# INTRODUCTION

*Medieval France: An Encyclopedia* is an introduction to the political, economic, social, religious, intellectual, literary, and artistic history of France from the early 5th century to the late 15th. We have sought to present in a single, convenient reference work aspects of medieval France that are otherwise treated in separate scholarly publications. The subject matter is complex and vast, and we therefore make no claims for completeness. We hope, however, to have provided a balanced, informative, and up-to-date reference work that, although directed primarily toward students and the general public, will also provide a useful starting point for scholars in various disciplines.

Entries range from about fifty words to over 3,000. Shorter entries provide ready reference; longer entries explain and interpret major institutions, writers and works, movements, and monuments. The encyclopedia offers a cross-disciplinary focus that promotes the integration of materials, provides a synthetic perspective, and encourages immediate connections among fields often held in isolation. Though scholars using this volume will be familiar with the basic information and bibliography contained in articles that cover their areas of expertise, they will find the articles in fields other than their own to be indispensible for general orientation, interpretation, and bibliography. The index at the end of the volume and cross-referencing at the end of each entry are designed to enhance the cross-disciplinary perspective.

Both "medieval" and "France" require definition. By "medieval," we mean that vast period between the fall of the Roman Empire, with the decline or loss of such Roman institutions as schools, roads, towns, and law—in short, civilization as we conceive it—and the advent of the Renaissance in late 15th-century France. It is a period in which a new and specifically French civilization and identity were forged, in which new institutions were conceived and developed: the universities, the feudal monarchy, scholastic philosophy, Romanesque and Gothic art, western monasticism and mysticism. Paris, which under the Capetians became the capital of a growing dynasty, was the intellectual, artistic, and political center of late-medieval France. But "France" itself is an elusive geographical area during the period in question. For purists, it is no more than the Île-de-France, the region immediately surrounding the capital. But for our purposes, it extends roughly from Brussels to the Mediterranean, from Switzerland to Brittany, and briefly even into Britain: all the area that was dominated by the new court culture that grew out of the Carolingian and Capetian intellectual centers. Individuals who played a dominant role in medieval French political, artistic, or intellectual life, and who are associated chiefly with French cultural centers, whether or not they happened to have been born within the boundaries of contemporary France, are included—for example, Peter Lombard, Thomas d'Angleterre, Thomas Aquinas, Hugh of Saint-Victor, Robert de Courçon, among many others.

Entries are arranged alphabetically. In the listing of literary works, preference has been given to the names of the authors, whenever known, rather than to titles of works.

Thus, *Perceval (Conte du Graal)* will be found under CHRÉTIEN DE TROYES and the *Gesta Francorum* under AIMOIN DE FLEURY. The form of the individual's name chosen to alphabetize has frequently proven problematic. At the conception of the project, it was the editors' intention to use the modern French form for all proper nouns, but it quickly became clear that both scholars and the general public would be disoriented, and perhaps shocked, to have to look under GUILLAUME LE BÂTARD for the familiar William the Conqueror, or PIERRE LE CHANTRE for Peter the Chanter. The compromise reached was that we would seek to include that form of the name most familiar to scholars in historical disciplines and to the general public. Thus, all kings of France and England, dukes of Burgundy, and many members of the royal families are found under their Englished form (Charles the Bad, Philip the Bold, Henry II); most theologians and philosophers are anglicized (Philip the Chancellor, William of Champeaux, Thierry of Chartres); while all vernacular authors are found under the usual French form of their name (Marie de France, Thomas d'Angleterre, Peire Cardenal). In all cases, however, the user should try the following equivalencies when the name is not where initially sought: Gautier=Walter; Guillaume/ Guilhem=William; Jean=John; Matthieu=Matthew; Philippe=Philip; Pierre/Peire=Peter.

A further complicating factor was whether to alphabetize under the given name or the cognomen. As the article PERSONAL NAMES makes clear, cognomens began to be used only in the 11th century and were generally loconyms common to all people living in a given place, changing as the person changed residence. The personal name remained the individual's chief identification. But, by the 14th century, family names as we know them slowly began to become fixed, so that cognomens vied with personal names in providing identification. Furthermore, many individuals from this period are more readily identified by their cognomens than their personal names (Villon, Deschamps, Ockeghem). So it was decided that individuals whose primary period of activity preceded the 14th century were to be identified by their personal names (Peter of Blois, Renaut de Beaujeu, William of Sens), whereas those who were active principally or wholly in the 14th and 15th centuries are to be found under their cognomens (La Marche, Olivier de; Ockham, William of; Ferrières, Henri de). A few exceptions were made, always with the intention of providing the most accessible and familiar entry (Bernard Gui, Christine de Pizan, René d'Anjou), and usually where the cognomen is still clearly a loconym. The user is encouraged to seek first under the given name, since fully 90 percent of the individuals found herein are so alphabetized, and secondarily under the cognomen.

In the case of anonymous literary works like the *Chanson de Roland* or *Roman de Sidrac,* we have taken the "Chanson de" or "Roman de" as a generic indicator, rather than as a part of the title; these works are listed as *ROLAND, CHANSON DE* and *SIDRAC, ROMAN DE.* French cities are listed under their French spellings, which in only a few cases differ from their English forms (Lyon, Marseille, Strasbourg).

The volume includes maps, genealogies, and illustrations to add a visual dimension that will help clarify individual topics and inform the reader. The index at the end of the encyclopedia is intended to guide users to topics that either lack their own entry or are cited repeatedly throughout the volume. The bibliographies appended to the entries are not intended to be exhaustive but instead provide key reference materials that will enable the student and scholar to move quickly and confidently into the matter at hand. They are

generally organized as follows: primary sources (editions, then translations where appropriate), followed by secondary scholarship, cited alphabetically by author.

A work of this magnitude requires the collaboration and cooperation of many persons. Our deepest gratitude goes in the first place to the many colleagues who graciously gave of their time and knowledge to write the articles that are the very soul of this enterprise; their names are listed both at the beginning of the volume and after the articles they contributed. In addition to writing key articles, several colleagues provided special assistance in drawing up lists of entries and defining coverage for specific areas: Matilda T.Bruckner for vernacular romance, William W.Clark for art history, Margot Fassler for music, Alan E.Knight for theater, Whitney S.Stoddard for art history, and Roy S.Rosenstein for Occitan poetry. Other colleagues generously contributed some of the photographs used to illustrate this volume: Rebecca Baltzer, Karen Gould, and Joan Holladay. The editors wish to express deep appreciation to Whitney S.Stoddard for making his superb collection of photographs available and to Oberlin College for permitting reproduction of photographs from the Clarence Ward Photograph Collection. Joseph Romano was most helpful in connection with the Ward photographs. The editors wish to thank the following libraries and museums for permission to reproduce items in their collections: Allen Memorial Art Museum, Oberlin College; Archives Nationale, Paris; Bargello, Florence; Biblioteca Medicea Laurenziana, Florence; Bibliothèque de l'Arsenal, Paris; Bibliothèque Municipale d'Arras; Bibliothèque Municipale, Douai; Bibliothèque Nationale, Paris; Beinecke Rare Book and Manuscript Library, Yale University; British Library; Cleveland Museum of Art; The Cloisters, New York; Louvre, Paris; Metropolitan Museum of Art, New York; Museum of Fine Arts, Boston; National Gallery of Art, Washington, D.C.; Pierpont Morgan Library, New York; Walters Art Gallery, Baltimore. Also, Joel Herschman, Virginia Jansen, and the French National Tourist Office permitted reproduction of photographs. Help with typing, bibliography checking, and computer applications was provided by Elisabeth Barret, Mary-Alis Kibler, Jennifer A. Zinn, Thelma Roush, and Terri Mitchell. For timely help in art history, we are particularly grateful to Stacy L. Boldrick and Karen Gould. Finally, this work would never have seen the day without the suggestions, insights, and careful copyediting by Gary Kuris of Garland Publishing. Also at Garland, Helga McCue was instrumental in the early production stages of the encyclopedia, while Eunice Petrini's patience, good humor, eagle-eye, and gentle wisdom proved invaluable in the final editing and assembling of the volume. The University of Texas and Oberlin College provided research assistance to the editors.

| | Theuderic IV (721–37) | |
| | Childeric III (743–51) | |

### CAROLINGIAN KINGS OF WEST FRANKS/FRANCE

| | |
|---|---|
| Pepin (III) the Short (751–68) | Louis III (879–82) *and* |
| Carloman (768–71) *and* | Carloman II (879–84) |
| Charles I (Charlemagne) (768–814) | Charles III the Simple (898–922) |
| Louis I the Pious (814–40) | Louis IV d'Outremer (936–54) |
| Charles II the Bald (840–77) | Lothair I (954–86) |
| Louis II the Stammerer (877–79) | Louis V (986–87) |

### ROBERTIAN/CAPETIAN KINGS OF FRANCE

| | |
|---|---|
| Eudes (888–98) | Philip II Augustus (1180–1223) |
| Robert I (922–23) | Louis VIII (1223–26) |
| Raoul (923–36) | Louis IX (St. Louis) (1226–70) |
| Hugh Capet (987–96) | Philip III the Bold (1270–85) |
| Robert II the Pious (996–1031) | Philip IV the Fair (1285–1314) |
| Henry I (1031–60) | Louis X the Quarrelsome (1314–16) |
| Philip I (1060–1108) | John I (1316) |

Louis VI the Fat (1108–37)  Philip V the Tall (1316–22)
Louis VII (1137–80)  Charles IV the Fair (1322–28)

**VALOIS BRANCH OF THE CAPETIAN FAMILY**

Philip VI (1328–50)  Charles VII (1422–61)
John II the Good (1350–64)  Louis XI (1461–83)
Charles V the Wise (1364–80)  Charles VIII (1483–98)
Charles VI (1380–1422)

# COUNTS OF ANJOU

Foulques I le Roux d. (938)  Geoffroi III le Barbu (1060–68)
Foulques II le Bon (938–58)  Foulques IV le Rechin (1068–1109)
Geoffroi I Grisgonelle (958–87)  Foulques V (1109–29)
Foulques III Nerra (987–1040)  Geoffroi IV Plantagenêt (1129–51)
Geoffroi II Martel (1040–60)  Henri (Henry II, king of England) (1151–89)

# VALOIS DUKES OF ANJOU

*[Also counts of Provence and claimants to Naples]*

Louis I (d. 1384)
Louis II (1384–1417)
Louis III (1417–34)
René le Bon (1434–80)
Charles (1480–81)

# DUKES OF AQUITAINE/COUNTS OF POITOU

Ebles II (d. ca. 934)  William VII (ca. 1138–58)
William III (935–63)  William VIII (Gui-Geoffroi) (1058–86)
William IV Fier à Bras (963–95)  William IX (1086–1126)
William V the Great (995–1030)  William X (1126–37)
William VI the Fat (1030–ca. 1038)  Eleanor (1137–1204)
Eudes I (1038–40)  *[Held by Eleanor's descendants, kings of England, until 1453]*

# COUNTS OF BLOIS and COUNTS OF CHAMPAGNE

Thibaut I le Vieux (d. ca. 940)
Thibaut II le Tricheur (ca. 940–ca. 977)
Eudes I (975–96)
Eudes II (996–1037)  Eudes II count of Champagne (1025–37)
Thibaut III (I of Champagne) (1037–89)
Étienne-Henri (1089–1102)  Hugues I count of Champagne (1093–1125)
Thibaut IV le Grand (1102–52)  Thibaut IV le Grand (II of Champagne) (1125–52)
Thibaut V (1152–91)  Henri I le Libéral count of Champagne (1152–81)
Louis (1191–1205)  Henri II (1181–97)
Thibaut VI (1205–18)  Thibaut III (1197–1201)
Marguerite (1218–25)  Thibaut IV (1201–53) (king of Navarre [1234–53])
  Thibaut V (II of Navarre) (1253–70)
  Henri III (I of Navarre) (1270–74)
  Jeanne (m. Philip IV) (1274–1305)
  Louis (X of France) (1305–16)

## DUKES (COUNTS) OF BRITTANY

Nominoe (d. 851)

Erispoe (851–57)

Salomon (857–74) (divided rule [874–88])

Alain I (888–907)

Wramaelon (908–19) (divided rule [919–36])

Alain II (936–52) (divided rule [952–70])

Conan I (970–92)

Geoffroi I (992–1008)

Alain III (1008–40)

Conan II (1040–66)

Hoel (1066–84)

Alain IV (1084–1112)

Conan III (1112–48)

Eudon (1148–55)

Conan IV (1155–66) (under English rule [1166–81])

Geoffroi II (Geoffrey Plantagenêt) (1181–86)

Arthur I (1186–1203)

Gui de Thouars (1203–12

Pierre I Mauclerc 1213–37)

Jean I (1237–86)

Jean II (1286–1305)

Arthur II (1305–12)

Jean III (1312–41)

Charles de Blois (1341–64)

Jean IV (1364–99)

Jean V (1399–1442)

François I (1442–50)

Pierre II (1450–1457)

Arthur III (Richemont) (1457–58)

François II (1458–88)

Anne (1488–1514) (m. Charles VIII, then Louis XII of France)

## DUKES OF BURGUNDY

*Capetian Line*

Robert I (1032–75)

Hugues I (1075–78)

Eudes I (1078–1102)

Hugues II (1102–43)

Eudes II (1143–62)

Hugues III (1165–92)

Eudes III (1192–1218)

Hugues IV (1218–72)

Robert II (1272–1305)

Hugues V (1305–15)

Eudes IV (1315–49)

Philippe de Rouvre (1349–61)

*Valois Line*

Philip the Bold (1363–1404)

John the Fearless (1404–19)

Philip the Good (1419–67)

Charles the Bold (1467–77)

Marie (m. Maximilian of Austria) (1477–82)

## COUNTS OF FLANDERS

Baudouin I (862–79)

Baudouin II (879–918)

Arnulf I (918–65)

Baudouin III (d. 961)

Arnulf II (965–88)

Baudouin IV (988–1035)

Baudouin V (1035–67)

Baudouin VI (1067–70)

Arnulf III (1070–71)

Robert I the Frisian (1071–93)

Robert II of Jerusalem (1093–1111)

William Clito (1127–28)

Thierry d'Alsace (1128–68)

Philippe d'Alsace (1168–91)

Baudouin VIII (1191–95)

Baudouin IX (1195–1205)

Jeanne de Constantinople (1205–44)

Marguerite (1244–78)

Gui de Dampierre (1278–1305)

Robert III de Béthune (1305–22)

Louis I de Nevers (1322–46)

Louis II de Mâle (1346–84)

Baudouin VII (1111–19)　　　　　*[Thereafter, see dukes of Burgundy]*

Charles the Good (of Denmark) (1119–27)

## DUKES OF (UPPER) LORRAINE

Albert of Alsace (d. ca. 1033)　　Ferri III (1251–1304)

Gerard (1048–70)　　　　　　　Thibaut II (1304–12)

Thierry I (1070–1115)　　　　　Ferri IV le Lutteur (1312–28)

Simon I (1115–39)　　　　　　　Raoul le Vaillant (1328–46)

Mathieu I (1139–79)　　　　　　Jean I (1346–90)

Simon II (1176–1205)　　　　　Charles I (1390–1431)

Ferri I (1205–08)　　　　　　　René I d'Anjou (1431–53)

Ferri II (1206–13)　　　　　　　Jean II (1453–70)

Thibaut I (1213–20)　　　　　　Nicolas (1470–73)

Mathieu II (1220–50)　　　　　René II (1473–1508)

## DUKES OF NORMANDY

Robert I (Rollo) (911–28)　　　　Robert (III) Curthose (1087–1106)

William Longsword (928–42)　　Henry I (1106–35)

Richard I (942–96)　　　　　　Stephen of Blois (1035–44)

Richard II (996–1026)　　　　　Geoffroi IV Plantagenêt (1144–50)

Richard III (1026–27)　　　　　Henry II (1150–89)

Robert (II) the Magnificent (1027–35)　*[Held by kings of England to 1204, then annexed by kings of France]*

William the Conqueror (1035–87)

## COUNTS OF TOULOUSE (SAINT-GILLES FAMILY)

Raymond I (d. 924)　　　　　　Raymond IV (1090–1105)

Raymond II (Pons) (924–ca. 960)　Alphonse-Jourdain (1105–48)

Raymond III (ca. 960–85)　　　Raymond V (1148–94)

Pons II (985–90)　　　　　　　Raymond VI (1194–1222)

Guilhem Taillefer (990–1045)　　Raymond VII (1222–49)

Pons III (1045–60)　　　　　　Alphonse of Poitiers (1249–71)

Guilhem (d. 1090)

# POPES 440–1503

# MUSICAL TERMS

**CANON.** A term describing a kind of imitation in polyphonic music. In informal usage, canon or canonic imitation refers to the most common situation, the exact duplication of a leading voice by a follower at a given time interval, e.g., a round like *Frère Jacques*. In more formal usage, canon is a rule whereby one or more unnotated following voices are derived from a notated voice, e.g., *Fuga in diapente* (derived voice proceeds at the interval of a fifth below the given voice); or in the 15th century often in playful terms, e.g., *Vous jeunerez les quatre temps* (derived voice rests four breve measures before following); or *Cancer eat plenus sed redeat medius* (derived voice performs the given voice in retrograde motion, then returns from the end back to the beginning in halved rhythmic values).

**COUNTERPOINT.** Polyphony; the term derives from *punctus contra punctum,* note against note, by extension melody against melody.

**IMITATION.** "Imitation" or "melodic imitation" is a technique of polyphonic music involving successive, overlapping statements of a melodic contour by two or more voices.

**LIGATURE.** A symbol of musical notation encompassing several notes, all sung to the same syllable. The interpretation of rhythmic values in the rhythmic modes depends on certain regularly recurring patterns of ligatures.

**MELISMA.** In music, a style of text setting that involves singing several pitches to a single syllable. Melismatic text setting is the opposite of syllabic text setting.

**MODE.** In medieval music theory, "mode" refers according to context either to the church modes or to the rhythmic modes. The medieval church modes can be epitomized as a series of eight scales, two for each of the four final pitches D, E, F, and G, one (authentic) extending above the final, the other (plagal) centered on the final. Some medieval theorists discuss modes in terms of species of the fourth, fifth, or octave, i.e., the particular pattern of tones and semitones that fill those intervals.

**MONOCHORD.** A simple musical instrument for the examination of musical intervals and tuning, constructed of a single string stretched between two points with a movable bridge.

**MONODY.** Monophonic vocal music, either plainchant or secular monophony.

**MONOPHONY.** Music composed of a single line or melody; monophonic music.

**PLAINCHANT; PLAINSONG.** The monophonic melodies of the church; Gregorian chant.

**POLYPHONY.** Music composed of several simultaneously sounding lines; polyphonic music.

**PROPORTION.** A property of musical rhythm exploiting fractional relationships of durations within a voice or between voices. Proportional rhythmic relationships are particularly important in 15th-century music.

**SOLFÈGE; SOLMIZATION.** A teaching tool attributed to Guido d'Arezzo (early 11th c.). Overlapping scales of six notes, which were named after the initial syllables of

the first six lines of the hymn *Ut queant laxis/Resonare fibris* (Ut, Re, Mi, Fa, Sol, La), helped beginners learn to sing. The note names of this system were used in the West throughout the Middle Ages and beyond.

**TETRACHORD.** In medieval music theory, a scale segment of four notes. The three possible patterns of tones and semitones within a tetrachord (T-S-T; S-T-T; T-T-S) were significant in some descriptions of the church modes.

# A

**ABBEVILLE.** The town of Abbeville (Somme) was an important center on the Somme River that became the seat of the county of Ponthieu. In 1184, the count recognized a commune that the townspeople had organized some years earlier. The heiress to the county married Ferdinand III of Castile in 1257, and Ponthieu became the dowry of their daughter Eleanor when she married Edward I of England. Abbeville passed back and forth between France and England during the Hundred Years' War and was one of the strategic towns along the Somme

Abbeville (Somme), Saint-Vulfran, nave and north aisle. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

that were given to the duke of Burgundy in 1435 subject to repurchase by the king of France. Louis XI exercised this option in 1463, but the town was regained by Burgundy for a few more years before the French king acquired it permanently.

In 1257, Abbeville was the site of negotiations that culminated in an Anglo-French treaty by which Henry III and Louis IX renounced their claims to territories held by the other.

The sole remaining medieval monument in Abbeville is the large church, formerly a collegial, of Saint-Vulfran, whose most notable feature is its Flamboyant façade. The building, which was badly damaged in 1940, was constructed in two periods: the nave and transept from 1488 to 1539; the chevet from 1661 to 1691. In contrast to the lavishly decorated façade with its full complement of sculptures, the post-World War II restorations robbed the interior of any interest.

**ABBO OF FLEURY** (ca. 945–1004). Born near Orléans, Abbo entered the Benedictine monastery of Fleury-sur-Loire as a child oblate. After study in Paris and Rome, he returned to Fleury to teach and write. Abbo spent two years in England at Ramsay abbey and was there ordained priest by Archbishop Oswald of York, who had been a monk at Fleury. Upon returning to France, he was elected abbot of Fleury in 988. Abbo died from a wound received in a quarrel over monastic reform while visiting the abbey of La Réole, a dependency of Fleury.

Abbo's writings include scientific treatises (on astronomy, arithmetic, and the *computus*), the *Canones Abbonis* (a collection of conciliar canons and other materials), a work on grammar, the *Vita sancti Edmundi* (written while in England), a brief and incomplete work on lives of the popes, and an *Apologia* concerning a quarrel with Arnoul, bishop of Orléans. Some seventeen letters by Abbo survive. He traveled twice to Rome on behalf of King Robert II, and he was known as an advocate of ecclesiastical and monastic reform.

**ABÉLARD, PETER** (1079–1142). Much of the life of Abélard, one of the most renowned 12th-century thinkers, is known from his *Historia calamitatum,* written ca. 1133. Born into a minor noble family in Le Pallet, Brittany, in 1079, Abélard embarked on a career as student, then master, in various French schools. He studied with leading masters at three cathedral schools: Roscelin (Loches), William of Champeaux (Paris), and Anselm of Laon (Laon). He himself taught at Paris (Mont-Sainte-Geneviève, Saint-Denis [while a monk there], and the cathedral school at Notre-Dame), Melun, Corbeil, Laon, and the Paraclete (near Troyes). An intellectual combatant, at Paris he challenged Willliam of Champeaux on the existence of universals and at Laon criticized Anselm as lacking theological insight and dialectical skills. Abélard himself was harshly criticized and rebuked. In 1121, a council at Soissons found him guilty of heresy concerning the Trinity and required him to burn his treatise *On the Trinity and Unity of God* (or *Theologia "Summi Boni"*). In the late 1130s, William of Saint-Thierry, deeply troubled by Abélard's *Theologia christiana,* wrote to Bernard of Clairvaux, who had Abélard summoned to a council at Sens in June 1140, where he was charged with heresy. The council condemned nineteen points in Abélard's theology; the pope soon thereafter also condemned Abélard. Following the condemnation at Sens, the Cluniac abbot Peter the

Venerable offered Abélard a refuge at Cluny. According to Peter, Bernard and Abélard were reconciled before Abélard died in April 1142 at Saint-Marcel, a Cluniac priory near Chalons-sur-Saône.

While teaching in the schools of Paris, Abélard became involved in a passionate love affair with Héloïse, possibly the niece and certainly the ward of Fulbert, canon of the cathedral of Notre-Dame in Paris. Fulbert engaged Abélard to tutor the brilliant Héloïse, but the two were soon making love, not studying philosophy. Héloïse became pregnant; Fulbert, unsatisfied by the secret marriage of Abélard and Héloïse, had Abélard castrated. Abélard and Héloïse entered the monastic life in 1119, she at the convent of Argenteuil, near Paris, he at the monastery of Saint-Denis, also near Paris. At Saint-Denis, Abélard began teaching again, at the request of students. He earned the monks' enmity by suggesting that the St. Denis to whom their abbey was dedicated was not the same as the mystical author Pseudo-Dionysius the Areopagite, an identification generally accepted in the 12th century.

Abélard's *Historia calamitatum* chronicles the love affair and its aftermath, particularly Abélard's career. A subsequent series of letters exchanged between Abélard and Héloïse reveals her deep attachment to him, his grow ing concern for her and her sister nuns, and his efforts to provide them with sermons, hymns, and a monastic rule. The authenticity of the correspondence has been challenged in recent years, but the consensus is that the letters represent a genuine exchange between Abélard and Héloïse.

Abélard finally left Saint-Denis and built a hermitage dedicated to the Paraclete at a remote spot near Troyes, where he taught students who sought him out. He later gave the land and buildings to Héloïse and her sister nuns for a convent after they were ejected from Argenteuil by Suger of Saint-Denis. In 1126, Abélard became abbot of Saint-Gildas de Rhuys in Brittany; after an abortive attempt to reform this lax monastic establishment, he fled, probably to Paris and the schools.

An accomplished master of dialectic (logic), Abélard pushed vigorously for questioning in the field of theology, with the goal of arriving at truth through a rigorous examination of conflicting opinions drawn from Scripture and authoritative writings (Augustine, Gregory the Great and other popes, church councils). This approach received classic expression in *Sic et non*. Here, Abélard posed 158 theological questions, gathered statements from the tradition favoring each side of the question, but offered no solution *(sententia)* of the differences in position.

In ethics, Abélard taught a doctrine of intentionality and disinterested love. In *Scito te ipsum,* Abélard argues that the actual deed is morally indifferent; the key to ethical behavior is the intention with which the deed is carried out.

Concerning the doctrine of Christ's atonement, Abélard set forth in his commentary on the Epistle to the Romans a distinctive teaching, often called a "subjective" theory. Abélard argued that the effect of Christ's death was not an "objective" change in the relation of God and humanity (in light of human sin) as presented in Anselm of Bec's *Cur Deus homo*. Rather, Christ's death reveals self-sacrifice and absolute self-giving love, which evokes in the believer a response of total sacrifice and love and effects not a cosmic transaction involving divine justice but a personal and individual transformation of love and intention.

Among Abélard's other writings are an unfinished *Dialogus inter Philosophum, Judaeum, et Christianum,* the *Confessio fidei universalis,* letters, poems, forty-three

sermons for use at the Paraclete, an *Apologia,* and *Hexaemeron* (a commentary on the six days of creation in Genesis). Abélard left disciples but no established school. Though he influenced the development of the scholastic method, especially the *quaestio,* in general his contributions to theology were topical and not systematic.

Abélard's poetry reveals exceptional emotional power in lyrics on biblical and religious themes, such as the lament *(planctus)* of David on the death of Jonathan, which he invests with a notable sensibility of personal pain and loss. He wrote other laments, liturgical poems, and a collection of hymns for Héloïse and the nuns at the Paraclete. In a letter, Héloïse remarks that Abélard wrote popular love poems that were the talk of Paris when he and Héloïse were lovers; none survives.

Peter the Venerable transferred Abélard's body to the Paraclete, where it was buried in the church. When Héloïse died in 1163/64, she was buried beside him. Their remains were taken to Paris when the Paraclete was destroyed after the Revolution, and they now rest in a tomb in the cemetery of Père-Lachaise.

*ABRÈGEMENT DU FIEF.* Because of the services and potentially lucrative feudal incidents owed by the holder of a fief, a fief could be abridged in value if it came into the hands of a holder who could not render military service (such as a nonnoble or a cleric) or a corporate body that never died (generally, an ecclesiastical house). When a nonnoble acquired a fief, the circumstance was known as *franc-fief,* and the lord was entitled to a payment, of the same name, to compensate for the abridgment of the fief's value.

When a fief passed from an individual to a corporate body, it was said to change from a state of *main vive* to a state of *main morte,* and this change of status was called *amortissement.* The term *amortissement* also described both the permission required for such a transaction and the payment that the lord required as compensation for the abridgment.

It was not until the 13th century that lawyers began to articulate these principles, perhaps because alienation of fiefs to nonnobles was rare until that time. The French kings, now claiming recognition as supreme suzerains in the feudal hierarchy, began to issue ordinances regarding alienations of feudal property, the first of these being in 1275. Between 1291 and 1313, Philip IV began to use the concept of *abrègement du fief* as a device for raising money. He had commissioners investigate property transactions throughout the realm and levy fines for *franc-fief* and *amortissement* that amounted to several years' revenues of the property in question. In 1321, Philip V regulated all transactions that had occurred in the past sixty years, ordering the church to pay *amortissement* of six years' revenues of fiefs received as gifts and eight years' revenues of fiefs acquired by purchase. The crown made heavy use of *abrègement du fief* as a fiscal device during the 1320s and continued the practice intermittently thereafter, but as regular taxation developed during the Hundred Years' War the exploitation of this source of revenue lost its significance.

**ABUZÉ EN COURT.** This anonymous poem interspersed with prose, preserved in six manuscripts and five incunabula, has been incorrectly attributed to King René d'Anjou or Charles de Rochefort. Written in the third quarter of the 15th century, it is a condemnation of court life in the tradition of Alain Chartier's *Curial* and *Quadrilogue invectif.* Abuzé encounters allegorical figures (Abuz, Folcuider, Temps, Folle Bobance, etc.) and recounts his experiences at court. The work, in the Grand Rhétoriqueur tradition, makes extensive use of rhetorical figures.

# ACCOUNTING

. The topic can be divided into the categories of private and public accounting. French royal accounting received considerable impetus from the reign of Philip II Augustus, at which time the careful registration of income and expenses began. A *Chambre des Comptes* would emerge in the early 14th century. However, France did not have an adequate royal budgetary system until after the end of the *ancien régime*. The most advanced private accounting techniques evolved first in medieval Italy and were later best implemented outside Italy in the Low Countries. This is not to say that France did not witness the development of accounting systems, which attained considerable sophistication at markets like the Champagne fairs.

Accounting procedures existed in the context of large rural estates, where *terriers* or *compoti* might provide data on the seed sown, the acreage cultivated, and the yield realized. In the realm of commerce, there survive some few fragmentary private accounts: those of an unknown draper of Lyon for 1320–23, of the notary and draper Ugo Teralh of Forcalquier for 1330–32, of the merchant and draper Jean Saval of Carcassonne, of the Bonis brothers of Montauban in the mid-14th century, and of the merchant Jacme Olivier of Narbonne at the end of the century.

It is generally accepted that the technique of double-entry bookkeeping emerged in Italy in the 13th century. The categories of credits and debits did not exist side by side in the earliest forms of French accounts. In those of Ugo Teralh, debtors wrote in their own obligations. The brothers Bonis kept various books, several of which have survived: a book, labeled C, for credit offered to debtors; a *livre vermeil* for deposits, which also contained the accounts of estates managed by them; a book D, which in part continued C. Forestié has identified additional books A and B, which do not survive but would have preceded book C. The Bonis lent money at interest in addition to their commercial cloth, spice, and pharmaceutical business. Their accounts of credits and debits were not positioned opposite each other but rather consisted of discrete entries in succession. In contrast to the accounts of the Bonis, the account book of Jacme Olivier provided no general accounting of the credits and debits at the end of the volume. However, Olivier provided not only accounts for particular individuals but also for specific voyages, noting the costs of merchandise and shipping. Though not on a par with Italian financial technology, the pressures of complex commercial operations, the existence of associations of multiple partners bringing capital to an affair, and the increased use of delegated authority for administration of property encouraged the development of sophisticated accounting measures in France by the end of the Middle Ages.

# ACHARD OF SAINT-VICTOR

(d. 1170/71). Born in England, Achard became abbot of Saint-Victor, Paris, in 1155, succeeding the community's first abbot, Gilduin. In 1161, Achard was elected bishop of Avranches, a position he held until his death. Fifteen surviving sermons, edited by Châtillon, are important for their presentation of Achard's christology and his theological anthropology.

# ACROSTIC

. Verbal play in which initial or individual letters, taken in order, form a word or phrase—called an acrostic—appears in French texts from about the middle of the 13th century, and the practice continues throughout the medieval period. The acrostic is often a device for naming either poet or patron, as in *Cleomadés,* the *Roman de la Poire,* the *Roman du castelain de Coucy,* and Villon's *Testament*. Stanzaic prayers and hymns to the Virgin are sometimes built on alphabetical acrostics or on the letters in the name "Maria." The acrostic device suggests a growing literacy among the audience for vernacular poetry and an interest in the visual qualities of the written text, especially in cases where the acrostic is highlighted through the use of ornamental initials.

# ADALBERO OF LAON

(ca. 955–1031). Nephew of Archbishop Adalbero of Reims, Adalbero became bishop of Laon (r. 977–1031), where he was intimately involved in the royal affairs of kings Lothair I, Louis V, Hugh Capet, and Robert II. Adalbero is perhaps most famous for his betrayal of the last Carolingian pretender, Charles of Lorraine, whom he turned over to Hugh Capet (Eastertide, 991); the treason—he had sworn on broken bread and wine to be

faithful—recalled that of Judas and gained him the epithet *vetulus traditor* and the nickname Ascelin. His motivations were more pro-Ottonian than pro-Capetian; in 995, he plotted, unsuccessfully, with Otto III and Eudes of Blois, an opponent in the Carolingian struggle, to overthrow the Capetians. Despite his multiple offenses, however, Adalbero survived all the fluctuations in his and the kingdom's fortunes: unlike his more talented contemporary Gerbert of Aurillac, who committed no such treasonous acts, Adalbero was an "insider" in the aristocratic world of northern French episcopal politics. He is the author of a treatise on dialectic, a theological poem, and two satirical poems. His *Carmen ad Rotbertum* contains one of the earliest French articulations of the idea of the "Three Orders" and expresses Adalbero's deeply conservative views and his opposition to the unregal piety of Robert II, who, "ruled over" by Odilo of Cluny, accepted new religious movements like the Peace of God and monastic reform, and raised humble clerics to the ranks of bishop.

# ADAM DE LA HALLE

(ca. 1240–ca. 1285). Dramatist and poet. Also called "Adam le Bossu" or "le Bossu d'Arras" (*bossu* 'awkward' or 'crippled'), Adam de la Halle lived and wrote in Arras during the last third of the 13th century. His modern reputation is based primarily on two plays: a satiric drama, the *Jeu de la feuillée* (1,099 octosyllabic lines), and a work often referred to as a comic opera, the *Jeu de Robin et Marion*. Since *feuillée* has been interpreted to mean the shelter of branches built to house the reliquary of Notre Dame at Pentecost, the *Jeu de la feuillée* is thought to have been composed for performance in the town of Arras for this festival. This first extant secular drama in French contains little plot, presenting mostly a succession of scenes that tease and ridicule forty-nine named male and female citizens of Arras. The humor of the play depends on exploiting character traits known to the audience, as well as proverbs and puns whose full meaning could be appreciated only by those familiar with the citizenry of Arras. Contemporary documents that contain the names of the characters in the play allow us to date the work to 1276 or 1277. It provides the earliest example on the French stage of the ridicule of the medical

profession, which reached its height with Molière. The extant manuscripts preserve some of the music for the songs included in the play.

Closely related to the pastourelle, the *Jeu de Robin et Marion* (780 octosyllabic lines) dramatizes the encounter of a shepherdess and a knight on a spring morning. When his advances are rebuffed, the knight kidnaps the young girl and carries her away on his horse after beating her friend Robin. However, Marion is soon released unharmed, and friends arrive to sing, dance, eat, and play games. Spoken dialogue alternates with singing. When first presented in Arras, the play was preceded by a short dramatic prologue, in which a pilgrim tells of his travels in Italy and says that everywhere he went he heard about a talented, gracious, and noble clerk, native of Arras, loved and hon-

The beginning of the section of chansons by Adam de la Halle in the *Chansonnier d'Arras*. Arras, Bibliothèque Municipale, MS 139 (anc. 657). *Courtesy of Arras, Bibliothèque Municipale.*

ored by the count of Artois because of his poetic and musical talent. The pilgrim states that he visited Adam's tomb the year before and sings two of Adam's songs as examples of his talent.

In addition to the plays, Adam wrote thirty-six chansons, seventeen *jeux-partis,* sixteen rondeaux, five motets, a *congé,* and the first nineteen laisses of an epic poem, the *Roi de Sicile*. Fifteen of the seventeen *jeux-partis* by Adam were composed with Jehan

Bretel, who alludes to Adam's superior education, his youth, and his loves. Before 1271, the date of Bretel's death, Adam was already well enough known to write *jeux-partis* with the prince of the Puy. While his chansons written in the tradition of the Provençal love lyric dwell on the suffering endured patiently by a lover whose lady appears indifferent to him, there is no reason to believe that they were based on true feelings.

Although Adam lived and wrote in Picardy for much of his life, the language of his songs reflects relatively few traits of the Picard dialect, whereas the speech of the characters in his plays relies more heavily on dialect and probably resembles the language used in Arras in the 13th century.

In 1276 or 1277, Adam wrote his *Congé* (farewell poem), one of three such poems composed by trouvères (the others are by Jehan Bodel d'Arras and Baude Fastoul). In 156 lines divided into strophes of twelve octosyllabic verses, Adam takes leave for Paris to continue his studies; he expresses his gratitude, good wishes, and regrets to the people of Arras. His departure is by choice and not due to disease, as with the other two *congés*. In *Feuillée,* he also mentions his imminent departure for Paris, though it is not possible to know if he ever actually went.

During his lifetime, Adam's fame stemmed equally from his musical and poetic skills. Many of his melodies and lyrics have been preserved in versions that often resemble each other more closely than is normally the case with trouvère compositions, implying perhaps that they may have been copied from one model even though such a model has not survived. In addition to the typical songs for one voice, Adam also wrote music for five motets for three voices, fourteen rondeaux, and two other refrain songs, suggesting that he probably knew how to read and write music, a rare phenomenon among the trouvères.

Even though he must be considered one of the most versatile poets and composers of his time, no document survives that dates any event in the life of this prolific artist. However, Baude Fastoul, another trouvère of Arras, mentions him in a work dated 1272. Adam died between January 7, 1285, the date of the death of Charles of Anjou, for whom Adam began to compose *Le Roi de Sicile,* and before February 2, 1289, the date on which the copyist Jean Madot, upon finishing a transcription of the *Roman de Troie,* boasts of being the nephew of Adam le Bossu, who had died recently far from Arras.

# ADAM DU PETIT-PONT

(Adam of Bosham or Adam Balsham; fl. early 12th c.). A shadowy figure, Adam was a dialectician and moral theologian of the speculative school at a time when the most famous names, such as Peter the Chanter and Stephen Langton, were "biblical moral" theologians. Two of his works are preserved for us, an *Ars disserendi* or *dialectica* and *De utensilibus* or *Phaletolum*. Although Adam is praised by a later member of the Petit-Pont school, Alexander Neckham, the adjective *parvipontani* was used as a term of abuse for sophistical hairsplitters.

*Lesley J.Smith*

# ADAM OF SAINT-VICTOR

(Adam Precentor; d.1146). Cantor (precentor) at the cathedral of Notre-Dame in Paris by 1107, Adam served in this high office until at least 1133, when he donated his prebend at the cathedral, with all its monies and privileges, to the Augustinian abbey of Saint-Victor and probably took up residence there. Adam was involved in the political embroilments that divided the cathedral clergy in Paris during the first half of the 12th century and found himself on the side of the reformers, an ally of Bishop Stephen of Senlis and the Victorines. He was doubtless involved in the failed attempt to convert the cathedral canons to the common life (ca. 1128).

Adam was known as a great sequence poet by the mid-12th century; his stature as first musician at the cathedral makes it likely that he composed sequence melodies as well. Some texts probably by Adam are *Zima vetus,* and *Mundi renovatio,* both for feasts of the Easter Octave; *Lux iocunda, lux insignis,* for Pentecost; and *Heri mundus,* for St. Stephen. Adam's association with both the cathedral of Notre-Dame and the abbey of Saint-Victor helps explain the fact that both institutions had related yet distinct sequence traditions.

# ADELAIDE OF SAVOY

(ca. 1098–1154). Queen of France. The daughter of Humbert II, count of Maurienne, and a relation of Pope Calixtus II, Adelaide was born shortly before 1100 and became queen of France in 1114, when she married Louis VI. In twenty-three years of marriage, she bore him six sons and one daughter and had considerable influence at court. After the king's death, she married the constable of France, Matthieu de Montmorency. She died in 1154 at the abbey of Montmartre.

# ADÈLE OF CHAMPAGNE

(ca. 1145–1206). Daughter of Count Thibaut IV of Blois (III of Champagne), Adèle became the third queen of Louis VII in 1160. In 1165, she bore him a long-desired heir, the future Philip II, thereby ensuring the survival of the Capetian dynasty and providing it Carolingian blood, a fact later exploited by royal propaganda. Adèle and her brothers, Henri I (count of Champagne, r. 1152–81) and Thibaut V (count of Blois, r. 1152–91, and royal seneschal)—who married Louis's daughters by Eleanor of Aquitaine—together with Guillaume (bishop of Chartres, r. 1165–68, and archbishop of Sens, r. 1168–75, and Reims, r. 1175–1202) constituted an influential party at the royal court. Adèle and Guillaume shared the regency for Philip II while he was on the Third Crusade (1190–91), but little else is known about her public or private life.

# ADÉMAR DE CHABANNES

(Ademarus Cabannensis; 989–1034). Son of Limousin aristocrats, monk of Saint-Cybard in Angoulême, educated at Saint-Martial in Limoges, Adémar was a talented and versatile scribe. His autograph manuscripts (over 1,000 folios) include editions, drawings, poetry, liturgy with musical notation, sermons, history, and *computus*. In 1010 at Limoges, at the height of an apocalyptic crisis triggered by Al-Hakim's destruction of the Holy Sepulcher in Jerusalem and various signs, wonders, and natural disasters, he had a vision of a cross planted in the heavens with Christ on it, weeping rivers of tears. Around 1025, he began a history of his time, which survives in three recensions and, in its global scope and popular religious activity, resembles that of Raoul Glaber.

With his ambitions frustrated in Angoulême by the deaths of his abbot and the count of the city, Adémar turned to Limoges, where he strove to become the impresario of the enormously popular cult of St. Martial, writing a new "apostolic" liturgy to accord with a new popular legend that the saint was a companion of Jesus. But on August 3, 1029, the day of the liturgy's inauguration, a prior from Lombardy roundly defeated him in public debate, turning the crowd against the liturgy and ruining its debut. Adémar returned to Angoulême in disgrace and, after defending himself in a circular letter that he never sent, turned to forgery and fiction. He produced a whole dossier of texts—papal letters, conciliar decrees, sermons, interpolations into famous Christian writers, and lengthy accounts of the Peace councils of Poitiers and Limoges in 1031, where "a certain cleric" from Angoulême carries the day for St. Martial. Adémar is perhaps best known for his *Historia* in three books, which traces the history of the Franks from their mythic Trojan beginnings to 1028. In 1032–33, he deposited his life's work at Saint-Martial before going on a terminal pilgrimage to Jerusalem. Given his "mythomania," his work is difficult to interpret, but he is an invaluable source for his period, especially the castellan wars, the Peace of God movement, the rise in relic cults and pilgrimage, and apocalyptic anxieties.

# ADENET LE ROI

(ca. 1240–ca. 1300). A popular professional poet of the late 13th century, Adenet is known for four major works. He was old enough to have been trained as a court poet before 1261, the year of the death of his first patron, Henri III, duke of Brabant and trouvère. In 1270, he was in Flanders, where he met his new patron, Gui de Dampierre, whom he accompanied to Tunis on the Eighth Crusade. His later travels led him across France and frequently to Paris, the court of Philip the Bold and Marie of France, who also influenced his literary activity. Of the four works known to be by Adenet, only the romance *Cleomadés* can be dated with certainty, to 1285. His earlier production, all chansons de geste, was completed after 1273–74. *Beuvon de Conmarchis* is probably the earliest, followed by the *Enfances Ogier* and *Berte aus grans piés* in that order. The last mention of Adenet appears in a document dated 1297.

*Beuvon* is considered to be the earliest of Adenet's narratives because of its unpolished style. Typical of the late chanson de geste, the laisses are monorhymed. Adenet adopts, however, the Alexandrine and the short-line refrain of the Guillaume d'Orange cycle. *Beuvon* is a reworking of the *Siège de Barbastre,* containing 3,945 lines and lacking a conclusion. Neither truly romance nor epic, the story exhibits above all a propensity for gallant adventures and praise of women.

Adenet's second narrative, also a reworking, was ordered by Gui de Dampierre and was enjoyed by Queen Marie of France, to whom Adenet sent a copy. Retaining the monorhymed laisse, he reverts to the decasyllabic line without refrains. The *Enfances Ogier* (9,229 lines) imitates the first branch of the *Chevalerie Ogier.* Adenet has considerably improved in skill by concentrating on a few characters. Women retain the place he set for them in *Beuvon de Conmarchis.*

Though the subject matter and form are epic, *Berte aus grans piés* is closer to romance. The monorhymed laisses contain 3,486 Alexandrines. Conciseness and unity characterize this narrative, which has earned praise from critics for its sensitive treatment of the heroine, Berte.

*Cleomadés,* Adenet's fourth and best-known narrative (twelve manuscripts and three fragments survive), was inspired by Queen Marie and her sister-in-law Blanche of France, widow of the son of King Alfonso X the Wise of Spain, who invited Adenet to compose a story based on the tale of the magic ebony horse from the *Arabian Nights.* Blanche could have come across the legend of the flying horse at Alfonso's court in

Spain, which was an important center of cross-cultural transmission from East to West. Surprisingly, Adenet abandons all pretense of creating an epic by choosing rhymed octosyllabic couplets. Aside from the source mentioned above, Adenet included as part of this long romance (18,698 lines) autobiographical information from his travels in Italy.

Son of the powerful Marcadigas, king of Spain, Cleomadés travels across Europe to perfect himself, spending the most time in France, land of honor and courtesy. Envious neighbors, meanwhile, encroach on Marcadigas's territory, leading to war. Cleomadès returns home to head a battalion and establishes his reputation by accomplishing great exploits and leading his countrymen to victory. Three African kings, suitors of Marcadigas's daughters, contrive marvelous automatons to trick the king. As the machines are put to the test, the daughters are overcome with fright and bewilderment. Through the suitors' treachery, Cleomadés is carried off at vertiginous speed by an ebony horse. He lands in Tuscany and falls in love with the king's daughter, Clarmondine. He meets her in her moonlit bedroom, where they confess their love. With her consent, they again take to horse and announce to Clarmondine's parents their intention to marry and govern Spain. But she is soon captured by the traitor Crompart, who schemes to marry his captive. Meanwhile, Meniadus, the king of Salerno, falls in love with the captive and likewise decides to marry her. To save herself, she pretends to go mad. Cleomadés, disguised as a merchant, sets out in search of his beloved. His friend Pinçonnet suggests consulting Meniadus because of his custom of gathering news from travelers. Cleomadés convinces the king that he is a doctor so that he can cure the patient recently gone mad. To accomplish his goal, he must tie the girl to the ebony horse. They soon fly away, enjoying courteous conversation and the pleasure of being together. Back in Spain, the only sad note is the death of Cleomadés's father and Clarmondine's mother. A sumptuous wedding ends the romance. *Cleomadés* is generally rated as Adenet's most successful work.

The advent of Adenet le Roi marks a pivotal moment in the evolution of the chanson de geste. For epic savagery, he has substituted the prestige of courtly conversation. With Adenet, one might venture to say that the epic, as it was known, was buried under the triumph of written romance.

# ADMIRAL OF FRANCE

. During the late Middle Ages, the admiral had central command of the royal navy of France as well as serving in the military council with the constable, marshals, master of crossbowmen, and, in the 15th century, master of artillery. While the Byzantines, Spanish Muslims, and Sicilian Normans had an admiral as part of their military command earlier in the Middle Ages, the French did not establish such a position until 1244, with the temporary assignment of an admiral over the fleet of the Levant. Only at the end of the century did the post of admiral become permanent.

The earliest appointees were foreigners, generally Genoese or Monagesque sea captains, such as Benedetto Zaccharia, Henri Marchese, and Renier Grimaldi. By the reign of Philip VI, with the admiral now a member of the military hierarchy, the king began to appoint Frenchmen. Philip's first such admiral, the inexperienced Hugues Quieret, was a failure who lost his life when the French fleet met disaster at Sluis in 1340. During the course of the Hundred Years' War, however, the French did produce some able admirals, notably Jean de Vienne, Braquet de Braquemont, Prigent de Coetivy, Jean de Montaubary, and Louis Malet de Graville.

The responsiblities of the French admirals, who were paid extremely well for their services, included overseeing the fleets in the Mediterranean and Atlantic, installing police and judicial officials in the port towns, organizing pay for naval troops, and sitting in judgment over naval illegalities. Lieutenants or vice-admirals frequently assisted them in these duties. Admirals also sat in the Grand' Chambre of Parlement and at the Table de Marbre, a special tribunal for cases involving military, naval, and forestry affairs.

# *ADVOCATUS/AVOUÉ*

. During the 10th and 11th centuries, it became normal for religious houses to have an *advocatus,* also known as a *custos* or *adjutator.* This advocate was generally a powerful local layman, most commonly a count or duke in the 10th century, although by the late 11th century castellans too might be advocates. The duties of an advocate were to act as a monastery's agent in the outside world and to protect it from its enemies. The monks

consulted their advocate before electing a new abbot. A layman who founded or reformed a monastery in the 11th century normally became its advocate. Most advocates seem to have taken their responsibilities seriously and sought to defend "their" monks from other laymen, but the monks relied so much on their advocate that they were virtually helpless if he turned against them.

Although almost all monasteries, including Cluny and her daughters, had advocates in the 10th and 11th centuries, the office became much less common in the 12th century, with the impact of the Gregorian separation of lay and ecclesiastical affairs. Cistercian houses never had formal advocates, but they still hoped for the support and protection of their secular neighbors.

# *AFFRANCHISSEMENT*

**.** Act granting freedom to an unfree person or privileges to a community. In granting freedom to a serf or, in the earlier law, to a slave, *affranchissement* is synonymous with manumission or emancipation. In *affranchissements* from slavery, the legal assimilation of the freedman to the existing free population remained partial under the laws of the state. It was only with the grandchild of the freedman that the last taint of servile status vanished *de jure.* A lord's *affranchissement* of a serf, on the other hand, would transform personal status completely and immediately, but only when the act was properly confirmed by the appropriate superior lord. This was because rights over serfs were ordinarily appurtenant to fiefs. Typically, therefore, an *affranchissement* diminished a fief. It followed that approval was necessary from the superior lord who (or whose ancestor) had granted the fief and who continued to have residual interests in it, such as the right of escheat and relief.

A closely related usage of *affranchissement* is for the act granting liberties or privileges ("franchises") to urban or rural, even servile, communities. The precise number and extent of liberties granted were spelled out in formal charters and differed from community to community depending on the political, social, and economic situation that induced communities to seek and lords to grant the franchises. Since there was much borrowing from one charter to the next, it is possible to talk about a "typical" *affranchissement,* which usually provided for freedom of inheritance, freedom of trade in the protected environment, relaxation of seigneurial taxes and hospitality, reduction of some aspects of military service, and a degree of self-government. In return, either the community made a fixed annual payment to its lord or individuals paid fixed rents to the lord for their tenements in the franchise.

# AGDE

. Founded as a Greek colony (Agathé Tyché) by Phocaens from Marseille in the 6th century B.C., Agde (Hérault) was later a Roman colony and an early bishopric of the Roman church (ca. 450). Ramparts were authorized in 1173 by Louis VII to help defend Languedoc from sea raiders. A Carolingian basilica dedicated to St. Étienne (built 848–72) was replaced in the late 12th century by the current fortified Romanesque cathedral of black lava. A keeplike tower, containing some of the earliest examples of machicolations, was added to its north transept during the Gothic period. Built in the form of a capital T, the church has a wide aisleless nave (100 feet by 50 feet) of six bays, with a transept but no apse.

# AGEN

. A Gallic *oppidum,* Aginnum, and capital of the Nitiobriges, Agen (Lot-et-Garonne) was captured by Clovis I in 506. Made a bishopric in the 10th century, it passed in 1152 with the rest of Aquitaine to Henry II Plantagenêt. After 1271, it was again nominally French but was reoccupied by the English in 1360 and not definitively reunited with France until 1444. The Inquisition was installed in Agen in 1242, leading the new orders to establish religious houses here: the Dominicans (1249), Franciscans (1262), Carmelites (1272), and Augustinians (1290).

The present cathedral of Saint-Caprais, with its 12th-century apse, radiating chapels, and transept, was a parish church until the cathedral of Saint-Étienne was destroyed in the Revolution. Built in the shape of a Latin cross, Saint-Caprais features a broad apse with three radiating chapels. The nearby chapter house has an impressive Romanesque façade. The double-aisled brick church of Notre-Dame-des-Jacobins, with ogival vaulting, is an important example of 13th-century Toulousan Dominican architecture. Like other

Dominican foundations, it has a flat chevet and two equal naves divided by pillars. The Tour du Chapelet is a reminder of the 14th-century medieval city walls.

# AGENAIS

**.** Centered on the city of Agen in southwestern France, the seat of the bishopric and county, the Agenais comprised an irregular territory lying between the rivers Garonne and Dordogne. On the west, it included the town of Marmande; on the east, the towns of Tournon and Puymirol; and on the south, Moissac and Auvillars.

From the 9th through the 12th century, the Agenais fell under the authority of the dukes of Gascony and Aquitaine. In 1196, to secure peace on his southern borders, Richard the Lionhearted granted the Agenais in fief to Count Raymond VI of Toulouse. This transfer brought the Agenais into the center of the turbulent events that commenced with the Albigensian Crusade in 1209 and concluded with the victory of France in the Hundred Years' War. Simon de Montfort attacked the region in 1212, capturing the fortress of Penne d'Agenais, where Cathar heretics were found and burned. In 1219, the crusading army of the future Louis VIII of France assaulted Marmande, which suffered pillage and massacre. By the Treaty of Meaux in 1229, Raymond VII of Toulouse retained the Agenais. On his death in 1249, it was occupied by his son-in-law Alphonse of Poitiers, brother of Louis IX.

The Agenais remained thereafter an object of contention between France and England, where Henry III asserted his claims as duke of Aquitaine. In 1259, the Treaty of Paris conceded the Agenais to England should Alphonse of Poitiers die without heirs. This eventuality came to pass in 1271, but the county was not restored to Edward I of England until 1279. Quarrels between Edward and Philip the Fair rekindled hostilities in the Agenais; from 1293, French seneschals and English administered portions of the disputed territory. The Agenais suffered heavily during the Hundred Years' War. Restored to England briefly by the Treaty of Brétigny in 1360, it returned definitively to France in 1370. At the close of the Middle Ages, the Agenais, like the Quercy, recovered slowly from rural depopulation and economic depression.

# AGINCOURT

. The greatest English victory of the Hundred Years' War came when France was divided by the Armagnac-Burgundian feud. Henry V seized this opportunity to invade France and forcibly reassert a dubious claim to the French throne. Henry captured Harfleur and then marched north toward Calais. On October 25, 1415, a hostile force cut off his route. An exhausted English force of 1,000 men at arms and 6,000 archers confronted perhaps 25,000 French. Henry shrewdly profited from the restricted, muddy terrain and so deployed his troops to defeat an adversary ill served by a divided command. English archers provoked the overconfident French into an assault that squandered their numerical advantage, allowing the outnumbered but disciplined English to encircle and destroy the uncoordinated French mass. At least 5,000 French died and many French peers were captured, while English casualties were trivial. The dramatic victory proved crucial to Henry's ambitions. With Armagnac forces devastated, he was emboldened to undertake the occupation of Normandy and to conclude an alliance with Burgundy. The resulting Treaty of Troyes gave him widespread recognition as the legitimate heir to the throne of France.

# AGRICULTURE

. Throughout the Middle Ages, a huge majority of France's population was engaged in agriculture; land with the laborers on it remained the primary source of wealth even after towns, commerce, and industry revived later in the period. From late antiquity to the 9th century, although there were some independent peasant holdings, agriculture was generally practiced on great estates or villas that were the successors of Roman villas. These estates, organized and worked under a system called manorialism, tended to be self-sufficient, having little recourse to trade and producing for all their own needs. A small surplus went to support the warrior or clerical owner, but few of the villas were large enough to have supported a great man and his retinue through a twelve-month period; to live off their estates, early-medieval lords had to move from one to the next during the year.

Ownership of such estates and rights to the tenancies within them became more fragmented as the centuries passed; by the 12th century, inefficiencies of scale and the

numerous middlemen who had inserted themselves between peasants and owners often meant that what remained of the old Carolingian villa produced little for its owners. In the 10th and 11th centuries, however, this situation began to be alleviated by an expansion of cultivation into nearby forest and waste, where new fields, called by such names as *appendariae* or *bordariae,* were both more fertile and more profitable. Lords attempted to reap benefits from the expanded tillage by instituting new types of taxation (based on the *bannum*), by building new mills, ovens, and winepresses, and by encouraging the settlement of forested areas. It was frequently the lords who instigated the foundation of new villages in forest and waste, which would yield them considerable revenues, or who encouraged settlement in reclaimed coastal and riverine marshes.

The main crop produced by medieval agriculture was cereal, but cereal production was practiced within a mixed system of pastoralism and animal husbandry, gardening, viticulture, and, along the Mediterranean coastline, olioculture. Relative dependence on cereals and pastoralism as well as the details of agricultural organization varied with local conditions in each of the numerous *pays,* or regions, but two major zones of agriculture can be distinguished: the flat wheat-producing plain of the north and the more rugged, often mountainous sheep- and rye-producing regions of the south. Several varieties of wheat, sometimes mixed together, along with rye, oats, barley, and pulses (peas, beans), were produced. The Romans and Christianity had encouraged the spread of viticulture throughout France, even into regions today considered wholly unsuited to wine production. Particularly in the early Middle Ages, when yields from the fields were low, there was considerable dependence by all areas on hunting and fishing, and on the forest surrounding cultivated areas for pasture for pigs and products like nuts, berries, and honey. Later, although the clearing of forest and increased limitations on its use came at a time in the central Middle Ages that is associated with increased agricultural yields, the growing difficulty of access to forest resources must have made the famines of the early 14th century even more devastating.

In the early Middle Ages, the major tool for cultivation was the Roman, or scratch, plow *(araire),* which was usually pulled by two oxen over fields made roughly square, since they were plowed across and then again at right angles to the original plowing. Even in later centuries, the scratch plow and the accompanying two-year rotation course would be favored particularly in the Midi, where soils were light and dry, and wherever rural populations were too poor to adopt the heavier, more expensive wheeled plow, which needed more animal power for traction than the scratch plow. During the early period, the organization of tillage was generally on a two-year, two-course rotation in which winter wheat was sown in one of two fields each fall, while the other lay fallow for the entire year. Small bits of outfield or garden plots around homesteads may have been planted with pulses or oats in the spring. Yields were poor—generally no more than 2.5- or 3-to-l yield to seed.

Probably even in the late Roman period, wherever there was sufficient spring and summer rain, some spring sowing was done along with the more usual fall planting, or if winter crops failed. Later, in heavily populated areas of the north (as documented in the 9th-century ecclesiastical surveys of great estates called polyptychs), the spring planting was gradually incorporated into some variation of a three-course, three-field rotation. In this rotation scheme, one field was planted to winter wheat, one to a spring crop like oats, and only a third of the field was left fallow each year. In many areas, this three-field

system was probably introduced after clearance of additional land from forest and waste to make a third field. Even where it was introduced without an associated expansion of arable land, such a three-course rotation effectively increased the total arable land under cultivation in any year. Unless other improvements in agricultural practice were also introduced, the new rotation methods would not have improved production for long, for yields should have dropped on fields expected to produce in two out of three instead of one out of two years. Instead, in this period, not only did older fields produce slightly more often, but yield/seed ratios actually appear to have increased to about 4 to 1 by the 14th century. These higher yields are significant, since they produced a doubling of net yields or consumable produce from earlier gross yields of 2.5 to 1. Yields were maintained partly due to more frequent plowing of the fallow lands and the introduction of spring crops, such as oats and pulses, which had nitrogen-fixing capability. More important were better iron tools, which allowed clearance of new lands, and the introduction of the heavy, wheeled plow, or *charrue*. In addition to wheels, this plow had an iron cutting knife, or coulter, which went ahead of the share to cut open the soil, an iron share, and an iron or wooden moldboard, which turned over the sod completely in one direction or the other. This meant that it dug deeper into the soil to turn over the sod sufficiently to increase the fertility of existing tillage, and it could be used for tilling the heavier soils of river valleys previously inaccessible to agriculture. The disadvantage of the new plow was that it required eight oxen or a pair of horses to pull it, an expense that often must have been shared among villagers. It was also considerably harder to turn this plow. The shape of holdings in fields needed to be changed to the long, slightly S-shaped strips familiar from aerial photographs; except where it was introduced in entirely noval lands, this must have meant a considerable redistribution of village lands when the new plow was adopted. The new wheeled plow was frequently pulled by horses, an innovation that was possible only after the introduction of the horse collar, better hitching methods, and iron horseshoes. The use of horses thus, like the plow itself, required increased availability of iron and is linked to increased iron production and the burgeoning of forges throughout the countryside during this period. The horses used to pull these plows, like the mounts of the warriors who owned the estates, were fed oats, a spring crop, so that the introduction of horse power in the fields also probably encouraged the spread of the new three-course rotation.

These interrelated innovations in agricultural practice and technology appeared in France between the years 950 and 1150, particularly in the region north of the Loire, and would be distributed fairly widely in north and central France (although much less so in the Midi, where soil and climate were not appropriate) by the 12th and 13th centuries. They marked what has rightfully been called the "Agricultural Revolution of the Middle Ages." This revolution was accompanied by considerable demographic growth, by a widespread expansion of the total area under cultivation in France, by the building of castles by territorial lords, by increased agricultural yields, and by a revival of towns and specialized artisanship in those towns. Much of this revolution, which took place in the 10th and 11th centuries, is undocumented, for there is a dearth of records for the period during and after the 9th-century invasions. Until recently, historians gave credit for the agricultural revolution to monks, particularly the new monks of the 12th century. More recent studies instead show that anonymous peasants needing more land for their families, hermits going out to live alone in the forest, and lords intent on getting a share

of the profits of expansion by encouraging settlement advance and technological innovation were all more important than the religious orders.

By the 12th century, for which documents are much more abundant, the major parts of this transformation had taken place. Secondary improvements continued into the 13th century and were often promoted by the new monastic groups. They included the consolidation of fragments of old estates, the elimination of middlemen from claims to the produce of estates, the building and improvement of mills, an improved ratio of animals to arable land through the introduction of transhumance, and the beginnings of selective breeding of animals. Efficiencies were also created when monastic owners of the new consolidated estates of the central Middle Ages cultivated their great demesnes or granges with hired laborers or domestic servitors or lay brothers. However, this last was a short-lived phenomenon, for by the 14th century such demesnes had been rented out to farmers at a fixed rent or in sharecropping contracts.

By the 13th century, the rural world was considerably different from that of the early Middle Ages. The old villa and the social structure associated with it had broken down, as manorialism was replaced by seigneurialism. Peasants were no longer on the verge of starvation but were able to support a growing population of townspeople. Remaining forest was less dense and was threatened more from demand for building materials and fuel for the towns than by clearance; contention over forest rights increased. Pigs grazing in forest, the major protein source for the earlier period, were replaced by transhumant sheep moved seasonally from region to region. There was a shift in diet, not just from pork to lamb, but general improvement—from a diet often based entirely on cereals to one including much more meat, cheese, and other animal products, as well as increasingly good and abundant wines. Other demand, particularly for industrial materials, such as wool, hides and leather, dyes, hemp, flax, and parchment for book and document making, was also beginning to influence rural production.

By the late 12th century, there were indications of problems to come. For instance, peasant cultivators were already finding that not all the newly cleared and drained lands were fertile or reliable enough to provide a livelihood and were abandoning some of them. Grants of frequently flooded but extremely fertile river-valley fields were often made to monks and other religious groups who could keep up the dikes and absorb the risks of crop failure. Near the great cities, some owners and peasants ceased cereal production altogether in favor of commercial production for market, particularly of wines, dyestuffs, and garden produce, making themselves wholly dependent on grain shipments, which in times of dearth would not be forthcoming. Population continued to grow, although by 1300 the pace of that growth was falling off. From that date on, there are indications of feeble attempts to again breach what remained of the great medieval forests or to reclaim land on the coasts. A series of poor harvests, warfare, famine, and increasing malnutrition left the population particularly susceptible to the Black Death in 1348. Afterward, despite population losses, rural prosperity only gradually declined. With a smaller labor force was seen the abandonment of the least productive lands, the renting out of demesnes, and increasing interest in animal husbandry.

In the late 14th and the 15th century, agriculture came more under the control of the wealthiest peasants, who farmed or sharecropped the demesnes. Lords abandoning the countryside for the towns, depended increasingly on seigneurial rights and dues, or on fixed rents. With the exception of the importation into the Midi of new crops and

irrigation practices from Arab-controlled parts of Spain in this later period, and except in the vicinity of the great cities whose markets encouraged new forms of cropping, medieval agricultural practice remained more or less unchanged from the 13th through the early-modern centuries.

# *AIDES*

**.** The feudal obligation of a vassal to render "aid and counsel" to his lord gave rise not only to the specific "feudal aids" payable on designated occasions but also to military service and pecuniary assistance demanded at other times. Aside from feudal *aides* generalized to include subjects who were not royal vassals, we find, as early as Philip II, *aides de l'ost,* payments in lieu of military obligations. Occasional levies called *aides* gave way to more frequent and controversial ones after 1294, when France was frequently at war and the king's finances badly stretched.

Among the terms used for tax in the early 14th century, "war subsidy" was most common, but *aide* was also used in this sense. The word gradually began to refer mainly to indirect taxes on the sale of merchandise, supplanting *maltôte,* which also applied to indirect taxes but carried with it a sense of unjust exaction. Up to 1360, however, *aides* had no very specific meaning when not referring to one of the customary feudal aids. In December of that year, the need to raise a substantial sum for the ransom of King John II led the crown to establish three regular indirect taxes. One of these, which applied

specifically to salt, retained the old name of *gabelle*. The other two were a tax on wine (at first about 8 percent but later raised to 25 percent on retail sales) and a general value-added tax on other commodities. Since the occasion was a royal ransom, these taxes amounted to a feudal aid generalized to affect the whole population.

Collected through the 1360s as the *aides pour la délivrance,* these taxes remained in force for all but two of the next fifty-seven years and after 1369 were called the "aids for the war." Thereafter, the term always referred to these taxes and rarely to anything else. Royal indirect taxes being contrary to the traditions of Languedoc, the Estates of that region arranged in 1362 to replace them with an equivalent amount paid as a lump sum and apportioned locally.

Regular taxation came to a halt during the civil wars of the early 15th century, the *aides* being canceled in 1417. For the next two decades, the Estates General occasionally granted *aides,* but they were unpopular with the towns, and regional assemblies usually changed them to another form of tax. The Estates of 1436 restored the *aides* and *gabelle,* and this time the format was not altered and the crown continued to collect them. Languedoc, once again, replaced them with a substitute now actually called the *equivalent*. These taxes now became a permanent feature of the royal fiscal system.

# AIGUES-MORTES

. A royal port built on the Mediterranean coast in the 13th century, Aigues-Mortes was founded because no existing major ports or towns with access to good harbors on the Mediterranean coast of France were susceptible to decisive royal penetration before the end of the reign of Louis VIII. Even when, in the late 1220s and 1230s, the crown made inroads into the independence of a few of these towns after the Albigensian Crusade, it was felt, given the legacy of hostility from the war, that a distinctly royal port would be advantageous. The transformation of this desire into reality came about as a result of Louis IX's need for an embarkation point for the soldiers who accompanied him on his first crusade (1248–54). Beginning in earnest in the mid-1240s, the king's men laid out a small town about 20 miles east of Montpellier, in an area facing saltwater lagoons and stagnant pools, which together account for the name given to the settlement, Aigues-Mortes ("Dead Waters"). Laid out on a square grid, the town was a typical foundation of the 13th century except for the extraordinary degree of royal interest in its success. It was heavily fortified with both impressive walls—originally in wood, in the 1270s rebuilt in

stone—and an imposing tower, the Tour de Constance, set slightly apart from the walls themselves.

Dredging and canal building were employed to control silting and to give access to the sea. Even at its best, however, the inner harbor could not handle large ships. These were obliged to anchor in the open sea, where they were subjected to the heavy winds characteristic of that part of the Mediterranean.

Aigues-Mortes (Bouches-du-Rhône), city walls. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

Aigues-Mortes, city plan. After Stierlin.

The townsmen who inhabited Aigues-Mortes received an enormous number of privileges to stimulate the prosperity of the foundation. For example, every ship that came within

sight of the port had to put in at Aigues-Mortes. Self-government, on the other hand, was severely circumscribed by the presence of a resident royal governor.

For all its limitations as a physical site, Aigues-Mortes was an important outpost of royal power in the later 13th and early 14th century. No estimate of the number of inhabitants is absolutely trustworthy, but a resident population of 1,000–3,500 seems reasonable. During periods of peak use, such as embarkations for crusades (1248, 1270), this number swelled. Royal fiscal accounts show that the crown expended considerable revenue in keeping the walls in repair and the harbor open. High officials in the government may even have entertained the possibility of diverting a freshwater river to Aigues-Mortes, since the natural water supply was insufficient for a large town.

In the course of the 14th century, older and better ports on the Mediterranean coast either came under French rule or succumbed to more effective royal control. Since the oligarchies of these towns had always resented the favored status of Aigues-Mortes and since the crown, once it established effective control, no longer doubted its ability to work through these oligarchies whenever it needed to discharge obligations that required the use of ports, Aigues-Mortes gradually decreased in importance as a commercial center and as an object of special royal encouragement. It is no doubt due to this decline that the extensive city walls and fortifications of Aigues-Mortes remain largely intact and that the original grid plan of the town is still respected. Together, they make Aigues-Mortes one of the finest surviving examples of 13th-century fortified town planning.

# AIMOIN DE FLEURY

(ca. 960–ca. 1010). The son of an aristocratic family in Périgord, Aimoin entered the Benedictine monastery of Fleury-sur-Loire as a child and took monastic vows between 969 and 978. His major writings made important contributions to the development of historiography and hagiography in medieval France. The *Historia (Gesta) Francorum* is a history of the Franks from their beginnings to Pepin the Short, written with the purpose of supporting the Capetian claim to the throne and utilized later by the authors of the chronicles of Saint-Denis and the *Grandes chroniques de France*. Aimoin's *Vita*

*Abbonis,* written in the early 11th century, depicts the life of Abbot Abbo of Fleury, who died in 1004. Books 2 and 3 of the *Miracula sancti Benedicti* form the third major work by Aimoin. Continuing the work of Adrevald de Fleury, Aimoin carries the account of miracles associated with St. Benedict through the period of the abbacy of Abbo.

# AIMON DE VARENNES

(fl. late 12th c.). The poet Aimon de Varennes informs the reader that his romance *Florimont* was written for love of his lady in 1188. After apologizing for his nonnative French, he tells how Florimont's initial success is disrupted by betrayal of his secret love. Once cured of lovesickness, "Povre Perdu" goes to Phelipople and ultimately triumphs, marries the king's daughter, and becomes the grandfather of Alexander the Great. Much of *Florimont* recalls *Partonopeu de Blois,* while mixing in memories of voyages, local legends, and oriental stories, along with other literary sources. Like 12th-cen tury romancers in general, Aimon uses common forms and materials renewed by his own (re)inventions.

# AIOL

. Composed in Picardy during the first third of the 13th century, this chanson de geste (10,983 assonanced lines) is unusual in that the first part is mainly in decasyllables with the rare caesura 6/4, while line 5,367 and thereafter are Alexandrines. Scholars assume

that the poet was not comfortable with the decasyllable, a traditional meter of this genre, and gradually moved to one that allowed more latitude.

The poem recounts how Aiol obtains the reinstatement of his father, Elie, a brother-in-law of the king, banished from the court of Charlemagne's son, Louis, by the intrigues of the traitor Makaire de Losane, who is drawn and quartered at the end. Aubri de Trois-Fontaines links *Aiol* to the Garin de Monglane cycle; indeed, the topic must already have been widespread in the mid-12th century, since Aiol is mentioned by Guiraut de Cabrera (d. ca. 1160) in his *Ensenhamen* as well as by Raimbaut d'Aurenga in a poem dated 1165. *Aiol* exists in a single manuscript in French, B.N. fr. 25516; it was adapted twice into Middle Dutch in the 13th century; into Italian by Andrea da Barberino (ca. 1370-post 1431) in his *Aiolfo;* and into Spanish, in the second of six romances about the noble knight Montesinos.

# AIRAINES

**.** The church of Notre-Dame at Airaines (Somme) was given to the Cluniac monks of Saint-Martindes-Champs in Paris in 1118 or 1119, although the present building was built only ca. 1130–40. The most interesting and oldest aspect of Airaines is the four-bay nave. While the rectangular side aisles are covered with groin vaults, the main nave is one of the earliest rib-vaulted structures in northern France. These vaults, domical in shape, were inspired either by such early examples in Normandy as the chapter house at Jumièges or by the nearly contemporary (but partly rebuilt) vaults at Lucheux (Somme). The transept at Airaines was partly rebuilt in the 13th century. The partially collapsed crossing vault was not rebuilt, whereas the rectangular chevet was rebuilt after the fire of 1422 and damaged again in the 16th century when the tower collapsed. The church still houses a rare, rectangular baptismal font, dated by some scholars to the 11th century.

*William W.Clark*

Aubert, Marcel. "Airaines." *Congrès archéologique (Amiens)* 99 (1936):459–67.

# AIRVAULT

. The former abbey church of Saint-Pierre at Airvault (Deux-Sèvres) was founded under the patronage of Aldéarde, the late 10th-century viscountess of Thouars. This community of Augustinian canons regular experienced a period of revival and expansion in the late 11th century under Abbot Pierre de Saine-Fontaine, who initiated the construction of a new church (consecrated 1110).

The building has an apse with an ambulatory and three radiating chapels, a transept with apsidioles off each arm, and a nave with aisles; it is preceded by an inexplicably off-center narthex. In the 13th century, the square pillars of the transept and choir were reconstructed in the Gothic style. Likewise, the apse, choir, and nave were revaulted in the Angevin manner—the aisles, however, retain their original barrel vaults—and a bell tower with spire was added.

The heavily ornamented interior displays work from both the Romanesque and Gothic periods. Historiated capitals depict biblical scenes, the occupations of the months, and scenes of knights in combat. Engaged statues include representations of St. Peter, the Virgin, St. John, and various animals. Throughout the building, vegetative and purely ornamented forms encrust moldings and keys.

In the north arm of the transept is a cenotaph to Pierre de Saine-Fontaine (12th c.). Nearby conventual buildings include the remains of a 15th-century Flamboyant cloister.

# AIX-EN-PROVENCE

. The historic capital of Provence, Aix (Bouches-du-Rhône) has its origin in a Celto-Iberian fortress founded in the 4th century B.C. on the plateau north of the present-day city. That stronghold was destroyed in 123 B.C. by the Romans under Sextius Calvinus, who, attracted by the site's thermal springs, founded the first Roman settlement in Transalpine Gaul, Aquae Sextiae. This settlement became the capital of Gallia Narbonensis Secunda, but was abandoned and used as a quarry after being sacked by Lombards in 574. Aix was a preferred residence of the counts of Aragon in the 12th and 13th centuries, then of the counts of Anjou. King René d'Anjou made it his headquarters in 1471, but after his death in 1480 in Aix the city was merged with France. Its university was founded in 1409.

The 13th-century Gothic chapel of the knights of Saint-Jean-de-Malte, with its fortified apsidal tower, was built ca. 1285 in the form of a Latin cross; its bell tower dates

from 1376. The church of Saint-Sauveur is an amalgam of styles, from a 5th-century baptistery surrounded by eight recuperated Roman columns, through a 12th-century Provençal Romanesque south aisle, a 13th-century Gothic central nave and apse (ca. 1285), to a 16th-century Flam-boyant façade. The 15th-century triptych of the Burning Bush within the church depicts King René and his queen, Jeanne, kneeling to either side of the Virgin, who holds the Child Jesus. Adjacent to Saint-Sauveur is a charming late 12th- and early 13th-century Romanesque cloister with delicately carved capitals.

# AIX-LA-CHAPELLE

(Aachen). Site of Charlemagne's royal residence. Located in North Rhine-Westphalia, Germany, Aix was described by Carolingians as the second Rome, the new Jerusalem. The area earned the name Aquae Grani ("waters of Granus," whence Aix or Aachen) from the Romans for its warm baths and the god whom the native Celts had worshiped there. The Carolingian palace, begun ca. 785, included a great hall with living quarters for the royal family and rooms for administrative activities, a large bath, and the still-extant, sixteen-sided chapel with its octagonal dome.

Although initially Charlemagne had no permanent residence but traveled with his court throughout the realm, as his reign progressed he passed an increasing portion of every year at Aix. The palace became the center not only of imperial administration but of cultural and intellectual life: among the scholars associated with the palace school were the Anglo-Saxon Alcuin, the Goth Theodulf of Orléans, the Frank Einhard, and the Italians Paul the Deacon and Paulinus of Aquileia. Their writings, together with the impressive productions of the scribes and artists also linked with the court at Aix, marked the beginning of the Carolingian renaissance.

After Charlemagne's death, Aix-la-Chapelle remained a principal royal and imperial residence until the later 9th century, when its importance declined with the breakup of the empire.

# ALAIN DE LILLE

(ca. 1115/20–1203). Known throughout the later Middle Ages as *Doctor universalis,* Alain was probably born in the city of Lille (Nord), though the Île-de-la-Cité in Paris has also been proposed. He became a Cistercian shortly before his death; when his body at Cîteaux was exhumed in 1960, his age was put in the eighties, and his height at about 5 feet.

An anecdotal life sometimes appended to commentaries and frequently found in early printed editions of the *Parabolae* is late and untrustworthy. We have no contemporary record of where Alain studied, or of any ecclesiastical benefits he enjoyed. His early literary and theological works, however, imply a Paris training, and reliable 13th-century sources list him among the masters there. Study before 1150 at the Benedictine abbey of Bec has been suggested, but there is no proof.

Alain seems to have been based in the southwest by the 1160s and to have written extensively against the Cathars in that region. Manuscripts of his works often call him Alainus de Podio, implying a connection with Le Puy, and two 13th-century manuscripts call him Alain of Montpellier. His *De fide catholica contra haereticos* was dedicated to Guilhem VIII, count of Montpellier (r. 1172–1202); in four books, it argues successively against Cathars, Waldensians, Jews, and Muslims. His *Distinctiones dictionum theologicarum* was dedicated to Abbot Ermengaud of Saint-Gilles (r. 1179–95). The *Liber poenitentialis* is dedicated to Archbishop Henry Sully of Bourges (r. 1183–93), and his brief commentary on the Song of Songs was written for the prior of Cluny.

With a few exceptions, the dates and chronology of Alain's works are far from certain, but the earliest are generally thought to be the *Regulae caelestis iuris* (ca. 1160), also known as *De maximis theologicis,* which treated theology as an exact science, with scientific rules based on geometry, and the summa *Quoniam homines* (1160–65), an incomplete work discussing God and the Trinity, angels and humanity, according to the rules of logic. Some themes are repeated in the brief *De virtutibus et vitiis et de donis Spiritus Sancti*. His shorter theological works include numerous *Sermones diversi,* commentaries on the Lord's Prayer and the Apostles' and Nicene creeds, several short pieces on angels, including *De sex alis cherubim* (sometimes accompanied by a drawing), and the rules of celestial law, which made use of geometrical principles in its discussion of the heavens. A few hymns are also ascribed to Alain of which the best known is *Omnis mundi creatura*.

The Latin *Parabolae* are a collection of maxims in elegiac verse, similar in approach to the *Distichs* of Cato and also designed for use in Latin classes in the schools. They were frequently copied from the 12th through the 15th century, and early printed editions are common.

All of Alain's major works enjoyed wide European circulation throughout the Middle Ages. Many were innovative tools for clergy. His *Liber poenitentialis* built on the

tradition of pentitential canons to present the first known manual for confessors. The *Ars praecandi,* which applied rhetorical methods and techniques to the construction of forty-eight sample sermons, is the earliest known preaching manual. And the *Distinctiones dictionum theologicarum* was an alphabetical index of biblical words covering scriptural and theological topics, with appropriate quotations.

The earliest of Alain's literary works is usually considered to be the *De planctu Naturae,* written probably before 1171. Like Boethius's *De consolatione Philosophiae,* it is written in the mixture of verse and prose known as Menippean satire. The Goddess Nature, God's vicar, appears to the dreaming poet, robed in all creation, with signs of the zodiac in her crown and a flowery meadow at her feet. Only her heart, where man resides, is muddied and torn. She explains to him the ways in which he has violated the natural order, in thoughts and in deeds. The vividness of the condemnation of "unnatural" sex in the fifth prose and metrum led some medieval commentators to describe the work as *Contra sodomitam,* but all vices, including the ultimate corruption, of language and thought, are described at length and condemned. Good love is the offshoot of Venus and Hymenaeus, god of marriage. Evil love, Jocus, was begotten when Venus abandoned Hymenaeus for Anti-Genius. The remedy is provided at the end of the work, when Hymenaeus appears with a train of virtues. Nature's vicar, Genius, then appears, order is restored, and the poet awakens. An epilogue, *Vix nodosum valeo,* on the superiority of virgins to matrons, has traditionally been ascribed to Alain but seems more of a parody than a conclusion to the work.

In the epic Latin poem *Anticlaudianus,* usually dated ca. 1179–83, Nature is viewed more philosophically, and the allegory is more clearly and consistently developed. Nature, assisted by Nous, explains the making of the physical universe, with much material on astronomy and cosmology drawn from Bernard Silvestris. The Seven Liberal Arts build her a chariot in which to explore the universe.

The *Anticlaudianus* and the *De planctu* survive in over 150 manuscripts each and were read throughout medieval Europe as part of the advanced rhetoric curriculum in schools and universities. The *Anticlaudianus* was translated into German by Henry of Mursbach and received a detailed commentary by Raoul de Longchamp ca. 1212–25. Several commentaries on the *Anticlaudianus* and the *De planctu Naturae* remain in manuscript.

The figures of Nature and Genius in the *De planctu,* and Nature in the *Anticlaudianus,* had great influence on allegorical dream visions in the later Middle Ages. Guillaume de Lorris and Jean de Meun used them in the *Roman de la Rose*. It was to Genius that the lover made his confession in Gower's 14th-century *Confessio Amantis*. Alain is also frequently cited in later medieval treaties on dictamen and rhetoric as a model of modern poetic style.

# ALANI

(Alans). The only non-Germanic settlers in the western Roman Empire during the so-called barbarian invasions, the Alani spoke an Indo-Iranian language. They were living as nomads in southern Russia when the arrival of the Huns in the 370s caused groups of them to move west, along with many Germanic tribes. With the Vandals and Visigoths, they entered Gaul in the early 5th century, and groups of them settled around Orléans and subsequently moved into Armorica (Brittany) in the later 5th century; others settled around Toulouse and Narbonne. They generally received land grants from the Roman authorities. Their small numbers, lack of a strong tribal structure, abandonment of their nomadic ways, and adoption of Christianity led to the swift assimilation of the Alani in the mixed culture of Gaul, and they ceased to be seen as a distinct people by the end of the 5th century. The chief traces of their existence in Gaul are in the personal name Alain and the many place-names with *Alan-* or *Alain-* as a component. They may have had a role in the development of the "Aquitanian" style of art and the rising importance of cavalry and cavalry tactics in later centuries; they perhaps contributed elements to the Arthurian legends.

A substantial body of Alani remained with the Vandals, with whom they soon assimilated. Vandal kings carried the title King of the Vandals and Alans from ca. 419 to the end of the Vandal kingdom. Other Alani were prominent in the political and military affairs of the eastern Roman Empire in the middle third of the 5th century, and others settled in northern Italy under Roman authority.

# ALARD DE CAMBRAI

(fl. mid-13th c.). In the 13th century, Alard de Cambrai translated into French verse the *Moralium dogma philosophorum* of Guillaume de Conches. In the teachings of the resulting *Dits ou moralités des philosophes,* each proverb is attributed (wrongly) to a classical philosopher, commented on, and adapted to the needs of the knightly society for which Alard wrote.

# *ALBA/AUBE*

. The Provençal *alba* (OFr. *aube*) is a lyric monologue or series of monologues, possibly originating in a popular tradition indigenous to practically every culture, that expresses in its most typical form the sadness of lovers who, having spent the night together, must part and/or the concern of the watchman, whose duty it is to warn them of the fast-approaching day. The Provençal dawn song contains a refrain consisting minimally of the word *alba* and occasionally uses *alba* as a generic designation. Its French counterpart, remaining closer to popular sources, makes no such use of *aube*. Whereas only five *aubes* survive, four of them anonymously, eighteen *albas* are preserved, thirteen of which are attributed. Music accompanies one *aube* and two *albas*. Though apparently never popular in Italy, the form was adopted by the German Minnesänger as the *Tagelied*. The troubadours, notably Guiraut Riquier, developed several variations on the standard dawn-song theme, such as the counter-*alba,* in which the solitary lover longs for the coming of night, when he will be united with his beloved, and the religious *alba,* in which the dawn becomes a metaphor for the Day of Judgment.

# ALBERT THE GREAT

(Albertus Magnus; ca. 1200–1280). Now remembered as a theologian and philosopher, this teacher of Thomas Aquinas is perhaps most original in his scientific works. Albert was born into a noble family in Lauingen on the Danube, near Ulm. He studied at Bologna and Padua, where he entered the Dominican order in 1222. His theological training was in Germany, but ca. 1241 he went to Paris, where from 1245 to 1248 he was a Dominican regent master and taught his most famous pupil, Thomas Aquinas. In 1248, he and Thomas went to Cologne to start a new Dominican *studium generale*. In 1253–56, he was provincial of the German Dominican province, journeying to Rome in 1256 to defend the mendicants against the attacks of William of Saint-Amour and his followers. In 1260, he agreed to take the see of Ratisbon, simply to sort out its administrative disorder. He resigned two years later to return to Cologne and teaching. There was to be no peace: in 1264–66, he taught at the Dominican house in Würzburg; in 1268, he was at Strasbourg and elsewhere; in 1269–80, he was based in Cologne (where he is buried), although he attended the second Council of Lyon (1274) and was in Paris in 1277 to take part in the arguments over Aristotelian and Averroist doctrine.

Albert, known as *Doctor universalis* or *Doctor expertus,* has suffered from the proximity of his gifted pupil, Thomas, in particular from comparison with Thomas in theology and philosophy. Albert is a less systematic thinker than Thomas and less comprehensive. But this is to misjudge his gifts, which were much more for personal observation, new information, and experimentation. He was much more influential in the natural sciences, especially biology and zoology, where his warmth comes through with a sense of his own observations, than in theology.

Albert was fascinated by the created world and wanted to know all about it. The sheer amount and variety of his work make him difficult to classify and assess: some is simple collation, some is close analysis. In the mold of a Paris master, he wrote biblical commentaries, a commentary on the *Sententiae* of Peter Lombard, theological tracts, and questions. He commented on the whole of Aristotle and used him for work on the natural sciences and psychology. Although he could use and understand philo-sophical principles, he is not a philosher through preference; he prefers to use philosophy as a tool in other, more interesting, fields.

# ALBI

. The city of Albi (Tarn) in southern France, whose name became associated with heresy, crusades, and the Inquisition, remained until the 11th century a town of modest size and importance. It was endowed with a bishopric from the 5th century and in 778 became the seat of a county. Following the collapse of Carolingian authority, Albi fell under the power of the counts of Toulouse-Rouergue, who administered it through hereditary viscounts. The viscounts thereafter extended their domains through marriages, culminating with the union of Viscount Raymond-Bernard, called Trencavel, and Ermengarde, heiress of the counties of Carcassonne, Béziers, and Agde (ca. 1066).

The power of the viscounts of Albi, however, did not efface that of the bishops, who retained broad regalian

Albi (Tarn), Sainte-Cécile, plan. After Stoddard.

rights and secular jurisdiction. After 1066, the overextension of the Trencavels allowed the bishops to achieve practical autonomy and effective control over their city. At the same time, the burghers, whose numbers and importance increased with growing economic prosperity, allied with the bishops in their struggle for autonomy. During the Albigensian Crusade (1209–29), the burghers and bishop alike collaborated faithfully with Simon de Montfort, and in 1220 Bishop Guilhem Peire recognized the citizens' rights in a charter of liberties and franchises.

The political crisis of Albi came in the reign of Bishop Bernard de Castanet (r. 1277–1308) with the end of the alliance between the bishop and burghers. The latter, seeking increased independence, appealed to the royal government. Bishop Bernard responded by using the power of the Inquisition. In 1299 and 1300, thirty-two of the leading citizens were arrested and condemned for involvement with heresy. Thereafter, the fate of the

Albigeois became a rallying point in the great struggle of the Midi against the Inquisition. Both the episcopal and communal power emerged from this struggle diminished; effective authority passed after 1320 to the government of the king, which retained control of Albi through the crises of the Hundred Years' War and the 15th century.

*Alan Friedlander*

Albi (Tarn), Sainte-Cécile, nave.
*Photograph courtesy of Alinari/Art Resources.*

The cathedral of Sainte-Cécile at Albi stands as a monumental symbol of the crusade against the Albigensian heresy in southern France. It was begun in 1282 in the wake of extirpation of the heresy by Bernard de Castanet, bishop of Albi and inquisitor of Languedoc, to be a fortress as well as a cathedral. Although it was built primarily in the 14th century from 1282 to 1347, its massive military appearance remains its major characteristic.

The cathedral is a single-nave structure of red brick whose compact mass is broken only by a tall tower rising from a square base at the west end. The exterior presents a regular alternation of the rounded buttresses that rise from splayed feet up the 130-foot height of the cathedral, with wall surfaces broken by narrow windows. The main entrance is on the south side through the Porch of Dominic of Florence, bishop of Albi from 1397 to 1410. This portal represents the artistic contrasts found in Albi cathedral, since it connects a sturdy crenellated tower that was once part of the surrounding fortification wall with the ornate 15th-century openwork carving of the four arches above the entrance portal.

The vast space of the single nave without aisles or transepts dominates the interior. It is 320 feet long, 63 feet wide, and the vaults reach to 100 feet high. Wall partitions that correspond to the external buttresses create twelve bays with side chapels surmounted by galleries. The ribs of the vaults, which are continued down the partitions by colonnettes,

add definition to the bays. The main vaults are supported by the smaller vaults of the chapels, as well as by external buttresses.

Late Gothic decoration of the 15th and 16th centuries brings a delicacy to the appearance of the interior. The Amboise family, who were bishops at Albi at this period, commissioned painters, primarily from Italy, to cover the vaults and walls. A *Last Judgment* is on the west wall, and Old and New Testament subjects, painted by Bolognese artists between 1508 and 1514, adorn the vaults. The choir screen is a late 15th-century masterpiece of intricately carved canopies, pinnacles, and sculpted figures. This decoration transforms a fortress-cathedral of the 13th and 14th centuries into a refined expression of Late Gothic taste.

# ALBIGENSIAN CRUSADE

. Name given to the series of military campaigns that began in the spring of 1209 as part of the effort to eradicate the Cathar heresy, an important center of which was the town of Albi in southern France.

France's Languedoc and Midi regions, together with northern Italy, had long offered fertile ground to religious heterodoxy. Geography played a key role in this. These regions' traditional involvement in the diverse cultural, commerical, and intellectual life of the Mediterranean exposed them to a steady stream of new religious and philosophical thought; and their relative lack of, or freedom from, an effective centralized political authority, a situation owing much to the disjointed topography of the territories, made it easy for dissenting ideas to take root. Not only did none of the established religious or civil authorities have the *de facto* power to suppress heresy when it appeared, but their very inability to exert that power inevitably inspired many local inhabitants to question the *de jure* authority of their supposed leaders. In a world where popular belief in such things as a "pure" river's inability to receive the "corrupt" body of an accused criminal (the underlying assumption behind trials by ordeal), the failure to exert power made it easier for people to doubt the validity of the authority in whose name that power was supposedly levied.

Heretical movements appeared in southern France as early as 1120, but an identifiable Catharism cannot be detected until the 1140s and 1150s. Despite its rigors, Catharism appealed to all social levels, including the nobility in Languedoc, and to men and women alike. Its fast-growing popularity led the church to organize episcopally directed preaching missions, and the Third Lateran Council in 1179 enjoined all believers to give their bishops aid in the struggle to root out the heresy, including physical force. But force was not used at once. Instead, preachers like St. Dominic and his followers were dispatched, courts of inquiry (the early Inquisition) were established, and ineffective or corrupt bishops were deposed. By 1204, however, Pope Innocent III decided that stronger measures were needed and called upon the Capetian king Philip II Augustus to take arms against the rebels. Philip demurred, citing his current difficulties with King John of England, and matters came to a standstill as papal energies were drawn to the tangled affairs of the Fourth Crusade then getting underway in Venice.

On January 14, 1208, however, a papal legate in Languedoc was murdered, and suspicion fell upon the count of Toulouse, Raymond VI, widely reputed to have Catharist sympathies. Innocent proclaimed a crusade against the heretics, whom he regarded as a worse threat to Christendom than even the Muslims, and against their protectors and those who tolerated the presence of heterodoxy. By the spring of 1209, a large army had convened, drawn from across Europe. Raymond of Toulouse submitted to the church and underwent a penitential scourging, but others fared worse. The viscount of Béziers and Carcassonne, who was also lord of the territory surrounding Albi, saw his lands invaded and his subjects fiercely cut down. Simon de Montfort, a middling baron from the Île-de-France and a leader of the crusade, took command of the Trencavel lands and turned Béziers into the base from which annual campaigns against the remaining heretics were launched.

Political and strategic matters quickly became complicated. Raymond of Toulouse's failure to fulfill his penitential vows drew Simon's angry attention, and when he directed the crusade against Toulouse throughout 1211 and 1212 Simon found himself battling the king of Aragon, who had come to the aid of Raymond, his brother-in-law. This king, Peter the Catholic, was at that time one of Christendom's great champions, having played a role in the decisive Battle of Las Navas de Tolosa against the Muslims of Spain, which had effectively broken the power of the Islamic princes over the bulk of the peninsula, and his opposition to Simon gave the pope an excuse to abolish the crusade privileges bestowed upon those fighting the Cathars. Innocent by this time wanted desperately to raise soldiers for another crusade to the Holy Land and felt that the drawn-out Cathar affair undermined his hopes. Simon, however, defeated Peter at the Battle of Muret in September 1213, leaving the Aragonese ruler dead on the field and the crusading army in control of most of Raymond's lands in southern France.

The towns of the region, regardless of their religious attitudes, then rebelled against Simon's growing authority, which they viewed as an unwarranted abrogation of their traditional independence. When Simon was killed in a skirmish outside Toulouse in 1218, few mourned. The new pope, Honorius III, restored crusader privileges to those involved in the fight against the Cathars but with little result. Matters remained stalemated until 1226, when King Louis VIII of France led his own crusading force southward, as much in the hope of securing a Capetian outlet to the Mediterranean as out of a desire to defend orthodoxy. The Treaty of Meaux-Paris, signed in early 1229, formally ended the

Albigensian Crusade by restoring the Toulousan count (Raymond VII, by this time) to at least part of his lands and by establishing a Capetian foothold in the south. Catharism itself, however, survived well into the 14th century, especially in remoter towns and villages.

The Albigensian Crusade showed the impotence of crusading as a solution for deeply rooted heresy and pointed the way to the need for a different sort of response—the Inquisition. The ways in which political and dynastic concerns affected crusader efforts, usually for the worse, were also amply illustrated; and the crusade's most lasting consequence was the effective halting of Catalan claims of overlordship north of the Pyrénées and the establishment of Capetian power throughout Languedoc, the Midi, and eventually Provence.

# ALBRET

. The lords of Albret ("Lebret," "La Bret"), vassals of the dukes of Aquitaine, belonged to one of the most important families in Gascony. Their original seat was Labrit (Landes), but eventually they considered Casteljaloux (Lotet-Garonne) their chief residence. They bore an unusual coat of arms, *de gueules plain,* devoid of heraldic devices, and five of them were named Bernard-Aiz (a spelling now considered preferable to the more common Bernard-Ezi, which derived from the Latin genitive).

Amanieu V (d. 1240) was a first cousin of Isabelle d'Angoulême, queen of England. Amanieu VII (d. 1326), Edward I's occasional ambassador to the pope, became rector of the northern papal states for Clement V and served France in the Anglo-French war of Saint-Sardos (1323–25). His son Bernard-Aiz V (d. 1359), son-in-law of the count of Armagnac, switched sides several times during the preliminaries of the Hundred Years' War. He fought for Edward III at Poitiers and was rewarded with a pension of 1,000 pounds.

Bernard-Aiz V's son Arnaud-Amanieu (d. 1401) paid homage to the Black Prince in 1363 and fought as his vassal in Castile (Nájera, 1367). The inability of the Black Prince to continue his pension made him receptive to the overtures of Charles V of France. In 1368, Arnaud-Amanieu married Charles V's sister-in-law Marguerite de Bourbon and was promised a substantial pension. He later became *Grand Chambellan de France*.

Arnaud-Amanieu's son, Charles I (d. 1415), grew up at the French court as a "companion" to the dauphin (Charles VI) and was named constable of France in 1403. As partial payment for his royal pension, he received the county of Dreux in 1407. Considered a member of the Armagnac party, he was replaced as constable in 1411 but regained the post in 1413 and was killed at Agincourt. His son Charles II (d. 1471) sired Alain le Grand (d. 1522), whose son Jean married the queen of Navarre in 1484.

# ALCUIN

(Albinus Alcuinus; ca. 735–804). Born in Northumbria, Alcuin became the primary teacher of Charlemagne's palace school. Alcuin was educated under Bishop Egbert of York and saw himself in the intellectual tradition of the Venerable Bede. He met Charlemagne in Italy in 771 and represented him on a mission to Offa of Mercia in 790 and at the councils of Frankfurt (794) and Aachen (799). Ordained deacon but never priest, Alcuin was abbot of several French monasteries and made the abbey of Saint-Martin of Tours an important center of Carolingian learning. His writings include biblical commentaries (on Genesis, the Psalms, Ecclesiastes, the Song of Songs, some New Testament epistles, and the Gospel of John), liturgical treatises, hagiography, poems, many letters, tractates against the Spanish Adoptionists, a treatise on the phases of the moon, and school texts. These last, covering the Trivium (grammar, rhetoric, and dialectic), are in the form of dialogues between Alcuin and his pupils, including "a Saxon," "a Frank," and Charlemagne. At court, Alcuin was called "Flaccus" after the Roman poet Horace. His greatest legacy to medieval France was a tradition of school learning continued by his students Louis the Pious and Rabanus Maurus. He died at the monastery of Saint-Martin.

# ALEMANNI

. The Alemanni or Alamanni ("All Men") were a confederation of Germanic tribes first mentioned in A.D. 213 as fighting against the Roman Empire; they raided both Italy and Gaul in the 3rd and 4th centuries. In the early 5th century, they were able to cross the Rhine, and the decline of the western Roman Empire in the middle of that century allowed them to expand westward to the Vosges and into Alsace. Colliding with Frankish expansion, they were defeated by Clovis I in the mid-490s at Zülpich (Tolbiac). Afterward, most of the Alemanni were under Frankish authority.

Although the fortunes of the Alemanni were generally linked to those of the Frankish kingdom of Austrasia, they did enjoy a measure of self-rule under native dukes subordinate to the Merovingians, and they came to dominate southwestern Germany and northern Switzerland along the Jura mountain range. The Alemanni were included in the kingdom of Louis the German in the Treaty of Verdun in 843 and later were attached to Germany rather than to France, forming the core of the later duchy of Swabia. In the Merovingian period, Alemannia was a sort of eastern frontier of the Frankish kingdom, and the Alemanni gave their name to the French words for Germany *(Allemagne)* and for Germans *(allemands).*

# ALEXANDER III

(d. 1181). Pope. When Pope Hadrian IV died in 1159, the majority of the cardinals elected the chancellor of the Roman church, the Sienese Rolando Bandinelli, to succeed him as Alexander III. The emperor Frederick I Barbarossa, offended by Rolando's conduct at the Diet of Besançon earlier that year, supported the rival claim of Cardinal Octavian. Despite support by the Norman king of Sicily, William I, and by the cities that formed the Lombard League, in 1162 Alexander was forced to take refuge in France, where he conducted councils at Montpellier (1162) and Tours (1163). Although Louis VII, fearing to alienate his mighty vassal Henry I Plantagenêt of England, adhered to Alexander, he also was reluctant to offend Barbarossa. Alexander also found himself caught between princes when in 1170 Louis demanded in vain that the pope condemn

Henry for the murder of Thomas Becket. (Alexander had advised Thomas against challenging the Plantagenêt monarch, one of his allies.) This difficult situation was resolved when an impoverished pope and the emperor, who had been defeated by the Lombard League at Legnano, were reconciled in the Peace of Venice (1177). Alexander returned to Rome, where in 1179 he held the Third Lateran Council. Its canons, which imposed penalties on violators of the Truce of God and regulated clerical discipline, became part of the canon law. So did many of Alexander's decretals, which clarified points of law for judges-delegate throughout Christendom.

# ALEXANDER OF HALES

(ca. 1185–1245). Theologian. Alexander's early life is conjectural: born probably in Hales (now Hales Owen), in the English Midlands, he studied arts, then theology, in Paris, from around the turn of the century. From 1226 to 1229, he was a canon of Saint Paul's, London, although he remained in Paris. He was one of four masters sent to Rome by the University of Paris in 1230 to represent its case in the famous dispute (which led to strike and dissolution) with the French king. Gregory IX's bull *Parens scientiarum* (1231), arising out of the dispute, was partly Alexander's work. In 1231, he was made canon of Lichfield and archdeacon of Coventry. At the height of his career, in 1235, he joined the fledgling Franciscan order (apparently breaking off a sermon he was preaching, taking the habit, and returning to finish the sermon), thus giving the Franciscans their first holder of a magisterial chair in the University of Paris. He was active in teaching for the Franciscans and as an adjudicator of disputes until his sudden death, probably of an epidemic disease, in Paris in 1245.

The catalogue of Alexander's works is unclear. He is best remembered today for introducing commentary on Peter Lombard's *Sententiae* into the Paris theology syllabus. His own *Sententiae* gloss, the earliest we possess, survives in more than one version, apparently being student *reportationes* of his lectures. A set of *Quaestiones disputatae* "antequam esset frater" belongs to him, but a *Summa theologiae* begun by Alexander was finished by William of Melitona, John of La Rochelle, and other members of the "Franciscan school" that Alexander headed. It is thus a useful summary of 13th-century Franciscan ideas. The same group of friars was responsible for an exposition of the Franciscan *Rule,* in 1242.

With William of Auvergne, Alexander (known as *Doctor irrefragibilis*), was the first Paris master to use Aristotle in the service of theology; and, like William, he used Aristotle's ideas in a framework of traditional Augustinian orthodoxy. Alexander's main sources are Augustine, Pseudo-Dionysius, Boethius, and the "moderns" of the 12th century: Bernard of Clairvaux, Gilbert of Poitiers, Anselm, and others.

Alexander's prosaic style makes it difficult for us today to appreciate his enormous contemporary success, although his structured and ordered approach remains a key feature of his work. Bonaventure was of one of the succeeding generation who revered Alexander, suggesting that his teaching in person may have been more gripping than the remnant left to us.

# ALEXANDER NECKHAM

(1157–1217). Alexander Neckham (or Nequam, a nickname meaning "worthless") was born in England at St. Alban's and traveled to read arts at Paris ca. 1175. He returned to England to teach at Dunstable (ca. 1182) and St. Alban's (ca. 1185–90), then studied theology at Oxford (ca. 1190–97). Around 1200, he entered the order of Augustinian Canons, acted as a papal judge-delegate in 1203 and 1205, and was made abbot of Cirencester in 1213. He died in Kempsey, Worcestershire.

Like other "encyclopedists" in England and France at this time, Alexander wanted to know everything. He belonged to a group of Oxford scientists whose knowledge and methods were the best in Europe. He wrote biblical commentaries, consulting Jews for this purpose, and learned some Hebrew, and he wrote on grammar and natural science. Alexander's two major works, *De nominibus utensilium* and *De naturis rerum,* show his

encyclopedic learning by defining long lists of words and thus describing everyday objects (saddles, clothing, beds), technology (goldsmithing, manuscript copying, agricultural tools), the liberal arts, buildings and their furnishings, and the like. He also versified Aesop's Fables *(Novus Aesopus)* and was the author of a poem, *De laudibus divinae sapientiae,* and biblical commentaries. An Augustinian theologian who used Aristotle in his science, he complained, while abbot, that religion and study were becoming incompatible—creeping professionalism even in the 12th century.

# ALEXANDER ROMANCES

**.** Alexander the Great (356–323 B.C.), king of Macedonia (336–23 B.C.) and in the Middle Ages considered one of the Nine Worthies, became the subject of a fantastical biography by the PseudoCallisthenes in the 2nd century A.D. Julius Valerius's 4th-century Latin translation of this Greek biography, as summarized in a 9th-century *Epitome,* was the principal source of the medieval French *Roman d'Alexandre,* a long poem resulting from a compositional process spread over most of the 12th century.

The earliest extant Old French poem was composed by Albéric de Pisançon in his native Franco-Provençal dialect (Dauphinois), in the first third of the 12th century; only one manuscript fragment, 105 octosyllables arranged in fifteen monorhymed laisses, survives. Albéric's name is known only thanks to the German priest Lamprecht, who translated most (or even all; the life is unfinished) of Albéric ca. 1155. A generation or so later, ca. 1160, an anonymous decasyllabic poem in the dialect of Poitou drew on Albéric to give an account of the conqueror's youth *(enfances).* To this were added two poems: the first, by Lambert le Tort de Châteaudun, narrates Alexander's adventures in the East *(Orient)* up to his arrival in Babylon; a separate, anonymous, branch treats the hero's death *(mort).* These three poems *(enfances, Orient, mort)* were combined, resulting in two manuscripts totaling 6,015 and 9,947 lines, respectively.

After another short interval, Alexandre de Paris, from Bernay in Normandy, rewrote the earlier compilation in twelve-syllable laisses (hence the term "Alexandrine"), adding a previously separate account of a raid on Gaza, the *Fuerre de Gadres,* by a certain Eustache (ca. 1155). Alexandre's work is found in seventeen manuscripts; in the critical edition, the poem is arranged thus:

| Albéric *(enfances)* | Br. I, first half | 1,656 Alex. |
|---|---|---|
| linked to | I, middle | 1,009 |
| the *Fuerre de Gadres* | I, last quarter | 619 |
| the *Fuerre de Gadres* | II, first two-thirds | 1,424 |
| linked to | II, last third | 676 |
| Lambert *(Orient)* | III | 7,839 |
| *mort Alexandre* | IV | 1,709 |
| | | 14,932 Alex. |

Branch III, the core of the romance, is composed largely of extraordinary adventures, including Alexander's exploration of the depths of the sea in a bathysphere, and of the heavens, harnessed to a flock of birds. Dalliance with exotic and amorous—and dangerous—damsels is of course not lacking. The Middle Ages saw in Alexander the epitome of chivalry and the model of valor *(prouesse)* and generosity *(largesse).*

Alexandre's *Alexandre,* like earlier versions, is a formal anomaly in medieval French literature; though composed in laisses, which are elsewhere used only for the chanson de geste, thematically the poem is a romance, treating the story of a single hero, from birth to death, and not a single episode or series of episodes in which the hero opposes what could be deemed societal enemies. The *Roman d'Alexandre* is thus much more an adventure romance than a biography, classified generally among the Romances of Antiquity because of its subject matter. Its oriental setting was to have an important influence on many Old French romances.

A number of poems were subsequently composed in the north about episodes of the hero's career and are usually found interpolated into the *Roman d'Alexandre* text or at least contained in *Roman d'Alexandre* manuscripts. Among these are Jean Le Névelon's *Venjance Alixandre* (last quarter of the 12th c.; 1,936 lines), Gui de Cambrai's *Vengement Alixandre* (before 1191; 1,806 lines); the anonymous *Prise de Defur* (before 1257; 1,654 Alexandrines); the *Voyage d'Alexandre au Paradis terrestre* (1270–1350; 503 Alexandrines); and Jacques de Longuyon's *Vœux du paon* (ca. 1312), with its continuations by Jean Brisebarre, *Restor du paon* (before 1338), and Jean de Le Mote, *Parfait du paon* (1340). An independent Anglo-Norman Life of Alexander was composed by Thomas of Kent. After 1206, the poem was put into prose, with a second redaction between 1252 and ca. 1290 and a third in the 14th cen-tury (total of eighteen manuscripts), with editions through the 16th century.

# ALEXANDRE DU PONT

(fl. mid-13th c.). Alexandre's *Roman de Mahomet,* a 1,997-line poem composed in Laon (Aisne) in 1258, is a free adaptation of the *Otia de Machomete* written by Gautier de Compiègne after 1137. It is preserved by a single manuscript, B.N. fr. 1553. The prophet's mythical biography is enhanced by colorful portrayals painted by a longwinded writer, a knowledgeable craftsman of epic poetry, who gave free rein to his moralizing bent.

*Annette Brasseur*

Alexandre du Pont. *Le roman de Mahomet de Alexandre du Pont,* ed. Yvan G.Lepage. Paris: Klincksieck, 1977.

# ALEXIS, GUILLAUME

(ca. 1425–1486). A Benedictine monk in the abbey of Lyre in Normandy, Guillaume Alexis (also spelled Alecis) was a prolific writer whose vigorous style derives at once from innovation and variety in rhyme schemes and from his mordant, outspoken moralizing and railing against vainglory. His first poem, *L'ABC des doubles* (1451), uses a complex rhyme scheme based on the letters of the alphabet to offer moral advice. Several of his works, notably the *Blason des faulses amours,* the *Débat de l'omme et de*

*la femme,* and the *Débat du mondain et du religieux,* present cynical views of love. He is often compared with Villon, as some of his poems intersect thematically with Villon's; the direction of influence between the two poets has yet to be clarified.

# ALGER OF LIÈGE

(ca. 1050–ca. 1131). As deacon and *scholasticus* of Saint-Bartholomew in Liège, and later canon of Saint-Lambert and secretary to Bishop Otbert after 1101, Alger became the leading master in Liège and was involved in major controversies. His *Liber de misericordia et iustitia* addressed questions in the conflict between Bishop Otbert and adherents of the Gregorian reform movement; *De sacramentis corporis et sanguinis dominici* was a product of the debate in Liège occasioned by Rupert of Deutz's eucharistic doctrine. In 1121, Alger entered the Benedictine abbey of Cluny, where he died ca. 1131.

# *ALISCANS*

. A 12th-century epic of 8,435 decasyllabic lines divided into rhymed laisses, *Aliscans* offers variations on material in the latter part of the *Chanson de Guillaume:* the death of Vivien; the flight of Guillaume to Orange; the battles against Desramé and his monstrous pagans, with final victory won for Guillaume by the heroic exploits of Rainouart; Rainouart's exclusion from the celebrations that follow; the reconciliation; and finally his baptism, knighting, and marriage to Aelis, the king's daughter and Guillaume's niece.

Different in *Aliscans* is the early announcement, before Rainouart has proved himself, that he will wed Aelis.

# *ALLEU*/ALLOD

. An allod was freehold land, land that the possessor owned outright, without owing dues, rents, or homage for it. "Allodial land" in Merovingian times generally referred to inherited property, as opposed to property one had purchased, but soon came to mean any land owned outright. Although scholars used to describe peasants as primarily renting their land and nobles as holding theirs in fief, they now argue that all sectors of society owned much allodial land throughout the Middle Ages.

# ALPHONSE OF POITIERS

(1220–1271). Count of Toulouse. Alphonse was the brother of Louis IX (St. Louis) and was himself one of the great territorial princes of the 13th century. When they came of age, the younger sons of Louis VIII were provided for by means of apanages, territorial holdings of considerable extent. Alphonse, who was invested with the apanage of Poitou in 1241, immediately ran up against serious problems. Poitou and its southern marches constituted a region that had seen an English army of invasion a generation before. Nobles in the region were fiercely independent, and many had rallied to the English king, their former overlord, in 1214. They had been defeated, but the region remained discontented. So long as their new lord was the French king, a remote figure, discontent did not become open rebellion; but in 1241, when authority was given over to the cadet prince Alphonse at a great festival in Saumur in the heartland of Poitou, the occasion was interpreted as a direct challenge to the independence and authority of the native nobility. Alphonse's first years as count of Poitou were thus checkered by the necessity of putting down a rebellion in which the rebels received both the support of the English and the

encouragement of the count of Toulouse. The rebellion failed, but it pointed up the precariousness of Capetian rule in the southwest.

Alphonse's holdings were vastly increased in the south in 1249 on the death of his father-in-law, the erstwhile rebel Count Raymond VII of Toulouse. Raymond's heir, as provided by the Treaty of Meaux-Paris (1229) that ended the Albigensian Crusade, was his daughter Jeanne, Alphonse's wife. Although he was with his brother on crusade at the time of Raymond's death, Alphonse's interests were protected by the decisive action of his mother, the regent Blanche of Castile. Reacting swiftly to information that some southerners were refusing to adhere to the transfer of the deceased count's lands to Alphonse, she made a show of force and quickly won their capitulation.

The biography of Alphonse, therefore, is largely the history of his attempts to govern his apanage and the diverse lands that fell to his administration from the holdings of the count of Toulouse. Back from crusade in 1250, he set about ruling these vast territories, which included, besides Poitou and Toulouse, Saintonge, Auvergne, and part of the Rhône Valley. In addition to resident administrators (*sénéchaux, viguiers,* and *bayles*), he employed *enquêteurs,* investigators modeled on his brother's *enquêteurs,* whose duty it was to investigate periodically complaints against his government. He had commissioned a handful of these agents in 1249 at the time of his departure on crusade. He extended the commissions in 1251 to all the lands inherited from the count of Toulouse; and he used the *enquêteurs* regularly thereafter. Their work went a long way toward assuaging the discontent in his territories.

Though governing from Paris, Alphonse took an active, almost obsessive interest in the details of administration, as his surviving administrative correspondence and his excellent accounts demonstrate. He monitored closely the activities of his provincial officials and took a judicious interest in the workings of the high court or parlement of Toulouse.

It is difficult to get a nuanced sense of Alphonse as a man. Although briefly a crusader, he seems on the whole to have been conventionally pious. He detested Judaism and vigorously exploited the wealth of the Jews in his domains; but he did not disdain to use a Jewish physician when he had some painful eye trouble. There is an element of closefistedness in his character, although it would be wrong to call him a miser. He seems to have enjoyed a happy married life. Despite the fact that she bore him no children, Alphonse never deserted Jeanne, and both went on St. Louis's last crusade (1270). Both died on the trip homeward (1271) within a few days of each other. Their holdings escheated to the crown.

# *ALTA CAPELLA*

**.** A standard grouping of musical instruments in the late Middle Ages. The *alta capella* was employed by 15th-century courts and cities to provide *haute musique* ("loud music") for dancing, ceremony, and enter

A late 15th-century ball (Burgundy, ca. 1469–70), with an *alta capella* consisting of two shawms and slide trumpet. MS fr. 5073, fol. 117v. *Courtesy of the Bibliothèque de l'Arsenal, Paris.*

tainment. The ensemble was typically made up of three or four minstrels who played shawms, slide trumpets, sackbuts, and bombardes. Until late in the 15th century, much of the repertory of *alta* musicians was improvised; one instrumentalist played the *cantus firmus* (frequently a standard *basse danse* tune), while the others improvised counterpoint around it.

# *AMADAS ET YDOINE*

. The original version of this anonymous Anglo-Norman romance was written between 1190 and 1220, perhaps earlier. Considerable fragments have survived in two Anglo-Norman manuscripts and a complete version (7,912 lines) in a Picard manuscript from Arras (MS P; B.N. fr. 375), dated 1288. *Amadas* was relatively popular, especially in England; it was alluded to in subsequent texts and its hero was cited in lists of famous lovers.

Ydoine is the daughter of the Duke of Burgundy; Amadas, the son of the duke's seneschal. Ydoine sends her suitor out into the world to win martial renown, but when the duke marries his daughter to the Count of Nevers, Amadas falls into insanity. However, with the assistance of three sorceresses, Ydoine conserves her virginity. The countess cures the young man of his madness, and he rescues her after she has been abducted by a demon. Ydoine then arranges for her marriage to be annulled so she can wed her true love.

*Amadas et Ydoine* is filled with fine speeches, courtly elegance and descriptions of contemporary life. The author takes a number of themes or conventions literally—lovesickness, love madness, death and rebirth, woman's manipulation and deceit, enchantments, the supernatural—and, extending them to their extreme limits, explores what, both as fact and metaphor, they imply. Following in the tradition of the Tristan romances and Chrétien, the *Amadas* poet seeks to provide ideals of courtly conduct in order that the social code be respected and that true love flourish.

# **AMALARIUS OF METZ**

(ca. 775–ca. 850). The most influential and controversial liturgist of the Carolingian age and the major western Christian propagator of an allegorical understanding of the liturgy. Born near Metz and educated in the school of Alcuin, Amalarius held many positions of importance: archbishop of Trier (811–13), Charlemagne's ambassador to Constantinople (813), and archbishop of Lyon (835–38). It was in this last position, which he held for only three years, that Amalarius became a controversial figure. His highly allegorical liturgical writings, which stressed a polyvalent, many-tiered understanding of ritual, were

attacked by the deposed bishop Agobard of Lyon, to whose place Amalarius had been appointed. Because of Agobard's influence, Amalarius was subsequently condemned by the Synod of Quierzy (838) and deposed from his bishopric. In spite of this judgment, the liturgical writings of Amalarius, especially the *Liber officialis* (823), were widely read throughout the Middle Ages. His emphasis on the flexibility of meaning in the liturgical mysteries helped to bring about a shift toward liturgical devotion; this in turn aided the development of late-medieval forms of piety. Amalarius's allegories are difficult, however, and are still in need of detailed study from the point of view of ritual and symbolic thought.

# *AMANT RENDU CORDELIER*

**.** The full title of this tale, *L'amant rendu cordelier en l'observance d'amour,* summarizes its 234 *huitains,* a dream vision in which an unhappy lover confesses his troubles (presenting a bittersweet critique of love's service) to the prior of a Franciscan house, before entering the order. Once the lover takes his vows, however, the narrator awakens and contrasts the lover's sufferings to bitter monastic penance, thus wittily coming out in favor of love. Originally attributed to Martial d'Auvergne, the anonymous text (tentatively dated 1440–50) is now associated with the literary circle of Pierre de Hauteville (d. 1447).

# AMBROSIUS AUTPERTUS

(d. 784). Author of an influential commentary on the Apocalypse. Born in Provence in the first half of the 8th century, Autpertus entered the monastery of San Vincenzo on the Volturno, near Benevento, in 754. Ordained a priest, he became abbot of his community in 777 but was opposed by a Lombard faction and forced to abdicate. He died on his way to Rome to testify about another dispute in his community.

Autpertus's commentary on the Apocalypse, an ecclesiological interpretation synthesized from Primasius, Tyconius, Augustine, Victorinus, and Jerome, circulated widely in medieval France and was a major source for later exegetes. Autpertus also wrote an allegory based on Prudentius, prayers, sermons, and saints' lives.

# *AMI ET AMILE*

**.** This 3,504-line chanson de geste (divided into 177 decasyllabic laisses partly assonanced, partly rhymed, and each concluding with a six-syllable, feminine *vers orphelin*), composed ca. 1200, tells the story of the superhuman friendship of two young nobles, Ami and Amile. Born on the same day in different families, they are physically identical. At the age of fifteen, they meet and become sworn friends and companions. After entering the service of Charlemagne, they quickly distinguish themselves. Ami obtains the hand of Lubias, lady of Blaye and niece of a traitor, Hardré. It is a disastrous marriage. Meanwhile, a daughter of Charlemagne, Belissant, having fallen hopelessly in love with Amile, sneaks into his bed and lets herself be seduced by him. The lovers are denounced by Hardré, always envious of the friends' success. Amile must prove his innocence in a judiciary duel. Ami replaces him in this duel, swearing (rightly) that he has never slept with Belissant. He wins the duel, and Charlemagne offers him the hand of Belissant. Since he accepts, despite the admonishment by an angel, he commits technical bigamy and becomes a leper. Although protected by his young son, Gérard, he is driven out of his home by the evil Lubias. Accompanied by two ever-faithful servants, he wanders in search of Amile, now happily married to Belissant. Following a series of adventures, the two friends meet. An angel appears again to Ami to show him the only remedy against his shameful disease: Amile must sacrifice his two young sons and wash his friend in their blood. The superhuman friendship cannot be refused anything, and Amile does as he is told. Ami recovers immediately. God, rewarding the father's heroic act, restores his children to life. Shortly after, Ami and Amile die in Lombardy upon their return from the pilgrimage to Jerusalem. They are buried in Mortara.

The exact origin of this work cannot be determined, but it is obvious that folkloric, hagiographic, romance, and epic elements entered into its composition. The legend, preserved in at least two Latin and numerous foreign versions, was popular, surely because of its strong thematic components: the absolute friendship of the identical "twins," the Isaac-like child sacrifice, the miraculous cure from leprosy, and probably the

absolute dichotomy between the good (Ami, Amile, Belissant, Gérard, faithful servants) and the evil (Hardré and Lubias). All these components are, however, well integrated into the King Cycle.

The story is also preserved in a late 12th-century Anglo-Norman romance, *Amis e Amilun,* and a 15th-cen-tury miracle play, as well as in unpublished versions in prose. The chanson de geste of *Jourdain de Blaye* is a continuation of *Ami et Amile*. Its protagonist is the grandson of Ami. The two works form a little "Blaye Cycle."

# AMIENS

**.** Throughout the Middle Ages, Amiens (Somme) was an important artistic center known for its architecture, sculpture, manuscript illumination, and painting. The cathedral is the city's outstanding monument. After a fire in 1218, rebuilding commenced ca. 1220 and was substantially completed by 1269. The architect, Robert de Luzarches, was succeeded by Thomas de Cormont and his son Renaud, who finished the upper levels and chevet. Additions included 14th-century chapels in the nave, two western towers, and reconstruction of the spire over the crossing after a 1528 fire.

Amiens represents the epitome of French Gothic architecture. The double-aisled, rib-vaulted cathedral has seven bays in the nave, four in the choir, a slightly projecting transept, and a chevet with seven radiating chapels. The 3:1 proportion of vault height to nave width, and the elevation, whose arcade equals the combined height of the triforium and clerestory, accent the verticality. Piers, ribs, and tracery of clerestory windows convey an impression of lightness and skeletal linearity. Most of the medieval stained glass has been destroyed.

On the exterior, the flying buttresses and sculptured portals typify the Gothic style. The west façade, dated ca. the 1230s, with three recessed porches, is the most unified iconographic and stylistic ensemble of French Gothic sculpture. The central portal depicts the Last Judgment in the tympanum with the famous trumeau of Christ, *Beau Dieu,*
Amiens (Somme), Notre-Dame, plan.

Stoddard.*

and jamb figures of the Apostles. The left portal is dedicated to St. Firmin, the first bishop-martyr of Amiens, with other local saints on the jambs. The Virgin is honored on the right door with a tympanum depicting her death and coronation and jamb figures representing an infancy cycle. The piers and basements contain statues and reliefs of prophets, Virtues and Vices, and signs of the zodiac and months. The heavy drapery with broad angular folds enhances the direct presentation of iconographic themes.

The south portal of ca. 1270 features a trumeau statue of the Virgin and Child, *Vierge Dorée,* and scenes from the life of St. Honoré, a 6th-century bishop of Amiens, in the tympanum. Swaying poses, delicate faces, and complex drapery characterize this elegant Gothic style. Two 13th-century bishops have bronze slab tombs in the nave. Two chapels of ca. 1375 contain statues of Charles V and his sons. John Ruskin called the late 15th- and early 16th-century carved choir screen and stalls the "Bible of Amiens" because of their wealth of scriptural subjects. The 13th-century edifice, its sculptured portals, and Gothic furnishings make Amiens one of the great medieval churches.

# ANAGRAM

. A word or phrase formed by transposing the letters of another word or phrase, anagrams appear in French texts from the mid-13th century and were generally used to identify the poet, the patron, or the poet's lady. Anagrams can be embedded in specified lines of text or in individual words or phrases. Although poets give instructions for the solution of anagrams, these are sometimes so complicated that the puzzles remain unsolved. It may be necessary to split letters in half (e.g., forming two *i*'s from an n) or to invert them (forming a *u* from an *n*). Particularly elaborate anagrams appear in the *Roman de la Poire,* the *Bestiaire d'amour rimé,* and the works of Guillaume de Machaut and Christine de Pizan. Earlier examples of devices related to the anagram include Jean Renart's use of wordplay to name himself at the end of the *Guillaume de Dole* (early 13th c.) and Tristan's adoption of the pseudonym Tantris in Thomas d'Angleterre's *Roman de Tristan* (mid-12th c.). Anagrams reflect delight in the manipulation of the written word, an index of increasing literacy within the aristocratic audience for vernacular poetry.

# *ANALECTA HYMNICA MEDII AEVI*

. The largest printed collection of medieval Latin liturgical poetry, edited by Guido Maria Dreves, Henry Marriott Bannister, and Clemens Blume. The volumes are organized in several ways: some are devoted to a single genre, others to a particular genre of poetry from one region, others, more rarely, to the works of a particular poet or group of poets. In general, hymns are found in Vols. 2, 4, 11, 12, 14, 16, 19, 22, 23, 27, 41a, 43, and 51; sequences in Vols. 7, 8, 9, 10, 34, 37, 39, 40, 41a, 42, 44, 53, 54, and 55; tropes in Vols. 47 and 49; rhymed offices *(hystoriae)* in Vols. 5, 13, 17, 18, 24, 25, 26, 28, 41a, and 45a. Also included are religious songs and motet texts, rhymed prayers, and rhymed psalter texts. The index, prepared by Max Lütolf, contains alphabetized incipits for all texts and indices for genre and for liturgical assignment. *Analecta hymnica* can be supplemented by the index in Chevalier's *Repertorium hymnologicum;* trope texts are now being edited in the several volumes of the *Corpus troporum.* Although *Analecta hymnica* remains useful, many of the sources listed in the lemmata are misdated, and there are frequent errors in the reporting of variants.

# ANDRÉ DE FLEURY

(d. ca. 1050–60). A monk of the Benedictine abbey of Fleury-sur-Loire, André wrote Books 4–7 of the *Miracula sancti Benedicti,* continuing the work of Aimoin de Fleury. André expanded the account beyond miracles to include events relating to the monastery locally and elsewhere. He also wrote a life of Gauzlin, abbot of Fleury 1004–30.

# ANDREAS CAPELLANUS

(André le Chapelain; fl. late 12th c.). Author of a treatise on the art of love, *De amore* (or *De arte honeste amandi*), composed for a certain Gautier. Andreas's identity remains enigmatic. He has most frequently been identified with a chaplain of the same name in the service of Marie de Champagne, the daughter of Louis VII and Eleanor of Aquitaine and the patroness of Chrétien de Troyes.

*De amore,* preserved in over thirty manuscripts and collections, is composed of three books. The first expounds the nature of love; the second, in a series of twenty-one judgments attributed to some of the noblest ladies of France (Eleanor of Aquitaine, Marie de Champagne, Elizabeth of Vermandois, and others), tells how to maintain love; and the third condemns love. The entire treatise shows the influence of Ovid's *Ars amatoria* and *Remedia amoris,* as well as an intimate knowledge of the casuistry and rhetorical traditions of the medieval Latin school system. Its interpretation, however, like that of Chrétien's *Chevalier de la charrette,* remains problematic. Modern critics are divided as to whether to take the work seriously or read it ironically. If Andreas's intention was to produce a treatise on the practice of (courtly) love, then how can one explain the

antifeminism of the final book? Was this true remorse or an ironic stance to avoid ecclesiastical condemnation?

The work was translated into Franco-Italian prose in the second half of the 13th century and into Old French by Drouart la Vache in 1290. It also made its way into Catalan, Italian, and German.

# ANDREW OF SAINT-VICTOR

(d. 1175). Biblical exegete who provided the most sustained treatment of the Hebrew Bible according to the literal sense since the time of St. Jerome (4th–5th c.). Born probably in England, Andrew entered the abbey of Saint-Victor in Paris and studied under Hugh of Saint-Victor. He later returned to England as abbot of Wigmore, a house of regular canons in Herefordshire.

Andrew was influenced by Hugh's emphasis on the importance of the literal sense of Scripture as the foundation for understanding the allegorical and moral senses. In contrast to Hugh's interest in the threefold interpretation of Scripture, Andrew wrote exegetical treatises only on the Hebrew Bible, with the literal sense his only focus. His commentaries on the Octateuch, Historical Books, Wisdom Books, Minor Prophets, and Isaiah, Jeremiah, Ezekiel, and Daniel have been preserved. These commentaries indicate that Andrew consulted with Jews in the vernacular and then translated their interpretations into Latin. It is not likely that he had extensive knowledge of biblical or postbiblical Hebrew. From Andrew's commentaries, however, we learn about Jewish liturgical practices and mourning customs. Richard of Saint-Victor wrote *De Emmanuele* condemning Andrew's acceptance of Jewish teachings about Isaiah 7:14, an important messianic prophecy for Christians. But Andrew did not accept all Jewish explications in uncritical fashion. He considered Jewish claims about messianic deliverance and restoration of the sacrificial cult in Jerusalem to be "fables." Andrew's writings influenced Peter Comestor, Peter the Chanter, Stephen Langton, and Herbert of Bosham.

# ANGERS

. Situated on both banks of the River Maine, five miles north of its confluence with the Loire, Angers (Maine-et-Loire) is rich in monuments exhibiting a Gothic style, Angevin Gothic, that is quite different from the Early and High Gothic of the Île-de-France. Besides the famous 14th-century tapestries of the Apocalypse exhibited inside the castle, Angers has a series of buildings that reveal both the uniqueness and the quality of this local, western French style and its evolution over a span of a hundred years.

Angers had long been governed by the counts of Anjou, some of whom had been dukes of Normandy and Aquitaine, counts of Brittany, and kings of England. Geoffroi IV Plantagenêt was the father of King Henry II of England, who was the husband of Eleanor of Aquitaine and father of Richard I the Lionhearted. In 1204, Angers surrendered to the Capetian king Philip II Augustus, and later in the century Louis IX had vast walls built to protect Angers. These walls were flattened to create the boulevards surrounding the city.

The powerful castle of Angers was begun under Count Foulques III Nerra to protect Anjou from the Normans. After surrender to the Capetians, Louis IX rebuilt Foulques's castle in whitestone with contrasting bands of black slate on two levels, and the seventeen semicircular towers were crowned by overhanging turrets. In the course of the 14th and 15th centuries, the dukes of Anjou continued to embellish the castle: Louis II, nephew of the French king Charles V, and his wife, Yolande d'Aragon, added the Gothic chapel, and their son, the "good duke" René d'Anjou, constructed comfortable living quarters overlooking the Maine. Parts of the castle were dismantled during the Wars of Religion of the 16th century, but much remains of this magnificent example of medieval military architecture.

The three square bays of the nave of the cathedral of Saint-Maurice, which were vaulted with domical, ribbed vaults between 1149 and 1153, exhibit the beginnings of Angevin Gothic. The exterior walls of the nave, with evenly spaced wall buttresses, belong to the 12th-century cathe

Angers (Maine-et-Loire), château, ramparts, and moat. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

dral, which may have been connected to a choir and short transept with chapels excavated in 1902. This 11th-century nave was covered with either a wooden roof or domes rising from pendentives (the span of 50 feet is too wide for a barrel vault). The single-nave vessel appears often in the Romanesque of the region; the single nave, vaulted with domes, can be found in the Dordogne (Cahors, Souillac) up through western France (Périgueux, Angoulême to Fontevrault, 35 miles southeast of Angers). In the mid-12th-century campaign of the cathedral of Angers, new, large wall buttresses were added to the exterior corners of the three bays, while new thick responds with multiple colonnettes supported the transverse, diagonal, and longitudinal ribs of the four-part vaults. These domical vaults have stylistic connections with those in the north and south tower of Chartres cathedral (1134 and after 1145); the elevation of Angers exhibits connections with the nave of Le Mans. In spite of these relationships to Chartres, to Le Mans, and to

the cupolas on the pendentives of Fontevrault, Saint-Maurice is a creative synthesis of Romanesque and Early Gothic characteristics.

Between the completion of the nave of Saint-Maurice in the mid-12th century and the construction of its transepts and choir in the 13th, several monuments in Angers reveal stages in the evolving Angevin Gothic. At Saint-Martin, excavated by an American team under George H. Forsyth, Jr., a small Merovingian church of the 7th century was enlarged in two campaigns in the 9th and 10th centuries by the addition of crossing, transepts, and choir with chapels on the ends of each. Surmounting the crossing was a wooden tower. In the 11th century, the lower section of the crossing tower was reinforced. Finally, after the middle of the 12th century, a new Gothic choir was constructed in two stages: the western square bay and the eastern bay and apse. This western bay is crowned by a domical vault supported by two transverse ribs, two wall ribs, two diagonal ribs, ridge ribs, and two ribs springing from a column between the windows. Thus, twelve ribs strengthen the webbing of the vault. The middle bay is

Angers, Saint-Maurice, plan. After Conant.

more domical in profile and with the same number but thinner ribs. The windows of the middle bay are considerably larger. Finally, the eastern apse has five even larger windows with more complicated frames of three colonnettes supporting the archivolts. This choir, ca. 1150–80, led stylistically to the vaulting of the transept and choir of the cathedral of Angers in the first half of the 13th century.

One other monument in Angers was built before the transept and choir of the cathedral, the Hospice Saint-Jean. Founded in 1180 with a papal bull and two charters signed by King Henry II in 1181, the Hospice consisted of a three-aisled rectangle of eight bays, square chapel, cloister, and separate granary. The room for the sick has aisles and nave of the same height covered with four-part, domical vaults with thin rounded ribs. Used as a hospital until 1865, the spaces were originally divided into wards by

screens. The elegance of the ribs is the main characteristic of the Angevin style in the late years of the 12th century.

The four square bays, which comprise the transept and choir of the cathedral of Angers, reveal the stylistic influence of Saint-Martin and the Hospice. The ribs are a simple torus molding under the domical vaults, which are doubled or widened for the transverse and wall ribs. Eight-part vaults of diagonals, ridge ribs, and liernes spring to the central keystone from the keystone of the wall (or longitudinal) rib. The marked domical profile, the thin rib, and eight-part vaults are exactly like the eastern bay of the choir of Saint-Martin. Transept and choir of the cathedral were built in the first half of the 13th century; the narrow bay and apse date from the second half of the 13th century.

One outstanding example of Angevin Gothic remains to be discussed: the choir of the Benedictine monastery of Saint-Serge. The plan consists of a four-bay nave with smaller aisles, all the same height. Nave bays and the three western bays are capped with eight-part, domical vaults with thin, rounded ribs—transverse, longitudinal, ridge, diagonals, and two ribs springing from the keystone of the longitudinal ribs. The carved and polychromed keystones capture eight ribs. With ribs of different lengths, the bay becomes domical in shape with the ribs visible on the top of the vaults. Flanking the nave and aisles are chapels of two bays at a higher level. A small square apse extends eastward. The ribs multiply in the eastern half of the apse,

Angers, Saint-Maurice, nave elevation
and section. After Losowska.

eastern bays of the aisles, and eastern bay of the north chapel. The proliferation of ribs by the addition of more liernes exhibits, together with the thinness of the nave supports, the decorative delicacy of the structure.

It is the Angevin Gothic of the choir of the cathedral, of Saint-Martin, and of Saint-Serge that spreads beyond the walls of Angers and to the south of the Loire River. Angevin Gothic is a unique style, found only in areas around Angers and to the south. Little attention is given to the exteriors, since no flying buttresses were utilized. Often, these buildings consist of a single nave or interior spaces of the same height with emphasis on elaborate vaulting.

In the nave and crossing of the cathedral of Saint-Maurice are floral capitals vaguely following the Corinthian type, often with human heads and elaborately carved abaci. The west portal of the cathedral is based on the west-central portal of Chartres. Christ in

Majesty, surrounded by the four Evangelists, is located in the tympanum. The lintel and trumeau were destroyed in the 18th century to enlarge the entrance to the cathedral. The figure style resembles that of some of the sculpture on the archivolts of the three west portals and on the tympana of the side portals of Chartres. This sculptural campaign is probably contemporary with or slightly later than the vaulting of the nave of the cathedral (1149–53).

Carved capitals in the choir and apse of Saint-Martin are mostly nonfigurative. In the apse and eastern bay, six statues once stood on columns with capitals and visually supported the ribs. In style, they appear to date ca. 1180. They are now in the Yale University Museum.

The ornamental and figurative sculpture on capitals, keystones of some arches, and on all complicated keystones of each vault of the choir of Saint-Serge echoes, in its detailed carving and polychromy, the elegance of the architecture.

# ANGLO-NORMAN LITERATURE

. The conquest of England by William, duke of Normandy, in 1066 had consequences in linguistic and literary development no less far-reaching than in the political, economic, and social domains. For over 300 years, a dialect of French was to be the official language of the ruling class in both church and state. That dialect, deriving principally from the western (Norman) French of William's followers, was destined to become for a time one of the most important literary languages of northern Europe. Cut off from its continental roots by the natural barrier of the English Channel and forced into an uneasy cohabitation with the Anglo-Saxon dialects of the resident English aristocracy and merchant class, it proceeded to develop along independent lines and within little more than a generation had produced a written form recognizably different from its continental cousin. These differences not only are apparent in phonology, morphology, and syntax but extend to metrical form and syllabic count. Thus, from the early 12th century on, it becomes necessary to distinguish between continental Norman and what for want of a better name has come to be called Anglo-Norman. The advent of the Angevin dynasty in 1154 with the coronation of Henry II brought new and varied continental influences to bear upon the dialect and its literature. Anglo-Norman writers begin to be conscious of the "insular" nature of their dialect, and some continental writers poke fun at Anglo-

Norman speech habits. A third phase begins with the loss of the continental provinces by King John in 1204. Deprived of their continental fiefs, the Anglo-Norman barons identify increasingly with their English counterparts, with whom there has been much intermarriage, and the linguistic tide slowly but inexorably turns in favor of English. There is evidence that English is already the dominant vernacular even among the upper classes in the early 13th century, but Anglo-Norman remains a convenient lingua franca for administrative purposes, having a much wider currency than Latin and the advantage of being understood by the literate in all parts of the kingdom at a time when dialectal differences make English unsuited to this task. In literature, the fateful step is taken by Chaucer in the latter part of the 14th century, when he chooses English as his vehicle of expression. His contemporary John Gower writes chiefly in French, but already a literary French greatly influenced by continental models and far removed from the heavily anglicized patterns of Anglo-Norman in its decline. When Henry Bolingbroke assumes the crown of Richard II in 1399, he is the first monarch since Edward the Confessor (d. 1066) to use the English language for everyday discourse.

Several problems arise in determining what comprises Anglo-Norman literature. Some continental texts, such as the *Vie de saint Alexis* and the *Chanson de Roland,* are preserved in manuscripts executed by Anglo-Norman scribes. Others, such as Wace's *Roman de Brut* and Benoît de Sainte-Maure's *Chronique des ducs de Normandie,* were written at the behest of Henry II and other powerful figures in the Anglo-Norman *regnum,* or were intended to engage their attention, but these are Anglo-Norman neither in language nor in place of origin. Marie de France represents something of a grey area. She claims to be "from France" but appears to have written most if not all of her work in England, and her language shows some slight insular influence.

From its beginnings in the early years of the 12th century, with the "scientific" *Cumpoz* and *Bestiaire* of Philippe de Thaün and Benedeit's highly imaginative *Voyage de saint Brendan,* to the prose and poetry of John Gower in the latter half of the 14th century, Anglo-Norman literature has been distinguished by its variety, its richness, and its originality. That it differs in some respects from continental literature of the same period is hardly surprising, since it sprang from another soil and was fed by different streams. Like the dialect itself, it was a graft from a very different culture. Patronage plays a significant role in its development, and the disparate tastes and requirements of the various patrons, Normans, Angevins, Anglo-Normans, and Anglo-Angevins, clerical and lay, exerted a marked influence on the form and content of the works commissioned by them, or written to court their favor. The "didactic" and "practical" quality of much Anglo-Norman literature has frequently been cited. The principal genres are the chronicle, the romance, the saint's life, and what might loosely be termed moral literature. There are no chansons de geste as such, and until the ballades of John Gower at the end of the Anglo-Norman literary period there is little evidence of a strong lyric tradition. What has survived is often political rather than personal in inspiration and accords with what has been seen as the Anglo-Norman predilection for affairs of state and lineage over those of the heart.

*Chronicles.* The earliest surviving chronicle in French is the Anglo-Norman *Estoire des Engleis* (ca. 1140) by Gaimar, who makes it clear that this is the second part of a tripartite structure involving a history of the ancient Britons (commonly referred to as a *Brut*), a history of the English, and a contemporary history from the time of the Conquest.

Gaimar uses both the *Anglo-Saxon Chronicle* and Geoffrey of Monmouth's recently completed *Historia regum Britanniae* as sources. The latter work, although written in Latin, must also be seen as belonging to the Anglo-Norman corpus, since it was to play such a significant role in popularizing Celtic myth and legend in the Anglo-Norman *regnum* and beyond. Gaimar's *Estoire,* the only section of his planned work to survive in completed form, uses the octosyllabic rhyming-couplet pattern established by the *Brendan*. In both form and content, Gaimar's influence was probably felt by the Norman Wace, whose *Brut* may well have led to the eclipse of that of his predecessor. Wace's second section, the *Roman de Rou,* giving an account of the dukes of Normandy rather than of the kings of England, was in its turn supplanted by Benoît de Sainte-Maure's *Chronique des ducs de Normandie,* a work likewise destined to remain unfinished. A series of *Bruts* in verse and later in prose continues through the 13th and 14th centuries, each one updated to include contemporary material. Among the more interesting are that by Peter of Langtoft (d. 1307?) in laisses of Alexandrine lines, an account of the reign of Edward I that was to become the source for all subsequent chroniclers, and the *Scalacronica* of Sir Thomas Gray of Heton (d. 1369), beginning not with the fall of Troy but with that of Lucifer, and continuing to the year 1362.

Not all Anglo-Norman chronicles took such a long view of history. Jordan Fantosme records only the troubled years 1173 and 1174 of Henry II's reign, but he does so more as creative writer than as historian, emphasizing the human weaknesses of his protagonists and the vicissitudes of fortune. Unlike Gaimar and Wace, he writes for the most part in rhyming Alexandrines grouped in laisses. The *Histoire de Guillaume le Maréchal* (1226), commissioned by Guillaume's eldest son soon after his father's death in 1219, marks a return to the octosyllabic couplet. This work, composed by a Norman writer, is a kind of official biography, beginning with the subject's childhood during the reign of Stephen and continuing through the reign of Henry II. It details Guillaume's close association with Henry, the Young King, and continues on through the turbulent reigns of Richard I and John, ending with Guillaume's regency and finally his death. Its 19,254 lines not only contain a vast amount of historical information, but are enlivened by well-observed miniatures of daily life and especially of children. The *Croisade et mort de Richard Cœur de Lion,* a prose work of undetermined date (possibly mid-13th c., but perhaps as late as 1320), is based on several sources, chief among these the Latin chronicle of Roger Howden. It chronicles Richard's participation in the Third Crusade, beginning in 1186 and ending with his death in 1199 from an arrow wound received on a battlefield in Normandy.

*Romances.* As a general rule, Anglo-Norman romances depart markedly from their continental counterparts in both form and content, perhaps owing to differences in social organization arising from the Conquest. All land, and hence power, derived ultimately from William, who granted land in tenure only, and from his successors. This centralized power structure eliminated to a large extent local wars among the barons, which were in any case expressly prohibited by Henry II. In consequence, an important concern is the maintenance of feudal rights in face of usurpation and the consolidation of such rights through successive generations. It is no surprise, then, that the majority of romances composed for Anglo-Norman patrons should stress the rights of inheritance, the establishment of solid family ties, and the avoidance of adulterous relationships, however courtly, that might endanger legitimacy. Where continental romances examine the

tensions between the claims of the individual and the demands of society, especially within that most personal and intimate domain, the love relationship, Anglo-Norman writers are more inclined to tell tales of disinheritance, exile, struggle, and return. Where Chrétien and others, building on the troubadour discovery of sexual love as an ennobling power, concentrate largely on the hero's efforts to win or win back his lady, their insular counterparts stress the high moral courage of the hero, which results in his reinstatement in his patrimony, the triumph of justice, of right over wrong. Love is understood not as an end in itself but as a means to establish a lineage, the promise of generations to come. In respect of male-female relations, the ethos of these more typically Anglo-Norman romances is closer to that of the chansons de geste and to the teachings of the medieval church. In the *Roman de Horn* (ca. 1170), the work of a certain Master Thomas, the exiled hero in his attempts to vindicate himself and regain his lost kingdom finds himself pitted against the might of the "Saracens," a convenient catchall for pagan tribes. There is a continuing love interest, but it is far from courtly. The women actively woo the handsome hero and indulge in amorous fantasies while he attends to more important concerns.

The "courtly" tradition is not absent, however, and may even be said to flourish during the reign of Henry II. In addition to the *Lais* of Marie de France, which may date from as early as 1160, this tradition is represented by two other important texts: the *Tristan* of Thomas (mid-12th c.?) and the Oxford version of the *Folie Tristan* (late 12th c.?). Those works whose influence was felt far beyond the Anglo-Norman *regnum* are unconnected with the Anglo-Norman preoccupation with feudal land rights. The theme of exile and return is recurrent, but it is less a physical exile than an alienation from society and the real world where true union can be achieved only in death. *Amadas et Ydoine* (ca. 1190–1220), like Chrétien's *Cligés* (with which the Anglo-Norman author was probably unacquainted), appears to be an attempt to present the Tristan-Iseut problem in a manner less disruptive of social norms. Its explicit references to the Tristan legend claim for its protagonists a moral superiority over the more famous couple, and the author boasts that their love, rooted in nature rather than a magic potion, was also more profound and true. Ydoine rejects adultery as a solution for her situation and, unlike Fenice, preserves her virginity until such time as her marriage can be dissolved. A high moral tone combined with subordination of the love interest to that of *compagnonnage* is exhibited also by *Amis e Amilun* (late 12th c.), in which hagiographic as well as epic elements are present. This octosyllabic version is probably earlier than and independent of the French *Ami et Amile.* Hue de Rotelande's *Ipomedon,* for its part, seems almost to lampoon the "courtly" tradition, naming the unapproachable lady "La Fière" and interjecting bawdy comments that bespeak an iconoclastic approach to one of the principal literary topoi of the day, that of the beautiful but haughty princess wooed by a lover of supposedly inferior rank.

Those love-centered romances, whatever their position on *fin'amor,* share with the vast majority of continental romances the fluid octosyllabic couplet form that by mid-century had become traditional for virtually all court-oriented poems. What is curious is that many of the Anglo-Norman poems whose principal interest is not love but rather feudal rights, inheritance, and family tend later to abandon this form in favor of rhyming laisses composed of decasyllabic or Alexandrine lines. Among the latter are the *Roman de Horn* mentioned above, Thomas of Kent's *Roman de toute chevalerie* (1175–85?; also known as the *Anglo-Norman Alexander*), and *Boeve de Haumtone* (early 13th c.). Their

form suggests that they were intended, like the chansons de geste, to be recited or sung to a wider audience in the great hall rather than in the *chambre* or *soler,* a tradition that may have continued longer in England than on the Continent. Still other romances, notably *Waldef* (late 12th c.), the *Lai d'Haveloc* (ca. 1200), and *Gui de Warewic* (ca. 1230), marry the octosyllabic form to the characteristic Anglo-Norman content. In the case of *Gui de Warewic,* the theme of exile and return is interrelated at first with that of a highly conventional portrayal of *fin'amor,* but devotion to the lady as spur to heroic deeds is eventually superseded in Gui's case by devotion to God, and the romance acquires hagiographic overtones. In the case of *Fouke FitzWarin,* an early 14th-century prose rendering of a lost mid-13th-century poem in octosyllabic couplets tracing the vicissitudes of the FitzWarin family from the time of the Conquest through the reign of King John, the generic distinction between romance and chronicle is decidedly blurred.

*Saints' Lives.* The *Voyage de saint Brendan* by Benedeit, dated variously between 1106 and 1121 depending on whether the original dedicatee is believed to be the first or second wife of Henry I, is the first long narrative poem in French to use the octosyllabic rhyming couplet. Combining adventure and a taste for the exotic with a didactic purpose that seems never far below the surface of most Anglo-Norman works regardless of genre, it relates the voyage of the abbot Brendan, with fourteen chosen monks and three last-minute intruders, to the Earthly Paradise. Based on an Irish *immram* (voyage tale), this is also the first French vernacular text to make use of Celtic lore, which was to be so significant an element in later medieval literature.

That Anglo-Normans show a predilection for treating the lives of British or English saints is not surprising. Local saints are at once a source of pride and profit. The shrines of St. Alban, St. Edmund the King, St. Edward the Confessor, and above all St. Thomas Becket, martyred in 1170 and canonized in 1173, were favorite pilgrimage sites. All have one or more *Lives* translated from the original Latin into Anglo-Norman. Denis Piramus, a monk who by his own confession had dabbled in courtly love poetry before seeing the error of his ways, wrote a *Life* of St. Edmund the King (ca. 1173), and the noted 13th-century chronicler Matthew Paris (d. 1259) composed *Lives* of St. Alban, St. Edward, and the recently canonized St. Edmund of Abingdon. St. Thomas Becket was the subject of several Latin *Lives* and at least three French *Lives* written within a few years of his martyrdom in 1170. A Norman, Guernes de Pont-Sainte-Maxence, wrote two of them in five-line stanzas of monorhyme Alexandrines, and Beneit, a monk of Saint-Albans, composed a *Life* in six-line tail-rhyme stanzas. Other local saints recorded in Anglo-Norman legends are St. Osyth (late 12th c.), St. Audrey of Ely (early 13th c.), and the Irish St. Modwenna (early 13th c.), whose *Life* is written in monorhyme octosyllabic quatrains. St. Richard of Chichester (d. 1253) is the subject of a Latin *Life* by his confessor written between 1262 and 1270 and translated on request by Peter of Peckham.

The saints of the early church are not neglected, however. Although probably written on the Continent, the *Vie de saint Alexis* is preserved in a number of Anglo-Norman manuscripts, the finest from the famous abbey of Saint Albans. The *Vie de saint Laurent* (mid-12th c.) is the oldest French version of that legend. St. Catherine of Alexandria, one of the most popular saints of the Middle Ages, is the subject of at least three Anglo-Norman Lives, one of which, preserved only in a fragment (John Rylands Library fr. 6), may be as early as the *Voyage de saint Brendan.* Its use of varied meters has led to the suggestion that it may have been intended for some kind of dramatic presentation. The

second, dating from the latter half of the 12th century, is one of four Anglo-Norman hagiographical works written by women within a period of no more than a century. Its author is Clemence, a nun of Barking, and despite its obvious piety it displays to a remarkable degree the influence of courtly literature of the period and, in particular, both the concept of reciprocal love and its rhetoric associated with the *Tristan* of Thomas. The third is a late 13th-century work on the "Mystic Marriage" of St. Catherine with Christ, a kind of "Enfances sainte Catherine" preserved in a 14th-century cursive manuscript (Additional 40143) in the British Library. Toward the end of the 12th century, Simon de Freine wrote a *Vie de saint Georges* in heptasyllabic couplets and Guillaume de Berneville his *Vie de saint Gilles* in the more traditional octosyllabic form. Early in the 13th century, Chardri (an anagram of Richard?) treated the "oriental" themes of *Josaphat* and the *Set dormanz.* The anonymous *Vie de saint Jean l'Aumônier* (ca. 8,000 ll.) may also be attributed to this period or shortly after, and the *Vie de saint Grégoire le Grand* (ca. 2,950 ll.) by Frère Angier, author of a translation (ca. 24,000 11.) of St. Gregory's *Dialogues,* is thought to date from 1216.

*Moral Literature.* Saints' lives form only a part of the considerable volume of moral and religious literature in Anglo-Norman. The earliest translation into French of a book of the Bible is that of the *Proverbes de Salomon,* which Samson de Nanteuil prepared (ca. 1150) for Aeliz de Condet, possibly as a kind of moral instruction manual for her son Roger. Composed of nearly 12,000 octosyllabic couplets, it is preserved in only one manuscript (B.L., Harley 4388). The *Jeu d'Adam,* probably from the same period, is an imaginative dramatization (the earliest with exclusively French dialogue) of the story of the Fall. It covers also the killing of Abel by his brother, Cain, and ends with a procession of the prophets foretelling the coming of the Redeemer, the New Adam. Stage directions are given in Latin, and each section begins with the relevant Scripture reading also in Latin. The Oxford and Cambridge *Psalters* and the *IV livre des reis* are prose translations that date from the late 12th century, as does Simon de Freine's *Roman de Philosophie* or *Roman de Fortune,* an adaptation of Boethius that shows considerable interest in science and the observation of natural phenomena. The *Espurgatoire saint Patrice,* generally attributed to Marie de France, is a verse rendering of a Latin text from the late 12th or early 13th century recounting the knight Owein's visit to Purgatory, Hell, and the Earthly Paradise, while the Anglo-Norman *Lettre du Prêtre Jean,* which defies generic classification, appears to be the first vernacular adaptation of this curious late 12th-century document. Its interest in the exotic recalls the *Brendan,* but its general tone owes more to satire than to piety. Chardri's *Le petit plet,* a dialogue between a youth and an old man on problems of life, love, friendship, and death, is also from the turn of the century.

The Fourth Lateran Council (1215) and the subsequent Council of Oxford (1222) led to an outpouring of sermons and guides to the spiritual life emphasizing penitence and personal piety. The popularity of the *Mirour de seinte Eglyse* (or *Speculum Ecclesiae*) by St. Edmund of Abingdon (d. 1240) can be measured by the vast number of extant Latin, French, and English manuscripts. The work is a systematic guide to true Christian living through a combination of self-awareness and the contemplation of God. A printed version was made as late as the 16th century. Robert Grosseteste (d. 1253), chancellor of Oxford University and later bishop of Lincoln, wrote the *Chasteau d'amour,* a short religious allegory showing the influence of scientific theories on his theological thought; it was sufficiently well regarded to merit a translation into Latin and several into English. The

anonymous *Manuel des péchés* (ca. 1260) was likewise popular, but the need for a Latin version was apparently not felt. Peter of Peckham's *Lumere as lais* and *Le secré des secrés* are also associated with this movement toward individual piety, and later Nicole Bozon, author of eleven short saints' lives, composed the heavily allegorical *Char d'orgueil* and *Passion* written in quatrains of Alexandrine lines, the *Proverbes de bon enseignement* in approximately octosyllabic couplets, a series of didactic *Contes* in prose, sermons in verse, and a number of poems to the Blessed Virgin in a variety of meters. Henry of Lancaster's *Seyntz medicines* (1352), a lengthy prose allegory presenting the Seven Deadly Sins as seven wounds each in need of a specific treatment, continues this tradition, which culminates in Gower's *Mirour de* l'omme (ca. 1376–79), a poem of some 30,000 octosyllabic lines detailing the corruption of the world and the way to reform through the help of God and the intercession of the Blessed Virgin.

# ANGLURE, OGIERD'

(ca. 1360-after 1412). Ogier VIII, lord of Anglure in Champagne, traveled to Rhodes, Jerusalem, Cairo, and Cyprus in 1395 and 1396. His prose account, *Le saint voyage de Jherusalem du seigneur d'Anglure,* is extant in two manuscripts, providing two distinct versions. He furnishes a wealth of historical and geographical information on the areas visited, as well as numerous insights into everyday life.

# ANGOULÊME

**.** The cathedral of Angoulême (Charente), the fourth since Roman times, retains much of its former majesty despite the unfortunate restorations of Abadie in the 19th century. Begun ca.1110, it belongs to a distinctive group of churches characterized by a single nave covered with a series of domes. The western bay, with its simple arches and massive supports, is among the earliest of this type; however, its primitive austerity was altered by Abadie to harmonize with the two succeeding bays. The "Byzantine" crossing is an Abadie invention; of the four radiating chapels, only that of the northwest is original. The bell tower of the north transept, with its light-filled base, rich carvings, octagonal cupola, and elegant five-storied exterior, is striking in its boldness.

The entire western façade displays a grand theme of triumph, beginning with the Mission of the Apostles in the false tympana and culminating in the apparition of the Son of Man surrounded by the symbols of the four Evangelists

Angoulême (Charente), Saint-Pierre.

and attendant angels. The sculpture of the upper level, the most accomplished of the several campaigns, shows affinities with the art of Languedoc. Abadie additions include the superstructure, with its gable and flanking turrets, the sculpture of the central tympanum, that of St. George and St. Martin, and the head of Christ.

# ANGOUMOIS

. The Angoumois was a small county in west-central France of only modest importance in medieval times. On its borders lay Poitou to the north, the Limousin to the east, the Périgord to the south, and the Saintonge-Aunis to the west. Since the French Revolution,

it has been part of the department of the Charente. Owing to its small size and its proximity to larger territorial states, it did not give rise to a feudal principality of any consequence save for brief periods in the late 9th and early 12th centuries. Nor did it become an ecclesiastical center of any more than regional importance. In early Roman times, the Angoumois belonged to the jurisdiction of the Santones (Saintes, Saintonge), then in the 4th century it broke away as a separate *civitas* centered on the town of Angoulême. Early tradition credited a 4th-century St. Ausonious with being the first bishop, though the first attested one is St. Cybard (d. 581). The bishopric of Angoulême belonged to the archdiocese of Bordeaux.

Almost nothing is known of the Angoumois under the Merovingians save that Angoulême, its only town of any size, was fortified by the 7th century and formed part of the duchy of Aquitaine. Armies of Pepin the Short conquered the province in the 760s preparatory to a century of Carolingian rule. After heavy damage by 9th-century Viking raids, recovery began later in the century with the establishment of Vulgrin I as count of Angoulême (r. 867–86) by Charles the Bald. Vulgrin not only restored order in the Angoumois but annexed the neighboring counties of Périgord and Agen to the south and possibly the Saintonge to the west and began the hereditary dynasty of the counts of Angoulême later called Taillefer. For a brief moment, Angoulême was the capital of a major territorial principality of west-central France, but Vulgrin's successors not only were unable to preserve it intact but could not resist the counts of Poitou/dukes of Aquitaine, who extended their power over the Angoumois in the 11th century.

The county became part of the Plantagenêt empire in the later 12th century, though its counts led bitter Aquitanian resistance to their rule. King John of England's abduction in 1200 of Isabelle, heiress of the county of Angoulême, led to Capetian intervention and the ousting of the English. After John's death in 1216, Isabelle's marriage with Hugues X de Lusignan, her intended husband prior to her abduction, contributed to the creation of a powerful feudal state ruled by the united Taillefer-Lusignan dynasty, which controlled the counties of the Aunis, Saintonge, La Marche, and Angoulême in the early 13th century. Capetian power gradually prevailed, however, and the Angoumois was integrated into the royal domain in 1314. Several monasteries flourished in the medieval Angoumois, most notably those of Cellefrouin, Saint-Étienne-de-Baigne, Saint-Amant-de-Boixe, and the oldest, Saint-Cybard-d'Angoulême. A monk of this latter abbey, Adémar de Chabannes (d. 1034), here wrote the chronicle that is the most important surviving source for the history of Aquitaine from the 9th to 11th century.

