash” in new programming. Mfume predicted similar agreements would follow with the ABC, CBS, and Fox networks.

MICHELANGELO

Born: March 6, 1475

Caprese, Italy

Died: February 18, 1564

Rome, Italy

Italian artist

Michelangelo was one of the greatest sculptors of the Italian Renaissance and one of its greatest painters and architects.

Early life

Michelangelo Buonarroti was born on March 6, 1475, in Caprese, Italy, a village where his father, Lodovico Buonarroti, was briefly serving as a Florentine government agent. The family moved back to Florence before Michelangelo was one month old. Michelangelo’s mother died when he was six. From his childhood Michelangelo was drawn to the arts, but his father considered this pursuit below the family’s social status and tried to discourage him. However, Michelangelo prevailed and was apprenticed (worked to learn a trade) at the age of thirteen to Domenico Ghirlandaio (1449–1494), the most fashionable painter in Florence at the time.

After a year Michelangelo’s apprenticeship was broken off. The boy was given access to the collection of ancient Roman sculpture of the ruler of Florence, Lorenzo de’ Medici (1449–1492). He dined with the family and was looked after by the retired sculptor who was in charge of the collection. This arrangement was quite unusual at the time.

Early works

Michelangelo’s earliest sculpture, the *Battle of the Centaurs* (mythological creatures that are part man and part horse), a stone work created when he was about seventeen, is regarded as remarkable for the simple, solid forms and squarish proportions of the figures, which add intensity to their violent interaction.

Soon after Lorenzo died in 1492, the Medici family fell from power and Michelangelo fled to Bologna. In 1494 he carved three saints for the church of San Domenico. They show dense forms, in contrast to the linear forms which were then dominant in sculpture.

Rome

After returning to Florence briefly, Michelangelo moved to Rome. There he carved a Bacchus for a banker's garden of ancient sculpture. This is Michelangelo's earliest surviving large-scale work, and his only sculpture meant to be viewed from all sides.

In 1498 the same banker commissioned Michelangelo to carve the Pietà now in St. Peter's. The term pietà refers to a type of image in which Mary supports the dead Christ across her knees. Larger than life size, the *Pietà* contains elements which contrast and reinforce each other: vertical and horizontal, cloth and skin, alive and dead, female and male.

Florence

On Michelangelo's return to Florence in 1501 he was recognized as the most talented sculptor of central Italy. He was commissioned to carve the *David* for the Florence Cathedral.

Michelangelo's *Battle of Cascina* was commissioned in 1504; several sketches still exist. The central scene shows a group of muscular soldiers climbing from a river where they had been swimming to answer a military alarm. This fusion of life with colossal grandeur henceforth was the special quality of Michelangelo's art.

From this time on, Michelangelo's work consisted mainly of very large projects that he never finished. He was unable to turn down the vast commissions of his great clients which appealed to his preference for the grand scale.

Pope Julius II (1443–1513) called Michelangelo to Rome in 1505 to design his tomb, which was to include about forty life-size statues. Michelangelo worked on the project off and on for the next forty years.

Sistine Chapel

In 1508 Pope Julius II commissioned Michelangelo to decorate the ceiling of the chief Vatican chapel, the Sistine. The traditional format of ceiling painting contained only single figures. Michelangelo introduced dramatic scenes and an original framing system, which was his earliest architectural design. The chief elements are twelve male and female prophets (the latter known as sibyls) and nine stories from Genesis.

Michelangelo stopped for some months halfway along. When he returned to the ceiling, his style underwent a shift toward a more forceful grandeur and a richer emotional tension than in any previous work. The images of the *Separation of Light and Darkness*, and *Ezekiel* illustrate this greater freedom and mobility.

After the ceiling was completed in 1512, Michelangelo returned to the tomb of Julius and carved a *Moses* and two *Slaves*. His models were the same physical types he used for the prophets and their attendants in the Sistine ceiling. Julius's death in 1513 halted the work on his tomb.

Pope Leo X, son of Lorenzo de' Medici, proposed a marble facade for the family

parish church of San Lorenzo in Florence to be decorated with statues by Michelangelo. After four years of quarrying and designing the project was canceled.

Medici Chapel

In 1520 Michelangelo was commissioned to execute the Medici Chapel for two young Medici dukes. It contains two tombs, each with an image of the deceased and two allegorical (symbolic) figures: *Day* and *Night* on one tomb, and *Morning* and *Evening* on the other.

A library, the Biblioteca Laurenziana, was built at the same time on the opposite side of San Lorenzo to house Pope Leo X's books. The entrance hall and staircase are some of Michelangelo's most astonishing architecture, with recessed columns resting on scroll brackets set halfway up the wall and corners stretched open rather than sealed.

Poetry

Michelangelo wrote many poems in the 1530s and 1540s. Approximately three hundred survive. The earlier poems are on the theme of Neoplatonic love (belief that the soul comes from a single undivided source to which it can unite again) and are full of logical contradictions and intricate images. The later poems are Christian. Their mood is penitent (being sorrow and regretful); and they are written in a simple, direct style.

Last Judgment

In 1534 Michelangelo left Florence for the last time, settling in Rome. The next ten years were mainly given over to painting for Pope Paul III (1468–1549). In 1536 Michelangelo

Michelangelo.

began the *Last Judgment*, for Pope Paul III, on the end wall of the Sistine Chapel. The design shows some angels pushing the damned down to hell on one side and some pulling up the saved on the other side. Both groups are directed by Christ. The flow of movement in the *Last Judgment* is slower than in Michelangelo's earlier work. During this time, Michelangelo also painted frescoes in the Pauline Chapel in the Vatican (1541–1545).

Works after 1545

Michelangelo devoted himself almost entirely to architecture and poetry after

1545, including rebuilding of the Capitol area, the Piazza del Campidoglio, for Pope Paul III. The pope also appointed Michelangelo to direct the work at St. Peter's in 1546. The enormous church was planned to be an equal-armed cross, with a huge central space beneath the dome. Secondary spaces and structures would produce a very active rhythm. By the time Michelangelo died, a considerable part of St. Peter's had been built in the form in which we know it.

Michelangelo's sculpture after 1545 was limited to two *Pietàs* that he executed for himself. The first one, begun in 1550 and left unfinished, was meant for his own tomb. He began the *Rondanini Pietà* in Milan in 1555, and he was working on it on February 12, 1564 when he took ill. He died six days later in Rome and was buried in Florence.

Michelangelo excelled in poetry, sculpture, painting, and architecture. He was the supreme master of representing the human body. His idealized and expressive works have been a major influence from his own time to ours.

HARVEY MILK

Born: May 22, 1930

Woodmere, New York

Died: November 27, 1978

San Francisco, California

American politician and civil rights activist

San Francisco city politician Harvey Milk helped open the door for gays and lesbians in the United States by championing civil rights for homosexuals (those sexually attracted to members of the same sex). Since Milk's murder in 1978, he has remained a symbol of activism. However, Milk was not a one-issue politician. For him, gay issues were merely one part of an overall human rights vision. During his tragically short political career, Milk battled for a wide range of social changes in such areas as education, public transportation, child care, and low-income housing.

As a boy

Harvey Bernard Milk was born on May 22, 1930, in Woodmere, New York. His grandfather, an immigrant from Lithuania, was the owner of a respected department store. Milk's father, William, was also involved in the retail clothing trade. By his early teens, Milk was already aware of his homosexuality, but he chose to keep it to himself. In high school, he was active in sports and was considered a class clown. He developed a passion for opera and would frequently go alone to the Metropolitan Opera House in New York City.

In 1947 Milk entered New York State College for Teachers in Albany, New York. After earning his degree in 1951, Milk joined

the navy. He served as a chief petty officer on a submarine rescue ship during the Korean War (1950–53), in which American forces aided the South Korean fight against North Korea. Eventually he reached the rank of junior lieutenant before his honorable discharge in 1955.

Looking for a career path

Returning to New York, Milk took a job teaching high school. By this time, Milk was living openly with his lover, Joe Campbell, though he still kept his homosexuality hidden from his family. After a couple of years, Milk left teaching. He tried his hand at a number of other occupations before landing a job with the Wall Street investment firm Bache and Company in 1963. At Bache, Milk discovered that he had a knack for finance and investment, and his rise through the corporate world was swift.

In spite of his lifestyle, Milk's political and social values were conservative through the early 1960s. As the decade progressed, however, his views gradually began to change. Milk's new lover, Jack Galen McKinley, worked in theater, and through him Milk became involved as well. He was particularly interested in the experimental work of director Tom O'Horgan (1926–). Since the presence of gays in the theater world was very visible, Milk began to come to terms with his homosexual identity. At the same time, his overall world view began to move away from the mainstream, or what is typical, and toward a more left-leaning one.

In San Francisco

In 1968 McKinley was hired as stage director for O'Horgan's San Francisco pro-

Harvey Milk.

Reproduced by permission of the Corbis Corporation.

duction of the musical *Hair*. Milk decided to move with McKinley to California, where he got a job in finance. Eventually, the conflict between his personal and professional lives became too much for Milk. During a 1970 protest of the American invasion of Cambodia, Milk burned his BankAmericard in front of a crowd of people. He was fired from his job later that day.

With his ties to mainstream life now broken, Milk returned to New York and theater work. By this time he was sporting long hair and a beard, looking more or less like an aging hippie. In 1972 he moved with his new partner, Scott Smith, back to San Francisco,

where the pair opened a camera shop on Castro Street, in the heart of what was becoming the city's gay neighborhood.

The Mayor of Castro Street

Milk entered the political arena for the first time in 1973 after being angered by the Watergate scandal. (Named after the building in which a burglary took place, Watergate involved political cover-ups that ultimately led to the resignation of President Richard Nixon [1913–1994].) Hoping to produce change through politics, Milk decided to run for a spot on the Board of Supervisors, San Francisco's city council. Using the gay community as his voting base, Milk sought to develop an alliance with other minorities in the city.

Of the thirty-two candidates in the race, Milk came in tenth. Though he lost the election, he gained enough support to put him on the city's political map. Because of his popularity in his own largely gay district, he became known as "the Mayor of Castro Street." Milk spent much of the next year preparing for his next election campaign, including taking on a more mainstream look. He also revitalized the Castro Village Association as a powerful civic organization and launched the popular Castro Street Fair. In addition, he conducted a voter registration drive that signed up two thousand new voters, and he began writing a newspaper column for the *Bay Area Reporter*.

Milk ran for supervisor again in 1975. Although he gained the support of several important labor unions, he lost again, this time placing seventh. In recognition of Milk's growing power base, however, newly elected Mayor George Moscone (1929–1978)

appointed Milk to the Board of Permit Appeals. This would become Milk's first public office. After just a few weeks, however, Milk announced his intention to run for the state assembly. That announcement led to his removal from his city post.

Milk ran against the Democratic party on the campaign theme "Harvey Milk versus the Machine." Milk lost yet again, by a mere four thousand votes. By this time, however, he had established a political machine of his own, the San Francisco Gay Democratic Club. In 1977, on his third try, Milk was finally elected to the Board of Supervisors, becoming the first openly gay elected official in the city's history.

Milk's agenda

Several key themes characterized Milk's successful campaign as well as his short career as a city official. One was his demand that government respond to the needs of individuals. Another was his ongoing emphasis on gay rights. A third theme was the fight to preserve the unique character of the city's neighborhoods.

As city supervisor, Milk was the driving force behind the passage of a gay-rights law that prohibited discrimination, or unequal treatment, in housing and employment based on sexual orientation. At his urging, the city announced a drive to hire more gay and lesbian police officers. He also started programs that benefited minorities, workers, and the elderly. Milk then gained national attention for his role in defeating a state senate proposal that would have prohibited gays and lesbians from teaching in public schools in California.

A life ended

On November 27, 1978, Milk and Mayor Moscone were shot to death in City Hall by Dan White (1946–1985), a former city supervisor who had quit the board to protest the passage of the city's gay rights law. In his trial for the killings, White's attorneys employed what came to be known as the Twinkie Defense. They claimed that the defendant had eaten so much junk food that his judgment had become impaired, or damaged, and that he had little control over his actions. White was convicted only of voluntary manslaughter, meaning he would receive the lightest sentence possible for a person who had admitted to intentionally killing someone. He served five years in prison before being paroled. On October 21, 1985, White committed suicide.

The outcome outraged homosexuals and their supporters across the United States. In San Francisco, riots erupted, resulting in hundreds of injuries, a dozen burned police cars, and about \$250,000 in property damage. The following night, thousands of people flocked to Castro Street to celebrate what would have been Milk's forty-ninth birthday.

Since his death, Milk has become a symbol for the gay community of both what has been achieved and what remains to be done. He has been immortalized in the names of the Harvey Milk Democratic Club (formerly the San Francisco Gay Democratic Club), Harvey Milk High School in New York, and San Francisco's annual Harvey Milk Memorial Parade. In 1985 the film *The Times of Harvey Milk* won the Academy Award for best documentary. Ten years later, *Harvey Milk*, an opera co-commissioned by the Houston Grand Opera, the New York City Opera, and the San Francisco Opera, opened in Houston.

JOHN STUART MILL

Born: May 20, 1806

London, England

Died: May 8, 1873

Avignon, France

English philosopher and economist

The English philosopher and economist (someone who studies the buying and selling of goods and services) John Stuart Mill was the most influential British thinker of the nineteenth century. He is known for his writings on logic and scientific method and for his many essays on social and political life.

Early years and education

John Stuart Mill was born the oldest of nine children on May 20, 1806, in London, England, to James and Harriet Burrow Mill. His father, originally trained as a minister, had come from Scotland to take up a career as a journalist. In 1808 James Mill began his lifelong association with Jeremy Bentham (1748–1832), the utilitarian (a philosophy

John Stuart Mill.

Courtesy of the Library of Congress.

saying that anything useful is positive and that to determine if an action is right, the usefulness of its consequences is the answer) philosopher. Mill shared the common belief of nineteenth-century psychologists that a child's character and performance are the result of the experiences and relationships he or she has as a child. With this view, he attempted to make his son into a philosopher by totally supervising his education.

John began the study of Greek at the age of three and took up Latin between his seventh and eighth years. From six to ten each morning the boy recited his lessons, and by the age of twelve he had mastered material

that was equal to a university degree in classics. He then took up the study of logic, mathematics, and political economy with the same energy. In addition to his own studies, Mill also tutored his brothers and sisters for three hours daily. Throughout his early years, Mill was treated as a younger equal by his father's friends, who were among the greatest intellectuals in England.

Only later did Mill realize that he never had a childhood. The most satisfying experiences he recalled from his boyhood were walks, music, reading *Robinson Crusoe*, and a year he spent in France. Before going abroad, Mill had never associated with anyone his own age. A year with Bentham's relatives in France gave young Mill a taste of normal family life and another language.

When he was sixteen, Mill began a debating society of utilitarians to discuss and make popular the ideas of his father, Bentham, and others. He also began to publish on various issues, writing nearly fifty articles and reviews before he was twenty. But in 1823, at his father's insistence, Mill cast off his interest in a political career and accepted a position at East India Company (a successful trading firm), where he remained for thirty-five years.

Adult life

Thomas Carlyle (1795–1881) once described Mill's life as "the autobiography of a steam engine." Nonetheless, in 1826 Mill underwent a mental crisis. He felt empty of satisfaction even with all of his knowledge. Mill eventually overcame his depression by opening himself to poetry. When he was twenty-five, he met Harriet Taylor, and she became the most important influence of his

life. Although she was married, they maintained a close relationship for twenty years, eventually marrying a few years after her husband's death.

“System of logic”

The main purpose of Mill's philosophic works was to repair the British empirical (experimental) tradition extending from English philosopher John Locke (1632–1704). He overcame much of the confusion of Locke by distinguishing between the connotation, or understood meaning, of terms and the denotation, or real meaning. Mill understood logic as knowledge by inference (the act of transferring a meaning from one thing to another).

Mill's logic concludes with an analysis of the methods of the social sciences. However, the variety of conditioning factors and the lack of control and repeatability of experiments weaken the effectiveness of both the experimental method and deductive (coming to a conclusion by reasoning) attempts. The proper method of the social sciences is a mixture: deductions from the inferential understandings provided by both psychology (study of the mind) and sociology (study of society and groups).

Mill's ideas

Mill suggested that there are higher pleasures and that men should be educated to these higher dreams, for a democratic government based on agreement is only as good as the education and tolerance of its citizenry. This argument is put forth in Mill's famous essay, “On Liberty.” Therein the classic formula of liberalism (political philosophy believing in progress, individual freedom, and protection of rights) is stated: the state

exists for man, and hence the only justifiable interference upon personal liberty is “self-protection.”

The great sadness of Mill's later years was the unexpected death of his wife in 1858. He took a house in Avignon, France, in order to be near her grave and divided his time between there and London. He won election to the House of Commons in 1865, although he refused to campaign. He died on May 8, 1873.

EDNA ST. VINCENT MILLAY

Born: February 22, 1892

Rockland, Maine

Died: October 19, 1950

Austerlitz, New York

American poet

Edna St. Vincent Millay was an American lyric (expressing direct and personal feeling) poet whose personal life and verse reflected the attitudes of rebellious youth during the 1920s.

Edna St. Vincent Millay.
Courtesy of the Library of Congress.

Early life and education

Edna St. Vincent Millay was born in Rockland, Maine, on February 22, 1892, one of Henry Tollman Millay and Cora Buzzelle Millay's three daughters. Her father worked as a teacher. Edna's parents divorced when she was eight, and she moved with her mother and sisters to Camden, Maine. Her mother worked as a nurse to support the family. She encouraged her daughters to be independent and to appreciate books and music. Edna studied piano and considered a music career, but when one of her first poems appeared in *St. Nicholas* magazine, she decided to become a writer. "Renascence," a

long poem written when she was nineteen, appeared in a collection called *The Lyric Year* (1912) and remains a favorite. A wealthy friend, impressed with Edna's talent, helped her attend Vassar College in New York.

Begins writing career

Following her graduation in 1917, Millay settled in New York's Greenwich Village and began to support herself by writing. Her first volume, *Renascence and Other Poems* (1917), brought her some attention. She also wrote short stories under the pseudonym (false writing name) Nancy Boyd. *A Few Figs from Thistles* appeared in 1920. In 1921 she issued *Second April* and three short plays, one of which, *Aria da Capo*, is a delicate but effective satire (making fun of) on war.

In 1923 Millay published *The Harp Weaver and Other Poems*, which won the Pulitzer Prize. She also married Eugen Jan Boissevain, a wealthy Dutchman. In 1925 they bought a farm near Austerlitz, New York. Millay participated in the defense of Nicola Sacco (1891–1927) and Bartolomeo Vanzetti (1888–1927), two Italian anarchists (those who rebel against any authority or ruling power) who had been accused of murdering two men in a Massachusetts robbery. Many people believed that the two men were charged only because they were foreigners and because of their political beliefs. In 1925 Millay was hired to write an opera with composer Deems Taylor (1885–1966); *The King's Henchman* (1927) was the most successful American opera up to that time. That year, after Sacco and Vanzetti were sentenced to death, she wrote the poem, "Justice Denied in Massachusetts," and also contributed to *Fear*, a pamphlet on the case.

Addresses social topics

Millay issued *Buck in the Snow* (1928), *Fatal Interview* (1931), and *Wine from These Grapes* (1934). She tried a dramatic dialogue on the state of the world in *Conversation at Midnight* (1937), but the subject was beyond her grasp. She returned to the lyric mode in *Huntsman, What Quarry* (1939). The careless expression of her outrage at fascism (a political movement that places nation and race above the individual and supports a government run by a single leader) in *Make Bright the Arrows* (1940) took away from its power. *The Murder of Lidice* (1942) was written in response to the destruction of a Czechoslovakian town by the Nazis (members of the controlling power in Germany from 1933 until 1945). Then Millay began to lose her audience; *Collected Sonnets* (1941) and *Collected Lyrics* (1943) did not win it back.

Millay's last years were dogged by illness and loss. Many of her friends died, and her husband's income disappeared when the Nazis invaded Holland during World War II (1939–45; a war in which Germany, Italy, and Japan fought against Great Britain, France, the Soviet Union, and the United States). In 1944 a nervous breakdown kept her in the hospital for several months. Her husband died in 1949; on October 19, 1950, she followed him. Some of her last verse appeared after her death in *Mine the Harvest* (1954).

Edna St. Vincent Millay's poems' included such topics as sex, the liberated (freed from traditional roles) woman, and social justice. Though she wrote in traditional forms, her subject matter; her mixed tone of unconcerned calm, courage, and extreme force; and her lyric gifts were highly appreciated in her time.

ARTHUR MILLER

Born: October 17, 1915

New York, New York

American dramatist, novelist, and screenwriter

Best known for his play *Death of a Salesman*, American playwright, novelist, and screenwriter Arthur Miller is considered one of the major dramatists of twentieth-century American theater.

Early years

Arthur Miller was born on October 17, 1915, in New York City, the second of Isidore and Augusta Barnett Miller's three children. His father had come to the United States from Austria-Hungary and ran a small coat-manufacturing business. His mother, a native of New York, had been a public school teacher.

Arthur Miller.

Reproduced by permission of AP/Wide World Photos.

Miller was only an average student. He was much more fond of playing sports than doing his schoolwork. Only after graduating from high school in 1932 did Miller think about becoming a writer, when he read Russian novelist Fyodor Dostoyevsky's (1821–1881) *The Brothers Karamazov*. Miller attended City College in New York for two weeks, then worked briefly with his father and in an auto-parts warehouse to earn money to attend the University of Michigan. He enrolled there two years later, continuing to work as a dishwasher and as a night editor at a newspaper to help pay his expenses while he studied drama. He graduated in 1938, having won several awards for playwriting.

Miller returned to New York City to a variety of jobs, including writing for the Federal Theater Project, a government-sponsored program that ended before any of his work could be produced. Because of an old football injury, he was rejected for military service, but he was hired to tour army camps to collect material for a movie, *The Story of G. I. Joe*. His notes from these tours were published as *Situation Normal* (1944). That same year the Broadway production of his play *The Man Who Had All the Luck* opened, closing after four performances. In 1945 his novel *Focus*, an attack on anti-Semitism (the hatred of Jewish people), appeared.

Three successful plays

Miller's career blossomed with the opening of *All My Sons* on Broadway in 1947. The play, a tragedy (a drama having a sad conclusion), won three prizes and fascinated audiences across the country. Then *Death of a Salesman* (1949) brought Miller the Pulitzer Prize for drama, international fame, and an estimated income of two million dollars. The words of its hero, Willy Loman, have been heard in at least seventeen languages as well as on movie screens everywhere.

By the time of Miller's third Broadway play, *The Crucible* (1953), audiences were ready to accept his belief that "a poetic drama rooted in American speech and manners" was the only way to produce a tragedy out of the common man's life. The play was set in Salem, Massachusetts, in 1692, a time when many people were accused of being witches and were burned alive. Miller's play pointed out how similar those events were to Senator Joseph McCarthy's (1909–1957) investigations of anti-American activities during the

early 1950s, which led to wild accusations against many public figures. Miller himself was called before the House Committee on Un-American Activities in June 1956 and was asked to give the names of guilty parties. He stated, "My conscience will not permit me to use the name of another person and bring trouble to him." He was convicted of contempt of (lack of respect for) Congress, but the conviction was reversed in 1958.

Hit-or-miss efforts

Two of Miller's one-act plays, *A View from the Bridge* and *A Memory of Two Mondays* (1955), were social dramas focused on the inner life of working men; neither had the power of *Death of a Salesman*. Nor did his film script, *The Misfits* (1961). His next play, *After the Fall* (1964), was based on his own life. His second wife, actress Marilyn Monroe (1926–1962), was the model for one of the characters. *Incident at Vichy* (1965), a long, one-act play based on a true story set in France during World War II (1939–45; when Germany, Italy, and Japan battled France, Great Britain, the Soviet Union, and the United States), examined the nature of guilt and the depth of human hatred. In *The Price* (1968) Miller returned to domestic drama in his portrayal of a tight, intense struggle between two brothers, almost strangers to each other, brought together by their father's death. It is Miller at the height of his powers, cementing his position as a major American dramatist.

But *The Price* proved to be Miller's last major Broadway success. His next work, *The Creation of the World and Other Business*, was a series of comic sketches first produced on Broadway in 1972. It closed after only twenty performances. All of Miller's works after that

premiered outside of New York. Miller staged the musical *Up From Paradise* (1974) at the University of Michigan. Another play, *The Archbishop's Ceiling*, was presented in 1977 at the Kennedy Center in Washington, D.C.

In the 1980s Miller produced a number of short pieces. *The American Clock* was based on Studs Terkel's (1912–) history of the Great Depression (a slump in the country's system of producing, distributing, and using goods and services that led to almost half of the industrial workers in the country losing their jobs during the 1930s). *Elegy for a Lady* and *Some Kind of Story* were two one-act plays that were staged together in 1982. Miller's *Danger, Memory!* was composed of the short pieces *I Can't Remember Anything* and *Clara*. All of these later plays have been regarded by critics as minor works. In the mid-1990s Miller adapted *The Crucible* for a film version starring Daniel Day-Lewis and Joan Allen.

Later years

Despite the absence of any major successes since the mid-1960s, Miller seems secure in his reputation as a major figure in American drama. In addition to his Pulitzer Prize in 1949, his awards include the Theatre Guild National Prize, 1944; Antoinette Perry (Tony) Award (given for achievement in the theater), 1947 and 1953; Emmy Award (given for achievement in television broadcasting), 1967; George Foster Peabody Award, 1981; John F. Kennedy Award for Lifetime Achievement, 1984; Dorothy and Lillian Gish Prize, 1999; National Book Foundation lifetime achievement award, 2001; New York City College Alumni Association medal for artistic devotion to New York, 2001; and the Japan Art Association lifetime achievement award, 2001.

HENRY MILLER

Born: December 26, 1891

New York, New York

Died: June 7, 1980

Pacific Palisades, California

American writer

American author Henry Miller was a major force in literature in the late 1950s, largely because his two most important novels, banned from publication and sale in the United States for many years, tested federal laws concerning art and pornography (material intended to cause sexual excitement).

Early years

Henry Miller was born on December 26, 1891, in New York, New York. His father was a tailor. From an early age he rebelled against his parents' devotion to work and a "respectable" life. In *Black Spring* (1936; United States pub-

lication, 1963), Miller wrote that "I was born in the street and raised in the street.... In the street you learn what human beings really are." Miller liked to read from an early age, finishing many adventure stories as well as classics of literature. He was an excellent student in high school and enrolled at the City College of New York, only to leave after two months. From 1909 to 1924 he tried different jobs, including working for a cement company, assisting his father at a tailor shop, and sorting mail for the Post Office. While in the messenger department of Western Union, he started writing a novel.

Goes to France to write

Throughout this period Miller had a troubled personal life, including two unsuccessful marriages (throughout his life he married five women and divorced all of them). Determined to become a writer, Miller went to Paris, France, where he remained for nearly ten years with very little money. In 1934 he composed *Tropic of Cancer* (published in the United States in 1961), a loosely constructed autobiographical (based on his own life) novel describing his struggles during his first years in Paris. Famous for its striking descriptions of real life, it won praise from other writers such as T. S. Eliot (1888–1965) and Ezra Pound (1885–1972). Many were outraged by the book's sexual passages, however, and Miller had to go to court to lift a ban on his work. The publicity helped the book become a best-seller, although critics continued to argue over its value.

Black Spring and *Tropic of Capricorn* (1939; United States publication, 1962) are similar in style and feeling to *Tropic of Cancer*, drawing from the experiences of Miller's boy-

hood in Brooklyn, New York, and his early years overseas. In 1939 Miller visited his friend, the British novelist Lawrence Durrell (1912–1990), in Greece. *The Colossus of Maroussi* (1941), an account of his adventures with the natives of the Greek islands and one of the finest modern travel books, resulted.

Back in America

Returning to the United States in 1940, Miller settled permanently in Big Sur, on the Pacific coast of California. His sharp and often hilarious criticisms of America are recorded in *The Air-conditioned Nightmare* (1945) and *Remember to Remember* (1947). *The Time of the Assassins* (1956), a thoughtful study of the French poet Arthur Rimbaud (1854–1891), is a statement of Miller's artistic beliefs. *Big Sur and the Oranges of Hieronymus Bosch* (1958) deals with Miller's California friends.

Miller's major fiction of this period was the massive three-volume work *The Rosy Crucifixion*, which included *Sexus* (1949), *Plexus* (1953), and *Nexus* (1960). These contain retellings of his earlier adventures but lack the violent language of his earlier works. Miller's correspondence with Lawrence Durrell was published in 1962, and his letters to writer Anaïs Nin (1903–1977) were published in 1965. His *The World of Lawrence: A Passionate Appreciation* (1980) is about the life and career of writer D. H. Lawrence (1885–1930). *Opus Pistorum* (1984) is a novel thought to have been written by Miller in the early 1940s when he needed money. Most critics consider the work to be pure pornography, and some question whether Miller was the actual author.

Henry Miller.

Courtesy of the Library of Congress.

Later years

In Miller's later years he was admired mainly for his role as spokesman and thinker. Criticizing the empty materialism (focus on the acquiring of personal possessions) of modern existence, he called for a new religion of body and spirit based upon the ideas of the writers Friedrich Nietzsche (1844–1900), Walt Whitman (1819–1892), and D. H. Lawrence. Miller's novels, despite shocking material and offensive language, express deep feeling. Their freedom of language and subject also helped lead the way for Beat Generation (intellectuals who also scorned the values of middle-class society) writers such as Jack

Kerouac (1922–1969) and Allen Ginsberg (1926–1997). Miller lived his final years alone pursuing his lifelong interest in watercolor painting. He died on June 7, 1980, in Pacific Palisades, California.