# ANIMALS (DOMESTIC)

. Except for the Roman introduction of chickens, domestic animals in medieval France were little different from those of prehistoric times or, except for their smaller size, from domestic animals today. From early on, dogs were bred for hunting and herding and horses for riding and pulling; religious prohibitions prevented the use of either for food. Improved breeding of other species occurred from the central Middle Ages. Although the military and agricultural usefulness of the horse increased tremendously with the early-medieval introduction of horseshoes, horsecollars, and stirrups, most peasants continued to use oxen for plowing; asses served as pack animals (in the Midi they were widely used for hauling salt) and as riding animals for clerics and women. The preference for cattle, despite the higher speeds and greater strength of the horse, was due to the high cost of feeding the latter, particularly over the winter; even with cattle, there was a tendency to sell extra animals before winter, and considerable profits were made by urban dealers having access to winter feed who bought cattle in the fall from peasants and then sold them back for the spring plowing. Cows were kept primarily for the young they produced rather than for their limited milk production. Because large animals competed with humans for food (there was tension between the needs for sufficient livestock to manure the fields, for pasture for that livestock, and for arable for cereals), small-animal husbandry generally predominated in food production. In the earliest period, pigs, being adaptable, were the primary source of meat; they were able to live in a wild state on acorns and nuts in the forest but were also kept by town dwellers. As forests disappeared and their use became more controlled in the central Middle Ages, and as demand for meat, cheese, wool, leather, and parchment increased, sheep and goats became increasingly important in the rural economy, as did the practice of transhumance. Chickens, ducks, geese, and peacocks are mentioned by Carolingian sources, and rabbits appear to have been domesticated during this period.

# ANJOU

. Originally a relatively small *pagus* (administrative county) centered on the town of Angers at the confluence of the Loire and Mayenne rivers, Anjou expanded throughout the 11th century to become one of the major principalities of France. Under strong counts, Anjou was able to dominate much of western Francia independently of the king of France. From this base, the Plantagenêts were able to conquer Normandy and England,

acquire Aquitaine by marriage, and establish the Angevin empire of the 12th century. After the king of France conquered the continental portions of this empire in 1202–04, the stable administrative institutions found there influenced the development of the Capetian kingdom.

In the 9th century, Anjou was merely a part of a larger lordship given to the Robertian family by Charles the Bald to defend against Viking attacks. Its chief city, Angers, was administered for the Robertians by a viscount, one of whom, Foulques le Roux (ca. 888–941), usurped the title of count by 930. Under his descendants, Anjou expanded beyond its original boundaries—sometimes by military conquest, often by marriage alliances. Before the end of the 10th century, Anjou had absorbed the Mauges and dominated Nantes in Brittany to the west, Vendôme to the east, and Loudun and the Gâtinais in the south.

Count Foulques Nerra (r. 987–1040) and his son Geoffroi Martel (r. 1040–60) were the true architects of Angevin expansion into a major power. By military victories, Nerra was able to maintain control of Nantes and the Mauges and to conquer Saintes, Saumur, and a major part of the Touraine. By diplomatic means, he dominated Vendôme and Maine. Geoffroi Martel capped Angevin expansion into the Touraine by capturing Tours from the count of Blois in 1044. This union with the Touraine made Anjou a major power in western Francia. Angevin control over the conquered territories was marked by an ambitious program of castle building, creating a complex system of defense in depth. Angevin domination was ensured as long as the lords of these castles were loyal to the count of Anjou.

Under the weak and unpopular rule of Geoffroi le Barbu (r. 1060–68), however, the system broke down. In the midst of a civil war between Geoffroi and his younger brother, Foulques le Rechin (r. 1068–1109), the Angevin barons increased their own power to the detriment of the count. By the time Foulques finally seized the countship in 1068, the Angevin state had been seriously weakened. He spent most of his reign trying to reassert his authority while successfully fighting off Norman advances into Maine. Although Angevin domination of outlying regions receded, control over the heartland of Anjou and the Touraine was maintained.

From this territory, Foulques le Rechin's successors, Foulques V (r. 1109–29) and Geoffroi Plantagenêt (1129–51), were able to reassert comital authority over the bar-

ons. Maine was effectively united with Anjou by the marriage of Foulques V to the heiress of that county. In 1128, his heir, Geoffroi Plantagenêt, married Matilda, daughter and heiress of Henry I, king of England and duke of Normandy. Geoffroi, count of Anjou, Maine, and Touraine, thus had a claim to both England and Normandy. The claim was frustrated, however, when Stephen of Blois, King Henry's nephew, seized the English throne in 1135. Geoffroi, forced to fight for his wife's inheritance, conquered Normandy in 1144. The war in England continued for another decade.

When Geoffroi's son Henry became count of Anjou in 1151, he also governed Normandy and pursued his claim to England. The following year, Henry gained the vast duchy of Aquitaine by marrying its heiress, Eleanor. As the result of a political settlement with Stephen, he secured the throne of England in 1154. Anjou thus became part of an

enormous territory, including all of England and most of western France, ruled by one man and sometimes called the "Angevin empire." Following a flexible Angevin model, rather than the more tightly controlled Anglo-Norman model, monarchs made little attempt to integrate Anjou into a unified Plantagenêt state. Anjou was ruled by the Plantagenêt kings of England until 1202, when Philip Augustus (r. 1180–1223) captured Angers from John of England. From that point on, the history of Anjou is part of the history of France.

# ANJOU, HOUSES OF

. After acquiring the county of Anjou from the Plantagenêt kings of England in the early 13th century, French kings twice assigned the county as an apanage to a younger son. The first house of Anjou was established by Charles I (1227–1285), the youngest brother of Louis IX, who also acquired Provence by marrying Beatrice, the youngest daughter of the count.

With papal backing, Charles I in 1266 invaded the Regno, as the kingdom of Sicily and its mainland province were called. With his victories at Benevento (1266) and Tagliacozzo (1268), Charles carried out Innocent IV's de-

sire to "exterminate that brood of vipers," the German Hohenstaufen dynasty, which had acquired the Regno in 1194 and had seriously threatened the papal states. As the new king of Sicily, Charles I continued the bureaucracy and system of taxation established by earlier Norman and Hohenstaufen kings. His ambitious plans led to the diversion to Tunis of Louis IX's last crusade and to a projected attack on the recently restored Byzantine state at Constantinople.

His oppressive government, marked by heavy taxation, led to the rebellion against Charles I in 1282 known as the Sicilian Vespers. The ensuing war (1282–1302) pitted Aragon, to whose royal house the Sicilians had entrusted themselves, Genoa, and Byzantium against Naples, the mainland part of the Regno, supported by France, Venice, and the papacy. Charles II (r. 1285–1309), who retained Provence and Naples but had to return Anjou to France, concluded the Peace of Caltabellota with Frederick III of Sicily in 1302, but intermittent conflict between the mainland and island parts of the old Regno continued until 1442, when Alfonso V of Aragon seized the kingdom of Naples.

The older son of Charles II, known as Charles Martel, married the heiress of Hungary and established an Angevin dynasty there. Charles Martel's grandson Louis the Great (r. 1342–82) added Poland to his dominions in 1370. The younger son of Charles II, Petrarch's friend Robert (r. 1309–43), reigned in Naples and Provence and led the resistance of the Italian Guelfs against the invasion of the emperor Henry VII. Robert's son, Charles of Calabria, became *signore* of Florence from 1325 to 1328. The latter's daughter, Joanna I (1326–1382), succeeded her grandfather Robert and married her cousin Andrew of Hungary, whose murder in 1345 many blamed on Joanna. Her long reign was troubled by the rebellious nobles of the Regno and an invasion by Louis of Hungary, who pressed his claim to the succession.

In France, King John II the Good created the second house of Anjou by bestowing the county on his son Louis I (1339–1384) as an apanage. Louis's Italian ambitions were fueled by the papal Schism of 1378, as the French-backed antipope Clement VII hoped for French military assistance against Rome. The childless and oft-married Joanna I of

Naples was induced to name Louis as her heir, but her cousin of the Hungarian line Charles of Durazzo seized Naples and reigned as Charles III (r. 1382–86) after capturing and murdering Joanna. Charles III was succeeded by his son Ladislas (r. 1386–1414) and daughter Joanna II (r. 1414–35), during whose reign the Regno disintegrated.

The second house of Anjou, which had seized Provence, continued to claim Naples. Louis I, who failed to dislodge Charles of Durazzo, died in Italy in 1384. His claims passed on to his son Louis II (d. 1417) and grandson Louis III (d. 1434). The latter's brother René (d. 1480) had married Isabelle, the heiress of Lorraine, which with its dependencies he added to Anjou, Maine, and Provence—the inheritance from his brother. René seemed about to realize his family's Neapolitan claims when Joanna II adopted him as heir in 1434. He actually ruled in Naples from 1438 until expelled four years later by Alfonso of Aragon. An ineffectual ruler, René never returned to Italy, and after abdicating Lorraine to his son Jean he turned in his old age to the pursuit of art and literature.

# ANNE OF BEAUJEU

(ca. 1461–1522). Duchess of Bour-bon. Anne of France, the oldest child of Louis XI and Charlotte of Savoy, was born ca. 1461 and was married in 1474 to Pierre de Bourbon, lord of Beaujeu, a prince who gave her father able service. She inherited much of her father's ability and, while still in her early twenties, had to act as guardian for her brother, Charles VIII, who became king at the age of thirteen. Despite considerable opposition, she and Pierre retained custody of the young king, skillfully managed the Estates General of 1484, and defeated a princely uprising. For five years, she exercised considerable authority over the French government. In 1488, when her husband inherited the duchy of Bourbon and her brother reached the age of eighteen, her political influence diminished.

# ANNE OF BRITTANY

(1477–1514). Duchess of Brittany and queen of France. The oldest daughter of François II, duke of Brittany, and Marguerite de Foix, Anne of Brittany was born at Nantes on

January 26, 1477. At the death of her father in September 1488, she became duchess of Brittany, the heiress of a strategic territory and much sought after as a bride. The autonomy of her duchy was severely threatened, and she finally married Charles VIII of France in December 1491, seven weeks before her fifteenth birthday. Between the ages of sixteen and twenty-two, the young queen experienced repeated pregnancies, but no child lived more than a few years and none survived Charles VIII, who died in 1498. Charles was succeeded by Louis XII, his father's second cousin and an old acquaintance of Anne's, although fifteen years her senior. She married Louis in January 1499 and bore him four children, of whom two daughters survived. The older one, Claude, was married to Francis, duke of Angoulême, who succeeded Louis as king in 1515. Their son, Henry II, inherited Brittany from Claude and finally brought the duchy under the direct rule of the French crown. Anne of Brittany, beloved as the last ruler of independent Brittany, died at Blois in January 1514, so did not live to see her daughter reign as queen of France.

# ANONYMOUS 4

(fl. second half of the 13th century). The English author or compiler of an unattributed treatise on music that probably dates from the 1280s is designated Anonymous 4 after the ordering of *anonymi* in the first volume of Coussemaker's *Scriptorum de musica medii*

*aevi*. Anonymous 4 is the sole source for almost all our knowledge of historical individuals of the Notre-Dame School because he gives an apparently chronological listing of significant individuals working in Paris from the late 12th to the late 13th century, up to and including Franco of Cologne. He knew Léonin by reputation and could describe in detail musical works of Pérotin. His knowledge of other Parisian *magistri* leaves little room to doubt his presence in Paris sometime in the mid- to late 13th century, possibly as a student at the university. A secondary source for Garlandian modal theory, the treatise further appears to be either an adaptation to insular practices or a substantially original extension of Garlandian modal theory independent from developments in Paris.

# ANONYMOUS OF BÉTHUNE

**.** A native of Artois in the service of Robert VII of Béthune, this author composed two prose histories, the *Histoire des ducs de Normandie et des rois d'Angleterre* (ca. 1220) and the *Chronique française des rois de France* (ca. 1223). The *Histoire* takes a Plantagenêt slant; the *Chronique* reflects a French viewpoint and is notable for its inclusion of a version of the Pseudo-Turpin chronicle. These works belong to the rising genre of vernacular prose histories composed for the French and English elite. There is no complete edition of the *Chronique*.

# ANSELM OF BEC

(or Canterbury, or Aosta; 1033–1109). Anselm of Bec was born in Aosta, Italy. After the death of his mother, he left for Burgundy and France, where he was attracted to the monastic life and entered the remote monastery of Bec in Normandy in 1059. His countryman Lanfranc of Pavia (d. 1089) was prior at Bec and taught grammar and logic. Anselm became Lanfranc's student, then his assistant, and finally a fellow teacher. When

in 1063 Lanfranc became abbot of Saint-Étienne, Caen (before becoming archbishop of Canterbury in 1070), Anselm succeeded him as prior at Bec and became abbot after the death of the monastery's founder, Herluin, in 1078. As abbot, he paid frequent visits to England to inspect the lands owned by Bec. While at Bec, Anselm wrote works of a mixed devotional and philosophical nature: *De grammatico* (1060–63), a linguistico-philosophical treatise about the term "grammarian"; *Monologion,* a soliloquy on proving the existence of God by reason alone; *Proslogion,* an improved version of the *Monologion;* and three treatises, *De veritate, De libertate arbitrii,* and *De casu diaboli.* During this period, he also wrote his *Orationes sive meditationes.*

Anselm succeeded Lanfranc as archbishop of Canterbury in 1093. Before long, he clashed with King William II Rufus over such issues as church property, the right of appointment to ecclesiastical offices, and the recognition of Urban II as pope. Another contentious issue was Anselm's wish to travel to Rome to receive the token of his episcopal dignity, the *pallium,* directly from the pope. In the end, Anselm did not go, yet he did succeed in preventing the king from usurping the right of investiture. There followed a period of relative calm during which Anselm published his *Epistola de incarnatione verbi* in 1094 and started work on his *magnum opus, Cur Deus homo.* In the meantime, Anselm's relations with the king had once more become strained; in 1098, he went in exile to Rome, where he completed *Cur Deus homo.* He also attended the Council of Bari, at which he defended the "double procession" of the Holy Spirit (from the Father and the Son) against the Greeks (later published as *De processione Spiritus Sanctus*).

Following William Rufus's death in 1100, Anselm returned to England. After a peaceful interval, he collided with the new king, Henry I, over old issues, such as homage and investiture. From 1103 until 1106, he lived in exile, mainly in France, and returned to England only after a compromise had been reached with the king. He died in 1109 at Canterbury, having completed in 1108 his *De concordia* (on the concordance of foreknowledge and predestination and the grace of God with free will).

Anselm's writings are marked by a balance between rational argumentation and contemplative intensity. Claiming in his *Proslogion* to prove the existence of God by one single argument and by reason alone, he takes his starting point in a negation of that existence. This negation has to be seen as a dialectical-intellectual game within the monastic context in which it serves the aim of bringing out the presence of the divine. The fool who denies the existence of God is met with the argument that God is that than which no greater can be thought. The logical implications of this formula are such as to exclude the possibility of God's nonexistence. As a consequence, God's presence, which in the beginning of the treatise had been phrased in terms of monastic desperation, frustrated by an inaccessible light, gains clarity and offers joy to the meditating mind. *Cur Deus homo* follows the same pattern. The accusation by the infidels that the Christian concept of incarnation is primitive is met by an analysis of the beauty of God's order. God is bound by intrinsic necessity to keep his order intact and save humanity, which for its part is bound to make satisfaction for its sin. The two elements come together in the necessary appearance of a God-man, who is no other than Christ.

Anselm's dense style of argumentation is further developed in his treatises on truth, on the will, and on the fall of the Devil. In conformity with his monastic way of life, it is the real truth and the real existence of justice that count most. As a result, the freedom of will

is the freedom to do the right thing. By the same token, the freedom to sin turns out to lack a real object—injustice having no subsistence of its own—and therefore to be illusory.

Although Anselm has always been held in high esteem, his philosophical and theological influence has been limited mainly to the so-called ontological proof of God's existence and the argument of *Cur Deus homo*. The *Orationes sive mediationes,* on the other hand, were widely read all through the Middle Ages.

# ANSELM OF LAON

(ca. 1050–1117). As schoolmaster at the cathedral of Laon, Anselm stands at the beginning of an era that saw the expansion of literacy and intellectual training beyond the cloister walls, reaching out to a burgeoning urban population. Through a curriculum that focused on the study of the Bible and basic Christian principles of belief and daily living, Anselm helped to channel both the spiritual awakening that was sweeping Europe and the ecclesiastical reform that was an important focus of the Gregorian papacy.

Anselm composed commentaries on several books of the Bible, including Isaiah, Matthew, the Psalms, the Song of Songs, the opening chapters of Genesis, and Revelation. With his brother Ralph and a younger contemporary, Gilbert the Universal (later schoolmaster at Auxerre and then bishop of London), Anselm began to compile a commentary that was to become the standard *(Glossa ordinaria)* for the Bible by the end of the 12th century. Anselm and his associates digested, abbreviated, supplemented, and otherwise edited the vast deposit of commentaries produced by the Christian authors of late antiquity and the Carolingian era, placing the longer comments in the broad margins of Bibles designed for this purpose and the shorter comments between the lines of the

biblical text itself. Anselm was responsible for the *Glossa ordinaria* for the Psalms, for the epistles of Paul, and perhaps for the Fourth Gospel as well.

Equally important were Anselm's collections of theological opinions *(sententiae)*. They ranged over the whole spectrum of Christian teaching, from God and Creation to redemption and the sacraments, but focused on such current issues as the nature of marriage and relations with Jews, who had been severely persecuted in the wake of the First Crusade.

Anselm was one of the more successful scholars in addressing the need for a trained and competent clergy, able to deal with the needs of the newly emerging society. Some of the most distinguished theologians of the 12th century studied with him, including Gilbert of Poitiers and William of Champeaux. However influential Anselm was as the central figure of a school for teaching, he did not establish a school of thought characterized by a common set of assumptions.

# ANTICHRIST

. Medieval eschatology held that just before the end of the world a great adversary would arise, the Antichrist, who would initiate the most terrible persecution of all, tempting even the saints themselves. Although the term "Antichrist" appears in the New Testament

only in the Epistles of John (1 John 2:18, 4:3; 2 John 7), and is thus a relatively late addition to early Christian eschatology, subsequent commentators interpreted other biblical prophecies of a last persecutor as referring to this same Anti-christ: Daniel 7–12, Matthew 24:15, 2 Thessalonians 2:3–8, Revelation 13:11–18. By the patristic period, the Anti-christ had become a central element of Christian eschatological teachings, discouraging apocalyptic hopes by describing in lurid and supernatural terms the hideous persecution of the just that will occur before the final Parousia and Redemption. In some versions, there were two Antichrists: an imperial one (Nero *redivivus*) and a Jewish one (born of the tribe of Dan in Babylon). Because this latter figure would be a false Christ, taking over the temple, establishing himself as God, and forcing all the nations to circumcise, this teaching effectively branded any Jewish messianic figure as Antichrist, thus guaranteeing Christian hostility to Jews at the End Time.

And yet, while this element of the Antichrist legend grew greater over time, that of an imperial Antichrist was transformed into its opposite. By interpreting Paul's references in 2 Thessalonians to a "man of sin [or lawlessness]" as Antichrist, the "rebellion" as the collapse of public order, and the "obstacle" to Antichrist as the existence of the Roman Empire, patristic exegetes provided the most conservative form of Christian eschatology: even before Constantine, it was incumbent on good Christians to pray for the continued strength of the Roman Empire. This proimperial eschatology eventually produced the legend of the Last Emperor, himself a supernaturally powerful man who would unite Christendom and rule in peace and justice for 120 years (*Tiburtine Sybil,* ca. 350; *Revelations of Methodius,* ca. 650). At the end of his reign, he would lay down his crown at Golgotha in Jerusalem, thus abdicating and bringing on the reign of Antichrist.

Antichrist imagery flourished throughout the medieval centuries. Earlier exegetes, such as Gregory the Great, Bede, Alcuin, and Haimo of Auxerre, elaborated on his attributes, leading to Adso's highly influential *Libellus de Antichristo* (ca. 950). In the 12th century, ecclesiastical writers like Otto of Freising and Rupert of Deutz elaborated on aspects of the Antichrist's career; dramas like the *Ludus de Antichristo* revealed to laypeople the terrifying details of his career. Indeed, Antichrist imagery appears in every medium of high- and late-medieval culture—theology, visions, polemic, art, drama, history.

Because Antichrist was to be born in Babylon and rise to power only in his thirtieth year, one way to make apocalyptic pronouncements was to announce his birth in the East, thus placing the final events within the lifespan of those now alive, although not immediately (e.g., Martin of Tours, ca. 390). Although such speculation was regularly discouraged (the passage on Martin's belief was censored from Sulpicius Severus's *Dialogues* for centuries), it crops up perennially. When Bernard of Clairvaux and Norbert of Xanten met ca. 1125, Norbert declared, as had Martin, that Antichrist would reveal himself in the present generation.

At the same time, because the Epistles of John spoke of an Antichrist and his precursors, the antichrists, there was a wide range of accusations that polemicists could make against their enemies. One could, for example, disapprove of improper religious fervor (such as a mass pilgrimage to Jerusalem in 1033), without condemning it *per se,* by claiming that it was "beating down a path for Anti-christ." Such accusations, traditionally reserved for heretics and foreign enemies, reached new heights in the Investiture conflict, where both pope and emperor called each other Antichrist. Joachim

of Fiore, by identifying a hidden Antichrist working inside the church, prepared the way for the spiritual movements of the later Middle Ages, from the Spiritual Franciscans in the 13th century to the conciliar movements of the 15th, to view the church as the seedbed for Antichrist, in some cases identifying a specific pope, such as Boniface VIII, as Antichrist. The smear became so common that modern historians have a tendency to dismiss it as a mere topos, a possibly anachronistic elevation, particularly for the period before the 12th century.

# ANTIFEMINISM

**.** Although the classical roots of medieval antifeminism are many, the most important classical author is St. Jerome, whose *Contra Jovinianum* (A.D. 393) brings together most of the Greek and Roman arguments against marriage and against women. Misogyny pervades medieval ecclesiastical writing—letters, Sermons, theological tracts, discussions of canon law, scientific works, and philosophy. But antifeminism is an element that can be found in almost any work, even those generally considered profemale, such as *Aucassin et Nicolette.*

In medieval Latin literature, the arguments of St. Jerome were used Héloïse to dissuade Abélard from marriage and by John of Salisbury in his *Policraticus.* One model of antimatrimonial satire is *De coniuge non ducenda* (ca. 1225–50), a skillfully drafted discussion of the disadvantages of marriage. The classic 13th-century complaint against women is the Latin *Lamentationes* (ca. 1290) of Matheolus, a cleric who lost his source of income when his ecclesiastical superiors discovered that his wife had previously been married, which status made Matheolus a bigamist in the eyes of the church. His tirade on the victimization of men by women was translated into French (1371–72) by Jean Le Fèvre. Even Andreas Capellanus, whose 12th-century *De arte honeste amandi (Art of*

*Courtly Love)* is often taken as a rulebook for the favorable treatment of women, devotes the final third of his effort to arguments against marriage and womankind.

French literary works of the 12th and especially 13th centuries give the theme free rein. Criticism of women cites their lecherousness, garrulity, and insatiability. Woman is instability personified, contradictory at every turn. Even courtly romances, though claiming to elevate the status of women, can use the themes of antifeminism. An example is the romance of *Amadas et Ydoine.* The anonymous author, attempting to praise his heroine, Ydoine, does so by describing all the things she is not, and the reader is provided with a long litany of woman's failings. Irony is a favorite authorial tool used to attack women; one example among many is the title of the late 14th-century *Quinze joies de mariage.*

Antifeminism is pervasive in the fabliaux, where woman is a favorite object of satire, portrayed with all her "failings," particularly lechery, gluttony, and garrulity. Popular texts, dits like the *Dit des cometes,* the *Contenance des fames,* or the *Évangile aux femmes,* use arguments initiated by Jerome, found repeated in medieval Latin literature and in the fabliaux to criticize women; rare is the popular text that praises the female sex. Proverbs of the period enshrine the theme of antifeminism in popular wisdom. The emphasis in proverbial literature is on the mutability of women; "Cueur de femme est tost mué" is a typical example. These proverbs are often cited in French literary works.

The *Roman de la Rose* also includes the theme. Although Guillaume de Lorris implied that women have bad features, Jean de Meun exploited antifeminism with a vengeance. Most notable in this vein is the long tirade by the Jealous Husband on female vices (ll. 8,437–9,330), repeating all the characterizations seen in other French and Latin literary works. Jean's antifeminism later raised the ire of Christine de Pizan, leading to the celebrated "Quarrel of the Rose."

The popularity of antifeminist arguments in the Middle Ages is not necessarily proof of rampant misogyny. One must be wary of attributing to authors the opinions expressed by characters in their works. Antifeminism, however, was a literary theme appreciated by medieval audiences and much exploited by medieval authors.

# ANTIPHON

. Word deriving from the Greek adjective *antiphonos,* the neuter plural of which became the Latin substantive *antiphona* (OFr. *antifone*). Appearing for the first time in a Christian context in the latter half of the 4th century, "antiphon" denoted either a short musical refrain or a manner of performance using that refrain. Apart from the fact that two choral groups were involved, it is not clear how the antiphon interacted with the psalmody at this early period. By the 8th century, "antiphon" usually meant a short textual-musical unit of one to four phrases intended to be sung at the beginning and end of a psalm and possibly intercalated a number of times between verses.

Evidence from Syria implies that the earliest antiphons were nonbiblical and that they played a role in doctrinal controversies. The earliest reference to antiphons in Gaul occurs in the *Institutes* of John Cassian (ca. 360–ca. 435), an eastern monk who seems to assume that his western counterparts already understood their use in the Divine Office. Antiphons appear also in the Office prescribed by the monastic rules of Caesarius and Aurelian, bishops of Arles in the first half of the 6th century (r. ca. 500–43 and 546–51, respectively).

The melodies to which the verses of the psalms are sung have cadences designed to lead smoothly into the beginning of the antiphon, thus implying that at one time the antiphon was repeated between at least some verses of the psalm. Tonaries, catalogues of antiphons grouped according to the psalm tone appropriate to each, record the repertoire of antiphons as early as the first third of the 9th century, but the notated sources begin only ca. 1000, with the Antiphoner of Hartker (St. Gall, Stiftsbibliothek 390–91). The earliest source of the texts without music is the Antiphoner of Compiègne (B.N. lat. 17436), from the last third of the 9th century.

The antiphons for ordinary weekdays, which consist of a psalm hemistich set to a primarily syllabic melody, may represent the oldest layer of the repertoire. Some antiphons that consist solely of the word *alleluia* may be contemporary with them. Other antiphon texts are drawn from other books of the Bible and, in the case of saints' Offices, from the hagiographical literature. Successive antiphons for some later Offices were composed in ascending order of the eight modes. Antiphons with rhymed metrical texts enjoyed great popularity in the high Middle Ages. Certain processional chants and a special group of pieces in honor of the Blessed Virgin were called "antiphons," even though most were not associated with the singing of psalms. Typically, these newer antiphons can be distinguished by their fuller melodic development.

Two of the chants of the Mass, the Introit and the Communion, originated as antiphons with psalm verses. Both are associated with movement: the entrance of the clergy and the congregation's movement to the altar for communion.

# ANTIQUITY, ROMANCES OF

. The three Romances of Antiquity, the *Roman de Thèbes* (ca. 1152), the *Roman d'Énéas* (ca. 1160), and the *Roman de Troie* by Benoît de Sainte-Maure (ca. 1165), made classical antiquity accessible to a vernacular audience. All are linked to the literary currents of the court of Henry II and Eleanor of Aquitaine and are based on classical epics: Statius's *Thebaid,* Virgil's *Aeneid,* and the late-antique accounts of the Trojan War by Dares and Dictys, respectively. In their concerns (celebrating ancient heroes and civilization as forerunners of the present) and techniques (rewriting, rearranging, and medievalizing classical material), they form a coherent body of texts. They appear together in some manuscripts (e.g., B.N. fr. 60).

The *Roman de Thèbes* (10,562 lines) popularized the traditional romance form of the octosyllabic rhymed couplet. Its prologue characterizes the concerns of the genre of Romances of Antiquity as a whole. The poet, identified in the first line as he "who is wise," has the duty to share his knowledge in order to be remembered forever. Homer, Plato, Virgil, and Cicero are adduced as examples of men who did just that. This list exemplifies the *translatio studii* topos, a concept central to the Romances of Antiquity: civilization began in Greece, moved to Rome, and has now arrived in French-speaking territory. The subject matter is worthy since it derives from ancient *auctores*; it also teaches a moral lesson, which for *Thèbes* is inherent in the story of Oedipus and his sons, Eteocles and Polynices, who begin a civil war after Oedipus's abdication. One should not act against nature—this is in fact the final lesson pronounced by the *Thèbes* poet. Whether this lesson refers to Oedipus's incestuous marriage or to the dangers of waging war is not clear. In any case, the poet accentuates the ravages of war and in particular denounces the horrors of fratricidal, that is, civil war. Although the story is set in antiquity and the characters are called "pagans," many features are medieval: people go to church, there are convents and archbishops, medieval weapons and armor. The tragic love story between Atys and Ismene, not found in Statius's *Thebaid,* inaugurated the strong love interest evident in later romances.

In the *Roman d'Énéas* (10,156 lines), love plays an especially important role and is, for the first time, expressed in the Ovidian forms that later become commonplace. Unlike *Thèbes, Énéas* has no prologue but starts with the prehistory of Aeneas's voyage, the Trojan War. A digression recounts the Judgment of Paris: the three goddesses who were present at the origin of the Trojan War seem to provide the structural principle for the romance. In the promises made to Paris, Venus gives passion (i.e., Dido) to Aeneas; Athene oversees Aeneas's victorious battle against Turnus; and Juno is responsible for Aeneas's winning of Lavinia and the all-important *demesne,* the land that will be Rome. On the whole, the story line follows Virgil's *Aeneid,* but the medieval poet adds a lengthy

development on the love between Lavinia and Aeneas. Monologues and dialogues spin out the growing love between the two, and Lavinia often takes the initiative. The poet clearly wants to celebrate the success of a dynastic marriage, perhaps not unlike that of Henry II and Eleanor of Aquitaine. Thus, in contrast to the *Aeneid,* which ends with Aeneas's killing of Turnus, the *Énéas* closes with the joyous description of Aeneas's and Lavinia's wedding and the celebration of their lineage, which engendered the founders of Rome. Other important additions to Virgil include long passages describing marvelous works of art, such as Pallas's tomb.

Benoît's *Roman de* Troie, with 30,316 lines by far the longest of the Romances of Antiquity, tells the story of the Trojan War from Jason's winning of the Golden Fleece to the homecoming of the Greek heroes and Odysseus's tragic death at the hands of Telegonus, the son he had by Circe. Benoît's lengthy prologue, introduced by the topos of the duty of imparting one's knowledge to others, justifies in detail his rejection of Homer as an authoritative source: he was not a participant in the Trojan War. Dares and Dictys, on the other hand, Benoît insists, fought by day and wrote by night. Benoît thus accepts the claims of these late-antique writers as authentic. The story of how their texts came to light underlines the continuity of the geographical and linguistic *translatio* of his source, which ensures Benoît's own authority.

From a didactic perspective, the numerous diplomatic missions and attendant discourses could provide models of political behavior to a medieval audience, while the story of Troilus and Briseida posed the problematics of prowess in war and love. The theme of Briseida's inconstancy, taken up later by Boccaccio, Chaucer, and Shakespeare, led Benoît to some misogynistic tirades, which he interrupted only to praise Eleanor of Aquitaine.

All three romances brought pagan antiquity into medieval literature and thus participated in the "renaissance of the 12th century." Their adaptations of Latin epics introduced new concepts of love and history underlining the disruptive power of war in both domains.

# ANTI-SEMITISM

. Anti-Semitism or, more properly for the Middle Ages, anti-Judaism, was the set of attitudes toward Jews that derived from regarding their religion as inferior to Christianity and themselves as the heirs of deicides. By their persistence in adhering to their religion, Jews, it was widely believed, convicted themselves as approvers of the killing of Jesus. Modern anti-Semitism, contrary to medieval anti-Judaism, is rooted in an ethnic notion of Judaism. Modern anti-Semites regard converts to Christianity from Judaism and their lineage as Jews or as having "Jewish blood" and, therefore, as objects of contempt. Yet there is little evidence that converts or their offspring faced such hatred in the Middle Ages, a few isolated incidents aside, until the huge wave of forced conversions in Spain in the late 14th century and after.

Medieval religious attitudes toward Jews were mediated by the political, social, and economic concerns of various segments of the Christian population in France. Consequently, neither governmental nor popular actions against the Jews should be ascribed merely to religious bigotry. It would nonetheless be naive to think that such actions can be explained without recourse to the fact of religious hostility.

As early as Agobard of Lyon, or even earlier in stories by Gregory of Tours, many of the higher clergy in France articulated theological positions stressing the inferiority of contemporary Judaism. One commonplace asserted that the wine of Sinai had degenerated into the vinegar of postbiblical Judaism. Some French theologians and canonists also shared with people untrained in formal theology cruder attitudes toward Jews and Judaism, attitudes rooted in the notion of the inferiority of Judaism and the corruption of morals that that inferiority was said to imply. The solidarity of the Jewish communities in the face of this contempt savored of clannishness to many critics, and the clannishness savored of a dangerous attraction to secrecy. By the end of the 12th century, many Frenchmen had come to accept the idea that the Jews ritually reenacted the crucifixion of Jesus by kidnaping innocent Christian children to torment *in occulto*. By the end of the 13th century, there is abundant evidence of the widespread acceptance of the notion that Jews indulged in secret curses and slurs of the Christian religion in their religious books, notably the Talmud; that they were required to ingest innocent Christian blood for secret rituals; and that they contrived to get their hands on and desecrate the consecrated host of the Christian eucharist. They were said to lead simpleminded people, particularly servingwomen and wet nurses in their employ, away from the Christian faith. The men were stereotyped as excessively wealthy and avaricious moneylenders and as occasional seducers of Christian women.

It is impossible to know what proportion of the Christian population in France, or anywhere else for that matter, indulged in these attitudes, whether urban anti-Judaism was more intense than rural, whether class or level of education worked effectively to mitigate or exacerbate attitudes. Many high churchmen and many kings did not take certain of the charges seriously. While Philip Augustus, for example, believed that Jews carried out ritual murders, Louis IX seems never to have countenanced the allegation.

Nonetheless, actions taken by the royal government, by baronial, ecclesiastical, and municipal authorities, and by vigilantes point up the pervasiveness of these attitudes. Segregation of Jews from Christians became widespread and was increasingly stringent from the 12th through the 14th century. Judicial murders of Jews, tolerated by the count of Blois in 1171 and by ecclesiastics in Troyes in 1288, originated from charges of malicious murder against them. Philip the Fair himself permitted the execution of a Jew of Paris in 1290 for allegedly desecrating the host. And large-scale massacres in 1321 were founded on the rumor of a plot between lepers and Jews, supported by the Muslims of Granada, to poison the wells of France. Expulsion, the ultimate policy of governments hostile to Jews, secured to the lords who pursued it in France the seizure and liquidation of Jewish property to their profit.

# ANZY-LE-DUC

. The priory of Anzy-le-Duc (Saône-et-Loire), constructed in the second half of the 11th century, has a five-bay nave, flanked by aisles—all groin-vaulted. Two short barrel-vaulted transepts open off the crossing. In spite of the relatively small size of Anzy, the interior appears wide because of the ample nave arcades and the direct clerestory windows. The crisp ashlar masonry emphasizes the mural nature of the thick walls. The south flank of the priory reveals the simple massing of nave above aisles, the penetrating transept, and the crowning three-storied, octagonal tower above the crossing. Projecting buttresses and punctured windows animate the surfaces.

The most dramatic part of Anzy-le-Duc is its east end. The plan, which is identical to that of Charlieu and related to that of Cluny II, calls for six apsidioles: two opening off the transept arms, two off the bays flanking the fore choir (chapels in eschelon), and one off the choir. When viewed from the side, the apsidioles climb dramatically to three different heights and extend eastward in four different planes.

Fine capitals decorate each nave pier. Starting in the second bay from the façade, sutures, or breaks in the

Anzy-le-Duc (Saône-et-Loire), priory, chevet. *Photograph courtesy of Whitney S.Stoddard.*

masonry, descend. Masonry above and to the west of this suture is a later campaign. The west portal depicts Apostles on the lintel, the Ascension in the tympanum surrounded by Elders of the Apocalypse in the archivolts. Edson Armi argued that the lintel, capitals, and archivolts were carved by two distinct sculptors whose work at Anzy predates the famous choir capitals of Cluny III. The Mont-Saint-Vincent Master created the crude portal of Mont-Saint-Vincent, the inner narthex lintel and tympanum of Charlieu, and the lintel of Anzy-le-Duc. The Avenas Master, deriving his name from a fine altar at Avenas south of Cluny, carved sculpture on the portal of Mâcon, Anzy-le-Duc (archivolts and capitals), and Perreay-les-Forges before continuing to work at Vézelay and Cluny III.

The dates of this sculpture depend upon the dating of the Cluny III choir capitals, which varies from 1085 to 1150. The capitals are probably slightly later than the Cluny III portal of 1109–13; if this conclusion is correct, the Anzy-le-Duc sculpture can be dated in the early 12th century.

In addition to nave capitals and façade portal, there are two other later portals: one in a museum in Paray-le-Monial and the other in a building south of the priory.

# APANAGE

. From *apaner,* to endow with a means of subsistence, the word apanage, appanage, or appannage is used for a province or jurisdiction, or later for an office or annuity, granted (with the reservation that in the absence of direct heirs the land escheated to the crown) to the younger children of royalty to compensate them for not receiving the throne and to preserve peace and love in the family. Robert II (r. 996–1031), son of Hugh Capet, stopped partitioning the realm, as the Frankish kings had done, and began crowning his eldest son during his lifetime, a practice continued until the reign of Philip Augustus. He gave Burgundy to his second son. Like many of their predecessors and successors, the next monarchs provided for their younger sons by marrying them to rich heiresses so that they did not have to diminish the royal domain by enfeoffing part of it to a relative.

Beginning with the sons of Blanche of Castile and Louis VIII (r. 1223–26), apanages became normal in France. By installing their sons as rulers, monarchs could control newly acquired outlying areas, as northern French nobles had long done. In 1237, Robert got Artois; Alphonse (who married the heiress of the last count of Toulouse), received Poitou and Auvergne; and the posthumous Charles, Anjou. The royal line of Bourbon dates from 1272, when the heiress of the Bourbonnais, Beatrice of Navarre, married Robert, sixth son of St. Louis, who had received the county of Clermont as an apanage. Philip IV's brother Charles, who received Valois, fathered the house that came to the throne in the person of his son Philip VI in 1328.

A number of these early grants escheated to the crown when the cadet branches died off: Poitou and Auvergne, for example, at the death of Alphonse in 1271. In 1316, the law of succession was interpreted to exclude women not only from the throne but from succession to apanages as well. The younger sons of John II (r. 1350–64), Philip and John, received Burgundy and Berry, respectively, ruling them virtually as independent fiefs. Thereafter, royal princes with apanages tended to become peers; by the accession of Charles V in 1364, when the heir apparent began to receive the Dauphiné, which Philip VI had purchased from the last dauphin, Humbert II, in 1349, younger sons regularly received duchies.

Louis XI (r. 1461–83) brought these virtually independent territories to heel after his father had expelled the English, their frequent allies, from Aquitaine in 1453. The later dukes of Burgundy tried to transform their holdings, having acquired other adjacent principalities on each side of the imperial border, into a resurrected Middle Kingdom that was broken up only after the defeat of Charles the Bold in 1477. Provence, ruled by successive houses of Anjou, only escheated when the last duke, King René, whom Louis XI had forbidden to remarry, died childless in 1480. The crown seized the vast Bourbon apanage after its duke rebelled in the 1520s. The holders of apanages, however rich and powerful, never again threatened the unity of France.

The Angevin and Plantagenêt kings also established apanages in England. Whereas John Lackland received only money and the overlordship of Ireland, Henry III's brother Richard got Cornwall and his younger son Edmund, Lancaster. After Edward I conquered Wales and formally made his eldest son prince there in 1301, it became customary to give younger sons York, Lancaster, Gloucester, or Bedford as ducal apanages, but they never had aspirations to become independent as their counterparts did in France.

# APOCALYPSE TAPESTRY

. On April 7, 1377, the accounts of Louis I, duke of Anjou and brother of King Charles V, mention a payment of 1,000 francs to Nicholas Bataille for two tapestries of the "Story of the Apocalypse." In January 1378, fifty francs were paid to Hennequin de Bruges for the design and cartoons. The entire set originally involved seven pieces and probably eighty-four scenes altogether. In spite of the loss of several scenes, the tapestries, now displayed in the castle of Angers, remain one of the most ambitious tapestry projects ever undertaken and still measure some 354 feet long by over 13 feet high. They were among the first storied tapestries, as tapestry design had been previously restricted to geometric and animal patterns.

In the Book of Revelation, the last book of the Bible, also known as the Apocalypse of St. John, the angel of Christ reveals the events of the Apocalypse, or the end of time, to St. John. Representations were popular in 13th-and 14th-century Apocalypse manuscripts, and the duke of Anjou borrowed a manuscript of the historiated *Apocalypse* (now B.N. fr. 403) from his brother the king to use as a model. All scenes run from left to right and with alternating red and blue backgrounds. The first three pieces have solid backgrounds, while those of the final four pieces are strewn with flowers, stylized animals, and scrollwork to break the monotony. Each piece originally seems to have held a figure in an architectural setting to one side, then continued with two registers of seven scenes each for the narration, with a band of angels above to represent the heavens, and a band of plants below for the earth. St. John appears in all of the scenes, which closely follow the text of the Apocalypse. The arms of Louis I of Anjou and Marie of Brittany, the wife of Louis, appear in the banners held by angels.

# APOCRYPHAL LITERATURE

. Biblical books not regarded as inspired, and hence excluded from the sacred canon, appeared in the early Christian centuries in response to pious curiosity about Jesus, his family, and his companions. From the point of view of medieval literature, four Greek texts are of prime importance: the 2nd-century *Book* (or *Protevangelium*) *of James* and the *Gospel of Thomas,* which deal with the childhood of Mary and the birth and infancy miracles of Jesus; the 6th-century *Gospel of Nicodemus,* which supplements the gospel accounts of the Passion; and the 7th-century *Assumption of the Virgin,* which describes the death, funeral, and miraculous assumption of Mary. The *Nicodemus* was translated into Latin in the later 6th century and again a century or so later, while the stories from the *Gospel of Thomas* and the *Book of James* were combined in the 8th or 9th century into a new Latin collection called the *Gospel of Pseudo-Matthew.* This in turn was the source of the *Gospel of the Nativity of Mary*.

Apocryphal legends first appeared in French in the 12th century, in Wace's *Conception,* which includes the story of the three Marys and the birth, childhood, and assumption of the Virgin. Similar material appeared in three texts dubiously attributed to Gautier de Coinci a half-century later. Quite different versions of this material occur in the 13th-century *Roman de saint Fanuel* and *Histoire de Marie et de Jésus*. The childhood miracles of Jesus were recounted in verse in Old French and Anglo-Norman and in three distinct versions in Provençal. There are ten poems on the Passion (which was usually completed by one of four versions of the Descent into Hell), as well as three translations of the *Gospel of Nicodemus*. In 1357, Jean de Venette compiled most of the legends into his long poem *Histoire des glorieuses Maries*. Apocryphal material also supplemented the more strictly biblical narratives of Herman de Valenciennes, Geoffroi de Paris, Roger d'Argenteuil, and Macé de la Charité. Prose versions of the legends appear from the middle of the 13th century, usually in collections of saints' lives but independently as well.

# APOLLONIUS DE TYR

. The legend of Apollonius of Tyre, which involves the incestuous love of a father for his daughter, was immensely popular in the Middle Ages. There are some sixty Latin texts, and at least six French prose versions from the 14th and 15th centuries. Its influence on later works, such as *Belle Helaine de Constantinople,* the *Roman du comte d'Anjou,* and Philippe de Beaumanoir's *La Manekine,* is manifest.

# *APPATIS*

. Military law and custom provided a procedure known in Old French as *appatis* to regulate the behavior of troops living off the land in friendly territory. A special levy on the local inhabitants to support military forces, it generally involved requisitioning supplies. While the affected populations might regard *appatis* as thinly disguised extortion, it did provide an orderly, legal means of supplying troops without resort to outright pillage.

# AQUINAS, THOMAS

. (ca. 1224–1274). The only medieval philosopher whose ideas command an active following in the 20th century. The symmetry of Thomas's methodical synthesis of traditional Christian (Augustinian and Platonist) theology with Aristotelian methods and categories may be thought of at once as the zenith of medieval scholastic thought and its downfall. Thomas's apparently comprehensive, even-tempered certainties, the product of method and reason, continue to attract those seeking answers to the problems of faith.

Thomas was born in Roccasecca, near Monte Cassino, Italy, the youngest son of Count Landulf of Aquino, a relative of the emperor and the king of France. He was schooled at Monte Cassino, where his family hoped he would become abbot, and later (1240) studied arts at Naples. Thomas's love of Christian learning urged him to join the Dominican order. His family opposed his becoming a mendicant, when the wealth of the

Benedictines beckoned, and kept him prisoner, fruitlessly, in Roccasecca for fifteen months. In April 1244, he joined the Dominicans and was sent to Paris (1245–48) to study theology with Albert the Great. In 1248, he accompanied Albert to the new Dominican *studium* at Cologne, but by 1252 he was back in Paris as lecturer at Saint-Jacques, the Dominican convent. Here he defended mendicant poverty against the attacks of William of Saint-Amour and his followers, writing *Contra impugnantes Dei cultum.* He became master of theology (his formal degree having been delayed by the dispute) in 1256. From 1259 to 1269, he taught at Dominican houses in Italy: Anagni, Orvieto, Santa Sabina and the *studium generale* in Rome, and Viterbo. In 1269, just before the condemnation of Aristotelian errors by Étienne Tempier, he returned to Paris but was moved once more, to establish a Dominican *studium* in Naples, in 1272. He was traveling again, to the Second Council of Lyon, when he died at Fossanuova, on March 7, 1274.

Thomas, known as *Doctor angelicus* and *Doctor communis,* is renowned for his massive output, which was remarked upon in the evidence for his canonization. He was said to dictate seamlessly to several secretaries at once, each writing a different work. He wrote biblical commentaries, at least one commentary on the *Sententiae* of Peter Lombard, commentaries on much of Aristotle and the *liber de causis,* disputed and quodlibetal questions, and other works common to a Paris master, as well as short tracts in answer to specific questions, whether in opposition to the Averroists or Avicebron, for instance, or in reply to the duchess of Brabant on government. Aware of the inadequacy of western knowledge of Aristotle, he had William of Moerbecke (1215–1286) translate or retranslate many of his works, leaving a valuable legacy for later scholars. But Thomas's name is almost synonymous with his *Summa theologica* (or *Summa theologiae*), which, together with the earlier *Summa contra Gentiles,* is a massive statement of the whole of Christian theology. The *Summa* is in three parts, the first *(prima)* dealing with God *in se,* the second dealing first *(prima secundae)* with God's relations with humanity and second *(secunda secundae)* with humanity's relations with God, and the third *(tertia)* with Christ and the sacraments as the path for the human return to God. (The plan is similar to Peter Lombard's *Sententiae* but in three unequal books rather than four.)

Although Thomas's place in the hierarchy of medieval philosopher-theologians is secure, he is perhaps recognized today more for his system and clarity than for his originality of thought. As we learn more about earlier 13th-century scholastics, we see Thomistic ideas in prototype or isolation. His gift was in a synthesis of what had previously tended to the imposition of Aristotelian categories of thought within a Platonist Christian worldview. He brought the so-called scholastic method of argument and truth seeking to its finest honing.

Although Thomas is not generally remembered for his spirituality and is not a mystical theologian in the style of Bonaventure, he was nevertheless revered in his lifetime for his holiness, simplicity, and devotion. Quiet (he was nicknamed "the dumb ox") and unassuming, he had powers of concentration that took on a semimiraculous quality for the secretaries who worked with him. He was canonized in 1323.

Thomas was not without his critics. Some of his positions were condemned by Bishop Étienne Tempier in 1270 and 1277, by Robert Kilwardby in the latter year, and by John Peckham in 1284; but his opinions were officially imposed on the Dominican order in

1278. The Roman Catholic church considers his teaching an authentic expression of doctrine, and canon law makes study of his works the accepted basis for theology.

# AQUITAINE

. Aquitaine, in southwestern France, was the largest and one of the most important provinces in France during the Middle Ages. It gave rise to successive regional governments and a distinctive civilization that long resisted efforts of northern kings to subdue and integrate its population into the life of the French monarchy and nation. Nonetheless, Aquitaine was anything but a clearly defined geographical entity, nor did it have a homogeneous population. Save for the Atlantic coast in the west, it lacked natural geographical boundaries. Its borders therefore fluctuated under the pressure of historical events, and it is sometimes difficult to know just which counties and regions it included. Medieval Aquitaine was in fact an artificial conglomeration of smaller regions that themselves did have some linguistic, cultural, and ethnic unity. Bearing in mind the periodic changes, we may describe medieval Aquitaine as extending from its northern limits in Poitou south of the Loire to Gascony in the south and from the coast eastward to the Massif Central. It grouped together more than a dozen counties: in the north, Poitou and Berry; in the center, La Marche, Limousin, Angoumois, Saintonge, Aunis, Bordelais, Périgord, and Uzerches; and in the south, Agenais, Quercy, Rouergue, and Auvergne. As disparate as its population was its physical environment. In climate, soil, topography,

vegetation, and its range of agricultural systems, Aquitaine was a composite of different regions.

The beginnings of medieval Aquitaine go back to the Roman conquest and occupation. By the 4th century, the Romans had for administrative reasons divided southwestern France, aside from the Narbonne region, into Aquitania Prima and Secunda, Bourges being the capital of the first and Bordeaux of the second. This political division disappeared after the Germanic invasions and settlement of the 4th and 5th centuries, but the church perpetuated it through medieval and into modern times in its ecclesiastical organization, with Bourges becoming the see of a vast archdiocese in south-central France and Bordeaux the center of the western archdiocese that included the dioceses of Poitiers, Saintes, Angoulême, Périgueux, and Agen. The christianization of Aquitaine began in the later 4th century and continued through the early-medieval period with the establishment not only of the bishoprics in Aquitanian towns but also monasticism and the parish system in the rural areas. As a result of the 5th-century invasions, most of Roman Aquitaine became part of the ephemeral Visigothic kingdom of southern Gaul and Spain (406), but the Frankish conquest under Clovis I installed the Franks as rulers of the region after the Battle of Vouillé (near Poitiers) in 507. The failure of the Franks to settle in substantial numbers in Aquitaine, combined with the repeated division of their kingdom under the later Merovingians, meant that Frankish rule and influence were minimal during the 6th and 7th centuries. A distinctive Aquitanian civilization took shape during this time, characterized on the one hand by its fidelity to the Roman past in language, education, laws, institutions of local government, coinage, business customs, and the like and on the other by its Christian character. For a brief period at the beginning of the 8th century, the Aquitanians, profiting from the dynastic troubles of the Merovingian kings, acquired political autonomy with the founding of the first medieval duchy of Aquitaine by Duke Odo (ca. 720).

This was only an interlude. Two foreign invasions put an end to Aquitanian independence by the later 8th century. Gascon immigrants from the Pyrénées had already occupied much of southern Aquitaine as far north as Bordeaux in the late 6th century and were followed in the 720s by Muslim invaders, whose northern advance was stopped at the Battle of Poitiers in 732. Charlemagne firmly implanted Frankish control and reorganized the duchy into the subkingdom of Aquitaine, ruled by his son, Louis (781). The Carolingian hold on Aquitaine was in its turn weakened by the Viking invasions in the mid-9th century. Striking sporadically for the next century and a half up major river valleys from the Loire to the Garonne, the Vikings attacked not only coastal areas but also far inland, devastating towns, dispersing populations, and disrupting ecclesiastical life in both the monasteries and the secular church. In the confusion and destruction of the later 9th century, Carolingian kings gradually abandoned the province, and the kingdom of Aquitaine, barely a century old, came to an end.

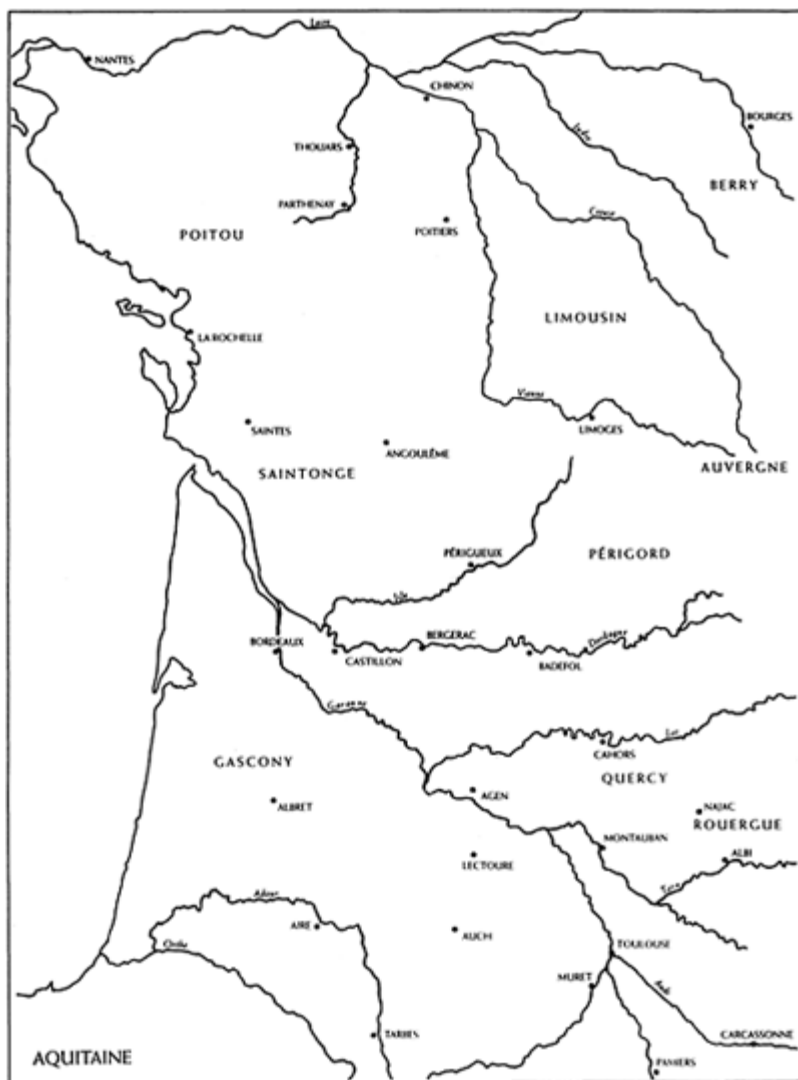
AQUITAINE

PAMIERS


Recovery began with the reestablishment of the duchy of Aquitaine in the mid-10th century, when the dynasty of the counts of Poitiers, in the far northern part of the province, gained possession of the ducal title. Successive descendants, all named William, ruled the duchy for nearly two centuries until extinction of the male line at the death of William X in 1137. Under the Poitevin count-dukes, the duchy of Aquitaine became one of the greatest territorial principalities in France, reaching its high point in power and prestige under the rule of William V the Great (r. 995–1030) and Guy-Geoffrey (William VIII, r. 1058–86). The latter completed the unification of the previously independent duchy of Gascony with Aquitaine in 1058 and thereby made his

line rulers of western France from the Loire to the Pyrénées. Nonetheless, it was precisely at this time that the dukes of Aquitaine saw their authority increasingly challenged internally by the growing power of regional aristocracies centered in the stone castles built in great numbers during this period. In the end, these feudal nobles seriously undermined ducal authority.

The 11th and 12th centuries were a time of sustained population and economic expansion leading to the widespread clearance of previously waste lands, foundation of new towns, and beginnings of foreign trade. The same period witnessed the introduction of church reform led by the Gregorian movement and the expansion of Benedictine, Cluniac, and Cistercian monasticism. Pope Urban II pointedly appealed to and counted on Aquitanians to support his call for the crusade in 1096. Aquitanian civilization flowered in two other senses at the end of the 11th century: first, architecturally, in the appearance of many great Romanesque cathedrals and monastic churches; second, in the beginning of a new vernacular (Occitan) literature as exemplified by the earliest surviving troubadour poems of William the Troubadour (Guilhem IX, duke of Aquitaine, r. 1086–1126). During his reign, Poitiers, the capital of the duchy, became one of the leading towns of western Europe.

The failure of William X to leave a male heir at his death in 1137 led to foreign domination from which the Aquitanians never recovered. The marriage of William's daughter and heiress, Eleanor, to Louis VII of France placed the duchy under French rule for fifteen years, but Eleanor did not produce a male heir and their union ended in divorce in 1152. This Capetian interlude had little impact on the duchy. Within months, however, Eleanor married the count of Anjou and duke of Normandy, Henry Plantagenêt, and in 1154, when the latter made good his claim to the English throne, Eleanor became queen for a second time and her duchy fell under English overlordship. Aquitanian resistance prompted Henry to install their son Richard as duke of Aquitaine, but later familial rebellions against Henry's rule compromised the Angevin efforts to subjugate the duchy. After Richard's accession to the English throne in 1189, Eleanor became duchess of Aquitaine once again, but after her death in 1204 the duchy passed to the English crown.

For the next 250 years, English rule in Aquitaine was challenged by the French kings, who finally, in 1453, succeeded in driving out their perennial foes and imposing their own authority. Philip Augustus began the French offensive in 1202, when he invoked feudal custom to disinherit King John, his vassal for Aquitaine, and confiscate his duchy. In subsequent invasions, royal armies conquered Poitou and Saintonge in northern Aquitaine as well as Normandy, Anjou, and Maine. The Treaty of Paris of 1259 confirmed these losses and left the English ruling over a duchy of greatly reduced size, comprising mainly lands south of Bordeaux. Despite these wars, Aquitaine enjoyed a period of prosperity in the 13th century in the form of rural and urban expansion (e.g., the founding of the *bastides*) and above all in the wine trade with England. The volume of wine exported to England through Bordeaux reached enormous proportions at this time.

The longstanding English-French antagonism erupted in the late 1330s, when Philip VI and Edward III made aggressive moves against each other, marking the beginning of the Hundred Years' War. In the early hostilities, the outcome was indecisive, with territorial gains for both

sides. But then the Black Prince assumed command of the English forces in 1355 and won an astounding victory, capturing the French king at the Battle of Poitiers in 1356. The Treaty of Brétigny in 1360 restored the earlier English losses and made the Black Prince, named prince of Aquitaine in 1362, the ruler of an immense principality covering nearly one-third of France. For a decade, Prince Edward ruled in high style over a virtually independent state, but his severe tax levies aroused indigenous resistance and the French once again intervened. Between 1368 and 1374, they regained most of their losses from the Treaty of Brétigny and reduced the English holdings to mere fragments of their once extensive duchy. The last phase of the Hundred Years' War, beginning in 1429, saw the French wear down English defenses, and with their loss of Bordeaux in 1453 the English were definitively expelled from Aquitaine. As was true for most parts of France, the period of the Hundred Years' War was a time of misery and hardship in Aquitaine quite apart from losses suffered in the wars. Plague, periodic famine, widespread brigandage, and economic decline made the later Middle Ages a dark period in Aquitanian history.

# ARABIC INFLUENCE ON LITERATURE

. The nature and depth of the Arabic impact on medieval European civilization are a source of controversy. The rapid conquests of Muslim armies in the 8th and 9th centuries altered the political configurations of southern Europe and the Mediterranean basin; well into the subsequent centuries, even when Muslim-held territories were retrenching, the ethnic, religious, and cultural landscapes were also considerably altered. The Arabic role in the history of the Iberian peninsula and of Sicily is a major area of scholarly inquiry, but the relationship of these European-Arabic cultures with medieval French civilization is far less studied, primarily because Muslim political domination of territories that were to become modern France was brief: the advance of the Muslim armies was arrested by Charles Martel at Poitiers in 732. Nevertheless, because national frontiers were far from firmly established, because much of Europe's Arabic culture was in the fluid form of translations or oral tradition and was during roughly the 10th through 12th centuries, at a peak of prestige, and because travel in and out of Muslim-held territories was widespread, for both peaceable and bellicose reasons, medieval French *belles lettres* are best understood in the context of a Europe with an influential Arabic presence.

To a large extent, French epic poetry depends on the epochal events of the Muslim conquests of southern Europe for its inspiration, although the narrations of events and the descriptions of the Arab enemies—in many cases, both at several centuries remove—are often transformed into quasimythological versions, as in a text like the *Chanson de Roland*. Other epic texts reflect the ambiguous relationship with the Saracen enemy in narrative and descriptive detail that is less distant and transformed: the cycle of Guillaume d'Orange, for example, features recognizable historical events and characters. In both cases, a minority of scholars perceive a rich, more directly literary influence from Arabic epic narrations and other literary forms, from themes, images, and characters to such details as the names of swords of the French-Christian heroes. In both cases, too, the rich "background" provided by centuries of interaction with "Saracens," who had become a fixture of the European scene, is manipulated in these literary texts to work out historical-ideological and metaliterary issues. This kind of multitiered interaction can be seen most clearly in a work like *Aucassin et Nicolette,* whose hero has an Arabic-like name, whose heroine is an abducted Saracen, and whose themes reflect historical events and literary issues. The work, moreover, is dependent for its background, as are many others in Old French literature, on the complex and variable relationships between the

"French"-Christian and the "Spanish"-Arabic worlds: trading partners, culturally interdependent, yet often in a state of military or ideological conflict.

The most debated "origins" question in Romance literatures concerns the courtly vernacular lyric of Provence. The earliest and, more recently, most controversial of the theories is that it is, at least in part, of Andalusian provenance (al-Andalus being the Arabic name for Spain). While this so-called "Arabist theory" has shown a number of variations since it was first proposed in the 16th century, it cur rently centers on the preexistence of an Arabic-Romance courtly lyric with striking thematic and formal affinities with the poetry that would arise in Provence in the late 11th century and transform European poetry thereafter. It is argued that, in the period immediately before the birth of Provençal courtly poetry and through its heyday during the next century and a half, the Hispano-Arabic world was closely linked to it both politically and culturally (Guilhem IX of Aquitaine, for example, was closely involved with al-Andalus in battle and in marriage) and that the innovative Andalusian *muwashshaha,* an Arabic lyric genre whose final half-strophe was often in the Spanish Mozarabic dialect and which was at its peak of popularity, would have been heard in courts throughout the "frontier" territories frequented by the earliest generations of troubadours.

The least disputed area of incursion of Arabic material into northern European culture is that which derived from the translations that proliferated primarily from the 11th through the 14th centuries, with the most famous and productive centers being Toledo and, under Frederick II, Sicily. The earliest major French figure in this vast commerce in the sciences, philosophy, and medicine was Gerbert of Aurillac, who would become Pope Sylvester II. He traveled to Catalonia in the 10th century to study mathematics and astronomy, both areas in which the Arabs were in the vanguard. Also noteworthy is Peter the Venerable, the influential abbot of Cluny, whose trip to Spain in the mid-12th century yielded, among many other riches, a Latin translation of the Qur'an, the first into a language other than Arabic. Much of the intellectual life of Europe at this time is in fact centered on translated philosophical texts. Not only were Plato and Aristotle an integral part of the Arabic tradition that was eventually made available to a Latin West that had long since lost access to them, but so too were the critical works of Andalusian and other Jewish and Muslim philosophers, such as Avicenna, Maimonides, and, most of all, Ibn Rushd (Averroes). Some scholars believe that much of the 12th-century renaissance in France resulted from upheavals in technology, institutional structures, and philosophy brought about by the reintroduction of the Aristotelian corpus that derived from translations from Arabic materials.

# ARABIC PHILOSOPHY, INFLUENCE OF

. Less than a century after the death of Muhammad in 632, most of Spain had come under
Muslim jurisdiction, while inroads had been made into the areas of Narbonne and
Carcasonne and even into south-central France, until Charles Martel turned the tide at
Poitiers and Tours in 732. As the Muslims were consolidating their power, they were also
changing the *lingua franca* of the Byzantine and Roman-Visigothic empires that they had
superseded. Arabic, however, had no religious and philosophical texts of its own besides
the Qur'an. Thus, Arabic intellectual activity in the sciences and in philosophy began
with translation of the Greek writings of the very civilizations that had been overrun. The
ensuing work helped make Arabic into a medium for absorbing and developing originally
non-Muslim scientific and scholarly concepts and ideas and for transmitting this new
synthesis to Latin Christendom.

In the East, this intellectual work was stimulated by the 'Abbasid caliphs of Baghdad
in the second half of the 8th and the 9th centuries, beginning with al-Mansur and Harun
al-Rashid and finding its culmination in the rich patronage of al-Ma'mun. Al-Ma'mun
scoured libraries in the formerly Hellenistic Middle East and even in Byzantium for
Greek scientific and philosophical works that were then translated into Arabic. Especially
for this purpose, he instituted at Baghdad the influential *Bait al-Hikmah* ("House of
Knowledge" or "Wisdom"); here worked for a time Hunain ibn Ishaq, a Nestorian
Christian, who besides putting many Greek texts into Arabic also developed a
methodology for precise translation. In the course of a century and a half, much of the
work of Plato, Aristotle, Porphyry, Hippocrates, Galen, Nicolaus, Albinus, Nemesius of
Emesa, and parts of Plotinus and Proclus were made available to Muslim scholars. The
intensive contacts between the East and the West of the Muslim sphere of influence soon
ensured the availability of these texts throughout the Arabic-speaking world. Many were
translated again, this time into Latin, and in the late 12th and the 13th centuries they
entered western Europe—at first Italy and especially France—via Sicily and Spain for the
use of Latin Christian scholars.

In the Spanish West of the Arabic world, interest in scholarship and learning began in
earnest under the Umayyad rulers at the end of the 9th century, but it was not until the
end of the 10th century that Cordova became a center of Muslim culture and learning that
could rival Baghdad. Caliph al-Hakam II's library at Cordova in the third quarter of the
10th century is said to have contained around 500,000 volumes. Toledo, too, was a
repository of learning, especially of the sciences (including astronomy) and medicine.
Thus, philosophy came relatively late to Muslim Spain. But, once it arrived, it exerted
enormous influence on western Christianity. In the East, crusading Franks tended to
destroy the cultural infrastructure—for example, after the fall of Tripoli they destroyed

the 100,000-volume library that had been assembled by Abu Talib. In the West, however, the victorious Spanish and French largely saved the Muslim inheritance and incorporated it into Christendom. In its turn, the scholastic movement in medieval French schools and universities played a decisive role in the preservation and synthesis of this Greco-Arabic knowledge.

The place of philosophy in medieval Islam—at least until the synthetic work of al-Ghazali (Algazel; 1058–1111) and the condemnation for heresy of Ibn Rushd (Averroes; 1126–1198) at Cordova in 1195—differed from that in western Christendom. Latin Christians, following the lead of Augustine of Hippo, who associated the term *theologia* with pagan religious rites and Neoplatonist religious thought, preferred the term *vera philosophia* for reflections on the moral Christian life and its thought, and they used such words as *doctrina* and *studia sacrae scripturae* for exegetical studies of the Bible. It was not until Peter Abélard in the 12th century that the term *theologia* again began to receive currency as a description of a specific subject of pious scholarly endeavor. Yet even then, philosophy and theology were still practiced by the same group of people: Christian monks and clerics, whether in monasteries or at the ecclesiastically dominated cathedral schools and later the universities. On the other hand, in 'Abbasid Baghdad and Umayyad Spain a clearcut division was made—not generally to the liking of religious leaders— between Islamic theology *('ilm al-kalam)* and philosophical discussion *(al-falsafa)*. *Kalam* was the study of the Word of God revealed in the Qur'an and of the Hadith (the traditional acount of the prophet Muhammad's sayings and actions); *falsafa* concerned itself with natural-scientific and philosophical knowledge deriving mostly from Greek but also from Persian and Indian non-Arabic sources. Unlike its place in the Latin world, philosophy here was not the prerogative of theologians but was associated closely with the study of medicine, astronomy, and mathematics. This is illustrated clearly by the medical interests of such important philosophers as Ibn Sina (Avicenna; 980–1037) and Ibn Rushd.

The first intellectual contacts of French scholars with Arabic learning were restricted to scientific fields. Paradigmatic is the case of Gerbert of Aurillac (ca. 945–1003), who studied mathematics and astronomy in Catalonia between 967 and 970, albeit not from the Arabic sources but from Latin translations collected in the library of the monastery of Ripoll. Arabic medical works, among others, were soon to be translated by Constantinus Africanus (d. ca. 1087), a Muslim who had been converted to Christianity. He is famous for his *Pantegni,* a reworking of 'Ali ibn al-'Abbas's *Kitab al-maliki*. This work was to help William of Conches (ca. 1085–ca.1154) in his formulation of a new philosophy of nature, which was criticized forcibly by William of Saint-Thierry (1070/90–1148) for its strong materialism and its independence from theology. William of Conches's *Dragmaticon,* which incorporates Greek and especially Arabic ideas, substantially influenced the cosmological and encyclopedic writings of Alain de Lille (ca. 1115/20– 1203) and Thomas de Cantimpré (1201– ca. 1270). In general, it might be said that the influx of Arabic medical and astronomical writings helped develop an awareness in medieval Europe—especially in the 12th-century French schools—that the cosmos and the natural world could be understood without recourse to Christian mystical and religious interpretations of the Middle Platonist or Neoplatonist sort.

Another important aspect of these early contacts between French and Muslim scholars was the apologetic one. Peter the Venerable (1092/94–1156), reform abbot of Cluny, held

a high regard for "Saracen" learning and wrote that Christians had gone to Muslim Spain to seek out manuscripts on the liberal arts and "physics" (the study of nature). Peter's main purpose in stimulating the translation of Arabic texts into Latin, however, lay in trying to understand Islamic religion in order thereby to find ways of converting the Muslims. Translations of the Qur'an and of other Islamic religious writings were collected with Peter's polemical and apologetic writings against Islam to form the so-called *Corpus/Collectio Toletanum/a*. This collection was employed extensively to counter Islam throughout the Middle Ages; it was still being quoted by Nicholas of Cusa, Denis the Carthusian, and Torquemada in the 15th century.

From ca. 1150, translations began to appear of Arab philosophers and of arabicized Greek authors. Central to this movement was the Spanish city of Toledo, which had been taken by the Christians in 1085. While scientific works continued to receive attention, Dominicus Gundissalinus (d. after 1181), archdeacon of Toledo, in collaboration with Ibn Dawud (Avendeath; fl. 1150), was perhaps the greatest of the early translators of Muslim and Jewish philosophical works. He translated works by Ibn Sina, al-Ghazali, and the Jewish thinker Ibn Gabirol (Avicebron; ca.1021– ca.1058), but no doubt his most important work was a synthesis of Arabic and Latin scholarship in four of his own works: *De anima, De unitate, De divisione philosophiae,* and *De processione mundi*. Through this work, western philosophers of the Middle Ages were stimulated to discuss psychological, noetic, and epistemological problems in the context of a Neoplatonic Avicennan reading of Aristotle. Traces of Gundissalinus's efforts can be found in a succession of authors from William of Auvergne (1180/ 90–1249) to Bonaventure (ca. 1217–1274), Albert the Great (ca. 1200–1280) and Thomas Aquinas (ca. 1224–1274). The Jewish philosopher Moses Maimonides (1135–1204), who wrote in Arabic, was also translated and often used. Aquinas derived his third way of proving that God exists from Maimonides's analysis. The Neoplatonism of Ibn Sina, al-Ghazali, and Ibn Gabirol's *Fons vitae* found fertile ground in the developing Augustinian, Pseudo-Dionysian, Chartrian, and Victorine Platonist interpretations of Christian theology; for example, a form of Ibn Gabirol's doctrine on matter was fundamental to Bonaventure's conception of all created beings, including souls and angels, as partly material, and thus made its way into Franciscan spirituality.

Increasingly, western scholars began to be interested in the Aristotelian corpus. A generation after Gundissalinus, translations from the Arabic were taken up with great vigor by Michael Scot (d. ca. 1236), who worked in Spain but also in the scientific environment of the Sicilian court of Frederick II of Hohenstaufen. To get an impression of the influx of Latin versions of the Arabic Aristotle and his Muslim commentators in the University of Paris, the following can be noted. The Statutes of the Arts Faculty in 1255 prescribed the study of Aristotle from the following works (the availability of a translation from the Arabic is noted in parentheses): *Ethics, Physics* (translated by Gerard of Cremona and Michael Scot), *Metaphysics* (translated by Michael Scot, who also translated Ibn Rushd's great commentary on it), *De animalibus* (translated by Michael Scot), *De caelo* (translated by Gerard of Cremona and Michael Scot), *Metereologica* (translated by Henricus Aristippus and Michael Scot), *De anima* (translation by Michael Scot, who also translated Ibn Rushd's commentary on it), De *generatione et corruptione* (translated by Gerard of Cremona), the Pseudo-Aristotelian *De causis,* actually by Proclus (translated by Gerard of Cremona), *De somno* (translation of Ibn Rushd's

epitome, perhaps by Michael Scot), the Pseudo-Aristotelian *De plantis* actually by Nicolaus Damascenus (translated by Alfred of Sareshel), *De memoria* (translation of Ibn Rushd's epitome, perhaps by Michael Scot), De *differentia* (translated by John of Seville), De morte, and the logical works (some translations from Arabic available). Some of these works were also translated directly from the Greek, but those from the Arabic can be shown to have been immensely popular by the number of manuscripts that have come down to us. From this list, it can also be learned that at Paris by the mid-13th century Avicennan Neoplatonism had made way for an Averroistic interpretation of Aristotle, in particular of the *Metaphysics* and *De anima*.

Perhaps the most important philosophical debate of the second half of the 13th century was the Parisian controversy between Siger de Brabant (ca. 1240–ca. 1284) and Thomas Aquinas, on the noetic problem of the structure and the function of the soul. Much of the argument was based on the various interpretations of texts of Aristotle, his Greek and Arab commentators, and to a lesser extent of Muslim thinkers. Siger agreed with Ibn Rushd that for all people there is one intellect, which comes from without and joins with the different activities of the human body (life and sensation) to become a composite soul *(anima composita)*. The intellect, however, does not become an integral part of the body, because it would then not be able to be separated from it; it operates much in the way— Siger here adopts Aristotle's famous analogy in *De anima*—of a sailor on a ship. It thus follows that it is not the individual human being who thinks but rather the unitive intellect *in* the human being. According to Aquinas, this is a misrepresentation of Aristotle, and thus philosophically untenable, and it also leads to conflict with Christian theology, that is, with regard to individual human responsibility and in the end beatitude for the personal soul.

The strong rationalism and the secularizing naturalism of Ibn Rushd's interpretation of Aristotle and that of the Latin Averroists, such as Siger, indeed brought on the infamous condemnation of 219 propositions by Étienne Tempier, bishop of Paris, in 1277. Yet Jean de Jandun (ca. 1289–1328) continued to defend Ibn Rushd's interpretations of Aristotle. Compelled to flee Paris because of his defense of Marsilius of Padua's *Defensor* pacis, he went to Ferrara and became the great stimulator of North Italian Averroism in the 14th and 15th centuries.

A different aspect of Arabic influence on medieval French thinking is by way of the Catalan polymath Ramon Lull (ca. 1232–1316). Lull's system is decidedly nonscholastic in method, and this can account for its popularity in mystical and even in courtly circles outside the academic system of medieval universities. When he was just over thirty years old, Lull dedicated his life to serving God by taking it upon himself to convert the Muslims. He spent a decade in Mallorca learning Arabic, studying Latin Christian theology and philosophy, and reading Muslim authors. Lull himself was a prolific author in Arabic, Catalan, and Latin; besides mystical and philosophical works, he wrote romances and even a handbook of chivalry. The Arabic elements in his universalist philosophy of Christian Neoplatonism and his project of transforming courtly love into religious mysticism—a kind of philosophy of love—derive especially from such authors as Ibn Sina and alGhazali. Lull's creation of a "dynamic" metaphysics and epistemology shows great affinity with and may even have been derived from the ideas of Lull's Muslim contemporary Ibn Sab'in (d. 1270) of Murcia. Lull later taught at Paris, Montpellier, and Naples, and his works were widely distributed throughout France and

Europe. He taught especially against Averroism and adhered to a curious amalgam of Arabic and Latin Neoplatonism.

Although Lull's philosophical system and his polemical thought were adopted by many in France, they became the object of virulent controversy at the end of the 14th century. A Dominican inquisitor of Aragon, Nicolas Eymerich, in 1376 obtained a papal bull that prohibited teaching Lullism, and between 1395 and 1402 Jean Gerson, chancellor of the University of Paris, forbade Lull's works. Still, Lullism continued to have its adherents: through the work of the Neoplatonist Heimeric van de Velde (1395–1460), who had studied at Paris and later taught at Cologne, it influenced deeply the thought of Nicholas of Cusa and through him Leibniz and a whole string of thinkers leading to Hegel at the beginning of the 19th century.

# ARBITRATION OF DISPUTES

. While the ordeal, the *placitum* or formal public court hearing, and the feudal court have been seen as the normal ways in which medieval people resolved disputes, there has been a growing appreciation of the role of arbitration in dispute settlement. Descriptions of such settlements appear primarily in ecclesiastical charters and most often concern property disputes.

Arbitration occurred throughout much of the Middle Ages, but it seems that it was particularly during the high Middle Ages that adversaries preferred to turn to a third party to resolve their dispute. Although public officials could serve as arbitrators, they did so

rarely. Instead, arbitrators tended to be the prominent and powerful men of the district who were frequently identified simply as *boni viri*.

Three characteristics of arbitration settlements stand out. First, despite the weight of the evidence, arbitrators most often recommended a compromise. With each side receiving some satisfaction, there was less likelihood that the dispute would be renewed. Second, in order to ensure the stability of the settlement, great care was taken to have it witnessed by as many people as possible. In some cases, a settlement might be held in more than one location. Finally, the guarantors *(fideiussores)* often committed themselves and their property to ensure the compliance of the disputants to the settlement.

Despite the inherent fragility of such settlements, arbitration proved to be a remarkably successful pragmatic means of ending disputes.

# ARCHER/BOWMAN

**.** Archers and archery were a traditional part of the French army during the Middle Ages. The bow was first used by the Franks in the 4th century but did not become a required arm of the Frankish infantry until the time of Charlemagne. These early archers generally were equipped with a short bow of simple wood construction. But in the following centuries bows were improved by the addition of horn, sinew, and glue in a composite construction complete with angled ears to give more pull to the bowstring. By the 11th century, archers had become a designated unit within the French army, differing in responsibility, status, arms, and armor from the regular infantry unit. Rarely were archers mounted, and then only for transportation to and from the battlefield.

With the influx of crossbows, the use of short bows died out in French armies, and by the 13th century they were not considered a weapon of war in most parts of Europe. However, they did persist as hunting weapons. During the late Middle Ages, the crossbow dominated the archery of the French army, although some French military leaders attempted to hire groups of short- and longbowmen from Scotland and mounted archers from Spain and Italy.

Archers were seen as unchivalric participants of battle and frequently were massacred by opposing forces if captured.

# ARGENTAN

. Virtually leveled in World War II, this Norman town nonetheless has important vestiges of two late-medieval churches. In addition, the 15th-century Tour Marguerite is a remnant of the late-medieval city walls, and the 14th-century castle includes the remains of a 12th-century keep. The church of Saint-Germain preserves a beautiful porch in Flamboyant Gothic style (14th c.); the six-bay nave with its triforium and the polygonal apse with its double deambulatory and apsidal chapels are likewise Flamboyant. The vaulting in the choir features unusual pendant keystones. Saint-Germain preserves some remarkable 15th-century stained glass as well. The 14th-century chapel of Saint-Nicolas has been heavily restored.

*William W.Kibler/William W.Clark*

Prieur, Lucien. "Argentan." *Congrès archéologique (Orne)* 111 (1953):84–112.

# ARGENTERIE

. *See* **HÔTEL DU ROI,**

# ARGENTEUIL

. A suburb of Paris on the Seine, Argenteuil (Val d'Oise) was during the Middle Ages the site of a Benedictine priory of women. Its early history is sketchy, though it was in existence by the late 7th century; it is mentioned only rarely in the succeeding centuries. At the beginning of the 12th century, Abbot Suger of Saint-Denis claimed that from its foundation the priory had belonged to his abbey. He produced a charter of the emperors Louis I and Lothair I to support his claim, and in 1129 Argenteuil was "returned" to Saint-Denis and the nuns expelled. There is, however, evidence that Suger fabricated the story and the document that supported his claim. It was to this priory that Abélard led Héloïse after their marriage; it was where she took the veil; and she was the superior when the nuns were expelled.

From the mid-12th-century, the church at Argenteuil claimed to possess the relic of the Holy Tunic, the seamless robe that Christ had at the Crucifixion and that the monks claimed had been given to the priory by a daughter of Charlemagne. Though in the Middle Ages the priory possessed extensive domains, from the time of the Hundred Years' War it suffered losses. In 1686, Argenteuil was joined to the royal foundation at Saint-Cyr. At the Revolution, the priory was suppressed and destroyed, and today only a few fragments of sculpture remain.

# ARISTOCRATIC REVOLT

. Potential for the resort to force of arms characterized 15th-century French politics. Great magnates and princes of the blood regularly assembled coalitions of lesser men anxiously seeking patronage and protection. Those who openly challenged royal authority in 1439, 1465, and 1488 typically cloaked their rebellion in a demand for "reform" but were motivated less by ideology than self-interest. Wishing to dominate rather than resist the monarchy, such rebels demanded a role in crown governance and access to crown resources.

The Praguerie, named in memory of the Hussite revolt, occurred when peers acted to restrain Charles VII, who had been emboldened by the Treaty of Arras and his recent recapture of Paris. At the Estates General of 1439, Charles had threatened princely autonomy by outlawing private armed forces. The duke of Bourbon and others seduced the youthful dauphin, Louis, into joining them in open revolt. Skirmishes in Poitou, Auvergne, and the Bourbonnais restored crown authority by June 1440, but the price of peace was the delay of military reform as well as the provision of *pensions* and seats in the royal council for many of the rebels.

In 1465, peers again united in an inaptly named Ligue du Bien Publique to restrain a monarch whose reach exceeded his grasp. Nominally led by Louis XI's brother, Charles of France, the League was dominated by the dukes of Bourbon and of Brittany and by Charles the Bold, then count of Charolais. Louis's army restored his authority in the Bourbonnais and succeeded in holding Paris after the indecisive Battle of Montlhéry (July 16, 1465). Compelled to compromise nonetheless, Louis, in the treaties of Conflans and Saint-Maur, promised to restore the *pensions* and positions of many he had injudiciously ruined upon his accession to the throne as well as to grant his brother the apanage of Normandy and to reconcile himself to the dukes of Brittany and Burgundy.

As late as 1488, a similar revolt occurred, in the so-called Guerre Folle, when the dukes of Brittany and of Orléans challenged the regency of Anne of Beaujeu. The subsequent attachment of Brittany to the royal domain, however, ended the era of armed defiance of royal authority by eliminating the last great independent principality. Henceforth, rebels, such as the duke of Bourbon in 1525, would be viewed not as disobedient vassals but as traitors deserving exile or execution rather than reconciliation.

# ARISTOTLE, INFLUENCE OF

. The importance of the introduction of translated works of the Greek philosopher Aristotle (384–322 B.C.) into medieval Christian thinking is one of the most often stated and least clear aspects of 13th-century history.

Aristotle's *Categories (Praedicamenta), On Interpretation (Perihermeneias), Topics,* and *Prior Analytics* were widely known through the 6th-century Latin translations of Boethius. With his translation of Porphyry's *Isagoge,* they were the source of Aristotelian ideas in the West until the translation of Averroes's commentary on Aristotle by Michael

Scot, at the Sicilian court of Frederick II, in the first third of the 13th century. By 1250, most of the works of natural philosophy, logic, and metaphysics were translated and were basic texts for the arts faculty in Paris. The anonymous *Liber de causis,* thought to be by Aristotle, was also highly influential, although it is in fact Platonic. By ca. 1240, the *Rhetoric, Ethics* (very influential), *Politics,* and *Economics* were also available, mostly through translations by James of Venice. In the mid-13th century, Thomas Aquinas and Albert the Great (the greatest Christian Aristotelian philosophers of the theology faculty; the most important Aristotelians in arts were Boethius of Dacia and Siger de Brabant) recognized the need for better translations, and Thomas persuaded William of Moerbecke (1215–1286) to revise and retranslate much of the work. In fact, however, Aristotelian ideas long were best known through Averroes and Avicenna.

The two key theological problems that Aristotle raised were the eternity of the world (an affront to the Creation) and the notion of the unity of the intellect (which, if true, would deny the resurrection of the individual person). As well, later readers of Averroes thought that he taught a double-truth theory: that some things might be true for philosophy but not for theology, and that in such cases philosophy should have priority.

The public or private teaching of Aristotle in theology was first prohibited at the Council of Sens in 1210. Robert de Courçon's statutes (1215) for the University of Paris forbade the teaching of the *Metaphysics* and all books on physics and natural science; the works on logic were allowed. This was restated in Gregory IX's bull *Parens scientiarum* (1231). The tide was irresistible, however, and in 1255 the statutes of the university allowed all of Aristotle's works to be taught. The first theologians to use Aristotle in theological works were Alexander of Hales, Philip the Chancellor, and William of Auvergne, all writing at the beginning of the 1230s, soon after the new Latin translations appeared. All were orthodox theologians who chose from Aristotle whatever suited their purposes, without engaging with the implications of his doctrines as a whole.

Thomas Aquinas, and to some extent Albert the Great before him, made the exemplary synthesis of Christian and Aristotelian ideas, but some of Thomas's propositions were condemned as errors by Bishop Étienne Tempier at Paris, in 1270 and again in 1277. It was not until Thomas's canonization in 1323 that the final nail in the anti-Aristotelian coffin was driven.

It can be argued that what Aristotle provided, and what was so much needed, was a means of approach rather than particular ideas. His ideas of logical argument and of categories, and his four causes (formal, material, final, efficient), were taken up zealously. God could be defined as the First Cause, the Uncaused Causer. The joy of Aristotle, and the danger, was his comprehensiveness: he had addressed almost every branch of knowledge; this held deep appeal for the medieval sense of the unity and knowability of the world.

The followers of strictly Aristotelian ideas were known as Latin Averroists, from their use of Averroes's *Commentary*.

# ARLES

. The city of Arles (Bouches-du-Rhône) remained in the shadow of Marseille until 46 B.C., when Julius Caesar established a colony of Roman veterans on the left bank of the Rhône, called Arelate. Arles developed rapidly under his successors, serving as an important communications link between Italy and Spain. Its bishopric was founded in the 1st century by St. Trophimus. By the 2nd century A.D., it had acquired substantial defensive walls and major public-works projects and had supplanted Marseille as the leading Mediterranean port. Arles became the principal residence of the emperor Constantine I the Great (ca. 280–337) and was the birthplace of Constantine II (317–340). In 314, it was the site of the church synod called by Constantine I to deal with the Donatist controversy.

Following the collapse of the western Roman Empire, Arles became the capital of the Visigothic leader Euric, and in 536 it came under the control of the Franks. In the early 8th century, Arles was plundered by the Muslims and became a center for Provençal rebels; Charles Martel had to subdue the town twice before securing control over the region.

Arles was to play a central role in the history of medieval Provence. It was a major commercial center, and in 972 its count, Guillaume II, drove the Muslims from their base at Garde-Freinet. The archbishops of the city were leading figures in the Peace Movement and the reform of the church in the 11th century. In the 12th century, Arles became a free city ruled by a *podesta,* a status it retained until the French Revolution.

*Stephen Weinberger*

The church of Saint-Trophime at Arles, built during the first quarter of the 12th century, is one of the most important Romanesque churches of southern France. It consists of nave and two aisles, each originally terminated in the east by two apsidioles and the semicircular choir. The nave is tall, thin, and aspiring with high and wide nave arcades surmounted by a single clerestory window above a horizontal band of ornament. Nave piers have double responds on all four faces: supporting the nave arcade, the diaphragm arch over the aisles, and the colonnettes and capitals above the inner respond, which in turn supports the continuous horizontal frieze by pointed barrel vaults, while the aisles are vaulted by three-quarters of a barrel vault, strengthened by diaphragm arches behind each pier. If Burgundian ideas come down the Rhône Valley, they are overwhelmed by Roman influences in forms and decoration to create a distinct regional, Provençal Romanesque style.

In the mid-15th century, the shallow Romanesque east end of Arles was replaced by a deep, handsome Flamboyant choir, ambulatory, and radiating chapels. Ribs melt into the masonry of vaults, and moldings take on a life of their own. This new east end resulted in the destruction of a large crypt completed in 1152 to receive the relics of Trophimus.

The cloister for the Augustinian canons of Saint-Trophime is the most important of the many cloisters in Provençe. Indeed, it can be argued that the north gallery of the Arles cloister is the finest in western Europe, if the criteria for judgment include architecture and sculpture and their total interrelationship, as well as the consistency and the high quality of the sculpture. The north gallery, dating from the late 1140s to early 1150s, is vaulted by a three-quarter barrel, which drops lower on the garden side of the cloister,

necessitating exterior wall buttresses. Each corner pier of the north gallery has three figures with relief sculpture between them, which visually support the diagonal arch and the two transverse arches, while the two intermediate piers have single projecting figures supporting the transverse arch and recessed flanking figures.

Trophimus is on the northwest corner pier, and St. Stephen, to whom the church was first dedicated, is on the northeast. They are flanked by Peter and Paul. The intermediate piers contain Christ between two pilgrims, which combine Christ meeting the Apostles on the road to Emmaus and the Pilgrimage to Santiago de Compostela. The eastern, intermediate pier depicts Christ between James and Thomas.

Two sculptors appear to be responsible for the monumental sculpture in the north gallery. One, influenced by the sculpture of Saint-Gilles-du-Gard, carved, in order, small Christ, Peter, Paul, John, James; the other, more influenced by western French sculpture, created Stephen, Trophimus, Christ, two pilgrims, and Thomas. The Peter-Paul Master carved more of the historiated capitals. In the east gallery (1150s–60s), the capitals depict scenes from the Incarnation and the Passion of Christ. More sculptors were involved, and some relationship with Italian sculpture is evident.

Arles (Bouches-du-Rhône), Saint-Trophime, cloister, pier. St. Peter. *Photograph courtesy of Whitney S.Stoddard.*

The south and east galleries are Gothic, dating from the late 13th and 14th centuries. Encrusted with a thick layer of gypsum, they are difficult to interpret. The façade portal of Saint-Trophime is a paradox. Although dramatic in thematic concept, the execution is often uninspired. The single portal, added to the older façade, is in the form of a projecting portico supported by six columns. Its de-sign is clearly inspired by the façade of Saint-Gilles-du-Gard, which in turn is based on Roman monuments like the arches at Saint-Rémy or Orange.

Paul, a less sensitive replica, in reverse, of the Saint-Gilles Paul, served as model for six of the other seven Apostles carved by a less skilled sculptor. Peter is the work of a third sculptor. The Paul Master seems to have carved the tympanum, and the Peter Master the lintel. The base of the trumeau and some capitals and socles appear to have been carved by an Italian sculptor. The entire portal seems to have been sculpted rapidly by four artists, most likely in the 1170s but certainly by July 30, 1178, for the coronation in Saint-Trophime of Frederick as king of Burgundy.

# ARLES-SUR-TECH

**.** Situated along the Tech River in Roussillon, the abbey of Sainte-Marie d'Arles (Pyrénées-Orientales) boasts a rich history that is still visible in the abbey church and cloister. Founded in 778 as Sainte-Marie de Vallespir at the ancient Roman baths of Arles (Amélie-les-Bains), the Benedictine community was decimated by invasions during the 9th century. Relocated to its present site, the monastery entered a period of protection and prosperity in the 10th and 11th centuries. In 1078, further protection was afforded the abbey when it came under the authority of Cluny. The 12th and 13th centuries saw increasing profits and new construction, due in part to the rich mines of iron, silver, and copper in the area.

Architecturally, little appears to have survived from the late 9th-century foundation, with the possible exception of the unusual western orientation of the church. The plan of the surviving church, roughly dated by a 1046 consecration, follows a typical basilican format with nave, two side aisles, and three corresponding semicircular apses. The nave arcade on rectangular piers supports a high clerestory with twelve windows. Highly unusual are the three niche chapels that are carved out of the massive eastern wall. When

the structure was refurbished around the time of the 1157 consecration, a larger and higher arcade was integrated with the older one, providing additional support for a new vaulted ceiling. Both arcades are visible today. A beautiful Gothic cloister of white marble and double columns that reflect Languedoc models was the final, major addition to the complex under the successful abbacy of Raimond de Bach (r. 1261–1303).

Arles-sur-Tech is most renowned for its 11th-century façade. A rare example of a Lombard-type façade in Roussillon, it includes several series of blind arcades that dominate the exterior. Significant examples of pre-Romanesque sculpture decorate the small central window and the tympanum. The tympanum in particular features a fine example of early sculpture depicting Christ and the symbols of the Evangelists inscribed within a cross. The focus on a decorative and two-dimensional patterning of the figures is typical and derives from techniques native to ivory- and metalworking. This approach to sculpture had an unusually long life at Arles-sur-Tech, as evidenced by the 1211 tomb of Guillaume Gaucelme, now embedded in a wall within the church.

Fragmentary evidence remains of wall painting in the central niche of the eastern end. The representation of the Last Judgment, often found on the entrance wall of churches, included Christ in Majesty in the hemidome and, below, cherubim and seraphim in adoration. The artistic activity of Sainte-Marie d'Arles also extended to the glorification of the saints Abdon and Sennen, whose relics were housed at the abbey.

# ARMAGNAC

. The lands that came to comprise the county of Armagnac in southwestern France formed part of the great duchy of Gascony in Aquitaine. In the early 10th century, the eastern portion of the duchy was detached to form the large county of Fézensac, centered on the town of Vic-Fézensac and including the archiepiscopal city of Auch. The county of Fézensac in turn was dismembered by the creation of the county of Astarac and, in the middle of the 10th century, by the detachment of its western region as the county of Armagnac. The small county, whose chief towns were Riscle and Aignan, retained these dimensions until the death of the the last count of Fézensac, Astronove II. In 1119, his widow married Géraud III of Armagnac, reuniting the two counties.

Among the early counts of Armagnac, the most notable was Bernard II Tumapaler (1014–1080), whose attempt to succeed to the duchy of Aquitaine-Gascony was defeated in 1054. During the 12th and 13th centuries, the counts of Armagnac-Fézensac were noted as vassals of their principal overlord, the king of England; Count Bernard-Aiz V was conspicuous in the service of Henry III at Taillebourg in 1242. This traditional alliance ended in the 14th century, as the counts acquired fiefs directly under the lordship of France, most significantly the county of Rodez, added in 1302 through the marriage of

Count Bernard VI. Bernard VI, disputing the succession of the viscounty of Béarn, also initiated the great quarrel with the counts of Foix. Thereafter, the history of Armagnac is dominated by this rivalry and by the counts' determined alliance with the cause of the French monarchy against the English. Count Jean I (r. 1319–73), royal lieutenant in Languedoc, vainly opposed the Black Prince's raid in 1355. Bernard VII, constable of France, murdered in 1418, animated the anti-Burgundian party known as the Armagnacs. The reign of Count Jean V brought the downfall of the house of Armagnac. Charged with rebellion against the king, he was besieged and assassinated at the castle of Lectoure in 1473. The domains of Armagnac passed to the family of d'Albret and finally to the monarchy with the accession of Henry IV in 1589.

# ARMAGNACS

. During the summer of 1411, the name Armagnacs began to be used by the Parisians for the faction supporting the duke of Orléans against the duke of Burgundy, John the Fearless. The origin of this ducal struggle was the murder of Louis of Orléans in 1407 at the instigation of Burgundy. At the Peace of Chartres (March 9, 1409), the king pardoned Burgundy, saying that the murder was committed for the good of the kingdom. He commanded Louis's sons Charles, duke of Orléans, and Philip to swear not to pursue vengeance, but the feud did not end.

The nickname reveals the strong influence within the group of Count Bernard of Armagnac, son-in-law of the duke of Berry. Bernard became important when he joined Berry on April 15, 1410, in an alliance with the dukes of Orléans and Brittany and the counts of Alençon and Clermont, aimed against Burgundy and called today the League of Gien. At this time, a marriage was arranged between Bernard's daughter Bonne and Charles d'Orléans. Civil war was averted by the Peace of Bicêtre, announced by the king on November 2, 1410. It was the quick result of a royal threat to confiscate the property of members of the league.

The duke of Orléans initiated new strife on January 30, 1411, with a kidnaping and then began to skirmish with the Burgundians in Picardy. On July 14, Orléans and his brothers sent the king the "Manifesto of Jargeau," which claimed that the royal pardon to Burgundy in 1409 was against divine law and the oaths given at Chartres were therefore invalid. Hostilities resumed, and in October the Armagnacs took Saint-Denis and the bridge of Saint-Cloud. Intercepted letters proved Berry's complicity with their faction,

and two royal armies marched against him (November-December 1411 and May-July 1412). After a long siege at Bourges, the king's son, the duke of Guyenne, negotiated a treaty that Berry accepted on July 15, 1412. The more formal Treaty of Auxerre followed on August 22.

The ensuing delicate balance was upset when Burgundy incited the riot of the Cabochiens in Paris in April 1413. Named for the butcher who led them, the Cabochiens were the popular faction of the Burgundian party in Paris. The fall of the Cabochiens in August and Burgundy's flight resulted in a period of Armagnac influence, during which the king led a military campaign against John the Fearless that ended with the Peace of Arras (September 1414; finalized February 22, 1415). The duke of Guyenne sought to curb the influence of the Armagnacs, but his death al-lowed them much greater freedom to act. Bernard of Armagnac was named constable of France and became the leader of his party with the departure, in 1417, of Louis II of Anjou, a bitter enemy of Burgundy. Berry had died in 1416, and the dukes of Orléans and Bourbon, taken captive at Agincourt, were still prisoners in England. In April 1417, Bernard engineered the exile of the queen, Isabeau of Bavaria, who was plotting against the supremacy of his party. She was rescued, however, and set up a rival government in Troyes. In May 1418, the Burgundians attacked Paris, and on July 12, two days before the entry of Burgundy and the queen, Bernard was put to death. During the invasion in May, one of his partisans had spirited away the dauphin, the future Charles VII, who then became head of the anti-Burgundian party. After this time, the faction continued to be called the Armagnacs.

# ARMOR AND WEAPONS

. The armor worn in France throughout the medieval period was directly derived from that worn in the Migrations Period by the leaders of Germanic war bands, and its basic structure, which included a shield, helmet, and coat, changed little between ca. A.D. 100 and 1150. In the early period, the shield (Lat. *scutum,* OFr. *escu*) was normally constructed of wood covered with leather and reinforced with strips of bronze or iron centered on a hemispherical metal boss that covered the grip. Down to ca. 1000, the shield was usually ovoid or round and about three feet in diameter. A round shield of

similar construction continued to be used by infantry into the 15th century, but a longer and narrower shield of Byzantine origin, shaped like an elongated almond, was introduced in the 11th century for use by heavy cavalry and predominated from ca. 1050 to 1150. The normal type of helmet (MHG *helm,* OFr. *helme,* MidFr. *heaume*) in the period before 1150 took the form of a more or less convex cone, most commonly constructed from four or more triangular sections of metal or some other hard material bound by iron bands. It was usually supplied with a nasal bar and until ca. 750 with hinged cheek plates as well.

The coat was almost always made of mail (OFr. *maille*), a mesh of interlocking iron rings of uniform size. The names most commonly given to the mail coat in the period before ca. 1300 were derived from the Old Germanic word *\*brunaz* 'bright': Lat. *brunia,* OFr. *brunie* or *bro(i)gne.* Down to ca. 800, no protection for the neck was generally worn, but in the 9th century it became customary to wear a mail hood with attached shoulder cape over or partially under the mail coat and under the helm. This caped hood was apparently known as the *halsbergen* 'neck guard' in Frankish and by a derivative word variously spelled *halberc, halbert, (h)auberc,* etc. in Old French. This word (in English in the form "hauberk") has been applied since at least the 17th century to the mail coat or *brogne* itself, but this was an error of the antiquarians, and historically it had designated only the caped hood as long as the latter was still in use—that is, until the 14th century. The hood proper, which was often attached directly to the *brogne,* was called the *coiffe,* and from the 12th century onward the *brogne* with attached *coiffe* was called an *haubergonne.*

Helmets and mail coats were expensive, and before ca. 800 they were worn only by kings, nobles, and their most distinguished companions-in-arms. In the 9th century, however, they came to be distributed to the ordinary members of royal and noble military retinues, newly named vassals, and from ca. 950 they were to be characteristic of knights, who were always expected to appear for battle in the most complete and up-to-date armor.

The period 1150–1220 saw the first major changes in the form of armor used in France since the Frankish conquest. Most of these changes were in the direction of increased protection for the body, already begun with the adoption of the long shield. In the late 12th century, the sleeves of the *brogne* were extended from the elbows to the wrists and finally acquired attached mittens. Mail leggings, or *chausses,* though occasionally worn earlier, similarly came into general use among knights ca. 1150 and were worn to ca. 1350. Also ca. 1150 began the custom of wearing a surcoat (OFr. surcote, *cote a armer*)—a loose, generally sleeveless cloth coat probably borrowed from the Muslims— over the coat of mail. The surcoat was universally adopted by ca. 1210 and worn thereafter until ca. 1410. Throughout this period, it was commonly emblazoned with its wearer's heraldic "arms," but these new ensigns were primarily displayed on the shield— which between 1150 and 1200 also lost its traditional boss, between 1150 and 1220 was made progressively shorter and wider, and between 1200 and 1250 was given an increasingly triangular shape through the leveling of its upper edge.

Although the traditional conical helm continued in use until ca. 1280, several new forms emerged in this period that were destined to supersede it. The most important were the flat-topped "great" helm, which between 1180 and 1220 evolved to enclose the whole head in a cylinder of steel pierced only by slits for seeing and holes for breathing, and the

close-fitting hemispherical bascinet, which emerged ca. 1220. The great helm survived with little further structural change from 1220 to 1400, and from ca. 1300 its apex was often provided with a distinctive heraldic "crest" *(cimier)* of wood or boiled leather, worn primarily in the tournaments to which, by 1380, the helm was restricted. The bascinet was at first worn under the helm and over the coif of the mail hood, but from ca. 1260 the hood was increasingly replaced with a mail curtain (the *camail* or *aventail*) suspended from the outside of the bascinet, and the bascinet thus augmented gradually replaced the clumsy great helm as the principal defense for the head in real warfare. In consequence, the bascinet became steadily larger and more pointed, and acquired in the last decade of the 13th century a movable "visor" *(vissere)* to protect the face.

The eight decades between ca. 1250 and ca. 1330 witnessed a major change in the history of European ar-mor, stimulated in large part by the development of weapons capable of piercing mail: the gradual introduction of pieces of plate (at first of whalebone, horn, and boiled leather, as well as of the iron and steel that ultimately prevailed) to cover an ever larger part of the mail. By 1330, every part of the body of a knight was normally protected by one or several plates, including a poncholike "coat of plates" concealed by the surcoat. By 1410, the various pieces of plate, including a breastplate and backplate instead of the earlier coat of plates, were all connected by straps and rivets in an articulated suit, or "harness," of polished steel. After ca. 1425, this "white" armor was usually worn without a surcoat or any other covering.

The adoption of elements of plate to protect the body steadily reduced the importance of the shield, which between 1250 and 1350 diminished steadily in size until it was only about 16 inches in height. Even this diminished shield was finally abandoned between 1380 and 1400. A new form of shield called the *targe,* of similar size and structure but roughly rectangular in outline, concave rather than convex, often deeply fluted and cusped, and provided with a notch, or *bouche,* for the lance, was introduced in the same two decades, but it was used primarily in tournaments, and knights of the 15th century seem to have done without any shield in battle.

The only offensive weapons commonly borne by the Frankish warriors who seized power in Gaul in the 5th century were the lance, or *framea,* of sharpened ash; the barbed javelin, or *ango;* and the throwing ax, or *frankisca*. The lance or spear, whose more expansive form, equipped with an iron head, was destined to displace the sharpened form and survived with little basic change until the end of the Middle Ages and beyond—for many centuries the only weapon generally available to ignoble as well as noble warriors.

Kings and the leaders of war bands also carried swords, usually of the long, straight, double-edged type called in Latin *spatha,* first developed by the Celts of Gaul ca. 400 B.C. and later borrowed by Germans and Romans. As the Old French use of espee for "sword" suggests, the *spatha* (whose blade was ca. 30 inches long) was ancestral to most of the later forms of sword developed in western Europe, of which some thirty-three types and subtypes have been recognized by scholars, four of them antedating A.D. 600. Around 600, the Frankish king and nobles temporarily abandoned both *spatha* and *frankisca* in favor of a machetelike single-edged sword called a *saxo,* whose 18inch blade permitted it to be used for stabbing and even throwing as well as slashing; but under Viking influence the *spatha,* which the Scandinavians had continued to use and develop, was reintroduced into Frankish lands and quickly became the principal weapon not only

of the rulers and nobles but of the rank-and-file members of the new heavy-cavalry units ancestral to the knights of the 10th and later centuries.

Lesser weapons were also employed by knights after 1050. Special forms of ax, hammer (bec), mace, club, and flail were introduced in the 12th and 13th centuries to supplement the sword, but it was only after 1300 that these were both fully developed and commonly used. Most knights and squires also carried a stiff dagger on their sword belt after ca. 1350. All of the knightly weapons were used by the nonknightly combatants who could acquire them, but among the base-born infantrymen a number of weapons scorned by the knightly class were also employed. The simple bow, despised by most Germanic tribes outside of Scandinavia, was little used in France outside of Normandy before the 14th century, when six mounted archers were included in the "lance," or standard tactical unit of the royal army. The crossbow, or *arbaleste,* was reintroduced into France ca. 950 and was commonly used thereafter to ca. 1550, primarily by special infantry units placed from ca. 1200 to 1534 under the overall authority of a grand master of the crossbowmen *(arbalest[r]iers).* After ca. 1350, the bow and crossbow were supplemented on occasion by a primitive handgun. In addition to these projectile weapons, the infantryman of the 14th and 15th centuries had at his disposal new forms of polearm, which were in essence lances with special forms of head.

# ARMS (HERALDIC)

. The term "arms" (Lat. *arma,* Fr. *armes, armoiries,* or *blasons*) was used from the late 12th century for a design of fixed elements in a fixed arrangement and fixed colors, conventionally covering the whole surface of a shield or flag, consistently and uniquely employed at any particular time within a particular kingdom or province by a single person, lineage, or corporation as a mark of identity and authority and heritable according to local rules comparable with those governing the inheritance of real property. The design almost always consisted of a colored background, or "field," and one or more objects, or "charges," placed upon it, both depicted in one or two strongly contrasting colors, or "tinctures." The charges could take the form of simple geometrical shapes, such as a cross, band, chevron, or quarter, or of stylized representations of beasts, plants, or objects, usually drawn from a conventional repertory. The repertory of tinctures, charges,

and partitions, and the language of "blazon" used to describe them, was developed gradually in the period between 1130 and 1300, mainly by heralds, and it changed little between 1300 and 1500.

Down to ca. 1500, simple arms, representing a single lineage, office, or corporate entity, normally included only one or two distinct forms of charge. In families, such simple arms were in principle borne in France from ca. 1170 "plain," or undifferenced, only by the heir of the first user, in keeping with the principle of primogeniture; all younger sons in every branch and generation were obliged in theory to add permanent marks of difference, or "brisures," to their fathers' arms, and even the heirs apparent had to add a temporary mark during their fathers' lifetimes. After 1300, the arms of princes and barons became still further complicated as increasing numbers of them combined on the same shield steadily growing numbers of simple arms, representative of different principalities and baronies they possessed or claimed. After 1350, these arms were usually arranged on "quarters" of the shield, whose number after 1430 often grew beyond four.

Arms, as defined above, first appeared in France and neighboring countries in the 1130s. Although they were at first displayed primarily on the shields and flags actually borne in battle, their form and use before ca. 1250 are known to us largely from seals, on which they were commonly portrayed from ca. 1135 either on the effigy of the owner or on a representation of the shield alone. The earliest arms often incorporated emblems used before 1135 on seals, coins, or flags, and some princes adopted two distinct armorial designs, one representing their person and, when inherited by their descendants, their patrilineage, and usually displayed on their shield; the other representing their principal dominion, and usually displayed on their banner. The practice of adopting such jurisdictional arms gave rise after 1200 to the idea that arms could be adopted to represent other types of office, jurisdiction, or corporation and to the use of initially dynastic arms as arms of territorial jurisdiction.

Until ca. 1160, the use of arms in France was confined to princes, but after 1160 it spread gradually downward through the ranks first of the military nobility, among whom it became virtually universal by 1260, then of the rest of society, in which it always remained relatively limited. In northeastern France, where these developments occurred first, arms were adopted by lesser barons and knights banneret between 1160 and 1220, by simple knights between 1180 and 1220, and by simple esquires between 1220 and 1260. All of these men used their arms on a real shield as well as on the purely pictorial one represented on their seal, but the existence of the latter led to the gradual adoption of arms by both individuals and bodies who had no occasion to appear in battle: by married women of the upper and middle nobility after 1180, though rarely before 1230; by prelates after 1210, though rarely before 1250; by lesser clerics, especially after 1350; by men of the bourgeoisie after 1300; and by guilds after 1250, though rarely before 1350. Although the arms of nobles were normally designed by professional heralds, down to 1500 lawyers generally maintained that new arms could be adopted at will by anyone, so long as they were different from all existing arms within the kingdom. Even peasants used quasiarmorial seals.

At first used primarily as marks of identity, after 1240 arms were increasingly displayed on every type of object, both as a mark of ownership and as an element in the

scheme of decoration. This usage reached its height in the 14th century, which was the last in which arms played an important role on the field of battle.

# ARNAUT DANIEL

(fl. 1180–1200). The troubadour Arnaut Daniel was admired by Dante, Petrarch, and Pound as much for his technical virtuosity as for his notorious difficulty. Little can be said for certain about his life, except that his literary reputation as a bold if hermetic poet was well established by 1195, when he appears in the Monk of Montaudon's satiric gallery of troubadours. According to his *vida,* he was a noble from Ribérac in the Dordogne, but this assertion, like that of the *razo* that links him to Richard the Lionhearted, cannot be substantiated. Both the *vida* and the Monk of Montaudon's portrait rightly note that Arnaut Daniel delighted in composing difficult rhymes. His nineteen surviving poems, all but one of which are love songs, attest this penchant for *caras rimas* (difficult rhymes). Arnaut's craft is emblazoned throughout by the daring innovations of the *trobar ric* style. His word choices are unusual, his images unfamiliar, his sound patterns harsh, his poetic rhythms broken. The global effect of his lyrics is always striking, often jarring. No doubt, this originality earned him the respect of subsequent writers, but it has also contributed to his reputation as an obscure poet. An example of Arnaut's brilliant creativity was his invention of the sestina.

# ARNULF

. Name of three counts of Flanders. Arnulf I the Great (885–965, r. 918–65), also known in his last years as "the Old," "the Rich," or "the Lame," was the son of Count Baudouin II. After the death of his younger brother in 933, he ruled an area that included his family's ancestral lands in western and southwestern Flanders, Boulogne, Tournai, territories around Saint-Omer and Thérouanne, and perhaps Ghent. A reformer of the Flemish abbeys and a skilled diplomat, he allied with the counts of Vermandois to check the rising power of the dukes of Normandy. The west Frankish king Lothair gave him the title princeps, previously held only by Hugues le Grand, count of Paris, and established the principle that all feudal bonds in Flanders passed through the *princeps* and ultimately to the king. Arnulfs son, Baudouin III, predeceased him, and Lothair arranged the succession of Baudouin's son, Arnulf II (ca. 961–988, r. 965–88). Arnulf II's rule witnessed the beginning of serious conflicts in Flanders between the counts' two feudal lords: the king of France, who occupied southeastern Flanders as a condition of permitting Arnulfs accession, and the Holy Roman emperor, lord of the territory east of the Scheldt. Arnulf II married the daughter of King Berengar II of Italy in 976 and died prematurely in 988. Arnulf III (r. 1070–71) was the son of Count Baudouin VI. He ruled only a few months before being killed in battle by his uncle Robert the Frisian, who usurped the countship.

# ARNULF OF LISIEUX

(Bishop of Lisieux, r. 1141–81). Arnulf was born into an Anglo-Norman family that included several members of the clergy. Not much is known of his early life, though he probably studied at Chartres, in Italy, and at Paris. He held an archdeaconry at Sées and was often in the service of the English king Henry I, though after his death in 1135, like most of the Norman clergy, he supported the claim of Stephen to the English throne. Arnulf was a staunch supporter of Pope Innocent II during the schism of 1130, and his earliest extant writing is directed against Gérard, bishop of Angoulême, who had supported the antipope Anacletus II. Freely elected bishop of Lisieux by the cathedral chapter in 1141, he often tried to reconcile the interests of the kings of France and En gland and was one of the ecclesiastical leaders of the Second Crusade. In his own diocese, Arnulf is best remembered for his support of the regular canons and the

rebuilding of the cathedral at Lisieux. In his last years, he lost the confidence of Henry II, and his stance during the Becket controversy was criticized by the archbishop's partisans. He retired to the abbey of Saint-Victor in Paris, where he died in 1181. His letters, which he collected, are an important source for mid-12th-century history.

# ARRAS

. The city of Arras (Nord) and the surrounding region, Artois, derive their names from the Gallic tribe known as the Atrebates. After a bishopric established in the 6th century by St. Vaast was removed to Cambrai, a cathedral chapter remained at Arras as the nucleus of the medieval *cité.* Some distance away, a monastery honoring the memory of St. Vaast was founded in the 7th century and richly endowed by the Frankish kings. The medieval *ville* developed around the monastery and grew rapidly thanks to a favorable location near intersecting trade routes.

The Vikings seriously damaged the town in the 880s, but it recovered after the counts of Flanders absorbed Artois in the 10th century. Arras became an important center for the production and marketing of woolen cloth at an earlier date than the more famous Flemish towns. This cloth was traded actively by the early 11th century. By 1137, merchants of Arras were carrying their goods to the fairs of Champagne, and in the last decades of the 12th century they were doing business as far afield as Genoa. Location on the route between Flanders and Champagne favored the economy of Arras, but after ca. 1220 the Italians began to cut into the carrying trade, eventually developing a sea route to Flanders that bypassed the town. Arras then became an important center of moneylending, making available vast sums to towns and princes. When warfare, economic distress, and diminished population afflicted the town in the 14th century, Arras coped with the situation by adapting the technology of cloth production to the manufacture of tapestries for the luxury trade. For a time, the name Arras became virtually synonymous with tapestry.

Artois passed to the French crown as the dowry of Queen Isabelle de Hainaut in 1180. In 1194, Philip II granted Arras a charter, under which a group of *échevins* (municipal magistrates) ruled the town. It was modified in 1302 to accommodate excluded elements that were showing discontent, but the ruling oligarchy of wealthy entrepreneurs enjoyed remarkable continuity, with one family being represented in the urban government most of the time between 1111 and 1450. This patriciate seems to have originated among the petty officials of the abbey of Saint-Vaast, who gradually accumulated enough capital to embark on large-scale cloth production, then large-scale moneylending, and finally the production of tapestries.

In 1435, Arras was the site of a major peace conference among England, France, and Burgundy. The result ant Franco-Burgundian treaty helped the French emerge victorious in the Hundred Years' War.

Arras is known today for its network of connecting Late Gothic city squares and the medieval and Renaissance houses that line them. The main squares were commercial centers lined by shops. Their recessed lower story permitted the arcaded gallery that protected shoppers and goods from the rain.

Prior to the French Revolution, Arras possessed one of the largest and most famous Gothic cathedrals in northern France. This extraordinary structure was begun ca. 1160 at the east end. Shortly after the construction of the crypt, which had an ambulatory with a single polygonal chapel, the plan was enlarged and expanded. The original scheme called for broad bays of four stories (vaulted aisles and galleries topped by a continuous wall passage and clerestory windows). The change in the design is clearly visible in the contrast between the single, large, round-headed windows of the ambulatory and the elaborate triplet pattern of the gallery and clerestory. The result was an elegant and elaborate design matched in height by the broadly projecting transept arms, which, like those at Laon, had terminal towers. Some of the capitals from this lavishly appointed building are preserved in the municipal museum.

# ARRAS, JEAN D'

(fl. late 14th c.). Author of the prose romance *Mélusine* (1393). Written at the behest of Marie, duchesse of Bar, for her brother, Jean, duke of Berry, *Mélusine* recounts the marvelous origins of the powerful noble family of Lusignan. There are ten 15th-century manuscripts, a 1478 Geneva printed edition, and numerous reprints, as well as an English translation from 1500. Coudrette's verse romance *Mélusine* was possibly inspired by Jean d'Arras.

The founding mother of the Lusignan line, the fairy Mélusine, whose name derives possibly from "mère des Lusignan," has been cursed by her mother to become a serpent from the waist down on Saturdays. Concealing the secret from her husband, Raimondin, who promises never to see his wife on that day, Mélusine bears him ten sons, eight of whom are marked with a fantastic trait, and brings the family great prosperity; she builds the Lusignan's castle in Poitou. But Raimondin breaks his promise and learns Mélusine's secret, remaining silent at first. When he learns that his son Geoffrey has burned the abbey of Maillezais, thus killing one of his sons, he furiously blames his wife and curses her. His betrayal turns Mélusine forever into a huge serpent, who leaves her family but returns periodically to haunt the castle.

# *ARRIÈRE-BAN*

**.** Just as the word *ban* sometimes referred to a military summons of the king's vassals, so the *arrière-ban* (Lat. *retrobannum*) conveyed a summons to his rear vassals—those owing service to an intermediate lord rather than to the king directly. In actual fact, when Philip IV and his successors used the *arrière-ban,* it went well beyond the world of purely feudal relations and called to service all men able to bear arms. In principle, it was a somewhat archaic device for mustering substantial numbers of fight-ing men in an emergency. The *arrière-ban* never completely lost this connotation, but if applied to more than a very local area it would have produced a horde of untrained, ill-equipped people. Its real purpose was largely fiscal. During its period of greatest use, the first half of the 14th century, it was used to impress people with a sense of emergency and to facilitate the collection of money in commutation of actual military service.

# ARS ANTIQUA

. An antithesis to the term Ars Nova, Ars Antiqua designates music written before the late teens of the 14th century, at which time music and its theory began to incorporate innovations championed as new and modern. In the seventh and last book of his *Speculum musicae* (completed ca. 1325) Jacques de Liège looked back upon the generation of Pseudo-Aristotle (Lambertus) and Franco of Cologne, active in the second half of the 13th century, as the representatives of an Ars Antiqua or Ars Vetus in music for which he had greater respect and admiration than the new music of his own day. There is also attributed to Philippe de Vitry a treatise entitled *Ars nova,* for which there is only a fragmentary set of sources, that deals with an Ars Vetus before introducing the innovations of the Ars Nova. The theoretical principles of the Ars Vetus in this treatise deal largely with such matters as solfège, intervals, and the monochord.

What is now designated Ars Antiqua has come to include (1) the sacred, Latin-texted repertory of organa, clausulae, conductus, and motets of the Notre-Dame School, which may be dated from ca. 1160 to 1250; (2) indigenous English polyphony, which has Latin and some French texts, extending from the earliest Worcester Fragments to about the middle of the 14th century, when the impact of the continental Ars Nova becomes apparent in extant insular sources; (3) the large and predominately vernacular motet collections of the second half of the 13th century, such as those in the Montpellier and Bamberg codices; and (4) theoretical writings about temporally measured music *(musica mensurabilis)* that do not include notational principles and innovations described in the treatise entitled *Ars nova*.

# ARS NOVA

. A term taken from notational theory of the early 14th century to describe the musical style of the 14th century in France. The period after the death of Machaut is now more frequently labeled Ars Subtilior.

Some sources attach the name Ars Nova to a music-theory treatise apparently dependent on the teachings of Philippe de Vitry. The term seems further justified by the elderly Jacques de Liège, who unfavorably contrasts works of a new generation of composers, representatives of the Ars Nova, with works of the old school (what we call

the Ars Antiqua) in Book 7 of his *Speculum musicae* of 1325. Finally, a letter of Pope John XXII (1324–25) proscribes the application of certain musical techniques, some of which are recognizably characteristic of the Ars Nova, to church music.

The "new art" (more properly "new technique") originally concerned the notation of rhythm. Building upon the foundation of Franco of Cologne's notational theory (ca. 1280), Jehan des Murs—the role of Philippe de Vitry is unclear—took Franco's principles of imperfection (in triple meter, subtracting a third part of a note) and alteration (in triple meter, doubling the value of a note to fill two beats of a three-beat unit) and systematically applied them to both longer and shorter note values, thereby vastly increasing the repertory of rhythmic durations available to the composer. A new note shape, the minim, was introduced for the short values. The full admission of duple ("imperfect") divisions alongside the old triple ("perfect") divisions is a principal characteristic of Ars Nova notational theory, and the system provides for the notation of works in our modern time signatures of 9/8, 6/8, 3/4, and 2/4. Finally, by means of notes written in red instead of black ink, provision was made for changing between perfect and imperfect time within a work, although composers did not fully exploit ramifications of this innovation until the late 14th-century Ars Subtilior.

The first practical source of Ars Nova music is a beautifully illuminated manuscript of the *Livres de Fauvel* (B.N. fr. 146; ca. 1318). Alongside musical insertions of Ars Antiqua motets and conductus are isorhythmic motets of the early Ars Nova. Although no works are attributed in the manuscript, some are probably by Philippe de Vitry. The isorhythmic motet provided the perfect expression for Ars Nova notational developments, exploiting a wide range of durational values in rigorously logical musical works laid out hierarchically with very slow note values in the tenor and fast note values in the motetus and triplum.

Besides the isorhythmic motet genre, the Ars Nova also contributed innovations in the chanson genres. The manuscript of the *Roman de Fauvel* contains a fascicle of chansons in dance forms by Jehannot de Lescurel (d. 1304?). These works, including one three-voice and thirty-one monophonic chansons, are noticeably more florid and rhythmically varied than comparable works of the 13th century (e.g., the rondeaux of Adam de la Halle). Jehannot's cultivation of dance lyrics set to advanced rhythms announced a shift of emphasis in the secular song. All that remained after further consolidation of the poetry of the dance lyrics as the fixed forms—ballade, rondeau, and virelai—was the musical addition of an untexted accompanying voice, a step probably taken ca. 1340 by Guillaume de Machaut.

Around 1350, with the mature polyphonic fixed-form chansons of such composers as Machaut and Pierre des Molins, the mature isorhythmic motets of Philippe de Vitry, Machaut, and others, and the authoritative summa of the notational system found in the *Libellus cantus mensurabilis* of Jehan des Murs, the Ars Nova entered its high phase. In the course of the 1370s, 1380s, and 1390s, developments in the notation of extremely complex rhythms preoccupied composers particularly in the south, at the courts of Gaston Phoebus at Béarn, the popes at Avignon, and John I of Aragon. This phase is now most often called the Ars Subtilior.

# ARS SUBTILIOR

. A term coined by Ursula Günther to distinguish the style of French music cultivated approximately during the time of the papal Schism (1378–1417) from the earlier Ars Nova. As with Ars Nova, the name derives from treatises on musical notation. Most Ars Subtilior works were written in the south of France, at the court of Aragon, or in northern Italy. The musical style, seen in fixed-form chansons as well as in motets, is characterized primarily by extreme rhythmic complexity, including frequent changes of meters, conflicting meters in different voices, complex proportional relationships, and "displacement syncopation," in which a prevailing meter (e.g., 6/8 in modern transcription) is displaced by one or two eighth notes for a lengthy passage. The music requires a vast assortment of notational symbols, including red notation, note heads with odd hooks and tails, and complex time signatures. Composers who cultivated this style include Matheus de Sancto Johanne, Solage, Cuvelier, Jacob de Senleches, Johannes Ciconia, and the Italians Mateo da Perugia and Philippus de Caserta.

# ARTEVELDE

. A politically important family of 14th-cen-tury Ghent. A legendary figure in Flemish history, Jacques van Artevelde (ca. 1290–1345) became extraordinary captain of Ghent in 1338, at the outbreak of the Hundred Years' War. Ghent and Flanders were caught between the demands of the French kings, feudal overlords of the Flem-ish counts, and the dependence of the Flemish cities on English wool for their cloth industries. Van Artevelde was a wealthy broker and dealer in foodstuffs, perhaps with ties to the brewers' guild. Under his captaincy, Ghent dominated the other cities of Flanders and the countryside, and he attempted to control Count Louis of Nevers, who managed to escape to France. Jacques van Artevelde led Flanders into an open English alliance, but a truce in 1340, renewed in 1342, contributed to a lessening of tensions in Flanders and deprived him of the justification for his extraordinary magistracy. Van Artevelde had come to power with the assistance of the weavers' guild, the largest occupational group in Ghent, but he associated all groups in a unity regime: the "small guilds," whose members worked for a local market, the aristocratic landowners, and the weavers' often bitter rivals, the fullers. He is for this reason often portrayed as a democratic reformer; in fact, he became dictator in Ghent, where he maintained his position only by violence and an enormous bodyguard. He ferociously suppressed rebellions against his authority in the smaller Flemish towns and became a personal friend of King Edward III of England. In 1344–45, he supported weaver regimes throughout Flanders in denying a wage increase to the less affluent fullers. He survived a coup attempt in early 1343 but was deprived of his captaincy in the spring of 1345. Personal rivals, including the dean of the weavers' guild, used the rumor that he wanted to recognize the Prince of Wales as count of Flanders as a pretext for assassinating him on July 17, 1345.

The youngest son of Jacques van Artevelde, Philippe (1340–1382), had an obscure early career in which he played no political role. He became confiscation commissioner of Ghent in December 1381, when a rebellion against Count Louis II (de Male) had already been in progress for more than two years. He became captain, the office that his father had held, on January 24, 1382, as the count was on the verge of starving Ghent into submission. Philippe's power was based more exclusively than his father's had been on the support of the weavers, and he seems to have objected in principle to French influence in Flanders. After using his first month in power to exterminate personal rivals, notably the eldest sons of men involved in the plot to assassinate his father, Philippe began negotiating for an English alliance, then captured Bruges in a surprise attack on May 3 and forced Count Louis II, who had been in that city, to flee to France. Although he controlled Flanders and styled himself "regent" from that point, the English help never materialized. The forces of Louis II, his son-in-law and eventual successor, Philip the Bold, duke of Bur-gundy, and King Charles VI of France invaded Flanders and crushed the Flemings on November 27, 1382, at the Battle of Roosebeke, where van Artevelde lost his life.

# ARTHUR

. Legendary Dark Age king of Britain, Arthur of Avalon was a major inspiration to French vernacular writers from the 12th through the 14th century. Recent research indicates there may have been a late 5th- or early 6th-century warlord around whom popular legends amalgamated, but if such a man did exist he was neither a king nor named Arthur. Given a historical cachet by the Latin fictions of Geoffrey of Monmouth's *Historia regum Britanniae* (ca. 1136), which was translated into French by Wace in 1155, Arthur appears first in romance in the works of Chrétien de Troyes (ca. 1165–90). The power of Chrétien's imaginary constructs, particularly the Lancelot-Guenevere love story and the Grail quest, inspired countless imitators and continuators. Arthur was counted as one of the Nine Worthies during the Middle Ages.

# ARTHURIAN COMPILATIONS

. A number of authors, beginning in the late 13th century, compiled lengthy bodies of French Arthurian material, drawn from earlier sources and often assembled with little concern for coherent organization. The *Roman de Roi Artus* of Rusticiano da Pisa, an Italian writing in French during the late 1270s or the 1280s, includes the entire romance of *Palamedes* as well as numerous adventures of Branor le Brun, Tristan, Lancelot, and other knights. A century later (ca. 1391), Jehan le Vaillant de Poitiers produced a vast work consisting of a *Brut* followed by miscellaneous stories about Arthurian characters. Around 1470, Michot (or Michel) Gonnot drew material from the *Prose Tristan,* the Vulgate Cycle, and other romances of the preceding century to assemble his compilation. The dimensions of these works were prodigious, so much so that during the 16th century

Rusticiano's was divided and published as two distinct romances, *Guiron le Courtois* and *Meliadus*.

# ARTHURIAN VERSE ROMANCE

. The history of Arthurian romance from the end of the 12th century through most of the 13th is dominated by Chrétien de Troyes. When Chrétien died, probably in the 1180s, he left behind four complete romances of about 6,000 lines each (*Erec et Enide, Cligés, Lancelot,* and *Yvain*), and a fifth, unfinished at 9,234 lines *(Perceval).* The renown of these poems was unparalleled in French literature, their popularity being attested by reference, allusion, quotation, translation, and adaptation. Verse romance after Chrétien may be seen as a response or reaction to the works of the master.

The two or three decades following Chrétien's death are peculiarly wanting in Arthurian verse romance. This may be historical accident, of course, in that little has survived, but it does look as if authors at the end of the 12th and very beginning of the 13th century had difficulty coping with the overwhelming reputation of Chrétien. Only Renaut de Beaujeu's *Bel Inconnu* and a number of shorter poems can be assigned with any probability to this period. Renaut's full-length romance is at once clearly different from Chrétien's and yet owes a good deal to him. Two short so-called lais, Cor and *Mantel,* not actual *lais bretons* as written by Marie de France, are variations on a chastity-test theme in which many of the ladies of Arthur's court prove to have been unfaithful to their partners. The poems are humorous and border occasionally on the obscene, perhaps surprising for such early texts. Two anonymous *lais bretons, Tyolet* and *Melion,* are Arthurian in their setting rather than in their essence, although *Tyolet* is quite clearly derived from Chrétien's *Perceval.* The Gawain romances, *Mule sans frein* and *Chevalier a l'épée* also date from ca. 1200. Finally, the first two continuations of Chrétien's *Perceval* may have been composed in their first versions about the turn of the century.

The 13th century saw the composition of *Meraugis de Portlesguez* by Raoul de Houdenc, *Gliglois, Durmart le Gallois,* Yder(all probably before 1220), the Occitan jaufre (ca. 1230), Fergus by Guillaume le Clerc, the *Chevalier aux deux épées* or *Meriadeuc* (before 1250), *Floriant et Florete,* the *Merveilles de Rigomer* (before 1268), *Claris et Laris,* and *Escanor by* Girart d'Amiens (before 1282). These po ems have many features in common with the Gawain romances. The only Arthurian verse romance written in the 14th century is Froissart's *Méliador,* which can better be seen as an anachronism than the last example of the genre.

Raoul de Houdenc's *Meraugis de Portlesguez,* of 5,938 lines, is notable for its discussion of courtly virtues articulated through the rivalry of two friends, Meraugis and Gorvain Cadrut, for the love of Lidoine. Raoul, perhaps the most talented of those writing

in Chrétien's wake, is one of the first to accept the challenge laid down by Chrétien. For Raoul, the decision to write an Arthurian romance meant acknowledging a debt to the master while realizing the necessity to do something different. Raoul's Arthurian romance is playful, the humor ranging from light burlesque to broad farce.

*Gliglois* is a romance of 2,942 lines concerned with the rivalry of Gawain and his squire, Gliglois, for the love of the aptly named Beauté. Gawain relies on his reputation, assuming that this will be sufficient to win him the lady; Gliglois, on the other hand, serves her patiently and eventually wins her love. *Gliglois* is unusual in that it is a "realistic" poem without any fantastic or supernatural events and none of the usual adventures of Arthurian romance. It is also, by virtue of Gliglois's success and Gawain's failure, an exceptionally "meritocratic" romance.

The influence of Chrétien de Troyes is strangely lacking in *Gliglois*. The same cannot be said of the 16,000-line *Durmart le Gallois,* whose author is heavily indebted to *Erec et Enide, Yvain,* and *Cligés* in particular. Much of the narrative of *Durmart* is based on Durmart's quest for the love of the Queen of Ireland, whom he has never seen but of whose extraordinary beauty he has heard tell. The scene in which Durmart wins a sparrowhawk for her makes conscious use of the famous episode in *Erec et Enide*. After many adventures, Durmart marries the queen, founds an abbey, and frees Rome from the pagans. Unusual are the Irish setting and the general lack of humor and burlesque (save perhaps the sight of King Nogant fleeing from Durmart on a camel).

The very beginning of *Yder* is missing. The extant 6,769 lines relate how the illegitimate Yder attempts to win the love of Queen Guenloie. This he eventually does, marries her, and then brings about the wedding of his father and mother, thus legitimizing his own birth. *Yder* is remarkable for its unflattering portrayal of the Arthurian court: there are hints of an amorous relationship between Yder and Guenevere, and Arthur and Kay are positively obnoxious characters rather than the ineffective king and caustic seneschal found elsewhere. In other respects, particularly in its preservation of the Yder-Guenevere story, *Yder* is archaic and shows evidence of otherwise lost traditions.

*Fergus,* by Guillaume le Clerc, is a romance of 7,012 lines set in Scotland, which may well have been written between 1237 and 1241 for the Balliol family as an ancestral romance in support of territorial claims. Political associations apart, this romance again shows the pervasive presence of Chrétien, and Fergus has even been called a "new Perceval." Certainly, *Perceval, Yvain,* and *Erec et Enide* provided Guillaume with material for much of the poem, which is centered on the love of Fergus and Galiene. *Fergus* is an excellent postclassical romance, full of humor and told in a lively manner.

The hero of the *Chevalier aux deux épées* is Meriadeuc, from whom the romance takes its alternative title. This poem of 12,352 lines has a complex plot, the main part of which concerns the love of Meriadeuc for Lore of Caradigan and Meriadeuc's search for his own identity. Meriadeuc's father had been unwittingly slain by Gawain, who is eventually reconciled with the hero. Meriadeuc marries Lore, and Gawain consummates his love for a girl he had cham pioned earlier. The *Chevalier aux deux épées* is typical of romances of the period and of the compositional techniques of romance in general, reworking episodes and motifs found elsewhere into a tightly knit and satisfying whole.

*Floriant et Florete* (8,278 lines) is one of the rare later romances that reverts to the marriage-crisis-resolution structure found in Chrétien's *Erec* and *Yvain*. Floriant, posthumous son of a king of Sicily, is abducted by Morgan the Fay, educated, and sent to

Arthur's court. After defending his mother against the Emperor of Constantinople, Floriant marries Florete; like Erec, Floriant takes his wife with him to prove his prowess after he has been accused of *recreantise*. The end of the romance is lacking. It is evident that the basic central structure of *Floriant et Florete* is that of *Erec et Enide,* and indeed there are many verbal echoes from this and Chrétien's other romances. The use of material provided by Chrétien, in *Floriant et Florete* and elsewhere, ranges from the use of motifs and entire narrative segments down to verbatim quotation.

The *Merveilles de Rigomer,* by an author known simply as Jehan, is an incomplete romance of 17,271 lines and has often been regarded as a degenerate example of the last stages of Arthurian verse romance. However, seen in the light of its relationship to Chrétien and the prose romances, it can better be regarded as an example of the creative reception of existing models. It has a double plot, the first involving Gawain's quest to free the imprisoned Lancelot, and the second, Arthur's restoration of her inheritance to the heiress of Quintefuele. One of the most remarkable features of the *Merveilles de Rigomer* is its bestiary of fantastic creatures, such as talking birds, flame-breathing panthers, and a man-eating falcon. Its treatment of the Arthurian material is burlesque and often outrageous.

The most distinctive feature of both *Claris et Laris* and *Escanor* is perhaps their complex narrative structure, based on a series of multiple quests. Although these two lengthy romances (30,369 and 25,936 lines, respectively) have long been regarded, like the *Merveilles de Rigomer,* as degenerate and rambling, their qualities can be seen in a different light when the influence of the prose romances is taken into account. Since they make extensive use of narrative techniques and characters from the prose tradition, they can in many respects be regarded as prose romances in verse.

Recent study of these romances stresses their "epigonal" relationship to Chrétien's œuvre with particular reference to audience reaction. Authors make such frequent and subtle use of Chrétien's works that it must be assumed that audiences were aware of this and listened to the romances against the background of Chrétien. There were many ways for Arthurian authors to respond to the phenomenon of Chrétien: they could attempt, although they rarely did, to do blatantly otherwise than he had done; they could attempt various degrees of burlesque and parody; they could write severely didactic works using Arthurian material as sugar for the pill. The Chrétien epigones usually deal less with the fundamentals of human existence than did Chrétien, and their productions are frequently lighthearted and self-consciously literary. It has recently been argued that many of these romances were written directly, but not exclusively, for the Anglo-Angevin court and that they had a strong political function, strengthening dynastic and territorial claims on both national and regional levels. If this is true, then part of their audience must be sought in England and they need to be placed at least partly in a British historical and cultural context. Whatever the case, they are finally beginning to attract the attention they deserve from scholars, and the yoke of the odious comparison with Chrétien is at last slowly being cast off.

# ARTILLERY

. Playing a major role in medieval warfare, artillery evolved parallel to the art of fortification. Although Roger Bacon introduced gunpowder to the West ca. 1260 and the English used cannon at Crécy in 1346, it took a further century of experimentation before cannon supplanted *trébuchet* (i.e., tension) artillery. Improvement of explo-sives, projectiles, and guns was impeded by the difficulties in obtaining adequate amounts of matériel and equipment. But by 1400 cannon had come into regular use, and the final campaigns of the Hundred Years' War made their superiority unmistakable. Either protecting sappers or breaching walls themselves, they became an indispensable tool in sieges. In response, defense tactics and military architecture changed rapidly after 1450. Governments were compelled to modernize fortifications, and every town was driven to acquire artillery for its own defense.

Following French use of artillery at Formigny (1450) and Castillon (1453), where cannon were shown to be useful on the field as well as in siege warfare, the Valois monarchy led the way in the perfection of technology, in the development of an institutional infrastructure, and in the exploitation of the full potential of the new arms. Gaspard Bureau, *maître de l'artillerie* for Charles VII, formed a permanent force of cannoniers that grew steadily thereafter. Limited range, inadequate rates of fire, and immobility limited reliance on artillery for the remainder of the 15th century, and cannon remained auxiliary to cavalry and infantry in the army of Louis XI. Only the triumphs of Charles VIII, who made dramatic use of artillery in Brittany and in the Italian campaign of 1494, removed all doubt that only armies with adequate artillery could hope to prevail in modern warfare.

# ARTOIS

. Named after the ancient Gallic tribe of the Atrebates, the important cloth-producing region of northern France known as Artois belonged to the counts of Flanders for much of the Middle Ages but became the dowry of Isabelle de Hainaut when she married Philip II in 1180. Her son, Louis VIII, inherited Artois but arranged for it to pass after his death to Robert, the oldest of his cadet sons as one of the earliest apanages.

Robert I of Artois accompanied his brother Louis IX on crusade and died in Egypt in 1250. His son, Robert II, also met a violent end, at the Battle of Courtrai in 1302, and succession to the county was disputed between his daughter Mahaut, countess of Burgundy, and Robert III (1287–1342), the child of Robert II's only son. Philip IV decided for Mahaut (d. 1329), but intermittent strife continued for a generation. Of the next four kings, the only one to favor Mahaut was Philip V, who had married her daughter Jeanne (d. 1330). Their two daughters, Jeanne and Marguerite, were married, respectively, to Eudes IV, duke of Burgundy, and Louis I, count of Flanders. These two important princes thus acquired a vested interest in the succession of Mahaut's descendants, creating an awkward situation for Charles IV and Philip VI, two kings who were close friends of Robert III.

Feeling certain of royal support, Robert demanded his inheritance from Philip VI after the death of his cousin Jeanne in 1330, but the opposition of Burgundy and Flanders led the king to rule against him, whereupon Robert turned rebel and recognized Edward III of England as king of France. The two daughters of Philip V succeeded in turn as countess of Artois. Marguerite, by then dowager count-ess of Flanders, died in 1382, followed two years later by her son Louis II of Flanders. Artois was one of several important lands inherited by the heiress of Flanders, Mar-guerite (d. 1405), wife of Philip the Bold, duke of Bur-gundy. For a century, Artois was part of the Burgundian state. Louis XI was able to occupy the county in 1482, but in the crown's ensuing struggles with the Habsburgs, who had inherited the Burgundian Netherlands, the latter regained Artois and held it until the 17th century.

# ARTS DE SECONDE RHÉTORIQUE

. The term *seconde rhétorique* is used in several 15th-century French poetic treatises in three senses: to mean verse as opposed to the *première rhétorique* of prose, vernacular rhetoric rather than Latin, and poetry written by the laity rather than by *clercs.* The first such treatise, *L'art de dictier,* was written by Eustache Deschamps in 1392, although the *Prologue* written by Guillaume de Machaut in the 1370s to introduce his complete works perhaps has a competing claim as the first vernacular treatise on the art of poetry. The other *Arts* include Jacques Legrand's *Des rimes* (1405), *Les règles de la seconde rhétorique* (1411–32), Baudet Harenc's *Le doctrinal de la seconde rhétorique* (1432), *Traité de l'art de rhétorique* (1450?), Jean Molinet's *L'art de rhétorique* (1493), *Traité de rhétorique* (1495–1500), and *L'art et science de rhétorique vulgaire* (1524–25). Most of these survive in only a single manuscript, but there are signs of borrowing or of a common model among several. Five authors refer to the *puys d'amour,* which makes it likely that their treatises represent rules of versification drawn up for the judges and competitors in those contests. Others, including Deschamps, Legrand, and Molinet, claim to be writing at the request of aristocratic or even royal patrons, presumably in order to teach them the practical skills of lyric poetry. The works come mainly from northern France, but also from Chalon-sur-Saône and Lorraine.

The majority of the treatises are simply manuals of lyric versification. Their structure typically consists of a short introduction followed by a description, with examples, of a range of rhyme schemes and poetic forms. Five also contain rhyming and spelling lists and, in one case, glossaries of proper nouns and obscure vocabulary. The examples they cite include poems by Machaut, Froissart, and Deschamps, as well as poems from the *puys.* The anonymous 1450 *Traité* also appends a separate collection of lyrics. Molinet's *L'art de rhétorique* is the best organized; the 1524–25 treatise copies it closely, and there are further correspondences with Deschamps, the 1450 treatise, and Baudet Harenc. The anonymous 1411–32 treatise presents an interesting history of vernacular poetic masters from Guillaume de Lorris to Froissart and Deschamps.

Few of the treatises offer any kind of poetic philosophy. In fact, most distinguish their humbler purposes (versification) from instruction in poetry. The case is different for Machaut and Deschamps. Machaut claims the agency of "Sens," "Rhétorique," and "Musique" in his powers of composition, giving pride of place to Music. Deschamps similarly emphasizes music, placing poetry under the category of *musique naturelle,* as opposed to *musique artifi-cielle,* or art music. This has been taken by some scholars to signal a radical departure from traditional medieval views of the relation between music and poetry. Others, however, argue that there is no contradiction between Des-champs and Jean de Garlande's description of rhythm as a species of music and Jean Molinet's

equation of rhythm and *rhétorique vulgaire*. According to such a view, Deschamps exalts poetry by appealing to its traditional relation to music, not by denying that relation.

# *ASPREMONT*

**.** A late 12th-century chanson de geste of some 11,000 decasyllabic rhyming lines, *Aspremont* is preserved in multiple manuscripts, a number of which were copied in England and Italy. In Italy, the poem gave rise to Franco-Italian adaptations and the *Cantari d'Aspramonte* and Andrea da Barberino's *Aspramonte* in prose; through its Anglo-Norman connection, the story appears in Denmark, Norway, and Iceland.

The epic treats Charlemagne's defense of southern Italy from a Saracen invasion. Charles is aided by the rebel baron Girart de Fraite, who proves his loyalty when Christendom is in danger, and young Roland, who performs his first acts of prowess.

*Aspremont* is important for the splendor of its traditional, rhetorical style in celebration of heroism and for its "correction" of the *Chanson de Roland,* its notion of a more perfect Christian universe, one without pride or division, supposed to have existed prior to the events of Roncevaux, when Roland was young and Charlemagne in his prime.

# ASSEMBLIES

. Historians of political institutions have long been attracted to medieval assemblies, studying them for evidence of the origins of modern parliamentary bodies. Assemblies convened by princes were special gatherings, generally much larger than the small group of advisers that met frequently to conduct regular business, yet both might be called "court" or "council."

Scholars have tended to treat assemblies as precursors of, or substitutes for, Estates or parliamentary bodies. They have made distinctions between parliaments and preparliaments, between consultative and deliberative bodies, between counsel and consent. They have argued over whether assemblies were judicial, legislative, or financial in function, whether they were representative or not, whether they were imposed on rulers or exploited by them. This entire scholarly enterprise has carried with it much ideological baggage, and the character of the inquiry has varied greatly from nation to nation. Assemblies have especially interested historians of law and politics, who have generally emphasized their function or purpose in some legal/constitutional context.

The assemblies held in medieval France were in fact so varied as to defy simple classification. With roots that lay deep in the culture of the past, they often convened for purposes that had no obvious connection with the modern constitutional model. Over time, some of them evolved their own traditions and acquired unforeseen functions that might or might not have implications for future political institutions.

Perhaps the earliest type of assembly was the convo-cation of military followers, originally a tribal war band. Great military convocations were common under the Carolingians. As ethnic distinctions blurred and royal authority became fragmented, the meetings of the 10th and 11th centuries generally were assemblies of a land or region, concerned with maintaining the fragile peace. Being concerned with maintaining or restoring order, they retained a military character but also began to exercise functions that we would describe as judicial. Both the early tribal assemblies and the later peace assemblies were occasions that might involve hard negotiating to resolve conflicts among competing interests, but such discussions took place behind the scenes and the plenary assemblies themselves were rituals of consensus. When held under the auspices of a king or great territorial lord, they were celebrations of the ruler's majesty.

Although extraordinary and ceremonial occasions, regional assemblies that dealt with problems of a recurring nature gradually showed signs of customary procedures and institutional evolution. Those "courts" concerned with maintaining order in the south were the first assemblies in France (12th and 13th centuries) to include urban representatives.

Because the power of kings and lords long required an element of public visibility, these rulers, who were constantly on the move, continued to use assemblies of various kinds to affirm loyalty and acknowledge their power. In northern France, festival courts reinforced a royalist culture of chivalry. But as the royal government grew larger in the 13th century, it became more costly and created more political strains. As it became more difficult to celebrate a consensus and exclude partisanship, the crown made less use of assemblies for several generations. Contentious matters increasingly came before the standing body of judicial experts that became the Parlement de Paris. When Philip IV

turned again to large assemblies after 1300, they served their traditional purpose of celebrating royal power and majesty, presenting a consensus in the face of his adversaries, initially Pope Boniface VIII. Philip and his sons, however, soon experimented with other uses for assemblies, although always trying to maintain control of the proceedings and use them to reinforce royal authority.

These assemblies of the 14th century now generally included the elected representatives of towns, and they began to be organized as Estates. Those who attended them were not always content with the rhetoric of consensus. Purely ceremonial assemblies did not cease to occur, but the most conspicuous gatherings of the late Middle Ages were those like the Estates, concerned with money and political policy, or the Parlement, concerned with judicial matters. When judicial questions merged with political debate, or when a ceremonial expression of royal power was called for, the kings generally preferred to use the Parlement as their forum.

# ASTRONOMICAL AND NAVIGATIONAL INSTRUMENTS

. The Middle Ages have left a variety of instruments intended to measure celestial phenomena. Most were based on Hellenistic predecessors, but some were invented or developed during the medieval period. Ara-bic scholars served as the principal means of transmitting knowledge of these instruments and their design principles to the West.

To tell time by celestial means requires least a simple sundial, and this was frequently incorporated into the architectural detail of churches. An excellent specimen is the angel holding a sundial found on the south tower of Chartres cathedral (12th c.). Portable sundials for travelers also were fabricated.

The astrolabe was the next most common instrument. By measuring the angle above the horizon of the sun or a selected star, the astrolabe projects onto a celestial map the position of the body and thus allows the observer to read the time of day from a dial or graph. Indeed, the astrolabe dial is the ancestor of the analogue clock face. The most common subtype of astrolabe was a simplified version without the celestial map, called the mariner's astrolabe. The spread of astrolabes stimulated interest in precise astronomical tables giving the position of the sun, and sometimes other celestial bodies, for each day of the year. One of the earliest was produced at Montpellier by Robert de Montpellier in 1141.

Southern France was the source of several other astronomical instruments as well. Robertus Anglicus, writing at Montpellier ca. 1276, described a form of quadrant *(quadrans vetus)* whose ultimate origins lie in India. Shortly thereafter, a member of the scholarly Provençal family of translators Yacob ben Machir ibn Tibbon (Prophatius Judaeus; d. ca. 1304), developed the "quadrant of Israel" incorporating features from astrolabes. It later was known as the "new quadrant" *(quadrans novus)*. Another Jewish scholar born in Languedoc, Levi ben Gershom, invented ca. 1342 a simplified form of measuring device, the cross-staff or Jacob's staff, later favored by mariners. Sightings from the cross-staff or the mariner's astrolabe were referred to tables like that mentioned above to determine latitude while at sea. These instruments remained in common use into the 17th century.

A novel navigational instrument appeared in the 12th century, the magnetic compass. Although there is still controversy over how the compass reached Europe, its Chinese origin is indisputable. The earliest European description comes from an English scholar resident in Paris, Alexander Neckham, writing in 1187. The earliest complete treatise on the compass was composed by the French soldier Pierre de Maricourt (Petrus Peregrinus) in 1269.

Medieval adaptations of earlier instruments include the addition of a sighting tube to the armillary sphere. Resembling a modern telescope but lacking lenses, the tube was apparently used to better orient the sphere to the north celestial pole by sighting Polaris in isolation from its surrounding stars. The earliest representation of such a device is in a manuscript by Gerbert of Aurillac (930–1003), later Pope Sylvester II. Perhaps related to the sighting tube was the nocturlabe, or nocturnal, a device with a dial and a sighting hole. One aligned pointers on the device with stars in the circumpolar constellations and read the time from a dial.

# **AUBERT, DAVID**

(b. before 1413, fl. 1453–79). Born into a family of prosperous, literate public servants, Aubert became a prolific calligrapher, translator, and literary adapter at the Burgundian court. Books copied by his fa-ther, Jean Aubert, and a brother of the same name are also known. In 1463, Aubert is mentioned as one of the duke of Burgundy's scribes for the first time. He is especially known for copies of *Charles Martel* (Brussels, Bibl. Roy. 6–9) and *Perceforest* (Paris, Arsenal, 3483–94), and for his compilations, the *Croniques et conquestes de Charlemaine* (Bibl. Roy. 9066–68), begun for an early sponsor, Jean V de Créquy, but completed for Philip the Good, and for a *Chronique des empereurs* (Arsenal 5089). Some twenty manuscripts are attributed to his hand. In 1469, after Philip the Good's death, he helped inventory the ducal library.

# *AUCASSIN ET NICOLETTE*

. *Chantefable* of the early 13th century. Extant in only one manuscript (B.N. fr. 2168), this anonymous work is one of the most unusual and, for modern audiences, one of the most popular of all Old French texts. It consists of twenty-one verse sections alternating with twenty in prose. It is normally dated to the first half of the 13th century, but a

possible allusion in Section 24 to the écu, a coin minted only after 1266, would produce a later date and one that is not unsuited to the spirit of the text. The Picard dialectal features in the late 13th-century manuscript seem to reflect the original area of composition. The possible allusion in line 2 of Section 1 to an old man (*viel antif,* a disputed reading) has been seen as relating to the author of the text. Whoever he was, the latter would have been a sophisticated minstrel or more likely a cleric (cf. the distinction between "handsome cler-ics" and "old priests" in Section 6).

The story is one of thwarted lovers who eventually live happily ever after. Aucassin, son of the Count of Beaucaire, loves Nicolette, Saracen goddaughter of the viscount of the town. Aucassin is rightly convinced that Nicolette is of noble birth, but his parents make every effort to keep the lovers apart and finally both are imprisoned. Nicolette, who is in many ways the dominant character in the relationship, escapes, and after Aucassin's release the lovers are reunited in a bower constructed by Nicolette. Attempting to leave France by sea, they are driven by a storm to the curious land of Torelore, where Aucassin, suddenly becoming more assertive, deals roughly with the king, who is lying in childbed, and intervenes in a ritualistic war fought with a variety of soft foodstuffs. His injection of violence proves successful but unpopular. The inhabitants, who, unlike Aucassin's parents, recognize Nicolette's noble birth, want to throw him out and keep Nicolette for the king's son. The land of Torelore is then attacked by pirates, who place Nicolette and Aucassin on different ships. A storm drives Nicolette's ship to the "cité de Cartage" (normally interpreted as Cartagena in Murcia province, Spain), where she discovers that she is the long-lost daughter of the king. Aucassin's ship takes him back to Beaucaire, where he becomes count. The lovers are united and marry, once Nicolette, disguised as a jongleur, discovers Aucassin's whereabouts.

In recent years, it has frequently been maintained that the principal driving force of the text is parody, directed against contemporary literary genres, such as the epic, the romance, and the saint's life. But it is rather the comic potential of these genres that seems to be exploited, and throughout the text the author's humor is the most distinctive feature, not his attack on the works of other writers. A further dimension of the plot is the twenty-year war between the Count of Beaucaire and the Count of Valence (occasionally seen as a reflection of the Albigensian Crusade), and much of the early comedy centers on Aucassin's refusal to participate in his father's war, then in his willingness to do so provided he has a kiss from his beloved Nicolette. When he does fight, he puts an end to the war in remarkably quick time, dragging his father's enemy to him by the nose piece of his helmet. But because of his father's refusal to keep his side of the bargain, he soon releases his captive. Other sources of comedy are scenes like Aucassin's encounter with Nicolette's godfather, to whom he explains that he would prefer to live in Hell with Nicolette than to spend his days in Paradise without her (Section 6); the meeting of Nicolette and later Aucassin with a group of shepherds (18, 22); the lovers' futile conversation about the nature of true love, conducted through the crack in the wall of Aucassin's prison (14); Aucassin's arrival at Nicolette's bower with a dislocated shoulder (24–26); his treatment of the King of Torelore, whom he calls the "son of a whore" (29–30); and Nicolette's search for Aucassin disguised as a jongleur. She sings to him of their love without his ever realizing who she is (39).

If there is any deeper significance to the text, it lies in the author's treatment of the generation gap, in the comic exploitation of the futility of war, and in Aucassin's failure

to make his ideals coincide with reality. But in spite of his scandalous rejection in the name of love of the principles of feudal society, Aucassin becomes on the death of his father an ideal ruler who keeps his domain safe from war (34). In addition, in spite of his obsessive love for a Saracen captive, he has chosen a partner who is right for him and for society.

The author refers to his text as a *cantefable* (41, 1.24), presumably a term he invented to cover the mingling of verse and prose. The *fable* is the narrative itself, which is closely associated with the lyrical and musical elements in the text. Each verse section is prefaced by the formula *Or se cante,* and some musical notation is contained in the manuscript. Analogues for the mingling of verse and prose can be located in other literatures (e.g., Arabic, Celtic, Chinese, Latin, Provençal), and one finds, for example, a good number of songs performed by the characters in Jean Renart's *Guillaume de Dole.* But the use of the seven-syllable line for the assonanced verse sections and the roughly equal dose of verse and prose have no clear equivalents. Thematically, there are links with other French texts, such as *Floire et Blancheflor, Piramus et Tisbé,* and the Tristan romances, but everything suggests an author with a highly original mind and a superb command of the themes and conventions of contemporary literature.

# AUDEFROI LE BÂTARD

(fl. first third of the 13th c.). One of the trouvères of Arras. The compositions attributed to him, all surviving with their melodies, include ten *chansons d'amour, a jeu-parti,* a lyrico-narrative dialogue with a forlorn lover, and five *chansons de toile*. The last constitute Audefroi's only notable contribution, representing a unique attempt to renew that apparently old genre, partly through innovations in meter and homophony but chiefly through narrative amplification and an accumulation of detail.

# *AUGUSTINE, RULE OF ST*

. From about the 12th century onward, some religious communities in the West took as their guide the *Rule of St. Augustine*. This document has a complicated history, analyzed by Luc Verheijen. In its generally received form, the *Rule* was composed of two major elements: the *Ordo monasterii,* probably sketched out by Augustine's friend Alypius and given final form by Augustine, and the so-called *Praeceptum,* a set of rules for the organization and discipline of a community, written by Augustine. In the medieval period, the received text of the *Rule* reduced the *Ordo monasterii* to the first sentence of that text. In the manuscript tradition, the *Praeceptum* also appears in a form with feminine, not masculine, pronouns and is often attached to Augustine's Letter 211, an admonitory epistle sent to a group of female ascetics. Both sections of the *Rule,* but especially the *Praeceptum,* had provisions for liturgy, food, clothing, manual labor, and the like, but these were frequently set aside in favor of local customaries developed in light of specific Benedictine or Cistercian practices that were more suited to the situation in northern Europe.

However complicated and obscure the pre-12th-century history of the *Rule of St. Augustine* may be, the influence of that text on medieval religious life was profound. Most orders of regular canons, as at Prémontré or Saint-Victor, followed the *Rule,* and when St. Dominic found it necessary to choose from an existing rule for the Order of Preachers (Dominicans), he turned to the Augustinian rule. The *Praeceptum* was first set out in the context of Augustine's own concern with the formation of a community of priests living a life dedicated to poverty and a fully common life in his episcopal household in Hippo. Thus, the later history of the *Rule* as a guide for communities of priests was a faithful echo of its origin in the creative days of the formation of the ascetic-monastic ideal in the West, even before the time of St. Benedict and his own immensely influential *Rule*.

# AUGUSTINIAN CANONS

. *See* **REGULAR CANONS**

# AUGUSTINIAN FRIARS/HERMITS

. In 1256, Pope Alexander IV ordered several groups of hermits in northern Italy to unite under the authority of the *Rule of St. Augustine* and to model their life according to the *Constitutions* of the Dominican order, which also followed the Augustinian *Rule*. These groups of hermits thus came under the influence of the mendicant ideal and soon moved to cities. The new order quickly spread to France, Spain, Germany, and England; like the Dominicans and Franciscans, the Augustinian Friars quickly established houses of study at university centers and became major participants in late-medieval university life.

# AULNAY-EN-SAINTONGE

. Situated on the important Roman road that connects the Île-de-France to the southwest via Tours and Poitiers, Aulnay (Roman Aunedonacum) is the site of an important pilgrimage church on the route to Santiago de Compostela. Little is known about the construction of the church of Saint-Pierre-de-la-Tour, which dates most probably to the middle of the 12th century, when the regional Romanesque of Poitou and Saintonge was at its height. This richly sculpted church is located outside the town in the midst of an ancient cemetery in which Roman burials have been found.

The exterior gives an impression of squat massiveness, reinforced by the crossing tower, whose upper level and steeple are later additions. The central apse contains some of the most harmonious sculpture at Aulnay: in the space between the window and the flanking colonnettes, the sculptor has placed a series of eight graceful figures set in foliage. But the glory of Aulnay lies in the sculptures of the south and west portals. The south portal consists of four richly sculpted archivolts, peopled by figures carved in a squat and stolid manner to match the shape of the
Aulnay-en-Saintonge (Charente-Maritime), Saint-Pierre, south portal. *Photograph courtesy of Whitney S.Stoddard.*

stones. The innermost archivolt contains six animal figures in a swirl of scrollwork reminiscent of Arabic art. The second archivolt contains twenty-four haloed saints; the third has the twenty-four Elders from Revelation; and the final archivolt is a bestiary of fanciful animals that suggests the Feast of Fools or humanity's constant struggle with its bestial nature. This theme may be echoed in the second archivolt of the central portal of the west façade, where we find armed Virtues trampling the Vices. The third archivolt depicts the Wise and Foolish Virgins. The style here, with its graceful and elongated figures, is very different from that of the south portal. The flanking portals of this façade show the crucifixion of St. Peter and Christ in Majesty.

The interior of Saint-Pierre consists of a five-bay nave with narrow side aisles, a transept, and a deep choir. Quatrilobed columns with richly sculpted capitals carry broken barrel vaults. One famous capital shows three elephants; others have griffins, fantastical animals, and monsters; but the most celebrated shows the sleeping Samson being bound by Delilah while a Philistine is cutting his hair with enormous shears.

# *AUMÔNIER/AUMÔNERIE*

. The Latin title *elemosinarius,* from which the Old French *almosn(i)er or aumosnier* and its English equivalent, "almoner," are derived, was applied from an early date to the official of a religious house who was charged with the distribution of alms (*almosnes, aumoesnes,* derived through Latin from Greek *eleemosune* 'compassion, charitable gift'). By the 14th century, a similar officer, normally a cleric of some sort, had come to be attached to the households of many princes and prelates, where he often functioned as a sort of chaplain as well. Great princes sometimes maintained a whole corps of almoners, who together formed a department of their household or chapel called the *aumosnerie*. In the household of the king of France, this department was called the *grande aumosnerie de France,* and its chief officer, who was normally a prelate, bore the title *grand aumosnier de France*.

*D'A.Jonathan D.Boulton*

# AURAY

. The town of Auray (Morbihan) was the site of a battle, fought on September 29, 1364, that brought an end to a war of succession in the duchy of Brittany that had lasted for twenty-three years and established as duke Jean IV of the Montfort family. The opposing claimant, Charles de Blois, had French support, and his army contained the celebrated Bertrand du Guesclin and most of the great lords of Brittany. Jean de Montfort could count on only one major Breton lord, Olivier de Clisson, but he had with him three renowned English captains—John Chandos, Hugh Calverly, and Robert Knolles.

While Montfort's forces besieged Auray, his enemies attacked in an effort to raise the siege, but they met with overwhelming defeat, as Charles was killed and Du Guesclin captured. Chandos and his compatriots are credited with the decisive role in the victory, while Clisson, who lost an eye in the battle, won his reputation as a courageous warrior.

Auray has only one building with vestiges of its medieval past, the former Chapel of the Holy Spirit. Although radically transformed into a military hospital after 1831, fragments of the late 13th-century window tracery and other elements of the chapel are still visible. Most remarkably, the late 13th- or early 14th-century oak roof is still intact.

# AURELIAN OF RÉÔME

(fl. late 9th c.). The *Musica disciplina,* a collection of theoretical texts drawn from a wide variety of disparate sources, is attributed to one Aurelian of Réôme. The manuscript tradition and the compiler's relation to the Benedictine house of Saint-Jean de Réôme suggest the treatise originated in the late 9th century, probably in Burgundy.

The compilation is one of the earliest collections of music theory treating medieval liturgical practice. It begins (Chapters 2–7) with an extended essay on music as a liberal art, basically a collection of material drawn from Boethius and glosses on *De institutione musica,* from Cassiodorus, and from Isidore. A chapter on the modes follows, which, while a curious compilation of sources, is an important witness to modal terminology of the Carolingian era. The core of the collection (Chapters 8–18) presents a primitive theoretical tonary—a discussion of each mode, or "tone"—citing over a hundred examples of liturgical melodies in all genres. A chapter on the psalm tones follows, which in the earliest manuscripts includes musical notation in paleo-Frankish neumes, the only place any form of musical notation is found. The treatise concludes (Chapter 20) with an essay concerning genres of liturgical melodies and an epilogue.

The centonate nature of the treatise itself is reflected in the manuscript tradition, for only three sources contain the work as a whole, while over twenty codices contain pieces from the whole. It is by no means clear if these "pieces" are excerpted from *Musica disciplina* or if they have an independent textual history. Aurelian's compilation is nevertheless a major accomplishment in the history of medieval music theory, for through this collection one can establish the nature of texts that were being read and circulated in the 9th century.

# AUSTRASIA

. Austrasia, "the eastern land," was the northeastern region of the Frankish kingdom. It stretched from near the Seine to the Rhine and included the important Meuse and Moselle river valleys. In general, its population was more Germanic-speaking and Germanic in culture than the other regions of the Frankish kingdom, and in fact it included most of the Franks themselves. It was especially the region inhabited by the Ripuarian, or Rhineland,

Franks, and the *Lex Ribuaria* was for Austrasia. The Carolingians and their early supporters were Austrasians.

Austrasia first appears in the sources in the later 6th century as the kingdom of Childebert II (r. 575–95), and it was not truly based on the divisions of the Frankish kingdom among the sons of Clovis I in 511 or the sons of Clotar I in 561. It probably had its origins with the 5th-century kingdom of the Rhineland Franks centered on Cologne and taken over by Clovis I. From the later 6th century, Austrasia was seen as a distinct region within the Merovingian kingdom, with its own administration led by an Austrasian mayor of the palace even when it did not have its own king. With the Carolingian and Austrasian triumph in 687, it no longer enjoyed a separate administration, though Austrasians dominated early Carolingian government.

Much of later Merovingian history can be seen as a struggle for domination between the magnates of Austrasia and those of Neustria, which was more Roman in language, culture, and population. More than a century of Neustrian supremacy ended with the victory of the Austrasian mayor Pepin II at Tertry in 687. Most of Austrasia was allotted to Lothair I by the Treaty of Verdun (843), and it comprised most of the kingdom that went to his son Lothair II in 855, which then came to be called Lotharingia, or Lorraine. However, some of western Austrasia was assigned in 843 to Charles the Bald, who ceded the region to Hugues l'Abbé. It later made up most of the lands of Herbert II of Vermandois, but at his death in 943 his lands were divided among his heirs, as well as Hugues le Grand and King Louis IV.

# AUTUN

. Saint-Lazare at Autun (Saône-et-Loire) exemplifies the Burgundian Romanesque style. Construction began ca. 1120 south of the cathedral of Saint-Nazaire, which the new church, consecrated in 1130, replaced. Building was almost complete by 1146, when the relics of St. Lazarus were translated. Work continued with completion of the west porch, additions of flying buttresses in the 13th century, and building of towers and side chapels off the aisles in the 15th and 16th centuries.

Autun (Saône-et-Loire), Saint-Lazare,
west-portal tympanum, Last Judgment.
*Photograph courtesy of Whitney
S.Stoddard.*

Autun, Saint-Lazare, nave wall.
*Photograph courtesy of John B.
Cameron.*

The elevation, vaulting, and architectural details show the influence of Cluny. The plan features a nave of seven bays flanked by single aisles, projecting transept arms, and a choir of two bays with single aisles. Small apses terminate the aisles with a larger central apse behind the altar. The three-story elevation has a lower arcade with pointed arches that is twice the height of the upper stories, a triple-arched passage for the triforium, and a clerestory with a single opening in each bay. A pointed barrel vault spans the nave, transept, and choir. The aisles are groin-vaulted, and a dome on squinches surmounts the crossing. Fluted pilasters of classical inspiration extend from the springing of the transverse ribs of the vaults through the compound piers of the arcade.

The sculptural program of Saint-Lazare has exterior decoration on the west-façade tympanum and north-transept portal along with about fifty capitals and the tomb with relics of St. Lazarus on the interior. The west tympanum is still *in situ;* fragments and some of the capitals are preserved in the upper sacristy and the Rolin Museum. The inscription GISLEBERTUS Hoc FECIT on the west tympanum identifies the sculptor, and his work displays a consistent style and quality. In the Last Judgment of the west tympanum, the static abstract presence of Christ at the center contrasts with the active elongated figures of the elect and the damned to the sides. The expressive quality of Gislebertus's sculpture appears in the contortions of the damned and in the gentle touch with which angels raise the elect. This artistic range continues in the historiated capitals, where Gislebertus depicts torment, as in the Suicide of Judas or the tender bond between the Virgin and Child in the Flight into Egypt. The reclining Eve from the lintel of the north portal, a rare medieval portrayal of a female nude, is both sensuous and sensitive. Because of the unity of its architecture and sculpture, Autun is one of the best preserved and most outstanding monuments of Romanesque art in France.

# AUVERGNE

. Region of central France, comprising roughly the present-day *départements* of Puy-de-Dôme, Cantal, and Haute-Loire. Auvergne formed part of the subkingdom of Aquitaine under the young Louis the Pious (779–840; king of Aquitaine from 781). In the late 9th century, it became part of the dominions of the duke of Aquitaine, William I the Pious (d. 918).

By ca. 986, Gui (Wido), the hereditary viscount at Clermont, had taken the title of count. From this same family came also the 10th- and 11th-century bishops of Clermont. Nevertheless, the count's regional power was weak, while the dukes of Aquitaine—a title now held by the counts of Poitou—were only nominal overlords. Political and economic power in the 10th and 11th centuries was exercised by numerous castellans, aristocratic families who held and resided in castles. Their impact was great enough to shift settlement patterns: the earlier villages of the fertile plains gave way to nucleated villages centered on hilltop castles. Important patrons of monasteries and cathedral chapters,

Auvergnat castellan families swelled the archives of houses like Brioude and Sauxillanges.

Continuous wars between castellan groups in the 10th through early 12th centuries were part of ongoing processes of feuding and peacemaking. New forms of peace were created. Gerald of Aurillac (d. 909), whose *Vita* by Odo of Cluny (d. 942) presented one of the first models of a warrior saint, was an Auvergnat aristocrat. Early and important peace councils met in Auvergne: at Laprade ca. 975/80 (probably the first instance of the Peace of God) and at Saint-Paulien ca. 993/94).

When Eleanor of Aquitaine married Henry II Plantagenêt in 1152, Auvergne became part of the Angevin empire. In 1189, however, Henry recognized the suzerainty of Philip Augustus (d. 1223) over the region. Auvergne subsequently became an apanage (part of the royal domain given out to a cadet of the royal house). Thus, in 1225, Louis VIII (d. 1226) granted the region to his son Alphonse (d. 1271), while in 1360 it was among the territories given to John, duke of Berry.

# AUVERGNE, MARTIAL D'

(ca. 1430/35–1508). A native of Paris and procurator at the Parlement de Paris after 1458, Martial d'Auvergne is best known for the prose *Arrêts d'Amour* (ca. 1460). In this work, which grew out of the Quarrel of the *Belle dame sans merci,* Martial narrates a series of fifty-one fictional trials before the Court of Love. After a lively and often realistic presentation of opposing arguments in appropriate jargon, the cases are closed by unappealable decisions: Love's decrees (arrêts). No manuscripts survive, but the work was frequently printed in the late 15th and early 16th centuries.

Martial's *Vigiles de Charles VII* (1477–83), a long poem in honor of the late king (d. 1461), incorporates a chronicle of his reign with alternating allegorical passages lamenting the "good old days." The *Matines de la Vierge* alternates passages relating the life and miracles of Mary with intimate insights into Martial's own life. He may also be the author of a *Danse des femmes,* on the model of the *Danse macabre des hommes.*

# AUXERRE

. Situated on the left bank of the Yonne, medieval Auxerre (Yonne) grew from the Roman Autessiodurum, founded on the site of the Gallic settlement of Autricum. Sources on early Christian activity mention the martyrdom of Priscus (late 3rd c.) and the establishment of early church leadership under Peregrinus and Germain (418–48). One of the seven cities of the civil province Lugdunensis Quarta in 400, Auxerre and its see came under Frankish control in the 6th century. The episcopal domain, established by 700 and restored in the 10th century, changed hands a number of times before being reunited to France under Charles V in 1370. In the Middle Ages, the Benedictine abbey at Auxerre was celebrated for its schools, founded in the 11th century. In the late Middle Ages, the flourishing religious communities in Auxerre began to decline, due largely to the Hundred Years' War and the Wars of Religion. However, much of the medieval fabic of the city remains.

With its asymmetrical west front of one bulky tower and series of blind canopies, the former cathedral of Saint-Étienne dominates the city. Its 11th-century painted crypt is 40 feet wide and divided into a nave and two side aisles

Auxerre (Yonne), Saint-Étienne,
chevet section. After King.

by two rows of early compound piers. In the upper church, with its three-story elevation, the 13th-century Gothic choir has quadripartite rib vaulting, with sexpartite vaults in the nave. The base of the west portals (ca. 1285–1385) carry Old Testament and other scenes in relief, framed by quatrefoils and trefoils. The painted vaults of the crypt, dated to ca. 1100, feature Christ and angels on horseback and were probably executed under Bishop Humbaut. Stained glass from the 13th-16th centuries can be found in the east end. The treasury features medieval enamels, manuscripts, and miniatures.

Built from the 12th century to the 16th, the church of Saint-Eusebius has a Romanesque nave, but little else remains from the medieval period. In contrast, much of the abbey church of Saint-Germain survives. Founded in the early 6th century, the abbey initially consisted of a basilica with a number of tombs in an above-ground crypt built

beyond the east end. Royal patronage financed much of the early construction. Conrad, uncle of Charles II the Bald, ordered a wax model of the basilica to ensure the outcome of his funds before building took place. The abbey church originally had a bell tower in front of the church, three parallel apses, cruciform piers, and a tower-framed façade. The abbey church has a 9th-century crypt with Carolingian frescoes and an upper church with a 13th-century choir and 15th-century nave.

# AVALLON

. The church of Saint-Lazare at Avallon (Yonne) is a modification of Romanesque Vézelay, 8 miles west. The nave and aisles were constructed in the 1140s in front of an older sanctuary and crypt. The nave consists of five bays flanked by aisles, with a nave arcade, blank wall above it, and a clerestory. Nave and aisles are crowned by groindomed vaults. The elevation replicates that of the church of La Madeleine at Vézelay, but the spaces of Avallon are thinner and taller than those of Vézelay. This slight shift in proportions is the result of domical profiles of vaults in each bay. No capitals animate piers, as in Vézelay.

The choir is 30 feet lower than the pavement in the western bay of the nave. A series of steps, adjacent to the nave piers, lowers the level. This change is echoed by the lowering of the molding that establishes the bottom of the clerestory. This simplified variant of the Vézelay interior elevation, combined with sensitive treatment of a difficult site, makes Avallon an interesting structure.

Only two of the three west portals have survived, and only one of the seven jamb statues is *in situ*. The tympanum of the right portal depicts the Adoration of the Magi, Journey of the Magi, and the Magi before Herod. Although related to Vézelay sculpture, figures are thinner and more attenuated. Ornament, smothering bases and archivolts, represents the late, baroque flowering of Romanesque Burgundian sculpture. The lone jamb figure is clearly influenced by the west portals of Chartres, finished by the mid-1140s, but the head remains Burgundian.

# AVENAS

. Located on the Roman road from Lyon to Autun, Avenas in Beaujolais is the site of a 12th-century church whose Romanesque altar is one of the finest sculpted altars of medieval France. Carved in white limestone, it depicts

Avenas (Rhône), altar. *Photograph courtesy of Whitney S.Stoddard.*

Christ in a mandorla surrounded, on two levels, by the twelve apostles holding books representing their writings. On the left lateral face are depicted scenes from the life of the Virgin, and on the right face is King Louis VII offering the church of Avenas to the chapter of Saint-Vincent of Mâcon.

*William W.Kibler*

# AVESNES

. The Avesnes family of Hainaut became involved in dynastic quarrels there and in Flanders and Holland. Jacques d'Avesnes was a vassal of both Count Baudouin V of Hainaut and his brother-in-law, Count Philippe d'Alsace of Flanders, in the late 12th century. The family's fortunes were made when Burchard d'Avesnes married Marguerite, sister and eventual successor (1244–78) of Countess Jeanne of Flanders (r. 1206–44). In 1219, however, he was imprisoned and his marriage to Marguerite declared invalid. After Marguerite's remarriage to Guillaume de Dampierre, the Avesnes and Dampierre families quarreled over her inheritance. In 1246, Louis IX of France awarded rule of Flanders to the Dampierres and of Hainaut to the Avesnes, but neither party accepted the decision, and they continued to fight over imperial Flanders, which had been unaffected by it. During the struggles between the Flemish count Gui de Dampierre and King Philip IV of France during the 1290s, the Avesnes naturally followed France. Jean d'Avesnes

had married Aleid of Holland, sister of Count William II, which formed the basis for the dynastic union of Holland, Zeeland, and Hainaut under the Avesnes in 1299. The direct line of the family was extinguished in 1345, when William II was succeeded by his sister Marguerite, the wife of the emperor Louis of Bavaria, and her son William III, whose rule unleashed civil warfare in Holland. The Bavarian Avesnes ruled Holland, Hainaut, and Zeeland until these principalities were absorbed into the Burgundian state in 1433.

# AVIGNON

**.** The Roman city of Avenio seemed destined to mediocrity before the arrival in France of the papal court in the early 14th century. Thereafter, however, it grew to be the leading city of the Vaucluse and one of the richest of France. Its prosperity in the late Middle Ages is attested even today by its impressive, well-preserved ramparts (over two miles long), its many churches and chapels, but espe

Avignon (Vaucluse), Papal Palace.
*Photograph courtesy of Karen Gould.*

cially by the enormous papal palace. The bridge of Saint-Bénézet, celebrated in song, was constructed between 1177 and 1185, rebuilt in the 13th century, but later largely destroyed by flooding. Only four spans of the original twenty-two remain.

The Palais des Papes is actually two palaces around a large courtyard. With its high walls with arcades, its turreted entrance, and its large rectangular towers at either end (the eight-storied Tour de Trouillas and Tour des Anges), the palace is more a fortress than a residence. It is indeed an excellent example of 14th-century military architecture. The large but austere Palais Vieux was begun in 1335 by Pierre Poisson for Pope Benedict XII. Centered on its cloister, the first floor includes the butlery, the consistory, garderobe, treasury, library, and several chapels. Of particular interest are the superposed chapels of Saint-Jean and Saint-Martial, which were decorated with frescoes of court life by Matteo di Giovanetti da Viterbo for Clement VI. Other frescoes by Giovanetti are preserved in the Chambre du Cerf and Salle de la Grande Audience in the Palais Neuf. The upper floor of the Palais Vieux includes the major reception rooms as well as the private apartments of the popes.

The sumptuous L-shaped Palais Neuf, begun in 1345 by Jean de Loubière for Pope Clement VI, communicates directly with the Palais Vieux. It includes large reception rooms as well as apartments for visiting dignitaries. The elegant Chapelle Clementine, reached by the Grand Staircase, was reserved for special ceremonies. Its nave is 50 feet wide, but its vaults reach only 62½ feet, because it was constructed over the Salle de la Grande Audience and its roof could not extend beyond that of the other build-ings in the complex. After the departure of the papacy in the late 14th century, the palace fell into disrepair and was eventually used as a prison—a use that saved it from destruction in the Revolution.

Churches in Avignon include Saint-Agricol (14th-16th c.), with a Flamboyant portal whose tympanum depicts the Incarnation; Saint-Didier (1325), with a magnificent altar frontal by François Laurana (15th c.) depicting Christ carrying the Cross; Saint-Pierre, rebuilt after 1358; the late 14th-century convent of the Celestines; and the chapel of Saint-Nicolas. But the most important medieval church is the Romanesque Notre-Dame-des-Doms. It consists of a nave of five aisleless bays with four western ones vaulted by pointed barrel vaults strengthened by double transverse arches and the eastern bay capped by a cupola supported by eight relieving arches. The east end consisted originally of a semicircular apse but was altered by the addition of one bay plus a polygonal apse in the 17th century. The eastern cupola is enclosed in an octagonal lantern.

The west end of Notre-Dame-des-Doms consists of a low chamber with a squarish higher room above, which is crowned by a cupola on squinches. This whole narthex has a four-storied bell tower rising above the cupola. A porch with engaged half-columns supporting a classical entablature was added to the narthex. This last element can be found on numerous Provençal churches. However, the narthex with bell tower is not typically Provençal.

The nave displays wide bays, partially obstructed by additions to the piers to support a 17th-century balcony. From this balcony, one can clearly see the colonnettes, capitals, and impost blocks that animate the outer responds and visually support the floral cornice, which runs the length of the nave. The ornament of the nave and the exterior of the lantern are strongly related to that of Roman monuments. According to Alan Borg, Notre-Dame-des-Doms was constructed in the late 11th century.

Besides the ornamental sculpture of Notre-Dame-des-Doms, there is the Episcopal Throne in the nave and fine marble capitals from the destroyed cloister, both historiated and floral, which are now in the Musée des Beaux Arts in Avignon, as well as in museums in Aix-en-Provence, Marseille, Lyon, Cambridge, New York, and Philadelphia. Like Arles, this cloister has ornamented capitals on the garden side and mostly historiated ones on the gallery side. The cloister was created in the late 1150s.

# AVIGNON PAPACY

. The Avignon papacy has suffered both from Petrarch's description of it as "Babylon" and from invidious comparisons with the reforming popes of earlier centuries. Recent scholarship has offered a more balanced assessment of the 14th-century popes without masking the complacency, fiscalism, and nepotism prevalent at Avignon. The papal court was not an appendage of the French monarchy; but its ethos was predominantly French in the largest sense, reflecting the origins of the popes and most of their cardinals.

A strong Capetian influence can be traced in the curia in the second half of the 13th century, when several French popes reigned and the papacy became entangled in the Angevin domination of Naples. The transfer of the papacy to Avignon, however, resulted from the defeat of Boniface VIII (r. 1295–1303) by Philip IV the Fair and the king's domination of Clement V (r. 1305–14). Failing to elect one of themselves to succeed Benedict XI (r. 1303–04), the cardinals had chosen the archbishop of Bordeaux, who even before his coronation as Clement V acquiesced to Philip's desire that the ceremony be held in his presence at Lyon. Philip imposed his will on a timid and ailing pontiff. The papal bull *Clericis laicos* (forbidding secular rulers from taxing clerics without papal consent) was revoked, and *Unam sanctam* (asserting papal supremacy in temporal as well as spiritual matters) was given an evasive interpretation. Only in helping deny the imperial crown to Charles of Valois, Philip's brother, did the pope frustrate the Capetian king's desires.

Clement never felt able to go to Rome, a dangerous city. While preparing for the Council of Vienne (1311), he resided in Avignon in Provence, an Angevin fief just outside France. The council condemned several errors, including those ascribed to the béguines; but Clement had to wrest final consent to the dissolution of the Templars, against whom Philip IV was proceeding, from a secret consistory. The canons of the Council of Vienne were revised for inclusion in the *Constitutiones clementinae,* the last official collection of medieval canon law. Its emphasis on orthodoxy, obedience, and coercion of dissidents would be typical of the Avignon popes.

Clement died at Carpentras in 1314; a long conclave, dominated by French cardinals, finally named Jacques Duèze, who reigned as John XXII (r. 1316–34). In his pontificate, Avignon became the papal residence, a center of government, finance, trade, and theological debate. To maintain a court so far from Rome, to which it was supposed to return some day, John expanded and regularized papal patronage of benefices, as well as the fees and taxes collected by the curial bureaucracy. At the same time, special commissions began trying to resolve numerous theological issues. Among the writers condemned were Jean de Pouilli, a Parisian master who questioned the papacy's ability to concede pastoral powers to the friars, and the Dominican mystic Meister Eckhart. After a long series of inquiries, a posthumous condemnation was decreed for Peter Olivi, a Franciscan who had espoused Joachite views, strict poverty, and his own version of papal infallibility, which would safeguard recent papal endorsements of the belief that Christ and the Apostles had no property rights. John, with the acquiescence of Michael of Cesena, the Franciscan minister general, began proceed ings for heresy against the Spiritual wing of the order, especially in southern France; but the pope soon decided that any Franciscan doctrine of poverty was subversive. When Michael found the pope adamant about revoking past papal pronouncements on this subject, he and William of Ockham fled to Germany, taking refuge with the emperor Louis of Bavaria, John's most bitter political foe.

John was on good terms with Philip V of France, but his relations with the empire had deteriorated rapidly. Clement V had supported Robert of Sicily, an Angevin, against Emperor Henry VII, despite having favored that Luxembourg prince's election as King of the Romans. After Henry's death, the papacy temporized among the rival claims of Luxembourg, Habsburg, and Bavaria. In 1327, Louis of Bavaria, deciding that John was his chief foe, marched on Rome. The Eternal City fell, and an antipope was installed there. Louis's vicar for the city was Marsilius of Padua, whom John had condemned for arguing on the basis of reason and revelation that a lay monopoly on coercive jurisdiction would bring peace to Italy. William of Ockham argued that John's errors concerning apostolic poverty made him a heretic. Although Louis's campaign failed and his antipope became John's prisoner, the polemics of the king's apologists would continue to haunt the papacy. Their credibility was boosted by John's short-lived effort to challenge accepted ideas about the beatific vision.

John's successor, Jacques Fournier, an experienced inquisitor, reigned as Benedict XII from 1334 to 1342. During his pontificate, pope and cardinals began building permanent palaces at Avignon, as if the curia never would return to Rome. Benedict, however, kept a stricter rein on the life of the court than had Clement or John. He also attempted reform of monastic communities, often in a peremptory manner. The pope inherited his predecessor's quarrel with Louis of Bavaria, but French influence foiled negotiations for peace. This old sore would continue to fester until, during the next pontificate, Charles of Luxembourg displaced Louis as emperor.

Benedict, like many popes of that period, cherished the hope of launching a successful crusade. This was foiled when the Valois succession in France was disputed by both Charles of Navarre and Edward III of England. Philip VI had the pope's favor for a time, but he wished to keep the funds raised for the crusade for wars nearer home. Benedict's best efforts to reconcile Philip with Edward failed, leaving the English convinced that the Valois interest dominated Avignon. Edward, moreover, allied himself with Louis of

Bavaria and used antipapal legislation to pressure the clergy into helping fund his campaigns.

When Benedict died in 1342, the cardinals quickly agreed on Pierre-Roger de Beaufort, who reigned as Clem-ent VI from 1342 to 1352. Pierre-Roger had been a Benedictine, a theologian and preacher, an archbishop of Rouen, and a servant of the French crown. Despite the ravages of the Hundred Years' War and the eruption of the Black Death in 1348, Clement's pontificate would be regarded as the great age of the papal court at Avignon. The city of Avignon was purchased from the Angevins, as if the papacy never would leave. The papal palace was expanded, harboring an elegant court, one that contrasted sharply with Benedict's austerity. The best artists, musicians, and writers were employed. In this period, Petrarch enjoyed papal benefactions, even as he wrote poems about Laura, described his ascent of Mount Ventoux, and criticized his master. The ceremonies of the papal chapel were conducted decorously under Clement's supervision, and he preached on important occasions. Nor did the pope neglect the welfare of his subjects during the plague years, burying the dead and caring for the survivors.

The papal palace, however, was not sufficient to contain the entire court and bureaucracy. The papal household alone employed many lay and ecclesiastical functionaries, who, besides caring for the pontiff, entertained his most important guests. A Dominican served as master of the sacred palace, teaching theology and delivering opinions on disputed points of doctrine. The cardinals had their own households, where young clerics might start their quest for advancement. All of these households overlapped with the curial apparatus.

The chancery handled the most important correspondence, including responses to petitions for favors from throughout Christendom. The chancery also examined the fitness of clerics lacking university degrees for the benefices they sought. All documents concerned with private interests were subject to taxation on a set schedule of fees. The chamber received revenues, audited accounts, and resolved disputes concerning these transactions. The penitentiary handled cases concerning matters of conscience, granted routine dispensations, and maintained a staff of confessors able to deal with the major languages of Europe. The papal system of justice still employed judgesdelegate conducting hearings throughout Christendom, but a liberal policy of receiving appeals combined with a desire for decisions by the highest tribunals encouraged litigants to carry an increasing volume of business to Avignon. Many princes, prelates, and ecclesiastical corporations retained permanent proctors at the curia. Others employed those who clustered around the tribunals. The highest court was the consistory, that is, the pope and cardinals meeting as a tribunal; but most cases were handled by such bodies as the Rota, whose decisions provided precedents for canonists to study. An entire tribunal existed just to verify documents presented by litigants, but forgery remained common. Bribery and nepotism flourished, helping to give the curia a bad name.

Clement's reign, despite the purchase of Avignon, saw the papacy become preoccupied with Italian politics, leading eventually to efforts to return it to Rome. Cola di Rienzo rose and fell as tribune of the Roman people. Papal legates made efforts to gain control of the turbulent cities of the papal states, many the domain of tyrants. The Visconti rose to power in Milan, and the papacy vacillated over whether to accept their regime as legitimate. Visconti domination drove Florence, once the heart of the Guelf

alliance, to renew its ties with the Angevins. Naples, however, fell into the incompetent hands of Joanna, granddaughter of Robert the Wise. Without effective Angevin support and unable to rely on Clement, Florence began its own campaign to dominate all of Tuscany. None of these tensions prevented the pope from organizing a short-lived Latin League to campaign against the Turks; but rivalries between Genoa and Venice prevented it from exploiting its initial success. The rising tensions in Italy were the background of Gil Albornoz's campaign to win control of the papal states for Clement's successor, Innocent VI (r. 1352–62). That native of the Limousin, a more austere and reforming pontiff than his predecessor, poured money into his legates' campaigns. Fiscalism predominated, although some of the curia's income went into bribing free companies turned loose in a lull in the Hundred Years' War to leave Avignon alone. Albornoz won sufficient success to prepare the way for a brief return of the papacy to Rome in the reign of Urban V (r. 1362–70). Urban, however, left part of the bureaucracy at Avignon, evidence of French reluctance to face the perils of Italy. Pressure for a more permanent return persisted from figures as different as Petrarch and Bridget of Sweden.

The decisive decade for the Avignon papacy was the 1370s. Urban's successor, Gregory XI (r. 1370–78), a nephew of Clement VI, was modest, pious, and learned but lacking in resolution. Sufficient resolution to return the papacy to Rome was provided by Catherine of Siena, who lectured the pope on his duty both through letters and in person. The divisions of the curia about a return can be seen in the contemporaneous building campaigns of Gregory around Avignon and in Rome. Both helped exhaust a papal treasury already drained by the benefactions of Urban V. Other distractions were provided by Anglo-French tensions, war with Florence, and the pope's efforts to suppress the Waldensians of Provence. At last, Gregory agreed to go to Rome. He left in 1376; but, once more, part of the curia remained in Avignon. The pope entered Rome in 1377, and he remained there until his death the next year. The Limousin and Gallican factions in the College of Cardinals, unable to elect a cardinal from either group in the tumultuous atmosphere of Rome, whose populace feared another flight to Avignon, chose a curial official, Bartolomeo Prignano, who became Urban VI (r. 1378–89).

Matters might have reached peaceful resolution had Urban VI proved reasonable. His efforts to reform the cardinals, however, were tactless, and his temper was violent to the point of seeming insanity. The cardinals, even the few Italian ones, fled Rome. They met in Fondi, in Joanna's Neapolitan kingdom, and chose Robert of Geneva as Clement VII (r. 1378–94). After failing to drive Urban VI from Rome, Clement returned to Avignon. The princes of Europe held inquiries into the cases for the two pretenders; but the choice between Rome and Avignon tended to follow the lines of alliances in the Hundred Years' War. Despite loud cries for unity, Christendom remain divided for four decades until the Conciliar Movement healed the rupture, though not before a third papal line was begun at the Council of Pisa (1409). The papacy never would regain the degree of control it had exercised from the palace at Avignon in the days of Clement VI. Avignon itself would remain a papal possession until the time of the French Revolution, when it was annexed by the First Republic.

# AYCELIN DE MONTAIGU

. An important noble family from Auvergne that held lands near Billom (Puy-de-Dôme), the Aycelin produced a series of influential prelates and royal councilors in the 14th century. Pierre Aycelin, who was a contemporary of Philip III (r. 1270–85), left the family lordships to his eldest son, Guillaume, while several younger sons pursued ecclesiastical careers. Hugues, a Dominican, became a cardinal in 1288; Jean became bishop of Clermont; and Gilles, an accomplished lawyer, became archbishop of Narbonne in 1290 and archbishop of Rouen in 1311.

Gilles Aycelin, an important adviser of Philip IV the Fair (r. 1285–1314), had to act with circumspection during Philip's conflicts with the papacy. As archbishop of Narbonne, he favored an ecclesiastical rather than a secular trial when Philip arrested his suffragan, Bernard Saisset, bishop of Pamiers, on charges of treasonable conduct in 1301. In Philip's final conflict with Boniface VIII in 1303, Gilles supported the plan to bring the pope to trial for heresy before a church council. During the pontificate of Clement V (r. 1305–14), when Philip IV moved to have the Templars condemned for heresy, Clement made Aycelin president of the papal commission to investigate the order. Before his death in 1318, the archbishop established the Collège de Montaigu, later one of the most prominent colleges in the University of Paris.

Guillaume Aycelin had two sons, Gilles, lord of Montaigu, and Albert, bishop of Clermont (r. 1307–28). Two generations later, the family produced two additional prelates. The elder of these, another Gilles (d. 1378), served briefly as royal chancellor in 1357 and was bishop of Thérouanne. A younger brother, Pierre, served as chancellor to John, the young duke of Berry (1357–60), and then entered the service of Charles V. He became bishop of Laon, and therefore a peer of France, in 1370 and subsequently a cardinal.

Pierre Aycelin de Montaigu became associated with those advisers of Charles V known as the Marmousets, a loose alliance of financial officers and military commanders. The faction, and its leader, Olivier de Clisson, constable of France, competed for power with the dukes of Berry and Burgundy in the early years of Charles VI's reign (r. 1380–

1422). On November 2, 1388, the cardinal of Laon proposed in the royal council that Charles dismiss the dukes and assume personal control of the government. Aycelin died six days later, amid widespread suspicions of poison. A subsequent remark by Clisson suggests that Pierre had indeed been the spokesman of the Marmousets when he made his proposal. He was the last member of the family to hold a powerful position, as the male line ended with the death of his nephew Louis, lord of Montaigu, in 1427.

# *AYE D'AVIGNON*

. Preserved complete in a single manuscript (B.N. fr. 2170), this anonymous late 12th-century chanson de geste of some 4,132 Alexandrines combines epic and romance characteristics. Starting as an epic attached to the small Nanteuil Cycle (thematically related to the Rebellious Vassal Cycle), it tells, in outline, of the marriage of the eponymous heroine to Garnier de Nanteuil and the maneuvers of the treacherous clan of Ganelon to secure the marriage for one of its members instead. They succeed in buying the favor of Charlemagne and in capturing Aye; she spends some time as prisoner of a virtuous Saracen king, Ganor, who wishes to marry her. Rescued by Garnier in disguise, Aye returns to Avignon with him and gives him a son, Gui. The Ganelonides succeed in treacherously killing Garnier and bribing Charlemagne to give his widow to their leader, Milon. Ganor, who had earlier abducted Gui, now returns to the rescue with the youth, who kills Milon in battle; Ganor, having proved himself worthy of Aye's love and been converted, marries her.

The interest of this action-packed poem lies in the dovetailing of the romantic story of Ganor's love and his suit for Aye's hand into an epic (the inevitable passivity of the beautiful heiress being the unifying link) and in the poet's transcendance of the normal epic assumption that Saracens and Christians have clear and opposite moral roles: here, the boundaries are intriguingly smudged.

# *AYMERI DE NARBONNE*

. An epic poem of 4,708 rhymed decasyllables from the early 13th century, *Aymeri* tells how Charlemagne, returning from Spain distressed by the disaster of Roncevaux, discovers the rich and admirably fortified Saracen city of Narbonne. In vain, he proposes to grant it to any knight capable of conquering it: all the heroes are tired and discouraged. Only the young Aymeri, pushed by his father, Hernaut de Beaulande, is willing to attack this seemingly impregnable place. He succeeds thanks to his military talent and, finally, the help of Charlemagne's army. After the death of his parents, his advisers urge him, as the only son, to take a wife and recommend Hermengarde, sister of the king of the Lombards, Boniface. A series of adventures of his delegation to Pavia is followed by others of Aymeri himself and his companions; an agreement is at last reached between Boniface and the Narbonnais, and Hermengarde and Aymeri are betrothed. However, while he is returning to Narbonne with his fiancée, Saracens besiege the city; Aymeri liberates it with the help of an army of his uncle, Girart de Vienne, after a violent battle in which he is seriously wounded. Once Aymeri is healed, the marriage takes place in Narbonne, and Aymeri, who lives for a hundred years, has seven sons and five daughters with Hermengarde.

Although inspired by previous poems, the work is remarkable for several scenes, particularly Charlemagne's despair at his barons' refusal of the yet unconquered fief of Narbonne. *Aymeri* is preserved in five manuscripts of the 13th and 14th centuries; the poem has been little modified, since the manuscripts closely follow its composition. However, there exist two 15th-century prose versions, the second of which was partially inserted in David Aubert's *Croniques et conquestes de Charlemaine* (1458). In addition, in the Venice Codex Marcianus fr. IV (ca. 1300), a version of the poem in Franco-Italian immediately follows the *Chanson de Roland;* this version is even more considerably altered in the cyclic Tuscan poem *La Spagna* (1350–80), and it also exists independently in a poem called *Amerigo di Nerbona* (ca. 1380). The "matter" of Aymeri also passed into Andrea da Berberino's huge prose compilation *I reali di Francia* (1380–1420) and in a second, later work by the same author, *Le storie Nerbonesi,* The Occitan "chronicle" by the Pseudo-Filomena (early 13th c.) contains an important sequence reminiscent of Aymeri's conquest of, and investiture with, Narbonne.

# B

# BADEFOL, SEGUIN DE

(ca. 1331–1366). A soldier of fortune who became notorious as a captain of freelance troops *(routiers)* in the 1360s, Seguin de Badefol was the second of four sons of a middling noble from Périgord. Born in the ancestral castle at Badefol-sur-Dordogne, Seguin fought on the French side at Poitiers in 1356, but the king's capture there led to a truce and an end to the payment of troops. Badefol was soon at the head of a route, or company, numbering about 2,000 men and nicknamed the Margot. This company joined with other bands in 1360 to form a large force, called the Tard-Venus, that pillaged eastern France. They captured Pont-Saint-Esprit on the Rhône in December and demanded a large payment before leaving. For most of 1361, Badefol's troops ravaged the Velay and lower Languedoc before local resistance induced the Margot to withdraw toward Auvergne and the Lyonnais.

A number of bands combined early in 1362 to form the "Great Company," which decisively defeated a royal army at Brignais on April 6. This engagement left southeastern France exposed to brigandage. In September 1363, Badefol took Brioude, which served as his base for eight months until he agreed to evacuate the town for a payment of 40,000 gold florins. He soon found another lucrative base, Anse, on the Saône north of Lyon, which his troops captured in November 1364. Badefol styled himself "captain of Anse for the king of Navarre," seeking a veneer of legality based on an earlier offer of employment by Charles the Bad, king of Navarre. In his name, the Margot terrorized a large region before finally evacuating Anse for another 40,000 florins in September 1365.

To rid the country of *routiers,* the French crown offered them large sums to join an expedition to Spain. Using this plan as a pretext, Badefol went to Navarre to seek rewards from the king. Charles the Bad, however, was offended by his demands and had him poisoned in January 1366.

# BAILLI/BAILLIAGE

. In medieval rural lordships, a familiar manorial officer known as the bailiff (Fr. *bailli*) often acted as manager of an estate. When employed by the French crown in the 12th century, the *bailli* was a salaried judicial officer who inspected the work of the *prévot,* who farmed the revenues of the royal domain and rendered justice at a local level. In 1190, when Philip II was leaving on crusade, he established regulations covering the duties of the *baillis,* who increasingly resembled the English itinerant justices.

   In 1204, Philip II gained possession of Normandy, where *baillis* had begun to be associated with a geographical area. Over the next fifteen years, the *bailli* in royal lands gradually lost the character of an itinerant justice and became the administrator of a district called the *bailliage*. Well paid, he represented the king in judicial, military, and financial matters, receiving appeals from lesser jurisdictions. By the late 13th century, a specialized subordinate, the "receiver," assumed most financial duties. During the 14th century, a system of royal judges took over some of the judicial business of the *bailliage,* and because of the endemic warfare of that period the *bailli* concentrated increasingly on military matters. Whereas the early 13th-century *baillis* were drawn mainly from the middling nobility of the old royal domain in the Île-de-France, many of them in the late 14th century were natives of their *bailliage*. This district, and its southern counterpart, the sénéchiaussée, remained the basic provincial administrative unit of late-medieval France.

# BALLADE

. The ballade evolved from the courtly chanson in the late 13th century and was originally meant to be sung. By the late 14th century, with the separation of text and music, it became *littera sine musica*. As defined by Eustache Deschamps in his *Art de dictier et de fere chançons* (1392), the ballade may consist of three stanzas, eight to ten lines each, with seven to eleven syllables per line. A one-line refrain concludes each stanza; it is syntactically joined to the preceding phrase and rhymes with one of the two preceding

lines. A typical eight-line strophe has one of the following rhyme schemes, sung to two melodic phrases:

ab ab bc bC / ab ab cc dD / ab ab cd cD
*A A B          A A B          A A B*

Other common forms include *septains* in ababbcC, *neuvains* in ababccdcD, *dizains* in ababbccdcD, *onzains* in ababccddedE, and *douzains* in ababbccddedE. Most ballades end with an *envoi* that reproduces the rhyme scheme of the second half of the stanzas and frequently begins with the apostrophe *Prince*.

# BALLETTE

. Under the rubric "ballettes," MS Douce 308 (Oxford, Bodleian Library, ca. 1300) groups monodic songs, most often composed of three stanzas, generally three to four lines each, rhyming aa(a)b. The meter of each line varies from seven to twelve syllables. A one- to three-line refrain, which may also precede the first verse, is repeated at the end of each strophe. Its metrical and rhyme structure need not correspond to that of the stanzas, although a typical two-line refrain (AB/BB/CB) is usually linked, through its rhyme scheme, to the last line of each strophe. Ballettes were seemingly meant to accompany dancing.

# *BAN/BANALITÉ*

. The *ban* (Lat. *bannus, bannum*) was the royal power to command and punish. The Merovingians employed it primarily to summon free men to military service; the Carolingians extended it to include royal protection of the defenseless (churches, widows, orphans, minors) and jurisdiction over crimes of violence, such as assault, rape, and arson. The counts exercised the ban by delegation in public courts until the 10th century; thereafter, the ban devolved to castellans, great landlords, and monasteries with immunities or their lay advocates.

As the *ban* was privatized, military service fell for the most part to a professional class of knights who served their immediate lords. Philip IV later reestablished the principle of

the *arrière-ban* (Lat. *retrobannum*), service owed the king from the feudal tenants of his direct vassals, and in the 14th century the commutation of the *arrièreban* became an important source of royal taxes.

For nonnobles, the *ban* became a district in which all residents, no matter who their landlord, performed labor services, such as maintenance of roads, bridges, or castles, and abided certain monopolies *(banalités)*. Georges Duby coined the phrase "banal lordship" *(seigneurie banale)* to describe this new, nonlanded form of lordship, and the concept has been adopted by most historians, although the medieval terms most often used in that sense were *districtus* and *potestas* (in the north) and *mandamentum* (in the south).

By the 12th century, *banalités* consisted of two types of economic rights possessed by some landlords. The first was the monopoly of the local mill, oven, and winepress: local residents were compelled to use those services *(per bannum)* in return for a payment in kind (e.g., every sixth loaf of bread or one-twentieth of the wine or flour processed). Such indexed revenues were important economic resources at a time of expanding population and agrarian production but relatively fixed rents. Even lords who granted generous community franchises often retained the *banalités* of their townsmen. The second type of *banalité* was the *banvin,* the lord's exclusive right to sell wine *(ad bannum)* during a prescribed period, usually just before or after a new vintage.

# BANKING AND MONEYLENDING

. The early admixture of banking functions helps to explain the disagreement among financial historians regarding the origins of banking in the Middle Ages. Three in particular have attracted attention: deposit banking, moneylending, and exchange. All three activities can be documented in medieval France. Usher argued that the deposit function was primordial in the development of banking. Sayous acknowledged the existence of the deposit function as typical of banking but offered the hypothesis that before bankers achieved the public confidence necessary to attract deposits, their primitive function was that of lending money. With the passage of time, according to Sayous, those loan bankers became credit bankers and changers. In the opinion of de Roover, it was foreign exchange that would give rise to modern banking techniques.

Pawnbroking, common in most French towns, was frequently the domain of the Jews, who served both urban and rural clienteles. Funds moved frequently via exchange between Italy and France, Paris and the Champagne fairs in the 13th and 14th centuries.

From ca. 1260, the fairs developed the function of financial clearinghouse. Towns like Montpellier and Perpignan acted as intermediaries in the late Middle Ages in financial networks linking the Hispanic world with Bruges and northern France. Papal financial operations from the capital of Avignon crisscrossed medieval France in the 14th century.

From the 13th century until 1307, the Temple in Paris functioned as the French royal bank; Jews and Italians were also prominent on the national lending scene. French kings, notoriously short of funds, borrowed frequently and were not adverse to confiscating assets of their creditors to increase royal revenues. While Louis IX legislated against any interest as usury, French kings in the 14th century sanctioned interest rates of between 15 and 20 percent. Medieval France lagged behind Italy and the Low Countries in the sophistication of its private and public financial institutions.

# BANNERET

. The word *banneret* was coined in France under Philip II to describe knights or esquires who, as the commanders of military units of about ten to a hundred men (typically including some other knights or esquires), displayed their personal heraldic arms on the large rectangular flag called a "banner" *(bannière)* rather than on the small triangular lance-pennon carried by knights and esquires of the rank and file. Down to 1438, *chevalier* and *escuier* (or *damoiseau*) *banneret* constituted the highest noble pay grades in the royal army, above those of *chevalier simple* or *bachelier* and *escuier simple,* but like the proportion of knights the proportion of bannerets of both grades in the royal armies diminished steadily between 1340 (when it was 1.5 percent) and 1411 (when it was 0.3 percent), and these grades were finally suppressed.

# BANQUETING

. Banqueting in medieval France called for a group of separately served courses with several dishes to a course—as many as fifteen in each of three to five courses at 15th-century courts, with forty items in a course reported for the spectacular Pheasant Banquet

given by Philip the Good in 1454. Fortunate banqueters might be given something resembling a modern "Chinese" banquet or Swedish smorgasbord, but those sitting at the highest table would have been offered the choicest selection. Others may have been served a quarter or less of the items listed on banquet menus. These menus included a high proportion of game, especially game birds, with more elaborate stews and pastries than those found on more modest menus, and they usually omitted the primarily vegetable pottage, made with greens, peas, or beans, that was the usual basis, or sole ingredient, aside from bread and drink, of everyday meals.

The order of service may seem odd by modern standards, and it varies in different times and places. Sometimes, a sort of hors d'œuvres course came first; at other times, banquets began, as in England, with the most basic meats and pottages. In most cases, delicacies, often sweet, came last, followed by spiced wine and wafers, and/or fur-

A 14th-century banquet as depicted in a manuscript of Guillaume de Machaut's *Remede de Fortune*. BN fr. 1586, fol. 55. *Courtesy of the Bibliothèque Nationale, Paris.*

ther *confits* and so on to end the meal. But it was between the courses, usually before the last full course, that the most striking feature of a banquet appeared: the *entremets,* usually edible but presented primarily as entertainment. Decorated pies were used as *entremets* for centuries, but anything unusual could count as such a diversion, ranging from a jellied fish to a skit involving live human players. The most famous examples of this genre are the roast swans and peacocks reclothed in their own feathers, often seen in pictures of such banquets.

# BAR-LE-DUC

**.** The county of Bar-le-Duc was created primarily from allodial lands located between Champagne, Burgundy, Lorraine, and Luxembourg. In ca. 960, Frederick I, duke of Upper Lorraine, in order to check incursions from Champagne, built a fortress on the Ornain River that he called Bar (Lat. *barra* 'barrier') and settled his knights on confiscated lands of the nearby abbey of Saint-Mihiel. Bar and its adjacent lands passed to his great-granddaughter Sophie (d. 1093), who first adopted the title countess of Bar.

A line of energetic successors steadily expanded the county by usurpation, conquest, purchase, and marriage. By the mid-12th century, the county had become an important, autonomous principality between France and Germany, although it always was dominated by French cultural and political interests. Count Renaud II (r. 1149–70) married Agnès de Champagne, sister of Queen Adèle and Count Henri I of Champagne. His second son, Renaud, became bishop of Chartres (r. 1182–1217). The prestige of the counts of Bar was such that, when the barons of Champagne sought someone to lead them on the Fourth Crusade after the death of their own count, they asked first the duke of Burgundy, then Count Thibaut I of Bar (r. 1191–1214). Mindful of his own brother Henri I's death on the Third Crusade, Thibaut declined.

Counts Henri II (r. 1214–39) and Thibaut II (r. 1239–91) significantly increased the political role of Bar in eastern France. By awarding substantial fiefs and by purchasing the homages of important nobles in the frontier region, they effectively preempted further eastward expansion by Champagne. In 1297, royal forces invaded Bar after Count Henri III (r. 1291–1302) supported his father-in-law, King Edward I of England, against Philip IV, and in 1301 the entire county west of the Meuse River, including the city of Bar, became a fief *(Barrois mouvant)* held from the French crown. The counts continued to figure prominently in French affairs and even married into the royal family. In 1354, they acquired the ducal title and became peers of France. Following the loss of the duke's four sons at the battles of Nicopolis and Agincourt, Bar passed indirectly to a grandson, René d'Anjou (r. 1430–80).

# *BARLAAM ET JOSAPHAT*

. Name given to three 13th-century poems and three prose tales based on the life of the
Buddha. From elements of the legendary life of the Buddha, an original *Barlaam et
Josaphat* was composed between the 5th and 7th centuries in Palestine. The work spread
throughout the Christian world through translations in most European languages of the
Latin version (ca. 1050), of which almost a hundred manuscripts survive. In French, there
are three rhymed versions, by a certain Chardri (1,477 octosyllabic couplets in Anglo-
Norman, before 1216), by Gui de Cambrai (6,467 octosyllabic couplets in the Picard
dialect, after 1209), and an anonymous version (first quarter of the 13th c.) of 6,113
octosyllabic couplets without dialectal markings (two manuscripts and two fragments, ed.
Sonet 1949, 1950). There are also three anonymous prose versions, written in the
Champagne dialect between 1199 and 1229 (fourteen manuscripts, ed. Mills), translated
from a Greek fragment (early 13th c.), and derhymed from the anonymous verse text
(three manuscripts, ed. Sonet 1952).

Despite all his efforts, Avennir, king of India, fails in shielding his son Josaphat from
the influence of the Christian religion and from the teachings of the anchorite Barlaam,
who succeeds in converting his pupil. Having received half the kingdom from his father,
Josaphat establishes Christianity in his realm but then spends the rest of his life with
Barlaam in the desert.

A number of tales embedded in this story (e.g., *Le lai de l'oiselet, Le dit de l'unicorne*)
appear also in most of the common medieval collections of legends, exempla, and
sermons, in Latin and in the vernacular. In France, the story of Josaphat is also told in the
*Mystère du roy Advenir* by Jean du Prier (ed. Meiller) and in a *Miracle de Nostre Dame
par personnages* (B.N. fr. 819; 15th c.). The legend is also found in an Occitan version in
prose from the late 13th or early 14th century.

# BARON/BARONY

**.** The Latin *baro* (pl. *barones*), probably derived from a Germanic word whose basic sense was "man as distinct from woman," was rarely used in documents before ca. 1030 and was almost always used in that sense. In the half-century after 1030, however, *baro* appeared with rapidly increasing frequency in diplomatic documents composed in northern France and its cultural colonies, primarily to designate the principal vassals, or "men," of both the princes and the castellans who emerged in the same period. By 1120, its Old French derivative *ber(s)* (oblique *baron*) had come to be used adjectivally to characterize personages of high rank or honor, including kings, saints, and even Christ.

In the second half of the 12th century, the sociopolitical use of both *baro* and *ber(s)* was regularized and restricted upward. In the language of the royal chancery, the expression *barones regni* replaced the traditional *proceres regni* as the designation of the leading magnates, who were soon defined as those who held one of a certain set of major castellanies or still larger dominions in fief immediately of the crown. These dominions, which included all of the duchies in France and many of the counties and viscounties, acquired the generic title "barony" (OFr. *baronnie* etc., Lat. *baronia*), and baronial fiefs were said to be held "in" or "by barony." Within certain of the greater principalities, themselves baronies of the realm, the more important fiefs, including all dependent counties and viscounties, were similarly recognized as baronies, and their lords as barons, of the principality.

Although all dukes, counts, and viscounts were barons on one level or the other, the title "baron" was applied after 1180 especially to those barons who had no higher title of dignity—i.e., the more important castellans, of whom there were probably between 300 and 400 in the whole kingdom. In the 13th century, the word "barony" came to be treated as a specific title, applicable to the name of a simple baron's principal dominion on the model of "county" (e.g., *la baronnie de Coucy*). For some reason, "baron" itself remained a purely generic title until the 16th century, and simple barons continued to employ a style of the form *N, sire de X,* common to all minor lords after ca. 1200. The feminine title "baroness" (Lat. *baronissa,* OFr. *barnesse*) did not appear until ca. 1220, but thereafter it was increasingly applied as a generic title to the wives, widows, and heiresses of barons.

# BASIRON, PHILIPPE

(Phelippon, Philippon de Bourges; ca. 1450–1491). Composer, musician, and cleric. Basiron first appears as a choirboy in the records of the Sainte-Chapelle in Bourges in 1458. He maintained a lifelong association with this institution, which was closely tied during Basiron's lifetime to both Charles VII (r. 1422–61) and Louis XI (r. 1461–83). Basiron was granted a vicariate at the Sainte-Chapelle in 1467 and served for most of his career as master of the chapel choirboys. Basiron, or "Phelippon," was the composer of over a dozen surviving works, including a *L'homme armé* Mass and seven Burgundian chansons.

# BASOCHE

. In the early 15th century, the law clerks of Paris and other cities organized professional associations called basoches, one of whose functions was the staging of dramatic spectacles. In Paris, each high court of justice had its Basoche, the primary ones being those of the Parlement (the Palais de Justice) and the Châtelet (the high criminal court). By the end of the century, there may have been as many as 10,000 Basochiens in Paris. The Basoche had its own administrative and judicial structure, with a king, a chancellor, and a high court.

The Basochiens assembled at special times, such as Mardi Gras, to stage a variety of spectacles, including *tableaux vivants,* burlesque lawsuits called *causes grasses* ("fat" cases, because they were presented at carnival time), and plays, such as moralities, farces, and *sotties*. The Basoche also contributed comic plays to the performances of *mystères* organized by the Confrérie de la Passion. The Enfants-sans-souci, the principal Parisian company performing *sotties,* may have been part of the Basoche. Authors who were not law clerks, such as Pierre Gringore, also appear to have written for the Basoche. Some critics, in particular Howard Graham Harvey, argue from the records of Parlement and from evidence drawn from late-medieval plays that the Basoche had taken on the "more or less exclusive privilege of staging comic plays in Paris." While professional entertainers, students, and others also put on comic plays, the Basoche had a crucial influence on the development of satiric theater in medieval France.

# *BASSE DANSE*

. An elegant, choreographed procession dance of the 15th and early 16th centuries. The favorite dance in the courts of France, England, and Spain, it was closely related to the Italian *bassadanza*.

Although the earliest mention of the *basse danse* is in a poem by Raimon de Cornet (ca. 1320), nothing is known of the dance steps until the early 15th century, when a number of tunes and choreographies were preserved in manuscripts. From these instruction manuals, we know that each *basse danse* employed a combination of five steps: *reverence, branle, simples, double,* and *reprise*. Each choreography had a unique sequence and length and was paired with a particular tune of exactly the correct number of notes to fit the dance steps.

In the later 16th century, the *basse danse* lost its individual choreography and was performed with a continuous repetition of a set sequence of steps to music of uniform-length phrases.

# BASTIDE

. Fortified community in western France. In Aquitaine, preceding the Hundred Years' War, along the Anglo-French border both English and French kings or their officials founded fortified towns, usually in contracts (called in French *pariage*) with Cistercian and other monastic houses on lands that had formerly been granges under the direct cultivation of the monks. These fortified towns, or large villages, of the late 13th and early 14th centuries differ from the *villeneuves* in that they were founded on land that was

already under cultivation by religious houses rather than in forest or waste and are thus not part of the earlier *défrichement* (deforestation) movement. Detailed plans for the setting out of such towns and for the attraction of settlers frequently accompany the *pariage* contracts. The success of such ventures varied considerably; some never attracted more than a few settlers, while others survive as thriving market towns to this day. Their striking characteristics, evident on plans or in aerial photos, include a compact grid of lots laid out on streets meeting at right angles within the fortifications and a large market square with covered market and arcades surrounding the central square with adjacent parish church.

# BAUDE, HENRI

(ca. 1430-ca. 1496). Henri Baude had a turbulent career as legal agent for Charles VII in the Bas-Limousin and as magistrate in the Paris courts. Baude composed rondeaux, ballades, epistles, and a satirical morality performed by the Basoche in 1486. Among his longer works are the *Testament de la mule Barbeau,* a satire of the courts, and the *Lamentations Bourrien,* satirizing ecclesiastics. Referring to current events in 15th-century France, his poetry is reminiscent of Villon's. The most original effort by this admittedly minor poet are his *Dictz moraux pour faire tapisserie,* short poems to be used as subjects for wall hangings.

# BAUDE FASTOUL

(d. 1272). Just before entering the Beaurains leprosarium in 1272, the trouvère Baude Fastoul addressed a *congé* to his countrymen and benefactors in Arras. It reveals an original writer, capable of talking about his disease with humor while subjecting himself to God's will with resignation and trust.

# BAUDOUIN

. Name of nine counts of Flanders between the 9th and 13th centuries. Baudouin I (d. 879), known as "Iron Arm," was already count of the small *pagus Flandrensis,* centered on Bruges, when he seduced Judith, daughter of Charles the Bald and widow of King Aethelwulf of Wessex. His son, Baudouin II (865–918, r. 879–918), was the true founder of the fortunes of his dynasty, consolidating its hold on the Courtrai, Aardenburg, and Cassel areas and initiating Flemish efforts to expand into areas of predominantly Romance settlement, Arras and the Vermandois. Baudouin III (d. 962), son of Count Arnulf I and grandson of Baudouin II, shared governance with his father but predeceased him.

Baudouin IV (977–1035, r. 988–1035), nicknamed "With the Handsome Beard," was one of the most noteworthy Flemish counts. His domain was in the Germanic areas bordered roughly by Bruges, Ghent, Lille, and Saint-Omer, which were then Flemish. He concentrated his attentions on expanding eastward. He faced a rebellion in the Courtrai area in the 990s, and the problems between the French- and Germanic-speaking parts of his county plagued him. After the threat of the 990s had passed, Baudouin divided most of Germanic Flanders, but not the south, into large *châtellenies*. Baudouin IV fought the emperor Henry II in the early 11th century, but in 1011 Henry enfeoffed him with Valenciennes and the northern coastal parts of Flanders, which formally made the Flemish count a vassal of both France and the empire. In 1028, he faced a rebellion from his son, the future Baudouin V, who had married Adèle, daughter of the French king Robert the Pious. In 1030, Baudouin fortified Audenarde, and by 1034 the Flemings had gained effective control of "imperial Flanders," the southeastern lands between the Scheldt and the Dendre.

Baudouin V (r. 1035–67) generally continued his father's policies. He lost several wars but was a superb diplomat who raised the prestige of Flanders to new heights and consolidated his internal administration. He founded several towns and acquired Aire-sur-la-Lys and Lille, becoming known as "Baudouin of Lille." Much of the thrust of his policy was toward the southwest, as he built a Norman alliance and extended his own territories in that direction. In 1050, Richilde, widow of Count Herman of Hainaut, agreed to marry Baudouin's minor son, whom the emperor invested in 1056 as Baudouin VI of Flanders and Baudouin I of Hainaut. When Henry I of France died in 1060, Baudouin V of Flanders, as the late king's brother-in-law, became guardian of the eight-year-old King Philip 1. Baudouin VI (r. 1067–70) was an able man, but he died prematurely. Baudouin VII (r. 1111–19) was the son of Count Robert II. His reign was

marred by war with his mother, Clemence. Baudouin's chief adviser was his cousin Charles of Denmark, who succeeded him.

Baudouin VIII (r. 1191–94), who was also Baudouin V of Hainaut, succeeded his uncle, Philippe d'Alsace, as count of Flanders. Although Philip II of France recognized Baudouin VIII, his price of recognition was keeping extensive territories in southern Flanders. His son Baudouin IX (r. 1194–1206) ruled in Hainaut as Baudouin VI (1195–1206). He quickly recovered much of the territory lost to the French crown and made an English alliance. Baudouin departed on crusade in April 1202. He became ruler of the Latin kingdom of Constantinople in 1205 and governed Flanders through a regency council, but word reached Flanders in February 1206 of his death in captivity.

# BAUDOUIN DE CONDÉ

(ca. 1250-early 14th c.). Born into a family from Condé-sur-Escaut (Hainaut), this minstrel at the court of Marguerite of Flanders (d. 1280) was particularly famous in his time. For the edification of the great of this world, he wrote twenty-four *dits* in oct octosyllabic verse, notable for their multifarious inspiration: cautionary reflections *(Li vers de droit),* stories of unrequited love *(Li prisons d'amours),* satires on the vices of the age *(Li contes de l'aver),* religious verse *(Li Ave Maria),* gruesomely realistic description (*Dit des trois mors* et des *trois vis*). These topics are often obfuscated by excessive wordplay and metrical acrobatics.

# *BAUDOUIN DE SEBOURC*

. A mid-14th-century northern French chanson de geste loosely attached to the Crusade Cycle. Its 25,778 lines, in Franco-Picard dialect, were probably composed in Hainaut, possibly at Valenciennes. There are two manuscripts, B.N. fr. 12552 and 12553. The hero is a composite figure; in other 13th- and 14th-century Crusade epics, the name is given to the third Frankish king of Jerusalem (Baldwin of Le Bourg, 12th c.), but there is some evidence for independent legends about a Picard adventurer called Baudouin de Sebourc. Sebourg is a village in what is today the Département du Nord.

The poem has relatively brief sections set in the Middle East, but only its ending leads, artificially, into the roughly contemporary crusade poem *Le Bâtard de Bouillon*. Most of the action takes place in northern France or the Low Countries and concerns the adventures of Baudouin's youth. The hero is treated according to the conventions of the late epics rather than historically. Baudouin is separated from his family as a child and spends many years wandering before at last avenging the treachery of the villainous Gaufroi and becoming a crusader. Some of his adventures derive from folklore, others— the visit to Hell, the moving of a mountain by prayer—from literary tradition. The hero's martial and sexual exploits (he has thirty bastards) are presented with a verve and piquancy of expression that have given the work an outstanding reputation among the poems of its genre and period.

# BAUDRI OF BOURGUEIL

(Baldricus Burgulianus; 1045–1130). An important representative of the humanistic revival of the early 12th century in the Angers region, Baudri was born at Meung-sur-Loire. He studied at Angers under Marbode of Rennes and, according to Dronke, with the poet Geoffroi de Reims. He was elected, ca. 1080–82, abbot of the Benedictine foundation of Saint-Pierre-de-Bourgueil, a place that he described in a verse letter to the nun Emma as having charming landscape but little learning, where onions were commoner than stylus and tablet. In 1107, he became archbishop of Dol-de-Bretagne. His diocese did not appeal to him, and he traveled in England and Normandy while bishop. The journeys are recorded in his *Itinerarium*.

Baudri's best-known prose work is the Latin *Historia Hierosolymitana,* an account of the First Crusade written shortly after 1107, based on the French *Histoire anonyme de la première croisade*. He also wrote a life of Robert d'Arbrissel for the abbess of Fontevrault. As a poet, he is noted for his correspondence with a number of learned females, including the nun Emma and Adèle, countess of Blois, daughter of William the Conqueror and mother of King Stephen. His longest poem is a 1,366-line description— whether real or imaginary has been debated—of Adèle's palace and chamber with its zodiac on the ceiling, world map on the floor, statues of the Liberal Arts, Philosophy, and Medicine around the bed, and tapestries of Old Testament, Greek, Trojan, and Roman myths and history around the walls. Other substantial works include a moralized mythology, drawing on his favorite classical author, Ovid.

Baudri's shorter poems are chiefly to and about students and friends from his clerical circle and the female convent of Le Ronceray at Angers. He carefully preserved even the short verses that he wrote for mortuary rolls. His religious verse includes a dedicatory poem for the church of Saint-Samson-sur-Rille. His history of the bishops of Dol is lost, but a *vita* of St. Samson and an account of the translation of the head of St. Valentine survive. In all, 256 Latin poems by Baudri are known today.

# BAYEUX

**.** The Treaty of Saint-Claire-sur-Epte (911) included Bayeux as one of the places named as a settlement for the Viking leader Rollo. With its strategic position, Bayeux continued to gain importance under the dukes of Normandy but experienced much destruction in the process. Not until the 11th century could restoration of the cathedral take place under Bishop Hugues (r. 1015–49), when Normans began to fund ecclesiastical buildings. By the end of the Hundred Years' War, the English had evacuated and left the area desolate. Today, the city retains much of its medieval fabric, including the cathedral of Notre-Dame, some timber-framed houses, and of course the Bayeux Tapestry.

Notre-Dame-de-Bayeux stands on the site of a Roman temple and later sanctuaries (tradition holds that St. Exupère founded an oratory here), but little documentary evidence survives prior to the 11th century. Orderic Vitalis
Bayeux (Calvados), Notre-Dame, plan.
After Valery-Radot.

notes that Odo, bishop of Bayeux, consecrated the church in 1076 and finished it in 1087, having "endowed it abundantly with many riches and ornament." In 1105, Henry I of England stormed the city and burned the church, and another fire in 1159 initiated the restoration of most of the building. Only Odo's crypt and the west towers survived the 12th century.

Bayeux, Notre-Dame, chevet.
*Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

Most of the 11th- and 12th-century Romanesque portions remain visible inside the building in the intricate sculpture of the nave arcade, the crypt, and the west towers, but

later alterations irretrievably transformed the exterior of the church into a Gothic building with 13th-century tracery, gables, flying buttresses, and 15th-century central tower.

Despite stylistic differences, both Gothic and Romanesque portions conform to a high degree of ornamentation. On the exterior, late 13th-century Gothic work sheaths parts of the Romanesque west towers, and two false blind portals frame the three actual portals that lead into the nave with double side aisles. Only the center portal directly introduces the visitor to the longitudinal space. Cluster piers and subtly molded round-headed arches delineate the six bays of the nave, vaulted with early 13th-century quadripartite rib vaults. Large Gothic clerestory widows illuminate the richly carved surface of the Romanesque arcade: tooled reticulated work covers the entire surface of the walls with complex interlacing, interwoven and overlapping patterns, a variety of arch moldings, and molded architraves with figural and fantastic subjects. Framed figural sculpture, of bishops and nonwestern characters, resides in isolation in the spandrels.

A balustrade with arcade provides a visual transition between the round-headed arcade below and grand lancet windows at clerestory level. Later 13th-century transept arms support a 19th-century tower, reconstructed to avoid total collapse. In the south transept, the Gothic portal tympanum displays the life of St. Thomas Becket. The 13th-century choir has an ambulatory, radiating chapels, and extended chevet. Here, engaged shafts extend from floor to clerestory, where each shaft springs into transverse and diagonal ribs. Medallions pierce the surface of the spandrels throughout the choir arcade, and figural sculpture features Old and New Testament scenes along with the

Bayeux, Notre-Dame, nave.
*Photograph courtesy of Whitney S. Stoddard.*

legend of SS. Vigor and Loup on the south side of the choir. The 11th-century crypt holds carved capitals.

Of conventual buildings, a late 12th- or early 13th-century chapter house survives, as well as a treasury. The Grand Seminary, known as the Centre Guillaume-le-Conquérant, displays the entire 231 feet of the Bayeux Tapestry.

# BAYEUX TAPESTRY

**.** Produced in England between 1066 and 1083, the Bayeux Tapestry illustrates Harold Godwinsson's visit to Normandy and the invasion of England by William the Conqueror. Technically an embroidery, the hanging gained the label of "tapestry" from centuries of French references to *tapis,* an all-inclusive label for designed textiles. Eight joined strips of linen (19 inches in width by 231 feet in length) hold the main narrative, embroidered in eight colors of wool thread. Brief Latin inscriptions identify the portrayed events. The border of grotesque animal figures, landscape elements, and battle scenes between nudes offers a running commentary on the main events and ancillary relationships with literary themes. Scholarship suggests that the patron of the embroidery was Odo of Bayeux, half-brother of William the Conqueror and bishop of Bayeux in the late 11th century. Although displayed in the 15th century on the feast of relics in Bayeux cathedral, the original function of the tapestry remains a subject of speculation, with the possibility of contexts religious (the cathedral of Bayeux) and secular (a great hall).

# BAYONNE

. The only fortress of any consequence in southwestern France, Lapurdum, now Bayonne (Pyrénées-Atlantiques), was the principal port of the Roman province of Novempopulania. Fortified by the 1st century B.C., it experienced attacks by Visigoths, Basques, Moors, and Normans. When Charlemagne's kingdom of Aquitanie was broken up, Bayonne became the capital of the county of Labourd, which was attached to Gascony in the 12th century. It prospered as a whaling, fishing, and shipbuilding center under Norman rule, from 1154 until the end of the Hundred Years' War, when it was captured by Jean de Dunois (1451).

The Château-Vieux (12th and 15th c.), built on Roman foundations, is a square fortress with corner towers. It was here that Bertrand du Guesclin was imprisoned to await ransom. The Château-Neuf was constructed in 1489. The cathedral of Sainte-Marie is one of the finest in southwestern France. Begun in 1213 on the site of a Roman temple, it was built over two centuries in imitation of northern Gothic churches. South of the church are the 14th-century cloisters, with elegant wide bays.

*William W.Kibler/William W.Clark*

Lambert, Élie. "Bayonne." *Congrès archéologique (Bordeaux et Bayonne)* 102 (1939):507–70.

# BAZAS

(Gironde). The ancient *oppidum* of Cossium, former capital of the Vacates, became one of the principal towns of the Roman province of Novempopulania. It was raised to a bishopric in the 5th century and is mentioned by Gregory of Tours. The Gothic cathedral of Saint-Jean-Baptiste, begun in 1233 and continued into the 14th century, is built over an 11th-century Romanesque church destroyed by the English in 1198. It consists of a long (274-foot) and narrow (76-foot) aisled nave of eleven bays, a choir with ambulatory and five radiating chapels, but no transept. The blind triforium with a flattened arch in each bay is an unusual feature possibly imported from the Parisian area. Three portals on the west façade, dedicated to the Last Judgment, the Dormition and Coronation of the Virgin, and the life of St. Peter, preserve remarkable examples of 13th-century Gothic sculpture. Attacked by the Huguenots in 1577 and 1578, the precious sculpture was saved only by a ransom of 10,000 crowns raised by parishoners. The cathedral was extensively restored between 1583 and 1635, following the Wars of Religion.

Gardelles, Jacques. "La cathédrale de Bazas." *Congrès archéologique (Bordelais et Bazadais)* 145(1987):21–37.

# BÉARN

**.** The viscounty of Béarn in Gascony, created in the 9th century, consisted of two principal valleys, the Aspe and the Ossau, draining the northern slopes of the Pyrénées and extending northwest into the lower lands of the Oloron and Pau rivers. Béarnese rulers of the 10th and 11th centuries joined in Navarrese and Aragonese military expeditions against the Muslims and gravitated primarily in an Aragonese political orbit from the late 11th century to the early 13th, when Catalano-Aragonese influence in Languedoc was abruptly ended by the victory of the Albigensian crusaders. In 1170, rights to the viscounty of Béarn passed to members of a Catalan noble lineage, inaugurating a period of relatively weak vice-comital rule. In 1221, Guillem Ramon de Montcada, viscount of Béarn, confirmed important additions to the *Fors d'Oloron,* an 11th-century legal charter. The enhanced text lay the groundwork for the celebrated *Fors de Béarn* and led to the establishment of the "estates" of Béarn, an association of nobles, nonnobles, and churchmen whose consultations with the viscount were institutionalized in the late 14th century. Béarn vacillated between allegiance to the kingdom of France and to the English dukes of Aquitaine from 1228 to 1364, when Viscount Gaston Phoebus declared Béarn independent of England.

# BEAUCAIRE

**.** The town of Beaucaire (Gard) was the site of a fortress guarding the eastern border of Languedoc. It lay on the right bank of the Rhône, a river that for much of the Middle Ages marked the frontier of the realm in southeastern France. After lower Languedoc was taken over by the French crown in 1229, the district was administered by a royal seneschal whose military headquarters were at Beaucaire, while the judicial and administrative seat lay at Nîmes, farther west.

*John Bell Henneman, Jr.*

[**See also:** *AUCASSIN ET NICOLETTE*]

# BEAULIEU-SUR-DORDOGNE

(Corrèze). The 12th-century church with magnificent sculptured portal, chapter house, several reliquaries, and a beautiful Virgin and Child covered in silver repoussé are all that remain of the Benedictine abbey of Saint-Pierre, founded on the banks of the Dordogne in the 9th century and affiliated to Cluny at the end of the 11th. Typically Limousin in detail, the abbey church emulates the plan of the great pilgrimage churches: wide, groin-vaulted side aisles, galleries (albeit small and dark), transept with apsidioles, ambulatory with three radiating chapels. An octagonal dome, irregular in shape, crowns the crossing. The façade dates from the 13th century (with later modifications) and the attached bell tower from the 14th.

The format of the south portal (ca. 1130–40) appears to follow that of Moissac; the imagery, however, is novel. Most striking are the appearance of the bare-breasted Christ displaying his wounds, the prominence accorded the Cross, the seven gesticulating figures beneath the Apostles, and the double lintel arrangement of apocalyptic and exotic beasts. The theme of the tympanum, based on Matthew 24 and elements from the Apocalypse, is the Second Coming, which precedes the final Judgment. The reliefs of the porch evoke the penitential season of Lent. The whole may be seen as an affirmation of church doctrines threatened by heretical attack.

# BEAUMANOIR, PHILIPPE DE REMI, SIRE DE

(ca. 1250–1296). Jurist, author, and royal official, Beaumanoir came from the village of Remy, near Compiègne, where his family held a fief from the abbey of Saint-Denis. He

was the second son of Philippe de Remi (ca. 1205-ca. 1265), who served as *bailli* of Gâtinais for Robert, count of Artois, from 1237 to 1250. By 1255, the father had apparently built a manor house on the property, for he then styled himself "lord of Beaumanoir," a title that passed to his heir, Girard, then to the younger Philippe at Girard's death. Beaumanoir fils began his administrative career in 1279 as *bailli* of Clermont-en-Beauvaisis for Robert, count of Clermont. In 1283, he completed the *Coutumes de Beauvaisis,* a systematic treatise on customary law composed in Francien prose with strong traces of Picard. Beaumanoir declares in his prologue that it is essential to write down the legal customs of the region so that they can be maintained without change "because, since memories are fleeting and human lives are short, what is not written is soon forgotten." His book was widely copied in the Middle Ages (thirteen manuscripts extant, ten or eleven other copies known to be lost) and is today considered the most significant work on French customary law of the 13th century. In 1284, Beaumanoir was knighted and entered royal administration; he served as seneschal of Poitou (1284–87) and Saintonge (1287–89), then as *bailli* of Vermandois (1289–91), Touraine (1291–92), and Senlis until his death (1292–96).

Since the 1870s, a substantial body of narrative and lyric poetry has been attributed to the author of the *Coutumes:* two romances in octosyllabic verse, *La Manekine* (8,590 lines) *and Jehan et Blonde* (6,262 lines), both signed Phelippe de Remi; at least three *chansons courtoises,* two naming the poet Phelippe de Remi; a moralistic fabliau, *Fole Larguecel* and several shorter poems, including a *Salu d'amours* signed Phelippe de Beaumanoir, two *fatrasies,* and an *Ave Maria*. Traditional scholarship holds that Beaumanoir composed most of these works as Philippe de Remi while in his twenties, between 1270 and 1280, and assumed the name Philippe de Beaumanoir only in 1279, when he turned his energies to law and administration. Some recent scholars, troubled by the unusual productivity of such a young man and by the disparity between courtly and legal subjects, prefer to attribute all the poetry to the father and date it between 1237 and 1262. A major factor underlying the revisionist attribution is the revival of a turn-of-the-century Germanist argument that Rudolf von Ems used both romances as sources for his *Willehalm von Orlens,* completed before 1243. Attribution and dating of the poetry remain open questions.

*La Manekine* is a pious adventure romance based on the folklore motif of "The Maiden Without Hands," also treated in the somewhat later *Belle Helaine de Constantinople* and *Lion de Bourges*. A Hungarian princess who cuts off her right hand rather than marry her father incestuously is set adrift and lands in Scotland, where she marries the king, only to be betrayed by his mother; set adrift again, she lands in Rome, where she is miraculously healed, reunited with her husband, and reconciled with her father. *Jehan et Blonde,* perhaps based in part on the *Roman de Horn* and deeply influenced by the romances of Chrétien de Troyes, tells the story of an impecunious French knight, Jehan, who rises in the world by serving as squire to the Count of Oxford and winning the love of Blonde, the count's daughter; it can be read as a how-to manual for success at court and for moral behavior by lordly vassals. The 15th-century prose romance *Jehan de Paris* is a free adaptation of *Jehan et Blonde*.

# BEAUNE

. Built on the site of prehistoric springs, the Roman town of Belina or Belnocastrum prospered from stock breeding, agriculture, and viticulture. It was fortified at the time of the Germanic invasions (3rd-4th c. A.D.) and became a county during the Carolingian period. In the Middle Ages, it was one of the favorite residences of the dukes of Burgundy. It was chartered by Duke Eudes in 1203 and made a parliamentary seat in 1227. The city walls, largely intact today, were built in 1368. After the death in 1477 of Charles the Bold, last duke of Burgundy, it took Louis XI five weeks to subdue the city.

As a religious center, Beaune was home to Benedictines, Dominicans, Franciscans, and Carthusians. The Romanesque church of Notre-Dame, begun in 1120 under Bishop Étienne de Bâgé, is a typical Cluniac large-porched structure. The ambulatory and three separated radiating chapels are pure Romanesque; the High Romanesque nave, which resembles Autun and Cluny III, has pointed barrel vaulting, while the side aisles have rib vaulting. The crossing tower features Gothic bays over Romanesque blind arcades. The church of Saint-Nicolas, rebuilt in the 13th century, retains a Romanesque tower, porch, and sculpted portal. Within the town, one can admire a number of 12th-and 13th-century houses with linteled windows, a chapter house with a façade dated to the 13th century, and a rectangular belfry of 1403.

Beaune's celebrity today comes primarily from its hospital, or Hôtel-Dieu, founded in 1443 by Nicolas Rolin, chancellor of Duke Philip the Good. A marvel of Flemish Late Gothic style, it was designed by the Brabantine archi-
Beaune (Côte d'Or), Hôtel-Dieu, courtyard. *Photograph courtesy of Joan A.Holladay.*

Beaune (Côte d'Or), Hôtel-Dieu. *Photograph courtesy of Whitney S. Stoddard.*

tect Jean de Visscher (or Wiscrère). The exterior is picturesque, with its high-pitched roof covered with multicolored glazed tiles, its wooden galleries, dormer windows, lacework leaden ornamentation, and gilded vanes. The main ward inside is 172 feet long under an impressive polychromed timber roof in the form of an upturned ship's keel. Within is the magnificent *Last Judgment* by Rogier van der Weyden, commissioned by Rolin in 1443 for the high altar of the main ward.

# BEAUNEVEU, ANDRÉ

(d. 1402). Sculptor and painter active in Flanders and in France during the last third of the 14th century. Beauneveu was commissioned to carve a tomb figure of Charles V in 1364 and is documented as embellishing the duke of Berry's château at Mehun-sur-Yèvre with sculptures and paintings in 1386. The duke's inventories state that he also painted the miniatures of prophets and Apostles at the beginning of the duke's psalter (B.N. fr. 13091). These miniatures are executed in *grisaille,* in a style emulating the volumetric effects of sculpture, for which Beauneveu was renowned. He has also been credited with painting the *Parement de Narbonne* in the Louvre and miniatures in the *Très belles heures de Notre Dame* in Paris (B.N. n.a. lat. 3093), but these attributions remain controversial.

# BEAUVAIS

. In the first half of the 13th century, the chapter of Saint-Pierre in Beauvais (Oise) decided to replace a church that had been destroyed twice by fire, once in 1180 and again in 1225. Identifying sources of income for this

Beauvais (Oise), Saint-Pierre, chevet.
*Photograph: Clarence Ward
Collection. Courtesy of Oberlin
College.*

project, the chapter also agreed to devote one-tenth of its revenue for the next ten years to the building of a magnificent church, the cathedral of Saint-Pierre. A papal legate approved the plan in 1245.

The foundation for the choir and apse was laid in 1238; had the catheral been completed as originally planned, it would have been the largest Gothic cathedral in the world. The irregular placement of pillars and buttresses, specified by the ambitious architectural plan, resulted in structural weaknesses. The roof caved in twice, in 1247 and 1284. The unfinished cathedral is 239 feet long and 160 feet high. The choir alone is 121 feet in length. Its vaulting, supported by twelve double flying buttresses, opens on an ambulatory by a succession of triangular arcades. A 14th-century clerestory, situated within the three bays, is composed of triangular and trefoil arches. Above the seven

ambulatory chapels and the rectangular chapels are a blind triforium and a clerestory of the 13th century. This clerestory is surmounted by a series of windows ornamented with full and quarter-trefoils and a rose window in foliated tracery.

At the west end, adjoining the transept, is the nave of an earlier cathedral, known as Notre-Dame de la BasseŒuvre. The oldest religious edifice in Beauvais, this church was established 987–88 by Hervé, bishop of Beauvais. The materials for its construction were probably taken from Roman ramparts.

Also at Beauvais is the church of Saint-Étienne, Beauvais's first Christian edifice. It was destroyed by the Normans in 859 and after reconstruction was damaged twice by fire. In 997, Bishop Hervé undertook its restoration. It offers an early example of cross-ribbed vaulting. Its nave and transept with a central bell tower are from the 12th century.

# BEDFORD, JOHN OF LANCASTER, DUKE OF

(1389–1435). The third son of Henry IV of England, John spent his youth serving with distinction on campaigns in Scotland, Wales, and France. He became regent in France in 1422 and proved himself an excellent general and administrator, though he failed to secure the conquests of Henry V. Maintaining an English alliance with Burgundy was the keystone of his policy. To that end, he signed an alliance with Brittany and Burgundy at Amiens in 1423 and married Anne de Bourgogne in June 1424. Paris, which had accepted Henry V out of Burgundian fidelity, he left essentially self-governing and concentrated on Normandy. Seeking loyalty there, he governed generously through an unusually disciplined administration. He continued to exert military pressure against the Valois, but even his greatest victory, at Verneuil in 1424, proved indecisive. After his defeat at Orléans in 1429 and the death of his wife in 1432, he faced the prospect of a rapprochement between Charles VII and the duke of Burgundy. Bedford's failure to prevent this confirmed his incapacity as a diplomat, though he succeeded in holding Normandy. His death, on the eve of the Treaty of Arras, symbolized the doomed hopes of the Anglo-French kingdom.

# BÉGUINES

. Pious laywomen who chose to live a holy life, but not in a convent as members of a regular ecclesiastical order. Béguines emerged in the 12th century as part of a new form of piety that sought to imitate the poverty of Christ and the earliest Christians. These women lived either in groups or alone, mostly in urban centers; by the early 13th century, a strong women's movement had evolved in Germany, the Netherlands, and France. Exemplifying religious zeal for a Christian life of chastity and poverty, they lived either from alms or from the work of their hands. Early on, such work often involved the carding of wool, spinning, and weaving. Later béguine occupations included the teaching of children, care of the sick in hospitals, and prayers for the souls of the dead.

In the late 12th and early 13th centuries, these women were called "béguines," a derisive term conveying the suspect, even heretical, character of their piety in the judgment of their social peers and ecclesiastical authorities. By the second half of the 13th century, however, the term was applied, with a positive connotation, to women who lived a religious life together in a house, most often called a béguinage, or to women who lived as religious solitaries. The solitary béguine could live as a recluse, mendicant, itinerant teacher, or preacher. The name was also given to those suspected of heresy. The béguines were thus viewed with both suspicion and admiration.

The problems attending the béguine life surfaced as early as 1215, when the Fourth Lateran Council forbade the founding of new religious orders; the béguine houses had no existing general ecclesiastical structure. Legitimate recognition would be available if the houses were somehow understood to be annexes of male monasteries, or if the women in the houses could support themselves in strict enclosure without depending on alms, that is, if the women were wealthy enough themselves or if the houses found a wealthy patron

to endow them. In 1216, however, through Jacques de Vitry's appeal to Pope Honorius III, béguines in Liège, in the kingdom of France, and in the German empire, received permission to live in communities that were connected to no established religious order and conformed to no extant monastic rule. In 1233, Pope Gregory IX published the bull *Gloriam virginalem,* which formally approved of these groups of virgins living holy lives. With this official recognition, houses of béguines began to proliferate.

In France, the proliferation is most notable in the north, where by the mid-13th century there is evidence for the existence of béguines in four important areas. The earliest mention of a béguinage in northern France occurs in Cambrai in 1236, when Godfrey of Fontaines, bishop of Cambrai (r. 1220–37), indicated his intention to support a community of pious women. In 1239, a hospital was founded for béguines in Valenciennes. A church was built for béguines in Douai in 1245, and béguines are mentioned in a document from Lille dated 1247. These communities had powerful protection from members of the clergy, particularly Godfrey of Fontaines and other bishops who with abbots and parish priests gave public support to the spiritual béguine life. Support from secular guardians, who furnished lands and buildings and convinced local magistrates to support these houses for béguines, was crucial for the survival of the communities. The most powerful protection came from the Capetians. Beginning with Louis IX, the French crown founded and supported a number of béguine houses, and Louis's heirs continued the support with royal revenues. The largest of these houses was the great béguinage of Paris, which, according to Louis's confessor, housed close to 400 women. During the reign of Philip IV the Fair, the crown made certain that papal privileges and exemptions continued to benefit the Paris béguinage and ensured the construction of a chapel for them in which a priest was to celebrate Mass once a year.

The evidence for this kind of support is crucial, because by the mid-13th century public opinion regarding the béguines took on hostile overtones. In 1274, in light of this growing antipathy, the Council of Lyon repeated the proscriptions of the Fourth Lateran Council against the founding of new orders. In addition, the council declared that any orders founded since 1215 without papal approval were forbidden and dissolved. Béguines, however, never claimed to be an order, and particular houses took refuge in letters of protection from the pope, bishops, and civil magistrates. The most serious attack came in 1312 from the Council of Vienne, which promulgated two decrees. *Cum de quibusdam mulieribus* explicitly condemned the status of béguine, citing it as being in violation of the Fourth Lateran ban of new orders, and yet closed with an "escape clause" that conceded that truly pious women might be allowed to live in communal houses. The other decree, *Ad nostrum,* identified in catastrophic fashion the béguines with the organized heretical sect of the Free Spirit. The failure of the Vienne council to develop a workable distinction between truly pious and heretical béguines resulted in what was tantamount to a war on béguines, especially in Germany. In France, however, they may have fared better because of support and protection from their powerful patrons in the French court, nobility, and ecclesiastical hierarchy.

# *BELLE HELAINE DE CONSTANTINOPLE*

**.** A lengthy (14,000–18,000 lines) and convoluted romance of Byzantine inspiration, *Belle Helaine* was a popular story, composed first in verse (1250–60; three 15th-c. manuscripts) and later reworked in prose, notably by Jean Wauquelin. Telling the story of a heroine whose right hand is cut off to avoid her identification, the anonymous Tourangeau author used assonanced Alexandrines to disguise his adventure romance as a chanson de geste.

# BELLS

**.** The early history of Christian church bells is obscure. One cannot credit the medieval view that they were introduced by St. Paulinus (d. 431), who never mentioned them in his writings. The notion apparently stems from the coincidence that *campana* and *nola* are common terms for church bells and that Paulinus was bishop of Nola in Campania. Monastic rules in the 4th century already indicate that the monks were assembled for prayer and meals by a signaling device, but this was probably a wooden gong *(sematron)* rather than a metal bell. Gregory of Tours (d. 594) mentions bells on a number of occasions, and it is clear that they were regularly employed in churches of the Carolingian period, perhaps influenced in this respect by Irish and English missionaries. (Another common medieval term for bell, *clocca,* the origin of the French *cloche,* derives from the Gaelic *clog*.) Bells rapidly became an important part of medieval life. They increased in size and number, and great towers were built to house them; they were blessed in an elaborate ritual, given affectionate names, and made to ring on numerous prescribed occasions. They signaled the beginning of Mass and the canonical hours, the time of curfew and of the Angelus; they welcomed princes and bishops and sounded the

"passing bell" and the "death knell"; and their primitive efficacy against evil spirits was called upon as they were rung to ward off storms and plague.

In the later Middle Ages, many of their functions came to be shared by the bells of civic bell towers, and great mechanical clocks became a feature of cathedral and town hall alike. The ritual use of bells at Mass is itself a late development, with the most prominent instance of this, that at the elevation of the host, originating in 13th-century Paris; this could be done from a special bell in a tower surmounting the crossing of the church or by a small bell *(tintinnabulum)* held by the acolyte. As a sign of mourning, all church bells were silent from the end of the *Gloria in excelsis* on Holy Thursday to its beginning on Holy Saturday; in their place, some sort of wooden rattle or clapper was used.

# BENEDEIT

(early 12th c.). An Anglo-Norman poet. Benedeit's *Voyage de saint Brendan* is a 1,834-line retelling in Anglo-Norman verse of the 9th- or 10th-century *Navigatio sancti Brendani*. The author is intriguingly referred to as "Li apostoiles danz Benedeiz." The poem (first quarter of the 12th c.), preserved in four complete manuscripts, is one of the first to use the octosyllabic rhyming couplet. The text relates a legendary voyage by Brendan and his monks from Ireland to Paradise. Paradise is represented as an idyllic garden reached after a seven-year period of wandering that includes a meeting with Judas, who recounts his sufferings vividly. The poem reflects genuine voyages of discovery by early Irish monks but can also be read symbolically as the quest for happiness and eternal life in a world beset with dangers and difficulties. Those with true faith achieve their ends.

# *BENEDICT, RULE OF ST*

. The monastic rule that was most frequently followed by French abbeys during the Middle Ages was written in Italy in the early 6th century by Benedict of Nursia, the abbot

of Monte Cassino. It was written for his own monastery and probably for a handful of neighboring houses. St. Benedict relied in part on the slightly earlier *Rule of the Master* and incorporated large amounts of Scripture into his *Rule,* but it was his unique blend of practicality and moderation in a community designed to be almost a family of monks under a fatherly abbot, that made it widely adopted. This *Rule* was popularized at the end of the century by Pope Gregory the Great (r. 590–604), who wrote a Life of Benedict as Book 2 of his *Dialogues*.

Benedict's focus was on humility and obedience. The *Rule* laid out the steps of humility, likened to Jacob's ladder, and provided for the monk to climb that ladder under the fatherly direction of an abbot to whom the *Rule* gave full authority, always with the stipulation that he was responsible for the monks' souls before God as well as his own. The *Rule* stressed that the monks should give up normal physical pleasures, from fancy clothes to red meat, and drew a sharp dividing line between the world within the cloister and the always dangerous world outside. The monks especially had to give up individual property, and could not even receive gifts from their secular relatives without the abbot's permission. Benedict assumed that some monks would enter the house as adult converts, but many would arrive as boys, their parents' offering to the monastery, and be brought up and educated by the monks. When the abbot died, according to the *Rule of St. Benedict,* the monks of the house would elect a new one, preferably unanimously, but certainly by the choice of the "wiser part."

# BENEDICT OF ANIANE

(d. 821). The *Rule of St. Benedict* was popularized in France in the early 9th century in large part due to the efforts of Benedict of Aniane. He founded the monastery of Aniane in the diocese of Montpellier, ca. 779. Although initially he seems to have sought to establish an especially rigorous form of monastic life there, within ten years he decided instead to adopt the *Rule of St. Benedict*.

Under Louis the Pious, Benedict was encouraged to establish Benedictine monasticism at all monasteries in Aquitaine. In a synod at Aix-la-Chapelle in 817, Benedict spelled out legislation on how the *Rule of St. Benedict* was to be followed, with an emphasis on seclusion, discipline, and moral conversion. His purpose was to create uniformity among all Benedictine houses: *una regula, una consuetudo.* He greatly increased the emphasis on liturgy and prayers for the dead and also made some modifications, such as allowing

Frankish monks more clothing than the *Rule,* written in Italy, had countenanced. Benedict assembled a group of a dozen monasteries, all uniformly following the *Rule,* into a monastic "family," including Inde, the imperial model monastery near Aix-la-Chapelle. Although the uniformity quickly broke down after Benedict's death, his idea of monasteries organized as a family later influenced the Cluniacs and ultimately the Cistercians.

# BENEDICTINE ORDER

**.** When St. Benedict of Nursia wrote his monastic rule for Monte Cassino, in the early 6th century, he had no intention of founding an order. But from the 7th century onward, the *Rule* was adopted at a large number of French houses. Institutional ties among these houses were rare, however, and if the abbot of one Benedictine house became abbot of another as well such a tie rarely lasted more than a generation. Benedict of Aniane, with his family of monasteries established in 817, and Cluny with its permanent priories of the 10th and 11th centuries, were exceptions. Almost every house of Black Monks, as the Benedictines were often called, followed the *Rule* somewhat differently.

Cîteaux, mother house of the Cistercian order, which began to spread in the first decades of the 12th century, began the first institutionalized, organized system of affiliated monasteries within Benedictine monasticism. In the 13th century, those houses of Black Monks that had not been affiliated with any other order created their own group, called the Benedictine order, although they certainly had no exclusive claim to Benedict's *Rule*. The Fourth Lateran Council of 1215 ordered all unaffiliated monasteries to group together for a chapter general meeting every four years, in imitation of the Cistercian annual meeting; a number of independent houses long resisted such bonds.

# BENEFICE (NONECCLESIASTICAL)

. A *beneficium* (*benefice* in modern French and English) was originally, under the Carolingians, a grant of land that the kings made to their counts to hold as long as the counts held office. It referred to land that belonged to one lord but that was delegated to someone else for a temporary period, in return for certain services. Monasteries, too, might grant parts of their lands *in beneficium* to their secular neighbors, usually for a specified period of time (say, the layman's lifetime) and for an annual fee.

The benefice system by which kings and churches rewarded the services of their friends became a common part of more private transactions during the 10th and 11th centuries. By the mid-11th century, a benefice became in most cases indistinguishable from a fief, which a noble or knight held permanently by hereditary right from a noble lord, as long as he promised fidelity and performed homage for the land. The terms *beneficium* and *feudum* (fief) began to be used interchangeably.

# BENOÎT DE SAINTE-MAURE

(fl. 1160–70). Little is known about Benoît de Sainte-Maure that does not emerge directly from his texts. The author of the *Roman de Troie* names himself in line 132 as Beneeit de Sainte-More, and as Beneit in lines 2065, 5093, and 19,207. He praises Eleanor of Aquitaine in the *Roman de Troie* and flatters Henry II in the other text of which he is believed to be the author, the *Chronique des ducs de Normandie*. Here, the author is identified simply as Beneit from Touraine (albeit in summary passages that may not be by the author himself), who, it is presumed, took over for the aged Wace when the latter abandoned his *Roman de Rou,* also a history of the dukes of Normandy. Benoît's *Chronique* has 44,542 lines in octosyllabic rhymed couplets. It begins with the creation and division of the world and ends with the death of Henry I of England. The Latin chronicles of Dudo de Saint-Quentin and Guillaume de Jumièges provided much of the material. But Benoît also invented long discourses for his historical characters and inserted countless proverbs into his narrative. As in the Romances of Antiquity, anachronism and medievalization are rampant. The romance form of the *Chronique* suggests that it was part of the repertoire of texts recited in a courtly milieu. The *Chronique,* together with Wace's *Rou,* is an excellent example of the desire of a new dynasty (as the Angevins with Henry II were in England) to celebrate their roots and their history in vernacular texts that would be accessible not only to a learned clerical audience but also to the aristocracy.

# BERENGAR OF TOURS

(ca. 1000–1088). Born at Tours, Berengar studied at Chartres under Fulbert and returned to Tours to become *scholasticus* at Saint-Martin's in 1031 and archdeacon of Angers in 1041. During and after his studies, Berengar displayed a penchant for appealing to reason rather than to church authorities, a characteristic that perhaps led him to question the specifics of eucharis-tic theology, the doctrine of the Real Presence. Details of Berengar's beliefs must be gleaned from the writings of his opponents and his own obscure treatise, *De sacra coena* (ca. 1065–70), a polemic against one of his most vociferous adversaries, Lanfranc of Bec. For Berengar, the doctrine of the Real Presence seems to have meant that a spiritual or intellectual presence was added to the bread and wine but that their substance did not change. Thus, he is credited with having initiated the first heresy in the history of eucharistic theology.

Berengar attracted many disciples, who were eager to defend him in the debate over the eucharist. His teachings, however, were countered by numerous tracts written by his adversaries, most notably Lanfranc of Bec, and were condemned by a series of councils: at Rome in 1050, Vercelli in 1050, Paris in 1051, and Rome in 1059 and 1079. At the council of 1079, Berengar signed a profession of faith containing the first official use of the words *substantialiter converti.* Returning to France after the council of 1079, Berengar retired to the island of Saint-Côme near Tours, where he died in 1088. In addition to *De sacra coena,* Berengar's extant work includes correspondence, refutations of Lanfranc, accounts of the various synods, and a poem, *Iuste iudex Iesu Christe.*

# BERENGUER DE PALAZOL

(Palau, Palol). Described by the author of his *vida* as a poor knight from Catalonia, the troubadour Berenguer de Palazol remains, despite repeated attempts at identification, undatable. If, as seems likely, Berenguer composed his few surviving *cansos* in the 13th century, his work offers nothing that is thematically, met-rically, or stylistically original.

# *BÉRINUS, ROMAN DE*

**.** Based on a rhymed version (ca. 1252) of which only two fragments survive, the prose *Roman de Bérinus* (ca. 1350–70) by an unknown Burgun-dian, fuses narrative elements taken from a variety of sources into the episodic story of the Roman merchant and king of Blandie, Bérinus, and his son, Aigres, who, among other adventures, beheads his father (to save him from being prosecuted for defrauding the imperial treasury) and marries the Roman emperor's daughter. *Bérinus* is loosely modeled on the didactic frame narrative of the *Roman des sept sages de Rome;* its linear structure and literary purpose, however, relate it more closely to the *roman d'aven-tures.* There are four 15th-century manuscripts and one fragment of the prose *Bérinus,* and four early printings (first half of the 16th c.).

# BERNARD DE SOISSONS

(fl. 13th c.). Mentioned in texts of 1282 and 1287 as master mason of the cathedral of Reims, Bernard de Soissons supervised construction of the vaults of the five western nave bays and a major portion of the façade. His image, which was set into the now destroyed labyrinth of the cathedral, showed him drawing a circle with a large compass, indicating

that he designed the west rose window. Although Bernard's work in the upper levels of the nave consciously continued the forms of the earlier cathedral masters, his expansive rose composition reveals the impact of "modern" Rayonnant models, particularly the transepts of Notre-Dame in Paris.

# BERNARD GUI

(Bernardus Guidonis; ca. 1261–1331). Historian, inquisitor, and bishop, Bernard was a Dominican who rose through the ecclesiastical ranks in southern France, in Limoges, Castres, Albi, and Carcassonne. He was inquisitor at Toulouse from 1307 to 1323. Between 1317 and 1321, he also served Pope John XXII on diplomatic missions in Italy and Flanders. All of Bernard's writings were in Latin. Though most were of a historical nature, he also produced several works of theology *(De articulis fidei, De peccato originali),* liturgy *(De ordinatione officii missae),* and hagiography *(Legenda sancti Thome de Aquino, Speculum sanctorale).* The *Speculum,* a collection of a number of saints' lives in four parts, was extremely popular in its day. His most important work is the still unpublished *Flores chronicorum* (ca. 1316), a history of the papacy from the birth of Christ to Clement V. This work, known in over fifty manuscripts (some now lost), went through ten revisions, the latest of which continues the history to 1331 (*John XXII*). Already in the 14th century, it was translated into Occitan (B.N. fr. 24940) and twice into French (four manuscripts). Other historical works by Bernard include treatises on the Roman emperors (*Imperatores Romani,* over forty manuscripts), on the kings of France (*Reges Francorum,* which exists in four revisions and two French translations), and on the Dominican order (catalogues of provincial priors, monographs on individual houses, acts of General Chapters, etc.).

Especially noteworthy is Bernard's history of the Inquisition (*Practica officii Inquisitionis;* ca. 1314–16; four manuscripts), which includes an important section on such heretical groups as Manichaeans, Vaudois, Pseudo-Apostles, béguines, relapsed Jews, and sorcerers. He also composed local histories of the cities in which he lived: Limoges, Toulouse, and Lodève. In spite of the great popularity of his work in the late Middle Ages, as evidenced by the numerous manuscripts and the translation of much of his *œuvre* into French by Jean Golein for Charles V, few of Bernard's works have found

modern editors. He was a diligent compiler and accurate researcher, keen to tease the truth from contradictory sources. Traveling from monastery to monastery, Bernard assembled evidence, interviewed witnesses, and verified his sources at every step. As information accumulated, he prepared copious lists, edited, revised, and expanded. Faced with mountains of material, he regularly composed abridged versions of his most important works. Bernard's lack of literary skill is compensated for by his careful preservation of significant documents and information whose original sources have been lost.

# BERNARD OF CHARTRES

(d. 1124–30). Most of our knowledge of Bernard comes through John of Salisbury's *Metalogicon.* John studied with Gilbert of Poitiers, William of Conches, and Richard the Bishop, who were all Bernard's pupils at Chartres when he was chancellor of the schools. Not only was John's knowledge secondhand, but his *Metalogicon* has an ulterior motive: he is not merely describing Bernard for archival reasons but wishes to contrast his good, old teaching methods with the newfangled approach of the Cornificians. It is difficult, then, to be certain how far to trust John's encomium.

John counted Bernard the best Platonist of his time, although to us he seems less interesting than Gilbert of Poitiers or Thierry of Chartres (who is unlikely to have been his younger brother, as is sometimes asserted). He seems to have had no academic contact with the great scholars of his day, William of Champeaux, Roscelin, or Anselm of Laon. Like all the Chartrians, he got his Plato through Neoplatonist sources, chiefly Chalcidius, Boethius, and Eriugena. His work survives only in fragments quoted by John of Salisbury, though a possible set of glosses on the *Timaeus* by Bernard is now in print. Famous for his cultivation of faith and goodness, as well as simple academic brilliance, Bernard is perhaps best remembered today for reporting the aphorism that compared scholars of the modern age to dwarfs standing on giants' shoulders—their further vision was the result of their elevated viewpoint, not their greater acumen (*Metalogicon* 3.4).

# BERNARD OF CLAIRVAUX

(1090/91–1153). Born in Fontaines near Dijon and educated with the canons of Saint-Vorles in Châtillon-sur-Seine, Bernard entered the Cistercian monastery of Cîteaux, together with thirty companions, in 1112. In 1115, he founded the monastery of Clairvaux. From this remote corner of the civilized world, he intervened in matters both political and ecclesiastical. In 1128, at the Synod of Troyes, he obtained recognition for the *Rule* of the new order of Knights Templar. In 1130, he supported Innocent II against Anacletus II in the dispute over papal succession, and a few years later he supported Innocent in the conflict with Arnold of Brescia. In 1145, a pupil of his became Pope Eugenius III. Besides continuing to mediate in all kinds of conflicts, Bernard energetically preached the Second Crusade and lived to witness its utter failure in 1148.

Bernard presided over the enormous expansion of the Cistercian order. The first houses founded from Cîteaux—La Ferté, Pontigny, Morimond, and Clairvaux—became centers from which hundreds of monasteries spread over all of western Europe. As abbot of Clairvaux, an obscure Cistercian settlement on the border of Burgundy and the Champagne, Bernard traveled widely, not only advising bishops and princes but also raising his voice on delicate doctrinal isssues. Lacking the modern dialectical skills of his opponents, he focused his criticism on their alleged deviations from traditional theological methods. At the Council of Sens (1141), his intervention decided the fate of Abélard, and a few years later, at the Council of Reims, he spoke out against Gilbert of Poitiers. Bernard was canonized in 1174 and created a doctor of the church in 1830.

Bernard's œuvre consists of treatises, many sermons, and letters. His most famous work is the series of sermons on the Song of Songs *(Sermones super Cantica canticorum),* left unfinished at his death. In it, he deals with a variety of themes from the behavior of monks to the mystical union between the Bridegroom from the Canticle (Christ) and the Bride (Bernard, or the church). The method applied to the Canticle text is based on the medieval exegetical scheme of the fourfold meaning of Scripture: literal, allegorical, moral, and mystical. However, unlike earlier medieval commentators on the Canticle, such as Bede, Bernard never loses sight of the literal, dramatic power of the Canticle text. Isolating one textual fragment or even a single word, he then creates clusters of associations with other biblical and patristic writings. The result is a rich and a meticulously organized text that could be used both by the monks as an amplification of

their ritual form of life and by a wider literate public, both clergy and lay, for literary enjoyment and religious insight.

Many of Bernard's other sermons follow the cycle of the liturgical feast days *(Sermones per annum),* such as the Annunciation, Christmas, Epiphany, Easter, the Assumption. Noteworthy for their poetic quality and intensity, Bernard's sermons on the Virgin Mary contributed to the development of mariological devotion in the later Middle Ages.

In his treatises, Bernard deals in a more thematic way with the issues of monastic life and of religion in general. A treatise on the steps of humility, *De gradibus humilitatis et superbiae,* is a commentary on a passage from the Benedictine *Rule*. A treatise on love, *De diligendo Deo,* describes the journey toward God, who is to be loved because of himself with a love that is "measure without measure" *(modus sine modo).* Bernard combines the relentless desire for God characteristic of the monastic life with the stability of its goal. The long treatise on consideration, *De consideratione,* dedicated to Pope Eugenius III, outlines the ideal portrait of a pope while offering theological and mystical reflections on the knowledge of God.

In his many letters, Bernard often takes circumstantial matters as a point of departure for reflection. His first letter is, like his *Apologia,* a fierce attack on the luxuriousness of the Cluniac (or, more widely, Benedictine) way of life. This critical attitude was based on Bernard's own Cistercian predilection for simplicity and austerity in art. The lengthy Letter 190, to Innocent II, is directed against Abélard on the occasion of the latter's condemnation at the Council of Sens, depicting him as a dangerous innovator whose application of reason to matters of faith threatens religious stability. In fact, it is Bernard's concern about the legitimacy of his own monastic way of life in the light of the Christian tradition and culture, rather than the motives of his opponent, that comes to the fore. Yet in spite of his claim that he, unlike Abélard, is staying within the bounds of the Christian tradition, Bernard is to be seen as part of the general renaissance of the 12th century. In defending the quality of his own ascetic life, he cherished a sophistication that many of his contemporaries sought in the further refinement of reasoning and art.

# BERNARD SILVESTRIS

(d. ca. 1159). Bernard probably taught in the cathedral school at Tours in the second third of the 12th century, where one of his students was Matthieu de Vendôme. The dedication of his longest and most important work, the *Cosmographia,* to Thierry of Chartres, has led some scholars to confuse him with John of Salisbury's beloved teacher Bernard of Chartres, who would have been a generation older than Silvestris. If, as seems likely, Bernard was also trained at Tours, he would have studied under Hildebert of Lavardin.

Bernard's earliest works are a commentary on the first six books of Virgil's *Aeneid* and another, incomplete, on Martianus Capella. The commentary on Plato's *Timaeus* mentioned in the Martianus commentary has not been identified. In his elegiac poem *Mathematicus,* Bernard discusses destiny and necessity in mathematical terms. Also at least partly his is the *Experimentarius,* a work taken from Arabic sources on cosmography. Two short opuscules derived from problems in Quintilian and Seneca are also usually attributed to him: respectively, *De gemellis* and De *paupere ingrato.*

The *Cosmographia* (ca. 1147–48) has two parts, *Megacosmos* and *Microcosmos.* In the first part, Nature approaches Nous, the personification of the divine eternal mind of God, whom she begs to improve the physical universe. Nous separates the four elements, gives matter form from divine ideas, and shapes the world soul. The new universe is described in detail. *Microcosmos* depicts the formation of humankind. Nature encounters Genius, and they set out to seek Urania and Physis, who will guide them through the heavens to find man's soul and bring it back to earth. The title is explained: man is the world in little.

Though the work has multiple sources, including Boethius, Martianus Capella, and ancient and Arabic scientific sources, the basic concept is apparently original with Bernard. His poem circulated widely—over fifty copies survive in European libraries— and influenced the two most widely read 12th-century allegorical visions of nature, the world, and humanity: Alain de Lille's *De planctu Naturae* and *Anticlaudianus.* In the rhetorical work of Matthieu de Vendôme, he is frequently cited for his excellence of style.

# BERNART DE VENTADORN

(fl. ca. 1145–1180). With Jaufre Rudel, Bernart de Ventadorn was one of the most popular and most imitated of the 12th-century troubadours. His romanticized biography, or *vida,* says that he was of humble origins but rose to sing his love for the wife of the lord of Ventadorn. Aside from links to the Ventadorn castle and school, which are clear from his name and style, Bernart sang at the court of Count Raymond V of Toulouse and probably also visited England, perhaps in the entourage of Eleanor of Aquitaine. The *vida* further tells us that he retired to the Cistercian abbey of Dalon, but this, like the reports of his early years, has not been documented.

Of his lyric production, some forty-one songs survive, all but three of which are love songs, or *cansos*. (Two of the three *tensos,* or debate poems, are of less than certain attribution.) Eighteen of Bernart's songs are preserved with their music. Bernart sang in the clear style called *trobar leu*. His *cansos* are characterized by the melodious language, nostalgic tone, vivid imagery, and musical virtuosity that won him imitators among medieval poets. But it is their lyrical intensity and emotional span that have especially earned him admirers in our own time.

# BERNAY

. The church of Sainte-Croix at Bernay (Eure) was begun in 1374. The choir was completed without aisles by the end of the 14th century, as were four arcades, the north crossing, the north aisle of the nave, and the principal entrance. The nave, built during the first part of the 15th century, features intersecting, ribbed vaulting. Sainte-Croix contains the tombstone of Guillaume d'Auvillars, abbot of Bec (1418), and large statues (15th c.) of the Apostles and Evangelists. These stand against the pillars of the nave and choir. The aisles and radiating chapels were constructed in the 19th century.

A Benedictine abbey was founded at Bernay in the beginning of the 11th century by Judith de Bretagne, wife of Richard II, duke of Normandy. Constructed in stone, the abbey church included a nave, seven bays with aisles,

Bernay (Eure), plan of abbey church.
After Musset.

a transept, a choir of two bays that culminated in an apse in cul-de-four (vaulting formed by a semicupola). The choir is flanked by two aisles with apsidioles. Fragments from Gallo-Roman constructions were used for the foundation. Despite modifications and attempts at destruction and reconstruction, this abbey church of Bernay is one of the most interesting monuments of Romanesque architecture in Normandy.

# BÉROUL

(fl. late 12th c.). Nothing is known of Béroul other than that he was the author of a late 12th-century Tristan verse romance. He twice names himself in his surviving text. Owing to certain stylistic inconsistencies and even factual contradictions within the poem, some scholars have concluded that his *Tristan* is the work of two authors, or even more. Such suggestions remain unproved, however, and a good many scholars have argued the case for single authorship.

Béroul clearly composed the poem during the second half of the 12th century, but the date or even decade remains in question; some have contended that it was as early as 1165, while others, concluding that line 3,849 of the poem refers to an epidemic that attacked the Crusaders at Acre in 1190–91, assign the poem to the last decade of the century. The *Tristan* is preserved in fragmentary form in a single manuscript (B.N. fr. 2171) that was copied during the second half of the 13th century. The beginning and end of the poem are both missing, leaving a single long fragment of nearly 4,500 lines of octosyllabic narrative verse; in addition, the manuscript contains a number of lacunae, and the text is obviously defective in many passages.

The poem belongs to what is generally called the primitive or common version (as opposed to the courtly version) of the Tristan legend. That is, it is presumed that this text derives from an earlier, noncourtly stage of the legend, whereas that of Thomas d'Angleterre integrates the work thoroughly into the current of courtly love.

Béroul's extensive fragment begins with the famous encounter of Tristan with Iseut under the tree in which her husband, Marc, is hiding to trap them; they see his reflection in the water and speak in such a way as to allay his suspicions. The poem continues with the episode in which the dwarf spreads flour on Iseut's floor in order to detect Tristan's footprints (should he visit her at night); the scene in which Tristan, having been taken prisoner, asks permission to enter a chapel and pray, whereupon he leaps to freedom from a window; Marc's delivering Iseut to a colony of lepers (for their pleasure and her punishment) and Tristan's rescue of her; the lovers' miserable life in the forest (including Marc's discovery of them, as they sleep with a bare sword between them, and his erroneous conclusion that they are guiltless); their eventual repentance, caused by the waning of the love potion (which, in this tradition, had been made to be effective for three years); and the long episode in which Iseut, tested in the presence of Arthur and his knights, succeeds in exonerating herself by swearing an equivocal oath. At the end, Tristan ambushes and kills one of the lovers' enemies and brings his hair to show Iseut; when he arrives, they discover another of their enemies spying on them, Tristan immediately kills him, and the text breaks off in mid-sentence.

As in the Tristan tradition in general, Béroul's narrative presents a cyclical form: whether physically separated, threatened by Marc or their enemies, or resolved to reform, the young lovers repeatedly fall back into their sinful ways; Marc becomes suspicious, initially refuses to believe he is being betrayed, and is finally convinced; after a period of separation or abstinence on their part, the cycle repeats itself. Most often, the lovers have in fact no great desire to reform, and when they do they are motivated by less than noble impulses. Yet despite their sin and despite the fact that they both betray Marc (Iseut is his wife, while Tristan is both his vassal and his nephew), the sympathies of the author and of the reader remain with the couple, both because their enemies are presented as despicable and jealous characters and because Béroul frequently insists that God favors the lovers and will punish those who oppose them.

The *Tristan* is a highly ironic and ambiguous text. Appearances are always deceiving: when the lovers appear most innocent, they are consistently the most guilty. When Marc thinks them innocent, he is being deceived or else, as in the episode where they sleep with a naked sword between them, he is misinterpreting the evidence. Tristan is a trickster who clearly takes pleasure in deception, as, for example, when, disguised as a leper, he explains to Marc that he was infected by his unnamed lady, who resembled Iseut and whose husband was a leper.

Despite the potential tragedy of the lovers' passion, Béroul's poem is characterized by humor and, in many passages, by a tone far more reminiscent of the fabliau than of the courtly romance. His style is lively and engaging, bearing many of the marks (such as frequent addresses to *Seigneurs*) of both public presentation and authorial personality. Despite numerous textual problems, the poem as we have it holds considerable charm and appeal.

Although Béroul's composition is incompletely preserved, the *Tristrant* of Eilhart von Oberge, written before 1190, presents the common version of the Tristan story in the

form of a complete romance. Although Eilhart's German text abridges or omits some episodes found in Béroul's, the two works appear to have at very least a common source, and it has sometimes been suggested that Eilhart adapted the story directly from Béroul's account of the lovers.

# BERRY

**.** The region just south of the Loire and to the west of Burgundy originally inhabited by the people known as the Bituriges Cubi, Berry englobes the modern departments of the Cher and Indre and includes neighboring parts of Loiret, Indre-et-Loire, and Creuse. It formed part of the Roman imperial province of Aquitania Prima, of which its chief *civitas,* Bourges, became the capital. According to legend, St. Ursinus founded an archbishopric in Bourges during the 3rd century.

On the fall of the western Roman Empire, Berry became a part of the Visigothic kingdom and then of the Frankish subkingdom, later the duchy, of Aquitaine. In 926, King Raoul suppressed the countship of Bourges, after which no major feudal power emerged to complement that of the town's archbishops. This lack resulted in encroachments by the dukes of Aquitaine and the counts of Anjou and Blois.

In 1101, Eudes Harpin de Dun, viscount of Bourges, sold his office to King Philip I, who reasserted the royal presence, but the royal holdings in Berry were granted in 1137 to Eleanor of Aquitaine as a dowry upon her marriage to the future Louis VII. In 1152, she carried them with her when she married the future Henry II of England. French royal presence returned in 1200, when King John of England returned the holdings to Philip II, who, in 1201, having appointed a royal *bailli* for the region, granted them to Eleanor's granddaughter, Blanche of Castile, upon her marriage to the future Louis VIII. Royal control increased from that time on.

In the 14th and 15th centuries, Berry increased in importance to the monarchy. Declared a duchy in 1360, it was given in apanage to John (d. 1416), third son of John II and a famous patron of the arts.

From 1418 to 1436, with Paris in hostile hands, the province sheltered the royal government of Charles VII, "le roi de Bourges." On the death of Duke John's daughter, Marie, in 1434, the duchy was rejoined to the crown, only to be granted out again in 1461 by Louis XI to his brother, Charles, who exchanged it for Normandy at the end of his

rebellious *Guerre du Bien Publique* in 1465. It was next granted to Louis's sainted daughter, Jeanne la Boiteuse, who, repudiated by her husband, Louis XII, in 1499, founded in Bourges the order of the Annonciade. The title was often borne after that by members of the immediate family of the reigning monarch.

# BERSUIRE, PIERRE

(ca. 1290–1362). Encyclopedist, moralist, and translator born probably in the Vendée region, Bersuire entered the Franciscan order before joining the Benedictines. His early career (ca. 1320-ca. 1350) was spent amid the fervent intellectual climate of the papal court at Avignon, where he enjoyed the protection and extensive library of Cardinal Pierre des Prés of Quercy, and it was here that he produced his major Latin works. Bersuire came ca. 1350 to Paris, where he seems to have studied theology late in life. He was accused of heresy, imprisoned, and eventually released through the intervention of the new king, John II the Good. In 1354, he was made prior of the Benedictine abbey of Saint-Éloy in Paris, a benefice he held until his death. Both in Avignon and Paris, Bersuire frequented the leading intellectuals and scientists of his day, among them the Italian humanist Petrarch, the surgeon Gui de Chauliac, the English Dominican Thomas Waleys, the musician Philippe de Vitry, and the poet Guillaume de Machaut.

Bersuire's works comprise voluminous original treatises in Latin on moral theology and translations into French. None of his works has been preserved complete or in an autograph manuscript. Of his Latin works, the *Reductorium morale* and *Repertorium morale* have survived fairly intact, while the *Breviarium morale* and *Cosmographia* (or *Descriptio mundi*) have not been positively identified. The encyclopedic *Reductorium* and *Repertorium* are extensive biblical commentaries designed to organize and locate material for preaching. The *Reductorium* is so named because its purpose was to "reduce" to its moral interpretation all that was known or could be known about God, nature, and the world, both visible and invisible. The first thirteen books (ca. 1340), which survive in only one complete exemplar, were based largely on Bartholomew the Englishman's *Liber de proprietatibus* and cite hundreds of classical and medieval *auctores*. The final three books were composed later and circulated independently: *De natura mirabilibus* (1343–45) is a moralization of the marvels of the natural world, drawing especially upon the legends of the Poitou region and the *Otia imperialia* of Gervais of Tilbury; *Ovidius moralizatus* (or *De fabulis poetarum*) is a moralizing commentary on Ovid's *Metamorphoses,* for which Bersuire drew upon, among other sources, the French *Ovide moralisé;* and *Super totam Bibliam* offers moral interpretations of the best-known Old and New Testament episodes.

The *Repertorium morale* is an alphabetical listing of several thousand biblical words of all sorts (proper and common nouns, verbs, adverbs, etc.), each of which is accorded a

moralizing interpretation. This work, if printed today, would run to over twenty octavo volumes. Bersuire's usual procedure is to list all the different meanings the word has in Scripture, which are followed by a series of short rhymed statements, each expounded by reference to the Bible, the fathers, theological commentators, or even pagan authors. The lost *Breviarium morale* was perhaps a general introduction to the *Reductorium* and *Repertorium.*

Between 1354 and 1356, Bersuire undertook at the behest of King John a translation into French of the three decades (1, 3, 4) of Livy's *Ab urbe condita* then known. The principal source for late-medieval knowledge of Roman history, the translation survives in some eighty manuscripts and was possibly reworked by Laurent de Premierfait. An important glossary of technical words, many forged by Bersuire, precedes the translation proper.

An important compiler of received knowledge rather than an original thinker, Bersuire was a significant moralist and polemicist, who frequently castigated abuses of ecclesiastical and political offices. With his translation of Livy, his friendship with Petrarch, and his frequent citations of classical authorities, he can be seen as a precursor of humanistic thinking in France.

# BERTHA OF HOLLAND

(fl. late 11th c.). Queen of France. As part of the peace agreement of 1072 between King Philip I (r. 1060–1108) and Robert the Frisian, Robert married his stepdaughter Bertha to the king. She was daughter of Florence, count of Holland. Although she became the mother of Philip's heir, Louis VI, Philip repudiated her in 1092 for Bertrade de Montfort, saying Bertha was too fat.

# BERTRADE DE MONTFORT

(fl. late 11th-early 12th c.). Queen of France. The daughter of Simon I, lord of Montfort, Bertrade was first the wife of Foulques IV le Rechin, count of Anjou. Her son, Foulques V, count of Anjou (1109–29), became king of Jerusalem (1131–43).

In 1092, Bertrade left Foulques IV for Philip I, the king of France (r. 1060–1108), whom she bore two sons and a daughter. Because their marriage was regarded as bigamous, she and Philip faced repeated excommunications between 1094 and 1104, and the kingdom was for a time under interdict. Bertrade influenced royal policy, shared in the profits of simony, and was much feared. Reportedly behind the death of her stepson Geoffroi d'Anjou in 1106, she plotted against Philip's heir, the future Louis VI, whom she was said to have tried to poison.

In spite of Philip's repeated promises to live apart from her, and his reconciliation with the church in 1104, Bertrade signed documents as queen until the end of the reign. After Philip's death, she retired to Fontevrault and was still alive in 1115.

# BERTRAN DE BORN

(ca. 1150–1215). The feudal lord of Hautefort in the Périgord is remembered as the warmongering troubadour because of Dante's presentation of him in *Inferno* 18. 118–23 and his own political satires, or *sirventes,* in praise of discord and strife. In his lyrics, Bertran claimed that the active life is lived fully only on the battlefield. But this stance was in part literary pose. Though he cut a quarrelsome figure in the personal and political struggles of his time, the historical Bertran de Born was throughout his long life a benefactor of the church, and he was, like Bernart de Ventadorn, a Cistercian monk at Dalon for his last twenty years.

Bertran's latest editors accept some forty-seven of the songs attributed to him (forty-three certain; four doubtful). Throughout, he upholds the virtues of war, particularly courage and generosity. This martial worldview is expressed through moral aphorisms or direct language sometimes seconded by violent imagery. Even in his few love lyrics, Bertran voices his disapproval of an imperfect, unheroic society. As both lover and warrior, the poet's persona embodies the knightly values whose absence all around him he satirically laments. His *sirventes, cansos,* and *planhs* are all directed toward realizing those consummate moral and social ideals of the courtly world.

# BERTRAND DE BAR-SUR-AUBE

(fl. late 12th c.). A wellborn cleric, by his own account, Bertrand claims to have composed the chanson de geste *Girart de Vienne* at Bar-sur-Aube in Champagne. The poem, which dates ca. 1180, is preserved in five manuscripts and consists of just under 7,000 decasyllabic lines arranged in 192 rhymed laisses. It belongs in some sense to both the Rebellious Vassal and the Guillaume d'Orange cycles. Girart becomes an uncle of Aymeri de Narbonne, Guillaume's father. His youth at Charlemagne's court is characterized by capricious and unjust treatment from the emperor, who later besieges Vienne for seven years but is finally reconciled to the hero, acknowledging that he has been in the wrong. This will become a pattern paradigmatic for the epics of revolt. But Bertrand is also influenced by the contemporary romances: the siege (for which Bertrand followed an earlier and more savage chanson de geste, now lost) becomes partly a romanticized account of the origin of the friendship of Roland and Oliver, here on opposite sides, and the former's betrothal to Aude (with obvious reference to the *Chanson de Roland*).

References to Bertrand in other poems testify to his fame as both trouvère and jongleur. At the end of *Girart de Vienne,* a passage found in all the extant manuscripts announces a poem on Aymeri de Narbonne. The epic of that name has been attributed to Bertrand in consequence, but the matter is debated. Bertrand is important for his probably original division of epic material into three *gestes,* or cycles, linked with his connection of a traditional rebel to the loyal clan of Guillaume d'Orange; he is also a skillful *remanieur* able to combine the epic and the romance, with an unusual interest in motivation and indeed psychology.

# BERZÉ-LA-VILLE

. About six miles southeast of the abbey of Cluny lies the small farm or grange of Berzé-la-Ville. In

Berzé-la-Ville (Saône-et-Loire), grange, apse. *Photograph courtesy of Whitney S.Stoddard.*

the early 12th century, thirty granges around Cluny supplied food for the large monastic community. Inside the chapel of this grange are the finest extant Burgundian mural paintings. Christ in Majesty, surrounded by the twelve Apostles, is seated on a throne inside an almond-shaped mandorla. The inclusion of the twelve Apostles rather than symbols of the four Evangelists suggests a connection with Rome. On the spandrels below the semicupola are holy virgins and martyrs holding lamps, and around the base are nine half-length saints. The martyrdoms of SS. Blaise and Lawrence are depicted within niches on the sides of the choir.

The Berzé muralist painted figures in reds, greens, purple, and white against a blue background. The dark blue sets off the figures in warm tonalities. The figure of Christ has the same frontal pose as does the Vézelay Christ, yet the anatomical articulation of the

figure is more emphasized in the fresco. There seem to be strong connections between Cluny and painting in Rome ca. 1100, with its Byzantine flavor.

The martyrdom of St. Lawrence exhibits the compositional sensitivity of the Romanesque muralist. The painter is given a space framed by columns supporting capitals and an arch. The lower part of the mural is filled by the flattened grill with the nude martyr being consumed by flames. In his pose, the Roman delegate repeats the curve of the arch. The backs and heads of the executioners repeat the shape of silhouettes of column, capital, and arch, while diagonals unite the composition. Painting and architecture are united. The architecture of the two-storied grange, like the figures in the murals, is carefully articulated by many planes in space. The exterior resembles the first Romanesque style, with masonry pilasters or wall buttresses and arched corbel tables. The interior walls have multiple arches and responds.

Dating Berzé-la-Ville is difficult. The spread among scholars is from the end of the 11th century to the middle of the 13th. Since Hugues, abbot of Cluny 1049–1109, probably used Berzé for retreat, and since the style of the frescoes is related to dated manuscripts of ca. 1100 or the following decade, Berzé-la-Ville may have been constructed and painted in the early 12th century.

# BESTIARY

**.** A treatise on animals, usually offering a symbolic or allegorical interpretation of their traits. Old French bestiaries derive ultimately from the *Physiologus,* a Greek text that originated in Alexandria in late antiquity and was translated into Latin sometime between the 4th and the early 6th centuries. The *Physiologus* consists of descriptions of birds, animals, and stones, based largely on legend and subjected to allegorical interpretation. Vernacular bestiaries can feature moral, spiritual, or amorous allegory.

Four French bestiaries survive from the 12th and early 13th centuries. The oldest is the Anglo-Norman bestiary of Philippe de Thaün, dedicated to Adeliza (Aaliz) de Louvain, second wife of Henry I of England, and dating from ca. 1125. The bestiary of Gervaise was produced toward the beginning of the 13th century; those of Guillaume le Clerc (also known as Guillaume le Normand) and Pierre de Beauvais were completed within the first two decades of the century. The best known is that of Guillaume le Clerc, which was one of the most important vernacular sources for the *Physiologus* material. In all four of these

examples, the salient feature of a bird or animal becomes an allegory for some element in sacred history or the life of Christ, or for the salvation of the soul.

Bestiary material also appears in vernacular encyclopedias, such as Brunetto Latini's *Li livres dou tresor* and the *Livre des propriétés des choses,* a 1372 translation by Jean Corbechon of Barthélemy l'Anglais's *Liber de proprietatibus rerum.*

The principal examples of love allegory in the bestiary tradition are Richard de Fournival's *Bestiaire d'amours,* dating from the mid-13th century; the related *Response au bestiaire;* and the *Bestiaire d'amour rimé,* a verse adaptation of Richard's *Bestiaire.* In these texts, the birds and animals retain their traditional attributes; but instead of figuring events in sacred history or aspects of the moral and spiritual life of the soul, the creatures of the natural world are interpreted as representing aspects of the love relationship. For example, the weasel, said to conceive through the ear and give birth through the mouth, is treated in religious bestiaries as an allegory for the Virgin Mary. Richard de Fournival, however, makes of the weasel a figure for the recalcitrant lady: she receives her would-be lover's request through the ear and gives birth through the mouth to her refusal.

Bestiary allusions appear in many works, such as Nicole de Margival's *Dit de la panthère* d'amours, in which the beloved lady is represented as a panther and the enemies of love as a dragon. The trouvères incorporated bestiary allusions into their songs; in *Aussi com l'unicorne sui,* Thibaut de Champagne compares his lovesick state to that of a unicorn, lured to its death in the lap of a maiden.

Bestiaries are usually illustrated. The spiritual bestiary of Guillaume le Clerc is often provided with two-part miniatures, each representing both the animal in question and its allegorical significance. For example, the pelican is shown feeding its babies with its blood, accompanied by an image of the Crucifixion; the turtledove mourning its mate is accompanied by an image of Ecclesia mourning the death of her bridegroom, Christ. Illustrations of the *Bestiaire d'amours* do not manifest this two-part format, but the lover and lady are sometimes included in the miniature along with the animal.

# BETROTHAL AND MARRIAGE CONTRACTS

. Under Roman and canon law, the institution of marriage had a contractual dimension that influenced Merovingian practices. Betrothal became part of Frankish marriage customs, often formalized by written contract between families. Upon betrothal under

Roman law, pledges or earnest money *(arrhae)* were often made. In the Middle Ages, families might enter into contracts of betrothal promising young children in future marriage, although the church prohibited the formal marriage of girls under twelve and boys under fourteen. Churchmen often were present at the passage of betrothal and marriage contracts, with the actual ceremony performed at the church door before a nuptial Mass.

In southern France in the high and late Middle Ages, marriage contracts were drawn up before a notary. The contract might open with the constitution of dowry by the bride's family, followed by the bride's donation of herself (implying individual consent) to her future husband with a prdmise of loyalty. The groom then made the same commitment and gave acquittal for the receipt of the dowry. He then proceeded in some contracts to make a *donatio propter nuptias* (OFr. *augment*), with the projected return of both dowry and *augment* to his widow secured by his own property. Finally, he renounced any legal recourse to invalidate obligations. The ceremony of marriage generally followed shortly after the contractual arrangements had been concluded.

# BEVERAGES

. Water was just as important a means to slake thirst in the Middle Ages as it is today. And just as we must today be cautious about the source of potable water, so six hundred years ago streams and rivers running through urban areas tended to become too polluted to afford safe drinking water. Normally, the dug well was vital to any community. People who had access to a spring or a fountain could consider themselves fortunate: their water was valued for its clarity and its dependable purity.

Water was not considered to be a proper beverage at meals. To accompany food and to aid digestion, a mildly fermented drink of some sort was usually available. The presence of alcohol reduced the risk of bacterial contamination in a beverage. Depending upon both tradition and the strengths of regional agriculture, this drink varied in France among beer (Ofr. cervoise), used generally in north-eastern areas and in Paris when wine was

unavailable, and wine elsewhere. In neither case was the alcoholic content high; proper storage was difficult and expensive, and the product was retailed as soon as it was drinkable. A good number of popular "recipes" were compiled during the period on ways to cure spoilage in stored wines. Two varieties of beer were recognized: a better grade, from barley or spelt, and a small beer, from wheat and rye, oats, vetch, and virtually any other grain. Just as today, the reputation of wines depended upon their geographical source. The Burgundian vineyards produced the most valued, but imported wines, from Greece, Cyprus, or Palestine, had a certain vogue.

Cider and mead (*hydromel,* from a fermented mixture of honey and water, particularly in its flavored forms as *medon* and *bergerasse*) enjoyed local appeal in northern France.

Certain special wines were customarily served as aperi-tifs, cordials, and digestives at formal meals. For instance, *grenache* was commonly used to "open the stomach" in such meals. Medical faith in the power of spices, both to promote digestion and to ensure a healthy balance of corporal humors, led to the elaboration of fortified wines, such as *hypocras* (in which name the authority of Hippocrates is apparent) and *claret*. Flavoring was also provided wines by wormwood (absinthe), aloes, hyssop, myrtle, anise, rosemary, cubebs, sage, and musk.

A number of other beverages derived as well from the realm of medicine, often by way of their use as ingredients in special cookery. Natural fruit juices, *poiré* and *prunellé,* for example, and in particular citric juices because of their bitterness, were so used from the end of the 14th century. Finely ground flower petals lent a scent and flavor to water. Normally available for finger washing during a meal, an infusion of rose petals *(eaue rose)* enjoyed extensive use particularly in its distilled form, first as a medically prescribed therapeutic beverage, then as a beverage consumed for the maintenance of good health, and finally as a culinary ingredient. The techniques of the still, or alembic, provided the medieval physician with *aqua vitae* from various wines; but thirsty people soon realized that what was beneficial for the sick could be equally salutary for anyone.

# BÉZIERS

. Occupying a fortified site on hills overlooking the Orb River, Béziers (Hérault) was an important center of commerce and administration in medieval France. Under the Carolingians, Béziers became the seat of a county, and then (ca. 880) a viscounty under the counts of Toulouse. A series of marriages brought Béziers into the assemblage of territories controlled by the Trencavel family in 1066.

The authority of the viscounts remained paramount in the city until the 12th century. Their subsequent difficulties and conflicts with the counts of Toulouse and Barcelona allowed the power of the bishop and commune to emerge. By the end of the 12th century,

Béziers had become a co-seigneurie, five of its *bourgs* recognizing the sole authority of the bishop. The commune of Béziers first appeared in 1131. Tensions between the viscount and burghers reached a peak in 1167, when the citizens murdered Viscount Raymond Trencavel in the church of the Madeleine. Béziers, under its consuls, enjoyed a well-developed municipal organization throughout the 13th century; in 1280, the artisanal classes gained entry into the consulate through the system of *échelles,* which grouped them into several ranks or grades and accorded to each a position in the consulate.

Béziers suffered heavily during the Albigensian Crusade. Taken by assault on July 22, 1209, it was pillaged and the church of the Madeleine, within which townsmen had taken refuge, was burned. Despite dramatic accounts, the extent of this massacre should not be exaggerated. Bézier's economic growth and the prosperity of its leading families continued unaffected, and the 13th century witnessed the period of greatest brilliance for the city. It emerged as a center of textile production and possessed an important *studium* of civil law. Social conflicts, notably the violent popular uprising led by Bernard Porquier in 1381, agitated Béziers in the 14th century. At the end of the Middle Ages, however, Béziers recovered an important position, particularly through the favor of Charles VII, who located there his Parlement from 1425 to 1429.

Little that is medieval remains of the burned church of the Madeleine. The church of Saint-Aphrodise preserves a Romanesque crypt, nave, and aisles, wedded to a Gothic choir. More significant are the Romanesque church of Saint-Jacques and the fortified Gothic church of Saint-Nazaire. Saint-Jacques contains a five-sided apse in southern Romanesque style, with a sculpted decor inspired by classical art, as at Alet. Saint-Nazaire, recently restored, has two fortified towers on the west façade separated by a machicolated arcade under an enormous rose window. Only fragments of the crypt (9th-10th c.) and Romanesque choir and tower antedate the destruction of the town in 1209; the transept dates from the 13th century and the nave from the 14th. There are stained glass from the 14th century and important murals dated to 1347. The 15th-century octagonal sacristy and chapter house are unusual.

# BIBLE, CHRISTIAN INTERPRETATION OF

. Put together over centuries and argued over for longer, full of inconsistencies, contradictions, obscurities, peculiar vocabulary and syntax, ancient poetry, and tribal law, the Bible is an interpreter's dream: a source that claims to be authoritative—the written Word of God—and to be both necessary and sufficient for the salvation of the believer. Generations of scholars have exercised their learning and ingenuity on this text of texts.

The medieval West was not, then, unusual in its fascination with the Bible as a starting point for commentary and interpretation. Its particular interest for students of interpretation (or "exegesis," after the Greek term) lies not only in studying the methods in which medieval biblical scholars worked but also in trying to discern links between exegesis and everyday life. Medieval society was a Christian society, inasmuch as the ruling societal myth was Christian. With few exceptions, everyone was considered to be Christian. Rulers were Christian princes, and the church held, or attempted increasingly to abrogate to itself, temporal as well as spiritual powers. In such circumstances, the teachings of the Bible, as laid down by authoritative scholarship, had pertinence for an audience wider than academic theologians or devout laypeople.

Over the period A.D. 500–1500, the circumstances of biblical interpretation varied a great deal, moving from Carolingian schools, through monasteries, to secular (i.e., religious but nonmonastic) schools and universities. By the mid-13th century, the interpretation of the Bible had become the preserve of professional theologians, working in universities and generally members of the mendicant orders. Scholastic "questions" from this period ask *who* could interpret the Bible: any believers or only trained interpreters? While theologians had to admit that the Holy Spirit could move any simple believer to a correct understanding of the Word of God, they nevertheless inclined firmly toward professionalization and credentialism.

Before considering how medieval interpreters went about their work, we must ask what exactly was the Bible at this time. The Bible as a physical object rarely existed in one single volume (called a "pandect"), or even two—Old Testament and New. It was much more likely to come in sets of books on the lines established by Cassiodorus in the 6th century. Six-volume sets of Pentateuch, History books, Minor Prophets, Major Prophets, Gospels, and finally Acts, Epistles, and Revelation were common. As the canon of the Old Testament varied in the Hebrew and Greek traditions, some books, such as Maccabees, might be included although they were understood to be apocryphal. The order of books was not always consistent.

Of the translations of the Bible into Latin, the most common was that of Jerome, known now as the Vulgate. By the 13th century, it was rare to find a Bible that was not Jerome's translation, accompanied by his prefaces to each book or group of books and including his *Liber de nominibus hebraicis,* an alphabetical list explaining the meaning of biblical proper nouns.

Interpretation of the Bible came in a number of forms. Jerome and Augustine, almost exact contemporaries, were foundational for Christian biblical interpretation, and yet their surviving writings show us the range of possibilities for the work of an exegete. Jerome was even in his lifetime acknowledged as the supreme linguist and translator, whose knowledge of the biblical text was unparalleled. Apart from his translation, he is known for his letters on theological issues but also for his series of commentaries on the whole Bible. Augustine had different gifts. He did not have Jerome's linguistic skills; his direct commentaries on biblical books are few. Rather, his biblical interpretation comes out in his sermons (which are largely exegeses of texts), treatises on theological issues, and works that respond directly to issues of the day. Augustine *uses* the Bible and exegesis in his work as a bishop, whereas Jerome expounds the Bible in a more detached and scholarly fashion.

Jerome and Augustine are just two of the fathers of the church whose biblical interpretation was crucial for the Middle Ages. Other common Latin and Greek patristic authors were Gregory the Great, Gregory Nazianzus, Ambrose of Milan, Cassiodorus, Origen, John Chrysostom, John Damascene, Bede, Isidore of Seville, and later Rabanus Maurus. The work of those who had gone before was crucial to the medieval method. In the worldview of the Middle Ages, truth was attained by accretion rather than by the overthrow of one system by another. Truth must also have stood the test of time—the very fact of longevity was important. Continued approbation over generations of the church was in itself a test of rightness. Thus, one was on safe ground in using the interpretations of the fathers.

Classical authors, such as Cicero and Seneca, were also utilized to support arguments, but not without reservations. Plato and Aristotle had the biggest influence of any non-Christian sources. The lexicographical interests of some Christian scholars and the stubborn opacity of some Old Testament texts led to consultation with Jews, but this was never a widespread practice; for most people, Jerome was enough of a source for the Hebrew meaning. However, Philo Judaeus, Josephus, Rashi, and Maimonides were known and used. Although Arabic scientific work circulated from the 12th century onward, it had little direct influence on biblical interpretation.

Biblical interpretation could take a variety of forms, from a commentary to be read alongside the text of a whole book or set of books, to a sermon explaining and expounding a few verses. Extended commentaries often appear under such generally interchangeable titles as *Expositiones, Commentaria, Glossa,* or *Postilla*. Titles are not a medieval notion—these tend to be later additions—and the usual medieval description for such a work is, for example, *In Genesim* ("On the Book of Genesis").

Perhaps the biggest medieval innovation in biblical exegesis was a matter not of content or style but of layout, culminating in the production of biblical texts with integrated commentary known as the *Glossa* or *Glossa ordinaria* (the "Gloss" or "Ordinary Gloss"). From the Carolingian period onward, we have books of the Psalms and the Epistles with marginal glosses. The style itself was not new—it was also used for ancient texts—but it was adapted to the Bible with great success. Between 1140 and 1170, a large number of Bibles were produced, made with a planned page layout for integrated patristic interlinear and marginal glosses that are remarkably standardized. Sometime between the Carolingian books and these planned, mass-produced volumes, the text of the glosses and the page format had been decided upon. We know little about

this process of evolution, although it has long been associated with Anselm of Laon. We must, however, bear in mind that each biblical book or set of books has a different exegetical history; the manner and type of glossing is not the same all the way through. Moreover, although Laon may have had a large part to play in producing the text, it was in Paris that many glossed Bibles of this period originate. Paris became a renowned center for book production, and it was perhaps the quantity and quality of glossed Bibles made here in these years that fueled its reputation.

How the *Glossa* was used, and what effect it had on subsequent medieval exegesis, is still a moot point. The surge in the production of texts of the *Glossa* coincides with the rise of secular schools, where reference books would be highly useful tools. The patristic texts chosen for inclusion in the *Glossa* are, as far as we can tell without a modern critical edition, conservative. We can therefore see the *Glossa* either as petrifying the accepted range of interpretation of a particular passage of Scripture or as collecting the standard exegesis and putting it to one side so that scholars could move on in other directions. Depending on one's point of view, the *Glossa* gives the fundamental norms of interpretation, or it gives the old-fashioned approach. Its usefulness must vary according to the knowledge and skill of its user.

After the 1170s, new copies of the *Glossa* become rare. They are replaced by the *Historia scholastica* of Peter Comestor (a sort of digest and paraphrase of the Bible that was immensely popular among students), the *Sententiae* of Peter Lombard, and later by the biblical commentaries of Stephen Langton and the Dominican master Hugues de Saint-Cher, whose postilla on the whole Bible were immensely successful. These, in their way, are the *Glossa ordinaria* of the 13th century.

The *Glossa,* then, was the standard first step for biblical interpreters of the 12th century. They might use it to produce their own exegeses of the text, whether in sermon form or continuous commentary. The production of biblical commentaries remained the standard form of professional development for aspiring theologians. As part of the higher degree in theology at the University of Paris, the premier European institution for the study of theology in the 12th and 13th centuries, every student had to "read," that is, lecture on, at least one book of the Old Testament and one of the New.

How was the Bible interpreted? The usual generalization is that exegesis is made according to the "senses" of Scripture. The number and exact nature of these senses varies with time and commentator, but the basic division is into a literal or historical sense and a moral or allegorical sense. This dichotomy is generally linked to the prevailing practices and theological preferences of the early Christian church at Antioch, which held to the literal sense, and at Alexandria, which preferred allegory. In this vein, the main early interpreters of the Antiochene school were John Chrysostom and Theodore of Mopsuestia; the leading Alexandrine exegete was Origen.

Over time, the picture grows more complicated, with the spiritual sense dividing into further categories, so that, for instance, John Cassian held to a ninefold sense of Scripture. However, the classic formulation for the Middle Ages is a fourfold sense of Scripture, enshrined in a verse attributed to Augustine of Dacia:

> Littera gesta docet, quid credas allegoria,
> Moralis quid agas, quo tendas anagogia.

("The literal [or historical] sense teaches us about what things were done; the allegorical sense tells us what we should believe; the moral [or tropological] sense tells us what to do; and the anagogical sense tells us about our heavenly ends.")

A common medieval example of a word glossed according to the four senses is taken from John Cassian. "Jerusalem" in the literal sense is the city in the Holy Land; in the allegorical sense, it is the Church Militant on earth; tropologically, it stands for the faithful believer; anagogically, it is the heavenly city of Jerusalem. In a sense, the three "spiritual" definitions are arbitrary; they are not the only expositions of "Jerusalem" according to these senses that one might find in medieval exegesis. Indeed, there were books of "distinctions" *(distinctiones)* that gave lists of words, arranged alphabetically, defined according to various senses of Scripture; different definitions may be given for any one word in any one sense.

Furthermore, this neat division cannot be taken to be a description of the reality of exegesis. First, it is *not* the case that exegetes go through each pericope (short section of text), interpreting it according to one sense after the other. The closest one can get to that are the commentaries of Stephen Langton, which proceed according to a general "literal" sense and then to a blanket "allegorical" or "moral" one. Langton's method enabled his commentaries to circulate in various forms, some with both senses of Scripture present, others with only the literal or only the allegorical. But Langton is an exception. Generally, commentators jump from one sense to another, depending on the passage in question and their aim in making the exegesis: a commentator beginning a scholarly consideration of a text may begin with a lexicographical survey (included in the literal sense); but a commentator whose purpose is exhortation will use the allegorical or tropological senses.

Second, not all pericopes, as Hugh of Saint-Victor noted, are suitable for interpretation according to every sense of Scripture. Some appear to have no historical sense, as they are simply untrue or so obscure as to be incomprehensible. Others are only fruitful in an anagogical understanding.

Medieval exegesis cannot be easily characterized and divided into periods when literal or spiritual senses prevailed. In the best cases, interpreters were fluid in their use of Scripture and were always conscious of the task of strengthening the faithful in their beliefs. They write with the needs of their audience in mind and so will shift between senses or through metaphors in order to make a point, or to wrestle a Christian meaning from a pericope.

Third, the meaning of the senses—what each of them included by definition—varied over time. For instance, before the middle of the 13th century the literal sense came to encompass not only a lexical exposition of the text, as well as "what happened" in the historical or narrative sense, but also whatever meaning the author intended, even when that intention was a metaphor or allegory. This shift in definition was possibly to counteract criticism that interpreters could prove anything by recourse to the spiritual senses; it led to fears for orthodoxy. Right doctrine must have its roots in the literal sense of Scripture. The literal sense provided the foundations for the house of interpretation. In order to allow christological (a passage that foreshadows the coming of Christ) and typological (an Old Testament passage acting as an extended metaphor for a New Testament scene or theme) interpretation of the Old Testament, which no Christian medieval exegete would have considered anything but foundational, commentators had to

include an allegorical interpretation in the basic meaning of the literal sense. This was, for them, a "commonsense" extension of the definition of literalness: much of the point of the Old Testament is to pave the way for the New.

Much has been made of supposed differences in exegesis between that of the monasteries and that of the schools and later the universities, with the work of the Augustinian abbey of Saint-Victor in Paris standing as a kind of bridge between the two. Such a distinction must be made with care. It is not a simple question of different texts, sources, methods, and procedures. If the distinction is to be found anywhere, it is in the use and goal of the interpretations: why they were made, who was to read them, why they read them. A biblical commentary made in a monastery as an aid to contemplation, for example, will differ in tenor and style from one made in a mendicant school as a friar's preaching tool. In fact, we know little about why biblical commentary was done and what purpose many of the vast, repetitive volumes of exegesis were intended to serve.

From the later 13th century, the place of the Bible as a source of revelation and in theology and devotion was overshadowed by increased interest in science, the natural order, observation, and experiment and by the production of devotional literature inspired by direct revelation, written by or for laypeople. Many of these spiritual texts are in the vernacular, and this fact, together with other devotional aids and translations, even of the biblical text itself, illuminates a shift in the place of "professional" biblical interpretation from the center of the Christian life—a shift that Protestantism would move to redress in the 16th century.

# BIBLE, JEWISH INTERPRETATION OF

. The study and exposition of the Hebrew Bible was one of the fundamental activities of the Jewish community in medieval France. The biblical text, understood as the "Written Torah," was augmented by an "Oral Torah," which according to Jewish teaching had been transmitted from God to Moses and then through a chain of tradition to the ancient rabbis. The rabbis in France received this "Oral Torah" in the form of written

documents—Mishnah, Talmud, and Midrash—composed in the land of Israel and Babylonia between the 3rd and 6th centuries. The task of the medieval rabbi was to harmonize the interpretations of the "Written" and "Oral" Torahs with the praxis of Jewish life.

Jews in medieval France studied Scripture in their academies and also heard Scripture read and expounded during their daily and Sabbath liturgy. Scriptural study thus inspired various genres of rabbinic literature: the biblical commentary, the homily, *responsa* (legal decisions by rabbis), and the liturgical poem. Biblical commentary was never fully separated from other branches of Jewish learning.

In northern France (Champagne, Île-de-France, Lorraine), Jewish learning emerged during the 10th and 11th centuries and was shaped largely by the texts and traditions transmitted by the more ancient Jewish communities in the Rhineland cities of Speyer, Worms, and Mainz. Drawing upon the writings of Jews in Italy and the Byzantine empire, these communities focused their efforts almost entirely on the classical canon of rabbinic literature and developed the Midrash, or homiletic exposition of the Bible and liturgical poetry.

By contrast, the communities in southern France (Provence, Languedoc) had experienced Jewish settlement since late antiquity. Mediterranean commerce and exposure to the Islamic empire opened these communities to a broader sphere of influences from outside the rabbinic canon. The flowering of biblical scholarly activity in south-ern France began in the mid-12th-century migration of significant scholarly families from Spain in the aftermath of the Almohade invasions. These scholars brought the Spanish tradition of Jewish biblical exegesis with its highly developed use of the linguistic sciences of lexicography and grammar. In addition, the philosophical and poetic traditions of the Judeo-Islamic world had a significant impact on these French communities. It was in Narbonne that most of the Jewish philosophical works written in Arabic, such as Maimonides's *Guide to the Perplexed,* were translated into Hebrew. Southern France thus became a center for the integration of philosophical topics into biblical exegesis. Also by the mid-12th century, the first groups of scholars engaging in mystical interpretation of Scripture began to flourish in Provence.

Both northern and southern French centers of Jewish exegesis were profoundly affected by contacts with the surrounding Christian culture. On occasion, Christian scholars actively solicited Jewish insight for their own exegesis. Examples of these exchanges are Abbot Stephen Harding of Cîteaux's invitation to Jews for discussions or Andrew of Saint-Victor's incorporation of "Traditions of the Jews" into his biblical commentaries. Christian evangelization often called upon Jews to defend their interpretations of Scripture. These challenges led to the composition by Jews of polemical treatises that refuted christological explications of the Hebrew Bible. Many scholars also argue that the contact with Christianity, particularly in northern France, was one of the primary motivations for the development of *peshat* ("plain" or "contextual meaning") exegesis.

The development of biblical exegesis in northern France may be divided into three periods: the 11th century, characterized by the compilation of Old French glosses on Hebrew Scripture and the exegesis of Rabbi Solomon ben Isaac of Troyes (Rashi; 1040–1105); 1100–75, marked by the development of an exegesis of the Hebrew Bible independent of rabbinic allegorization; and 1175–1300, showing the evolution of a

dialectical method that harmonized Rashi with contradictory authorities in classical rabbinic literature, the composition of polemical treatises, and the compilation of Old French-Hebrew glossaries.

The earliest example of exegetical activity in northern France seems to have been a group of scholars called *Poterim* ("translators"), whose primary activity was the assembling of lists of words in Hebrew and Old French for teaching children. The unique aspect of the *Poterim* seems to be their focus on the language of Scripture and not on the broader dimensions of the Bible and rabbinic literature.

Rashi gave the basic shape to northern French biblical exegesis. He left Troyes to study in the academies of the Rhineland, where scholars had been compiling notebooks, or *quntresim,* of exegesis on the Talmud. This Talmud commentary focused on clarifying the language of the dialectical arguments within the text. Rashi brought this style of interpretation, which focused on clarification of the sequence of argument, back to Troyes. On the basis of the *quntresim* of his teachers, Rashi wrote a commentary on almost all the tractates of the Babylonian Talmud. This vast project guaranteed that his writings would comprehend the full spectrum of rabbinic learning. Drawing upon the linguistic works of the *Poterim* and the tradition of Talmudic commentary in the Rhineland, he developed a hermeneutics that harmonized the Hebrew Bible with the rabbinic tradition.

Rashi wrote commentaries on the entire Hebrew Bible (except Ezra-Nehemiah, Chronicles, and the Book of Job). One of his fundamental principles was to balance the lexical boundaries of the biblical words or phrases against a variety of potential interpretations from rabbinic literature. He described his approach in the following way: "There are many Aggadic Midrashim, and our Rabbis have previously set them in proper order in Genesis Rabbah and other Midrash collections, and I have come for the plain meaning of the biblical text and for the Aggadoth which settles the words of the Scriptural text in their proper order" (Genesis 3.8). Rashi used the Hebrew phrase unique to his writings, *Peshuto shel Miqra* (translated "plain meaning"), to describe his goal. The goal of the exegete was to examine the sequence of biblical phrases in context and then turn to rabbinic sources that would be adapted to interpret the phrases. Rashi thus focused on narrative aspects of the text, through the sequence of words, joining the "plain meaning" and rabbinic authorities.

Rashi's commentaries generally provide an introduction to each biblical book. In most cases, the introduction is part of the comment on the initial verse. It describes the purpose of the book and gives some details about its author. In these, Rashi employs material from rabbinic literature but adapts it for his own purpose.

Rashi's biblical commentaries were the subject of glosses produced by scholars of the next generation, who saw themselves free to explore the lexical level of the text independently of rabbinic literature. Rashi's younger colleague Rabbi Joseph ben Simon Kara (b. ca. 1060/70) also traveled to the academies in the Rhineland. He wrote glosses on the Pentateuch and full commentaries on the Prophetic and Historical Books and the Writings. He also wrote commentaries on synagogue poetry that contained exegesis of Scripture. Joseph Kara distinguished himself from Rashi by his focus on the biblical text independent of rabbinic literature. In his commentaries, Kara attempts to engage the reader of a biblical verse directly through a series of questions and answers that lead to a comprehension of the entire passage.

By the mid-12th century, Rashi's grandsons, Rabbi Jacob ben Meir of Ramerupt (1100–1171) and Rabbi Samuel ben Meir (Rashbam; 1080–1160), had become the most prominent rabbinic authorities in France. In his commentary on the Pentateuch, Rashbam indicates that he wishes to continue the work of his grandfather Rashi. He focused on the *Peshat,* or plain, meaning of the biblical text. He extends the meaning of *Peshat* by claiming to seek the *'Iqqar Peshuto,* the fundamental plain meaning, of the Bible. This means that he seeks the explanations of difficult words or phrases by connecting them with passages from the same context. Rashbam does not rely on classical rabbinic interpretations but rather refers to human custom and the natural world in his commentaries.

The focus on explaining the biblical text independent of rabbinic tradition continued in the work of two other scholars, Rabbi Joseph of Orléans, also known as Joseph Bekhor-Shor, and Rabbi Eliezer of Beaugency. Joseph of Orléans's primary focus was on discerning the continuous narrative of the biblical text. His commentary also includes polemics against Christian allegorical interpretations of the Hebrew Bible that indicate his knowledge of the text of the Latin Vulgate and some of the most common Christian typological interpretations. Rabbi Eliezer of Beaugency's commentaries on Isaiah, Ezekiel, and the Minor Prophets reveal a striking independence from classical rabbinic interpretations. His emphasis is on the historical background of the Prophets and their visions and on the historical aspects of the prophetic texts.

In the mid-12th century, the Spanish-born Rabbi Abraham ibn Ezra (1089–1164) came to Rouen. His influence on contemporary French biblical exegesis is difficult to determine, but his later influence was extensive. He wrote commentaries on almost all books of the Bible. Ibn Ezra, however, incorporates rabbinic traditions in commentaries that range from philological notes to long scientific treatises. His commentary on the Song of Songs is the most original; in it, he proposes three levels of meaning: the lexical, the narrative, and the historical allegory.

After the development of *Peshat* exegesis during the 12th century, the dialectical Talmudic commentary called *Tosafot* seems to have become dominant. Collections of the biblical comments of these Talmudic masters have been preserved, printed under the titles *Da'at Zeqenim* ("Opinions of the Elders"), *Hadar Zeqenim* ("The Glory of the Elders"), and *Moshav Zeqenim* ("Dwelling Place of the Elders"). In addition, some collections can be ascribed to a single author, such as *Sefer HaGan* by Rabbi Aaron ben Yossi Ha-Cohen or *Minhat Yehudah* by Judah ben Eliezar (fl. 1300). Their biblical comments, usually based on Rashi's explanation, offer a harmonization of his comment with other passages in rabbinic literature.

The concept of assembling previous exegetical work also appears in the polemical treatise *The Book of Joseph the Zealot* by Joseph ben Nathan Official (fl. 1260–70). His polemical treatise, arranged according to the order of the books of the Hebrew Bible, refutes Christian allegorical interpretations with philological and rational arguments. Each chapter is augmented by a narrative that sets the stage for the argument: a conversation with a bishop; an argument with a mendicant; or a discussion with nobility.

Yet another series of exegetical collections from the 13th century comprise glossaries, probably influenced by Rashi's Old French glosses. These dictionaries provide the word in biblical Hebrew, an Old French translation in Hebrew characters, and the Old French

in Latin characters. At times, several Old French explanations are proposed for a single biblical phrase.

Jewish intellectual activity in southern France may be divided into two periods: 900–1150 and 1150–1350. The conquest of the Almohades drove Jews educated in the Judeo-Islamic methods of exegesis into Provence, particularly Narbonne, in the mid-12th century. Even before the Spanish-educated Jews arrived, however, Provence hosted Jewish communities that produced literary works in traditional genres of rabbinic literature, such as legal codes, Talmudic commentary, and scriptural exegesis. From 1150 to 1350, the study of the Bible continued with careful attention to linguistic problems and was enhanced by the assimilation of philosophical investigation into Jewish religious thought. Jewish biblical studies during the 10th century in Provence focused on the collection of rabbinic *Aggadah,* or nonlegal material. Rabbi Moses Ha-Darshan ("the Preacher") of Narbonne is the main literary source. Scholars have ascribed two collections to him, *Midrash Bereshit Rabbati* and *Midrash Tadshe*.

The arrival of the Kimchi family changed the direction of biblical exegesis in southern France. Joseph (1105–1170) and his two sons, Moses (d. 1190) and David (d. 1235), brought with them the Spanish tradition of grammar, lexicography, and philosophical learning. These approaches contrasted with the homiletical or allegorical traditions that had dominated biblical studies in previous generations. Joseph Kimchi believed that the foundation of biblical exegesis lay in the knowledge of grammar. From his commentaries on the Pentateuch, Job, and Proverbs, as well as citations of his commentaries on the Prophets by his son David, we can observe Joseph's gift for resolving exegetical problems through a proper understanding of grammar and syntax. He also pursued the broader horizons of biblical meaning that were available through a rationalist approach to exegesis, and he utilized both grammar and rational analysis to refute Christian interpretations of the Hebrew Bible. He wrote *Sefer HaBerit* ("The Book of the Covenant") as an apologetic work proving the truth of Judaism. During this same period, Rabbi Jacob ben Reuben wrote an anti-Christian treatise in Gascony, the *Milchamot HaShem* ("The Wars of the Lord"). The spirit of religious polemic and apologetic, so much part of the broader Christian ambience in mid-12th-century southern France, pervaded Judaism as well.