SLOBODAN MILOSEVIC

Born: August 20, 1941

Pozarevac, Yugoslavia

Yugoslav president and Serbian political leader

Slobodan Milosevic was president of Serbia (a republic, or member state, of Yugoslavia) from 1989 to 1997 and president of Yugoslavia from 1997 to 2000. In 2001 he was sent to stand trial at the international war crimes tribunal (court) in The Hague, Netherlands, for his actions during the civil war that occurred in Yugoslavia during the 1990s.

The young Milosevic

Slobodan Milosevic was born on August 20, 1941, in Pozarevac, a small town near Belgrade, Serbia, the capital of Yugoslavia.

Slobodan was the second of two sons of Svetozar and Stanislava Milosevic. His ancestors belonged to the Vasojevici clan from Montenegro, another republic of Yugoslavia. His father finished Eastern Orthodox seminary (a place where people study to be priests) in Cetinje, Montenegro, and then studied at the School of Theology in Belgrade. His mother was a teacher in Pozarevac. People remember her as a strict, hardworking woman and a devoted Communist (a person who believes that goods should be owned and equally distributed by the government). When Slobodan was young, his parents separated and his father went to live in Montenegro. It is believed that his parents both eventually took their own lives—his father in 1962 and his mother in 1973.

Milosevic finished his elementary and high school education in Pozarevac. According to his teachers and classmates, young Milosevic was an outstanding high school student, always attentive and always neatly dressed. Although quiet and solitary, he was politically active and published several of his writings in the local high school journal. While still in high school, Milosevic met his future wife, Mirjana (Mira) Markovic, whose family ranked among the most prominent Communists in Serbia. Her father was a hero from World War II (1939–45; a war fought between the Axis [Germany, Italy, and Japan] and the Allies [the United States, Britain, China and other nations]). Her uncle later became one of the leading politicians in post-war Serbia, and her aunt was a personal secretary of Josip Broz Tito (1892–1980) who was the Communist president of Yugoslavia from 1953 to 1980. The young couple's friends did not doubt that the love between Mirjana and Slobodan was sincere and gen-

uine—theirs was a bond between two similar souls. They raised two children.

A career in the making

In 1960 Milosevic was a law student at the University of Belgrade. He was an excellent student who was active in the university section of the League of Communists (the official name for the Communist Party), where he met Ivan Stambolic, a nephew of one of the most powerful Serbian Communist leaders. Many believe that it was Stambolic who elevated the political career of Milosevic.

In 1964, after graduating from the university, Milosevic was appointed as an economic adviser and a coordinator of the information service in the government of Belgrade. In 1968 he became a deputy director of a state-owned gas company, Tehnogas. After Stambolic left Tehnogas in 1973 and became the prime minister of Serbia, Milosevic rose to the post of director. Five years later he became president of the powerful Belgrade bank Beobanka. In 1982 he became a member of the collective presidency of the League of Communists of Serbia, and two years later a chief of the City of Belgrade Party Organization. The collective presidency of the League of Communists of Serbia elected Milosevic as its president in 1986.

A defining moment

On April 24, 1987, Milosevic visited Kosovo Polje, a suburb of the capital of the self-governing Serbian province of Kosovo, and attempted to calm the group of Serbs and Montenegrins who were protesting the continuous mistreatment by the Albanian majority. When an excited crowd tried to enter the

Slobodan Milosevic.

Reproduced by permission of Archive Photos, Inc.

building to speak directly to Milosevic, they were beaten back by the local police. Milosevic strode out and shouted to the crowd: “No one has the right to beat you!” These simple words changed the structure of Serbian politics. Shortly after, in a series of heated sessions of the League of Communists of Serbia, Milosevic succeeded in removing Stambolic and his associates from the Serbian political arena. In 1989 Milosevic became president of Serbia.

The disagreement among Serbia’s Communists over the Kosovo province shook the already crumbling Yugoslavia. After Serbia took back authority over the self-governing provinces of Kosovo and Vojvodina, the

prospect that Serbia might dominate all of Yugoslavia fueled nationalism (a patriotic desire for one's people to have its own nation) in the Yugoslav republics of Slovenia and Croatia and gave a boost to secessionist movements (or movements to withdraw from a nation). Following the collapse of the League of Communists of Yugoslavia in 1990, multiparty elections were held in each of the six Yugoslav republics. While Milosevic and his Socialist Party retained power in Serbia, forces that openly desired secession from Yugoslavia came into power in almost all other republics (with the exception of Montenegro).

The nationalist emotions that spread throughout Yugoslavia inspired ugly memories among Serbs who had been subjected to genocide (the intentional destruction of a people by mass murder) during World War II. Milosevic, who had already established himself as the leading champion of Serbian rights, was the natural ally to more than two million Serbs living outside the borders of Serbia. When the talks among the various Yugoslav republics were called off in 1991, the violent breakup of Yugoslavia was near.

Civil war

The collapse of Yugoslavia and the resulting civil war among the breakaway nations brought new attention to Milosevic. In the fighting that began in April 1992, Milosevic avoided personal involvement, leaving Serbian military groups to carry out attacks against the newly established nations of Croatia and Bosnia-Herzegovina. Nevertheless, many critics, particularly in the West, portrayed him as a merciless tyrant who wanted to create a greater Serbia. At the same time,

Milosevic and his Socialist Party appeared to be secure in their Belgrade headquarters.

By late 1995 United Nation-imposed sanctions had destroyed the Serbian economy, and Milosevic agreed to a peace plan during talks at an air base in Dayton, Ohio. He attempted to rebuild his image, since he was thought by many to be the force behind war crimes and millions of deaths. Milosevic began making strides at winning a more favorable public opinion, calling for tolerance, or respect, among ethnic groups and portraying himself as a heroic and peace-promoting defender of Serbs. Despite the near-40 percent unemployment and the overall decline in quality of life among Serbs, he was able to retain supporters.

Losing hold on power

In 1997 Milosevic's second and final term as president was at an end, but he hoped to continue his presidency by using a legal trick. On July 23, 1997, he changed his title from president of Serbia to president of the Yugoslav federation (which now consisted only of Serbia and its junior partner, Montenegro) in an attempt to retain his term. Then, in 1999, Milosevic refused to withdraw troops who were trying to stop an independence movement in Kosovo. In retaliation, the North Atlantic Treaty Organization (NATO), led by the United States, bombed Serbia for two and a half months. Serbian forces, nonetheless, caused a significant amount of suffering in Kosovo.

On July 7, 2000, Yugoslavia's federal parliament enacted changes to the country's constitution that would allow Milosevic to serve two more four-year terms. However, Milosevic resigned in October 2000 because of the

massive popular revolt against him. Six months later, Milosovic was arrested by police after he threatened to kill himself, his wife, and his daughter. Only two months later, in late June 2001, he was sent to The Hague to be tried for war crimes, including genocide.

JOHN MILTON

Born: December 9, 1608

London, England

Died: November 8, 1674

London, England

English poet and essayist

The English poet John Milton was a champion of liberty. As a Protestant, he believed that the individual reader should interpret the Bible. He is chiefly famous for his epic (a long poem centered around a legendary hero) poem *Paradise Lost* and for his defense of uncensored (not checked for materials that may be harmful) publication.

Background and education

John Milton was born on December 9, 1608, in London, England. The future poet's father, John Milton, Sr., was a scrivener (a person who draws up deeds and wills). About 1600 he married Sara Jeffrey, the wealthy daughter of a merchant-tailor. Three of their children survived infancy: Anne, John, and Christopher.

The young Milton was known for his devotion to his studies, and his early interest in poetry. From his father, who was an amateur composer (a writer of music), young John developed the love of music, which later spread through his poetry. After private tutoring, he entered St. Paul's School in about 1620. Admitted to Christ's College at the age of fifteen, he intended to become a priest in the Church of England. Because of a disagreement with his tutor, he was rusticated (temporarily expelled) in 1626. Back at Cambridge about April 1626, Milton was assigned a different tutor and resumed the study of logic, ethics, Greek, Latin, and Hebrew. He composed Latin poems and epigrams (short poems dealing pointedly with a single thought or event and often ending with a clever turn of thought).

In 1628 Milton wrote his first major English poem, *On the Death of a Fair Infant, Dying of the Cough*, about the death of his sister's baby. A year later he wrote *On the Morning of Christ's Nativity*, celebrating the harmonizing power of divine love.

Milton, in one of his college orations (public speeches), broke with the usual practice of speaking in Latin by delivering English verse, beginning "Hail native language." Thereafter, he wrote Latin verse occasionally and a series of sonnets (poems of fourteen

John Milton.

Courtesy of the Library of Congress.

lines with a specific rhyming pattern) in Italian, but he composed increasingly in English.

The graceful thirties

After receiving bachelor of arts and master of arts degrees in 1629 and 1632, Milton lived in his family's suburban home in Hammersmith, England, and then at their country estate in Horton, Buckinghamshire, England. He continued studies in theology, history, mathematics, and literature, and participated in social and cultural life in London and the country. At this time he wrote sonnets, lyrics, and *A Mask* (better known as *Comus*; a mixture of song, dance, pageantry and poetry).

Milton's themes were both particular and universal. In *Lycidas* (1637) he deals with why God allows the good to die young. In 1639, when he learned that a friend had died, he penned a moving Latin elegy (poetry for the dead), finding solace in Christian hope. By this time Milton had abandoned the idea of entering the ministry. He was, however, dedicated to making the Church of England more Protestant (non-Catholic).

In 1638 and 1639 Milton toured France and Italy. His good looks, enthusiasm, and his ability to speak many languages helped him to enter polite society abroad. He intended also to go to Greece, but news of the growing political and religious crisis in England led him to return to London.

Crucial decades, 1640–1660

It was by writing prose that Milton found opportunity to serve his God and country. There was a civil war in England that lasted from 1642 to 1648. King Charles I (1600–1649), who was Catholic, was opposed by a large number of his subjects, who were Puritan Protestants. King Charles was defeated and executed. In 1641 and 1642 Milton poured out tracts (leaflets) opposing the control over religion held by the Catholic bishops. He felt their powers were based on man-made traditions, self-interest, and a combination of ignorance, superstition, and deliberate lies.

In 1644 Milton's *Of Education* dealt with another kind of domestic freedom: how to develop discipline, reasonableness, broad culture, all-round ability, and independence of judgment in schoolboys. The same year saw *Areopagitica*, his defense of man's right to free speech and discussion as the best means of

advancing truth. As the civil war ended, Milton turned to condemning royal tyranny (the abuse of power). *The Tenure of Kings and Magistrates* (1649) argued that men have a natural right to freedom and that contracts they make with rulers are voluntary and can be ended. Soon after its publication Milton began a decade as the revolutionary government's secretary for foreign tongues. His chief duty was to translate state letters into Latin. For some years, however, Milton had been losing his eyesight, and by early 1652 he was totally blind.

Milton had married Mary Powell in May 1642. In 1656, four years after his first wife's death, Milton married Kathrine Woodcock. Two years later she died after giving birth to a child, and he tenderly memorialized her in a sonnet, *To my late departed Saint*. In 1663 he married Elizabeth Minshell.

Milton heroically persisted despite his misfortunes. During the crisis preceding restoration of the monarchy he wrote several tracts. In *A Treatise of Civil Power* (1659) he again urged toleration and separation of Church and state. *Ready and Easy Way* (1660) argued for preservation of a republic, a government in which citizens hold power and vote to elect officials as their representatives in the government.

Triumph in defeat

When Charles II, son of the executed Charles I, regained the throne in 1660, Milton was in danger for supporting the overthrow of the monarchy. Milton was harassed and imprisoned and several of his books were burned. However, he was included in a general pardon.

Paradise Lost, the epic published in 1667, is inspired by the Bible story of the Creation,

the fall of Adam and Eve, the rebellion of Satan against God, and Satan being cast out from heaven. In it Milton tried to convey some insight into God's wisdom and providence, but he did not intend it to be taken literally. *Paradise Lost* is generally regarded as the greatest epic poem in the English language. In 1671 its sequel, *Paradise Regained*, appeared in one volume with *Samson Agonistes*. *Paradise Regained* treats the rejection by Jesus of Satan's temptations. Its central point is that the true hero conquers not by force but by humility and faith in God. *Samson Agonistes* deals with the theme of temptation, dramatizing how the Hebrew strong man yielded to passion and seeming self-interest.

In 1673 Milton reentered public controversy (open to dispute) with *Of True Religion*, a brief defense of Protestantism. Before his death he was planning to publish writings that appeared posthumously (after death): his Latin state papers (1676) and a short history of Moscovia (1682). In 1694 his nephew Edward Phillips published a life of his uncle with an English translation of the state papers.

In the early nineteenth century the Latin manuscript of Milton's *Christian Doctrine* was discovered and translated (1825). In it he systematically set out to free the Scriptures from misinterpretation by discovering what the Bible itself said on such matters as fate, angels, and faith.

Reputation and influence

Milton influenced many writers. Some, like John Dryden (1631–1700), admired his work and used it as the basis for their own writing. Others, including Alexander Pope (1688–1744), poked fun at it. Still others, such as Samuel Johnson (1709–1784),

admitted the worth of Milton's work but disagreed with his religious and political views.

In general, eighteenth-century poets praised him for possessing outstanding spiritual, intellectual, and moral worth. William Blake (1757–1827) and Percy Bysshe Shelley (1792–1822) praised his Satan as a romantic rebel. Samuel Taylor Coleridge (1772–1834) praised Milton's artistry and depth. In the 1920s, T. S. Eliot (1888–1965) criticized Milton's verse chiefly because of its influence. However, since about 1930, Milton has again been highly respected for his work.

John Milton died in London on November 8, 1674.

JOAN MIRÓ

Born: April 20, 1893

Montroig, Spain

Died: December 25, 1983

Palma de Majorca, Spain

Spanish painter

The Spanish painter Joan Miró was one of the first surrealists (artists who created art that emphasized fantastic imagery who were part of a movement called surrealism that began in the early twentieth century). Miró developed a highly personalized visual language that originated from prehistoric and natural sources.

Early life

Joan Miró was born the first son of Michel Miró Adziras and Dolores Ferra on April 20, 1893, in Montroig near Barcelona, Spain. He came from a long line of hard-working craftsmen, and his father also worked as a goldsmith and a watchmaker. Although Miró did poorly at school, he began drawing regularly at the age of eight. (His sketchbooks of 1905 contain nature studies from Tarragona and Palma de Majorca, both areas in Spain). In 1907 he attended the Lonja School of Fine Arts in Barcelona where he received encouragement from his teachers. After a brief period working as a clerk, he attended the Gali School of Art in 1912, also in Barcelona.

Career begins

After Miró completed his artistic education in Barcelona, he produced portraits and landscapes in the Fauve manner, a style of painting popular around 1900 that emphasized brilliant and aggressive colors. He had his first one-man show in Barcelona in 1918 and later that year he became a member of the Agrupacio Courbet, to which the ceramist Joseph Llorenz Artigas belonged.

In 1919 Miró made his first trip to Paris, France, and thereafter he spent the winters in Paris and the summers in Montroig. He met

members of the Dada group, an artistic and literary movement which sought to expand the boundaries of conventional (having to do with the common and the unoriginal) art. His first one-man show in Paris was held in 1921 and his paintings of this period reflect cubist (having to do with an artistic movement in the early twentieth century which used geometric shapes) influences. His painting, *Montroig (The Olive Grove)*; (1919), for example, has a frontal, geometric pattern greatly influenced by cubism.

The Tilled Field (1923–1924) marked the turning point in Miró's art toward a personal style. In the midst of a landscape with animals and delicately drawn objects are a large ear and eye; thus the person of the painter comes into the picture. The change in his art was furthered by his encounter with the works of Paul Klee (1879–1940), Wassily Kandinsky (1866–1944), and Jean Arp (1887–1966).

Miró's message

Miró's aim was to rediscover the sources of human feeling, to create poetry by way of painting, using a vocabulary of signs and symbols, plastic metaphors (an implied similarity between two different things), and dream images to express definite themes. He had a genuine sense of humor and a lively wit, which also characterized his art. His chief consideration was social, to get close to the great masses of humanity, and he was deeply convinced that art can make a genuine appeal only when returning to the roots of experience. In this respect Miró's attitude can be compared to that of Klee.

Miró was connected with the surrealists from 1924 to 1930. Surrealism was a source of inspiration to him, and he made use of its

Joan Miró.

Reproduced by permission of Archive Photos, Inc.

methods; however, he never accepted any surrealist "doctrine," or teachings. Rather, his art, like Klee's, seems more connected to modern fantastic art. Under the impact of surrealism Miró painted the *Harlequin's Carnival* (1924–1925) with its frantic movement of semiabstract (having both recognizable and unrecognizable qualities) forms. In 1926 he worked together with Max Ernst (1891–1976) on the sets and costumes for Sergei Diaghilev's ballet *Roméo et Juliette*.

Larger works and legacy

In 1936 Miró fled to Paris during the Spanish Civil War (1936–39; a revolt against

the conservative Republican government). The following year he created a large mural, the *Reaper*, for the Spanish Pavilion at the International Exposition in Paris. His work began to achieve great power through increased simplicity, intensified color, and abstraction, as in the *Bullfight* (1945), *Woman and Bird in Moonlight* (1949), and *Painting* (1953). He was awarded the Grand Prix International at the Venice Biennale for his graphic work.

Miró's most famous monumental works are the two ceramic walls, *Night and Day* (1957–59), for the United Nations Educational, Scientific and Cultural Organization (UNESCO) building in Paris; the mural painting (1950) and the ceramic mural (1960) for Harvard University in Cambridge, Massachusetts; and the ceramic mural (1967) for the Guggenheim Museum in New York City. In 1975 Miró demonstrated his devotion to his native country with the donation of the Miró Foundation to the city of Barcelona, Spain. The building, which houses his works and the exhibitions of other artists, was designed by the artist's great friend, Josep Lluís Sert. One exhibition room was dedicated to the showing of works by young artists who had not yet been discovered by the public. Miró died in Palma de Majorca, Spain, on December 25, 1983, at the age of ninety.

Miró enjoyed international acclaim during his long and productive career. He was one of the many outstanding Spaniards—including Pablo Picasso (1881–1973), Juan Gris (1887–1927), Salvador Dalí (1904–1989), and Francis Picabia—who, by belonging to the School of Paris, helped to establish the high esteem in which it was held during

the first half of the twentieth century. And like many of those other artists, Miró continued to energetically produce his art and to experiment with form and subject long after the years of his initial celebrity had passed.

MOLIÈRE

Born: January 15, 1622

Paris, France

Died: February 17, 1673

Paris, France

French dramatist, writer, and actor

The French dramatist Molière was the master of French comedy. His plays often attacked hypocrisy (pretending to possess qualities one does not actually have). He also directed, acted, and managed theater groups.

Early life

Molière was born Jean Baptiste Poquelin in Paris, France, on January 15, 1622. His father was a successful upholsterer (one who puts soft coverings on chairs) who held the post of official furnisher at the royal court.

Molière had been attracted to the theater since childhood. When Tiberio Fiorelli (called Scaramouche), an Italian actor, came to Paris in 1640, Molière struck up a friendship with him. Molière was educated at the Collège de Clermont, a Jesuit (Catholic order devoted to educational work) institution. There he received a solid classical background, and he may have known some future freethinkers, such as the dramatist Cyrano de Bergerac (1619–1655). After finishing his secondary education, Molière studied law briefly and was allowed to practice in 1641.

Chooses career in theater

Molière was expected to take over the post his father held, but in 1643 he decided to devote himself to the theater. He had met a young actress, Madeleine Béjart, with whom he was to be associated until her death in 1672. Since the theater life was not considered very respectable, he assumed the name “Molière” in order to spare embarrassment to his family. He joined a troupe known as the Illustre Théâtre that included Béjart and her family. By 1644, having served two prison terms as a result of the company’s debts, Molière joined another company with the Béjarts and toured all over France for the next thirteen years. In 1650 Molière became the head of the troupe, and he managed to secure the patronage (support) of the Prince of Conti.

Although little evidence of Molière’s travels is available, it is certain that he and his players learned much while performing in the French provinces. The short, stocky Molière was a hard worker. He frequently acted, sometimes under a clown’s mask, with the troupe he managed. When the company was called to give a performance before Louis

Molière.

XIV (1638–1715) in 1658, it was Molière’s comedy, *Le Docteur amoureux*, that most amused the king. The king’s brother became patron (supporter) of the troupe, and Molière returned to Paris, the city of his birth.

Success and criticism

In December 1662 Molière presented a comedy, *L’École des femmes*, before the king. It was to be his greatest success. The play centers around Arnolphe, a middle-class man who chooses a child for his bride, whom he then raises in total ignorance. A young rival, unaware of Arnolphe’s identity, tells him exactly how he plans to steal the girl from

under his nose. The play caused a huge protest, known as the “Quarrel of *L'École des femmes*.” Molière’s enemies, jealous of the king’s favor toward him, attacked him as immoral and claimed he had stolen the story from another writer. Molière chose to answer his enemies in the form of a play. His *Critique de l'École des femmes*, presented in June 1663, included a discussion on stage of both the critics and the criticisms. The “Quarrel” served to establish comedy as an accepted form of literature.

In May 1664 Molière was invited to perform *Tartuffe ou l'Imposteur*, an attack on religious hypocrisy, for Louis XIV at Versailles, France. The play angered the Society of the Holy Sacrament, a powerful religious group, and for five long years Molière struggled without success for the right to perform his play. Finally, in 1669, the power of the Society had lessened, and *Tartuffe* was revived with great success at the Palais Royal. *Dom Juan*, first presented in February 1665, is considered one of Molière’s greatest plays, although it was not published until after his death and remained almost unknown until the twentieth century.

Later years

Although Molière enjoyed the personal support of the king, he struggled with illness, marital problems, and depression. Still, during this period he wrote and presented a work that shows his mastery and genius. *Le Misanthrope*, presented in June 1666, pleased his admirers, but it lacked the popular appeal necessary to make it a success. *L'Avare*, presented two years later, failed miserably, and Molière faced extreme financial (related to money) problems. A comedy-ballet, *Le Bour-*

geois gentilhomme (1670), helped bring in the public once again.

Molière had also developed a bad cough, which he tried to mask as a comic device. When overcome by a coughing spell onstage, he exaggerated it in an attempt to make the audience laugh. The condition worsened greatly, but Molière had little faith in medicine. In 1671 *Les Fourberies de Scapin*, a bright comedy similar to his early works, was presented. On February 17, 1673, during the fourth performance of his last work, *Le Malade imaginaire*, Molière began having seizures. He died that same night, attended only by two nuns, having been refused the right to see a priest.

CLAUDE MONET

Born: November 14, 1840
Paris, France
Died: December 5, 1926
Giverny, France
French painter

The French painter Claude Monet was the leading figure in the growth of impressionism, a movement in which painters looked to nature for inspiration and used vibrant light and color rather than the solemn browns and blacks of previous paintings.

Background and early influences

Claude Monet was born in Paris, France, on November 14, 1840. His father, Adolphe Monet, was a grocer. In 1845 the family moved to Le Havre, France, where Monet's father and uncle ran a business selling supplies for ships. By the time he was fifteen Monet had become popular as a caricaturist (one who makes exaggerated portraits of people). Through an exhibition of his drawings at a local frame shop in 1858, Monet met Eugène Boudin, a landscape painter who became a great influence on the young artist. Boudin introduced Monet to outdoor painting, an activity that soon became his life's work.

By 1859 Monet was determined to pursue an artistic career. He worked at the free Académie Suisse in Paris, and he frequented the Brasserie des Martyrs, a gathering place for Gustave Courbet (1819–1877) and other French painters of the 1850s.

Early period

Monet's studies were interrupted by military service in Algeria (1860–62). In 1862 he entered the studio of Charles Gleyre in Paris and met Pierre-Auguste Renoir (1841–1919), Alfred Sisley (1839–1899), and Jean Frédéric Bazille (1841–1870). During 1863 and 1864 he often worked in the forest at

Claude Monet.

Fontainebleau, France, with other artists including Théodore Rousseau (1812–1867) and Jean François Millet (1814–1875). At the outbreak of the Franco-Prussian War in 1870, Monet traveled to London, England, where he met the art dealer Paul Durand-Ruel. The following year Monet and his wife, Camille, whom he had married in 1870, settled at Argenteuil, France, which became his home for the next six years.

Monet's constant movements during this period were directly related to his artistic ambitions. He was interested in natural light, atmosphere, and color, and he tried to record them in his paintings as accurately as possi-

ble. A striking example of his early style is the *Terrace at the Seaside, Sainte-Adresse* (1866), which contains a shining mixture of bright, natural colors. Throughout the 1860s and 1870s, he was often short of money and destroyed his own paintings rather than have them taken away by creditors (those to whom money is owed).

Monet and impressionism

As William Seitz wrote, “The landscapes Monet painted at Argenteuil between 1872 and 1877 are his best-known, most popular works, and it was during these years that impressionism most closely approached a group style.” Monet exhibited regularly in the impressionist group shows, the first of which took place in 1874. On that occasion his painting *Impression: Sunrise* (1872) inspired a newspaper critic to call all the artists “impressionists,” and the name stuck. Monet and the impressionists discovered that even the darkest shadows and the gloomiest days contain a wide variety of colors. However, Monet learned that he had to paint quickly and to use short brushstrokes loaded with individual colors.

During the 1880s the impressionists began to drift apart, although individual members continued to see one another and occasionally work together. Monet gradually gained critical and financial (relating to money) success during the late 1880s and the 1890s. This was due mainly to the efforts of Durand-Ruel, who sponsored one-man exhibitions of Monet’s work as early as 1883 and who, in 1886, also organized the first large-scale impressionist group show to take place in the United States.

Late work

Monet’s wife died in 1879; in 1892 he married Alice Hoschedé. During the 1890s he devoted his energy to paintings of haystacks (1891) and the facade (front) of Rouen Cathedral (1892–94). In these works Monet painted his subjects from the same physical position, allowing only the light and weather conditions to vary from picture to picture. By 1899 he began work on his famous paintings of the many water lilies in his gardens at Giverny, France. Monet’s late years were very difficult. His health declined rapidly, and by the 1920s he was almost blind.

In addition to Monet’s physical ailments, he struggled with the problems of his art. In 1920 he began work on twelve large canvases (each fourteen feet wide) of water lilies, which he planned to give to the state. To complete them, he fought against his own failing eyesight and the fact that he had no experience in creating large-scale mural art. In effect, the task required him to learn a new kind of painting at the age of eighty. The paintings are characterized by a broad, sweeping style and depend almost entirely on color. Monet worked on the water lily paintings until his death on December 5, 1926.

THELONIOUS MONK

Born: October 10, 1917

Rocky Mount, North Carolina

Died: February 17, 1982

Englewood, New Jersey

African American musician, composer, and music director/conductor

Thelonious Monk was an important member of the jazz revolution that took place in the early 1940s. Monk's unique piano style and his talent as a composer made him a leader in the development of modern jazz.

Teaches self to read music

Thelonious Sphere Monk was born on October 10, 1917, in Rocky Mount, North Carolina. The first musical sounds he heard were from a player piano that his family owned. At the age of five or six he began picking out melodies on the piano and taught himself to read music by looking over his sister's shoulder as she took lessons. About a year later the family moved to the San Juan Hill section of New York City, near the Hudson River. His father became ill soon afterward and returned to the South, leaving

Thelonious's mother, Barbara, to raise him and his brother and sister. Though the family budget was tight, she managed to buy a baby grand Steinway piano, and when Thelonious turned eleven she began paying for his weekly piano lessons. Even at that young age it was clear that the instrument was part of his destiny.

As a boy Monk received training in the gospel music style, accompanying the Baptist choir in which his mother sang, and playing piano and organ during church services. At the same time he was becoming initiated into the world of jazz; near his home were several jazz clubs as well as the home of the great Harlem stride pianist James P. Johnson, from whom Monk picked up a great deal. By the age of thirteen he was playing in a local bar and grill with a trio. At the Apollo Theater's famous weekly amateur music contests, Monk won so many times that he was eventually banned from the event.

The New York scene

In 1939 Monk put his first group together. His first important gig came in the early 1940s when he was hired as house pianist at a club called Minton's. It was a time of dramatic innovation in jazz, when a faster, more complex style was developing. The musicians for this new music, called bebop, created it virtually on the spot. Yet while Monk was important in inspiring bebop, his own music had few ties to any particular movement. Monk was Monk—an original—and the proof was in his compositions.

As the 1940s progressed and bebop became more and more the rage, Monk's career declined. In 1951 he was arrested with

Thelonious Monk.

Reproduced by permission of AP/Wide World Photos.

pianist Bud Powell on an extremely questionable charge of narcotics (illegal drugs) possession. Not only was he confined for sixty days in prison, but the New York State Liquor Authority removed his cabaret card, without which he could not get hired for local club dates. For the next several years he survived only with the help of his good friend and patron the Baroness de Koenigswarter.

Eccentric behavior causes trouble

The strange behavior that Monk displayed in public sometimes got him into trouble. In 1958 he was arrested, unde-

servedly, for disturbing the peace, and his cabaret license was revoked a second time. Forced to take out-of-town gigs, he was separated from his two main sources of stability—New York City and his wife Nellie. His odd behavior intensified as a result. During one episode in 1959 in Boston, Massachusetts, state police picked him up and brought him to the Grafton State Hospital, where he was held for a week.

Toward the end of the 1950s Monk began to receive the prestige he had for so long deserved. His late 1950s recordings on the Riverside label had done so well that in 1962 he was offered a contract from Columbia. As a performer he was equally successful, commanding, in 1960, two thousand dollars for week-long engagements with his band and one thousand dollars for single performances. His December 1963 concert at New York's Philharmonic Hall, a big-band presentation of originals, was for him a personal landmark.

In the early 1970s Monk made a few solo and trio recordings for Black Lion in London and played a few concerts. Beginning in the mid-1970s he isolated himself from his friends and colleagues, spending his final years at the home of the Baroness Nica de Koenigswarter in Weehawken, New Jersey. After playing a concert at Carnegie Hall in March 1976, Monk was too weak physically to make further appearances. He died on February 17, 1982, in Englewood Hospital, after suffering a massive stroke. Along with Miles Davis (1926–1991) and John Coltrane (1926–1967), Monk is remembered as one of the most influential figures in modern jazz. The music Monk left behind remains as some of the most innovative and unique material in all of music, jazz or otherwise.

MARILYN MONROE

Born: June 1, 1926

Los Angeles, California

Died: August 5, 1962

Los Angeles, California

American model and actress

Decades after Marilyn Monroe's death, the film actress and model has remained one of Hollywood's greatest sex symbols with her eye-catching style, champagne blond hair, and breathless manner of speaking.

Growing up Norma Jean

Norma Jean Baker, better known as Marilyn Monroe, experienced a disrupted, love-

less childhood that included two years at an orphanage. When Norma Jean, born on June 1, 1926, in Los Angeles, California, was seven years old, her mother, Gladys (Monroe) Baker Mortenson, was hospitalized after being diagnosed as a paranoid schizophrenic, a severe mental condition. Norma was left in a series of foster homes and the Los Angeles Orphans' Home Society. The constant move from one foster home to another resulted in Norma's "sketchy" educational background.

After Norma's sixteenth birthday, her foster parents had to move from California. To avoid an orphanage or a new foster home, Norma chose to get married. On June 19, 1942, Norma married James Dougherty, but the marriage would all but end when he joined the U.S. Merchant Marines in 1943. Though her difficult childhood and early failed marriage would make Norma Jean a strong and resilient woman, these experiences would also add to her insecurities and flaws—things that would ultimately shape her into a great tragic figure of the twentieth century.

Becoming Marilyn

During World War II (1939–45; a war fought between the Axis powers: Japan, Italy, and Germany—and the Allies: England, France, the Soviet Union, and the United States), Norma Jean worked at the Radio Plane Company in Van Nuys, California, but she was soon discovered by photographers. She enrolled in a three-month modeling course, and in 1946, aware of her considerable charm and the potential it had for a career in films, Norma obtained a divorce from Dougherty. She then headed for Hollywood, where Ben Lyon, head of casting at

Marilyn Monroe.
Reproduced by permission of Archive Photos, Inc.

Twentieth Century Fox, arranged a screen test. On August 26, 1946, she signed a one hundred twenty-five dollar a week, one-year contract with the studio. Ben Lyon was the one who suggested a new name for the young actress—Marilyn Monroe.

During Monroe's first year at Fox, she did not appear in any films, and her contract was not renewed. In the spring of 1948 Columbia Pictures hired her for a small part in *Ladies of the Chorus*. In 1950 John Huston (1906–1987) cast her in *Asphalt Jungle*, a tiny part which landed her a role in *All About Eve*. She was now given a seven-year contract with Twentieth Century Fox and appeared in *The*

Fireball, *Let's Make It Legal*, *Love Nest*, and *As Young as You Feel*.

In 1952, after an extensive publicity campaign, Monroe appeared in *Don't Bother to Knock*, *Full House*, *Clash by Night*, *We're Not Married*, *Niagara*, and *Monkey Business*. The magazine *Photoplay* termed her the "most promising actress," and she was earning top dollars for Twentieth Century Fox.

Popularity and personal failures

On January 14, 1954, Monroe married Yankee baseball player Joe Di Maggio (1919–1999). But the pressures created by her billing as a screen sex symbol caused the marriage to fall apart, and the couple divorced on October 27, 1954.

Continually cast as the "dumb blond," Monroe made *The Seven Year Itch* in 1954. Growing weary of the stereotyping (broad generalizations based on appearance), she broke her contract with Fox and moved to New York City. There she studied at the Actors Studio with Lee and Paula Strasberg. Gloria Steinem (1934–) recalls a conversation with Monroe during that time in which Monroe referred to her own opinion of her abilities compared to a group of notables at the Actors Studio. "I admire all these people so much. I'm just not good enough."

In 1955 Monroe formed her own studio, Marilyn Monroe Productions, and renegotiated a contract with Twentieth Century Fox. She appeared in *Bus Stop* in 1956 and married playwright Arthur Miller (1915–) on July 1, 1956. Critics described Monroe in the film *The Prince and the Showgirl*, produced by her own company, as "a sparkling light comedienne." Monroe won the Italian David di

Donatello award for “best foreign actress of 1958,” and in 1959 she appeared in *Some Like It Hot*. In 1961 she starred in *The Misfits*, for which her husband Miller wrote the screenplay.

End of a star

The couple was divorced on January 24, 1961, and later that year Monroe entered a New York psychiatric clinic. After her brief hospitalization there she returned to the Fox studio to work on a film, but her erratic (unsteady and irregular) behavior betrayed severe emotional disturbance, and the studio fired her in June 1962.

Marilyn Monroe was found dead in her Los Angeles bungalow on August 5, 1962, an empty bottle of sleeping pills by her side. The exact events surrounding her death are not totally known and have been the subject of many rumors and books over the years. Monroe’s image is one of the most lasting and widely seen of any star in the twentieth century—and today. As a subject of biographies, more than twenty books have been written about her short and tragic life.

JOE MONTANA

Born: June 11, 1956

New Eagle, Pennsylvania

American football player

Joe Montana has earned a reputation as one of the top quarterbacks ever to play professional football, first rising to fame in the 1980s.

The quarterback’s beginnings

Joseph C. Montana Jr. was born on June 11, 1956, in New Eagle, Pennsylvania. His father, Joe Montana Sr., was a manager with a finance company, and his mother, Theresa, was a secretary with the same company. They lived in Monongahela, Pennsylvania. Joe loved playing sports. Every night as a young boy he would wait for his father to come home so that they could play catch with a football or a baseball, and practice throwing the balls through tire swings for accuracy. The Montanas also had a basketball hoop in their driveway, where Joe would often be seen playing a game with friends or practicing on his skills. He just loved to play sports.

Joe went to the local public schools, and graduated from Ringgold High School. There he was a B-student, a member of the choir, and

Joe Montana.

Reproduced by permission of the Corbis Corporation.

served as vice president of his class during his senior year. He also was the starting quarterback for the football team from the middle of his junior year on. His abilities attracted the attention of major colleges around the country. In 1974 he was named in *Parade Magazine* as an All-American quarterback.

Seventh string

Joe Montana nearly accepted a basketball scholarship to North Carolina State University. But western Pennsylvania is known for its love of football, and such a tradition finally swayed Ringgold High's star quarterback to attend the University of Notre Dame

in Indiana on a football scholarship. It was a school known for excellence in both sports and academics. Joe knew that he would get a good education as well as a great chance to play football. As a homesick freshman, however, Montana may have had doubts about his decision-making skills when he realized that he was barely holding on as the Fighting Irish's seventh-string quarterback.

Early in his career Montana made the most of his occasional appearances in football games. As a sophomore he twice led Notre Dame back from behind in the fourth-quarter for unlikely wins, including a game against Air Force in which he came off the bench with just twelve minutes remaining to erase the Falcons' twenty-point lead. He inspired two more rallies as a junior and two more still as a senior. He soon was known as Notre Dame's "Comeback Kid." Still, Montana did not become Notre Dame's first-string quarterback until his senior year; and in his last game he again performed a comeback in the fourth quarter during an ice storm to defeat Houston in the last seven minutes. Yet, despite his amazing football instincts and his calmness under pressure, Montana was not a highly promoted prospect when he entered the 1979 National Football League (NFL) draft.

Life as a professional player

Eighty-one players were selected before the San Francisco 49ers drafted Montana late in the third round. New 49ers coach Bill Walsh ignored the negative scouting reports on his rookie quarterback, and envisioned Montana as the leader of his complex ball-control passing attack. Walsh's "system" depended on a quick quarterback with an accurate arm who could adjust quickly to the

other team's defensive strategies. By the 1981 season Montana and the 49ers had become a sophisticated and practically unstoppable offensive machine, but they met an old enemy in the National Football Conference championship game, the Dallas Cowboys. Montana again led a team from behind to win this game in the last seconds.

Super Bowl hero

San Francisco went on to win Super Bowl XVI over the Cincinnati Bengals, 26-21. Montana was named the game's Most Valuable Player (MVP). It was to become a familiar scenario during the decade. The 49ers would win four titles by 1990, including consecutive Super Bowls in 1989 and 1990, and Montana was awarded the MVP trophy in three of those championship games. Not only did Montana complete almost 70 percent of his passes in those four Super Bowl victories, but he also never threw an interception in 122 attempts. He drove the 49ers 92 yards in the last few moments of Super Bowl XXIII to beat Cincinnati again, 20-16. In Super Bowl XXIV Montana came back with an even more impressive performance, completing five touchdown passes in a 55-10 victory over the Denver Broncos. When he retired in 1995, Montana held NFL playoff records for completions, yards, and touchdowns, as well as single-season (1989) and career records for passing efficiency.

Life after football

Joe Montana was inducted into the Pro Football Hall of Fame on July 29, 2000. He is now involved in sports of a different kind. He raises horses with his family in Northern California. He and his children compete as riders of

the horses they raise. But no matter where he goes, Joe Montana will always be remembered as one of professional football's greatest players.

MONTESQUIEU

Born: January 18, 1689

Bordeaux, France

Died: February 10, 1755

Paris, France

French philosopher and satirist

The French satirist (writer using sarcasm to communicate his message) and political and social philosopher Montesquieu was the first of the great French scholars associated with the Enlightenment (a philosophical movement in the eighteenth century that rejected traditional social and religious ideas by placing reason as the most important ideal).

Early life

Charles Louis de Secondat, Baron de Montesquieu was born on January 18, 1689, at the castle of La Brède near Bordeaux. His father, Jacques de Secondat, was a soldier

Montesquieu.

Courtesy of the Library of Congress.

with a long noble ancestry, and his mother, Marie Françoise de Pesnel, who died when Charles Louis was seven, was an heiress (a woman with a large monetary inheritance) who eventually brought the barony (title of baron) of La Brède to the Secondat family. As was customary the young Montesquieu spent the early years of his life among the peasants (poor working class) in the village of La Brède. The influence of this period remained with Charles Louis, showing itself in his deep attachment to the soil. Montesquieu was also born into a climate of discontent in France. King Louis XIV's (1638–1715) long reign was uncomfortable for the citizens of France. His

unsuccessful wars and attempts to dictate religion and culture had a bad effect on France. Knowledge of this situation helps to explain some of Montesquieu's curiosity and his interest in societal rules and laws.

In 1700 Montesquieu was sent to the Oratorian Collège de Juilly, at Meaux, where he received a modern education. Returning to Bordeaux in 1705 to study law, he was admitted to practice before the Bordeaux Parlement (parliament) in 1708. The next five years were spent in Paris, France, continuing his studies. During this period he developed an intense dislike for the style of life in the capital, which he later expressed in his *Persian Letters*.

In 1715 Montesquieu married Jeanne de Lartigue, a Protestant (a member of the church that had left the rule of Roman Catholicism), who brought him a large dowry (sum of money given in marriage). He was also elected to the Academy of Bordeaux. The following year, on the death of his uncle Jean Baptiste, he inherited the barony of Montesquieu and the presidency of the Bordeaux Parlement.

Scholarly and literary career

Montesquieu had no great enthusiasm for law as a profession. He was much more interested in the spirit that lay behind law. It is from this interest that his greatest work, *The Spirit of the Laws*, developed. To free himself in order to continue his scholarly interests, he sold his office as president of the Bordeaux Parlement in 1721. With his newly freed time he wrote the *Persian Letters*.

The *Persian Letters* was a fierce and bitingly critical view of European civilization

and manners. The work takes the form of letters that three Persians (people from what is now Iran) traveling in Europe send to families and friends at home. Their letters are notes on what they see in the West. Montesquieu gave his travelers the foreign, commonsense understanding necessary to effectively criticize European (French) customs and institutions. Yet he also gave his Persians the weaknesses necessary to make his readers recognize in them their own weaknesses. All sides of European life were criticized. The message is that society lasts only on the basis of virtue and justice, which is rooted in the need of human cooperation and acceptance.

Although the *Letters* was published without his name, it was quickly recognized as the work of Montesquieu and won him the approval of the public and the displeasure of the governor, Cardinal André Fleury, who held up Montesquieu's introduction into the French Academy until 1728.

The Spirit of the Laws

Montesquieu brought his search for the general laws active in society and history to its completion in his greatest work. Published in 1748, *The Spirit of the Laws* was an investigation of the environmental and social relationships that lie behind the laws of civilized society. Combining the traditions of customary law with those of the modern theories of natural law, Montesquieu redefined law as “the necessary relationships that derive [come] from the nature of things.” Laws “must be adapted to each peoples.”

The Spirit of the Laws helped to lay the basis of the eighteenth-century movement for constitutionalism (government run by established law), which ended in the Revolution of

1789 (1789–93; rise and revolt of the middle class against the failures of King Louis XVI and his royals, many of whom were killed by the guillotine, or chopping block). In this sense Montesquieu's most basic belief may be viewed as an attempt to state the necessity of law review. *The Spirit of the Laws* was immediately celebrated as one of the great works of French literature.

Following the completion of his work, Montesquieu, who was going blind, went into semiretirement at La Brède. He died on February 10, 1755, during a trip to Paris.

MARIA MONTESSORI

Born: August 31, 1870

Chiaravalle, Italy

Died: May 6, 1952

Noordwijk, Netherlands

Italian physician and educator

Maria Montessori.

Reproduced by permission of AP/Wide World Photos.

The Italian educator and physician Maria Montessori was the first Italian woman to receive a medical degree. She was the originator of the Montessori method of education for children.

Early life

On August 31, 1870, Maria Montessori was born in Chiaravalle, Italy. Her father, Alessandro Montessori, a retired army officer, was very traditional. Her mother, Renilde Stoppani Montessori, was an intelligent, modern-thinking woman from a wealthy family. Maria's mother taught her daughter how to be compassionate by giving

her the task of knitting for the poor every day. Maria herself chose to scrub a portion of the tile floor every day. Much later, as a teacher, Montessori included such work in her studies for children, calling them "exercises of practical life."

As an elementary school student Montessori blossomed. She was average in intelligence, but good at exams, and she led her classmates in many games. She found the classroom set-up and repetitions very boring, yet she learned. When it came time to leave elementary school she had to ask her parents if she could continue. Women in her time were not encouraged to get more than an elementary school education.

Montessori's father discouraged her interest in a professional career. With the encouragement and support of her mother, however, she prepared herself for her later career. When she was twelve, the family moved to Rome, Italy, to take advantage of the better educational facilities. An interest in engineering technology and mathematics led her to enroll in classes at a technical institute at the age of fourteen. Later an interest in biology led to her decision to study medicine. This decision required some courage, because of society's views on women's education.

Professional life

In 1894 Montessori became the first woman to receive a medical degree in Italy. Her experiences in the pursuit of this degree reinforced her already well-developed feminist (in support of equality of the sexes) ideas. Throughout her life she was a frequent participant in international feminist events.

Montessori's first appointment was as an assistant doctor in the psychiatric clinic of the University of Rome, where she had her first contact with learning disabled children. She became convinced that the problem of handling these children was as much one of teaching method as of medical treatment. In 1898 she was appointed director of the State Orthophrenic School in Rome, whose function was to care for the "hopelessly deficient" and "idiot" children of the city. She enjoyed tremendous success in teaching the children herself, while refining and applying her unique methods. In 1901 Montessori left the school to pursue further studies and research.

In 1906 the Italian government put Montessori in charge of a state-supported school in the San Lorenzo quarter of Rome, which had sixty children, aged three to six, from poverty-stricken families. By this time her early successes with learning disabled children suggested to her the idea of trying the same educational methods with normal children. She used what she termed a "prepared environment" to provide an atmosphere for learning—that is, small chairs and tables instead of rows of desks. The basic features of the method are development of the child's natural curiosity through responsible and individual freedom of behavior, improvement of the sharpness of the five senses (hearing, seeing, tasting, touching, smelling) through training, and development of body coordination through games and exercise. The function of the teacher is to provide educational material, such as counting beads or geometric puzzles, and act as an adviser and guide, staying as much as possible in the background.

The Montessori method

Montessori's view of the nature of the child, on which the Montessori method is based, is that children go through a series of "sensitive periods" with "creative moments," when they show spur-of-the-moment interest in learning. It is then that the children have the greatest ability to learn, and these periods should be utilized to the fullest so that the children learn as much as possible. They should not be held back by forced, rigid curricula (plans of study) or classes. Work, she believed, is its own reward to the child, and there is no necessity for other rewards. Self-discipline (controlling oneself) emerges out of the freedom of the learning environment.

Montessori's method was basically at odds with other major twentieth-century trends. Thus it was used only by a relatively few private schools. Since the early 1950s, however, her system has enjoyed a revival and a renewed interest in learning disabled children. Her works have been translated into at least twenty languages, and training schools for Montessori teachers have been established in several nations.

THOMAS MORE

Born: February 6, 1478

London, England

Died: July 6, 1535

London, England

English statesman and humanist

The life of the English humanist (one who studies human nature, interests, and values) and statesman (political leader) Sir Thomas More represents the political and spiritual disorder of the Reformation (the time of religious change in the sixteenth century that moved away from Roman Catholic tradition toward Protestantism). The author of *Utopia*, he was beheaded for being against the religious policy of Henry VIII (1491–1547).

Early life

Thomas More was born in London on February 6, 1478, to John and Agnes More, whose families were connected with the city's legal community. His father, John More, was the butler at the lawyer's club, Lincoln's Inn, as his father was before him. John very much wanted to be a lawyer himself. That opportunity came when he married Agnes Granger, the wealthy daughter of a local merchant. In marriage she shared some of that wealth with John. He was well-liked at Lincoln's Inn and was voted to be a member and then was admitted to the bar (a group of practicing lawyers). Agnes and John had four other children besides Thomas but three died very young.

Thomas' education began at a prominent London school, St. Anthony's. In 1490 Thomas entered the household of Archbishop John Morton, Henry VII's closest adviser. His

mother and father's connections made this possible. Service to Morton brought experience of the world. In 1492 More transferred to Oxford, where he first started Greek studies. Two years later he returned to London, where legal and political careers blossomed. By 1498 More had gained membership in Lincoln's Inn.

Christian humanism

More, while pursuing his legal career and entering Parliament in 1504, was drawn to the Christian humanist circle. This philosophy (the study of knowledge) coupled the study of Greek with the study of the gospel in seeking a more direct message. He spent his mid-twenties in close touch with London's strict Carthusian monks and almost became one. But More then decided that he could fulfill a Christian call to ministry while remaining a layman (non-clergy).

More first married Jane Colt, who bore three sons and a daughter before dying in 1511. He then married Alice Middleton. His legal career grew and led to an appointment as London's undersheriff in 1511. This meant additional work and income as public lawyer at Henry VIII's court and as court representative with foreign merchants.

More's first official trip abroad, at an embassy at Antwerp in 1515, gave him leisure time in which he began his greatest work, *Utopia*. Modeled after Plato's (c. 427–c. 347 B.C.E.) *Republic* and finished and published in 1516, it describes an imaginary land, free of the prideful greed and violence of the English scenes that More had witnessed.

Service under Henry VIII

In *Utopia* More discusses the difficulties of counseling (as a lawyer) princes. This aware-

ness kept him from accepting frequent invitations to serve Henry VIII, whose policies were often quite opposite to the humanist's philosophy. He finally accepted Henry's fee late in 1517 and had a solid career in diplomacy (the conduct in dealing with other nations), legal service, and finance. In 1529 he was chosen as the successor to Cardinal Wolsey as chancellor (secretary of the king) of England.

More's early doubts, however, proved justified. Under Wolsey's direction More, as Speaker of the House of Commons in 1523, promoted a war tax so unpopular that its collection was discontinued.

Wolsey's inability to obtain the annulment (to make invalid) of Henry's marriage to Catherine of Aragon (1485–1536) had raised More to highest office, and had placed him in the increasingly distressing role of Henry's chief agent in the strategies that began to sever England from Rome. More was deeply engaged in writings against Lutherans, defending the fundamental (essential) rules of the Roman Catholic Church, whose serious defects he knew. More cannot justly be held responsible for the increased number of Protestants killed during his last months in office, but this was the gloomiest phase of his career. He continued writing until a year after his resignation from office, given on May 16, 1532, which was caused by illness and distress over England's separation from the Catholic Church.

Break with the king

More recognized the dangers that his Catholic writings might bring in the upside-down world of Henry's break with Rome. So he tried to avoid political controversy (open to dispute). But Henry pressed him for a public acknowledgment of the country's break from Rome in 1534. More refused to take the

Thomas More.
Courtesy of the Library of Congress.

accompanying oath that denied the pope's power in England.

More's last dramatic year—from the first summons for questioning on April 12, 1534, through imprisonment, trial for treason (the act of betraying one's country), defiance of his lying accusers, and finally execution (a death sentence carried out legally) on July 6, 1535—should not be allowed to overshadow his entire life's experience. Its significance extends beyond the realm of English history. For many of Europe's most critical years, More worked to revitalize the Christian world. He attacked those who most clearly threatened its unity; once convinced that

Henry VIII was among their number, More withdrew his service and resisted to his death the effort to remove his loyalty.

JIM MORRISON

Born: December 8, 1943

Melbourne, Florida

Died: July 3, 1971

Paris, France

American singer and songwriter

Lead singer for the rock group the Doors, Jim Morrison was the poster-boy for the mind-bending, outlandish lifestyle of the 1960s in his brief but brilliant career.

First creative outlet in film

James Douglas Morrison was born in Melbourne, Florida, on December 8, 1943. His father, a career Navy officer, was transferred from base to base during his son's

childhood, but, by his Jim's early teens, the family had settled in Alexandria, Virginia. After finishing high school in Alexandria, Morrison took several classes at St. Petersburg Junior College and Florida State University before pulling up roots in 1964 and heading for the West Coast. By 1966 the twenty-two-year-old Morrison was enrolled in film classes at the University of California at Los Angeles (UCLA), but a friendship with fellow student Ray Manzarek would sideline any plans he had of becoming a filmmaker.

While the two young men had known each other only casually as fellow students, they ran into each other one day by accident, on a Venice, California, beach. Manzarek, an organist, along with Morrison, guitarist Robbie Krieger, and drummer John Densmore, decided to form their own rock band to put their songs to music. The young men decided to call their group the Doors, a name inspired by a quote from nineteenth-century English poet William Blake (1757–1827): "If the doors of perception were cleansed every thing would appear as it is, infinite." As Morrison was fond of saying, "there are things known and things unknown and in between are the Doors."

A long-term gig at the Whiskey-a-Go-Go on Hollywood's Sunset Strip allowed the Doors to develop their stage presence, and it eventually drew the attention of talent scouts searching for new recording acts. Not the least of the group's attractions was Morrison, who sang in a husky baritone, wore skin-tight pants, and went even further than Elvis Presley had in incorporating sexually suggestive movements into his onstage performances. With lyrics like "Come on baby, light my fire," Morrison drove young women wild.

The rise (and fall) of the Lizard King

After the release of their first album, *The Doors*, the group went back into the studio and cut *Strange Days*, both of which came out in 1967. Other albums would include *Waiting for the Sun* (1968), *The Soft Parade* (1969), *Morrison Hotel* (1970), *Absolutely Live* (1970), and *L.A. Woman* (1971). Morrison, interested in Native American lore and the images of the American deserts, dubbed himself the “Lizard King” and wrote several songs, including “Celebration of the Lizard,” in reference to his reptilian alter ego (another aspect of one’s personality).

Caught up in a wave of popularity, the young band found itself carried into a new world, where drugs, alcohol, and sex played a major role. Morrison, whose status as a celebrity had begun almost overnight, found it difficult to handle the change: his growing dependence on alcohol would dim his talent in the years that followed, and the superstar status made him believe he was immune to normal authority.

On March 1, 1969, Morrison and the Doors were booked for a concert at Dinner Key Auditorium, in Coconut Grove, in Morrison’s home state of Florida. During his performance before thirteen thousand screaming fans, Morrison exposed himself briefly to the audience. Nothing was done until pressure from disgusted Miami-area residents forced local police to issue a warrant for Morrison’s arrest. The singer, who had been vacationing out of the country, turned himself in to the Federal Bureau of Investigation (FBI) and returned to Miami, where he went on trial on August 12, 1970. Found guilty of a misdemeanor (a minor crime) for profanity (vulgar language or behavior) and drunkenness, he

Jim Morrison.

Reproduced by permission of Archive Photos, Inc.

was sentenced to six months hard labor, although the sentence was stayed (postponed) while his attorney appealed the conviction. Morrison would not live to see the outcome of that appeal.

An early end

After the trial in Miami, Morrison’s life grew more chaotic, his relationships with band members more strained. Searching to recover a sense of himself, he went back to the poetry that he had loved while a college student. In 1970 he published his first book of verse, *The Lords [and] The New Creatures*, which had been privately printed the year before.

On July 3, 1971, Morrison's girlfriend found him dead in his bathtub. The cause of death was determined to be a heart attack, although an autopsy was never performed. He was buried at the Pere-Lachaise Cemetery in Paris, France. His death was kept secret until after the funeral to eliminate the crowds of saddened fans that would likely have attended. Morrison's grave remains one of the most visited sites in all of Paris.

TONI MORRISON

Born: February 18, 1931

Lorain, Ohio

African American writer

Toni Morrison is the first African American woman to win the Nobel Prize for Literature. She is best known for her novels focusing on intimate relationships, especially between men and women. These stories are set against the backdrop of African American culture.

Birth and family history

Toni Morrison was born Chloe Anthony Wofford in Lorain, Ohio, on February 18, 1931. She was the second of four children born to Ramah and George Wofford. Her mother's parents, Ardelia and John Solomon Willis, had left Greenville, Alabama, around 1910 after they lost their farm because of debts that they could not repay. Morrison's father's family left Georgia and moved north to escape sharecropping (a system of farming in which a farmer works on someone else's land and pays the owner a share of the crop) and violence against African Americans in the South. Both families settled in the steel-mill town of Lorain on Lake Erie. Morrison grew up during the Great Depression in the 1930s, a time of severe economic hardship. Her father supported the family by working three jobs for seventeen years.

Folklore, music, and history

Morrison's childhood was filled with African American folklore, music, rituals, and myths. Her family was, as Morrison says, "intimate with the supernatural" and frequently used visions and signs to predict the future. Storytelling was an important part of life in the Wofford family and both the children and the adults would share stories with one another. Morrison sees her writing functioning much like storytelling did in the past. It reminds

people about their heritage and shows them their place in the community. She has said that she uses her childhood memories to help her start writing. Her real-life world, therefore, is often included in her novels.

Once Morrison learned how to read, it became one of the things in life that she loved spending time doing. When she was in high school, she began to read the works of great authors such as Jane Austen (1775–1817), Leo Tolstoy (1828–1910), and the nineteenth-century French writer Gustave Flaubert (1821–1880). Morrison was impressed by the specific way these writers portrayed the things that they were familiar with. Their talents motivated her to write in such a way about the things she was most familiar with, particularly her African American culture.

Attends university and becomes a teacher

In 1949 Morrison went to Howard University in Washington, D.C., to study English. She changed her name to Toni because people at Howard had trouble pronouncing the name Chloe. While at Howard she was a member of the Howard University Players, a theater company that presented plays about the lives of African American people. Morrison received her bachelor of arts degree in English from Howard in 1953. After she received her master's degree in English from Cornell University in Ithaca, New York, in 1955, she taught for two years at Texas Southern University in Houston. Then she returned to Howard University to teach.

Marriage, family, and a career as an editor

While at Howard, Toni met Harold Morrison, a young architect from Jamaica who

Toni Morrison.

Reproduced by permission of Mr. Chris Felver.

also taught at the university. The couple married in 1958 and had two sons, Harold (also known as Ford) and Slade, before divorcing in 1964. Then Morrison went to Syracuse, New York, and began working as an editor for a Random House company. She had two small children and free time in the evenings. This environment helped her turn her attention to writing novels.

In 1968 Morrison moved to New York City, where she continued working as an editor for Random House. She eventually became a senior editor and was the only African American woman to have that job in the company. While there she helped to pub-

lish books by African American writers, including Toni Cade Bambara (1939–1995), Gayl Jones (1949–), and June Jordan (1936–). She also taught part-time, lectured across the country, and wrote many novels.

Morrison's novels

Morrison began writing her first novel, *The Bluest Eye* (1970), while she was in a writers' group at Howard University. The story is about an African American girl who wishes that her eyes were blue and fit a different image of beauty. Thirty years later the book still speaks to a universal audience and was chosen to be an Oprah Winfrey Book Club selection. *Sula* (1974), Morrison's second novel, was nominated for a National Book Award. Her third book, *Song of Solomon* (1977), won a National Book Critics Circle Award in 1977 and an American Academy of Arts and Letters Award. It was also chosen as the second novel by an African American to be a Book-of-the-Month selection. *Tar Baby* was published in 1981. *Beloved* (1987) won the Pulitzer Prize in 1988. *Jazz* was published in 1992 and *Paradise* followed in 1997. Meanwhile, Morrison worked as writer-in-residence at the State University of New York, first at Stony Brook and later at Albany, before moving on to Princeton University in New Jersey.