The most extensive exegetical writings of the Kimchi family come from David. His systematic treatise on textual criticism of the Bible, *Et Sofer* ("The Scribe's Pen"), describes manuscript variants and the problems of the Massorah (the traditional consonantal Hebrew text as furnished with vowels by medieval scribes). His grammar book, *Sefer Mikhlol* ("The Compendium"), contained both a dictionary and a description of Hebrew grammatical rules. He wrote commentaries on Genesis, all the Prophets, the Psalms, Proverbs, and Chronicles, as well as allegorical commentaries on the Garden of Eden, Cain and Abel, and the first chapter of Ezekiel. Like his father, David Kimchi actively pursued polemics against Christian allegorical interpretations of the Hebrew Bible. Many of these polemical interpretations appear in his commentary on Psalms.

During the 12th and 13th centuries, Jewish communities in Provence witnessed the development of two genres related to biblical exegesis. Beginning in Posquières, Jewish esoteric, or mystical, speculation resulted in the composition of the first treatises on that subject. The doctrines developed in these circles would lead to the production of mystical writings in Gerona and throughout Spain in the 13th and 14th centuries. Jacob ben Abba

Mari Anatoli (fl. 1300) composed one of the first works of Jewish sermonic literature, *Malmad Ha Talmidim* ("Goad for Students"). Arranged according to the weekly Pentateuch reading, Anatoli provided moral lessons in the form of model sermons for preaching. This work, although not formally biblical exegesis, would have great influence on the development of sermonic literature and biblical exegesis in the centuries to follow.

# BIBLE, LATIN VERSION OF

. Although the Bible was written mostly in Hebrew and Greek, the world of early Christianity was chiefly one of Roman imperialism, so a Latin translation was imperative. Until the translation made by Jerome (ca. 342–420), referred to as the Vulgate, a number of other Latin versions were in circulation in the early church. Generally referred to as the Old Latin *(Vetus Latina)* versions, their translations of the books of the Old Testament were made from the Greek translation known as the Septuagint rather than from the original Hebrew. The Old Latin Bible was thus the work of many hands and a number of revisions over the course of the 2nd century A.D.; hence, different traditions of the text existed, particularly in North Africa and Italy. The language of the Old Latin versions is somewhat odd, reflecting the Greek original, which it sometimes merely transliterates rather than translates, and its popular audience, rather than the Latin style of the cultured elite. No complete manuscript of the Old Latin Bible has survived; the Bible (the word is

plural in the Greek) was made up of separate volumes, and pandects (Bible in a single volume) were a later development.

The varying forms of translation and difficulties in the Latin text persuaded Jerome, at the behest of Pope Damasus I, to undertake a new translation, this time from the original languages. This Vulgate text (*vulgata* 'popular') became the standard Bible in the Latin West from about the 6th century to the Reformation. However, although he is responsible for the majority of the text, Jerome is not the sole author, nor did he accord each book the same attention. Since the text of the Old Latin Old Testament was a translation of a translation, Jerome concentrated his energies here. Most of the Vulgate Old Testament is his work, with the exception of the Psalter (which is a corrected Old Latin text) and the five books that were included in the canon by Greek-speaking Jews but were not in the Hebrew canon: Wisdom, Ecclesiasticus, Baruch, 1 and 2 Maccabees. These retain the Old Latin text.

The text of the Psalter, with its varying traditions, involved more than one attempt at a solution. It is possible that the text of the Roman Psalter (that one commonly used by all the churches in Rome) is Jerome's first, hur-ried, attempt at a translation. His first definite attempt is the Gallican Psalter, based on the Hexapla text of manuscripts collected by Origen at Caesarea (known as Hexapla from its six-column format for comparing Hebrew and Greek texts). This was the version preferred by Alcuin, and, since it was, broadly, the text of the 13th-century Paris Bible and the basis of the first printed Bibles, it was the normal text for centuries. Jerome's final attempt at a Psalter translation, the "Hebrew," is so called because Jerome made it afresh, from the original Hebrew. This never (except for a time in Spain) achieved the popularity of the Gallican Psalter translation.

For the New Testament, Jerome himself seems merely to have revised the Gospels, perfunctorily at times, with the Greek text in hand. The rest of the books were revised by other scholars whose identities remain unknown, although the earliest references to the revised text are found in Pelagius. As well, Jerome wrote a series of prologues to the books or groups of books of the entire Bible, and these were commonly circulated with the text itself, becoming almost an integral part of it. The order of the books is variable.

Jerome seems to have begun the project with the simplest task, the revision of the Gospels, ca. 382. The Gallican Psalter was completed ca. 392, and the Hebrew Psalter and the rest of the Old Testament were done by ca. 407. The new version was not an immediate success, although by the late 6th century it seems to have become the standard text, a position that it retained until the Reformation. It was declared the authentic biblical text by the Council of Trent in the 16th century.

# BIBLE MORALISÉE

**.** Name given to a group of illustrated adaptations of the Bible first composed in Latin in the 13th century and translated into French in the 14th. The text consists of quotations from the Old and New Testaments that do not flow continuously. These are accompanied by commentary in the form of allegorical interpretations or moral applications of the biblical text and illustrated by some 5,000 miniatures. The *Bible moralisée* is to be distinguished from the *Bible historiale figurée,* a 14th-century compilation of similar nature but composed of different texts and commentaries.

# BIBLICAL TRANSLATION

**.** Exact translations of biblical texts were rare in Old French. Prepared for a lay audience, many "translations" were actually adaptations or paraphrases or included extensive commentaries. Still others drew on noncanonical sources, especially the apocryphal texts dealing with the life of the Virgin and the childhood of Jesus.

Translations of the Bible into French appeared first in England in the 12th century. The so-called "Psalters" of Cambridge and Oxford were produced in prose before 1200 and perhaps before 1150. The former, based on the Hebrew Psalter, is really a gloss on the Latin text, while the latter, based on the Gallican Psalter, is a continuous translation. Verse translations—the *Sauter en fraunceys* and Sanson de Nanteuil's *Proverbes de Salomon*—appeared in England in the second half of the century. These were followed in the latter 12th century by prose versions of the Books of Kings and the Apocalypse. The *Quatre livres des rois* is much less literal than the Psalters; it includes continuous commentary on the text but is of particular importance for the force and elegance of its

style. In the enormously popular *Apocalypse,* on the other hand, text and commentary are subservient to the sumptuous illustrations.

On the Continent, the 12th century saw the translation of a different selection of individual books, with enough commentary to place them in an exegetical tradition. Evrat's *Genèse* (1198) includes symbolic explanations and moral applications. Landri de Waben's *Cantique des cantiques* (1176–81) is a poetical paraphrase of the Latin text with interpretations according to the four senses of Scripture. The anonymous *Exodus* and the French version of the psalm *Eructavit* sometimes attributed to Adam de Perseigne are both allegorical in nature. In the latter part of the century, Herman de Valenciennes made the first attempt at an "integral text" of the Bible. His *Roman de Dieu et de sa mère* (also called *Roman de sapience*), is a poem in epic laisses that draws on both testaments and incorporates much legendary material about the life of Mary, drawn from apocryphal accounts of her childhood, marriage, and assumption. His work survives in over thirty-five manuscripts.

Biblical translation flourished in the 13th century, which saw the appearance of no fewer than five verse renderings as well as the scholarly prose version known as the "Thirteenth-Century Bible" or the "Paris Bible." This last was produced under the aegis of the University of Paris toward the middle of the century. It was the work of several translators and was not entirely original, for it incorporated earlier versions of Psalms and the Apocalypse. At the end of the century, its text was combined with Guyart des Moulins's *Bible historiale* (a translation of Peter Comestor's *Historia scholastica*) to form the *Bible historiale complétée*. This text, used in many illustrated Bibles, provided the basis for the *Bible historiale figurée* and for the 14th-century *Bible moralisée*.

Most of the biblical works in verse are more properly described as adaptations. The first successors to Herman de Valenciennes's version were two anonymous renderings written in the early 13th century. One of these (B.N. fr. 763) is fairly faithful to the Vulgate for the Old Testament but incorporates legendary material in the New and ends abruptly with a brief account of the Passion. The other poem (B.N. fr. 898 and 902), written in epic style, covers only the Old Testament, but a prose version of this text (B.N. fr. 6260 and 9562) is virtually complete. Geoffroi de Paris's *Bible des sept estats du monde* (B.N. fr. 1526; ca. 1243) is quite different in character, consisting of a collage of independent texts, many of them apocryphal, arranged in sequence to constitute a sort of biblical legendary. Jean Malkaraume's *Bible* from the middle of the century is generally more faithful to the Vulgate, but it incorporates extraneous material as diverse as *Piramus et Thisbé,* the *Roman de Troie,* and the apocryphal genealogy of the Virgin. The last, longest, and most nearly complete of the verse Bibles was produced by Macé de la Charité between 1283 and the early 14th century. Like its principal source, Peter of Riga's *Aurora,* this version stresses the allegorical meaning of the biblical text. With the later addition of an allegorical exegesis of the Apocalypse, the whole runs to some 43,000 octosyllabic lines and is preserved in a single manuscript (B.N. fr. 401).

Alongside the "integral texts," individual books of the Bible continued to draw translators' attention. Guillaume le Clerc produced his verse *Tobie* at the beginning of the 13th century. Near the middle of that century, Gautier de Belleperche rendered the Book of Maccabees in epic style, producing the 23,000-line octosyllabic *Roman de Judas Machabée*. His poem was completed in 1280 by Piéros du Riés, who may also have written a second, shorter version of the same book in 1285, the *Chevalerie de Judas*

*Machabée et de ses nobles frères.* Two anonymous prose translations of Maccabees appeared in this period, as well as prose versions of Judges, Kings, Genesis, and Proverbs. The popularity of the Apocalypse was unrivaled, and the 12th-century prose translation was followed by seven others, as well as two verse versions. A second rhymed Psalter was made in the second half of the 13th century, and translations of the penitential psalms were frequently copied in books of hours.

In the Midi, the work of translation was closely associated with the activities of the Cathars and the Waldensians. Interest centered on the New Testament, particularly the Gospels. The earliest surviving text is a fragment of a literal rendering of the Gospel of John from the second half of the 12th century. The Languedocian New Testament dates from the early 13th century, while the Vaudois New Testament exists in a mid-15th century manuscript. The Provençal Gospels, with their pronounced popular character, appeared late in the 13th century. The Old Testament is represented only by the 14th-century *Livre de Genesi,* which completed sacred history with apocryphal legends.

# BINCHOIS, GILLES

(Gilles de Bins dit Binchois; ca. 1400–1460). Together with his contemporary Guillaume Dufay, Binchois had a profound effect on continental musical style in the early 15th century. As a member of the Burgundian court for nearly thirty years, Binchois was the strongest single influence on the development of the centrally important repertory of Burgundian chansons.

Binchois was probably born in Mons, into a bourgeois family. The earliest documents regarding his musical career are at the the church of Sainte-Waudru in Mons, where he was organist ca. 1419–23. He served briefly as a musician, and possibly as a soldier, to William de la Pole, earl of Suffolk, during the middle 1420s, when Suffolk was resident in Paris. Documents pertaining to an assassination attempt on Philip the Good, duke of Burgundy, show that Binchois composed at least one song, now lost, for Suffolk. By ca. 1425, Binchois was a member of the choir of the Burgundian court, an association that continued for the rest of his career. Unlike the majority of early 15th-century composers, Binchois was never ordained as a priest, nor did he have a university degree. This did not,

however, preclude him from service as a chaplain to the duke of Burgundy. He was also able to secure profitable prebends in Bruges, Mons, Cassel, and Soignies, which added to his considerable salary from the duke.

Binchois died in retirement at Soignies in 1460. His music was renowned throughout Europe, and in the *Champion des dames* (ca. 1442) by the Burgundian poet Martin Le Franc he was lauded with Dufay as one of the leading musicians of the day. It is apparent from Dufay's emotional *déploration* on Binchois's death that Dufay knew and respected his contemporary's music. Binchois's death is also lamented in a ballade by his younger colleague Johannes Ockeghem. Although Binchois's songs were outdated in style by the time of his death, they remained popular as subjects for polyphonic elaborations until the end of the 15th century.

Binchois composed a great deal of sacred music, much of it presumably for services in the ducal chapel of Burgundy. Over two dozen surviving Mass Ordinary movements are ascribed to him, but none of the surviving movements appears to have been part of a cyclic Mass. Most of the Mass music is set in a simple style, often resembling contemporary English music in its counterpoint and in its use of texture changes. There are over thirty additional sacred works by Binchois, mostly settings of the Magnificat, antiphons, and hymns. Several of these works are set in *fauxbourdon,* and as in the Mass settings most of them are in a simple style, suggesting day-to-day use in chapel services. Two of his more ambitious sacred works, however, were apparently written for specific events or personages. Binchois's only isorhythmic motet, *Nove cantum/Tanti gaude* (incomplete in its unique source), was written for the baptism of Philip the Good's short-lived son Antoine in 1431. The triplum text of this motet provides a list of Binchois's musical colleagues at the Burgundian court. His *Domitor Hectoris* was apparently written in 1438 to honor Nicholas Albergati, cardinal of the Holy Cross of Jerusalem and the pope's envoy in the delicate three-way peace negotiations among Burgundy, France, and England.

It was Binchois's songs that had the widest circulation and the broadest influence. Nearly sixty surviving songs may be attributed to him, forty-six of which are rondeaux. With the exception of *Files a marier,* Binchois's texts are couched in the language of courtly love, an idiom perfectly suited to the chivalric Valois aesthetics of the Burgundian court. Among the lyrics set by Binchois are three texts by prominent 15th-century poets, *Dueil angoisseux* by Christine de Pizan, *Triste plaisir* by Alain Chartier, and *Mon cuer chante joyeusement* by Charles d'Orléans. Virtually all of his songs are set in a three-voice texture that is entirely dominated by the melody of the uppermost voice. Binchois was unequaled among 15th-century composers as a creator of flowing, arch-form melodies. His rondeaux and ballades feature a carefully contrived formal balance between sections, and the approach to tonality is strikingly modern. The high quality and reputation of his songs and his musical leadership at the court of Burgundy during the apex of its political and artistic power ensured Binchois's strong influence on the next generation of Franco-Flemish composers, including Ockeghem and Antoine Busnoys.

# BIOGRAPHY

**.** In contrast to classical and medieval Greco-Latin tradition and to subsequent development of the genre from the Renaissance on, French medieval secular biography is relatively poor. It appears as if the luxuriant growth of hagiography has stifled the urge to describe nonsaintly lives. Furthermore, it is difficult to distinguish, particularly in the earlier period, between the specifically biographic and the more general historical, didactic, and moral writing that might include biographical accounts of heroes who, today at least, are not considered saints. It can be said that until the end of the 14th century collections of the lives of famous persons belonged chiefly if not exclusively to the clerical—i.e., Latin—tradition. The beginning of this medieval, christianized tradition probably can be traced back to St. Jerome's *De viris illustribus* (ca. 342–420).

The same applies to individual biographies. There is hardly anything in French literature of the 11th, 12th, and 13th centuries that could be compared with the properly biographical *Vita Karoli magni imperatoris* by Einhard (ca. 770–840). But many elements of this monument of secular biography, with its conscious imitation of Suetonius and wealth of details about both the public and private life of the emperor, were either directly or indirectly "borrowed" in such immensely popular works as the Pseudo-Turpin Chronicle (Latin version ca. 1140; seven Old French translations in the course of the 13th c.). Pseudo-Turpin's account was incorporated into the *Grandes chroniques de France* by the monks of Saint-Denis. By 1274, most of this great historical compilation was translated into French. Philippe Mouskés's *Chronique rimée* (continued to 1243) devotes almost a third of its 31,256 lines to the life and deeds of Charlemagne. He takes his material from an Old French version of Pseudo-Turpin, as well as from the less authentic chansons de geste. Dealing with these forms of Charlemagne's biography, we must be mindful that there might have been an important hagiographic element contributing to its popularity, for Charlemagne was formally canonized.

Similar problems of genre are encountered in another work that, from a modern point of view, should certainly be qualified as biographical Jean de Joinville's *Histoire* (or *Vie) de saint Louis*. Asked (ca. 1309) to write a memorandum on the life of the saintly king to serve in the canonization process, Joinville (1225–1317) composed a lively account of his companion, which is also the first serious autobiography in French, since Jean talks interestingly and abundantly about his own life.

In the Occitan domain, there is a curious biographical subgenre. The 13th-century *vidas* are usually brief prose notes on troubadours' lives preceding the poems of a given

troubadour, often paraphrasing information culled from the poems. About a hundred such biographies have come down to us, all but two anonymous.

The 15th century witnessed the development of the secular biography proper. There is no doubt that the impetus came, at least in part, from the immense success of Boccaccio's *De casibus virorum illustrium* (1355–60). The purpose of this collection of lives of men and women from Adam to such contemporaries as Charles I of Anjou or Philippa of Catania is moral as well as biographical. As the *casus* of the title indicates, Boccaccio wished to offer a moral commentary on the fickleness of Fortune. The immensely popular *De casibus* was translated by Laurent de Premierfait at the beginning of the 15th century as *Des cas des nobles hommes et femmes,* further contributing to the popularity of the biographic-moral genre.

In 1405, Christine de Pizan (ca. 1364-ca. 1430) composed in prose her *Livre de la Cité des Dames* (1405), containing a long "catalogue" of illustrious ladies of all epochs. Christine was inspired by Boccaccio's *De claris mulieribus* (completed after 1362). Her book, again, is not a pure biography (if such a thing exists) but chiefly a defense of women from misogynous attacks. Christine also wrote the *Livre des fais et bonnes meurs du sage roy Charles V* (1404), in which she uses historical sources and court documents as well as personal reminiscences. The main purpose is not so much historical as biographicopanegyric. Largely panegyrical also is the *Livre des fais du bon messire Jehan le Maingre, dit Bouciquaut,* composed anonymously between 1407 and 1409, during the life of the protagonist. This lengthy prose panygeric has occasionally been attributed to Christine de Pizan, but this identification is generally rejected. The main purpose of this biography seems to be to exalt the chivalric ideal of the times.

The century ends with a far more realistic portraiture of Louis XI and other nobles in the *Mémoires* (completed in 1498) by Philippe de Commynes. The realism and vivacity of the biographical elements in this work foreshadow the triumph of biography during the Renaissance.

# BLACK DEATH

. Beginning in late 1347, most of western Europe was attacked by a pandemic that overshadows both the earlier outbreaks in 6th- and 7th-century eastern Gaul and the recurrent epidemics from the 14th through the 16th centuries. The plague later acquired the labels "bubonic" and "black," for the swellings and hematomas it caused, but it was called the "Great Pestilence" by contemporaries. It originated in the Far East and was spread by the rat-flea as carrier of the *pasteurella pestis*. Landing in Marseille in December 1347, the disease swept along the coast and up the Rhône, entering Avignon within the next month. By August 1348, it had ravaged Languedoc and reached Bordeaux, overran Provence and Burgundy, and entered Paris. Before year's end, it raged through Normandy and the northern counties.

Populous, weakened by famines, and distressed by war, France suffered the highest mortality. Fatalities ran between one-fifth of the pontifical courtiers to over half of the population in many rural parishes from Anjou to Savoy. In Paris, Jean de Venette recalled, over 500 dead were buried each day. Religious communities were afflicted disproportionately, with several monasteries in the south decimated or exterminated. The poor were defenseless, but even the noble were not exempt: Philip VI's queen, Jeanne of Burgundy, and her daughter-in-law Bonne de Luxembourg succumbed in the last weeks of the pandemic. Many fell ill but lived, and some of these left poignant testimonies, notably the mystic friar Jean de Roquetaillade and the papal physician Gui de Chauliac.

Distinguishing between pneumonic and bubonic plague, Chauliac reported that in the former, more contagious and prevalent in winter, people died within three days after running a high fever and spitting blood; in the latter, the victims often survived after developing abscesses, particularly in the armpits and groin. The vast medical literature generated by the pestilence, including an official report by the University of Paris made at the request of Philip VI, was largely sterile. Scientific attempts to determine the causes, while more rational than the popular explanations, hinged on humoral theories and astrological beliefs. Prescriptions offered, at best, commonsensical precautions and palliation; at worst, they recommended such dangerous procedures as bleeding and the lancing of buboes. Many physicians evidently labored heroically, for the profession suffered more from a severe decline in numbers than from a crisis of credibility.

The socioeconomic and cultural consequences of the Black Death, ranging from inflation and class changes to mass psychoses and a preoccupation with mortality, cannot always be isolated from the impact of the Hundred Years' War and of subsequent epidemics. Among the immediate effects, however, may be counted an extension of the Truce of 1347, a setback for constitutional reforms, and the outbreak of the flagellant movement, which, though banned from the realm, raged in the fringe regions of Flanders, Hainaut, and Lorraine.

# BLANCHE OF CASTILE

(1188–1252). At the age of twelve, Blanche of Castile, the daughter of Alfonso VIII of Castile, was married to Prince Louis of France, who would reign briefly as Louis VIII (1223–26). Louis's early death while on the Albigensian Crusade left the throne to their young son, Louis IX. The regency was entrusted not to a male relative or a council of barons but to Blanche.

In the first years of her regency, Blanche was confronted with armed rebellions intended to displace her and with the serious possibility of a reversal of French successes in the southern lands that had been conquered in the Albigensian Crusade. She triumphed in both cases. Gifted with an iron will and clever in her ability to cultivate allies but careful not to link her fortunes too closely to any baronial house, such as the house of Champagne, through a hasty remarriage, she pursued a policy of divide-and-conquer against the rebellious barons. Their uprisings and shows of force never achieved a decision in their favor. Blanche's success against the baronial opposition in the north was both cause and effect of her maintenance of French dominance in the south. The swiftness and decisiveness of her actions against the northerners induced the southern nobles to negotiate their grievances; and the army that had been left in the south at her husband's death remained, despite some difficulties, loyally commanded and in firm control. By 1229 and the Treaty of Meaux-Paris, the opposition in Languedoc acknowledged its defeat. The prestige of victory in the south encouraged loyalty and support in the north when the crown had to respond to new baronial demonstrations against it in the 1230s led by, among others, the titular count of Brittany, Pierre Mauclerc.

Blanche's regency was distinguished by a balanced foreign policy. On the one hand, the traditional enemy, the English, never effectively made inroads into those provinces, like Normandy, that they had lost in 1204. On the other hand, she made no concerted effort to eject the English from their remaining territories in Aquitaine. In the war of words and sometimes of men between the emperor Frederick II and the papacy, she kept to a neutral path.

In the later 1230s down to 1244, Blanche's role in government gradually diminished. Her son reached adulthood, married, and became more active, especially in military affairs. This translation of power was not entirely easy. There was mutual dislike between

Blanche and her son's wife, Marguerite of Provence; Blanche also vigorously opposed Louis's decision in 1244 to take the crusader's vow. Nonetheless, she remained a close political adviser to the king, far closer than his wife, and Louis entrusted the reins of government to Blanche when he embarked on crusade in 1248.

As a deeply devout and morally strict woman, an enthusiastic patroness of the church, especially the Cistercian order, and a Castilian who grew up in an environment of fierce commitment to the holy war of reconquest in Spain, Blanche's opposition to her son's crusade remains something of a puzzle. But however she felt about his enterprise in the abstract, she devoted her full energies to making certain that he was well supplied and that he need not trouble himself about governance at home while he fought in the East. She managed to negotiate a two-year extension of the clerical income tax of one-tenth in order both to finance the war effort and to replenish the king's coffers after the disastrous early phase of the crusade that saw Louis captured and ransomed in Egypt. She acted with her characteristic firmness in 1249, on the death of the count of Toulouse, when a movement took shape to turn aside the settlement of 1229 that designated her son Alphonse to be the new count of Toulouse. She thought well of the so-called Pastoureaux (1251), Flemish and northern French rustics who proclaimed themselves crusaders determined to rescue and otherwise aid the king. But when bands of these forces rioted in Paris and pillaged other towns, it was she who authorized and oversaw their destruction. Blanche died in November 1252. When her son, still in the Holy Land, received the news some months later, he succumbed to a grief so profound that it troubled all who knew and loved him.

# BLOIS

**.** Originally one of six *pagi* dependent on Chartres, Blois (Loir-et-Cher) became the center of a county in the 9th century. The dukes of France installed a viscount there and later assigned the county to one of their vassals, Thibaut le Vieux, viscount of Tours (r. 908–40). His son, Thibaut I le Tricheur, created a powerful principality in the middle Loire Valley by adding the counties of Blois and Chartres to that of Tours (r. 940-ca. 975). Blois became the natural center of these lands, especially after the loss of Tours to the Angevins (1044), as the counts had few lands or vassals in Chartres, which was dominated by its bishop and cathedral chapter.

Count Eudes II (r. 996–1037) began to reorient the dynasty in 1021, when he claimed succession, through his grandmother Liedgard of Vermandois, to the counties of Meaux and Troyes in Champagne. To soften King Robert's opposition to the impending encirclement of the royal domain, Eudes enlisted Fulbert, bishop of Chartres, to plead his case as rightful heir and loyal vassal. Having succeeded in planting the house of Blois in Champagne, Eudes then managed to link the two lands through Berry by marrying the last heiress of Sancerre (ca. 1030). The eastward thrust of the Thibaudians was reinforced

by the loss of Tours and the subsequent acquisition by marriage of two additional counties in Champagne, Bar-sur-Aube and Vitry, under Thibaut III (I of Champagne, r. 1037–89).

Thibaut's elder son, Étienne, became count of Blois-Chartres-Meaux (r. 1089–1102), while the younger, Hugues, was granted Troyes, Bar-sur-Aube, and Vitry (r. 1093–1125). Étienne is best known for his marriage to William the Conqueror's daughter, Adèle, and his ignominious departure from the First Crusade on the eve of Antioch's capitulation. Although his motives are now better understood, contemporary derision forced his return to the Levant to complete his crusade vow. Despite courageous service on the Crusade of 1101, and his execution in captivity, chroniclers relished retelling his earlier misdeeds. Count Hugues likewise perished overseas, on his third expedition.

Étienne's eldest son, Thibaut IV le Grand (II of Champagne, r. 1102–52), inherited the patrimony of Blois-Chartres-Meaux, then in 1125 acquired the counties of his uncle Hugues, who had disowned his own son. Thibaut was a major personage of the time: among the most powerful French princes and a firm supporter of Bernard of Clairvaux, he was, according to Gerald of Wales, an ideal prince. His decision to shift his energies from the confines of the Loire Valley to the more promising counties of Champagne, where he established the international fairs, dramatically transformed the house of Blois: Champagne passed to his eldest son, Henri I, and became a major principality, while the counties of Blois-Chartres, shorn of their accretions, receded to second-tier standing. Thibaut's younger brother, Étienne, who had been sent to England to make his fortune at the court of their uncle Henry I, became King Stephen of England (r. 1135–54) but failed to install a dynasty there.

From 1152, the counts of Blois-Chartres were steadily drawn into the royal orbit. Thibaut V le Bon (r. 1152–91), who was appointed royal seneschal (1154) and who married Louis VII's daughter, Alis, by Eleanor of Aquitaine (1164), regularly attended the king. He accompanied Philip Augustus on the Third Crusade and died at Acre. His son, Count Louis (r. 1191–1205), deprived of a role at court (the office of seneschal was left vacant), encouraged the development of his towns by franchising, among others, Blois, Châteaudun, and Clermont-en-Beauvaisis (which he acquired through his wife) in 1196/97. Blois, however, with a population under 10,000, remained small compared with its neighboring rivals Tours, Orléans, and Chartres. The count's resources, concentrated in the county of Blois, were inadequate to raise the town of Blois to any significant level of administrative, commercial, or cultural importance. That Louis became one of the organizers and leaders of the Fourth Crusade was due entirely to his close familial tie with the count of Champagne. Louis supported the diversion of that expedition to Constantinople and led an assault against the city walls. Awarded the duchy of Nicaea in October 1204, he died in combat the next spring at Adrianople.

Thibaut VI (r. 1205–18) maintained the family crusading tradition by serving in the Albigensian Crusade and at Las Navas de Tolosa, but he died without issue after contracting leprosy and the counties reverted to his father's sisters: Marguerite took Blois (r. 1218–25) while Isabelle took Chartres (r. 1218–56). Both counties became direct royal fiefs in 1234, when Louis IX purchased their homages from the count of Champagne. Although Chartres was sold to Philip IV in 1286, Blois passed by marriage to the Châtillon family and was inherited by its eldest sons through the next century. Count Louis IV of Blois died at Crécy, and his sons led royal forces against the English. Gui II

de Châtillon, count of Blois (1381–97), who subsidized Froissart's researches for Book 3 of his *Chroniques,* sold Blois to Charles VI's brother, Louis of Orléans, in 1391.

The château of Blois, which dominates the bluffs above the Loire, was begun by Thibaut I in the 10th century. Nothing, however, remains of his fortress in the Renaissance château now on its site. The Tour de Foix and Salle des États, with its timber vaulting, are all that still stand of a 13th-century reconstruction. Charles d'Orléans, the poet and son of Louis of Orléans, began construction in 1440 on what was destined to become the current château, which was a favored residence of French Renaissance kings. The church of Saint-Nicolas preserves a transept, lantern tower, and ambulatory from the first campaign of construction (1138–86) and has a nave, side aisles, and façade with towers from ca. 1210.

# BLONDEL DE NESLE

(fl. 1180–1210). An early trouvère, Blondel was part of the lyric coterie that included Conon de Béthune, Gace Brulé, and the Châtelain de Coucy. No doubt noble, he may have been Jean II, lord of Nesle from 1202 to 1241, but there is no firm evidence. His two dozen poems date from ca. 1180 to 1200–10; all preserved with music, they are courtly love songs in a style derived from the Provençal tradition. Often repeated since its appearance in the mid-13th-century *Récits* of the Ménestrel de Reims, the story of Blondel's daring rescue of Richard the Lionhearted from captivity in Austria seems groundless.

# *BOECI*

. The fragmentary Occitan paraphrase of Boethius's *De consolatione Philosophiae* is regarded as the oldest literary text preserved in the language, written, perhaps, ca. 1000–30. In 258 lines of epic verse, the fragment narrates Boethius's imprisonment and then describes the visit of Lady Philosophy, as in Book 1 of the *De consolatione*.

# BOETHIUS, INFLUENCE OF

. The late Roman philosopher, translator, and political figure Boethius (480–534) belongs to the group of late-antique scholars who conveyed to the earlier Middle Ages the techniques and principles of classical learning. His work lies in four distinct areas: (1) *Logic.* Boethius provided and improved texts and commentaries in the Aristotelian tradition, which were gradually recovered by the Carolingians to form the basis of the "old logic" *(logica vetus)* and constituted the *logica nova* of the 12th-century schools. (2) *De arithmetica* and *De institutione musica.* Both treatises made available Greek numerical theory, on which scholars from the 11th century onward (such as Guido of Arezzo) could base their discussions. (3) *Five theological tractates,* called the *Opuscula sacra.* Written as a contribution to debate on the nature of Christ, these were a rare example of theological questions subjected to logical analysis, with no appeal to the authority of Scripture or the church. As such, they caught the attention of Johannes Scottus Eriugena and the Carolingian school of Auxerre. Whether or not they were known to Anselm of Bec, his philosophical theology is in the same tradition. A new critique was offered by Gilbert of Poitiers and others in Paris in the 1140s, and the first tractate was analyzed a century later by Aquinas. (4) *De consolatione Philosophiae.* Boethius's masterpiece was written (or presented as having been written) in his last months as a prisoner of King Theoderic in Pavia. The *Consolation* is Boethius's debate with himself on the meaning of life. What is the value of wealth and learning, the justification of moral acts, the role of chance in a divinely ordered universe? In Boethius's concluding words, "God sees all." His relation to God is that of the philosopher: there is no reference to Christ. Thus, the *Consolation* has no point of contact with the *Opuscula sacra;* instead, it rehearses the literary and philosophical commonplaces of the classical world. The work was endlessly fascinating to medieval readers, from Alcuin onward. In particular, Book 3, meter 9 *(o qui perpetua mundum ratione gubernas),* conjured up a Platonist universe in which there was every temptation

to cast the Holy Spirit as the *anima mundi,* Equally influential were the myths (e.g., Orpheus: 3.12) and legends (e.g., Ulysses: 4.3), the fragments of classical geography, and the well-honed moral epigrams. The *Consolation* was always good value as a child's schoolbook, the next step after the *Disticha Catonis.*

By ca. 1300, the Dominican Nicholas Trivet had written the definitive commentary on the *Consolation,* and translations were appearing in the European vernaculars (e.g., Jean de Meun, Chaucer). Such a book might be lavishly illustrated, and it might also carry extensive additional commentary. In broad terms, in the 14th and 15th centuries it was the French who preferred the luxury "coffee-table" edition, while the Germans (especially the Carthusians) provided extensive new and spiritual annotation. Even in the 16th century, Queen Elizabeth I filled her leisure hours by providing a new English translation: the *De consolatione Philosophiae* was still considered an edifying work suitable for an aristocratic young lady.

# BONAGUIL

**.** Located on a promontory of rocks that have broken from a plateau, the castle of Bonaguil (Agenais) is encircled by the valley of the Thèze and Lémance. The promontory offers protection for the castle except on the north side, where it is still attached to the plateau. Bonaguil's history dates back to the 13th century, to a frontier post that probably became the north section of the existing pentagonal keep. The castle came into the possession of the powerful Roquefeuil family in the 15th century and was remodeled ca. 1480 to resist cannon. To the north, its walls are more than 13 feet thick. Its transformation manifested the family's "will to power." Between 1445 and 1482 and under the direction of Jean de Roquefeuil, the keep became a structure with a ground floor and two stories, illuminated by immense windows and furnished with fireplaces. A crenellated parapet bordered the roof. Stairs cut into the stone provided access to the fortress. Thereafter, Jean's sons Berengier and Brigon continued adding buildings, towers (most notably a 30-foot square tower), and levered bridges. The principal entrance was changed from the west to the north side of the castle.

# BONAVENTURE

(John of Fidanza; ca. 1217–74). Bonaventure was born in Bagnoregio, near Viterbo, and sources say that he fought his well-to-do family to enter the Franciscan order; this he did in Paris, probably in 1243. Legend has it that as a child he was miraculously cured by St. Francis's intervention. He was educated in the Franciscan friary in Bagnoregio and moved to Paris for the arts course ca. 1234. He studied theology in the Franciscan school under Alexander of Hales, John of La Rochelle, William of Melitona, and Odo Rigaldus; his wide use of the Dominican Hugues de Saint-Cher suggests that he may have been Hugues's pupil as well. He was made regent master, probably in 1253, but formal acceptance for him and for Thomas Aquinas was delayed until October 1257 by the dispute between secular masters and the mendicants.

   In February 1257, Bonaventure was made minister-general of the Franciscans, on the suggestion of John of Parma, who had resigned under pressure from Pope Alexander IV. His nomination suggests that the divide between the two wings of the order (Conventual and Spiritual) was not yet unbridgeable, since John was later characterized as a Spiritual and Bonaventure a Conventual. As a master, he composed a commentary on Peter Lombard's *Sententiae* (by far his longest and most systematic work) and biblical commentaries, as well as various theological "questions."

   Bonaventure's accession to the minister-generalate effectively ended his academic career, but he continued to write devotional works. His writing is marked by a lucid latinity and deep devotion, qualities that he could also bring to academic argument. He combined academic discipline with fervent piety: for Bonaventure, more clearly than for any other scholastic theologian, the point of any theology was the building up of the life of faith and prayer. After a visit to La Verna, in Italy, in 1259, he began to write mystical texts of great influence; he had, in the Franciscan tradition, a particular devotion to the Passion.

   During the 1260–70s, he worked to defend the order, which did not practice the absolute poverty of its founder, against charges of hypocrisy, especially by his *Apologia pauperum* (1270). His aim was to reinterpret Francis's *Testament* for subsequent generations. He was called the "second father of the order," because of his attempt to produce a theology of the Franciscan life. On the publication of his new *Life of Francis* (1266), all previous Lives were ordered to be destroyed, as had happened similarly when Humbert of Romans had produced his new *Life of Dominic* (1260). Bonaventure was made Cardinal-Bishop of Albano in 1273; he died unexpectedly at the Second Council of Lyon in 1274.

   Bonaventure's theology is traditionally Augustinian. He is willing to make use of whatever tools come to hand, and to this end he was prepared to use Aristotle, but he held no specifically "Aristotelian" opinions. As well as Aristotle, his sources include Pseudo-Dionysius the Areopagite's *Celestial Hierarchy,* John Damascene, Boethius, and mystical

"moderns" like Richard of Saint-Victor. For Bonaventure, theology was so far above philosophy in purpose that there could be no difficulty deciding between faith and reason. This is not to say that faith is irrational; in cases of apparent disagreement, faith is clearly acting out of a different rationality. He made careful distinction among the object of faith *per se,* which is God, who can be known directly (the "believable" or "credible" thing); the object of faith as known through the authority of Scripture; and the object of faith as investigated in theological inquiry. Theology's task is not superior to either revelation or Scripture, or undermining of it, but is intended to cast a new light—that of intelligibility—on the search for God.

Bonaventure, known as *Doctor devotus* and *Doctor seraphicus,* saw the Son of God as the pattern for life on earth, and his theology is particularly Trinitarian—indeed, he described many things in threes. For instance, he developed a theology-spirituality of the triple way: the purgative way, moved by the prick of conscience; the illuminative way, moved by the light of the intellect; and the unitive way, moved by the flame of wisdom.

The obviously devotional stance of Bonaventure's work has sometimes led to his being unfavorably compared with Thomas Aquinas; the two are better seen as complementary than as comparable.

# BONIFACE VIII

(d. 1303). Pope. When Celestine V renounced the papacy in 1294, the cardinals elected Benedetto Gaetani, a noblemen from Anagni, who reigned as Boniface VIII. Gaetani had been a legate to France, where he silenced temporarily the complaints of the masters at Paris about the privileges given the friars by the popes. As pontiff, Boniface took charge of the curia and attempted to prevent war between Edward I of England and Philip IV the Fair of France by forbidding, in the bull *Clericis laicos,* lay taxation of the clergy without papal consent. This attempt to deny him the fiscal resources for war caused Philip to prohibit the export of bullion from France. Pressed by this embargo, by French propaganda, and by his own feud with the Colonna family, Boniface made peace with Philip. Neither pope nor king, however, would remain conciliatory. In 1298, Boniface incorporated *Clericis laicos* into his *Liber sextus decretalium.* In 1300, the pope felt buoyed by the success of his holy year and by French reverses in Flanders. Philip, however, took the offensive against the pope, arresting in 1301 the bishop of Pamiers in violation of canon law, which reserved jurisdiction over the episcopate to the Holy See. A second propaganda war ensued, in which most of the French clergy backed the king, even though Boniface's constitution *Unam sanctam* claimed that obedience to the pope was necessary for salvation. In 1303, Sciarra Colonna and Guillaume de Nogaret, one of Philip's advisers, seized Boniface in his palace in Anagni. Although a mob forced the conspirators to release the pope, he died soon after, a broken man, and France would be dominant in its relationship with the papacy for the next seventy-five years.

# BOOK OF HOURS

. A late-medieval prayer book used by the laity, particularly common in France and the Netherlands. In the 13th century, the Little Office of the Blessed Virgin was frequently bound together with the psalter to create the psalter-hours. The psalter was soon dropped and the Little Office became itself the core of a prayer book for lay use that consisted primarily of devotional items that had been added to the monastic office in the 9th and

10th centuries. While there was much variation in the makeup of these books, a nucleus of items appeared in most: the calendar, a lesson from each of the four Gospels, the two Marian prayers *Obsecro te* and *O Intemerata,* the Little Office, the penitential psalms, short offices of the Holy Spirit and the Cross, the Office of the Dead, and a series of "suffrages" (prayers to popular saints).

The book of hours allowed the devout member of the laity to follow a daily regimen of prayer that was similar to that of the monks and clergy but much shorter and lacking in its complex day-to-day variation. Books of hours sur vive in great numbers. While the more lavishly illustrated examples—such as the *Grandes Heures* and the *Très Riches Heures* of the Duke of Berry, the Heures *de Catherine de Clèves,* or the *Grandes Heures de Rohan*—were owned by the nobility, members of the literate middle class had their own more modestly decorated copies. The genre is of immense importance in the history of art and in fact was the principal vehicle of late-medieval painting. France was preeminent in this respect, particularly in the later 14th and earlier 15th centuries. Among the more important illustrations generally found in books of hours are the portraits of the four Evangelists, a series of eight scenes from the life of the Virgin Mary illustrating the Little Office, the depiction of David in Prayer illustrating the penitential psalms, and a great variety of depiction for the Office of the Dead.

# BORDEAUX

. Originally a Gallic settlement, Bordeaux (Gironde) became a prosperous commercial center under Roman domination and the capital of Aquitania Secunda. Attracted by its wealth, Visigoths, Muslims, and Vikings laid siege to it over the early centuries of the Middle Ages. Around 630, King Dagobert made his brother Charibert subking for Aquitaine, with Bordeaux as his capital. Muslim incursions from Spain in the course of the 8th century effectively weakened the influence of Bordeaux in Aquitanian politics, in favor of Poitiers farther to the north.

In 1137, the marriage of Eleanor, the only heir of Duke Guilhem IX of Aquitaine, to the future King Louis VII of France was celebrated in Bordeaux. With her divorce and subsequent marriage to Henry II Plantagenêt, Bordeaux and all of Aquitaine fell under foreign dominance. It was during this period that Bordeaux red wine, which had been introduced by the Romans, came to be especially appreciated by the Norman

Plantagenêts. During the Hundred Years' War, Bordeaux was the capital of Guyenne and served as an important staging center for English troops. Edward the Black Prince set up his court and headquarters in the city. Only in 1453, with the Treaty of Bordeaux that marked the end of the Hundred Years' War, did the city again come under French domination. Today the port city of Bordeaux is rich in 18th-century architecture. Nevertheless, the spires of its medieval bell towers and churches recall the city's first golden age, in the 14th century, as well as its earlier importance on the pilgrimage route to Compostela.

*Cathédrale Saint-André.* Despite the Gothic superstructure (ensemble primarily 13th-c., with later revaulting), the broad single nave of seven bays is more closely related to regional Romanesque, parts of which remain, and contrasts with the northern Gothic format of the lofty choir and transept (blind triforium, large windows, classic ambulatory with five radiating chapels). The west wall retains important 11th-century architectural elements; the major sculptured portals are the two transept portals (14th-c.) and the celebrated mid-13th-century "Royal Portal." Four statues of the same era adorn the beautifully proportioned chevet. Within the cathedral are 14th-century alabaster statues of "Notre-Dame de la Nef" and St. Martial. Fragments from the 14th-century cloister (destroyed 1865), as well as fifty-five 12th-century capitals from the cathedral complex, are in the Musée d'Aquitaine. The freestanding bell tower, to the southeast of the cathedral, is attributed to Archbishop Pey (Pierre) Berland (begun ca. 1440; present spire is 19th-c.).

*Saint-Seurin.* All that survives of the Romanesque collegiate church are the crypt (subsequent modifications), vestiges of 1 1th-century walls, and the western tower porch (important early capitals) partially hidden behind the 19th-century neo-Romanesque façade. The present structure is essentially Gothic: rectangular choir of two bays covered with rib vaults (late 12th-c.); nave of five bays (first bay contemporary with the choir; subsequent bays 13th- and 14th-c.); sculptured south portal (13th-c.) within a Renaissance porch. The original proportions and simplicity have been altered by the infilling of the nave, reworking of supports, and addition of chapels. Notable are the episcopal throne, the wooden stalls of the canons (both 15th-c.), a beautiful alabaster Virgin and Child (14th-c.), and two alabaster retables.

*Sainte-Croix.* The former Benedictine abbey church has undergone modifications. The basic format was determined by the 11th-century construction (wide nave and side aisles, extended transept, timber roof). Twelfth-century campaigns include the transformation of the chevet and transept (principal apse, two transept apsidioles), considerable modification of nave supports and crossing (important series of capitals, the finest of Languedocian influence), and the richly sculptured façade with its impressive south tower. The whole was vaulted in the late 12th and 13th centuries (Gothic capitals), the north transept reconstructed, and the side-aisle windows remade; subsequent changes include the high windows of the nave and Burguet's reworking of the apse.

The most dramatic modification is Abadie's 19th-century "restoration" of the west façade. Most of the present sculpture is his, as is the north tower. Intact, for the most part, is the projecting central block, suggestive of a triumphal arch, framed by bundles of decorated columns. Both architectural format and decoration are inspired by the Saintonge. A number of the voussoirs are original, including some of the Elders of the

Apocalypse and zodiac signs of the large central portal, and representations of Avarice and Luxuria in the lateral blind arches.

*Saint-Michel.* A longtime dependency of Sainte-Croix and the largest of Bordeaux's parish churches, the present church (vestiges of Carolingian and Romanesque structures excavated) was begun ca. 1357, with the bulk of its construction dating from the second half of the 15th century. Three polygonal apsidal chapels correspond to the nave and wide side aisles. The choir has three bays; the nave, four. The transept arms terminate in high gables flanked by turrets and pinnacles with sculptured portals at the bases (sculpture of the south portal reworked in the 18th c.). The numerous chapels are primarily 16th-century. Subsequent restorations include 19th-century revaulting of the structure. A bombardment in 1940 destroyed the major part of the stained glass. There are three Late Gothic sculptures: a large Deposition of 1495, a poignant Pieta (late 15th-c.), and St. Ursula sheltering her companions under her mantle. The freestanding bell tower, built over the ossuary of the parish cemetery by Jean Lebas of Saintes and his son (1472–92), is the highest in southwestern France (also transformed by Abadie).

*Sainte-Eulalie.* Little remains of the church consecrated in 1175. The present composite structure, originally conceived as a hall church, dates from the 13th to the 16th centuries, with additions and restorations, including the new façade of 1901. The polygonal apse was built in 1476; the majority of the buttress statues appear to be of the same period.

*Saint-Pierre.* Built in the 14th and 15th centuries, the church was almost entirely restored at the end of the 19th. It conserves, however, its elegant pentagonal chevet, the Flamboyant west portal, the lower part of the walls of the south side aisle, and the beautiful south portal.

*Saint-Eloi.* Founded in the 12th century, the church occupied an important site near the ramparts, city gate, and route to Compostela; however, the present church dates from the Late Gothic period. It is composed of a nave with a single wide side aisle and a pentagonal chevet with bell tower. The upper part of the façade was reconstructed in 1828 by Poitevin.

*Civil Architecture.* The gate of Saint-Eloi, used by pilgrims on their way to Compostela, was converted (15th-17th c.) into a belfry (the "Grosse Cloche"); the Porte Cailhou, transformed into a triumphal memorial in 1495, was restored in the 19th century.

# BOSCHERVILLE

. Saint-Martin-de-Boscherville (Seine-Maritime) is one of the last great Norman examples of 12th-century Romanesque architecture. In contrast to the founding of the majority of great Norman abbeys, the foundation of Boscherville abbey was neither royal nor ducal, but seigneurial; the seigneurs of Tancarville owned the land. The complex history of the edifice has yet to be fully explained. A charter, dated to 1053–66, mentions that a cham-berlain of William the Conqueror, Raoul de Tancarville, had replaced the small church of Saint-George with a larger edifice in the form of a cross. There, he installed a community of regular canons of the order of St. Augustine. Subsequently, the Benedictines replaced the Augustinians. The abbey was virtually destroyed during the Revolution; only the church and the chapter house escaped.

In construction, the abbey church is similar to certain Norman churches: Cérisy-la-Forêt, Saint-Nicholas de Caen, Saint-Gabriel, and Lessay. It comprises a nave of eight bays, a transept with a small apse at each arm, a choir of two bays bordered by aisles, a straight chevet, and an apse. The cross-ribbed vaulting that exists today in the nave is not original. Each arm of the transept is subdivided in height at the level of the triforium by a gallery supported by a central column. Semicircular vaulting covers the two bays of the choir. The façade consists of a central door, two-story windows, two corner towers, and a central square tower that culminates in an octagonal spire. The chapter house, located at the north arm of the transept, opens to the east by three bays. Arcades are supported by pillars with historiated capitals. The interior exhibits ribbed vaulting and column statues. A frieze runs along the walls, the work of Abbot Victor, completed ca. 1170.

# BOUCICAUT

. The sobriquet Boucicaut was given to members of the Le Meingre family of Touraine, two of whom served as marshals of France during the Hundred Years' War. The elder Jean le Meingre, who was probably born in the decade before 1320, served as an esquire in the campaigns of the 1330s and was one of the many people of undistinguished birth who rose to positions of power under King John II. He was serving as seneschal of Toulouse when the Battle of Poitiers (September 1356) decimated French leadership.

Appointed to one of the vacant posts of marshal, he held that office until shortly before his death in early 1368.

Boucicaut was already advanced in years when his son, the younger Jean le Meingre (1366–1421), was born at Tours. By the age of eighteen, the young Boucicaut had fought in his first campaign and served as a chamberlain to the duke of Burgundy. In 1391, he became a marshal of France, the post he held for twenty-seven years. He also served as governor of Dauphiné (1399–1407) and of Genoa (1401–09). Although he was celebrated in the annals of French chivalry (*Livre des fais du bon messire Jehan le Maingre, dit Bouciquaut,* found in a single manuscript; 1406–09), historians remember him today for his role in two French military disasters, the battles of Nicopolis (1396) and Agincourt (1415), at both of which he was taken prisoner. He died a captive in England in 1421. His younger brother Geoffroy le Meingre was known as "le petit Boucicaut."

# BOUCICAUT MASTER

. An anonymous manuscript illuminator active in Paris during the first two decades of the 15th century, named for the patron of his most elaborate work, a book of hours illuminated for Jean le Meingre II, marshal of Boucicaut (Paris, Musée Jacquemart André 2). Sometimes associated with Jacques Cœur from Bourges, he is believed to have headed a large and prolific atelier; his style dominated French manuscript illumination into the 1420s.

# BOULOGNE-SUR-MER

. Situated near the narrowest point of the Channel, Boulogne (the Roman Gesoriacum) was the major crossing point to Roman Britain. Part of Belgica Secunda and then of the Merovingian kingdom of Neustria, it became the center of the Carolingian *pagus Bononiensis*. After its destruction by the Norse, it reappeared in the late 9th century and was promptly absorbed by Count Baudouin II of Flanders.

After 962, Boulogne was ruled by the descendants of Baudouin's younger son. Count Eustache II (r. 1049–93) wedded an English princess and played a major role in the Norman Conquest of 1066. His granddaughter, Matilda (Mahaut), joined the countship with the English crown by her marriage to King Stephen, but the death of their son, Eustache IV, in 1153, left their daughter, Marie, a nun, the sole heiress. Her forced marriage to Mathieu d'Alsace, younger son of the count of Flanders, began a series of female inheritances that carried the Boulonnais to various families while the collateral male lines established overseas dynasties.

King Philip Augustus seized Boulogne in 1212, when Count Renaud joined forces with John of England but then granted it to his legitimized son, Philippe Hurepel, Renaud's son-in-law. The imposing 13th-century fortifications of the *haute-ville* survived the bombardments of World War II. The 14th century saw Boulogne face to face with English-occupied Calais and, in its last decades, as a base for diplomatic activities to end the Hundred Years' War.

In 1416, Boulogne was seized by the Burgundian duke John the Fearless, an action confirmed by the marriage of Michelle, daughter of King Charles VI, to Philip the Good, heir of Burgundy (1419) and by the Treaty of Arras (1435). After the death of Charles the Bold, last duke of Burgundy (1477), King Louis XI was able to take the fortress. He united it to the royal domain, compensating Bertrand VI, count of Auvergne, with Lauragues and making the town a fief held of Notre-Dame-de-Boulogne, thus avoiding earthly homage.

The cult of Notre-Dame-de-Boulogne was extremely popular in the later Middle Ages. It centered on a miracle-working statue said to have drifted into port in the 7th century on a crewless ship. The abbey of Notre-Dame, which was elevated to the status of cathedral in 1567, was sold after the French Revolution and demolished, with the exception of its 12th-century crypt, which survives under the 19th-century cathedral. The only other medieval structure in Boulogne, the transept and chevet of the church of Saint-Nicolas, was rebuilt in the Flamboyant Gothic style between 1567 and 1604.

# BOURBON/BOURBONNAIS

. The Bourbonnais in central France, lying southeast of Berry and north of Auvergne, with Moulins (Allier) as its principal town, was the site of a lordship in the 10th century, centered on the castle of Bourbon-L'Archambaud. It was long a fief of the French crown. The population included free peasants and a network of lesser seigneuries with servile tenants. Although the region produced cereal grains, it was best known for the highly regarded wines of Saint-Pourçain, its principal commercial product.

The male line of the ruling house of Bourbon-Dampierre came to an end in 1249 with the death of Archambaud IX, who was succeeded by his older sister Mahaut and then a younger sister, Agnès. The latter's daughter Beatrix married Robert, count of Clermont-en-Beauvaisis, the sixth son of Louis IX and Marguerite of Provence. The couple inherited the Bourbonnais at the death of Agnès in 1283. Their son Louis I (1280–1342) inherited the Bourbonnais from Beatrix in 1310 and Clermont from Robert in 1318. In 1327, King Charles IV traded his county of La Marche to Louis for Clermont and made Louis duke of Bourbon. Soon thereafter, the duke became a peer of France. Louis's son Pierre I (r. 1342–56) married Isabelle de Valois, sister of Philip VI, and their daughter Jeanne married Philip's grandson, the future Charles V, in 1350.

Jeanne's brother, Duke Louis II (1337–1410), with his close connections to the royal house, was a figure of importance in French political life and in the institutional life of the Bourbonnais. At the national level, he held important military commands under Charles V and led a crusade to North Africa in 1390. As one of Charles VI's uncles, he played a prominent role in the royal council but avoided the factionalism that led to the dismissal of two royal uncles in 1388 and of their rivals in 1392. Only in the 15th century did he join the growing anti-Burgundian party. Although as prodigal as his Valois cousins, Louis began adding lands to his duchy and established administrative institutions modeled on those of the crown, such as the judicial Grands Jours in 1371 and a *Chambre des Comptes* at Moulins in 1374. Nevertheless, the Bourbonnais suffered terribly from the ravages of undisciplined soldiers *(routiers)*. Conditions became even worse when the next duke, Jean I (1382–1434), was captured at Agincourt in 1415 and spent the rest of his life as a prisoner in England.

Under Charles I (r. 1434–56) and Jean II (r. 1456–88), the duchy of Bourbon participated in the 15th-century revival of France. By marriage and other means, the dukes had added Forez, Beaujolais, Auvergne, and Montpensier to their possessions, and Jean II ruled a powerful apanage. Although occasionally rebellious, he was usually loyal to Louis XI, whose daughter Anne married his brother and successor, Pierre de Beaujeu. As the crown gradually gained control of Burgundy, Anjou, Provence, Brittany, and Orléans, the Bourbon lands constituted the largest block of nonroyal holdings in France by 1500. When the daughter of Anne and Pierre married her cousin Charles of Bourbon-Montpensier, their combined holdings constituted a serious threat to the monarchy, but the rebellion and subsequent disgrace of Charles in the 1520s brought an end to the independent history of the Bourbonnais.

Meanwhile, a younger son of Louis I, Jacques, count of La Marche (d. 1362), founded a cadet line of the house of Bourbon that was to have a great future. His son married the

heiress of Vendôme, and this county passed to the couple's younger son, Louis (d. 1446), whose descendant would inherit the French throne as Henry IV in 1589.

# BOURGEOISIE

. As urban life gradually revived in France between the late 10th and the 12th centuries, one widespread development was the settlement of mercantile communities adjacent to fortified places, such as a walled *cité.* These settlements often were known as *bourgs,* and their inhabitants became known as *bourgeois* (Lat. *burgenses*). These bourgeois generally took the lead in pursuing urban self-government, obtaining charters restricting seigneurial authority, and in some circumstances forming communes.

As their communities became larger and their rights and privileges better defined, *bourgeoisie* came to signify more than just a collective noun for bourgeois. It implied citizenship in a particular community possessing specific rights. These rights varied from one place to another, as did the conditions one had to meet in order to acquire bourgeois status. A common requirement was residence in the community for a year and a day, but the period might be as long as ten years. Some towns required a substantial payment for admission to bourgeois status. In others, it could be obtained by marrying into a bourgeois family.

There were legal and economic advantages to having the status of bourgeois in a town with extensive privileges, and the bourgeois of royal towns could claim to be subject to the king's jurisdiction when they were in other parts of the kingdom. During the mid-13th century, when royal officials found pretexts for expanding the king's jurisdiction, the government began to offer "letters of bourgeoisie," which declared the recipient a bourgeois of a royal town even when not a resident of it. In principle, this privilege could not apply to people living in the lands of a territorial lord with high justice, but the presence of significant numbers of so-called *bourgeois-le-roi* in nonroyal lands could lead to interventions by royal officials that might seriously undermine seigneurial jurisdiction.

Predictably, letters of bourgeoisie aroused opposition, and in 1287 Philip IV issued an ordinance intended to curb abuses and regulate the *droit de bourgeoisie.* For a man to be admitted as a bourgeois of a particular town, he had to buy or build a domicile of a certain value and either he or his wife had to reside there from November through June. If he or his wife owned property in nonroyal lands, that property was subject to the jurisdiction of the local lord with high justice.

This ordinance, and another one issued thirty years later by Philip V, reduced the attractiveness of letters of bourgeoisie, and they seem not to have become as widespread as some 19th-century historians believed. They did not disappear, however, and the crown employed them as a device for extending protection to, or extracting "protection

money" from, certain people. The kings of the early 14th century, for instance, required Italian merchants in France to purchase letters of bourgeoisie for a sum equal to 5 percent of their property—a thinly disguised tax known as the *boite aux Lombards*.

# BOURGES

. Situated on a hill at the confluence of the Auron and Yèvre rivers, Bourges (ancient Avaricum) was the chief town of the Bituriges Cubi in pre-Roman Gaul. It became the capital of the imperial province of Aquitania Prima and of the medieval province of Berry. It was also the seat of an archbishopric founded, according to tradition, in the 3rd century by St. Ursinus.

At the fall of the western Roman Empire, Bourges was occupied by the Visigoths and then by the Franks and preserves much of its fortifications from this period. It was given a count, but that office was suppressed by King Raoul in 926 and was replaced by a viscountship. In the absence of any major secular powers in the region, its archbishops came into prominence as hosts to synods in 1031, 1225, and 1276 and built, between 1135 and 1324, the main structure of the magnificent five-aisled cathedral that dominates the old quarter of the town.

Bourges (Cher), Saint-Étienne, plan.
After Branner and Capron.

In 1101, the viscountship was purchased from Eudes Harpin de Dun by King Philip I, presaging a rebirth of royal influence in Bourges. Although Berry was given in dowry to Eleanor of Aquitaine and Blanche of Castile, Philip Augustus established a *bailli* in Bourges, and royal influence increased in the 13th century.
Bourges (Cher), Saint-Étienne, south flank. *Photograph courtesy of Whitney S.Stoddard.*

Bourges, Saint-Étienne. *Photograph courtesy of Whitney S.Stoddard.*

In the 14th and 15th centuries, royal attention focused on the area. Berry was made a duchy for John (d. 1416), third son of King John II, whose sepulchral monuments grace the cathedral, and passed to his daughter Marie (d. 1434). Charles VII during the darkest days of the Hundred Years' War established his royal government south of the Loire and became known as *le roi de Bourges* from his residence in the town. It also became the center of the financial dealings of Jacques Cœur, whose house still stands there. The Estates met in Bourges in 1422, as they had in 1316 and 1317, and in 1438 the city was host to an ecclesiastical assembly that resulted in the proclamation of the Pragmatic Sanction defining the "Gallican liberties" of an autonomous French church.

Louis XI was born near Bourges and established a university there in 1463. His daughter, St. Jeanne of France (of Valois), lame and repudiated by her husband, Louis XII, in 1499, resided in Bourges as duchess of Berry and there founded her order of the Annonciade. After 1500, the town resumed its role as a local center.

*R.Thomas McDonald*

Bourges has preserved two major medieval monuments: the cathedral of Saint-Étienne and the house of Jacques Cœur. The cathedral is one of the most audacious designs of the 12th century, the culmination of half a century of experimentation. The first builder-designer, who worked from 1195 to 1214, conceived this mighty, five-aisled building as a

Bourges, Saint-Étienne, inner aisle and nave. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

Bourges, Saint-Étienne, main roof.
*Photograph: Clarence Ward
Collection. Courtesy of Oberlin
College.*

monospatial structure spreading laterally to the equivalent of its height. Construction started with the crypt, necessitated by expansion of the site beyond the Gallo-Roman city wall, and included the remarkable pyramidal elevation reaching five stories in height. The lower level included the ambulatory and radiating chapels; the intermediary level (the inner aisle) has a full three-story elevation, which is revealed by the extraordinary height of the main nave piers. The daring and complexity of the design is matched by the audacious engineering of the structure, supported by steep, thin flying buttresses. The second builder, who took over after completion of the chevet, continued the pyramidal spatial scheme but increased the size and thickness of the flying buttresses, as well as reinforcing the chevet buttresses by adding an upper layer to both ranks, probably in response to problems at Notre-Dame in Paris.

In spite of Branner's attempt to link the Bourges designer to areas outside of Paris, it was the scheme of Notre-Dame that served as the starting point for the Bourges design. On the other hand, the builder is the most original designer of his generation. He borrows from a number of sources but synthesizes them into his unique design. The audacity of the design, as well as its exterior profile, may partly explain why this most magnificent spatial achievement of Gothic architecture was so seldom imitated.

The five-aisle plan translates into five west portals, producing one of the most elaborate sculptural ensembles of the period. While the west-façade sculpture must date close to the mid-13th century, there is clear evidence that the decisions as to subjects of the portals was made much earlier, probably in conjunction with the planning of the stained-glass program. Throughout, Bourges gives evidence of careful, integrated planning of architecture, stained glass, and sculpture, including the jubé (most of which is now found in the Louvre). The care in planning is illustrated by the decisions made concerning quality of stone and quarry sources.

Of the many other medieval churches in Bourges, only the unusual tympanum of the west portal of Saint-Ursin continues to fascinate. The royal palace, which once housed a magnificent chapel, is known only through drawings and the statues preserved in the local museum. In the house of Jacques Cœur, however, Bourges preserves the most splendid surviving townhouse of 15th-century France. Many of the details, such as fireplaces, stained-glass windows, and the painted ceiling of the family chapel, are well preserved.

# BOUVET, HONORÉ

(ca. 1340-ca. 1405). Long misnamed Bonet, this orator, diplomat, and administrator was a long-time prior of the Benedictine abbey of Sellonet (Basse-Alpes). Associated with the house of Anjou and a student at the University of Avignon, he became Doctor of Decretals in 1386. His *Arbre des batailles* (1387), a commentary on the international laws of war, influenced by the Bolognese law professor John of Legnano, was dedicated to Charles VI. It included a portrait of the philosopher king as opposed to the tyrant. The over sixty extant manuscripts show it as his most successful work. His *Somnium super materia schismatis* (1394), on the papal Schism, led to a sermon on the subject that he preached before Wenceslas, king of the Romans, as Charles VI's representative (1399).

In the *Apparicion maistre Jehan de Meun* (1398), dedicated to the duke of Orléans, the Schism and other contemporary problems are discussed in the hope that the prince would

seek remedies for them. Jean de Meun appears in a vision to discuss these problems because Bouvet was living at the time in the poet's former Parisian house.

# BOUVINES

. On Sunday, July 27, 1214, a massive and violent battle took place at the bridge of Bouvines, south of Tournai, in the county of Flanders. On one side fought the German emperor, Otto IV of Brunswick; William, earl of Salisbury and half-brother of King John of England; Ferrand of Portugal, count of Flanders and Hainaut; William, count of Holland; and Henri I, duke of Brabant. Also present were the rebellious nobles of France, Renaud de Dammartin, count of Boulogne, and Hugo, the baron of Boves. Opposing them was the king of France, Philip Augustus. Backing Philip morally and financially was Pope Innocent III; the prince-bishop of Liège, Hugues de Pierrepont, also sent troops to fight for the French.

The two armies joined in a tripartite battle. The allied left wing, composed mostly of Flemish mounted knights under Ferrand, met a similarly composed French right wing. In the center, Otto IV, with German knights and infantry, faced Philip with his strongest soldiers. Finally, the allied right wing, composed largely of English and Boulognese infantry under Renaud de Dammartin, faced a similar French force. Before long, it became apparent that the strength and unity of the French army, more experienced in military affairs, having fought frequently in tournaments and in the Crusades, were superior to that of the allied armies. The battle lasted only three hours; the allied left wing was defeated and their center fled, leaving only Renaud de Dammartin's troops to continue the battle. But despite a valiant effort on their part, the Boulognese eventually succumbed to the continual French attacks. Philip Augustus and the French were victorious.

Many contemporary chroniclers compare the Battle of Bouvines to a tournament, describing the brilliance of the armor and the grandeur of the heraldic banners, which included the fleur-de-lis, the oriflamme of Saint-Denis, and the German imperial eagle with dragon. Few died on either side, with an estimated death toll of 169 allied knights but only two French knights. Henri of Brabant, Hugo de Boves, and Otto fled from the battlefield, while at least five counts (Ferrand of Portugal, William of Salisbury, Renaud de Dammartin, William of Holland, and Otto of Tecklenburg), twenty-five other nobles, and 139 knights were captured and imprisoned.

The loss at Bouvines meant the end of Otto IV. By 1215, Frederick II of Sicily, an opposing candidate to the imperial throne, had the acceptance of all of Germany, and Otto's reign ended. The failure of Bouvines also forced King John of England, then campaigning in Poitou, to return home and later to conclude the Peace of Chinon, which virtually ended England's chance to regain its Angevin lands. For his victory, Philip gained not only continued papal friendship, the English lands in France, and an alliance with Germany, but effective control over the rich but troublesome Low Countries.

# BRABANT

. A predominately French-speaking territory located in the central Low Countries, the duchy of Brabant came into being when Godefroi I le Barbu, count of Louvain and Brussels, was enfeoffed with the margraviate of Antwerp by the emperor Henry V in

1100 and given the title of duke. In 1190, Henri I (r. 1183–1235) took the title duke "of Brabant," a regional designation first used in 1086. Brabant was entirely in the empire, but its population was Romance in the south and Germanic in the north.

The towns of Brabant were still small in the early 12th century but then grew rapidly, rivaling the Flemish cities in the international marketplace during the 13th century. Henri I sided with the English and Flemings at Bouvines, but thereafter the dukes of Brabant maintained correct relations with their French and Flemish neighbors, concentrating on territorial expansion in the east and promoting urban development. The towns were assimilated peacefully into the governance of the duchy in a series of power-sharing arrangements in 1312, 1314, and particularly the Joyeuse Entrée of January 1356.

Duke Jean III (r. 1312–55), the last of his line, abandoned his predecessors' neutrality to pursue an active military and diplomatic policy. He allied briefly with the English against King Philip VI, but in 1347 he married his daughter and eventual heiress, Jeanne, to the pro-French Wenceslas of Luxembourg. Jeanne continued to rule after Wenceslas's death until 1406. But in 1390, she designated her niece, Marguerite of Flanders, and Marguerite's husband, Philip the Bold of Burgundy, her successors, but she outlived them both and was succeeded by Antoine, their younger son. Brabant was incorporated into the Burgundian state when Antoine's line failed in 1430.

# BRAINE

. The Premonstratensian abbey church of Saint-Yved at Braine (Aisne) is important for its plan, its elevation, and the extraordinary richness of its sculptural deco-ration, all of which demonstrate that there were no influences from Cistercian churches on Premonstratensian buildings. New analysis of the documents places the construction between 1176 and 1208. The most notable feature of the plan is the arrangement of double chapels angled in the space between the transept and the chevet, an arrangement that was repeated in a number of other buildings. The presence of the open lantern tower,
Braine (Aisne), Saint-Yved, plan. After King.

like the three-story elevation with wall passage, suggests influences from the destroyed Benedictine abbey of Saint-Vincent at Laon. Indeed, the destroyed westwork of Saint-Yved, now known only through imprecise documents, might have been influenced by the westworks of Noyon and Laon. For all the local sources, however, the originality of the designer in his interpretation of the rich regional decorative traditions sets the building

apart. The remains of two west portals, a Coronation of the Virgin (reinstalled on the interior of the church) and a Hell (in the museum in Soissons), suggest links to sculpture at Laon, while the stained glass is related to that of Saint-Remi at Reims.

# BRASSART, JOHANNES

(ca. 1396?–1455). Composer, musician, and cleric. Brassart was probably born in Lowaigne, near Limbourg. His earliest documented position was at Saint-Jean l'Évangéliste in Liège. He was briefly in Rome during the pontificate of Martin V (ca. 1425) and in 1431–32 served in the papal chapel of Eugenius IV, where he was a colleague of Guillaume Dufay. Brassart was a member of the chapel at the Council of Basel (1433–37) and also served as a senior member of the chapels of Emperor Sigismund (d. 1438), King Albrecht II (d. 1439), and King Frederick III (later emperor). Brassart held canonries at the church of Our Lady in Tongeren and at the collegiate church of Saint-Paul in Liège. Over thirty compositions by Brassart survive, primarily polyphonic Mass movements and motets, similar in style to works of his more famous contemporary Dufay.

# BREAD

. Bread was the basis of every meal in the Middle Ages: in France, other foods were summed up in the word *companage,* "what accompanies the bread." It was usually made from wheat, rye, or maslin (mixed wheat and rye), but barley and oats, among other grains, were also sometimes used. The best wheat bread, the kind that appeared most often on the tables of the rich, was described as "white." The brown, or "bis," bread, likely to be the fare of the household help and often used for "trencher" bread (a slice on which a diner could put pieces of meat, etc., as we use plates), might be either whole wheat or maslin. Rye bread, apt to be the food of peasants but not confined to any one class, was usually classified as "black." Bread was made simply from flour and water, with or without a leavening of sourdough or yeast—usually derived from beer brewing. Unleavened bread was baked on a hearthstone or grill into flat breads or wafers, while leavened bread was generally baked in an oven. All standard loaves were round, whether they were small individual rolls *(miches)* of white bread or large rye loaves.

# BRÉTIGNY

. A village in the Beauce, Brétigny (Eure-et-Loire) was the site of an important treaty between England and France. Concluded on May 8, 1360, it ended the first phase of the Hundred Years' War. Having captured John II in 1356, Edward III had negotiated two draft treaties with the French, but when the second was rejected he invaded France in 1359. Unable to force a decisive battle or capture a major town, Edward agreed to the Treaty of Brétigny, which French historians have considered a disaster for their country. It was, in fact, less harsh than the rejected draft of 1359. It provided for major cessions of territory in southwestern France, giving England a large duchy of Aquitaine that would be held in full sovereignty without feudal ties to the French crown. John II would be released in return for a ransom of 3 million *écus* (500,000 pounds sterling), 20 percent to be paid before his release and the remainder in six annual installments. The banished supporters of the rival kings would recover their property, and Edward III would abandon his claim to the throne of France. Although ratified at Calais in October 1360, when John was released, the treaty was not implemented in every detail, and war resumed in 1369.

**.** *See* **TRAVEL**

# BRIENNE

**.** A little town in Champagne, Brienne (Aube), was the seat of an important noble family that played a prominent role in the Crusades and furnished three constables of France. Gautier III, count of Brienne (d. 1205), fought in the Holy Land and later claimed the kingdom of Sicily through his wife. One of his relatives, Jean de Brienne, was elected king of Jerusalem in 1209. His daughter mar-ried the emperor Frederick II, who forced him to cede his rights to Jerusalem, but Jean later went to Constantinople, where he ruled the Latin Empire for a number of years during the minority of Baudouin II. His descendants Raoul I and Raoul II, counts of Eu and Guines, were constables of France in 1327–44 and 1344–51, respectively. Meanwhile, the senior line of the family, descended from Count Gautier III, had acquired by marriage the title of duke of Athens. Gautier VI of Brienne, duke of Athens, became constable of France in 1356 and died in the Battle of Poitiers in September of that year.

*John Bell Henneman, Jr.*

# BRIGAND/BRIGANDAGE

**.** In military terminology, the brigand was a professional foot soldier whose protective garb, a leather jacket covered with metal rings *(brigandine),* was lighter and cheaper than the hauberk of chain mail worn by knights. Troops of this sort served in the army of Philip II and again during the early stages of the Hundred Years' War. After the mid-14th century, "brigand" began to acquire the pejorative meaning that it has had ever since.

People began to associate brigands with other foot soldiers, *pillars,* who served a knight and foraged for supplies. Too often, these *pillars* looted and "pillaged" the local property rather than following the legal procedure of levying *appatis* on the populace. Especially in unfriendly territory, *pillars* were more inclined to obtain supplies by outright theft than by observing legal niceties. The familiar military garb made it easy to confuse them with those foot soldiers known as brigands.

As the word "brigandage" evolved, it acquired two dimensions. It came to refer to violent, felonious conduct by undisciplined soldiers, but it also described similar behavior by rural folk reduced to desperation by the soldier-brigands. This second type, the bandit-brigands, could constitute a serious social uprising if assembled in sufficient numbers. In a number of cases, they were called *tuchins,* a term associated particularly with disorders in Languedoc in 1383–84.

Pillaging by soldiers was originally a symptom of poor discipline, but the problem of discipline was soon eclipsed by that of pay. Increasingly, soldier-brigands tended to be unpaid or unemployed troops—professional soldiers from abroad or uprooted petty nobles from French border districts. They first became a major problem in the years 1357–69, a relative lull in the hostilities between England and France, when brigandage helped to hasten the establishment and financing of a salaried royal army. Generally operating as "freelance" companies, or routes, these *routiers,* as they were called, served under colorful if bloodthirsty leaders like Seguin de Badefol, John Hawkwood, Arnaud de Cervole, and Perrin Boias. They would occupy some stronghold and terrorize the surrounding region until paid a large sum to leave and go elsewhere. Late in 1360, Badefol and Hawkwood took Pont-Saint-Esprit on the Rhône and extorted a large sum from the pope before leaving. In 1362, Badefol and Boias, cornered at Brignais near Lyon, defeated a royal force.

The depredations of the *routiers* finally produced two responses by the French crown. One was to pay them to go on a foreign expedition. The other was to establish a regular salaried army that would provide steady employment for the best troops and could be used to defeat or drive out the others. Both policies cost money, and they led the French to pay high taxes in peacetime (when the danger of unemployed troops was always worst).

These remedies brought some relief to the French countryside in the later 14th century, but the fiscal and military system collapsed during the princely civil wars after 1400, and a new wave of brigandage became especially severe after the Franco-Burgundian treaty of 1435. In this period, the companies were called *écorcheurs* ("flayers") and had such leaders as Rodrigo de Villandrando and Étienne de Vignolles. At length, the crown restored internal order by resorting to the remedies first used in the 1360s: sending large numbers of troops on an expedition against the Swiss in 1444 and then establishing a regular, paid force of men-at-arms (the Compagnies d'ordonnance) in 1445.

# BRIGNAIS

. The small fortified town of Brignais (Rhône) near Lyon was the site of an important 14th-century battle. In 1362, eastern France was menaced by numerous unemployed soldiers (routiers), who had combined to form the "Great Company," led by Seguin de Badefol, Perrin Boias, and Perrin de Savoie. John II appointed Jean de Melun, count of Tancarville, to be royal lieutenant in the region, and he assembled a force of several thousand men who besieged these brigands at Brignais. Entrenched in a favorable position, the outnumbered *routiers* withstood the assault of the royal troops on April 6, 1362, and won a crushing victory in which the leading royal commanders were killed or captured. This battle represented the nadir of French military fortunes in the 14th century and hastened the establishment of a regular salaried royal army at the end of 1363.

# BRIOUDE

. The church of Saint-Julien in Brioude (Haute-Loire) was erected in the early 5th century upon the site of its patron's martyrdom. It soon became a center for pilgrimage, and in the Merovingian era St. Julien's cult rivaled that of St. Martin. Destroyed by Muslims, the church was rebuilt in the late 8th century, and in the 9th century a college of canons was founded here.

The present structure is the result of a series of building campaigns. In the late 11th and early 12th centuries, the narthex and the nave were constructed. The choir, with ambulatory and five radiating chapels, dates from the end of the 12th century, and the two side porches are from the early 13th. After 1259, the nave was rib-vaulted and rose windows and bays in the Gothic style were added.

The interior is highly ornamented. Sculpted capitals throughout the church include figures of angels, Evangelists, sirens, centaurs, antique masks, and knights in combat. Walls and columns also exhibit remains of polychrome figures and decorative motifs in vermilion, pink, fiery yellow, grey, green, and violet. An important 12th-century fresco

cycle in a chapel off the south aisle depicts Christ in Majesty surrounded by angels and personifications of the Virtues and Vices.

The façade dates from the mid-19th century, as do the west tower and most of the bell tower over the crossing.

# BRITTANY

. Culturally and politically, Brittany has always been one of the most distinctive regions of France. From prehistoric times onward, maritime trade and migration routes along the Atlantic coasts of Europe were as important as landward links with central-northern France: throughout the Middle Ages, Brittany was open to influence and pressure from both the British Isles and from France. The union of the Breton duchy with the French crown in 1532 confirmed the predominance of French political and cultural influences and ended a millennium of intermittent conflict between the two.

The Roman name for the region was Armorica. Profound but poorly documented changes during and after the collapse of Roman rule in Gaul transformed Armorica into Britannia Minor, Brittany, a name first encountered in Gregory of Tours. Migration from the British Isles brought settlers into the three western *civitates* (Osismiorum, capital Carhaix, later Brest; Curiosolitarum, capital Corseul then Alet; Venetum, capital Vannes), areas already affected by economic recession, administrative and military reorganization, and coastal raiding. In these *civitates,* medieval administrative geography only partly respected Roman antecedents. The immigrants' contribution to the culture here is most evident in language and place-names. Philologists disagree about the respective contributions of imported Brittonic and indigenous Gaulish to the Breton language, but the predominance of places with names in *plou-, lan-,* and *tre-* points to close affinities with Cornwall and Wales, where these place-name elements are also widespread. Their distribution, together with later formations in *loc-* and *ker-,* is, roughly, west of the rivers Couësnon and Vilaine and in the Guérande peninsula. Also characteristic of the Breton-speaking region is the plethora of obscure local saints represented in church dedications, many of which recur in Wales and Cornwall.

There is scant archaeological or documentary evidence for the Merovingian period; it is known that the Bretons were divided into several principalities with hereditary ruling families. Merovingian sources comment on Breton raiding into the Frankish-controlled counties of Nantes and Rennes. Later Breton hagiographical traditions are unanimous in portraying early Breton churches as monastic communities founded by aristocratic or

royal saints of Welsh or Irish descent; the Merovingian church tried without success to assert its authority over them.

Carolingian efforts to protect Frankish ecclesiastical interests in the border area and to realize claims inherited from the Merovingians to hegemony over the Bretons began when Pepin III sacked Vannes in 751/53; the border march was possibly established at this time. Victorious campaigns to subdue the Bretons in 786 and 799 were only temporarily successful: several revolts are recorded in the early 9th century. Louis the Pious (r. 814–40) tried to integrate Brittany into the Carolingian empire, as witness imperial diplomas issued for Breton monasteries, references to Frankish counts in Breton-speaking areas, and the appointment in 831 of the Breton Nominoe as imperial *missus* in Brittany. After 840, Nominoe's position changed; despite some initial support for Charles the Bald (r. 840–77) in the civil wars of 840–43, he raided western Neustria repeatedly thereafter until his death in 851. His ejection in 849 of all the bishops of Breton-speaking sees (Vannes, Alet, Quimper, Saint-Pol, and Dol) became a *cause célèbre*. Charles the Bald was badly defeated by the Bretons in 845 and 851, the latter defeat inflicted by Nominoe's son and successor, Erispoe (r. 851–57). Territorial concessions and the promise of a marriage alliance placated Erispoe, but peace was ended by his assassination by his cousin and successor, Salomon (r. 857–74). Salomon joined in the revolts of Neustrian magnates in 858–63 and again raided Neustria in 865–66. Additional grants of Frankish lands in 863 and 867 extended Breton rule yet farther into Neustria; in all, Charles the Bald yielded the pays de Retz (Rais) and the counties of Nantes, Rennes, Avranches, Coutances, and

western Anjou to the Bretons. Salomon's virtual independence from Frankish control was symbolized by his efforts to extract the Breton church from its dependence on the archbishop of Tours, creating instead a Breton archbishopric at Dol, and by the title *rex* given to him in some Breton charters. There are, nevertheless, clear signs of Frankish

influence within Brittany, especially in the records of the monastery of Redon in southeastern Brittany and in the manuscripts and writings surviving from Landévennec on the west coast. A distinctive Breton social organization based on the community of the *plebs* (Breton *plou*), in which the *machtiern* was a powerful figure, is evident in southeastern Brittany in the 9th century; affected by the growth of Redon's lordship, it is not traceable after the 10th century.

With the exception of Alain I (r. 888–907), Salomon's successors found it increasingly difficult to retain control over all of Brittany and to keep the Vikings out. From ca. 915, the region was almost entirely in Viking hands and Breton leaders and churchmen were in exile. Alain II (r. 936–52) returning from England in 936, took back Brittany, including Nantes, Rennes, and the pays de Retz. Occasional raids from Normandy continued until 1014, but Alain II began to restore the Breton church and may have been the founder of the medieval bishoprics of Saint-Brieuc and Tréguier. His duchy had much in common with other 10th-century territorial principalities, with a basis of Carolingian administrative practices.

By the end of the 10th century, Alain II's successors had lost the ducal title to the counts of Rennes, whose weak authority was virtually nonexistent in western Brittany and in Nantes. The emergence of powerful castellanies further altered the political geography of Brittany. Throughout the later 10th and 11th centuries, the counts of Rennes and of Nantes were caught up in the territorial ambitions of the counts of Blois and of Angers and, increasingly, the dukes of Normandy. William I the Conqueror already had Breton vassals by 1066, several of whom he endowed with English lands. The honor of Richmond, granted to the sons of Eudo de Penthièvre, uncle of Conan II (r. 1040–66), remained in the hands of the Breton ducal family until 1399.

Norman lordship over Brittany was intensified by Henry I. Henry II integrated Brittany fully into the Angevin empire: in 1166, the betrothal of Constance, infant daughter of Henry's vassal Duke Conan IV (r. 1155–66), to Henry's young son Geoffroi gave Henry the excuse to rule Brittany directly until Geoffroi came of age in 1181. The firm rule of Henry, Geoffroi (r. 1181–86), and the duchess Constance (d. 1201) did much to strengthen ducal power as revolts were crushed and a ducal administration established similar to that in other provinces of the Angevin empire. The *Assize of Count Geoffrey* (1185) changed rules of inheritance to reduce the fragmentation of fiefs and thereby to safeguard military services. Henry II tried to revive the claim for a separate Breton archbishopric, but in 1199 Innocent III definitively quashed Dol's claims. The territorial extent of Brittany—the Breton west plus the counties of Rennes and Nantes—has not changed since unified as an Angevin province.

King John's imprisonment and murder of Geoffroi's posthumous son, Arthur (1186–1203), gave Philip Augustus the opportunity to bring Brittany under Capetian influence. In 1212, he married the Breton heiress Alix to his relative Pierre Mauclerc, who performed liege homage for Brittany but after 1226 oscillated between allegiance to England and France. With the help of French-trained administrators, Mauclerc (r. 1212–37) and his son Jean I (r. 1237–86) took strenuous measures to build up ducal de-mesne, revenues, and judicial and fiscal administration, to curtail seigneurial independence, and to assert control over the church, particularly episcopal appointments and temporalities. By the 14th century, ducal power was established and an effective household-based administration with a network of local officials put in place.

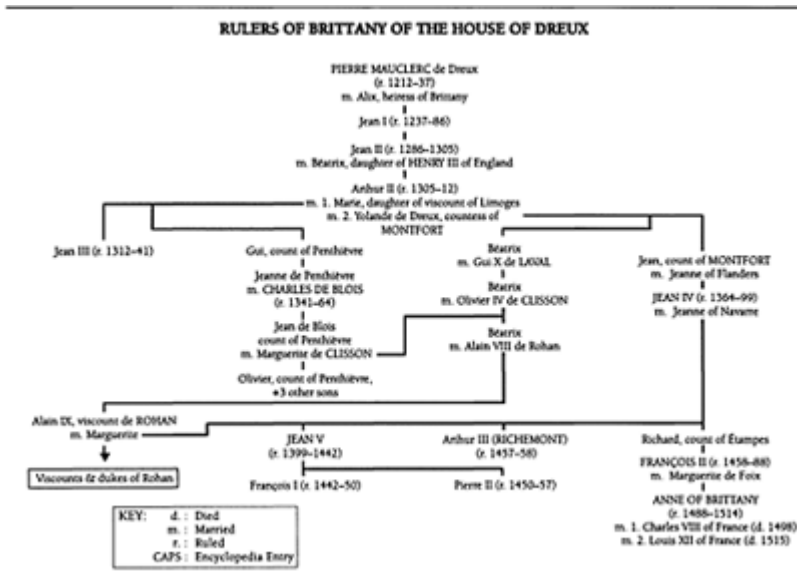
The 12th- and 13th-century growth in ducal resources coincided with Brittany's belated economic expansion as land was cleared for exploitation, notably by the Cistercians and Hospitalers, and new urban markets founded. Breton participation in trade (salt from the Guérande peninsula, wine from Burgundy, Caen stone) encouraged the growth of ports in French-speaking eastern Brittany. By the 14th and 15th centuries, towns along the northern and western coast were also engaged in the carrying trade south to Gascony and Portugal, north to Flanders, and across the Channel to southern England, especially Cornwall, where Breton and Cornish were mutually intelligible languages. Increasing quantities of Breton canvas and leather products were exported.

Trade significantly altered the linguistic balance between French and Breton, as French spread outward from major towns. In eastern Brittany, the linguistic frontier had greatly receded by the end of the Middle Ages. The Breton aristocracy had adopted French language and culture from the 11th century; with French and Latin as the languages of administration, Breton was a low-status tongue. It was used by the church for preaching; Breton literature survives from the 15th century onward and is mostly devotional.

When Jean II (r. 1286–1305) was created a peer of France in 1297 and his right to the ducal title finally recognized by the royal chancery, Brittany was opened to an even greater degree of French cultural influence and royal control. Military service was expected of the Breton duke, Breton cases were heard in the royal Parlement, royal ordinances were extended to Brittany, and, although the ducal right to strike coin was recognized by the crown, it was carefully monitored lest royal coinage be affected. Growing French control nevertheless provoked a reaction, and in the 14th century royal intervention was restricted. Ducal administrators developed notions of the duke's inalienable regalian rights and validated them by reference to the independent Breton kingdom believed to have existed in the early Middle Ages.

The balance of royal and ducal interests was shattered when Jean III died in 1341, leaving a disputed succession. For the rest of the Middle Ages, the problems of an uncertain succession were worked out against the backdrop of the Hundred Years' War. In the Arrêt de Conflans (1341), Philip VI ruled in favour of Jeanne de Penthièvre and her husband, Philip's nephew Charles de Blois, in preference to the late duke's half-brother, Jean de Montfort. After Montfort's death in 1345, Edward III intervened as guardian of his son, the future Jean IV. The Breton civil war (1341–64) was a convenient theater for Anglo-French hostilities. The defeat and death of Charles de Blois (Auray, 1364) led Charles V to recognize the Montfort claim and left the duchy exhausted by ravaging, coastal pillaging, the collapse of central authority, and arbitrary exactions by both sides. Jean IV (r. 1364–99) had the delicate task of balancing the economic advantages of friendly relations with England with the need to keep on cordial terms with France. He and his son Jean V (r. 1399–1442) had to reassert ducal authority in the face of the Breton aristocracy, among whom the Penthièvre claim still had supporters and several of whom found employment in French service (Bertrand du Guesclin, Olivier de Clisson, and Arthur de Richemont among others). However, they were able to take advantage of the weakness of the French crown to create an effectively independent, well-administered duchy in which the duke's regalian prerogatives were stressed by fostering a sense of Breton national identity, adopting royal ceremonial, and refusing liege homage. Frequent meetings of the Breton Estates (an advisory, legislative, and until

1492 judicial body) furthered ducal sovereignty. The Breton church was similarly inde
pendent: Breton clergy did not attend French ecclesiastical assemblies, and the Pragmatic
Sanction of Bourges was not applicable in Brittany; the papacy negotialed directly with
Brittany and appointed only Bretons to Breton benefices. The establishment of the
University of Nantes in 1460 symbolized this independence.

**RULERS OF BRITTANY OF THE HOUSE OF DREUX**


Regalian claims culminated during the reign of the incompetent and untrustworthy
Duke François II (r. 1458–88), who came into direct conflict with the revived royal
power of Louis XI and Charles VIII. After participating in several of the princely revolts
against Louis XI, the duke tried to create alliances with Maximilian of Austria and
Edward IV of England, but in 1480 Louis XI bought out the Penthièvre claim to the
duchy and attracted discontented Breton nobles into his service. When Charles VIII
finally attacked Brittany in 1488, François II had an empty treasury and was left without
effective support from either his allies or his subjects. Forced to conclude peace, he died
shortly thereafter, leaving as heir his daughter Anne (r. 1488–1514), who continued the
fighting until 1491. The treaties that accompanied her marriages first to Charles VIII
(1491) and then to Louis XII (1499) stipulated terms for the incorporation of the Breton
duchy into the kingdom of France.

When the Breton Estates voted for perpetual union with France in 1532, the judicial,
fiscal, and ecclesiastical liberties of the duchy were safeguarded. The status of Brittany
under the *ancien régime* was thus established; with its foundations in the Middle Ages,
Brittany's cultural identity has long outlived the loss of political independence.

# BROU

. The church of Brou (Ain), near Bourg-en-Bresse, was constructed by Marguerite of Austria in fulfillment of a vow made by her mother-in-law, Marguerite de Bourbon. The conventual buildings for the Augustinian community were erected between 1506 and 1512, with the church following between 1513 and 1523. Loys van Boghem, the Flemish master mason, realized a design of spatial balance and clarity in the Latin-cross plan and two-story elevation that is divided by a balustraded walkway at mid-height.
Bourg-en-Bresse (Ain), Church of
Brou, plan. After Nodet.

The understatement of the architecture showcases the liturgical furniture, including the jubé and choirstalls; lavishly sculpted retables, such as the Seven Joys; the rich stained glass, whose program revolves around the Resurrection and particularly the aristocratic tombs of Marguer-ite de Bourbon, Duke Philibert le Beau of Savoy, and Marguerite of Austria. Designed in 1516 by Jean de Bruxelles, with the effigies cut 1526–31 by Conrad Meyt, the tombs rival those of the dukes of Burgundy in splendor. The tombs of Philibert and Marguerite of Austria are unusual in their inclusion of two *gisant* figures, the corpse in a burial shroud below and the deceased lying in state in ceremonial costume above.

# BRUGES

. The Flemish commercial city of Bruges was the chief port of northern Europe in the 14th and 15th centuries. By the second half of the 9th century, it was the administrative center of the *pagus Flandrensis,* the nucleus from which the counts extended their power. The counts had a fortification there by 892. Its name means "bridge" or "harbor," although Bruges is not known to have had commercial significance before the 11th century. By the 12th century, it had an active trade with England and at the fairs of Champagne. The rise of the sea level gave Bruges easy access to overseas trade. As the waters receded, Bruges founded Damme and Sluis as outports where merchandise would be discharged for eventual consignment in the halls of Bruges and undertook continual dredging operations against the silting of the Zwin River, which linked the city with the sea.

Bruges led the Flemings in rebellion against the incursions of Philip IV of France into Flanders in 1302 and became involved in the revolt of maritime Flanders between 1323 and 1328 as a result of the count of Flanders's attempt to limit the city's monopolies at Sluis. After this rebellion failed, Bruges generally supported the Flemish counts unless pressure was applied from Ghent, joining only reluctantly in the effort to suppress the cloth industries of the smaller communities. Particularly during the Flemish rebellion of the 1380s, Bruges favored the count except when garrisons of Ghent were in the city.

Bruges was the wealthiest Flemish city, although it was smaller than Ghent, reaching a maximum population of around 35,000 in 1340 and declining thereafter in the wake of plague and civil conflict. The development by the Italians of vessels that could make voyages from the Mediterranean to the North Sea ports made Bruges the "marketplace of the medieval world." During the 14th century, various Italian groups, together with the Castilians, the merchants of the German Hanse, and the English, had resident colonies at Bruges. Virtually all the seaborne trade of Flanders went through the city. Although Bruges had a substantial textile industry, commercial wealth and its small-volume luxury industry were more important, and its occupational structure was thus more diversified than those of Ypres and Ghent, its neighbors and frequent rivals.

Bruges reached the height of its commercial prosperity and political importance in the 15th century. The Burgundian counts spent most of their time there and at Brussels. Under the patronage of their court, music and the plastic arts flourished at Bruges. In the 15th century, Bruges was the center of Flemish painting, boasting such masters as Jan van Eyck (ca. 1380–1441), Petrus Christus (d. ca. 1473), Hans Memling (ca. 1430–1494), Hugo van der Goes (ca. 1440–1482), and Gérard David (ca. 1460–1523). But the continued silting of the Zwin, the advantages of Antwerp, the Flemish wars after 1477, and piracy all contributed to the rapid decline of Bruges, and after 1500 its only economic role was as a regional market for west Flanders. It continued, however, to exercise considerable political power as one of the four "members" of Flanders, along with its castellany, the "Franc" of Bruges.

The 13th-century bell tower of Bruges is, at 268 feet, the tallest in Belgium. The basilica of the Holy Blood (Saint-Sang) was begun ca. 1150 to house a vial of Christ's blood brought back from the Crusades by Thierry d'Alsace, count of Flanders. Its lower chapel retains its Romanesque character, but most of the basilica was rebuilt in the later Middle Ages in Flamboyant style. The nearby Hotel de Ville (1376–1420) is an excellent example of secular Gothic architecture. Its six tall windows and three turrets give its façade a strong sense of verticality. The Bruges béguinage was founded in 1245 by Marguerite de Constantinople, countess of Flanders, but its buildings are largely postmedieval. Other medieval buildings in Bruges include the church of Notre-Dame (largely 13th c.), which houses the tombs of Charles the Bold (d. 1477) and his daughter, Marie de Bourgogne; the church of Saint-Sauveur, founded in the 10th century; and the Gothic lockhouse of the former inner harbor (Minnewater).

# *BRUN DE LA MONTAGNE*

**.** An incomplete 14th-century verse romance preserved in a single manuscript (B.N. fr. 2170), *Brun de la Montagne* recounts in ca. 4,000 lines the adventures of Brun, whose destiny is foretold at his birth by three fairies. The first predicts his beauty; the second, his prowess. The third announces that he will be irremediably hapless in love (and, indeed, he is called "Tristan" for this reason). Much of the story of Brun, before it breaks off, is occupied by lengthy accounts of adventures and combat. The text offers a number of Arthurian echoes in addition to the Tristan agnomen, but it is fundamentally a non-Arthurian composition.

*Norris J.Lacy*

Meyer, Paul, ed. *Brun de la Montagne.* Paris: Didot, 1875.

# BRUNETTO LATINI

(ca. 1220–1294). Brunetto Latini was active in Florentine public life as a *notario,* or lawyer, by 1254. In 1260, he was sent as ambassador by the Florentine commune to King Alfonso X the Wise of Castile, with the aim of enlisting this Guelf monarch in the struggle against Manfred and the Ghibellines. According to his *Tesoretto* (11. 123–62), Brunetto was returning from this embassy when he met a student from Bologna in the Pass of Roncevaux who told him of the Guelf defeat at Montaperti (September 4,1260). Brunetto then spent six years of exile in France until the defeat and death of Manfred at Benevento (February 28, 1266). On returning to Florence, he held a series of important public offices and was frequently consulted by the Florentine government. While in France, Brunetto had written his *Rettorica,* a translation of and commentary on the first seventeen chapters of Cicero's De *inventione.* He later continued this effort at public education by translating a number of Ciceronian orations into Italian and composing his *Sommetta,* a collection of letters for teaching *ars dictaminis.* Brunetto died in 1294 and was buried at Santa Maria Maggiore, Florence.

During his years of exile in France, Brunetto visited friars at Montpellier (according to *Tesoretto,* ll. 2,539–45) and wrote notarial letters at Paris (September 1263) and Bar-sur-Aube (April 1264) that are probably to be associated with the commercial fairs that drew many Italians on business. He may have lived in Paris, but it seems more likely he lived among Italian notaries and moneylenders in Arras: his encyclopaedic *Tresor* was

composed and dictated in the Picard dialect of this region. Brunetto's two most important and influential works were written in France. The Italian *Tesoretto,* a dream poem indebted to the first part of the *Roman de la Rose,* ends incomplete after 2,944 lines. The didactic ambitions of this work, which are cramped by its seven-syllable couplets, are satisfied by the *Livres dou tresor,* an encyclopedic compilation in French prose. In a celebrated passage in the first chapter, Brunetto explains his choice of the vernacular, appealing to his present circumstances and the widespread popularity of French: *Et se aucuns demandoit pour quoi cis livres est escris en roumanç, selonc le raison de France, puis ke nous somes italien, je diroie que c'est pour .ii. raisons, l'une ke nous somes en France, l'autre por çou que la parleure est plus delitable et plus commune a tous langages* (1.1.7). ("And if anyone should ask why this book is written in Romance according to the usage of the French, even though we are Italian, I would say that there are two reasons: one, that we are in France, the other, that French is more pleasant and has more in common with all other languages.")

Although the *Tresor* is written in French, Brunetto explains that it is designed to assist those wishing to serve an Italian commune rather than a French king (3.73.5–6). Its three books observe a distinction between theoretical (Book 1) and practical (Books 2 and 3) philosophy that derives from Eustratius's Greek commentary on the *Nichomachean Ethics,* Their contents (with major sources in parentheses) are as follows: Book 1, theology (Isidore of Seville), universal history (Bible, Isidore of Seville, Paulus Orosius, Peter Comestor, Geoffrey of Viterbo, Honorius of Autun), physics (Gossoiun, *Image du monde; Roman de Sidrac*); geography (Solinus); agriculture and house building (Palladius); natural history (Solinus; *Physiologus;* Ambrose; Isidore; *De bestiis*); Book 2, ethics and econom-ics (Herman the German's *Compendium Alexandrinum;* Isidore; French translation of William of Conches, *Moralium dogma philosophorum;* Martin of Braga, *De quattuor virtutibus;* Albertano of Brescia, *Ars loquendi et tacendi;* Peraldus, *Summa aurea de virtutibus*); Book 3, rhetoric (Cicero, *De inventione;* Boethius, *De rhetoricae cognitione; Li fet des Romains*), politics (*Oculus pastoralis;* John of Viterbo, *De regimine civitatum;* official documents of the Commune of Siena).

Brunetto's *compilatio* surpasses its models in its simplicity and in its choice of important passages. The *Tresor* was extremely popular and survives in seventy-three manuscripts. An Italian translation called the Tesoro, once attributed to Bono Giamboni but now regarded as Brunetto's own work, survives in forty-four manuscripts, and there are versions in Latin, Provençal, Castilian, Catalan, and Aragonese.

The *Tresor's* first critics were its scribes, who were often moved to amend its style and doctrine; some families of manuscripts contain extensive interpolations. Several *Tresor* manuscripts reached England: Thomas of Woodstock, duke of Gloucester (murdered 1397), owned a copy, and John Gower used the *Tresor's* discussion of rhetoric in his *Confessio Amantis.* The poet Alain Chartier, the chronicler Aimery du Peyrat, and the compilers of the *Leys d'amors* all made good use of the *Tresor.* But its most famous reader was Dante Alighieri, who acknowledges Brunetto in *Inferno* 15 as one who taught him *come l'uom s'etterna* ("how man makes himself eternal," l. 85); Brunetto speaks of his *Tesoro* as the work *nel qual io vivo ancora* ("in which I still live," 1. 120).

# BRUNHILDE

(ca. 545/50–613). A daughter of the Visigothic king Athanagild, Brunhilde became the wife of the Merovingian king Sigibert I of Metz. After her husband's death in 575, she continued to play a leading role in Frankish royal affairs as the wife of Merovech, the son of Sigibert's brother Chilperic I by his first wife, Audovera, and therefore her own nephew, and as regent for her son Childebert II of Austrasia (r. 575–95) and Burgundy (r. ca. 590–95), her grandsons Theudebert II of Austrasia (r. 596–612) and Theuderic II of Burgundy (r. 596–613), and her great-grandson Sigibert of Burgundy (r. 613). During her reign, she was in correspondence with Pope Gregory I and clashed with the Irish monk Columban, whom she banished from Burgundy in 612.

After repudiating Audovera, Chilperic I married Brunhilde's sister Galswintha but then murdered her, perhaps at the instigation of a third consort, Fredegunde, which set off a feud matching Chilperic and Fredegunde on the one hand and Sigibert and Brunhilde on the other. This feud lasted for three generations and led to the assassinations of both Chilperic and Sigibert. Brunhilde's domination of her grandson Theudebert II and her attempt to romanize the royal administration led the Austrasian aristocrats, especially Arnulf of Metz and Pepin I of Landen, to expel her. She moved to Burgundy, where she held a commanding position over Theuderic II. In 612, she temporarily reunified Burgundy and Austrasia, but again the Austrasians refused to accept her and called in Clotar II of Neustria, the son of Chilperic and Fredegunde, who took over Burgundy as well. Clotar had Brunhilde killed by being dragged to death by a wild horse to which she had been tied.

# BRUNO

(ca. 1030–1101). Founder of the Carthusian order. Originally from Cologne, Bruno served as canon, schoolmaster, and eventually chancellor at the cathedral of Reims; he may even have been offered the archiepiscopal office ca. 1081. Fleeing the city for a life in the "desert," he settled as a hermit at Sèche-Fontaine, attached to the monastery of Molesme; but he did not find the isolation he sought there and finally established a hermitage on a nearly inaccessible massif at La Grande Chartreuse, in the Alps, in 1084. Bruno believed that hermits needed a rule, decrying those who practiced what he considered an anarchical life, and that isolation and autonomy were necessary to keep away the influence of the secular world. After a few years, Pope Urban II summoned Bruno from La Grande Chartreuse to the papal curia; the pope then tried to name him bishop of Reggio. Instead, Bruno retired to a hermitage in Calabria, where he died in 1101.

# BUEIL

. The lords of Bueil in Touraine played an important role as military commanders in late-medieval France. Jean III (1346–91) commanded important contingents of royal troops over a twenty-year period beginning in 1368 and served as a royal seneschal in Languedoc between 1374 and 1382. His brother, Pierre, was bailiff of Touraine for nineteen years and was a partisan of Louis I of Anjou and then Louis of Orléans in the rivalries among royal princes. Jean IV, also a supporter of Orléans, rose to the position of master of crossbowmen in the 1390s but met his death at Agincourt in 1415. His brother Hardouin, bishop of Angers, became guardian of his young son. Jean V (ca. 1406–1477) fought in the Battle of Verneuil (1424), served under La Hire and Jeanne d'Arc, and participated in most of the remaining campaigns of the Hundred Years' War. Although he joined the princely rebellion of 1440 (the Praguerie), he became reconciled with Charles VII, who named him admiral of France in 1450. In 1461, however, the new king, Louis XI, relieved him of this office when he ousted most of his father's leading officers.

In his subsequent retirement, Jean V composed his famous *Le Jouvencel* (ca. 1466)—part autobiographical reflection, part art of warfare, all couched as a *roman à clef*. Much is borrowed from Christine de Pizan's *Livre des fais d'armes* and other sources, but there are many personal insights into 15th-century life and warfare. Le *Jouvencel* faithfully describes in prose the ideal warrior as he was conceived during the reigns of Charles VII and Louis XI. It was popular, with at least thirteen manuscripts preserved, as well as five printed editions between 1493 and 1529.

# BURGUNDIAN CHRONICLERS

. The dukes of Burgundy, Philip the Bold (1342–1404), John the Fearless (1371–1419), Philip the Good (1396–1467), and Charles the Bold (1433–1477), all exhibited great interest in history not only by collecting historical writings but also by appointing official court chroniclers and serving as patrons to writers who wrote historical accounts. These numerous writers approached their task with differing degrees of objectivity. Some were admitted propagandists, while others set out to alter the truth while appearing serious and competent. Some were excellent writers, while others became bogged down in artificial rhetoric. As a group, they left an invaluable record of the Burgundian court, which has given this time and place prestige, importance, and influence; and the style and comprehensiveness of their writings have influenced subsequent chroniclers and historians.

Froissart traced the beginnings of the power of the house of Burgundy, and the future chroniclers of Burgundy imitated and claimed to continue his work. The first was Enguerrand de Monstrelet, a native of Picardy, whose ac-counts cover the years 1400–44. Although present at the meeting between Philip the Good and Jeanne d'Arc, he did not record any of the conversation, claiming a lapse of memory. Matthieu d'Escouchy, from Hainaut, continued the narrative to 1461. Slightly livelier and less partisan, he describes spectacular feasts and celebrations, including the famous Pheasant Banquet (1454).

The most renowned of these chroniclers, Georges Chastellain received his appointment as official historiographer of the Burgundian court from Philip the Good in 1455. In the prologue to his chronicle, Chastellain defined for himself the role of historian, aiming for impartiality and objectivity. Sincere, independent, and truthful, he nevertheless tried to dwell on the strong points of the reigning family while minimizing the weak ones. He documented his accounts thoroughly from contemporary works and

from personal contact with those who were making history. His narrative begins with the murder of John the Fearless at Montereau in 1419 and ends, uncompleted, in 1474. Chastellain's official successor was Jean Molinet (1433–1507), who assumed the title of official historiographer in 1475, having worked with Chastellain for many years. In his chronicle, which covers the years 1474–1506, he also attempts objectivity but obviously favors his patron.

Although Olivier de La Marche (1425–1502), friend and colleague of Georges Chastellain, was never appointed official historiographer, his memoirs cover the years 1435–88. He witnessed both the grandeur and dismemberment of the empire acquired by the dukes. He organized many entertainments at court, including the Pheasant Banquet. He was particularly talented at describing feasts, tournaments, customs, and clothing.

Among the other chroniclers of the house of Burgundy are Edmundus de Dynter, Le Fèvre de Saint-Remy, Jacques du Clercq, Jean de Wavrin, Jean de Haynin, Hugues de Tolins, and Philippe Wielant.

# BURGUNDY

. The region that medievalists today generally call Burgundy is the duchy of Burgundy: the area located between the Saône and the Loire, stretching from a little south of Sens and Troyes to north of Lyon. The duchy's major cities were Dijon and Autun; its bishoprics were Autun, Auxerre, Chalon-sur-Saône, Langres, Mâcon, and Nevers. (Dijon became a bishopric only in the early 18th century.) Located halfway between Paris and the Mediterranean, the duchy of Burgundy is often considered the cultural and religious heart of France.

Burgundy is a watershed where waters divide for the Atlantic (via the Loire), the English Channel (via the Seine), and the Mediterranean (via the Rhône). In the center of the duchy rises the Morvan, a wild area, even today, of granite mountains. On the eastern edge, the floodplain of the Saône has worn away the limestone deposited over the granite, making an abrupt drop, the Côte. Here, the good drainage and the morning sun falling on the grapes have produced superb wines, which have been traded throughout Europe since Roman times. In the economic expansion of the high Middle Ages, Burgundy became especially noted as a wine-growing region. Because the rivers of northern Burgundy drain into the Seine, it was easy for growers to load their barrels on barges and float them downstream to the profitable markets at Paris. A chronicler of the late 13th century commented that in the region around Auxerre no one grew grain, only grapes.

*Burgundia* was also used in the Middle Ages to describe regions other than the duchy of Burgundy. The name derives from the Burgundians, one of the Germanic tribes that

settled in the Roman Empire in the 5th century, who established a kingdom that lasted close to a century; centered at Geneva, it stretched down the Rhône to Lyon and south toward Arles, and north from Lyon along the Saône Valley as far as Dijon. The sons of Clovis conquered Burgundy in the 530s, and, with Neustria and Austrasia, it became one of the three principal divisions of Frankish territory. Frankish Burgundy was a large area, comprising most of the Loire and Rhône-Saône river basins, stretching from Orléans, the capital, to Arles and the Mediterranean. It was divided by the sons of Louis the Pious at the 843 Treaty of Verdun. Charles the Bald received as one part of his share essentially what became the duchy of Burgundy, the region between the Saône and the Loire. The rest of Burgundy was subject to Lothair I and the empire: the area south along the Rhône from Lyon to Arles, and also the region around Geneva and Besançon, where the original Burgundian kingdom had been established five centuries earlier. Imperial Burgundy was further divided in the late Carolingian period into upper, or trans-Saône, Burgundy, the northeast portion, and the southern part, called variously lower, or cis-Jurane, Burgundy or Provence.

Lower Burgundy, which had become subject to Charles the Bald when he took the imperial throne in 875, became an independent kingdom in 879 under Boso (r. 879–87), Charles's brother-in-law and the first non-Carolingian king in the west for a century. At the same time, Boso's brother, Richard le Justicier, was establishing ducal power in French Burgundy, the region taken by Charles the Bald in 843. This duchy was ill defined in the late 9th and 10th centuries, but by the time of Richard's death in 922 his rule had been established in the area which was considered the duchy of Burgundy throughout the high Middle Ages, plus the regions of Troyes and Sens.

Boso's nine years as king of lower Burgundy were marked by constant wars with the Carolingians, French dukes, and even his brother, Richard. But in 890, three years after Boso's death, his son Louis succeeded to his father's kingdom. In 900, Louis also became king of Italy, and in 901 he was crowned emperor. Louis's success was short-lived. In 905, he was captured and blinded by Berengar, his principal Italian rival. Louis l'Aveugle retreated to his capital of Vienne, where he lived until 928,

but the kingdom of lower Burgundy was never again an independent entity.

In the meantime, upper or trans-Saône Burgundy had also become an independent kingdom in 888, under Rudolph I, of the Welf family. The Rudolphian kings took over lower Burgundy as well after the death of Louis l'Aveugle in 928. Their kingdom continued to be indepen dent until 1032, when Rudolph III died without sons, and the whole region, from his capital at Besançon to Lyon and to Arles, was reabsorbed into the empire.

The French duchy of Burgundy was ruled, after the death of Richard le Justicier, by his son Hugues le Noir and nephew Giselbert. Hugues le Grand, father of Hugh Capet, also exercised authority in Burgundy. After Giselbert's death

Valois dukes of Burgundy

in 956, the duchy was taken by Hugh Capet's brother Otto, who married Giselbert's daughter, and, after Otto's death, by Henri, another brother of Hugh Capet. The Capetian dukes continued to rule Burgundy until the mid-14th century. When Henri died in 1002, however, there was initially a war between his nephew, King Robert II, and his stepson, Otto-William. Otto-William had become count of Mâcon by marriage and called himself count of Burgundy as well, but he was unable to defeat the king's forces. He settled for Mâcon and the territory east of the Saône that he was able to control under the authority of the Rudolphian kings; his descendants greatly increased their authority in this region after 1032. King Robert II made his son Robert duke in Burgundy during his own lifetime.

Once established under its own dukes, the French duchy of Burgundy was able to maintain its political identity in the 11th, 12th, and 13th centuries. Besides the dukes, the most powerful figures were the counts of Chalon, of Mâcon, and of Auxerre, Nevers, and Tonnerre. The last three counties were usually in the hands of one person in this period, although Tonnerre had been an independent county until the middle of the 11th century; younger brothers of the counts of Nevers took the other two counties for their lifetimes, but they then reverted to the main line of the family.

The dynasty of the Capetian dukes of Burgundy ended in 1361, and the duchy was taken by the crown. In 1363, it became an apanage of Philip the Bold, son of the Valois king John the Good. Burgundy reached the height of its glory under the Valois dukes. Under Philip the Bold (r. 1363–1404), the duchy grew by the addition of the county of Nevers, which had once been attached to the duchy but had become separated in the 13th century, and by the Franche-Comté of Burgundy and the counties of Flanders and Artois. All these territories were part of the inheritance of Philip's wife, and he succeeded in 1384, when his father-in-law died. The Franche-Comté was essentially the western part of what had once been the Rudolphian kingdom of Burgundy. Succeeding dukes, John (r.

1404–19), Philip the Good (r. 1419–67), and Charles the Bold (r. 1467–77), made Burgundy the capital of a powerful principality that stretched across northeastern France. It included, as well as the duchy and the county of Burgundy, much of Lorraine, Luxembourg, Hainaut and Brabant, and Flanders. The dukes of Burgundy supported the English during the Hundred Years' War.

The Valois dukes of Burgundy were important patrons of music, supporting trumpeters and minstrels as well as the singers and composers of the chapel. During much of the 15th century, the musical institutions of the court of Burgundy were the richest in Europe, surpassing those of war-torn France. Numerous composers were employed at Burgundy, including Binchois, the Englishman Robert Morton, Dufay (an honorary appointment), Hayne van Ghizeghem, and Busnoys. The last Burgundian duke, Charles the Bold (r. 1467–77) was himself a harpist and composed chansons.

When Charles the Bold died without sons in 1477, the entire principality of Burgundy was claimed by Maximilian, the imperial heir, who married Charles's daughter Marie. However, prolonged wars between Maximilian and France led to a division of the principality, including a reseparation of the duchy of Burgundy, which remained under the authority of the French king, from the Franche-Comté, which remained in the empire.

While Burgundy was politically one of the most important parts of France during the Middle Ages, it was even more significant as a religious center. At the beginning of the Middle Ages, some of the earliest and most influential monasteries, such as Saint-Maurice-d'Agaune or Saint-Germain-d'Auxerre, were located in the Merovingian kingdom of Burgundy. The Cluniac and Cistercian monastic orders, two of the most influential of the high Middle Ages, were both founded in Burgundy; Cluny was founded not far from Mâcon in 909, and Cîteaux was founded a short distance south of Dijon, in the diocese of Chalon, in 1098. Molesme, the house from which Cîteaux's first monks had come, was also Burgundian, having been founded in the diocese of Langres in 1075. The most important of Cluny's priories and of Cîteaux's daughter houses, including her "four eldest daughters," La Ferté, Pontigny, Clairvaux, and Morimond, were all located in Burgundy. The reform of the religious life had probably the greatest impact in Burgundy of any region of France; by the end of the 12th century, there were essentially no colleges of secular canons left in the duchy, other than the cathedral chapters; the rest had all been reformed as monasteries or houses of canons regular. Dukes and counts from the 10th century on, castellans beginning in the 11th century, and knights in the 12th century were all generous donors to Burgundian monks and canons.

Burgundian churches were also influential architecturally, especially in the 12th century. Abbey churches like Vézelay, La Charité, and Cluny (the last of which was destroyed under Napoléon, although a few portions remain), all built in the first decades of the 12th century, represent the fullest development of the Romanesque style. The sculpture that decorated these and other churches, such as the 12th-century cathedral of Autun, is marked by elongated figures, full, detailed drapery, and an impression of dignity. The first Gothic cathedral is normally considered to be that of Sens, built on the northern edge of Burgundy in the middle of the 12th century.

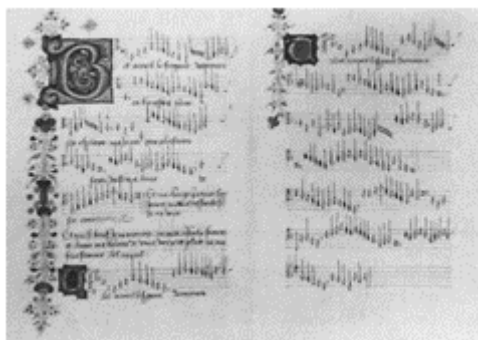
# BUSNOYS, ANTOINE

(Busnois; ca. 1430–1492). French composer in the service of the Burgundian court. His works, of which three-voice chansons are most numerous, typify the Franco-Burgundian style in the third quarter of the 15th century.

Busnoys's name indicates that he or his family came from Busne (Pas-de-Calais), a town in northeastern France. Nothing is known of his early life and education, but in 1461 he was recorded as a chaplain at Saint-Gatien in Tours, at which time he was involved in an attack on a priest and was excommunicated. He did not remain in disgrace for long, since he soon became a singer and minor cleric at the royal abbey of Saint-Martin in Tours and in April 1465 was promoted from the position of choir clerk to subdeacon there. At Tours, he was a colleague and perhaps a student of the famous composer Johannes Ockeghem, master of the French royal chapel and treasurer of the abbey of Saint-Martin. In September 1465, Busnoys sought and received the post of master of the choirboys at Saint-Hilaire-le-Grand, Poitiers, which he held until July 1466.

In his motet *In hydraulis,* which pays homage to Ockeghem, Busnoys describes himself as "unworthy musician of the illustrious count of Charolais," referring to Charles the Bold, son of Philip the Good, duke in June 1467. Busnoys was listed as a singer in Charles's private service in March 1467, and he continued in that position


Busnoys's rondeau Bel Acueil ("Fair Welcome"), the Mellon Chansonnier. MS 91, fols. lv-2. *Courtesy of Beinecke Library for Rare Books and Manuscripts, Yale University, New Haven, Connecticut.*

when Charles succeeded his father as duke in June 1467. Busnoys was officially admitted to the ducal chapel in 1471 and, with other members of the chapel, followed Charles on most of his military campaigns, but probably not the last, the disastrous battle at Nancy in 1477, at which Charles was killed.

After Charles's death, Busnoys served his daughter, Marie de Bourgogne, and her consort, Maximilian of Austria, whom she married in 1478. He remained a member of the Habsburg-Burgundian chapel in the Netherlands until it was temporarily disbanded in 1483 after Marie's death. He is listed in court documents of that time as a "priest-chaplain."

Busnoys's subsequent activities are uncertain, but they may have included a visit to Italy, since some works with Italian texts are attributed to him and his music was widely disseminated there. At the time of his death in 1492, he was choirmaster at Saint-Sauveur in Bruges.

Busnoys's reputation as a composer during his later years and after his death was exceeded among his contemporaries only by that of Ockeghem. The theorist Johannes Tinctoris dedicated his treatise on the modes (1476) jointly to Ockeghem and Busnoys, and as late as 1529 Pietro Aron called him "a great man and an excellent musician."

Busnoys was also an outstanding poet. A friend of Jean Molinet, with whom he exchanged poems, he undoubtedly wrote many of the texts he set to music, in the tradition of such earlier poet-musicians as Adam de la Halle and Guillaume de Machaut. His works include two Masses for four voices *(L'homme armé, O crux lignum),* a Credo, a Magnificat, eight motets (mostly four-voice), two hymns, and some seventy-five secular pieces, almost all French rondeaux and virelais. His music is characterized by its triadic sonority, strong harmonic progressions, clear structure, and extensive use of imitation, securing for him a central position in the evolution of musical style from Dufay to Josquin.

# BUTLER OF FRANCE

. The butler *(bouteiller)* originally was a household officer concerned with supplying wine (and revenues from wine) from the king's estates. In the 11th century, the holder of this position was recognized as one of the "great officers of the crown," like the seneschal and constable. Beginning in 1130, the position was held for several generations by members of an important seigneurial family from Senlis that took the surname of Le Bouteiller. For a thirty-year period beginning in 1317, the king's chief financial adviser (Henri de Sully, then Mile de Noyers) held the position of "Grand Butler." Thereafter, it gradually became largely honorific, as the butlers never succeeded in carving out a permanent political or administrative role for themselves.

*John Bell Henneman, Jr.*

# C

# CABOCHIENS

. The butchers and flayers of Paris, nicknamed the Cabochiens after one of their leaders, Simon Caboche, created a reign of terror in Paris in 1413, evidently at the instigation of the duke of Burgundy, who hoped to thwart the plans the duke of Guyenne was forming against him.

On April 28, some of Burgundy's officers led the Cabochiens on a rampage against the Bastille and the residence of the duke of Guyenne, arresting a number of Guyenne's officers whom they considered traitors. On May 11 and 22, more prisoners were taken, including the queen's brother. The actions of the Cabochiens were successful because Charles VI, often ill during this period, issued no order against them. At their request, Charles held a *lit de justice* in the Parlement on May 26 and 27, promulgating a list of reforms that a government-sponsored commission had been working on for several months. The list, still unfinished, contained 258 articles and was written in the form of a royal ordinance, dated May 25, 1413. Historians have called it the *Ordonnance Cabochienne*. The commission, using more than twenty old reform ordinances as sources, dealt with every facet of government. The general objective of the *Ordonnance* was to bring money back into the king's coffers and prevent the dilapidation of his resources.

The excesses committed in the summer of 1413 alienated many Parisians from the Cabochiens. This, along with the king's willingness to negotiate with the Armagnacs and allow the duke of Guyenne to free the prisoners taken in the spring, led to the fall of the Cabochiens. Their silent partner, John of Burgundy, was fearful of the duke of Guyenne's revenge and fled Paris. On September 5, 1413, the *Ordonnance Cabochienne* was revoked in its entirety because it had been published in haste without proper deliberation in the royal council or the Parlement and because it contained a final clause that "injured" the king's authority.

# CAEN

**.** The medieval city of Caen (Calvados) gained importance in the 11th century owing to the favor of William the Conqueror, who established his base there for the governance of lower Normandy. Around the middle of the century, the duke built a castle and enclosed the town with walls, and shortly afterward he and his wife, Matilda, founded two monasteries at Caen. A short distance from the sea and situated where the Orne and the Odon rivers join, Caen enjoyed a flourishing trade, and the conquest of England in 1066 contributed to its prosperity. The excellent limestone of the area was for centuries one of Caen's chief exports; it was even transported to England to rebuild the cathedral of Canterbury and palace of Westminster. Through the 12th century, Caen remained the military and administrative center of lower Normandy, and the supreme court of justice and finances, the Échiquier de Normandie, was held there.

Caen's administrative importance declined after the conquest of Normandy in 1204 by the French king Philip II Augustus, but the town continued to prosper: cloth manufacturing became an especially important industry. The 13th and 14th centuries saw the flowering of High Gothic and Flamboyant Gothic architecture, best represented in Caen by the church of Saint-Pierre. During the
Caen (Calvados), plan of Saint-Étienne. After Conant.
Caen, Saint-Étienne, façade.
*Photograph courtesy of Whitney S. Stoddard.*

Hundred Years' War, the town suffered much damage at the hands of the English, who were resolved to win back their French possessions. Sacked in 1346 and 1417, Caen served as the base for the English conquest and occupation of Normandy between 1417 and 1450. One positive outcome of the English possession of Caen was the duke of Bedford's foundation of its university in the 1430s. After the Battle of Formigny in 1450, Caen, with the rest of Normandy, returned to the French.

*Cassandra Potts*
Caen, La Trinité, plan. After Musset.

In the last quarter of the 11th century, William the Conqueror transformed the site on the River Orne into a forest of Norman architecture. Despite destruction from World War II, well-preserved Norman Romanesque and Gothic structures surround vestiges of the Conqueror's 11th-century fortress. Conveniently and strategically located, Caen also served as a place of atonement for the Conqueror and Queen Matilda. Between 1059 and 1065, Matilda founded the Abbaye-aux-Dames with its church of La Trinité. By 1063, William followed his wife with the foundation of the Abbaye-aux-Hommes, including the church of Saint-Étienne at the other end of Caen. The town grew between the two abbeys and fortress.

Built in one campaign, the sleek, rectilinear surface of the west façade of Saint-Étienne stretches to three stories before the western towers, topped with 17th-century spires, begin. Four massive buttresses and a series of regular roundheaded windows divide the west front into three sections, which correspond to the interior space with nave and side aisles. Inside the nave, alternating cluster piers delineate eight bays and a three-story elevation with arcade, triforium gallery, and clerestory with wall passage. The vaulted ceil-ing from 1130 is one of many subsequent alterations in the 11th-century fabric, which ends with the short transept arms. In the 13th century, Master William (whose tombstone can be found in the south part of the choir) replaced the original Romanesque choir with a Gothic chevet that retains the three-story elevation but departs from the original apse-in-echelon plan. Some conventual buildings of the Abbaye-aux-Hommes survive from the 13th to 15th centuries, and other portions were rebuilt in the 18th century.

At the far end of the rue Saint-Pierre, La Trinité (dedicated 1066) offers an alternative to the austerity of Saint-Étienne. While the west front shares the twin-tower design with Saint-Étienne, an accurate 19th-century reconstruction of molded blind arcades and windows achieves an exciting balance with variation in size and ornament. The narthex is lost. Although the central-portal tympanum sculpture is a 19th-century addition, much 11th- and 12th-century sculpture survives within the fabric: fanciful corbels line the exterior, and creatures reside in ambulatory capitals and one of the crypt capitals. The nave is notable for its great length and width, and the two-story elevation sports a false triforium on exterior and interior. Despite periodic campaigns of construction from 1059 until 1130, La Trinité is remarkably coherent in execution. Only a few parts of the church date from later than the 11th century: the 12th-century (1125–30) apse with semiambulatory and concurrent alterations in the transept arms, a 13th-century chapter house off the south arm, and modern apsidal chapels adjoining the the north arm. A black-marble slab designates the remains of Queen Matilda near the entrance to the choir.

Founded by monks of Saint-Étienne, the 11th-century parish church of Saint-Nicolas retains the Romanesque choir of Saint-Étienne and the narthex of La Trinité but is built on a smaller scale. Decoration, though minimal throughout most of the building, is explosive in the east end. Some vaults and spires are 13th- and 15th-century alterations.

Other ecclesiastical buildings in Caen include Saint-Pierre, a Gothic and Renaissance church (13th-15th c.), Saint-Jean (14th-15th c.), Saint-Sauveur (14th-15th c.), and, within the ramparts, the chapel of Saint-Georges (Romanesque nave). Of civic structures, 12th-, 14th-, and 15th-century walls surround the Conqueror's fortress, later transformed into the château of Philip Augustus and captured by the English, who founded a university there in 1432. The château was heavily restored after World War II.

# CAESARIUS OF ARLES

(ca. 470–542). Reforming bishop, exemplar of pastoral care, popular preacher, monk, and advocate of monasticism. Born near Chalon-sur-Saône, Caesarius was a monk at Lérins from ca. 490 to 497, when he was ordained priest at Arles. In 502, he became bishop of Arles and in 514 was made primate of Gaul. Revered for his personal holiness, his benevolence, and his pastoral care, Caesarius was made a saint of the Catholic church after his death. An Augustinian in theology, he was influential in the Second Council of Orange (529), which established the accepted interpretation of Augustine's teaching on grace and salvation against the Semi-Pelagianist views of Faustus of Riez and John Cassian. Caesarius wrote a rule for monks (for a community under his nephew) and a rule for nuns (for a convent in Arles in which his sister, Caesaria, was abbess). Some 238 of his sermons survive and provide important documentation of church life in 6th-century Gaul.

# CAHORS

. Built on the site of a sacred spring, Cahors (Lot) was a flourishing commercial and university city during the Middle Ages. Thanks to the presence of the Lombards and the Templars, the principal moneylenders of the period, Cahors was one of the largest cities in 13th-century France. It was ceded to the English by the Treaty of Brétigny (1360) and was decimated during the Hundred Years' War. However, it still retains several of its medieval monuments, most prominent of which are the cathedral of Saint-Étienne, the Pont Valentré, and the churches of Saint-Barthélemy and Saint-Urcisse.

The cathedral of Saint-Étienne (main altar consecrated in 1119) is a harmonious fusion of two regional architectural features: the single nave (unusually wide at Cahors) covered by a series of domes and the apse with radiating chapels but no ambulatory. Successive alterations and additions to the east end, beginning in the late 13th century, have partially obscured this unity. The massive, fortresslike façade was added in the 14th century; the Flam-

Cahors (Lot), Pont Valentré.
*Photograph courtesy of William W.Kibler.*

boyant Gothic cloister, once richly ornamented, dates from 1504.

The beautiful Romanesque north portal suggests affiliations with both the southern tradition of Moissac and the first flowering of the northern Gothic. Unusual in the tympanum is the combination of theophanic vision (the Ascension) with narrative scenes

from the martyrdom of St. Stephen. The porch and exterior wall have been overrestored in this century.

The Pont Valentré, despite the loss of its barbican, remains one of the most impressive examples of military architecture of the 14th century.

# CALAIS

**.** Originating as a fishing village along the northern coast of France, Calais (Pas-de-Calais) began to prosper first under Arnulf I, count of Flanders, who in 938 gave the village and nearby land to the monks of Saint-Bertin, and later under Gérard de Gueldre, the count of Boulogne, who in 1224 fortified it and established it as a town. In 1346, Calais was besieged by Edward III in one of the early engagements of the Hundred Years' War. Fresh from victory at the Battle of Crécy, the English army besieged Calais because of its strategic location, lying only twenty-three miles from Dover, and because of its proximity to their allies in the southern Low Countries. The English forces, perhaps numbering 30,000, constructed large siegeworks that completely cut the town off from all land and most sea commerce. Calais was besieged for nearly a year. Its inhabitants held out, hoping for relief from their king, Philip VI. Finally, in July 1347, Philip arrived at Calais with a relief army, but he was unable to raise the siege. The French retreated to Paris, and the town surrendered on August 4, 1347. The captors exiled all French citizens of the town, replacing them with English merchants and soldiers.

Calais remained an English possession for more than 200 years, despite several attempts to return it to French control, including another extended but unsuccessful siege in 1435–36 by Philip the Good, duke of Burgundy. In 1558, it was recaptured by François de Lorraine, duke of Guise.

# CALAIS, JEAN DE

(fl. early 15th c.). A poem of some 410 lines in *the Jardin de plaisance,* Calais's *Lamentations* is a series of dialogues that a certain Jehan holds with Reason and Fortune. The protagonist, hiding in a monastery from the persecution of the authorities, is abandoned by all save his faithful wife. His only crime was to have loved his king. Reason encourages him and Fortune assures him that the real cause of his suffering was that he followed foolish counsel. Droz and Piaget have tentatively identified the Jehan of the poem with Jean de Calais, a rich Parisian bourgeois who in 1430, during the English occupation, participated in a plot against Henry VI, favoring the return of Charles VII (the so-called *conjuration dauphinoise*). The plot was discovered and several persons were arrested and executed. Jean was liberated upon payment of a large sum of money. The Jean de Calais mentioned by Villon (*Testament* 173) is another person.

# CALENDAR, LITURGICAL

**.** "Calendar" has three distinct meanings. In the broadest sense, it refers to the astronomical calendar that provides the context for the other meanings; it is also applied to the annual cycle of ecclesiastical festivals; and it refers to the document that appears at the beginning of a liturgical book.

The astronomical calendar in use throughout western Europe in the Middle Ages is the Julian calendar, so-called for its establishment under Julius Caesar in 46 B.C. It defines a year as consisting of 365 and a quarter days, requiring an additional day every fourth, or leap, year. (This is some eleven minutes longer than the true astronomical year, creating the need for the corrections of the Gregorian calendar worked out under Pope Gregory XIII in 1582: the omission of ten days in October 1582 and the subsequent omission of the leap year in years divisible by 100 but not 400.) The Julian calendar utilized the twelve months of modern usage but had no weeks. The seven days of the week, named after the seven planets as then understood, were added in the 2nd century. The seven-day week, long maintained in the Jewish calendar, greatly influenced the Christian calendar, which replaced the Sabbath by Sunday as the principal day.

The annual round of liturgical dates is divided into a temporal and a sanctoral cycle. The temporal cycle, or temporale, consists of Sundays and the feast days commemorating the events of the life of Jesus Christ. There is a lesser sequence of fixed dates associated

with Christmas and the Epiphany, December 25 and January 6; and a major sequence associated with Easter, which is celebrated on the Sunday after the first full moon of spring. The precise calculation of Easter's date, involving differences over the astronomical calendar and other issues, was the subject of intense controversy in the early Middle Ages. The sanctoral cycle, or sanctorale, includes the feast days of saints; these are celebrated on the date of their death, a practice stemming from the fact that the early sanctorale is derived from the Martyrology, itself originating as a calendar commemorating the date and place of a martyr's passion. The temporal and sanctoral festivals were interspersed in the early-medieval liturgical books but eventually separated.

The calendars that preceded liturgical books generally devoted one page to each month beginning with January. One line, in turn, was devoted to each day of the month, giving the name and type of its feast, or left blank if none occurred. In the left-hand margin were three columns of numbers and letters. The inner one gave the date of the month, usually according to the Roman system of nones, ides, and kalends. A second gave the so-called dominical letters, a series of the first seven letters of the alphabet, repeated continuously over the twelve months of the year; thus, whatever letter stood next to the first Sunday of a given year would point to the remainder of its Sundays. Finally, the outer column of numbers called the "golden numbers," encoded the annual lunar tables in such a way so that if they were used in conjunction with the dominical letters a knowledgeable person could calculate the date of Easter for any year.

In the later Middle Ages, calendars were often the subject of special artistic attention, displaying two twelve-fold series of illustrations: the signs of the zodiac and the labors of the month. The latter in particular were sometimes splendidly executed, as in the celebrated full-page miniatures of the *Très Riches Heures* of John of Berry. These book paintings, in turn, influenced some of the earliest easel paintings, like Breugel's great series on the months of the year.

# CAMBRAI

. Capital of a Frankish kingdom destroyed by Clovis in the early 6th century, Cambrai (Nord) was attached to Lotharingia in the division of Charlemagne's empire in 843. The cathedral of Cambrai, destroyed in the aftermath of the French Revolution, was one of the largest and most important Gothic structures in northern France. It was built in three major phases, beginning with the west tower in 1148, a scheme that was revised after the

partial collapse of the tower in 1161. Before the nave was completed, ca. 1180, the transept was begun. It was completed in the early 13th century and the chevet built 1220–50. Our knowledge of the church comes from a series of drawings and the plan by Boileux that has been shown to be accurate. The drawing of the exterior from the east by van der Meulen shows details of the chevet and transept; but the only known interior view of the nave is one made during the destruction that shows the interior elevation of the tower.

# CAMPIN, ROBERT

(ca. 1376–1444). Late-medieval painter whose career is shrouded in mystery because of limited archival information and few attributed works. He is known principally for his famous pupil Rogier van der Weyden. Campin's reputation in Tournai as a master is substantiated by the positions he held: subdeacon of the goldsmith's guild, head of the painter's guild, and one of the stewards to the city in charge of finances and accounts. Tournai's relationship with the Burgundian court ultimately affected Campin's production. In one of his earlier works, the *Entombment Triptych* (1415–20), Campin displays a knowledge of the italianate painters of the court, such as Malouel and Bellechose, in his use of gold background and treatment of the angels. Court patronage, however, did not provide the artists of Tournai with a steady source of income. Instead, they belonged to guilds and served the city and local clients. Campin's most famous work and the one that epitomizes his style is the *Merode* Altrarpiece (ca. 1425), now at the Cloisters in New York. Commissioned by the Ingebrecht family, who appear at the left of the panel, the triptych demonstrates Campin's skill with disguised symbolism. The composition teems with mundane objects that acquire meaning in the presence of the divine. Sadly, Campin's career suffered greatly in the 1430s, when the pro-Burgundian faction in Tournai snatched power away from the guilds. In the midst of the conflict, Campin was arrested and, though he was eventually set free, his career never recovered.

# *CANON LAW*

. The medieval church was governed by universal canon law and local laws and customs. The former was taught at the universities, especially in Bologna and Paris. It was divided into *ius antiquum,* the conciliar canons, papal decretals (many of them spurious), and patristic texts included in Gratian's *Decretum,* a private (i.e., not ecclesiastically sanctioned) collection from the 12th century, and *ius novum,* recent canons and decretals. Collecting of decretals began as a private endeavor, but the papacy took an interest early in the 13th century. Ultimately, there were three official collections, promulgated to the universities, the *Liber extra* or *Gregorian decretals* of Gregory IX (1234), the *Liber sextus decretalium* of Boniface VIII (1298), and the *Constitutiones clementinae,* left unpromulgated on the death of Clement V in 1314 and reissued by John XXII in 1317. (Other papal decrees, or *extravagantes,* were collected unofficially.) The greatest number of the texts in these collections concerned the discipline and business of the clergy. Teaching from these texts and commenting on them made the canonists important figures in medieval political and ecclesiological theory. Canonistic science was brought into pastoral care through the *summae confessorum,* handbooks, many of which were composed by friars to guide priests in hearing confessions and assigning penance. The Roman curia supplemented universal canon law with collections of its own regulations and decisions of its tribunals, especially the Rota. Local canon law continued to exist in a subordinate role; and numerous synods and provincial councils issued regulations, applying the universal canon law or dealing with regional problems.

# CANONICAL HOURS (DIVINE OFFICE)

. The form of service, comprising psalms, hymns, readings, and prayers, designated for the sanctification of specific hours of the day. The two chief types, monastic and secular (for secular clergy), arose to accommodate the particular needs of these communities; their differences reside primarily in the number and arrangement of the items.

As early Christianity existed under constant threat of persecution, most assemblies occurred in the evening, and out of these vigils the most important Hours developed. The

4th century saw important steps toward the formation of the Offices. Drawing from eastern rites, Ambrose (340–397) brought the antiphonal performance of psalms and the singing of hymns to the service; in turn, the flourishing of monastic life at this time generated a need for a measure of uniformity in the celebration of the Hours. This standardization was achieved in large part through adoption of the *Rule of St. Benedict,* although Benedictine practice was but one of many uses; variants persisted throughout the Middle Ages, particularly in the Franciscan and Dominican communities.

The Divine Office consists of a daily cycle of seven Hours in addition to Compline, the night office. The "named" or Greater Hours are Vespers, Matins, and Lauds, performed at sunset, night, and before Mass, respectively. These three emerged out of the vigils of the earliest Christian services and are the most elaborate musically. The Lesser Hours—Prime, Terce, Sext, and None—are celebrated at about 6 A.M., 9 A.M., noon, and 3 P.M. and are linked symbolically to the moments of the Passion and, in some regions, the periods of salvation history. The frequency and arrangement of these periods of common prayer draw their inspiration from two biblical passages: the exhortation from Luke 18:1 to pray always, and Psalm 118 (119): 164: "Seven times a day I praise you."

By the end of the 13th century, the Offices were contained in three books: Breviary, Antiphonary, and Choir Psalter. The Breviary, designated for the officiating priest, generally included Proper items only (those specific to a given feast day or liturgical season). The Antiphonary was the principal choir book and contained all of the Proper items; the Choir Psalter supplemented this with the Common items of the Office, which were fixed regardless of the season or feast day. It was only later that almost all of the texts were merged into the portable form of the Breviary, suitable for private devotions.

# *CANTUS CORONATUS*

("crowned song"). Prize-winning songs in the *puys* were said to be "crowned," and 13th- and 14th-century manuscripts identify about thirty songs as *chansons couronnées*. The theorist Johannes de Grocheio (fl. ca. 1300) identified the highest-level secular songs as *cantus coronatus,* works that maintained elevated courtly poetic language and melody. His examples, *Ausi comne unicorne* (King of Navarre) and *Quant li roussignol* (Chastelain de Coucy?) were composed by noble trouvères. In 15th-century music, the term has been applied to series of long notes marked by fermatas, perhaps indicating passages of improvised vocal ornamentation.

# *CANTUS FIRMUS*

. A preexisting segment of music, usually extracted from Gregorian chant, upon which a new polyphonic composition is based. The use of a *cantus firmus* provided the earliest means of constructing polyphony and remained important as a compositional procedure in France throughout the Middle Ages. *Cantus firmi* extracted from Notre-Dame organa of the late 12th and early 13th centuries provided the foundation voice for the earliest motets, the most progressive polyphonic form of the 13th century. The *cantus firmus* was subjected to strict rhythmic patterning, and the preexisting segment of music lent the authority of the sacred chant to new compositions based on it. By the latter part of the 13th century, composers occasionally employed secular *cantus firmi*. Often, the texts of the upper voices of a motet were related to the word or words identifying the *cantus firmus* in a complementary or ironic fashion. Use of a *cantus firmus* continued in isorhythmic motets of the 14th and 15th centuries, as well as in the unified cyclic Mass of the 15th century.

# CAPETIAN DYNASTY

. The Capetians, called in the Middle Ages the "third race" of French kings, coming after the Merovingians and Carolingians, ruled France in unbroken succession from 987 to 1328. (The first kings from the lineage had already ruled briefly a century before Hugh Capet's accession in 987 on the death of Louis V: Eudes [r. 888–98] and his brother Robert I [r. 922–23].) The term "Capetian" was coined in the French Revolution, but the "third race" was a recognized entity 800 years earlier; the epithet "Capet," meaning a cap or cape, was attached to Hugh Capet in the 13th century. Although the Capetian line is considered to have ended with the advent of the Valois in 1328, in fact the Valois and all succeeding French monarchs through Louis XVI were descended in the male line from Hugh Capet.

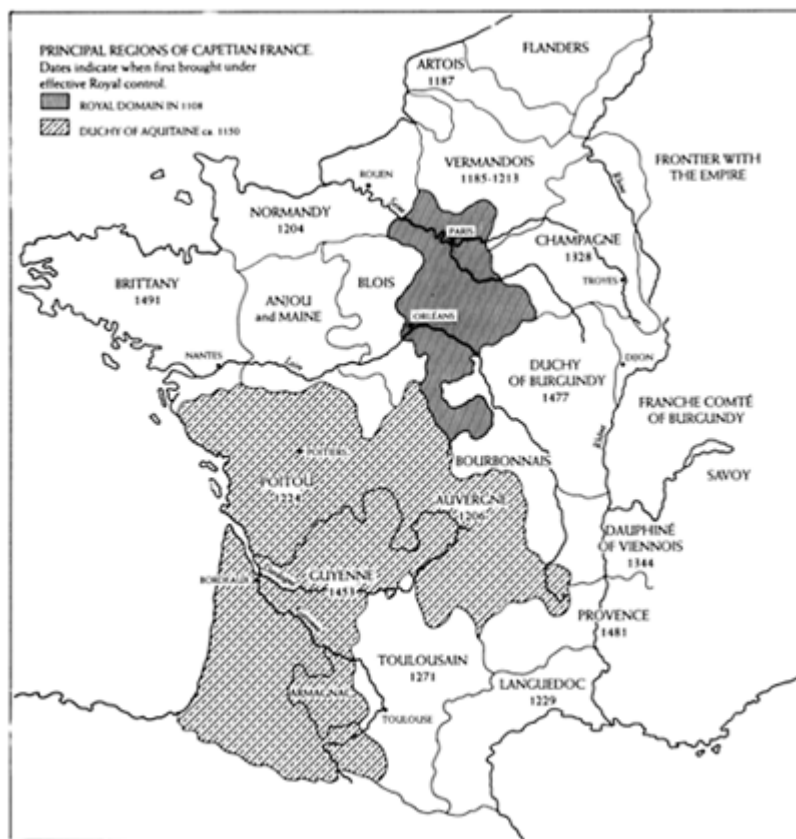
For the first century or so of Capetian rule, the kings exercised little authority outside the restricted area surrounding their capital at Paris. The counts of Blois and Troyes, whose counties flanked royal Francia, were more powerful in many respects. Yet the Capetians had succeeded the Carolingians with an almost theocratic aura as God's

anointed administrators of justice, and they had several advantages that the Carolingians and Ottonians, or for that matter most ducal or comital lineages, lacked.

First, they managed to produce a male heir in every generation. Although the kings from Hugh Capet through Louis VII in the 12th century all practiced anticipatory succession, associating their oldest sons on the throne with them before their deaths, no other family challenged the Capetian claim to royal rule after the end of the 10th century. The production of an heir was, however, sometimes difficult, as in the case of Louis VII, whose only son was born to his third wife, after he had divorced his first wife, Eleanor of Aquitaine, and his second, Constance of Castile, had died. Second, the Capetians were believed capable of healing scrofula, "the king's evil," by their touch; Robert II was first credited with this ability at the beginning of the 11th century. Third, they had few internal quarrels, unlike, for example, the Plantagenêt kings of England. Some of the kings (Hugh Capet, Philip I, Louis VII) had only one legitimate son, thus eliminating sibling quarrels. In other cases, younger sons were given territory of their own. Robert II had his second surviving son, Robert, succeed to Burgundy while Henry I, his oldest surviving son, was designated the royal heir; the Capetian dukes of Burgundy ruled until the middle of the 14th century. Henry in turn married his second son to the heiress of Vermandois. The kings did not divide the central family patrimony, which was attached to the crown from the time Capetian rule began and went whole to the oldest son, but they found it useful to distribute newly acquired territories, like Burgundy, to cadets. The vast territorial acquisitions of the kings in the 13th century made possible the birth of the most developed form of this practice, the apanage system.

While building their political power, the Capetians enjoyed better relations with the church than did other western kings. They did not, like the German emperors, become embroiled in the investiture issue or in the delicate question of secular justice for ecclesiastics, as did the English kings. Philip I worked out a compromise with the pope on royal investiture of bishops that anticipated the Concordat of Worms between the pope and the emperor (1122). Popes fleeing Italy or archbishops fleeing England routinely sought refuge in France in the 12th century.

When French kings were excommunicated in the 11th and 12th centuries, it was for their matrimonial difficulties, not for open breaks with the ecclesiastical hierarchy. Robert II married his cousin Bertha, the widowed countess of Blois, in 996 but was ultimately forced to separate from her on grounds of consanguinity. His grandson Philip I repudiated his first wife in 1092 for an alliance with Bertrade de Montfort, an alliance that he was able to have recognized eventually but that caused him a good deal of difficulty. Philip II's most serious differences with the papacy stemmed from the repudiation of his queen, Ingeborg of Denmark, in 1193.

Although Philip I, excommunicated at the time, could not go on the First Crusade, Louis VII and Philip II were leaders of the Second and Third Crusades, respectively,


and most of the crusading activity of the 13th century was led or influenced by Louis IX. In 1303, Philip IV did make an open break with the papacy, when he captured Boniface VIII, but by then the Capetians had the support of the French bishops. Succeeding popes at Avignon were firmly under the influence of the French kings, even though their see was officially in the empire, not the French kingdom.

Despite their good relations with the church, the Capetians were not great ecclesiastical patrons. Dukes and counts were much more generous to the French monaster ies. Long after kings and popes had agreed on the minimal role the kings were to play in the selection of new bishops, the crown still attemped to influence episcopal elections and to seize episcopal property during a vacancy. The 12th-and 13th-century monarchs issued diplomas of confirmation and immunity for an increasing number of churches, but this practice was tied more closely to the spread of their political power than to religious sentiment. The ecclesiastical hierarchy was, however, practical enough to recognize that the French kings were the best friends it was likely to have.

The Capetians rose from obscurity to unquestioned power in the space of three centuries. The kings of the 11th century added political and territorial influence to Hugh Capet's legacy, but Louis VI (r. 1108–37), is usually considered to have reestablished French royal power. Louis, who was fortunate in having a laudatory biographer in his friend Suger, abbot of Saint-Denis, was effective in making the king's vassals recognize royal suzerainty; the great lords of France presented the Capetians with few problems after the first decades of the 12th century. His greatest territorial triumph was acquiring Aquitaine for his son, Louis VII (r. 1137–80), by marrying him to Eleanor, heiress to the vast duchy. This triumph lasted only for fifteen years, however; Louis divorced Eleanor on grounds of consanguinity in 1152, although the real reason seems to have been her failure to produce a son. She brought Aquitaine to her new husband, Henry II of England, and English control of Aquitaine was to last for 300 years. Because of this loss, and his involvement in the unsuccessful Second Crusade (1147), Louis VII is often seen as a weak king. But he should be credited with establishing excellent relations with both the secular and ecclesiastical powers of the kingdom and with laying the foundations for the achievements of his son, Philip II Augustus (r. 1180–1223).

Philip reorganized the government, using a system of royal officers to oversee estates and courts. He relied especially on nonnobles, men who owed their position to the king, rather than on the sometimes dangerously independent nobles who had earlier served as royal officials. After the loss of the French royal archives at the Battle of Fréteval in 1194, Philip set up an efficient royal chancery, which remained at Paris rather than traveling with the king. He was able to generate enough revenues to pay for expensive wars against England, cultimating in the Battle of Bouvines (1214), where he took Normandy from King John.

The governmental organization of the early 13th century laid the basis for the reign of Philip's grandson, Louis IX (r. 1226–70), the most celebrated of the Capetians. Louis, the only king of the high Middle Ages to be sainted, is known especially from the

biographical portrait by his close friend Joinville. Though revered more for his personal qualities, his dispensing of justice, and his crusading activities than for administrative innovation, he presided over a well-organized government. The Parlement de Paris became the highest judicial court in France, to which the decisions of all other courts could be appealed.

During the 13th century, the issue of the "dynastic legitimacy" of the Capetians began to be important. After nearly three centuries of rule, no one was likely to challenge their dynasty, but at a time when the kings were greatly expanding their territory beyond Francia it became important to establish that they were the heirs to Charlemagne. The tombs of both Capetians and Carolingians at the abbey of Saint-Denis were rebuilt and carefully rearranged. Most of the queens of France were construed as being in some way Charlemagne's descendants.

Louis IX's grandson, Philip IV the Fair (r. 1285–1314), has had none of the personal appeal of St. Louis, with his suppression of the Templars, battles with the papacy, wars with the English, and repeated devaluations of the currency. But he presided over a France that was firmly united. When the third and last of his sons, Charles IV, died without sons of his own in 1328, no parts of the kingdom broke away, and no one from outside the lineage claimed the throne. The only question was whether succession should go to a woman, or, as it eventually did, to Philip VI, first cousin of Charles IV and first of the Valois kings.

The history of the kingdom of France in the central Middle Ages has to be considered in relationship to the history of its ruling family. Between 987 and 1328, these rulers went from being one family of princes among many to being the leaders of the highly centralized government of one of Europe's most powerful countries.

# CAPITULARY

. The documents recording the legislative acts of certain Carolingian kings, which contemporary sources refer to as capitularies (Lat. *capitulare,* pl. *capitularia*), earned this name because their contents were often organized into series of short articles, or chapters (Lat. *capitula*). Although capitularies have survived from the time of Carloman (r. 741–47) and Pepin III (r. 741–68), the number of such texts sharply increased under Pepin's son Charlemagne (r. 768–814), as one element in his effort to improve the administration of the vast realm that he came to control. Writing was always of marginal importance in the government of Charlemagne, however; the foundation of law remained what it had been under earlier Frankish monarchs, the king's oral pronouncement based on the royal ban, his absolute power to command. The capitulary possessed no legislative power in itself but merely set forth what the monarch had proclaimed. Furthermore, although the king might consult with his lay and ecclesiastical magnates, at least through Charlemagne's lifetime there is no evidence that their consent was necessary in order for a capitulary to be valid. It is only in some capitularies produced under Louis the Pious (r. 814–40) that the assembly's consensus seems to have become a more vital element of lawmaking. This occurred at the time of a decline in royal authority and a rise in the power of the nobility. While the practice of issuing capitularies continued under Louis the Pious, after the breakup of the empire in 843 (Treaty of Verdun) capitularies are found only from west Francia during the reign of Charles the Bald (r. 840–77). They disappeared even from there shortly after Charles's death in 877.

The peripheral importance of writing to legislative activity under Charlemagne and his successors helps to explain the erratic manner in which Carolingian capitularies have survived. Provisions for the preservation of copies of these documents in the palace archives became common only under Louis the Pious and Charles the Bald and even then were inconsistent. To a great degree, the capitularies have come down to us only because of records preserved by *missi dominici,* representatives of the king who circulated them in the realm. The capitularies that still exist, largely thanks to such collections, take a variety of forms but in general are devoted to specific issues needing attention, both secular and ecclesiastical in character. Some deal with such concerns to the church as the role of images and the propriety of their worship, or the organization of monastic and canonical life; others note matters to be discussed at later assemblies, amend the realm's systems of law, or contain instructions to *missi dominici* or to counts in different parts of the empire.

Among the most important of the capitularies from Charlemagne's reign are the Capitulary of Heristal (779), which aimed at wide-reaching reform of lay and church administration in his realm; the *Admonitio generalis* of 789, a program of ecclesiastical reform that, among other things, provided regulations for the establishment of schools near cathedrals and monasteries; the Programmatic Capitulary of 802, concerning the new situation created by the imperial coronation in 800; and the Capitulary of Thionville (805), which sought to deal with the weakening of Charlemagne's power toward the end of his life and the corresponding increase in corruption among local officials.

# CAPUCIATI

. The Capuciati exemplify the mix of politics and religion, of lay religiosity and social revolution, that characterizes the high Middle Ages. In 1182, responding to an infestation of brigands in the wake of the Plantagenêt-Capetian wars, a carpenter from Le Puy named Durand Dujardin had a vision of the Virgin telling him to form a brotherhood of peace. This confraternity of humble men wearing white hoods *(capuciati)* took a collective oath to go to Mass, to forgive each other all sins, and to renounce gaming, blaspheming, and frequenting taverns. Their numbers grew with astonishing rapidity, spreading throughout the central and southern provinces of France (Berry, Limousin, Gascony, Aquitaine, Provence). Chroniclers initially praised the movement and admired the piety of these laymen, and both lay and ecclesiastic nobles in their regions supported them. Within a year, the sworn Peace militias of the Capuciati had defeated several armies of brigands, slaughtering thousands.

Flushed with success, the Capuciati extended their definition of plunder to include prelates and nobles who exploited their serfs; they even invoked Adam and Eve as proof that all should be free and equal. This may be the earliest reference we have to the invocation of the Creation myth among European commoners to denounce aristocratic privilege; in later peasant revolts (England in 1381, Germany in 1525), we hear the ditty: "When Adam delved and Eve span/Who was then the Gentleman?" It is noteworthy that in all three cases these revolts of the commoners were preceded by translations of the Bible into the vernacular (by Waldo in the 1170s, Wyclif in the 1370s, Luther in 1521).

The aristocracy, perceiving the threat, turned against the Capuciati. Chroniclers denounced their "madness" and branded them heretics; and the brigands, now with the assistance of the nobility, took vengeance for their earlier defeats, massacring the Capuciati both on the battlefield and in their towns. Hugh of Noyers, a bellicose lord of royal lineage, became bishop of Auxerre in 1183, defeated the upstart peasants, and condemned them to go for a full year without covering their heads. By 1185, there seems to be no trace left of the Capuciati. Their fate recalls that of the peasant *coniuratio* of 859

in Neustria, formed to defend against Viking raiders but wiped out by the local aristocracy for engaging in a collective oath, as described in the *Annales sancti Bertiniani*. But the overall dynamics reflect changes in both the religious and social situation in Europe after the millennium. In its ideology of peace, its collective oaths, and its popular militias, the movement was closely related to the early 1 1th-century Peace of God, although unlike this clerically led movement the Capuciati arose from the ranks of lay commoners.

# CARCASSONNE

. Situated in a strategic position on the Aude River between the Toulousain and the Mediterranean port of Narbonne, the city of Carcassonne (Aude) served throughout the Middle Ages primarily as a military stronghold and center of administration. Occupied at least since the 1st century A.D. by the Romans, Carcassonne was a major Visigothic stronghold after the 5th century, before becoming one of the largest walled cities in western Europe during the later Middle Ages. In the Carolingian period, the fortress of Carcassonne became the seat of a county; a comital dynasty appeared in the early 9th cen

Carcassonne (Aude), plan of upper city. After Stierlin.

Baltzer.*

tury. During the 11th and 12th centuries, Carcassonne was at the center of the vast
domains controlled by the family of Trencavel. The city, twice lost and regained by the
viscounts, played a pivotal role in the struggles between the counts of Toulouse and
Barcelona.

The Albigensian Crusade of 1209 ended the dynasty of the Trencavels. Under Simon
de Montfort and, after 1226, the king of France, Carcassonne became the seat of a
*sénéchaussée*. In 1240, the final attempt of the young Raymond Trencavel to recover his
domains failed in the desperate siege of Carcassonne. Trencavel's retreat left the *bourg,*
which had joined his rebellion, abandoned and destroyed. It remained depopulated until
1248, when Louis IX had it reconstructed on the left bank of the Aude. At the end of the
13th century, the *bourg* was again the center of agitation, led by Bernard Délicieux
against the Inquisition in the Midi. In 1305, fifteen burghers, including the consuls, were
hanged for attempted insurrection and treason against the king of France.

Although Carcassonne never achieved the importance of Béziers, Narbonne, or Nîmes,
its economic prosperity, particularly as a center of textile manufacture, reached its height
in the first half of the 14th century. After 1350, the city declined rapidly both in

commercial and military importance. The raid of Edward, the Black Prince, in 1355 again left the *bourg* destroyed; in 1384, complicity in the revolt of the Tuchins subjected the burghers once more to crippling penalties.

*Alan Friedlander*

The city consists of a rectangular castle, 247 feet by 148 feet, and double curtain walls separated by grassy lists; the outer ramparts (about 5,000 feet long) have some twenty reinforcing towers or strongholds, and the inner ramparts (about 3,600 feet), twenty-five. The so-called Palace of the Viscounts was actually built, according to Héliot, in the 13th century by Simon de Montfort and especially Louis IX. Constructed of rough-worked sandstone, it is surrounded on three sides by a deep moat and protected by nine towers. Its main entry, between two half-round towers, is defended by a bridge and a semicircular barbican. Within, in lieu of a central keep, is an open courtyard flanked by a high watchtower. Construction on the walls was continued under Louis's son Philip III, who was responsible for several of the more remarkable towers, notably the Tour du Trésaur and Tour de l'Inquisition. A number of the towers have their own well and could be independently defended in the event other sections fell. The principal entry to the town, the Porte de l'Aude, was defended by a series of barbicans and outer works; those entering were required to approach first parallel to the line of defense, then perpendicular to it, thus exposing themselves to fire from every angle.

In its present state, and in spite of major restorations by Viollet-le-Duc in the 19th century, Carcassonne is one of the finest examples of a medieval walled city. Its ramparts and towers, with their crenellations, arrow loops, embrasures, potlug holes, hoarding, walks, and battlements, provide an outstanding example of medieval military architecture.

# CARLOMAN

. Name of several Carolingian rulers. The first Frankish ruler to bear the name Carloman was the eldest son of Charles Martel, mayor of the palace in the united Frankish kingdom. After Charles's death in 741, this Carloman became mayor of Austrasia, while his brother, Pepin III, received the mayoralty of the kingdom of Neustria. Since the Merovingian monarchs were then virtually powerless, the mayors were the most important officials in the land. Carloman and Pepin cooperated to extend their authority,

quelling uprisings and supporting the church's efforts to spread Christianity in the region. In 743, they together reestablished a Merovingian, Childeric III, on the throne, vacant since 737. In 747, Carloman abdicated in favor of his brother in order to become a monk. He died in 754 in a monastery at Vienne, three years after Pepin had deposed Childeric and claimed the crown for himself.

The second Carloman was Pepin's younger son. When Pepin, now king of the Franks, died in 768, Carloman was given the more central territories and Charles, the future Charlemagne (742–814), the eldest, received lands encircling those of his brother. The two rulers did not get along, but Carloman's death in 771 permitted Charles to reunite the kingdom. Sometimes called Carloman II to distinguish him from his uncle, the younger Carloman was the first to reign as king. A century later another Carloman (d. 884), son of Louis II, reigned briefly. These two Carlomans should not be confused with King Carloman of Bavaria and Italy (d. 880) or Carloman (d. 876), the son of Charles the Bald.

# CARMELITE ORDER

. The religious order of Our Lady of Mount Carmel, popularly known as the Carmelites, originated in Palestine during the period of the Crusades and under the impetus of monastic and ascetic reform, although it claimed continuity with earlier hermits living on Mount Carmel and even with the prophet Elijah and his followers. Founded ca. 1154, with the earliest rule formulated in 1209 by Albert of Vercelli, Latin patriarch of Jerusalem, the Carmelites emphasized strict asceticism, abstinence from meat, a semi-eremitic life, and total poverty, much in line with other 12th-century monastic foundations and reforms. Their *Rule* was approved by Pope Honorius III in 1226. With the collapse of the crusader states and the crusading movement generally, the Carmelites moved to Europe and reorganized themselves after the pattern of the mendicant orders (Dominicans and Franciscans). They changed from a movement dedicated to prayer and solitude into an order centered on an urban ministry, with preaching and care of the poor. A female branch of the order was established in the Low Countries in the mid-15th century and has continued as one of the most ascetic and enclosed of the modern female religious orders. Like other mendicant orders, the Carmelites began to seek a university education for their members so as to carry out preaching and missionary work, and the order gradually became clericalized. The quest for education and the acquisition of

property for their urban mission led to tension with the original ideal of total poverty and solitude. The 16th century saw a major renewal and reform of the order in both its male and female branches.