Morrison's novels are carefully written to produce poetic phrases and strong emotional responses from her readers. Her characters try to understand the truth about the world they live in. The subjects she writes about include good and evil, love and hate, beauty and ugliness, friendship, and death.

Morrison's masterpiece

Beloved, a story about life after slavery, is considered Morrison's masterpiece. In 1993, when she won the Nobel Prize for Literature for the body of her work, the Nobel Committee cited *Beloved* as Morrison's outstanding work. In 1996 she received a Medal for Distinguished Contribution to American Letters from the National Book Foundation.

In 1999 Morrison's first children's book, *The Big Box*, was published. She worked on the book together with her son Slade. The story is a dark look at childhood in America that pushes children and parents to take a new look at the rules and values that make up their lives. The book shows the ways in which well-meaning adults sometimes block children's independence and creativity.

Honored by the president

In 2001 Toni Morrison was given a National Arts and Humanities Award by President Bill Clinton in Washington, D.C. The president gave a speech during the award ceremony and said that Morrison had "entered America's heart."

SAMUEL F. B. MORSE

Born: April 27, 1791

Charlestown, Massachusetts

Died: April 2, 1872

New York, New York

American inventor and artist

Samuel F. B. Morse, American artist and inventor, designed and developed the first successful electromagnetic (magnetism caused by electricity) telegraph system.

Early life

Samuel Finley Breese Morse was born in Charlestown, Massachusetts, on April 27, 1791. He was the first son of Jedidiah Morse, a clergyman, and Elizabeth Breese, of New Jersey. "Finley," as his parents called him, was the son quickest to change moods while his other two brothers, Sidney and Richard, were less temperamental. His brothers helped him out many times in his adult years. The Morses' commitment to education had Samuel in Phillips Academy by the age of seven. Though not a star student, his drawing skills were good. Both his teachers' and his parents' encouragement led to Samuel's success with miniature portraits on ivory. Samuel graduated from Yale College in 1810. He wished to pursue a career in art, but his father was opposed to this. Samuel took a job as a clerk in a Charlestown bookstore. During this time he continued to paint. His father reversed his decision and in 1811 allowed Morse to travel to England to pursue art. During this time, Morse worked at the Royal Academy

with the respected American artist Benjamin West (1738–1820).

Artist at work

In 1815 Morse returned to America and set up a studio in Boston, Massachusetts. He soon discovered that his large canvases attracted attention but not sales. In those days Americans looked to painters primarily for portraits, and Morse found that even these sales were difficult to get. He traveled extensively in search of work, finally settling in New York City in 1823. Perhaps his two best-known canvases are his portraits of the Marquis de Lafayette (1757–1834; a French general who served with George Washington [1732–1799] during the American Revolution), which he painted in Washington, D.C., in 1825.

In 1826 Morse helped found, and became the first president of, the National Academy of Design, an organization that was intended to help secure sales for artists and to raise the taste of the public. The previous year Morse's wife had died; in 1826 his father died. The death of his mother in 1828 dealt another severe blow, and the following year Morse left for Europe to recover.

Electromagnetism

In October 1832 Morse returned to the United States. On the voyage he met Charles Thomas Jackson, an eccentric doctor and inventor, with whom he discussed electromagnetism. Jackson assured Morse that an electric impulse could be carried along even a very long wire. Morse later recalled that he reacted to this news with the thought that "if this be so, and the presence of electricity can be made visible in any desired part of the cir-

Samuel F. B. Morse.

Courtesy of the Library of Congress.

cuit, I see no reason why intelligence might not be instantaneously transmitted by electricity to any distance." He immediately made some sketches of a device to accomplish this purpose.

Even as an art professor at the University of the City of New York, the telegraph was never far from Morse's mind. He had long been interested in gadgetry and had even taken out a patent (document protecting the owner of an invention from having it stolen). He had also attended public lectures on electricity. His shipboard sketches of 1832 had clearly laid out the three major parts of the

telegraph: a sender, which opened and closed an electric circuit; a receiver, which used an electromagnet to record the signal; and a code, which translated the signal into letters and numbers. By January 1836 he had a working model of the device that he showed to a friend, who advised him of recent developments in the field of electromagnetism—especially the work of the American physicist (scientist of matter and energy) Joseph Henry (1797–1878). As a result, Morse was able to greatly improve the efficiency of his device.

Invention trial

In September 1837 Morse formed a partnership with Alfred Vail, who contributed both money and mechanical skill. They applied for a patent. The American patent remained in doubt until 1843, when Congress approved thirty thousand dollars to finance the building of an experimental telegraph line between the national capital and Baltimore, Maryland. It was over this line, on May 24, 1844, that Morse tapped out his famous message, "What hath God wrought [made]!"

Morse was willing to sell all of his rights to the invention to the federal government for one hundred thousand dollars, but a combination of a lack of congressional interest and the presence of private greed frustrated the plan. Instead he turned his business affairs over to Amos Kendall. Morse then settled down to a life of wealth and fame. He was generous in his charitable gifts and was one of the founders of Vassar College in 1861. His last years were spoiled, however, by questions as to how much he had been helped by others, especially Joseph Henry.

Morse died in New York City on April 2, 1872.

MOSES

Born: c. 1392 B.C.E.

Egypt

Died: c. 1272 B.C.E.

Moab, Syria

Egyptian prophet

The Old Testament prophet Moses was chosen to lead Israel out of Egyptian slavery. He created Israel's nationhood and delivered the Ten Commandments.

Childhood years

Moses was the son of Amram and Yochebed of the tribe of Levi. Miriam and Aaron were his brother and sister. He was born in Egypt during the period in which the Israelites (Hebrews) had become a threat to the Egyptians simply because of their large population. The Pharaoh had ordered that all newborn male Hebrew children be cast into the Nile to drown. Amram and Yochebed took their newborn son and placed him in a waterproof basket and hid him in the tall

grasses of the Nile. Meanwhile, his sister Miriam hid and watched over the baby from a distance. A group of women and servants were bathing nearby. The Pharaoh's daughter, hearing the baby cry, found and rescued him. She named him "Moses," meaning "drawn from the water." Her desire for a son fulfilled, she made certain that he had the best of everything, including education.

Moses was brought up in the splendor of the Egyptian court as the Pharaoh's daughter's adopted son. Grown to manhood, he was aware of his Hebraic roots and shared a deep compassion for his confined kinsmen. He became furious while witnessing an Egyptian master brutally beating a Hebrew slave, and he impulsively killed the Egyptian. Fearing the Pharaoh's punishment, he fled into the desert of Midian, becoming a shepherd for Jethro, a Midianite priest whose daughter Zipporah he later married. While tending the flocks on Horeb Mountain in the wilderness, he saw a bush burning yet not turning to ash. He heard a voice from within the bush telling him that he had been chosen to serve as one to lead the children of Israel out of Egypt. He was also told to declare the unity of God to his people. At that time most Israelites were worshipping many gods. Moses was to tell them that there was only one God.

The tremendous responsibility of Moses's task, his shyness, and his own feeling of unworthiness brought forth a hesitancy and lack of confidence. The Divine answer was "Who made your tongue?" He was then assured that Aaron, his more talkative brother, would serve as his spokesman both to the children of Israel and to the Pharaoh. The promised destination for the Israelites' journey was a "land rich with milk and honey."

Moses.

Reproduced by permission of the Corbis Corporation.

Moses returned to Egypt and persuaded the Hebrews to organize for a quick trip from their Egyptian slave drivers. With Aaron, Moses informed the Pharaoh that the God of the Hebrews demanded that Pharaoh free God's people. The Pharaoh refused to obey, bringing upon himself and his people nine terrible plagues (diseases that spread rapidly and can cause death) that Moses produced upon Egypt by using the miraculous staff he had received from God as a sign of his authority. The Egyptians suffered under the plagues of water turned into blood, frogs, gnats, flies, disease to their cattle, boils, hail, locusts, and darkness. Each plague was

severe to the Egyptians but left the Israelites untouched. The tenth plague is now the Hebrew story of Passover. God sent the Angel of Death to kill the firstborn sons of the Egyptians—a proof of His immense strength and power. The Israelites protected their households by putting lamb's blood on their doorway, so that the Angel of Death would know to pass over their homes. This last plague broke the Pharaoh's resistance and moved him to grant the Hebrews permission to leave immediately. Moses thus found himself the leader of an undisciplined collection of slaves, Hebrew as well as non-Hebrew, escaping from Egyptian territory toward freedom.

Exodus

Moses' immediate goal was Mt. Horeb, called Mt. Sinai, where God had first revealed Himself to Moses. The Hebrews came to the sacred mountain encouraged by the power they sensed in Moses. Summoned by God, Moses ascended the mountain and received the tablets of stone while the children of Israel heard the thundering forth of the Ten Commandments. Inspired, the people agreed to the conditions of the Covenant (agreement made between people and God).

Through forty years in the wilderness of Sinai, overcoming many obstacles, Moses led the horde of former slaves, shaping them into a nation. Many miracles happened along the way. When the Israelites stopped in front of the Red Sea with the Egyptian soldiers at their heels, it was Moses' raised staff that parted the Red Sea so that they could cross. Once they had safely crossed, the sea crashed down, drowning many of their pursuers. When food supplies ran out, God sent down what was called "manna" (spiritual food) everyday for the nourishment of the

Israelites. Moses had to hear the Israelites complain about the food, the climate, and the slowness of their progress. Moses even had to hear the Israelites claim that Egypt had been better than this wilderness trip. When the people were in need of water, God told Moses to speak to a rock and water would spring from it. Moses' character was apparently worn down because, instead of following directions, he struck the rock with his staff. That was to have lasting impact on Moses's final days.

Covenant

With the help of his brother Aaron, Moses was able to hold together his ragtag band of ex-slaves for forty years. Only a man with tremendous will, patience, compassion, humility, and great faith could have forged the bickering and scheming groups who constantly challenged his wisdom and authority into a nation. Throughout the forty years Moses was in constant communication with his Lord, the God of Israel. This God added to the Ten Commandments through Moses by giving a code of law regulating the social and religious lives of the people. This collection of instructions, read to and confirmed by the people, was called the *Book of the Covenant*. These were protected in a specially designed box called the Ark of the Covenant. All of the specific details were spoken through Moses by the God of the Israelites.

Under Moses's leadership, most of the land east of the Jordan was conquered and given to the tribes of Reuben and Gad and to half of the tribe of Menashe. Moses, however, was not permitted to lead the children of Israel into Canaan, the Promised Land, because he had been disobedient to God during the period of wandering in the desert. His regular meetings with God had fulfilled him in ways that even his fellow

Israelites could detect. His face was always radiant when he exited any interview with his Almighty. Moses, 120 years old, died in the land of Moab and was buried opposite Bet Peor.

GRANDMA MOSES

Born: September 7, 1860

Greenwich, New York

Died: December 13, 1961

Eagle Bridge, New York

American painter

Grandma Moses was one of America's best-known primitive painters (artists who did not receive a formal art education).

Anna Mary's youth

Anna Mary Robertson was born in Greenwich, New York, on September 7, 1860,

Grandma Moses.

the third of ten children born to Russell King Robertson, a farmer, and Margaret Shannahan. She had a happy childhood and worked hard on their family farm. Her father enjoyed seeing the children's drawings and would buy them large sheets of blank newspaper upon which they could draw. The young Anna Mary loved to draw happy, colorful scenes. She only attended school in the summer due to the cold and her lack of warm clothing. At twelve she began earning her living as a hired girl at homes near the family farm.

In 1887 Anna Mary married a farm worker, Thomas S. Moses, and the couple settled on a farm in Virginia. They had ten chil-

dren, five of whom died at birth. In 1907 the family moved to Eagle Bridge, New York, where Grandma Moses spent the rest of her life.

First paintings

It was on this farm in Eagle Ridge that Anna Mary painted her first painting. She was wallpapering her parlor and ran out of paper. To finish the room she put up white paper and painted a scene. It is known as the *Fireboard*, and it hangs today in the Bennington Museum in Bennington, Vermont. Her husband died in 1927, and her son and daughter-in-law took over the farm. As she aged and found farm work too difficult, Grandma Moses took up embroidering pictures in yarn to fill her spare time. At the age of seventy-six, because of arthritis, she gave up embroidery and began to paint. Her early work was usually based on scenes she found in illustrated books and on Currier and Ives prints (prints made during the 1800s, showing American lives, historical events, and celebrities).

Recognition

In 1938 Grandma Moses's paintings were discovered by an art collector and engineer, Louis Caldor. He saw a few of her paintings displayed in the window of a drug store in Hoosick Falls, New York, while on vacation. He purchased these, and the next day he bought all the paintings Grandma Moses had at her farm. In October of 1939, three of these paintings were exhibited at the "Contemporary Unknown Painters" show at New York's Museum of Modern Art. Her first one-woman show was held in New York City in 1940 and immediately she became famous. Her second one-woman show, also in New

York City, came two years later. By 1943 there was an overwhelming demand for her pictures, partially because her homespun, country scenes brought about wonderful feelings and memories for many people.

Most of Grandma Moses's paintings were done on pieces of strong cardboard, 24 by 30 inches or less. She regularly portrayed happy scenes of rural home life, sometimes picturing herself as a child. She also painted a number of historical pictures, usually about her ancestors, one of whom built the first wagon to run on the Cambridge Pike. In some works figures are dressed in eighteenth-century costumes, as people might have dressed in the country. Certain color schemes correspond to the various seasons: white for winter, light green for spring, deep green for summer, and brown for autumn. Among her most popular paintings are *The Old Oaken Bucket*, *Over the River to Grandma's House*, *Sugaring Off*, and *Catching the Turkey*.

Grandma Moses worked from memory, portraying a way of life she knew from experience. The people in her paintings are actively engaged in farm tasks, and, although separated, are part of the established order of seasonal patterns. In most paintings the landscape is shown as a large, scenic view and would be completed before the tiny figures were put in. Grandma Moses died on December 13, 1961.

Primitive art

Technically the work of primitive painters is distinguished by a conceptual (a general and broad view) rather than a visual or realistic and accurate approach to painting. This involves an innocent picture using a linear format (flat, one dimensional space) that portrays scenes and people with an absence of

weather in the skies and shadows around shapes. Some of the strengths of primitive painting lie in the feeling for pattern that is painted into the picture and the charm of the mood that is projected from the work. In Grandma Moses's paintings the viewer often feels the joy of life illustrated in the scenes. In *McDonnell's Farm* (1943), for example, a group of children are shown in a circular dance at the right, while all the other figures are busily engaged in farm tasks: one man loads the hay wagon, another harvests, another cuts the grass with a hooked tool called a scythe. In her paintings there is no despair, unhappiness, or aging, yet this unrealistic view of life is presented with remarkable power.

MOTHER TERESA

Born: August 27, 1910
Skopje, Macedonia

Died: September 5, 1997

Calcutta, India

Albanian nun

Mother Teresa's devotional work among the poor and dying of India won her the Nobel Prize for Peace in 1979. She is also known as the founder of the only Catholic religious order still growing in membership.

Early life

Mother Teresa of Calcutta was born Agnes Gonxha Bojaxhiu in Skopje, Macedonia, on August 27, 1910. At the time of her birth Skopje was located within the Ottoman Empire, a vast empire controlled by the Turks in the fifteenth and sixteenth centuries. Agnes was the last of three children born to Nikolla and Dranfile Bojaxhiu, Albanian grocers. When Agnes was nine years old, her happy, comfortable, close-knit family life was upset when her father died. She attended public school in Skopje, and first showed religious interests as a member of a school society that focused on foreign missions (groups that travel to foreign countries to spread their religious beliefs). By the age of twelve she felt she had a calling to help the poor.

This calling took sharper focus through Mother Teresa's teenage years, when she was especially inspired by reports of work being done in India by Yugoslav Jesuit missionaries serving in Bengal, India. When she was eighteen, Mother Teresa left home to join a community of Irish nuns, the Sisters of Loretto, who had a mission in Calcutta, India. She received training in Dublin, Ireland, and in Darjeeling, India, taking her first religious vows in 1928 and her final religious vows in 1937.

One of Mother Teresa's first assignments was to teach, and eventually to serve as principal, in a girls' high school in Calcutta. Although the school was close to the slums (terribly poor sections), the students were mainly wealthy. In 1946 Mother Teresa experienced what she called a second vocation or "call within a call." She felt an inner urging to leave the convent life (life of a nun) and work directly with the poor. In 1948 the Vatican (residence of the pope in Vatican City, Italy) gave her permission to leave the Sisters of Loretto and to start a new work under the guidance of the Archbishop of Calcutta.

Founding the Missionaries of Charity

To prepare to work with the poor, Mother Teresa took an intensive medical training with the American Medical Missionary Sisters in Patna, India. Her first venture in Calcutta was to gather unschooled children from the slums and start to teach them. She quickly attracted both financial support and volunteers. In 1950 her group, now called the Missionaries of Charity, received official status as a religious community within the Archdiocese of Calcutta. Members took the traditional vows of poverty, chastity (purity), and obedience, but they added a fourth vow—to give free service to the most poor.

The Missionaries of Charity received considerable publicity, and Mother Teresa used it to benefit her work. In 1957 they began to work with lepers (those suffering from leprosy, a terrible infectious disease) and slowly expanded their educational work, at one point running nine elementary schools in Calcutta. They also opened a home for orphans and abandoned children. Before

long they had a presence in more than twenty-two Indian cities. Mother Teresa also visited other countries such as Ceylon (now Sri Lanka), Australia, Tanzania, Venezuela, and Italy to begin new foundations.

Dedication to the very poor

Mother Teresa's group continued to expand throughout the 1970s, opening new missions in places such as Amman, Jordan; London, England; and New York, New York. She received both recognition and financial support through such awards as the Pope John XXIII Peace Prize and a grant from the Joseph Kennedy Jr. Foundation. Benefactors, or those donating money, regularly would arrive to support works in progress or to encourage the Sisters to open new ventures.

By 1979 Mother Teresa's groups had more than two hundred different operations in over twenty-five countries around the world, with dozens more ventures on the horizon. The same year she was awarded the Nobel Prize for Peace. In 1986 she persuaded President Fidel Castro (1926–) to allow a mission in Cuba. The characteristics of all of Mother Teresa's works—shelters for the dying, orphanages, and homes for the mentally ill—continued to be of service to the very poor.

In 1988 Mother Teresa sent her Missionaries of Charity into Russia and opened a home for acquired immune deficiency syndrome (AIDS; an incurable disease that weakens the immune system) patients in San Francisco, California. In 1991 she returned home to Albania and opened a home in Tirana, the capital. At this time there were 168 homes operating in India.

Mother Teresa.

Saint Teresa

Despite the appeal of this saintly work, all commentators remarked that Mother Teresa herself was the most important reason for the growth of her order and the fame that came to it. Unlike many “social critics,” she did not find it necessary to attack the economic or political structures of the cultures that were producing the terribly poor people she was serving. For her, the primary rule was a constant love, and when social critics or religious reformers (improvers) chose to demonstrate anger at the evils of structures underlying poverty and suffering, that was between them and God.

In the 1980s and 1990s Mother Teresa's health problems became a concern. She suffered a heart attack while visiting Pope John Paul II (1920–) in 1983. She had a near fatal heart attack in 1989 and began wearing a pacemaker, a device that regulates the heart-beat.

In March 1997, after an eight week selection process, sixty-three-year-old Sister Nirmala was named as the new leader of the Missionaries of Charity. Although Mother Teresa had been trying to cut back on her duties for some time because of her health, she stayed on in an advisory role to Sister Nirmala.

Mother Teresa celebrated her eighty-seventh birthday in August, and died shortly thereafter of a heart attack on September 5, 1997. The world grieved her loss and one mourner noted, "It was Mother herself who poor people respected. When they bury her, we will have lost something that cannot be replaced."

Legacy of Mother Teresa

In appearance Mother Teresa was both tiny and energetic. Her face was quite wrinkled, but her dark eyes commanded attention, radiating an energy and intelligence that shone without expressing nervousness or impatience. Conservatives within the Catholic Church sometimes used her as a symbol of traditional religious values that they felt were lacking in their churches. By most accounts she was a saint for the times, and several almost adoring books and articles started to canonize (declare a saint) her in the 1980s and well into the 1990s. She herself tried to deflect all attention away from what she did to either the works of her group or to the God who was her inspiration.

The Missionaries of Charity, who had brothers as well as sisters by the mid-1980s, are guided by the constitution Mother Teresa wrote for them. They have their vivid memories of the love for the poor that created the phenomenon of Mother Teresa in the first place. The final part of her story will be the lasting impact her memory has on the next generations of missionaries, as well as on the world as a whole.

WOLFGANG AMADEUS MOZART

Born: January 27, 1756

Salzburg, Austria

Died: December 5, 1791

Vienna, Austria

Austrian composer

Wolfgang Amadeus Mozart was an Austrian composer (a writer of music) whose mastery of the whole range of contemporary (modern) instrumental and vocal forms—including the symphony, concerto, chamber music, and especially the opera—was unchallenged in his own time and perhaps in any other.

Child prodigy

Wolfgang Amadeus Mozart was born on January 27, 1756, in Salzburg, Austria. His father, Leopold Mozart, a noted composer, instructor, and the author of famous writings on violin playing, was then in the service of the archbishop of Salzburg. Leopold and Anna Maria, his wife, stressed the importance of music to their children. Together with his sister, Nannerl, Wolfgang received such intensive musical training that by the age of six he was a budding composer and an accomplished keyboard performer. In 1762 Leopold presented his son as performer at the imperial court in Vienna, Austria, and from 1763 to 1766 he escorted both children on a continuous musical tour across Europe, which included long stays in Paris, France, and London, England, as well as visits to many other cities, with appearances before the French and English royal families.

Mozart was the most celebrated child prodigy (an unusually gifted child) of this time as a keyboard performer. He also made a great impression as a composer and improviser (one who arranges or creates). In London he won the admiration of musician Johann Christian Bach (1735–1782), and he was exposed from an early age to an unusual variety of musical styles and tastes across Europe.

Wolfgang Amadeus Mozart.
Courtesy of the Library of Congress.

Gaining fame

From the age of ten to seventeen, Mozart's reputation as a composer grew to a degree of maturity equal to that of most older established musicians. He spent the years from 1766 to 1769 at Salzburg writing instrumental works and music for school dramas in German and Latin, and in 1768 he produced his first real operas: the German Singspiel (that is, with spoken dialogue) *Bastien und Bastienne*. Despite his growing reputation, Mozart found no suitable post open to him; and his father once more escorted Mozart, at age fourteen (1769), and set off for Italy to try to make his way as an opera composer.

In Italy, Mozart was well received: in Milan, Italy, he obtained a commission for an opera; in Rome he was made a member of an honorary knightly order by the Pope; and at Bologna, Italy, the Accademia Filarmonica awarded him membership despite a rule normally requiring candidates to be twenty years old. During these years of travel in Italy and returns to Salzburg between journeys, he produced his first large-scale settings of opera seria (that is, court opera on serious subjects): *Mitridate* (1770), *Ascanio in Alba* (1771), and *Lucio Silla* (1772), as well as his first string quartets. At Salzburg in late 1771 he renewed his writing of Symphonies (Nos. 14–21).

In Paris and Vienna

Paris was a vastly larger theater for Mozart's talents. His father urged him to go there, for "from Paris the fame of a man of great talent echoes through the whole world," he wrote his son. But after nine difficult months in Paris, from March 1778 to January 1779, Mozart returned once more to Salzburg, having been unable to secure a foothold and depressed by the entire experience, which had included the death of his mother in the midst of his stay in Paris. Unable to get hired for an opera, he wrote music to order in Paris, again mainly for wind instruments: the *Sinfonia Concertante* for four solo wind instruments and orchestra, the Concerto for flute and harp, other chamber music, and the ballet music *Les Petits riens*. In addition, he began giving lessons to make money.

Mozart's years in Vienna, from age twenty-five to his death at thirty-five, cover one of the greatest developments in a short span in the history of music. In these ten years Mozart's music grew rapidly beyond the

realm of many of his contemporaries; it exhibited both ideas and methods of elaboration that few could follow, and to many the late Mozart seemed a difficult composer.

The major instrumental works of this period bring together all the fields of Mozart's earlier activity and some new ones: six symphonies, including the famous last three: no. 39 in E-flat Major, no. 40 in G Minor, and no. 41 in C Major (the *Jupiter*—a title unknown to Mozart). He finished these three works within six weeks during the summer of 1788, a remarkable feat even for him.

In the field of the string quartet Mozart produced two important groups of works that completely overshadowed any he had written before 1780: in 1785 he published the six Quartets (K. 387, 421, 428, 458, 464, and 465) and in 1786 added the single Hoffmeister Quartet (K. 499). In 1789 he wrote the last three Quartets (K. 575, 589, and 590), dedicated to King Frederick William (1688–1740) of Prussia, a noted cellist.

Operas of the Vienna years

Mozart's development as an opera composer between 1781 and his death is even more remarkable, perhaps, since the problems of opera were more far-ranging than those of the larger instrumental forms and provided less adequate models. The first important result was the German Singspiel entitled *Die Entführung aus dem Serail* (1782; *Abduction from the Seraglio*). Mozart then turned to Italian opera. Mozart produced his three greatest Italian operas: *Le nozze di Figaro* (1786; *The Marriage of Figaro*), *Don Giovanni* (1787, for Prague), and *Così fan tutte* (1790). In his last opera, *The Magic Flute* (1791), Mozart turned back to German opera, and he

produced a work combining many strands of popular theater and including musical expressions ranging from folk to opera.

On concluding *The Magic Flute*, Mozart turned to work on what was to be his last project, the *Requiem*. This Mass had been commissioned by a benefactor (financial supporter) said to have been unknown to Mozart, and he is supposed to have become obsessed with the belief that he was, in effect, writing it for himself. Ill and exhausted, he managed to finish the first two movements and sketches for several more, but the last three sections were entirely lacking when he died. It was completed by his pupil Franz Süssmayer after his death, which occurred in Vienna, Austria, on December 5, 1791.

HOSNI MUBARAK

Born: May 4, 1928

Kafr-El Meselha, Egypt

Egyptian president

Hosni Mubarak became president of Egypt after the assassination (political murder) of Anwar Sadat (1918–1981). He continued his country's peace with Israel, made efforts to bring peace to the entire Middle East, and cracked down on Islamic groups that participated in terrorist activities.

Early years

Hosni Mubarak was born on May 4, 1928 in the Nile delta province of Minufiya. He had four siblings and his father was a minor official in the Ministry of Justice. Mubarak's village of Kafr-El Meselha was known for its schools and had produced four cabinet ministers. Mubarak did well in school and completed primary schooling in his village and secondary studies in the nearby capital of Shibin El-Kom, Egypt, before going on to Egypt's Military Academy and then its Air Academy. He graduated from the Air Academy in 1950, completing his studies in only two years by attending year-round. He became a pilot and received part of his training in the former Soviet Union.

Military career

Mubarak was an instructor at the Air Academy and commanded Egypt's bomber force in the Yemen civil war in the 1960s. He was named director of the Air Academy in 1967 and given the important task of rebuilding the air force, which the Israelis had destroyed in the Six Day War of June 1967. Mubarak moved up to air force chief of staff in 1969 and commander in chief in 1972. He helped plan a successful surprise attack on Israeli forces occupying the east

Hosni Mubarak.

bank of the Suez Canal in October 1973, launching the Yom Kippur War.

President Sadat named Mubarak vice president in 1975. Sadat preferred the international spotlight to administrative work, so Mubarak took over the day-to-day running of the government, leading cabinet meetings and handling security details. He gained foreign affairs experience with many trips to other countries, including Syria, Iraq, the United States, and China. His experience was important in the talks leading to the 1978 Camp David Accords, agreements signed by Egypt and Israel that ended years of conflict.

Takes over as president

Mubarak escaped with a minor hand wound when Islamic fundamentalists (those who interpret their religious beliefs as law) assassinated Sadat in October 1981. Taking over as president, he moved quickly to crush an Islamic uprising and jailed over two-thousand five-hundred members of militant (engaging in violence) Islamic groups. Mubarak kept most of Sadat's foreign and domestic policies, including the Camp David treaty and Sadat's close ties to the United States. All the Arab states but three had criticized Egypt for the treaty with Israel, so Mubarak tried to rebuild relations with Jordan, Iraq, Saudi Arabia, and Palestine Liberation Organization leader Yasir Arafat (1929–). It was Mubarak who encouraged Arafat to compromise and recognize Israel's right to exist.

Throughout the 1980s Mubarak increased the production of affordable housing, clothing, furniture, and medicine. He also kept a close eye on his officials, firing ministers at the first hint of wrongdoing and fining members of parliament for unnecessary absences. Egypt's heavy dependence on U.S. aid and her hopes for U.S. pressure on Israel for a Palestinian settlement continued under Mubarak. He also quietly improved relations with the former Soviet Union. In 1987 Mubarak won election to a second six-year term.

More Middle East conflict

Mubarak was angered over the 1990 Iraqi invasion of Kuwait, and he sent forty-five thousand troops to help fight back against the Iraqis. In 1993 he was reelected with 96.3 percent of the vote, a sign of the Egyptian people's approval of his stand against Islamic fundamentalists. Plots to assassinate Mubarak had

surfaced in 1992, 1993, and 1995, after two policemen were killed in another attack against the president. But Mubarak continued his tough stance. His crackdown led to charges against his government of torture, threats to the press, and other human rights abuses.