# CAROLINGIAN ART

. Although members of the Carolingian dynasty ruled in France from 751 to 987, artistic production was concentrated between the last quarter of the 8th century and the end of the 9th. This period witnessed an explosive increase in artistic production in many areas, notably architecture, monumental painting, book production, ivory carving, and many forms of metalwork, and it can fairly be said that Carolingian art laid the foundation for later medieval developments. Little remains today of the monumental arts, although many literary sources describe buildings and their decoration, and considerable evidence has been recovered from archaeological investigation, so that the numerous and often perfectly preserved examples of the "minor arts" give the fullest and clearest picture of Carolingian art as a whole.

The very term "Carolingian art," derived from the ruling dynasty, reflects a tradition of seeing the art of the period as primarily stimulated by centralized royal patronage, and indeed monarchs and ecclesiastical figures in the immediate royal circles were prominent and influential sponsors of artistic projects. On the other hand, much artistic production was spread widely throughout the kingdom, especially in the northern regions, and shows relatively little influence from courtly subjects or styles. Although the Carolingian monarchs clearly revived the ancient tradition of the ruler as patron and often subject of important artistic projects, the early-medieval tradition of artistic production being carried on in monasteries was also continued. Courtly and monastic patronage and production are often inseparable, with monasteries often producing works of art for or at the behest of the monarch.

For a variety of reasons, it seems that artistic production played an especially important role during the Carolingian period, often expressing contemporary political and theological circumstances, a phenomenon encouraged by the debate about the proper role of images in the Christian church, which from 726 to 843 dominated the Byzantine world. There, the conflict between those who favored the veneration of holy images, or icons, as central elements of Christian cult and those, known as Iconoclasts, who opposed such practices and sought to destroy such images or circumscribe their use called for a western and especially Carolingian reaction. In 792, Archbishop Theodulf of Orléans drafted the first of a series of lengthy Carolingian treatises devoted to religious art. His work, now known as the *Libri Carolini* and in fact the most extensive early-medieval text concerning art, was originally designed to express an official Frankish viewpoint that

images should be neither venerated nor destroyed and that they could help to instruct the faithful. The emphasis on didactic art that could convey an important message became a leading feature of Carolingian art, sometimes joined with a growing ability to evoke personal empathetic responses to the image. Images thus assumed a place of special significance, enhanced by the tendency to make grand artistic works to mark special personal and political moments.

The first important Carolingian building in France was the new monastery church at Saint-Denis, begun at the death of King Pepin to house his tomb, and completed and dedicated by his son Charlemagne in 775. Excavations suggest that the basilican church had a large transept, a feature previously contained only in the apostolic basilicas of St. Paul in Rome, and thus announcing a major

Crucifixion. Upper cover of the binding of the *Lindau Gospels,* Morgan MS M1. Gold and jewels, c. 870. *Courtesy of the Pierpont Morgan Library, New York.*

feature of Carolingian artistic production, the relationship to early Christian and papal Roman art. The feature of the transept seems to have become common, even standard, in later Carolingian basilicas. The great basilica built during the 790s by Angilbert at Saint-Riquier (Centula) in northeastern France, now known from extensive literary descriptions and from some postmedieval drawings, had not only a transept but also several massive towers. An outstanding source of information for architecture and many other subjects is

the famous Plan of Saint-Gall, a detailed layout of buildings for a monastery in Switzerland designed ca. 820, and probably reflecting building ideas more widely current throughout France as well as other parts of the Carolingian world. Not all ecclesiastical buildings were basilicas. The famous octagonal palace chapel built by Charlemagne at Aix-la-Chapelle in the 790s is not in France, but a contemporary central plan structure was erected by Archbishop Theodulf of Orléans at Germignydes-Prés, and Charles the Bald built a magnificent palace chapel in the Aix-la-Chapelle tradition at Compiègne, consecrated in 877.

Few Carolingian mural paintings survive in France, but the extensive decorations in Switzerland, Italy, and Germany support the evidence of the crypt of the church of Saint-Germain at Auxerre that mural painting was produced in large amounts and achieved a high level. A special feature of Carolingian mural decoration is the use of mosaic at Aix-la-Chapelle (Aachen) and probably at Compiègne. The late 8th- or early 9th-century mosaic apse from Theodulf's oratory at Germigny has an unusual subject, the Ark of the Covenant as described in the Old Tes-

A Seraph, superimposed on the text of the *Sanctus,* Drogo Sacramentary. MS lat. 9428, fol. 15. *Courtesy of the Bibliothèque Nationale, Paris.*

tament, with statues of winged cherubim. Such an unprecedented subject for treatment in a major apse surely reflects the contemporary debate about images in the Christian church and stems directly from the patron's special interests.

Some of the most famous works of Carolingian art are illuminated manuscripts, which survive in large numbers and are often nearly perfectly preserved. Best known are the groups of books that can be closely associated with rulers, especially Charlemagne and Charles the Bald, and that appear to have been produced by scribes and painters directly

attached to the royal entourage. The books for Charlemagne include the Gospel lectionary written by Godescalc (B.N. n.a. lat. 1203), datable 781–83, whose colophon employs one of the earliest examples of Carolingian minuscule script and which has elaborately ornamental frames for every page of text as well as impressively large portraits of Christ and the four Evangelists bearing many stylistic and iconographic connections with the 6th-century mosaic art of Ravenna. A slightly later group of books connected with Charlemagne and produced after the establishment of the royal court at Aix-la-Chapelle in 795 make a tighter group, including the Harley Gospels (B.L.Harley 2788), Soissons Gospels (B.N. lat. 8850), Abbeville Gospels, and Lorsch Gospels (Bucharest and Vatican Pal. lat. 50). Some features of the style, iconography, and layout of these books were followed by later groups associated with such monarchs as Charles the Bald, for example, the great *Codex aureus* from Saint-Emmeram of ca. 870 (Munich, Clm. 14000), and also by manuscripts produced at Reims, Fulda, Tours, and other monasteries, which from the second quarter of the 9th century produced luxury manuscripts in large numbers. With Reims is associated a dynamic and expressive, sketchy style of drawing whose greatest representative is the Utrecht Psalter; with Tours is especially associated a series of Bible manuscripts containing extended narrative sequences for scenes from Genesis, Exodus, and other biblical books.

Carolingian production of luxury manuscripts is most often associated with the great Gospels and Bibles but also includes a variety of other texts, some of which are of classical and early Christian origin, such as the comedies of Terence, the astronomical works of Aratus, and the *Psychomachia* of Prudentius; these clearly followed, to some degree, surviving ancient illustrated manuscripts. New pictorial schemes were developed as well. Several Sacramentaries received extensive cycles of illustrations for the first time, and the sequence of extraordinary acrostic poems written in the 820s by Rabanus Maurus of Fulda, *De laudibus sanctae crucis,* were designed from their inception for elaborate pictorial illustration and survive in several luxurious 9th-century manuscripts.

The altar was a preoccupation of Carolingian religious thought, which focused to a great degree on the eucharistic sacrifice, and it is therefore no surprise that architecture often made provision for multiple altars, each of which was required to contain at least one relic, and that a large amount of luxury art was produced for use on the altar. The great silver-gilt and enamel altar made by Vuolvinus and another artist for San Ambrogio in Milan in the mid-9th century probably draws upon French precedents and represents a type of altar decoration that must have been widespread. Altar books included not only Gospels and Psalters but Sacramentaries and prayer books, decorated with elaborate gold and jeweled or ivory covers of which one of the most spectacular is the cover with the crucifixion image of the Lindau Gospels, a work of the second half of the 9th century. Reliquaries were made in large numbers, still for the most part in the form of boxes or chests. A distinctive Carolingian type of object is represented by reverse-carved rock crystals, produced primarily in the general area of Lorraine. Generally decorated with the Crucifixion scene and clearly meant for the altar, the most spectacular of the group is decorated with eight scenes of the story of Susanna and appears to have been especially meant for the use of the king.

Although carved ivories were common in late antiquity, virtually none had been produced before the revival of the technique at the end of the 9th century in works generally associated with Charlemagne's circle. Well over a hundred 9th-century ivory

carvings survive, some close transcriptions of early Christian models but others strikingly inventive in style and iconography, as, for example, a superb group close to Charles the Bald that draws upon the expressive style of the Utrecht Psalter. The largest surviving group of ivories decorate a throne made probably in eastern France for Charles the Bald and now preserved in the Vatican as the *Cathedra Petri,* including a remarkable group of twelve Labors of Hercules.

# CAROLINGIAN DYNASTY

**.** Named after its most illustrious member, Charles (Lat. *Carolus*) the Great, or Charlemagne (742–814), the Carolingian family originated in the intermarriage of the Austrasian noble families of Pepin I of Landen (d. 640) and Arnulf of Metz (d. ca. 645). By the 9th century, their descendants ruled an area en compassing portions of modern East Europe and most of the western part of the Continent. From Pepin III's coronation in 751 until the early 10th century, there was always at least one Carolingian on a western throne.

Carolingian fortunes were initially advanced by the Merovingian king Clotar II (r. 584–629), who named Pepin of Landen mayor of the palace *(major domus)* of Austrasia for his help in uniting the Frankish kingdoms of Austrasia and Neustria. Under Pepin I, the post of mayor developed into the most powerful office in the Frankish regions. Such was the position's importance that when Pepin's son, Grimoald, became mayor on his father's death, he had his own son adopted by the reigning Merovingian king in order to place him in line for the throne. This was a maneuver that other Frankish nobles could not tolerate, however, and it led to Grimoald's murder in 656.

Despite this temporary setback for the Carolingians, Pepin I's grandson and duke of Austrasia, Pepin II of Heristal, managed to gain the mayoralty of both Austrasia and Neustria in 687. In contrast to Grimoald, he did not then seek access to the throne but limited himself to the office of *major domus,* a vantage point from which he was able to

expand his hold on Frankish territories. His death in 714 precipitated a period of friction within the kingdom, as a power struggle opposed his sole surviving yet illegitimate son, Charles (later Martel), to Pepin's widow, Plectrude. It was only after defeating the forces of Plectrude and other opponents that Charles attained the political authority of his father.

Charles Martel proved a forceful leader of the Franks, strengthening their territorial claims through victories over other Germanic groups as well as over Muslims from Spain. Above all, his military prowess is epitomized by his defeat of a Muslim advance near Poitiers, in October 732. Although scholars debate the significance of that episode—subsequent engagements were necessary in the 8th and early 9th centuries before Muslim raids into the Frankish realm ended—it came to be viewed among western writers as the turning point in the West's struggle against Islam. This was the battle for which Charles received the nickname Martel ("the Hammer") in the 9th century.

The rudimentary administrative machine available to Charles allowed him to maintain only a loose control of the Frankish territories, and it was largely to preserve his grip on them that, as had Pepin II, he lent his support to the church and to its missionary work in the eastern regions. Like his father, Charles considered the church an instrument to further his own ends. He secularized ecclesiastical property to remunerate his supporters, appointed laymen to head abbeys and sees, and otherwise exercised his power, as he saw it, to name and to depose bishops. Such measures made for an incoherence in ecclesiastical organization that would be rectified only through the reforms of Charles's successors.

Upon Charles's death in 741, the kingdom was divided between his legitimate sons, Carloman (d. 754), the eldest, and Pepin III. The two brothers cooperated closely in governing the area left to them. In 743, they placed another Merovingian, Childeric III, on the royal throne, vacant since 737, as a measure to suppress rebellious sentiment among noble factions. In 747, Carloman felt called to the religious life and abdicated in Pepin's favor, leaving him mayor of a reunited realm. By 751, Pepin had asked Pope Zachary I to support his decision to depose Childeric and take the crown for himself, a move accomplished in November of that year. The new king, his wife, and sons, the first-born Charles (later Charlemagne) and a second Carloman, were anointed by Pope Stephen II in 754, who acclaimed Pepin and his sons "patricians of the Romans" in recognition of their special role in protecting Rome, and, at the same time, of the Holy See's new political orientation away from the East and toward northwestern Europe.

As mayor of the palace and king, Pepin supported, if only to a limited extent, Boniface's program to reform the Frankish church along Roman lines, which included efforts to improve clerical discipline and training. This was of fundamental importance to the surge in cultural and intellectual activity after Pepin's death, the Carolingian renaissance.

When Pepin III died in 768, his kingdom was shared between Charles and Carloman; the territories of the former encircled those of the latter. Friction existed between the two brothers, but Carloman died in 771, leaving Charles the sole monarch. Charlemagne's reign, first as king and from 800 as emperor in the West, witnessed a dramatic increase in the lands under Frankish control, the evolution of an administrative machine to govern this territory, and the cultural and intellectual developments that marked the Carolingian renaissance. During the first thirty years of his rule, Charles was involved in almost constant warfare: in 774, he defeated the Lombards; in 787, Duke Tassilo of Bavaria was

overcome, though not decisively; campaigns in the 790s brought the conquest of the Avars; reprisals were launched against the rebellious Bretons during the later 8th century; in the early 9th century, engagements with Muslims led to the formation of the Spanish March along the Pyrénées. Above all, Charles faced the hostility of the Saxons to the east, whom he struggled to subdue from 772 until 804—through forced conversions, mass executions, and deportations as well as through battle. By the time these wars of conquest ceased in the early 9th century, the Carolingian territories extended from the English Channel to southern Italy, and from the Atlantic into eastern Germany.

Under Charlemagne, the basic units in the governance of so vast a realm were the counties, each headed by a member of the upper aristocracy given the title of count. The count maintained the peace, promulgated and enforced the laws, administered justice, and levied taxes. Government operated primarily at this local level, and ultimately the court had only limited control over the counts. The chief link between them and the central administration were the *missi dominici,* noble laymen, bishops, and occasionally abbots chosen to be the king's representatives, who undertook tours of inspection for him throughout the realm. They investigated charges of misconduct by local officials, assisted in certain judicial proceedings, heard new oaths of loyalty to the sovereign, and published new laws. The laws that the *missi* circulated and royal directives to

them were often recorded in documents known as capitularies, among them such important works from Charlemagne's reign as the Capitulary of Heristal (779) and the *Admonitio generalis* (789). Yet then, as previously among the Franks, the foundation of legislative action was the king's spoken word. The capitularies from Charlemagne's court were merely records of what he had orally decreed and carried no legislative weight in their own right. This legislative and administrative activity was matched by the cultural and intellectual revival of the same period, forwarded by the artists and scholars—Alcuin, Theodulf of Orléans, Paul the Deacon, Paulinus of Aquileia, and others—who gathered around Charlemagne.

All of these developments cast light on the motivations for Charlemagne's coronation as emperor of the West by Pope Leo III, on Christmas Day, 800, in St. Peter's, Rome. Whether the idea for the move came from the papal or the Carolingian court—a point debated by scholars—it suited both parties' interests. Even before 800, Carolingian writers had been evolving a concept of Charlemagne as the successor to Constantine I and the leader of a new Christian-Roman empire in the West. For the papacy, on the other hand, the coronation underscored Charles's special role as protector of western Christendom, at a time when papal authority was particularly threatened.

It is uncertain whether Charlemagne initially viewed the imperial title as a personal honor or one to be passed on to an heir. No arrangement was made concerning it in the *Divisio regnorum* of 806, which decreed that after his death the empire be partitioned among his legitimate sons, Charles the Younger (d. 811), Pepin (d. 810), and Louis (778–840; later known as "the Pious"); but the inheritance of the imperial crown may have been something that even then Charlemagne intended to settle later. By 813, Charles the Younger and Pepin were dead, however, and in September Louis was crowned co-emperor. He became sole emperor upon his father's death in January 814.

The reign of Louis the Pious witnessed probably the peak of the Carolingian renaissance in arts and letters as well as the implementation of important religious and administrative reforms; but it also saw the political crises emerge that led to the empire's dissolution. The political turmoil of the 830s stemmed partly from the disaffection of aristocratic groups over Louis's ecclesiastical reforms and partly from problems caused by his plans for the succession.

The terms of the inheritance were first outlined in the *Ordinatio imperii* of 817. Whereas Charlemagne had arranged the imperial succession only a year before his death, Louis the Pious made this from the start a basic element of his plans. The *Ordinatio* stipulated that each of his sons—Lothair I (795–855), Pepin of Aquitaine (800–838), and Louis (804–876; later known as "the German")—receive a portion of the empire to govern, while Italy remained under Louis the Pious's nephew, Bernard. But the imperial crown was bestowed immediately on Lothair I alone, who was to rule the empire's most important territories, including Aixla-Chapelle and Rome, and to exercise supremacy over his brothers and Bernard. Although Louis the German and Pepin were too young to react to these plans, the *Ordinatio*

provoked Bernard to revolt in 817. The rebellion was crushed and its instigator blinded, a punishment from which he died.

Difficulties for Louis the Pious increased with the birth in 823 of Charles (later known as "the Bald") to his second wife, Judith. (The three older sons were by his first spouse, Irmengarde.) A revised scheme of inheritance gave to Charles lands previously intended for his older brothers. Coming on top of existing tensions between Louis and Lothair I, this drove Lothair and his supporters to revolt in 830. Over the next several years, conflicts between the aging emperor and one or more of his sons plagued the empire. Although Louis managed to regain political control in 834 and confined Lothair to Italy, strife among Lothair, Louis the German, and Charles the Bald flared after their father's death in 840. The written records that were made of one attempted accord between Louis the German and Charles, the Oaths of Strasbourg of 842, provide unique evidence of the French and German vernaculars of the day; but the agreement failed to achieve a lasting peace. In 843, the Treaty of Verdun ended the ideal of a united empire by dividing it into separate kingdoms for Louis the Pious's surviving sons: to Charles went the western regions, to Louis the German the eastern territories, and to Lothair the middle section. Yet this only temporarily ended the conflict. The tensions among the brothers, along with such external threats as Viking raids, undermined the authority of the Carolingian monarchs and encouraged the rise of aristocratic factions. The church's authority in secular affairs also grew, as it increasingly claimed a right to intervene in political issues.

After Lothair I's death in 855, his kingdom was shared among his three sons. Italy was given to the eldest, Louis II (d. 875), who had received the imperial crown in 850, while Lothair II (d. 869) obtained the kingdom of Lorraine and Charles (d. 863) the kingdom of Provence. Charles of Provence's realm was partitioned after his death between his two brothers. When Lothair II died, however, Louis II was too busy battling the Muslims in southern Italy to be a serious contender for his lands, and the Treaty of Meerssen (870)

split them between Louis the German and Charles the Bald. The boundaries thus formed are the basis for those between France and Germany today.

Emperor Louis II died in 875, leaving no male heirs, and Charles the Bald gained the title of emperor and the realm of Italy. Since Louis II's brothers also had lacked sons who could inherit (the church had thwarted Lothair II's attempt to divorce his wife and marry a mistress who had borne him a son), the rule of Lothair I's line ceased.

The political chaos of the decades after 840 was offset, in Charles the Bald's kingdom, by the continued flourishing of artistic and intellectual activity. Charles's court rivaled those of his father and grandfather in the renown of the theologians it attracted, among them Hincmar of Reims and Johannes Scottus Eriugena, and in the impressive artwork associated with his reign, but this was the last great center of learning and art linked with the Carolingian dynasty. Toward the end of the 9th century, continued Viking raids and the rising power of local aristocracy speeded the disintegration of the central administrations in the eastern and western kingdoms. When the death of the West Frankish king in 884 left only an infant as heir, the great clerics and laymen of that realm turned to the emperor Charles the Fat, king of the East Franks, who thereby reunited virtually the entire area of Charlemagne's empire, but when Charles the Fat was deposed in 887 the West Frankish nobility gave the crown to a non-Carolingian. The Carolingians returned to power in the western territory with the enthronement there of Charles the Simple (r. 898–922) and later with the reigns of Louis IV d'Outremer (r. 936–54), his son Lothair (r. 954–86), and his grandson Louis V (r. 986–87). Louis V was the last ruler of the line, and after his death the kingdom passed to Hugh Capet.

In the East Frankish realm, Charles the Fat was succeeded in 887 by Arnulf of Carinthia (r. 887–99), the illegitimate son of Charles's older brother, Carloman, and then by Louis the Child (r. 899–911), Arnulf's son and a minor when he came to the throne. When Louis died, the nobles elected Conrad of Franconia.

# CARON, FIRMINUS

(fl. late 15th c.). Composer active in the years 1460–80, to judge from the sources and styles of his music. None of the proposed identifications has the correct first name, as attested by the generally reliable Johannes Tinctoris and by one musical source. A Firminus Caron was a senior musician at Amiens Cathedral in 1422, too early to be our composer, though conceivably related to him. Given the large number of musical institutions for which no adequate documentation survives, it should be no surprise that direct biographical information is lacking for an important and influential composer.

Caron's known works comprise five Mass cycles (surviving only in Italian manuscripts) and some twenty French chansons. His Mass *L'homme armé* shows the distinct influence of Guillaume Dufay (d. 1474), as does his rondeau *Du tout ainsy.* Two of his songs set poetry by Alain Chartier. His prime distinction is in certain songs that were repeatedly copied: *Accueilly m'a la belle* (nine sources), *Cent mille escus* (fifteen sources), *Le despourveu* (eleven sources), and particularly *Helas que pourra devenir* (twenty-one sources)—this last being an extreme case of the intricate close imitation with offbeat rhythms that he so often explored in his music.

# *CARTA CARITATIS*

. Relations among houses of the Cistercian order were governed by the *Carta caritatis,* drawn up probably in 1114, when Cîteaux founded Pontigny, its second daughter house. This document, intended as a basis for regulating the relations between the New Monastery of Cîteaux and her daughters, emphasized the uniformity of practice at Cistercian houses and the mutual love that should bind them together. Like most of the early institutes of the Cistercian order, the *Carta caritatis* was produced by Abbot Stephen Harding (r. 1108–33).

# CARTHUSIAN ORDER

. The monastery of La Grande Chartreuse, the mother house of the Carthusian order, was founded by St. Bruno in 1084, high in the Alps north of Grenoble. Bruno was assisted in this foundation by Bishop Hugues I of Grenoble (d. 1132). The house always retained many eremitical elements; the monks lived in individual cells, although they met together for Matins and Vespers every day and for a walk once a week. In their search for isolation, the monks avoided parish responsibilities and prayers for the dead other than their own monastic brothers and indeed even tried to avoid visitors. Like the Cistercians, the Carthusians relied for agricultural labor on *conversi,* men who had left the world though not living a life of constant prayer. The purpose, again, was to be self-sustaining so as to minimize contact with the outer world.

In the 12th century, all Carthusian houses were founded far from any settlements, although in the 13th century new houses began to be founded just outside of cities. The order always remained small. By the end of the Middle Ages, Carthusian houses (or "Charter houses") were found as far away as Hungary, England, and Portugal, but the Carthusians never attained the popularity of their contemporaries the Cistercians. The order was widely admired for its holiness of life and attracted new members primarily from within the church, especially the more intellectual sector. Unlike every other medieval monastic order, it never needed reform.

# CARTULARY

. For a notary, the cartulary is the book of notes, first drafts, or summaries of charters issued by him as a quasipublic or public authority. He could consult those notes when necessary to authenticate a contract that he or one of his predecessors had written up. Another type of cartulary is strictly private; these began to be drawn up in earlier times (although the 12th and 13th centuries were the heyday of such compilations) by monastic

and other ecclesiastical corporations, universities, and powerful families intent on gathering evidence of their rights and land-holdings by copying into parchment codices, or occasionally rolls, private charters, royal diplomas and papal bulls, and other materials (e.g., *censiers,* or rent books) concerning that family, abbey, or bishopric and its holdings in a particular district. The relationship between the private cartulary and the original charters and other documents was often complex. In some cases, the first drafts were made directly into the volume and then charters were copied out for the parties involved; more often, the cartulary constitutes the copy (or even reconstruction, sometimes forgery) of documents written down at a considerably earlier date.

*Constance H.Berman*

Pryor, John H. *Business Contracts of Medieval Provence.* Toronto: Pontifical Institute of Mediaeval Studies, 1981.

# *CAS ROYAUX*

. The development and expansion of royal justice in the 13th century led the French crown to extend royal jurisdiction at the expense of others, like the church or the great seigneurs. One of the methods was to place more emphasis on the category of cases known as *cas royaux,* in which only royal courts had jurisdiction. The concept was not new, but the ability of royal courts to claim such a monopoly and enforce it with respect to an expanding list of cases came only during the 13th century. The *cas royaux* included those involving *lèse majesté,* rebellion, counterfeiting the royal seal or coinage, violation of royal safeguard, the conduct of royal officials, amortissements, peerages, and royal forests.

Perrot, Ernest. *Les cas royaux.* Paris: Rousseau, 1910.

# CASSEL

. The town of Cassel (Nord), a stronghold in medieval Flanders that Count Arnulf I rebuilt after the Norse raids of the 9th century, was the scene of two important battles. The first of these was in 1071, when Robert the Frisian defeated the forces of Philip I of France and thereby secured the county of Flanders. The second battle occurred in 1328, after Count Louis I appealed for help to the new king of France, Philip VI. A rebellion of several years' duration had forced Louis out of Flanders, and Philip VI, who lacked a clear title to the throne and needed the count's support, agreed to render aid. The Flemings had shocked the French with their victory at Courtrai in 1302, and when they attacked the royal army near Cassel on August 23, 1328, they achieved some initial

success. The French, however, with critical assistance from the count of Hainaut, overcame early reverses and won a decisive victory, effectively restoring Louis to his county and strengthening Philip's position at home.

# CASSIAN, JOHN

(d. 435). Essentially nothing is known of the early life of this important figure in the development of Christian monasticism in southern France. Born probably in the Roman province of Scythia Minor (present-day Romania), Cassian appears ca. 385 as a member of a monastic community in Bethlehem; in 385, or shortly thereafter, he and a friend named Germanus left for a "tour" of the monastic settlements in Egypt, where they discussed such matters as ascetic discipline and prayer with desert monks. By 399 or 400, Cassian and Germanus had left Egypt, probably because of controversy over the theology of Origen. In Constantinople, Cassian was ordained deacon by John Chrysostom and then, in 405, went on to Rome. By 410–15, Cassian was at Marseille in southern Gaul, where he founded two monasteries, one for women, the other for men.

Cassian's fame rests on two books that he wrote after settling at Marseille: the *Institutes* and the *Conferences*. The *Institutes* was composed at the request of Castor, bishop of Apt, who had decided to found a monastery. In Books 1–4, Cassian deals with the dress, prayer, and rules for monks in community and draws extensively on his Egyptian experience. Books 5–12 are each devoted to one of the eight capital sins (gluttony, lust, covetousness, anger, melancholy, accedia, vanity, and pride), their symptoms, and their remedies; in this, as in many other aspects of his spirituality, he follows the Greek monastic author Evagrius. In the *Conferences,* Cassian claims to be recounting conversations held several decades earlier with Egyptian desert ascetics. The twenty-four conferences are concerned primarily with the techniques of bodily and spiritual discipline that lead to effective prayer, and thus contemplation. Within the monastic life, Cassian distinguishes an "active life," which he understands as the pursuit of virtue and flight from sin, from the "contemplative life," the life of quietness, prayer, and contemplation. Drawing again upon Evagrius, Cassian sees the goal of the active life as *apatheia* (Evagrius's Greek term for a state of passionlessness or detachment) or "purity of heart" (Cassian's usual term for the same state; cf. Matthew 5:8, "Blessed are the pure in heart for they shall see God"). This state of tranquillity, purity, and freedom from distraction is the starting point for concentration, interiorization, and advancement in prayer leading toward the experience of divine presence.

Cassian also wrote an anti-Nestorian christological treatise *(De incarnatione)* and in his thirteenth *Conference* opposed Augustine's ideas about grace by suggesting that the human will has some independent role in salvation (a position later known as Semi-Pelagianism).

Cassian's influence on western monasticism and spirituality was profound and lasting. His monastic regulations and spirituality influenced Benedict of Nursia and many later monastic writers. His transmission of the ideas of Evagrius, especially on *apatheia* or purity of heart, was crucial for western spirituality. The *Rule of St. Benedict* 's requirement that the *Conferences* be read to the monks during meals ensured that generations of monks would be shaped by the ideals of asceticism and prayer that Cassian had gleaned from the desert ascetics.

# CASTEL, JEAN

(ca. 1425–1476). Grandson of Christine de Pizan and son of another Jean Castel, secretary of the French dauphin, the future Charles VII, Castel became a Cluniac monk at Saint-Martin-des-Champs ca. 1439. In 1461, Louis XI transferred there from Saint-Denis the official chronicles of France and appointed Castel an official chronicler. In 1468, he composed for Jean de Bellay, bishop of Poitiers, his *Spécule des pécheurs,* a long moralizing poem. He also exchanged ballades with Georges Chastellain. He was named king's secretary in 1470 and two years later was nominated abbot of Saint-Maur-des-Fossés, where he spent his last years. Castel is the presumed author of a *Mirouer des dames et damoyselles et de tout le sexe femenin,* a meditation on worldly vanity written in a mixture of French and Latin. Although he is mostly forgotten today, Martin Lefranc considered him one of the best poets of the day and Jean Molinet spoke of his importance as a historian.

# CASTELLAN/CHÂTELAIN

**.** Commander of a castle. Originally the deputy of a superior, the castellan became largely independent during the proliferation of castle building after the year 1000. Behind the protection of their walls, they could defy superiors and subjugate the local rural population within their district. By the end of the 11th century, castellans, with the help of warrior bands often garrisoned in the castles, exercised extensive judicial and economic authority *(bannum)* over the surrounding region. They constituted a middle-level aristocracy between the dukes, counts, and viscounts on the one hand and the *milites* (knights) on the other. For the remainder of the Middle Ages, the title of castellan could indicate anything from a local lord to a petty official (similar to a *prévôt*) to a courtly sinecure.

# CASTLE

**.** Fortifications were ubiquitous throughout medieval Europe, but "castle" (Fr. *château* from Lat. *castellum*) generally applies to a specific type of fortification that first appeared in France in the 10th century. The development of castles was linked to the changes in society during the "Feudal Age" following the breakup of Carolingian power. Growing out of the military needs of the great princes and seigneurs, castles were not simply fortresses but centers of political, economic, and social life as well. They profoundly influenced the development of the French countryside during the high Middle Ages.

Originally, the most common fortifications of the early Middle Ages were the massive walls of Roman cities, such as Poitiers and Le Mans, fortified in the 3rd century. Smaller fortifications were constructed throughout the Merovingian and Carolingian periods, many of them to serve as temporary refuges for the rural population. The Carolingians claimed a monopoly on military construction, but the collapse of Carolingian power led to the need for local defense and the proliferation of a new type of fortress.

At its simplest, this new fortress consisted of an earthen mound, or "motte," surrounded by a ditch and a wooden rampart, the "bailey." Often a tower of wood or stone, called the "donjon" (Lat. *dungio*), appeared on the mound. It was designed to provide both a residence and a defense for the lord of the castle. Remains of mottes are especially numerous in France, with one modern *département* alone having seventy-seven. While most of the construction was originally of wood, stone became the most common material in the late 11th and early 12th centuries.

Function rather than appearance distinguished the castle from other fortifications. The castle's military and political role can best be illustrated by the career of Count Foulques Nerra of Anjou (r. 987–1040), sometimes called "the Builder" because of his innovative use of stone castles. In his strategy, castles were built to ensure communications with far-flung possessions threatened by enemies. His interlocking network of fortifications, each constructed a day's ride from the next, created a "defense in depth" for the Angevin heartland. Although it ensured the external security of Anjou, the system generated an internal danger: the growing power of the castellans entrusted with the castles. After 1060, many Angevin castles slipped from the count's control into that of castellans acting as independent seigneurs. Of diverse origins, the seigneurs used their castles to establish their own authority over the neighboring territory. For them, the castle was not exclusively a military installation. The birthplace of the lineage, castles gave their possessors a particular place in the feudal hierarchy. Seigneurs exercised power that had once pertained to kings and royal officials over the people of the surrounding countryside. The growth of rural population and trade often focused on the location of castles and parish churches, thoroughly disrupting the settlement pattern inherited from late antiquity.

Tension between counts seeking to maintain public authority and fortified seigneurs seeking to enhance their own independence was typical of much of France. As in Anjou, the princes of the great territorial principalities had to struggle, not always successfully, to reestablish their control over the seigneurs. Castle architecture became increasingly complex from the 12th to 13th centuries. The donjon was no longer a residence but now had several stories with thicker walls. Eventually, it became merely one of the towers of the enclosing wall. Inner walls were added, as well as massive defenses to protect the gates. Elaborate crenellations, machicolations, and turrets to aid the defenders gave the appearance most often associated with medieval castles. All of these precautions became obsolete with the widespread use of gunpowder in the 14th and 15th centuries, and castles became simply country residences for the nobility. As such, they remained symbols of seigneurial rights until the French Revolution.

# CATALONIA

. Catalonia, a region whose name derives from the proliferation of castles during the 11th century, is situated in the northeast corner of the Iberian peninsula. It comprises four modern provinces in Spain (Barcelona, Tarragona, Gerona, and Lérida), plus Andorra and the adjacent French *département* of the Pyrénées-Orientales. Mountains divide the region into valleys that drain into the Mediterranean Sea either directly or via the lower Ebro River.

From the 5th century, Visigoths inhabited Catalonia's Roman cities (e.g., Barcelona, Tarragona, Gerona), which declined in population with economic stagnation; during Muslim invasions of the 8th century, many Christians sought refuge in high mountain villages, concentrating populations there. In 795, Charlemagne designated north-ern Catalonia as the "Spanish March" of his Frankish kingdom, in anticipation of military victories over local Muslim rulers. Through the intervention of Alcuin, the Adoptionist teachings of Bishop Felix of Urgel were condemned in the late 8th century; subsequently, Roman orthodoxy gained ground in the Catalonian church over Mozarabic influences. The 9th century saw the emergence of an indigenous Hispano-Gothic ruling aristocracy, which intermarried with the southern French nobility and remained loyal to the Frankish kingdom.

As the caliphate of Cordova disintegrated into petty kingdoms, the military advantage shifted to Christian forces. From the early 11th century, the Catalonian nobility profited from trade in arms and export of mercenary services to the Muslim south. The gold they received in exchange contributed to an economic revival both in Catalonia and in western Europe generally.

Catalonia's social order was severely disrupted in the early 11th century by the deterioration of the authority of the count of Barcelona. Local strongmen usurped the authority of the count by constructing castles from which they subjugated a heretofore largely free peasantry. By the end of the 11th century, the rule of law was generally replaced by a new system of military alliances cemented by bonds of fealty and grants of fiefs. Such social and political turmoil inspired the Truce of God movement in Catalonia beginning in 1027.

During the 12th century, the count of Barcelona succeeded in redirecting the energy of Catalonia's military class toward the expansion of his influence and power within the region of Catalonia and beyond its boundaries. In 1137, Ramon Berenguer IV acquired political control of the inland kingdom of Aragon through his marriage to Queen Petronilla. His descendants from 1180 on were known as "count-kings" (of Barcelona-Aragon).

Prior to the Albigensian Crusade, the influence of the House of Barcelona extended north and east of the Pyrénées to the Occitan region of Béarn, Foix, and Toulouse and to Provence. However, the defeat of Count-king Peter I in the Battle of Muret in 1213 effectively ended Catalonia's political influence in Occitania, and under James I the nobility redirected its military attention toward the reconquest of Muslim Spain and the projection of Catalonian influence in the eastern Mediterranean. Nominal suzerainty of the Capetian monarch over the count-kings of Barcelona ended with the Treaty of Corbeil in 1258.

# CATHARS

. Cathari (Greek for "pure ones") was the least offensive of many names for members of a dualist heresy that spread through much of western Europe in the later 12th and 13th centuries. They were also known as Bulgari, *bougres,* buggers (from the Bogomils of Bulgaria), Albigenses (from their stronghold in Albi), and Manichaei (from their alleged dualist ancestors in late antiquity). Despite the survival of some Cathar texts (Gnostic "scrip-tures" from late antiquity, rituals, the *Book of Two Prin*ciples), the movement is known largely from church documents, such as chronicles, theological invective, and inquisitorial transcripts. As a result, almost everything about the movement is a matter for scholarly dispute. Some historians place its origins in the early 11th century, when popular "heresies" that reject the church first begin to appear in the West; these, they argue, are the result of missionaries of the 10th-century Bogomil heresy from Bulgaria. But none of these cases shows explicit evidence of either dualism or eastern influence. That first appears in the documents of the mid-12th century, when the Cathars seem to be spreading at alarming speed. It is in many cases difficult to judge whether a movement's rejection of ecclesiastical media of salvation and emphasis on asceticism come from a desire to replicate the spirituality of the Apostles or from a dualist ideology. Indeed, the Cathars present themselves as apostolic communities.

Like the Gnostics of late antiquity, the Cathars believed that evil was an independent force in the universe, that it was Satan who in fact had created the physical universe (hence, the God of Genesis), which he used as a prison in which to trap souls, which would continue to transmigrate from incarnation to reincarnation until they had escaped the tentacles of the Evil One. Procreation merely perpetuated Satan's work, and Cathar adepts refused not only all sexual contact but the eating of anything that came from coition, such as meat, cheese, and eggs (but not fish, which they believed reproduced spontaneously). These beliefs were expressed in mythical accounts of the Creation, in which Satan was alternately a fallen angel, a younger brother of Christ, or, in the case of radical dualists, a direct rival of God. This literature focused far more on the evil God and his minions, rulers of this world, than on the good God.

Unlike earlier "heretics," the Cathars developed an independent ecclesiastical structure. The first sign of this alternative church appeared in the Rhineland (1143) and rapidly spread throughout western Europe. By 1165, there were public debates at Lombers (near Albi) between Cathar leaders and Catholic bishops. A decade or so later, first in Italy, then in Languedoc, an eastern envoy named Nicetas converted many to a more radical brand of dualism. This doctrinal source of divisiveness was soon amplified

by a Donatist-like controversy over the moral purity of certain Cathari, including the man who had administered the *consolamentum* to Nicetas.

Despite this apparent internal strife, the Cathar movement continued to gain adherents throughout Europe. Persecution in the northern regions, however, tended to push them southward to the more tolerant climes of Occitania, where they became a large minority of the population or even in some places a majority, as in Foix. They gained adherents from among all sectors of the population, urban and rural, peasant, artisan, merchant, and noble; the high numbers of artisans in the early movement led the northern French to name them *texerant* ("weavers"). The movement spread particularly effectively through women, who turned their households into centers of Cathar preaching and learning. The role of women in the movement led the Inquisition to demand oaths of loyalty to the church from boys over twelve years old but from girls over eight.

The Cathar church was structured in several layers. At the top was a relatively clear-cut ecclesiastical hierarchy, presided over by bishops who administered the *consolamentum* to the "perfects." The perfects adhered to a rigidly ascetic code: apostolic poverty, regular fasts, monthly public confession, constant prayer, and avoidance of physical contact with the opposite sex, killing, swearing of oaths, and foods associated with coition. The perfects often traveled about, preaching to, praying for, and confessing the faithful. Laypeople in general were not expected to live up to the standards of the perfects and took the *consolamentum* only shortly before death. While not allowed to address God as "Our Father," hence to pray, they were to attend sermons and confess regularly *(melioramentum)*. A group known as the "believers" took a more active role in the support of the perfects and may even have been able to say the Lord's Prayer.

Beyond these groups was a large number of sympathizers who, out of conservatism or fear, may have remained Catholic but who nevertheless admired the perfects for their spiritual discipline and found the mythical theodicy attractive. It was thus impossible for contemporaries, and so much the more for modern historians, to have a sense of how numerous and influential the Cathars were. It seems clear, however, that the moral and ascetic contrast between the way of life of the Cathar and the Catholic clergy worked decisively to the advantage of the former in drawing the loyalty of the laity.

The new sect's popularity and absolute rejection of the Catholic church posed a grave threat. Early efforts to resist their advances in the area of their greatest strength, Languedoc, failed: Cistercians, licensed as papal legates, rode horses and dressed in rich ecclesiastical vestments, thus failing to win much popular support for their brand of Christianity against the simply dressed, pedestrian Cathars. Although the "apostolic" Waldensians were ready and willing to go into battle against the Cathars, clerics were too suspicious to let them. Even Dominic, whose career began with bringing a Cathar back to the church and who adopted poverty so as to debate more effectively with Cathars (1206), failed to bring about lasting results. The papacy, prompted to take extreme action, launched the Inquisition with the papal bull *Abolendam* in 1184 and called in 1208 upon the king of France to fight the Cathars in Languedoc.

The Catholics eventually won the long and brutal Albigensian Crusade, which resulted in the royal annexation of Languedoc (1229) and the formation of the papal Inquisition to root out "heresy" in the region (1233–34). The battle went on throughout the 13th century: in 1244, some 200 Cathars were captured at Montségur and burned; 178 were burned in Verona in 1278; and the last Cathar bishop was captured in Tuscany in 1321.

But in the late 13th century, several revivals took place in the Pyrénées, and in the early 14th century the village of Montaillou in the Pyrénées had a healthy Cathar presence. Cathars and their mysterious beliefs continued to hold fascination for religious seekers, inspiring such esoterics as the anthroposophist Rudolf Steiner (1861–1925) and the Nazi Otto Rahn.

# CATHERINE OF FRANCE

(1401–1438). Queen of England. The daughter of Charles VI and Isabeau of Bavaria, Catherine was married to Henry V of England in 1420 as part of the settlement that made Henry heir to the French throne. Soon after giving birth to the future Henry VI, the young queen was widowed. She subsequently married Owen Tudor, earl of Richmond, and their grandson became Henry VII of England.

*John Bell Henneman, Jr.*

# CAUCHON, PIERRE

(ca. 1371–1442). Born near Reims, Pierre Cauchon studied at Paris and became university rector in 1403. He supported the Cabochien revolt, helped write the famous *Ordonnance* of 1413, and entered Burgundian service. He was appointed bishop of Beauvais in 1420. Driven from his see in 1429, he had political and personal motivations for his leading role in the condemnation of Jeanne d'Arc. Bishop of Lisieux after 1432, he served the cause of Henry VI of England until his death. Infamous for his treatment of Jeanne d'Arc, Cauchon is better remembered as a political cleric typical of the late-medieval church.

# CAUDEBEC-EN-CAUX

. Longtime capital of the Pays de Caux, Normandy, the little town of Caudebec-en-Caux (Seine-Maritime) has two significant medieval monuments. The Maison des Templiers, with its well-preserved gableend walls, is a rare example of 13th-century civil architecture. The Flamboyant Gothic church of Notre-Dame (1426–84), miraculously spared when the town was burned in 1940, was called by Henry IV the "prettiest chapel

Caudebec-en-Caux (Seine-Maritime), Notre-Dame, nave. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

in my kingdom." The western façade features a rose window above three exquisitely carved Flamboyant porches, which recall those at Saint-Maclou in Rouen. A bell tower, attached to the south side, is capped by an unusual three-tiered octagonal spire that recalls the papal tiara. The triple nave (185 feet by 72 feet), with three-story elevation of arcades, triforium, and clerestory windows, is typically Flamboyant. Notre-Dame preserves a magnificent ensemble of 15th-and 16th-century stained glass, including windows devoted to John the Baptist, Our Lady, and SS.Michael, Catherine, and George. There also survive impressive late-medieval statues in wood and stone.

# CAVALRY

. Military units on horseback are often seen as the supremely characteristic form of medieval warfare. Glorified in chivalric literature, the image is one of medieval armies composed primarily of knights engaged in mounted shock combat and of medieval wars won by these cavalry forces. Until the 12th century, however, mounted shock combat was impossible. Throughout the Middle Ages, fighting on foot and sieges against fortifications dominated warfare, with the horsemen playing only a subsidiary role.

Although the Franks were excellent horsemen, and Merovingian armies had many cavalry units, drawn not only from among the Franks but also from the remnant of Roman forces as well as from other Germanic peoples, most of the wars of this period centered on the taking and holding of fortified sites, both cities and *castra*. The decisive military forces thus were the engineers and footmen who weakened and stormed the defensive works, with horsemen playing virtually no role in this sort of fighting. Moreover, even in battles in the open field, cavalry was usually ineffective against well-trained and disciplined foot soldiers in prepared defenses. The role of the cavalry was usually limited to areas where its mobility was helpful: in reconnaissance, patrol duty, prevention of encirclement, feigned retreats to draw the enemy from its lines, flank attacks, and pursuit. While aristocrats reveled in hunting on horseback and received careful training in horsemanship, they usually dismounted and fought on foot throughout the Merovingian, Carolingian, and post-Carolingian periods.

The development of mounted shock combat was delayed until the 12th century, when technology finally permitted it. The stirrup, introduced in western Europe by ca. 700, was not used in warfare until the 10th century. In the 12th century, cantles to keep the horseman from being pushed off the rear of the saddle were introduced, along with high, wraparound pommels to protect his groin and abdomen and double girths to hold the saddle firmly on the horse. At last, a horseman with lance clutched firmly to his side could make a charge at full speed with a reasonable hope of success and survival.

# CENS

. Fixed sum paid annually by a tenant in recognition of an ultimate right or proprietorship. In practice, the *cens* (Lat. *census*) constituted a small, unchanging rent. In the 9th century, it was collected primarily from nondomainal property, such as vineyards, fields, and newly cleared land. By the 12th and 13th centuries, it had become a type of tenure known as the *censive* and distinguished from feudal tenure, for which service was required, and allodial tenure, which was free from both rent and service. All kinds of urban as well as rural property could be held for *cens*.

Since the *cens* was fixed and heritable, the inflationary environment of the high Middle Ages often made it profitable for tenants to sublease their *censives* at higher rents, while landlords attempted to limit the duration of tenure (e.g., to one or two lifetimes) and to tax transfers beyond the original tenant family. Transfer taxes in effect compensated for the fixed low rate of the *cens*. Landlords with large numbers of cens-paying tenants often compiled rent books, called *censiers*.

# CENT BALLADES, LES

. Composed at the end of the 14th century by Jean de Saint-Pierre, the seneschal of Eu, in collaboration with Philippe d'Artois, count of Eu, Boucicaut le Jeune, and Jean de Crésecque, the *Cent ballades* is a variation on the poetic love debate. In the first fifty ballades, an old knight gives advice to a young man on how to make war and how to love by avoiding Fausseté and seeking out Loyauté. Later, the young man encounters a

woman, La Guignarde, who insists that Fausseté brings more joy to love the Loyauté. Puzzled by the conflicting advice, he decides to consult the opinions of the count of Eu, Boucicaut, and Crésecque, all of whom opt for Loyauté. In the final ballade, the four authors ask all lovers to respond to the dilemma. Thirteen answers complete the work, with most pronouncing in favor of Loyauté. In the six manu scripts that preserve the work, the ballades are organized into groups of four with seven different forms, making four series of twenty-eight, twenty-eight, twenty-eight, and sixteen poems, respectively, with the same succession of forms in each.

*Deborah H.Nelson*

Raynaud, Gaston, ed. *Les cent ballades.* Paris: Didot, 1905.

# *CENT NOUVELLES NOUVELLES, LES*

. In the early 1460s, amusing after-dinner stories were told at the court and in the presence of Philip the Good, duke of Burgundy (1396–1467). Sometime later, before the duke's death, an anonymous author-compiler wrote down these hundred prose tales, attributing the telling of them to thirty-five *conteurs*. Thirteen of the stories are ascribed to the duke himself, fifteen to monseigneur de la Roche (Philippe Pot), ten to Philippe de Laon, and others to various of the duke's aristocratic friends and courtiers. Two tales are anonymous, and the author himself "tells" five. The latter is doubtless responsible for giving a sense of unity to those basically diverse stories. They come to us in one manuscript (Glasgow, Hunter 252) and an incunabulum (Paris: Antoine Vérard, 1486).

The only *conteur* with a well-established literary reputation mentioned is Antoine de La Sale (ca. 1385–1461), who "tells" the fiftieth story. Because of that, it was long thought that he was the author-compiler of the collection. This attribution is no longer accepted, nor is that of authorship to Philippe Pot.

The origins of those tales are varied and impossible to pin down. The idea of a collection of a hundred *nouvelles* was doubtless much influenced by the *Decameron,* well known in the French-speaking lands through the translation by Laurent de Premierfait (1414), but the *Cent nouvelles* owe little directly to Boccaccio. A more likely literary source is the *Liber facetiarum* by Poggio (Gian Francesco Poggio Bracciolini; 1380–1459). Their real origin, however, must be sought in the local, popular, oral tradition. For the most part, they are tales of the fabliaux kind (e.g., the nineteenth story is, in fact, the well-known fabliau of "The Snow Child"). Racy, farcical, joyful, and occasionally crude, they deal with the eternal comedy of adultery and sex, with its cuckolded husbands, easygoing girls, lusty clerics, crafty and lecherous wives, all placed in a panorama of the social classes: monks, nuns, knights, merchants, bourgeois, and peasants.

Besides their powers to amuse, the real value of the *Cent nouvelles* lies in the documentary character of many of these stories. Under their amusing and irreverent form, we can find a great deal of *realia* of the everyday life in Brabant (where the stories were apparently told), Flanders, Hainaut, Holland, and the north of France. The authenticity of the settings is enhanced by the authenticity of the language. The anonymous author-compiler was a man of obvious talent with an excellent ear for the spoken word. There is

no doubt that this collection is one of the most important monuments of Middle French prose.

# CERCAMON

(fl. 1137–49). Little may be said for certain about the life of this early troubadour. His pseudonym ("Search the World") tells us nothing about his origins, and the author of his brief *vida* says simply that Cercamon was a Gascon jongleur. References in his songs to the death of Guilhem X, count of Poitiers, and to the Second Crusade allow us to date his production to the second quarter of the 12th century. His *vida* also tells us that Cercamon wrote songs and *pastorelas*. None of the latter have survived, but among his seven authentic lyrics we find the first *planh,* the first *tenso,* and the first two *sirventes,* as well as three love poems. However, much of the assessment of his originality is based on the perhaps unreliable statement in the *vida* of Marcabru that Cercamon was his master. Many recent scholars think, rather, that it was Cercamon who was the disciple, in which case some of the innovations attributed to Cercamon should be credited instead to Marcabru. In any event, Cercamon's poetry resembles closely that of his fellow moralist and Gascon contemporary in that both denounce the miserly nobles and their deceitful debauchery, which undermines true love.

# CERVERÍ DE GIRONA

(fl. ca. 1259–82). Listed alternatively by medieval scribes as Guillem de Cervera, the Catalan troubadour Cerverí de Girona was a prolific craftsman given to experimentation with genre and rhyme. His work comprises 114 lyric pieces, five narrative poems, and a long moralizing satire called the *Proverbis*.

*Elizabeth W.Poe*

[**See also:** TROUBADOUR POETRY]

Cerverí de Girona. *Obras completas,* ed. Martin de Riquer. Barcelona: Instituto Español de Estudios Mediterráneos, 1947.

# CERVOLE, ARNAUD DE

(ca. 1320–66). Soldier of fortune. Arnaud de Cervole, the younger son of a minor lord from Périgord, acquired the title of archpriest of Velines (Dordogne) and is generally known as "the Archpriest." A prominent military commander in the mid-14th century, he gained notoriety as a captain of *routiers* (freelance soldiers) in the decade after 1356. Apparently a protégé of King John II's cousin Charles of Spain (constable of France, 1351–54), Cervole served as royal lieutenant between the Loire and Dardogne rivers during most of 1351. He began to act independently after the constable's murder but soon received a royal pardon and the lordship of Châteauneufsur-Charente. He fought for the king in 1355 and 1356.

The defeat and capture of John II at Poitiers in September 1356 brought an end to regular payment of troops, as England and France sought to negotiate a treaty. Unemployed soldiers, as companies of routiers, began to support themselves by pillage and extortion, and Cervole quickly became one of their most prominent captains. In 1357, his troops descended the Rhône and caused havoc in Provence for more than a year. Between 1358 and 1361, the Archpriest campaigned in Berry and Nivernais before turning his attention to Burgundy. Although he quickly turned to brigandage when not employed, Cervole was always ready to accept royal employment, and he fought for the crown at the unsuccessful Battle of Brignais (1362) and the successful one at Cocherel in Normandy (1364). As part of a royal project to send the *routiers* eastward on crusade in 1365, Cervole led a force into the empire, where his troops ravaged Alsace and threatened nearby districts. He was threatening Savoy in the spring of 1366 when he was killed by one of his own men on May 25.

# CHAALIS

. Notre-Dame-de-Chaalis (Oise), a Cistercian abbey in the Gothic style near Senlis, was founded on January 9, 1137, by Louis VI in memory of Charles the Good of Flanders, who had been killed in 1127. The site had previously been occupied by a Benedictine priory founded by Renaud de Mello on his return from the First Crusade and was dependent upon Vézelay. The Cistercian refoundation was a dependency of Pontigny (Yonne). The first abbot, André de Baudemont, had been seneschal for Thibaut IV, count of Blois.

The abbey, suppressed in 1791, is now in ruins. Of the first church erected in the 12th century, there are no remains. The second church, begun by Abbot Adam ca. 1202, survives in fragmentary form: the apse and south transept have been destroyed down to their foundations, but parts of the north transept and fragments of the claustral buildings adjacent to it survive. The church was consecrated on October 20, 1219. Abbot Adam was buried in front of the main altar, and numerous tombs of other abbots, as well as those of thirteen bishops of Senlis and aristocratic patrons, once filled the church. An abbot's chapel located to the east of the church and built ca. 1245–50 is intact, though it was heavily restored in the 19th century. The conventual buildings erected beginning in 1736 now house collections belonging to the Jacquemart-André Museum, and the abbey as a whole is the property of the Institut de France.

The abbey church is notable for its size (almost 270 feet long, with a nave 46 feet wide) and the unusual character of the transept, which had polygonal terminations with seven chapels in each arm. Although often associated with the rounded transepts of Valenciennes, Tournai, Cambrai, and Saint-Lucien at Beauvais, there are important differences between the design of the monastery church and these other monuments in northern France; the transept design seems to have been inspired instead by the chevet of its mother house, Pontigny, begun ca. 1186–1210. Prior to the Revolution, a similar

arrangement could be found at the destroyed abbey of Quincy (Yonne), also a daughter of Pontigny.

# CHACE

. A musical composition employing strict canonic imitation at the unison, usually in three voices: the medieval analogue to *Frère Jacques*. Probably derived from 13th-century techniques of voice exchange found in some organa and motets, the earliest complete French *chaces* appear in the first quarter of the 14th century. The name probably refers to the manner in which voices "chase" each other, often employing hocket effects. *Se je chant mains que ne sueil* is a text on hunting, subject matter suggested by the term itself. Around the middle of the 14th century, Machaut wrote a ballade in the form of a *chace,* and employed *chaces* in two of his *lais,* one of which uses three-voice unison canons to symbolize the Trinity ("Car cil .iij. font toute une essance").

# CHAISE-DIEU

. The Benedictine abbey of Chaise-Dieu (Haute-Loire) was founded in 1044 by St. Robert of Turlande, a canon of Brioude, who retired to these forested heights to lead a life of prayer and penance. Chaise-Dieu reached its apogee in the 12th and 13th centuries, when it had over 200 monks and was at the head of a community of ten abbeys and some 300 priories. The new abbey church of Saint-Robert, begun in the early 14th century under Abbot Pierre-Roger de Beaufort (later Pope Clement VI), is in the severe Gothic style of southern France. The western façade consists of two fortified towers joined by an arcade. The nave is unusually vast (241 feet by 79 feet by 59 feet) and flanked by side aisles of the same height. There is no transept or ambulatory, and the chevet ends with chapels opening directly onto the choir. The choir screen is 15th-century, as are the 144

carved oak choirstalls given by Abbot André de Chanac (r. 1378–1420). The 15th-century wall painting of the Dance of Death (6 feet by 86 feet) is an important representation of this popular Late Gothic theme. Its three panels show Death inviting the powerful, the bourgeois, and the peasantry to dance. Only two wings remain of the 14th-century Gothic cloister that abutted the south aisle of the church.

In the Middle Ages, Chaise-Dieu was a thriving artistic center that sent architects and sculptors far afield. The monastery was sacked by Huguenots in 1562 during the Wars of Religion, beginning a long period of decline, culminating in the desecrations of the Revolution.

# CHÂLONS-SUR-MARNE

. Although there are text references to earlier Carolingian and Romanesque buildings, the oldest parts of the present cathedral of Saint-Étienne at Châlons-sur-Marne (Marne) are part of the crypt and the north tower flanking the chevet, which should be dated ca. 1150. The tower contains some of the earliest stained glass in Champagne. Repairs to the old building began in 1205 and were financed by income from the relic of St. Stephen acquired in 1204. Serious construction, begun probably after a fire in 1230, proceeded slowly; the north transept and porch were in progress 1260–65. Construction of the choir began in 1285 but was finished only in the later 17th century, following partial construction of the nave in the 15th and erection of the classical façade early in the 17th. The confused building history has been admirably analyzed by Ravaux.

In contrast to the cathedral, the important parish church of Notre-Dame-en-Vaux is a remarkably homogeneous construction of the later 12th century. The lower parts of the transept and the two chevet towers are close in style to the cathedral tower and probably survived the collapse of the old church in 1157. Through the 1160s and 1170s, donations to the fabric financed construction of the lower nave and aisles, although the upper parts and the four-story chevet must have been constructed only after lengthy disputes of income and finances were settled in 1187. The chevet of Notre-Dame and the two upper stories of the nave are closely modeled on the new chevet of Saint-Remi in Reims. In spite of destruction to the exterior and heavy-handed restorations to the interior, Notre-Dame preserves a series of elegant, crisply carved foliate capitals that predict the marvelously inventive architectural decoration of the cloister. Fragments of the 12th-century cloister were excavated, and the site was turned into a museum to display them. The number and diversity of subjects in the statue columns and historiated capitals make this one of the most important sculptural discoveries of the century. Five major styles have been discerned, yet the placement marks indicate that the whole project was constructed simultaneously.

Two other parish churches in Châlons merit mention: Saint-Jean and Saint-Alpin, both of which existed by 1028. Saint-Jean has later 1 1th-century aisles, which were vaulted in

1671, an early 13th-century chevet, and a 14th-century façade. It was scrupulously restored in the 19th century, while Saint-Alpin was nearly destroyed. The mid-12th-century work here, however, was inspired by Notre-Dame. The main nave and façade were built 1160–75, and vaults were added ca. 1230 to a scheme never planned for them. The apse was replaced ca. 1500, and there was disfiguring work in the 18th and 19th centuries.

# CHAMBERLAIN

. Officer of the royal bedchamber. The 11th and 12th centuries distinguished the bedchamber *(cubiculum)* from the chamber *(camera, chambre)*. The *chambrier (camerarius),* head of the chamber, seems to have supervised the furnishing and upkeep of the palace and royal wardrobe, arranged the king's *gîtes* (travel lodgings) and guarded the treasury and archives, then housed in the *camera*.

When the institutions of the monarchy reorganized and developed, the *chambrier* lost his guardianship of the treasury and archives. Displaced when the *camera* absorbed the *cubiculum,* he also lost his domestic functions and became a bureaucrat, the *chambrier de France*. Still a great officer of the crown, he had charge of selling licenses to those who made or sold clothing in and around Paris. Such merchandise was inspected by his agents, and his justice was rendered in the Grand Palais.

The *chambellan de France (grand chambellan)* was originally head of the bedchamber. He enjoyed income from various *métiers* and after the 14th century continued to perform certain domestic duties when the king was in Paris. The king also had a *chambellan de Normandie*. The duke of Berry had a *chambellan de Poitou* and a *chambellan de Berry et Auvergne*.

The Valois kings' bedchamber *(chambre)* was supervised on a daily basis by a *premier chambellan* and a rotating group of ordinary chamberlains. The *premier chambellan* carried the royal privy seal and kept for himself some of the money charged

for its use. The chamberlains played a role when the king received homage, for this customarily took place in the bedchamber. Royal chamberlains, always knights, were so regularly in the king's company that he often made them councilors.

The duke of Burgundy's chamberlains attended his *coucher.* His *premier chambellan* kept his privy seal and the key to his bedchamber.

# CHAMBIGES, MARTIN

(d. 1532). Known during his lifetime as *supremus artifex,* Martin Chambiges must be viewed as one of the most gifted architectural designers in Late Gothic France. A Parisian, Chambiges is first mentioned between 1489 and 1494 as the master mason charged with completing the south transept of Sens cathedral. This commission was symptomatic of Chambiges's major works, which comprised additions to 12th- and 13th-century edifices. His personal style, evolved from an original fusion of High and Rayonnant Gothic elements with forms derived from the contemporary Parisian milieu, is distinguished by its disciplined visual richness and exuberant plasticity.

In 1499–1500, Chambiges was called in as a consultant on the foundations of the collapsed Pont-Notre-Dame in Paris. His evident structural expertise and proven ability to work harmoniously yet creatively with older structures doubtless led to his appointment in 1500 as master mason of Beauvais cathedral, where he supervised construction of the north and south transepts and the eastern bay of the nave. Soon after his arrival in Beauvais, he appears to have begun the new choir of the parish church of Saint-Étienne, while his design for the north transept of Sens (after 1500) was executed under the direction of an assistant, Cuvelier. Chambiges's activity was extended to Troyes cathedral, for which he authored plans for a new west façade in 1502–03. The triple-portal and twin-towered scheme of Troyes looks back to such High Gothic models as Paris or Reims, but the projection and recession of buttresses and portals as well as the deeply excavated statue niches, framed by sharpened moldings and nodding ogee canopies, vigorously animate the façade.

Chambiges has been credited with additional works, including the west rose of the Sainte-Chapelle, the portal of the Dominican church, and the parish church of Saint-Gervais-et-Protais in Paris, although documentary evidence is absent and stylistic demonstrations are inconclusive. The influence of his architecture was felt strongly in Troyes, where masons from the cathedral workshop adopted the flat east end, steep two-

story elevation, and undulant piers of Saint-Étienne, Beauvais, for the churches of Saint-Pantaléon, Saint-Jean-au-Marché, and Saint-Nicolas. Martin Chambiges died on August 29, 1532, and was buried west of the crossing in Beauvais cathedral.

# CHAMBRE DES COMPTES

**.** The French monarchy long lacked a central auditing agency like the English exchequer to monitor collection of its "ordinary" or domanial revenues. The Chambre des Comptes finally filled this need. From the mid-12th century, the crown entrusted its finances to the Knights Templar, who maintained a banking establishment in Paris. This tradition caused the royal treasury to be organized like a bank in which the king had the largest account. The receipt of revenues and the payment of salaries often involved simply the transfer of funds from one account to another. Except in the case of Normandy, where the French government inherited an exchequer established by the Anglo-Norman kings, royal officers in the field, who sent revenues to the Temple, had their accounts audited by the royal council, which had special clerks assigned to work at the Temple. By the late 13th century, these financial specialists were being called the *curia in compotis*. From ca. 1297, they audited accounts twice a year, after St. John's (June 24) and Christmas.

In 1295, Philip IV removed his treasure from the Temple and placed it in the fortress of the Louvre. He returned it to the Temple in 1303 but ordered its final removal in 1307. Between 1295 and 1307, the royal financial administration was dominated by the Guidi brothers of the Florentine firm of Francezi. Their deaths coincided roughly with the final removal of funds from the Temple, and Enguerran de Marigny became effective head of royal finances. The financial specialists received accounts for audit in a room of the royal palace that became known as the Chambre des Comptes, and they began to be identified collectively by the same name, although still only a sub-commission of the royal council, consisting of about sixteen people.

Several years after the fall of Marigny, Philip V issued the important ordinance of Vivier-en-Brie (1320), which first gave official structure to the Chambre des Comptes, requiring it to audit accounts, judge cases arising from accountability, and maintain registers of documents bearing on finance. For the next twenty-five years, under Henri de Sully and then Mile de Noyers, the Chambre des Comptes became an important organ of the government, and for a time in the 1340s the leaders, or "sovereigns," of the Chamber

were virtually synonymous with the royal council. Thereafter, however, the Chamber suffered political eclipse.

Consisting of eleven clerks and eight masters of accounts in 1320, the Chamber grew by about 50 percent in the next two decades but was reduced to twelve clerks and seven masters in 1346. In 1381, the Chamber acquired a president (then an ecclesiastic), and a second (lay) president was added in 1400. The personnel was stabilized in 1408, when the Chamber consisted of two presidents, eight masters, twelve clerks/auditors, two "correctors," plus notaries and ushers. Following the Burgundian (and later English) occupation of Paris in 1418–20, the Chamber in Paris represented the Anglo-Burgundian government, and Charles VII established a rival body at Bourges. After he regained Paris in 1436, a single Chambre des Comptes resumed normal operations in Paris.

At the very time that it was becoming a stable institution in the later 14th century, the Chambre des Comptes was losing its central position in royal finance. First, the currency was put under a separate organ, then the increasingly regular "extraordinary" taxes, such as the *aide, taille,* and *gabelle,* came under the authority of the *généraux* of the emerging Cour des Aides. The crown's domanial revenues, over which the Chamber retained control, fell in both relative importance and absolute value. By 1400, the role of the Chambre des Comptes was much reduced from what it had been sixty years earlier.

# CHAMPAGNE

. The county of Champagne was a classic feudal principality of the high Middle Ages and among the most powerful of the realm. The counts, commanding almost 2,000 direct feudal tenants, from great barons to simple knights, created a sophisticated and well-run government. Their farsighted economic policies led to the vigorous development of both the countryside and their castle towns and to the establishment of fairs that made Champagne the center of international trade and finance. The counts were also noted supporters of reformed monasteries, primarily the Cistercians, and patrons of writers, of whom Chrétien de Troyes was the most illustrious. The proximity of Champagne to the royal domain and intimate ties between the comital family and the Capetians led to close, though not always amicable, relations between the two lands and resulted in the county's ultimate attachment to the royal domain.

As an open region east of Paris bounded by the rivers Aisne, Marne, and Yonne, Champagne lacked a natural center. In the late Roman Empire, northern Champagne was part of a frontier province facing Germanic tribes on the Rhine, while southern Champagne belonged to an interior province centered at Lyon. The church observed that division in creating two archiepiscopal sees, at Reims and Sens. Under the Franks, southern Champagne entered the Burgundian orbit; the northern area, with its chief city of Reims, fell under the sway of royal Francia. Remi baptized Clovis (ca. 496) at Reims, and later Archbishop Hincmar (845–882) made his city the preferred site of royal coronations and its most prestigious monastery, Saint-Remi, the royal necropolis. The cathedral school of Reims enjoyed wide repute from the 9th century, producing such influential personages as Gerbert (later Pope Sylvester II) and Fulbert (later bishop of Chartres).

The collapse of Carolingian government brought political fragmentation to Champagne: numerous counties and lesser lordships, monasteries with immunities, and episcopal cities all resisted integration into larger territorial units. The prelates of Reims and Châlons-sur-Marne, the major urban centers of Champagne, assumed control of their cities and surrounding counties, in effect displacing secular authority from most of northern Champagne. In the 10th century, the house of Vermandois acquired the counties of Meaux and Troyes by marriage, but on the death of Étienne, count of Meaux-Troyes (r. 995–1019/ 21), those counties passed to his closest heir, Eudes II, count of Blois (r. 996–1037). Eudes's son, Thibaut III of Blois (I of Champagne; r. 1037–89), acquired the adjacent counties of Bar-sur-Aube and Vitry through marriage to Alix de Valois and thus held the four old counties of southern Champagne that would later become the core of the new county of Champagne.

At Thibaut's death, however, the counties of Champagne were temporarily divided between his sons: Meaux remained with the eldest, Étienne-Henri, count of Blois (r. 1089–1102), while Troyes, Bar-sur-Aube, and Vitry passed to the youngest, Hugues (r. 1093–1125). Since Count Hugues's most important urban center and principal residence was the city of Troyes, it became the *de facto* capital of southern Champagne. Count Hugues's young nephew, Thibaut IV of Blois (II of Champagne; r. 1102–52), spent much time in Champagne in his capacity as count of Meaux, and thus it was natural that when Hugues disowned his own son on suspicion of illegitimacy, he transferred his three counties to Thibaut (1125).

Thibaut le Grand continued his uncle's support of the Cistercians, who were rapidly expanding in eastern France under Bernard of Clairvaux's leadership. The count offered secure routes to merchants traveling through the county and supervised trade fairs for the exchange of merchandise. Those Champagne fairs, later organized into a cycle of six terms that rotated between Troyes, Bar-sur-Aube, Provins, and Lagny, became in the course of the 12th century the center of international trade between northern Europe and the Mediterranean. The fairs also served as a financial clearinghouse for princes, aristocrats, and merchants through the 14th century, long after the Atlantic shipping route had displaced the overland trade routes converging in Champagne.

Thibaut's rapprochement with King Louis VI had longterm consequences for Champagne. The count served as guardian to young Louis VII, whom he escorted to Bordeaux for marriage with Eleanor of Aquitaine (1137); and despite a falling out that resulted in the destruction of Vitry by a royal army (1142/43), Thibaut restored good

relations with the king, even entrusting his young son Henri to Louis's entourage on the Second Crusade. That crusade experience forged a bond that later permitted Henri and his brother Thibaut to marry Louis's two daughters by Eleanor, while the king in turn married their sister Adèle (of Champagne). Their brother Guillaume, in part because of the royal connection, enjoyed rapid promotion in the church as bishop of Chartres (1165–68), then as archbishop of Sens (1168–75) and Reims (1176–1202).

Largely because of Thibaut's attention, Champagne had become by his death the most promising of his lands.

Not surprisingly, his eldest son, Henri, born and raised in Champagne and associated early in its governance, chose it as his inheritance, leaving Blois-Chartres and Sancerre to his younger brothers, Thibaut and Étienne. The Champagne lands of Henri I le Libéral (r. 1152–1181) consisted entirely of fiefs held from ten lords, of whom the most important were the king (for Meaux), the duke of Burgundy (for Troyes), the archbishop of Reims (for Vitry), and the bishop of Langres (for Bar-sur-Aube). Over his disparate lands, the count created a new territorial unit, the county of Champagne, by imposing a single administrative system of castellanies (districts of his own feudal tenants) and *prévôtés* (districts of his domainal lands). The organization of the new principality is best seen through the only surviving administrative record from his rule, the census of his feudal tenants known as the *Feoda Campanie* (1170s), which furnishes the names and military obligations of his barons and knights in each of the twenty-six Champagne castellanies. No doubt, his officials kept equally exact but routine, and therefore expendable, financial accounts of his domain and fair revenues.

Count Henri actively attracted immigrants to clear lands, to create new villages, and to settle in his castle towns. Only two of his towns, however, could approach the size of the neighboring episcopal cities like Reims, Châlons-sur-Marne, and Sens: his capital of Troyes and Provins (which was becoming a second capital), with populations of ca. 15,000 and 10,000, respectively. The growing fairs of Champagne complemented the

essentially rural economy of the county and contributed substantial revenues to the comital treasury. The count's coins, minted at both Troyes and Provins, circulated widely in northern France, and the *provinois* even acquired international currency through the fairs.

Henri le Libéral was well known for his generosity to the church, as his 400-odd extant charters testify, and founded a number of collegial chapters, of which Étienne of Troyes and Quiriace of Provins served his administrative needs. Henri and Marie also were noted patrons of writers whose interests ranged from spirituality to poetry and romance. Besides Chrétien of Troyes, the best known included Pierre de Celle, Gautier d'Arras, and Gace Brûlé, none of whom, however, were in residence at the count's court.

Henri II (r. 1181–97) ruled only briefly in Champagne (1187–90). His mother was regent while he was a minor (r. 1181–87) and after he left on the Third Crusade in the company of his uncles, counts Thibaut V of Blois and Étienne de Sancerre, and a large army of Champenois. Henri cooperated closely with his uncle Richard the Lionhearted and, after marrying Isabelle, queen of Jerusalem, assumed leadership of the westerners defending what little remained of the crusader states after Saladin's conquests.

Henri II's younger brother, Thibaut III (r. 1197–1201), is remembered chiefly as one of the organizers of the Fourth Crusade, with his cousin Louis, count of Blois, and his brother-in-law Baudouin, count of Flanders. Thibaut's marshal, Geoffroi de Villehardouin, supervised the logistical arrangements, including the treaty with Venice for the construction of ships, and later recorded his memoirs of that crusade as the *Conquête de Constantinople*. Count Thibaut, however, died shortly before the expedition departed. To his young widow, Blanche of Navarre, fell the daunting task of defending Thibaut's posthumous son's inheritance against Henri II's daughter by Isabelle. Although Henri II had designated Thibaut as successor in Champagne, should Henri not return, no one had foreseen Henri II's marriage overseas nor Thibaut's own untimely death without a male heir.

Countess Blanche's regency for Thibaut IV (1201–22) was a trying period for Champagne. After almost eighteen years under Marie of France (also known as Marie de Champagne), the barons did not relish another long regency, especially by a foreign-born woman. There was regional resentment, too, as Thibaut III had begun to expand comital authority in southeastern Champagne at the expense of formerly independent baronial families. Ultimately, Blanche's determination prevailed. A series of treaties with Philip II, for which she paid dearly, placed Thibaut IV under royal protection. When Érard de Ramerupt, scion of the prominent Brienne family, claimed Champagne through his wife, Henri II's daughter Philippa, the king convened a royal court at Melun (1216) where the peers of the realm (first mentioned here) declared for Thibaut IV. Brienne and his disgruntled supporters attempted a military solution, but a brief civil war (1216–18) left Blanche victorious on the field of battle as well. In May 1222, Blanche handed her son a county not only intact but with a baronage finally subdued.

Thibaut IV le Chansonnier (r. 1222–53) is often depicted as a songwriter of distinction but as an otherwise incompetent leader who committed serious gaffes, such as abandoning Louis VIII at the siege of Avignon (1226) and dallying with the regent queen, Blanche of Castile. In fact, Thibaut IV made significant contributions to the governance and prosperity of the county. He steadily expanded the county eastward, often in competition with the count of Bar-le-Duc, by awarding new fiefs and by

purchasing the *mouvance* of others. He consolidated both central and local administration. A "governor" exercised executive authority in the count's absence, and financial "receivers" supervised the comital finances. *Baillis* oversaw the castellanies and *prévôtés* and convened courts of the first instance. The supreme court of Champagne, the Jours of Troyes, met regularly from this time, although its decisions are known only from a later compilation known as the *Coutumier* of Champagne (ca. 1290).

The 1230s brought important changes to the county. In 1230–31, Thibaut franchised his castellany towns after they had vigorously resisted an invasion by French barons led by Pierre Mauclerc, duke of Brittany, to avenge Thibaut's abandonment of their conspiracy against Blanche of Castile. The count commuted *tailles* and personal restrictions to a wealth-based tax, and he granted a large measure of self-governance exercised by elected mayors and councils. Since the franchises included the towns and their surrounding districts, they applied to most of the count's nonfeudal tenants. A number of barons subsequently franchised their own tenants. Those who were not franchised in the course of the 13th century, primarily tenants on church lands,

THIBAUT IV le Grand of BLOIS (1102–1152) II of CHAMPAGNE (r. 1125–52) — STEPHEN OF BLOIS king of England (r. 1135–54)

THIBAUT V, count of BLOIS (r. 1152–91) m. Alix, daughter of LOUIS VII — Étienne count of Sancerre — Henri I le Liberal, count of CHAMPAGNE (r. 1152–81) m. MARIE, daughter of LOUIS VII — Guillaume, bishop of Chartres; Archbishop of Sens, Reims — ADÈLE OF CHAMPAGNE m. LOUIS VII of FRANCE

Louis, count of BLOIS (r. 1191–1205) — Marguerite, countess of BLOIS (r. 1218–25) — Henri II, count of CHAMPAGNE (r. 1181–97) m. Isabelle, queen of Jerusalem — THIBAUT III, count of CHAMPAGNE (r. 1197–1201) m. Blanche of Navarre — PHILIP II / LOUIS VIII / LOUIS IX / PHILIP III

THIBAUT VI, count of BLOIS (r. 1205–18) — Marie m. Hugues de CHÂTILLON — THIBAUT IV, count of CHAMPAGNE (r. 1201–53) king of Navarre (r. 1234–53)

Counts of Blois from the CHÂTILLON family

Philippa — Alix — THIBAUT V of CHAMPAGNE & II of Navarre (r. 1253–70) — Henri III of CHAMPAGNE & I of Navarre (r. 1270–74)

JEANNE OF NAVARRE (1273–1305) m. PHILIP IV of France

KEY: d. : Died / m. : Married / r. : Ruled / CAPS : Encyclopedia Entry

and who therefore retained the old personal liabilities and restrictions, later were stigmatized as "serfs."

In 1234, Alix, queen of Cyprus, the second daughter of Henri II, arrived in Champagne claiming the county as her inheritance. Thibaut bought her off for £40,000 and a pension, but unable to find the ready cash, he sold the *mouvance* of Blois (and Sancerre) to Louis IX, thus severing the historic tie between Blois and Champagne. In the

same year, however, Thibaut acquired his mother's inheritance, the kingdom of Navarre, where he and his successors spent many years.

The county achieved its ultimate shape under Thibaut IV. His sons, Thibaut V (r. 1253–70) and Henry III (r. 1270–74), brought Champagne under increasing royal influence. Thibaut V, having married Louis IX's daughter, maintained a residence in Paris, while Henri affianced his daughter Jeanne (b. 1273), heiress of Champagne, to a son of Philip III. With Jeanne's marriage to the future Philip IV (1284), Champagne lost its independence. Philip III already had issued directives to the *baillis* of Champagne, and soon the *Jours* of Troyes were staffed by royal officials and the county administered as a royal province. Title to both Champagne and Navarre passed through Jeanne to her son Louis X, then to his daughter Jeanne, who was dispossessed of Champagne by Philip V (1316). Charles IV assigned most of the county in dower to his wife (1325) and had the comital archives transferred to Paris.

As a royal province, Champagne suffered misfortune. Heavy taxation spawned an antiroyal league of nobles (1314). The decline of the fairs as trading centers weakened the county's economic vitality. Plague and the Jacquerie, which flared along the Marne and particularly in Meaux, destabilized the social order. And by the 1370s, the Hundred Years' War brought its ravages to Champagne. A demographic decline of 50 percent and more, especially in the towns, forced the abandonment of many villages. Only in the late 15th century did some semblance of order return to this once prosperous province.

# CHAMPEAUX

. The legendary founding of the church at Champeaux (Seine-et-Marne) was as a Benedictine monastery in the 7th century, although nothing remains to confirm the story. By 1065, the monks had been replaced by canons, and by 1124 at the latest Saint-Martin at Champeaux belonged to the bishop of Paris. This association explains why the church has close architectural ties to Notre-Dame at each of its three phases of construction. Parisian associations are least visible in the transept, which dates to ca. 1160, although the capitals do relate to examples from Paris. The three-story nave at Champeaux, based directly on the nave of Notre-Dame, was probably begun ca. 1180. The alternating single and double columns reflect the six-part vaults; the original second story had a tracery oculus—the round outer frame is still visible—that must have resembled the design of the third story of the cathedral elevation. Exterior flying buttresses appear in every other bay of the nave at Champeaux, making them among the earliest to be based on the Paris nave design. The deep chevet of Champeaux was built in the early 13th century and again reveals close ties to Paris, although less obviously to Notre-Dame. Saint-Martin at Champeaux is an important example of the impact of Parisian cathedral design on properties outside the city.

# CHANCELLOR

. The most important of the king's household officers, the chancellor was responsible for the preparation, publication, and preservation of royal documents. The title, *cancellarius,* derived from scribes who sat behind a screen *(cancelli)* in Roman lawcourts, but the office in its medieval form originated with Charlemagne. Then, most literate men were clerics, and the king's chapel provided the personnel. Ecclesiastics administered the office until the 14th century. Second only to the constable in prestige, the chancellor

enjoyed far greater constitutional importance and influenced justice, finance, and diplomacy through his administration of crown communications and precedence within council. With the growth of government after 1100, the Capetians often found the office too dangerous to fill and suspended it in 1227. Its administrative functions were diverted to the *garde des sceaux* ("keeper of the seals"). Louis X restored the office in 1314 and began appointing laymen. Louis XI, 150 years later, provided lifetime tenure for the office.

The chancellery developed into a formidable institution in which a growing bureaucracy of secretaries (fifteen clerical before 1300, over 150 lay and clerical by 1360) operated with ever more rigid procedures. They drafted documents in accordance with formularies dating from Merovingian times. After editing and verifying texts, they transcribed them with distinctive scripts in prescribed forms, such as diplomas, letters patent, or *mandements,* and sealed them with appropriate ribbons and waxes (e.g., green wax for the permanently effective *ordonnances*) to ensure their authenticity, signify their importance, and preclude forgery. Finally, texts were proclaimed in formal assemblies and dispatched. Many, but not all, texts were thereafter preserved in the Trésor des Chartes or synopsized in its annual registers.

In 1482, Louis XI codified chancellery staffing and practices in the *ordonnance* of Plessis-les-Tours. The institution continued to grow, but the office of chancellor itself was reduced to a judicial function as chief magistrate. Kings appointed jurists to the office but suspended their nonjudicial functions in favor of the *garde des sceaux.* After 1550, the "great" chancellery lost its effective monopoly on governmental correspondence. Its productions were complemented by those of the "little" chancelleries of the parlements and the Chambre des Comptes and its administrative functions supplanted by those of the king's household secretaries who emerged as independent ministers of state.

# CHANDOS HERALD

(fl. late 14th c.). Herald for Sir John Chandos, constable of Aquitaine, the so-called Chandos Herald was frequently used as a messenger between disputing parties in the Hundred Years' War. Working, like Froissart, from personal reminiscences as well as interviews with those who lived the events described, he composed ca. 1385 a *Vie du Prince Noir* in some 4,200 rhymed octosyllables. It records the principal events of the Black Prince's life and extols his prowess and piety. Froissart drew extensively upon his

account of the Spanish expedition and Battle of Nájera in 1367. The poem is extant in a single manuscript in Worcester College, Oxford.

# CHANSON DE GESTE

. A long narrative poem celebrating the exploits (Lat. *gesta*) of famous national heroes, particularly Charlemagne. As the word *chanson* implies, at least at the beginning these epic poems were sung or chanted in public, rather than read silently in private chambers.

The chanson de geste could vary in length, from the celebrated *Chanson de Roland's* 4,002 lines in editions of the Oxford manuscript to some of the later epics, which number in the tens of thousands of lines. Most lines follow an established form: ten syllables with a caesura, or pause, after the fourth (sometimes the sixth) syllable. Rhyme did not appear until near the end of the 12th century. Until then, assonance sufficed to separate strophes of unequal length, called "laisses." The early *Gormont et Isembart* counts only eight syllables per line, while the *Voyage de Charlemagne* and many later poems survive in dodecasyllables, or Alexandrines. The songs connected with the hero Guillaume are characterized by a short refrain, *le vers orphelin,* of four syllables, which is sporadically attached to the end of laisses.

Controversy still rages on the manner in which the chanson de geste was born. Three early poems typify the problem: the *Chanson de Roland,* the *Chanson de Guillaume,* and *Gormont et Isembart*. All three portray events that transpired in the 8th or 9th centuries, yet their earliest documentary evidence dates from the late 11th or early 12th century. Scholars of the 19th century sought to explain how the kernel of historical truth underlying such poems could have reached their authors, and in such a distorted form; they concluded that the extant epics stand in a long line of oral narrative poems, called *cantilènes,* originating at the time of, or immediately subsequent to, the events portrayed. These anonymously composed short poems were later combined into the longer poems that survived. This view is today labeled "Traditionalist."

A positivist reaction led by Joseph Bédier at the start of the 20th century rejected the continuous poetic tradition in favor of a literate, cultured poet, the trouvère, composing onto parchment like any modern writer—though for singing by a performer, the jongleur. The individual creator thus replaced the vague group contributors. Few critics have equaled the influence that Bédier had upon literary history; his persuasiveness and clarity of style persuaded most scholars to his theories. Bédier's famous opening of his four-volume study of *Les légendes épiques* set forth in a nutshell the basis for his theory: "Au commencement était la route" ("In the beginning was the [pilgrimage] road"). Truly positivistic, Bédier accepted only tangible evidence in the elucidation of his theory of origins. He rejected outright any notion of *cantilènes* and thus of the existence of oral tradition as bearer of the legends. Epic poems first appeared not in the 9th century,

according to Bédier, but in the 12th and thereafter. The poets' sources were in Latin chronicles that related the Carolingian events that provided the historical kernel; Bédier connected these with monasteries along the pilgrimage routes of Europe, which claimed to have in their possession relics from celebrated heroes. To draw pilgrims to their institutions, the custodians of these venerated objects prepared publicity in the form of the chansons de geste. Bédier insisted upon the near-contemporaneity of the written text and the creation of the surviving epic, while his predecessors (and followers) believed that one way or another, and probably through oral tradition, the event was borne over centuries through history.

Bédier's view, labeled "Individualism," dominated scholarship until a "Neotraditionalist" current was inaugurated in 1955 by the publication of Jean Rychner's *Essai sur l'art épique des jongleurs*. Rychner relied on the notion that the feudal civilization in which the chanson de geste was born created and consumed "literature" orally. Not only did audiences listen to the singing of the poems, but the poets actually created this highly formulaic poetry in the act of singing. In the wake of Albert Lord's discoveries about Yugoslav singers of tales still thriving in preNazi Europe, Rychner showed how a poet could memorize motifs, themes, and formulae and skillfully recombine them for oral presentation, recomposing the poem each time he sang it, using his own stock of formulae. Thus are explained in great part the vexing contradictions that appear in almost all the story lines of the epic, the numerous exhortations to listen carefully, and the apparent repetitions.

In the late 1950s, Ramón Menéndez Pidal returned to theories expounded as early as the 19th century concerning the oral origins of the *Chanson de Roland*. He had investigated the manner in which Spanish epic had been born at the moment of the historical event. In 1924, he published *Poesia juglaresca y juglares,* demonstrating that Spanish literature cultivated short, totally epic poems and setting forth the hypothesis that French literature undoubtedly passed through a period that mirrored this archaic phase. After Rychner's book, Menéndez Pidal's inquiries into the neotraditionalism of the French epic, particularly in the *Roland,* gave impetus to the growing orality movement. The debate is of importance, for how we view the very nature of the early chansons de geste depends on the answer: are we dealing with literature (in the sense of works composed of letters) at all, or with an ever-changing tradition of sung epic that has no definitive form but exists in a multiplicity of performances, one of which is accidentally preserved in each manuscript manifestation?

No matter its origins, scholars have had to admit the influence of handwriting, courtly romance, and other literary phenomena in the chansons de geste by the end of the 12th century. As the "classical" epic appeared to be dying, efforts were made to preserve its traditional *matière* by creating and copying accretions, which led to the formation of cycles. An early attested recognition of the division into cycles is recorded by Bertrand de Bar-sur-Aube in the prologue to *Girart de Vienne* (early 13th c.). He discerned three: the *gesta* (deeds) of Charlemagne (the King Cycle), of Doon de Mayence (the Rebellious Vassal or Doon de Mayence Cycle), and of Garin de Monglane (the Guillaume d'Orange Cycle). Aside from the allusion to Charles in the King Cycle, the hero mentioned by Bertrand is not the most famous but rather an ancestor of the principal protagonist of each cycle. To give each hero a glorious past, these authors invented histories of their ancestry. In addition to Bertrand's divisions, modern scholars have discerned the *gestes* of the

Crusades (of which the most famous is the imaginative *Chevalier au Cygne*) and those of Lorraine, Blaye, Nanteuil, and Saint-Gilles.

The masterpieces of the genre are generally considered to be the earlier poems: the *Chanson de Roland,* the *Chanson de Guillaume,* and *Gormont et Isembart,* from the early 12th century, and *Raoul de Cambrai, Girart de Roussillon, Aliscans,* the *Couronnement de Louis*, the *Charroi de Nîmes,* and the *Prise d'Orange* from the late 12th or early 13th century. Throughout the cycles, traits of the genre may be distinguished. The matter is generally grave in tone and women play a dependent role, particularly in the earlier poems. At the heart of the tale are the battle and accompanying motifs: arms and armor, the warhorse, and formulaic acts of combat. The typical jongleur organized his materials so as to recite the events in a linear story without flashbacks or such withholding devices as interlacing, popular in the prose romances. Often, too, the story commences *in medias res*. The narrator's voice could be heard infrequently but with considerable authority to comment on the events, characters, or outcome. If the *Roland,* for example, portrays two fairly unified actions (Roland's defeat, Charles's victory), poems of the Guillaume legend tend to be episodic, even contradictory, despite their generally shorter length. Some lack a unified plot entirely, such as the *Couronnement de Louis* and the *Moniage Guillaume*.

In a second generation of chansons de geste, composed in the late 12th and 13th centuries, the influence of romance was strongly felt, and women and the fantastic came to play significant roles. Totally absent in *Gormont et Isembart,* more masculine than feminine in *Guillaume,* women came to play major roles in such epics as *Raoul de Cambrai,* the *Prise d'Orange,* and *Aye d'Avignon*. The motif of the Saracen princess who converts to Christianity is important in many epics, but love themes always remain secondary to those of battle. Woman is an object of possession, identified generally with the fief and marriage, and is never an object of desire for her own sake. Increasing interest in the marvelous can be seen in *Huon de Bordeaux,* which places in the foreground a handsome magician and dwarf, Auberon, who will, he claims, take a seat next to God when he decides to depart this world. Even later epics (also called *chansons d'aventure*), such as *Tristan de Nanteuil* and *Lion de Bourges,* feature extraordinary adventures throughout the known (and imagined) world, played out by a cast that includes invulnerable heroes, seductive damsels, angels, shapeshifters, magicians, dwarfs, giants, and fabulous beasts.

Since the 15th century, several notable attempts to revive the epic as a viable genre have failed: among others, Ronsard's *La Franciade,* Voltaire's *La Henriade,* and Hugo's *Légende des siècles*. When the Middle Ages were rediscovered in the 19th century, reaction extended far beyond literary circles into the realm of politics, architecture, and the military. Louis-Napoléon attempted to restore the spirit of epic crusades by venturing into Syria and Crimea. Intellectuals seized upon the epic as a model of the French heritage. While the Round Table was vigorously hailed as a precursor of democracy, the courtly practice of adultery seemed scandalous. To counter the spread of illicit relations, moralists praised the virtues of the epic hero. The scholarly methodology applied to the epic has had handsome rewards. Aside from the variety of approaches that have been useful for other genres, the question of orality has been particularly rich. The study of a warrior society in which the mode of literary consumption was oral has led to new definitions of the process of thinking as well as to surprising cultural ramifications of reliance on voice rather than writing.

# *CHANSON DE TOILE*

**.** This lyrico-narrative genre, indigenous to northern France and with no counterpart in Provençal poetry, which might be translated as "weaving song," is represented by a score of compositions, mostly anonymous, preserved in 13th-century songbooks or as interpolations in romances (especially Jean Renart's *Guillaume de Dole*). Four anonymous pieces and all of the later, more elaborate ones by Audefroi le Bâtard survive with melodies. The origin and function of the songs (also known as *chansons d'histoire*) are murky and controversial; the genre appears to have arisen at the time of the early epics as an accompaniment to women's spinning and weaving. The texts are simple, brief stanzaic tales of frank and insistent, "precourtly," desire related from the point of view of a young noblewoman.

# CHARITÉ-SUR-LOIRE

**.** The priory of Notre-Dame at Charité-sur-Loire (Nièvre) was among the largest Cluniac foundations. Its first church, built in the second half of the 11th century, was modeled on Cluny II and featured an apse echelon of three apses to either side of a larger central apse. Soon after the dedication in 1107, remodeling influenced by Cluny III enlarged the church. The double-aisled nave was lengthened to eleven bays, and the choir was extended by an ambulatory with five radiating chapels. An imposing narthex was begun, but only one tower was constructed in the second half of the 12th century. Although parts of the church were destroyed, the tower and apse show rich architectural detailing with cusped arches reflecting Moorish influence.

# CHARLEMAGNE

(742–814). The Frankish king and later emperor who gave his name to the Carolingian empire was born to Pepin III the Short and Bertrada in 742. In accordance with Frankish custom, on Pepin's death in 768 his realm was divided between his legitimate male offspring, Charles and his younger brother, Carloman. Carloman received the central provinces of the kingdom; Charles's territories, including Thuringia, Frisia, parts of Alemannia, Austrasia, and Neustria, encircled those of his brother. The brothers did not get along, but Carloman died in 771 and Charles took over his lands, setting aside his brother's two sons. From then until his own death in 814, Charles was the sole ruler of the Franks. At its peak, the realm, which with his imperial coronation in 800 came to be regarded as the Christian-Roman empire in the West, comprised portions of modern East Europe and most of the western area of the Continent. Charles's achievements as king and emperor—his extension of the lands under his rule, his efforts to protect and reform the church, and his fostering of a cultural and intellectual revival—inspired western monarchs throughout the rest of the Middle Ages. They justly earned him the name of Charlemagne (Lat. *Carolus Magnus*), or Charles the Great.

For thirty years after Carloman's death, Charlemagne expanded the frontiers of his realm and strengthened his hold on the conquered regions. In 774, he conquered Lombardy and took the title king of the Lombards. He subdued Bavaria, though not decisively, in 787; during the 790s, efforts to protect the Carolingians against Muslim incursions led to the annexation of the territory along the Pyrénées that became the Spanish March. Further cam-paigns in the 790s crushed the Avars, while from 772 to 804 Charlemagne strove to conquer the Saxons on the eastern boundaries of his realm. The long-term struggle against the Saxons provoked the Carolingians to try a variety of

strategies to win control, including forced baptisms, mass executions and deportations, and settlement of Franks in the area.

The large area under Charlemagne's authority was tied socially to the royal power through the system of benefices, lifetime grants to nobles of lands in different parts of the realm in return for oaths of vassalage and services to the monarch, particularly military service. As under earlier Frankish kings, administration still operated primarily at the local level. The main instrument of local government during Charlemagne's reign was the count, who within his county exercised the absolute power of the royal ban on the king's behalf. But local government was linked to the central administration by the annual assemblies of the most powerful aristocrats and by the *missi dominici,* magnates selected as the king's representatives who undertook for him regular tours of inspection throughout the kingdom. One method used to instruct the *missi* in their duties as well as to promulgate new legislation involved documents known as capitularies, which issued from Charlemagne's court at a rate far surpassing anything seen under earlier Frankish rulers. Legislative authority, however, continued to rest with the king's oral pronouncement and was based on the royal ban, not on the capitularies.

Charlemagne was crowned emperor of the Romans by Pope Leo III on Christmas Day 800, in St. Peter's, Rome. Whether the papal or the Frankish court instigated the move, it is clear that for some years previously Carolingian churchmen, such as Alcuin, had been developing a concept of Charlemagne's role as the successor to the first Christian emperor, Constantine I, and the leader of a new Christian-Roman empire in the West. The decision to bestow the imperial title on Charles was inspired by such thinking and, in Rome, by the political difficulties of the pope, threatened by hostile factions within Rome that sought his deposition.

The imperial coronation testified not only to Charlemagne's success at increasing the territory under his authority but also to his work on behalf of the church. Ecclesiastical reform was a major subject of several capitularies issued before 800, among them the *Admonitio generalis* (789) and the Capitulary of the Council of Frankfurt (794). In addition to the efforts in these documents to regulate the lives of clergy, monks, and female religious, to reform the ecclesiastical hierarchy, to ensure that the clergy knew the basic articles of the Christian faith, and to provide guidelines for the religious conduct of the laity, certain of the capitulary decrees and the very proliferation of such texts testify to a new drive, encouraged by Charlemagne, to make the written word the keystone of his administration. That drive—despite the problems that Charlemagne himself encountered in his own efforts to learn to write, according to his biographer, Einhard—built upon, but vastly exceeded in scope, anything under Charles's father, Pepin III. The degree to which Charlemagne and his churchmen perceived mastery of written language as the hallmark of his court is manifested in the *Libri Carolini,* completed in 793. Encompassing 228 pages in the current printed edition, this massive treatise, in which Charlemagne is presented as the one who speaks, denounces the Byzantine empire for its inferiority to the Carolingians on a host of issues; but most fundamentally, it rebukes the eastern government for its failure to understand Scripture, because of the Greeks' inability to match the Carolingians in their command of the written word.

The importance that Charlemagne and his court attached to the skills relating to written language fueled the artistic and intellectual "renaissance" that occurred during his reign, again beginning even before his imperial coronation. The prose writings and poetry

by scholars from all over Europe who joined Charles's court circle—the Anglo-Saxon Alcuin, the Visigoth Theodulf of Orléans (author of the *Libri Carolini*), the Italians Paul the Deacon and Paulinus of Aquileia, the Frank Einhard, and others—and the creations of Carolingian artists during the same years, show a sophistication, a subtlety in their use of earlier texts and artistic productions, and an innovativeness that scholars are only starting to appreciate fully. The artistic and intellectual achievements that Charlemagne fostered laid the groundwork for the accomplishments in the same areas under his son Louis the Pious (778–840), yet Louis inherited an empire that, in other ways, was showing signs of strain. During the last decade of Charles's reign, with the end of the wars of conquest and the flow of revenue from them, the Carolingian empire experienced increasing corruption and disaffection among its aristocracy. Charlemagne responded in part by reemphasizing older, Frankish traditions, and thus in accordance with Frankish custom the *Divisio regnorum* of 806 arranged that after Charles's death his territories be divided among his legitimate sons, Charles the Younger (d. 811), Pepin (d. 810), and Louis, each of whom he had already appointed to be king of part of the empire. No attempt was made at the time to ensure the empire's continued unity, nor was a plan set forth for transmission of the imperial title.

By 813, Charles the Younger and Pepin were dead, however, and Louis the Pious received the imperial crown in September of that year. He became sole emperor in the West when Charlemagne died, in January 814.

# CHARLES I

(1226–1285). Count of Anjou and king of Sicily. The brother of Louis IX, Charles was intended for a career in the church, but the death of another brother, Jean, transformed his life. In 1246, the crown decided to grant Charles an apanage of the counties of Anjou and Maine, originally intended for Jean. Earlier that year, Charles had married Béatrice de Provence, a marriage that gave him effective, although theoretically temporary, authority in the county of Provence. Charles thus became an important territorial prince in both northern and southern France. He made several efforts to consolidate and expand his authority. For example, after his return in 1250 from his brother's first crusade (1248–54), he intervened in a succession crisis in Hainaut but failed to secure the county for himself (Treaty of Péronne, 1256). He was more successful in maintaining his authority in Provence despite the fierce independence of key Provençal cities, especially Marseille, reduced by Charles to submission in the later 1250s, and the vigorous, sometimes military, efforts of his mother-in-law and his wife's sisters, the queens of England and France, to secure their rights in the county after Béatrice's death.

The main theater of Charles's operations was Italy. It was he who accepted the invitation of the papacy to deliver the Holy See from the Hohenstaufen threat in southern Italy and Sicily in the 1260s and, in doing so, carved out a huge zone of influence for himself in the central Mediterranean. Besides defeating the Hohenstaufen and becoming king of Sicily in 1266 (though resistance continued until 1268), he became the effective ruler (senator) of Rome, imperial vicar in Tuscany, protector and governor of several important north Italian towns, overlord of Albania, and, after he took command of his brother's second crusade (1270), the possessor of important concessions in Tunisia.

In 1277, Charles secured the rights of Marie of Antioch to the throne of the kingdom of Jerusalem, a symbolic indication of the scale of his ambitions in the Mediterranean. Charles also began seriously to make preparations for the invasion of the Greek empire, which had recently been reconquered by the Paleologoi after the Frankish domination (1204–61) following the Fourth Crusade. He was thwarted in this final design by trouble in Sicily, the great nativist uprising (1282) known as the Vespers. Moreover, the king of Aragon, whose marriage to a Hohenstaufen princess gave him claims in Sicily, supported the uprising. French royal aid to Charles, to counter that support, culminated in the crusade against Aragon (1285), during which King Philip III of France, Charles's nephew, perished. Charles himself died early in the same year, leaving a much less able son as his successor and a tangle of problems not fully resolved until the end of the Middle Ages.

# CHARLES II THE BAD

(1332–1387). King of Navarre. The son of Philippe d'Évreux and Jeanne, daughter of Louis X of France, Charles succeeded his father as count of Évreux in 1343 and became king of Navarre (as Charles II) when his mother died in October 1349. Although he became a bitter enemy of the royal house of Valois, whose propagandists accused him of many nefarious deeds and plots, Charles was a popular young man who commanded a considerable political following in the 1350s. Not until the 16th century did he appear as "El Malo" in Navarrese historiography, but this sobriquet gained wide acceptance among subsequent generations of royalist or nationalist historians in France.

The Évreux family had serious grievances against the Valois monarchy, which kept possession of Jeanne's inheritance of Champagne and Brie, never relinquished to her the promised compensation, Angoulême, and remained dilatory in providing the revenues that were to have replaced these territories. The northwestern nobles, disaffected for much of Philip VI's reign, had many connections to the house of Évreux, which had cultivated clients among them. Other critics of the monarchy were genuine reform-ers whose intellectual wing was based in the Collège de Navarre in Paris, a longtime recipient of Évreux patronage.

The Valois rulers made efforts to cultivate their Évreux cousins. Philip VI, as an aging widower, married Charles's teenaged sister Blanche in 1349, and Charles himself married Jeanne, the eldest daughter of John II, a few years later. These overtures, however, did not defuse the grievances, and the delays in paying his wife's large dowry embittered Charles further. John II aggravated the bad royal relations with the northwestern nobility by summarily executing the constable Raoul de Brienne in 1350. The new constable, John's inexperienced young favorite Charles of Spain, received lavish royal gifts, including the county of Angoulême, which Charles the Bad considered to be rightfully his own. With considerable sympathy from critics of the regime, Charles had the constable murdered in January 1354, thus beginning a decade of rebellion against his father-in-law.

To shield himself from royal wrath, Charles called on the English for aid, and John II had to conclude the Treaty of Mantes (February 1354), which pardoned Charles and his followers and granted him substantial new lands in lower Normandy in return for his definitive renunciation of Champagne and Brie. Charles then proceeded to disrupt Anglo-French negotiations at Avignon and bring troops to Normandy, where he hoped to cooperate with an English invasion. When contrary winds kept Edward III from coming, Charles had to conclude a less advantageous treaty with John II at Valognes (September 10, 1355). The king of Navarre remained a magnet for discontented elements in

northwestern France and apparently tried to subvert the dauphin, John's eldest son, into rebelling against his father.

Increasingly bitter toward his son-in-law, John II suddenly arrested Charles at Rouen in April 1356, executing several of his followers and placing him in prison. Normandy was swept by civil war, and in September John and his supporters suffered devastating defeat by the Prince of Wales near Poitiers. With John II now a captive, the dauphin's weakened government faced a large array of critics, some of whom demanded the release of Charles the Bad.

Released by his friends in November 1357, Charles resumed his role as a leader of forces opposed to the crown, yet within a year his position had eroded. Nobles in particular and reformers generally became attracted to the dauphin's camp after the hostility of the Parisians toward nobles drove a wedge between noble and bourgeois reformers. Charles the Bad became suspect because he cooperated with the Parisians and because his negotiations with the English indicated an interest in partitioning France. He and his supporters failed to prevent the release of John II via the Treaty of Brétigny. An uneasy peace with John ended when the king bestowed Burgundy on his son Philip the Bold in 1363. Charles asserted a claim to Burgundy, and with the new hostilities thousands of unemployed soldiers *(routiers)* claimed to be fighting in his name.

At the end of 1363, the Estates General of northern France established a tax to support a regular salaried army. In the spring of 1364, as Charles V was succeeding John II on the French throne, this new army, commanded by Bertrand du Guesclin, won a crushing victory over the forces of Charles the Bad at Cocherel in Normandy. This campaign broke the power of the Navarrese party in Normandy and around Paris. Charles was forced to accept the southern barony of Montpellier and relinquish some of his family's Norman strongholds.

After this time, Charles played a diminished role in French politics, although a scandal came to light in 1378 that implicated him in plots against the crown. With the dissidents who formerly supported him now firmly in the royal camp, Charles was restricted to his role as ruler of a minor Spanish kingdom.

# CHARLES II THE BALD

(823–877). King of the West Franks. Charles II the Bald was the only son of Emperor Louis the Pious (r. 814–40) by his second wife, Judith. Three other sons, Lothair I (d. 855), Pepin of Aquitaine (d. 838), and Louis the German (d. 876), had been born to Louis's first wife, Irmengarde. The terms of inheritance outlined in the *Ordinatio imperii* of 817 had divided governance of the empire among Lothair, Louis the German, and Pepin and indicated that Lothair, the eldest, would exercise supremacy as sole heir to the imperial title. But the arrival of a fourth son prompted Louis the Pious to revise his scheme by designating lands for Charles from among those of his half-brothers. The subsequent clashes of Louis the Pious with reformers at his court and with his older sons, along with the struggles for power among his children, created a turmoil that eventually destroyed the empire's unity. In 843, the Treaty of Verdun divided the empire into three separate kingdoms for Charles, Lothair, and Louis the German, with Charles allotted the western third of the empire.

Charles's rule in west Francia was highlighted early on by an assembly at Coulaines (843), at which the king promised to safeguard the rights of his subjects and in return requested their counsel and aid. This pact represented a new step in relations between Carolingian monarch and aristocracy. Although throughout his reign Charles's authority was threatened by his brothers, aristocratic factions, and Viking raids along his coasts, his court remained culturally the most brilliant center of his day in the West, attracting such theologians as Hincmar of Reims and Johannes Scottus Eriugena. Moreover, Charles managed to secure and even extend his power. By the Treaty of Meerssen (870), he and Louis the German shared the territories of their nephew Lothair II, who had ruled Lorraine from 855 to 869. When Emperor Louis II died in 875, Charles the Bald gained the kingdom of Italy and the imperial title. In 877, having decided to conduct an expedition into Italy against the Muslims, he held an assembly at Quierzy remembered for its guarantee of the rights of blood relations in the inheritance of offices and properties vacated during his absence. Charles the Bald died October 6, 877, before his return from Italy. His son, Louis the Stammerer, succeeded to the throne of west Francia.

# CHARLES IV THE FAIR

(1294–1328). King of France. Charles, the youngest son of Philip IV, acceded to the throne in 1322 after the death of his elder brother, Philip V, whose only children were daughters and so excluded from the throne. Early in his reign, Charles IV executed an obstreperous southern notable, Count Jourdain de l'Isle, and firmly established his authority by a subsequent progress through the south.

Charles dissipated some of the respect he enjoyed by employing unpopular and dubious means to strengthen his finances. He sold offices, manipulated the coinage, and hounded Christian debtors who owed money to Jews whose account books had been confiscated by the crown in 1306. He continued the process, begun by his brother, of collecting the fines that had been imposed on Jews who had returned from exile in 1315 but who were accused in 1321 of having plotted with lepers to poison the wells in France. In 1322, large numbers of Jews emigrated; whether this was under an order of expulsion issued by the king is uncertain.

Territorial ambitions and jurisdictional squabbles led Charles into war with England and military intervention in Flanders during his short reign. The war with England, which began in 1323 and produced a French invasion of Guyenne, had more success than the Flemish campaign. Owing to the overthrow of Edward II of England by his wife, Isabella (Charles's sister), in 1327, the peace that ended the English war resulted in a 50,000-mark payment to the French crown and small territorial concessions in the Agenais.

The king relied on the advice of his uncle, Charles of Valois, on most matters and entrusted him with important military duties and a principal role in negotiating with the pope over a proposed crusade. Some scholars feel that Charles IV expressed interest in a crusade chiefly as a ruse to raise money for more pressing foreign and domestic objectives. Others recognize the force of financial concerns in his hard bargaining with the pope but see no necessary contradiction between these concerns and a genuine interest in promoting a crusade. In any case, no serious crusade took place.

Charles's first wife, Blanche d'Artois, had been implicated in an adultery scandal that rocked the royal household in 1314. After that marriage was annulled in 1322, he married Marie de Luxembourg, who bore a son who died in infancy and then herself died in 1324. Charles then married Jeanne d'Évreux, who bore only daughters. When Charles died on February 1, 1328, at Vincennes, the succession was uncertain until the magnates rallied to his cousin Philip of Valois.

# CHARLES V THE WISE

(1338–1380). The third French king of the Valois line, Charles V was born on January 21, 1338, the oldest son of John II and Bonne de Luxembourg. He was the first heir of a French king to be styled dauphin of Viennois. Charles owes much of his reputation to Christine de Pizan, who depicted him as a prudent and skillful ruler despite chronic poor health. His reign as king (1364–80) was a time of success for France, in contrast to those of his predecessor and successor, but some recent scholars have questioned how much of the success can be attributed to his abilities.

Charles had an eventful political career before becoming king. In 1355, he was implicated in conspiracies against his father fomented by Charles the Bad, king of Navarre. In 1356, after the defeat and capture of John II at Poitiers, Charles was left to face attacks on the government from partisans of Charles the Bad, genuine political reformers, and ambitious men who hoped to oust unpopular royal financial officers and take their place. Nonnobles were increasingly hostile to nobles, while much of the nobility of northern and western France had been hostile to the Valois monarchy for years.

As royal lieutenant and later regent in the name of his captive father, Charles had to deal with a serious crisis in the years 1356–58. Riot and rebellion in Paris, independent military action by the forces of Charles the Bad, and the savage uprising against nobles known as the Jacquerie all contributed to this crisis, as did a seriously unstable currency and the ravages of unemployed companies of soldiers *(routiers)*. Throughout the period, the Estates General convened repeatedly, but the militance of the urban representatives soon alienated the nobles, who slowly gravitated into the royalist camp.

After Charles regained Paris in 1358, the royal government began to recover its authority and institute reforms. A new English invasion in 1359–60 failed to capture any major towns, and the Treaty of Brétigny in 1360 secured John II's release. To pay his ransom, stabilize the currency, and deal with the brigandage of *routiers,* the crown was able to establish substantial regular taxes in 1360 and 1363, and these financed the troops that won a major victory over the Navarrese at Cocherel on May 6, 1364. Charles V, who had just succeeded his father as king, inherited a favorable situation and a reform-minded royal council led by Guillaume de Melun, archbishop of Sens. Charles continued to cultivate the newly royalist nobility of the north and west, who began to provide the bulk of his military leaders. His brother Louis I of Anjou became royal lieutenant in Languedoc, providing energetic leadership there for most of the reign.

As king, Charles profited from two important international developments, both of them in 1369. His brother Philip the Bold married the heiress of Flanders and Artois, thus denying these strategic lands to a potential English suitor. In Spain, Bertrand du Guesclin, the victor of Cocherel, helped establish a pro-French candidate on the throne of Castile, giving Charles an ally with an important fleet. At home, Charles lured into the French

camp Olivier de Clisson, who brought with him a host of Breton knights who played a vital role in the French army. The king also cultivated discontented Gascon magnates, accepting their appeal against the English regime in Aquitaine, thus reopening the Hundred Years' War in 1369, when France was able to win quick victories. Aided by a Castilian naval victory off La Rochelle in 1372 and the policy, promoted by Clisson, of avoiding pitched battles, France reduced the English possessions in France to a few coastal enclaves by the end of the reign.

Charles V made his two great mistakes in 1378. One was the attempted confiscation of Brittany, which cost him the valuable military services of the Breton magnates. The other was his quick recognition of the questionable papal election of Clement VII, which brought about the Great Schism. A pious ruler with a strong sense of royal majesty and duty, Charles had profited greatly from the taxes enacted toward the end of his father's reign, but he felt uneasy about their rightness. An important intellectual in his circle, Nicole Oresme, had written a French version of Aristotle's *Politics* in which he strongly criticized taxation. In this climate of opinion, Charles, on his deathbed, canceled the *fouage* (hearth tax), which had financed his victorious armies.

Although clearly not as able a leader as traditionally portrayed, Charles V was a successful ruler who picked effective subordinates, encouraged needed reforms, and had the skill to use rather than antagonize the politically most influential groups in his kingdom.

# CHARLES VI

(1368–1422). Charles VI (r. 1380–1422) was born in Paris on December 3, 1368, to Charles V and Jeanne de Bourbon. He was crowned king on November 4, 1380. His father had stipulated that during his minority the oldest of his paternal uncles, Louis I of Anjou, was to be regent, but Anjou agreed under pressure, on October 2, 1380, that Charles VI be declared of age and the kingdom ruled in his name according to the advice of all four royal uncles. In 1388, influenced by a plan set in motion by Olivier de Clisson, Charles VI took control of the government himself. The counselors he then favored, scornfully called Marmousets by the dukes, initiated a program of reform that was cut short by the onset of his mental illness on August 5, 1392.

This crisis enabled the dukes to regain their power. The king considered himself recovered within five weeks, but other psychotic episodes followed. Charles VI suffered from recurring persecutory delusions and exhibited forms of behavior commonly observed today in schizophrenics. There was often no clearly visible line of demarcation to distinguish his schizophrenic thought patterns from "sane" ones. Since he often seemed able to function, he was allowed to continue to rule with full power, his royal prerogative protected by the sacred character of French kingship. Despite a manifest desire to be a good king, Charles VI made many important decisions while his thinking was disordered, and this soon upset the equilibrium of his government.

His mental illness caused him to deal in an inconsistent and questionable manner with the assassination of his brother, Louis of Orléans, in 1407. The consequence was almost constant civil war that exacerbated the persecutory delusions suffered by the king, for suspicion of treason was everywhere. This atmosphere also had the effect of making the king's schizophrenic thinking often seem sane.

In an attempt to protect the monarchy from control by either the Burgundians or the Armagnacs (the Orléanist party), the king's eldest son, Duke Louis of Guyenne, sought to form a separate royalist party. These efforts, spoiled by the invasion of Henry V of England and by Louis's own death in December, were not continued by the dauphin Charles (later Charles VII), who fled Paris as it fell to the Burgundians on May 29, 1418. He did not return until 1437.

The dauphin Charles and the Armagnacs found support in each other for their demands. The government was anxious for the dauphin to return to the royal court, but reconciliation became impossible after he sanctioned the assassination of John the Fearless, duke of Burgundy, at Montereau in September 1419 and then committed treason by usurping royal authority to call himself regent of France. As a result, Charles VI accepted the Anglo-French-Burgundian Treaty of Troyes in May 1420 and married his daughter Catherine to Henry V. The treaty declared Henry heir to the French throne with the powers of regent, but preserved Charles VI's rights and authority. Charles VI survived Henry and died at the Hotel de Saint-Pol on October 21, 1422.

# CHARLES VII

(1403–1461). One of the best known but least understood of the medieval kings of France, Charles VII was the eleventh child of Charles VI and Isabeau of Bavaria. That he would become king or be immortalized by his association with Jeanne d'Arc and the reconquest of France was unimagined during his youth. Becoming dauphin in 1417 after the unexpected deaths of older brothers, he entered the political scene in one of the darkest periods of French history. In 1418, upon escaping a Burgundian coup in Paris, he became head of a government in exile dominated by the Armagnac faction. His ill-advised role in the assassination of the duke of Burgundy in 1419 united the English and Burgundians, and they sought to disinherit him in the 1420 Treaty of Troyes. When Charles did become king in October 1422, he controlled only the third of the realm south of the Loire. He indiscriminantly accepted a wide range of supporters and advisers, whom he only slowly learned to control. Denied access to Paris and derisively called "king of Bourges," Charles courted provincial estates and the *bonnes villes*. His actions foreshadowed the administrative decentralization of his later reign.

After years of catastrophic defeats, the appearance of Jeanne d'Arc marked a turning point in Charles's fortunes. Her victories at Orléans and Patay brought Charles to Reims for a coronation in July 1429. By 1435, he brought Burgundy to a separate peace in the Treaty of Arras, which allowed the Valois reentry into Paris in 1436. A contentious decade of reform passed before Charles could complete the reconquest of France. The Pragmatic Sanction of Bourges in 1438 affirmed royal control of the French episcopacy and ecclesiastical revenues, and, at the Estates of 1439, Charles increased taxation and attempted to outlaw unauthorized armed forces. The military anarchy of the brigandage *(écorcherie)* and the revolt of his son, the future Louis XI, and many peers in the Praguerie posed a new crisis that took all of Charles's tactical and diplomatic skills to overcome. Influenced by his mistress Agnès Sorel, he settled on his two reliable advisers: Pierre de Brézé and the constable Richemont, and by 1445 he was able to implement his program. In 1449, the revitalized Valois army renewed the war, and by 1453 the English had been driven from Normandy and Guyenne.

Consolidating his authority for the rest of his years, Charles easily disciplined such restive princes as the count of Armagnac and the duke of Alençon, used the courts to reconcile a nation embittered by civil war, and perfected the administrative structures that had brought him victory. Only his son, the future Louis XI, impatiently waiting in Burgundian exile, celebrated his death. Sometimes called "the Victorious," Charles was a man who preferred negotiations to war and judiciously waited to exploit his enemies' divisions. He is better remembered as "The Well-Served" king, skilled in the selection and management of advisers who helped him construct a new monarchy out of the cruel necessities of a lifelong struggle to reunite France.

# CHARLES VIII

(1470–1498). The son of Louis XI of France and Charlotte of Savoy, Charles VIII was thirteen when his father and mother died; the young king's guardian was his twenty-one-year-old sister Anne, supported by her husband, Pierre de Bourbon, lord of Beaujeu. Louis XI had been an effective but unpopular king, in whose reign the burden of taxation had increased dramatically. The great magnates, led by Louis of Orléans, who was next in line for the throne, wished to gain control of the government. The Estates General met at the beginning of 1484, and Anne and Pierre managed the proceedings skillfully, sacrificing some unpopular officials from the previous reign and accepting a large reduction in the principal royal tax. Later, they overcame an uprising of the princes known as the Guerre folle ("Mad War").

After 1488, as Charles VIII gained increasing control over affairs, Anne and Pierre slipped into the background. The death of François II of Brittany in the same year left the duchy to his eleven-year-old daughter Anne. In 1491, Charles VIII married her in hopes of securing Brittany for the crown. The young queen bore him several children but none lived very long. To marry Anne of Brittany, Charles first had to divest himself of young Margaret of Austria, to whom he had an unconsummated proxy marriage. He also wanted her father, the emperor Maximilian, to stop interfering with his Italian ambitions, and in order to appease the Habsburgs he had to surrender Artois and the Franche-Comté, both parts of the former Burgundian state.

A pious monarch with a strong sense of the historic mission of the French kings to reform the church and defend Christendom, Charles also had a tenuous claim to the kingdom of Naples. These considerations and the urgings of Italian exiles led him to plan a massive invasion of Italy. After careful preparations, he entered the peninsula in 1494 with a large army. He met little effective opposition and succeeded in taking Naples, but a coalition of Italian and foreign powers intervened against him, and the French had to fight their way back home. While planning a second expedition, Charles died at Amboise on April 7, 1498, after suffering an apparently minor blow to the head. His Italian invasion had ushered in the international wars of the early-modern period; his death marked the end of the senior branch of the Valois line of kings.

# CHARLES DE BLOIS

(ca. 1319–1364). Duke of Brittany. Charles de Blois was a younger son of Gui de Châtillon, count of Blois, and Marguerite de Valois, sister of King Philip VI. In June 1337, he contracted a marriage with Jeanne, countess of Penthièvre (1322–1384), niece of the childless duke of Brittany Jean III. The duke preferred Jeanne as a successor over his half-brother, Jean de Montfort, but he never made a public declaration of his preference. When he died in April 1341, the decision was left to the king and peers of France, who convened in September and awarded Brittany to Jeanne and Charles.

In the meantime, Montfort had seized major Breton towns and enlisted the support of Edward III of England. Most of the great Breton lords were pro-French and supported Charles, but many of them died in 1347 at La Roche-Derrien, when he was badly defeated and captured by the English commander Thomas Dagworth. Montfort having died in 1345, England now backed his young son, Jean. Charles secured his release in 1356 but had to promise not to take arms against the English, who now had a strong foothold in Brittany. The duchy was excluded from the Anglo-French treaty of 1360, and by 1362 young Jean de Montfort was old enough to fight in Brittany on his own behalf. With the crucial support of some veteran English captains, Jean won a decisive victory at Auray in 1364, where Charles lost his life. Although his widow had to recognize Jean IV as duke of Brittany in 1365, the Blois-Penthièvre faction remained an important opposition party in Brittany for another sixty years.

Charles had a reputation for piety and sanctity, and in 1371 his son-in-law, Louis of Anjou, promoted an unsuccessful movement to have him canonized as a saint.

# CHARLES D'ORLÉANS

(1394–1465). Son of Valentina, daughter of the duke of Milan, and Louis, duke of Orléans and brother of King Charles VI. In 1407, Louis was murdered by John the Fearless, duke of Burgundy, and Valentine died at Blois the following year. In 1406, Charles had married Isabelle, widow of Richard II of England and daughter of Charles VI. The year after her death in 1409, he married Bonne d'Armagnac. Captured by the English at the Battle of Agincourt in 1415, Charles spent the next twenty-five years in England in the custody of several noblemen. Bonne died in France during this period. Released in 1440, Charles returned joyfully to France and soon afterward married fourteen-year-old Marie de Clèves, niece of Philip of Burgundy, who had helped to arrange his release. After a period of political involvement, he spent most of his remaining years at Blois, where two daughters and a son who was to become King Louis XII were born.

During the last fifteen years of his life at Blois, Charles received many visitors, who joined with members of his household to participate in poetry contests. Samples of this literary activity have survived in a manuscript (B.N. fr. 25458) that served as Charles's personal album, in which he recorded in his own hand his own poems, had some entered by scribes, and also invited members of his entourage and visitors to make contributions. Included in this collection are poems by important political figures of the day, by writers with established reputations, and even by the itinerant poet and sometime criminal François Villon, who may have received a small allowance while living at the court. Charles often proposed the first line of a rondeau or ballade and asked his entourage to write a poem following the restrictions of the prescribed form. It was under these circumstances that Villon wrote *Je meurs de suef auprés de la fontaine,* probably in 1457 or 1458. Villon's other poem in the collection, *Épître a Marie d'Orléans,* was probably composed to celebrate the birth of Charles's daughter in December 1457. The wit and good-natured bantering found in the poems written at the court of Blois serve as evidence of an unusually pleasant and relaxed atmosphere, in which poetry writing was an agreeable pastime.

Charles and his two younger brothers, Philippe and Jean, received a traditional medieval education under the direction of a private tutor. Writing in verse seems to have come naturally, since the first work attributed to Charles, *Le livre contre tout péché,* was written at the age of ten. His numerous poetic works include the *Complainte de France,* written in 1433 after he had been in England for many years; *Retenue d'amours,* composed prior to his capture; the *Songe en complainte* (1437), a 550-line sequel to *Retenue d'amours;* eighty-nine chansons and five complaintes written in England, perhaps after Bonne's death; 123 ballades written mostly during but also after his captivity; four *caroles;* and 435 rondeaux written mostly at Blois. In addition to the poems in French, about 125 in English, many with French counterparts, are attributed to him with increasing confidence.

Charles d'Orléans is known particularly for his use of allegory and the introspective nature of his poetry. Recurring themes in his ballades and rondeaux include exile, the passage of time, the flight of love, life as a prison, old age, the decomposition of the human body, and melancholy. He may be one of the best known and least appreciated French poets. Nearly every anthology of French poetry includes a few of his ballades and rondeaux, especially the ubiquitous *Le temps a laissié son manteau.* Many literary historians refer patronizingly to the charm and superficiality of his poetry and the seeming ineffectiveness of his life, echoing Gaston Paris's assessment that Charles was merely a child with a gift for polished verse, who never understood his role in life. Scholars long considered Charles the last courtly poet, using outmoded medieval conventions to express traditional clichés, while they lionized Villon as a fresh and original forerunner of modern poetry. In addition, because so much biographical information is available, scholarship has often been stifled by the attempt to tie Charles's creative work to his life. Recently, however, scholars have taken a closer look at his poetry, have become aware of the libraries to which he had access in both England and France, and consequently have begun to discover in many of his poems a new depth and complexity never before suspected. He is now often classed as a precursor of some of the 19th-century romantic and symbolist poets, especially Baudelaire. His *nonchaloir* has been likened to the "spleen" of later times.

Charles's poems have been translated into English, Dutch, Italian, and Romanian. In addition, scholarly books about his life and works have been published in Japanese, Polish, and Russian.

# CHARLES MARTEL

(ca. 688/9–741). The founder of the Carolingian dynasty, Charles Martel was the dominant figure of western Europe in the first half of the 8th century. As sole mayor of the palace, he ruled the Frankish kingdom as a virtual monarch, and in his active career he re-established Frankish unity and restored Frankish authority over most of the surrounding regions. His most celebrated victory was over a Muslim raiding expedition, near Poitiers in 732, the first serious check on the advance of Islam in Europe. His activities paved the way for the even greater careers of his son Pepin the Short and his grandson Charlemagne.

Charles was the illegitimate son of Pepin II of Heristal, the last of the Pippinid, or Arnulfing, mayors of the palace. Pepin II's death in 714, with the only legitimate heirs his young grandchildren, led to an intense power struggle within the Frankish kingdom and invasions by Frisians and Aquitanians. Aided by the powerful Austrasian rela-tives of his mother, Alpaide, Charles was able to defeat his opponents and by 723 had established himself as the sole mayor of the palace under the nominal kingship of the Merovingian Theuderic IV.

Charles, now usually styled *princeps,* then extended his rule over the neighboring regions, waging successful campaigns against the Frisians, Saxons, and Alemanni. As part of his effort to dominate the Germanic territories, he supported Anglo-Saxon missionaries, especially the disciples of Willibrord in Frisia and Boniface in Thuringia and Hesse. Boniface's close ties to the papacy led to warm relations between Charles and popes Gregory II and Gregory III.

The advance of the Muslims into southern France after the fall of the Visigothic kingdom threatened the Aquitanians, whose duke, Eudes, appealed to Charles for military assistance. The victory won by Charles at Moussais, near Poitiers, on October 25, 732, was not the battle that saved Europe from Islam, but it did lead to his being given the sobriquet Martel—from the Latin *martellus* 'hammer'—in the 9th century. His campaigns in the south for the rest of the 730s did halt Muslim advances and led to his conquest of Provence, which realized the old Frankish dream of gaining direct access to the Mediterranean. Charles, however, was not able to bring Aquitaine fully under his authority. He paid for manpower for his many wars in the 730s in part by appropriating church lands and giving them to his military followers, supposedly to be held from the church. Historians consider these grants the beginning of feudal institutions in the Frankish kingdom.

King Theuderic IV died in 737. Charles did not allow a Merovingian successor to be recognized, and he ruled the last four years of his life without a nominal king. In 739, Pope Gregory III recognized Charles's position as the most powerful Christian ruler of western Europe by appealing to him for assistance against the Lombard king Liutprand. But Charles and Liutprand were close allies, and this initial effort to bring in the Franks as papal allies against the Lombards failed.

Charles's death in 741 temporarily broke the unity of the Frankish kingdom. His elder son, Carloman, was made mayor over Austrasia, Alemannia, and Thuringia, while the younger, Pepin the Short, received Neustria, Burgundy, and Provence. Charles was buried in Merovingian royal style at Saint-Denis.

# CHARLES OF VALOIS

(1270–1325). Father of King Philip VI. The third son of Philip III, Charles became associated with the county of Valois in northern France, which he received as an apanage in 1285. His territorial interests and ambitions, however, extended over a much larger area. In 1282, Peter III of Aragon had invaded Sicily, which was ruled by Charles's granduncle, Charles I of Anjou. The ensuing diplomatic crisis pitted the papacy and the French crown against Aragon in a war (1285) that has been called a crusade. To cement the papal-French alliance, Charles of Valois was to receive the crown of Aragon. French defeat in the war rendered his claim to the title empty, but his renunciation of it in 1295 required considerable diplomatic maneuvering, including the release of Charles II of Anjou, then a hostage in Aragon (1288). In 1290, Charles of Valois married his first wife, Marguerite, the daughter of Charles II, through whom he received the counties of Anjou and Maine.

In the course of his career, Charles also laid claim to the Byzantine empire (since 1261 again in the hands of the Greeks) and put himself forward for the imperial title in Germany. Active militarily on behalf of Pope Boniface VIII in northern Italy, he managed to overcome Florentine resistance to the pope, but his Italian expedition was cut short in 1301, when his brother, Philip IV of France, came into conflict with Boniface. He served Philip in his wars, commanding forces in Guyenne in 1295 and in Flanders in the 1290s and the first two decades of the 14th century.

After the death of Philip IV in 1314, Charles of Valois became a principal counselor to the new king, Louis X (r. 1314–16), and was instrumental in the execution of Enguerran de Marigny, his late brother's financial adviser. Less intimate with Louis X's brother and successor, Philip V (r. 1316–22), he reemerged as a close adviser to the youngest of his nephews, Charles IV (r. 1322–28). In his later years, Charles of Valois seems to have been deeply drawn to the idea of mounting a crusade and pledged in 1323, at age fifty-

three, to undertake one. His plans were thwarted first by the king's difficult negotiations with the pope on how to finance an expedition and then by Anglo-French hostilities.

Charles appears to have been a literate and cultured prince who patronized a number of authors and may have been an author of verses himself, but it was in politics that he wanted to make his mark. Although he was the son and brother of kings, the uncle of three kings, and the father of Philip VI, who established the Valois line on the French throne, Charles himself, despite his many claims, died in December 1325 without ever gaining a royal title.

# CHARLES THE BOLD

(1433–1477). Duke of Burgundy. Charles was the last of the four Valois dukes of Burgundy, whose state, based in the Netherlands, became a European power in the 15th century. Although his French sobriquet,"le Téméraire," means "the Rash," Charles has usually been called "the Bold" in English, and his most recent biographer has emphasized the greater appropriateness of the latter name.

The historiography of Charles, inextricably bound up with that of his great antagonist, Louis XI of France, has long relied on colorful but inaccurate narrative sources. Charles hated and feared Louis, but his international ambitions were almost all directed toward the empire rather than France, and it was enemies in the empire, not Louis XI, who eventually caused his ruin.

Charles succeeded his father, Philip the Good, on June 15, 1467, inheriting a state that included most of the Low Countries and a southern cluster of lands around the duchy of Burgundy. Between these two large parcels lay Alsace and Lorraine, both of which Charles tried to acquire, although not placing great emphasis on linking up his lands into a compact territory. He also pursued territorial ambitions in the northern Low Countries and in Savoy to the south. His great desire was to gain a crown, preferably the imperial title. In his elaborate diplomacy, his only child, Mary, was a valuable pawn as Europe's most marriageable heiress.

Allied with Edward IV of England, Charles waged inconclusive border warfare with France in the years 1471–75 while he pursued his imperial ambitions. He gradually overhauled the Burgundian army, turning it into a professional body. By 1475, he had occupied Lorraine and had a virtual protectorate over Savoy and the Vaud. Throughout his career, his treatment of towns was harsh, as at Liège in 1468. Townsmen feared him greatly and resisted him bitterly, as at Beauvais in 1472 and Neuss in 1475. A coalition of imperial cities at last determined to drive him from Alsace and Lorraine. At the beginning of March 1476, a largely Swiss army defeated him at Grandson on Lake Neuchâtel. On June 22, a far more serious defeat at Morat (Murten) removed Savoy from Burgundian control. To recover Lorraine, Charles rebuilt his forces and laid siege to Nancy in

November. Marching to the rescue at the end of the year, the Swiss won their third victory in ten months on January 5, 1477, a battle in which Charles met his death.

# CHARLIEU

. The Cluniac priory of Saint-Fortunat at Charlieu (Loire) is known for its Romanesque church with sculptural decoration. The church, which replaced a 10th-century structure, was begun ca. 1030, dedicated in 1094, and received a narthex ca. 1135–40. Although it survives in fragmentary form, the church had a tunnel-vaulted nave with clerestory, transept, and central apse with added apsidiole. The inner portal sculpture represents the Ascen

Charlieu (Loire), Notre-Dame, north portal, Christ in Majesty. *Photograph courtesy of Joan A.Holladay.*

sion with Christ in a mandorla supported by two angels and Apostles in an arcade on the lintel. The narthex with a room above has a lateral entrance whose sculptured tympanum depicts the Apocalyptic Christ in a patterned Late Romanesque style.

# CHARLOTTE OF SAVOY

(1439–1483). Queen of France. The youngest daughter of Louis, duke of Savoy, and Anne of Cyprus, Charlotte of Savoy became queen of France through her marriage to Louis XI (r. 1461–83). Louis had married her in 1451, when she was twelve years old and he was still dauphin. At that time, he was feuding with his father, Charles VII, who opposed the marriage. The marriage failed to convert the duke of Savoy into an ally, as Louis had hoped, but Charlotte bore him several children, including the future Charles VIII in 1470. The queen's death late in 1483 prevented her from playing a role in the power struggles that followed the death of her husband.

*John Bell Henneman, Jr.*

# CHARNY, GEOFFROY DE

(d. 1356). Geoffroy de Charny, lord of Pierre-Pertuis, died guarding the king's standard at the Battle of Poitiers. His *Livre de chevalerie* is a prose text that deals with the instruction of a young knight. He is also the author of another *Livre* on the same subject written in verse, as well as the *Demandes pour la joute, les tournois et la guerre,* which takes the form of questions to members of the Order of the Star on points of chivalry. In all three works, he is concerned with degrees of honor and achievement in chivalry.

# *CHARROI DE NÎMES*

. This epic poem of 1,486 assonanced decasyllabic lines, one of the oldest of the Guillaume d'Orange Cycle (after 1150), tells of the conquest by ruse of the city of Nîmes. The poem's rich thematics link traditional epic matter with 12th-century problems: the duties of king and vassal, the situation of the young fiefless knight, the problem of crusade. Capetian policy itself, with the expeditions of Louis VI and Louis

VII to the south of France, may even have its role, intersecting with the theme of pilgrimage to Saint-Gilles.

The structure of the text, the diversity of tone, and the novelty of the role accorded Guillaume make the *Charroi* one of the cycle's most original poems. The first half of the work is a stirring encounter between King Louis the Pious and his vassal, who requests recompense for his services; the second is a lively and sometimes humorous tale of conquest. Nowhere else are Guillaume's heroic qualities so in evidence: not only an invincible warrior, he is also an epic poet, recounting with moving vigor the deeds of Béranger or exhorting his men to crusade with his account of Saracen atrocities. Thanks to suggestions from his nephew Bertrand, this bard is also a counselor of mythic stature: so that peace may reign in the kingdom, the wise vassal must ask to conquer his fief from the Saracens. Finally, Guillaume's doubts and hesitations when he is faced with knightly challenges provide him a new depth of characterization.

# CHARTER

. Record of a private contract, act, or transaction, most often a donation, sale, exchange, will, or marriage agreement, written in Latin (or occasionally the vernacular) on parchment by a cleric or notary. The legal force of the private charter, written up by monastery or bishop or powerful lord, was ambiguous and changed over the centuries. At first, its value lay primarily in the fact that it listed witnesses to the act or deed, who could be called forward in the event of a dispute. The legal force of the private contract gradually came to lie in the contract itself, and demands would be made for the written document to be produced in cases of disputes; eventually, it was the seals of public authorities—bishops, abbots, lords, and even ladies—affixed to it that gave it its force. Charters written by notaries, found earliest in the towns of the Midi, contain the much wider range of business transactions found among townsmen; the authenticity of charters written up by notaries lay in the notary's possession of his cartulary notes, which could be used as proof of its authenticity.

*Constance H.Berman*

[**See also:** CARTULARY; NOTARIES]

# CHARTIER, ALAIN

(ca. 1385-ca. 1430). Author and diplomat, known chiefly for his controversial poem, the *Belle dame sans merci,* and for his talent as an orator. A native of Bayeux, Alain Chartier studied at the University of Paris, earning the title of "maistre." Early in his career, in the period between 1409 and 1414, Chartier worked in the household of Yolande d'Anjou, mother of King René and of Marie d'Anjou, who was betrothed to the future Charles VII in 1413. Charles's presence at the Angevin court gave him occasion to acquaint himself with Chartier's talents. By 1417, Chartier was in the service of the dauphin as notary and secretary, serving also for a time King Charles VI.

For a decade beginning in 1418, Chartier's life followed the wandering of the exiled dauphin through Berry and Touraine, areas withstanding the Anglo-Burgundian onslaught. In addition to routine duties as secretary and notary, Chartier's later service to Charles included ambassadorial functions on missions during 1425 to the emperor Sigismund's court in Hungary and to the Venetian senate in an effort to convince Sigismund to side with the French against the English. In 1428, at the court of James I of Scotland, Chartier helped to renew relations between France and Scotland and to negotiate the marriage between James's daughter Margaret and the dauphin Louis. During these missions, Chartier provided eloquent introductory discourses opening the diplomatic exchanges.

From 1420 on, Chartier held various ecclesiastical offices. In 1420, he was named canon of Notre-Dame of Paris, although he was unable to assume the responsibilities of the office because of the Burgundian occupation of the city. In 1425, he was named curate of Saint-Lambertdes-Levées near Angers; in 1426, he was granted the prebendal canonry of Tours; and in 1428, he was appointed chancellor of Bayeux. An epitaph engraved in 1458 mentions that he was archdeacon of Paris.

It is generally assumed that Chartier died ca. 1430, since his signature does not appear on any royal document after 1428; *L'esperance,* begun in 1428, was never finished; and shortly after July 17, 1429, he sent a letter to Sigismund recounting Jeanne d'Arc's achievements and the consecration of Charles VII in Reims. By 1432, Chartier's brother had succeeded him as curate of Saint-Lambertdes-Levées. Record of a tombal inscription suggests that he was buried in the church of Saint-Antoine in Avignon, although the reason for his presence in Avignon at the time of his death is unknown.

An active and valued royal servant who held important ecclesiastical positions, Chartier was also a master of prose both in Latin and French and an accomplished poet. The range of style, form, and subject matter in Chartier's work is impressive.

His most controversial, celebrated, and imitated work, the *Belle dame sans merci* (1424), begins with a conventional situation: the wandering, mournful narrator overhears an exchange between a disconsolate lover and his lady. The language the lover uses to persuade the lady of his love and to ask for hers in return reveals that he has been cast in the old mold, in which the lady either granted such requests or maintained a neutral distance. Chartier's *belle dame* reserves her right to refuse and to disabuse the lover of his

belief in the power of his own courtly rhetoric. To the lover, who says he will die if she does not take pity on him, she suggests that he is succumbing to a metaphor, since she has seen no one actually die of unrequited love. To his persistent and sometimes accusatory pleas, she affirms that her indifference is neither cruel nor harmful. She counsels him to be reasonable and to take her refusal in stride. The narrator suggests at the close of the work that the lover did in fact die as a consequence. He asks lovers to shun meddlers and braggarts who have done harm to the cause of love; and he asks women not to be as cruel as the *belle dame sans merci.*

The reaction in courtly circles to the *Belle dame sans merci* attests both to the continuing hold that convention had at court in determining codes of amorous conduct and to Chartier's innovative view of these codes. By the following year, while on his mission to Hungary, Chartier was summoned to appear before a "Court of Love" because of objections women at the French court had made to his work. Chartier defended himself from a distance, composing *L'excusacion aux dames* (1425), in which the God of Love accuses the author of wrongs against love's rights. The author responds that, while in some women pity is so deeply hidden as to be invisible, he maintains confidence in love itself. He also claims that he had merely recorded the exchange between lover and lady. It is not known to what extent his *Excusacion* won him forgiveness at court.

The *Lay de Plaisance* (1414) and numerous short lyrics composed thoughout his career show Chartier's mastery of poetic conventions in portraying states of love. Two amusing debate works, the *Débat des deux fortunes d'Amour* (1425) and the *Débat du réveille-matin* (uncertain date), present divergent and unreconciled views on the value and nature of love. More frequently, Chartier's poems rely heavily on convention, while introducing new vantages or combining other concerns with the subject of love. Just as the *Belle dame sans merci* moves outside of convention to challenge it, the *Livre des quatre dames* (1416), composed in the wake of the French disaster at Agincourt, intertwines love stories with the moral and political elements of a national tragedy. The traditional springtime *locus amoenus* in this work, replete with the amorous diversions of a shepherd and shepherdess, provides the backdrop for the sorrowful tales of four women whom the narrator encounters. Each woman describes the fate of her beloved at Agincourt: the lover of the first has been killed, the second lady's lover has been taken prisoner, the fate of the third lady's lover is unknown, and the fourth lady's lover has disgraced himself by fleeing the battlefield. They ask the narrator to say which of them is to be pitied the most. He confesses inability to judge and refers debate to his own lady in writing.

Chartier rarely supplies resolutions to the debates related in many of his works. The *Débat du hérault, du vassault et du villain* (ca. 1421–26) explores but does not resolve the conflict between generations and between social classes. His best-known prose work, the *Quadrilogue invectif* (1422), is also cast in the form of a debate. Lady France, disheveled and tattered, eloquently inveighs against her three "children," asking them to account for their role in the lamentable state of the nation. The Knight, the Cleric, and the Peasant present in turn excuses, accusations, and expressions of despair. No single estate is to bear the burden of blame at the end of the *Quadrilogue,* yet it is clear that each must assume a share of responsibility and that the divisive forces that cause them to rail against one another need to be eliminated through concern for the common good. Chartier seems

to have borrowed from his Latin to provide the first known occurrence of the word *patrie* in this work, as well as the concept of a socially and politically unified France.

While the *Quadrilogue* remains Chartier's best-known prose work in French, the complexity of his concern for the political and spiritual welfare of his compatriots is best seen in the *Livre de l'esperance ou Le livre des trois vertus,* a work begun in 1428 and left unfinished. Interspersing with lyric interludes extensive prose dialogue between the author's personified faculty of Understanding and personifications representing Hope and Faith, Chartier explores many seemingly unanswerable questions about the turmoil and moral decline in France. Having chased away the specters of Melancholy, Indignation, Mistrust, and Despair, whose cumulative influence had brought Understanding to the brink of suicide, Faith and Hope, chiefly the latter, provide extensive lessons to aid in Understanding's recovery. His memory is reawakened to allow him to apply the lessons of secular and biblical history, recounted through numerous exempla, to the current state of affairs in France and to his own spiritual state. Even in its unfinished form, *L'esperance* is a summa of Chartier's own erudition, put to the task of resolving the political turmoil of his time or, at least, of finding an appropriate spiritual context in which to understand it.

Numerous other works, in Latin and French, also bear witness to Chartier's versatility as a writer. Life as a courtier is criticized in the *Curial (De vita curiale),* written after 1422. The *Epistola ad regem* (1418), *Epistola ad Universitatem Parisiensem* (1420), and *Epistola ad detestacionem belli gallici et suasione pacis* (ca. 1422–24) display strongly held political convictions. A number of his diplomatic orations survive, no doubt because of their eloquence: *Oratio ad imperatorem* (1425), *Oratio ad regem Romanorum* (1425), *Persuasio ad Pragenses in fide deviantes* (1425), and the *Discours au roi d'Ecosse* (1428). A number of shorter, more personal Latin prose works bear the clear influence of Cicero: *Invectiva contra ingratum amicum* (ca. 1425), *Invectiva contra invidium et detractorem* (ca. 1425), and *Epistola ad fratrem suum iuvenem* (uncertain date).

The large number of manuscripts, early printed editions, and imitations of Chartier's works attests to his continuing popularity as an author well into the 16th century and beyond.

# CHARTRES

. Originally the capital of the Carnutes, Chartres (Eure-et-Loire), called Autricum by the Romans, was one of the main centers of Gallic Druidism. Indeed, the cathedral of Notre-Dame was founded on the site of a Druidic sanctuary. The town was sacked on several occasions: by the Burgundians (600), Aquitainians (743), and the Vikings (858, 963). In 1360, Edward III's siege of Chartres was his last military action before the Treaty of
Chartres (Eure-et-Loir), plan of Notre-Dame. After Burckhardt and Merlet.
Chartres, Notre-Dame, west façade.

Brétigny. The English occupied Chartres from 1417 to 1432, when it was recaptured by Jean de Dunois.

Chartres was one of the leading intellectual centers in France in the 11th and 12th centuries, renowned for its humanistic studies. Founded probably in the 10th century, the cathedral school rose to prominence under bishops Fulbert (d. 1028) and Ivo (d. 1116). The influence of Plato, Boethius, and Macrobius, as well as a solid grounding in the classical authors, characterized humanistic studies here. The masters at Chartres sought through their studies and writings to demonstrate the essential harmony between faith and reason, between revealed truths and Platonic cosmology. In the universals controversy, the Chartrians inclined to realism. Important masters at Chartres include Bernard of Chartres, Gilbert of Poitiers, and Thierry of Chartres; among leading students were

William of Conches, Bernard Silvestris, and Clarembald of Arras. John of Salisbury was bishop of Chartres from 1176 until his death in 1180.

Two important Gothic monuments are located at Chartres: the famous cathedral of Notre-Dame and the Benedictine abbey church of Saint-Père-en-Vallée. These structures represent stylistic developments in Gothic art from the mid-12th century through the early 14th.

Notre-Dame at Chartres is one of the great Gothic cathedrals. The earliest part of the extant structure is the west façade and narthex, constructed ca. 1140–60 following a fire in 1134, which destroyed the façade of the Romanesque church. It consisted of two bell towers connected by a tripleportal entrance, the Royal Portal. Sculpture articulates the entire façade. Old Testament figures are placed on the jambs, whose historiated capitals contain New Testament scenes. Christ in Glory appears on the central tympanum, and the Ascension is depicted on the north portal. The south portal is dedicated to the Virgin enthroned with Christ on the tympanum, where the Seven Liberal Arts in the archivolts attest to the intellectual importance of the school of Chartres. The volumetric figures with calm demeanor exemplify the Early Gothic style.

Above the Royal Portal are three stained-glass windows depicting the Tree of Jesse (north), Christ's childhood and ministry (center), and a Passion cycle (south). These windows along with a Virgin and Child, *Notre-Dame de la Belle Verrière,* now in the south-choir aisle, are important examples of 12th-century stained glass, notable for their vibrant blue color.

Another fire in 1194 destroyed the cathedral except for the west façade with narthex and the crypt. The new cathedral was substantially complete by the dedication in 1260. Later additions included the 14th-century chapter house with chapel of Saint-Piat east of the chevet, the 15th-century Vendôme chapel along the south aisle, and the north-tower spire constructed by Jean Texier (Jean de Beauce) in 1507–13.

Chartres represents a classic design of a Gothic cathedral. The basilica plan has a nave of seven bays with single aisles and a double-aisled choir of four bays terminating in a chevet with radiating chapels. The projecting transept arms almost bisect the longitudinal axis. Quadripartite rib vaulting provides structural and aesthetic unity. In the elevation, the arcade and clerestory are equal in height. The piers and engaged ribs emphasize vertical lines, which the triforium arcade balances horizontally. The clerestory windows of double lancets surmounted by a rose allow light to permeate the interior. Systematic use of exterior wall and flying buttresses support the effects of light and verticality.

The iconographic programs of Gothic sculptural façades are developed in the north and south transepts. On the north, the central portal is dedicated to the Virgin with her death, assumption, and coronation on the tympanum. The left portal contains infancy scenes on the jambs and tympanum, while the right portal has Old Testament figures with the Judgment of Solomon on the tympanum. The south façade places the Last Judgment in the center

Chartres, Notre-Dame, west façade, central portal, Christ in Majesty. *Photograph: Clarence Ward Collection. Courtesey of Oberlin College.*

with a martyrs portal on the left and a confessors portal on the right. Additional sculpture fills the transept porches. The north- and south-central portals were carved ca. 1200–15 in a style whose clinging drapery accentuates the plastic forms. In the slightly later sculpture of the south-side portals (ca. 1220), the north-side portals (ca. 1230), and the mid-13th-century porches, the drapery falls in heavier vertical folds.

Chartres preserves the greatest amount of French Gothic stained glass *in situ,* with 173 windows. Donors represent a microcosm of medieval society, including craft guilds, clergy, nobility, and royalty. The varied subjects depict saints, biblical episodes and figures, and historical legend, as in the Charlemagne window. Lower-level windows are composed in medallions; higher windows usually contain large figures. Rich red, blue, yellow, and green predominate. As a total ensemble of architecture, sculpture, and stained glass, Chartres expresses the spiritual and aesthetic vision of the Gothic cathedral.

The abbey church of Saint-Père in Chartres is a composite of several periods. The west-tower porch is dated ca. 990. The church without transept extends along a longitudinal axis of nave and choir flanked by single aisles. The elevation of the six-bay nave constructed ca. 1210–40 is similar to Chartres cathedral. The lower level of the

Chartres, Notre-Dame, nave.
*Photograph courtesy of Whitney
S.Stoddard.*

choir retains its 12th-century plan of five bays terminating in a hemicycle with side and radiating chapels. Its upper stories were rebuilt ca. 1260–1300 in the Rayonnant style. The glazed clerestory of choir (ca. 1270 reusing glass ca. 1245), chevet (ca. 1295–1300), and nave (ca. 1300–15) shows developments in stained-glass composition and technique combining *grisaille* and colored panels. Together, the cathedral of Notre-Dame and the abbey of Saint-Père show the importance of Chartres as an artistic center in the Gothic period.

# *CHASTELAINE DE VERGY*

. This anonymous romance of 948 octosyllabic lines was written between 1203 and 1288.
It turns on a series of broken promises. A knight, having sworn never to reveal his love
for the Chastelaine, is obliged to confess it to the Duke of Burgundy because of the
infatuation he has inspired in the duchess. He is thus caught between his promise to his
lady land his allegiance to his lord. The jealous duchess contrives to extract the secret
from her husband, who is caught between his promise and his loyalty to the duchess.
When the duchess reveals her knowledge of the secret love to the Chastelaine, the latter
becomes so distraught she dies. After her maid explains the cause of her death to her
lover, he stabs himself. The duke, realizing his role in the tragedy, kills his wife and
buries the three victims before departing on crusade.

The tale has inspired various interpretations, from *roman à clef,* to a retelling of
traditional themes, to a criticism of *fin'amor,* It has also been suggested that the jealous
duchess belongs more to the fabliau than to the courtly romance. One of the most
intriguing of medieval tales, it continues to inspire diverse interpretations.

# CHASTELLAIN, GEORGES

(1415–1475). Born in Flanders at Alost, Georges Chastellain studied at the University of
Louvain and went to war against the French under Philip the Good. After ten years in
France in the service of Charles VII (1435–46), he returned to Burgundy, where he
served in many capacities at court before Philip appointed him official chronicler of the

house of Burgundy in 1455. Re-appointed in 1467 by Philip's successor, Charles the Bold, who named him a knight of the Golden Fleece in 1473, he continued his work until his death. Although his chronicles are considered his most important contribution, he left numerous literary works, virtually all of which reflect his interest in court life and exhibit the same didactic, moralistic tone. His two historical or political morality plays, the *Mort du duc Philippe* and the *Paix de Péronne,* were both presented in 1468 for Charles the Bold. The first memoralizes the death of Charles's father, and the second celebrates the brief truce between Charles and King Louis XI of France.

Chastellain's many poems represent a change in form but not in substance. The *Epistre au bon duc Philippe de Bourgogne* praises the duke and advises him on his duties. *Rhythmes sur le trespas du bon duc de Bourgongne* laments the death of Philip the Good, while *Souhaits au duc Charles de Bourgogne* looks ahead to the reign of Charles the Bold. Le prince, reflecting the intense political conflict between Charles and Louis XI, sparkles with the passionate anger of the author toward the French king. Chastellain the poet was never far from Chastellain the chronicler.

# CHASTELLAIN, PIERRE

(fl. second half of the 15th c.). Little is known of the life of the poet Pierre Chastellain. In the service of King René d'Anjou, he spent four years in Rome (1450–54). After his return to France, he completed the two poems definitely attributed to him: *Le temps perdu* and *Le temps recouvré.* These semiautobiographical works, inspired by such writers as Vincent of Beauvais, Jean de Meun, and Michault Taillevent, reflect on the poet's past and offer long and sometimes cynical meditations and digressions on themes of poverty, aging, and death.

Chastellain has occasionally but unconvincingly been identified with a certain Jehan Vaillant, a lyric poet in the entourage of Charles d'Orléans.

# CHÂTEAU-GAILLARD

. One of the first European castles raised in the style of the crusader fortifications of the Holy Land. Built at Eure in Normandy in 1196–98 at the behest of the English king Richard the Lionhearted, Château-Gaillard stands on a precipitous cliff 300 feet above the Seine River. The castle consists of three baileys arranged in a line, with a donjon, which may have been a later addition, standing on the edge of the precipice, principally within but also projecting outside of the inner bailey. Five years after its construction, Château-Gaillard was besieged by Philip Augustus. Building his own siegeworks of trenches and towers, Philip began his assault on the castle. Using siege engines, sappers, and mines, the French took their prize in March 1204, but not before suffering high casualties. Château-Gaillard was besieged several times during the Hundred Years' War. In 1418, the French lost the castle

Château-Gaillard (Eure), ruins of castle. *Photograph courtesy of William W.Kibler.*

to Henry V's English forces after six months of siege; in 1420, the French retook it, although the English regained it soon thereafter. Finally, in 1449, Charles VII restored it to French control.

# CHÂTEAU-LANDON

. Of the medieval monuments of Château-Landon (Seine-et-Marne), only the church of Notre-Dame retains its architectural interest. To a late 11th-or early 12th-century nave, a broad transept and open, spacious triapsidal chevet was added in the 1130s-40s. The chevet is of particular interest as a good surviving example of the regional traditions in decoration mainfested in the 12th-century additions to the church of Saint-Denis.

*William W.Clark*

Serbat, Louis. "Excursion à Larchant, Château-Landon, Ferrièresen-Gâtinais." *Bulletin monumental* 75(1911):285–305.

# CHÂTEAUDUN

. Now a sleepy provincial town, Châteaudun (Eure-et-Loir) was an important center in the Middle Ages, with an imposing château that commanded the river below. The château retains a 12th-century donjon and a 15th-century wing with a private chapel.

The most interesting of the remaining churches is La Madeleine, which has a 12th-century nave started on an ambituous scale with double aisles on the north, or town, side. The plan, which initially called for an ambulatory around the chevet, was curtailed with a simple polygonal apse. The elaborate acanthus capitals in the nave recall Parisian work of the third quarter of the 12th century; several are particularly close to examples in the churches of Saint-Denis and Saint-Pierre-de-Montmartre in Paris; others are related to a series of acanthus capitals in the Loire Valley. The south nave wall reveals that rib vaulting was initially planned but like the elaborate east end was abandoned prior to completion, although the aisles have their original vaults. A curious mid-12th-century portal on the south side was rediscovered in 1885. Major repairs were necessary in the 16th and 17th centuries and in the aftermath of World War II.

First mentioned in 1037, the church of Saint-Valérien was built in the 12th century and given rib vaults in the later years of that century. Heavily remodeled in 1491 and again in 1591, the aisles nevertheless preserve groin-vaulted bays. The flat chevet was covered by an elaborate ten-part rib vault. In all, Saint-Valérien is related to architectural practices slightly to the east, perhaps ultimately owing to Sens, in which naves were given six-part vaults matching double aisle units.

# CHÂTILLON

. Taking its name from the castle of Châtillonsur-Marne (Marne), the Châtillon family served as castellans there for the counts of Champagne, who held the fortress in fief from the archbishops of Reims. The first member of the family known to hold this office was Gui (fl. 1059–87), from whom descended a line of knights whose sphere of activity and influence soon passed beyond the borders of Champagne. By 1127, Henri I de Châtillon was lord of Montjay, located about 18 miles from Paris.

The office of castellan of Châtillon was hereditary and included rights and property that formed the nucleus of a castellany that must be distinguished from the more important count's castellany of Châtillon, which included the donjon and the town and continued to exist as a separate entity. The holdings at Châtillon eventually were among the less important possessions of the family, which advanced to a higher social level through the marriage, in the early 1160s, of Gui II to Adèle de Dreux, granddaughter of King Louis VI. At the time, Gui was already lord of strategically located Montjay, and the marriage served a political purpose for both Adèle's uncle, Louis VII, and her father, Robert I de Dreux.

The children of Gui II and Adèle included Gaucher III, who married the heiress to the county of Saint-Pol, and Robert (d. 1215), who became bishop of Laon in 1210. Gaucher III was *bouteiller* of Champagne, seneschal of Burgundy by 1193, and in 1210 one of the leaders of the royal army. He fought heroically at Bouvines in 1214. His sons, Gui III and Hugues I, married descendants of Louis VI, heiresses, respectively, to the counties of Nevers and Blois. Gui III (d. 1226) left a son who died childless, but from his daughter Yolande, countess of Nevers and wife of the lord of Bourbon, descended the dukes of Bourbon and Bar and the later dukes of Burgundy. From Hugues I descended the counts of Porcien and the counts of Saint-Pol. The latter line ended with another Gui, who died in England as a hostage ca. 1363. His sister's marriage brought Saint-Pol into the house of Luxembourg.

Gaucher de Châtillon (d. 1329), called (perhaps erroneously) Gaucher V, was a grandson of Hugues I. He united the two castellanies of Châtillon by receiving from Philip IV in 1290 the rights that had belonged to the counts of Champagne, whose heiress was Philip's queen. By the end of 1303, he had returned the count's castellany to the king in exchange for other lands and rights, some of which were combined with his newly purchased lordship of Château-Porcien to form, by royal grant, the county of Porcien. Gaucher also held the office of constable, both for Champagne and for France. The counts of Porcien and the lords of Dampierre were descended from his son Gaucher. Jacques de Châtillon, lord of Dampierre and admiral of France, died at Agincourt in 1415. From Constable Gaucher's son Jean, lord of Châtillon (d. 1363), descended a line that died out in the second half of the 15th century.

# CHÂTILLON-SUR-SEINE

. In the high Middle Ages, the small town of Châtillon-sur-Seine (Côte-d'Or), a former center of Gallic and Gallo-Roman activity, enjoyed the protection of a château owned by the bishops of Langres. According to tradition, one of them, St. Didier, founded the oratory of Sainte-Marie-du-Château in the 4th century. In 868, during the Viking invasions, the relics of St. Vorles (d. 592) were transported to the oratory at the instigation of Isaac le Bon, bishop of Langres. This translation is the origin of the church of Saint-Vorles, built in the last years of the 10th century.

The original plan of the church was distorted by careless construction, particularly in the chevet, and parts of the church have been gutted; yet one of its most distinctive features is still easily recognized: the transept or massive transversal, situated in front of the nave, perhaps inspired by Carolingian *églises-porches*. The transept includes a crossing covered by a cupola and two projecting crossbars, vaulted in semicircular Romanesque arches. Of the original choir, only the principal apse remains. In the Lombard style, which is exceptional for this northern part of Burgundy, Saint-Vorles displays unwieldy and massive internal structures with minimal decoration.

*E.Kay Harris*

Deshoulières, François. "Église Saint-Vorles." *Congrès archéologique (Dijon)* 91(1928):184–205.

# CHAUVIGNY

. Built on a spur over the Vienne, Chauvigny (Vienne) preserves the remains of four medieval fortresses, a testimony to its military importance in the period. The Château Baronnial was begun in the 11th century, when

Chauvigny (Vienne), view of town.
*Photograph courtesy of Whitney S. Stoddard.*

Chauvigny was a possession of the bishops of Poitiers. It has a massive square 12th-century keep with flanking turrets. The Château d'Harcourt (13th–15th c.) belonged to the viscounts of Châtellerault and retains its entry tower and impressive ramparts. Ruins of the Château de Mauléon (12th and 15th c.) and the square keep of the Château de Gouzan (11th c.) are still evident. The Romanesque church of Saint-Pierre, founded by the lords of Chauvigny, was begun in the 11th century and completed with an impressive 13th-century double-bayed bell tower. The interior is remarkable for the richness and originality of the sculpted and polychrome capitals in the choir. All are naively carved but enormously expressive; some are grotesques (dragons, monsters), but most are biblical, including such motifs as the Annunciation, Adoration of the Magi, and Presentation in the Temple. The triple-apsed Romanesque church of Notre-Dame likewise preserves important sculpted capitals but is more remarkable for the late 14th- or early 15th-century mural of Christ Bearing His Cross, attended by numerous civil and religious leaders.