In September 1999 Egyptian voters elected Mubarak to a fourth six-year term in office. In 2000 he became the first Egyptian head of state to visit Lebanon since 1952. He also continued his efforts to achieve peace in the Middle East, meeting with Arafat, Israeli Prime Minister Ehud Barak (1942–), and U.S. President Bill Clinton (1946–). During these meetings he urged the foreign leaders to end the violence for the benefit of the entire region. In October 2001 Mubarak ordered hundreds of Islamic militants to stand trial in Egyptian courts for participating in terrorist activities.

MUHAMMAD

Born: c. 570

Mecca, Arabia

Died: 632

Medina, Arabia

Arabian prophet

Muhammad was the founder of the religion of Islam and of a community at Medina that later developed into the Arab Empire.

Call to be a prophet

Muhammad was born after his father's death in Mecca, Arabia, around 570. His grandfather and mother both died when he was a child. As a child, he was unable by Arab custom to inherit anything. He was therefore relatively poor until about 595, when a wealthy woman, Khadija, asked him to go to Syria as a steward (protector, manager) of her trading supplies. After the successful accomplishment of the mission, she offered him marriage. She was a rich widow fifteen years his senior. She and Muhammad had four daughters, and several infant sons who died. From this time onward Muhammad was wealthy, but he began to spend time in solitary reflection on the problems of Mecca, where religious principles were being degraded and general unrest was in the city.

During a period of solitude around the year 610, Muhammad heard a voice as he meditated (focused his thoughts in a manner of prayer). The voice said, "You are the Messenger of God" (this being the title more frequently given to him by Muslims than that of prophet). Muhammad later decided he had heard the archangel Gabriel. He also found certain words "in his heart" (that is, his mind) as he meditated. Friends helped to convince him that he was called to convey messages from God to the Arabs as Moses (c. 1392–c. 1272 B.C.E.) and Jesus Christ (c. 6 B.C.E.–c. 30 C.E.) had done to the Jews and Christians. He continued to receive such messages from time to time until his death. They were collected into chapters and make up the Koran (Qur'an). The Koran, though sent through Muhammad, is held by Muslims to come from God.

Meccan preacher

At first Muhammad told these messages only to sympathetic friends, but from 612 or 613 he stated them publicly. Many people in Mecca, especially younger men, became followers of Muhammad. These members of his new religion of Islam became known as Muslims. In the course of time, however, resistance to Muhammad appeared among the leading merchants of Mecca, and he and his followers were sometimes mistreated. Apparently to escape the mistreatment, approximately eighty of his followers traveled to Ethiopia. About 616, pressure in the form of a boycott (refusal to trade with) was placed on the clan of Hashim to make it cease protecting Muhammad. But until after the death of the head of the clan, Muhammad's uncle Abu-Talib, it was felt that to abandon him would be dishonorable.

The new head, however, found a justified way to leave Muhammad behind, and it became virtually impossible for Muhammad to continue preaching in Mecca. In September 622, after secret negotiations over the previous two years, he settled in the area of Medina, two hundred miles to the north, where seventy of his followers had already gone. This "emigration" (leaving one's living place for another) is the Hijra (Latin, *hegira*), on which the Islamic era is based.

First years at Medina

The Arab clans of Medina mostly acknowledged Muhammad's prophethood and entered into association with him and the emigrants (those who leave their country) from Mecca. At first the emigrants depended on Medinese hospitality, but soon small groups of them began to attempt raids on

Meccan caravans. Later the Muslims of Medina also joined in. At first the raids had little success, but in March 624 a larger band of just over three hundred, led by Muhammad himself, defeated a supporting force of perhaps eight hundred Meccans with heavy losses. This was a serious blow to Meccan reputation, and the Muslims felt that God was defending Muhammad.

To teach Muhammad a lesson, the Meccans in March 625 invaded the Medinese area with about three thousand men. Many Muslims were killed before they could regain the safety of the hill. Militarily this was not a serious loss for Muhammad, since the Meccans had also suffered casualties and retreated immediately; but the loss shook the belief that God was defending him. Confidence was only gradually restored.

The next major event was the siege of Medina by ten thousand Meccans and allies in April 627. Muhammad protected the central part of the area by a trench that tricked the cavalry. After two weeks Meccans and their allies retreated. In March 628 the Meccans settled the Treaty of al-Hudaybiya with him. The treaty was a triumph for Muhammad. In the following months many nomadic (having to do with moving from area to area) tribesmen and a few leading Meccans joined Muhammad and became Muslims. When the treaty was criticized in January 630, Muhammad was able to march on Mecca with ten thousand men. Muhammad entered Mecca in triumph. Two weeks later two thousand joined Muhammad's army in opposing a concentration of tribesmen east of Mecca and shared in the victory of Hunayn.

New religion

By 630 the religion of Islam had become firmly rooted. In the earliest parts of the Koran, it emphasized God's goodness and power and called on men to acknowledge this in worship. It also stated the reality of the Day of Judgment, when men would be assigned to paradise or hell depending on their attitude toward God, their generosity with their wealth, and similar points. These matters were significant to the tensions of Mecca, which were seen as arising from the merchants' overconfidence in their wealth and power. The Koran contained attacks on idols (symbols of objects to be worshipped) and a resolve that "there is no deity but God."

The religious practices of the Muslims included communal worship or prayers several times a day touching the ground with the forehead in acknowledgement of God's majesty. They also gave alms (money to the poor). At Medina the fast (not eating any food) from sunrise to sunset during the month of Ramadan (sacred ninth month of the Islamic calendar) was introduced; and when circumstances made it possible, some of the ceremonies of the traditional pilgrimage (holy journey) to Mecca became a duty for Muslims.

Years of triumph

Beyond Medina a system of alliances was gradually built up with the nomadic Arab tribes. As Muhammad grew stronger, he came to insist that those wanting an association should become Muslims. After the conquest of Mecca and the victory at Hunayn in January 630, he was the strongest man in Arabia, and delegations came from tribes seeking alliance with him. When he died on

Muhammad.

Courtesy of the Library of Congress.

June 8, 632, he was in effective control of a large part of Arabia.

Muhammad's personality and achievement

Muhammad is said to have been a fast walker, of sturdy build, with a prominent forehead, a hooked nose, large brownish-black eyes, and a pleasant smile. He showed great charm in his dealings with people and, when appropriate, gentleness and even tenderness. Medieval Europe (500–1500), however, on the defensive against Arab armies and Islamic culture, came to look on him as a monster or demon.

At times Muhammad was indeed harsh to those in his power, but this was not out of keeping with the times. His marital relations—at his death he had nine wives and one concubine (a kept woman without marriage)—must also be judged in the framework of the times. A political purpose can be traced in all of his marriages. For his time he was a man seeking positive change for his people.

Politically Muhammad's greatest achievement was to create the framework that made possible the uniting of the Arab tribes. He also won over his chief Meccan opponents, and their administrative skills were later invaluable in conquering and ruling many provinces. The growth of the Arab Empire, and with it the religion of Islam, was made possible by favorable circumstances; but the opportunity would not have been grasped but for Muhammad's gifts as visionary, statesman, and administrator.

ELIJAH
MUHAMMAD

Born: October 7, 1897
Sandersville, Georgia
Died: February 25, 1975
Chicago, Illinois
African American religious leader

Elijah Muhammad was the leader of the Nation of Islam (“Black Muslims”) during their period of greatest growth in the mid-twentieth century. He was a major promoter of independent, black-operated businesses, institutions, and religion.

Early life

Elijah Muhammad was born Elijah (or Robert) Poole on October 7, 1897, near Sandersville, Georgia. His parents were former slaves who worked as sharecroppers (farming the owner’s land for a share of the crops) on a cotton plantation; his father was also a Baptist preacher. One of thirteen children, his schooling only lasted until he was nine; then Elijah had to work in the fields and on the railroad. His light skin color made him even more aware of the injustices (unfair treatments) that had been done to his ancestors. He left home at age sixteen to travel and work at odd jobs. He settled in Detroit, Michigan, in 1923, working on a car assembly line.

Poole became an early follower of W. D. Fard (c. 1877–c. 1934), the founder of the Nation of Islam, a religious faith practiced by Muslims in which Allah is the one god and Muhammad is his prophet (one who speaks through messages from a divine source). Fard

appeared in Detroit in 1930, selling silk goods and telling his customers in the African American ghetto of their ancestral “home-land” across the seas. Fard proclaimed Islam the one correct religion for African Americans, denouncing Christianity as the religion of the slave masters. Soon Fard announced the opening of the Temple of Islam. It featured an unorthodox (nontraditional) form of Islam, but the movement also emphasized African American self-help and education.

Life as leader

Fard disappeared, as mysteriously as he had arrived, in the summer of 1934. The movement he had founded quickly developed several smaller groups. The most important was led by Poole, who had become a top leader to Fard and who had changed his name along the way to Elijah Muhammad. The movement had long had a policy of requiring members to drop their “slave” names.

Settling in Chicago, Illinois, Muhammad built what quickly became the most important center of the movement. Chicago soon featured not only a Temple of Islam, but a newspaper called *Muhammad Speaks*, a University of Islam, and several apartment houses, grocery stores, and restaurants—all owned by the movement. Temples were opened in other cities, and farms were purchased so that “pure” food could be made available to members. The movement was very controlled. Members had strict rules to follow regarding eating (various foods, such as pork, were forbidden), smoking and drinking (both banned), dress and appearance (conservative, neat clothing and good grooming were required), and personal

Elijah Muhammad.

behavior—drugs, the use of foul language, gambling, listening to music, and dancing were all not allowed.

Muhammad also revised the religion of the movement. Under his system Fard was proclaimed the earthly representative of Allah, and Elijah Muhammad was his divinely appointed prophet. Muhammad also taught that black people were the original human beings and that white people had been given a temporary privilege to govern the world. That period, however, was due to end soon; the time was at hand for black people to resume their former dominant role.

In 1942 Muhammad was one of a group of militant African American leaders arrested on charges of violation of the draft laws. He was accused of sympathizing with the Japanese during World War II (1939–45; a war fought between the Axis—Germany, Japan, and Italy—and the Allies—England, France, the Soviet Union, and the United States) and of encouraging his members to resist the military draft. He had, indeed, argued that white people oppressed (forced down) all people of color, and that it made no sense for African Americans to fight those who were victims of white discrimination (an unjust treatment or judgment because of differences) as much as they themselves were. For his words and actions Muhammad spent four years, from 1942 to 1946, in a federal prison at Milan, Michigan.

Splintering off

Small groups of like-minded individuals occasionally withdrew from Muhammad's movement. In the early 1960s Muhammad came to be overshadowed by the charming Malcolm X (1925–1967), leader of the New York Temple. In 1964 Malcolm X founded his own movement, which moved toward a more traditional form of Islam. However, Malcolm X was assassinated on February 21, 1965.

Elijah Muhammad died on February 25, 1975. After his death the leadership of his movement passed to his son, Wallace (now Warith) Deen Muhammad, who renamed the movement the World Community of Al-Islam in the West, and then the American Muslim Mission. Warith Muhammad relaxed the strict dress code, abandoned resistance to military service, encouraged members to vote and to salute the flag, and even opened the

movement to white people. In general, he made the movement much more conventionally Islamic.

Many members were disturbed at the movement's new, moderate direction. The most important of them formed a new group called the Nation of Islam, led by Louis Farrakhan (1933–). Farrakhan generally retained Elijah Muhammad's ideas and practices.

JOHN MUIR

Born: April 21, 1838

Dunbar, Scotland

Died: December 24, 1914

Los Angeles, California

Scottish-born American naturalist and explorer

The writings of John Muir, American naturalist (a scientist of natural history) and explorer, are important for their scientific observations and their contributions to the cause of conservation (the preservation and protection of natural resources).

Early life

John Muir was born in Dunbar, Scotland, on April 21, 1838. He was the third of Daniel and Anne Gilrye Muir's eight children. Muir recalled in *The Story of My Boyhood and Youth* (1913) that his father was religious and extremely strict, keeping his children in line with frequent whippings. In 1849 the Muirs moved to the United States and bought farmland near Portage, Wisconsin. Muir's father worked him hard on the farm and would not allow him to waste daylight hours on reading. Muir asked for and received permission to rise early in order to study. He invented an "early-rising machine" that dumped him out of bed at one o'clock each morning so that he could read. In 1860 he displayed this and other inventions at the Wisconsin State Fair.

Student of nature

In 1861 Muir entered the University of Wisconsin to study science. He also tried studying medicine but soon gave it up for various jobs that challenged his skill at inventing things. His interest in nature, particularly plants, was growing; he made frequent trips throughout Wisconsin and nearby states to observe plant life. In 1867 he gave up his own inventions "to study the inventions of God." He set out on the walk described in *A Thousand Mile Walk to the Gulf* (1916). Actually, he went as far as Cuba. In 1868 he traveled to San Francisco, California, and worked on a sheep ranch. Exploring Yosemite Valley occupied much of his next six years. On all of his explorations he kept a journal of scientific and personal observations and also pencil drawings.

In 1880, after returning from exploring in Alaska, Muir married Louie Wanda

John Muir.

Reproduced by permission of Archive Photos, Inc.

Strentzel, the daughter of a Polish plant grower. They would have two children. In 1881, after another trip to Alaska, Muir settled on a fruit ranch near Martinez, California. He worked for ten years to make enough money to enable him to stop. Having provided permanently for his wife, two daughters, and himself, he turned his full attention to the study of nature. Glaciers and freezing particularly interested him, and his work contributed to an explanation of the process by which glaciers are formed. He also went on expeditions to Europe, Asia, and Australia.

Pioneer in conservation movement

In 1889 Muir argued in *Century* magazine that Yosemite Valley should become a national park. The passage of a law in 1890 making that happen owed much to Muir's influence. *The Mountains of California* (1893), *Our National Parks* (1901), and his many articles in popular magazines greatly advanced the conservation movement, as did his creation in 1892 of the Sierra Club, an organization dedicated to preserving wild lands such as Yosemite. Muir served as the president of the club until his death.

Muir's wife died in 1905. From then until his death Muir published four books, including *Stickeen* (1909), which was a popular dog story, and *My First Summer in the Sierra* (1911). He died in Los Angeles, California, on December 24, 1914. *John of the Mountain*, drawn from Muir's journal of his 1899 Alaskan expedition, was published in 1938.

EDVARD MUNCH

Born: December 12, 1863

Loieten, Norway

Died: January 23, 1944

Oslo, Norway

Norwegian painter and artist

The Norwegian painter and graphic artist Edvard Munch illustrated man's emotional life in love and death. His art was a major influence of the expressionist movement, in which where artists sought to give rise to emotional responses.

Early life

Born on December 12, 1863, in Loieten, near Kristiania (now Oslo), Norway, Edvard Munch was the son of a military doctor. Childhood experiences with death and sickness—both his mother and sister died of tuberculosis (an often-fatal disease that attacks the lungs and bones)—greatly influenced his emotional and intellectual development. This and his father's fanatic Christianity led Munch to view his life as dominated by the “twin black angels of insanity and disease.”

After studying engineering, Munch soon turned to art. In 1880 Munch began to study art and joined the realist painters (school of painters who sought to depict their subjects as realistically as possible) and writers of the Kristiania bohemian (fashionable and uncon-

ventional) circle. His ideas were strongly influenced at this time by the writer Hans Jaeger (1854–1910), who sought to establish an ideal society based on materialist atheism (not believing in material wealth) and free love. Jaeger's hopeless love affair with the wife of Christian Krohg, leader of the bohemian painters, and Munch's own brief affairs caused him to intensify the connection he saw between women, love, and death.

Munch's paintings during the 1880s were dominated by his desire to use the artistic vocabulary of realism to create subjective content, or content open to interpretation of the viewer. His *Sick Child* (1885–1886), which used a motif (dominant theme) popular among Norwegian realist artists, created through color a mood of depression that served as a memorial to his dead sister. Because of universal critical rejection, Munch turned briefly to a more mainstream style, and through the large painting *Spring* (1889), a more academic version of the *Sick Child*, he obtained state support for study in France.

A change

After studying briefly at a Parisian art school, Munch began to explore the possibilities made available by the French postimpressionists, a movement that looked to push impressionism beyond its limitations. The death of his father in 1889 caused a major spiritual crisis, and he soon rejected Jaeger's philosophy. Munch's *Night in St. Cloud* (1890) embodied a renewed interest in spiritual content; this painting served as a memorial to his father by presenting the artist's dejected state of mind. He summarized his intentions, saying "I paint not what I see, but what I saw," and identified his paintings as "symbolism: nature

Edvard Munch.

viewed through a temperament" (manner of thinking). Both statements accent the transformation of nature as the artist experienced it.

In 1892 the Berlin Artists' Association, an official organization consisting primarily of German academic artists, invited Munch to exhibit in Berlin, Germany. His paintings created a major scandal in Germany's artistic capital, and the exhibition was closed. But Munch used the publicity to arrange other exhibitions and sell paintings; his art prospered and he decided to stay in Germany. He also began work on a series of paintings later entitled the *Frieze of Life*, which concentrated on the themes of love, anxiety, and death.

To make his work accessible to a larger public, Munch began making prints (works of art that could be easily copied) in 1894. Motifs for his prints were usually derived from his paintings, particularly the *Frieze*. The *Frieze* also served as the inspiration for the paintings he made for Max Linde (1904), Max Reinhardt's *Kammerspielhaus* (1907), and the *Freia Chocolate Factory in Oslo* (1922).

Later years

Following a nervous breakdown, Munch entered a hospital in Copenhagen, Denmark, in 1908. In the lithograph (a type of print) series *Alpha and Omega* he depicted his love affairs and his relationship to friends and enemies. In 1909 he returned to Norway to lead an isolated life. He sought new artistic motifs in the Norwegian landscape and in the activities of farmers and laborers. A more optimistic view of life briefly replaced his former anxiety, and this new life view attained monumental expression in the murals of the Oslo University Aula (1911–1914).

During World War I (1914–18), when Germany led forces against the forces of much of Europe and the United States, Munch returned to his earlier motifs of love and death. Symbolic paintings and prints appeared side by side with stylized studies of landscapes and nudes during the 1920s. As a major project, never completed, he began to illustrate Henrik Ibsen's (1828–1906) plays. During his last years, plagued by partial blindness, Munch edited the diaries written in his youth and painted harsh self-portraits and memories of his earlier life. He died in Ekely outside Oslo on January 23, 1944.

RUPERT MURDOCH

Born: March 11, 1931

Melbourne, Australia

Australian publisher

Starting out as a newspaper publisher in his native Australia, Rupert Murdoch became a powerful media entrepreneur (someone who begins a business venture) with many publications in England and the United States. His style of journalism brought criticism from serious readers but served the entertainment needs of a wide audience.

Early life

Born March 11, 1931, in Melbourne, Australia, Keith Rupert Murdoch was the second son of a distinguished journalist. He and his two sisters and a brother were raised on a farm. His mother surrounded her children with classics in literature as well as music, with their living room hosting a grand piano.

Rupert learned to ride horses at the age of five. His childhood has been described as ideal. His father, Sir Keith Murdoch, was a celebrated World War I (1914–18) reporter, who later became chief executive of the leading Melbourne *Herald* newspaper group.

After studying at Oxford University in England, Murdoch entered journalism as a reporter for the Birmingham *Gazette* and served an apprenticeship at the London *Daily Express*, where he learned the secrets of building circulation (average number of copies of a publication sold over a given time period). Returning to Australia to begin his publishing career, Murdoch revived the Adelaide *News* that he had inherited after his father's death in 1952.

Publishing world

In the process of expanding his \$1.4 billion-a-year News Corporation Limited, Murdoch often heard from critics who disliked his entertaining style of journalism. He applied a recognizable formula to most of his papers. His trademark operations included rigid cost controls, circulation gimmicks (tricks to gain sales), flashy headlines, and a steady emphasis on sex, crime, and scandal stories. Murdoch's brand of publishing was scorned as rude and irresponsible by his fellow publishers.

In early 1969 Murdoch became a London publisher when he gained control of the Sunday paper *News of the World*, the largest English-language circulation paper in the world. Later in 1969 he bought a worn-down liberal paper, the *Sun*, which he transformed into an eye-catching tabloid featuring daily displays of a topless girl on page three. The *Sun* became the most profitable paper in his

Rupert Murdoch.

Reproduced by permission of AP/Wide World Photos.

empire. In 1981 Murdoch bought the failing but prestigious London *Times*.

Murdoch expanded into the American market in 1973 when he acquired the San Antonio *Express and News*. In early 1974 he started the weekly tabloid the *National Star* (later renamed *Star*) to compete with the popular *Enquirer*. It adopted a format based on celebrity gossip, health tips, and self-help advice that boosted its circulation to almost four million.

In his quest for a big-city audience, Murdoch surprised the publishing world in 1976

when he bought the *New York Post*, a highly regarded liberal (open-minded) paper. By changing its image he nearly doubled the circulation. Murdoch's newspaper style, though, did not fare as well in the United States as in Britain. The *New York Post* was a steady financial drain despite its increased circulation. Murdoch's formula did not attract advertisers. His American papers did not show a profit until 1983.

Murdoch was seen as an effective popular journalist who gave his readers what they wanted. Ignoring his critics, he regarded most papers as too snobbish in their approach and too boring in appearance. He preferred a bright and entertaining product that would attract the largest body of readers.

Branching out

In 1983 Murdoch purchased a controlling interest (a majority of the company's stock that allowed him to make decisions for the company) in Satellite Television, a London company. His plan for beaming programs from satellites directly to homes equipped with small receivers did not progress, and his attempt to gain control of Warner Communications and its large film library did not succeed. In 1985, however, he did purchase the film company Twentieth Century Fox. A year later he bought six (Metromedia) television stations and sought to create a fourth major network called Fox Television. The United States does not permit foreign nationals to own broadcast stations. In order to maintain his control of Fox Television, Murdoch became a citizen of the United States in 1985. In 1987 he bought the U.S. publishing house Harper and Row.

Other than publishing, Murdoch's busi-

ness interests include two television stations in Australia, half ownership in the country's largest private airlines, book publishing, records, ranching, gas and oil exploration, and a share in the British wire service Reuters News Corporation Limited, which earned almost \$70 million in 1983.

Murdoch's personal wealth has been estimated at over \$340 million. Seen as fierce in his business dealings, Murdoch is known to be shy in his personal life. Living primarily in New York, he guarded his privacy with his wife Anna (a former *Sydney Daily Mirror* reporter) and their four children, one by a previous marriage. Murdoch divorced Anna in 1999 and married Wendi Deng, a former television executive more than thirty years his junior. In April 2000 he was diagnosed and treated for a "low grade" form of cancer. His radiation treatments did not slow his work pace. In 2001 Wendi had a baby girl, making Murdoch a father for the fifth time.

BENITO MUS SOLINI

Born: July 29, 1883

Predappio, Italy

Died: April 28, 1945

Como, Italy

Italian dictator

Benito Mussolini was head of the Italian government from 1922 to 1943. He was the founder of fascism, and as a dictator he held absolute power and severely mistreated his citizens and his country. He led Italy into three straight wars, the last of which led to his overthrow by his own people.

Early life and career

Benito Mussolini was born at Dovia di Predappio, Italy, on July 29, 1883. The Mussolinis were a poor family who lived in a crowded two-bedroom apartment. His father was a blacksmith and a follower of socialism (a system providing for the sharing of land and goods equally among all people); his mother taught elementary school. Benito, although intelligent, was violent and had a large ego. He was a poor student at school and learned very little. As a student at a boarding school in Faenza, Italy, Mussolini stabbed another student, and as a result he was expelled. After receiving his diploma in 1901 he briefly taught secondary school. He went to Switzerland in 1902 to avoid military service, where he associated with other socialists. Mussolini returned to Italy in 1904, spent time in the military, and engaged in politics full time thereafter.

Mussolini had become a member of the Socialist Party in 1900 and had begun to attract wide admiration. In speeches and articles he was extreme and violent, urging revolution at any cost, but he was also well spoken. Mussolini held several posts as editor and labor leader until he emerged in the 1912 Socialist Party Congress. He became editor of the party's daily paper, *Avanti*, at the age of twenty-nine. His powerful writing injected excitement into the Socialist ranks. In a party that had accomplished little in recent years, his youth and his intense nature was an advantage. He called for revolution at a time when revolutionary feelings were sweeping the country.

From Socialist to Fascist

Mussolini deserted the Socialist Party in 1914 to cross over to the enemy camp, the Italian middle class. He knew that World War I (1914–18) would bury the old Europe, and he began to prepare for “the unknown.” In late 1914 he founded an independent newspaper, *Popolo d'Italia*, and backed it up with his own movement, the Autonomous Fascists. He drew close to the new forces in Italian politics, the extreme middle-class youth, and he made himself their spokesman. The Italian working class now called Mussolini “Judas” and “traitor.” Mussolini was wounded during army training in 1917, but he managed to return to politics that same year. His newspaper, which he now backed with a second political movement, Revolutionary Fascists, was his main strength. After the war, Mussolini's career declined. He organized his third movement, Constituent Fascists, in 1918, but it did not survive. Mussolini ran for office in the 1919 parliamentary elections but was defeated.

Benito Mussolini.

Reproduced by permission of AP/Wide World Photos.

In March 1919 Mussolini founded another movement, Fighting Fascists, won the favor of the Italian youth, and waited for events to favor him. The elections in 1921 sent him to Parliament at the head of thirty-five Fascist deputies; the third assembly of his movement gave birth to a national party, the National Fascist Party, with more than 250 thousand followers and Mussolini as its uncontested leader. In October 1922 Mussolini successfully marched into Rome, Italy. He now enjoyed the support of key groups (industry, farmers, military, and church), whose members accepted Mussolini's solution to their problems: organize

middle-class youth, control workers harshly, and set up a tough central government to restore "law and order." Thereafter, Mussolini attacked the workers and spilled their blood over Italy. It was the complete opposite of his early views of socialism.

Fascist state

Once in power, Mussolini took steps to remain there. He set general elections, but they were fixed to always provide him with an absolute majority in Parliament. The assassination of the Socialist leader Giacomo Matteotti, a noted opponent, by Fascist followers reversed his fortunes and nearly brought him down. Mussolini, however, recovered. He suspended civil liberties, destroyed all opposition, and imposed open dictatorship (absolute rule). In 1929 his Concordat with the Vatican settled the historic differences between the Italian state and the Roman Catholic Church. Pope Pius XI (1857–1939) said that Mussolini had been sent "by Divine Providence."

As the 1930s began, Mussolini was seated safely in power and enjoyed wide support. The strongest groups who had put Mussolini into power now profited from it. However, the living standard of the working majority fell; the average Italian worker's income amounted to one-half of that of a worker in France, one-third of that of a worker in England, and one-fourth of that of a worker in America. As national leader, Mussolini offered no solutions for Italy's problems. He surrounded himself with ambitious and greedy people and let them bleed Italy dry while his secret agents gathered information on opponents.

Mussolini's three wars

In 1930 economic depression (a decline in the production of goods because of a decline in demand, accompanied by rising unemployment) arrived in Italy. Mussolini reacted at first with a public works program but soon shifted to foreign adventure. The 1935 Ethiopian War was planned to direct attention away from internal problems. The "Italian Empire," Mussolini's creation, was announced in 1936. The 1936 Spanish intervention, in which Mussolini aided Francisco Franco (1892–1975) in Spain's civil war, followed but had no benefit for Italy. Mussolini then joined forces with German dictator Adolf Hitler (1889–1945) and in 1938 began to attack Jewish people within the country just as Germany was doing. As the 1930s ended, Mussolini was losing all his support within Italy.

The outbreak of World War II (1939–45) left Mussolini an unimportant figure in world politics, and he worried that Hitler would redraw the map of Europe without him. He decided "to make war at any cost." The cost was clear: modern industry, modern armies, and popular support. Mussolini lacked all of these. Nonetheless, in 1940 he pushed Italy into war against the will of the people, ignoring the only meaningful lesson of World War I: the United States alone had decided that conflict, and therefore America, not Germany, was the most important power.

Disaster and death

In 1940–41 Mussolini's armies, badly supplied and poorly led, suffered defeats from Europe across the Mediterranean to the African continent. Italy lost its war in 1942; Mussolini's power collapsed six months later. Restored as Hitler's puppet in northern Italy in 1943, he drove Italy deeper into invasion, occupation, and civil war during 1944 and 1945. The end approached, but Mussolini struggled to survive. He was finally executed by a firing squad on April 28, 1945, at Dongo in Como province.

VLADIMIR NABOKOV

Born: April 23, 1899

St. Petersburg, Russia

Died: July 2, 1977

Montreaux, Switzerland

Russian-born American writer and poet

Russian-born American poet, fiction writer, and butterfly expert Vladimir Nabokov, most famous for the novel *Lolita*, noted for his dramatic descriptions, experimental style, and carefully structured plots, was one of the most highly acclaimed novelists of his time.

Gifted child

Vladimir Nabokov was born in St. Petersburg, Russia, on April 23, 1899, one of Vladimir Dmitrievich Nabokov and Helene Rukavishnikov Nabokov's five children. Nabokov's parents were wealthy and encouraged him to develop his imagination. He studied languages, mathematics, puzzles, and games, including chess, soccer, and boxing. He was educated by private tutors and read English before he read Russian. He entered Prince Tenishev School in St. Petersburg at age eleven. Interested in butterflies his entire life, he became a recognized authority on the subject while still young. Nabokov began writing poems when he was thirteen years old and, as he described it, "the numb fury of

Vladimir Nabokov.

Reproduced by permission of AP/Wide World Photos.

verse making first came over me.” His first book of poetry was published in 1914.