# *CHEVALERIE OGIER*

. Early 13th-century chanson de geste. Ogier, originally a legendary hero of the Ardennes region *(Ogier [Ar] denois),* the heartland of the Carolingians, has often been confused with the historical Autcharius Francus, who defended the rights of the children of

Charlemagne's younger brother, Carloman (d. 771), when he accompanied them to the Lombard king Desiderius in Pavia. From this confusion sprang the dichotomy of Ogier: on the one hand, he is one of Charlemagne's most loyal peers, attested as such in the *Nota Emilianense* (ca. 1070), the falsification of Saint-Yrieux (ca. 1090), the *Chanson de Roland,* and the *Voyage de Charlemagne;* on the other hand, the tradition of a rebel is found since the *Conversio Othgerii militis* of the abbey of Saint-Faron at Meaux (ca. 1070–80).

Ogier as a rebel is the subject of the *Chevalerie Ogier,* which was probably composed by a certain Raimbert de Paris. In 12,346 assonanced decasyllables, the poem tells how Ogier, son of King Godefroy of Denmark, is left as hostage and educated at Charlemagne's court and is later knighted by the emperor during a fierce battle against the Saracens under the walls of Rome. He becomes an intractable rebel after his bastard son Bauduinet is killed by Charlemagne's son Charlot over a game of chess, a crime left unpunished by the king. Ogier eludes the Frankish army thanks to his miraculous horse, Broiefort; he turns quite ferocious, finally holing up in Castel Fort, where he sustains a seven-year siege. The only survivor, he escapes but is found, exhausted, by Turpin, whom Charlemagne puts in charge of the prisoner at Reims. After seven years in prison, a Saracen invasion makes his help necessary. Ogier kills the Saracen king and saves France. Charlemagne and Charlot hold his stirrups after his safe return; Ogier then weds the daughter of the king of England, whom he had freed from the Saracens, and receives from Charlemagne the fiefs of Hainaut and Brabant. At his death, he is buried in Meaux.

The *Chevalerie Ogier* is a romanticized reworking of a lost 12th-century epic known only from a *remaniement* in Alexandrines of the 14th century (still unpublished), a lost poem in decasyllabic laisses (ca. 1350) recognizable in Jean d'Outremeuse's *Myreur des histors* in prose (second half of the 14th c.), and the prose romance *Ogier le Dannoys* (15th c.). The first *branche seems* to be preserved in Adenet le Roi's *Enfances Ogier* (ca. 1290) as well as—though differently—in Book 3 of the Norwegian *Karlamagnús saga,* the Danish *Karl Magnus Krønike,* and the Franco-Italian *Uggeri il Danese.*

# *CHEVALIER AU BARISEL*

. Also known as *Le conte du barril,* this pious tale from the early 13th century is transmitted to us in three versions. In a little more than 1,000 octosyllabic couplets, the poet tells of an evil knight who has nothing but disdain for his fellow man, who has no interest in religion, and who has been in a state of sin for thirty years. Prodded by his men into accompanying them to visit a saintly hermit, he finds himself telling his sins. The hermit suggests a number of penances. The knight turns them all down as too troublesome. He does accept an easy one—to fill up a bowl (*barisel* 'keg, cask') with water. But the task turns out to be difficult; indeed, no water will stay in the container. At the end of a year of effort, transformed into a haggard, poverty-stricken man, he reappears at the hermit's dwelling. The hermit is filled with grief at the thought that the knight will go to Hell, and this compassion causes the knight to repent and weep. One tear falls into the *barisel* and fills it up. In conclusion, the poet reminds us that God is always ready to forgive repentant sinners. The tale is told with economy, yet with lively dialogue and craftsmanlike presentation of the transformation of the hero.

# *CHEVALIER AU PAPEGAUT*

. Found in a single manuscript (B.N. fr. 2154), the early 15th-century prose romance *Le Chevalier au Papegaut* contains a series of adventures from a number of earlier romances, here assigned to Arthur. Arthur leaves his kingdom in the hands of King Lot to answer the call of a distressed damsel. Traveling incognito, his first adventure is to win a parrot, which will be a comic presence throughout the romance. After a series of complicated and amazing adventures on both land and sea, Arthur rescues the princess Flordemont and returns home. This complex but humorous romance appears to have had no influence on subsequent Arthurian literature.

# CHILDERIC I

(ca. 436–482). The father of Clovis I and the first fully historical figure of the Merovingian dynasty, Childeric I was one of several chieftains of the tribes of the Salian Franks of northern Gaul, with his power based on Tournai, in modern Belgium. He made his group of Salian Franks important in the affairs of northern Gaul and set the stage for the greater career of his son.

Childeric's own career is poorly known, but in broad terms it prefigures that of Clovis. He came to power by 463 and appears to have been a loyal federate of the Roman Empire. He supported Roman military operations in northern Gaul all the way to the Loire—fighting under Aegidius against the Visigoths at Orléans in 463 and under Count Paul against the Saxons at Angers in 469. He also opposed the Alani at Orléans. He may have held Roman authority in the province of Belgica Secunda, and Frankish legends also report an eight-year exile that he may have spent in Thuringia. Childeric left a good reputation among the Christians of northern Gaul.

What was probably his grave was discovered outside the walls of Roman Tournai in 1653. Reflecting the mixed nature of his career, the grave produced a signet ring bearing his name and the Latin title *rex,* the remains of the uniform of a Roman official, and Frankish weapons. Most of the items were stolen in 1831.

# CHILDHOOD

. In medieval France, people defined childhood according to the Roman categories of the Ages of Man: early childhood ended at age seven, and puberty was legally established at age twelve for girls, fourteen for boys. A great deal of legal capacity and responsibility was already attributed to children and adolescents in medieval France. A child of seven could be engaged to be married, enter minor clerical orders, hold a benefice without cure of souls, and sometimes be held responsible for crimes. On reaching puberty, an individual might marry, confirm a religious vocation, hold a benefice with cure of souls, be a witness in civil cases, and consistently be held responsible for crimes. Yet a person was not considered to have reached full adulthood until the age of twenty-five, and the word *adolescens* might qualify men as old as thirty.

The care and treatment of children are documented sparsely until the late Middle Ages, from which period date texts concerning children of the aristocracy and bourgeoisie. Babies then usually received a ritual bath immediately after birth and were baptized the following day. They were breast-fed on demand by the mother or sometimes a wet-nurse and given gruel until about age two, when they adopted an adult diet. Babies were swaddled for the first year, then dressed in loose robes. Children played with dolls, balls, hobby horses, and tops and at such games as hide-and-seek, hopscotch, and blind-man's-bluff. Although childraising was more a female than a male concern, fathers often participated in all the tasks of childraising except, apparently, hygiene. By the age of seven, many children, if not enrolled in a school, were sent outside the family—to train to be a knight, to enter clerical or religious orders, to train as an apprentice, or to work directly—according to the social status of the child's family.

About one out of three children fell victim to the high infant-mortality rate before the age of five. This fact, among others, has led some historians, like Philippe Ariès, to argue that parent-child relationships could not have been very intense, but recently such historians as Emmanuel Le Roy Ladurie and Danièle Alexandre-Bidon have emphasized the warmth and intensity of parental attachment evident in many texts.

# CHILPERIC I

(ca. 537–584). The youngest son of the Merovingian king Clotar I, Chilperic I was king of the Franks first at Soissons and then at Paris. A panegyric by Venantius Fortunatus lauds Chilperic for his power and intellectual achievements, but the more famous work of Gregory of Tours condemns Chilperic as the "Nero and Herod of our time."

Upon the death of Clotar I in 561, Chilperic received a kingdom centered on Soissons, but most of his reign was consumed in warfare to gain a larger realm at the expense of his brothers Charibert, Guntram, and Sigibert. Chilperic's responsibility for the murder of his Visigothic wife, Galswintha, and the subsequent elevation of the low-born Fredegunde as his chief wife intensified his struggle with his brother Sigibert I, who was married to Galswintha's sister Brunhilde. After Sigibert's assassination in 575, Brunhilde married Chilperic's son Merovech, whom Chilperic later had killed. By the time of Chilperic's own assassination in 584, two decades of internecine struggle had left him in control of the largest of the four Merovingian kingdoms, comprising Neustria and Aquitaine.

In spite of Gregory's hostile account, it is clear that Chilperic possessed a keen mind. He composed verse and hymns, wrote a book questioning the Trinity, added letters to the Roman alphabet that more accurately reflected Frankish pronunciation, and added a

provision to Salic Law permitting daughters to inherit ancestral lands if no brothers were alive.

# CHINON

**.** The town and castle of Chinon (Indre-et-Loire), located in Touraine, was the site of a truce concluded in 1214 between Philip II Augustus and John Lackland of England following the French victories of that summer.

Chinon's major claim to fame, however, arises from events that occurred during Charles VII's residence there in 1428–29. Charles concluded a treaty with James I of Scotland that arranged for the marriage of James's daughter Margaret to the five-year-old heir to the French throne, the future Louis XI. In September, Charles convened the Estates General at Chinon in a rare gathering that included representatives from nearly all parts of France then under his control and granted him a substantial tax without demanding ratification by regional estates. In the ensuing months, the English besieged Orléans, and there was every prospect that they would take this critical city. Charles VII was still at Chinon during late February 1429, when Jeanne d'Arc arrived at his court and launched her brief but spectacular public career by persuading him to let her accompany the troops who would make a final effort to relieve Orléans.

One of the largest castles in western Europe, Chinon is in actuality the ruins of three separate fortifications, divided by deep moats: the 13th-century Fort-Saint-Georges, built by Henry II Plantagenêt and named for the patron of England, with its principal fortifications to the east; the 12th- and 14th-century Middle Castle, with its well-preserved clock tower; and the Château de Coudray, constructed by Philip Augustus in the 13th century. Within the town are the medieval churches of Saint-Maurice (12th-16th c.), Saint-Étienne (15th c.), and Saint-Mexme (10th, 11th, and 15th c.).

# CHIVALRY

. The word *chevalerie,* related to *chevalier* 'knight,' has been used as a collective noun, to refer to a body of knights, or to all knights, or to an entire social order—all members of the class from which knights were drawn. Yet it also meant a set of values, a collection of virtuous qualities that became a code of conduct for those who belonged, or aspired to belong, to the aristocracy of mounted warriors. Modern writers usually refer to chivalry in this sense.

Some of these values have been associated with all warrior societies. Others survived into modern times because of their appeal to social elites. The true age of chivalry, however, fell between 1100 and 1500, and the incubator, if not the birthplace, of chivalry was France. To understand chivalry is to understand the "chivalric virtues," but different sources in different periods gave them different emphasis, reflecting the agenda of the writers. There are three main types of sources: ecclesiastical, literary/romantic, and instructional treatises. In them, we find six major virtues, of which two had almost universal acceptance: prowess (a combination of courage and style) and loyalty. Almost as important was *largesse,* which drew support from different groups for different motives. The virtue of courtesy appeared later and survived longer than the others, but its meaning varied greatly. A fifth virtue, associated with words like "honor" and "glory," was of greater importance in some periods than in others. Finally, an imprecise concept of good birth and virtuous behavior was embodied in the word *franchise*.

Huizinga contended that this value system became divorced from "harsh realities" in the declining civilization of the later Middle Ages. Recent scholars, who tend to refute Huizinga, have had to evaluate chivalry in its social and cultural context over successive centuries. The most admired chivalric virtue was prowess, a quality esteemed in fighting men for centuries and not specific to the heyday of the medieval knight. Loyalty had roots in the war bands of early Germanic society and remained important under the Carolingians. By the 11th century, most warriors were men who owed a lord personal service, and loyalty was an important virtue.

Perceptions of loyalty and disloyalty evolved over time. Early epic literature often portrayed faithful warriors who were wronged by their lords. By the 12th century, however, villains of the stories were knights who betrayed their lords. By the 14th century, treason was a crime against the king associated with *lèse-majesté*. Loyalty, then, was a reciprocal obligation between a warrior and his lord, which evolved into an obligation to the king, who was increasingly the embodiment of a state. Finally, loyalty was a reciprocal obligation among the members of the lay orders of knighthood that proliferated in the 14th and 15th centuries.

The virtue of generosity, or *largesse,* doubtless originated in the distribution of booty among members of a war band, but it acquired new economic significance in the 11th century, when the knight had become a trained warrior requiring a strong war-horse and expensive equipment. Knighthood now became an increasingly aristocratic occupation, and those without sufficient lands could be properly equipped only through their lord's

generosity. If *largesse* was important to the poorer knights, it also received emphasis from the troubadours, who sang or recited epic tales to noble audiences. Since their livelihood depended on the generosity of their listeners, they had a particular economic stake in promoting *largesse* and making stinginess a mark of unknightly behavior.

In the dangerous and disorderly 11th century, lords seeking to build up a cavalry force turned increasingly to feudal institutions. The spread of the fief reinforced the tendency of noble lineages to consolidate their positions by leaving most of the family patrimony to a single heir. Hundreds of noble families produced sons trained as knights but lacking any prospect of an inheritance. These unmarried landless knights, the "youth" described by Georges Duby, posed a threat to public order and induced the church to accelerate its efforts to regulate warfare. From the dawn of the 11th century, the church promoted a peace movement aimed at protecting the defenseless against the depredations of warriors. Toward the end of the century, it began promoting the Crusades, one objective of which was to direct aggressive fighting men away from Catholic Europe and into projects that served the Christian church. The influence of the church on chivalry has been debated: did ecclesiastical writers describe anything approaching reality, or only an ideal? Certainly, sources emphasize the idea of knighthood as an order of society with a Christian calling, and they present the view that proper knightly behavior required the considerate treatment of noncombatants, with an obligation to defend the weak against the strong. This principle, an important addition to the values of chivalry, was embodied in the virtue of courtesy.

Courtesy is generally associated with the proper treatment of women, but it was not restricted to this sense in 12th-century literature. In many romances, the knighterrant is recognizable as a landless noble "youth." The heroes displayed the chivalric virtues, treating kindly those who were defenseless, defeating opponents who violated chivalric norms, and being rewarded with the hand of an heiress or a respected position in royal service.

As knights became recognized as part of the nobility, and as some nonnobles became wealthier and no longer economically inferior to the knights, chivalry began to acquire greater class-consciousness. High birth grew in importance, especially as a qualification for membership in one of the chivalric orders. Toward the end of the Middle Ages, an increasingly literate aristocracy grew more interested in the culture and literature of ancient Rome, and Roman influences began to supplant those found in the medieval romances. The result was a stronger interest in honor and military discipline, while courtesy became more and more restricted to relations with other members of one's own class, particularly women.

An earlier Roman influence, that of law, had made its presence felt by the 13th century, producing a gradual codification of the rules governing warfare. This *ius militare* was a legal manifestation of chivalric principles, but it dealt only with the relations among members of the military class. The church's earlier concern for the defenseless nonwarrior was relegated to the background in the later Middle Ages, and in this sense Huizinga may have rightly perceived a distortion of former ideals.

Chivalry acquired more elaborate and ceremonial trappings, especially the tournaments, which still provided the essential military training that had called them into being ca. 1100. The elaborate display did not mean that chivalry had lost touch with reality. As long as kings needed warriors with the equipment and training of a knight, the

chivalric lifestyle was an essential element in providing the necessary pool of personnel. What had changed was the attitude toward depredations by undisciplined warriors. In the 15th century, such brigandage was a felonious infringement of the king's monopoly in matters of war and peace. Three centuries earlier, when that monopoly was inconceivable, undisciplined violence by troops drew criticism for violating the Christian knight's obligations toward noncombatants.

# CHRÉTIEN DE TROYES

(fl. 1165–91). Although Chrétien wrote lyric poetry in the troubadour and trouvère traditions, he is known principally for his Arthurian romances, where he appears to have treated for the first time, in French at least, the chivalric quest, the love of Lancelot and Guenevere, and the Grail as a sacred object. He also emphasized the problematic side of the love of Tristan and Iseut and may have contributed to the spread of this legend in French in an early work that is lost today.

Although the chronology of his writings is uncertain, the order of composition of his major romances seems to be as follows: *Erec et Enide, Cligés, Le chevalier de la charrette (Lancelot), Yvain (Le chevalier au lion),* and *Le conte du graal (Perceval).* He may also have written *Philomena,* an adaptation of the Ovidian story of Philomela (*Metamorphoses* 6.426–74), and *Guillaume d'Angleterre,* a saint's life told like an adventure romance. The prologue to *Cligés* refers to works Chrétien wrote in his early years: *Philomena* ("de la hupe et de l'aronde") and another, lost, on the tale of Pelops ("de la mors de l'espaule"), as well as French versions of Ovid's *Ars amatoria* and *Remedia amoris,* and a Tristan story, concerning which, curiously, Chrétien does not mention Tristan himself: "del roi Marc et d'Iseut la blonde." He is also the author of two courtly chansons in the trouvère tradition.

Chrétien names as patrons Marie de Champagne, the first daughter of Eleanor of Aquitaine and Louis VII of France, who, he writes, gave him the *matiere* and *san* for the *Charrette,* and Philippe d'Alsace, count of Flanders, who gave him "the book" for the *Conte du graal.* Philippe died in the Holy Land in 1191, which may explain why the

romance is incomplete. But there is also evidence that Chrétien died before completing it. The last 1,000 lines of the *Charrette* were written by the otherwise unknown Godefroi de Leigni, who names himself in the epilogue and says that he is following Chrétien's plan for the romance. The *Charrette* plot is referred to three times in *Yvain,* and it is likely that Chrétien worked on the two romances at about the same time; this may explain why he left the completion of the *Charrette* to another, whose work he supervised while himself completing *Yvain.*

*Erec* treats the love of Erec and Enide. In the first part, Erec successfully completes the combat for the sparrowhawk and brings Enide to Arthur's court, where they marry. A dispute between husband and wife breaks out in the second part because Erec abandons deeds of prowess, notably in tournaments, to dally with his wife. Erec and Enide set out in quest of reconciliation, after which they return to Arthur's court and are crowned king and queen there upon the death of Erec's father.

*Cligés* also has two parts. The first relates how Alixandre, the first son of the Emperor of Constantinople, goes to Arthur's court to test his mettle, falls in love with Gauvain's sister, Soredamors, and helps put down an insurrection by one of Arthur's vassals. Alixandre and Soredamors then marry. The second part recounts the career of their son, Cligés. Alixandre's younger brother, Alis, had been crowned emperor during his older brother's absence. The latter relinquished the throne after Alis had promised not to marry so as to allow Cligés to succeed him. But Alis breaks his word by marrying Fenice. Fenice and Cligés fall in love. At the end of a complicated plot, including a magic potion, a false death, and a secret hideaway, Alis dies and Cligés and Fenice are united in matrimony.

The *Charrette* tells the first known version of the love of Lancelot and Guenevere. The queen is abducted by Meleagant to the land of Gorre. Lancelot, known as the Knight of the Cart after riding in that infamous conveyance, succeeds in saving her from her captors while liberating Arthur's subjects held captive with her.

*Yvain* tells how the hero knight wins the hand of Laudine, the lady of the magic fountain, by defeating and mortally wounding her husband. After this courtly variant of the Widow of Ephesus tale, Yvain neglects to return to her after more than a year of following tournaments, then goes mad when she repudiates his love. A quest ends with their reconciliation. During the quest, Yvain aids, befriends, and is accompanied by a lion—whence his sobriquet: the Knight with the Lion. *Yvain* offers interesting parallels and contrasts in plot, structure, and theme with *Erec.*

Chrétien's last major work, the incomplete *Conte du graal,* or *Perceval,* relates how a young, naive squire rises to prominence through combat and love, then fails in the adventure at the Grail Castle because an earlier wrong or "sin" committed against his mother ties his tongue, preventing him from asking the questions he should. The Grail Castle is closed to him, and, as he later learns, great misfortune spreads through the land because of his fault, affecting orphans, widows, and others whom the knight should protect. Perceval sets out to right the wrong. After five years of wandering, during which time he forgets God, Perceval finds himself and God again at his uncle's hermitage, where he also learns of his fault. Interlaced with Perceval's quest are the adventures of Gauvain, accused of murder, and later obliged to seek the Bleeding Lance, which was also found in the Grail Castle during Perceval's visit there. The romance breaks off while relating his remarkable adventures.

Chrétien's romances each average about 7,000 lines and comprise two parts, with the exception of the *Conte du graal,* which extends to somewhat more than 10,000 lines, an apparently more complex variant of the two-part narrative structure. All are written in octosyllabic rhymed couplets, but without the regular alternation between masculine and feminine rhymes that came to characterize classical Alexandrine couplets. Of more importance for the evolution of French romance from verse to prose was Chrétien's extensive use of the "broken" couplet. Before Chrétien, rhymed couplets in French tended to be taken as wholes, so that no sense or breath arrest took place other than on the even-numbered line. Chrétien favored "breaking," whereby the arrest occurred on the odd-numbered line. This reduced the formality of verse enunciation and, besides the freedom it allowed the writer, was a step toward the transition to prose romance in the 13th century.

Chrétien is remarkable for his self-conscious artistry. He seems to have been proud of his achievement, judging by the evidence of the prologues written to almost all his works, as well as by interventions wherein the narrator comments on his art, ideas, and narratives. He knew that his works contributed to fostering French civilization, especially its chivalric and intellectual features. The *Cligés* prologue in particular stresses and conjoins aristocratic *chevalerie* and learned *clergie*. Whatever he may have understood specifically by these ideals, it is clear that they vouchsafed a civilization that came to France from Greece and Rome. However, the prologues to *Erec* and the *Charrette* are most explicit regarding the art of romance, which Chrétien helped define and illustrate. They identify three major features of Chrétien's art: *matiere, san,* and *conjointure*.

The question of Chrétien's putative sources is complex. He refers to written sources in the prologues to *Cligés* and the *Conte du graal;* his Ovidian tales also illustrate his use of traditional written sources. However, the Arthurian *matiere* is explained by its origins in Celtic legend. Chrétien mined oral traditions for his tales. The prologue to *Erec* mentions the jongleurs who had related the story before him, and other sources refer to itinerant storytellers who told marvelous stories about Arthur, Tristan and Iseut, and other Celtic heroes and heroines. We know little about these stories. None has survived in its original state. It is generally believed that they provided the Round Table, as well as most of the names of knights and ladies; the motif of the quest as a passage into the otherworld—the world of the dead, of adventure, of marvelous love between a man and a woman who is not mortal—was probably drawn from Celtic traditions circulating in Chrétien's time. Earlier versions probably had a mythological basis, but Chrétien most likely knew or understood little about it. One clear example of the "Celticity" of Chrétien's sources is the quest in *Erec*. Erec and his wife have a misunderstanding about his love for her. They both set out on a quest and encounter many adventures that test Erec's prowess and Enide's love. The final adventure in the quest is with the count Limors, readily understandable to French ears as "the Dead." During the couple's return, they encounter the adventure known as the Joy of the Court. A huge knight does battle in a magic garden of eternal spring. Whenever he defeats an opponent, the latter loses his head, which is then fixed on a stake in the garden. Erec's victory ends the custom and releases joy in the garden and the outside world. Rituals of combat and death, following prescribed custom, were known in Celtic tradition as *geis*. In Chrétien's romances, they become the more or less euhemerized adventures of questing knights. The inexplicability of such adventures accounts for their marvelous quality.

The *san* that Chrétien says he received for the *Charrette* from Marie de Champagne seems to imply context, significance, an informing idea that is drawn out of the *matiere* to explain it in a manner comprehensible to Chrétien's audiences. In the *Charrette,* for example, the bringing together of Lancelot and Guenevere as lovers has generally been taken to imply that Marie's *san* was what is today called courtly love—an ennobling love shared by the queen and her lover. That Chrétien makes a mystery of Lancelot's name until near the midpoint of the romance suggests that his audiences did not know who Lancelot was until Guenevere names him for the first time while he is fighting for her liberation.

The *Charrette* begins with a quest for Guenevere after her abduction. The knight who liberates her and others entrapped in the kingdom of Gorre makes it obvious early in the narrative that he loves the queen in a most extraordinary way. He is willing to compromise his honor in the eyes of all if it serves her liberation by mounting the shameful cart in order to find her again. Although Lancelot is subject to fits of despair and self-forgetfulness, nothing prevents him from carrying out his service and liberating the queen. In fact, his love seems rather to make it possible for him alone to accomplish the quest. He meets numerous adventures along the way, including a damsel who offers her love if he will protect her from a would-be rapist; the lifting of a mysterious tomb that only the knight able to liberate the queen can open; and the crossing of a sword-bridge on bare hands and knees. Lancelot's return to Arthur involves his own abduction and a great tournament that demonstrates anew his service for the queen.

Much ink has flowed in efforts to determine whether Chrétien approved or disapproved of the adulterous liaison between Lancelot and Guenevere. Basic to the dispute is the presumed adulterous character of courtly love. Courtly love, as a term, is a modern invention. In the Middle Ages, writers spoke of *fin'amors,* stressing the adaptability of love to different contexts, environments, and social circumstances. The basic features seem to have been the joy it produced and the resulting good that accrued to the lovers and the world in which they lived. Chrétien affirms Lancelot's joy, as well as his accomplishments, despite the difficulties the love causes him.

A striking feature of Chrétien's romances is the close relation obtaining between love and prowess. Prowess is not only prowess in arms but the sum of those qualities that represent worth in the knight or lady—the *chevalerie* of the *Cligés* prologue. Arms may demonstrate worth, but so may the quality of love the knight and lady share. Chrétien's courtly chansons evince an effort to overcome the constraints of human passion and make it enhance individual worth and serve noble ends, most notably by the rejection of the irrational features of Tristan and Iseut's love. The rejection also occurs in the romances, especially *Cligés,* It is important to note that, in both the broader medieval context and in Chrétien's own romances, adultery is not predominant, despite the example of Lancelot and Guenevere. More striking, in a medieval context, is the emphasis on conjugal love. The notion must have seemed much more original in the 12th century than it may appear today, after centuries of love stories. That marriage could be more than a social or family obligation is obvious in Chrétien. Erec chooses his bride without consulting his family, and so does Yvain. And there is no sense of forced marriage except for Fenice in *Cligés,* and that marriage does not succeed precisely because it is forced and because the husband, Alis, in marrying, violates an oath made to his brother and thus threatens the succession of his brother's son, Cligés, to the throne.

Marital problems do arise, but they are also solved. Chrétien insists on a certain equality between the spouses. Not that he meant a contractual equality in any modern legal sense but rather a natural, noble equality that was tried and tested in conflict with the outside world and in the resolution of disputes that occur in the marriage.

The word *conjointure* occurs only once, at least in the sense used to describe romance narrative—in the prologue to *Erec*. Chrétien distinguishes his "very beautiful" *conjointure* from the stories about Erec told by storytellers, who were wont, he says, to take apart and leave out material *(depecier et corronpre)* that belonged in the tale. This seems to mean that Chrétien's romance puts the story together as it should be, omitting nothing essential. That "putting together" would include both *matiere* and *san*. This appears to be the case in Erec, whose first part combines two stories, the sparrowhawk episode and the hunt for the white stag, to each of which Enide, because of the qualities that make her desirable as a spouse, provides a denouement. In the sparrowhawk contest, Erec proves that Enide is the most beautiful woman, and Arthur bestows the "kiss of the white stag" on her for the same reason.

Enide's beauty comprehends qualities of body, vestment, and, most importantly, mind and mentality that make her exemplary of perfect womanhood. In the aristocratic world of medieval romance, where everyone of worth is "naturally" on a pedestal, Erec and Enide come together out of admiration and a kind of noble affinity. By the identification of the qualities of persons—the invention of those qualities in source material and their elucidation in romance narrative—Chrétien brings together the disparate elements of the storytellers' versions and fills out the missing features in his new romance. The *molt bele conjointure* depends on the disparate elements of romance marvels, reveals the ideal truth perceived in them by 12th-century civilization, and articulates a new, marvelous narrative. Once the exceptional quality of that narrative was recognized—apparently as early as *Cligés*—a new genre had emerged. The word *roman,* which first meant "in the French language," came to mean "romance" as a narrative recounting marvelous adventures that express an aristocratic ethos. That achievement was Chrétien's.

Chrétien's popularity in his own day is attested both by the unusually large number of surviving manuscripts of his romances—an average of seven for the first four, and as many as fifteen for the *Conte du Graal*—and the enduring influence he had on the romancers who succeeded him. While such writers as Jean Renart and Gautier d'Arras deliberately set out to rival him, others more wisely welcomed his influence in their work. His most influential romances were the two he left unfinished: the *Chevalier de la charrette* and the *Conte du Graal*. The latter spawned a series of verse continuations in the early 13th century, while both provided inspiration for the immensely successful *Lancelot-Grail* or *Vulgate Cycle* of the second quarter of the same century. The Grail story was also reworked independently by the anonymous author of the *Perlesvaus.*

# CHRISTINA MIRABILIS

(1150–1224). Blessed Christina was born in the town of Saint-Trond. After the death of her parents, she took to tending sheep and eventually lived as a laywoman at the monastery of Sainte-Catherine. Christina's life is described in a *vita* composed by Thomas de Cantimpré. Unlike other women mystics of her era, Christina focused exclusively on extreme physical phenomena to express her spirituality. Her extraordinary charismatic gifts—salamandrism, clairvoyance, bodily elongation, levitation, agility—served the community as a reminder of Purgatory and an exhortation to live a life free of sin while still in this world. Her *vita* constitutes a transitional type of saint's biography, in that it mixes an earlier focus on revelations about Purgatory with a 13th-century concern with biographical information and mystical phenomena.

# CHRISTINE DE PIZAN

(ca. 1364–ca. 1430). France's first woman of letters was in fact born in Italy, where her father, Tommaso de Pizzano of Bologna, was employed by the Venetian Republic. Soon after Christine's birth, her father was appointed astrologer and scientific adviser to the French king Charles V, so the family established itself in Paris in the shadow of the French court. Christine's early taste for study was interrupted by marriage at sixteen to Étienne du Castel, a young notary from Picardy, who was soon given a promising appointment to the royal chancellery. This happy marriage was interrupted ten years later by the husband's unexpected death, leaving Christine to support three children and a widowed mother. She found herself in a world that had little respect for women, where she was cheated at every turn. She found comfort in study and in writing poetry to express her grief and she soon discovered a talent for writing verse in the fixed forms popular in her day.

Her writing brought her into contact with the court of Louis of Orléans, to whom she dedicated several works, beginning with a narrative poem, the *Épistre au Dieu d'Amour* (1399), which makes fun of fashionable young men who pretend to *fin'amor* while reading Ovid and Jean de Meun. This work was followed by other narrative poems: the *Dit de Poissy* (1401), *Le Débat des deux amants, Livre des trois jugemens,* and *Dit de la pastoure* (1403). These eventually led to even more ambitious allegorical poems, the semiautobiographical *Chemin de long estude* (1402–03), which also commented on society's current troubles and proposed an international monarchy, and a lengthy account of the role of Fortune in universal history, the *Mutacion de Fortune* (finished at the end of 1403).

It was also to Louis of Orléans that Christine dedicated an equally ambitious work in poetry and prose, the *Épistre Othea* (ca. 1400) combining a commentary on classical mythology with advice to a young knight. It was one of her most popular works. As the duke was unwilling to find a place in his household for Christine's son, Jean du Castel, after 1404 no further works were dedicated to him. At about this same time, Christine was commissioned by the duke of Burgundy, Philip the Bold, to write a biography of the late king, the *Faits et bonnes meurs du sage roy Charles V* (1404), her first work entirely in prose.

Slightly earlier, her views on Jean de Meun and the *Roman de la Rose* had involved Christine in a debate with members of the royal chancellery, Jean de Montreuil and Gontier and Pierre Col, who admired Jean de Meun's erudition, whereas she saw his unfortunate influence on society's attitudes toward women. Christine did not start the debate, as was formerly thought, but she moved it from a private theoretical discussion to a wider audience by giving copies of the letters it inspired to the queen and the provost of Paris (1402), a gesture that added to her literary reputation and marked her first important defense of her sex against traditional misogynistic literature. It also inspired her to compose three later works: the *Dit de la Rose,* a long poem written in the midst of the debate; the *Cité des dames,* inspired largely by Boccaccio's *De claris mulieribus,* in a certain sense a rewriting of it from a feminine point of view; and the *Livre des trois vertus* (1405), offering advice to women of all classes in an interesting commentary on contemporary French society.

The year 1405 marked a turning point in France's affairs, an open break between the political ambitions of the dukes of Orléans and Burgundy, inspiring Christine to write a letter to the French queen, Isabeau of Bavaria (October 5), begging her to act as savior of the country. The letter had little effect on the queen, but it focused Christine's attention on matters of public interest, inspiring the *Livre du corps de policie* (1407), on the ideal of the perfect prince, the first of several works directed to the dauphin Louis of Guyenne. These also included the *Livre des fais d'armes et de chevalerie* (ca. 1410), based on Vegetius and on Honoré Bouvet, outlining the essentials of military leadership and stressing international laws to govern warfare. With affairs in France steadily worsening, in 1410 she addressed a letter to the elderly duke of Berry, King Charles VI's uncle, begging him to act to save the country. A civil uprising, the Cabochien revolt, led her to appeal once more to Louis of Guyenne in the *Livre de la paix* (1412–14). This prince appeared to be developing qualities of leadership, but his untimely death (December 1415) added to France's chaos following the defeat at Agincourt. This disaster inspired Christine's *Épistre de la prison de vie humaine,* addressed to Marie de Berry, duchess of Bourbon, but speaking to all women who had suffered losses at Agincourt and indeed to widows and bereaved women of all wars.

As violence in Paris increased, Christine sought refuge in a convent, probably the abbey of Poissy, where her daughter had been a nun for many years. There, she wrote the *Heures de contemplation de Notre Dame,* possibly at the time of her son's death in 1425. Her hopes for France were unexpectedly renewed by the appearance of Jeanne d'Arc, who inspired her final poem, the *Ditié de Jehanne d'Arc,* written shortly after the coronation of Charles VII at Reims in July 1429.

The date of Christine's death is unknown, but Guillebert de Mets, writing memories of Paris in 1434, refers to her in the past tense.

Although not French by birth, Christine wrote many pages inspired by her concern for France; as the mother of three children, her views on education of the young were considerably in advance of her times; as a woman obliged to make her own way in an unfriendly society, she courageously raised her voice in protest against traditional misogyny. She is an unusually interesting witness of her times. Her works were printed and read well into the 16th century, providing for her the earthly fame she, like other early Renaissance writers, so greatly desired.

# CHRISTMAS OCTAVE

. *See* **LITURGICAL YEAR**

# CHRODEGANG OF METZ

(d. 766). A member of the Frankish royal court under Charles Martel and Pepin III, Chrodegang became bishop of Metz in 753 and also served as papal legate to the Franks. He founded two monasteries, at Gorze and Lorsch, but is perhaps best known for his efforts to regularize the life of the canons (i.e., priests) of his cathedral in Metz. His *Rule for Canons* was declared authoritative by the imperial Synod of Aachen in 816. It imposed some elements of a shared common life for cathedral canons but allowed them to possess private property and live in private dwellings.

# CHURCH, INTERIOR

. The earliest Christian churches were simply assembly rooms in domestic dwellings, whether Roman tenements or court-centered villas like that excavated at Dura-Europos. Their liturgical arrangements and furnishings amounted to little more than a wooden table, serving as an altar at one end of the room. This changed dramatically with the emancipation of the church begun under Constantine in 313. By the end of the century, every town and city had at least one impressive stone basilica with an elaborately appointed interior. The liturgical functions were carried out in the east end of these buildings (although the congested city of Rome lagged behind other areas in the matter of orientation, as much for practical as symbolic reasons). The east end culminated in an apse; at the center of it the bishop sat on the *cathedra* ('chair'), while his clerical colleagues sat to either side of him on the *synthronon,* semicircular benches lining the inner walls of the apse. The altar was just to the west of the bishop, who stepped up to it to celebrate the eucharist facing the congregation. The altar retained its relatively small size for centuries, more cubular than oblong in shape, although it came to be of stone and to contain the relics of some martyr. The altar might be covered with rich cloth, but there were few objects on it beyond the chalice and a book for the biblical readings.

The apsidal east end of the basilica was slightly elevated and enclosed by waist-high stone partitions called *cancelli,* creating the sanctuary area. The term *cancelli,* which refers to wooden latticework, indicates the original structure of these barriers; it accounts for the Old French and current English word "chancel." The chancel barriers were frequently surmounted by decorative pillars and an architrave, while the modest-sized altar was made prominent by the baldochin, a stone canopy supported by pillars. Two important modifications to the basic arrangement were the addition of the ambo, a pulpit for reading and chanting, in the 6th or 7th century under Byzantine influence, and the roughly contemporary extension of the chancel barriers into the nave in order to accommodate singers and the entry procession of the clergy.

The essentials of this arrangement persisted well into the Middle Ages, particularly in Italy. A fundamentally different one can be observed in the enclosed choir of the late-medieval cathedrals and collegiate churches of the north. To some extent a by-product of the development of Romanesque and Gothic architecture in France, this arrangement was achieved by walling-in the entire sanctuary area at the east end of the church, separating it from the nave on the west and the ambulatory that surrounded it on the north, south, and east. At the east end of the enclosed area was the high altar; just to the west of it was an open space for the attendant clergy, called the presbytery; and to the far west, the choir stalls, two sets of benches facing each other. In the later Middle Ages, the walls of the choir, generally called screens, might boast splendid sculpture on their exterior facing the ambulatory, as at Chartres and Amiens, while the portion facing the nave, called the jubé in France, was surmounted by a gallery that frequently supported a great organ.

The high altar was now oblong in shape with painted panels or a sculptured wall at its back, the retable or reredos. The celebrating priest faced the altar with his back to the other participants, and the bishop sat on the *cathedra* at the north side of the presbytery. On the altar, in addition to chalice and book, there was a crucifix and candles, the number of them varying according to the solemnity of the occasion. Lighted candles began to appear on the altar in the 11th or 12th century; in the early Middle Ages, they had been carried by acolytes before the entering bishop and placed on the floor near the altar, sometimes to be extinguished after the reading of the gospel. There was no ambo in the northern arrangement, but rather one or more lecterns for readers and cantors; a common decorative feature of lecterns was to shape the book support as a large bronze eagle, symbolizing the Gospel of John.

The enclosed choir excluded the laity from much of the liturgical action. To remedy this, an altar on which to celebrate Mass for the people was erected in the nave just to the west of the *jubé*. During the Enlightenment, the *jubé* was dismantled in most French churches and replaced by wrought-iron gates through which one could observe the ceremonies.

# CICONIA, JOHANNES

(ca. 1370–1412). Composer and music theorist born in Liège. Ciconia was probably the most important single influence in the unification of Italian and French musical styles that took place ca. 1400. His birth date, long thought to be ca. 1335, is now widely agreed to have been nearer 1370 (most literature published before 1985 must be treated with caution). By 1391, he was a singer in Rome; the texts of several songs, particularly *Una panthera* and *Le ray au soleyl,* show that he must have been at the Visconti court in Pavia later in the 1390s; from 1401 until his death, he was a beneficed singer at Padua cathedral.

Ciconia's musical works include at least ten Mass movements, eight motets, sixteen Italian songs, and four French songs. The motets, in an apparently novel style, include several written for important public events in Padua, including the episcopal installations of both Albano Michele (1406) and Pietro Marcello (1409); others praise Francesco Zabarella and members of the Carrara family. Among his early songs, the virelai *Sus un' fontayne* includes exact quotes from three songs by Philipoctus de Caserta and stands as one of the most complex examples of what is known as the Ars Subtilior. His extraordinary last songs include settings of Leonardo Giustinian *(O rosa bella* and *Con lagrime bagnandome nel viso)* and Domizio Brocardo *(Lizadra donna).* Here, there is a virtually unprecedented degree of text expression, heightened by sequential repetition. Of his two surviving music theory treatises, *De proportionibus* is a later adaptation of a chapter from his larger *Nova musica.*

# CISTERCIAN ART AND ARCHITECTURE

. The Cistercians produced art that reflects the purpose of their order, which was to revive the true spirit of Benedictine monasticism. As eloquently stated by St. Bernard, their artistic

Fontenay (Côte d'Or), Cistercian
monastery, plan. After Aubert.

ideals focused on simplicity that eschewed excessive richness in materials or decoration. At the same time, the Cistercians maintained flexibility in their interpretation of these

standards, so that Cistercian art in France adopts regional styles and becomes more elaborate in the progression from Romanesque to Gothic.

The original ideals of early French Cistercian architecture are best preserved in the Burgundian abbey of Fontenay, founded in 1118 as a daughter house of Clairvaux. The church dates from 1139–47, and the other structures are also of this period. The church has a simple façade with a single portal and a few plain windows in the upper story. The nave of eight bays with single aisles is spanned by a pointed barrel vault. The transept of two bays has a rectangular apse and chapels opening off its east side. The beauty derives from the simple lines, balanced proportions, and the play of light on surface. The location of the cloister, chapter house, monks' dormitory, refectory, and other build-

Le Thoronet (Var), Cistercian abbey, cloister. *Photograph courtesy of Whitney S.Stoddard.*
Nave of the Cistercian abbey church of Le Thoronet. 12th century. *Photograph courtesy of Whitney S.Stoddard.*

ings are rationally conceived according to a basic Cistercian plan that facilitated the principal activities of worship, contemplative reading, and manual labor.

Other French Cistercian abbeys adapted this plan with regional modifications, as seen, for example, in the Provençal convents at Sénanque and Le Thoronet dating from the second half of the 12th century. While these small, austere churches conform to the Cistercian rule, both have a semicircular apse. Sénanque has a cupola over the crossing, and the double columns in the cloisters have more elaborate vegetal covering.

The spread of the Cistercian order coincided with the spread of Gothic architecture, and most French Cistercian building utilizes "simplified Gothic" style, which featured cross-rib vaulting, more foliate carving, and increased luminosity. Royaumont, founded by St. Louis in 1228, illustrates these features. Although the church itself does not survive, its plan is known and the well-preserved conventual buildings show its style. Instead of the simple apse, it had a two-bay choir with ambulatory and radiating chapels. The slender proportions of architectural members are typical of the linear features of Rayonnant Gothic.

As time progressed, the Cistercians also introduced more sculpture and stained glass into their building programs. Because of their devotion to the Virgin, most convents had at least one statue representing the Virgin and Child or other Marian themes. Carved altar frontals, such as the early 14th-century retable from Fontenay with a central Crucifixion

surrounded by scenes from Christ's life, were also used. Stained glass was in the *grisaille* technique without color. Cistercian *grisaille* windows feature beautifully designed foliate or abstract patterns, which were probably intended to enhance contemplation and meditation.

The Cistercians also produced illuminated manuscripts. Their most notable works emanated from the scriptorium at Cîteaux and other Burgundian abbeys in the 12th century. Some of these manuscripts follow Cistercian decorative edicts by using a monochrome style where the emphasis is on page design, calligraphed script, and arabesque initials. Other Cistercian manuscripts utilize illumination with tinted drawings, as in the Bible of Stephen Harding. The initials constructed of human figures in some of the Cîteaux manuscripts display an inventiveness and humor that reveal an added dimension of Cistercian spirituality.

# CISTERCIAN ORDER

**.** Within fifteen years of Cîteaux's foundation by Robert of Molesme in 1098, the monastery began to found daughter houses, as more monks came to join the New Monastery than could be accommodated there. Between 1113 and 1115, the "four eldest daughters" of Cîteaux were founded, La Ferté, Pontigny, Clairvaux, and Morimond. Relations among all these houses were spelled out in the *Carta caritatis* (1114), which emphasized the mutual love and obligations binding them together.

The Cistercian order grew quickly, as all four daughter houses began founding daughters of their own, and Cîteaux founded additional houses. The earliest houses were all located in the French duchy of Burgundy, but within a short period Cistercian houses were being founded in other parts of France and in England, Germany, and Italy. A brief and unsuccessful attempt was made in the 1150s to restrict the size of this rapidly growing order. Each of the Cistercian houses had its own abbot, who was supposed to visit the abbot of his mother house once a year and in turn was also supposed to visit annually each of the daughter houses that his own monastery had founded. An annual chapter-general brought together the abbots of all the houses at Cîteaux.

From the beginning, the Cistercian order distinguished itself by a greater austerity of life than many other Benedictine monks. They took almost exclusively adult converts, rather than child oblates. Cistercian houses were founded far from the cities, and the monks emphasized manual labor rather than performance of the liturgy. The land they

received was organized into granges. The monks tried to practice direct cultivation of their fields, rather than relying on the rents and dues of peasant tenants, and thus by the 1130s had established the institution of *conversi,* men without an educational background who still wished to live apart from the world; these *conversi* worked the monks' fields.

The Cistercians became the most influential of the new monastic orders of the 12th century, due in part to the perceived holiness of their way of life and in part to the charisma of their most famous member, Bernard, first abbot of Clairvaux (r. 1115–53).

# CITÉ

**.** The word *cité* (Lat. *civitas*), or city, described the urban center of the administrative districts of Gaul in the Roman Empire and the Frankish kingdom. The Roman *civitas,* however, included the surrounding district, and the two formed a single administrative unit. In the late Roman and Merovingian periods, the urban *civitas* capitals survived as centers of royal and ecclesiastical administrations as well as the focus of commercial activity, providing a framework for the unity of the heterogeneous population of the Frankish kingdom.

The barbarian invasions of the 3rd and 4th centuries led to the rapid construction of walls around the capitals of the *civitates,* and these walls gave security to the inhabitants. The capitals continued to function as administrative headquarters for the civil bureaucracy, and the church likewise took refuge behind the protective walls. The cities became the residences of bishops and the cen-ters of diocesan organization. Thus, a permanent and important population became fixed and protected in the *civitas* capitals, and the cities survived. They also remained at the center of the network of roads and

waterways, dominating the trade and commerce of the region. The *cités* provided the political, social, economic, and religious focus for the Frankish kingdom. In Gaul, most of the *cités* that the Romans had not walled disappeared by the end of the 6th century.

In the Merovingian kingdoms, the *cités* were the centers of royal administration. From these cities, the counts *(comites),* supported by garrisons of troops, presided over the local administration for the kings, collecting taxes, administering justice, and assembling the local levies for the royal army while also keeping a close eye on the powerful bishop. Most of the royal mints were also located in these cities. Church life was focused on the *cité*. It was the residence of the bishop and his assisting clergy, the home of the major churches and the site of the major cults of the saints, whose festivals provided a strong sense of cohesion for the surrounding population. Down to the mid-7th century, the Merovingian kings resided in the *cités,* especially Paris, Rouen, Metz, Soissons, Tours, and Orléans, which were the centers of their political activity.

Despite the overwhelmingly rural character of the population of the Frankish kingdom as a whole, the cities exercised a preponderant role in its affairs. The control of the small enclosed cities meant the control of the political, military, and ecclesiastical centers of life, and warfare in this period was concerned largely with the capture and holding of the *cités*.

# CÎTEAUX

. Sixteen miles south-southeast of Dijon, Cîteaux is the mother house of the Cistercian order, founded here in 1098 by Robert of Molesme (d. 1111), St. Albéric (d. 1109), and St. Stephen Harding (d. 1134). The first years were difficult, but with the arrival of St. Bernard in 1112 or 1113 fortune shone on the new foundation. He became abbot in 1115, and soon the first four "daughters of Cîteaux" were born: La Ferté, Pontigny, Clairvaux, and Morimond. By the turn of the 13th century, Cîteaux was "mother" to over 1,000 religious establishments in France alone. Little remains of the original abbey: a 12th-century chapel now disaffected, a vaulted hall, and portions of the Gothic cloister.

# CIVRAY

. The squat, four-bay, 12th-century Romanesque church of Saint-Nicolas of Civray (Vienne) is anomalous in the Poitou region. Triangular pendentives, each with a crudely sculpted grotesque, support an unusual octagonal tower over the square crossing of the transept. Wall paintings on the south arm of the transept (late 13th or early 14th c.) celebrate the life of St. Gilles.

The western façade exhibits a decorative and iconographic program of striking richness and exceptional quality. A cornice divides the space into two levels, each of which is further subdivided by three arches. The moldings around the central door depict Christ in Majesty surrounded by the four Evangelists, the parable of the wise and foolish virgins, the Assumption of the Virgin, and the signs of the zodiac. The flanking arches in the ground level include scenes of St. George fighting the dragon, a demon devouring the host, acrobats, a tightrope walker, and human busts.

On the upper level, to the left, is a heavily mutilated equestrian sculpture—possibly an allegory of Constantine crushing paganism. The upper-central arch exhibits the vic-

Civray (Vienne), façade. *Photograph courtesy of Whitney S.Stoddard.*

tory of Virtue over Vice. The right arch shows the legend of St. Nicolas saving three women from prostitution and representations of four Apostles. Historiated capitals throughout the program depict single figures and biblical scenes.

# CLAREMBALD OF ARRAS

(ca. 1110-after 1170). A pupil of Thierry of Chartres and Hugh of Saint-Victor, Clarembald was a Neoplatonist philosopher and theologian. His life centered on Arras, where he was provost ca. 1152–56 and archdeacon until his death. Summoned ca. 1160 to direct the school at Laon, he relinquished the post as soon as he decently could.

Clarembald taught philosophy but is best known as a theologian, especially for his commentary on Boethius's *De Trinitate,* written for the elucidation of young monks. He also commented on Boethius's *De hebdomadibus* (*Opus. Sac.* 3) and Genesis 1. Though he was not an adventurous thinker—his ideas depend largely on Thierry of Chartres—his polished, clear style and vast knowledge of sacred and secular tradition give his works a personal stamp.

In the Chartrian mold, Clarembald got his Platonism from Chalcidius and was heavily influenced by Boethius. He was a Realist, who viewed God as the Form of all being. God is pure form, pure act, pure entity, pure and simple being; God is therefore a Unity to which all other creation owes its being.

*Lesley J.Smith*

# CLAUDIUS OF TURIN

. A biblical exegete and theologian during the reign of Louis the Pious, Claudius was born near Seo de Urguel and studied in the school of Felix, one of the theologians attacked by Alcuin as "Adoptionist," before traveling to the classroom of Leidradus in Lyon. He also spent some years in the palace school at Aix-la-Chapelle, where he brought together *catenae* on earlier commentary on many books of the Bible, notably the Heptateuch (of which Deuteronomy and Numbers do not survive), Matthew, and the Pauline epistles. Most of these influential texts remain unedited. Claudius was appointed

bishop of Turin by Louis the Pious ca. 818. Almost immediately, he began a war of words against the cult of relics he found flourishing in that city. His iconoclastic writings are perhaps of most interest, but these survive mainly in the writings of his opponents Sungal and Jonas of Orléans.

# CLAUSULA

**.** In 12th- and 13th-century music, a clausula (pl. clausulae) was a melismatic passage of plainchant set in the two-part (later sometimes three-part and rarely four-part) polyphony of the Notre-Dame School. The added part (the duplum) moved predominantly note-against-note to the plainchant melisma, a texture termed "discant" style. Some melismas, such as *In seculum* from the Gradual *Hec dies* and *Latus* from the Alleluia *Pascha nostrum,* were frequently set as independent clausulae because their length and melodic properties lent them well to this treatment. The primary Notre-Dame manuscripts (W1, F, and W2) are the main sources for clausulae, and together they transmit some 900 two-part discant passages, many embedded in organa. In W1 and F, there are also separate fascicles containing independent clausulae in series, each of which maintains the liturgical order of the organa to which they belong.

In the clausulae identified as the earliest, the tenor usually is notated as rhythmically equal longs without any pattern. Somewhat later, the longs of the tenor became differentiated in length. Finally, both the tenor and the duplum were subject to modal rhythm, moving rhythmically at about the same pace. One of the most important innovations in the composition of clausulae was repeating the tenor, either with the same rhythmic pattern or with a different, contrasting one. This led to repetition in which the rhythmic pattern overlapped repetition of the melismatic melody, a device that proved to be the precursor of isorhythm, which was of great importance to the musical style of the Ars Nova in the 14th century. Texting the duplum of a clausula created the earliest motets.

# CLEMENT IV

(r. 1265–68). Pope. After Urban IV died in 1264, the conclave in 1265 elected one of his cardinals, Guy Foulques, to succeed him as Clement IV. The new pope was a native of Languedoc and the author of one of the earlier legal opinions on the Inquisition. He had served as a papal legate to England during a baronial rebellion against Henry III. As a subject of Louis IX of France and of his brother Alphonse, the Capetian count of Toulouse, the new pope favored the efforts of their brother, Charles of Anjou, to conquer the kingdom of Naples. Clement agreed to finance Charles's campaign against Manfred, the illegitimate son of the emperor Frederick II; and he crowned Charles king of Sicily at the Lateran in 1266. After Manfred's death, the brutality of the Angevin army moved the pope to protest to the king, but papal support of Charles continued during the war against Conradin, Frederick's surviving grandson, to whose execution Clement gave tacit consent. Clement also rejected overtures from the Byzantine emperor Michael VIII Palaeologus, who was trying to avoid an Angevin attack on Constantinople. Papal financial support of Charles's ambitions led Clement to expand the papacy's claims to appoint to vacant benefices. His successor Gregory X (r. 1271–76) temporarily would reduce Angevin influence in the curia.

# CLEMENT V

(r. 1305–14). Pope. After the death of Boniface VIII in 1303, his successor, Benedict XI (r. 1303–04), sought a compromise with Philip IV the Fair of France while condemning Guillaume de Nogaret's actions at Anagni. When Benedict died, Bertrand de Got, archbishop of Bordeaux, was elected as a compromise candidate in 1305. As a subject of both Edward I in Aquitaine and of Philip, the new pope, Clement V, was in a position to reconcile old foes. Clement, however, beginning with his being persuaded to be crowned in Lyon, in the presence of the French king, not at Vienne, soon proved himself

compliant to most of Philip's wishes. This compliance was based partly on the pope's ill health and partly on Philip's frequent threats to have Clement's prececessor Boniface VIII condemned for various crimes and vices. Clement canceled *Clericis laicos* and interpreted *Unam sanctam* in an evasive manner. Other concessions included dropping proceedings against Nogaret and consenting reluctantly to French efforts to dissolve the Templars and confiscate their wealth. Clement also increased French influence in the curia by creating a majority of non-Italian cardinals and avoiding a journey to Rome. Clement did, however, work to have Henry of Luxembourg, not Charles of Valois, Philip's brother, elected King of the Romans. Clement V's Council of Vienne (1311–12) acted to condemn various groups, including the béguines and beghards, for heresy; but it did not wish to suppress the Templars. Instead, Clement had that act ratified in a secret consistory. The acts of the council and other papal decrees, including the revocation of *Clericis laicos,* were inserted into the *Constitutiones clementinae,* the last official collection of medieval canon law, prepared in Clement's lifetime but issued after his death by his successor, John XXII.

# CLEMENT VI

(r. 1342–52). Pope. Clement VI has been described as the most typical of the Avignon popes, especially as a lover of luxury. Petrarch denounced Clement as Nimrod, even while accepting benefices from him. Pierre-Roger de Beaufort, the future Clement VI, was born into a noble family in Limousin. As a second son, he was dedicated to the church, entering the abbey of Chaise-Dieu in the Auvergne. Pierre-Roger was sent to Paris to study, and he became a theologian and a noted preacher. As a professor, he made his name by defending the privileges of the clergy before an assembly held at Vincennes by Philip VI, the first Valois king of France, in 1329. Pierre's ecclesiastical promotions included elevation to prior, abbot, and bishop, including the archbishopric of Rouen (1330). Philip VI employed Pierre-Roger as a councilor and administrator. Despite difficult relations with John XXII and a role as go-between for Philip and Benedict XII, Pierre-Roger was made a cardinal in 1338,

Elected pope in 1342, Pierre-Roger reigned as Clement VI. The papal palace in Avignon, begun by Benedict XII, was expanded and made into a showplace, a home of art, music, ceremony, and feasting. A powerful Limousin faction was created in the College of Cardinals. Clement made himself popular through his patronage of scholars and students, but this bounty required further expansion of the curia's fiscalism. Clement

took pleasure in religious ceremonies and in preaching on state occasions. When the Black Death struck Avignon, however, the pope remained in the city, seeing to the burial of the dead and the welfare of the survivors. Clement was less kind to the bands of flagellants who descended on Avignon in 1349, ordering them dispersed as a threat to order.

In the political sphere, Clement, despite the ravages of the Hundred Years' War, formed a Latin League against Turkish pirates; but its initial success was insufficient to spark a crusade. Clement opposed the intervention of Charles IV of Luxembourg in Italy. Although Avignon was purchased from the Angevin monarchy, the pope welcomed the collapse of Cola di Rienzo's domination of Rome. His lack of interest in returning the papacy to Italy was one reason for Petrarch's denunciation of him.

# *CLERIADUS ET MELIADICE*

. A lengthy prose romance from the middle of the 15th century that deals with the love of Clériadus, son of the Count of Asturias, and Méliadice, daughter of King Philippon of England. The narrative, which takes place variously in England, Spain, and Cyprus, is largely given over to adventures in which Clériadus proves himself worthy of the love of Méliadice. The work, found in nine manuscripts and five early printed editions, was popular in its day.

*Keith Busby*

Zink, Gaston, ed. *Clériadus et Méliadice: roman en prose du XVe siècle.* Geneva: Droz, 1984.

# *CLERICIS LAICOS*

. In February 1296, Pope Boniface VIII issued his constitution *Clericis laicos,* which forbade lay powers to tax the clergy without papal consent. This decree was intended to deprive Philip IV the Fair of France and Edward I of England of the fiscal resources for war. *Clericis laicos* closed loopholes in the canon law, which had permitted the clergy to make "voluntary" offerings to kings. Its text also was inflammatory, opening with a claim

that the laity always had been hostile to the clergy. Apologists for the lay powers would respond by denouncing the ambition and greed of the clergy. *Clericis laicos* set Robert Wichelsey, archbishop of Canterbury, in opposition to Edward; but the French clergy rallied behind Philip. Pressed by troubles with the Colonna family at home and by a French embargo on the export of bullion in 1297, Boniface issued *Etsi de statu,* which permitted the French monarchy a discretionary power to tax the clergy for the defense of the realm. Despite this check, Boniface incorporated *Clericis laicos* into his *Liber sextus decretalium* (1298). Philip IV, aware of this, later pressured Clement V into revoking this canon. The canonists, however, continued commenting on the text, emphasizing the inability of the clergy to evade canon law by passing their obligations on to their lay dependents.

# CLERMONT-FERRAND

. Since Roman times, when it was named Augustonemetum, Clermont (Puy-de-Dôme) has been the major city of Auvergne. Christianized in the mid-3rd century by St. Austremoine, one of the "seven apostles
Clermoni-Ferrand (Puy-de-Dôme),
Notre-Dame, reconstructed plans of
10th-century chevet and crypt. After
Ranquet.
Clermont-Ferrand, Notre-Dame-du-Port, nave elevation and section. After Losowska.

Clermont-Ferrand, Notre-Dame-du-Port, south portal. *Photograph courtesy of Whitney S.Stoddard.*

of Gaul," the city was dominated by its bishops, who exercised the most effective political power throughout the Middle Ages. Although destroyed by Pepin the Short in 761 and pillaged by the Normans in 854 and 916, Clermont regained its prominence in the mid-10th century, as witnessed by the building of a new cathedral in the 940s. In 1095, at the Council of Clermont, Pope Urban II issued his call to Christian warriors to wrest the Holy Land from the Muslims, and the age of the Crusades was born.

Following several setbacks in his attempts to seize control of Clermont from the bishop, the count of Auvergne, Guillaume VI, established a fortified *bourg* at Montferrand, 2 miles to the northeast, in the 1120s. This local conflict was played out against a background of international politics, for the count was the vassal of the duke of Aquitaine, Henry II Plantagenêt, after 1152 the king of England, while the bishop was supported steadfastly by Philip II Augustus. Repeated comital assaults finally led to Philip's aggressive armed intervention, and by 1213 the city and region were firmly under royal control. Montferrand, sold to Philip IV the Fair in 1292, became the seat of royal administration. In 1630, however, it was joined administratively to Clermont, hence the name Clermont-Ferrand, and gradually declined into little more than a distant suburb of the larger city.

The architecture of Clermont-Ferrand offers a kaleidoscope of styles that reflects both stylistic developments over time as well as the city's location between northern and southern France. The crypt of the cathedral, dedicated in 946, is one of the earliest examples in Europe of a plan with an ambulatory and radiating chapels. A fully developed version of this scheme appears at Notre-Dame-du-Port, one of the quintessential examples of the vital school of Romanesque architecture and sculpture that flourished in Auvergne in the late 11th and early 12th centuries. The elevation and fully vaulted structure of Notre-Dame-du-Port are connected closely to the so-called pilgrimage-road basilicas of the Loire Valley and Languedoc, such as Saint-Martin at Tours, Sainte-Foy at Conques, or Saint-Sernin at Toulouse. The powerful, thick-set figures that inhabit the capitals and the south portal relate as well to the work at Toulouse and Conques.

The Gothic made its first tentative inroads into Clermont with the arrival of the mendicant orders in the early 13th century, but, as seen in the chapels of the Franciscans and Dominicans, it was limited to such details as crocket capitals and pointed arches. With the reconstruction of the cathedral, the architecture of Paris and the Île-de-France was transplanted to Auvergne. Begun in 1248 by Jean Deschamps, who drew upon such recent projects as the nave chapels of Notre-Dame (Paris), the new work at Saint-Denis, the Sainte-Chapelle, and Beauvais cathedral, Clermont's verticality, thin walls, and luminous windows broke emphatically with previous Auvergnat traditions to establish a clear manifestation of episcopal authority allied staunchly to the French crown. The cathedral workshop also seems to have erected a new chapel for the Franciscans between 1264 and 1284, now engulfed in the Préfecture. However, in keeping with the order's statutes, the church eschews architectural elaboration in favor of a simple single vessel covered by ribbed vaults, a scheme repeated for the Carmelite house (1329), today the parish church of Saint-Genès. Notre-Dame in Montferrand (ca. 1300–16th c.), constructed as a single-nave edifice, reflects not only the impact of monastic ideas on secular church architecture but also building traditions from southern France.

# CLÉRY

. The collegiate church of Notre-Dame de Cléry (Loiret), located in a small village just south of Orléans, has been an important site of Marian devotion since the late 13th century and enjoyed lavish support by the kings of France. During the first decade of the 14th century, a new church, whose bell tower still survives on the north flank, was erected with the assistance of Philip IV the Fair. After its destruction by the English in 1428, Cléry was rebuilt by Charles VII and Dunois. By 1449, construction had reached the north-transept portal under the direction of Pierre Chauvin, master of the works of the duchy of Orléans, and in 1482 Louis XI, who is buried at Cléry, inaugurated the addition of the four western bays of the nave.

Despite its adoption of such up-to-date Flamboyant style features as double-curved tracery and continuous moldings, Cléry is characterized by decorative severity, a disciplined order of forms, and conscious retrospection. The plan, with its nonprojecting transept and ambulatory without chapels, seems a simplified version of Notre-Dame in Paris. Similarly, the cylindrical piers and taut membranous wall surfaces of the two-story elevation continue ideas that had been part of Parisian architecture since the late 12th century.

# CLIMATE

. Though directly implicated in the rise or fall of some of the great civilizations of the past, climate had only an indirect effect on public affairs in medieval France. Its primary significance lay in the fact that it directly touched the lives of ordinary people. Despite the reappearance of cities and urban life during the later Middle Ages, the vast majority

of those living in medieval France continued to be peasants, the producers of the food and fiber essential for maintaining themselves and everyone else. More than any other environmental factor, climate provides the limits within which agriculture can be practiced. The patterns of temperature, precipitation, and wind direction and velocity that constitute climate play a ma-jor role in determining what can be planted and when, as well as how much emphasis can be placed on livestock.

As it does today, France during the Middle Ages straddled three climatic zones. The mildest, known as the Mediterranean climate, encompassed the Mediterranean coastal lowland and the lower Rhône Valley. Here, mist and moisture from the Atlantic alternated with dry winds from the Sahara to form cool, damp winters and hot, dry summers. This pattern supported an agricultural complex of wheat or barley, planted in a winter cycle, supplemented by olives and vines, the classic Mediterranean triad. Because of the annual summer drought, the primary livestock were sheep and goats, taken from lowland winter pastures to highland summer pastures in an ancient pattern known as transhumance. At the other extreme were scattered locations in the high Alps and Pyrénées that experienced a northern or Alpine climate. With snow on the ground for much of the year and only short, cool summers, the possibilities for agriculture were limited to the grazing of cattle, sheep, and goats, supplemented by limited production of rye and oats in favored locations.

The remainder and by far the greatest proportion of France lay within the temperate zone, so called because it experienced extremes neither of temperature nor of precipitation. Not only could peasants in this zone practice a traditional agricultural complex of summer crops and heavy dependence on cattle, from the 9th century onward they added a winter planting cycle as well. Because soils over much of this zone were heavier and thicker with a higher organic content than was found in the Mediterranean zone, new agricultural implements were necessary to put them into production effectively. The development of the moldboard plow by the 9th century helped to make the temperate region of France one of the richest agricultural regions of Europe by the high Middle Ages.

Though the gross features of climate during the Middle Ages were not significantly different from those today, there were some variations over the period that seriously affected the production of food and fiber. These variations can be grouped as follows: 400 to 750, cool and wet; 750 to 1200, warm and dry; 1200 to 1350, cool and wet; and 1350 to 1550, warmer but continued wet. Variations in precipitation usually affected agriculture more directly than did temperature variations. Too much precipitation might reduce the harvest in temperate Europe, while drier conditions might have the same effect in Mediterranean Europe. Indeed, one of the best-documented harvest failures to strike temperate Europe occurred in 1315, a year that saw much higher than average precipitation in northern France and surrounding areas.

# CLISSON

. The village and castle of Clisson (Loire-Atlan-tique) became the seat of a family important in 14th-century Brittany. Lords of Clisson appear in monastic documents as early as the 11th century, but their precise genealogy before the 14th century remains uncertain.

The Clisson family rose to wealth and prominence through a succession of brilliant marriages. Around 1200, Guillaume I was ranked as a baron. His grandson Olivier I acquired the important castle of Blain from his mother and rebelled against the duke of Brittany until the latter forced him into retirement in 1262. His successor, Olivier II (d. ca. 1295), acquired lands in lower Normandy through marriage, and ca. 1300 his son Guillaume married Isabelle de Craon, linking the Clisson to her important Angevin family.

The two sons of this marriage, Olivier III and Amaury, were active on opposite sides in the Breton war of succession that began in 1341 and lost their lives as a consequence. Olivier III in 1330 married Jeanne de Belleville, heiress to important lordships in northern Poitou, just south of the Clisson family lands. After Olivier's execution for treason in 1343, the French crown confiscated their lands. Jeanne fled to England, where her surviving son, Olivier IV (1336–1407), was raised as a partisan of the English-backed claimant to Brittany, fighting on his side in the victorious Battle of Auray (1364) that won him the ducal title as Jean IV.

By this time, Olivier IV had inherited lands given to his mother by the English and had reacquired the vast family holdings previously confiscated by the French. He married Béatrix de Laval, a cousin of Duke Jean, further increasing his wealth and prestige. In the later 1360s, however, Olivier IV grew increasingly hostile to the English and became a strong supporter and military adviser of Charles V of France. By 1370, his estrangement from Jean IV had become a bitter feud that would last for twentyfive years. His sound tactical sense, his expertise with fortifications, and his almost legendary ferocity in battle made him the most prestigious military commander of his day, and after the death of Charles V he became constable of France and a leading councilor of Charles VI.

In his twelve years as constable, Clisson headed a political faction known as the Marmousets, who opposed the dukes of Berry and Burgundy at the French court. In 1392, he was the intended victim of a bungled assassination attempt that the king blamed on the duke of Brittany. On the ensuing punitive expedition against Jean IV, Charles VI became psychotic, and the royal dukes quickly seized power and ousted Clisson from the office of constable.

Returning to Brittany, Clisson waged bitter war against the duke until 1395, in alliance with his sons-in-law, Alain VIII de Rohan and Jean de Blois, count of Penthièvre, who had married his daughters Beatrix and Marguerite, respec-tively. After peace was made,

he returned to ducal favor but continued to annoy Jean IV and Jean V with litigation until his death on April 23, 1407, his seventy-first birthday.

The last male member of the family, Olivier IV had amassed a great fortune, and some of Europe's most important figures owed money to his estate. Through his older daughter, the Rohan family acquired two-thirds of this wealth and became the greatest noble family of Brittany. Olivier's younger daughter, the countess of Penthièvre, inherited her father's propensity for feuding and litigation and brought ruin on her family by inducing her sons to kidnap Jean V in 1420.

# CLOCKS AND TIMEKEEPING

. Devices to measure and indicate time are descended from astronomical instruments and, like most complex devices, tend to have a history that is international in character. The emergence of a purely mechanical timekeeper in the 14th century, the weightdriven clock, marks a triumph of medieval ingenuity. The French contribution to this development seems to have been in the construction of elegant timepieces and the refinement of mechanisms originally invented elsewhere in Europe.

Monastic houses served as the context out of which mechanical clocks developed. Water clocks with alarm mechanisms attached were used from the 11th century onward to awaken the brothers for midnight services. The rules of Saint-Victor in Paris, for example, made the registrar, a subsacristan, responsible for calibrating and adjusting the water clock, while archaeological remains of SaintVillers abbey dated 1267–68 show a detailed tablet on stone for this task. The only surviving manuscript illustration of a medieval water clock is found in a French *Bible moralisée* of ca. 1285. In his addition to the *Roman de la Rose,* Jean de Meun shows Pygmalion as possessing domestic versions of these alarm "clocks."

The earliest known examples of purely weight-driven clocks are English (Norwich, 1325; Saint Albans, ca. 1330) and Italian (Milan, 1333?; Padua, 1364), but the speed with which these new devices spread was remarkable. Their acceptance was no doubt enhanced by the fact that the weight-driven mechanism could be made quite large and could drive all manner of ancillary machinery, especially puppet jackwork and bell-

ringing devices. The new clocks quickly became objects of royal, noble, and municipal pride, either in the form of gigantic tower clocks or fine miniature chamber clocks. Froissart's poem *L'orloge amoureus* (1369) describes the new machine in detail and praises it lavishly. The cathedral at Strasbourg had an elaborate astronomical clock whose fame extended the breadth of Europe. To punish the rebellious burghers of Courtrai, Philip the Bold of Burgundy in 1382 confiscated their tower clock and put it to use in his own capital, Dijon. An inventory of the possessions of King Charles V in 1380 gives evidence of several chamber clocks in fine metalwork. A similar inventory of 1430 shows the first evidence for spring-driven clocks among the possessions of the duke of Burgundy.

The making of astronomical clocks, timekeepers accurate enough to be useful for observational purposes, was the epitome of the clockmaker's craft. Jean Fusoris (ca. 1365–1436), a physician and canon at Reims and later at Notre-Dame in Paris, was also the headmaster of a shop making instruments and clocks. His astronomical timepiece for the chapter at Bourges (ca. 1423) functioned until the 19th century.

In France, the clock was also adopted as a symbol of the virtue of temperance and the quality of wisdom. Manuscript illuminations of Christine de Pizan's *Épistre Othea* (ca. 1400) show Temperance adjusting a large clock. The image became conventional in Burgundy toward 1450, when Temperance came to be shown with clock, bridle and bit, spurs, eyeglasses, and a windmill. A French translation of Heinrich Suso's *Horlogium Sapientiae,* done in the early 1460s, shows Solomon as a clock repairman and Lady Wisdom surrounded by timekeeping instruments. These illustrations show how integral the clock had become to the European sense of order in natural and human affairs.

# CLOTAR II

(584–629). The son of Chilperic I and Fredegunde, Clotar II reunified the Merovingian kingdoms in 613 and passed on the kingdom intact to his son Dagobert I. It was during Clotar's reign that the Frankish aristocracy emerged as a major partner with the monarchy in the administration of the kingdom.

Clotar II succeeded to the kingship at the age of four months, upon the assassination of his father. Fredegunde held together a reduced kingdom for him until he came of age.

After 600, he repeatedly tried and failed to take over Austrasia and Burgundy. But in 612, as Brunhilde fell from power, the magnates of those regions accepted Clotar as king, and he ordered the execution of Brunhilde after her capture (613). Immediately afterward, in October 614, Clotar held a great council of lay and ecclesiastical leaders at Paris; the edict issued in this assembly confirmed the power that local nobles had acquired over the appointment of both bishops and secular officials. Under Clotar II, Neustria, Austrasia, and Burgundy each usually had its own administration under a mayor of the palace. Clotar recognized the Austrasian desire for autonomy by associating his son Dagobert I with him as subking there in 622.

# CLOTHING, COSTUME, AND FASHION

. Medieval clothing in Gaul was a combination of earlier Germanic apparel with Roman fashions introduced during the Roman occupation of Gaul (52 B.C.-ca. A.D. 486). The Frankish settlers protected themselves against the cold by wearing tight-fitting garments and für mantles and wrapping their legs in skins. The Romans introduced looser-fitting tunics and more flowing garments for both men and women.

Peasants wore working shoes with heavy soles (often of wood), a snood cap fastened under the chin, a leather belt over a simple knee-length smock *(sayon),* usually of linen, and wrapped leg coverings. Their clothing, which is well represented on the calendar pages of books of hours and in sculpted Labors of the Months, changed little throughout the medieval period.

Dress for the upper classes varied more from epoch to epoch. The Merovingian period appropriated many items of earlier Gallo-Roman dress, notably the flowing tunic and mantle. The tunic extended in ample folds to the ground and was generally gathered by a large belt or girdle, which could be adjusted for a longer or shorter waist. Multiple tunics were often worn, with the sleeves of the undertunic extending to the wrist, while those of the outer tunic, of a different color, ended at the elbow. The mantle was full and open in the front; it was secured by a clasp or brooch, often at the shoulder. Women wore a square of white or colored material over the head, secured by a circlet, often ornamented with jewels. Hair was worn long and usually braided; for festive occasions, it was intertwined with ribbons and gold threads. Heavy necklaces of gold disks, brooches of enamelwork or encrusted with precious and semiprecious stones, earrings set with stones cut *en cabochon,* rings, and bracelets were all favored by upper-class women. Colors

were bright and showy. Rich materials from the Byzantine East, combining Christian symbols and floral patterns in elaborate pictorial and geometric designs, were highly favored. Sometimes, both warp and weft were linen, but linen and wool were often used in combination. Silk was especially prized.

In the Carolingian period, fashion changed little: long doubled tunics were still in vogue, as were the rich eastern materials. Edges of mantles and tunics were frequently trimmed with wide bands of embroidery; jewel-studded girdles were worn just above the hips. Women still wore their hair long and braided, but after the 8th century it became fashionable to hide the hair under long veils or hoods.

With the advent of the Capetians (987), styles became simpler and more severe. Men and women both adopted the *bliaut,* a long straight garment with flowing sleeves. The dress for men consisted of a thigh-length *bliaut* over a linen shirt with long sleeves; linen, wool, or silk hose *(chausses)* in a solid color or striped horizontally with various hues; and a mantle or cloak. The *bliaut* was gathered by a leather belt; the bejeweled belts and heavy necklaces of earlier periods were abandoned. The sleeves of the *bliaut* were wide and funnel-shaped until ca. 1080–90, when they were drawn tightly against the wrists. The mantle was fastened with leather bands decorated with fringes and clasped at the right shoulder. The male bliaut remained short for the 11th century but was lengthened in the 12th, with the result that men's and women's fashions were nearly identical until the late 13th century, consisting for both sexes of *chainse, bliaut,* and *manteau.*

Women wore two dresses, one over the other. The underdress, called a *chainse* or *chemise,* was slash-waisted, long-sleeved, and trailing to the ground; it was made of fine linen, silk chiffon, or cotton knit. The outer *bliaut* was close-fitting at the waist, flared at the hips, with full and open sleeves. The collar was decorated with embroidered designs. The torso of the overlayed dress was worn close to the body and was gathered at the sides. A long silk, wool, linen, or leather belt worn on the *bliaut* was wrapped twice around the waist and then reached the floor. After the 11th century, the sleeves became longer and funnelshaped, allowing the *chemise* underneath to be seen. The *bliaut* was fastened at the waist by a double belt of cloth, tied now instead of sporting a bejeweled buckle. The mantle was generally fastened in the center at the breast, and a fine linen veil, which also covered the neck and shoulders, was worn on the head. This veil was the precursor to the wimple. Women still wore their hair long and parted in the middle, with two braids, sometimes joined in the back and often intertwined with ribbons, trailing nearly to the ground.

The Crusades in the 12th century introduced fashions and fabrics of oriental origin: silk became more widely used, and cotton materials were first used in France. New materials included *samite,* a heavy silk; *cendal,* a thinner silk like that of today; pers, a blue material; *camelin,* a camel's-hair fabric; cotton *fustaine;* and woven-wool *serge.* The crusading knight wore a short *bliaut* over his armor, usually decorated with the Crusader's Cross and gathered at the waist by a cloth or leather belt. Another fashion introduced by the crusaders and pilgrims was the wearing of a purse *(ausmoniere)* attached to the belt or girdle; it was often distinguished by lavish needlework. Fashion demands in the wake of the Crusades became so exacting that it became profitable for the first time for artisans and craftsmen to mass-produce clothing, accessories, and jewelry in specialized workshops in the larger cities of the industrialized north. Trade guilds favored specialization and highly skilled workmanship.

By the 13th century, the *bliaut* was replaced by the *surcot* for both men and women, sometimes with short sleeves, but even sleeveless. For men, it was split in front and extended just below the knees, while for women it was bell-shaped, closed, and floor-length. Women's clothing was now fitted to emphasize the shape of the female body: slim waists, tiny feet, narrow hips, and small bosom. To make the *surcot* more snug above the waistline, it became fashionable to slit the sides of the *chemise* and *surcot* from the waist to the armpit; the openings were then laced, but a little bare flesh was permitted to show. Sleeves were tight at the wrists and were buttoned or sewed together after the garment was put on. The *chemise* could be dipped in saffron for color and to provide a pleasant odor. Gloves as we know them first came into fashion for ladies of the upper nobility in the 12th century. Buttons were used on some clothing from the 13th century, but most medieval clothing was laced or held together by pins and brooches.

In the 13th century, young girls still wore their hair long and unbraided, but women's hair was generally hidden modestly under long veils or wimples. All this began to change late in the 13th century, when elaborate hairdos became the rage. Instead of braids, hair was rolled and worn in a bun either over the ears or behind the head. The bun was retained by a net called a *crispine* or *crispinette,* which for wealthy women might include gold threads or bands. A veil and wimple were sometimes worn over this elaborate hairdo, gathered by a jeweled circlet. Women used white powder and rouge on their faces, and older women might dye their hair to prevent its turning gray.

Extravagances in dress were condemned by moralists and religious leaders, and sumptuary laws were passed limiting the varieties and numbers of items of clothing a person could own. But even the saintly Louis IX admonished his courtiers to dress well, so that their wives would cherish them more and their people respect them.

In the late 14th century, male courtiers adopted a much shorter form of clothing, a doublet over long tight hose, which would remain in vogue until the 17th century. Although this was the first step in the direction of modern dress, the sharp break with the past brought accusations of indecency. The hose were made of expensive fabrics and were often particolored—that is, a different color was used for each leg. However, the long *bliaut* did not entirely disappear, as elderly men and even the kings from Philip VI to Charles V preferred traditional dress, particularly in the wake of Pope John XXII's condemnation of modern clothing as indecent. Imitating the kings, judges, lawyers, university intellectuals, and administrators all wore the long traditional robes, as did commoners and bourgeois. Only fashionable courtiers wore the effete shorter clothing.

Thin-soled leather shoes were a mark of distinction, being worn only by the wealthy. Sandals and wooden clogs were worn by commoners and peasants. Shoe shapes were simple and practical through the 13th century, but in the 14th century the mode was for pointed toes, which became exaggeratedly long in the *poulaine,* whose point was turned up like a ship's prow. Toes were often stuffed to maintain their shape. In the late 15th century appeared the *hennin* for women, a towering conical headdress as much as a yard tall; it was worn inclined to the rear, and from its peak fluttered a thin veil. The first of the high, elaborate hairdos to gain notoriety was the two-horned *escoffion,* popular ca. 1380–1410.

Because of the abundance of late-medieval tapestries, books of hours, and similar visual sources, the fashions of the 15th century are those most remembered today. All of the luxury fabrics, such as damask, brocade, and velvet from Florence, were widely used,

along with imitations of oriental silks that were fabricated in Lyon and Tours after the opening of fabric workshops there under Louis XI in 1466 and in 1480. The dukedom of Burgundy was particularly wealthy and reputed for its magnificent fashions.

# CLOTHING, JEWISH

. The Fourth Lateran Council of 1215 forced Jews to wear a distinguishing mark on their clothing that in France often took the form of a circular badge of red and white. Otherwise, their clothing was much like that worn by Christians, since religiously mandated elements of everyday dress were relatively few, strongly conservative, and for the most part unobtrusive. A beard and sidelocks *(pe'ot)* were traditionally required for men, but in the Middle Ages they were never exaggerated in the manner of those worn by Hasidic men in eastern Europe in the 16th to 20th centuries. Fringes *(ziziot)* knotted in a specific way were required on each corner of any fourcornered garment worn by a man; since few medieval garments were four-cornered, medieval Jews regularly wore a special fringed undergarment *(arbah kanfot, tallit kattan)* to ensure the observance of the commandment. Headcovering practices varied widely in medieval France, so except for certain occasions Jews would not have been particularly distinguishable on this basis.

Jewish women had no distinctive clothing *per se,* but married women were required to cover the hair, and men and women alike were enjoined to dress modestly. Both men and women were also prohibited from using certain fabrics by the biblical injunction against the commingling of wool and linen in garments.

Thus, Jews would not have stood out dramatically from their neighbors. Christian illuminators often needed to invent exotic, orientalizing, or bizarre garb when they wished to identify Jews in a negative or mocking way. Yet Jews observed another, less obvious admonition with regard to clothing, based on a traditional interpretation of Leviticus 18:3, which prohibits the emulation of the practices of the "nations" among which Jews find themselves. This was interpreted by medieval teachers, following Talmudic dicta, as a prohibition of the hairstyles, the fashions of dress, and the customs of headcovering of the dominant population. As a result, the garments of the masses throughout the Middle Ages seem to have been relatively conservative due to a concerted

attempt at retrograde fashion in order to stay "a few steps behind" the Christian population and thus distinguish themselves.

Christian manuscripts tend to depict such Jews: mostly men appear, and these are bearded. If they are intended to represent the tormentors of Jesus, or the collective "Jews" of the New Testament narrative, they wear homespun, peasant-style clothes, breeches, tunics, occasionally hooded. Their heads are covered by soft-peaked hats or hoods turned back. Other biblical Jews—prophets and Pharisees—as well as contemporary Jews are depicted in full-length tunics and cloaks, generally fastened at the shoulder.

Strikingly different is the image we receive from medieval Jewish manuscripts. There, Jews of both sexes wear tunics, cinched at the waist with belts or accompanied by an outer coat with tapering sleeves. Women's hairdress is varied and in some cases quite fashionable, utilizing hair nets, hats, and chin pieces in much the same way, though with some time lag, as such elements were popular in England and France. Though married women are inevitably depicted with hair covered, Jewish manuscripts give the impression that men went bareheaded most of the time.

The manuscript depictions are confirmed in the biblical and Talmudic commentaries of Rashi (ca. 1039–1104), which provide details of Jewish dress, as well as some description of the processes of tailoring, laundering, and perfuming garments. Although information about clothing is never systematically presented in his commentaries, it is from his work in particular that one gets a sense of Jewish attitudes toward clothing: clothes, Rashi tells us, honor the man—they constitute his "glory"—and should be well cared for, clean, and neat. Rashi describes three layers of clothes: a shiftlike undergarment, an outer robe with attached hose, and a coat of silk or other material, closed with cords hanging around the waist. He mentions puttees worn about the legs, and kneebreeches for men, belted with a string pulled through a hem about the waist, and presumably worn under the robe. The rounded cloak was known to Rashi, and he mentions cloaks of various weights to accommodate fluctuations in weather.

Rashi describes women's fashion more extensively. He discusses many more hairstyles than can be observed in manuscripts: woolen caps or snoods covered with a thin scarf, lace headdresses, headbands made of gold interlaced with silk threads, hats made of the ribs of feathers, and even hairpins are described in detail. He catalogues a variety of jewlery, from the pins or brooches used to fasten cloaks, to jeweled belts, perfume flasks, strings of pearls, amulets, and chokers to close the necks of gowns. Jewelry made by goldsmiths was peddled from door to door and kept in special jewelry boxes. Women and even young girls had their ears pierced, but girls did not begin to wear earrings until they were older. Rashi disapproves of "immodest" modes of dress. A woman who wears garments with slashed sleeves, so that she goes "'with her armpits uncovered' in the manner of the Gentile women in France, whose [bare] flesh can be seen from their sides" gives her husband grounds for divorce. Here, we can witness both the inherent conservatism fostered by the prohibition of Leviticus 18 and the stratification of Jewish society, in which such garments were worn by certain individuals, particularly those moving in "elite" circles in contact with Christians.

Rashi mentions both soft-laced shoes and harder shoes fastened with a buckle or clasp, all pulled on by means of a loop at the heel. Some shoes are described as having wooden soles, which would have to be planed to even them when they started to wear. To others,

iron taps were affixed. There were open-toed and open-backed shoes, and in the case of heavier shoes or poor weather socks were worn.

Certain specialized garments were reserved for liturgical use. The *tallit,* the four-cornered prayer-wrap, with the four requisite *ziziot* and large enough to cover "one's head and most of his body," was worn by the precentor at the synagogue for nearly every liturgical occasion and by all married men at morning prayers in synagogue or the home. In some locales, it was worn by boys from the age of religious majority (age thirteen—called *Bar Mizvah*) and in others by boys even below that age. Each morning, *tefillin,* leather boxes containing verses from the Pentateuch (Exodus 13:1–6; Deuteronomy 6:4, 11:13–21) written by a Torah scribe, were bound by all males above the age of thirteen to the upper arm by leather thongs, and around the forehead, for morning prayers, in accordance with the rabbinic interpretation of Deuteronomy 6:8. Finally, there was the special robe (*sargenes* or *kittel*), symbolic of humility and purity, which both echoed components of the garments of the priests in the Jerusalem Temple and served as one of the actual burial garments. This was worn by men at their weddings and thereafter on the High Holi-days, at Passover, and for burial. There was no distinctive clerical dress, although regional custom might dictate variations on the basic themes.

# CLOVIS I

(ca. 466–511). The most important of the Merovingian kings, Clovis I was the unifier of the Franks, the conqueror of most of Gaul, and the real founder of the kingdom of the Franks under Merovingian rule. He was also the first Christian king of the Franks. He is the possessor of a reputation for astonishing ruthlessness, brutality, and unscrupulousness.

Upon the death of his father, Childeric I, in 482, Clovis succeeded as chieftain over the group of Salian Franks settled around Tournai, in modern Belgium. He began his conquests in 486 by defeating Syagrius, an independent ruler over northern Gaul. This victory made Clovis the master of Gaul north of the Loire, the later Neustria, and he transferred his capital to Soissons, accompanied by his Frankish entourage.

The chronology and sequence of events of most of the rest of Clovis's reign are unclear and highly debated. Essentially, he became the sole Frankish king by eliminating the kings of other bands of Salian Franks through attack, treachery, and deceit. By similar means, he also rose to mastery over the Ripuarian, or Rhineland, Franks. Through a series of bitter and closely contested battles, he brought the Alemanni and Thuringians under his authority as well.

In the course of one of his battles against the Alemanni, at Zülpich (Tolbiac) in the mid-490s, Clovis converted to orthodox Christianity. This was not a sudden move, however. Like his father, Childeric, Clovis had been careful to maintain good relations with Christian authorities in his lands, and he had also married an orthodox Christian, the Burgundian princess Clotilde. The conversion of Clovis and some of his followers had little immediate effect on their pagan and polygamous habits, nor did it immediately christianize the Frankish people, but it did make Clovis the hero of orthodox Christians in Gaul.

Clovis exploited this position to gain his greatest victory. He attacked the Arian Visigoths, who controlled Gaul south of the Loire as well as Spain. In 507, Clovis defeated their army at Vouillé, near Poitiers, and in the ensuing campaigns his forces swept over most of southern Gaul. Only the military intervention of Theodoric the Ostrogoth preserved Septimania for the Visigoths and prevented the Franks from gaining the Mediterranean. Nonetheless, Clovis was the master of almost all of Gaul. For a time, he even exacted tribute from the Burgundians.

After the victory over the Visigoths, Clovis was given some sort of official recognition by the Byzantine empire, which began a century-long tradition of Frankish-Byzantine cooperation, and he moved his capital to Paris. The years after 507 saw two of his most notable achievements. It was he who probably issued the Salic Law for his Salian Franks and all those living north of the Loire, and in 511, at Orléans, he presided over the first great church council of the Frankish kingdom.

Clovis was the master of a heterogeneous population. Franks and other Germanic peoples were in the northeast, northern Gaul was Gallo-Roman but relatively barbarized and included Franks as well, and the south was thoroughly romanized. His administration continued Roman practices; Clovis worked closely with the Gallo-Roman aristocrats, while his military was primarily Frankish. Upon his death in 511, in proper Frankish fashion his kingdom was divided equally among his four sons. The Frankish kingdom was not united again until 558, by his youngest son, Clotar I.

Most of our knowledge of Clovis comes from the writings of Gregory of Tours, three-quarters of a century after the king's death. Despite the obvious greed and treachery of his hero, Gregory was impressed by Clovis's promotion of orthodox Christianity, especially in the face of the detested Arians. Gregory hailed Clovis as a new Constantine and praised him in terms borrowed from biblical laud for King David. The name "Clovis," which evolved into the French name "Louis," was itself a French form of his correct Frankish name, Chlodovech (Chlodwig in German).

# CLUNIAC ORDER

. When Duke William I the Pious of Aquitaine (d. 918) and his wife founded the monastery of Cluny in 909, it was not with the expectation that they were founding an order. Rather, they were establishing a monastery like several that had already been established in Burgundy in the second half of the 9th century, such as Vézelay and Pouthières, where monks of a regular life would live and pray, at least theoretically free from the outside interference of bishop or count.

Cluny followed the Benedictine *Rule,* but like all Benedictine houses it adopted its own particular customs, or *consuetudines,* which regulated many of the details of daily life not spelled out in the *Rule*. At Cluny, tremen-dous emphasis was given to the liturgy, including prayers for the dead—both monks and secular friends of the monastery. As the reputation of the monks' holiness spread, laypeople made generous gifts to the monastery, hoping to be associated with the monks and with St. Peter, their patron. It also became increasingly common for a layperson who controlled a monastery that had lost its regularity of life to give it to the abbot of Cluny for reform. In such a case, Cluny's abbot would become abbot, at least temporarily, of this monastery as well as of Cluny. Such a practice had a long history; houses needing reform had long been put under the direction of the abbot of a nearby house of undoubted regularity. When Cluny was first founded, its abbot, Berno, continued to be abbot of Baume, his original house, even though Cluny and Baume had separate abbots after his death. During the 10th century, Cluny's abbots undertook the reform of some several dozen houses, many in Italy or in Auvergne. In the late 10th and 11th centuries, many old monasteries in Burgundy, closer to Cluny, were similarly reformed. Although some, such as Paray-le-Monial or La Charité, remained permanently under Cluny's abbot, many others, such as Saint-Bénigne of Dijon or Bèze, had their own abbots again after a short period. In the late 11th century, other monasteries, like Vézelay, were added to the lists of dependent abbeys that popes periodically confirmed to Cluny, even though they always had their own abbots. In the 12th century, perhaps 1500 houses can be considered Cluniac.

By the first generation of the 12th century, however, the Cluniacs were being outcompeted for the affections of their Burgundian secular neighbors by the new order of the Cistercians. Though Cluny had not declined from its own standards of holiness, many people, both monastic and lay, were arguing that true spirituality lay in poverty more than in liturgical observance. Cluny's magnificent church, the largest in Christendom, was completed in the first decade of the century, and laypeople continued to make gifts to the house, but the overall level of generosity never again achieved that of ca. 1000, as potential donors made more of their gifts to the new monastic orders or to the regular canons.

Abbot Peter the Venerable of Cluny (r. 1122–56) carried out a long correspondence with Abbot Bernard of Clairvaux (r. 1115–53), the most visible spokesman of the Cistercian order, on the relative merits of their ways of monastic life. Although Bernard always argued that the Cistercians were more austere and closer to Benedict's *Rule,* the two men became friends, and, partly in imitation of the Cistercians, Peter adopted some of their system of economic organization to deal with financial difficulties at Cluny.

By the end of the 12th century, again in imitation of Cîteaux, Cluniac monasteries were for the first time being organized into a true order, with institutionalized relations among the houses that followed Cluny's interpretation of Benedictine monasticism. This organization took its final form in 1231, and chapters-general and organized regional leadership took the place of the personal relations between Cluny's abbot and the monasteries affiliated with Cluny. During the 14th and 15th centuries, economic difficulties multiplied, and a number of powerful men with no interest in furthering the monastic life took the post of abbot.

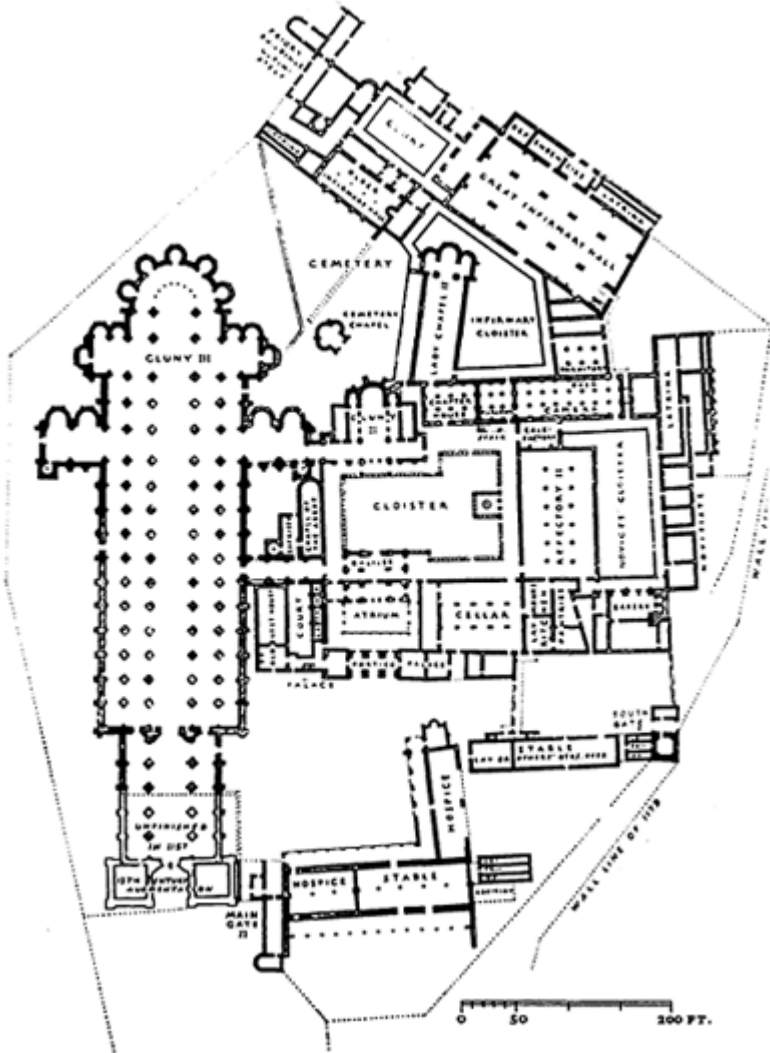
# CLUNY

**.** Though the great monastery of Cluny (Saône-etLoire) is in ruins today, it is important historically for the tremendous influence it had as both a political and an economic center. Kenneth John Conant dedicated his life to the study of the site, and it is through his reconstructions that one can understand the monastic complex as it once was.

The community was founded in 909 by Duke William I the Pious of Aquitaine and his wife, with Berno (r. 910–27), abbot of nearby Baume, as the first abbot. Berno constructed the first church on the site, Cluny I (915–27). No archaeological remains indicate the structure of this original church. Berno's successor, St. Odo (r. 927–42), obtained papal privilege to bring other monasteries under the authority of Cluny. The expansion of the order under Odo necessitated the need for a larger church. In 955, construction of Cluny II was begun (dedicated 981, completed ca. 1040). The church had a seven-bay nave, side aisles, and a narthex. It was crossed by a long and narrow transept

and ended in a long choir complex with stepped apses. The building was probably barrel-vaulted. The most influential abbot from this period was St. Odilo (r. 994–1049), who was instrumental in peacemaking efforts of bishops and kings and instituted the feast of All Souls.



Cluny (Saône-et-Loire), plan of
monastery, ca. 1157. After Conant.

Nothing remains of Cluny II, but small churches like the nearby Chapaize (ca. 1050) and Romainmoutier in Switzerland (ca. 1080) probably reflect, on a modest scale, its appearance.

Cluny reached its apogee under the direction of St. Hugues de Cluny (r. 1049–1109). By the 1080s, there were 200 monks at Cluny, as opposed to seventy in 1042, and the decision was made to build a third, larger church. The massive Cluny III was begun under Hugues's direction in 1088; its main altar was consecrated by Pope Urban II in 1095, and most of the church, except the nave vaults, was finished by the time of Hugues's death in 1109. The church was completed in 1130, when it was dedicated by Innocent II. During this period of power and prestige, Cluny had some 1,500 daughter houses throughout France, Germany, and Spain.

From porch to apse, Cluny III extended 455 feet (an addition to the porch was made in the 12th century and augmented in the 13th, resulting in a total length of 617 feet). The eleven-bay nave was flanked by double aisles. The eastern end of the nave was intersected by two transepts of unequal length, thus creating a plan based on the shape of the archiepiscopal cross. Two chapels extended from each transept arm and the apsed ambulatory had five radiating chapels. Covered by a system of pointed arches and barrel vaulting, the building reached an astounding
Cluny, abbey church, reconstructed
view by Kenneth J.Conant. *Courtesy of
Medieval Academy of America.*

height of almost 100 feet at its peak. Light entered the church on three levels: directly
through the clerestory windows, indirectly through the high windows under the groin
vaults of the inner aisles, and through the lower windows of the outer aisles. On the basis
of measurements made on the site and the study of 18th-century plans, Conant has
concluded that the master of Cluny III followed the proportional principles of the Golden
Section.

The exterior silhouette of the building was articulated by four principal bell towers, one square (over the crossing of the main transept) and three octagonal (capping the small transept, and atop the arms of the main transept). Towers on the western façade were erected after 1200.

Nine capitals from the hemicycle in the sanctuary of the choir survive in the Musée du Farinier at Cluny. These date probably from the first quarter of the 12th century and represent biblical scenes, the Seasons, the Virtues, and the Tones of Plainsong. Though sculptural remains from Cluny III are scant, ornamentation at other Romanesque churches in Burgundy can provide a sense of its once extensive decorative program.

Under the abbacy of Hugues, the rest of the monastic complex was greatly expanded, on a scale proportional to that of the new monumental church. A large hospice (36 by 163 feet) was built in the great forecourt of the monastery, as was a stable at least 100 feet long. In 1080, the

Cluny (Saône-et-Loire), abbey church, south transept. *Photograph courtesy of Whitney S.Stoddard.*

refectory for the monks was trebled in size and decorated with an immense fresco painting of the Last Judgment.

Cluny's last great abbot was Peter the Venerable (r. 1122–56), who gave sanctuary to Abélard and engaged in debates with Bernard of Clairvaux concerning Cluniac and Benedictine observance.

Ravaged by the Wars of Religion and progressively demolished for its stone between 1798 and 1812, almost nothing of Cluny III survives save the south tower of the main transept and a later side chapel built by Cardinal de Bourbon in the Burgundian Gothic style (1456). One can, however, gain a sense of this once magnificent Romanesque basilica through smaller-scale churches apparently close in style, such as Paray-le-Monial and the cathedral at Autun.

# CŒUR, JACQUES

(ca. 1395–1456). The most important businessman of medieval France, Jacques Cœur was born into a wealthy family in Bourges. By 1430, he was established as a financier, merchant, and master of France's Levantine trade, and he soon became a favorite of Charles VII. Royal *argentier* after 1438 and ennobled after 1441, he reorganized Valois coinage and finances and served as royal commissioner in financial and commercial negotiations. His vast financial, commercial, and industrial empire eventually made him the wealthiest man in Europe. During this period, he built a house in Bourges that

symbolized his magnificence and remains a monument of Gothic architecture. His most significant public action was to finance the reconquest of Normandy and Guyenne, but by 1451 his wealth and pride had won him the envy and resentment of both crown and nobility. Charles VII found it easier to ruin than repay his greatest creditor. Arrested on the absurd charge of having poisoned the king's mis-

Bourges (Cher), Hôtel Jacques Cœur, courtyard. *Photograph courtesy of Whitney S.Stoddard.*

tress, Agnès Sorel, Jacques Cœur was condemned for irregularities in fact typical of contemporary public finance. His holdings were confiscated by the crown, and he was imprisoned until 1454, when he escaped to Rome, where Calixtus III gave him command of a papal fleet. He died on campaign against the Turks at Chios in November 1456.

# COLIN MUSET

(fl. 2nd third of the 13th c.). Trouvèrejongleur of the second third of the 13th century. Colin has been credited with a score of lyrics, varied in genre and unusually reflective of the poet's life; about half survive with music. He was from Lorraine, of humble condition, and made his living as an itinerant entertainer. Colin was inventive in compositional form and original in substance, less concerned with the constraints of courtly love than with the delights, real or imagined, of a freer sensuality. Apart from love, his themes include the pleasures of the table, spring, and revery, the satisfactions and difficulties of a minstrel's calling, the avarice of some patrons, the animation of tournaments. The texts are striking in their relatively abundant concrete detail and unhindered self-expression; the genres are no less so, including as they do such rare ones as the *lai/descort* and *reverdie.* Colin Muset is perhaps the most markedly individual of the trouvères.

# COLMAR

. Located on the plain of Alsace near the foothills of the Vosges, Colmar (Haut-Rhin) dates back to at least the 13th century and possibly much earlier. Although the date of the first Christian settlement in the south of Alsace has not been attested, it is known that in 823 Benedictine monks of the abbey of Münster arrived, and they had founded a religious establishment west of the Harbourg by 865. A charter from the 10th century records a donation from Empress Adelaide for the foundation of the priory of Saint-Pierre. Among the many medieval buildings that have been preserved are the church of Saint-Martin, a cloister and chapel of a former Dominican monastery now incorporated in the Musée d'Unterlinden, a Franciscan house (now Saint-Matthieu), and a second church associated with the Dominicans.

The present Saint-Martin (1237–1366) replaced a 10th-century church. The transept was built first, followed by the nave, and then the choir near the end of the 14th century. The transept and nave seem to be the work of one architect, perhaps Master Humbert. In fact, on the south side a statue of Master Humbert with his square drawing-board adorns the portal of Saint-Nicolas. The nave comprises six bays, flanked by aisles on the north and south. The 14th-century octagonal choir by Guillaume de Marbourg features three bays, a series of interconnecting chapels, and an octagonal chevet and is surrounded by an ambulatory, unusual for Alsace. Four columns stationed at the crossing support 15th-century vaulting. Sculpted tympana, the Adoration of the Magi and the Last Judgment, rose windows, and windows with triple and double lancets adorn the façades. Medieval scuplture on display includes a 13th-century and a 14th-century Virgin and Child, figures of the Apostles (14th c.), and Crucifixion with the Virgin and St. John (14th c.).

To the northwest, the Musée d'Unterlinden incorporates the cloister and chapel of a former Dominican monastery. The chapel contains engravings by Martin Schongauer (ca. 1420–91); panels from the altar frontal of the Dominican church by the School of Schongauer (1480); the Bergheim predella (1460); a diptych of SS.Catherine and Laurence; and a statue of the Annunciation (15th c.). The basement contains, among the museum's archaeological collection, a Gallo-Roman mosaic (3rd–4th c.).

A second Dominican church was built between 1283 and 1295. Damaged by fire in 1458 and subsequently used as a corn market, the church was completely restored in the late 19th century. The nave, with six bays, is almost square. One of the prominent features of the Dominican church is its stained-glass windows, which depict the life of Christ, the saints with their attributes, and Ulrich and Agnes von Heckenheim, founders of the monastery. In the cloister are frescoes of the Resurrection of Christ, attributed to Urbain Huter (15th c.).

Saint-Matthieu, once a Franciscan church, is located in the north part of Colmar and contains good 14th and 15th century glass and a 15th-century choir screen. Although its history reaches back to the 10th century, the present chapel of Saint-Pierre is the work of an 18th-century architect, J.J.Sarger of Colmar.

# *COMITES*

. The *comites* (pl. of Lat. *comes* 'companion'), or "counts," were the chief representatives of royal power on the local level in the Frankish kingdom. Appointed by the king and serving directly under him, the *comites* were virtual viceroys in their districts, the *civitates*. These royal officials of the early Middle Ages gave rise to the counts of the high Middle Ages, who presided over often semi-independent counties, attached to the king by ties of vassalage and perhaps even of loyalty. But they were far removed from the *comtes* of the *ancien régime,* holders of this title of nobility conferred by the king.

The *comites* were originally recipients of the title *comes* from the Roman emperor in recognition of their being close associates, or companions, of his. Constantine the Great (r. 306–37) began to attach official duties to the title. By the 5th century, a great variety of *comites* appeared in the bureaucracy and military, including the *comites civitatum,* who governed the *civitates,* the subdivisions of the province. The Germanic kingdoms created in the territory of the western Roman Empire in the 5th and 6th centuries, including that of the Franks, adopted this official along with the rest of the Roman administration in their lands.

The *comites* served at the pleasure of the king, although they were often members of the local aristocracy. In the *civitas,* they exercised all royal functions. They were delegated the royal *bannum,* the right to command all subjects. They collected tolls and taxes, presided over the royal court (the *mallus* or *placitum*), supervised mints and markets, assembled local levies for the royal armies and sometimes even led them into war. They were generally responsible for law and order. *Comites* served without salary but were compensated by receiving a portion of legal fines and compositions (the *fredus*) and a third of the revenues of specifically reserved royal lands. In the Carolingian period, the *comites* also disseminated and enforced royal capitularies and decrees, as well as administered oaths of fidelity.

In the Germanic regions of the Frankish kingdom, the *comes* was called *grafio*. The *comites* were assisted by *vice comites* (viscounts), whom they appointed, as well as by vicars who administered the subdivisions of the *civitates*.

# COMMUNE

. Communes were sworn associations of rural or urban dwellers designed to provide collective protection from seigneurial authority. The earliest development of self-governing cities occurred in the later 11th century between the Loire and the Rhineland, as well as in northern Italy. A French urban commune typically consisted of a royal charter proclaiming the peace of the city, a belfry, and a town seal that permitted it to deal as a peer with seigneurial powers. Possessing these, a town could then organize and govern itself, generally by means of a mayor and twelve notables (Lat. *scabini,* Fr. *échevins*). The urban territory became officially a "peace zone." Responsibility for enforcing order and judging violators fell to the commune, as did collection of taxes and the payment of dues to the king or local lord. These urban franchises were available to all residents, including those who, fleeing servitude in the countryside, remained for a year and a day.

Economic and political forces at the turn of the millennium set the communal movement in motion. Enterprising lords hoping to develop underpopulated areas attracted immigrants by offering various franchises, thereby providing an escape from the more onerous aspects of the seigneurial *ban*. Those who settled around some privileged fortifications (*bourg, cité,* castle) became wealthier and more numerous, overshadowing the habitations of the lay or clerical lords who had first encouraged their association. By the years ca. 1100, conflicts between the growing urban collectivity and the interests of the traditional possessors of power reached a critical stage that dictated new agreements. Where the agglomerations were relatively new, lords granted liberties without much difficulty (Le Huy, 1066). Older urban communities with enlightened lords followed suit. Communal movements often gained support from the monarchy, which, outside its own cities, favored counterweights to its refractory nobility.

The self-assertion of the inhabitants became more violent, however, when lords refused to relinquish traditional authority, and the communal movement took over some of the revolutionary aspects of the Peace of God. Communes engaged all inhabitants in a communal oath, thus substituting a horizontal and egalitarian form of association for the more traditional hierarchical ones of the aristocracy. Within the commune, each member was subservient to the other as a brother. On the ideological level, the notion of "peace" played so fundamental a role that in some charters *pax* and *communa* are synonymous terms.

The word "commune" sometimes had stronger connotations. At Laon in the 12th century, the conservative cleric Guibert de Nogent found it a hateful novelty, while the populace considered it the rallying cry to insurrection. The charter and seal of a city constitute elements of a later, more normative phase of the movement, visible attributes

of rights achieved in an era when legal thought played a minor role. The belfry, however, represents the original strength of the movement: the right to sound the bell of alarm and convocation institutionalized the cry of *"communa,"* giving members the right to summon the collectivity to deliberate or fight for their peace. Such communes could lead to bloody insurrections, although such violence was not especially common or successful. But their frightening example must have played a role in any negotiation process; and violent hostility between lords and communes recurred throughout the Middle Ages.

Communes continued to form through the 12th and early 13th centuries, and in the reign of Louis IX there were over thirty-five of them in the regions directly north of Paris. They gradually became more established, with a hierarchy of guilds structuring relationships between segments of the population, often concentrating authority in the hands of a clique of ruling families. Communes began to decline after the 13th century, with European economic growth generally. Hardening class distinctions weakened their collective spirit, and communal governments fell into serious debt. By ca. 1300, some cities, such as Sens, Compiègne, Meulan, and Senlis, accusing their leaders of corruption and embezzlement, requested the king and Parlement to dissolve their communes. The disorder and heavy fiscal demands accompanying the Hundred Years' War destroyed some communes but revived the spirit of self-defense and insurrection in others. Although never regaining their institutional weight during the rise of the modern state, communes have retained an almost mythic place in the social imagination of the French.

# COMMYNES, PHILIPPE DE

(ca. 1447–1511). A member of the Flemish nobility, Commynes was first an important official of Charles the Bold of Burgundy and then afterward served as chamberlain, counselor, and confidant of Louis XI of France. His experiences in both capacities are the subject of his *Mémoires,* written between 1489 and 1498. Commynes's memoirs are one of the first examples of the memoir-as-history, a genre that was to be highly popular in the Renaissance.

Commynes was the son of Colard van den Clyte, a functionary of the dukes of Burgundy. Commynes took his name from Comines near Lille, the holding of his uncle, who raised him from the age of seven. From 1464, he was an intimate adviser of the future Duke Charles the Bold. In July 1472, Commynes defected from the Burgundian

side, perhaps for mercenary motives, and entered the service of the king of France, who compensated him with new titles and the holding of Talmont (a territory with 1,700 dependent fiefs), a pension, and, upon his marriage in 1473, the territory of Argenton. The relationship between Louis and Commynes was close; contemporaries noted that he was like the king's alter ego, and as Louis lay paralyzed on his deathbed, Commynes was the only person able to interpret his gestures and noises.

After the death of Louis in 1483, however, Commynes's position deteriorated; he was driven from the court and, between 1487 and 1489, imprisoned. He lost both Talmont and Argenton. In prison, Commynes underwent the religious conversion that explains the moralist tone of his memoirs. Commynes began composing them while still in exile, completing the first five books by 1490. After his rehabilitation, he continued working, completing Book 6 in 1493. Between 1494 and 1495, he accompanied Charles VIII on his disastrous Italian campaign, which became the subject of Book 7. The last book was completed shortly after the death of Charles VIII in 1498.

The *Mémoires* are an eyewitness account of a turbulent and crucial period of French and Flemish history, when the Burgundian dukes were attempting to establish their independence of the kings of France, and the kings were struggling to consolidate and centralize their political control. Commynes's intent was to present events as moral lessons about proper governance; his work is a mirror for princes. He wanted to see rational government and, to that end, to have diplomacy replace reliance on military might. No ruler in this violent age, therefore, was wholly admirable, not even Louis, whom Commynes loved. Commynes deliberately altered events to suit his didactic purposes; the *Mémoires* are factually treacherous. But they do shed light on rapidly changing 15th-century politics and political ideas.

Both the frank and factual quality of the *Mémoires* and its larger philosophical concerns have ensured the popularity of the work. Six manuscripts survive (only one of which contains Book 8), while the first printed edition was published in 1524, only twenty-six years after Commynes laid down his pen. This has been followed by more than a hundred editions and translations.

# *COMPAGNIES D'ORDONNANCE.*

Units of the regular French army established in the 15th century. By 1400, independent mercenary companies had come to dominate warfare. The greatest challenge facing the Valois monarchs became the need to control their own armed forces, which often ravaged France in periods of chaos, such as the *escourcherie* ("slaughter") of 1435. In the spring of 1445, Charles VII disbanded as many of these companies as possible and commissioned a limited number of captains to assemble new commands to be garrisoned in frontier towns where they were to be regularly paid and supplied. These new *compagnies d'ordonnance* were composed of up to a hundred *lances fournies,* each of which theoretically represented one man-at-arms, two archers, and three servants as well as their horses. The key element in the reform was less military than administrative, as the crown worked through regular musters, inspections, and payments by commissioners, comptrollers, and treasurers of war to enhance military discipline. The force never attained its proposed maximum of 12,000 men, *ordonnance* soldiers often relapsed into indiscipline, and the companies sometimes proved more loyal to their commanders than their kings, but they nonetheless represented a dramatic improvement and became the backbone of royal armies for the next century.

These units of heavily armored cavalry and mounted archers were tactically conservative even in the 15th century, but their permanent readiness made them the decisive force in the campaigns of the late Hundred Years' War. Other princes, such as the dukes of Brittany and Burgundy, soon imitated the innovation, and the companies enjoyed rising social and military prestige for the remainder of the century. Appointment to command or serve in the companies became a key form of princely patronage. Such service was ultimately restricted to the most privileged echelons of society. After 1500, the spread of firearms rendered heavy armor useless, and the emergence of modern light-cavalry and infantry formations ended the tactical preeminence of the companies. The traditional characterization of the companies as the first standing army in Europe is perhaps too simplistic, but the significance of the innovation is undeniable. In regularizing military service as a remunerative career, professionalizing the art of war, and providing a device for the cooptation of the medieval aristocracy into the disciplined service of the modern state, they represented a decisive breach with the medieval traditions of war.

# COMPLANT/*MÉPLANT*

. The complant, or *méplant,* contract (Lat. *medium vestum*) was used primarily to put land back into cultivation or to convert arable or waste to viticulture, or to make such capital improvements as the construction or repair of mills, although a variation was also used for animal husbandry. Its terms involved a grant of land by owner to laborer for a term of years during which the laborer was to clear it, enclose it and plant vines, or build a mill on it. Generally, costs were borne by the laborer, as were any profits, for the term of the contract. At the end of the term specified (three, five, seven years, or longer), the land with improvements was divided in half between the original owner and the improving laborer, and each henceforth owned half of the holding as an allod. Such contracts were used frequently in the 11th and 12th centuries as a means of instigating reclamation and land improvement.

# COMPOSERS, MINOR (14TH CENTURY)

. Virtually no music manuscripts supply composer attributions until late in the 14th century. Although many early 14th-century composers are named in the texts of two isorhythmic motets (*Musicalis scientia/Sciencie laudabili* and *Apollinis eclipsatur/Zodiacum signis*), we cannot identify specific works by them, except for some isorhythmic motets of Philippe de Vitry and the complete works of Guillaume de Machaut. For the late 14th and early 15th centuries, ascriptions in the Chantilly codex (Chantilly, Musée Condé 564) and the Modena manuscript (Modena, Biblioteca Estense, α.M.5, 24) together supply about forty names of composers of French music.

Pierre des Molins and Matheus de Sancto Johanne were with King John II in captivity in England from 1357 to 1359. Pierre's ballade *De ce que foul pense,* probably written in England, was the most widely transmitted musical work of the 14th century. To judge from the style of his five surviving works, Grimace was a contemporary of Machaut (d. 1377). His virelai *A l'arme, a l'arme* exhibits realistic vocal effects, a lover's emergency call to arms to his lady. Jean Vaillant (fl. ca. 1360–90), teacher at a singing school in Paris, may have served John, duke of Berry. His virelai *Par maintes foys,* which imitates birdcalls, was widely transmitted in the 14th century, even supplying the music for a contrafact by Oswald von Wolkenstein. Jean de Susay, active in the 1380s, is represented in Chantilly by one ballade close in style to Machaut and two ballades in a more complex Ars Subtilior style. He is also credited with the composition of one Gloria, possibly written for Avignon.

A center of composition for the Ars Subtilior was the papal court at Avignon. Magister Franciscus may have served under popes Gregory XI and Clement VII and perhaps can

be identified as the F.Andrieu who composed a lament on the death of Machaut to texts by Eustache Deschamps, *Armes, amours/O flour des flours*. Pykini, whose virelai in the Chantilly codex was possibly written for Pope Clement VII, probably served at Pamplona in the court of King Charles II of Navarre in the years 1374–87.

Hasprois (fl. 1378–1428), from Arras, who served Clement VII and Benedict XIII from 1393 until 1403, was earlier in the service of King Charles V. One of his ballades, the complex *Puisque je sui fumeux,* was probably written for Eustache Deschamps's society of *fumeux*. Haucourt (fl. 1390–1410) also sang in the chapels of popes Clement VII and Benedict XIII, and Matheus de Sancto Johanne served Clement VII in the years 1382–86. Johannes de Bosco (d. 1406?), a singer in Clement's chapel in 1391, also served Duke Louis I of Anjou, and followed Pope Benedict XIII from court to court later in the century. Other members of the papal choir at Avignon who cultivated complex Ars Subtilior chansons include Goscalch (fl. 1385–95), whose one ballade in Chantilly, *En nul estat,* is rhythmically one of the most complex compositions of the Ars Subtilior, and Philippus de Caserta.

A number of composers represented in the Chantilly codex are linked to the Francophile court of Aragon. Gacian Reyneau served at Aragon from 1398 until 1429. His rondeau *Va t'en mon cuer* looks forward to the simpler style of the early 15th century. Trebol (alias Borlet), composer of the virelai *He, tres doulz roussignol,* served under Martin I of Aragon in 1409. Trebor, perhaps the same person as Trebol, worked for Gaston Phoebus at Foix and later at Aragon under King John I. One of his ballades, *Passerose de beauté,* was written for the wedding of John, duke of Berry, to Jeanne de Boulogne on May 25, 1389. Three of the ten compositions of Solage (fl. 1370–90) were also destined for the duke of Berry. His rondeau *Fumeux fume,* written for Deschamps's society of *fumeux,* exploits surprising chromaticism and a low range unusual in 14th-century music.

Cuvelier (fl. 1372–87), *faiseur* to Charles V of France and author of a chronicle on Bertrand du Guesclin (1387), composed three complex ballades found in the Chantilly codex. Hymbert de Salinus, a member of the generation of composers who formed the transition from the Ars Subtilior style to the simpler style of the early 15th century, wrote *En la saison,* a ballade on a text by Cuvelier praising Olivier du Guesclin. Philippe Royllart, whose only known composition is the widely transmitted and influential isorhythmic motet *Rex Karole/Letitie pacis* in honor of King Charles V, is another late 14th-century composer of unknown origin.

The Modena manuscript, copied in Bologna in 1410/ 11, contains French chansons from the courts of popes Alexander V and John XXIII. Matheo da Perugia (d. ca. 1418), an Italian composer who probably assembled the manuscript, is represented by over thirty compositions, at least twenty-two of which are French chansons in 14th-century style. Other Italian composers writing French chansons were associated with the antipope Alexander V; for example, eight French chansons by Anthonello de Caserta are found in the Modena manuscript. His *Beauté parfaite* sets a ballade text by Machaut, and *Dame d'onour* quotes from Vaillant's *Par maintes foys,* evidence of the continuing influence of French music in Italy.

# COMPOSERS, MINOR (15TH CENTURY)

. Around 200 15th-century composers are known from musical manuscripts across Europe. Over two-thirds of them are French or Franco-Flemish, reflecting the fact that this was an age in which the Franco-Flemish school dominated music in all European countries except England. But it is also a century in which musical manuscripts from France and modem Belgium are in disastrously short supply, as can be seen from the survey of source origins in Vol. 5 of the Illinois *Census-Catalogue;* a vast majority of the surviving sources are from Italy or from eastern countries.

It is also a century in which the composer's name was only intermittently valued. Many musical sources never name a composer: there is no name among the forty-three works of the Chansonnier Cordiforme (Savoy, 1470s), the fifty-six in the Wolfenbüttel chansonnier (Loire Valley, 1460s), or the thirty-three of the Copenhagen chansonnier (Loire Valley, 1470s), to take only three of the most famous manuscripts. Turning to some of the largest manuscripts, we find only three names among the 240 pieces in Trent 91 (northern Italy, 1470s), and the few names among the 106 pieces in the Laborde chansonnier (Loire Valley, mainly 1470s) are nearly all added later.

The names of several important composers survive in only a single manuscript. Without the manuscript Q15 (1420s–30s) in the Bologna conservatory, we would know nothing of Johannes de Lymburgia, whose three dozen works evidently had a wide influence, and we would know little of the early sacred work of the leading composer of the time, Guillaume Dufay. Without MS. Canon. Misc. 213 of the Bodleian Library, we would lose the names of over twenty early 15th-century composers and have little idea of the achievement of such major figures as Pierre Fontaine, Nicolas Grenon, Jacobus Vide, Richard Loqueville, and Gilet Velut, not to mention Carmen, Tapissier, and Cesaris, later praised by Martin le Franc as the leading composers in Paris ca. 1400. Without that manuscript, we also would have lost most of the early secular work of both Dufay and

Binchois, music that establishes their reputation as the finest song composers of the century.

There is also a fair number of evidently famous and distinguished composers for whom there is no identifiable music. The theorist Tinctoris in the 1470s asks whether there could be anybody who does not know the fine music of Jacobus Carlerius; elsewhere, he mentions Courbet as though he were a household name, an impression reinforced by the position allotted to him in Compère's motet *Omnium bonorum plena* (ca. 1472). Payments for copying entered in two of the most distinguished musical establishments of the century, Cambrai Cathedral and Saint-Donatien in Bruges, mention substantial sacred works by Bauduin Mijs, Pasquin, Rasse de Lavanne, Johannes Fremiel, Alanus de Groote, Petit Jehan, and Heniart; the last two are now known from one slender secular piece each. Gafforius mentions Guillaume Guarnier (fl. 1470s) as *optimus contrapunctista* and names one of his Masses, Vincenzo Calmeta calls him a superb composer who taught the poet Serafino dall'Aquila, and as late as 1548 Heinrich Faber cites him as a composer of the highest distinction. Ramos de Pareja praises his teacher Johannes de Monte, presumably from Mons and perhaps active in the middle years of the century. Other such composers are mentioned in the writings of Simon Greban and Guillaume Crétin. Similarly, the poor source situation may explain why the greatest composer of the late 15th century, Josquin des Prez, was apparently born ca. 1440 though not a note of his music can be dated with any confidence earlier than ca. 1475, when he was already a middle-aged man by the standards of his time.

Moreover, the slender survival of documentary material from 15th-century France means that there are evidently famous composers for whom there is no biographical material. Barbingant may be a classic example: he is known from three songs and two Mass cycles, but his music strongly suggests that he was a substantial influence on the young Ockeghem and probably on Busnoys and Compère as well. There is a good case for believing that Barbingant was the main composer in Paris in the years ca. 1450. Johannes Tourant (fl. 1450–70) has yet to be located in any document, despite an impressive output of three Mass cycles and fifteen smaller pieces, some found in many sources. Yet another example is the prolific Caron.

On another front, there are major courts and churches for which no useful information survives. René d'Anjou had such a fine musical establishment at his death in 1480 that Louis XI appropriated the entire choir and installed it at the Sainte-Chapelle in Paris, remarking that it contained the finest singers of the time. Almost accidental documentation tells us that René was the only man to have served as patron to the two greatest composers of the century, Dufay and Josquin. Only the slenderest information survives about the evidently generous musical patronage of Jean II, duke of Bourbon (d. 1488), though it is all but certain that he employed two of the finest song composers of that generation, Hayne van Ghizeghem and Loyset Compère.

Music history is one of the smallest and most recent humanistic disciplines; many sources of information remain virtually untouched by researchers. Only within the last few years has exploration of the material at Bourges thrown light on the musical patronage of John, duke of Berry, producing the first biographical information on many eminent composers in the Bodleian manuscript. Recent research in the Vatican archives has brought valuable new details about the lives of such figures as Arnold and Hugo de Lantins, Pulloys, and Busnoys.

For all those reasons, it is often hard to qualify a composer as "minor" in the 15th century. Any newly discovered musical source or any newly explored documentary information could radically change the picture, though all those that now seem likely to have been significant have been mentioned here. The reader can find articles in *The New Grove Dictionary* on all known composers before 1450 and most of those from the second half of the century; there is more recent material on some of them, plus a few extra entries, in the *Dizionario enciclopedico universale*. The Illinois *Census-Catalogue* gives full information on the known manuscripts containing their work.

# *COMPUTUS*

**.** Treatise for calculating the dates of religious festivals, especially Easter. The Catholic church's use of both a solar and lunar calendar made the calculation of the dates of religious festivals a complicated matter; to assist the faithful in these calculations, the *computus* was devised, a work providing the information needed to determine when Easter and other mobile feasts would fall in a given year. Examples exist in Latin, Bede's *De temporum ratione* (725) being the best known.

This pseudoscientific genre found proponents, particularly in the Norman realm. Philippe de Thaün drafted the first vernacular *computus, Li cumpoz,* in Anglo-Norman (1113 or 1119); he was followed by Ralph of Lenham, author of a *Kalender* (1256; 1,330 lines; three manuscripts). An anonymous *Traité du comput* was written in Évreux before 1267, and there exists an Occitan *computus* (170 lines; two manuscripts) by Raimon Féraut (last quarter of the 13th c.). Of these texts, perhaps only that by Ralph of Lenham was destined for a lay audience.

# *COMTE D'ARTOIS, ROMAN DU*

. A 15th-century prose romance that recounts the adventures occasioned by the apparently impossible demands the Count of Artois, a perfect knight and courtly lover, makes upon his wife. Direct address to the reader, a favorite device of the author, shows his concern to rouse interest and stimulate imagination. Unaffected dialogues and lyrical soliloquies interspersed with ejaculatory remarks felicitously break up a narrative that might otherwise be weighed down by ponderous latinate rhetoric. The romance, relatively short by contemporary standards (only ca. 150 pages in its modern edition) is preserved in three 15th-century manuscripts.

*Annette Brasseur*

Seigneuret, Jean-Charles, ed. *Le roman du comte d'Artois.* Geneva: Droz, 1966.

# *COMTE DE POITIERS, ROMAN DU*

. A wife wrongly accused of adultery (ll. 1–1,230), a town conquered for the love of a young lady (ll. 1,230–1,719)—these two themes are the matter of a brief adventure romance inspired by the same model as Gerbert de Montreuil's *Roman de la Violette*. The influence of the chanson de geste and the courtly romance can be felt in this hybrid work, written in northern France ca. 1235–40, where a bawdiness worthy of the fabliaux and an epic style do not in the least hamper the expression of refined feelings and didactic intentions, both moral and religious. The poem is found in a single manuscript, Paris, Arsenal 3527.

# CONCILIAR MOVEMENT

. Conciliarism, like papalism, had its roots in the medieval heritage, especially in the diverse texts found in Gratian's *Decretum*. The dominant ecclesiology from Gratian to the Great Schism was papalist; but key texts suggested that popes had erred in the past—and could again. Critics, among them the emperor Frederick II, argued for convocation of a general council to correct a pope; and a different group, many masters at the University of Paris, were episcopalists, defending the rights of bishops and curates against the encroachments by the friars that the papacy had authorized. The earliest episcopalist, William of Saint-Amour, was driven into exile; and Jean de Pouilli was condemned for heresy by Pope John XXII. These privileges, too, found apologists, especially among the Dominicans, including Hervaeus Natalis and Pierre de la Palu, prominent figures at Avignon. Other controversies, especially those concerned with Franciscan poverty, helped shape opinion on papal and conciliar power. Even condemned writers like William of Ockham and Marsilius of Padua continued to be read, especially in Paris.

These arguments over poverty and privileges paled before the problems that arose in 1378 with the outbreak of the Great Schism. Christendom became divided between two pretenders to the papal throne. The princes chose sides, supporting either Urban VI (r. 1378–89) or Clement VII (r. 1378–94), usually along the lines of their alliances in the Hundred Years' War. Efforts to end this crisis, vindicating the cherished ideal of ecclesiastical unity, were complicated by the interests of princes and prelates; and a deeper critique of the institution than that of popular heresy appeared in the universities. John Wyclif in England and somewhat later John Hus in Bohemia argued that the corrupt, indulgence-selling church of their time was not the True Church. Nor could sinful priests celebrate the sacraments validly. These doctrines won popular support in the Lollard and Hussite movements; and some of the clergy realized that solution of the Schism had to be coupled with reform of the institution and defense of the faith.

The conciliar movement, which sought to accomplish these goals through convocation of a general council, was slow to appear. A council first was suggested in 1378 by the Italian cardinals. More detailed proposals were prepared in Paris by the theologian Henry of Langenstein and the canonist Conrad of Gelnhausen. Obstacles to holding a council lay in the canon law, which required convocation of such an assembly by the pope, and in the policies of princes. Most notably, Charles V expelled from Paris all those masters who would not support Clement VII, the claimant resident at Avignon. Langenstein and Gelnhausen left for Germany, where conciliarism soon took root.

From 1378 to the end of the 14th century, other solutions to the Schism were sought, especially through mutual renunciation by both pretenders, which would safeguard the benefices of clergy adhering to either. The French, divided between Burgundian and Armagnac interests, sought a solution in partial or complete "subtraction of obedience" from the two pretenders, the latter approach a policy promoted for the duke of Berry by Simon de Cramaud. This period saw a revival of episcopalism at Paris, which helped prepare the way for the emergence of Gallicanism by linking the interests of the secular

clergy, especially their attacks on the privileges of the mendicants, with the interests of the French crown. None of the proposals for subtraction of obedience moved Clement's successor, the Aragonese Benedict XIII (r. 1394–1417). Efforts to coerce him led only to his flight from Avignon. When Benedict and the fourth Roman claimant Gregory XII (r. 1406–15) failed to meet and discuss the means of ending the Schism, the cardinals on both sides agreed to summon the Council of Pisa (1409). Gregory sought refuge with the Malatesta of Rimini, and Benedict fled to Peñiscola in Catalonia.

At Pisa, under the presidency of Simon de Cramaud, conciliarism emerged as the dominant justification for the council's efforts to reunify Christendom. Two strands of conciliarism, canonistic and theological, met in the representatives of the Italian and French universities. Canonistic conciliarism was represented among others by Francesco de Zabarella, whose *Tractatus de schismate,* in its final form, made wide claims for both cardinals and council. The heart of his argument was the comparison of the church with a corporation, which was able to depose its rector, the pope, if he endangered its welfare. This doctrine emerged from canonistic discussion of cathedral chapters, from Augustine's statement that Peter received the keys as the church's representative, and from precedents in Gratian's *Decretum* describing past instances of popes falling into error. The theological approach leaned more heavily on Scripture, especially on Paul's reprehending Peter for breaking off contact with the gentile converts. The chief proponents of this viewpoint, Pierre d'Ailly and Jean Gerson, emphasized the visible church as the Mystical Body of Christ. The council, representing that body, could remove an erring pope. Corporation theory also can be found influencing this line of thought, and these theologians made frequent use of texts from canon law. Both schools thought equity justified holding a council even in the absence of a pope.

The Council of Pisa, identifying obstruction of reunification with heresy, declared both claimants deposed; but their first pope of unity, Alexander V, died soon after his election. His successor, the antipope John XXIII, could not win universal acceptance. Gerson and d'Ailly became convinced that another council was needed; and they helped persuade Sigismund of Luxembourg, King of the Romans, that John should be pressed to summon one. Already driven from Rome by the Angevin king of Naples, John was forced to acquiesce. When the Council of Constance began in 1414, the pope found himself regarded as dispensable. His flight from Constance ended in imprisonment, but the assembly had been forced to guarantee its own continuation. The decree *Haec sancta* (1415) embodied the classic tenets of conciliarism—that the council represented the church; that it had power from Christ to act for unity, defense of the faith, and reform; and that even a true pope was bound to obey. The cardinals present were apprehensive about the projected scope of reform and their role in electing the next pope; but the only real dissenter, the Dominican general Leonardo Dati, was moved by fear that Gerson's episcopalist leanings would lead to an attack on the friars. Gerson, however, was too busy trying to have Jean Petit condemned for his defense of the murder of Louis of Orléans as tyrannicide to attack the privileges of the mendicants forcefully.

The council pressed on toward unity. John XXIII and Benedict XIII were deposed. Gregory XII abdicated, after issuing a *pro forma* convocation of the council. The assembly also condemned the errors of Wyclif, whose bones were unearthed for cremation, and burned John Hus and Jerome of Prague as heretics. It nearly failed, however, when arguing whether reform should precede or follow election of a pope. At

last, a compromise permitted enactment of some reforms before a special electoral college began its conclave. The chief of these decrees, *Frequens* (1417), mandated holding a regular series of councils to supervise the papacy. Afterward, the electors chose Oddo Colonna, who became Martin V (r. 1417–31). Martin negotiated a series of concordats with the nations present in Constance—English, French, German, Spanish and Italian—which promised further reforms and other concessions. He followed the dictates of these pacts and those of the Council of Constance throughout his reign, but he frustrated the efforts of some present at the Council of Pavia-Siena (1423–24) to further curb the papacy's power. An impression that Martin opposed reform and conciliar authority, which was especially prevalent at the University of Paris, together with political problems in Italy and the Hussite domination of Bohemia, would cause problems for his successor, Eugenius IV (r. 1431–47).

Eugenius inherited the most recent unsuccessful crusade against the Hussites and a council summoned to meet at Basel. The pope wished to transfer the assembly to Italy to negotiate reunion with the Greeks; but the papal legate, Giuliano Cesarini, thought negotiations with the Hussites more crucial The assembly resisted transfer or dissolution, restating *Frequens* and then *Haec sancta* as a justification. The council flourished as it pursued successfully an agreement with the more moderate party among the Hussites. Eugenius, hard pressed by foes in Italy and a refugee from riots in Rome, was forced to authorize continuation of the council.

These confrontations led to a flurry of apologetic writing. The most important work was Nicholas of Cusa's *De concordantia catholica,* which balanced hierarchy and consent through a mechanism for the representation of lower ranks at each higher level of the ecclesiastical apparatus. The general council, in a spirit of concord, would reform the church. Nicholas, however, was not interested in any confrontation of pope and council. Instead, when the assembly debated making Eugenius's newly appointed presidents take the oath of incorporation, binding them and their master to obey conciliar decrees, he sided with Cesarini, who sought a compromise solution of the problem.

The council refused their advice, and the pope soon gave up any effort to be accommodating. The council's decision to curtail the curia's collection of annates without any compensation only made matters worse. So did Eugenius's inability to understand the conciliar viewpoint. The pope found few allies at Basel outside of Dominicans like Juan de Torquemada, who were confronted with renewed attacks on the privileges of the friars. A fight over the site of a council of union with the Greeks, however, drove Cesarini, Nicholas of Cusa, and others into the papal camp. The new leadership of the council derived largely from France and Savoy; and their justifications, in purely theological terms, were prepared by John of Segovia, who represented the theological conciliarism of Gerson. The final break came when the assembly insisted that the council meet in Avignon or Savoy, over the objections of both Eugenius and the Greeks.

Eugenius replied by calling a council to meet in Ferrara; and the Greeks, along with the minority party from Basel, went there. Later, at Florence (1439), the council would decree a short-lived union between East and West, which acknowledged papal primacy over the entire church. Basel would respond by declaring conciliar supremacy a dogma, decreeing the deposition of Eugenius and electing as pope Amadeus VIII of Savoy, who became Felix V.Eugenius condemned his opponents in the bull *Moyses,* which dismissed

*Haec sancta,* the chief prop of Basel's new dogma, as merely the act of one obedience in the Great Schism, and launched a diplomatic offensive against them. England and Burgundy supported Eugenius. Other princes, including the king of France and the powers of the empire, temporized, often maintaining a neutral stance and proposing a council that would absorb the assemblies at Florence and Basel. Papal diplomats slowly won them over, often more by bribery than by the effectiveness of their arguments. At the same time, a new generation of papalists, led by Torquemada, advanced refutations of conciliarism and new defenses of papal primacy. Finally, the last of the princes, those in Germany, embraced Eugenius's successor, Nicholas V (r. 1447–55). Felix resigned his claim. Even the remainder of the Basel assembly gave up, and nominal unity was restored.

The Renaissance papacy, freed of the threat from the Council of Basel, would act increasingly like a secular monarchy; but even before the Reformation it did not go uncriticized. Conciliar thought and demands for reform flourished, even in the curia. Conciliarism endured, moreover, in Paris as a constituent element in Gallican thought, influencing the development of Monarchomach theory. Fear of a council like that at Basel would slow the papacy's response to the Reformation, putting off wide consultation on defense of the faith and reform until Paul III (r. 1534–49) summoned the Council of Trent in 1545.

# CONCORDAT OF AMBOISE

. In an ordinance issued at Amboise on October 13, 1472, Louis XI proclaimed in France a concordat with Pope Sixtus IV that the pope had published two months earlier. Its language closely resembled that of papal proposals in the years since 1438, when the Pragmatic Sanction of Bourges had sharply reduced the authority of the papacy over the French church. The "Gallican liberties" embodied in the Pragmatic Sanction gave the French church, particularly the episcopate, considerable independence from both the pope and the king. It was strongly supported by the Parlement de Paris, but Louis XI, on becoming king in 1461, had alternately canceled it, restored it, and ignored it. He preferred to deal with the pope rather than to concede liberties to his own clergy.

The Concordat of 1472, which historians once thought was never enforced, prefigured the more famous Concordat of Bologna (1516), in that the pope and the king arranged for a joint hegemony over the French clergy, primarily with regard to episcopal appointments. Although the relations between Louis XI and Sixtus IV often were bitter during the succeeding decade, the Concordat of Amboise remained the *de facto* arrangement for handling bishoprics, and it enabled the monarchy to strengthen its control over the French church.

# CONDÉ, JEAN DE

(ca.1280–ca.1345). The son of poet Baudouin de Condé, Jean served in the court of the counts of Hainaut. Seventy-seven of his poems are extant, mostly in octosyllabic couplets. They comprise numerous didactic works, five fabliaux, and allegorical and moral narratives. Didactic subjects include advice to rulers, the estates, death, reflections on the nature of love, social and antifraternal satire, and religion and ethics. Several of the narratives have love subjects, and there is a love debate in the most famous of Jean's works, the *Messe des oisiaus et li plés des chanonesses et des grises nonnains*. But he was by no means a love poet and did not write lyrics. His several works called *lais* do not use the lyric form.

# CONDUCTUS

. A Latin poem relying on syllable count and rhyme that was set to either monophonic or polyphonic music, the conductus (pl. conductus) was one of the predominant musical genres of the 12th and early 13th centuries. Its main function was to substitute or supplement parts of liturgical services, often in processions. Many polyphonic conductus served as replacements for the *Benedicamus Domino,* with which all Offices end, because they conclude or rhyme with those words. These probably were for Vespers or Matins of important feasts. Directions in some liturgical dramas refer to the music sung during stage processions as conductus. Surviving Marian, political, and admonitory texts suggest that conductus also served for private devotion, commemoration of significant events, and learned editorial commentary. The largest extant source is the Florence codex (Biblioteca Mediceo-Laurenziana, Pluteo 29, 1) of Parisian origin ca. 1250.

It is controversial whether the music composed for conductus was sung in equal units of time for each syllable ("isochronous") or rhythmically modal, with the syllables rendered in patterns of long and short notes. The music theorist Anonymous 4 describes the declamatory, hymnlike, and usually strophic polyphonic conductus (e.g., the three-part *Deus in adiutorium*) appropriate for less accomplished clerics to sing, and through-composed ones with large, untexted (i.e., melismatic) sections known as caudae (e.g., Pérotin's *Salvatoris hodie*) for well-trained singers.

A number of troubadour and trouvère chansons have been identified as tenors of conductus, such as *A l'entrada del tens clar* in the three-part *Veris ad imperia.* A few conductus quote music and words of sequences, but perhaps the outstanding interrelation between conductus and other genres is that among their caudae, the untexted clausulae of the Notre-Dame School, and the motet, which originated by texting clausulae and became the preeminent genre in the 13th century. A famous instance is the final cauda of *Dic Christi veritas,* which was texted by Philip the Chancellor as *Bulla fulminante.*

# CONFRÉRIE DE LA PASSION

. Most religious confraternities in France considered organizing performances of plays as supplementary to their main *raison d'être*. The Paris Confrérie de la Passion was, however, established primarily to put on mystery plays, either on the Passion or the Resurrection, or other saint plays. Their statutes, approved by Charles VI, who had seen their plays earlier, were published in 1402. Their activities originally centered on the hall and courtyard of the Hôpital de la Trinité, but by 1538 they were also using the Hôtel de Flandre. From 1548, they occupied the well-known Hôtel de Bourgogne. In spite of the terms of their statutes, it seems certain that they also performed comic as well as religious plays. Some of these performances took place indoors, in the Hôpital de la Trinité, on a stage estimated to have measured about 40 by 20 feet; others were clearly outdoors, in a theater in the round. The Confrérie must have had a repertoire of plays, but only one surviving manu-script, of the anonymous *Vie de saint Louis* (Paris, ca. 1470; three days, 19,000 lines), bears an explicit mention of the society. Its best-documented performances date from the middle of the 16th century, when several large-scale mysteries were organized at the Hôtel de Flandre. In 1539, a Passion play was put on; a description of the *montre* of the preceding day has survived. In 1541, the Confrères presented the *Actes des Apôtres,* which took four months of rehearsals, and whose performance extended over thirtyfive days from May 8 to September 25. The following year, 1542, they put on a similar massive play, the *Mistère du Viel Testament,* which started on May 9 and ended October 22. This successful performance led to the printing of the 50,000-line text, several copies of which have survived. Contemporary documents contain descriptions of certain aspects of these productions.

In 1548, the Parlement de Paris published its edict forbidding the performance of *mystères sacrés;* in the same year, the Confrérie moved to the Hôtel de Bourgogne and continued to put on plays, though now entitled *comédies* and *tragi-comédies*. Though the Paris edict had little immediate effect in the provinces, the Confrérie de la Passion, as it had done from its foundation in 1402, changed with the times. Its history is a microcosm of the history of medieval French drama.

# *CONGÉ*

. The *congé,* or farewell poem, was a literary genre specific to the town of Arras in the 13th century. In 1202, Jehan Bodel, and in 1272, Baude Fastoul, both suffering from leprosy, sent their fellow citizens a poem to *demander* or *rover congié* ("ask for

permission to leave"). Their example was followed in 1276 or 1277 by Adam de la Halle, who was leaving his city in perfect health. The three poets borrowed the form of the *Vers de la Mort* by Hélinant de Froidmont: octosyllabic twelve-line stanzas made up of two sestets with an aabaab/bbabba rhyme pattern. All the themes of this new genre are already to be found in Jehan Bodel's *Congés*. But if the problem of salvation was paramount in Bodel's and Fastoul's concerns, Adam de la Halle intended above all to rebel against the injustice and scandalmongering that prevailed in Arras. The allegorical entities (*Cuer* 'Heart'; *Pitié* 'Pity'; *Anui* 'Pain'…) that his predecessors, taking their cue from Hélinant, had called upon at the beginning of their stanzas, were now out of place in a work that went beyond the bounds of the *congé:* a literary genre that was originally lyrical had become, with Adam de la Halle, essentially satirical.

# CONON DE BÉTHUNE

(fl. ca. 1180–1219/20). Now remembered as one of the classic generation of trouvères that included Gace Brulé and the Châtelain de Coucy, Conon, born into a noble family of Artois, was better known during his lifetime as warrior, diplomat, and statesman. A participant in the Third Crusade, he was a major figure in the Fourth, esteemed by the French for his wisdom and eloquence in dealing with recalcitrant allies. After the capture of Constantinople, he served the Latin (Flemish) emperors devotedly and was even named regent of the empire in 1219.

Ten songs, all preserved with their melodies, may be attributed to Conon with reasonable certainty. These include two crusade songs and a satirical love dialogue, along with *chansons d'amour* of an unusually personal stamp. One poem is particularly remarkable for evoking the difference between Conon's dialect and that of the royal court.

# CONQUES

. The town of Conques (Aveyron), situated in a remote valley along the mountainous route from Le Puy to Moissac, is the site of the former Benedictine abbey of Sainte-Foy. With its huge sculptured tympanum and magnificent treasury, the abbey provides perhaps the most

Conques (Aveyron), Sainte-Foy. *Photograph courtesy of Whitney S. Stoddard.*

complete experience of a medieval pilgrimage church. The dates of construction are controversial. If erected, according to the texts, during the abbacy of Odolric (1031–60), it would be one of the first, following Saint-Martin of Tours, of the great "pilgrimage"-type churches. Several writers, however, have cited archaeological factors, such as variation in stone and configuration of the chevet, to extend construction into the 12th century. Small in comparison with other churches of this type, the nave of six bays is elegant in line and bold in the verticality of its proportions. The transept is wide; a lantern tower surmounts the crossing above 14th-century ribbed vaults. The chevet unites two distinct types: chapels in eschelon opening off the transept and ambulatory with three radiating chapels.

The towers of the western façade are a 19th-century addition. The tympanum of the Last Judgment, retaining significant traces of polychromy, is one of the most celebrated in all of Romanesque sculpture. Christ the Judge, right arm raised in blessing, the left lowered in rejection, forms the center of a great diagram of salvation and damnation. Directly below his feet, St. Michael confronts a demon. The elect advance with dignity, seeking the Paradise of Abraham's bosom; the damned are shoved into Hell, where sinners and tormentors are graphically ren

Conques (Aveyron), Sainte-Foy.

dered. St. Foy, worker of miracles and deliverer of captives, intercedes for humankind. Inscribed banderoles and gables reinforce and expand the message. The figures are weighty, their faces impassive; the presentation is direct, vivid, and anecdotal.

The contrast between the sober façade and the rich tympanum, and discrepancies within the tympanum and its frame, have fostered various hypotheses regarding the original disposition of the portal—which may well have included the beautiful Annunciation and the figures of Isaiah and John the Baptist now mounted on the internal face of the north-transept façade.

Tympanum of the Last Judgment, Conques, ca. 1130–35. *Reprinted by permission of Giraudon/Art Resource, New York.*

Of the splendid objects in the remarkable treasury, the oldest and most venerated is the 10th-century gold reliquary statue (head and some jewels are earlier) containing the relics of St. Foy, brought from Agen to Conques by subterfuge. Part of the Romanesque cloister of Abbot Bégon (r. 1087–1107) is still preserved.

# CONSANGUINITY

. One of the chief preoccupations of medieval church law was consanguinity, the degree of relationship between two people such that a marriage between them would be incestuous. Roman law had forbidden marriages between people related "within four degrees." The Romans had calculated degrees by counting from one prospective partner back to the common ancestor and then down to the other partner, so that first cousins

were considered related within four degrees. By the 8th century, however, the church defined consanguinity as residing within seven degrees and changed the method of calculating degrees by counting back only to the common ancestor; hence, sixth cousins were considered related within seven degrees. These two changes vastly increased the number of people to whom one was theoretically too closely related to marry. Although the nobility initially tried to avoid consanguineous unions, not wanting to have a carefully arranged marriage broken up by the bishop, by the 12th century they frequently married their distant cousins deliberately. Then, if they decided they wanted a divorce, they could "discover" the consanguinity and have their marriage annulled. To discourage this divorce on demand, the Fourth Lateran Council of 1215 cut back the forbidden degrees from seven to four, although continuing to calculate degrees by counting back to the common ancestor.

# *CONSEIL*

**.** The word *conseil* presents problems for students of medieval political institutions, for it corresponds to two English words, "counsel" (advice) and "council" (deliberative body), while also having, in the medieval setting, a close connection with words that we translate as "court." Early Capetian kings conducted their business with the help of a small body of close advisers called the *curia regis.* Vassals who owed the king "counsel" were an important element in this body, but only a few were continually with the king. By the later 11th century, the most stable group of advisers came from the royal household, first the "great officers" and later on people with special expertise in legal or financial matters. When some important business, usually involving military operations, brought together many royal vassals, the small *curia* became, for the moment, a much larger assembly.

By the late 12th century, Langmuir has shown, this larger assembly was called a *curia* ("court") when its business was primarily judicial and a *concilium* when it deliberated on a major project of common interest, such as a crusade. When the judicial specialists began to act as a separate, sedentary body under Louis IX, the small body that remained with the king tended increasingly to be called his "council" rather than *curia regis.* Yet the Latin word *concilium,* when used in the French vernacular *(concile)* came to refer exclusively to councils of the church. The word *conseil* (Lat. *consilium* 'advice') meant

not only "advice" but also "advice-giving bodies." By the 14th century, a royal council was called not only *conseil* in French but also *consilium* where Latin still was used.

In the 14th century, the documents began to identify as royal councilors those who sat on the king's *conseil*. From the disputed succession of Philip V in 1316 until the late stages of the Hundred Years' War, kings often had to appoint councilors who reflected the political mood of the kingdom. For a time ca. 1340, Philip VI's council consisted exclusively of the "sovereigns" of the Chambre des Comptes, but discontent with the financial administration led him to abandon this experiment after 1343. For decades thereafter, frequent changes of councilors reflected the power of interest groups, although there was one period of relative stability (1359–74) when the body was dominated by Guillaume de Melun, archbishop of Sens.

Under Charles VI, the council was one arena for the power struggle between successive dukes of Burgundy and their rivals at court. In 1388, the anti-Burgundian faction called the Marmousets persuaded the king to oust his uncle Philip the Bold, duke of Burgundy, from the council. In 1406, the council, which had risen to more than fifty in number, was reduced by about half, a "reform" that purged most of the supporters of John the Fearless, duke of Burgundy. After many similar episodes, the council was more fully under royal control by the later 15th century.

# CONSTABLE OF FRANCE

. The office of constable (Fr. *connétable*), which came to signify the chief commander of the French royal army, originated with the "count of the stable" *(comes stabuli),* an officer in the household of 9th-and 10th-century monarchs. This apparently modest position grew into an important one as heavy cavalry became the essential element in military operations. War-horses and their equipment were increasingly expensive; their care and maintenance became a correspondingly important responsibility. Household officials whose duties were related to military activities tended to acquire more prestige than those concerned with domestic duties, especially if the household happened to be that of a ruler.

During the reign of Philip I (1060–1108), the constable emerged as one of the four "great officers" of the crown, who witnessed royal enactments and provided one stable element in a royal entourage of continually changing composition. At first, the chief

among these officers, even in military affairs, was the seneschal. Only after 1191, when Philip II let that office remain vacant, did the constable become the leader of the royal military forces.

In the 11th and 12th centuries, the constables were drawn from the nobility of the Île-de-France, most frequently from the Montmorency family. Nobles of the north and east began to dominate the office in the late 13th century, and three members of the Brienne family held it in the 14th. The Hundred Years' War made the position extremely important. The three most celebrated constables of that period were Bretons—Bertrand du Guesclin (1370–80), Olivier de Clisson (1380–92), and Arthur de Richemont (1425–58). These men were of progressively higher economic and social position, and Richemont ended his days as duke of Brittany. Thereafter, the constable was usually a member of the great nobility.

# CONSTANCE OF ARLES

(d. ca. 1034). Queen of France. King Robert II (996–1031) married his third wife, Constance of Arles, ca. 1005. She was the mother of all his children: Hugh, who died young in 1025; Henry I (1031–60), the next French king; Robert, who became duke of Burgundy; Odo; Adélaïde, who married Count Baudouin of Flanders; and probably Hadwidis, who married Count Raynaud of Nevers. Constance was the daughter of Count Guillaume II of Arles and of Adélaïde-Blanche of Anjou. She had a reputation for a ferocious temper. She seems to have wanted her third son, Robert, to succeed in 1031 rather than Henry, and she even waged a brief war against her sons in that year.

# CONSTANCE OF CASTILE

(d. 1160). Two years after his divorce from Eleanor of Aquitaine in 1152, Louis VII (r. 1137–80) married Constance, daughter of Alfonso VII of Castile. She died in 1160,

giving birth to a daughter. It is ironic that the woman Louis married after divorcing Eleanor for consanguinity was just as closely related: she was his third cousin.

*Constance B.Bouchard*

# CONSTRUCTION TECHNIQUES

**.** The history of construction in medieval France can be divided into two major periods. The first, embracing the 5th century into the 12th, is characterized by the survival and variations on the building techniques, as well as many of the ornamental forms, of Roman architecture. The second, the Gothic era of the 12th century to the early 16th, witnessed the advent of innovative methods of building and design and led to a dramatic change in the status of the architect.

The architectural record of France prior to the 9th century is fragmentary. With the collapse of coherent imperial authority in the West and the spread of Christianity in the 3rd and 4th centuries, the church and in particular its bishops emerged as the primary sponsors of major projects. At Cahors, Bishop Desiderius enclosed the city within defensive walls and built aqueducts in the 6th century, while Sidonius Apollinaris, the late 5th-century bishop of Clermont, erected a luxurious villa complete with baths and a swimming pool. However, church structures, not public works, were the primary focus, with the basilica and centralized baptistery serving as the major building types. In the laying out of ecclesiastical complexes, it has been argued that early-medieval masons employed Roman planning strategies based on harmonic proportions, but it is more likely that the simple geometric ratios that order the designs represent the habits of craft practice rather than a conscious continuation of past architectural principles.

In terms of actual construction techniques, political fragmentation produced increased variety. Rather than the Roman system of mass-producing standardized elements, such as columns or capitals, which were stockpiled at the quarry and later shipped to specific sites, building was conditioned by local materials and models. Nevertheless, it appears that many Roman building practices were continued, albeit on a decidedly less monumental scale. Masons continued to build using a rubble wall construction faced with cut-stone patterns, seen in the crypt walls at Jouarre (7th c.) or Notre-Dame de la Basse-Œuvre, Beauvais (late 10th c.), which were composed of *opus recticulatum* in the Roman manner, or stucco, as at Saint-Laurent, Grenoble (8th c.). The more impressive structures often incorporated spolia, for example, the cathedral of Vienne (5th c.), Selles-sur-Cher (mid-6th c.), or as at Jouarre imitated Roman columns and capitals. The sensibilities and renowned skill of "Gallic" masons are showcased in the baptistery of Saint-Jean, Poitiers (7th c.), where the pilasters, pediments, moldings, and geometrical designs set into the wall fabric become surface embroidery rather than structural articulation.

The loss or abandonment of pozzolan concrete as a primary building material had enormous technological consequences. Although masonry vaults and domes were erected from the 5th century (baptistery of Fréjus) through the 7th century (Jouarre), the weak

lime mortar used in place of pozzolan limited their scale, and large interior spaces were covered by timber roofs. Yet, despite their structural simplicity, early-medieval French buildings contributed new elements to the language of architecture. Monumental towers were erected at Saint-Martin, Tours (5th c.), in response to defensive and liturgical requirements and as a mark of the church's distinction as the burial site of St. Martin. Spacious crypts were created around the tombs of saints, seen at Notre-Dame-de-Confession at Saint-Victor, Marseilles (5th c.), or Saint-Germain, Auxerre (6th c.), or as privileged burial sites, such as Jouarre. The elaboration of interior space and the creation of an impressive exterior silhouette were to occupy architects throughout the remainder of the Middle Ages.

In the Carolingian period of the late 8th and 9th centuries, architectural practice was invigorated by a new wave of Roman retrospection. In the abbeys of Saint-Denis (754–75) or Saint-Riquier at Centula (790–99), the basilican plan with a transept, likely based on Constantine's St. Peter's in Rome, reappeared, but both buildings sported multiple

Flying buttresses, Chartres cathedral.

exterior towers. In addition to their ideological message, these plans reveal a greater coherence in planning. A consistent set of geometrical proportions governs the design,

with the result that each constituent space is related to the larger whole. In a similar vein, Carolingian construction achieved a greater degree of precision as builders turned increasingly to stone as the primary building material in contrast to the irregular rubble technique of previous centuries. At Saint-Philibert-de-Grandlieu (814–ca. 847), which combined stone, brick, and rubble, the masonry is laid in regular courses and ashlar blocks are used to articulate piers and arches. Despite these advances, however, the essential structural characteristics of Carolingian architecture remain virtually unchanged. While walls grew more massive, the main interior spaces were roofed in timber. The combination of groin and barrel vaults, small domes on squinches, and horseshoe arches at Theodulf's oratory at Germigny-des-Prés (806) hints at the absorption of external influences, probably from Byzantine architecture, but the Carolingian masons of Neustria never developed a structural complexity and spatial monumentality comparable with that of their eastern Mediterranean counterparts.

The quickening of France in the 11th and 12th centuries stimulated a burst of building that produced rapid technical development. Although each region of France tended to develop its own more or less distinctive traditions, Romanesque architecture can be characterized by massive walls and a complex structure that supported stone vaults. As the term "Romanesque" implies, this architecture approaches that of Rome in its monumental scale and its mastery of masonry construction. Related to the Roman *opera,* its muscular walls were built of rubble faced with brick or ashlar blocks and articulated by applied shafts and arcades.

The realization of many buildings must be understood as a collaboration between learned clerics and stonemasons. Cluny III, begun in 1095, was planned by the monks Gunzo and Hezelo, who drew upon their sophisticated knowledge of geometry, music, Vitruvius, and number symbolism to create a design whose order at once ensured stability, achieved beauty, and symbolized divine perfection. But once these programmatic decisions were made, the master mason set out the plan at full scale by means of ropes, a measuring rod, or simple pacing off, and his workshop then raised the structure according to long-established masonry traditions that did not require the guidance of intellectuals. While there were infinite variations, in general southern French Romanesque employed continuous courses of uniform bricklike masonry articulated by corbel tables and bands and emphasized vertically continuous elements. On the other hand, northern Romanesque techniques differentiated stone types, distinguishing frame from fill, tended to break the elevation into separate parts and stressed horizontal divisions.

Architectural ideas were transmitted over significant distances, as shown by the appearance of the "pilgrimage roads" plan and elevation at Saint-Martin in Tours, Saint-Martial in Limoges, Sainte-Foy in Conques, and Saint-Sernin in Toulouse during the last third of the 11th century. However, the repetition of this scheme, in which the main choir space was ringed by an ambulatory and radiating chapels and the elevation was composed of an arcade and gallery, was likely the result of patronal interchange rather than of migrating gangs of masons. To the contrary, Romanesque workshops, so far as we know, maintained a regional focus. One of the ateliers at Cluny III can be followed throughout Burgundy, where they built sections of churches at Charlieu, Anzy-le-Duc, Macon, Perrecy-les-Forges, Vézelay, and Paray-le-Monial.

The mastery of masonry vaulting was the most significant technological stride made by Romanesque builders. The first completely vaulted structures, including Cluny II (ca. 1010) and Saint-Bénigne, Dijon (1001–18), probably drew upon slightly earlier Lombard models. In the course of the 11th and early 12th centuries, each region seems to have developed its own response to the new technology. Spacious domed churches rose at Angoulême, Cahors, and Périgueux in Aquitaine. Hall churches appeared in Poitou. In Burgundy, pointed barrel vaults were introduced in the churches of Cluny III, Autun, and Paray-le-Monial; transverse barrel vaults covered the nave of Saint-Philibert at Tournus; while the nave of Vézelay received a groin vault. Norman churches, such as Bernay and Jumièges, retained timber ceilings through the 11th century but during the first quarter of the 12th introduced the ribbed groin vault at Saint-Étienne and Sainte-Trinité, Caen. Vaults appeared in combination with a variety of wall systems. At Dijon, the barrel vaults were supported by a vaulted gallery, but their weight reduced the windows to small openings. Such later examples as Saint-Sernin, Toulouse, and Conques retained galleries to buttress their barrel-vaulted naves but eliminated windows. In the "thick-wall" system of the Caen churches, a muscular wall, honeycombed with passages, was developed in depth while the "thin-wall" structure of Jumièges or Saint-Martin-de-Boscherville achieved stability through vertical masonry spines applied to the interior and exterior while emphasizing mural planarity. One of the stimuli to the widespread experimentation in Romanesque architecture may have been a search to combine the fireproof stone vault with greater interior illumination.