Nabokov’s father, a lawyer and newspaper editor, was part of a failed movement to establish democracy (a system of government where the people rule) in Russia. The family lost its land and fortune after the Russian Revolution (a Communist overthrow of the government) in 1917 and fled to London, England, where Nabokov entered Cambridge University in 1919. Nabokov graduated in 1922 and rejoined his family in Berlin, Germany, where his father was shot to death by a monarchist (a believer in absolute rule by a single person).

Begins writing career

Nabokov married Vera Slonim in 1925. They had one son, Dmitri, who later became an opera singer. In Berlin Nabokov taught boxing, tennis, and languages and constructed crossword puzzles. He began writing under the name “V. Sirin,” selling stories, poems, and essays to Russian-language newspapers in Berlin and then Paris, France. His work included translating different stories and poems into Russian and writing short stories, plays, novels, and criticism. In 1940 he moved to the United States.

In 1940 Nabokov taught languages at Stanford University in California. From 1941 to 1948 he taught at Wellesley College in Massachusetts, where he became a professor of literature. He also did research in entomology (the study of insects) at the Museum of Comparative Zoology at Harvard University in Massachusetts from 1942 to 1948. He later discovered several species of butterflies, including “Nabokov’s wood nymph.” While teaching he wrote *The Real Life of Sebastian Knight* (1941), a parody (humorous imitation) of a mystery story whose hero is based on the author’s own life. In 1944 he completed a study of the life of Russian author Nicolai Gogol (1809–1852). Nabokov became an American citizen in 1945. By then his stories were appearing regularly in popular magazines.

Nabokov’s 1947 novel *Bend Sinister* is about an intellectual’s battle with a police state. In 1949 Nabokov was appointed professor of Russian and European literature at Cornell University in New York, where he taught until 1959. He wrote a book of memories of his life in Russia, *Speak, Memory*, in 1951. Several short sketches published in the

New Yorker were put together in *Pnin* (1957), his novel about a Russian teaching at an American university.

Popular success

Nabokov remained unknown to the general public until writing *Lolita*, a sad but funny account of Humbert Humbert, a middle-aged professor who falls for a twelve-year-old schoolgirl. It was first published in Paris in 1955. After its American release in 1958, some U.S. libraries banned it. The publicity helped the book become immensely popular. Nabokov also wrote the screenplay (the script for a movie) for the 1962 movie version of the book. With profits from the novel and the film, Nabokov was able to quit teaching and devote himself entirely to his writing and butterfly hunting.

In 1959 Nabokov published *Invitation to a Beheading*, a story of a man awaiting execution, which he had first written in Russian in 1938. In 1960 he moved his family to Montreux, Switzerland. He received critical praise for *Pale Fire* (1962), written as a 999-line poem with a long speech by an unstable New England scholar who is actually a mythical king in exile.

Later works

In 1963 Nabokov's English translation of Alexander Pushkin's (1799–1837) romantic novel *Eugene Onegin* was published. Nabokov called the four-volume work his "labor of love." Several translations of earlier Russian works followed, including *The Defense*, a novel about chess. Nabokov constructed his novels like puzzles, rather than

working from beginning to end. In 1964 he told *Life* magazine, "Writing has always been for me a torture and a pastime." Nabokov died on July 2, 1977, at the Palace Hotel in Montreaux.

In April 2000 *Nabokov's Butterflies: Unpublished and Uncollected Writings*, which contained fiction, poems, nonfiction, and writings related to Nabokov's love of butterflies, was published. Dmitri Nabokov translated it from Russian.

RALPH
NADER

Born: February 27, 1934

Winsted, Connecticut

American activist, social crusader, and lawyer

Ralph Nader.

Reproduced by permission of AP/Wide World Photos.

American social crusader and lawyer Ralph Nader became a symbol of the public's concern over the business practices of large corporations. He inspired investigations that were meant to improve the operations of industries and government bureaus. He also ran for president and tried to bring about changes in the elective process to provide voters with more choices.

Dinner table discussions

Ralph Nader was born on February 27, 1934, in Winsted, Connecticut, the youngest of four children of Nadra and Rose

(Bouziane) Nader, Lebanese immigrants who operated a local restaurant and bakery. His parents led the family in political discussions every night around the dinner table. His father was against any kind of injustice and insisted that every person had an obligation to try to make the world a better place.

Nader was interested in the law at an early age; he loved reading copies of the Congressional Record (printed speeches of members of Congress) that his high-school principal gave him. He graduated from Princeton University's Woodrow Wilson School of Public and International Affairs in 1955 and then went to Harvard Law School, receiving his degree in 1958. His role as an activist began developing during college. While at Princeton he attempted, but failed, to stop the spraying of campus trees with a pesticide (spray to kill insects) called DDT. He considered pesticides to be dangerous and harmful to the environment. Nader served briefly in the U.S. Army, traveled, then opened a law office in Hartford, Connecticut. He also lectured in history and government at the University of Hartford.

Auto safety watchdog

Nader was one among many concerned about safety in auto design. While still at Harvard, he had studied auto injury cases and came to believe that design flaws, rather than driver mistakes, were responsible for the large numbers of car accidents. He testified on the subject before state legislative committees and wrote articles for magazines. In 1964 Nader was appointed a consultant (a person who provides professional advice or services) to the Department of Labor and began to study auto safety in depth. He also worked with the Government Operations Subcom-

mittee headed by Senator Abraham A. Ribicoff (1910–1998), providing it with data on auto accidents. In 1965 he left the department to prepare a book on the subject.

Nader's book *Unsafe at Any Speed: The Designed-in Dangers of the American Automobile* (1965) appeared while Ribicoff's committee was holding hearings on the subject of auto safety. Nader, after testifying before the committee, became a target of auto manufacturers then dealing with lawsuits by victims of auto accidents who blamed it on bad car designs. Although new safety laws would have eventually been established, the issue attracted public interest after Nader revealed that he had been personally harassed and his private life investigated by detectives working for General Motors. The admission in March 1966 by General Motors president James M. Roche that his firm had indeed had Nader investigated received national television coverage and made Nader a public figure. These events helped speed up the process of establishing new auto safety laws. In 1966, the National Traffic and Motor Vehicle Safety Act was passed. Nader's book became a best-seller and a factor in the new safety legislation becoming law in September. He broadened his investigations of the auto industry and the National Traffic Safety Agency, which was responsible for enforcing the new law. In November he sued General Motors for \$26 million for invasion of privacy.

Birth of "Nader's Raiders"

Nader then began a series of studies in various fields aimed at improving responsible industrial production. These included safety in mines and control of oil and gas pipes that were dangerous to people and the environ-

ment. Nader also worked on behalf of what became the 1967 Wholesome Meat Act. By being careful with his money, working efficiently, and using his income from book sales, article writing, and lectures, Nader attracted over a hundred young people—soon known as "Nader's Raiders"—from law schools and elsewhere. They helped him gather data about industries and government bureaus. In 1969 he founded his Center for the Study of Responsive Law (an organization that conducts research and publishes reports about consumer issues). In August 1970 Nader was awarded \$425,000 from his lawsuit against General Motors, funds he promptly put into his crusade.

From the late 1970s through the early 1990s, Nader's public image faded from his *Unsafe at Any Speed* days. By 1988, however, he campaigned successfully to reduce California car-insurance rates and used public opinion to help block a proposed 50-percent pay hike for members of Congress. He gained notoriety in 1990 when a *Forbes* magazine story accused him of working together with trial lawyers for supporting Americans' right to sue. The criticism failed to stop him from looking into other issues; he soon turned his attention to investigating safety flaws in the airline industry. But his book on the subject, *Collision Course: The Truth About Airline Safety*, with Wesley J. Smith (1949–), was criticized by some for its questionable use of data.

Presidential campaigns

After failing to stop the North American Free Trade Agreement (1993; an agreement between Canada, Mexico, and the United States to reduce tariffs and eliminate other barriers to trade), Nader was nominated as

the 1996 Green Party (a political party that focuses mainly on ecological and environmental issues) candidate for president, winning some support in popular polls. Nader himself summed up his philosophy this way: "You've got to keep the pressure on, even if you lose." In 1997 Nader again teamed with Wesley J. Smith to write *No Contest: Corporate Lawyers and the Perversion of Justice in America*. The book explored the business of law in which, the authors suggested, profit is more important than justice. In 1988 Nader launched Commercial Alert, an organization that fights against harmful and excessive advertising and marketing.

In June 2000 Nader again accepted the presidential nomination of the Green Party. He promised to run a campaign that focused on policies to address the gap between the rich and the poor, improve health insurance for all Americans, and challenge corporations to end practices that waste the country's resources and harm the environment. He argued that since he could see no real difference between George W. Bush (1946–) and Al Gore (1948–), the Republican and Democratic candidates, the two-party system did not give voters enough choice. Nader wound up with only 3 percent of the vote, but in one of the closest elections ever, Democrats criticized him for taking votes away from Gore and causing Bush to win key states and, therefore, the election. Nader shrugged off the criticism and went back to work to strengthen the Green Party and prepare for the next round of elections.

NAPOLEON BONAPARTE

Born: August 15, 1769

Ajaccio, Corsica

Died: May 5, 1821

Island of St. Helena

French dictator

Napoleon Bonaparte, French emperor, was one of the greatest military leaders in history. He helped remake the map of Europe and established many government and legal reforms, but constant battles eventually led to his downfall.

Early years

Napoleon Bonaparte was born Napoleon Buonaparte on August 15, 1769, in the Corsican city of Ajaccio. He was the fourth of eleven children of Carlo Buonaparte and Letizia Romolino. His father, a member of a noble Italian family, remained on good terms with the French when they took over control of Corsica.

Napoleon began his education at a boys' school in Ajaccio. Then, at age ten, he was allowed to enter French military schools for aristocrats and was sent in 1779, with his

older brother Joseph, to the College of Autun in Burgundy, France. Napoleon later transferred to the College of Brienne, another French military school. While at school in France, he was made fun of by the other students for his lower social standing and because he spoke Spanish and did not know French well. His small size earned him the nickname of the “Little Corporal.” Despite this teasing, Napoleon received an excellent education. When his father died, Napoleon led his household.

By 1785 Napoleon was a second lieutenant in the French army, but he often returned to Corsica. In 1792 he took part in a power struggle between forces supporting Pasquale Paoli (1725–1807), a leader in the fight for Corsican independence, and those supporting the French. After Paoli was victorious, he turned against Napoleon and the Bonaparte family, forcing them to flee back to France. Napoleon then turned his attention to a career in the army there. The French Revolution (1789–93), a movement to overthrow King Louis XVI (1754–1793) and establish a republic, had begun. Upon his return from Corsica in 1793, Napoleon made a name for himself and won a promotion by helping to defeat the British at Toulon and regain that territory for France.

Military successes

After being imprisoned for ten days on suspicion of treason and refusing assignment to lead the Army of the West, Napoleon was assigned to work for the map department of the French war office. His military career nearly ended, but when forces loyal to the king attempted to regain power in Paris in 1795, Napoleon was called in to stop the

Napoleon Bonaparte.

uprising. As a reward he was appointed commander of the Army of the Interior. Later that year Napoleon met Josephine de Beauharnais (1763–1814), and they were married in March 1796. Within a few days Napoleon left Josephine in Paris and started his new command of the Army of Italy. Soon the French troops were winning battle after battle against the Italians and Austrians. Napoleon advanced on Vienna, Austria, and engineered the signing of a treaty that gave France control of Italy.

Napoleon returned to Paris a hero, and he soon decided to invade Egypt. He sailed from Toulon, France, in May 1798 with an

army of thirty-five thousand men. With only a few losses, all of lower Egypt came under Napoleon's control. He set about reorganizing the government, the postal service, and the system for collecting taxes. He also helped build new hospitals for the poor. However, at this time a group of countries had banded together to oppose France. Austrian and Russian forces had regained control of almost all of Italy. Then, in August 1798, the British destroyed French ships in the Battle of the Nile, leaving the French army cut off from its homeland. Napoleon left the army under the command of General Jean Kléber and returned to France with a handful of officers.

Leadership of France

Landing at Fréjus, France, in October 1799, Napoleon went directly to Paris, where he helped overthrow the Directory, a five-man executive body that had replaced the king. Napoleon was named first consul, or head of the government, and he received almost unlimited powers. After Austria and England ignored his calls for peace, he led an army into Italy and defeated the Austrians in the Battle of Marengo (1800). This brought Italy back under French control. The Treaty of Amiens in March 1802 ended the war with England for the time being. Napoleon also restored harmony between the Roman Catholic Church and the French government. He improved conditions within France as well by, among other things, establishing the Bank of France, reorganizing education, and reforming France's legal system with a new set of laws known as the Code Napoleon.

By 1802 the popular Napoleon was given the position of first consul for life, with

the right to name his replacement. In 1804 he had his title changed to emperor. War resumed after a new coalition was formed against France. In 1805 the British destroyed French naval power in the Battle of Trafalgar. Napoleon, however, was able to defeat Russia and Austria in the Battle of Austerlitz. In 1806 Napoleon's forces destroyed the Prussian army; after the Russians came to the aid of Prussia and were defeated themselves, Alexander I (1777–1825) of Russia made peace at Tilsit in June 1807. Napoleon was now free to reorganize western and central Europe as he pleased. After Sweden was defeated in 1808 with Russia's help, only England remained to oppose Napoleon.

Napoleon was unable to invade England because of its superior naval forces. He decided to introduce the Continental System, a blockade designed to close all the ports of Europe to British trade. He hoped this would force the British to make peace on French terms. In Spain in 1808 the Peninsular War broke out over Spanish opposition to the placement of Napoleon's brother Joseph on the throne. The English helped Spain in this battle, which kept French troops occupied until 1814. In addition, Alexander I's decision to end Russia's cooperation with the Continental System led Napoleon to launch an invasion of that country in 1812. Lack of supplies, cold weather, and disease led to the deaths of five hundred thousand of Napoleon's troops.

Fall from glory

Napoleon had his marriage to Josephine dissolved and then, in March 1810, he married Marie Louise, the daughter of Emperor Francis II of Austria. Despite this union, Aus-

tria declared war on him in 1813. In March 1814 Paris fell to a coalition made up of Britain, Prussia, Sweden, and Austria. Napoleon stepped down in April. Louis XVIII (1755–1824), the brother of Louis XVI, was placed on the French throne. Napoleon was exiled to the island of Elba, but after ten months he made plans to return to power. He landed in southern France in February 1815 with 1,050 soldiers and marched to Paris, where he reinstated himself to power. Louis XVIII fled, and Napoleon's new reign began. The other European powers gathered to oppose him, and Napoleon was forced to return to war.

The Battle of Waterloo was over within a week. On June 18, 1815, the combined British and Prussian armies defeated Napoleon. He returned to Paris and stepped down for a second time on June 22. He had held power for exactly one hundred days. Napoleon at first planned to go to America, but he surrendered to the British on July 3. He was sent into exile on the island of St. Helena in the South Atlantic Ocean. There he spent his remaining years until he died of cancer on May 5, 1821.

OGDEN NASH

Born: August 19, 1902

Rye, New York

Died: May 19, 1971

Baltimore, Maryland

American poet and writer

Ogden Nash was one of the most commercially successful English-language poets of the twentieth century.

Early years and education

Frederick Ogden Nash was born in Rye, New York, to Edmund Strudwick Nash and Mattie Chenault on August 19, 1902. His father was in the import-export business, but the Nash family's ancestry in North Carolina stretched back to the American Revolutionary era; the city of Nashville, Tennessee, was named in honor of an ancestor. Nash grew up in various East Coast communities and also lived in Savannah, Georgia, during his youth. He attended St. George's School in Newport, Rhode Island, and he was accepted to Harvard but dropped out in 1921 after a year.

Nash held a variety of jobs but none for very long. He worked on Wall Street as a bond salesperson, but sold only one bond—to his godmother—and instead spent his afternoons in movie theaters. He was a schoolteacher for a year at St. George's School, and from there he was hired as an advertising copywriter for streetcar signs. In 1925 he was hired in the marketing department of the Doubleday publishing house and did well enough that he moved on to its editorial department as a manuscript reader.

Ogden Nash.

Begins writing verse

Nash said that it was the poor quality of the manuscripts he read that led him to try to write. He attempted to produce serious verse in the style of the eighteenth-century Romantic poets but soon gave it up. He preferred to scribble comic verse on pages that he crumpled and tossed across the office to the desks of coworkers. This led Nash and a friend named Joseph Alger to work together to produce a 1925 children's book, *The Cricket of Carador*. A few years later, Nash teamed with two Doubleday coworkers to produce *Born in a Beer Garden; or, She Troupes to Conquer*, which made fun of classic literature.

In 1930 Nash wrote a poem called "Spring Comes to Murray Hill" and submitted it to the *New Yorker*, one of the most respected, well-read magazines of the day. Nash had thought up the poem while gazing out his office window and thinking about his life. The *New Yorker* published the poem and invited Nash to submit more; his regular appearances in the magazine led to a contract for his first work, *Hard Lines*, published in 1931. It was a tremendous success, going into seven printings in its first year alone. Nash soon quit his Doubleday job.

Successful formula

During the 1930s and 1940s, Nash's poems continued to appear in many magazines and published collections, and he was praised as one of America's greatest humorists (writers of clever humor). He found great success with his ability to express disbelief and dismay at the problems of modern American life. He also criticized religious preaching and pompous (having to do with showing self-importance) senators and presented amusing quirks (particular or unusual characteristics) of the English language. Still, he referred to himself simply as a "worsifier" instead of a "versifier." British reviews of his work often criticized him for taking liberties with spelling and rhyme. One of his most famous examples is the line: "If called by a panther/Don't anther."

In 1931 Nash married Frances Rider Leonard, with whom he had two daughters. His experiences with fatherhood provided more subject matter for his verse, evident in the 1936 collection *The Bad Parents' Garden of Verse*. Nash also wrote screenplays for three Metro-Goldwyn-Mayer films—*The Firefly*

NEFERTITI

(1937), *The Shining Hair* (1938), and *The Feminine Touch* (1941). In California he met another well-known writer, S. J. Perelman (1904–1979), who had written for the Marx Brothers films. They worked together on a musical, *One Touch of Venus*, which was a huge success on Broadway in 1943.

Later years

Nash was elected to both the American Academy of Arts and Sciences and National Institute of Arts and Letters. During the 1950s he wrote more frequently for the children's market, with such titles as *The Boy Who Laughed at Santa Claus* (1957), *Custard the Dragon* (1959), and *Girls are Silly* (1962). He also wrote for television productions of *Peter and the Wolf* and *The Sorcerer's Apprentice*. He often wrote about his experiences babysitting his grandchildren. After suffering various illnesses in his later years, he wrote a number of poems about the medical establishment that were later collected in 1970's *Bed Riddance: A Posy for the Indisposed*.

Nash died on May 19, 1971. Several collections of his work were published after his death, including *I Wouldn't Have Missed It* (1975) and *A Penny Saved Is Impossible* (1981).

Born: c. 1390 B.C.E.

Thebes, Egypt

Died: c. 1360 B.C.E.

Egypt

Egyptian queen

Nefertiti was an Egyptian queen and wife of King Akhenaten who remains a mystery to scholars today. A bust (sculpture of a person's head and shoulders) of her discovered in 1913 is one of the most widely recognized symbols of ancient Egypt.

Few facts known

Nefertiti was born around 1390 B.C.E. Some believe she was of Egyptian blood, while others believe she was a foreign princess. Her name, which means "the beautiful one is come," is of Egyptian origin, and evidence indicates that she had an Egyptian wet-nurse or governess of noble rank, which has led to the belief that she was born within the circle of the Egyptian royal court. She may have been a niece or daughter of Ay, who was a keeper of records under King Amenhotep III.

As queen

When Nefertiti was fifteen years old, she married Amenhotep IV, who was a year older and became king upon his father's death. They had six daughters and, according to some, one son. During the first five years of Amenhotep's reign, Nefertiti enjoyed a high profile. Evidence of her political importance is seen in the large number of carved scenes in which she is shown accompanying him during ceremonial acts. She is shown taking part in the daily worship and making offerings

Nefertiti.

Reproduced by permission of Archive Photos, Inc.

similar to those of the king—acts quite unlike those usually performed by previous chief queens, all of whom had a secondary role.

In the fifth year of his reign, Amenhotep changed his name to Akhenaten. He went against the beliefs of previous kings by announcing that the sun god Aten was the greatest of all Egyptian gods and the only one who should be worshipped, rather than Amen-Ra, who had long been considered supreme. Nefertiti shared his belief. Largely because of opposition over this issue, Akhenaten built a new capital called Akhetaten and moved the royal family there.

Mysterious disappearance

After the fourteenth year of Akhenaten's rule, there are no more pictures of Nefertiti; she simply disappears from view. Some believe she was the power behind the throne and thus responsible for the changes during the rule of Akhenaten until being dismissed from her position and banished to the North Palace at Amarna. This would mean there was a conflict within the royal family, with Nefertiti favoring the continued worship of Aten while Akhenaten and his son-in-law Tutankhamen (c. 1370–c. 1352 B.C.E.) supported a return to the worship of Amen-Ra. Most scholars, however, now suppose that Nefertiti's disappearance may simply be due to the fact that she died, and one of the king's other wives took her place at his side. A more dramatic, if less accepted, theory holds that she assumed a new, masculine identity toward the end of Akhenaten's rule—that Nefertiti and the young Smenkhkare, who ruled briefly either with or after Akhenaten and is believed by some to have been his son, were in fact the same person.

ISAAC
NEWTON

Born: December 25, 1642

Woolsthorpe, Lincolnshire, England

Died: March 20, 1727

London, England

English scientist and mathematician

Isaac Newton was an English scientist and mathematician. He made major contributions in mathematics and physics (the study of the relationship between matter and energy) and advanced the work of previous scientists on the laws of motion, including the law of gravity.

Early life and education

Isaac Newton was born on Christmas Day, 1642, at Woolsthorpe, a village in south-western Lincolnshire, England. His father died two months before he was born. When he was three years old, his mother remarried and moved away, leaving Isaac in the care of his grandmother. After a basic education in local schools, at the age of twelve he was sent to the King's School in Grantham, England, where he lived in the home of a pharmacist (one who prepares and distributes medication) named Clark. Newton was interested in Clark's chemical library and laboratory and built mechanical devices to amuse Clark's daughter, including a windmill run by a live mouse, floating lanterns, and sun dials.

After Newton's stepfather died, his mother returned to Woolsthorpe, and she pulled him out of school to help run the family farm. He preferred reading to working, though, and it became apparent that farming was not his destiny. At the age of nineteen he entered Trinity College, Cambridge, England. After receiving his bachelor's degree in 1665, Newton stayed on for his master's, but an outbreak of the plague (a highly infectious and deadly disease often carried by rats)

Isaac Newton.

Courtesy of the Library of Congress.

caused the university to close. Newton returned to Woolsthorpe for eighteen months, from 1666 to 1667, during which time he performed the basic experiments and did the thinking for his later work on gravitation (the attraction the mass of the Earth has for bodies near its surface) and optics (the study of light and the changes it experiences and produces). The story that a falling apple suggested the idea of gravitation to him seems to be true. Newton also developed his own system of calculus (a form of mathematics used to solve problems in physics).

Returning to Cambridge in 1667, Newton quickly completed the requirements for his master's degree and then began a period

of expanding on the work he had started at Woolsthorpe. His mathematics professor, Isaac Barrow, was the first to recognize Newton's unusual ability. When Barrow resigned to take another job in 1669, he recommended that Newton take his place. Newton became a professor of mathematics at age twenty-seven and stayed at Trinity in that capacity for twenty-seven years.

Experiments in optics

Newton's main interest at the time was optics, and for several years his lectures were devoted to the subject. His experiments in this area had grown out of his interest in improving the effectiveness of telescopes (instruments that enable the user to view distant objects through the bending of light rays through a lens). His discoveries about the nature and properties of light had led him to turn to suggestions for a reflecting telescope rather than current ones based on the refractive (bending) principle. Newton built several reflecting models in which the image was viewed in a concave (rounded like the inside of a bowl) mirror through an eyepiece in the side of the tube. In 1672 he sent one of these to the Royal Society (Great Britain's oldest organization of scientists).

Newton was honored when the members of the Royal Society were impressed by his reflecting telescope and when they elected him to their membership. But when he decided to send the society a paper describing his experiments on light and the conclusions he had drawn from them, the results almost changed history for the worst. The paper was published in the society's *Philosophical Transactions*. Many scientists refused to accept the findings, and others

were strongly opposed to conclusions that seemed to show that popular theories of light were false. At first Newton patiently answered his critics with further explanations, but when these produced more criticism, he became angry. He vowed he would never publish again, even threatening to give up science altogether. Several years later, at the urging of the astronomer Edmund Halley (c. 1656–1743), Newton put together the results of his work on the laws of motion, which became the great *Principia*.

His major work

Newton's greatest work, *Philosophiae naturalis principia mathematica*, was completed in eighteen months. It was first published in Latin in 1687, when Newton was forty-five. Its appearance established him as the leading scientist of his time, not only in England but in the entire Western world. In the *Principia* Newton, with the law of universal gravitation, gave mathematical solutions to most of the problems relating to motion with which earlier scientists had struggled.

In the years after Newton's election to the Royal Society, the thinking of his peers and of scholars had been slowly developing along lines similar to those which his had taken, and they were more open to his explanations of the behavior of bodies moving according to the laws of motion than they had been to his theories about the nature of light. Yet the *Principia's* mathematical form made it difficult for even the sharpest minds to follow. Those who did understand it saw that it needed to be made easier to read. As a result, in the years from 1687 to Newton's death, the *Principia* was the subject of many books and articles attempting to better explain Newton's ideas.

London years

After the publication of the *Principia*, Newton became depressed and lost interest in scientific matters. He became interested in university politics and was elected a representative of the university in Parliament. Later he asked friends in London to help him obtain a government appointment. The result was that in 1696, at the age of fifty-four, he left Cambridge to become warden and then master of the Mint (place where money is printed or manufactured). Newton took the job just as seriously as he had his scientific pursuits and made changes in the English money system that were effective for over one hundred years.

Newton's London life lasted as long as his professorship. He received many honors, including the first knighthood given for scientific achievement and election to life presidency of the Royal Society. In 1704 he published the *Opticks*, mainly a collection of earlier research, which he revised (changed) three times. In later years he supervised two updated versions of the *Principia*, he carried on a correspondence with scientists all over Great Britain and Europe, he continued his study and investigation in various fields, and, until his very last years, he performed his duties at the Mint.

His Opticks

The *Opticks* was written and originally published in English rather than Latin, and as a result it reached a wide range of readers in England. The reputation the *Principia* had prepared the way for the success of Newton's second published work. Also, its content and manner of presentation made the *Opticks* more approachable. It contained an account of experiments performed by Newton him-

self and his conclusions drawn from them, and it had greater appeal for the experimentally minded public of the time than the more mathematical *Principia*.

Of great interest for scientists were the questions with which Newton concluded the text of the *Opticks*—for example, “Do not Bodies act upon Light at a distance, and by their action bend its rays?” These make up a unique expression of Newton's ideas; posing them as negative (incorrect) questions made it possible for him to suggest ideas that he could not support by experimental evidence or mathematical proof, paving the way for further research by future scientists.

Later years

Two other areas to which Newton devoted much attention were chronology (the science of assigning to events their proper dates) and theology (the study of religion). His *Chronology of Ancient Kingdoms*, published in full after his death, attempts to link Egyptian, Greek, and Hebrew history and myths and to establish dates of historical events. In his *Observations upon the Prophecies of Daniel and the Apocalypse of St. John*, his aim was to show that the predictions of the Old and New Testaments had so far come true.

Newton died on March 20, 1727. His surviving writings and letters reveal a person with tremendous powers of concentration, the ability to stand long periods of intense mental strain, and the ability to remain free of distractions. The many portraits of Newton show him as a man with natural dignity, a serious expression, and large searching eyes. He had developed a mathematical explanation of the universe and opened the door for further study. In changing from pursuit of

answers to the question “Why?” to focus upon “What?” and “How?,” he prepared the way for the age of technology (a scientific way of achieving a practical purpose).

reader's guide

U•X•L Encyclopedia of World Biography features 750 biographies of notable historic and contemporary figures from around the world. Chosen from American history, world history, literature, science and math, arts and entertainment, and the social sciences, the entries focus on the people studied most often in middle school and high school, as identified by teachers and media specialists.

The biographies are arranged alphabetically across ten volumes. The two- to four-page entries cover the early lives, influences, and careers of notable men and women of diverse fields and ethnic groups. Each essay includes birth and death information in the header and concludes with a list of sources

for further information. A contents section lists biographees by their nationality. Nearly 750 photographs and illustrations are featured, and a general index provides quick access to the people and subjects discussed throughout *U•X•L Encyclopedia of World Biography*.

Special thanks

Much appreciation goes to Mary Alice Anderson, media specialist at Winona Middle School in Winona, Minnesota, and Nina Levine, library media specialist at Blue Mountain Middle School in Cortlandt Manor, New York, for their assistance in developing the entry list. Many thanks also go to the following people for their important editorial contri-

butions: Taryn Benbow-Pfalzgraf (proofreading), Jodi Essey-Stapleton (copyediting and proofing), Margaret Haerens (proofreading), Courtney Mroch (copyediting), and Theresa Murray (copyediting and indexing). Special gratitude goes to Linda Mahoney at LM Design for her excellent typesetting work and her flexible attitude.