During the 1130s in the area around Paris, a new style began to take shape. Combining diverse Romanesque structural elements, such as the ribbed groin vault and pointed arches, this architecture, exemplified by the new choir of the abbey of Saint-Denis (1140–44), achieved a breathtaking spaciousness and visual lightness. In the course of the following century, master masons exploited the structural advantages of the ribbed groin vault to eliminate progressively solid areas of stone and transform the wall into a glazed membrane. With the invention of the flying buttress in the mid-12th century and the introduction of tracery in the early 13th, French architecture combined stupendous size with small-scale effects that effectively expressed transcendental spirituality and intimidating ecclesiastical power.

In writing about the reconstruction of Saint-Denis, Abbot Suger remarked that his master mason laid out the choir through his arithmetical and geometrical cunning. As plans became ever more complex, including congregational and clerical spaces, peripheral aisles for circulation, and a multitude of secondary chapels, and elevations grew taller yet more finely detailed, the master mason increasingly turned to drawing as a tool for design and to ensure precise execution. Small-scale preliminary sketches and full-scale plans of such elements as piers, window-tracery patterns, and flying buttresses were drawn in temporary tracing houses or on the floors and walls of the buildings themselves. Parchment drawings, which served as show plans to a patron as well as project blueprints, survive from the mid-13th century, although their previous existence is likely. The illustrations of church plans, stonecutting, and surveying procedures in the sketch-book of Villard de Honnecourt (ca. 1230) disclose the centrality of geometry to all aspects of the architectural endeavor.

Faced with the daunting task of erecting monumental buildings with the greatest possible speed and economy, Gothic masons evolved a system of production based, as in

Roman architecture, upon standardized forms. At Chartres, Soissons, and Cologne, the prefabrication, which extended to pier components, vault ribs, triforium shafts, and window tracery, permitted the separation of cutting and place-ment procedures. These elements could thus be prepared during the winter months, when inclement weather halted active construction, then rapidly installed. Amiens cathedral (begun 1221) reached an even higher degree of rationalization, likely based on production models offered by the local textile industry: the nave piers were assembled from only three elements, the engaged piers from two, and the wall-masonry courses were regularized. A complete uniformity of stonework was achieved at the Sainte-Chapelle in Paris (1241–48).

These new production techniques led to a greater specialization and division of labor as well as a marked rise of the master mason's social status. He increasingly focused on the graphic design of forms and the coordination of production activity at the quarry and in the lodge, leaving the actual cutting of stone to a second-in-command, the *appareilleur.* From the mid-13th century on, the stratified workshop organization, together with the use of drawing as a standard procedure, allowed the architect to supervise several projects simultaneously. The names of masters were now recorded in building records, their achievements celebrated on tombstones and in inscriptions. Pierre de Montreuil, a Parisian master who died in 1267, was vaunted as a "teacher of masons" *(doctor lathomorum);* the Late Gothic architect Martin Chambiges, who oversaw major projects in Beauvais, Sens, and Troyes, was called *supremus artifex* during his lifetime. No longer a mere craftsman, the Gothic master mason brought his awesome structures into being through his practical organizational abilities, his technical skills, and his gift of design, which seemed a reflection of divine creativity.

# *CONTENANCE ANGLOISE*

**.** The term appears in a passage from Martin Le Franc's *Champion des dames* (ca. 1440):

> Et ont pris de la contenance
> Angloise, et ensuy Domstable,
> Pour quoy merveilleuese plaisance
> Rend leur chant joieux et notable.

("They have taken on the *English way* and have followed Dunstable, in order that wondrous consonance might make their music joyous and renowned.") Martin thus

Illustration of Dufay and Binchois in a manuscript of Martin Le Franc's *Champion des dames,* 1451. BN fr. 12476, fol. 98. *Courtesy of the Bibliothèque Nationale, Paris.*

documents the influence of English musical style upon Dufay, Binchois, and other Franco-Burgundian composers during the second quarter of the 15th century. By mid-century, the impact of English music may be discerned in the fluid melodic style, harmonic writing, and mensural practices of continental composers.

# *CONTRAFACTUM*

**.** Adaptation of a new text to an old melody, a common practice in medieval music, seen in 13th-century motets, as well as in troubadour and trouvère songs. An example of a work that was subject to many *contrafacta* is Bernart de Ventadorn's *Can vei la lauzeta mover,* whose melody was adapted to seven additional texts, including *Quan vei l'aloete mover, Plaine d'ire et de desconfort,* and sacred texts like *Seyner, mil gracias ti rent* and *Quisquis cordis et oculi*. In the 14th century, several polyphonic French chansons were provided with sacred Latin *contrafacta* in German areas.

*Lawrence Earp*

# *CONVENIENTIA*

**.** A transaction of promise (Lat. *convenio*) between two equal parties expressed in a written contract called *convenientia* was used widely among nobles and churchmen in southern and central France in the central Middle Ages to seal agreements, often in place of homage or other feudal transactions. The mutuality and equality of such contracts are striking and in considerable contrast to the unequal relationships usually believed to be expressed by vassalage or feudalism. The *convenientia* has been used to argue for the nonexistence of feudalism in these regions (where, though, a *fevum* contract did exist, it was used to record transactions in which tenants were granted land for cultivation rather than to exchange property among warriors). Such *convenientia* contracts were used, for instance, in compromise settlements after arbitration of disputes between monasteries over pastoralism, in negotiation of marriage contracts between the children of elites, in mutual-aid compacts between warriors (who in fact may have been of unequal power but

treat one another as equals), and for the granting of castles by one knightly family to another.

# CONVENT ARCHITECTURE

**.** There have been no systematic analyses of the architecture of women religious in France, and few studies of convents include a concern for the special character of female religious life, as distinct from that of monks. In particular, the architectural implications of strict enclosure *(clausura),* which separated women from the external world, have not been examined, nor has the important and complicated issue of the architectural implications of enclosure for the relationship of women religious to the clergy and liturgy.

The reasons for this neglect are many. With the exception of a few royal or noble foundations (Longchamp, Lys, Maubuisson), convents were often small and poor and have therefore rarely attracted the attention of art historians, who have wanted to study large and significant monuments. At these sites, architectural elaboration was usually confined to one or two details, such as a tracery window (La-Cour-Notre-Dame in the diocese of Sens). The vast majority of convents were destroyed in the Revolution, or the churches and conventual buildings were converted to other purposes. Furthermore, enclosure discourages the study of the few medieval convents that are again in operation. It is probably also true that the lack of interest in convents has historical roots in misogyny.

An examination of the earliest rule specifically for women religious, that of Caesarius of Arles, indicates that the concept of enclosure originated in the early centuries of Christianity. Although there were also a number of double communities for men and women in these centuries, such as that of St. Paulinus at Nola, female monasticism normally took the form of separate establishments with a small number of male clergy in attendance to administer the sacraments. Above all, the monastic administration in women's orders was not centralized: there was therefore always a wide range of arrangements and solutions for women religious, ranging from one or several women practicing a religious vocation in a home to huge convents with several hundred nuns. Since these orders rarely possessed the unified organizational structure of their male counterparts, there is hardly ever the architectural consistency that can be found among many male houses, especially among the Cistercians and Carthusians. For women's monasteries, the annual visitation, performed by male counselors or ministers often outside the order, tended to concern observance of the rule, not issues of architectural conformity. The requirements of enclosure were interpreted differently by each order and

reached particular complexity in convents that had both male and female communities, such as Fontevrault and Saint-Louis-de-Poissy.

During the 13th century, the requirements of strict enclosure became increasingly rigid and universal; Poor Clares were known as among the most austere and enclosed of the female orders, even though their churches were open to the lay public. The revival and reaffirmation of strict enclosure, which culminated in Boniface VIII's bull *Periculoso* of 1298 and were to a large extent based on the rule of the Poor Clares, universalized regulations concerning convents. The abbeys had to incorporate new strictures concerning barriers, turning wheels, grills, and gates that would ensure the separation of women from the out-side world while allowing necessary supplies to be sent to the community. In some orders, such as the Cistercians, which prohibited the public from access to the church, the issues of enclosure were in some respects simplified: the churches of Cistercian women were often small chapels or simple rectangular structures, rarely with aisles or transepts. The only separations that were required were thus those between the clergy and the nuns. On the other hand, the churches at Fontevrault and Poissy, as well as many Clarissan convents, had to accommodate both male and female monastic communities, as well as the lay public and the clergy. These multiple audiences would have led to a series of screens or spatial divisions that are as yet imperfectly understood. It is evident, however, that as a result of enclosure women religious often could not see the altar or had only a partial view and could therefore not participate visually in the Mass, and in particular the elevation of the host.

# CONVENTS

**.** *See* **NUNNERIES**

# COOKING

. Most cooking in medieval France was done in a pot over a fire, suspended by a hook or held up by a trivet. Into this cauldron went such vegetables as cabbages, onions, peas or beans, and/or cereal grains, with or without meat or fish—along with water. The result could be a porridge, soup, or stew—or even, if the household was well provided, something resembling what is still called *pot au feu,* yielding a substantial piece of meat as well as soup. Herbs, especially parsley, frequently flavored the resulting *pottages,* some of which might be spiced in a well-to-do household and/or thickened with bread or eggs. A really well-equipped kitchen also had a spit, on which to roast meats and poultry, and perhaps a grill for broiling and a low-sided pan for frying: fried dishes seem to have been more common in France than in England and northern European countries, but they were rarely to be found in peasant households and generally constituted special treats.

Only the largest households had their own ovens. Some baking could be done directly on the hearth, but generally pastries—meat or fish pies being the most important type— were taken out to a communal oven for baking or purchased from a bakeshop, as bread often was in the towns. The food of the nobility and prosperous bourgeoisie was an elaborated version of what everyone else ate, utilizing more fresh (as against salted or dried) meat and fish and developing such elegant specialties as colored meat and fish jellies and the various dishes based on ground meat in almond milk that found their way to Europe from the Near East. Still, the early recipe collections originating in such wealthy households invariably begin with directions for simpler pottages.

# COQUILLART, GUILLAUME

(1452?–1510). First a lawyer in Paris, then an official of Reims cathedral, Coquillart wrote mock court cases and humorous debates and monologues: *Plaidoyé* and *Enqueste d'entre la simple et la rusée* (1478–79), *Droitz nouveaulx* (1480?), *Débat des dames et des armes* (1498?), and *Monologue Coquillart.* Four other dramatic monologues expressing the tribulations of lovers caught in the act and a sequel to the *Droitz nouveaulx* have also been attributed to him.

Coquillart treats domestic or erotic subjects in a mock-serious style. His first three works, written for the Basoche of Paris, use legal language and procedure to resolve such cases as that of the bourgeois wife who sues her chamber-maid for alienating her lover's affections. The *Droitz nouveaulx,* Coquillart's most popular work, is a legalistic compilation of such cases; *Plaidoyé* and *Enqueste* examine the claims of two women disputing possession of one man. The *Débat des dames et des armes,* which argues whether a prince should devote himself to war or women, was probably written for the entry of Louis XII to Reims, where Coquillart held important ecclesiastical and municipal posts. His works, full of verve, gaiety, and bawdy language, mock the foibles and foolishness of his contemporaries.

# CORBIE

. At the confluence of the Ancre with the Somme, Corbie (Somme) is the site of one of the most influential Benedictine abbeys of the Carolingian period. Founded in 657 by St. Balthild, wife of Clovis II, it was headed briefly by Charlemagne's cousin St. Adalard. It was here that Paschasius Radbertus wrote the first theological treatise on the eucharist. All that remains of the powerful abbey are portions of the abbey church of Saint-Pierre, begun in 1498 in Flamboyant Gothic style, and the Romanesque church of Saint-Étienne, with a 13th-century portal of the Coronation of the Virgin.

# CORDIER, BAUDE

(d. 1397/98). Composer and harp player, now believed to be identifiable with Baude Fresnel of Reims, harpist and *valet de chambre* to the court of Burgundy from 1384 until his death in 1397/98. Of his music, eight songs survive only in sources from the second quarter of the 15th century; but one Gloria appears in the 14th-century Apt manuscript and two unusually mannerist songs—*Tout par compas,* written in the shape of a circle, and *Belle bonne sage,* written in the shape of a heart—appear in the Chantilly manuscript (Musée Condé 564, ca. 1400).

# CORMONT

. Name of two Gothic architects, Thomas and Renaud. The inscription in the Amiens cathedral labyrinth related that Thomas de Cormont succeeded the first master mason, Robert de Luzarches, who began construction of the Gothic edifice in 1220. In turn, Thomas was followed by his son, Renaud, who brought the cathedral to completion and placed the labyrinth plaque in 1288.

Because Thomas de Cormont appears to have followed the plans and retained the forms of Robert de Luzarches, a precise determination of the work of these two Amiens masters remains elusive. Thomas is most frequently attributed with the construction of the ambulatory chapels, sections of the transepts, and west façade in the later 1230s and early 1240s. Numerous similarities in structure, decoration, and tracery patterns led Robert Branner to propose Thomas as the designer of the Sainte-Chapelle in Paris, erected 1241–48.

During a long career between 1245/50 and 1288, Renaud de Cormont built the upper levels of the Amiens choir according to a set of radically different architectural premises. Instead of his predecessors' clear articulation of the elevation's components, Renaud blurred the distinction between stories by setting the same number of units in the triforium and clerestory and by glazing the triforium. His highly decorative vocabulary, seen in the pierced gables of the choir clerestory, the openwork tracery of the flying buttresses, the gablelike moldings that crown the choir triforium openings, and the star vault of the crossing, imparts a sense of metallic fantasy to his architecture. However, Renaud's daring reduction of the mass of the supporting masonry armature and dissolution of the wall into expansive glazed surfaces led to problems of stability that plagued the Amiens chevet for the next three centuries.

# CORONATION/CONSECRATION OF KINGS

. From the anointing of Pepin the Short in 751 to the end of the Middle Ages, the Frankish and French kings were formally invested with their office by means of inaugural rituals that consisted mainly of consecration (or sacring—anointing with chrism) and coronation (*sacre et couronnement* in modern French, and *consecratio, inauguratio,* or *coronatio* in medieval texts). The rituals quickly became essential to accession to the throne.

The crowning of a king was originally a secular act and the sacring an ecclesiastical one. At first, the two were often administered in different times and places. From the coronation of Louis the Pious in 816, both rituals were sometimes performed together, and from 856 to 877 Hincmar, archbishop of Reims, composed texts that wove these two elements into a unified ceremony. Some prayers and benedictions adopted, adapted, or composed by Hincmar remained permanently in the French ceremony.

For centuries, there was little to differentiate the ceremony in France from that of other countries, nor was there a set place for the coronation of French kings until 1129 (Philip, eldest son of Louis VI). Thereafter, all medieval ceremonies took place in Reims; the archbishop of Reims was normally the coronator. The French rite came to be set apart from that of other monarchies with the adoption of the legend of the Holy Ampulla (the vial of Holy Chrism purportedly sent from Heaven when St. Remi baptized Clovis I), which was closely associated with Reims. The Holy Chrism is first mentioned in connection with a coronation ceremony in 1131 (Louis VII). Before the end of the 13th century, the legend of the ampulla had been fully incorporated into the French rite. More than anything else, this miraculous chrism created a "royal religion" in France, and the French ceremony was sometimes called an eighth sacrament. The monarch's ability to touch for scrofula after his sacring was considered a proof of his legitimacy and of the efficacy of royal unction. The Holy Chrism was never used on those occasions when a queen was anointed and crowned.

By the end of the Middle Ages, the coronation ceremonial was a protracted liturgical event that included many prayers and benedictions, unction, and investiture with the symbols of knighthood (boots or sandals, and spurs) and of royal office (sword, royal

mantle, ring, scepters, crown). The ceremony closed with a Mass and was followed by a postcoronation banquet.

The constitutive aspect of the coronation ritual was extremely important in the high Middle Ages, and no one fully possessed the royal title until he was anointed and crowned. The early Capetians crowned their successors as co-kings to solve the problem of succession and to establish the dynasty firmly upon the throne. The coronation ceased to be juridically necessary, but the circumstances of Charles VII's coronation in 1429 show that it remained indispensable. This, coupled with the requirement that the officiant be an archbishop or bishop, inextricably bound the secular office of government to the Christian religion and flavored the character of medieval French kingship.

# CORVÉE

**.** Forced labor service. From Late Latin *corrogare* 'to requisition,' corvées in effect had already been institutionalized in the late Roman Empire. Often reluctant and inefficient *coloni* had to perform a prescribed number of days' work without pay for their landlords. Due from certain categories of people to private proprietors, these services were distinguished from the *opera officialis* that certain freemen had to perform for the state. Frankish kings continued this system. *Coruada* was used in one of Charlemagne's capitularies for a day's work without pay that a man performed for his lord. Feudal nobles appropriated these Frankish usages, dividing them into fixed and exceptional, requisitioned only when normal means proved insufficient. Whether real (attached to the land) or personal, corvées forced labor from servile or free tenants but not from noble vassals. They consisted of repairing roads, bridges, castles, levees, or dikes; felling trees; threshing and carting grain and other materials; or even delivering letters—in return for any of which tasks the lords may have supplied food and drink. When they covered field work on the lord's demesne, plowing and harvesting predominated. Especially in the later Middle Ages, corvées were commuted to money payments, an act that removed any question of stigmatization through an indication of the servility often attached to them, after which inflation reduced them. Royal corvées, however, were instituted in the 17th

century and, along with certain unrepealed and much-resented seigneurial ones, lasted until the French Revolution.

Less common and onerous than manual labor and carriage (the duty to help transport with carts, draft animals, and wheelbarrows), a specialized corvée consisted of serving in the host and the guard (watch and ward).

# COUCY

. A town and barony in the Laonnais region, Coucy (Aisne) first became prominent under Thomas de Marle, who was lord of the place between 1116 and 1130 and a brutal warrior against whom Louis VI of France campaigned repeatedly at the behest of the clergy. Thereafter, the lords of Coucy tended to be loyal to the king without surrendering their spirit of independence. Enguerrand III the Great (1191–1243) turned the family castle into an enormous fortress. His daughter Alix married the count of Guines, and when the male line of the family died out in 1311, their son succeeded as Enguerrand V.

Enguerrand VII (b. 1340; lord of Coucy 1346–97) was a hostage in England in the 1360s and married the daughter of Edward III. In 1376, he returned to France, becoming a major military commander under Charles V and Charles VI. Like many nobles from northern France, he had been associated with Charles the Bad of Navarre in the faction opposing the ruling house of Valois and in later life was linked with the faction at court that supported Olivier de Clisson against the dukes of Berry and Burgundy. Yet he managed not to become too closely tied to any faction and retained the respect of all parties. Besides serving the French crown, he participated in crusades in 1390 and 1396. The latter campaign, which culminated in the disastrous Battle of Nicopolis in Hungary, led to his death in captivity. Enguerrand VII was the last male member of the Coucy family; his daughter Marie sold the lordship to the duke of Orléans.

The château of Enguerrand III, a masterpiece of military architecture, covered a vast site and stood on an easily defensible position, which may explain why, aside from repairs and rebuilding of the gateways and the donjon by Enguerrand VII in the 14th century, the complex survived largely intact until World War I. The original structure had some twenty-eight towers and walls that stretched for almost a mile. The château itself sits on the northern promontory of the site and is separated from the lower court, the bailey, by a trench, the whole dominated by the huge circular donjon. Two other deep trenches separate the bailey from the town and the town from the plateau. The parish church was built in the 12th and 13th centuries but extensively altered in the 16th.

# COUCY, CHÂTELAIN DE

(d. 1203). An outstanding early trouvère, Guy de Thourotte was governor of Coucy castle in Picardy from 1186 until his death as a crusader. Of more than thirty compositions ascribed to him in medieval songbooks, only fifteen or so seem authentic. All texts survive with music, and all pieces are courtly chansons in a style derived from the Provençal tradition. Like his friend and fellow trouvère Gace Brulé, the Châtelain sings invariably of love, but his songs are more poignant than despairing and suggest an erotic reality. By the end of the 13th century, the Châtelain had been mythified into a great tragic lover, whom Jakemes, an otherwise unknown writer, made the hero of his *Roman du castelain de Coucy et de la dame de Fayel*.

# COUNT/COUNTY

. The 174 administrative counties, or *pagi,* into which France was divided in 950 began to disintegrate between ca. 980 and 1030, and many of the banal powers formerly reserved to the count were progressively usurped by the lesser nobles who throughout France began to carve out zones of command around the castles they either seized from the count or built for themselves. The period 1025–1125 was characterized by a constant struggle not only between the rising castellans and the counts, who sought to reestablish some sort of authority over them, but also among neighboring counts in many regions, who commonly struggled for control of castellanies whose territories fell partly or wholly outside the traditional boundaries of their county.

When the social and political structures crystallized once again in the 12th century, there were still about a hundred dominions bearing the title "county" (OFr. *conté,* Old Occitan *comtat*) in the kingdom, but they were now, like the kingdom as a whole, federal

dominions whose boundaries were usually those of the castellanies and baronies whose lords had been persuaded to hold them in fief from the count, and they were held together largely by those new feudo-vassalic bonds.

The new federal counties varied greatly in extent, from the princely counties of Champagne and Toulouse, more than 12,300 square miles in area, to the tiny castellanial counties of Dammartin and Gaure, with areas of less than 100 square miles.

The 102 counties of 1100 were held by seventy-six counts (OFr. *cuens, conte,* Old Occitan *comte*), including the king and seven bishops, and the sixty-seven lay counts other than the king belonged to forty-six distinct patrilineages. Although the nature and extent of their authority varied almost as much as their wealth, all counts were relatively important lords—significantly richer on average than viscounts or simple barons. By 1200, all counties had come to be regarded as fiefs dependent either on the kingdom or on one of the great principalities, so that from 1202 there were three distinct classes of count: those who were barons and peers of the realm, those who were only barons of the realm, and those who were peers and (or) barons of a principality. From ca. 850, the wives and widows of the more important counts of southern France used the title "countess" (Lat. *comitissa,* Old Occitan *contesa*), and by 1100 the Old French *contesse* was also in general use in the north.

Between 1100 and 1500, the essential nature of the French county changed little. Some sixty-seven of the 102 counties of 1100 survived to 1500, most with only minor modifications of their boundaries, but others lost their comital title through annexation to a demesne. After 1237, new baronial counties were normally created by royal letters. The kings created some thirty-seven new counties in this way between 1314, when Beaumont-le-Roger was created, and 1498, and the number of counties was further affected by changes in the boundaries of the kingdom and the evolution of five counties into duchies between 1360 and 1498. As a result of all these changes, the total number of counties in France dropped to eighty-four by 1327, but rose again to ninety-five in 1422 and 105 in 1498. The number of counts also tended to decline down to 1327, as certain powerful princes, especially the king and members of the royal house of Capet, accumulated growing numbers of counties. The eighty-four counties of 1327 were held by only fifty-two counts, including thirty-nine lay barons and twenty-seven non-Capetians, but thereafter all three numbers fluctuated only slightly down to 1515.

# COUR DES AIDES

**.** *See GÉNÉRAUX*

# COURONNEMENT DE LOUIS

**.** This epic, one of the oldest of the Guillaume d'Orange Cycle (pre-1150; 2,670 assonanced decasyllables), is anchored in history. Acquainted with Carolingian chronicles, such as Einhard's *Vita Karoli* and Thegan's *Vita Hludowici,* its author alludes to Charlemagne's association of his son Louis with the throne at Aix-la-Chapelle in 813; but he is just as sensitive to the political preoccupations of his own day: imperial claims and the expansion of Capetian power, which, under Louis VII, was still weak.

The poem has five episodes. In the first, Guillaume thwarts a would-be usurper, Hernaïs d'Orléans, who sought to profit from Louis's inexperience (11. 1–241). The second begins with Guillaume's pilgrimage to Rome and ends with his victory over the Saracens and Corsolt. The hero is about to marry King Gaifier's daughter when messengers call him back to help Louis (242–1,386). Guillaume frees his lord and kills the usurper Acelin (1,387–1,960). A fourth episode has the hero traveling throughout the kingdom to pacify it; attacked by Acelin's father, Richard of Normandy, he captures him and turns him over to Louis, who imprisons him for life (1,961–2,197). All that is left for Guillaume is to negate Gui the German's claims on Rome (2,198–2,631), before a short conclusion informs us that Guillaume will never cease having to come to his lord's rescue.

Above all, the *Couronnement* proposes a model of royal power in its dealings with the great vassals. Essentially symbolic, royal power derives its practical efficacy from a harmonious collaboration with the knightly class, represented here by Guillaume's lineage, which alone permits it to fulfill its obligations: providing a balance of power within the kingdom, protecting the church, fighting the infidels, and laying imperial claims. This explains the apparently diffuse structure of the poem. Guillaume's fidelity to his lord is tested over time in analogous but never identical circumstances. A number of threads, always centered on the hero, are woven through the episodes; there is no need to posit an earlier, more unified version of the poem.

# COURTESY BOOKS

**.** Broadly defined as vernacular works for lay audiences that teach etiquette, comportment, and moral values according to gender and social class, courtesy books include works in a variety of genres written from the 12th to the 15th century. Drawing on biblical and historical exempla, the dicta of Cato and Solomon, precepts of the church fathers, proverbs, and contemporary literature and customs, the authors of courtesy literature defined appropriate behavior for men and women of a specified rank.

Among the oldest vernacular didactic works is the Occitan *ensenhamen* of Garin le Brun (second half of the 12th c.); eight other courtly didactic poems of this genre are extant. The oldest estates poem, the *Livre des manières* by Étienne de Fougères (late 12th c.), dedicated to the countess of Hereford, expounds the roles and laments the failings of kings, clergy, knights, peasants, bourgeois, and both virtuous and immoral women.

Courtesy literature flourished in the 13th century, as the royalty and the aristocracy sought to foster noble conduct in their families. St. Louis wrote separate letters of instruction to his son and to his daughters. At the behest of Philip III, Egidio Colonna (Giles of Rome) wrote *De regimine principum* for the future Philip IV the Fair. Translated into French in the late 13th century as the *Livre du gouvernement des rois,* this work has chapters on the domestic duties of women and the education of children, as well as on the rectitude of princes and civil and military government. A royal "mirror" for princesses, the *Speculum dominarum* by Durand de Champagne, was translated into French as the *Miroir des dames* in nine 14th-and 15th-century manuscripts before its adaptation by Ysambert de Saint-Léger in the Renaissance. Two works addressed to the lesser nobility, the anonymous *Urbain li Courtois* (second half of the 13th c.; eight manuscripts) and the *Enseignements de Robert de Ho* (1260?), conveyed lessons in courtesy and comportment from father to son: honor God and parents, avoid taverns and loose women, don't scratch in public. Both of these short treatises were composed in Anglo-Norman in octosyllabic rhyming couplets. Other late-medieval treatises on manners are preserved in only a single manuscript each: the *Apprise de nurture* (237 lines), *Bon enfant* (eighty-nine lines), *Edward* (332 lines), and *Petit traitise de nurture* (190 lines).

Following the lead of Perceval's mother in Chrétien's *Conte du graal,* poems like Raoul de Houdenc's *Roman des eles* (first third of the 13th c.) and *Ordene de chevalerie* (second half of the 13th c.) instructed knights in the moral lessons of chivalry. Three brief poems about table manners, the *Contenances de table,* dating from the late 13th to the 15th century and deriving from a Latin model linked to the *Liber faceti,* counseled cleanliness and polite behavior at table.

Courtesy literature sharply segregated roles for men and women, as seen in Robert de Blois, who wrote didactic verse for aristocratic patrons in the mid-13th century. His *Enseignement des princes* is a sober Christian allegory of princely virtues; the *Chastoiement des dames* alternates between stern moralizing and courtly banter about women's amorous activities. The enticing threat of female sexuality is a recurrent motif in these works: in *Urbain,* men are advised to marry illiterate women, who are more likely to be faithful.

Female instruction is the principal aim of two late 14th-century treatises. The *Livre du chevalier de la Tour Landry* (1371–72), written for his daughters by a knight of considerable standing who fought for France in the Hundred Years' War, contains 128 chapters that warn against impropriety and extol courtesy, modesty in dress, and especially chastity and marital fidelity. The Knight offers a frank depiction of sexual temptations and of the violent punishments—beatings, death—that follow women's disobedience. His examples, which the narrator says have been supplied by two priests and two clerics, are drawn from stock biblical and historical sources, fabliaux, and contemporary life. In a lengthy debate with her husband near the work's conclusion, the Knight's wife condemns courtly love as a dangerous trap for women. The Knight claims to have written a similar book for his sons, but only this one to his daughters has survived, in at least twenty-one French manuscripts, two English translations (one by Caxton in 1484), and a German printed edition.

In the *Menagier de Paris* (1392–94), a wealthy elderly bourgeois of Paris sets forth a compendium of moral wisdom and household management for his young wife, providing exhaustive details about housekeeping, gardening, cooking, the training of servants, horses, and hawking. As staunchly moral as the Chevalier de la Tour-Landry, the Menagier tries to show compassion for his wife's youth, insisting that he would never attempt to test her as Griselda had been tried. The Knight's and the Menagier's books paint a somber picture of the constraints placed on young women and offer revealing portraits of male attitudes about female instruction in late-medieval society.

Christine de Pizan was the first woman to write a courtesy book for other women. Her *Trésor de la cité des dames ou Le livre des trois vertus* (1405) was written for Marguerite of Burgundy, wife of the dauphin, Louis of Guyenne. The book defines the moral virtues and duties of women of all conditions and ranks: unmarried and married women, widows, princesses, women of rank, nuns, bourgeois and peasant wives, even prostitutes. Christine's message to women is no less conservative than that of her male predecessors, although her style is more refined. Like the Chevalier de la Tour Landry, she sternly condemns amorous intrigues and lauds chastity, marital fidelity, and obedience. She advocates that women of all classes aid their husbands in their duties, however exalted or humble they may be. Christine also sets forth principles for the instruction of princes, knights, and men of all classes in the *Livre du corps de policie* (1407). A century later, Anne de Bourbonnois adapted Christine's precepts for noble-women, along with those of St. Louis, in her book of instruction for her daughter, Susanne de Bourbon, in the *Enseignements d'Anne de France* (ca. 1504–05).

Medieval courtesy books continued to be read in the Renaissance, when several appeared in printed editions and served as sources for Renaissance treatises on gentility. Their popularity attests to the tensions and anxieties that surround the transformation of social roles. Far from being always predictable compendia of stereotypes, these diverse works offer historians and literary critics complex views of daily life and customs and sexual and social mores, as well as ironic commentary about human nature.

# COURTLY LOVE

. The expression "courtly love" does not date to the Middle Ages. It was in all likelihood first used by the eminent 19th-century French medievalist Gaston Paris in the context of a two-part article devoted to romances of the Round Table that appeared in 1881 and 1883. Paris's discussion of love focused upon Chrétien de Troyes's *Lancelot,* the first extant medieval work telling of the adulterous relationship between Arthur's queen, Guenevere, and Lancelot, premier knight of the court. For Paris, the importance of Chrétien's account was in the delineation of a particular type of love relationship that can be explained neither by its putative Celtic sources nor by any historically sanctioned theological or social attitude toward love and marriage. He sharply distinguishes it, most notably, from the brutal spontaneity of the most famous medieval story of adulterous passion, that of Tristan and Iseut, as well as from Chrétien's other romances, such as *Erec et Enide* and *Yvain,* which propose an ideal of wedded love. Specific to the Lancelot-Guenevere affair is its very artificiality, a sense of refinement that Paris qualifies as "excessive and

bizarre" (*Romania* 10:469). The idolatrous passion of Lancelot for Guenevere entails a type of rule-oriented behavior, predicated upon the superiority of the beloved and the lover's efforts to gain her favor. Although Paris cites the *Lancelot* as the first narrative fiction to glorify "courtly" love, the emotional construct was not necessarily Chrétien's invention; the romance conveyed an "absolute" vision of the lover "such as it had long before been conceived in lyric poetry and dreamed about, if not brought to realization, in life" (*Romania* 12:517). The tradition of love literature thus initiated in 12th-century lyric and romance continued in an unbroken line through to the 15th century in a variety of genres—lyric poetry, romance, short story, debate—that were the stock-in-trade of vernacular authors of the period, including many of France's most illustrious: Guillaume de Lorris, Thibaut de Champagne, Richard de Fournival, Adam de la Halle, Guillaume de Machaut, Jean Froissart, Charles d'Orléans, Alain Chartier.

Paris lists four characteristics of the type of love in question: (1) it is furtive and illegitimate, for such a desire founded in the perpetual fear of loss or distancing, requiring a constant sacrifice of oneself, could not take place in a context of public possession (i.e., marriage); (2) the lover, however great a knight, is always an inferior, while the beloved is haughty, capricious, and disdainful; (3) knightly deeds are conceived as a means of increasing one's value in the service of love, thus exalting the love relationship itself; and (4) "love is an art, a science, a virtue, which has its rules just as chivalry and courtliness have theirs." When Paris proceeds to summarize these qualities by coining the phrase "*courtly* love," it should be clear that he is establishing, through his use of italics, a precautionary critical distance. For his purposes, the phrase translates the vaguely paradoxical nature of this construct, uniting as it does the social or communal (courtly) and the personal (love); the playfully rule-oriented and the serious; the sensual and the mystical.

Paris depends for much of his material upon a text roughly contemporary to Chrétien's *Lancelot,* considered by many to be a serious treatise on the subject, Andreas Capellanus's Latin *De amore* (frequently translated as *The Art of Courtly Love*). In a series of fictional judgments pronounced by "authorities" like Eleanor of Aquitaine and her daughter Marie of Champagne (the patron to whom Chrétien's romance was dedicated), the treatise provides an outline of some of the cultural and social problems encountered in love relationships along with an enumeration of the rules and regulations themselves (e.g., "he who is not jealous cannot love"). This work, divided into three books, on the model of Ovid's *Ars amatoria,* itself remains highly ambiguous, however, for the third book functions as a palinode of the first two, a vociferous condemnation of the frivolity—indeed, the moral perniciousness—of such love relationships.

Paris's felicitous expression seems to have gained immediate acceptance, becoming common currency in discussions of medieval love literature: finally, a term was available to denote a phenomenon that had intrigued 19th-century scholars dating as far back as Stendhal's famous 1822 *Essai sur l'amour*. Although many had spoken of the appearance of a new type of romantic love in early 12th-century France, Gaston Paris gave it a name. As the use of the expression spread, however, so did its application become increasingly normative. The most influential account of courtly love since Gaston Paris, the one that has been read by generations of scholars and students as the "last word" on the subject, is C.S.Lewis's *Allegory of Love,* published in 1936: "The sentiment, of course, is love, but

love of a highly specialized sort, whose characteristics may be enumerated as Humility, Courtesy, Adultery, and the Religion of Love" (p. 2).

Early scholarship, taking the courtly-love paradigm as a sociological given, a real-life phenomenon fostered in the "courts of love," steered the question of origins in a multitude of directions. How could such a strikingly new way of expressing and codifying male-female relations have appeared from nowhere? Where did it come from? Answers to the latter question were proposed over the first half of this century, ranging from Neoplatonism to Arabic poetry, from Cathar heresies rampant in the south of France (prior to their extirpation in the Albigensian Crusade) to a rediscovery of Ovidian poetry. Historically oriented studies have attempted to demonstrate the appropriateness of courtly love's appearance at a time when feudal society was entering a new phase, in which a recently achieved economic and political stability gave rise to interconnected sociocultural phenomena: widespread civilizing impulses, an extensive network of literary patronage, and a generation of young disinherited nobles in search of a fortune and a family. Feminist critics have more recently debated the influence of noble-women in the conception and reception of the courtly ideal. No single theory has gained general acceptance, nor is there likely to be any consensus, as this side of the debate has been eclipsed by other issues.

The most vigorous work in recent years has tended to negate the validity of the expression itself. Preeminent among such critics, D.W.Robertson issued a strong challenge to those who believe in the existence of courtly love, basing his argument upon a Christian interpretation of medieval society. The criticism aimed at eliminating courtly love as a part of our literary vocabulary centers principally upon three issues. The first is terminological, arising from the fact that "courtly love" is a 19th-century concoction and not genuinely medieval. The second issue stems from the observation that what we know as courtly love is found almost exclusively in literary texts and is nowhere substantiated in legal, theological, or historical writings. Indeed, much of what is depicted in the courtly-love literature must be labeled either illegal or immoral when measured against the mores of medieval society. The third aspect of the criticism arises from an ethical and rhetorical interpretation of the texts themselves. Works like *Lancelot,* which seem to depict an antisocial "religion of love," are actually to be understood ironically, as the parodic presentation of idolatrous cupidity, for (so the argument goes) no medieval Christian audience could tolerate the serious depiction of such otherwise immoral behavior.

Jean Frappier has been the most effective defender of courtly love. While admitting the expression's lack of authenticity, he has convincingly demonstrated that the Middle Ages did have a term for the concept in question: *fin'amors,* or "pure love." The charge that the term's inauthenticity entails that of the concept is thus without substance, and the question becomes one of deciding how to redefine an expression that has become indispensable to our common critical vocabulary. As for the second critique, to expect socially orthodox behavior in the literature is to misunderstand the very status of vernacular courtly lyric and romance as escapist forms of literary creation cultivated in many cases at the margins of the dominant (theological and political) power structures and all that this status implies in terms of wish-fulfillment, personal fantasy, and potentially antiestablishment tendencies. Finally, Frappier's answer to the problem of the

texts' irony, framed as a rhetorical question, is succinctly co-gent: "How [or, we might add, why] could one mock or parody something that never existed?" (Frappier, p. 64).

The crux of the matter is not so much that the concept designated by the expression "courtly love" never existed, but that common usage of it needs to be subjected to as much caution as Andreas Capellanus's seemingly authoritative treatise. In this, the criticisms of "courtly love" are not totally foundationless, for they underscore a problem inherent in Gaston Paris's initial definition and more fully elaborated in C.S.Lewis's categorical restatement: a failure to differentiate lyric from narrative, subjective expression from fictional event, rhetoric from reality. As a complex of thematic elements and rhetorical figures that appears to have found its first formulation in the lyric poetry of the troubadours, thence gravitating to the courts of northern France, "courtly love" is first and foremost the expression of a male subjectivity confronted with the joyous exaltation and pain of erotic desire, accompanied by a consequent fear of isolation and potential loss. Elaboration of love on the psychological level tends to glorify its status as a sublimating virtue, while metaphoric developments of its enslaving power, frequently drawn from the registers of armed combat or imprisonment, abound. When transferred to a narrative setting, a fictional pretext for the lover's isolation needs to be found: hence, the frequently exploited theme of adultery. Adulterous relations are, to be sure, a recurring theme in troubadour lyric as well, but to assert that adultery is a constitutive element of courtly love is to mistake the incidental for the essential.

Short of extending the definition of "courtly love," it is impossible to account for the broad spectrum of literary creations, both in France and elsewhere in Europe, that developed the exalted expression of love-longing in both ironic and spiritual directions. Such divergent works as the lyric corpus of Jaufre Rudel, Thomas's *Tristan,* and Guillaume de Lorris's *Roman de la Rose,* all seminal items in the "courtly love" canon, scarcely present similar attitudes toward love. Adultery is central to *Tristan,* nonexistent in the other two. The particularity of the love object in *Tristan* and the *Rose* contrasts with the immateriality of Jaufre's beloved. Another work, the anonymous 13th-century *Chastelaine de Vergy,* seemingly a classic example of the paradigmatic situation described by Gaston Paris, all but eradicates the social aspects of the lovers' situation (the adulterous triangle) as it highlights the theoretical ramifications of the knight's unfortunate revelation of the furtive love affair: the Châtelaine dies for no other fictional reason than her inner disappointment at the breach of secrecy. Secrecy is no longer a fictional means to an end (maintaining the love relationship), but an end in its own right. By contrast, *Cele qui ne pooit oïr parler de foutre,* one of the many fabliaux predicated upon courtly stereotypes, pokes fun at the hypocritical courtly injunction toward proper speech by juxtaposing it with the pleasure of the uncourtly sexual act. The literary masterpieces that appeared elsewhere in Italy (Dante, Boccaccio), Germany (Gottfried von Strassburg, Wolfram von Eschenbach), and England (Chaucer) adapted French and Occitan courtly models to their own social and cultural needs.

To eliminate the term, to insist that there is no such tradition with specific rhetorical and thematic topoi, would be to impoverish our understanding of many works that presuppose a familiarity with its stereotyped erotic themes and vocabulary. This is especially true of those works, often written late in the Middle Ages, that maintain an ambivalent or overtly satirical stance toward the idealized tenets of courtly love service. How otherwise are we to comprehend the disintegration of the tradition in the 15th

century, most tellingly displayed in Alain Chartier's oblique condemnation of unrewarded love service in *La belle dame sans merci* and the extended debate to which it gave rise? Unless one sees love rhetoric itself as a form of poetic imprisonment, how to detect the transgressive satire of François Villon's bitter legacy to his apparently unfaithful "Love," his "dear rose"—neither his heart nor his liver, but a"large silk purse," figure of another part of the poet's anatomy?

# *COURTOIS D'ARRAS*

. The earliest and most original dramatization of the parable of the prodigal son (Luke 15:11–32), *Courtois d'Arras* was composed in Arras by an unknown author in the first quarter of the 13th century. There are no stage directions in the 664-line play, though six narrative verses introduce the central episode of Courtois's riotous living in the tavern, where he is tricked and robbed by two prostitutes and the innkeeper. The realism and humor of this scene, reminiscent of other 13th-century Arras plays by Jehan Bodel and Adam de la Halle, form a dramatic and metrical contrast to the subsequent lamentations of the destitute youth. Prodded by hunger, Courtois sincerely repents his folly and, recognizing his sin of pride, returns humbly to his father.

The biblical "famine in the land" is replaced in this play by the hero's own ravenous hunger. The inedible piece of bread given him by his new master and the dry, inedible peapods that the swine are trampling are an expressive contrast with the *pain et pois* ("bread and peas") he had rejected in his father's house. The opening and closing dialogues between the father and the unsympathetically portrayed elder brother frame the threefold central action of worldliness, repentance, and reconciliation, a pattern followed by many later miracle and morality plays. The pattern is symbolized here by Courtois's

three coats: the fine one he loses in the tavern, the ragged garment he wears as a swineherd, and the new robe given him on his return home to his father.

# COURTRAI

. On July 11, 1302, outside the town of Courtrai in the county of Flanders, a rebellious force of Flemish townspeople defeated a large French army composed mainly of mounted knights.

Under the direct rule of Philip IV, who had imprisoned their count, Gui de Dampierre, in 1297, the Flemings resented their subjection to the monarchy. In 1302, artisans in Bruges massacred a French force sent to put down a rebellious element. Gathered from all the towns and rural areas of Flanders, a newly formed army, led by a son and grandson of the imprisoned count, began advancing against French castles and garrisons in the county, arriving at the castle outside Courtrai on June 26.

A French army under the leadership of Robert d'Artois, composed of about 2,500 knights and accompanied by a support troop of many light infantry and Italian mercenary crossbowmen, arrived on the field of Courtrai on July 8. Robert faced 8,000–15,000 Flemish infantry and very few knights. Although the Flemish army was larger, the French troops were better armed and more experienced. The Flemings, however, held the better ground with their backs to a river, and had dug ditches in the field to hinder cavalry charges.

On July 11, the battle began with crossbowmen exchanging ineffective fire. Robert then sent his French infantry into battle. Although this infantry was effective, almost to the point of victory, Robert recalled them so that he could finish off the Flemings with his knights. The French knights charged repeatedly, but the Flemish infantry held, and the knights fell with little impact upon the Flemish lances and *godedags,* a curious weapon that combined features of the spear and mace. The French losses were great: between 40 and 50 percent of their knights died, including Robert d'Artois. Hundreds of their golden spurs (awarded for victories in tournaments) were collected by the Flemings and hung in the cathedral of the Virgin in Courtrai.

# COUTANCES

. The city of Coutances (Manche) existed from Roman times (when it was called Constantia) and became a bishopric in the early Middle Ages. In the 9th century, Coutances fell to Norman invaders. By the 11th century, the city regained its position as a religious center; a Norman Romanesque cathedral replaced the edifice that the Vikings had razed ca. 900.

A fire in 1218 severely damaged the Romanesque church, but the new Gothic cathedral constructed during the 13th century encases part of the Romanesque structure and essentially follows its plan and dimensions. The Gothic cathedral consists of a nave of seven bays with side aisles, to which chapels were added between the buttresses in the
Coutances (Manche), Notre-Dame, chevet. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

late 13th and early 14th centuries; a short transept with crossing tower and added porches; and a three-bay choir surrounded by an ambulatory merging with radiating chapels, to which a projecting central chapel was added in the 14th century. The elevation is three-story in the nave and two-story in the choir.

While some features, especially the unity of choir aisles and chapels, are reminiscent of French Gothic cathedrals, such as Bourges, many elements reflect traditions of Norman architecture. Both the interior and exterior display ample linear detailing as seen on the two-tower west façade. The dominant octagonal crossing tower is outstanding in both its construction on pendentives and its interior and exterior articulation.

Fifteen 13th-century stained-glass windows are preserved in the transept, ambulatory, and upper choir, including representations of SS. Thomas of Canterbury, George, and Blaise, as well as the Last Judgment in the south transept. Sculpture from the west façade was destroyed during the Revolution, but the tympana of the north and south transept porches have early 13th-century sculpture of the Virgin with Angels and the Apocalyptic Christ.

# *COUTUMES*

**.** When rural lords, lay and ecclesiastical, levied exactions on the rest of the population without clear legal authority, they justified them as being "customary." These customary dues, or *coutumes* (Lat. *consuetudines*), ranged from payments in money or in kind, such as tolls (giving the modern English "customs"), taxes, and fines, to services, such as demesne work or road and fortification building. In many cases, these represented forms of payment for protection and were disputed in principle by neither side. But at the beginning of the 11th century, the terms *malae* or *novae consuetudines* appear with increasing regularity, designating the exactions demanded by a more aggressive aristocracy, especially the new castellan class.

Among the burdens placed on the population, and often levied without discrimination on free and servile peasants, perhaps the most significant were rights of justice, a development associated with the collapse of the *pagus,* the basic unit of the Carolingian judicial system. These seigneurial rights, which derived from the acquisition of the royal ban (power to command) by the more powerful lords, characterized the French rural world from the 11th century on; and only their conversion into monetary payments eroded by inflation alleviated this burden. Officially, these "feudal rights" were abolished only by the revolutionary decrees of August 4, 1789.

*Coutumes* may also refer to the local practices established in individual monasteries as additions to or variations from a rule, such as the *Rule of St. Benedict.*

# COUVIN, WATRIQUET BRASSENIEX DE

(fl. 1319–29). Attached to the households of Gui de Châtillon, count of Blois, and his great-uncle Gaucher de Châtillon-sur-Marne, the minstrel Watriquet de Couvin left thirty-three poems, most dated between 1319 and 1329. Most of his works are occasional pieces composed for noble households, moral treatises, and allegorical *dits* in the tradition of the *Roman de la Rose,* but included in the extant corpus are two fabliaux and an obscene *fatras*. The titles of these pieces frequently indicate clearly their didactic bent: *Mireoirs as princes, De loiauté, Li despis du monde, De haute honneur, De Fortune,* and so on. Watriquet took much pride in his profession and was among the first writers in French to compile collections of his poems to be offered to various noblemen.

# CRAMAUD, SIMON DE

(1345–1423). Archbishop and cardinal. The son of a petty seigneur from the Limousin, Simon de Cramaud became one of the most influential French prelates of the later Middle Ages. Educated in law at Orléans, he began teaching canon law at Paris when he was about thirty years old. A member of the royal household and council in the late 1370s, he entered the service of John, duke of Berry, after Charles V died in 1380. He served as bishop of Agen (1382–83), Béziers (1383–85), and Poitiers (1385–91, 1413–23). He became patriarch of Alexandria (1391–1409) and archbishop of Reims (1409–13) and was named a cardinal in 1413. He was Berry's chancellor for five years (1386–91) and spent many years on the council of Charles VI. Politically, he followed his patron in

supporting the duke of Burgundy against the Marmousets and Orléanists at court, but when John the Fearless succeeded his father as duke of Burgundy in 1404, Berry (and therefore Cramaud) shifted to the Orléanist party. Soon, Cramaud was on a list of counselors whom Burgundy considered his enemies.

Because the duke of Berry was the French prince most committed to ending the papal Schism, Simon de Cramaud assumed a leading role in the unionist policies of the French crown. More than any other person in Europe, he succeeded in articulating, over a fifteen-year period, the *via cessionis* that called for the abdication of both popes. A skillful politician, he presided over several major councils of the Gallican church and over the Council of Pisa in 1409–10, as well as performing important diplomatic missions on behalf of church union. His influential treatise *De subtraccione obediencie* (1397) was a crucial document in the campaign to persuade the princes of Europe to endorse the *via cessionis* and the sanctions to enforce it.

# CRAON

**.** A town and castle in northwestern Anjou, Craon (Mayenne) gave its name to one of the most important families of northwestern France. Like many other such families, the lords of Craon can be traced to a castellan of the mid-11th century. They served the counts of Anjou and by the 13th century were hereditary seneschals of Anjou and lords of Chantocé, Ingrande, Sablé, Briole, and Châteauneuf-sur-Sarthe. They intermarried with the great seigneurial families of neighboring regions, such as the Clisson, Lusignan, and Laval. Amaury IV (d. 1373) was the last male member of the senior line. His sister Isabelle, who succeeded him, was the wife of Louis I, lord of Sully, and their daughter, Marie, married Guy VI de La Tremoille, bringing with her an inheritance that made the fortune of her husband's family. Cadet lines in the 14th century included the viscounts of Châteaudun, the lords of La Suze, and the lords of La Ferté-Bernard. The last male heir of each of these lines died at Agincourt in 1415. The inheritance of the La Suze line passed through a woman to Gilles de Laval, lord of Rais and marshal of France. The line of La Ferté-Bernard produced the Pierre de Craon whose scandal-ridden life included a bungled attempt to assassinate his second cousin, Olivier de Clisson, constable of France, in 1392. This act triggered the ill-fated royal expedition against Brittany during which Charles VI had his first attack of mental illness.

# CRÉCY

. In July 1346, King Edward III opened a new phase of the Hundred Years' War by landing in Normandy with an army of 15,000 men. By the end of July, the English had captured Caen and then marched to the east to secure other towns in Normandy. Finally, on August 24, they were attacked by the French at Crécy-en-Ponthieu. The French force, under the leadership of their king, Philip VI, numbered 40,000. Given the larger French numbers, the English dismounted and took a defensive position on higher ground to await an attack. The battle began in the late afternoon with a relatively ineffective exchange of archery fire between the English longbowmen and the mercenary Genoese crossbowmen. This lasted only a short time, but the French knights grew impatient. Recognizing their superior numbers and anticipating a quick victory, they charged through their own archers into the lines of dismounted English, commanded in part by Edward, the

"The Battle of Crécy," Froissart's *Chroniques*. BN fr. 2643, fol. 165. *Courtesy of the Bibliothèque Nationale, Paris.*

Black Prince. After an uphill charge through continuous English archery fire, with their lines confused and in disarray, these knights encountered the English soldiers. Despite constant pressure on the English line, the knights were unable to pierce it and the attack failed, with the French suffering heavy casualties. By midnight, the French army, including the king, retreated from the battlefield. The English rested for a few days, then marched to Calais, which they besieged for nearly a year before capturing it.

# CRÉTIN, GUILLAUME

(ca. 1460–1525). One of the Grands Rhétoriqueurs, Crétin was a prolific author of *épîtres* and other *poèmes de circonstance,* texts addressed to nobles in an attempt to please or curry favor. He composed many religious poems and even undertook a verse translation of Gregory of Tours, which he was unable to complete. Crétin also wrote a *Débat de deux dames sur le passetemps de la chasse des chiens et oyseaulx,* a text that continues a poetic debate begun some time before: is it better to hunt with dogs or with falcons? This composition was published only after Crétin's death. He was much admired in his day, and his style, particularly his *rimes équivoques,* was praised by Crétin's most influential contemporaries.

# CRIME AND PUNISHMENT

. Fifth-century Gaul saw the opposition between the Roman and the barbarian, especially Frankish, criminal-law systems. In Roman society, criminal justice was the affair of the state and the responsible individual. The state prosecuted individuals accused of crimes against the state and public order (treason, sacrilege) or against property (theft) and

people (murder, assault). The means of proof was rational (largely testimony), and punishment included execution, imprisonment, banishment, and corporal punishment. Criminal justice in the Frankish kingdom, on the other hand, was conceived of much as civil justice, as a matter in which two families confronted one another. The traditional ven-geance sought *(faida)* was replaced with monetary compensation *(wergeld)* detailed in exhaustive lists. The procedure was accusatory, and proofs invoked were co-oaths (families and neighbors swearing to the honor of the accused) and ordeals.

The feudal period saw the rise of seigneurial and ecclesiastical jurisdiction, in criminal as well as civil matters. The high and late Middle Ages saw three fundamental changes: the development of municipal courts, the growth of royal justice, which tended to overshadow the old seigneurial jurisdictions, and the reintroduction of Roman principles of justice, especially of procedure, at first through the church and canon law, then also through royal justice and some lower courts, especially in towns. With the strengthening of the notion of the state, inquisitory procedure began to supplement and then to replace the old accusatory procedure. Testimony and confession, both sometimes induced by torture, replaced co-oaths and ordeals as proof, and the practice of appeal was introduced. Individual responsibility tended to replace collective responsibility, and the intention of the accused became as important a factor as the facts of the crime.

With the growth of public authority, persons accused of crimes against religion (sacrilege, witchcraft, blasphemy), against public authority (treason, counterfeiting), and against public order (procuring, concubinage, gaming, sodomy) were prosecuted, as well as those having committed crimes against people (homicide) and property (theft). The principal forms of capital punishment were decapitation, hanging (especially for theft), and burning (for heresy, witchcraft, and sodomy). Corporal punishment was reintroduced; the most common mutilation was the cutting off of ears, normally for theft. Whipping was a common punishment, as was being exposed at the pillory for several days. Banishment was frequent; imprisonment, however, was rarely used as punishment. Confiscation of goods often accompanied other punishments, especially when the accused was noble or in cases of heresy, usury, or suicide. Fines were common, and the sum varied greatly; sixty sous, the standard fine in Frankish times, remained the most common.

# CROISADE CONTRE LES ALBIGEOIS, CHANSON DE LA

**.** A historical epic retelling the events of the Albigensian Crusade, the *Chanson* is an invaluable historical and literary resource. The author of the first 131 laisses (2,772 lines), Guilhem de Tudela (fl. first quarter of the 13th c.), began writing in 1210 and

ceased in spring 1213; he is a relatively impartial though dry reporter of events. Approving of the crusade, condemning the heretics, he defends, however, southerners whose orthodoxy was unquestionable. In 1228, an anonymous author continued Guilhem's story. Sympathetic to the southern cause, he recounts in detail those events to which he was an eyewitness; the style is more animated and much more dialogue is reported. His story stops in the midst of a description of the 1218 siege of Toulouse.

Using as model the *Chanson d'Antioche,* the work is composed of 9,582 Alexandrine lines, divided into 214 assonanced laisses; the last line of each laisse (of only six syllables) links to the next, *capcaudada* in Guilhem de Tudela's portion, *capfinida* in the second part of the work. Only one manuscript is extant (B.N. fr. 25425), with pen-and-ink illustrations, dated ca. 1275. Two prose chroniclers of the Albigensian Crusade appear to have had access to this text for their redactions.

# CROSSBOW

. The *arbalète,* or crossbow, was a mechanical bow that became the standard archery weapon in France during the Middle Ages. The basic construction of the weapon was a small bow attached to a stock that provided a groove for the bolt and handle, with a bowstring that was held in place ready for release by a trigger mechanism.

Descended from the ancient Greek *gastraphetes* (or "belly bow"), the *arbalète* became popular in western Europe during the late 11th century. Because of its brutality in war, both Pope Urban II (r. 1088–99) and the Second Lateran Council (1139) condemned its use among Christians. However, this condemnation was rarely heeded as the *arbalète* became increasingly popular in Europe. This was especially the case in France, where most kings and nobles used crossbowmen in their armies between the 12th and 15th centuries, frequently employing mercenary crossbowmen, principally Italians, when they failed to recruit sufficient numbers of these troops from among their own subjects. These troops were used tactically at the beginning of a battle and on the flanks as harassers of opposing forces.

By the late Middle Ages, the *arbalète* had increased in use and efficiency. The composite crossbow, made of horn, sinew, and glue, was considerably more powerful than earlier bows. Stirrups, windlasses, and *cranequins* were added to the stock to enable the bow to be strung with greater tension, increasing immensely the power of the pull.

Improvements to the release mechanism and to the bolt also added to the efficiency of the weapon. By the early 13th century, castles were being designed with openings for *arbalètes* and ships were being outfitted with the weapon, and during the reign of Philip the Fair the offices of master and clerk of crossbowmen were established to oversee the military organization and pay of these troops. The master of crossbowmen who eventually became the military leader over the entire infantry was often not a professional soldier, and the units of French or mercenary crossbowmen frequently in battle were confused, disorganized, and at odds with the other infantry or cavalry troops.

By the mid-14th century, crossbows were being replaced in defense of castles by small-caliber cannons, and a decline in the craft was also apparent. Steps were taken to halt this decline—Charles V in 1384 prohibited the playing of any game except with bow or crossbow, and Charles VII in the 1440s set up companies of *franc-archers* who used the weapon—but ultimately the *arbalète* could not survive the late 15th-century influx of handguns. By 1550, the weapon had disappeared from the battlefield.

# CRUSADE CYCLE

. This group of chansons de geste about the First and Third Crusades dates from the 12th, 13th, and 14th centuries. It is usually divided into two parts, a First Crusade and a Second Crusade Cycle; the poems of the second cycle are a partly revised, extended version of the first. (A state intermediate between the two cycles also has been preserved.) The texts are all in twelve-syllable rhymed laisses; they vary from about 2,000 lines to 10,000 and more. In its most developed form, the cycle counts some 60,000 lines. It has come under extensive critical scrutiny only recently.

Thirteen separate poems, or branches, are usually counted in the First Crusade Cycle. Their chronological order is roughly as follows: *Chanson d'Antioche* (late 12th c.); *Chanson de Jerusalem, Chétifs, Chevalier au Cygne, Enfances Godefroi de Bouillon, Naissance du chevalier au Cygne (Les Enfants-Cygnes)* (all probably early 13th c.); *Fin d'Elyas, Retour de Cornumaran* (13th c.); and the continuations of the *Chanson de Jérusalem: Chrétienté* [i.e., conversion of] *Corbaran, Prise d'Acre, Mort Godefroi, Chanson des rois Baudouin,* and the "Second Continuation," which has several forms and brings the story of the Crusades down to the time of Saladin; the latter branches are known in varying versions from the late 13th or early 14th century. There are also two abbreviated prose versions of parts of the First Crusade Cycle, one from the late 13th

century and one from the 15th. The latter has been published as the *Geste du Chevalier au Cygne*.

The Second Crusade Cycle, elaborated during the first half of the 14th century, includes a vast reworking of the narrative material of the first cycle (edited as the *Chevalier au Cygne et Godefroid de Bouillon,* 35,180 lines, two versions) and two loosely attached continuations, *Baudouin de Sebourc* (25,778 lines) and the *Bâtard de Bouillon* (6,546 lines).

The development of the First Crusade Cycle followed the usual rules for the extension and reworking of epic material. The oldest poem, *Antioche,* describes the preparations for the First Crusade, the crusaders' departure, their stay in Constantinople, and the successful campaign against the city of Antioch. This poem inspired works that stretch both forward and backward in narrative time, treating the subsequent capture of the Holy City *(Chanson de Jérusalem)* and then evoking both the ancestors and descendants of Godefroi de Bouillon (a sequence observed also in the growth of the Guillaume d'Orange Cycle). Hence, the oldest poems in the cycle as we have it are those that actually recount events of the First Crusade, the capture of Antioch and of Jerusalem. On the other hand, later works in the cycle, the group that tells the Swan Knight story, describe the rise of the house of Bouillon through the adventures of the legendary Elyas and the other Swan Children, victims of an evil stepmother who steals the magical chains that allow them to change in and out of human shape. Elyas, accompanied by a brother in bird form, saves the Countess of Boulogne from death, marries her, and after engendering the lineage of Godefroi and the Latin kings of Jerusalem, himself falls victim to a taboo deriving from folklore: he disappears when his wife is unable to refrain from asking him the fatal question of his origins.

Other prologues to the *Antioche-Jérusalem* core tell the story of the youthful Godefroi's exploits, which prefigure his role as first king of Jerusalem (a historically inaccurate title). The most recent poems of the First Crusade Cycle, on the other hand, are the "Jerusalem Continuations," which carry the Crusade story on beyond the crucial campaigns of the First Crusade. In the earliest continuations, Godefroi captures the city of Acre (Saint-Jean d'Acre, Akka); the great Saracen leader Corbaran (whose name recalls that of the emir Kerbogha) converts to Christianity; and Godefroi is poisoned by a jealous cleric. The later continuations are more closely tied to history, seeming at some points to derive from the text known as the *Chronique d'Ernoul*. They pay little attention to the Second Crusade but show an early concern with the downfall of the Latin kingdom of Jerusalem and its associated states, a concern that was to be developed at some length in the 14th-century Second Crusade Cycle.

The poem of the *Chétifs* ("captives"), the age and origins of which are debated, is heavily laced with folklore and oriental motifs; although it comes between *Antioche* and *Jérusalem* in the cyclical manuscripts, it is probably somewhat later in date. Recounting not the events of the Crusade but rather the adventures of Christian knights taken prisoner at the Battle of Civetot, it shares characteristics of the *chansons d'aventures*. The Crusade Cycle is thus a patchwork of relatively independent chansons, gathered more or less systematically into a single but far-from-seamless sequence, over several decades starting at the end of the 12th century. Earlier scholarship posited a historically accurate early version of the *Chanson d'Antioche* attributable to a participant in the Antioch campaign, called "Richard the Pilgrim." In the absence of any positive evidence for Richard's

existence or that of his poem, it is preferable to consider the Crusade epics as the products of a later period. They reflect not actual experience but a mythical view of the Crusades expressed through techniques typical of the chansons de geste. While the known text of *Antioche* does contain some passages that are historically correct, thanks probably to the influence of the chronicles, it is clear that much of its narrative, and nearly all of the cyclical poems that derive from it, are based on literary motifs. The Crusade Cycle embodies a legendary view of Christian military and moral superiority, and of Godefroi de Bouillon and his family, that was current in northern Europe some time after the events.

The London and Turin manuscripts of the First Crusade Cycle preserve a lengthy set of continuations, the "Second *Jerusalem* Continuations," that date from about the turn of the 14th century. Their content matches that of the earlier continuations in part, with numerous additions. These manuscripts offer a transitional state of the cycle. Much of their matter is preserved, in rewritten form, in the huge *Chevalier au cygne et Godefroid de Bouillon,* the core of the Second Crusade Cycle, which had attained its fully elaborated state by the middle of the century. It recounts the stories told in the First Crusade Cycle with often fanciful continuations. The independent poems *Baudouin de Sebourc* and the *Bâtard de Bouillon,* loosely associated with the Second Crusade Cycle, describe new, and often burlesque, adventures of knights of the lineage of Godefroi. A final "branch," known only in a 15th-century prose version, is dedicated to a legendary biography of Saladin; there are indications that it continued the Crusade story down to the fall of Jerusalem and the extinction of the house of Bouillon in the East. There are parallels with William of Tyre and "Ernoul," but most of the Second Crusade Cycle is a combination of common literary motifs.

The Crusade Cycle of chansons de geste embodied and transmitted a coherent myth of crusader character and action in a popular literary form. Its texts were copied, translated (most notably into Middle Dutch), and collected as late as the 16th century, and derivative prose versions were among the more frequently printed early French books. Its manipulations of history are highly revealing of attitudes toward the Crusades from the 12th century onward.

# CRUSADE SONGS/*CHANSONS DE CROISADE*

. The twenty-nine extant French crusade songs span the hundred years of the Second to Seventh Crusades; the thirty-five Occitan pieces include both earlier and later compositions. The latter, almost all the work of well-known troubadours, from Marcabru to Guiraut Riquier, belong to the lyric genre of the *sirventes* and deal with political, moral, or religious aspects of the Crusades, exhorting or rebuking. The French corpus is much more varied in form and, especially, in content. While over a third of the pieces are anonymous, many, most notably four by Thibaut de Champagne, stem from famous trouvères. In addition to composing polemical and hortatory songs of the Occitan type, the northern poets were concerned with the impact of the Crusades on their lives as lovers. Indeed, half of the corpus expresses, usually in the style of the *grand chant courtois,* the stress caused by the conflicting demands of love and religious duty, and the pain of separation from the beloved; two of the songs develop the separation theme from the woman's point of view.

# CRUSADER ART AND ARCHITECTURE

. The term "crusader art" refers to works produced in the Latin Kingdom of Jerusalem during the Frankish colonial period from 1099 to 1291. Due to the assimilation and interpretation of artistic elements by westerners within the Latin Kingdom, along with the fragmentary state of some works of art and architecture, much crusader art escapes stylistic definition and attribution to workshop and patron. Early approaches to crusader art involved polarized categories of "eastern" and "western," which reduced multicultural works to products of one homogeneous group. Recognition of the many groups in the Frankish kingdom and inquiries into definitions of ethnicity have recently contributed to

more careful approaches to assessment of the artistic practices and products in the Latin Kingdom.

This article will raise the questions that must be posed in order to gain an understanding of the complicated field. To start, the complex composition of the crusader environment and its chronological bounds must be acknowledged. What characteristics make a work of art a work of crusader art? How does crusader art change? Crucial questions center on definitions of crusader art, characteristics of these works, and their place of production. Such definitions must involve careful consideration of format, iconography, and technique. Inquiries into the roles played by western groups and Byzantium, the locations of major centers (the Holy Land or Constantinople), and the differences between artistic production and artistic centers in the 12th and 13th centuries must also be considered.

The Holy Land and the Mediterranean had long been an environment shared by Jews, Christians, and Muslims. Within the Christian population alone, distinct cultures were found in the variety of Christian sects, such as Orthodox Christians, Maronites, Jacobites, Melchites, Nestorians, Coptic Christians, Armenians, and Syrian Christians. Likewise, the Islamic world was unified politically only in the 12th century under Saladin. Even the westerners represented a variety of ethnicities, from Normans to Icelanders to southern Italians. In Sicily and Cyprus, colonization under the Normans in the 11th century had already instigated the meeting of Arab, Byzantine, and Norman cultures, artistic techniques, and products.

Crusaders called this variegated world *Outremer* ("Overseas"), a term used in reference to controlled states, especially the Latin Kingdom of Jerusalem, that included Lesser Armenia, the County of Edessa, the County of Tripoli, and the Principality of Antioch. The formal initiation of the Latin Kingdom began in 1099 with the capture of Jerusalem and the slaughter of all those non-Westerners who sought refuge within the walls of the Temple of Jerusalem. As for artistic activity, scholarship supports a later date for the formation and establishment of workshops and interest in patronage. Thus, artistic activity of the crusaders falls within two periods: from the early 12th century until the taking of Jerusalem by Saladin in 1187, and from 1191, when Acre became the new capital of the kingdom, until 1291, when Acre fell.

In the 19th century, scholarship of the French colonial mindset used selective stylistic or iconographic characteristics to polarize works of crusader art into ill-defined categories of "East" and "West." Such approaches have been overturned. A work of crusader art must be produced during the period of the Latin Kingdom, and its artistic production must involve at least one westerner. In many cases, a western or Byzantine donor can be identified or suggested due to sufficient documentation. A decisive application of ethnic labels must, however, be used with care, especially when labeling artist or workshop and locating the region of production. Careful investigation into iconographic elements problematic for the Orthodox church but part of western formal vocabulary may also contribute to the attribution of work to a regional workshop.

Due to westerners' lack of familiarity with new materials, many works of architecture and sculpture incorporate techniques native to the Latin Kingdom and suggest the cooperative efforts of local workshops. Other works, such as manuscript illuminations, icons, wall paintings, mosaics, and ivories, can be ascribed either to one particular culture (or in some cases to one workshop) on the basis of technique or use of iconographic

elements, or to a melange of workers of diverse ethnic backgrounds. In these media, Latin or Greek inscriptions offer clues to the circumstances of production.

In Jerusalem, the architecture of the Holy Sepulcher exemplifies the complex interchanges between cultures. For the crusaders, the building came to symbolize Jerusalem and the Latin Kingdom, as the number of holy sites grew and pilgrims assigned new meanings to sites within and outside the Sepulcher. Since the construction of the first building under the emperor Constantine, the Holy Sepulcher marked the site of Christ's burial, and subsequent destruction initiated the rebuilding financed by Constantine IX Monomachus. The domed structure was characteristic of Byzantine architecture, with a polygonal apse and three separate spaces for small chapels. Through alteration, the crusaders attempted to transform the building into a Benedictine pilgrimage church, changing the orientation of the altar from west to east and adding radiating chapels. Such alterations conform to western requirements for churches, but the building techniques come from a variety of sources. Rib vaulting is native to the crusader kingdom, the horizontal masonry is French, the flat roofs of the transepts resemble Palestinian buildings, and a tall Aquitinian dome surmounts the structure. The building also gained an additional function, when it served as a place of coronation and celebration of the anniversary of the taking of Jerusalem in 1099.

Another 12th-century monument that defies attribution to a single cultural group is the *Melisende Psalter* (B.L., Egerton 1139; ca. 1131–43). Its elaborately carved ivory cover studded with enamels, twenty-four full-page introductory miniatures, and eight illuminated initials suggest that a number of artists contributed to the psalter, which illustrates the high level of opulence in luxury goods desired by members of the aristocracy associated with crusader society. Though the psalter was initially attributed to the patronage of Queen Melisende (r. 1131–61), lack of evidence and the number of cultural elements point toward the probability of another patron. Such features as the Latin signature of the artist Basilius, the text of the calendar with English saints, the Byzantine dress of the character in the roundels of the ivory cover, and western iconographic elements may not easily offer a name or label for artists and patron, but they do suggest that the agents of production were many and mixed.

Joint patronage produced works that reflect the fusion of cultures and also their distinctiveness. In 1169, King Amalric I and the Byzantine emperor Manuel Comnenus commissioned mosaics that featured a variety of subjects with Byzantine and western elements in the church of the Nativity in Bethlehem. In the nave, the representation of the seven ecumenical councils on the south wall and the six provincial councils on the north wall are Greek in origin, relating to a profession of faith to bring out the condemnation of heresies. Greek inscriptions name the figures representing each council. Beneath these mosaics were the ancestors of Christ with Latin inscriptions that led to the west wall, which held a Tree of Jesse, a typically western iconographic element.

Also at Bethlehem, arcade columns in the nave carry paintings by a number of artists. A thickly painted holy figure graces each column. Saints from diverse geographic areas include Macarius, Anthony Abbot and Euthymius (hermit saints), George (English), Cosmas and Damian (Syrian), Canute and Olaf (Scandinavian), Fusca (Venetian), and St. Margaret of Antioch. One column bears an entire group, identified with Greek inscriptions: Mary the mother of James, Salome, Mary Magdalene, and the Virgin Mary. Another column holds both St. Leo and St. Anne. Kneeling donors underline the function

of the columns as votive paintings. Named in Latin, Greek, or both, these figures most immediately illustrate the significance and interdependence of religious and cultural roots for natives as well as for many foreigners and at the same time attest to the communal representation of these roots in crusader society.

During the first period of the Latin Kingdom, the Haram in Jerusalem had been transformed into the Templar headquarters and the site of an Augustinian house. After the fall of Jerusalem in 1187, many of the Christian buildings in the Haram were dismantled and the fragments were reused in the Aqsa mosque, the Dome of the Rock, the entrance to Bab as-Silsilah, and many other Islamic structures. The carving of these pieces are all of high quality, ranging from twisted columns to "wet leaf" acanthus capitals with the sinuous delicate leaf forms carved in relief. Due to the fragmentary nature of the material, however, the composition of the "Temple" workshop remains a matter for speculation, although scholars trace the subsequent migration of artists to southern Italy. In addition to the Temple Workshop, the figural capitals intended for the church of the Annunciation at Nazareth and two lintels over the main entrance to the Holy Sepulcher remain important works in a corpus of crusader sculpture.

When the capital moved to Acre in 1191, artistic activity lapsed until ca. 1250. The crusade of Louis IX and his presence at Acre (1252–54) brought greater support for the Latin Kingdom and motivated patronage, which may account for the greater number of surviving manuscripts and icons from this period. One of Louis IX's commissions for an Old French Bible, the Arsenal Bible (Paris, Bibliothèque de l'Arsenal 5211), shares features with frescoes in Constantinople. Louis IX also initiated investment in increased fortifications of such major sites as Caesarea, Jaffa, Sidon, and later in the century the capital of Acre.

A number of 13th-century icons have been characterized as the product of western artists because of certain unorthodox representations of Byzantine dress and the inclusion of western emblems. Due in part to the scanty remains of comparative material, such as monumental painting, and to the stylistic variety of local workshops, firm attributions of groups of icons to one location are not always possible. Applications of simple "eastern" or "western" labels do not take into consideration local commercial workshops that produced marketable icons for one ethnic group or another.

The Latin Kingdom was not the monolithic culture that westerners have wished to project. The diverse ethnic fabric demanded variety in patronage, eclectic artistic activity, and a broad range of artistic products. Distinct differences between the crusader world in the 12th and 13th centuries may hamper the search for continuity of workshops and patrons but at the same time underline the necessity of acknowledging the complex social, political, and economic circumstances surrounding the production of crusader art.

# CRUSADES

. The long series of military campaigns that aimed to expand the borders of Latin Christendom against international Islam and to defend Europe against residual paganism and resurgent heresy on the local scene. Drawing inspiration from earlier western notions of just war or divinely sanctioned war, the crusaders acted in the firm belief that their goals—the principal one, especially for the people of feudal France, being the recovery of the Holy Land—not only were justified in God's eyes but were in fact God's explicit wish. *Deus vult!* ("God wills it!") became their battle cry, which could be heard from the 11th century through the 15th. The campaigns against Palestine and Egypt, the Spanish *Reconquista,* the wars against paganism in Lithuania, the struggle to stamp out Catharism in southern France, and the 13th-century papal effort to topple the Hohenstaufen regime in southern Italy all form part of crusade history; but the repeated efforts to regain and defend the Holy Land are the center of the story, insofar as French military involvement and popular support are concerned. That support remained surprisingly constant over the centuries, despite the repeated failure of the campaigns themselves. Only the first four Crusades are examined here in any detail. But French enthusiasm for crusading, while it may never again have reached the extraordinary level of explosive energy that inaugurated the First Crusade, lasted well into the age of gunpowder.

The passion for crusading arose from a passionate desire for peace. The decay of Carolingian power in France in the 9th and 10th centuries amid endemic civil strife and renewed foreign invasion brought stable social and economic life to a virtual standstill in some parts of the realm. Famine and disease spread as brutal private wars engulfed the countryside. Desperate for peace, Frankish peasants and village artisans organized an impromptu series of mass protests that came to be known as the Peace of God movement.

These were highly emotive, popular demonstrations, in which bishops paraded the relics of local saints, led prayers for peace, and condemned Europe's warrior caste for its senseless shedding of Christian blood. Among some segments of the Frankish populace, these emotions were inspired by a belief in approaching Armageddon, although the extent to which apocalyptic convictions played a role is still disputed. Proclamations from Peace councils announced the inviolability from harassment of the Christian populace— especially of widows and children, the clergy, and those undertaking pilgrimage to holy sites—on penalty of excommunication. Having outlawed violence against particular persons considered holy, the councils soon took the next step and established the Truce of God, which condemned warfare on holy days as well. The Peace and Truce of God were essential precursors to the crusade phenomenon, since they established the precedent of the church being the arbiter of legitimate warfare.

The rapidly progressing Gregorian reform movement likewise influenced crusade ideology. Reforms like outlawing simony, demanding a celibate clergy, and condemning lay investiture increased popular support for the institutional church that had long been on the wane. The Papal Election Decree of 1059 finally secured the independence of the Holy See from imperial control and gave it the opportunity to exert its new-found strength by promoting a European-wide movement to complete the reformation of the Christian world by ensuring, by force if necessary, Christians' right to undertake unmolested pilgrimages to the site of Christ's birth, miraculous works, and death. Pilgrimage, and the cult of the saints to which it was linked, was a particularly popular devotional exercise among the peoples of the feudal north. Whether as voluntary exercises or as required penitential works, these arduous and dangerous journeys to holy sites figured large in Europe's spiritual life, and pilgrimage routes to popular sites like Canterbury, Rome, Santiago de Compostela, or Jerusalem itself often were filled with hundreds, if not thousands, of the devout. Reports of Muslim harassment of pilgrims en route to the Holy Land, and of the Egyptian caliph 'al-Hakim's 1009 slaughter of the Christian populace of Jerusalem and destruction of the Holy Sepulcher, struck European minds with horror. These reports were grossly exaggerated, but a certain amount of anti-Christian violence did occur with some frequency, usually by Arab or Turkish brigands acting independently rather than by state forces themselves. To defend the holy pilgrims as well as the Holy Land itself, the church considered it well within its rights to summon the military caste of Latin Christendom to lead a divinely sanctioned war to liberate Palestine, rescue the Christian populace held in what was believed to be servitude, and guarantee the safety of pilgrimage routes.

The First Crusade (1095–99) was the only complete success. Pope Urban II at the Council of Clermont (November 27, 1095) called specifically upon the people of France to "enter the road to the Holy Sepulcher and win back the Holy Land from the wicked race" of the Turks. The main army, trailing a rag-tag group of peasants led by the zealot Peter the Hermit, set off by land for Constantinople, from which, urged on by their nervous Byzantine hosts, they moved southward across Anatolia. Amid extraordinary hardship, they liberated city after city (the battle for Tripoli being the most difficult) before finally entering Jerusalem in July 1099. In their zeal, the crusaders sacked the city brutally, killing Jews and Muslims alike. When the fighting ceased, the army organized the resettlement of the Holy Land into four major Christian states: the principalities of Edessa, Antioch, and Tripoli and the kingdom of Jerusalem.

The Second Crusade (1147–49) was a fiasco. The fall of Edessa to the Mosul-based Turkish warlord 'Imad ad-Din Zengi raised fears for the remaining three Christian states. France's Louis VII determined to seize the advantage from the papacy and to lead the new campaign himself. This crusade would be, he hoped, a wholly French affair. The revered abbot of Clairvaux, Bernard, was conscripted to preach and raise recruits—which he did with great success. The soldiers gathered at Paris and set off for the East, by land once again, trailing a German contingent that had taken the cross despite French hopes to exclude them. Most of the German forces were cut down in Asia Minor. Popular tales of Louis's errant wife Eleanor of Aquitaine's scandalous behavior while traveling with the army have been exaggerated, but she does appear to have complicated tactical and diplomatic matters along the way with her willful behavior. The French army, arriving safely in Jerusalem, made the disastrous decision to march against Damascus, whose Arab ruler was actually allied with the Christians against Zengi's successor Nur ad-Din. Caught between the crusaders and Nur ad-Din's forces, the Damascenes sided with the Turks and forced the withdrawal of the French troops. Defeated on the battlefield, the crusaders returned home humiliated and confronted with angry demands for an explanation of their heavy losses.

The Third Crusade (1189–92) hoped to restore Europe's tarnished reputation by removing the new Mus-lim leader 'Al-Nasir Salah ad-Din (Saladin), who had come up from Egypt to unite the territories from the Nile to Aleppo under his control. At the Battle of Hattim (July 1187), Saladin had routed the army of the kingdom of Jerusalem and become master of all the Holy Land. This setback triggered the Third Crusade. Led jointly, if somewhat chaotically, by France's Philip II Augustus, England's Richard I the Lionhearted, and imperial Germany's Frederick I Barbarossa (who died en route), the crusaders fought surprisingly well against high odds and managed to secure Christians' right of free entry to Jerusalem, although the city remained under Saladin's control.

The Fourth Crusade (1202–04) was doomed from the start. Prompted by Innocent III's desire to reassert papal control of crusading after the two preceding monarchical efforts, the Crusade was preached throughout Europe by envoys from Rome. The crusaders gathered at Venice, whose government had contracted in advance to transport and supply the expected number of recruits. Too few crusaders enlisted to meet the Venetian bill, however, which necessitated a change of plans. Venice offered to forgive the crusaders' debt if they agreed to restore Zara, a Dalmatian colony formerly subject to Venice, to their control. With no alternative, the crusaders took Zara by force, even though it was a Christian city. Innocent responded by excommunicating the entire army. Hoping to restore themselves to the church's good graces, and spurred on by the promise of aid from the exiled claimant to the Byzantine throne in return for their help in ousting his rival, the crusaders then sailed to Constantinople, which they sacked in April 1204 and pillaged ruthlessly. Constantinople remained under Latin control until 1261. Content with their success in returning the Orthodox East to western rule, the crusaders never continued on to the Holy Land.

France's sainted Louis IX led two crusades against Islam (1248–54 and 1270) and had earlier sent a third crusade force against the Cathar heretics in southern France. Both of his overseas campaigns began in high hopes and ended miserably. After a well-executed assault on Damietta in mid-1249, delay and confusion set in, and Louis's army wasted five months sitting passively in the Nile delta. Strategic miscalculation in 1250 resulted in

the defeat of his entire army at Mansourah and in Louis's own capture by the forces of the Egyptian sultan. After his ransom, Louis spent four years overseeing the refortification of Acre, Caesarea, Jaffa, and Sidon, before returning to France and devoting himself to civil reforms. Determined to make up for his failure, though, Louis launched a new campaign in 1270, which aimed first at the seizure of Tunis before advancing toward Egypt and the Holy Land itself. Louis fell ill in Tunis, however, and died on August 25, after which his demoralized army returned to France.

The lasting consequences of the Crusades for France, as for the rest of the Latin Christian world, had little to do with the political or military aspects of the wars. Their effect on the Holy Land itself was slight. Indeed, to most of the larger Muslim world the battle to control Palestine was a relatively minor frontier struggle far removed from the center of Islamic life. Economically, the Crusades served as a catalyst for the growth of European commerce by contributing to the evolution of advanced systems of finance and capital administration; they also helped to expand western markets for eastern goods like spices, textiles, metalwork, and glassware. Inevitably, for the feudal north, the increased contact with the Greek, Jewish, and Islamic worlds introduced new ideas and methods into the European tradition—new technologies, new scientific concepts, new philosophical traditions, new artistic methods and techniques. But many of these developments were already well underway in the Mediterranean parts of Europe prior to the Crusades, and it would be a mistake to overemphasize the Crusades' importance in this regard. Indeed, the cultural influence of the Crusades has been greatest in later centuries, in the way that the conflicts have been remembered and either romanticized or vilified in the Christian and Islamic worlds. In popular western culture, they have come to be synonymous with chivalry and pageantry, the medieval world's ill-fated but noble attempt to rescue its spiritual homeland from the hands of foreign tyrants; to much of the Muslim world, they have been regarded, just as erroneously, as the clearest example of naked western aggression and hypocrisy, a cultural wounding from which Islam has yet to recover fully. Neither view is accurate.

For France, the most important legacy of the Crusades was the impetus they gave to the expansion of the kingdom's borders southward to the Mediterranean. The strategic need for a Mediterranean harbor from which to launch further Crusades (and to participate directly in the burgeoning maritime trade) provided a justification for Capetian expansion into the Midi, Languedoc, and Provence—and the crusade against the southern Cathars provided the vehicle for it. French churches acquired innumerable relics from the East, which augmented popular piety and enriched many ecclesiastical houses. Historical writing and poetry in France drew considerable inspiration from the crusade movement; the sheer scope of the enterprise excited the imagination of numerous writers, among them Guibert de Nogent, Jean de Joinville, Geoffroi de Villehardouin, and the anonymous author of the *Chanson d'Antioche*.

# CUNAULT

. The town of Trèves-Cunault (Maine-et-Loire) owes its origin to the monks of Noirmoutier, who, taking refuge from the Normans, settled in Cunault (846–57). The priory, established around the turn of the millennium, flourished in the 12th century thanks to the political and economic importance of the north bank of the Loire and an influx of pilgrims venerating the reputed marriage band of the Virgin. The oldest part of the church of Notre-Dame de Cunault is the mid-11th-century bell tower. Supported by four pillars, joined by arches, it has an octagonal cupola. The square upper portion is ornamented with a series of blind arches interspersed with Romanesque pilasters and colonnettes and is crowned by a 15th-century spire. The chevet (ca. 1140) is the oldest part of the church proper. Here, an ambulatory with three radiating chapels encircles a blind apse. The building's long nave is flanked by aisles whose first three bays carry eight-branch, 13th-century Angevin vaults. Sculpted capitals with interlaced vegetal designs and images of monsters and chimeras cap columns throughout the church. A formerly painted and gilded wooden shrine (13th c.) holds the relics of St. Maxenceul. In the tympanum on the façade sits a Virgin flanked by two angels (possibly late 13th c.).

# *CURIA REGIS*

. Although most commonly used for courts of the Norman kings of England, the Latin term *curia* ac quired a general usage for any court of a feudal lord and his vassals, including any meeting, whether for social, judicial, or political affairs. In France, *curia* tended to refer to the king's council acting in a judicial capacity. Rarely did all the twelve peers, as they came to be called, con-vene, much less meet together with lesser lords or prelates, because the kingdom was so loosely united and royal power so limited before the 13th century.

By the 13th century, the Capetian monarch was recognized as suzerain over a great number of direct and subvassals. The *curia regis* decided cases between the king and those who held directly from him while cases between his vassals-in-chief and their vassals were settled in their courts, until St. Louis (r. 1226–70) insisted on the right of appeal to his court in cases of denial of justice or *faux jugement* in the feudal courts. Often, he sat with his judges, who became specialized as the Parlement de Paris and broke off from the less specialized *curia regis,* which handled fiscal affairs as well as general policy. During the reign of St. Louis's grandson Philip the Fair (1285–1314), the Chambre des Comptes also broke off from the *curia* to handle fiscal affairs, and the Estates General evolved perhaps on the model of the English Parliament as a sort of great council with prelates and representatives of the lower clergy, peers and representatives of the lower nobility, and representatives of the towns. It asserted on occasion the power to approve taxes and legislate as well as to advise on policy. Under Charles VII (1422–1461), the Estates Gen-eral, which granted permanent taxes (*taille* and *gabelle*) for the army, lost control of the purse.

# CURRENCY

. The Frankish monarchy inherited late Roman coinage and continued production of a small gold coin known as the *triente*. While appropriate for large-scale trade, gold coins represented too much wealth to be useful in ordinary transactions by small consumers. Trade tended increasingly to be local and small in scale, requiring a coin of less value. Late in the 8th century, Charlemagne introduced a new monetary system featuring a silver penny (Lat. *denarius,* OFr. *denier*) weighing about 1.7 grams. Twelve of these equaled a shilling (Lat. *solidus,* OFr. *sol* or *sou*), and twenty shillings equaled one pound (Lat. *libra,* OFr. *livre*). Only the denier was an actual coin during the Carolingian period. The *sol* and *livre* were "money of account," denominations used for record keeping when large sums were involved.

The Carolingian reform was so successful that a system of pounds, shillings, and pence prevailed throughout Europe for 1,000 years. Centralized Carolingian power

declined, however, and soon there were many different coinages from the mints of kings, lords, and bishops. While all used the same accounting system, the value and silver content of the denier might vary considerably from one minting authority to another. Since money of account was based on the local *denier,* the amount of silver represented by a pound also varied from place to place. Coins received in any transaction had to be converted to local money of account for record-keeping purposes. Four pounds of Paris, *livres parisis* (l.p.), for instance, corresponded in value to five pounds of Tours, *livres tournois* (l.t.). As the volume and geographical scope of commerce began expanding in the 11th century, the moneychanger became an important figure.

This commercial revival also created demand for a stable currency. In various parts of France, especially Normandy, the inhabitants paid a "money tax" to the territorial lord in return for his promise not to alter the silver content of the coinage. Fearful that a new coinage might cheat them, people in some regions demanded that the design as well as the alloy be conserved, or even that no new coins be issued.

By the 13th century, the royal currency was far more important than others in France, and Louis IX was able to insist that royal coins circulate everywhere in the realm while others were valid only in the territory subject to the jurisdiction of the particular minting authority. Some nonroyal currencies survived in the 14th century, and Philip V was unsuccessful when in 1321 he asked for a tax to pay for buying these out. Even the crown could not establish a single money of account. The *livre tournois,* not the pound of Paris, was preferred in most of the realm.

For centuries the silver *denier* was the largest circulating coin, although its actual silver content varied widely by the 13th century. The increased range and volume of trade finally made it desirable again to have coins of greater value. After a brief experiment in the 1260s, the French crown resumed minting gold in the 1290s. Its most successful new coin, however, was the *gros tournois* issued by Louis IX in 1266. It represented twelve deniers in money of account and contained 4.2 grams of silver (the *denier* now having only 26 percent of the silver contained in its Carolingian predecessor).

The silver content and official valuation of a particular coinage in money of account became a matter of such contention that some technical discussion is necessary here. In France, the standard for measuring the intrinsic value of silver coins was the mark of Troyes, containing 4,608 grains of pure silver. The mints used *argent-le-roi,* which had a fineness of .958 (23/24), but if alloyed with other metals its silver content would be reduced. A coinage had three important characteristics. The *prix* was the official valuation of the coin in money of account. The *taille* was the number of coins minted (literally, "cut") from a mark of silver. The *titre* was the alloy or silver content of the coin expressed in units of twenty-four grains called *deniers* (the word also used for penny). The 14th-century monarchy incorporated these three characteristics into a formula that yielded an ordinal numeral called the *pied de monnaie*. The *pied* divided by four equaled the minted value of a silver mark, in *livres tournois*. If, for example, the royal mints issued *gros tournois* on the twelfth *pied,* a mark of silver would produce three l.t. in coins, or sixty *gros* valued at one *sol* each.

The government could alter the *pied* by changing one of its components. Lowering the *titre* (debasement) or rais ing the *prix* (overvaluing) would each raise the *pied* and "weaken" the coinage by producing a greater amount of currency, in money of account, from the same quantity of silver. The coinage of Louis IX on the twelfth *pied* (to use the

later terminology) long remained the standard for "strong" money. Weakening the coinage, which had the effect of increasing the money supply, was inflationary and recognized as such, but there were reasons why it might take place.

Mints were expected to be self-supporting, so coins actually issued were given an official value *(prix)* that exceeded the cost of the bullion. The difference, known as the *monnayage,* was made up of two parts—the relatively consistent *brassage,* which represented the cost of minting, and a second component, *seigneuriage,* which was the profit of the lord operating the mint. To issue "strong money," the royal mints had to buy silver for less than three l.t. per mark. If bullion were scarce and it cost more to attract it to the mints, the mints would lose money unless the *pied* were raised. One purpose of the old regional money taxes was to keep the mints solvent without weakening the coinage.

Most lords with mints, however, were not content merely to break even. As long as the *seigneuriage* remained modest and stable (another objective of the money taxes), few questioned the seigneurial right to profit from the mints, but the 14th-century monarchy had heavy military expenses and tried to use mint profits as a fiscal expedient, raising the *pied* to increase *seigneuriage*. After considerable outcry, Philip VI returned the *pied* to the level of St. Louis in 1330–33, but then the mints ran afoul of a bullion shortage and actually had to close from 1335 to 1337.

With the outbreak of the Hundred Years' War, Philip had to reopen his mints and needed the revenue from *seigneuriage*. By 1343, he had weakened the currency to the sixtieth *pied*. The demand for reform again led the king to strengthen the money, but when he suddenly adopted the fifteenth *pied,* the effect was profoundly deflationary and he soon had to weaken the currency again.

Under John II the Good, the currency was a major political issue. Innumerable changes geared to the level of commercial activity created such confusion that people now demanded "sound" (i.e., stable) money more than "strong" money. The leading theoretician of the period, Nicole Oresme, denounced the whole idea that currency was a private seigneurial right and insisted that it belonged to the whole community. The monetary chaos reached its height in the later 1350s. Then, in 1360, the requirements of the king's ransom led to the establishment of substantial regular taxes and a reform of the currency that placed the silver coinage on the twenty-fourth *pied* and established a new gold coin, the *franc,* that would equal one *livre tournois* in money of account. Regular taxation kept the kings from seeking high mint profits, and the reform of 1360 remained in force, with small modifications, for over fifty years. The civil wars and financial chaos of the early 15th century produced another generation of monetary confusion like that of 1337–60. Not until the later 1430s was the currency stabilized again.

Manufacture of coins at the mints was entrusted to specialists called moneyers who enjoyed a number of important, mostly fiscal, privileges. A few randomly selected coins from each issue, sent to Paris in a sealed box, were inspected to ensure accuracy and honesty at the mints. One or more specialists in the Chambre des Comptes exerted centralized control over the currency, and toward the late 1340s a subcommittee of the Chambre obtained official status as the Chambre des Monnaies, which maintained regular records after 1356.

# CUSTOMS DUTIES

. Throughout the Middle Ages, seigneurs and towns levied tolls and duties on passing commerce, but not until the later 13th century did the monarchy attempt, in any systematic way, to exact payments on goods passing across the frontiers of the kingdom.

For the customs to become a significant source of revenue, the king had to develop a specialized branch of the government in charge of *ports et passages,* and this customs service really dates from the reign of Philip IV, one of whose officers, Pierre de Chalon, was the first specialist in *ports et passages*. The first type of customs duty was based on the prohibition of exports. When France and England went to war in 1294, their respective kings undertook to raise revenue by prohibiting the export of wool and woolens. Those wishing to be excused from this prohibition, generally Italian merchant companies, had to buy a license from the crown, and the revenue from this source was in effect a customs duty on exports. It brought Philip IV considerable revenue in the early 14th century but had declined in value to 8,000 *livres parisis* in 1331 and only 2,000 1.p. by 1344. This tax was known as *haut passage*.

The improved machinery that Chalon established in the *ports et passages* administration made it possible to establish, in 1324, a second type of customs duty, this one a general tax on exports amounting to four *deniers* per pound, i.e., 1⅔ percent of the value of exported goods. This tax, known as the *droit de rève,* also began as a measure to finance war. It was worth 60,000 *livres tournois* in 1332 and 40,000 l.t. in 1344. The *rève* was incorporated into another duty, the *imposition foraine,* in 1369, but it was in force under Charles VI as a separate tax once more.

The *imposition foraine,* established in 1361, was the principal customs duty of late-medieval France. Like the others, it was levied on goods exported from the realm. When the *aides* were established late in 1360 to raise money for the ransom of King John II, they took the form of a 5 percent tax on the sale of goods. To prevent evasion of this tax in border areas, the crown imposed a tax of the same rate on goods leaving the kingdom. When, in 1362, Languedoc arranged to pay a different form of tax in lieu of the *aides,* the *imposition foraine* ceased to be levied on goods leaving Languedoc but was now levied on goods passing into Languedoc from parts of the kingdom that were subject to the *aides*. Replacement of this indirect tax in Languedoc thus created an internal customs barrier. In general, the *imposition foraine* was canceled and reestablished when the *aides* were, but because it gave rise to complaints that it damaged commerce, it was canceled

on several other occasions, only to be revived with modifications when the absence of this export tax encouraged evasion of the *aides*.

# CUSTUMALS/*COUTUMIERS*

**.** Throughout the Middle Ages, the law of France was based primarily on custom rather than written law. Beginning at the end of the twelfth century, with the *Très ancien coutumier* of Normandy, the customs of various regions began to be recorded in writing. These descriptions, known as "custumals," were private compilations, though regional courts came to treat those of Normandy and Brittany as virtually official sources of law. The authors are often unknown; when they can be identified, they were usually royal or princely judicial officials. Most custumals described the law of northern France; the south, the *pays de droit écrit* ("land of written law"), where Roman law formed the basis of local custom, produced few. A custumal might describe the law of a province, or a smaller region, or even of a town.

The most admired single custumal of the high Middle Ages is the *Coutumes de Beauvaisis* by Philippe de Beaumanoir (1283). The *Summa de legibus* (or *Grand coutumier*) of Normandy was written a few decades earlier; its unknown author rivals Beaumanoir in his ability to analyze the custom of his province. Another notable custumal is the *Établissements de saint Louis* (ca. 1270); despite its name, this work was not ordained by the king, and it incorporates slightly earlier custumals of the Orléanais and of Anjou and Touraine, rather than describing the customs of the Île-de-France. The *Très ancienne coutume de Bretagne* dates from ca. 1330. Jacques d'Ableiges wrote the misnamed *Grand coutumier de France* (ca. 1387–89), which describes merely some aspects of the custom of Paris. Several custumals were heavily influenced by Roman law, including the *Conseil à un ami* of Pierre de Fontaines, a jurist who wrote to describe Picard custom for a local noble (ca. 1253). Jean Boutillier, royal *bailli,* who wrote the *Somme rurale* to aid nonlawyers in understanding the law of the region around Tournai (1395), has been accused of not understanding the Roman law he cites. The *Livres de justice et de plet* (ca. 1254–60), although it claims to record Orléanais custom, consists of little more than excerpts from Roman legal sources.

These and most other private compilations of regional customs were made in the 13th or 14th century. Few appear thereafter, and the law of significant portions of northern

France remained unrecorded. By the mid-15th century, the need for an official record of every regional custom led Charles VII to order *baillis* and seneschals to compile custumals for their districts in order to avoid uncertainty about what the law was and consequent delays in legal process (1454). Progress was at times slow, but by the late 16th century the task had been accomplished. The products of this second wave of redaction, often known as *coutumes réformées,* remained in force, with few modifications, until the Revolution replaced regional customs with a national code based on Roman law.

# CUVELIER

(fl. late 14th c.). The author of the *Chronique de Bertrand du Guesclin* (ca. 1385), a 24,346-line French poem, Cuvelier is otherwise unknown. His subject, Du Guesclin (ca. 1324–1380), a minor Breton nobleman, rose through military service during the Breton wars of succession, campaigns in Spain, and the Hundred Years' War to become constable of France. Cuvelier's Bertrand is an epic hero: physically ugly but noble in character, fearless and cunning in war but generous to the common people.

Though unreliable, the *Chronique* was popular; thirteen manuscripts survive, including those of a prose epitome done in 1387 for Jean d'Estouteville.

# CYCLIC MASS

. The term "cyclic Mass" generally refers to polyphonic settings of most or all of the five principal items of the Ordinary of the Mass (Kyrie, Gloria, Credo, Sanctus-Benedictus, Agnus) as a musically unified entity.

The cyclic Mass became an important musical form only in the 15th century, but its roots can be traced back to the 13th, when the diverse chants of the Ordinary began to be collected into cycles. In 14th-century France, and possibly Italy and Spain as well, this practice was extended to the assembling of independent polyphonic Mass movements into cycles (Masses of Tournai, Toulouse, Barcelona, and the Sorbonne). However, only one such Mass seems to have been conceived in its entirety by a single composer: the Messe *de Nostre Dame* by Guillaume de Machaut (ca. 1300–1377). Even in this case, there is no clear internal unity among its six movements (which include a final *Ite missa est*), except that all are for four voices and are in Machaut's characteristic style. These movements fall into two distinct groups: the Kyrie, Sanctus, Agnus, and Ite employ plainsong *cantus firmi* from the Ordinary and are structured by similar isorhythmic procedures, while the Gloria and Credo are without *cantus firmi* or isorhythm, although they are structurally and texturally related to each other.

The use of the same thematic material in two mass movements (usually Gloria-Credo or Sanctus-Agnus) first appeared in England ca. 1400. Cyclic unification of such Mass-pairs was achieved through a common "motto" opening and/or plainsong *cantus firmus* in the tenor. Mass-pairs are not yet cyclic Masses, but the principles of musical unification employed in them were soon extended to embrace most or all of the Ordinary. Thus, the earliest true cyclic Masses, dating ca. 1420, are also English: the *Missa Alma redemptoris mater* by Leonel Power (ca. 1375–1445) and the *Missa Rex seculorum* and *Missa Da gaudiorum* by John Dunstable (ca. 1380–1453). All three masses are for three voices, consist of four movements (lacking the Kyrie, not always set in English cyclic Masses, or the Agnus), and employ the same chant in the tenor of all movements. It is this chant for which the Mass is named. By 1450, English composers had also composed cyclic Masses for four voices, many of which included the Kyrie. The most influential such work is the anonymous *Missa Caput* (formerly attributed to Dufay but recently shown to be an English work), which was taken as a model for like-named Masses by the later Netherlands masters Johannes Ockeghem (ca.1420–1497) and Jacob Obrecht (ca. 1450–1505).

Guillaume Dufay (1397–1474) was the first continental composer to write cyclic Masses of the English type. His earliest masses, for three voices, include the Kyrie but lack unifying themes. His later ones, however, are for four voices and are based on unifying *cantus firmi* placed in the tenor. These borrowed melodies are not only sacred *(Missa Ecce ancilla, Missa Ave Regina celorum)* but also secular *(Missa Se la face ay pale, Missa L'homme armé)*. Dufay was probably the first composer to base cyclic Masses on secular themes. In his *Missa Se la face ay pale,* Dufay took as a model one of his own chansons, while his *Missa L'homme armé* may have initiated the tradition of

composing Masses on this particular popular song that was followed by generations of composers throughout the 15th and 16th centuries, including Ockeghem, Antoine Busnoys (ca. 1430–1492), Firminus Caron (fl. ca. 1460–80), Guillaume Faugues (fl. ca. 1460), Johannes Regis (ca. 1425–96), Johannes Tinctoris (ca. 1435–1511),Obrecht, Josquin des Prez(ca. 1440–1521), Pierre de la Rue (ca. 1460–1518), Antoine Brumel (ca. 1460ca. 1520), Jean Mouton (ca. 1459–1522), Cristóbal de Morales (ca. 1500–53), Giovanni da Palestrina (1525–1594), and many others.

Following Dufay's example in his *Missa Se la face ay pale,* many 15th-century composers chose polyphonic models for their Masses, incorporating into them various themes and even whole polyphonic complexes from those models. (Dufay had done this but sparingly.) An outstanding example is Ockeghem's *Missa Fors seulement,* based on his own rondeau. This Mass stands on the borderline between the *cantus firmus* Mass and what might be called the "parody" or "imitation" Mass, which were terms actually applied to such works in the 16th century. It may be defined as a Mass based on the entire polyphonic complex of a preexistent composition.

Ockeghem also pioneered a type of cyclic Mass based on procedures other than the sharing of melodic material. His *Missa Prolationum* consists almost entirely of double mensuration canons, only two voices of which are notated and which are to be read in different mensurations (i.e., divisions of the measure, such as 3/4, 4/4, 6/8, and 9/8), while his *Missa Cuiusvis toni,* musically unified only by a vague related "motto" in each movement, is notated in such a way that it may be sung in more than one mode.

Jacob Obrecht specialized in Masses with multiple *cantus firmi*. His masterpiece in the genre is his *Missa Sub tuum presidium,* which combines a principal *cantus firmus* (after which the Mass is named) with cumulative additions, so that each movement is scored for one voice more than the preceding. Thus, it progresses from a three-voice Kyrie to a seven-voice Agnus that combines five different plainsongs.

The greatest master of the cyclic Mass in the 15th century, but belonging more to the Renaissance than the Middle Ages, was Josquin des Prez, whose more than twenty Masses range from strict *cantus firmus* types (including two Masses on *L'homme armé*) to Masses based on free paraphrases of plainsong *(Missa Ave maris stella, Missa Pange lingua),* on *cantus firmi* derived from sol-fa syllables *(Missa La sol fa re mi, Missa Hercules dux Ferrarie),* on canonic procedures *(Missa Ad fugam, Missa Sine nomine),* and at least one that comes close to being a full-fledged "imitation" mass (*Missa Mater patris,* based on a motet by Brumel).

Other important continental composers of cyclic Masses in the late 15th and early 16th centuries, besides those mentioned, include Johannes Martini (ca. 1450–1517), Loyset Compère (ca. 1450–1518), and Johannes Ghiselin (ca. 1455–ca. 1511). Most of these composers were French or Netherlandish (the Netherlands then being a dependency of Burgundy and dominated by the reigning French culture). Despite its medieval, liturgical origins, the cyclic Mass is the principal large musical form of the 15th and 16th centuries and emblematic of the flowering of French musical culture at the end of the Middle Ages and in the early Renaissance.

## DAGOBERT, PSEUDOCYCLE OF

. The Frankish king Dagobert I (r. 622–38/39) was the inspiration for a revival of the French epic around the middle of the 14th century for reasons that have not always been understood, although they are clearer when viewed in the context of the reign of Charles V (r. 1364–80). *Florent et Octavien,* the first of this group of late epics to have Dagobert's reign as a background, was followed by *Charles le chauve, Ciperis de Vignevaux, Florence de Rome,* and *Theseus de Cologne.* It was once thought that these poems derived from a lost primitive Merovingian cycle, although no evidence of this exists. There is no doubt, however, that during the later Middle Ages Dagobert was honored as the founder of the abbey of Saint-Denis; the legend was encouraged by the monks there, who had produced a *Gesta Dagoberti* (ca. 835) that became an important source for their *Grandes Chroniques de France,* wherein Dagobert is held up as a model for princes.

Dagobert already figures in the opening lines of the 13th-century octosyllabic *Octavien,* but his role becomes more important in the 14th-century Alexandrine version, which dates from the troubled times after the French defeat at Poitiers, when Edward III of England and Charles the Bad of Navarre were both claiming rights to the French throne. It was under these distressing circumstances that Charles V developed a program of propaganda to make clear his indisputable claim to the throne, including his descent from Dagobert.

In *Florent et Octavien,* the first of the series to support this claim, Octavien, emperor of Rome and friend of Dagobert, comes to his aid when Paris is threatened by an invasion of the pagan Wandres, who bear a certain resemblance to the invading English. He is seconded by one of his twin sons, Florent, who was separated from his father soon after birth but is reunited during this conflict in a dramatic episode. At a bleak moment, Dagobert prays to St. Denis for help against the foe, vowing to endow a monastery in his honor. St. George soon appears, accompanied by St. Maurice, to rescue the situation.

*Charles le chauve* (sometimes called *Dieudonné de Hongrie*) develops the ancestry of Dagobert, beginning with his imaginary great-grandfather Melisant de Hongrie, who adopts the name Charles le chauve when converted to Christianity. His son, Philippe, becomes the father of Dieudonné, who is in his turn the father of Dagobert. The author of this extravagant genealogy claims the authority of a Latin source he consulted at Saint-Denis. Dieudonné becomes king only after extraordinary adventures fighting the

Saracens, but nothing further is learned of him because the end of the single manuscript (B.N. fr. 24372) is missing.

*Theseus de Cologne* depicts the final years of Dagobert. Now grown old, he is called upon to rescue the king of Cologne, Foridas, father of Theseus. St. Denis appears as mediator of a dispute between Theseus and Dagobert's son, Ludovis (Clovis II). Before the end of the poem, Dagobert, who has now reigned for eighty years, dies, leaving his throne to Ludovis. (The historic Dagobert died by the age of thirty.)

When viewed in the context of the times that produced these tales, this pseudogenealogy is no more exotic than the Chevalier au Cygne's or Melusine's or, indeed, the Trojan origin of France, all popular in their day. Equally important is the personality of Dagobert in Charles V's successful program of propaganda to restore the morale of his subjects after the disaster of Poitiers and Étienne Marcel's civil uprising, encouraged by the King of Navarre's pretentions to the throne. Charles V's direct descent from Dagobert was an important element in this propaganda.

# DAGOBERT I

(608–638/39). The son of Clotar II, Dago-bert I was king of Austrasia (from 622) and then also king over Neustria and Burgundy after the death of his father in 628/29. He is the last Merovingian who is seen as a strong, active, and effective ruler over all of the Frankish kingdoms.

Dagobert was associated with Clotar II as subking of Austrasia, ruling from Metz, before moving to Paris upon his succession in Neustria and Burgundy. However, the particularism of the regions of the kingdom remained strong, and he made his younger brother Charibert (d. 632) subking in southern Aquitaine and established his young son Sigibert III as subking in Austrasia in 634. The powerful aristocracy that was so visible in the reign of Clotar II retained and enlarged its position, especially under the youthful subkings.

Dagobert left a reputation for personally supervising royal officials throughout his lands and personally giving judgments in legal cases. From his position as the source of justice, he saw to the promulgation of the Lex Ribuaria for the Austrasians, and perhaps he played a role in the codification of the laws of the Alemanni and the Bavar-ians. He

exercised supervision of the church in his kingdom, saw to the appointment of bishops of good quality, and supported missionary efforts among the Frisians. Dagobert gave lavish endowments to the church of Saint-Denis (which he founded ca. 624 and where he was bur-ied), which promoted its role as the center of the royal cult. He maintained Frankish control over the Bretons, Gascons, and Bavarians and campaigned successfully against the Visigoths. He failed, however, in his expeditions against the Wends, who were threatening Thuringia, and the Basques remained an unchecked menace to Aquitaine.

When Dagobert died in 638/39, he was succeeded by his sons, the nine-year-old Sigibert III in Austrasia and portions of Aquitaine and the five-year-old Clovis II in the other regions. The young kings were under the tutelage, and thus the domination, of the nobles of their kingdoms, especially the mayors of the palace, and the decline of the Merovingian monarchy under the "do-nothing kings" *(les rois fainéants)* began.

# D'AILLY, PIERRE

(1350–1420). D'Ailly studied at the Collège de Navarre in Paris and received the master of arts degree in 1368. He lectured at the Sorbonne on Peter Lombard's *Sententiae* in 1375 and promoted Ockham's teaching. In 1381, he became doctor of theology and canon in Noyon. He was rector of the college from 1384 to 1389 and befriended Jean Gerson, his most celebrated pupil. In 1389, he was made chancellor of the University of Paris. From 1389 to 1395, he became influential in Charles VI's court as the king's confessor and almoner. Appointed bishop of Le Puy in 1395, he never entered the see; in 1397, he was made archbishop of Cambrai. He attended the Council of Pisa in 1409 but supported the newly elected Alexander V unenthusiastically. Alexander's successor, the antipope John XXIII, utilized D'Ailly at the Council of Rome in 1411 and named him cardinal in 1412. The following year, he was appointed papal legate to Emperor Sigismund, subsequently playing a prominent role in the Council of Constance (1414–17). He presided over the first session without a pope in residence and supported the primacy of the general council over the pope. As president of the commission of faith, he examined John Hus and witnessed his condemnation in 1415. Martin V, elected by the council as the sole legitimate pope, appointed D'Ailly as legate to Avignon. He died there in 1420.

D'Ailly devoted most of his public life to ecclesiastical reform and to healing the Great Schism by means of a general council. Nevertheless, his writings covered a wide range of topics, including *Quaestiones* on Lombard's *Sententiae* (1390); a large collection of sermons; numerous ecclesiological and legal tracts (many of them later included with Jean Gerson's works), such as *De materia concilii generalis, Tractatus super reformatione ecclesiae,* and *Tractatus de ecclesiae autoritate;* treatises on the soul and the sacraments; a concordance of astronomy; and his famous *Imago mundi,* later owned and annotated by Co-lumbus, who found it to confirm a western passage to India.

# *DAME À LA LYCORNE, ROMAN DE LA*

. A lengthy mid-14th-century romance (8,575 octosyllabic lines) with twenty-five inserted lyrics in *formes fixes* and one inserted prose letter. It is found in a single manuscript (B.N. fr. 12562), where it is illuminated with 102 miniatures. The *Dame à la lycorne* is a late expression of traditional courtly themes, whose hero seems clearly inspired by Chrétien de Troyes's *Yvain, le chevalier au lion*. The inserted lyrics are a way for the two lovers to communicate their true sentiments in a discreet manner.

# DAMPIERRE

. A noble family from Champagne, the Dampierres were counts of Flanders from 1246 to 1384. Guillaume de Dampierre in 1223 became the second husband of Marguerite, countess of Flanders and Hainaut (1244–1278). His descendants fought the Avesnes family, descended from her first marriage, until 1323. After Gui de Dampierre became count in 1278, Flanders was embroiled in continuous difficulties with King Philip IV of France, who clearly hoped to add it to the royal domain. Although the famous Battle of Courtrai in 1302 was a Flemish victory, the peace of 1305 gave the monarchy major territorial concessions and a huge indemnity.

Gui de Dampierre died in 1305 and was succeeded by his son, Robert III de Béthune, who was caught between French claims and his subjects' desires for autonomy. Divisions within the Dampierre family made his position difficult. The quarrel with the Avesnes family ended in 1323 with their claims on Holland and Hainaut conceded. Robert's son, Louis de Nevers (1323–1346), was loyal to his French overlords. Louis de Male (1346–1384) was the most independent of the Dampierre counts, but also the last; in 1369, he married his daughter to Philip, duke of Burgundy, and they succeeded him in Flanders in 1384.

# DANCE

. Throughout the Middle Ages, dance was an important part of both religious worship and secular recreation. Sacred and secular documents, iconographic depictions, and literary references bear witness that dance played a central role in the lives of all classes of people throughout the medieval period.

From as early as the 4th century, there is documentation that dances were a part of the sacred celebrations on Easter, Pentecost, Christmas, and certain saints' days. It is not always clear at what point in the services dancing was involved; the most frequent references are to dancing in processions. But it could also have been involved more centrally in the services. A mid-13th-century statement by the troubadour Tezaur of Peire de Corbian confirms that by then dance was present during parts of the Mass: "Lords,

now I know very divinely indeed how to…dance the 'Sanctus' and the 'Agnus' and the 'Cunctipotens.'"

Between the 6th and 17th centuries, the church frequently forbade dance on certain occasions. In 1208, for example, the bishop of Paris declared it improper to dance the *carole* in processions, and in 1209 the Council of Avignon issued an edict against dancing *caroles* on the vigils of saints' days, calling the dance "obscene motion." In 1325, the general chapter in Paris forbade clerics, under pain of excommunication, from participating in dances, with the exceptions of Christmastime and the feasts of St. Nicholas and St. Catherine. The injunctions seem to be intended to regulate the use of dance during sacred ceremonies and to purge it of improper content, in both text and movement, but there is no suggestion that dance was unwelcome in the church. Its presence is recorded in official French church documents into the 17th century.

A repertory of music for sacred dancing can be found in the approximately eighty Latin monophonic rondeaux preserved in 13th-century French sources from the cathedral of Notre-Dame in Paris. The rondeau is described ca. 1300 as a "round dance" *(rotundellus)* by Johannes de

Clerics dancing. MS Pluteo 29, Is, fol. 463. *Courtesy of the Biblioteca Mediceo-Laurenziana, Florence.*

Grocheio in his treatise on music, and he explains that its music is distinguished from other types of dance in that the melody used for the refrain is similar to that of the verse (see Example 1). In conformity with the 1325 edict cited above, the majority of the Latin rondeaux texts are for Advent and Christmas, with several each for St. Nicholas and St. Catherine, although there exist rondeaux for other feasts as well. Some of the rondeau texts specifically mention dance: *Leto leta concio, hac die resonet tripudio* ("Let the joyful company this day resound in a joyful dance"); and an illumination in the major manuscript source depicts clerics in a "round" formation, probably dancing.

Whom the butcher killed In his wickedness;
And saved them from sin, He allowed three
maidens marriage, When he mitigated their
poverty By giving them bags of gold.
*Nicholas. Nicholas, Nicholas,*

Translation from Gordan A.Anderson, *Notre-Dame and Related Conductus, Opera omnia*,
vol. 8, p. xlii.

Secular dance music is frequently referred to in the troubadour literature as an important part of the minstrel's art. A poem by the late 12th-century troubadour Jaufre Rudel mentions dances along with other poetic and musical forms performed at court: "…minstrels who are in the palace play *descorts* and *suns* and *lais* and *danses* and *cansonz de gesta* on the *viula*. No one will ever see such a celebration again." It is significant that the account relates that the minstrels perform all of these musical forms on the vielle (or fiddle), a bowed string instrument similar in some ways to the later

violin. From other references and pictorial evidence, we know that this was the favorite instrument for performing all types of music in the 12th and 13th centuries.

Although only a small repertory has survived, poetic and musical, for the dance forms, the literature attests the vast popularity of all the dances in the courtly circles from the 11th to the late 14th century. Typical is the reference by Jean Maillart in his *Roman du comte d'Anjou* (ca. 1300), which includes dances within a courtly setting of various musical performances: "Then the linen was taken up, and when they had washed their hands, the *caroles* began. Those ladies who had sweet voices sang loudly: everyone answered them joyfully, anyone who knew how to sing, sang thus…. Some sang *pastourelles* about Robichon and Amelot, others played on vielles *chansons royales* and *estampies,* dances and *notas*. On lute and psaltery, each according to his preference [played] *lais* of love, *descorts* and ballades in order to entertain those who were ill."

Many more references to dance can be found, often in conjunction with instruments. But dances are also mentioned as songs to be sung without instruments, as in Raimon de Cornet's poem (ca. 1320): "A jongleur would rapidly learn stanzas and many little verses, cansos, and *basses danses*." This reference is the first known mention of the *basse danse,* which would become quite popular as an instrumental form in the 15th and 16th centuries. The implication here is that in the 14th century the *basse danse* was a vocal form, but none is known to have survived.

In spite of the number of dance names that are found in the sources, we have detailed information about only a few. Those that were also poetic forms are discussed in poetry treatises, such as the *dansa,* described in the Catalan treatise *Doctrina de compondre dictatz* (ca. 1300): "If you wish to compose a *dansa,* you should speak well and pleasingly of love in whatever state of mind that you may be in. And you should compose it with three stanzas, and no more, with a repost, with one or two *tornadas,* as you may think fit; it should always have a new tune…. A *dansa* is so called because it is normally sung while dancing, hence it should should have a pleasing tune; and it is sung with instruments and pleases everyone who sings and hears it." In this case, we have a clear picture of the *dansa;* it is unfortunate that none of the melodies for this poetic form has come down to us. Not all descriptions are so detailed; the early 14th-century treatise *Leys d'amors* by Guillaume Molinier supplies the name of a dance form called the *bal,* which was usually "composed as an instrumental tune and then supplied with words," but no further information is given. A vocal composition from the same time was known as "ballade," having a form related to the rondeau, and this may be what is referred to in the treatise.

The other source of description of late-medieval dance forms is Grocheio's music treatise, which identifies the secular dances "round" *(rotundellus), estampie (stantipes), carole (ductia),* and *nota*. The form of the secular round (rondeau) is the same as the sacred form discussed above; the music for both the *estampie* and *carole* is distinct from that of the rondeau in that they have separate melodic material for the verse and refrain. Further, both *estampie* and *carole* have separate vocal and instrumental forms, the main difference being that for the vocal dances a single musical setting is repeated with each new verse, whereas the instrumental dances are composed of many sets of musical verses all ending with the same refrain.

Grocheio describes the *estampie* as a complicated dance, remarking that it causes young men and women to concentrate because of its difficulty. The *Doctrina* adds the

information that its poetic subject is to center on "love and homage" and supports Grocheio's description of the *estampie's* difficult nature by stating that it requires more "vigor" in singing than do other songs. Seven complete instrumental *estampies* survive, as well as twenty-six *estampie* texts, two with music. The most famous medieval *estampie, Kalenda Maya,* is reported to have been both a vocal and instrumental composition; the text is said to have been written by the troubadour Raimbaut de Vaqueiras (ca. 1155–1205), to a melody he heard performed on the fiddle by two jongleurs at the court of Montferrat.

Although the *carole* was one of the two most popular dance forms from the 11th to the 14th century, little is known of its music or steps. Caroling is found frequently in the literature as a part of the picture of courtly entertainment and pastoral relaxation, as in the 13th-century romance *Guillaume de Dole* by Jean Renart: "Hand in hand…before the tent, in a green pasture, the maidens and young men have begun the *carole*." Reference to "hand in hand" suggests that the *carole* was danced in the round, a fact confirmed by Grocheio, who also implies that the difference between it and round dance (rondeau) was that the round dance was danced completely in round formation, while the *carole* could also use other formations, including that of a line, as in Philippe de Remi's *La Manekine* (ca. 1270): "Such a *carole* had never been seen, nearly a quarter league long." In performance, the dance leader would sing the *carole* verses and all of the dancers would reply with the refrain. Numerous French *carole* texts survive from these centuries, but we do not have even one musical example either of a text setting or an instrumental *carole*.

About the *nota,* little is known beyond the enigmatic statement by Grocheio that it had a musical form that was in some ways similar to the instrumental *estampie* and *ductia* ("either a form of *carole* or an incomplete *estampie*"). Jean Maillart's reference to it, cited above, where the *nota* is listed with *caroles, estampies,* and *dansas,* indicates that the *nota* was definitely a separate form. Only two examples are known to have survived, both from the 13th century: *La Note Martinet* and a piece by Adam de la Bassée, canon at Saint-Pierre in Lille. His composition is identified as "a Notula on the composition that begins 'to play and dance….'" The two compositions have only vague reference to the verse-refrain format of the *estampie* and *carole* and are formally quite different from one another, leaving little opportunity to draw conclusions as to what a *nota* was. I have speculated that perhaps *nota* was a term for those dances that had unique forms but bore some resemblance to the *estampie* and *carole*.

Most of the literary evidence and references are to courtly circles, but there is the constant suggestion that similar dances were also danced by the lower classes, especially the *carole,* although the absence of material does not allow us to know how they differed.

Because the dance forms discussed above were closely related to the troubadour and trouvère lyric tradition, they began to wane through the 14th century as the social and political organization of France changed. One of the changes in courtly life was the introduction of dancing masters and the sophisticated *basse danse,* in which the steps for each dance were individually choreographed. Some of the earlier dance names are occasionally found in the literature throughout the 15th century, but by then they had lost their social status. From the early 15th century, all the earlier dance forms were overshadowed as the *basse danse* became the most popular and fashionable court dance of the century.

# DAUPHIN

. The dominical title *dauphin* (Lat. *delphinus*) was borne from 1281 by the count of Clermont-en-Auvergne (who styled himself "dauphin of Auvergne") and from 1282 by the count of Vienne and Albon in the kingdom of Arles (who styled himself "dauphin of Viennois"). Derived from the personal name Dauphin, invariably borne either as a second forename or as a surname by the counts of the latter line from 1132 to 1282, it was apparently misinterpreted as a title. The corresponding jurisdictional title Dauphiné (Lat. *delphinatus*) appeared for the first time in 1285 and was thereafter applied to the whole estate of the dauphin. In July 1349, the last independent dauphin of Viennois, Humbert II de la Tour-du-Pin, despairing of an heir and deeply in debt, ceded the Dauphiné to Philip VI, who bestowed it upon his grandson, the future Charles V of France. In the following year, Charles became heir apparent to the throne, but it was not until he, as king, granted the Dauphiné to his own firstborn son, the future Charles VI, shortly after his birth in December 1368, that the delphinal dignity began to be treated as a distinctive attribute of the status of *primogenitus regis,* or firstborn son of the king. All subsequent heirs apparent to the throne, including the first five sons of Charles VI, were given the dignity of dauphin of Viennois at either birth or succession to the status of *primogenitus*.

# DAUPHINÉ/VIENNOIS

. The region that came to be known as the Dauphiné is bounded by the Rhône and Savoie on the west and north, by Italy on the east, and by Provence on the south. From the 5th century, it formed part of a succession of kingdoms known as "Burgundy" or "Arles and Vienne" (so named after the two cities that disputed the claim to be its capital). After 1032, this kingdom passed in theory under the direct authority of the Holy Roman emperor, but in fact it continued to be controlled by regional magnates. One of these, Archbishop Brochard of Vienne, gave comital authority over the northern part of the Viennois to the count of Savoy, while giving the southern part, with the title of count, to Guigues le Vieux (d. 1060/70), lord of Vion and Albon. This was the beginning of the Viennois as a political entity, but not until Guigues IV (d. 1142) does the name Dauphin appear, as a surname (Guigo Dalphinus). The reasons for this surname are unknown, but since Guigues's mother was English and had a cousin named Dolfin, she was probably responsible.

The rulers of the Viennois, while annexing the adjoining territories (the Briançonnais, Grésivaudan, Embrunais, Gapençais, and the baronies of La Tour-du-Pin, Montauban, and Mévouillon), continued to call themselves "count of Vienne and Albon" until the late 13th century, when *dauphin* first became a title and Dauphiné the name of the principality. The acquisition of the Dauphiné by the king of France occurred in 1349, after Humbert II sold it to Philip VI, who bestowed it upon his grandson, the future Charles V. Charles was thus the first dauphin belonging to a French royal family, and the royal heir apparent thereafter received the title, underlining the importance of this extension of French sovereignty beyond the Rhône. Under Dauphin Louis II (r. 1440–57), the future King Louis XI, the final important annexations (Valentinois and Diois) to the Dauphiné took place. The mother house of the Carthusian order, La Grande Chartreuse, was founded near Grenoble in 1084, as were the Hospitalers of Saint-Anthoine at about the same time in the Viennois. Several well-known troubadours came from the southern Dauphiné, and in 1339 a university was founded at Grenoble.

# *DAUREL ET BETON*

. A single 14th-century manuscript (B.N. nouv. acq. fr. 4232) preserves 2,200 lines of this Occitan chanson de geste in rhymed laisses (the first five in Alexandrines, the rest decasyllabic), composed ca. 1150–68. His father, Boves d'Antona, having been cruelly betrayed, Beton passes his *enfance* in Babylonian exile with the jongleur Daurel, who sacrifices his own child to save Beton. In a unique Odyssean prelude to Beton's revenge, Daurel recites the tale of betrayal before the traitor himself.

# DAVID OF DINANT

(fl. early 13th c.). A philosopher whose thought is known only obliquely or from fragments. The Council of Sens in 1210 ordered David's works to be burned. Only a few fragments are extant *(De divisionibus).* David is also paraphrased by Albert the Great, who attacked his views fiercely. It is hard to reconstruct David's thought, but he seems to have developed his ideas, particularly on being and essence, from a close knowledge of Aristotle, whom he translated and commented upon (the *Quannternuli*). His views were instrumental in the prohibition of Aristotle's works at the University of Paris.

Nothing is known of David's life, except that he was probably from Dinant in modern Belgium, and his title, *magister,* suggests a university education. In a letter of Innocent III (1206), he is called "our chaplain."

# DECRETALS

. Many of the most important papal documents of the Middle Ages were decretals, especially those rescripts offering legal advice to papal judges-delegate. The decretals of popes like Alexander III and Innocent III were collected by private individuals, and later the papacy promulgated official collections to the universities for teaching purposes. Some of these decretals, like Innocent III's *Per venerabilem,* concerned with the legitimization of a French nobleman's bastard son, were intended to create new law. Other papal bulls, like Boniface VIII's *Clericis laicos,* were constitutions, imposing law on the universal church on the pope's initiative.

# DEDICATION OF THE CHURCH

**.** In the Middle Ages, every cathedral and monastic or parish church was dedicated by a bishop in accordance with an ornate and venerable ceremony that has been substantially modified only since the Second Vatican Council (1962–65). The feast of the dedication in the Roman rite existed by the early 6th century, and its shape in later centuries, after it had been transported north of the Alps, can be studied in *Ordo romanus* 4 and, most importantly, in *Ordo romanus* 42, along with the Gallican-influenced *Ordo romanus* 41, which dates from the second half of the 8th century. A fusion of the Gallican and Roman ceremonies is represented in pontificals dating from the 10th century onward and in the pontifical of Guillaume Durand, bishop of Mende, compiled 1293–95.

The anniversary of the dedication of its church was of primary importance in the calendar of each community and was celebrated each year by the Mass and Office for the feast of the Dedication of the Church (often known by the incipit of its introit: *Terribilis est*); in addition, the feast of a cathedral might well be honored in secular churches throughout the diocese. The particular date of the dedication can therefore often be useful in helping to determine the origin of a liturgical manuscript. In many churches, the feast of the Dedication was celebrated at the Octave of the feast of the patronal saint, or soon after. Tropes and sequences, as well as other devotional texts and music, were written for the dedication throughout the later Middle Ages, and their texts, along with the numerous sermons written for the occasion, form a significant commentary upon changing interpretations of the feast.

# *DÉFRICHEMENT*

. Literally, the clearing away of brush; more generally, any reclamation of arable land from the waste. The major medieval rural expansion, although dated slightly differently from region to region, from 1000 to 1300, is called the *grands défrichements*. This conquest of France's "internal frontiers" has been used to explain the urban growth of the central Middle Ages, for agricultural surplus was needed to support town specialists and it was assumed that "frontier" lands were more fertile, gave higher yields and so on. Its chief architects were thought to be the new monks of the period, such as the Cistercians, who advertised their practice of manual labor and claimed to found their abbeys "far from cities." But the correlations between monks and clearance and between clearance and town growth were much less direct than once thought. Rural expansion began first on the margins of settlement, carried out by the population of overcrowded villages, who licitly or illicitly felled, drained, and cultivated surrounding wastelands, adding extra bits of land to their fields, or creating the new fields and holdings, called *appendariae* or *bordariae,* adjoining old village lands. More striking was the assarting and draining that occurred in the great forests and wastes beyond or between existing villages, affirmed by new place-names like Artigue, Finage, and Bordage. Although the older Benedictine monasteries were sometimes the lords involved in the founding of new villages in forest and waste, the actual work of reclamation was carried out by peasant settlers; moreover, where forest clearance was not a planned activity it was the work of hermits, charcoal burners, pastoralists, and other anonymous forest folk. The great expanses of land that the new monks like the Cistercians came to hold were not gained at the expense of forest but were purchased from these earlier cultivators and settlers.

# DENIS

. Patron saint of France and bishop of Paris. The earliest Life of the saint, known from its incipit as the *Gloriosae* (ca. 500), stated that Denis (Dionysius) had been sent to preach to the pagans by a "successor of the Apostles." Settling in Paris, he built a church and performed many miracles. Because of his success, he and his companions, the priest Rusticus and the deacon Eleutherius, were tortured and executed. However, they never ceased to confess their belief in the Trinity and their faith in the Lord. The pagans had planned to throw their bodies into the Seine, but a pious matron took them and buried

them six miles from Paris. There she built a mausoleum and later a basilica, where miraculous cures occurred.

This text, or a version of it, was known to Gregory of Tours, who stated in his *Liber historiae Francorum* that seven bishops were sent from Rome to Gaul at the time of the emperor Decius (r. 249–51). The *vita* of St. Geneviève (ca. 520) recounts that it was at Geneviève's urging that the Parisians built ca. 475 the first church in honor of the saint and that it was St. Clement of Rome (pope, 90–100) who had sent Denis to Gaul. (The earliest episcopal list from Paris, too, mentions that Denis was the first bishop of Paris.) The cult of the saint thus seems to have been in existence by the late 5th century and the first Passion shortly afterward.

The early 9th-century Passion *Post beatam et gloriosam* added the details that Denis of Paris was the same as the Dionysius the Areopagite converted in Athens by the Apostle Paul (Acts 17:34); that he was consecrated bishop by Pope Clement as he passed through Rome; that the martyrs were executed on a hill a mile from Paris (i.e., Montmartre); that after his decollation, the saint picked up his head and carried it two miles; and that the matron who buried the saint was called Catulla after "Catullacus," the old name for Saint-Denis.

It was probably in response to the apostolic character of the saint that in 827 the Byzantine emperor Michael the Stammerer sent a manuscript of the works of Pseudo-Dionysius the Areopagite to Louis the Pious, who gave it to the abbey of Saint-Denis. Its abbot, Hilduin (r. 814–40), translated the works of Pseudo-Dionysius from Greek into Latin; his *Passio sanctissimi Dionysii* explicitly joined Denis of Paris to Dionysius the Areopagite. Hilduin added, too, that the night before Denis was executed, as he was

St. Denis between angels, from Reims cathedral. *Photograph courtesy of Joan A.Holladay.*

celebrating Mass in prison with his disciples, just as he was about to receive the sacrament, Christ came and took the eucharist from his hand and gave it to him himself. The next day, after the execution, Denis picked up his head and, carrying it, walked five miles from Montmartre to Saint-Denis.

Although the legend had its critics, it was quickly accepted and appears among the lessons of the Roman breviary and the liturgy of Saint-Denis. The abbey, founded by King Dagobert I ca. 624, was especially favored by the Carolingians. Denis developed from being the patron of a monastery to a saint who was the object of a special devotion from the kings of France and in turn accorded them and their country a special protection. This protection was connected first with King Dagobert, whose devotion to the saint was portrayed in a series of apocryphal tales in the *Gesta Dagoberti*.

From the time of Hugh Capet (r. 987–96), a royal flag was deposited at Saint-Denis, a flag that was later identified with the Oriflamme, the flag given to Charlemagne by the pope. In 1124, when Louis VI prepared to march against the emperor Henry V, he came to the abbey, took the abbey's standard from the altar, and announced that the saint was the special protector of the realm. The royal flag and the abbey's standard were eventually viewed as one and the same, and the saint was credited with bringing victory to the armies of the kings of France.

It was to accommodate the crowds that flocked to the tomb of the saint that Abbot Suger of Saint-Denis (r. 1122–51) enlarged the abbey church and translated the relics of the saint to a new altar. By the 13th century, chroniclers at the abbey had woven together the legend of St. Denis and the history of France. Notable texts in this development are the *Vita et actus beati Dionysii,* the *Vie de saint Denis,* and the *Grandes Chroniques de France*. In this process, St. Denis became not only the patron and protector of the French kings, but of France itself. His feast day is October 9.

# DENIS PIRAMUS

(fl. late 12th c.). A cleric, probably from the abbey of Bury-Saint-Edmunds (Suffolk), Denis tells us in the opening lines of his Anglo-Norman *Vie seint Edmunt le rei* (after 1170, possibly 1190–1200) that he spent his early years at court, where he composed

various forms of courtly verse. He has been identified with a certain "magister Dionisius," a monk of St. Edmund's abbey mentioned in documents between 1173 and 1200. Denis's work on Edmund (king of East Anglia, martyred 870) was commissioned by the "segnur" of the abbey for which Edmund was patron saint. It recounts, in about 4,033 octosyllabic lines, the saint's early life as well as his death and miracles and combines elements of hagiography, history, and romance. Denis's version seems independent of the other versions of the legend, that of Gaimar, the anonymous quatrain redaction, and the continental prose life.

# DESCHAMPS, EUSTACHE

(ca. 1346–ca. 1406). Born near Reims at Vertus, in the family home burned in 1380 by the English, Deschamps says that he long applied himself to grammar and logic. He later studied law, probably at Orléans. From 1360, Deschamps was in the service of high nobility, and in 1367 he joined the king's retinue. For most of his life thereafter, he was attached in various capacities to Charles V, and to Charles VI and his brother Louis d'Orléans, as well as to other great personages. From 1375, his name appears in the records as *bailli* of Valois; he became *bailli* of Senlis in 1389. Married ca. 1373, he had two sons and a daughter, his wife dying in childbirth, probably in 1376. He did not remarry.

Until his final years, Deschamps associated with a wide circle of nobility and important figures, and much of his poetry deals with current political and social events. His works also show that he knew many poets of the time: he writes of a joke that Oton de Granson played on him, composes a ballade in praise of Chaucer and another poem praising Christine de Pizan (in response to a poem of praise from her), and in other works speaks of Philippe de Vitry, Jean de Garencières, and most of the poets of the *Cent ballades*. But his most important literary association was with his fellow Champenois Guillaume de Machaut, who figures prominently in several of his works and whose death he laments in a double ballade with the refrain, *La mort Machaut, le noble rethouryque.* He may have been a nephew of Machaut, whom he credits with "nurturing" (educating?) him. Accordingly, his poetry is mostly in the fixed forms that Machaut popularized. But Deschamps writes more on moral and topical subjects than on his mentor's predominating subject, love, and he did not write long *dits amoureux* comparable with Machaut's.

Deschamps's bulky œuvre is almost all preserved in a single thick manuscript compiled a few years after his death (B.N. fr. 840). Ballades predominate, 1,017 surviving. In addition, there are 171 rondeaux, eighty-four virelais, 139 *chansons royales,* fourteen *lais,* and fifty-nine other pieces, including twelve poems in Latin. His one important prose piece is the *Art de dictier et de fere chançons* (1392), probably written to instruct one of his "great lords" in the composition of lyrics; it is the only extant treatise on the art of poetry from 14th-century France. Notable is Deschamps's classification and discussion of poetry without music as "natural music"; musical notation is for him "artificial music." The treatise otherwise concentrates on illustrating the ballade, virelai, rondeau, and *lai.*

Neither of Deschamps's two extant long poems was completed, and in both cases rubrics state that death prevented the author from finishing them. The *Fiction du lyon* is a beast-fable on political events in France, with Charles VI presented as Noble the Lion, Charles the Bad of Navarre as Renard the Fox, and Richard II of England as the Leopard. Deschamps's *Miroir de mariage* is his longest poem by far, 12,004 lines in octosyllabic couplets. Drawing on standard writings against matrimony like St. Jerome's *Adversus Jovinianum,* it opens with a discussion of friendship, which leads to the main question, whether a young man named Franc Vouloir (Free Will) should marry. While such friends as Desir and Folie advise him to take a wife, Repertoire de Science (Wisdom) counsels against it in a long enumeration of the dangers and ills of carnal marriage. He contrasts spiritual marriage, which Franc Vouloir eventually chooses. The work ends with a poorly integrated review of history, interrupted at the Treaty of Brétigny (1360). The *Miroir* has been thought an important source for Chaucer's *Canterbury Tales,* but this is questionable.

The great bulk of poetry preserved in the major Deschamps manuscript, edited in eleven impressive volumes, his ballade to Chaucer, his wit, and his interest in current affairs have made Deschamps seem a more important poet than he was. Had it not been for a literary friend who gathered his works together after his death and had them copied, there would remain little evidence of his versifying. Much of the work is journalistic, and virtually none of the alleged influence on Chaucer is sure. Nevertheless, Deschamps was undoubtedly a master of the ballade, and his reports of quotidian incident, dialogues, petitions to his patrons, observances of ceremonial events, and a great variety of other discourses in ballade form are often amusing and well done. Without his work, we would certainly know much less about public life and literature in late 14th-century France.

# DEVISE

. *See* **MOTTO/DEVISE**

# DIDACTIC LITERATURE (OCCITAN)

. Although two of the earliest works in Occitan are religious, the *Chanson de sainte Foy* and *Boeci,* moral and didactic literature did not develop fully until after the Albigensian Crusade. In addition to short lyrics on religious subjects, there were translations of apocryphal gospels (*Évangile de l'enfance* and *Gospel of Nicodemus*), various poems dedicated to the Virgin's joys and sufferings, and a number of saints' lives (*Vie de saint Honorat* by Raimon Féraut; *Vie de saint Georges; Vie de sainte Marguerite; Vie de saint Alexis; Vie de saint Trophime*). From the 14th century come paraphrases and translations of Latin prayers, such as the Credo and Lord's Prayer, and of the psalms.

Moral and didactic poetry is well represented by the *sirventes* of the troubadours, particularly Arnaut de Mareuil, Guiraut de Borneilh, Peire Cardenal, and Guiraut Riquier. Moral poems directed to a specific class (women, jongleurs, young nobles) are called *ensenhamens*. Many, such as Arnaut's *Razos es e mezura,* offer advice on proper conduct in society. The Catalan troubadour Amanieu de Sescars's *Ensenhamen de la donzela* gives advice to young girls concerning clothing, games, and proper deportment at church; in his *Ensenhamen del escudier,* a master advises his protégé on how to succeed in love. *Ensenhamens* destined for jongleurs, notably that by Guiraut de Cabrera (*Cabra joglar,* ca. 1165), offer intriguing details on the way of life and the repertories of these entertainers. An important scientific and encyclopedic work is Matfre Ermengaud's 35,600-line *Breviari d'Amor*. There also exist separate treatises on birds, medicine, surgical techniques, and astrology.

Didactic literature is written more often in verse than in prose. However, there are several fragmentary translations of the New Testament, including the famous *Bible Vaudoise* from the late 13th century (preserved in a 15th-century manuscript) and an "Albigensian New Testament." Numerous saints' lives and religious legends were rendered into prose as well as verse, including "St. Patrick's Voyage to Purgatory" and "The Voyage of St. Brendan." Monastic rules and statutes were frequently translated into the vernacular, or occasionally even composed in Occitan. Prose translations of classical texts, such as Seneca's *Proverbs* and Cato's *Distichs,* are also known. Numerous charters were written in the vernacular, and we have important *coutumiers* (lists of local laws and customs) for Bordeaux, Avignon, Limoux, Agen, Albi, and Tarascon, among other southern cities.

# DIET AND NUTRITION

. An understanding about the nature of food in late-medieval France derived ultimately, along with all medical knowledge, from Greek doctrine as amplified by Arab physicians and philosophers. Central to the learning of medical practitioners was a set of notions about the nature of human beings and how this nature could be affected by everything in their environment. In a large sense, the relationship of a person to the environment was what was understood by the term "diet." The compendia of medical doctrine and its distillation in the more popular health handbooks, the *tacuina sanitatis,* and the ubiquitous *regimines sanitatis,* invariably contained a series of chapters that set forth highly practical advice on diet—what we might today term "lifestyle": how the individual could maintain a healthy personal balance of humors by avoiding certain dangers (e.g., by refraining from sexual intercourse during the dry period of summer). That most of the advice offered in the handbooks under the rubric "diet" is negative reflects a fundamental attitude: health is the natural state, diet offers the means to maintain health and avoid sickness. "Diet" in a more modern acceptation, as a temporary regimen followed specifically in order to correct an aberration, is applied to food only in the sense that it could also be used with regard to any other factor affecting health.

Among the wealthier classes, whether "diet" had to do with a "way of living" or a "way of feeding," medical doctrine ultimately defined it. For the wealthy, a diet of specific foods could be of several sorts. It could designate those foods that were consumed habitually and in the belief that they would not normally harm a person's health. Choice of foods was extensive and of relatively great variety: extant recipe collections show that the wealthy could choose from among breads, wines, leafy and root vegetables, peas, beans, rice, many fruits and nuts, some berries, meats of all domesticated and game animals, a broad range of freshwater and sea fish, and domestic and imported herbs and spices, including sugar, to provide appetizing colors and flavors. The wealthy in the late Middle Ages enjoyed a nutritious and varied diet of habitual foods. Therapeutic diet was dealt with in most medical treatises. Prescribed by a physician or surgeon for a patient, this diet was designed, as it is today, to counter the effects of a disease, particularly by restoring an ideal balance of humors. Finally, diet could also be defined as a set of recommended foods for any individual, those that should preserve health. Given the natural temperament of patrons, physicians specified which foods they could safely ingest, because of their properties, and which they should avoid, considering them to constitute a potential danger to patients.

Among the relatively poor, only the first two sorts of diet were current. Concerning the first, it is generally surmised that people habitually ate what they could afford to eat

in order to sustain themselves. The staples of this diet were probably bread, beer or wine, stewed vegetables (especially onions, leeks, cabbages), local fish, and some meat (especially chicken and pork). The full details of this diet and its nutritional value are still being studied, but we may assume that the foods of the poor varied according to the times.

# DIGULLEVILLE, GUILLAUME DE

(1295–1358) Guillaume, son of Thomas of Digulleville (Degulleville or Deguileville), Normandy, lived as a monk in the Cistercian abbey of Chaalis, Île-de-France, from 1326 until his death. He is known for his dream-allegory moral poems. Inspired by Jean de Meun's *Roman de la Rose* and perhaps by other allegories, he created a trilogy on the Piligrimage of Life theme, in which divine grace, nature, and the virtues and vices are personified. He composed the *Pèlerinage de vie humaine* in a first version in 1330–31, with a recension in 1355, and the *Pèlerinage de l'âme* between 1355 and 1358. He wrote a summary of both the second version of the *Pèlerinage de vie humaine* and the *Pèlerinage de l'âme* that survives in its entirety in only one manuscript. In 1358, he wrote the third part, the *Pèlerinage Jhesucrist.* He also composed a series of Latin poems intended for inclusion at the end of the *Pèlerinage de l'âme,* but these remain unpublished, as does the 1355 recension of the *Pèlerinage de vie humaine.* He wrote a further allegorical poem in French, the *Roman de la Fleur de lys.* This last work, which survives in two manuscripts, explains the origins and symbolism of the arms of France as a defense of the French royal dynasty against the claims of Edward III. Digulleville's popular pilgrimage trilogy, surviving in more than seventyfive manuscripts, inspired Chaucer, Lydgate, and Bunyan. The poems show the way to salvation through obedience to the church, its sacraments, and its principles. The first work takes a Pilgrim-monk from a prenatal vision of the New Jerusalem to his death, with authorial digressions of an encyclopedic nature along the way. In the second pilgrimage, the Pilgrim's soul visits the places on earth where he had sinned, the cemetery where his body rots, and Hell with its torments of the damned, ending in Purgatory. The third part is a life of Christ.

# DIJON

. A small city during the Gallo-Roman epoch, Dijon (Côte-d'Or) was fortified by the emperor Aurelian ca. 273. The dukes of Burgundy made Dijon their capital in the second quarter of the 12th century, and it continued to be the Burgundian capital throughout the Middle Ages. Unlike most capitals of dukes and counts, it was not a cathedral city—the dukes may even have chosen it for this reason. Its chief church was the Benedictine abbey of Saint-Bénigne, which had been founded as an abbey church ca. 525 upon the presumed tomb of the saint (2nd c.). At the end of the 10th century, Saint-Bénigne was reformed to Cluny's *ordo* at the instigation of Bruno, bishop of Langres. Under the abbacy of William of Volpiano, it became the most important 11th-century reforming center in northern Burgundy. Saint-Bénigne became a cathedral when Dijon was made a bishopric. In the mid-15th century, Philip the Good built a magnificent palace at Dijon, the towers of which still stand.

*Constance B.Bouchard*

Destroyed by fire in 1137, the city was rebuilt by Duke Hugues II. Under Philip the Bold (1342–1404), John the Fearless (1371–1419), and Philip the Good (1396–1467), the splendors of the Burgundian court reached their height, but the death of Charles the Bold at the Battle of Nancy (1476) left the Valois dukes without a male heir; and Louis XI, who, in spite of protestations of the states of Burgundy, seized the province, set up a parlement at Dijon, and refortified the city.

The present-day cathedral of Saint-Bénigne was restored at the end of the 9th century but then fell into ruin. After attaching itself to the community at Cluny, the mon

Dijon (Côte d'Or), Notre-Dame, plan.
After Losowska.

astery soon became one of the strongest and most prosperous of the Cluniac houses. A vast rotunda flanked by two towers marks the western end of this five-bayed basilica (constructed 1002–18). The polygonally apsed choir has no ambulatory and is flanked by two apsidioles. The crypt, circular in plan and containing the remains of the tomb of St. Bénigne, is notable for its column capitals ornamented with geometric, Carolingian-style motifs and schematic human silhouettes. Damaged by fires and repaired throughout the 12th and 13th centuries, the church was rebuilt 1281–1325 in Burgundian Gothic style. A number of associated monastery buildings (11th–13th c.) survive.

The church of Notre-Dame (1230–51), designed in the style of Saint-Bénigne, is a fine example of early 13th-century Burgundian Gothic. It has a long nave (215 feet) flanked by aisles and crossed by a transept and a choir without an ambulatory or radiating chapels. Typical of the style, the building is covered with six-part vaulting, and the graceful colonnettes of the triforium are ornamented with human faces. The west front has a deep triple porch, above which are two arcaded galleries separated by three broad friezes, each richly decorated with human and animal grotesques. The church displays the Jacquemart bell, which was carried off from Courtrai in 1382 by Philip the Bold.

Built before 1103 over the tombs of two 6th-century saints, the church of Saint-Philibert was rebuilt and restored after the 1137 fire. The 12th-century groin-vaulted basilica has a five-bay nave with aisles and a choir and is crossed by a transept. The façade is pierced by a late 12th-century Gothic rose window, and the porch dates from the same period. Above the crossing are a cupola and a 15th-century Flamboyant bell tower. In spite of these later additions, the building is fundamentally a Romanesque structure. Saint-Philibert is particularly associated with the municipal life of Dijon. Under its porch, the *vicomte mayeur* and the magistrates of Dijon were elected.

Philip the Bold established a Carthusian monastery, the Chartreuse de Champmol, in 1383 to ensure a proper burial for himself and his successors. All that remains of the once lavishly decorated building (torn down in 1793) is the entrance portal with its sculptural group by Claus Sluter (1395–1404). Here, Philip the Bold and his wife, Marguerite of Flanders, presented by their patron saints, John the Baptist and Catherine, kneel in attendance to the Virgin and Child. The fact that all of the figures here are on the same scale visually creates a link between the temporal realm of the ducal couple and the world of the divine. The tombs and altarpieces once inside the building are now housed in the museum at Dijon. In the adjacent courtyard stands the *Well of Moses,* also by Sluter. Originally the base of a Cavalry, a hexagonal pedestal rising from the well is surrounded by statues of Moses, David, Jeremiah, Zachariah, Daniel, and Isaiah.

# DIPLOMA

. Under Roman law, most transactions had required a written record, or diploma. These records became much less common in the early Middle Ages, and the *carta* became not a binding legal instrument so much as a record or reminder that an agreement had taken place. Almost all diplomas that survive from before the end of the 12th century are from ecclesiastical archives. The growing literacy of the 12th century led to a great increase in the number of written records. By the early 13th century, kings and popes were keeping chancery records of the diplomas they issued.

# DISEASES

. A general assessment of health problems in medieval France awaits systematic collation of written and physical evidence. At present, acute fatal diseases, with the exception of epidemics, as well as ailments considered minor or inevitable (e.g., measles in childhood or rheumatism in old age) are overshadowed by severe chronic illnesses. In learned writings on medical practice and in popular traditions of saints' cults, fevers predominate. This was not a mere catchall of symptoms but a true category of diseases whose essence was a process of "overheating" and whose branches stretched from ague and influenza to meningitis and typhoid. Professional medicine and folk religion diverged in their ranking of a second group, with digestive complaints more common for patients and obstetrical problems most baffling for physicians.

Of the maladies that eluded human treatment, some gained special notoriety under the name of a patron healer. Regular references to *le mal St. Quentin* or *St. Eutrope* indicate that dropsy, a form of edema often caused by malnutrition, was widespread. More notorious was epilepsy, *le grand mal* or *le mal St. Jean* or *St. Eloi (Leu, Loup);* in spite of the belief that it was both contagious and mental, the falling sickness was often feigned by beggars. Disorders with a relatively low profile in our principal sources of information include such modern threats as cancer, cardiac impairment, and even tuberculosis, which scattered evidence suggests may have been a most insidious and particularly French scourge. Far more than a respiratory affliction of the poor, it caused a host of other ills ranging from insanity to sterility, it cut short the career of the great physician-surgeon Henri de Mondeville, and it plagued the house of Valois.

Perhaps the most historically important disease is smallpox, of which one epidemic accompanied the Huns ca. 450, another sapped the Merovingians (according to Gregory

of Tours), and a third probably claimed Hugh Capet in 996. Frequent outbreaks occurred in the 13th century, in the wake of intensified travel. By the 15th century, variola had become endemic, for children succumbed while adults survived contagion by having acquired immunity, as did Charles V and Charles VIII. The latter contracted *la vérole* in 1494, on his march on Naples, from where his soldiers would spread a new "pox," *la grosse vérole* or "the French disease"—syphilis.

# *DISPUTATIO*

. *See* **SCHOLASTICISM**

# *DIT*

. As used by 13th-century authors, *dit* seems to designate a work treating, in the first person, subjects of general interest, generally directed to a popular audience. *Dits* treat topics as varied as women (good or bad), the churches of Paris, the butchers, bakers, or weavers of that city, or recent events (e.g., *Dit de la mort de Philippe de Grève*). Many have literary merit and can also be useful historical documents. Rutebeuf used the genre for his political broadsides (e.g., *Dit des cordeliers*). Many 13th-century *dits* are anonymous, written in octosyllabic couplets, but other forms of versification are found, especially in Rutebeuf's *dits*.

The nature of the genre changed over time. *Dit* came to designate longer works, a change that may have begun with Jean de Condé, whose *dits* vary from sixty-six *(Dit de bonne chere)* to 2,352 lines *(Dit dou chevaliera le mance),* or with his contemporary, Watriquet de Couvin (fl. 1319–29). These longer *dits,* narrative rather than descriptive, were directed largely to a courtly audience. The genre continued to flourish in the 14th

century, notably in the hands of Guillaume de Machaut and Jean Froissart, authors of *dits amoureux,* combining elements of romance, allegory, and lyric.

# DIVINE OFFICE

. In the Middle Ages, the word "office" had more or less the same connotations as the modern word "liturgy." Since the Middle Ages, however, the meaning of "office" has contracted to refer only to the daily cycle of services marking the chief hours of the day, excluding the Mass and the other sacramental celebrations, such as baptism or ordination.

The content of these daily services included a great deal of psalmody, which included the singing of the psalms, canticles (psalmlike poems from the other books of the Old and New Testaments), and nonscriptural hymns. There were also readings from the Bible and other holy books, prayers and blessings, and processions to different parts of the church (e.g., altars, the main cross, the baptistery) or other sites of religious significance, such as shrines or cemeteries. The methods of singing the psalms varied. In what may have been the oldest method, responsorial psalmody, a soloist (an ordained reader or cantor) sang the verses alone or perhaps with one or a few other soloists. After each verse, the congregation or a choir responded with an unvarying refrain, often but not always a verse from the same psalm. This type of psalmody, common by the 4th century, may have given rise to more complex types of psalmody that still survive in the eastern rites, which can involve alternation between two choirs, each with its own soloist and refrain. In the West, by the early Middle Ages, such methods gave way to the simpler one known as antiphonal psalmody: two choirs sang the verses in alternation, ending with the Gloria patri, and then joined together on the refrain or antiphon at the very end. On a high feast, the antiphon would also be sung at the beginning, but on an average day only its intonation or opening words would be sung by a soloist. Even simpler was direct psalmody, when the entire psalm was simply chanted straight through, without alternation or refrain, either by a soloist or by the entire choir.

The actual number of services per day varied much from one liturgical tradition to another, but it was often influenced by symbolic or allegorical considerations, based on mystical numbers (cf. Psalm 119:164), themes of light and darkness, prayer times mentioned in the Bible (e.g., Daniel 6:10; Acts 2:15, 3:1, 10:3–9), and the chronology of the Passion of Jesus—the third hour, when he was crucified; the sixth hour, when "there was darkness over the whole land"; the ninth hour, when he died; the evening, when he was buried; early Sunday morning, when he rose from the dead (cf. Mark 15:25–16:9).

There were many different traditions for celebrating the Divine Office in Gaul before the establishment of the Roman liturgy in Carolingian times; it is thus misleading to lump them all together, as is generally done, under the term "Gallican rite." Among the earliest sources is the *De institutis coenobiorum* of John Cassian (ca. 360–435), who had lived as a monk in both Egypt and Palestine prior to becoming abbot of a monastery in Marseille. His recollections from his own observation were widely read and profoundly influenced many of the major liturgical traditions of the West. Cassian described the Egyptian practice as following a plan revealed by an angel, consisting of two main services—cockcrow (early morning before dawn) and evening—each with twelve psalms, suggesting the ideal of praying twenty-four hours a day. The more complex Palestinian practice, as Cassian remembered it, added to these two services celebrations at the third, sixth, and ninth hours, with three psalms each, and with all-night vigils on Fridays, which were divided into three sections with three psalms and three readings each.

An office following the Egyptian plan was celebrated at the monastery of Lérins, founded by Cassian's disciple Honoratus (d. 429/30); evidence of it is preserved in the monastic *Rules of the Holy Fathers* from the 5th and 6th centuries and, in much more developed form, in the monastic writings of two bishops of Arles: Caesarius (r. 503–42), who had been a monk at Lérins, and Aurelian (r. 546–51).

In 567, a council in Tours decreed that the cathedral office in that city follow the Egyptian structure of twelve psalms morning and evening, though up to thirty psalms could be sung on long winter nights. The careful adjustment of psalmody to the length of the night was a feature of other Gallican liturgical traditions, such as the office outlined in the monastic rule of the Irish monk St. Columban (d. 615), who founded the monasteries at Luxeuil and Bobbio. Though Columban was aware of multiple traditions, he advocated a daily cursus of six hours: three during the day with three psalms each, and three during the night: services at the beginning and middle of the night with twelve psalms each, and a vigil service with twenty-four to thirty-six psalms depending on the season, thirty-six to seventy-five on Saturdays and Sundays (always arranged in groups of three).

By the 8th century, religious reformers increasingly sought to supplant the indigenous Gallican traditions with usages derived from the liturgical tradition of Rome. Bishop Chrodegang of Metz (d. 766), and the Anglo-Saxon missionary St. Boniface (680–754) were two of the early champions of the Roman liturgy. King Pepin the Short (r. 751–68), after meeting Pope Stephen II in 754, inaugurated a royal policy of romanizing the liturgy in the Frankish kingdom, a policy continued by his son Charlemagne (r. 771–814). The new Romano-Frankish liturgy of the hours took two basic forms: the Monastic Office, based on the prescriptions of the 6th-century *Rule of St. Benedict* (regarded as the Roman monastic rule) and the cathedral or secular Roman Office, to be used by nonmonastic clergy (first described in detail by Amalarius of Metz). These two traditions shared much common material and were similar in structure though they differed in the arrangement of an-tiphonal psalms; the Monastic Office also used some direct psalmody, while the Roman did so only in the Office of the Dead.

In both the Monastic and the Roman Offices, Sundays and major feasts began with Vespers the preceding evening. Most days, however, began with a long vigil service, Mat-ins, recited in the night hours leading up to sunrise. Like the Palestinian vigil described by Cassian, Matins was divided into three sections, or nocturnes, after a brief introduction featuring the Invitatory Psalm 94 and a hymn. (Vulgate psalm numbers are

used in this article.) Probably because a monk or cleric was considered late if he arrived after the invitatory psalm, the performance of this psalm was not modernized to the standard antiphonal method. The verses were sung by two soloists in alternation with the choir, which responded by alternating two forms of the refrain: the complete refrain and the second half of it. Special melodies were used that were more complex than the simple tones of antiphonal psalmody. The text, too, was not updated to the Latin Vulgate, as were the other psalms; an Old Latin or pre-Vulgate text is used even today. In the Monastic Office, Psalm 3 was chanted in direct psalmody before Psalm 94.

The Egyptian practice number of twelve psalms was preserved in the first nocturne of Roman Matins but split between the first two nocturnes of the Monastic. In both traditions, the psalms were arranged into three groups, each with its own refrain or antiphon. The Monastic third nocturne, unlike the Roman, used Old Testament canticles instead of psalms; the specific texts varied with the season. In both traditions, the antiphonal psalms of Matins were assigned mostly in numerical order, omitting those that would be sung at other hours during the day. However, the Roman Office began with Psalm 1, the Benedictine with Psalm 20, though both ended on Saturday with Psalm 108. Following the psalmody were readings from the Old Testament (first nocturne), hagiographical or heortological writings related to the day (second nocturne), and homilies of the church fathers on the Gospel of the day (third nocturne). Each reading was followed by a responsory, sung responsorially even though only a minority of responsory texts were taken from the psalms. The monastic office concluded with the reading of the Gospel itself, but in nonmonastic churches this was typically read only at Mass.