Comments and suggestions

We welcome your comments on the *U•X•L Encyclopedia of World Biography*. Please write: Editors, *U•X•L Encyclopedia of World Biography*, U•X•L, 27500 Drake Road, Farmington Hills, MI 48331-3535; call toll-free: 1-800-877-4253; fax to 248-699-8097; or send e-mail via www.gale.com.

FRIEDRICH NIETZSCHE

Born: October 15, 1844

Röcken, Germany

Died: August 25, 1900

Weimar, Germany

German philosopher and poet

The German philosopher Friedrich Nietzsche predicted a European collapse into a time where no one could define truth and the end of man was desired. In works of powerful and beautiful prose (writing that differs from poetry in its rhythm and closeness to ordinary speech) and poetry he struggled to head off the disaster.

Early life

Friedrich Wilhelm Nietzsche was born on October 15, 1844, in Röcken, Germany, where his father served as a Lutheran pastor. Friedrich's father's death, when he was four years old, was distressing, which he often referred to in his later writings. Soon after, his youngest brother died, resulting in his mother moving her family in with her mother and two sisters. The death of both his father and his brother left Nietzsche in a household of women including his sister, Elizabeth.

After attending local schools in Naumburg, in 1858 Nietzsche won a scholarship to Pforta, one of the best boarding schools in Germany. Here he received a thorough training in the classics and acquired several life-

Friedrich Nietzsche.

time friends. At the end of this period of schooling, Nietzsche, who had earlier shared the Lutheran religion of his family, found that he had ceased to accept Christianity—a view that soon hardened into outright disbelief in any God. With the highest recommendations of his Pforta teachers, Nietzsche enrolled in the University of Bonn in 1864.

There Nietzsche pursued classical studies with Friedrich Ritschl, and when Ritschl moved to Leipzig, Germany, Nietzsche followed him. Nietzsche attempted to enter into the social life of the students, even joining a dueling (formal combat with two people bearing weapons) club, but he soon discovered

that his sense of his own mission in life had distanced him from the pursuits and interests most students shared. At this time, too, Nietzsche apparently contracted syphilis (sexually transmitted disease) in a brothel (house where people trade sexual acts for money). The incurable disease gradually damaged his strong body. In middle life he suffered almost constantly from head and stomach upsets. Loneliness and physical pain were the constant background of his life—though Nietzsche later came to interpret them as the necessary conditions for his work.

Publications

Nietzsche's early publications in classical philology (study of literature and the languages of literature) so impressed his teacher that when a chair (professorship) of philology opened up at the university in Basel, Switzerland, Ritschl was able to secure it for Nietzsche, then only twenty-four years old and still without his degree. The University of Leipzig gave him his doctoral degree on the strength of his writings without requiring an examination. Nietzsche then entered upon a teaching career.

The composer (writer of music) Richard Wagner (1813–1883) had greatly influenced Nietzsche's first book, *The Birth of Tragedy* (1872), which gave an imaginative account of the forces that led to the rise of Greek tragedy (a drama that describes a struggle between a hero and a larger force or power with a sad or troubled ending) and to its later fall. Nietzsche's book ends with support of Wagner's musical drama as a revival of Greek tragedy. But no sooner had it been published than Nietzsche began to see the difference between Wagner's musical genius and the shabby mes-

sages of the Wagnerian cult (devoted followers of Wagner). From then on, though he still felt affection for Wagner personally, Nietzsche attacked ever more strongly the “decadence” of Wagner’s political and philosophical (having to do with knowledge) ideas. Two works of his last year of writing deal with the subject: *The Wagner Case* (1888) and *Nietzsche Contra Wagner* (1888).

Nietzsche’s teaching at Basel was interrupted frequently by prolonged bouts of sickness and by several months of service as a medical orderly during the Franco-Prussian War (1870–71; a conflict between France and the combined states of Germany, which resulted in the loss of some territory for France), which further irritated his illness. In April 1879 his health had weakened so much that he was driven to resign. He was given a small monthly income, and he now began a ten-year period of wandering in search of a friendly climate. Though having increasing pain from the ruthless progress of his disease, Nietzsche managed to produce one hundred one books before his final collapse. They belong to the first rank of German literature and contain a stimulating set of philosophical ideas.

Nietzsche’s philosophy

Nietzsche believed that European man was standing at a critical turning point. The advance of scientific enlightenment, in particular the Darwinian theory (Darwin’s theory that man evolved from primitive life forms), had destroyed the old religious ideas. In *Thus Spoke Zarathustra*, Nietzsche wrote: “God is dead.” Further, he declared that man, no longer “the image of God,” is a chance product of a nature uninterested in purpose or value.

The great danger is that man will find his existence meaningless. Unless a new grounding for values is provided, Nietzsche predicted a rapid weakening into destruction for society.

Nietzsche aimed in all his work to provide a new meaning for human existence in a meaningless world. In the absence of any religious guidance, men must create their own values. Nietzsche’s writings are either criticisms of the old system of values or attempts to form a new system. For European man, the traditions common to both Jewish and Christian religions were the source of the old values. Nietzsche attacked it head-on in such works as *A Genealogy of Morals* (1887) and *The Antichrist* (1888).

In Nietzsche’s constructive works he sought to find in life itself a force that would serve to set human existence apart. He found it in the theory of the urge to dominate and master. All creatures desire this, but only man has achieved sufficient power to turn the force back on himself. Self-mastery and self-overcoming are the qualities that give a unique value to human life. The ideal man, the “superman,” will delight in being the master of his life, measuring out his passions, and giving style to his character. His power over himself and his life will give him a flood of creative energy. This will be the new reality and the standard by which all of life is judged.

All morality (right conduct) is therefore the result of overcoming one’s self, but Nietzsche had a standard by which to tell between the morality of the superman from the morality of Christianity. Christianity is based on the concept of afterlife. It attacks the idea of being master of your life, calling that idea “pride,” and sees natural passions as evil, putting guilt and fear onto its followers.

The new morality, on the other hand, will support life, encourage self-assertion, and do away with guilt. In *Thus Spake Zarathustra* (1883) Nietzsche formed the ultimate test of the superman's statements. Confronted with the notion that the world process is cyclical (circular or in sequence) and eternal, the superman still supports life. Let it be—again and again—with all its joys and sorrows.

Last days

On January 3, 1889, Nietzsche collapsed on a street in Turin, Italy. When he regained consciousness, his sanity was gone. He began to send off wild letters to friends and strangers signed "Dionysus—the Crucified." He was taken to his mother's home and lived on in a semiconscious state, sinking ever further from the real world until his death on August 25, 1900.

FLORENCE NIGHTINGALE

Born: May 12, 1820

Florence, Italy

Died: August 13, 1910

London, England

English nurse

The English nurse Florence Nightingale was the founder of modern nursing and made outstanding contributions to the knowledge and improvement of public health.

Early years and study

Florence Nightingale was born in Florence, Italy, on May 12, 1820; she was named after the city of her birth. Her father, William E. Nightingale, was a wealthy landowner who had inherited an estate in Derbyshire, England. Like many members of the wealthy class, he and Florence's mother, Fanny, dedicated themselves to the pursuit of active social lives. Florence and her sister, Parthenope, were tutored by their father in languages, mathematics, and history. Though Florence was tempted by the idea of a brilliant social life and marriage, she also wanted to achieve independence, importance in some field of activity, and obedience to God through service to society.

In 1844 Nightingale decided that she wanted to work in hospitals. Her family objected strongly to her plan; hospital conditions at that time were known to be terrible, and nurses were untrained and thought to be of questionable morals. Ignoring all resistance, Nightingale managed to visit some hos-

pitals and health facilities. She then received permission from her parents to spend a few months at Kaiserworth, a German training school for nurses and female teachers. In 1853 she became superintendent of the London charity-supported Institution for Sick Gentlewomen in Distressed Circumstances. This opportunity allowed her to become independent from her family and also to try out new ideas in organizing and managing an institution, conducted in a scientific, nonreligious setting.

War efforts

In October of 1854 Nightingale organized a party of thirty-eight nurses, mostly from different religious orders, for service in the Crimean War (1853–56), in which Great Britain, France, and Sardinia fought against Russian expansion in Europe. The nurses arrived at Constantinople (now Istanbul, Turkey) in November. Conditions at the British base hospital at Scutari (now Uskudar, Turkey) were awful and grew steadily worse as the number of sick and wounded soldiers rapidly increased. The British army did not have enough medical services and used what it did have poorly—a confusing and complicated supply system actually cut off deliveries to the patients. The Barrack Hospital, where Nightingale and her nurses worked and lived, was built on a massive cesspool (an underground area into which liquid waste flows), which poisoned the water and even the building itself. The general attitude was that the common soldier was a drunken brute on whom all comforts would be wasted.

Nightingale saw that her first task was to get the military doctors to accept her and the other nurses. Her determined personality,

Florence Nightingale.

combined with the continuing arrival of the newly sick and wounded, soon brought this about. She also had a large fund of private money—much of it raised by the *London Times*—with which she could obtain badly needed supplies. By the end of 1854, some order had been created and the hospital was cleaner—not only through Nightingale’s efforts but also through improvements made by a governmental sanitary commission. The death rate among patients fell by two-thirds. But with improvement came new problems, including anger from officials who were found at fault for the poor hospital conditions and rising disputes among the nurses.

Hospital reform efforts back home

Florence Nightingale left Scutari in the summer of 1856, soon after the war ended. By then she was famous among the troops and the public as the “Lady with the Lamp” and the “Nightingale in the East.” This popular image is not quite accurate. Although she did some active nursing in the wards, Nightingale’s real work lay outside the expression of tenderness and concern. It began with her refusal to respond to public praise and with her use of her influence in high places, including with the queen, to fight for effective reform of the entire system of military hospitals and medical care.

In *Notes on Matters Affecting the Health, Efficiency and Hospital Administration of the British Army* (1857) Nightingale used the experiences of the war to prove that a new system was necessary. Within five years this effort led to the reconstruction of the administrative structure of the War Office. Nightingale’s *Notes on Hospitals* (1859) detailed the proper arrangements for civilian institutions (places that were not a part of the military). In the next year she presided over the founding of the Nightingale School for the training of nurses at St. Thomas’s Hospital in London, England. After 1858 she was recognized as the leading expert on military and civilian sanitation (the removal of water-transported waste) in India. She also believed that irrigation (the supplying of water to an area using artificial methods) was the solution to the problem of famine. In 1907 Nightingale was the first woman to be awarded the Order of Merit.

Later years

Nightingale’s personality is well documented. She rebelled against the idle, shel-

tered existence of her family her entire life. She achieved a leading position in a world dominated by men, driving and directing her male coworkers as hard as she did herself. She often complained that women were selfish, and she had no time for the growing women’s rights movement. But she also developed an idea of spiritual (relating to or affecting the spirit) motherhood and saw herself as the mother of the men of the British army—“my children”—whom she had saved. Florence Nightingale never really recovered from the physical strain of the Crimean War. After 1861 she rarely left her home and was confined to her bed much of the time. She died on August 13, 1910, in London, England.

**RICHARD
NIXON**

Born: January 9, 1913
Yorba Linda, California

Died: April 22, 1994

Yorba Linda, California

American president and vice president

Richard Nixon was the thirty-seventh president of the United States. He successfully served as a member of the House of Representatives and of the Senate and was vice president under Dwight Eisenhower (1890–1969). Despite all his political triumphs, Nixon will probably best be remembered as the first president to resign from office.

Young Nixon in California

Richard Milhous Nixon was born on his father's lemon farm in Yorba Linda, California, on January 9, 1913. Of the four other sons in the family, two died in childhood. After the farm failed, the family moved to Whittier, California, where Nixon's father ran a grocery store. Nixon had a troubled childhood. Raised by a sometimes abusive father and a controlling mother, Nixon adopted parts of both his parents' personalities. Some historians have believed that, as a result of his childhood, Nixon had a drive to succeed and felt he had to pretend to be "good" while using any tactics necessary to achieve his goals.

At Whittier College, Nixon excelled as a student and a debater. He was president of his freshman class and, as a senior, president of the student body. Graduating second in his class in 1934, he won a scholarship to Duke University Law School. Although he was a member of the national scholastic law fraternity, he failed to find a job in one of the big New York law firms. This failure, along with the views of his father, left him with a strong dislike of the "eastern establishment."

Reluctantly, Nixon returned to Whittier and began practicing law. Soon afterward, Nixon met Thelma Catherine Patricia (Pat) Ryan (1912–1993), a high school teacher. The two were married in 1940 and would have two daughters, Patricia and Julie.

Public service, then soldier

Shortly before the United States entered World War II (1939–45), where American-led forces faced-off against Germany, Japan, and Italy, Nixon began working for the federal government in the Office of Emergency Management. Nixon soon left this post and entered the navy as a lieutenant junior-grade in August 1942. He was sent to the Pacific as an operations officer with the South Pacific Combat Air Transport Command. Fourteen months later he returned to the United States to work as a lawyer in uniform.

In September 1945 a group of Republicans in Whittier asked him to run for Congress. He jumped at the opportunity. Nixon left the navy in January 1946 and began his victorious campaign, in which he defeated a five-term congressman.

Congressional activities and national fame

As congressman, Nixon was assigned to the House Labor Committee and to the Select Committee on Foreign Aid. In 1947 he and other committee members toured Europe. Nixon quickly established a reputation as an internationalist in foreign policy, proving that he worked well with foreign nations.

As a member of the House Un-American Activities Committee (HUAC), Nixon became a leading anti-Communist crusader. (Communism is a political system where

goods and services are owned and controlled by the government.) He first attracted national attention as a member of HUAC when he led the suit that resulted in the conviction of Alger Hiss (1904–1996), a former State Department official charged with Communist connections. While Nixon gained national attention fighting the threat of Communism, he also caught the attention of General Dwight Eisenhower (1890–1969), who chose him as his running mate in his successful presidential campaign of 1952. Eisenhower in part recruited Nixon in hopes of drawing valuable support in the West.

The vice presidency

As vice president, Nixon continued to please his supporters and anger his critics. He acted as the chief political spokesman in Eisenhower's administration. Among Nixon's assignments was foreign travel. In office less than a year, Nixon made an extended trip through Asia, visiting, among other places, Hanoi, North Vietnam, then under French control. He established many useful relationships on these trips and impressed critics at home with his knowledge of foreign affairs.

On a trip to Latin America in 1958, he was set upon by mobs but handled himself coolly. In 1959 he visited Poland and the Soviet Union, a former Communist nation made up of Russia and other states. While in Moscow, his meeting with Soviet premier Nikita Khrushchev (1894–1971) prepared the way for Khrushchev's later visit to the United States to meet with Eisenhower.

Running for president

In 1960 Nixon won the Republican presidential nomination and chose Henry Cabot

Lodge (1902–1985) as his running mate. The campaign against the Democratic team of Senators John F. Kennedy (1917–1963) and Lyndon Johnson (1908–1973) was close from the beginning. In the first of four televised debates with Kennedy, Nixon did not sharply challenge his opponent and appeared cold and distant, a far cry from the charming Kennedy. But the election was still close, and he lost by some one hundred thousand votes out of the sixty-eight million cast.

After the defeat, Nixon returned to Los Angeles to practice law. In 1964, after the Republican defeat by President Lyndon Johnson, it became clear that Nixon again considered himself a serious presidential contender. In 1968, winning his party's presidential nomination, he picked Governor Spiro T. Agnew (1918–1996) of Maryland as his running mate. Nixon and Agnew ran against the Democratic team of Hubert Humphrey (1911–1978) and Edmund Muskie (1914–). Third-party candidate George Wallace (1919–1998) of Alabama, a threat to both sides, eventually drew support away from Humphrey and cleared a path for Nixon's successful election to the White House.

The presidency

Nixon took the oath of office on January 20, 1969. In his inaugural address, or first speech as president, he appealed for harmony among American society. At that time American society was divided over the issues of domestic racial unrest and the Vietnam War (1955–75; a war in which American forces were aiding South Vietnam's fight against Communist North Vietnam). He promised to bring the nation together again.

Nixon's first foreign objective—to negotiate, or bargain for, an end to the Vietnam War—was unsuccessful. Despite repeated attempts, negotiations with North Vietnam at the Paris peace talks were unproductive. Meanwhile, in June he began replacing American troops with South Vietnamese troops. After a conference with South Vietnam president Nguyen Van Thieu (1923–2001), Nixon ordered 25,000 American combat troops brought home. By the end of 1969, having ordered 110,000 troops home, he expressed hope that all American combat troops would be out of Vietnam by the end of 1970. It would take two more years until most American ground troops had been withdrawn from Vietnam.

International relations

In his second month in office, Nixon embarked on a tour of Western Europe. His official visit to Romania made him the first American president to visit a Communist country. While on an Asian tour, the president called for cooperative efforts and promised American material aid but said that Asian countries must defend their freedoms with their own troops. In his first year, the president signed a treaty with the Soviet Union that worked toward placing limits on the production of nuclear arms.

In 1971 Nixon made the dramatic announcements that he would visit Peking, China, and Moscow, Soviet Union, in the first half of 1972. He also announced progress in the negotiations with the Soviet Union on an arms limitation treaty. The visit to Peking took place in February and he was invited to meet Chairman Mao Zedong (1893–1976), a mark of high respect.

*Richard Nixon.
Courtesy of the Library of Congress.*

The fall from grace

In the presidential election of 1972, Nixon and Agnew ran against Democrats George McGovern (1922–) and Sargent Shriver (1915–). The election was a landslide for Nixon, but no one was expecting what would happen next. During his last election campaign, what first appeared as a minor burglary was to become the beginning of the end of Nixon's political career. A break-in at Democratic national headquarters in the Watergate apartment complex in Washington, D.C., was linked to Republicans.

During the trial of six men charged in the crime, the existence of the cover-up began to emerge and government officials fell like dominos in its path. By October 1973, as the Watergate investigation continued, Nixon lost several top aides as well as his vice president. Agnew resigned before pleading no contest to federal charges of receiving bribes, failing to pay his taxes properly, and other crimes while serving as governor of Maryland.

Soon the U.S. Supreme Court forced Nixon to turn over tape recordings he made during the election. The tapes showed he obstructed, or blocked, justice in stopping a Federal Bureau of Investigations (FBI) probe of the Watergate burglary. On August 9, 1974, in national disgrace, he became the first president of the United States to choose to leave office before the end of his term. He boarded a plane with his wife and returned to his California home, ending his public career. A month later, in a controversial move, President Gerald Ford (1913–) issued an unconditional pardon for any offenses Nixon might have committed while president.

Private citizen

Nixon led a quiet life until the criticism from the Watergate scandal had softened. Nixon then emerged in a role of elder statesman, visiting countries in Asia as well as returning to the Soviet Union and China. He also consulted with the administrations of George Bush (1924–) and Bill Clinton (1946–) and wrote his memoirs, or a book of his memories, and other books on international affairs and politics.

The Richard M. Nixon Library and Birthplace opened in the early 1990s in

Yorba Linda. On January 20, 1994, in what would be his last public appearance, ceremonies honoring him on the twenty-fifth anniversary of his first inauguration were held. He also announced the creation of the Center for Peace and Freedom, a policy center at the Richard M. Nixon Library and Birthplace.

Richard Nixon died of a stroke on April 22, 1994. A state funeral was held five days later in Yorba Linda, where President Clinton and others praised Nixon and his achievements. However Nixon is remembered, he will most likely never escape the shadow of Watergate.

ALFRED NOBEL

Born: October 21, 1833

Stockholm, Sweden

Died: December 10, 1896

San Remo, Italy

Swedish chemist

The Swedish chemist Alfred Nobel invented dynamite and other explosives, but he is best remembered for using the bulk of his personal fortune to create the Nobel Foundation, which awards Nobel Prizes every year to those who benefit mankind.

Early life

Alfred Bernhard Nobel was born October 21, 1833, in Stockholm, Sweden, the son of Immanuel and Andrietta Ahlsell Nobel. He was often sick as a child and had to be attended to almost constantly by his mother. He attended St. Jakob's School in Stockholm in 1841 and 1842, but then the family moved to St. Petersburg, Russia, where Nobel's father, a chemist and inventor, had established an engineering and weapons company. Nobel and his brothers received private tutoring from 1843 to 1850. In 1850 Nobel set out on a two-year tour of western Europe and the United States, learning different languages and seeking ideas and contacts in engineering. Russia's involvement in the Crimean War (1853–56) led to great profits for Nobel's father's company, but after the war ended, weapons contracts were cancelled, and Nobel's father soon lost all of his money.

Explosive discoveries

Alfred Nobel remained in Russia when his father returned to Stockholm in 1858. Both were doing studies of nitroglycerin, a violent explosive liquid. In 1863 Alfred rejoined his father, and in that year he succeeded in exploding nitroglycerin at will by using gunpowder to set it off. In 1865 he introduced the use of exploding mercury to provide the charge for the blast, and this turned out to be the key to all the later high explosives. Nobel patented his invention and traveled around trying to cash in on it. Factories built to manufacture nitroglycerin were established near Stockholm and Hamburg, Germany, and the explosive oil was shipped around the world. In 1866 Nobel visited the United States and built factories in New York and San Francisco, California.

Meanwhile, in Europe, the Nobel companies faced growing criticism, arising from the many accidental explosions that happened when nitroglycerin was being moved or stored. Nobel had expected these problems. As early as 1864 he had tried using different solids to absorb the dangerous liquid, including kieselguhr (a light material made from the remains of certain kinds of algae, a type of plant that grows in water). This material reduced the blasting power slightly, and the resulting product was solid, plastic, and better able to withstand physical or temperature shock. This was dynamite, patented in 1867. The new invention was heavily promoted, and a worldwide industry was established.

After moving the company headquarters and laboratory to Paris, France, in 1870, Nobel continued to work toward developing other explosives. These included ballistite, which was created in 1887 in response to the military

Alfred Nobel.

Courtesy of the Library of Congress.

demand for a smokeless, slow-burning blasting powder. This was Nobel's last major invention, but throughout his life he improved on all of his creations in detail, patented them, and then left them to his companies, with which he had as little formal contact as possible.

Used fortune to benefit humanity

From 1865 to 1873 Nobel lived in Hamburg and then in Paris until 1891, when the use of ballistite by the Italian military made him unpopular there. He moved to San Remo, Italy, where he died on December 10, 1896. He was a truly international figure, traveling constantly. For all of his achieve-

ments, he was a reserved and shy man who hated publicity. He had taken care of his mother his whole life and never married.

Nobel's will directed that the bulk of his huge estate should fund annual prizes for those who, in the previous year, had most benefited mankind in five specified subjects: physics (the study of the relationship between matter and energy), chemistry, medicine, literature, and peace. His will was settled within four years, and the Nobel Foundation was created. A Nobel Prize is one of the highest honors that an individual can receive. Each winner receives a gold medal, a scroll, and a cash award based on the earnings of the foundation's investments during that year. Recent prizes have been around one million dollars each.

ISAMU
NOGUCHI

Born: November 17, 1904
Los Angeles, California

Died: December 30, 1988

New York, New York

Asian American sculptor

Isamu Noguchi was a well-respected and admired Japanese American sculptor and designer. His sculptures, fountains, and gardens are focal points in major cities of the United States and worldwide.

Noguchi's youth

Isamu Noguchi was born to Isamu Noguchi and Leonie Gilmore on November 17, 1904, in Los Angeles, California. His father, a Japanese poet and authority on art, and his mother, an American writer, were never married. In 1906 he moved with his family to Japan, where his father married a Japanese woman, and Noguchi remained with his mother until he was thirteen years old. In 1918, his mother sent him back to the United States to finish his education. He went to public school in La Porte, Indiana, graduating in 1922. He became an apprentice (a person working to learn a trade) to Gutzon Borglum (1867–1941), the sculptor of Mount Rushmore, who told Noguchi he was not talented enough to be a sculptor. Thus, in 1923, Noguchi enrolled as a premedical student at Columbia University in New York City.

Prophet of his age

In 1925 Noguchi, at the urging of his mother, enrolled at the Leonardo da Vinci Art School in New York City to study sculpture. Here his talents were recognized and encouraged. Noguchi also attended the East Side Art School in New York City. In 1927 he won a scholarship and moved to Paris, France, where he was an apprentice to abstract sculp-

tor Constantin Brancusi (1876–1957) who became a strong influence on Noguchi's art. Noguchi felt that this art form was one that was well suited to his way of expressing himself in his work.

Noguchi lived in Japan for six months in 1930, working with clay and studying gardens. There he realized land could be sculpture that could be put to public use. In the 1930s he made art reflecting his social concerns, including a cement mural, 72 feet long, in Mexico City, Mexico, narrating Mexican history. In 1935 he began making stage sets for dancer Martha Graham (1893–1991), a partnership that would continue for fifty years. Throughout his career, Noguchi also worked with other choreographers (people who develop the dance steps and dances used in performances). In 1938 he made his first sculpture in stainless steel, a symbol of freedom of the press at the entrance to the Associated Press building in Rockefeller Center, New York City.

Power in stone

Noguchi enjoyed occasional exhibitions throughout the United States, Europe, and Asia. Among his important group shows was the exhibition of "14 Americans" at the Museum of Modern Art, New York City, in 1946. A return trip to Japan in 1949 prompted Noguchi to begin direct carving in stone. He also traveled throughout the world, and his work was purchased by many important museums. His only marriage, to actress Yoshiko Yamaguchi, lasted from 1951 to 1955. In 1968 the Whitney Museum of American Art sponsored a show featuring his work, and in 1978 the Walker Art Center exhibited his show *Imaginary Landscapes*.

Isamu Noguchi.

Reproduced by permission of AP/Wide World Photos.

Connection with nature

Noguchi's forms seem to suggest nature and human beings interacting with one another or with their surroundings. Like Brancusi, Noguchi always retained in his pieces a strong feeling for the perfection of the material from which they are made. His preference was generally for wood or stone, and he was talented in making use of these materials in a way that showed them at their best.

Noguchi's work was also richly inspired by European surrealism (art that demonstrates the imagination and uses distorted images) and abstraction (art that does not resemble any real object). His experiences in

Asia gifted him with a unique ability for garden and courtyard design. Among his many important creations: a fountain and sculpture for the John Hancock Building, New York City; a garden for the UNESCO Headquarters, Paris (1956–1958); the Billy Rose Garden of Sculpture at the Israel National Museum, Jerusalem (1960–1965); a sunken garden at Yale University (1960–1964); and the 1968 *Red Cube*, a steel sculpture on Broadway in New York City.

Creative to the end

In 1982 Noguchi was awarded the Edward MacDowell Medal for outstanding lifetime contribution to the arts. In 1984, Noguchi's memorial to Benjamin Franklin (1706–1790), the *Bolt of Lightning*, a 102-foot stainless steel sculpture, was installed in Philadelphia, Pennsylvania. In 1985 the Isamu Noguchi Garden Museum, displaying more than two hundred of his works, opened in Queens, New York.

In 1986, Noguchi ended his long career with a playful signature as the U.S. representative to the Venice Biennale art exposition. His exhibition of sculpture and lamps included the *Slide Mantra*, a religious-looking marble sculpture which visitors could climb up and slide down.

Noguchi was best known for sculpture, but he worked in many other mediums, including painting, ceramics, interior design, and architecture. His fountains grace several cities. In every work, he remained deeply attuned to his material and sensitive to its connection to nature and to society.

Isamu Noguchi died on December 30, 1988, in New York City.

MANUEL NORIEGA

Born: February 11, 1934

Panama City, Panama

Panamanian military leader

First a friend, then an enemy of the United States, Manuel Noriega, the strongman of Panama, was finally taken down by a U.S. military operation, captured, and brought to Miami for trial on drug charges in 1989.

Early life

Manuel Antonio Noriega was born the son of an accountant and his maid in a poor section of Panama City, Panama, in 1934. At the age of five he was given up for adoption to a schoolteacher. He attended the National Institute, a well-regarded high school, with the intention of becoming a doctor, but his family could not afford to send him to medical school. Instead, Noriega accepted a scholarship to attend the Chorrios Military

Academy in Peru. He graduated in 1962 with a degree in engineering. Returning to Panama, he became a sublieutenant in the National Guard.

Military career

Colonel Omar Torrijos (1929–1981) liked Noriega and obtained for him the command of Chiriqui, the country's westernmost province. In October 1968, they led a military takeover of the government of President Arnulfo Arias. Noriega's troops seized radio and telephone stations in the city of David, cutting off communications with Panama City. Torrijos emerged as the major figure in the new government. In December 1969, when Torrijos was out of the country, a trio of officers tried to seize power. Torrijos flew his plane into an airport in David that had no lights for night landing. Noriega lined up cars along the runway with their lights on to help Torrijos make it down safely. With Noriega's troops at his service, Torrijos reclaimed the capital.

From that moment, Noriega's career blossomed. He became involved with U.S. intelligence activities. In 1971 he went to Havana, Cuba, at the request of U.S. president Richard Nixon (1911–1994) to obtain the release of crewmen of two American ships seized by Fidel Castro's (1927–) government. At this time Noriega was already involved in drug deals. A high-ranking drug enforcement officer recommended that President Nixon order Noriega's assassination, but Nixon did not follow through. As head of G-2, Panama's military intelligence command, Noriega was the second most powerful man in Panama. In 1975 G-2 agents rounded up businessmen who criticized Torrijos, took away their property, and sent

Manuel Noriega.

Reproduced by permission of Archive Photos, Inc.

them into exile in Ecuador. Torrijos once said of Noriega, "This is my gangster."

Increase in power

Torrijos died in 1981 in an unexplained plane crash. In the following two-year contest for power between politicians and military officers, Noriega emerged as the winner. In late 1983, following his promotion to general and commander of the National Guard, the guard was combined with the navy and air force into the Panama Defense Forces (which also included the national police). The following year Noriega's choice for president, Nicolás Ardito Barletta, won a narrow

victory over Arnulfo Arias. But Barletta failed to improve the country's weak economy (system of production, distribution, and use of goods and services), and Noriega forced him out. Noriega at this time began to be suspected of gun trafficking (smuggling), money laundering, torture, murder, and selling U.S. information and technology to Cuba and Eastern European governments. Noriega denied wrongdoing and said U.S. politicians were looking for a way to undo the Panama Canal treaties before the canal became Panamanian property on December 31, 1999.

In June 1987 Noriega's former chief of staff, Colonel Roberto Diaz Herrera, stated that Noriega had fixed the 1984 election and ordered the killing of Hugo Spadafora, who had publicly accused Noriega of drug trafficking. Herrera also said Noriega had been involved in Torrijos's death. Panamanians organized protests demanding the removal of Noriega. He responded by declaring a national emergency. He suspended constitutional rights, closed newspapers and radio stations, and drove his political enemies into exile. Herrera was captured and ordered to recant (take back) his statements. Church leaders, businessmen, and students organized into the National Civil Crusade, dressed in white, and went into the streets banging pots and pans. The riot squads drove them away.

United States steps in

By now Americans were outraged, and in June 1987 the U.S. Senate called for Noriega's removal. The administration of President Ronald Reagan (1911–) began looking for a way to bring Noriega down. The U.S. economic and military assistance ended, Panamanian bankers began withdrawing their

support, and Noriega quickly lost favor everywhere except for the Panama Defense Forces (PDF). Secret talks were held between U.S. officials and Noriega's representatives calling for him to resign and leave the country before the 1988 U.S. presidential election, saving George Bush (1924–), who as director of the Central Intelligence Agency (CIA) had dealt with Noriega, from embarrassment. The Justice Department filed charges against Noriega in federal court in early 1988 as a warning. Assistant Secretary of State Eliot Abrams went to Panama to get President Eric Del Valle to fire Noriega. Instead, Noriega forced out Del Valle and named a new president.

After taking over as president, Bush increased the pressure. In May 1989 Noriega decided not to run in the election but backed another candidate, Carlos Duque. The opposition Panameñista Party nominated Guillermo Endara, who was immediately provided with \$10 million by the Bush administration. Even though the election was being watched by former President Jimmy Carter (1924–) and other foreign officials, as soon as Noriega realized that Duque was losing, he ordered the PDF to seize ballot boxes. When the opposition took to the streets in protest, Noriega's squads beat them. Endara and a vice presidential candidate, Guillermo Ford, lost the election.

Last straw

Noriega declared the election void (having no legal force or effect), installed another president, and, in October 1989, survived a takeover attempt supported by U.S. forces. To improve the nation's international image and to prevent Noriega from naming one of his people as administrator of the Panama

Canal, Bush took stronger action. Using as an excuse the firing on U.S. soldiers passing the PDF headquarters and Noriega's statement that U.S. actions had created a state of war, the United States launched a full-scale attack (Operation Just Cause) with twenty-four thousand troops on December 20, 1989.

Fighting continued for four days, with the United States losing hundreds of troops and the Panamanians losing thousands. Noriega escaped capture for a few days but was found hiding in the Papal Nunciature, a religious office. Under pressure from Vatican officials, Noriega surrendered to the Vatican Embassy in Panama City on January 3, 1990. In a deal worked out with the U.S.-created government headed by Guillermo Endara, U.S. authorities brought Noriega to Miami for trial, which was delayed into the early 1990s. He was convicted of several crimes including cocaine smuggling. He was sentenced to forty years in a Miami prison and ordered to pay \$44 million to the Panamanian government. In 1999 a French court sentenced Noriega and his wife to ten years in jail along with a \$33 million fine. Also in 1999 the Panamanian high court announced that it would seek to have Noriega returned to that country to make sure he served time there for murder.

In 2002 a parole hearing took place in Miami, which resulted in Noriega's denial for early release from his U.S. prison sentence. He would remain in prison in the United States for at least five more years.

JESSYE NORMAN

Born: September 15, 1945

Augusta, Georgia

African American opera singer

Jessye Norman is an African American opera singer. Her rich soprano voice covers an uncommonly wide range, from classical to modern compositions.

Early years

Jessye Norman was born on September 15, 1945, in Augusta, Georgia. Her father, Silas, was an insurance broker and her mother, Janie, was a schoolteacher. There were four other children in the family. Music was very important in the family, and all the children took piano lessons at a young age. Her parents encouraged Jessye musically, and she began singing in church choirs at the age of four.

Norman's first step toward a singing career, taken at the suggestion of her high school chorus teacher, was to enter the Marion Anderson vocal competition in Philadel-

phia, Pennsylvania, at age sixteen. She did not win the competition, but her singing did gain her a full scholarship to Howard University in Washington, D.C. Norman fell in love with opera the first time she heard a Metropolitan Opera radio broadcast. "I was nine and didn't know what was going on, but I just loved it," she told Charles Michner of *Vanity Fair* magazine.

Debuts

Norman, to finance her graduate studies, entered the 1968 International Music Competition of the German Broadcasting Corporation in Munich, Germany, and took first prize. This famous award gave her immediate wide recognition and engagements throughout Germany leading to a December 1969 debut with the Deutsche Oper in Berlin, Germany. Norman had always been selective about her repertoire (a list of operas prepared for performance). She followed her own instincts and interests more than the advice of her teachers or requests of her management. This tendency put her at odds with the Deutsche Oper and forced her to seek out musical works on her own that she felt were more suitable to her vocal skills.

Norman's search took her to Italy, where she sang in Florence in the spring of 1970. In April of 1972 she made her debut at Milan's famous opera house, La Scala, in the title role of Verdi's *Aida*. Her first well-publicized American performance took place that summer in a concert performance of the same role at the Hollywood Bowl. Later in 1972 Norman further established herself in the United States with an all-Wagner concert at the Tanglewood Festival in Lennox, Massachusetts, and a recital tour of the country. That Septem-

ber she made her London, England, debut at the Royal Opera House, Covent Garden.

Travels

During the years from 1973 to 1975 Norman performed throughout the Western world—in Spain, Holland, Germany, Scotland, Italy, England, France, and Argentina, as well as the United States—and often performed works outside the standard repertoire.

In 1975 Norman moved to London and had no staged opera appearances for the next five years. While her reason for the withdrawal was that she needed to fully develop her voice, others felt that this was a period of concern for her weight and thus her stage image. She told John Gruen of the *New York Times*, “As for my voice, it cannot be categorized. I like so many different kinds of music that I’ve never allowed myself the limitations of one particular range.”

In October of 1980 Norman returned to the operatic stage in the title role of Richard Strauss’s (1864–1949) *Ariadne auf Naxos* at the Hamburger Staatsoper in Hamburg, Germany. In 1982 she appeared in her American stage debut with the Philadelphia Opera as Dido in Henry Purcell’s (1659–1695) *Dido and Aeneas* and as Jocasta in Igor Stravinsky’s (1882–1971) *Oedipus Rex*. Her debut at New York’s Metropolitan Opera took place in September of 1983. She sang at the January 21, 1985, inauguration of President Ronald Reagan (1911–), an invitation that she debated as an African American, as a Democrat, and as a nuclear disarmament activist. But she did accept and sang the folk song “Simple Gifts.”

Although Norman was concerned about her stage image, she often managed to con-

Jessye Norman.

Reproduced by permission of AP/Wide World Photos.

vert her large size to a positive advantage by choosing roles that called for stately and dignified bearing.

Honors and recent work

Among the numerous honors bestowed upon Norman were: *Musical America*’s musician of the year, 1982; honorary doctorates from Howard University (1982), Boston Conservatory of Music (1984), University of the South (1984), and Harvard University (1998). She was given the honor of being named *Commandeur de l’Ordre des Arts et des Lettres* from the French government, 1984. She also received awards for many of her recordings.

Norman's work in the 1990s included singing at the opening of the Metropolitan Opera's production of *Ariadne auf Naxos* in 1993, taking part at a gala for the New York Philharmonic in 1995, and appearing at concerts throughout the world.

In March 1997, Jessye Norman was honored by New York City's Associated Black Charities at the eleventh annual Black History Makers Awards Dinner for her contributions to the arts and to African American culture. Norman made her first appearance in Russia in 2001. She sang at the "Tribute in Light" memorial ceremony in New York City to honor those people who died in the destruction of the World Trade Center on September 11, 2001.

NOSTRADAMUS

Born: December 1503

Saint-Remy-de-Provence, France

Died: July 1566

Salon, France

French astrologer, physician, and author

Nostradamus was a physician (doctor) and astrologer (someone who believes that the future can be learned by studying the stars and planets). Today Nostradamus is remembered chiefly for the predictions he made of future events.

Early years

Michel de Notredame, commonly called Nostradamus, was born in December 1503 in the south of France. His family was of Jewish heritage but had converted to Catholicism during a period of religious intolerance (unwillingness to give freedom to people who have different beliefs) and prejudice (hostility aimed at a person or group of people based on their beliefs, looks, or habits). Both of his grandfathers were scholars and instructed Nostradamus themselves when he was young. One grandfather was a physician. The other taught him classical languages.

At the age of fourteen Nostradamus left his family to study in Avignon, France, a major ecclesiastical (church related) and academic center. In class he often voiced dissension (disagreement) with the teachings of the Catholic priests. Nostradamus later attended the University of Montpellier, where he studied both medicine and astrology. It was common to study both at that time. He graduated in 1522 and began calling himself Nostradamus, a Latin version of his name. This was a common practice of university graduates.

The first several years of Nostradamus's career as a doctor were spent traveling in France. Many towns and villages were being destroyed by the bubonic plague (a widespread destructive disease). It was called "Le Charbon" ("coal" or "carbon") because of the

black sores it left on its victim's body. The epidemic (a disease that affects a large number of people or regions) had no cure. Doctors commonly "bled" (letting blood out) their patients, thinking it would take the disease with it. They knew nothing of how to prevent further infection or how unclean conditions helped spread the disease.

Nostradamus prescribed fresh air and water for the afflicted. He also recommended a low-fat diet and clean bedding. He often administered an herbal remedy made from rosehips, later discovered to be rich in vitamin C. Entire towns recovered under his care. Nostradamus's herbal remedies were common to the era. His beliefs about infection control, however, were contrary to the practices of his time. Such beliefs could have resulted in charges of heresy (opinions that are against church teachings) and a sentence of death.

Nostradamus.

Reproduced by permission of the Corbis Corporation.

Personal tragedies

Word of Nostradamus's healing powers made him a celebrated figure. He wrote a book listing the doctors and pharmacists he had met in southern Europe, translated anatomical texts, developed recipes for gourmet foods, and received his doctorate in 1529 from the University of Montpellier. He also taught at the university for three years, but left when his radical ideas about disease were criticized.

Nostradamus married and settled in the town of Agen, France, with his wife. They had two children. Unfortunately, Le Charbon came again. While Nostradamus was trying to heal others, his wife and two young children died of the plague. Citizens looked upon him with scorn because he could not

save his own family. His in-laws sued for the return of his wife's dowry (the goods she brought to her husband when they were married). His patron (sponsor) also broke ties with him.

Visions

For the next several years Nostradamus traveled through southern Europe. By 1544 heavy rains were again helping to spread the plague to southern France. With his medicinal practices, Nostradamus managed to halt the spread of disease in one town. He was again celebrated for his skills.

Nostradamus moved to the town of Salon, France, set up a medical practice, remarried, and began a new family. Outwardly, Nostradamus was a devoted practicing Catholic. However, at night he spent the hours in his study meditating in front of a brass bowl filled with water and herbs. Meditation would bring on a trance. In such trances visions would come to him.

Nostradamus began writing about his visions when he wrote the first of his almanacs. It contained predictions of things to come in the next year. The almanacs appeared each year from 1550 to 1565. They were very popular with the public. The Almanacs spoke of astrological phases of the coming year and contained quatrains, or rhymed four-line verse, offering hints of upcoming events. The published works served to spread his fame across France to an even greater degree.

Nostradamus's visions had become such an important part of his studies that he decided to gather them into one massive work for future generations. He called this book *Centuries*. He planned that there would be ten volumes, each containing one hundred predictions in quatrain form. In it, the next two thousand years of humanity would be forecast—through the year 3797.

Prophecies brought fame and fortune

Nostradamus began working on *Centuries* in 1554. The first seven volumes were published the following year. He completed the other volumes soon after, but would not allow them to be published until after his death. The reception of the initial works made Nostradamus a celebrated figure.

Nostradamus's writings attracted the interest of France's royal family. He was invited to the Paris court of Henry II (1519–1559) and his wife, Catherine de' Medici (1519–1589). The Medicis were known for their Europe-wide political ambitions. The queen hoped that Nostradamus could give her guidance regarding her seven children. Nostradamus arrived in Paris in August of 1556.

Nostradamus explained that one of his quatrains referred to the king. It read: "The young lion will overcome the older one/ On the field of combat in single battle/ He will pierce his eyes through a golden cage/ Two wounds made one, then he dies a cruel death." Nostradamus cautioned King Henry against attending any ceremonial jousting during his forty-first year, which the regent's own astrologer had also asserted.

The physician spent the next few years in the luxury of the royal court. He heard that Catholic authorities were again becoming suspicious of his soothsaying (making prophecies) and were about to investigate him. He returned to his hometown of Salon and his wife and children.

On June 28, 1559, when he was forty-one years old, Henry II was injured in a jousting tournament celebrating two marriages in his family. With thousands watching, his opponent's lance "pierced the King's golden visor, entered his head behind the eye, both blinding him and penetrating deep into his brain. He held onto life for ten agonizing days," wrote John Hogue in *Nostradamus and the Millennium*.

Later years

Already a celebrated individual in France, Nostradamus now became a figure inspiring both awe and fright among the populace. His other prophecies regarding France's royal line were consulted, and most seemed to predict only death and tragedy. Henry's surviving widow, now Queen Regent Catherine de' Medici, visited him in Salon during her royal tour of 1564. He again told her (as he had when he drew up their astrology charts) that all four of her sons would become kings. All did, but all died young.

Nostradamus died in Salon, France, in 1566. Many translations of his *Centuries* and treatises on their significance appeared in the generations following his death. They remain popular to the present day. Some critics point out that the verses are vague and can be read in many ways. Other interpreters claim Nostradamus predicted Adolf Hitler's (1889–1945) rise to power, the explosion of the U.S. space shuttle Challenger in 1986, and many other events.

RUDOLF NUREYEV

Born: March 17, 1938

Irkutsk, Russia

Died: January 6, 1993

Paris, France

Russian dancer

The Russian-born dancer and choreographer (a composer of dance) Rudolph Nureyev captured international acclaim as the greatest male ballet dancer of the 1960s and 1970s. His versatility (the ability to change easily) and energy were expressed in countless classical and modern roles, on both stage and screen.

Childhood

Rudolf Hametovich Nureyev was born on March 17, 1938, on a train travelling to Vladivostok in Russia, where his father was an instructor of Soviet soldiers. He was the youngest of the four children of Hamet and Farida Nureyev, who came from Asiatic Mongol ancestry. At the outbreak of World War II (1939–45; a war fought between the Axis Powers: Germany, Italy, and Japan—and the Allies: England, France, the Soviet Union, and the United States), his father joined the Soviet army and the family moved to Moscow, Russia. There, Nureyev, along with his three older sisters, grew up in terrible poverty, and the Nureyevs were forced to live with other families. At school he did not fair any better. Constantly teased and harassed by his fellow students for being raised so poor, Nureyev grew up lonely and isolated. But the young boy found enjoyment in one thing—music.

Rudolf Nureyev.

Reproduced by permission of Archive Photos, Inc.

Nureyev, despite early discouragement from his parents, began his dancing career with amateur folk dance groups and the Ufa Opera Ballet. At the age of seventeen he entered the Leningrad Ballet School to study with the outstanding teacher Alexander Pushkin. After three years of training he joined the Kirov Ballet as a soloist, dancing full length roles in *Don Quixote*, *Gayane*, *Giselle*, *La Bayadere*, *The Nutcracker*, *Swan Lake*, and *The Sleeping Beauty*.

Earning fame

Nureyev's offstage reputation was equally sensational, bringing him constant

trouble with both the Kirov management and the Russian political authorities. In the Kirov's first-ever appearance in Paris, France, in 1961, Nureyev was an outstanding success, yet his resistance of company regulations sparked a command return to Moscow. On June 17, 1961, Nureyev cut his ties with the Soviet Union (the former country that consisted of Russia and several smaller nations) seeking political asylum (political protection) at Le Bourget Airport in Paris, France.

Within five days, Nureyev embarked on a six-month season with the international Grand Ballet du Marquis de Cuevas, dancing the Prince and the Blue Bird in *The Sleeping Beauty*. As partner to Rosella Hightower, he made his London, England, debut in October 1961 at the Royal Academy of Dancing, where he met the ballerina Margot Fonteyn (1919–1991), who became his principal partner for many years. He became a regular guest artist with the Royal Ballet from 1962 to the mid-1970s, in addition to performing with Ruth Page's Chicago Opera Ballet, American Ballet Theatre, and on U.S. and French television.

With an inexhaustible stamina, Nureyev continued to perform at a nonstop pace, acquiring over ninety roles and appearances with over thirty major ballet and modern dance companies. Frederick Ashton (1904–1988), the British choreographer, was the first to create a role specifically for Nureyev in *Marguerite and Armand* in March 1963. Nureyev's own first production was the last act of *La Bayadere* for the Royal Ballet in November 1963, and his first reconstruction was the nineteenth-century three-act classic *Raymonda* for the Royal Ballet in June 1964.

His fascination with modern dance, which led to performances with American choreographers Martha Graham (1893–1991), Murray Louis, and Paul Taylor, began with Rudi Van Dantzig's *Monument for a Dead Boy* with the Dutch National Ballet in December 1968. He broke into film in 1972 with his directing debut of his own production of *Don Quixote* in Melbourne, Australia, and the creation of the film *I Am A Dancer*. The film *Rudolph Valentino*, directed by Ken Russell in 1976, gave Nureyev his debut as a film actor.

Self-reliance and a constant drive directed Nureyev's energy into a performing schedule around the world that only Anna Pavlova (1885–1931) could equal. His guest performances were slightly cut back with his assumption (the act of taking for oneself) of a three-year directorship of the Paris Opera Ballet in 1983. A rapidly changing character—shrewd, cunning, charming, and passionate—Nureyev demonstrated a commitment and a savage power equaled by no other dancer in his day. His last stage appearance was for a curtain call at the Palace Garner

after the production of his dance *La Bayadere* had been performed. He succumbed to acquired immune deficiency syndrome (AIDS; a disease that attacks the body's immune system) in Paris on January 6, 1993. He was fifty-four years old. "Any time you dance," Nureyev once said in an interview in *Entertainment Weekly*, "what you do must be sprayed with your blood."

JOYCE CAROL OATES

Born: June 16, 1938

Lockport, New York

American writer and poet

One of the United States's most prolific (producing a lot of work) and versatile (producing a wide variety of work) contemporary writers, Joyce Carol Oates focuses upon the spiritual, sexual, and intellectual decline of modern American society.

Early years

Joyce Carol Oates was born on June 16, 1938, in Lockport, New York, the oldest of

Frederic and Caroline Oates's three children. The family lived on a farm owned by Caroline's parents. Joyce's father was a tool designer, and her mother was a housewife. Oates was a serious child who read a great deal. Even before she could write, she told stories by drawing pictures. She has said that her childhood "was dull, ordinary, nothing people would be interested in," but she has admitted that "a great deal frightened me."

In 1953, at age fifteen, Oates wrote her first novel, though it was rejected by publishers who found its subject matter, which concerned the rehabilitation (the restoring to a useful state) of a drug addict, too depressing for teenage audiences. After high school Oates won a scholarship to Syracuse Univer-

sity, where she studied English. Before her senior year she was the co-winner of a fiction contest sponsored by *Mademoiselle* magazine. After graduating at the top of her class in 1960, Oates enrolled in graduate school at the University of Wisconsin, where she met Raymond Joseph Smith, an English professor. They were married in 1961.

Teaching and writing

In 1961, after Oates earned her master's degree and began work on her doctorate in English, she found one of her own stories in Margaret Foley's collection *Best American Short Stories*. Oates then decided on a writing

career, and in 1963 she published her first volume of short stories, *By the North Gate* (1963). Oates also taught at the University of Detroit between 1961 and 1967. In 1967 she and her husband moved to Canada to teach at the University of Windsor, where together they founded the publication *Ontario Review* in 1974. After leaving the University of Windsor in 1977, Oates became writer-in-residence and later a professor at Princeton University in New Jersey.

Oates's first novel, *With Shuddering Fall* (1964), shows her interest in evil and violence in the story of a romance between a teenage girl and a thirty-year-old stock car driver that ends with his death in an accident. Oates's best-known early novels form a trilogy (three-volume work) exploring three different parts of American society. The first, *A Garden of Earthly Delights* (1967), tells the story of the daughter of a migrant worker who marries a wealthy farmer in order to provide for her illegitimate (having unmarried parents) son. The woman's existence is destroyed when the boy murders his stepfather and kills himself. In *Expensive People* (1967), Oates exposes the world of people in the suburbs whose focus on material comforts reveals the emptiness of their lives. The final volume, *them* (1969), which won the National Book Award for fiction, describes the violence and suffering endured by three generations of an urban (city-dwelling) family in Detroit, Michigan. Oates's experiences as a teacher in Detroit during the early 1960s contributed to her knowledge of the city and its social problems.

Oates's novels of the 1970s explore characters involved with various American professional and cultural institutions while

adding tragic elements. *Wonderland* (1971) is about a brilliant doctor who is unable to build a satisfying home life. *Do With Me What You Will* (1973) focuses on a young attorney who is honored by his peers for his devotion to social work. *The Assassins: A Book of Hours* (1975) deals with the effects of the murder of a politician on his wife and two brothers. *Son of the Morning* (1978) documents the rise and fall of a preacher whose faith is challenged and made stronger by various events in his life. *Unholy Loves* (1979) revolves around the lives of several teachers at a small New York college.

During the early 1980s Oates published several novels based on works by nineteenth-century authors. *A Bloodsmoor Romance* (1982) is the story of five maiden sisters living in Pennsylvania in the late 1800s and is influenced by the writings of Charlotte Brontë (1816–1855) and Emily Brontë (1818–1848). In *Mysteries of Winterthurn* (1984), Oates borrowed heavily from the works of Edgar Allan Poe (1809–1849). While some critics dismissed these works, others, citing Oates's accomplished description of evil, maintained that they are significant achievements in literature.

Other works and other names

Throughout Oates's writing career she has distributed her energies among several projects at once. Her book-length essay *On Boxing* (1987) led to at least one appearance commenting on a televised boxing match. Around the same time, she submitted a mystery novel to a publisher under a pseudonym (fake writing name) and had the thrill of having it accepted. Oates published the novel *Lives of the Twins* (1987) under the name Rosamond

Smith. "I wanted a fresh reading; I wanted to escape from my own identity," Oates told Linda Wolfe in the *New York Times Book Review*. Though she used the name again for several other books, she resumed using her name with the publication of *My Heart Laid Bare*, in which she explores morality (the question of right and wrong) during the 1920s.

Oates's works in other forms also address darker sides of the human condition. Most critics feel that Oates's short fiction, for which she has twice received the O. Henry Special Award for Continuing Achievement, best expresses her main themes. Such collections as *By the North Gate; Where Are You Going, Where Have You Been?: Stories of Young America* (1974); *The Lamb of Abyssalia* (1980); and *Raven's Wing* (1986) contain pieces that focus on violent and abusive relationships between men and women.

Later works

In *Because It Is Bitter, and Because It Is My Heart* (1990), Oates returns to the familiar themes of race and violence. Other works from this time include *Black Water* (1992), an account of a tragic encounter between a powerful U.S. senator and a young woman he meets at a party, and *Foxfire: Confessions of a Girl Gang* (1993), which describes the destructive activities of a group of teenage girls in the 1950s. The story is pieced together from former Foxfire gang member Maddy Wirtz's memories and journal and takes place in the industrial New York town of Hammond. Oates also had several plays published and produced in the 1990s.

In 1999 Oates's twenty-ninth novel, *Broke Heart Blues*, was published. In March 2000 *Blonde*, based on the life of actress

Marilyn Monroe (1926–1962), was released. The book was a finalist for the National Book Award for fiction. In June 2000 *Getting to Know You*, a film based on Oates's 1992 short story collection *Heat*, was released. Oates edited the collection *The Best American Essays of the Century*, which was published in 2000. *Middle Age: A Romance*, a novel, and *Beasts*, a novella (a work whose length is greater than that of a short story but less than that of a novel), were published in 2001.

SANDRA DAY O'CONNOR

Born: August 26, 1930

El Paso, Texas

American Supreme Court justice

In 1981 Sandra Day O'Connor became the first woman to serve as a justice in the 191-year history of United States Supreme Court. A Republican appointed by Ronald Reagan, O'Connor has grit and intelligence that has made her an interesting figure in the nation's highest court of law.

Life on the Lazy B

Sandra Day O'Connor was born in El Paso, Texas, on August 26, 1930. Her parents, Harry and Ida Mae Day, owned a cattle ranch in southeastern Arizona called the Lazy B. In the beginning, the ranch did not have electricity or running water. Sandra grew up branding cattle, learning to fix whatever was broken, and enjoying life on the ranch.

Her experiences on the ranch shaped her character and developed her belief in hard work, but her parents also wanted O'Connor to gain an education. Living in such a remote area, the options for going to school were limited, and she had already shown that she was quite bright. By age four, she had learned how to read. Exploring places and schools that would be the best match for O'Connor's abilities, her parents decided to send her to El Paso to live with her grandmother and attend school. In El Paso she attended Radford School for girls and Austin High. She spent her summers at the ranch and the school years with her grandmother. She graduated high school early at the age of sixteen.

In 1946, after competing against many other people and despite the probability that she might not be accepted because she was a woman, O'Connor was accepted to Stanford University. In a program in which she finished two degrees in just six years instead of seven, she graduated in 1950 with a bachelor's degree in economics and received a law degree in 1952. While she was in law school, she was a member of the board of editors of the *Stanford Law Review*, a very high honor for a law student. Upon graduation she was at the top of her class, graduating third in a class of 102 students. O'Connor was just two places behind another future Supreme Court justice, William H. Rehnquist (1924–).

Marriage and career

After graduating, O'Connor tried to get a job in Los Angeles and San Francisco law firms, but because of the prejudices against women at that time (unfair treatment based on her sex), she could not get a job as a lawyer. She was offered a position as a legal secretary, which did not match her education and training. Instead, she took a position as a deputy county attorney in San Mateo, California. During this time, she also married John O'Connor, who was one class behind her at Stanford. Upon his completion of law school, the couple moved to Germany, where he served as an attorney in the U.S. Army. She worked as a civilian attorney, specializing in contracts.

Upon their return to the United States, the O'Connors settled in the Phoenix, Arizona, area. O'Connor and another lawyer opened a law office in suburban Maryvale, but for the next few years she devoted most of her time to raising her three sons, who were born between 1957 and 1962. She also joined many groups to improve her community and she began to take an active role in local Republican politics.

In 1965 O'Connor returned to full-time employment as one of Arizona's assistant attorneys general, an assistant to the chief law officer in the state. In 1969 the state senator from her district resigned, which led Governor Jack Williams (1909–1998) to appoint O'Connor to replace him. When the position was open for election in 1970, O'Connor won it and was easily reelected again in 1972. She was chosen as the Republican majority leader in the state senate in 1972. This was the first time that any woman anywhere in the country had held that position.

*Sandra Day O'Connor.

In 1974 O'Connor left the state senate and became a county judge in the Maricopa County Superior Court. In 1979 Bruce Babbitt (1938–), the governor of Arizona, appointed her to the Arizona Court of Appeals.

During the last month of the 1980 presidential campaign, candidate Ronald Reagan (1911–) needed more support from female voters. He said that if he were elected he would appoint a woman to the Supreme Court. In July 1981 President Reagan kept his promise and nominated Sandra Day O'Connor. The Senate quickly and unanimously confirmed her. She became the first

female justice in the 191-year history of the court. When Reagan selected her for the Supreme Court, she became the first person appointed in twenty-four years with state court experience and the first in thirty-two years with lawmaking experience.

Supreme Court justice

Many people expected O'Connor to be solidly conservative (to work to preserve or keep traditions and resist changes) in her decisions on the Supreme Court. In fact, many conservative politicians objected to her appointment. They thought she would not oppose abortion (the termination of a pregnancy) because she was a woman. Abortion is a key issue for Republican conservatives. However, many women support abortion rights or the right for a woman to choose.

O'Connor made this issue somewhat confusing for the people who were studying her because she was not part of the organized women's movement which supports abortion. Although the Moral Majority (a very conservative Christian group opposing or against abortion) complained that O'Connor was in favor of abortion, she had cast votes against as well as for it in the legislature. As a justice, she aligned herself with the opponents of abortion (people against abortion).

Although she was not a strong supporter of the women's movement, O'Connor was a founder of both the Arizona Women Lawyers Association and the National Association of Women Judges. She also had fought to remove discrimination (or unequal treatment) against women from her state's bar (the body that governs law) rules and community property laws. As a justice, she was against discrimination based on gender. Her most

famous Supreme Court opinion (a formal written statement by a judge) was in the court case *Mississippi University for Women v. Hogan* (1982). In this decision, the Supreme Court ruled that it was unconstitutional for a state nursing school to refuse to admit men. With this decision, she displayed her ability to rule on equality issues that affect men.

Second decade on the Supreme Court