Following Matins was the service of Lauds, marking sunrise; its antiphonal psalms were chosen because their texts were considered appropriate to the theme of morning praise. Following a nigh-universal Christian tradition, the last "psalm" actually consisted of three psalms (148–50) sung as one. The third "psalm" of the Roman Office actually combined Psalms 62 and 66, while the fourth "psalm" in both traditions was actually an Old Testament canticle. The reading at Lauds, as at the other offices throughout the day, was a mere capitulum—a sentence quoted usually from the Epistle of the day, which was read in its entirety only at Mass. This was followed by a brief responsory in the Monastic Office; after that both traditions had a strophic hymn. The New Testament canticle *Benedictus* (Luke 1:68–79), sung antiphonally, was a focal point of this service.

The "little hours" of Prime, Terce, Sext, and None marked the first, third, sixth, and ninth hours of daylight, roughly 6 A.M., 9 A.M., noon, and 3 P.M. The community Mass would typically be celebrated after Terce. Each of these offices in theory consisted of three antiphonal psalms sung as one without a break and with only one antiphon, but the specifics differed in the two traditions. Besides segments of Psalm 118, by far the longest in the Psalter, there were numerical series of psalms omitted from Matins and Vespers: Psalms 21–25 in the Roman Office, 1–19 and 119–127 in the Monastic. In both traditions, this was followed by the singing of *Quicunque vult,* the so-called Athanasian Creed. A distinctive feature of Prime in both traditions was the reading of the martyrology for the following day, so that the monks or clergy would know what liturgical celebrations to expect.

At Vespers, the numerical series of psalms was continued from Psalm 109, having been interrupted at Matins with Psalm 108. The high point of this hour was the antiphonal

singing of the New Testament canticle *Magnificat* (Luke 1:46–55). Compline, said just before retiring, varied little from day to day. It began with a capitulum of 1 Peter 5:8, the *Confiteor* prayer of sorrow for sin and absolution, then continued with psalms chosen for their special appropriateness to the evening hour, sung antiphonally in the Roman Office with one refrain, directly in the Monastic Office with no refrain. The New Testament canticle *Nunc dimittis* (Luke 2:29–32) was sung antiphonally only in the Roman Office.

Though most French churches followed this outline from the 9th century on, there were many variations from place to place. The choice of readings and chants differed greatly from diocese to diocese and from monastery to monastery. On feasts of saints and other commemorations, different in each local calendar, the usual psalms of each hour were often replaced by others chosen for their textual relevance to the themes of the day. These local uses sur-vived the Middle Ages, lasting until the 18th century, when they were replaced by "neo-Gallican" liturgies inspired by the ideals of the Enlightenment. In the 19th century, under papal pressure, these reformed rites were suppressed and replaced by the official Roman Breviary as revised after the Council of Trent, which itself would be repeatedly revised and reformed during the 20th century.

Even in the Middle Ages, the official arrangement of daily services was not always followed in practice. On fast days, when one often could not eat before None or Vespers, there was an understandable incentive to get through the services early; a relic of this may be seen in the modern English word "noon," derived from the office of None even though it designated the hour that properly belongs to Sext. Similarly, the practice of anticipating Matins and Lauds by celebrating them after Compline enabled one to sleep until Prime. Such tendencies were exacerbated over the course of the Middle Ages, as the amount of material to be got through increased due to the proliferation of devotional accretions. The Pater Noster, Ave Maria, Apostles' Creed, and other prayers came to be recited quietly before and after each service, and such Marian antiphons as *Salve Regina* were regularly sung as each service ended. Votive or devotional offices were widely added to the Office proper, particularly the Little Offices of the Virgin Mary. The Office of the Dead, intended for use only in conjunction with other burial and funeral services, was often recited every day as a penitential exercise. By the 13th century, many clergy avoided the public celebrations of the Office (sometimes paying a vicar to take their place), fulfilling their obligation by reading the texts privately at more convenient times, even if that meant reading through the entire daily cycle at one sitting. In the 16th century, private recitation became the official practice of some religious congregations, such as the Jesuits, and in our day it is still the unofficial practice of most Catholic secular clergy.

# DOL-DE-BRETAGNE

. The Benedictine monastery at Dol (Île-et-Vilaine) was founded in 548 by St. Samson of Caldey, who was fleeing Saxon invaders in Britain. It was raised to an archbishopric in 848 by Nominoë, who was crowned here as king of the Bretons. Until 1159, its bishop was the primate of Brittany. A key frontier fortress, it successfully resisted William the Conqueror in 1075 but was eventually captured by Henry II Plantagenêt in 1164. Along the Grande-Rue are a number of well-preserved medieval houses. The Maison des Palets, with its original round-arched windows, is a singular example of domestic Norman Romanesque architecture that may date back to the 11th century.

The present Norman Gothic cathedral of Saint-Samson is built on the site of a Romanesque cathedral burned by John Lackland in 1203. Its sharply pointed arches and straight east end show English influence. The nave, side aisles, and transept, all dating from the early 13th century, are remarkable for the unusual plan of the pillars and their shafts, which are attached on the east and west but not on the north and south. The choir, side chapels, and rectangular ambulatory are more ornate and date from the late 13th century.

# DOMINICAN ORDER

. The Dominican Order of Friars Preachers, founded by the Castilian canon Dominic of Calaruega (1170–1221), represented the fruit of his long labor of preaching (1206–15) among the heretics of southern France. By 1213, his mission knew its first success, a foundation at Prouille that served simultaneously as a convent for women converted from heresy and a base of operations for Dominic and his disciples. By 1215, he and his band

of preachers had settled at Toulouse. They assumed the *Rule of St. Augustine* and were confirmed as an order by Pope Honorius III on December 22, 1216. The following year, Dominic split up his small community, sending two groups northward to Paris, another to Spain, leaving a remnant at Toulouse and traveling himself to Rome. Dominic thus transformed his local order of regular canons into an international order.

Between 1217 and 1221, papal bulls came to define Dominic's followers as an order of preachers, whose apostolate concerned "preaching and the salvation of souls," that is, pastoral care administered through preaching and its corollary, hearing confessions. The last two years of Dominic's life were given over to outlining the order's institutional form at its first two General Chapters (1220, 1221).

The pattern of Dominican life and mission was to be formed by a number of legislative sources. In the first place, there was the *Rule of St. Augustine*. Second, there were the customs of the order, drawn in large measure from the Premonstratensians. Third, there were the constitutions created for the order at its General Chapters. A species within the genus of regular, or Augustinian, canons, the Dominicans combined an internal life of communal prayer, weekly chapters, perpetual fast, and the common life with an external apostolate among the faithful centered upon the acts of preaching and hearing confession. Unlike other Augustinian canons, Dominicans were not bound to a single house or community and embraced communal as well as individual poverty, at least after the General Chapter of 1220. This radical approach to poverty associated them with other new orders of the day, the Franciscans above all, but also the Carmelites, Augustinian Hermits, Order of the Sack, and even smaller groups. Finally, Dominicans did away with manual labor as an integral component of their religious life. Manual labor was given over to lay brothers *(conversi)* so that the clerical brothers would be free for the two most important of their communal enterprises, prayer and study in preparation for their external apostolate.

The basic unit of the order was the convent. No Dominican convent could have fewer than twelve clerical brothers. Of these, one was required to function as prior and received this post by election. Another was required to function as lector or teacher and was appointed by the provincial prior. Groups of convents were organized into provinces. By 1221, what we now call France was divided into two provinces: France, roughly coterminus with the *langue d'oïl,* and Provence, roughly coterminus with the *langue d'oc*. Each was administered by a provincial prior elected by the province's conventual priors and two delegates from each convent. The provincial prior was charged with confirming the election of conventual priors, appointing lectors, visiting the province to ensure the maintenance of the constitutions and ordinances of the order, and presiding over the annual provincial chapters.

The provinces of the order together constituted the order as such. At its head was a Master General, elected by the provincial priors and two delegates from each province. Until the 14th century, the Master General had no fixed abode; later, he tended to reside at Rome. His responsibility was to visit the order as a whole, maintain its laws, correct abuses, and preside over the General Chapter, the order's legislative body.

This basic structure applies to the male First Order. A female Second Order was constituted not by convents but by monasteries of strictly enclosed nuns. Living by the same rule and customs, they claimed spiritual direction by their confreres. The constitutions stipulated that a community of at least six brothers should live within and

exercise pastoral care of each monastery of Dominican nuns. This heavy pastoral investment in the care of the order's sisters caused anxiety among male Dominicans from time to time. Anxiety reached a peak during the master-generalship of Conrad of Wildeshausen (1242–52), when there was a concerted effort to dissociate the order from its female wing. In the end, the weight assigned to the antiquity of Prouille and the monastery of St. Sixtus in Rome, Dominic's clear commitment to the women of these communities, and the strict enclosure they practiced carried the day. By 1285, a Third Order of lay Dominicans was added, who lived as much as possible in terms of the rule and ordinances of the order, placing themselves under the spiritual direction of the Friars Preachers.

In France, as in other parts of Europe, Dominicans showed a marked predilection for large conventual communities. Saint-Jacques at Paris, for example, counted 120 brothers only a few years (1223) after its foundation (1218). This predilection meant that there developed considerably fewer convents than were to be found in the Franciscan order, the Dominicans' closest analogue. Moreover, it meant that Dominicans preferred large urban centers. A medieval Latin verse had it that:

> Bernardus valles, montes Benedictus amabat, Oppida Franciscus, celebres
> Dominicus urbes.

("Bernard loved the valleys, Benedict the mountains. Francis the towns, Dominic the great cities.") In the province of France, the Dominicans had by 1250 established themselves at Paris, Lille, Arras, Valenciennes, Amiens, Saint-Quentin, Rouen, Beauvais, Reims, Verdun, Metz, Toul, Besançon, Langres, Troyes, Caen, Lisieux, Coutances, Nantes, Dinan, Dijon, Le Mans, Angers, Tours, La Rochelle, Poitiers, Clermont, Lyon, Lausanne, and Bourges. In the province of Provence, they established themselves at Bordeaux, Bayonne, Périgueux, Limoges, Cahors, Béziers, Carcassone, Perpignan, Narbonne, Montpellier, Le Puy, Valence, Avignon, Toulouse, Marseille, and Nice. Dominican urban preferences were so pronounced that some have thought to be able to follow the pattern of urbanization in 13th-century France by following the expansion of the order.

The medieval history of the southern province is dominated by struggle with the Cathar and Waldensian sects. Provence was home to an extraordinary number of Dominican preachers throughout the 13th and 14th centuries; and preachers of extraordinary gifts were essential to the task of disputing heretics effectively, since they were not limited to the region assigned their home convent. They could go wherever there were heretics to preach to and dispute. Popes consistently commissioned inquisitors for southern France from the time that Gregory IX (r. 1227–34) established the papal Inquisition (1233). Early on, popes began to favor mendicant friars for the task, especially Dominicans. Southern France thus saw a constant stream of Dominican papal inquisitors; one of the most scholarly Dominicans from the southern French provinces, Bernard Gui, produced not only careful historical research but also one of the most influential inquisitorial manuals.

In the province of France, i.e., the northern province, the Dominican experience was rather different, being dominated by study and the looming specter of its most cel-ebrated convent, Saint-Jacques at Paris. This is not to say that there was any lack of spiritual

struggle with heretics. The cities of Flanders, in particular, knew their share of heterodox believers. But it was learning, and especially theological learning, that distinguished the history of the Dominican order in northern France.

The order established *studia generalia* to serve as the apex of its educational structure. Each *studium generale* was administered by a regent master assisted by two bachelors; the subject of instruction was theology. Saint-Jacques at Paris housed the first and greatest *studium generale* of the order. In 1229 and again in 1231, it was granted a chair in the theological faculty of the University of Paris. In 1248, Provence received its own *studium* in the convent at Montpellier. In 1303, the newly established province of Toulouse received its own *studium generale* in its convent in Toulouse. After 1260, other types of schools were organized. *Studia naturalium* provided Dominicans an internal organ for the study of philosophy; other special schools were established for the study of logic and still others for the study of foreign languages, such as Greek, Hebrew, and Arabic.

Saint-Jacques's close association with the University of Paris created a fertile field in which to recruit novices for the order. Despite the inclusion of Dominican regent masters within the theology faculty of the University of Paris, the Dominican *studium generale* was imperfectly integrated with the rest of the university. This was particularly clear in the period 1229–31 and again in the 1250s, when the secular masters of the university called strikes that the Dominican masters refused to join. Their lack of solidarity provoked a far-ranging controversy with the secular masters, which came to be fought over mendicant (and by implication papal) claims to a pastoral apostolate and the office of doctor within the church. The controversy lasted intermittently for a century, heating up in the 1250s, again in the 1270s and 1280s, and then again in the years before the Council of Vienne (1311–12). Dominicans and their mendicant allies proved successful in defending themselves and their religious privileges, though their secular opponents created arguments that were more difficult to dispute than is sometimes realized. What is remarkable is the degree to which the French episcopacy either remained neutral in this protracted dispute or supported the Dominicans and their mendicant allies. In general, the French episcopacy looked upon the order with high favor throughout the 13th century.

The list of Dominican masters at Saint-Jacques includes some of the greatest thinkers of the Middle Ages: Albert the Great, Thomas Aquinas, and Meister Eckhart. Moreover, the Dominicans of Saint-Jacques were also responsible for impressive products of communal effort, including a concordance to the Bible and a complete set of postillae for every biblical book (under the direction of Hugues de Saint-Cher). Some even argue that the *pecia* system of manuscript production was developed by and for the needs of the *studium generale* at Saint-Jacques.

In France, as everywhere, the 13th century was a golden age for the Dominican order. The 14th century was less kind, although the order's numbers did not decline until the Black Death (1348). In 1337, in fact, membership in the order achieved its medieval high-water mark (12,000), in a census taken for Pope Benedict XII (r. 1334–42). Nevertheless, the economy of Europe began to stagnate in the late 13th century, and it became more difficult for the order to beg the resources that it needed to remain viable. The depredations of the Black Death only worsened the situation. Entrance standards loosened and study and the choral office were relatively neglected, as friars assiduously traveled their convent's begging routes.

The order began to combat the relaxation of its religious regime under the direction of Raymond of Capua late in the 14th century. He initiated a movement of strict observance of the contemplative and monastic side of Dominican life that burgeoned throughout the 15th century. It led in time to the formation of congregations within the order, that is, groups of Observant convents that existed autonomously within and across the provincial structure of the order. Of particular importance to the French provinces were the Congregation of Holland (1464) and the Congregation of France (1497).

# DOMMARTIN

**.** The Premonstratensian abbey church of Dommartin (Pas-de-Calais) was one of the largest and wealthiest of the houses founded from Saint-Martin at Laon. The 12th-century church, begun ca. 1160, was destroyed following the Revolution, but analysis of the ruins and excavations have produced an accurate plan (Pontroué) and numerous beautiful foliate capitals, some of which are housed in the museum at Amiens.

# DOMONT

. The church of Sainte-Madeleine at Domont (Val d'Oise), a dependency of the Parisian abbey of Saint-Martin-des-Champs after 1124, has a chevet that dates to 1150–55, although the axial chapel was added later. The transept and nave were rebuilt in the early 16th century, and there were major repairs in the early 18th. Nonetheless, the three-story interior elevation and the barely protruding flying buttresses on the south side (known through prerestoration photographs) link the chevet to the Parisian Early Gothic milieu.

# *DONATION OF CONSTANTINE*

. An 8th-century forgery that purports to establish the temporal authority of the papacy, the *Constitutum Constantini* or *Donation of Constantine* is based on legends of Pope Sylvester I that date from the 5th century, found in the *Legenda sancti Silvestri*. Although attributed to the Roman emperor Constantine I, the *Donation* was probably the work of a cleric of the church of the Savior (St. John Lateran). Divided into two parts and addressed to Pope Sylvester, "Constantine" describes his conversion to Christianity in the *Confessio,* and in the second part, the *Donatio* proper, he bestows on Sylvester and his successors a power that matches his own royal authority. While the document outlines or in a sense creates the temporal sovereignty of the pope, it implicitly undercuts this aim by having the power of the papacy derive from the emperor. Because of this ambiguity, the document has been used both to advance and to restrict the autonomy of papal rule. The *Donation* was also instrumental in developing the thesis of inalienability: no ruler had the right to give to others any of his essential governing powers or any of the lands in the royal domain. In the 15th century, Nicholas of Cusa and Lorenzo della Valle determined that the *Donation of Constantine* was not issued by Constantine, a revelation subsequently used by Protestants to argue that papal power was based on falsehoods. The oldest surviving copy of the *Donation* is the 8th-century manuscript B.N. lat. 2777.

# *DONATION OF PEPIN*

**.** An 8th-century document that transferred control of a strip of land in Italy to Pope Sylvester II, effectively establishing the temporal authority of the papacy. In 751, Rome and surrounding areas had been threatened by the Lombard king Aistulf. Since Sylvester was a Byzantine subject, he appealed to Emperor Constantine V for assistance, but to no avail. Seeking protection elsewhere, Sylvester traveled to Ponthion in 754, where he obtained a sworn oath from Pepin III the Short (714–768) to defend the Roman church. After Pepin had defeated Aistulf and the First Peace of Pavia had been concluded in 755, Aistulf refused to abide by the agreement and attacked Rome again. Summoned by Pope Stephen II, Pepin engaged Aistulf in battle once again and defeated him in 756. The Second Peace of Pavia levied heavy penalties against Aistulf. This time, Fulrad, the abbot of Saint-Denis, was charged with the duty of traveling to various cities in Italy to obtain tokens of submission to the pope. Afterward, Fulrad documented the lands that were given or restored to the pope. It is this document that is known as the *Donation of Pepin.* The lands, however, had not belonged to Pepin or to the pope but had been the property of the emperor, who had failed to defend them.

# *DONNEI DES AMANZ*

**.** Composed in the late 12th century, this incomplete and anonymous Anglo-Norman didactic poem has 1,244 octosyllabic lines in the only manuscript in which it is preserved (Cologny-Geneva, Bibliotheca Bodmeriana 82). The narrator overhears a conversation between a young noble and the lady he loves. In his attempts to win his lady's love, the young man cites examples of famous lovers, especially from the Romances of Antiquity. The episode from the Tristan legend cited in lines 919–1, 158 is commonly known as *Tristan rossignol.*

*Claude J.Fouillade*

# *DOON DE MAYENCE*

. A chanson de geste consisting of two parts: *Les enfances Doon* and *Doon de Mayence*. The first part may have been composed after 1250, possibly as late as the early 14th century, and the second part after 1250. The *Enfances* has 6,038 lines and the second part, 5,467, and both are in rhymed Alexandrines. They survive in three manuscripts (Montpellier, Faculté de medicine, H. 247, ff. 1–46, mid-14th c.; Paris, B.N. fr. 12563, 15th c., and B.N. fr. 1637, 15th c., incomplete). This epic enjoyed wide popularity and was printed, in a prose version, during the 16th century and beyond.

Doon defends his mother against the attempts of traitors who want to usurp the family's fief. He spends several years in a forest with his father, who has become a hermit. A rebel vassal of Charles, Doon receives permission to fight the Saxons. He conquers Flandrine and marries her.

This poem makes allusions to *Garin de Monglane,* the *Chevalier au Cygne,* and Chrétien's *Perceval.*

# **DORAT, LE**

. The collegiate church of Saint-Pierre in Le Dorat (Haute-Vienne) is the most impressive of extant Romanesque churches in the Limousin; elegant decorative arcades and vigorous carving enliven the starkness of the local granite. Most striking are the octagonal lantern tower with its trilobed blind arcade and high spire topped by a gilded angel, the polylobed oculus of the cupola of the crossing, and the scalloped archivolts of the western portal (original ironwork on doors). The entrance bay (cupola beneath a bell tower, lateral arcades) is similar to those of La Souterraine, Saint-Junien, and Bénévent; twelve stairs descend to the pointed barrel-vaulted nave (the narrow side aisles are groin-vaulted), transept with apsidioles, and choir with ambulatory and three radiating chapels. Other notable features include the crypt (11th c.), treasury, early font, and remnants of fortifications (15th c.).

Schneider P.Le *Dorat.* La Pierre-qui-vire: Zodiaque, 1964.

# DOUIN DE LAVESNE

(fl. mid-13th c.). Author of *Trubert,* a poem of 2,984 octosyllables. Masquerading variously as a fool, a carpenter, a doctor, a knight, and a girl, Trubert succeeds in duping the duke and duchess of Burgundy. The poem is violent, anarchic, sometimes obscene, and its central character, amoral. *Trubert* calls itself a fabliau, but it resembles rather a series of fabliaux linked by the figure of Trubert. Composed in the mid-13th century, *Trubert* is found in a single manuscript (B.N. fr. 2188).

# DOWRY

. The resources brought by a woman to a marriage for the support of the couple. In early-medieval France, the Frankish brideprice was replaced by the dowry, accompanied at times by the *Morgangabe,* which the groom provided following the consummation of the marriage, and by other family gifts to the bride. The dowry thus came to resemble the Roman dos, the gift by the bride or her family to the groom.

In the high and late Middle Ages, the *dos* and a *donatio propter nuptias, augment,* or "dower" were common. Landed or movable wealth might constitute the dowry; women of urban merchant families in southern France often received monetary sums as dowry. In most regions, the real property of a woman's dowry came under her husband's control *(Grand coutumier de France, Coutumes de Beauvaisis),* but she retained some right of approval for the alienation of property. In the case of movables, custom differed. The *Coutumes de Beauvaisis* granted the husband the right to administer movables, as did the *Très ancienne coutume de Bretagne,* but in the south of France the wife tended to retain control of her personal property, or *bona paraphernalia.*

In most regions, a woman could recover her dowry upon death or divorce; on the death of her spouse, the widow was entitled to her dower rights, which usually ranged from one-half to one-third of his property *(Coutumes de Beauvaisis, Les établissements de saint Louis).*

# DREUX

**.** The Roman city of Durocasses, Dreux (Eure-et-Loir) evolved into a countship by the 10th century. Strategically located between the royal domain, the duchy of Normandy, and the county of Chartres, it was seized by King Robert II ca. 1015 and remained part of the royal domain until the late 12th century. Fortified before 1100, Dreux had a royal mint under Henry I (r. 1031–60) and communal rights, without justice, which were confirmed in a charter of 1180.

The county of Dreux passed to a younger son of Louis VI, Robert (d. 1188), whose descendants held it until the late 14th century. The most notable of these were Philippe, bishop of Beauvais (d. 1217), a bellicose prelate who participated in the Third Crusade with his brother Robert II (d. 1218), and in the Albigensian Crusade and the campaign of Bouvines; Henri, archbishop of Reims (d. 1240), who dared to excommunicate St. Louis; and Pierre Mauclerc (d. 1250), husband of Alix de Thouars, heiress of Brittany. Pierre was renowned for his opposition to the regency of Blanche of Castile, for consolidating his wife's duchy in the interests of their son, for participating in the crusade of Thibaut de Champagne (1239–40), and for donating the magnificent south rose window to the cathedral of Chartres.

The comital line continued until after 1355, when it was disputed by three sisters—Jeanne, Péronelle, and Marguerite. The last two sold their claims to King Charles V in 1377 and 1378, respectively. In 1407, Charles VI granted Dreux to his brother, Louis of Orléans. When the latter's grandson became king in 1498, it returned to the royal domain.

Saint-Pierre is the only medieval church in Dreux to survive the French Revolution. Of the buildings started under Count Robert, only a few sections of wall survive, the rest having been rebuilt in the 13th century. The north transept, four aisle bays, and four ambulatory columns, as well as the buttress piers on the nave, were incorporated in the rebuilding following the damage from the siege of Dreux by Henry IV of England in 1424. Most of the rebuilding was finished by 1498, although the façade was completed only in 1524. The south tower was not finished in time for the dedication in 1540 and so has remained incomplete.

The most important religious structure in Dreux was the now-destroyed collegial church of Saint-Étienne, a royal foundation within the precincts of the château. The church, begun in the 1130s, was intended as the burial church of the counts. Several historiated and foliate capitals from the church have been identified; two are in the local museum, a fragment is at Yale, and several others are either embedded in the repaired château walls or reinstalled in the burial crypt of the Orléans family mausoleum built on the site in the early 19th century. The château is known from early views and from the extensive surviving walls, although no trace of the donjon or other structures remains.

# *DROIT DU SEIGNEUR*

. A symbol of abusive or aristocratic domination, the *droit du seigneur,* or *ius primae noctis,* was a custom once thought to have characterized the Middle Ages, whereby a lord might claim sexual relations with the bride of a servile tenant on her wedding night. There is no evidence that any legally recognized exaction of this sort ever existed. Karl Schmidt attempted to prove that all reports of a *droit du seigneur* are to be traced either to pure invention or misinterpretation of marriage taxes. There are, however, some references to a seigneurial abuse (rather than the right) of newly married women in the regions of the Pyrénées. Peasants in Catalonia agitating for an end to serfdom in 1462 complained of this practice and the king of Aragon abolished it, along with other more widely acknowledged servile incidents, in 1486. There is also indication that the same oppressive custom was practiced in Béarn and Bigorre during the 16th century.

In the 18th century, the *droit du seigneur* was denounced in the antifeudal writings of Voltaire, Restif de la Bretonne, and above all by Beaumarchais, in his *Mariage de Figaro*. Controversy erupted during the mid-19th century, when some asserted that most Frenchmen were the descendants of bastards because of the earlier prevalence of the *droit du seigneur*. The abusive right has appeared frequently in what might charitably be called romantic historical fiction. The historical core of this essentially literary and polemical theme is small but not completely fabricated.

# DROUART LA VACHE

(fl. late 13th c.). Otherwise unknown, Drouart la Vache names himself in a riddle at the end of his *Livres d'amours,* a Champenois poem of 7,640 octosyllabic verses composed in 1290. It closely follows Andreas Capellanus's *De amore,* of which it is a translation, first defining love, then presenting situations in which love may occur, and finally distinguishing virtuous "pure love" from "mixed love," which is to be condemned. Drouart says that he translated Andreas's book because he found it amusing, and his text is lighter in tone than its source. The *Livres d'amours* exists in a single manuscript (Paris, Arsenal 3122, last quarter of the 13th c.).

# DU CLERCQ, JACQUES

(1420–1501). Lawyer, counselor to Philip the Good of Burgundy, and lord of Beauvoiren-Ternois. Du Clercq's *Mémoires* (1448–67) are a font of local information, sprinkled with material of broader import. Only one manuscript of the *Mémoires,* now partially lost, exists.

# DUFAY, GUILLAUME

(Du Fay, Du Fayt; 1397–1474). Composer, musician, and cleric. During a career that spanned over fifty years, Dufay produced some of the finest music of the late Middle Ages. Contemporary esteem for Dufay and his music was matched only by the reputation of his contemporary Gilles Binchois.

Dufay's life and peripatetic musical career have been outlined to an extent matched by no other 15th-century composer. There are hundreds of surviving documents relating to his career, and gaps in the documentary record are often filled by evidence from the occasional works he composed. According to recent discoveries by Planchart, Dufay was born near Brussels, the illegitimate son of a priest, on August 5, 1397. The earliest documents regarding his musical career date from 1409, when he is listed as a *puer altaris* at Cambrai cathedral. By 1414, he had risen to the rank of *clericus altaris* and had been granted a chaplaincy at Cambrai. His precise whereabouts are unknown over the next few years, but it is likely that he was at the Council of Constance, possibly in the entourage of Pierre d'Ailly, bishop of Cambrai.

During the early 1420s, Dufay was in northern Italy. Two of his earliest datable works were written for the Malatesta family. He returned to France for a time, from 1423 or 1424 until 1426, probably with an eye toward securing prebends in the area of Laon. His rondeau *Adieu ces bons vins de Lannoys* (1426) bade fond farewell to Laon, as he returned once more to Italy. Dufay was in Bologna by early 1426, serving as secretary to Cardinal Louis Aleman, under whom he was ordained in 1427 or 1428. From 1428 until 1433 or 1434, Dufay served popes Martin V (d.1431) and Eugenius IV in the papal chapel, where he was associated with some of the best composers of the day, among them Arnold de Lantins and Johannes Brassart. His output included occasional motets in celebration of Eugenius IV.

Dufay traveled extensively over the next few years. During 1434–35, he was in the employ of the court of Savoy and made at least one extended visit to Cambrai. At Savoy, Dufay met Gilles Binchois for the first time; it was probably this meeting that is documented in Martin Le Franc's *Champion des dames*. He returned to Italy in 1435, rejoining the entourage of Eugenius IV in Florence. Dufay composed the motet *Nuper rosarum flores* in 1436 for the consecration of Florence cathedral by Eugenius. By 1437, he had returned once again to the court of Savoy, composing one of his last isorhythmic motets, *Magnanimae gentis* (1438), in celebration of a peace treaty between Louis, duke of Savoy, and Louis's brother, Philippe, count of Geneva.

By 1439, Dufay had settled once more in Cambrai, although he was frequently absent throughout the rest of his life, both on cathedral business and on a few freelance excursions. Dufay's activities at Cambrai included a wide variety of musical and clerical duties: supervising choir-boys and *petits vicaires* and overseeing the revision and editing of the cathedral's choirbooks. Throughout the 1440s, Dufay maintained an unofficial though familiar relationship with Philip the Good, duke of Burgundy, and some of Dufay's liturgical music of this period, including a sizable number of Mass Proper

settings, was composed for the Burgundian chapel. Louis, duke of Savoy, continued to woo the composer as well, and during an extended absence from Cambrai, in 1452–58, Dufay was employed by the Savoy court. It was probably during this last Savoy sojourn that Dufay composed most of his late songs. By 1458, Dufay had returned to Cambrai and remained there for the rest of his life, although he maintained contact with several important patrons, including the dukes of Burgundy and Savoy and, indirectly, with young Lorenzo de' Medici of Florence.

When Dufay died on November 27, 1474, he left explicit instructions regarding the music to be sung at his funeral, which was to include his large four-voice setting of the Marian antiphon *Ave regina celorum*. His will attests to a man of considerable means— books, furnishings, property, and money garnered from a lifetime of patronage and shrewd trading in canonical benefices. There is evidence that both Johannes Ockeghem and Antoine Busnoys composed *déplorations* on Dufay's death, although these works are now lost.

Dufay composed in virtually every polyphonic form of the 15th century, and it has recently been discovered that he composed plainchant as well. His works show an impressive command of every compositional technique available to a 15th-century musician: *fauxbourdon,* isorhythmic writing, *cantus firmus* technique, and imitation.

Dufay's thirteen, possibly fourteen or fifteen, surviving isorhythmic motets are among the latest and finest examples of this longstanding compositional tradition. In nearly all cases, they are works written for a specific event or patron, or may be tied to a period in Dufay's career. His earliest isorhythmic motet, *Vasilissa ergo gaude,* continues the tradition of Royllart's *Rex Karole* (written some forty-five years earlier for Charles V). The brilliant *Ecclesie militantis,* a motet written between 1431 and 1433 for Eugenius IV, is Dufay's most complex essay in isorhythm, in six sections, with two tenors based on different chants and three texted upper voices. With *Supremum est mortalibus* (1433) and his later isorhythmic motets, Dufay turned toward a simpler style, based upon English practices, with long upper-voice duets delineating the *talea* structure.

The majority of Dufay's surviving works are sacred: perhaps thirty or more settings of the complete Mass Ordinary, combined Ordinary and Proper, or Proper; nearly forty additional Mass movements; and nearly fifty settings of hymns, Magnificats, and antiphons for the Office and Marian antiphons. During the 1440s, Dufay conceived at least two large cycles of Proper settings, a series of Masses to various martyrs for Cambrai, and a cycle of votive Masses, probably for the Burgundian Order of the Golden Fleece. In the *Missa Se la face ay pale* and *Missa L'homme armé,* possibly written in the 1450s for the Savoy court, Dufay used secular tenors as a unifying device. His latest Mass, the *Missa Ave regina celorum,* was written in 1472 for the dedication of Cambrai cathedral. Dufay foreshadows later practices in Mass composition by quoting and reworking polyphonic material from his own motet *Ave regina celorum* and his *Missa Ecce ancilla*.

In his Office music and nonliturgical Latin works, Dufay sets the chant usually in the uppermost voice, often paraphrased, transforming it into a flowing melody similar to that of his secular songs. The simplest settings are his Office hymns, set in *fauxbourdon*. Some of Dufay's most expressive writing appears in his settings of Marian anti-phons. His four-voice *Ave regina celorum* (ca. 1464), sung at Dufay's funeral and reworked in

his *Missa Ave regina,* uses the chant melody as a *cantus firmus* and includes emotional prayers on behalf of the composer himself.

There are over eighty surviving songs by Dufay, composed from ca. 1420 to ca. 1465. His earliest songs exhibit a great variety of styles, from the virtuosity and notational complexity of *Resvelliés vous* (1423) to relatively simple works, such as the rondeau *J'atendray tant*. His late songs, such as *Adieu m'amour* or *Par le sregart,* products of a composer in his fifties and sixties, are more sedate than the vivacious songs of the 1420s and exhibit careful attention to text expression and formal balance.

Dufay and Binchois were acknowledged by their contemporaries as the best song composers of their generation, but there are striking differences between them. Binchois's nearly sixty songs are more or less unified in style, while Dufay's song style evolved substantially over his career. As in Binchois's songs, Dufay's most frequent subject is courtly love, but his works exhibit great variety, with texts celebrating May Day or New Year's Day (*Ce jour le doibt* and others), honoring patrons (*Resvelliés vous* for Carlo Malatesta), and other subjects. Like those of Binchois, the bulk of Dufay's texts are in fixed forms—rondeau, ballade, and (in later works) *bergerette*—but his songs also include settings of Latin or Italian poetry, including Petrarch's *Vergene bella*.

# DUKE/DUCHY

. The Latin word *dux* 'leader,' from which the later title "duke" was derived, was first employed as a formal title in the late 3rd century, when a new type of officer was put in command of all the forces within districts of the empire composed of one or several provinces, each of which included several *civitates,* or city-states. Down to 1344, all later *duces* in Gaul would have a comparable sphere of authority. Under the Merovingians, the *ducatus,* or ducal office, differed from its Roman predecessor primarily in being irregular and in having a much higher place in the hierarchy of dignities, immediately below the

(equivalent) dignities of *patricius,* or "patrician," and *rector* and above that of *comes,* or "count."

Like the patriciate and rectorate, the ducal dignity was suppressed under the first Carolingians, but the title *dux* was informally revived in the usage of the classicizing historians of the 9th century as one of several designations for the counts placed in command of the military forces of one of the border districts, or "marches," which like the former ducal commands were composed of several adjacent *pagi,* or counties—the successors of the former *civitates.* In the 10th century, "duke" was adopted in west Francia as a formal title of dignity by the rulers not only of these marches but of several similar groupings of counties formed within the kingdom with or without the consent of the king. Most of these new *ducatus,* or "duchies," had some sort of relationship to one of the principal ethnic groups within the kingdom, and all of them rapidly evolved into hereditary and effectively independent principalities: Francia, Burgundy, Normandy, Brittany, Gascony, Aquitaine, and Gothia. In most of these districts, however, "duke" continued to be used in random combination and alternation with "prince," "marquis," and "count" until the end of the 11th century, when the great princes finally began to settle on either "duke" or "count" as the exclusive expression of their authority (again in the process of redefinition) within each of their dominions. By 1120, only the lords of Burgundy, Normandy, Aquitaine, Gothia (renamed Narbonne), and Brittany retained the title "duke" (Occitan *duc,* OFr. *dus* or *duc*). In the same period, the jurisdictional title "duchy" (Occitan *ducat,* OFr. *duchié, duché*) came to be definitively attached to all but the last of these principalities, Brittany, whose lords continued to employ the alternative title "count" until 1280 and were not recognized as dukes by the royal chancery until 1297. The feminine title "duchess" (Lat. *ducissa,* Occitan *duquesa,* OFr. *duchesse* or *duchoise*) was first employed in France by Eleanor of Aquitaine ca. 1150 and after 1200 was normally used by the wives, widows, and heiresses of dukes, who had previously (since ca. 900) borne the title "countess."

After 987, duke was always regarded as the highest-ranking dominical dignity in France after that of king, and when the peerage of France was created in the early 13th century the rulers of all four of the recognized duchies were included among the twelve peers. Indeed, from 1202 to 1498 all strictly French dukes were also peers and all wholly French duchies were peerages of France. The barony of Bourbon was made a duchy and peerage by Charles IV in December 1327. Nine further duchies were erected in a similar way before 1500: Orléans in 1344; Anjou, Berry, Auvergne, and Touraine in 1360; Nemours in 1404; Valois in 1406; Alençon in 1415; and Valentinois in 1498.

# DUNOIS, JEAN, COMTE DE

(1402–1468). The bastard of Louis, duke of Orléans, Jean was raised in his father's home and became the effective head of the house of Orléans after the capture of his legitimate half-brothers at Agincourt in 1415. Naturally a member of the Armagnac faction, he joined the dauphin Charles's service. His victory at Montargis in 1427 inaugurated a distinguished military career, and his successful defense of Orléans until relieved by Jeanne d'Arc in 1429 ensured his fame. Though he was to play an intermediary role in both the Praguerie (1439) and the *Guerre du Bien Publique* (1465), he was undoubtedly the most loyal and effective Valois commander of the era. His campaigns in the Seine basin culminated in the triumphal royal entry into Paris in 1436. Jean played a major role in the military reforms of the early 1440s, and between 1449 and 1451 he commanded major elements of the armies that reconquered Normandy and Guyenne. Made count of Dunois in 1439 and count of Longueville in 1444, he held important positions in the government of reunited France, serving both abroad as an ambassador and at home as royal commissioner in the arrest of the duke of Alençon and the rehabilitation of Jeanne d'Arc. After a reconciliation in 1465, he served as a key adviser of Louis XI until his death in 1468.

# DUNS SCOTUS, JOHN

(ca. 1266–1308). Born in Scotland, Duns Scotus probably obtained his early education at the Franciscan convent in Dumfries, where he entered the order by 1280. He was sent to Oxford no later than 1290 to begin his studies and may have received his baccalaureate there. He lectured on the *Sententiae* of Peter Lombard at both Cambridge and Oxford. Ordained at Northampton in 1291, he went to the University of Paris in 1293 to study for the master's degree in theology, but before completing the degree he returned in 1296 to Oxford, where he commented again on the *Sententiae*. Duns Scotus went once more to Paris in 1302 and continued to lecture on the *Sententiae*. He was exiled in 1303, when he opposed Philip IV the Fair's appeal to a general council against Pope Boniface VIII. He returned in 1304, received the master's degree in 1305, and became regent master in the Franciscan chair for the next two years. In 1307, he was sent to teach at the Franciscan house in Cologne, where he died on November 8, 1308.

Possibly nicknamed "the Scot" early on at Oxford, he engaged in theological disputes with such skill and subtlety that he posthumously received the scholastic titles *Doctor subtilis* and *Doctor maximus*. Duns Scotus extended the moderate realism of Albert the

Great and Thomas Aquinas but was intent less on constructing a system than on pursuing, often relentlessly, solutions to philosophical and theological problems that he considered to blemish the systems of his predecessors, such as the issues of contingency, individuation, distinctions and univocity of being, the primary object of the intellect, and the relation of love and will to intellect. He took immense pains to distinguish and then properly to reconnect the tasks and provinces of "philosophy" and "theology." He reacted to the efforts of Henry of Ghent and others to reestablish Augustinianism at the University of Paris. Although influenced by Avicenna, he rejected both Augustinian and Aristotelian epistemologies and argued that being, not God or material things or their essences, is the primary object of knowledge. He saw theology as a science whose knowledge provides the "practical" means to reach the soul's supernatural end. He emphasized the special uniqueness, or *haecceitas*, of the individual, because each is the product of God's thoroughly free creative and loving election. He distinguished between nature and will and argued that the will alone possesses fundamental freedom and is the primary rational power. He analyzed the human capacity to love and to experience God. He distinguished the will's inclination to choose what is advantageous from its "affection" toward justice for its own sake, which enables the will to love God for God's sake and not for the soul's advantage alone. Scotus's concept of intellectual intuition explained the capacity of beatific and unique temporal visions of God in contrast with the ordinary process of knowledge through sensory experience. He promoted the doctrine of the Immaculate Conception and maintained that the Incarnation would have occurred regardless of the Fall.

Duns Scotus's principal composition was his commentary on the *Sententiae*. The two chief extant versions are included in the collections *Opus Oxoniense*, especially the *Ordinatio*, and in the *Opus Parisiense*, also known as the *Reporta Parisiensia*, containing notes from students and scribes. The *Tractatus de Primo Principio* and the quodlibetal questions represent his mature theological constructions. He also composed a series of logical commentaries, in the genre of "questions," on Porphyry's *Isogoge* and Aristotle's *Categories*. Especially interesting are his *Collationes*, composed of disputations held at Oxford and Paris. His writings not only influenced later Franciscan theologians, known as the Scotists, but also such diverse figures as Galileo, C.S.Peirce, and Gerard Manley Hopkins.

# DUPIN, JEAN

(1302–1374). Prior of Saint-Martin-des-Champs and then abbot of Cluny (1369–74), Dupin wrote the *Livre de Mandevie* between 1324 and 1340. This allegorical text is composed of eight books, the first seven written partly in prose and partly in verse, and the last entirely in verse (5,062 octosyllables). The author is guided by the knight Mandevie (*mander* 'to improve' +*vie* 'life') along a route where he meets allegorical figures representing the vices and virtues and the various estates of society. The final book, entitled *Mélancolies sur les conditions de ce monde,* is a moral satire that summarizes the contents of the first seven books; here, he abandons the allegorical form and directly attacks the abuses of this world. The work was popular in its day, resulting in a number of manuscripts and two early printed editions, but it is generally condemned today for its banality.

# E

## *EAUX ET FORÊTS*

. Forests, streams, and ponds were an important source of income to any seigneur fortunate enough to possess such resources, and all medieval kings attributed great importance to their forests. To prevent poaching and to administer sales of wood and other sources of revenue, the French crown employed a variety of forestry officials. A well-established local administrative structure was in place throughout the 13th century. Beginning with the reign of Philip IV, the system became more centralized. In March 1302, a royal ordinance on the administration of *eaux et forêts* established a two-tiered structure of "masters" and "guards." The main innovation of this reign, however, was the appointment of Philippe "le Convers" de Villepreux as *enquêteur* of the king's forests. Officials in the field reported to Villepreux, who traveled extensively to investigate the forest administration and eliminate abuses.

Villepreux remained active until 1327, and successors carried on his work until, in 1384, a royal ordinance formally established the position of "sovereign master of waters and forests." This position was abolished in 1413 but reinstated during the period 1428–1575. The *eaux et forêts* administration soon gained judicial responsibilities, and cases involving forest law were heard at the "marble table" in the royal palace.

## ÉBREUIL

. The former abbey church of Saint-Léger at Ébreuil (Allier) was founded in the 11th century by the monks of Saint-Maixent. In 1180, Gregory VII placed the monastery under the *Rule* of St. Benedict.

Built in the 11th century, the church has a six-bay nave flanked by aisles (the southern aisle was reconstructed in the 18th century) and an apsed choir with ambulatory and five radiating chapels. The transept (the north arm of which is now partially destroyed) is

surmounted by a cupola. The chevet, reconstructed in the Île-de-France style (late 12th-early 13th c.), has cross-ribbed vaults and is fortified by flying buttresses.

The western bell tower dates from the 12th century. Above a triple-arcaded porch rise two stories, each articulated by three arches echoing those on the ground level. The tympanum above the main portal displays Christ and two Apostles (12th c.). The walls of the tribune are embellished with late 12th-century wall paintings depicting St. Austremoine, St. Clement, St. Pancrace, the martyrdom of St. Valérie, and the archangels Michael, Gabriel, and Raphael.

# *ECBASIS CAPTIVI*

**.** The oldest beast epic known to us today, the 11th-century *Ecbasis captivi* is an important example of the genre. Written in Latin leonine hexameters, the text exists in two manuscripts, both now in the Royal Library, Brussels. The anonymous work seems to have been intended for readers who could appreciate the many references to Horace, Virgil, and Prudentius, to contemporary society, and to monastic life.

The story is told as a fable within a fable. At Eastertime, a calf is caught by a wolf who plans to eat it. The wolf has a dream that night warning him not to eat the calf. Meanwhile, the animals of the village have come to the wolf's cave. In an "inner fable," the wolf explains why he and the fox are enemies. Long ago, when the lion, the king of the beasts, was sick, all the animals except the fox came to him with cures. The wolf suggested that the fox be hanged. Warned by the panther, the fox appeared at court, justifying his absence with a tale of pilgrimage. His proposed cure involved flaying the wolf in order to make a blanket for the king. The fox then usurped the wolf's position as regent. Courtiers entertained the king; birds sang songs comparing the king's suffering to the passion of Christ. The lion recovered, and the animals returned to their homes, scorning the dying wolf. Switching to the outer fable, the story continues: the wolf shows himself to the angry crowd of village animals, thereby allowing the calf to escape. The wolf is impaled by the steer, and the fox writes his epitaph.

Noteworthy is the degree of humanization of the animals, which will be seen again in the *Ysengrimus* and in Old French fable literature, culminating in the *Roman de Renart*.

# *ÉCHANSON/ÉCHANSONNERIE*

. The Old French title *échanson* was given to the members of the household of a lord who were charged with serving drinks at the lord's table. The closest equivalent title in English is "cupbearer." In the royal household, servants bearing the title *scancio* (from Frankish *\*skanjo* 'drink-giver') or *pincerna* (a Late Latin word, from a Greek expression meaning "to mix for drinking") appeared under the early Merovingians, and their successors continued to function throughout the medieval period and beyond. The vernacular word was derived from the former title, but in official Latin the title *pincerna* prevailed from the time of the accession of Hugh Capet. Under the Merovingians, the cupbearers were placed under the authority of a *princeps pincernarum,* but under the early Capetians they seem to have been placed under the authority of the *bouteiller,* or butler, and their corps may have formed his whole department. In the ordinance of 1261 governing the royal *hostel* or inner household, the first document to describe the organization of the royal household of the Capetians, the *échansonnerie* or corps of *échansons* constituted one of the six *ministeria* or *mestiers* of the *hostel,* and it retained that standing thereafter. In 1291, the official staff of the *échansonnerie* consisted of five *échansons* (including the *grand échanson,* or head of the corps); four *bouteillers,* or butlers; four *barillers,* or coopers; two *portes-barils,* or barrel bearers; and one *potier,* or potter, but the number of officers tended to grow over time. The *échansons* and *bouteillers* probably served in rotation, as their successors cetainly did, and one was always in the personal service of the king.

# *ÉCHECS AMOUREUX*

. A commentary in French on an allegorical poem of the same name in the manner and tradition of the *Roman de la Rose*. This lengthy romance (some 30,000 octosyllabic lines), was composed by a layman between 1370 and 1430 and is extant in five manuscripts of the Bibliothèque Nationale. Built on a personified chess game, the *Échecs* contains a complete world-view—an informative mythography—that makes frequent references to the *Rose*. Close in time to writers following in the wake of the *Rose,* such as Chaucer, Deschamps, and Machaut, the mythography gives a reading that bears witness to its time, is not religiously motivated, and is the only complete explication of any poem in the tradition of the *Rose*. The unknown secular poet drew on many of the same sources

as Jean de Meun but also found inspiration in Vincent de Beauvais, Brunetto Latini, and others.

# ÉCHIQUIER DE NORMANDIE

**.** Henry I, king of England and duke of Normandy (r. 1100/06–35), established the Échiquier de Normandie, like its counterpart in England, as a central commision of royal finances. Like the English exchequer, the Norman *échiquier* had two main branches: an auditing board that balanced royal accounts and received revenue owed to the king-duke and a court that sat in judgment of cases concerning royal finance. Under the Anglo-Norman kings, the Norman exchequer generally met twice a year at Caen, although not necessarily at the "hall of the exchequer" that still survives. During each session, royal officials sat at a large table covered with a checkered cloth to reckon and collect the rent owed from specific lands. The checkered cloth, which gave the institution its name (Lat. *scaccarium,* Fr. *échiquier* 'chessboard'), served as a sort of abacus, with counters that were moved and stacked in different columns to demonstrate amounts owed and received. As in England, the financial accounts of the exchequer were later recorded on rolls of parchment, the earliest of which survives for Normandy from 1180, in fragmentary form.

After the conquest of Normandy by Philip Augustus in 1204, the Norman exchequer was moved first to Falaise and then to Rouen, where it remained, presided over by commissioners from Paris instead of Anglo-Norman lords. The exchequer's financial duties diminished under the French kings, but it remained the chief administrative and judicial body in Normandy.

# ÉCOUIS

. The church of Écouis (Eure) was founded by Enguerran de Marigny ca. 1310 and finished within three years. Its original timbered ceiling was replaced by red brick in the 18th century. The 14th-century statues within are among the masterpieces of Late Gothic sculpture: SS. Nicaise, Marguerite, François, Martin, Laurent, Cécile, Agnès, Jean-Baptiste, and particularly a splendid Véronique displaying the head of Christ on her veil.

# EDUCATION

. The educational system in 5th-century Gaul was based on the Greco-Roman model, which, like the Germanic one, was male-oriented. Boys were educated at home until age seven, when they were sent to a primary school to learn to read, write, and count (unless the family had means to provide a private tutor), then at twelve to a secondary school to learn Greek and Latin grammar, and at fifteen possibly to one of the rare centers of higher learning to study rhetoric. These schools declined and eventually disappeared in the following centuries.

Germanic society emphasized the practical education of young men as warriors; their skills were perfected largely through hunting. Christianity reoriented written culture toward the sacred writings and taught the masses through sermons and the liturgy. In the early Middle Ages, centers of learning were primarily religious, both clerical and monastic. Charlemagne issued capitularies requiring each diocese and monastery to have a school. The great monastic schools, such as Saint-Gall and Saint-Riquier, boasted fine libraries. The program studied comprised the Trivium (grammar, logic, and rhetoric) and the Quadrivium (geometry, arithmetic, astronomy, and music); the Carolingian reform of handwriting and the 10th-century introduction of punctuation facilitated reading. But even greater changes were taking place outside the monastery. The church to a large extent succeeded in christianizing the practical warrior education of the military elite through the ideals and institutions of chivalry. Changes in the liturgy emphasized the predominant role of the priest. And the schools that were to be the most influential in the coming centuries, many of which were to develop into universities, were growing in revived urban centers, such as Orléans, Paris, and Montpellier, influenced by the Italian schools in Bologna and Salerno.

Besides these universities, municipal lay schools developed in the 12th century in Flanders and by the 14th in many other regions. These schools, financed by the municipalities, taught the bases of the Trivium. Colleges for poor pupils were founded, often by papal initiative, starting in the 14th century. Children of the humbler classes received practical and manual education in apprenticeships in the trades, and the poorest

probably were put to work at about age seven. Also characteristic of the late Middle Ages is the increasing vulgarization of religious knowledge to the laity, as seen in the preaching efforts of the mendicant orders, the foundation of religious communities for laymen, and the proliferation of religious woodcut images and, by the end of the 15th century, of books.

Throughout the Middle Ages in France, the entire Jewish population learned to read in separate schools. There were at all times both supporters and opponents of female education; women were educated largely at home or in convents in the early Middle Ages. In the high and late Middle Ages, while women were generally excluded from the universities, there was nonetheless a tendency to favor some female education, as witness Héloïse and Christine de Pizan and the widespread iconographic motif of the Virgin reading at the moment of the Annunciation.

# EDWARD I

(1239–1307). King of England and duke of Aquitaine (1272–1307). Henry III of England's grant of Gascony to Edward gave his son the start on a career that was to engage him in the last Anglo-French war of the 13th century. Nonetheless, Edward did not enjoy real control over the administration of Gascony until he became king of England and duke of Aquitaine in 1272. It was in part the tension between these two positions that led to war with Philip IV.

In 1273, Edward did homage to Philip III for Gascony and then visited his duchy, where he captured his rebellious vassal Gaston de Béarn. Their dispute was negotiated to an end in 1278. On leaving for England, Edward appointed his first seneschal, whose administration was unpopular and resulted in a number of cases appealed to the Parlement de Paris, cases that had no grave diplomatic repercussions. Edward himself resolved problems arising from the Treaty of Paris, gaining most notably the Agenais in the Treaty of Amiens (1279). His fortune held when Philip III's death in 1285 kept Edward from having to choose between, on the one hand, the demands of his Gascon vassals not to fight in Aragon and his own policy of peace on the Continent, and, on the other, his duty as a vassal of the king of France to participate in the invasion of Aragon.

Edward's relations with the newly crowned Philip IV appeared amiable in 1286, when he returned to Gascony. Edward performed homage, compromised over Quercy, and mediated between Philip and Aragon. This harmony did not last. From 1292, conflicts

between English and French sailors led to appeals to Philip. The issue came to involve Edward's feudal status in Gascony when Philip emphasized an incident between crews of English ships and a ship from Bayonne. The situation that Edward had always sought to avoid was realized. He refused summons to appear before the Parlement de Paris. To Edward, however, the crisis appeared to have been averted in 1294 with a secret arrangement whereby, in return for surrendering Gascony to Philip, Edward would receive back Gascony with Philip's sister Marguerite in marriage. But once Philip took custody of Gascony, he broke this agreement and the war began. Edward's troubles in Scotland and Wales kept him from pursuing his cause forcefully until 1297, when, as an ally of its count, he landed in Flanders. A truce and papal mediation soon followed. Edward married Philip's sister but did not regain all of Gascony until 1303, when rebellion in Bordeaux and his other difficulties brought Philip to hand over Edward's duchy. In 1306, Edward granted Aquitaine and the Agenais to his son, Edward, Prince of Wales. The prince's officials took charge of these lands in 1307, and Edward I died that same year.

# EDWARD II

(1284–1327). King Edward I of England relinquished the duchy of Aquitaine to his son, the future Edward II, in 1306. After his father's death the next year, Edward II inherited, along with the English throne, the generations-old quarrel of the Plantagenêts with the kings of France over the family's French lands. In an attempt to secure peace, Pope Boniface VIII had arranged in 1299 a betrothal between Edward and Isabella, daughter of King Philip IV of France; the marriage took place early in 1308. Nonetheless, the fundamental problem of reconciling Edward's status as an independent monarch with his position as vassal of the French king caused two recurrent tensions: conflicts over appeals by Edward's Gascon subjects to the Parlement de Paris and insistence by the French crown that Edward do homage, a claim exacerbated by the rapid turnover of French kings during Edward's reign. France's aid to Scotland in its resistance to Edward added to the difficulties. Official attempts at mediation, as at the Process of Périgueux in 1311, achieved little, but Edward's personal efforts, such as his journey to Paris to do homage in 1313, smoothed over some of the problems.

Ultimately, the tension between the two crowns erupted in the War of Saint-Sardos. In 1323, one of Edward's vassals violently resisted attempts to construct a French royal bastide near the priory of Sardos in the Agenais. This incident and Edward's failure to do homage to King Charles IV of France since the latter's accession in 1322 led Charles to declare Edward's lands forfeit in 1324. Warfare in that year reduced Edward's holdings to a coastal strip running from Bordeaux to Bayonne. In 1325, Queen Isabella traveled to France and negotiated a settlement for Edward with her brother Charles: Edward was to do homage and regain his lost territory. Edward fell ill, and his son, the future Edward III, took his place, after receiving the duchy from his father. Charles failed to return the conquered lands, so in 1326 Edward II resumed administration of Aquitaine. That year, however, Isabella and her lover, Roger Mortimer, invaded England and overthrew Edward II before he could act effectively in the duchy.

# EDWARD III

(1312–1377). King of England and claimant to France. The son of Edward II and Isabella of France, Edward III became king of England in 1327, when his mother led a coup that deposed his father. Through his mother, Edward was the grandson of Philip IV of France and nephew of Louis X, Philip V, and Charles IV. He was therefore nearer in relation to the last Capetians than was Philip VI of Valois. But the successions of Philip V and Charles IV had established precedents excluding the succession of daughters, and the French princes decided in 1328 to exclude those whose claim was through the female line. At that time, and in 1329 and 1331, Edward had rendered homage to Philip VI for his French fiefs, acts implying acceptance of Philip's succession. But despite this Valois diplomatic victory, the issue of Edward's claim to the throne did not disappear, and it became a major subtheme of the Hundred Years' War.

Edward laid claim to the throne in 1337 and by 1340 was using the title "King of France." His reasons for reviving his claim were twofold. First, it transformed the feudal dispute over Gascony that had triggered the war from an unequal contest between the king of France and a rebellious vassal to a contest between equals. Second, it allowed Edward's partisans in such areas as Flanders and Brittany to support his cause without

technically rebelling against the throne. It was thus an important diplomatic and propaganda tool in his war with France.

How seriously did Edward take his claim? There is little doubt that his major aim in the war was to defend and secure his patrimony in Gascony, and in a number of negotiations he seemed willing to relinquish his claim to the throne of France in exchange for full sovereignty (rather than feudal tenure) over a Gascony freed of French territorial inroads. Edward was a master opportunist, and keeping his claim alive gave him many opportunities. Yet it is also probable that Edward and many of his English followers thought that his becoming king of two kingdoms was at least within the realm of possibility. Indeed, in the three years after the capture of King John II at Poitiers in 1356, culminating in the campaign against Reims and Paris in 1359, Edward must have felt within reach of this goal. In fact, it was always unlikely that Edward could have been accepted as king by a sufficient number of the French nobility. His great-grandson Henry V actually came closer to making good on the family claim.

*Stephen Morillo*

# EDWARD, THE BLACK PRINCE

(1330–1376). Son of Edward III of England. Edward of Woodstock, Prince of Wales and Aquitaine, known as the Black Prince, was the eldest son of Edward III and the father of Richard II. He was the chief English commander in France throughout the second phase of the Hundred Years' War (1355–70) and from 1362, by his father's creation, the ruler of Aquitaine, England's greatest possession in France. Like his father first and foremost a warrior, he was regarded by his contemporaries as the model of chivalry and the greatest knight living. His personal prowess aside, he was a competent though not brilliant field commander and was victorious in a series of campaigns in France and Spain. Heir apparent all his life, he died a year before his father, and the throne went to his ten-year-old son, Richard.

Edward's military career began at the age of sixteen, at his father's greatest victory, the Battle of Crécy (1346). After a profitable *chevauchée* (or mounted raid) through Languedoc in 1355, Edward led another the next year into Poitou. Although caught and forced to fight by John the Good, king of France, near Poitiers, he emerged victorious in one of the most spectacular English successes of the war. Outnumbered by perhaps 25,000 French, Edward's 6,000 troops, mostly longbowmen, handily won the Battle of Poitiers on September 19, 1356, capturing thousands of prisoners, including the king of France himself. His second most notable victory, at Nájera (April 3, 1367), was the culmination of a campaign launched into Spain to settle the succession of Castile, and

though it resulted in the temporary victory of the pro-English party there and the capture of Bertrand du Guesclin, the constable of France, it also seems to have been in this campaign that Edward contracted the disease that incapacitated him in the last years of his life.

His rule in Aquitaine cannot be called successful; he was never able to discipline the unruly Gascon nobility, and the taxation required for the campaign of Nájera sparked a revolt in 1369 that Edward met with great cruelty, the most notable example of which was the destruction of Limoges. In 1371, in bad health and unable to stem the encroachment of the French into Aquitaine, he returned to England, where he became involved in the domestic politics of the last years of his father's reign until his premature death in 1376.

# EGIDIUS DE MURINO

(fl. mid-14th c.). Music theorist named as the author of *De motettis componendis,* which gives some simple precepts for the composition of isorhythmic motets. One source names him as the author of the *Tractatus de diversis figuris,* elsewhere ascribed to Philippus de Caserta. He is praised as a theorist along with Philippe de Vitry and Jehan des Murs in two 14th-century motets that enumerate names of musicians in their texts, *Musicalis scientia/Scientie laudabili* and *Apollinis eclipsatur/Zodiacum signis.* He may be identifiable with the composer Egidius named in the Chantilly codex (ca. 1400) or with a number of other musicians of the same name.

# EINHARD

(ca. 770–840). Frankish scholar and biographer. The author of the 9th-century *Vita Caroli,* the first known western biography of a secular leader since late antiquity, was

born to noble parents in the Main Valley. As a boy, Einhard was educated at the monastery of Fulda and soon after 791 went to the palace school at Aix-la-Chapelle, headed by Alcuin. He became a close friend of Charlemagne (r. 768–814) as well as his adviser, official representative, and probably the supervisor of the building program at Aix.

After Charlemagne's death in 814, Einhard remained at the court of Louis the Pious (r. 814–840), as adviser to Louis's eldest son, Lothair I (d. 855). In 830, he retired with his wife, Imma, to a monastery founded by him on lands granted by Louis. The area became known as Seligenstadt (City of the Saints) after the church there that Einhard had dedicated to SS.Marcellinus and Peter and in which he placed relics of the two saints acquired by nefarious means. He died March 14, 840.

Einhard's extant writings include seventy letters, the treatise *Historia translationis BB. Christi martyrum Marcellini et Petri,* the short *Quaestio de adoranda cruce,* and the *Vita Caroli* (ca. 829–36). The biography is based on Einhard's personal knowledge of Charlemagne and events at Aix between his arrival there and 814, as well as on written sources and likely the eyewitness accounts of older members of the court for the years before ca. 791. Composed in an excellent Latin, the *Vita* shows the influence of various classical writers, above all of Suetonius's *De vita Caesarum,* particularly the life of Augustus. Like many Carolingian authors, however, Einhard did not borrow mindlessly from his sources but selected and manipulated his material to accord with what he wanted to say.

# ELEANOR OF AQUITAINE

(1122–1204). When Duke William X of Aquitaine died in 1137, he entrusted his fifteen-year-old daughter and heiress, Eleanor, to King Louis VI. The king quickly arranged to marry her to his own heir, Louis VII (r. 1137–80). Eleanor brought to the marriage the important duchy of Aquitaine, the southwest quadrant of France, which had long been fairly independent of the king.

Eleanor and Louis VII, who succeeded to the throne almost immediately after his marriage, were related within the "forbidden degrees," and their union was thus officially consanguineous. Abbot Bernard of Clairvaux pointed out to them that they were related within "four or five degrees": both were descended from King Robert II, as Eleanor's

great-grandmother Hildegard, wife of William VIII of Aquitaine, was the illegitimate daughter of Duke Robert of Burgundy, King Robert's son. However, the royal couple paid little attention to this relationship until, after ten years of marriage, it became clear that Eleanor was not going to produce a son. Their only child so far had been a daughter, Marie.

By 1147, when Eleanor accompanied her husband on the Second Crusade—and was rumored to have flirted with her uncle, Raymond of Antioch—Louis began to express doubts about the legitimacy of their marriage. Although when they stopped in Rome on the way home, the pope urged them not to be concerned about the degree of their relationship (and indeed, promised them a son), Louis continued to worry. Finally, in 1152, after the birth of Alix, their second daughter, he divorced Eleanor on the grounds of consanguinity and shortly thereafter married Constance of Castile.

Louis apparently had not anticipated that Eleanor would herself remarry, but she did so at once, to Henry, the young count of Anjou and duke of Normandy, who became Henry II of England (r. 1154–89) just two years later. She took Aquitaine with her to her new husband, and the duchy remained in English hands until the Hundred Years' War.

Eleanor and Henry had a son, William, within a year—indicating that Louis's failure to have a male heir had not been *her* fault. Although this son quickly died, Eleanor and Henry had four more: Henry, Richard (king of England, 1189–99), Geoffroi, and John (king, 1199–1216). Eleanor retained her title of duchess of Aquitaine even while she was also queen of England, and when her son John succeeded to the English throne she personally did homage for Aquitaine to the French king so that John would not have to do so.

Eleanor seems to have used her position, both as queen of France and as queen of England, to act as a patron of the arts. Louis and Eleanor contributed to the rebuilding of Suger's abbey church of Saint-Denis, often credited with being the first Gothic church, and Eleanor gave the abbey, by her husband's hand, a crystal vase of ancient origin. In England, a whole series of manuscript illuminations, begun after Eleanor married Henry, are believed to have been influenced by artistic styles from the southwest of France. Because her grandfather Guilhem IX wrote troubadour lyrics, some scholars have also thought that Eleanor's court may have influenced the rise of romances and courtly poetry in northern France in the mid-twelfth century.

Eleanor was a formidable woman—Henry II found it necessary to keep her imprisoned for part of their married life—who, as wife of two kings and mother of two more, strongly influenced the politics of both France and England in the 12th century. When she died in 1204, she was buried at the Poitevin foundation of Fontevrault, where Henry and Richard were already buried.

# ELECTION

. The word "election" has an ecclesiastical meaning, describing the process for choosing abbots and bishops. It also referred to the geographical jurisdiction of the the fiscal officers called *élus.* Yet it had a particular significance when applied to organs of the royal government. It meant the selection of officials on the basis of merit, rather than their being handpicked by the king and a few of his closest advisers. Election was an attempt to eliminate corruption, nepotism, and cronyism. Various ordinances of reform in the 14th and 15th centuries required that officers be "elected" by the royal council, which often contained men who were not of the king's own choosing. In practice, this requirement of election was not always observed, but it was relatively successful in the case of the Parlement de Paris, where "election" became a form of cooptation that gave this court considerable practical independence.

# *ELEDUS ET SERENE, ROMAN DE*

. Extant in a single manuscript (B.N. fr. 1943), *Eledus et Serene* is a Picard reworking of an earlier (lost) Occitan adventure tale, possibly in the form of a chanson de geste. The lovers are mentioned in several southern French works, the earliest being Matfre Ermengaud's *Breviari d'Amor* of 1288. Lacking its ending and with important lacunae, the poem nonetheless contains 7,314 octosyllabic couplets in its French version, which was composed in the early 14th century. It may be a fictionalized account of the struggles of the Romans and West Goths with the Vandals.

Reinhard, John R., ed. *Le roman d'Eledus et Serene.* Austin: University of Texas Press, 1923.

# ELNE

. Founded by Celto-Iberians in the 7th century B.C., the *oppidum* of Illiberis occupied a naturally fortified site above the River Tech. Renamed Helena in the 4th century A.D. in honor of St. Helena, the mother of the emperor Constantine, Elne (Pyrénées-Orientales) was the administrative and religious capital of the Roussillon during the Visigothic period. It was made a bishopric in 571, fell to the Muslims in 719, and was recaptured by the Franks fifty years later. Its richer neighbor Perpignan, however, eventually supplanted Elne in the 17th century. The Romanesque cathedral of Sainte-Eulalie, consecrated in 1069, is one of the oldest in France. Its basilica plan, with doubleaisled nave and no transept or apse, dates from the 11th century. The chevet is surrounded by the foundations of a Gothic chancel, vestige of a grandiose 14th-century project that was soon abandoned. Only the south tower, decorated with arcatures and Lombard arcades, is original. The side chapels are Gothic. The adjacent cloister (1172–86), is constructed of two sets of twin colonnettes alternating with square pillars of white marble. The historiated capitals, originally polychrome, contain sculpted scenes of a remarkable realism. Only the south walk abutting the church is wholly original (1175); the other parts were reconstructed in the 14th century after the town was sacked in 1285. Of the original two stories, the upper was destroyed in the 19th century.

# *ÉLU*

. When the French crown sought to levy taxes in the early years of the Hundred Years' War, some of the resistance to paying arose from popular distrust of the honesty of the collectors. In 1340, an assembly in northern France promised a tax if its own appointees collected it. In 1345, the king proposed that each region choose the people who would collect the taxes. In 1347–48, the Estates of several regions granted large sums to be collected by their own nominees. In 1355–56, the Estates General of Languedoil promised taxes to be appointed under the supervision of persons appointed *(élus)* by the Estates. The use of such *élus* not only appeared as a reform to those who distrusted royal officers, but it provided useful new machinery for dealing with "extraordinary" revenues that were becoming increasingly regular. In 1360, when the ransom of John II required collection of the *aides* and *gabelles* on a regular basis, the *élus* became permanent royal officials. An *élu* had responsibility for a geographical district that became known as an *election.* For most of the 14th century, this term was not used because it coincided with a diocese of the church. Subsequently, however, the units were divided and the *élections* became smaller and more numerous.

packed into cells on the metallic base, leveled, dried, fired, ground, and polished.

Decorative enameling, practiced by the Celts and Romans in Gaul before the Middle Ages, seems to have been eclipsed during the early-medieval period by inlaid jewelry. Enameling was revived in the 12th century in Limoges and the Rhine and Moselle river valleys. Originally confined to monastic workshops, by the mid-13th century production became commercialized, with a resultant diminution in quality. Most enamelwork, whether monastic or commercial, was for religious purposes: reliquaries, pyxes, gospel covers, censers. Among secular objects, one finds candlesticks, marriage caskets, and heraldic emblems.

The enameling techniques practiced in medieval France were principally *cloisonné* and *champlevé*. In *cloisonné* work, the powdered enamel is placed in separate cells formed from narrow metal strips or wires, to which the fused enamel adheres. These strips form a raised design above the baseplate, to which they are often soldered; the metalwork is ancillary to the enamel. In *champlevé* work, which largely supplanted *cloisonné* by the mid-12th century, the enamel fills cells encised in the baseplate, and the metal (often gold) left after cutting away the cells takes on a design importance of its own, with the metal and enamel playing harmoniously off one another.

Mosan and Rhenish enamels are easily distinguished by their colors, with greens and yellows predominating. A rich blue dominates most Limoges work. Limoges specialized in *champlevé* caskets and reliquaries, to which was often riveted a head or figure in high relief by repoussé (modeling sheet metal with hammer and punches).

In the 14th century, a new style imported from Italy and Spain, *basse-taille,* began to predominate in French production. This is a combination of techniques including carving, engraving, and enameling. Precious gold or silver was engraved and carved in bas-relief, then transparent enamel was fused level with the uncarved parts, allowing the design to show through. The most splendid example of *basse-taille* is the gold cup commissioned

by John, duke of Berry, as a gift for his brother, King Charles V. It is now in the British Museum.

# *ENFANCES*

. The genre in medieval literature in which the legend of the hero is completed by a return to his birth and youth is called *enfances*. Primarily a phenomenon of epic literature as works complete in themselves, *enfances,* composed after the narration of the heroes' adult exploits, seek to outline the origins of their lineage. The mystery of the birth, which frequently involves a fault committed by a supernatural being, is elucidated, often with recourse to folktale and myth. The heroes' first exploits mark them as destined for greatness. Most of the epic heroes are the subject of such treatment of their early lives, for example: the *Enfances de Charlemagne,* the *Enfances Guillaume,* the *Enfances de Vivien,* the *Enfances Ogier,* and the *Enfances Godefroi* in the *Naissance du chevalier au Cygne*. There is often a partial treatment of the theme, as in the figure of Guiot in the *Chanson de Guillaume,* but in these instances the treatment varies, with emphasis on the youth's fear and inability to tolerate hunger. The genre is visible in the apocryphal *Évangiles de l'enfance,* which recount the childhood of Christ, such as the *Protoévangile de Jacques* and the *Livre de la naissance de la bienheureuse Marie et de l'enfance du Sauveur,* and elements persist in romances, where there is a search for the hero's origins (Gauvain, Lancelot, Merlin, Tristan). As an echo of the Middle Ages, Rabelais made the genre larger than life in his parodic genealogy and youthful exploits of first the son, Pantagruel, then the father, Gargantua.

# *ENQUÊTEUR*

. Beginning ca. 1247, the crown periodically commissioned a small group of special investigators and judges, probably no more than twenty or so at a time, to uncover abuses of power, malfeasance, and other irregularities committed by public officials in France. To Louis IX belongs the credit of creating these *enquêteurs,* although earlier and contemporary rulers in France and elsewhere occasionally commissioned vaguely similar sorts of investigators. Louis's *enquêteurs,* largely Dominican and Franciscan friars, were originally commissioned to receive complaints on the eve of the king's departure for crusade. The courts they held as they traveled about the country were deliberately informal in order to encourage ordinary people to appear before them. Other lords, like the king's brother Alphonse of Poitiers, followed Louis's lead and employed *enquêteurs* in their lands as well. After Louis's return from crusade in 1254, he regularly issued new commissions to panels of *enquêteurs* right up until his death. The same pattern is discernible in the policies of Alphonse.

After the king's death in 1270, *enquêteurs* were retained in the royal administration, and much of their work, even if more formally conducted than in Louis's time, continued in the tradition he set. Although friars were rarely appointed after 1270, the *enquêteurs* continued to investigate abuses of power and initiate salutary reforms. Known as *enquêteurs-réformateurs on* account of this work, their investigative powers could nevertheless be used in less beneficent ways. The later Middle Ages saw the *enquêteurs* employed as agents to mulct local communities and provincial notables, to such an extent that there was sometimes strong opposition to their being commissioned in the first place.

# ENTRIES, ROYAL

. During the 14th century, French towns instituted a unique ceremony for receiving kings and particularly for celebrating the *joyeux avènement* of a new monarch. The ceremony was a composite of ecclesiastical, courtly, guild, and legal-administrative gestures for dealing with dignitaries. Because the clergy had always led visiting kings to the central church of a town, the ecclesiastical rites of *adventus regni* supplied a ritual core that the nonecclesiastical participants extended and embellished. From the 1350s, the clergy made new kings confirm their coronation promises to preserve the church and clergy as part of the welcoming ceremony. Secular corporations soon had the promises and privileges given to them by previous kings reenacted and confirmed by the kings they received in their midst. By the middle of the 15th century, the series of encounters between the king and various corporations were considered a single event, the "happy" or "joyous" entry ceremony. This ceremony consisted of extramural urban processions to greet the king, an intramural royal procession with urban escorts, and the production of spectacles along the processional route. In their entries, new kings carried the aura of the coronation throughout the realm, but they also exited from ritual theaters choreographed by clergy and nobility and entered one staged by inhabitants of the civic sphere.

Entry ceremonies were vehicles for urban-style politics of decorum. Various privileged and social groups found a place to assert their identities and to propagate ideas: youth groups greeted kings beyond the city's gates with songs, mock battles, or morality plays; guilds in livery met them to profess loyalty; magistrates in their robes of office rendered obeisance and solicited the confirmation of local liberties. During the 15th century, royal officials and—in cities where they resided—parlements exited the town and joined the celebrations, to acknowledge the king as their head and to receive promises of continuing royal favor. The entry procession grew to become the largest and most frequent form of assembly with the king, and its ordonnance was overseen by the parlements and royal chancery. Its performance was scripted to be a mirror for the prince and a model for the community: a rehearsal for the accord and reciprocity between kings and cities that should guide both of them in mundane political practices.

The ceremony appropriated forms of expression from many quarters. For example, the addition of the canopy over the king in urban processions resulted from the interplay between Corpus Christi celebrations and the occasion of an entry. The feudal *droit de gîte* (hospitality) was one among many precedents for gift giving and hospitality at royal entries. Liturgical and biblical plays augmented the culture of the entry. Poets and clergy advanced the coronation ceremony and the notion of the royal cult in entry pageantry. Communal and juridical corporations set forth their views with equal ardor. The ceremony flourished both because it opened the public space to interplay among social, political, and aesthetic practices and because its form corresponded to the actual social practices and political roles of its participants. Only in the 17th century was the entry confined to a celebration of royal power alone and only then consistently tagged "royal" rather than a "joyous" or "happy" entry.

Records of entries were kept in guild and town registers, royal chanceries, and parlements, as well as occasionally in chronicles. They are among the best sources for street theater, public art and rhetoric, and popular culture generally. Entries flourished in France and throughout Europe in the late Middle Ages because the *bonnes villes* and fledgling royal administrations found them useful ways of defining a state tradition and for establishing a record of political relations. The discourse of the entry ceremony affirmed peace and law; it sought to eclipse the horror of military conquest and sacking. Towns and officials staged them to give form to actions before the ruler and to place their acts securely into the public laws and history of France.

# ERIUGENA, JOHANNES SCOTTUS

(810–877). Little is known about the life of this Irish scholar who taught the liberal arts at the court of Charles the Bald in and around Laon in northern France. Although the earlier view of Eriugena as a lonely genius in a barren period has recently been modified, the wealth of his erudition and his remarkable knowledge of Greek make him stand out among his Carolingian contemporaries.

Eriugena first emerges as a participant in the controversy surrounding predestination in 850–51. In his campaign against the monk Gottschalk of Orbais, archbishop Hincmar of Reims asked Eriugena to refute Gottschalk's doctrine of double predestination (to eternal life and to eternal death), which the latter claimed to be the true Augustinian teaching. Eriugena, who is not known to have been a monk or priest, wrote *De divina praedestinatione* in compliance with Hincmar's request. Instead of advocating Hincmar's view of a single predestination, however, Eriugena argues that predestination is nothing more than God's eternal knowledge, and that humans have freedom of choice even after the Fall. After the condemnation of his views at the councils of Valence (855) and Langres (859), Eriugena never returned to the arena of ecclesiastical politics.

For Eriugena's next assignment, Charles the Bald ordered a new translation be made of the works of Pseudo-Dionysius the Areopagite. The Greek texts of this 6th-century Syrian mystic, who was identified with St. Denis, patron of the Franks, had become available through a codex donated by the Byzantine emperor Michael the Stammerer to Louis the Pious in 827. Through his reading and translation of Pseudo-Dionysius, Eriugena was introduced to certain features of Greek theology, such as the unfolding of the universe according to procession and return and the methods of negative and affirmative theology, which he subsequently incorporated into his own thinking. He also

translated Maximus the Confessor's *Quaestiones ad Thalassium* and Gregory of Nyssa's *De hominis opificio*.

Eriugena's major intellectual achievement was the *Periphyseon,* or *On the Division of Nature*. This work, written ca. 864–66, is the mature product of his reflections on Greek theology as well as on the western tradition of Augustine and Boethius. Its most impressive feature is its scope: an inclusive treatment of all of nature, under which he classifies both God and creation. Structuring the universe along the lines of procession and return, Eriugena discusses all major theological and philosophical issues of his time in a dialectical fashion. The discussion of nature ranges from God (nature that creates but is not created) through a treatment of the divine ideas (nature that is created and creates) and of spatiotemporal creations (nature that is created and does not create) back to God (nature that does not create and is not created). In addition, his *Expositiones in ierarchiam coelestem* (on Pseudo-Dionysius's *Celestial Hierarchy*) and his homily *Vox spiritualis aquilae* have become famous.

Due to the later association of Eriugena with the heresy of Amalric of Bène, Pope Honorius III in 1225 ordered that all extant copies of the *Periphyseon* be burned. Yet, through direct and indirect influence, Eriugena's voice continued to be heard in the medieval Christian-Platonic tradition. In connection with idealist philosophy and process theology, Eriugena's ideas also stimulate modern thinking.

# ERWIN DE STEINBACH

(fl. late 13th-early 14th c.). Since Johann Wolfgang von Goethe's paean to Erwin de Steinbach in *Von deutscher Baukunst,* published in 1772, the name of this master mason at Strasbourg cathedral has been enshrined in the pantheon of legendary builders. The

historical reality of his career can be pieced together from scattered documents and inscriptions: a 1284 contract mentions Erwin as master of the works; a destroyed 1316 inscription in the chapel of the Virgin, erected against the jubé, names him as its builder; and the master of Niederhaslach is identified as the son of Erwin, "once the master of the works at the cathedral of Strasbourg," on his 1330 tomb. The epitaph of an Erwin who was "governor" of the Strasbourg fabric and died on January 17, 1318, may commemorate a financial administrator rather than the builder; the famous 1277 inscription that appended the Steinbach surname to Erwin and credited him with beginning the "glorious work" of the west façade disappeared before 1732 and cannot be verified. Nevertheless, if Erwin was master from the late 1270s into the early 14th century, he would have built a considerable portion of the west front and may well have been the author of Projects B, B1, and D, which are among the most stunning architectural drawings ever produced. Project B, which corresponds closely to the portal zone as built, introduced the dramatic freestanding tracery that screens the masonry of the façade block. Based on the vocabulary of French Rayonnant architecture, these Projects showcase the elaborate optical effects that preoccupied designers in the later 13th century.

# ESQUIRE/ESCUIER

. By ca. 1100, the term *escuier* (derived from Lat. *scutarius* 'shield man' but normally represented in Latin by *scutiger* 'shield bearer' or *armiger* 'arms bearer') was generally applied, with *va(s)let* 'young vassal' and *damoisel* 'lordling,' to young men serving as apprentices to knights. Down to ca. 1180, most sons of knights who were not destined for a clerical career probably undertook this apprenticeship, and most of those who did so seem to have been dubbed to knighthood around the age of twenty-one. After that date, however, the growing expense of knighthood led increasing numbers of apprentice knights to postpone formal dubbing, or *adoubement,* indefinitely and to serve in battle with less than full equipment through most or all of their lives. Such adult but undubbed noblemen were known at first by a variety of titles, including *valet* and *damoisel* (later *damoiseau,* Occitan *donsel*), but the first of these titles survived in this sense only in

Poitou and Saintonge, and the second only in Burgundy and the south generally. In northern regions, all other titles were entirely replaced ca. 1250 by escuier, which gave rise to the English equivalent "esquire" and its shortened form "squire." By 1300, a substantial majority of the male members of the knightly nobility of France never received knighthood, and, according to region, *valet, damoiseau,* or *escuier* had come to be used by these men as a title of nobiliary rank on the model of *chevalier,* in the form N de X, *valet/damoiseau/escuier.* At first, these three equivalent titles designated the lowest grade of the nobility, below that of simple knight, but from ca. 1300 they were increasingly reserved for those undubbed noblemen who were rich enough to serve, like knights, as heavy cavalry; nobles who could not afford to fight in this way were increasingly distinguished by the title "gentleman" *(gentilhomme),* common to all persons of noble or "gentle" birth.

After ca. 1200, adult nobles of the rank of esquire commonly formed part of the household of kings, princes, and barons, performing functions thought to be appropriate to their rank. Some of these were distinguished by special titles, such as the *ecuyer-valet tranchant,* or "cutting squire," who cut his lord's meat.

# *ESTAMPIE*

. Although few examples survive, we know that the *estampie* was both a poetic form and a dance. The poetry is described in the anonymous *Doctrina de compondre dictatz* (ca. 1300) and the *Leys d'Amors* compiled by Guillaume Molinier during the first half of the 14th century. The subject of the *estampie* was "love and homage"; it was set in couplets with a refrain and possibly one or two *envois.*

The musical *estampie,* described by Johannes de Grocheio (ca. 1300) as having both vocal and instrumental forms, was composed of verses and refrains, with melodies and couplets. The melody of the refrain differs from that of the verse, thus distinguishing the *estampie* from other types of musical dance forms, such as ballade, virelai, and rondeau, in which the melody of the refrain was also used in the verse. Twenty-six poetic texts without music and two with music have been identified as *estampies,* but none seem to have the required refrain. Seven complete instrumental *estampies* and one fragment survive, all conforming to Grocheio's description.

Nothing is known of the steps, but Grocheio described it as a complicated and elegant dance. The word *estampie* may come from the Latin *stante pedes,* meaning standing, or stationary, feet.

# ESTATES (GENERAL)

. An assembly of nobles, clergy, and representatives of towns from the whole kingdom or at least most of Languedoil. Although the term was not used until 1484, "the three estates" are mentioned as early as the mid-14th century, and it is convenient to refer to the Estates General when distinguishing assemblies of this type from those of a more restricted social and geographical character.

Great barons and prelates had long attended royal assemblies of one sort or another, and the king had sometimes summoned nonnoble laymen as individuals who were experts on the matter to be discussed. "Estates" applies only to assemblies to which numbers of towns were told to send representatives. Such a summons not only established towns as the voice of the "third estate" (nonnoble laymen), but it also gave assemblies a representative character for the first time. After 1484, nobles and clergy were convened in most districts to choose representatives when the Estates were summoned, but for a long time persons from other than the third estate were summoned as individuals and did not serve as representatives of their social peers.

When the towns began sending representatives, the model for such action was the naming of a proctor *(procurator)* to represent a corporate body's legal interests before a court. Towns gave their representatives a "procuration" empowering them to act on behalf of the town. This fact has persuaded some historians to view the early Estates as analagous to a judicial proceeding subject to the rules of Roman and canon law, but in practice those who attended these assemblies seem not to have accepted that model. Their actions suggest that they understood these assemblies in more traditional, feudal terms, in which an obligation to give counsel was far more meaningful than the right of consent described in Roman law. Particularly when money was at stake, representatives often avoided making a binding commitment to anything for which they had not received precise advance instructions.

The king convened assemblies like the Estates General when he hoped such a body would be useful to him. At rare moments of crisis, the Estates tried to limit the king's authority in some area, but such exceptional action only persuaded the king to call the assembly less frequently. The Estates General was not a body whose function was to limit royal power.

The Estates General first appeared as a sort of propaganda forum in which the royal government hoped to drum up support for some potentially controversial policy. The earliest documented examples of this sort of assembly belong to 1302, 1308, and 1312, when Philip IV sought support for his ecclesiastical policies. Over the next ten years, numerous assemblies of different sorts were convened. A group of assemblies, divided by region and/or the estate in attendance, sometimes had the effect of composing what amounted to an Estates General, but the government was still experimenting.

When asked to grant taxes, the Estates usually avoided a binding commitment. In 1333, 1343, and 1346, the Estates convened, each time to deal with a crisis and with related financial issues. They gave their endorsement to financial arrangements that required subsequent local ratification. At the end of 1347, the Estates General bargained at length over measures to reform the government and agreed in principle to a large tax that, again, would be paid according to the arrangements made at regional Estates.

The Black Death frustrated the work of the Estates of 1347, and the disastrous Battle of Poitiers would do the same to the Estates that met eight years later. The Estates General met frequently during the years of the king's captivity (1356–60) but the efforts of their leaders to intimidate the royal government, and their failure to deliver the taxes they promised, persuaded the crown that they were more troublesome than useful. Meetings in 1363, 1367, and 1369 proved far more helpful to the king, but in the troubled reign of Charles VI the meetings of the Estates (1381 and 1413) led to large uprisings.

Charles VII had frequent recourse to the Estates (generally of Languedoïl only) in the years 1422–39 but still found them reluctant to rise above regional differences and make binding commitments to a royal tax. When they finally did make such a grant, he kept collecting the taxes without recourse to future assemblies. The last two medieval meetings of the Estates General were in 1468, when Louis XI used the meeting as an old-style propaganda forum, and 1484, when his daughter and son-in-law, who had custody of the young Charles VIII, used it to defuse opposition.

The Estates General could prove useful to the king, especially in time of crisis, but it could also prove troublesome. It never acquired a role that made it indispensable and therefore never became a regular institution of the French government.

# ESTATES (PROVINCIAL)

. Representative assemblies of many types and composition flourished in medieval France, becoming more active in the 13th century. In the following two centuries, membership in these meetings was frequently drawn from three social orders, or estates: the clergy, the nobility, and the townspeople. Such assemblies were held at various jurisdictional levels. Those at the provincial level were known as provincial Estates.

The chief importance of French provincial Estates from the royal point of view was that they provided a medium through which the consent of the influential inhabitants of the province could be obtained for extrafeudal taxes so urgently needed during the Hundred Years' War and the turbulent period following. They were important to the

inhabitants because, in times of war, they maintained and repaired local transportation routes. They also appointed deputies to present special grievances to the crown and to defend their interests before king and council.

The origins of French provincial Estates were multiple. They appear to have developed from the gradual blending of several main concepts to meet changing conditions. Feudalism, with its network of reciprocal relationships, gave the lord the right to summon his vassals to his court to give him aid and counsel. Many vassals soon saw advantages in attending and claimed the right to be summoned. A feudal council, gradually enlarged to include other men of influence, provided the framework for many, but not all, of the provincial Estates.

Also, the concept was growing throughout medieval Europe that one or more individuals could legally represent and commit their constituents. This depended on the organization of society into corporate groups, such as towns, monastic orders, cathedral chapters, and estates. The representative principle by which individuals could defend the rights of these corporate bodies and represent them at the court of lord or king was derived from Roman and canon law and their use of the power of attorney, through which a person could appoint someone to act for him in a court of law. The new corporate groups gradually obtained the same right and began to appoint proctors *(procuratores)* to act in their name.

By the 11th century, some ecclesiastical writers were describing French society in terms of three functional groups: those who worshiped, those who fought, and those who worked, reflecting roughly the social situation at the time. Thus emerged the belief that there were three estates: the clergy, the nobility, and the third estate. With the subsequent growth of towns and lay education, the third estate became a large conglomerate of diverse groups, chiefly inhabiting the towns. This concept of three estates led to the tripartite division of many of the assemblies that emerged.

In the case of provincial Estates that developed from the feudal council, only direct vassals of the lord were originally summoned. As a class of wealthy burghers emerged whose aid and counsel became valuable, lords gradually began inviting their representatives to attend as well. Delegates from other corporate bodies, such as cathedral chapters and monasteries, were also included.

In the 13th century, the French kings greatly enlarged the royal domain and extended their powers of suzerainty. As they were also fighting larger domestic and foreign wars, their expenses for government and warfare had increased substantially. They could no longer obtain sufficient revenue from the royal domain.

The outbreak of the Hundred Years' War placed even greater demands on the royal treasury. In the mid-14th century, the Estates General, or the regional Estates of Languedoil and Languedoc, were summoned several times to consider taxation. The experiment was unsuccessful because local Estates refused to accept their decisions. The crown then normally imposed and collected taxes without consent until the death of Charles VI. Then the dauphin, seeking recognition as legitimate heir to the throne, resorted once again to the use of Estates General and provincial Estates. Over a fifteen-year period beginning in 1421, he summoned the Estates General or the Estates of Languedoil almost every year. They voted financial assistance, but to collect the money locally usually required negotiating with the provincial and local Estates. After 1439,

Charles VII imposed taxes without consulting any central assembly, but, where customary, he continued to summon the provincial Estates to vote their share.

Estates continued to flourish in these regions, fostered by the strong provincial loyalties that characterized late-medieval France. By the late 15th century, some began to assume a stable composition and procedure. They consented to direct and sometimes indirect taxes. They comprised more than half of France, including such important provinces as Normandy and Languedoc. Elsewhere, Estates henceforth met rarely and never became part of the institutional structure.

During the reign of Charles VII, many of the more active Estates established a permanent bureaucracy and archives and levied taxes to support their own and royal expenses. The provincial Estates never challenged the authority of the monarchy and French kings usually accepted their role until well into the 17th century. They provided a useful forum for contact between the king and persons of influence throughout France.

The growth of French representative institutions was part of a trend marked by the development of similar institutions throughout much of Europe during the late Middle Ages. There were similar reasons for these parallel movements: the need by rulers to consult with their subjects and seek their support and money, especially for war; the desire of the politically active classes to act during emergencies, protect their own interests, and restrain princely excesses; and the severe economic, social, political, and demographic crises of the period, which exacerbated the level of warfare and shook the foundations of government.

In France and several other states, these developments occurred primarily at the local and provincial rather than at the national level. Because of the large size of the country, the deep-rooted particularism of the people, and the fact that the local and provincial Estates presented no particular threat to the monarchy, they were much more durable than the central assemblies.

# ESTOUTEVILLE

. The Estoutevilles were a great seigneurial family whose senior line was based at Vallemont in the Caux district of eastern Normandy. They claimed descent from a legendary Viking ancestor, Stoot (or Estout) the Dane. Robert I d'Estouteville participated in the Norman conquest of England, and his several sons by a second, Saxon, wife produced the English Stutevill families.

The main line of the Estoutevilles, in Normandy, survived until the 18th century, being loyal to the French crown after royal acquisition of Normandy in 1204. Jean II, lord of Estouteville, was captured by the English at Agincourt in 1415 and lost his lands in the subsequent English conquest of Normandy. His elder son, Louis, however, profited from the French reconquest and regained the family lands, while Jean's younger son, Guillaume (1403–1483), held several bishoprics and abbacies, became archbishop of Rouen and a cardinal, and was a major figure at the papal court for several decades.

The family produced prominent cadet lines, the most important being the lords of Torcy, descended from Estout, a younger son of Jean I, lord of Estouteville (d. 1259). Estout's son, Jean, married the daughter of a constable of France and sired a large and influential family. Their oldest son, Colart (a diminutive of Nicolas), had a military career that spanned half a century (1364–1415), and he became a royal chamberlain and councilor as well as serving fourteen years as seneschal of Toulouse. Among the younger sons were Thomas, bishop of Beauvais; Guillaume, bishop of Évreux and then Auxerre; Jean, lord of Charlesmesnil, a prominent member of the Marmouset party at the French court under Charles VI; Estout, abbot of Cérisy; and Jeannet the younger, lord of Villebon and a member of the royal household. A large number of adult Estoutevilles were active in public life toward the end of the 14th century, but many of them died in the period 1396–1416 and the family never again enjoyed so much influence.

# *ESTRABOT*

. The *estrabot* was a French lyric of mockery and insult mentioned only by Benoît de Sainte-Maure, Guillaume de Machaut, and perhaps Clément Marot. The two surviving Occitan monorhymed Alexandrine *estribotz* by Peire Cardenal and Palais, from which *estrabot* is probably derived, suggest that it was fixed in form. Its satirical nature has disappeared in the subsequent Spanish *estrambote* and Italian *strambotto*.

# ÉTAMPES

. Only three bays of the crypt remain of the original church of Notre-Dame-du-Fort in Étampes (Essonne). Founded in the 11th century by Robert II the Pious, the existing church (begun ca. 1140) is unusual in plan. A narthex, flanked on either side by irregularly shaped chapels, precedes the short nave with aisles. The choir (12th-13th c.) has a straight east end and an ambulatory of irregular plan. The early 13th-century western façade is placed obliquely in front of the bell tower, which surmounts the narthex. Its central tympanum depicts the Annunciation, the Visitation, the Nativity, the Annunciation to the Shepherds, and the Flight into Egypt. The portal on the south side of the church is directly dependent on the Royal Portal at Chartres. Here, jamb sculptures of Old Testament figures are crowned by capitals in the form of a frieze representing scenes from the life of Christ. The now mutilated tympanum depicts Christ surrounded by angels.

The church of Saint-Basile has a square bell tower, transept, and façade depicting the Last Judgment, all dating from the 12th century. The rib-vaulted nave, double aisles, and choir with aisles were reconstructed in the 15th century. Renaissance additions include lateral chapels and stained-glass windows.

Other buildings in Étampes include the church of Saint-Martin (begun ca. 1140), which has a dangerously leaning late 12th- or early 13th-century tower; the church of Saint-Gilles, founded in 1123 by King Louis VI; and the huge 12th-century keep, or donjon (ca. 1176–1236), where Philip II Augustus confined his queen, Ingeborg of Denmark, from 1201 to 1213.

# ÉTIENNE DE BOURBON

(ca.1190/94-ca. 1261). Born at Belleville-sur-Saône, Étienne studied at Mâcon and later at Paris. He entered the Dominican order in 1223 at Lyon. One of the first inquisitors, Étienne was present at Mont-Aimé in 1239 when 180 heretics were burned to death. After traveling extensively, he retired to Lyon in 1250 to compile a collection of exemplary lives. Combining medieval folkloric images and details with theological

interests, the *Tractatus de diversis materiis predicabilibus* is organized according to the seven gifts of the Holy Spirit and is the first representative of this genre. Étienne died before the work was completed. He wrote five sections, on fear, piety, knowledge, fortitude, and wisdom (unfinished). More commonly known as *Tractatus de donis Spiritu Sancti* or *De septem donis Spiritu Sancti,* this work includes the first account of the legendary female pontiff Pope Joan. Étienne's collection includes almost 3,000 stories from a great number of sources. Since his accounts of heroic Christians have affinities with the figures of Arthurian romance, his work registers a movement between and integration of popular and theological literary interests and cultures.

# ÉTIENNE DE FOUGÈRES

(d. 1178). King's chaplain and member of the chancellery of Henry II Plantagenêt, Étienne de Fougères was appointed bishop of Rennes in 1168. His writings were principally in Latin and, of these, two saints' lives, those of St. Firmatus and Abbot Vitalis of Savigny, survive along with his account of the embellishment of his cathedral at Rennes. The only French poem ascribed to him, the *Livre des manières* (1174–78), is preserved in a single manuscript (Angers 304 [295], fol. 141–50). Dedicated to the countess of Hereford, it is written in the western dialect of the Plantagenêt domain in monorhymed quatrains of eight-syllable lines. Since all of Étienne's other known writings were in Latin, the possibility exists that the *Livre des manières* is an anonymous translation from a Latin original by Étienne. The *Livre des manières* is the first of a number of Old French texts treating the estates of society. It is divided into two equal parts: lines 1–672 treat the higher orders of society (king, clergy, knights), while lines 677–1,344 discuss the lower estates (peasants, bourgeois, and women). Dividing these sections is the famous quatrain on social order:

> Li clerc deivent por toz orer,
> li chevalier sanz demorer
> deivent defendre et ennorer,
> et li païsant laborer.

(ed. Lodge, 11. 673–76)

("Clerics should pray for everyone, knights unhesitatingly should defend and honor, and peasants labor.") The purpose of the poem is to summarize the church's teachings on the social and political problems of the day, which Étienne does in a practical rather than theoretical manner. He laments the absence of justice in this world and exposes the dangers of vanity, criticizing the rich for being slaves to money and the church hierarchy for not practicing virtue. Étienne closes by warning against concupiscence and by regretting his involvement with women in his youth.

# ÉTIENNE TEMPIER

(d. 1279). A former master in the University of Paris, Étienne Tempier became bishop of Paris and then, in 1270 and 1277, issued two condemnations of philosophical errors in the teachings of Parisian masters. The first condemnation, December 10, 1270, specified thirteen philosophical errors identified with the teachings of the so-called Latin Averroists, led by Siger de Brabant, and included such ideas as the oneness of the intellect, the eternity of the world, the mortality of the individual human soul. On March 7, 1277—the third anniversary of the death of Thomas Aquinas—Tempier condemned a list of 219 propositions and declared excommunicated those who held or defended them. This list, hastily compiled and unsystematic in presentation, was composed mostly of Averroist positions but included propositions drawn from Aquinas. Influenced by Franciscan masters and theologians of an Augustinian orientation, this condemnation hastened the separation of philosophical inquiry and theological reflection in the university faculties.

# EUCHARISTIC VENERATION AND VESSELS

. The early church looked upon the eucharist more as an action than as an object. Veneration of the host in stasis was a distinctively medieval development. It was given impetus by the controversial views of Berengar of Tours (d. 1088) and the more orthodox responses that followed. Berengar did not altogether deny the Real Presence but held that no material change in the bread and wine was necessary to bring it about. The contrary view, the doctrine of Transubstantiation, was much discussed in the 12th century and defined as official church teaching by the Fourth Lateran Council of 1215. This theological ferment contributed to the popular movement of venerating the divine presence in the consecrated host. A prominent facet of this was an eagerness to gaze upon the host, which led to the ritual of the elevation. This originated in early 13th-century Paris, where the priest kept the host carefully concealed until the moment of consecration, when he held it aloft for all to see. The custom spread rapidly throughout Europe and became, along with the subsequently introduced elevation of the chalice, the dramatic high point of the Mass. Closely related was the feast of Corpus Christi, celebrated on the Thursday after Trinity Sunday; it was fervently championed by St. Juliana of Mont-Cornillon (d. 1258) and established by Pope Urban IV in 1264. The date came to be marked by a festive procession involving the entire population of a town as participants or spectators. The host was carried by the principal clergyman of the area, who stopped at set points to raise it in blessing over the faithful. This is the probable origin of the devotional practice known as the Benediction of the Most Blessed Sacrament. During the late Middle Ages, the ceremony was performed in church each evening after the singing of the *Salve Regina* at the close of Compline; this explains the French term for Benediction, *Salut,* which was applied also to the chant.

The principal eucharistic vessels are the chalice, ciborium, monstrance, and pyx. The chalice, used in the celebration of the Mass, was originally a glass cup similar to those in everyday use but came to be made of precious metal as early as the 4th century. In earlier centuries, the cup was broad, sometimes with handles, as it was used for the communion of the faithful, while it took on its familiar elongated shape in the Middle Ages when communion under the species of wine was reserved to the priest. The ciborium, of early-medieval origin, was shaped like a more ample chalice and was covered with a lid; its function was to store and to transport the hosts before and after consecration. The monstrance, or ostensorium, was used to display the host, as in Corpus Christi processions and at Benediction. Both its earlier form of a vertical glass cylin der enclosed in a gothic gable and its later form of a flat glass window surrounded by emanating rays were derived from reliquary designs. The pyx was a small box of varying shapes used to house the host. Its most familiar form in later centuries was that of the flat cloth-covered case in which the priest carried communion to the sick; it can also be seen in miniatures of 15th-century French books of hours, suspended over the altar beneath a round canopy.

# EUDES

(Odo; ca. 857–898). King of the West Franks (r. 888–98). The first king of the Robertian (Capetian) line, Eudes was the elder son of Robert le Fort, marquis of Neustria. Heroic defender of Paris during the Norse siege of 885–86, he succeeded Hugues l'Abbé (d. 885) as chief defender of Neustria. His prowess, the remoteness of the German Carolingian Arnulf, and the extreme youth of the French Carolingian heir apparent Charles the Simple led to his election as king after the deposition of Charles the Fat (887).

Eudes's election was opposed by Archbishop Foulques of Reims, who, after the king had suffered a series of defeats and when he was faced by a series of revolts, crowned the adolescent Charles the Simple in 893. Civil war engulfed the realm until Charles's submission in 897. Eudes died on January 1, 898, recommending the succession of Charles to his supporters but passing on his vast family lands and power to his brother, the future Robert I.

Eudes was the first of the Capetian kings to be interred at the abbey of Saint-Denis, which was to become the traditional burying place of the dynasty.

# EUDES RIGAUD

(d. 1275). Little is known of Eudes's life prior to his becoming a Franciscan ca. 1236, except that he was born in northern France to a devout family of the knightly class. By 1240, he was studying theology at Paris and succeeded John of La Rochelle in the Franciscan chair of theology a few years later. During his regency, ca. 1245, he commented on the first three books of Peter Lombard's *Sententiae* and collaborated with three of his Franciscan colleagues in commenting on the *Rule of St. Francis (Expositio regulae quaturo magistrorum).* In March 1248, Eudes was elected to the archiepiscopal see of Rouen, where he served until his death.

As archbishop, Eudes served Louis IX on several missions, including the Treaty of Paris (1259), which saw the Plantagenêts cede Normandy to the Capetians. Eudes is

perhaps best remembered for the careful records that he kept of his regular visits to the parishes and churches in his archdiocese to inquire into the lives of both clergy and religious. From these records, we get a clear picture of the life of the church in the third quarter of the 13th century (1248–69) and of the controversies and contentions, such as those of the Pastoureaux, that occupied the archbishop.

# EUGENIUS III

(d. 1153). Pope. A disciple of St. Bernard of Clairvaux and a Cistercian abbot of Saints Vincent and Anastasius, Bernard of Pisa became Pope Eugenius III in 1145. Under his pontificate, the first formal crusade bull was issued in 1145. The crusade proved unsuccessful, and subsequently both Roger of Sicily and Louis VII of France urged Eugenius to begin a new one. Eugenius refused to accede to their wishes. Skilled in diplomacy, Eugenius had recognized the anti-Byzantine features of the proposed crusade, and he had no wish to antagonize the Byzantines and their allies. Forced from Rome in 1146 by his archenemy Arnold of Brescia, Eugenius journeyed to France, where he remained until 1148. While there, Eugenius held a synod and a council at Reims. At the council, in 1148, Gilbert of Poitiers, once a student of Bernard of Chartres and later bishop of Poitiers, was charged with heresy. With the help of Roger of Sicily, Eugenius returned to Rome in 1149. In the Treaty of Constance, concluded in 1153, Eugenius and Frederick I Barbarossa reached an important agreement guaranteeing a relationship of mutual as sistance. Trained as a Cistercian monk, Eugenius remained a devout religious despite his involvement in the politics of his day. His good friend St. Bernard dedicated *De consideratione* to him. Eugenius died on July 8,1153, and his cult was authorized in 1872 by Pope Pius IX.

# ÉVREUX

. The episcopal city of Évreux (Eure) was the seat of a Norman county in the 11th and 12th centuries before being acquired by the French crown, but it is best known as the center of an apanage that gave its name to a cadet branch of the royal family in the 14th century. In 1307, Philip IV the Fair granted the county as an apanage to his younger brother Louis (d. 1319), and in 1317 Philip V erected Évreux into a peerage.

Louis of Évreux arranged marriages between his children and their royal cousins. His daughter Jeanne married Charles IV, and his son Philippe (1301–1342) married Jeanne (1312–1349), the daughter of Louis X and heiress of Navarre. Philippe and Jeanne continued this policy. Their daughter Blanche (1331–1398) married the much older Philip VI near the end of his life; their son, Charles II the Bad (1332–1387), married the daughter of King John II the Good. Although Jeanne was excluded from the French crown and also from her inheritance of Champagne and Brie, she and Philippe did become rulers of Navarre in 1328. They acquired clients and connections throughout northern and western France as well as in Champagne, attracting followers with grievances against the reigning house of Valois, including a growing body of reformers who wished to overhaul the royal government. They generously endowed the Collège de Navarre at the University of Paris, which became a center for reform-minded preachers and intellectuals in the second half of the 14th century and enjoyed continuing support from the Évreux family.

At his mother's death in 1349, Charles the Bad became king of Navarre, and for the next fifteen years the Évreux family played a major, often disruptive, role in French politics. Charles engineered the murder of the constable of France in 1354 and extorted from the crown the favorable treaties of Mantes (1354) and Valognes (1355). In 1356, John II arrested him for conspiring against the crown, and he spent the next seventeen months in prison. Critics of the monarchy clamored for his release, but after his liberation in 1357 Charles pursued an independent policy that involved a division of the kingdom. He gradually lost the support of the reformers in his party, many of whom rallied to Charles V after the royal army crushed the Évreux-Navarrese forces at Cocherel in 1364. Charles retained some political influence until his last conspiracy was exposed in 1378. His son, Charles III of Navarre (r. 1387–1425), the last male member of the family, ceded Évreux to the crown in 1404.

The most dangerous domestic enemies of the early Valois kings, the Évreux princes played a major role in weakening the monarchy during the mid-14th century, but their legacy was more positive and enduring. Many of their reform-minded followers became associated with the Marmousets, the political faction that brought major improvements in governmental efficiency under Charles V and Charles VI. Reformers associated with the Collège de Navarre enjoyed significant influence at court until well past 1400.

*John Bell Henneman, Jr.*

Although the town of Évreux was largely destroyed in World War II, some medieval buildings have survived. Overlooking the Eure, a bulky 17th-century mask covers the 12th-century twin towers of the cathedral of Notre-Dame and conceals the edges of the Gothic rose window. This strange façade prepares the visitor for the conglomeration of styles within. In 1119, Henry I of England burned the original church, dedicated in 1076–77. Construction took place sometime in the 12th century, but another fire in 1196 destroyed the fabric above the arcade, as shown by the Romanesque cluster piers and simply molded arcades that subside to late 13th-century triforium and clerestory. This fusion of Gothic and Romanesque elements continues throughout the eight-bay nave with side aisles and 13th-14th-century lateral chapels. The later 13th-century triforium is part of the same building campaign, which continues in the clerestory and choir. The four-bay 13th-14th-century choir terminates in a seven-sided east end with single ambulatory, four radiating chapels, and threebay chevet. On the exterior, a Flamboyant north-transept portal flaunts lacy gables and crossing tower, in contrast to the 16th-century Renaissance classicism of the west portal. Some heraldic and figural stained glass from the 14th and 15th centuries remains in the ground-level and triforium windows, but modern glass dominates.

On the south side of the cathedral, the 15th-century cloister was originally two stories tall but has been reduced to one. A 15th-century bishop's residence also survives.

Named after the local St. Taurinus, the founder of the diocese of Évreux, the church of Saint-Taurin has a stylistically variegated fabric. The structure consists of elements from the first quarter of the 12th century to the 18th. The 17th-18th-century façade leads to a three-story interior with a Romanesque north elevation and a south elevation from the Renaissance. The 12th-century north elevation has bulky cruciform piers and a round-headed arcade, with a later triforium and clerestory. Three sides of the polygonal east end hold 15th-century stained glass with scenes from the life of St. Taurin. Housed in this east end is the 13th-century gilt-silver reliquary of St. Taurin, produced by a Parisian atelier and representative of ornate Gothic house shrines.

# EXEMPLUM

**.** Until the 9th century, the exemplum was one of the *figurae sententiae* of Greco-Roman and, since Tertullian, of ecclesiastical rhetoric, a form of simile employed in semantic amplification to offer proof by demonstrating the common characteristics of two or more phenomena. By the 12th century, the use of the exemplum had spread beyond the monastic into the scholastic, urban milieu and into the vernacular; in the 13th and 14th centuries, exempla became themselves text and tale, literary and cultural artifacts assembled and preserved in numerous collections, such as Jacques de Vitry's *Sermones vulgares* and Petrus Alfonsus's *Disciplina clericalis*.

The medieval exemplum has been defined as "a short narrative said to be true and meant to be inserted in an oration (usually a sermon) for the purpose of convincing an audience by means of a salutary lesson" (Bremond, pp. 37–38). It is a didactic, originally oral tale based on pagan, Judeo-Christian, or medieval written and oral traditions or on a preacher's real-life experiences; it often sketches a realistic, sometimes humorous picture of the medieval world. The exemplum illustrates simple moral principles by simple narrative means: it is uncomplicated structurally, and logically it relies on analogy and metonymy. The ease with which it could be used and endlessly repeated precluded, once the standard corpus of stock exempla was established, the renewal and development of the genre beyond the 14th century.

# *EXPOSITIO MISSAE*

. The tradition of expounding the meaning of liturgical ceremonies began in the 4th century with the mystagogical catecheses, sermons in which the rites of baptism, confirmation, and the eucharist were explained to newly baptized adult converts. Liturgical commentaries were subsequently written by Pseudo-Dionysius the Areopagite (ca. 500), Maximus Confessor (580–662), Germanus of Constantinople (ca. 640–733), and others. The first western treatise exclusively devoted to liturgy is the *De ecclesiasticis officiis* of Isidore of Seville (ca. 560–636), which in turn served as a source for the *Expositio antiquae liturgiae Gallicanae* attributed to St. Germanus (bishop of Paris 555–76), the only description of a Gallican Mass ordo. But the bulk of *Expositiones missae* dates from the Carolingian period, when the Roman Mass was being assimilated by the Frankish church; these treatises are therefore important sources of information about the texts and ceremonies of the early Franco-Roman Mass and were among the sources consulted by Amalarius of Metz and other Carolingian commentators. By the 12th century, the *Expositiones* were no longer in circulation as such, because they had become incorporated into the canon-law literature and the liturgical book known as the Pontifical.

# *EXULTET*

. The Easter vigil, celebrated Holy Saturday night and ending Easter morning, began in both East and West with a lamplighting service *(lucernarium)*. In some of the western rites, but not originally at Rome, this involved the lighting of a large candle while a deacon sang a special Easter hymn, the *Praeconium Paschale*. There were many texts in use for the *praeconium,* but the one that became the standard medieval text (a Gallican text that came into the Roman rite via the supplement to the Hadrianum sacramentary) began with the words *Exultet iam angelica turba caelorum*. There were multiple melodic traditions, but the one that became standard was closely related to the tone for the Preface

of the Mass, that is, the prayer of the priest leading up to the Sanctus. Late in the Middle Ages, this melody was also adapted to another lengthy solo chanted by a deacon, the announcement of the dates of the movable feasts that took place at the bishop's Mass on Epiphany, January 6.

# F

# FABLE *(ISOPET)*

. Of the celebrated inventor of the genre, Aesop of Thrace (6th c. B.C.), medieval writers and compilers of fables knew little more than the name, from which derives the appellation *Isopets* of the French collections. Most medieval fables belong, in fact, in the Latin tradition of Phaedrus (1st c. A.D.), a naturalized Roman of Thracian origin, whose name had been forgotten by the 10th century. The earliest French version of Aesop's fables appears to be Guillaume Tardif's rendering (before 1498) of Lorenzo della Valle's Latin translation (ca. 1440) of thirty-three Greek fables.

Aesop's fables were eclipsed by Aesopic fables of the Phaedrean kind from the 10th to the 14th century. On Phaedrus's work (some 150 fables) are based four major groups of Latin adaptations: those of Avianus, Adémar de Chabannes, Rufus, and Romulus. Three Latin prose versions are attributed to the legendary Romulus: the *Romulus ordinarius* (eighty-three fables), the *Romulus of Vienna and Berlin* (eighty-two fables), and the *Romulus of Nilant* (fifty-two fables). Two Romulus versions are in verse: the *Romulus of Nevelet* (sixty to sixty-two fables), and Alexander Neckham's *Novus Aesopus* (forty-two fables). The *Romulus of Oxford* (forty-five fables) and the *Romulus of Berne* (thirteen fables) present abridged prose versions. Vincent de Beauvais included twenty-nine Romulean prose fables in his *Speculum historiale* and *Speculum doctrinale*.

The French fable collections are based largely on the Romulus versions: from the *Romulus of Nevelet* derive the *Isopet of Lyon* (sixty fables; one manuscript), the *Isopet I* (sixty-four fables; six manuscripts) and its prose adaptation, the *Isopet III* of Paris (forty-three fables; one manuscript). Neckam's *Novus Aesopus* is the source of the *Isopet II* of Paris (forty fables; two manuscripts) and of the *Isopet of Chartres* (forty fables; one manuscript). Vincent de Beauvais's fables were translated by Jean de Vignay in his *Mireoir historial* (first printed in 1479); an imitation of the *Speculum historiale,* entitled *Rudimentum noviciorum* and containing twenty-nine fables, was printed in Germany in 1475 and translated into French as *La mer des histoires* (1488).

In five manuscripts of the *Isopet* I, the Romulean fables are followed by eighteen fables inspired by Avianus (the *Avionnet*). A further nine fables translated from Avianus are contained in the York Fragment (ed. Warnke), and another twenty-seven are part of Julien Macho's translation (1480) of Steinhöwel's bilingual (Latin-German) edition of 147 fables of various origins, including eighty Romulean fables.

In the history of the French fable, the Anglo-Norman collection by Marie de France (12th c.; twenty-three manuscripts) is of particular importance. While her claim to have translated an English model is being increasingly discounted as an authorial topos of self-

justification, she likely knew, or knew of the *Romulus of Nilant,* with which she shares most of the initial forty of her 102–104 fables. Nevertheless, for more than 60 percent of her work no precise sources have been found, a fact that may demonstrate her originality or point speculatively to undocumented influences from as far away as Greece, Arabia, and India. That she greatly enriched the tradition of the Aesopic fable is manifest from the adaptations of her work by Berechiah ben Natronai *(Mischle Shu'alim),* by the compilers of the *Romulus of Robert,* the L(ondon)B(russels)-G(öttingen) fragments and an Italian fable collection, and by the author of the *Promptuarium exemplorum* (ed. Warnke).

The case of Marie de France's fables illustrates that despite a long history of written transmission, the genre is fundamentally an oral one. It shares with popular songs, proverbs, riddles, and fairy and animal tales the common sources of folklore and has, like them, an essentially didactic purpose. The lesson to be drawn from a fable is summarized in an opening "promythium" or in a closing "epimythium," or "moral." In keeping with their didactic function, fables usually adhere to a simple structural paradigm according to which the plot line progresses straight-forwardly from (1) the presentation of the characters (mostly but not always animals) and (2) their intentions to (3) their distribution into opposing roles (the strong against the weak, the poor against the rich), and from there to (4) their interaction and (5) its results.

Because of its origins, intent, and structure, the fable is often denied any intrinsic literary value. Only rarely are fables expanded into skillfully told stories in which the artistic purpose outweighs the didactic, or into a vast creation, such as the animal epic of the *Roman de Renart.* While the fable may have had to wait for La Fontaine in the 17th century to be admitted into the French canon of respectable literary genres, its medieval manifestations offer, despite their didactic dryness, invaluable insights into the everyday life of the society they describe and reflect.

# *FABLEL DOU DIEU D'AMORS*

. Written in the mid- to late 13th century, probably in Hainaut, the *Fablel* is among the earliest surviving allegorical first-person love visions. It occurs in a single Picard

manuscript (B.N. fr. 1553) in 142 monorhymed decasyllabic quatrains. The narrative includes a bird debate and an encounter with the God of Love.

# FABLIAU

**.** Concentrated in the north of France and dating from the 13th and first half of the 14th centuries, the fabliaux are relatively brief and generally comic tales, composed in the octosyllabic rhymed couplets that are the standard narrative form of the period. Although many Chaucerians designate certain of the stories in *The Canterbury Tales* as fabliaux, the term is more properly, if not exclusively, applicable to a large group of French texts. Over forty surviving manuscripts preserve fabliaux. Some include only a single one alongside texts from other genres; others are veritable compendia of fabliaux, with one (B.N. fr. 837) containing around sixty of the works. A traditional controversy about the fabliaux concerns their public and their fundamental character. Conceptions of the fabliaux were shaped largely by Joseph Bédier's 1893 study. Bédier, who had comparatively little regard for the purely literary merits of the fabliaux but a keen appreciation of their value for social historians, found a correlation between the rise of the genre and the growth of cities and of a thriving bourgeoisie. His conclusion was that, just as the courtly circles had their literature (e.g., courtly romances, cultivated lyric poetry, *lais*), now the bourgeois public had its own. This conception of origins and audiences offered a convenient explanation for the fabliaux' apparent lack of literary pretentions, their frequent choice of middle-class or peasant settings, their frankness in sexual and linguistic matters, and their irreverent and often unsubtle humor. The fabliaux, in other words, were everything the courtly romance was not, and they must therefore belong to a different social class.

In fact, Bédier's views were considerably less categorical than this summary suggests; he acknowledged, for example, that the fabliaux were heard and enjoyed in courtly circles. Nonetheless, what most scholars retained from Bédier's book was a sharp division of literature into courtly and bourgeois genres; and, while a few studies questioned or qualified his theories, they continued to be widely accepted until challenged by Per Nykrog in 1957. Acknowledging most of the characteristics Bédier identified in the fabliaux, Nykrog disagreed that the genre was the product of a bourgeois mentality. Identifying in a number of fabliaux certain situations and formulae that would likely be appreciated only by a courtly audience, he concluded that the fabliaux often exploit or parody courtly texts and situations. They are thus as courtly, in their way, as are romances and *lais*.

Although a necessary corrective to Bédier's theory, Nykrog's study is at times too uncompromising. Numerous fabliaux clearly do not reflect courtly ideals or language,

even as parody. The range of fabliau subjects and methods is extraordinarily wide, varying from linguistic playfulness and complex comic developments to unsubtle anecdotes and simple dirty jokes. Some are "courtly" in some sense; others are not, although we have no convincing evidence that even the crude sexual jokes might not appeal to inhabitants of courts. Moreover, as Jean Rychner demonstrated in 1960, we often have two or more variants of the same fabliau, with the situation or the language apparently adapted to different publics.

A second and more persistent controversy concerns the definition of the genre and the precise constitution of the fabliau canon, questions that have never been satisfactorily resolved. Bédier formulated the most frequently quoted definition: Les *fabliaux sont des contes a rire en vers* ("Fabliaux are comic tales in verse"). The generality of this convenient definition holds a certain appeal but also limits its usefulness considerably. Furthermore, the emphasis on humor may raise a question instead of resolving it. The inspiration or purpose of a fabliau is not always easy to define, and it is in any case of questionable value as a generic determinant. If we assume with Bédier that all fabliaux are humorous, we should then routinely exclude from the genre all compositions that we judge to be (for example) primarily moralizing, including a number of texts once published with fabliaux. An example is the well-known *La housse partie,* a work sometimes excluded, despite its cleverness and its general resemblance to fabliaux, simply because it is considered more serious than humorous.

On the other hand, this criterion is not applied uniformly, and scholars often include among the fabliaux a few works that make a serious moral point in a clever fashion. In *Du vilain qui conquis paradis par plait,* the protagonist argues his way into heaven by pointing out that the sins of those already there (e.g., Peter, who denied his Lord) are considerably more serious than his own.

One frequent approach to the problem of definition is to study self-nominated fabliaux, that is, those that describe themselves as being fabliaux. Critics may thus limit themselves to those works, which number about seventy, or they may begin with those in an attempt to define the properties of the genre and then include in the canon other poems that exhibit those same properties. Even this approach is problematical, however, because it assumes that medieval authors possessed both a specific consciousness of literary categories and a precise terminology for them, and the evidence does not convincingly support such an assumption. For example, many of the compositions commonly taken as fabliaux describe themselves in a variety of ways, as fabliaux, fables, *contes* ("stories" or "tales"), *dits* (short narratives), and a number of other terms.

The formulation of a satisfactory definition is by no means a simple matter. In practice, each critic is left to construct a canon. Bédier listed 147 works he considered to be fabliaux; Nykrog expanded that number to 160. Noomen's critical edition of the fabliaux, begun in 1983, will include 127 texts. Most likely, the specific confines of the genre can never be established; at the edges of the genre, at least, works that are presumably fabliaux tend to merge with other forms and types of texts. The solution to the problem of taxonomy is necessarily more pragmatic than technical or scientific: there is a solid core of texts accepted as fabliaux by virtually all critics, and from a study of those compositions we can derive reliable notions of the themes, styles, and techniques characteristic of the genre.

The fabliaux, although related by inspiration and often by specific thematic properties to earlier works from Europe, the classical world, and even the Orient, came into existence in France toward the end of the 12th century. Some scholars identify Jehan Bodel as the first author of fabliaux; Bodel, who died in 1210, was in any case the first whose name is known. Most fabliaux are in fact anonymous, but a number of fabliau authors in addition to Bodel are identified; they include Gautier le Leu, Henri d'Andeli, Eustache d'Amiens, Rutebeuf, Baudouin de Condé, and his son Jean (d. 1346), who was the last known composer of fabliaux.

The shortest of the fabliaux is Du prestre *et du mouton* (signed by one Haiseaus or Haisel) at eighteen lines. The longest run to some 1,300 lines, with the single exception of *Trubert,* a 3,000-line text that is often but not always considered a fabliau. Most contain between a hundred and 300 lines, with the average around 250.

Whether or not the fabliau is taken as a bourgeois genre, it is true that the characters most often belong to the middle class or to peasant society. Only rarely do knights play prominent roles. In some works, such as *De celle qui se fist foutre sur la fosse de son mari,* a knight may appear, but he is often not the protagonist, a role taken in this text by his squire. Similarly, descriptions of activities associated with the nobility are rare but not unheard of: *Le chevalier qui recovra l'amor de sa dame* offers an account of a tournament through which a knight will win a lady's love and is identifiable as a fabliau only because of a ruse perpetrated by the knight in the second half of the poem.

Readers interested in social history will find in these texts fascinating reflections of the daily life of the period. The characters in fabliaux are very often observed working, eating and drinking, and carrying on all the usual activities of middle-class and peasant existence. We have descriptions of houses, towns, professions (notably merchants, millers, and farmers), and leisure activities. References to work, food, and drink are extremely common in the fabliaux, but the activity most frequently depicted is sexual. Of course, sexuality within marriage is hardly ever treated, and sexual satisfaction between spouses is practically unheard of. When it is mentioned at all, marital sex is dismissed with a very few words or else reduced to an emphasis, not on desire or sexual intimacy, but on sex organs. A memorable but not atypical example is the absurd story told in *Les quatre souhaits saint* Martin, where a husband and wife, granted four wishes, initially have their bodies covered with genitals and have to use all their remaining wishes to return to normal.

Much more common is seduction or attempted seduction outside of marriage. This can hardly come as a surprise, not only because sexual humor is almost universally extramarital, but also because fabliau characterizations imply and invite such dalliances. Husbands are routinely presented as cruel or stupid, while many wives are found to be lascivious creatures with gargantuan sexual appetites, either ripe for an adulterous relationship or already embroiled in one. Adultery is a prevalent theme in the fabliaux. Nykrog calculated that sixty-three of his 160 fabliaux dealt with love triangles. Almost invariably, the participants in an adulterous relationship are married women and men other than their husbands, rather than husbands with mistresses. Seducers are never in short supply. Priests attempt the most seductions of married women, but they are rarely successful (only five out of twenty-two times, according to Nykrog). Knights and clerics invariably succeed.

The fabliaux frequently show an interest in language and its uses or misuses. Some are mere puns: in *Estula,* a man calls to his dog, but the dog's name, Estula, also means "Are you there?" and a thief hiding in the garden responds, "Yes, I'm here." Linguistic taboos provide the subject of *La damoisele qui ne pooit oïr parler de* foutre, a work about a young woman who finds the sexual act considerably less offensive than the word. Several texts offer amusing anecdotes that play on the distinction between figurative and literal language. In *Brunain, la vache au* prestre, an avaricious priest tells a naive couple that whatever they give to God will be returned doubly to them; they take his words literally (as indeed he intended) and obediently give the priest their cow, but the tables are turned when the cow comes home later, leading the priest's own.

Revenge is the motivating force in some of the best fabliaux. *L'enfant qui fu remis au soleil* has a woman explain her pregnancy to her husband by noting that a snowflake fell into her mouth and grew inside her; the husband bides his time, eventually sells the child into slavery, and explains his disappearance by insisting that the hot sun melted him. *Le boucher d'Abbeville* deals with a butcher who seeks shelter in a priest's house and takes revenge when the priest refuses it to him; he steals one of the priest's sheep, trades it for lodging, shares the meat, and seduces the priest's maidservant and mistress by offering both of them the sheep-skin—which he then sells to the priest himself.

The authors of fabliaux show a keen interest in genitalia. They thus give us works in which genitals talk, multiply, detach themselves from their owners, exhibit prodigious dimensions, and are frequently personified and described in endlessly imaginative ways. At the other end of the thematic and tonal spectrum are texts of subtlety and refinement, even though they are still intended for amusement and often have seduction as their subject. *Guillaume au faucon* presents a young man who is passionately in love with his noble master's wife and who fasts nearly unto death when the lady repels his advances. When her husband asks the reason for William's suffering, the woman, inventing an explanation in order to avoid complications, replies that William has asked for her husband's falcon. Most of this text is indistinguishable from a *lai* or an episode from a courtly romance, but it presents an ingeniously humorous conclusion, turning on the pun involving *faucon* ("falcon" and "false cunt") and on the result of her pretext: he orders her to give the young man what he wants.

A commonplace of fabliau criticism concerns the anticlericalism and antifeminism of these compositions. In the former instance, it is true that the fabliaux are populated with priests who are most often avaricious or lascivious; while the reader never senses that authors are attacking the institution of the church itself, it is indisputably true that priests themselves provide a tempting and popular target for humor. The question of antifeminism is more complex. Certain female characters in the fabliaux are presented as intelligent and virtuous, and the *Borgoise d'Orliens* is treated sympathetically even as she commits adultery while her husband is being brutally beaten nearby. In general, however, the weight of evidence, drawn both from situations and from explicit authorial commentary, suggests a considerably less than favorable view of women, many of whom are explicitly condemned for lasciviousness and deceitfulness. Admittedly, the fabliaux also criticize some men, but it is often for their foolishness in trusting women or allowing themselves to be led astray by them, and the condemnation thus extends to women as well. The most extreme treatment of women is exemplified by *La dame escoilliee,* in which a wife's strong will and presumption are attributed to her having testicles, a

graphic organic metaphor for "wearing the pants in the family." Here, though, the metaphor provides the pretext for physical punishment, and a brutal operation is performed to "remove" the offending items. In case she has not learned her lesson, she is told that any repeat of her unacceptable behavior will necessitate additional surgery.

In both theme and technique, the fabliaux exhibit a wide range, as indeed we should expect of a group of some 150 texts composed over a century and a half. Some are little more than dirty jokes; others are sophisticated and subtle compositions that indulge in refined humor. Some append morals (although they often have little or nothing to do with the preceding text), while others tell their story quickly and then stop. Most are simple and economical narratives, stripped of all nonessential material, while a few go to some lengths to establish character or tone. They do not always agree about women, priests, nobles, or other subjects—or especially about the best way to tell a story. What most do agree on is the need to please and amuse their audiences. Even when the authors draw logical moral conclusions from their anecdotes, their primary purpose is in a broad sense entertainment, if not always specifically humor. The fact that they succeeded in most cases is demonstrated by their literary influence on Chaucer, Boccaccio, and other authors, by their preservation and their survival in impressive numbers into the 20th century, and by their continued ability to give us pleasure today.

# FAIRS AND MARKETS

. The fair, or *nundinae,* had roots in the Roman era and can be distinguished from the regional weekly market day by its occurrence once a year and for a period of several days. The medieval fair resembled nothing so much as a wholesalers' gathering or merchandise mart, for the fair was geared to an economy that did not support the existence during many centuries of daily retail markets. While for the most humble fair it sufficed to make available a field and some tents, towns with well-established fairs

usually provided additional amenities in the form of display rooms and housing for visiting merchants. Taxation was an important element in internal fair organization. Displays and shops were taxed, as were actual sales. Tolls might be charged on merchandise making its way to a fair. French kings conceded fairs as privileges to some locales by regalian right, uncontested except in the case of the most rebellious of lords, such as the duke of Burgundy under Louis XI.

While the Champagne fairs are the most celebrated of all medieval fairs, they were by no means the only such gatherings in France. Mention of fairs and markets in Merovingian France is infrequent, although such venerable fairs as the October Fair at Saint-Denis (founded ca. 635), just north of Paris, are duly famous. Market quarters, often called *portus,* are noted at such Merovingian sites as Champtoceaux on the Loire. The Carolingian period witnessed many markets, often of agricultural dimension, scheduled to coincide with local feast days and sometimes favored by royal privileges. A February fair was added at Saint-Denis in the late 8th century.

One must await the commercial revolution of the 11th century for a flourishing of markets and fairs in medieval France. The Lendit fair in June at Saint-Denis emerged at this time, and by 1070 Italian merchants were frequenting the Saint-Denis fairs. Fairs in Flanders appear in this era. Indeed, small fairs grew up in many regions, Normandy, Brittany, the Touraine, and Anjou being the most important.

Languedoc, with its proximity to the Mediterranean and outlets to international trade, was the site of considerable growth in fairs. Noted from the early 12th century were fairs at such towns as Moissac, Nîmes, Carcassonne, Aniane, Villemagne (Villeveyrac), Montagnac, and Pézénas. Saint-Gilles, where the feast of September 1 took on the dimensions of a fair, was the ongoing focus of southern French commerce, thanks to its connections with Genoa and Pisa in the 12th century. By the 13th century, many fairs were concentrated in small towns of the Hérault and Orb valleys, where connections between the Mediterranean coast and mountainous routes leading to northern France could be made. In the late 13th and early 14th centuries, a cycle of six fairs developed at Pézénas and Montagnac. These fairs became important sites for the repayment of debts in international commerce, particularly for the cloth trade, much in the clearinghouse tradition of the Champagne fairs.

The late Middle Ages witnessed the emergence of new fairs. The fair of Chalon-sur-Saône, the cloth halls of which can be noted in 1244, picked up some of the cloth business between Flanders, northern France, and the papacy at Avignon in the 14th century. The fair of Beaucaire in Languedoc was founded in 1464. The fairs of Geneva took up some further slack from the declining merchandise fairs in Champagne in the 14th century. To counter the shift of north-south trade to routes lying east of royal territory, Louis XI reestablished the fairs of Lyon in 1463, as an alternative to Geneva. The Lyon fairs successfully offered a market in spices and silks until Antwerp came to dominate European commercial and financial markets in the 16th century. While the fair as an economic phenomenon persisted beyond the Middle Ages in France, the heyday of the fair economy had long passed by the late 15th century.

# FALAISE

. Celebrated in legend, the mighty citadel of Falaise (Calvados) is the oldest fortress in Normandy. Built atop a rocky spur (Fr. *falaise*), it was a favorite residence of the Norman dukes. According to legend, it was from the castle windows that Robert le Diable, the younger son of Duke Richard II, spotted the beautiful Arlette, daughter of a rich tanner, doing her washing in the river. Refusing to be carried off in secret, she rode boldly through the castle gates to become the mother of William the Conqueror. It was from Falaise that William launched his invasion of England in 1066. The town was captured by Philip II Augustus in 1204, retaken by Henry V in 1417, and finally rejoined to the French crown by Charles VII in 1450.

The castle is an impressive ruin, dominated by its 12th-century square Norman keep. The curtain walls, main gate, and sixteen flanking towers are 13th-century. Within the town are the Romanesque church of Saint-Gervais (11th c., with a 12th-c. lantern tower), and the Gothic church of La Trinité (13th-16th c.), both of which sustained damage in World War II.

# FAMILY AND GENDER
# (ARISTOCRACY)

. The word "family" today usually refers to either the nuclear family or an ill-defined group of cousins and in-laws, but there was no word in medieval Latin for either of these meanings, and aristocrats probably did not think in those terms. A *stirps* or gens, which we might now translate as "family," was a group that included both the living and the dead and generally was composed of those descended from a common male ancestor and the women who had married into this group.

What we would call family life for a high-medieval French aristocrat was centered on the hereditary castle, which was both a defensible fortress and an elegant home. Until the end of the 12th century, there was generally only one married couple in a castle, the lord and lady, who served as the symbolic parents of everyone living there. With the exception of a few women attending the lady and her own daughters, she was generally the only woman in the castle. All the rest, knights, servants, cooks, chaplains, stablemen, and the like, were men. The knights who served the castellans seem in many cases to have been local men who served until they were too old to fight, perhaps in their thirties, at which time they married and settled down nearby and might in time send their own sons to serve in the castle.

The girls born to the castellan and his lady were raised and educated at home. A girl's most important lessons were in household management, for noble girls married in their teens and were expected to take over administration of a castle. A girl's husband, who might be twice her age, was generally chosen by her parents. A castle's keys hung from its lady's belt as she planned, supervised, and bought the necessary food, clothing, and supplies for everyone who lived there. She kept peace among a castle's inhabitants and even defended it if necessary while her husband was away.

Noble boys spent only the first years of their life at home. By the time they were six or eight, they had been sent to a monastery or cathedral school if their parents intended them for a life in the church; boys entered the ecclesiastical life far more frequently than girls. Those boys who became warriors were generally trained in the castle of an uncle or feudal lord rather than at home. With their knightly training complete, they might spend time on crusade or on the tournament circuit until their fathers died and they inherited. Only at this point did a young noble marry, unless he had found an heiress with her own castle. Until the 13th century, usually only one or two of a castellan's sons ever married.

# FAMILY AND GENDER (BOURGEOISIE)

. Socioeconomic status was an important factor in determining family experience among the urban residents of medieval France. The marriages of the patriciate or urban elite, for example, were generally arranged unions heavily influenced by parental desires, business considerations, and property arrangements. Marrying at a younger age (in their mid- to late teens) than women from artisanal families and with access to more comfortable and healthier living conditions, patriciate women had larger families because they experienced a greater number of fertile years and lower infant mortality. The patriciate's

greater wealth also made for larger households, since the rich could afford to keep more servants and apprentices.

Most urban inhabitants did not, however, possess the wealth, political power, or social status of the patriciate. Instead of being wealthy merchants, officeholders, or *rentiers,* they worked in the crafts or petty retail trades. These artisanal families, like those of the urban elite, were primarily nuclear in form and were headed by men who first married in their mid to late twenties. But the wives and daughters of these families were more likely to work in the family business or outside of the household, particularly as domestic servants, or in the textile or food trades. Because the economic contribution of artisanal wives to the family income could be substantial, their influence within the family may have differed from that of patriciate women, whose primary financial contribution to the family was their large dowries.

Sons of artisans frequently began an apprenticeship when they were about fourteen and moved away from home to board and train in the homes of their masters. Apprentices also came from outside of the city, migrating along with many other young men and women who were attracted by the economic opportunities offered by towns. Most of these migrants were probably poor rural residents who took low-paying jobs that made it difficult for them to save sufficient funds to marry. They, along with the city's large numbers of apprentices, servants, and widows, accounted for the extraordinarily large number of single people in medieval towns.

Urban economic prosperity or demographic experience could also affect family life. Few urban families, even among the elite, lasted beyond three generations in the male line, especially during the late Middle Ages, when plague elevated urban mortality and family and household size declined. The effect of these factors must, however, have varied regionally, since differences in local custom, law, and economy, particularly between northern and southern France, undoubtedly had a significant impact on family formation, the status of women, and domestic life in medieval towns.

# FAMILY AND GENDER (PEASANTRY)

. The basic unit of the peasant economy and social organization was the family. The basic lines of the household economy and gender roles within it were part of the negotiations

that the parents of the bride and groom undertook at the formation of a new marriage. The bride brought to the marriage a dowry that might take the form of money, cattle, land, household goods, or other assets, while the groom guaranteed the support of his wife through marriage (brideprice) in the early Middle Ages or provision of a dower in the later Middle Ages.

The work that the couple engaged in fell into separate spheres. The woman's work was primarily that of the house and village, while the men worked primarily in fields, vineyards, and highways. Women's work included the rearing and training of the children in the household; work with domestic animals, such as cows, pigs, goats, and poultry; production of cheeses, butter, linen and woolen thread, and perhaps bread and beer for the market economy; planting and harvesting from the kitchen garden and the fruit trees; and tending the hearth fire, cooking the meals, and doing the laundry. Housecleaning occupied little time in the rudimentary peasant dwellings. Women did field work on a largely seasonal basis that included weeding, hoeing, and helping with harvesting. Men's work included working with the horses and oxen used for plowing and carting; plowing and other heavy field work; construction, wine production, butchering, road repair, and so on. The roles that men and women played in the household economy were so well defined and so heavily relied upon that when one of the couple died the other most frequently remarried quickly to reestablish the unit.

Although male and female children identified with the roles they would come to play in the household economy when they were toddlers, they evolved only gradually into the tasks they would eventually perform. Thus, boys and girls of five through ten first helped their mothers in such tasks as caring for poultry, picking vegetables and fruits, and fetching water. By the age of ten, male children began to work more with the tasks their fathers assigned, such as herding, goading the ox, and other field work. Only gradually did the older teenaged boys learn to plow and girls to brew or bake.

*Barbara Hanawalt*

# FAMINE

. Conditions of death or starvation resulting from crop failure caused by poor weather, infestation by pests, warfare, or other factors were considered famine. Records depict crowds of beggars waiting for food at the gates of monasteries, peasants abandoning holdings to seek food and livelihoods in other districts, distended stomachs from attempts to live on grass and roots, and human flesh hung up for sale in the markets. For the early Middle Ages, such conditions cannot have been markedly different from normal subsistence levels of the populace, which was consistently near starvation, when endemic malnutrition caused high infant mortality and low fertility, and when a diet composed almost entirely of cereals meant that human productivity and resistance to disease were low. Given the almost total dependence of the agricultural population on cereals and the extremely low yields of agriculture at the time (between 2:1 and 3:1 yield-to-seed ratios being considered normal) any slight worsening of weather, infestation of crops, or other bad luck could cause the inhabitants of a district to begin consuming grain needed for

next year's planting, pushing them into even more dire consequences and true famine in the following year if sufficient seed had not been found elsewhere to plant at normal levels. Even the lords could suffer famine insofar as they had to waive payment of rents, tithes, and taxes and hand out food and seed grain, in order to ensure that agricultural laborers did not depart or starve to death. Moreover, even for the lord or ecclesiastical almsgivers, once local reserves were gone there was little possibility of coming to the relief of the local population, for transport and communications were poor. Thus, although the diversity of climate, soils, and topography of France meant that bumper crops in one area might be accompanied by poor harvests in another, famines could be relieved not by importing food but only, to some extent, by people taking to the roads. When year after year of low yields followed one another in many areas, the results could be social unrest and even cannibalism (as was described by the Cluniac monk Raoul Glaber for ca. 1000) or the lowered resistance and susceptibility to diseases that followed the European-wide famines of 1315–17.

# FARCE

. Dramatic farces are short comic plays usually involving a trick by which one or more characters deceives another for personal gain. Major popular entertainments in urban areas in the 15th and 16th centuries, they were often played on trestle stages that were quickly set up in streets or squares on holidays. The small number of roles required few actors and few stage props, making the plays easily transportable. Farces were written and played by amateur groups, such as student organizations, municipal confraternities, and trade guilds. The comic theater owes a special debt, however, to the Basoche, or guild of law clerks, a chapter of which was found in every major city in France. It was no doubt the play-loving law clerks who were responsible for the large number of legal themes and courtroom scenes in the farces. When professional acting troupes began to appear in France in the 16th century, they too were avid practitioners of the genre.

The earliest extant play of the farce type is *Le garçon et l'aveugle* (13th c.), in which a boy tricks his blind but miserly master out of both money and clothes. The play's title lacks a genre designation, and it was probably not called a farce. The first recorded use of "farce" to designate a dramatic work is found in a document from Paris dated 1398, which forbids the playing of *jeux de personnages par manière de farces*. There are numerous references in 15th-century documents to the staging of farces, but no plays have survived that antedate the *Farce de maistre Pathelin,* written in the 1460s. About 175 farces have survived from the hundred years following the appearance of *Pathelin*.

Most of these farces portray the comic side of domestic life. The characters are ordinary people who exemplify everyday relationships (husbands, wives, mothers-in-law, neighbors) or who engage in familiar occupations (shoe-makers, tailors, tavern keepers,

servants). Farces combine dramatic simplicity with brevity to create a rich variety of easily recognizable character types. Among the most prominent are the domineering wife, the henpecked husband, the braggart soldier, and the dull-witted student. Characters of this kind permit quick and usually light satirical thrusts at common social abuses. Though the characters may be familiar, the plots of the plays are not realistic reflections of ordinary events in the lower-middle-class households portrayed. The action of a farce depends on improbable coincidences or unbelievable disguises. Moreover, when one considers that all the roles were played by men, it is easy to see that realism was not a quality that a medieval audience sought in a farce.

The world in which farce characters live is essentially amoral, because their actions have no ultimate consequences. Unlike the morality play, the farce has no heroes and embodies no ideals. Neither is there a higher power to reward good and punish evil. Its characters are wholly absorbed in gaining some immediate material advantage through trickery. The farce world is thus a kind of ethical jungle in which only the cleverest survive. And no character, however clever, is immune to being tricked. The wily lawyer Pathelin, for instance, cheats a clothier out of some expensive cloth, only to be cheated in turn by a simple, but cleverer shepherd. *Maistre Pathelin* exemplifies an axiom of the farce world: *à trompeur, trompeur et demi.*

A large number of farces deal comically with the problems of conjugal relationships. The wife in *Le cuvier* is a domineering woman who makes her timorous husband, Jaquinot, do all the housework—an ignominious role in medieval society. To ensure that he forgets nothing, she has him make a list of the chores. When later she accidentally falls into the washtub, Jaquinot refuses to pull her out because that chore is not on his list. He finally extricates her only after she agrees that he will henceforth be master of the house. Unfaithful and deceptive wives also are a frequent topic of these plays. In *Resjouy d'amours,* the wife hides her lover in a sack when her husband returns home inopportunely. In a fit of suspicion and jealousy, the latter sets fire to the house to smoke out his rival. At his wife's pleading, he saves the sack because it contains all their "worldly goods." When no lover comes out of the burning house, he asks his wife to forgive him for his suspicions. Such plays, while making the spectators laugh, had the effect of ridiculing weak husbands, who were perceived in the Middle Ages as a threat to social order and stability.

Other objects of ridicule in the farces are dull-witted students *(Maistre Mimin),* country bumpkins *(Mahuet),* cowardly soldiers *(Colin, fils de Thévot),* and bombastic lovers *(Les trois amoureux de la croix).* The kind of ridicule such plays utilize may be lightly satirical, but in all cases the comic elements take precedence over the satire.

There is, however, a subgenre of the farce in which social satire was clearly the primary goal of the playwright. This is the allegorical farce, in which the characters are no longer ordinary people who are sometimes foolish, but fools of various stripes in the guise of personified abstractions. The use of such characters allows the playwright to attack the abuses of the powerful behind the mask of folly. One type of allegorical farce is the *farce moralisée,* a good example of which is *Les gens nouveaux qui mangent le monde et le loge de mal en pire*. The *gens nouveaux* are those who have recently acquired wealth and power but who have abandoned traditional values to seek only fame and financial gain. Caring nothing for those they govern, they systematically pillage *le monde*

and its resources, making it go from bad to worse. In this caustic satire, the playwright presents the powerful as malicious fools and dramatizes the social effects of their folly.

Another type of allegorical farce is the *sottie,* in which the fools *(sots)* play no role in bringing about the social abuses that are condemned but limit themselves to observing and reporting the follies of the world. The effect of the satire is no less sharp, since their foolish and comic commentary causes spectators to compare the world they know with the utopian dream of an idealized society.

# *FATRAS/FATRASIE*

**.** These terms designate two related but distinct poetic forms. Sometimes considered a kind of medieval surrealism, both involve the creation of apparent nonsense, often by such methods as the juxtaposition of incongruities or the attribution of animate characteristics to inanimate objects. The dislocation of logic is limited to themes or images, however, while the grammar and syntax of the poems remain conventional and correct.

Both genres originated in northern France. *Fatrasie* dates from the 13th century; *fatras,* from the 14th and 15th. Most examples are anonymous, but eleven *fatrasies* are from the pen of Philippe de Remi, sire de Beaumanoir. Both are fixed forms. The form of the *fatrasie* is aabaab/ babab (in lines of five and seven syllables). The *fatras* began with two lines (AB) often taken from a popular song. The first of those lines is then repeated as the first line of the body of the poem, while B becomes the last line (thus, AB Aabaab/babaB). Occasional "double *fatras*" occur, with a second stanza constructed on an inversion of the initial distich.

*Fatras* continued to be composed after the Middle Ages, but they became *fatras possibles,* with simple parody replacing the linguistic inventiveness and "absurd" juxtapositions of the earlier genre.

# FAUSTUS OF RIEZ

(d. ca. 495). British monk of Lérins, bishop of Riez in Provence from ca. 458. Exiled by the Arian Visigoth king Euric from 477 to 485. Faustus was famous for his sermons against Arianism and his articulation of the "Semi-Pelagian" position on predestination. Faustus taught that grace attracts souls to God and that God's foreknowledge does not require predestination. Extant works of Faustus include treatises *De spirito sancto* and *De gratia Dei,* letters, and a collection of sermons that may include works by other authors. In *De spirito sancto,* Faustus argues the materiality of the human soul, a position close to that of the 2nd-century author Tertullian.

# *FAUVAIN*

**.** The *Histoire de Fauvain* or *Dit de Fauveyn* is an animal verse satire (258 octosyllabic lines) in Picard dialect by Raoul le Petit that accompanies a series of forty ink drawings in B.N. fr. 571 (ca. 1326). Evil appears as the traditional figure of a dun-colored she-ass or horse (Fauvain). The beast is ridden by greedy hypocrites; simony, broken promises, refusal to aid the poor, justice miscarried are censured. Although she slays Loyalty, Fauvain dies too, and her soul is shown carried off by the Devil while Loyalty's soul is received by God.

# *FAUVEL, LIVRES DE*

. An allegorical verse satire (3,280 octosyllabic lines) representing the horse Fauvel, harbinger of the Antichrist and emblem of hypocrisy and evil, whose dun color symbolizes vanity (*fauve* suggests *faus* 'false') and whose name spells out his vices: Flattery, Avarice, Unscrupulousness, Villany, Envy, Laxity *(Flaterie, Avarice, Vilanie, Varieté, Envie, Lascheté).*

The anonymous Book 1 of *Fauvel* (1310) was inspired by the discourse of Faus-Semblant in the *Roman de la Rose* and by such animal satires as *Renart le nouvel* by Jacquemart Gielée (1288). Condemning those who show their hypocrisy and greed by "currying Fauvel" (whence our expression "to curry favor"), Book 1 is organized as a traditional estates satire. It describes the upside-down world ruled by Fauvel and denounces corruption, decadence, and abuse of power in the church hierarchy, monastic orders, and the secular world, while commenting specifically on the scandalous charges brought against the Templars in 1307.

Book 2 was completed December 6, 1314, by a royal notary, Gervais du Bus, perhaps also the author of Book 1. Book 2 allegorically describes Fauvel's palace, peopled by Vices, and offers a noble portrait of Lady Fortune—daughter of God, sister of Wisdom, and mistress of the temporal world. Wooed by Fauvel, Fortune exhibits her twin crowns of ephemeral riches and virtuous poverty and her great wheel, whose turning governs the rise and fall of human destinies. Fortune then rejects his suit and, predicting his eventual destruction on the Last Day, she marries him off to Vain Glory. Book 2 gains topical overtones from its allusions to the kingdom of France and from its specific date, a week after the death of Philip IV and the very moment of the disgrace of his powerful minister Enguerrand de Marigny.

In 1316–17, another royal administrator, Chaillou de Pesstain, composed the vastly expanded version of *Fauvel* found in B.N. fr. 146 (1317), the earliest of a dozen manuscript sources. Chaillou borrowed extensively from Huon de Méry's *Tournoiement Antécrist* (ca. 1235) and the *Roman du comte d'Anjou* (1316) by another royal notary, Jean Maillart, to add some 1,800 lines narrating the wedding festivities of Fauvel: an allegorical banquet, a rowdy charivari, a tournament of Vices and Virtues, and a Fountain of Youth, where Fauvel's followers are renewed. Moreover, Chaillou illustrated his version with seventy-seven miniatures and 169 musical interpolations, including thirty-four polyphonic motets in Latin and French, numerous moral-satirical lyrics from the 13th century, and a large number of vernacular pieces in the emerging *forme fixe* lyric genres. These make Fr. 146 the most significant musical source to survive from the first half of the 14th century in France and *Fauvel* the most sumptuously embellished medieval romance. The effect of political reference is enhanced in Fr. 146 by the Parisian setting of the wedding celebration, by insertion of lyrics addressed to Louis X and Philip V, and by compilation of *Fauvel* with political *dits* by Geoffroi de Paris and an anonymous metrical chronicle of the kingdom of France from 1300 to 1316; these

transform the moral satire into a festive *admonitio,* or *speculum principis,* a work intended to instruct the prince.

# *FAUXBOURDON*

. A quasi-improvisatory practice associated with sacred music by 15th-century Franco-Burgundian composers. The term is associated with a repertory of over 170 surviving pieces, primarily hymns, psalms, Magnificats, and antiphons. The texture was also utilized in Mass movements, particularly in Introits and Sequences, but also in movements of the Ordinary. *Fauxbourdon* is usually notated as two voices, with a verbal cue *(faux bourdon)* indicating that a third voice is to be sung in parallel fourths below the cantus. In the example, Dufay paraphrases the plainchant in the cantus, while the tenor moves primarily in sixths and octaves below, giving the musical effect of a series of first-inversion triads resolving at cadences into sonorities of fifth and octave.

Guillaume Dufay, *Christe redemptor omnium, fauxbourdon* setting of verse 2

The simplest surviving *fauxbourdon* settings, such as those by Binchois, may reflect the sort of polyphony extemporized by 15th-century singers of liturgical music. While the precise origins of *fauxbourdon* are debated, it is clear that there was a connection with the similar English practice of singing "faburden." When *fauxbourdon* appears in relatively elaborate compositions, such as Dufay's *Supremum est mortalibus or Juvenis qui puellam,* it may have carried extramusical significance as a symbol or as a rhetorical figure in the setting of a humanistic text to music.

# FEALTY

**.** Fealty (OFr. *feelté*) was the oath of loyalty sworn by important Frankish men to their king from the 7th century. Charlemagne's capitulary of 802 extending that obligation to all free men, in order to reinforce public authority, had the force of generalizing fealty in private contracts, and by the 10th century it regularly supplemented homage. Initially, the oath was a promise not to harm, as indicated in Bishop Fulbert of Chartres's letter to the duke of Aquitaine (1020), but it acquired a more positive sense in the 11th century. As Galbert de Bruges explained (1127), a new vassal would perform homage, then would swear fealty (with his hand on the Gospels or a relic), and finally would be invested with a fief. Fealty in essence conferred a religious guarantee to a secular contract.

Like homage, fealty originally was an exclusive act that evolved to accommodate the increasing complexity of feudal tenure. In the 12th century, vassals with several fiefs often "reserved" their primary fealty for their liege homages. From the 13th century, feudal tenants often sealed charters attesting that they held their fiefs "by faith and homage," and in some cases written instruments even supplanted the acts themselves.

# FÉCAMP

. A Benedictine abbey on the English Channel in the diocese of Rouen, Fécamp was originally founded as a house for nuns in 664. It was destroyed by the Vikings in 841 and refounded in 1001 by Richard II, duke of

Fécamp (Seine-Maritime), La Trinité, nave. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

Normandy, as a house for monks. The first abbot was William of Saint-Bénigne of Dijon. The most famous member of the community, Jean de Fécamp, became abbot in 1028; Jean's monastic reforms reached far beyond his community. Fécamp was known in the central Middle Ages for liturgical chant and as a pilgrimage center focusing on a relic of the precious blood of Jesus. The church burned in 1168 and was rebuilt at the turn of the 13th century. Fécamp, part of the Maurist reform in the 17th century, was suppressed in the French Revolution.

# FERRAND OF PORTUGAL

(1188–1233). Ferrand of Portugal became count of Flanders and Hainaut when he married the young Jeanne de Constantinople, countess of Flanders and Hainaut, in 1212. The marriage was arranged with the permission of Philip II Augustus, who believed that it would secure the two counties for France and also align him to Portugal. Ferrand, however, refused to recognize Philip's sovereignty. In 1212, several kings and nobles, including Emperor Otto IV and King John of England, as well as Ferrand, rose against Philip. Philip defeated his foes at the Battle of Bouvines on July 27, 1214, and captured Ferrand, who was imprisoned in the Louvre until January 6, 1227. He was finally freed when Jeanne threatened to divorce him and marry Pierre de Dreux, duke of Brittany, a match less appealing to the new French king, Louis VIII. Ferrand returned to Flanders, where he continued to rule his two counties until his death in Noyon from hepatitis.

# FERRIÈRES, HENRI DE

(ca. 1315-after 1377). A Norman of noble birth, Henri de Ferrières wrote the *Livres du roy Modus et de la royne Ratio* between 1354 and 1377. Divided into two parts—the *Livre de chasse* and the *Songe de pestilence*—it takes the form of a dialogue between the expert hunter Modus and several disciples. The book, in prose with interspersed verse, is not simply a treatise on hunting, as is often asserted, but also an allegorical work offering a moral reflection on the vices and virtues of the time, based on a symbolic interpretation of the behavior of game animals. Some thirty-six manuscripts survive, many lavishly illustrated.

# FET DES ROMAINS

. Written ca. 1213/14 by an anonymous, probably Parisian, author, the *Fet des Romains* is a compilation of Roman historical texts. Sallust's *De coniuratione Catilinae,* Suetonius's *De vita Caesarum,* Lucan's *Pharsalia* (properly called *Bellum civile*), and especially Julius Caesar's *Commentarii de bello gallico* (then believed to have been written by one Julius Celsus) supplied the models for the translation into Old French prose. There are also traces of Flavius Josephus's *Bellum Judaicum,* Peter Comestor, Augustine, and Isidore of Seville. Despite announcements in the prologue that the work will cover all twelve Caesars, the *Fet* is essentially a life of Julius Caesar. The prologue, stressing the civilizing power of literature, the duty to impart one's knowledge to others, and the moral lessons that can be learned from the Romans, borrows heavily from Sallust. The text itself begins with a short overview of Roman history, recounts Caesar's birth (as a Caesarean section, based on Isidore of Seville's *Etymologies*), and then, like Suetonius, skips to Caesar's sixteenth year. The Catiline conspiracy and Caesar's political difficulties are followed by an account of the Gallic Wars which forms the bulk of the 744-page (in the modern edition) book. The civil war is recounted according to Lucan (whose anti-Caesar feelings largely disappear in the translation). The book ends with Caesar's murder.

The *Fet* was extremely popular, in both learned and aristocratic circles, in several countries and over several centuries. Its last period of popularity was in the Burgundy of Charles the Bold. More than sixty manuscripts survive, many of them beautifully illuminated. In one group of manuscripts, the *Fet is* preceded by the *Histoire ancienne jusqu'à César,* an unfinished history of the world that leaves off approximately where the *Fet* begins. Both texts are important because they are among the earliest examples of French prose and of historical texts in the vernacular. The *Fet* is also tied to contemporary politics through two allusions to similarities between Julius Caesar and the French king Philip Augustus. Perhaps the text indirectly supported Philip's expansionist desires. The *Fet* and the *Histoire ancienne* show the strong interest in ancient history as a source for both moral exemplars and a national past.

# FEUDAL AIDS

. In a feudal relationship, the vassal normally owed his lord "aid and counsel." The first of these originally meant, above all, military service, but it soon included pecuniary assistance as well. The word *aide* began to refer to a variety of taxes or payments to one's lord, and when the latter was a king or territorial prince, the payments were required of many subjects who were not his direct vassals. Four types of *aide,* however, were deeply rooted in the feudal relationship and appeared in customals as the *aides aux quatre cas.* These *aides,* confined to specific situations, were the ones that historians usually call the feudal *aides.* The four "cases" were (1) when a lord's eldest son was knighted, (2) when his eldest daughter was married, (3) when the lord had to be ransomed from captivity, and (4) when he went on crusade and the vassal chose not to accompany him. The first two of these were by nature nonrecurring, while the last was not customary in every part of France. The need for a ransom, while it might never occur, was also capable of occurring more than once. The ransom of a king, generally an expensive matter, required payments that went beyond direct vassals. Two such *aides*—that for Louis IX after 1250 and that for John II after 1360—were major events in the history of royal taxation and affected so many people that it is hardly appropriate to call them feudal *aides* at all.

# FEUDAL INCIDENTS

. In England, the customs that grew out of feudal tenure but were incidental—not essential—to it, are called "feudal incidents." No comparable term exists in French, although similar practices obtained. The three main incidents, relief, marriage, and wardship, arose from the fief grantor's desire to maintain the service owed by fiefs that had become hereditary. Family control over fiefs was much stronger in France than in England, where kings routinely abused their incidental rights. In France, the inheritance tax payable to the feudal lord and called "relief," or *rachat,* generally was exacted only in cases of collateral transfers (i.e., *escheats*), not when fiefs passed to direct heirs, as was the case in England and Normandy. Relief usually amounted to the annual income of the

fief. In the 13th century, a tax called the "fifth penny," or *quint,* often was assessed whenever fiefs were alienated to nonnobles.

Restrictions on the marriage of feudal tenants, whether they were widows, minor heirs, or adults, were imposed primarily by kings on their great vassals. Louis VII apparently was the first to object to the proposed marriages, and consequent political alliances, of his vassals inimical to royal interests; his successors remained alert to their vassals' marriage plans, but, unlike English kings, they did not force disparaging marriages on their feudal tenants. The wardship of minors, which in England fell to the feudal lord, was exercised in France by family members, usually the widow or eldest child.

Four *aides* were likewise exacted from feudal tenants but were not properly incidents, as they developed from the obligation of "aid and counsel" to one's lord. A lord could tax his vassals for the knighting of his son, the marriage of his daughter, a crusade, and his own ransom. Philip IV extended the collection of feudal *aides* to rearvassals and even nonnobles, and in the 14th century these exactions served as the basis for national taxation.

# FEUDALISM

**.** A term coined in the 17th century and widely used since the 19th, "feudalism" was intended to describe the practices and institutions associated with the word "fief" *(feudum),* When properly used in this technical sense, feudalism is best described in the entry FIEF HOLDING. In French, the word *féodalité,* which is supposed to refer to feudalism in this sense, has been used imprecisely, even though the French use another word, *féodalisme,* to refer to feudalism in the Marxist sense described below.

Medieval historians have become increasingly disenchanted with the term because it has lost much of its meaning as others have appropriated it to describe things having nothing to do with fiefs. It has been used to refer to decentralized aristocratic regimes, to any militaristic preindustrial society, to medieval conditions generally, and even to anything one considers reactionary. The most important of these developments came with the Marxist use of the term to define a stage in history that preceded capitalism. Feudalism in the Marxist sense generally describes a system of agricultural production in which large numbers of peasants work their own small plots as well as a larger demesne farm owned by a lord. Non-Marxist medieval historians often associate this system with the word "manorialism," described in this volume under AGRICULTURE and especially RURAL SOCIAL STRUCTURE. Many non-Marxists now use "feudalism" in something like the Marxist sense. These include most social scientists and many historians of postmedieval societies, but not non-Marxist medieval historians.

In its narrow, fief-holding sense, feudalism emerged in 11th-century France as a set of private arrangements that filled a void left by the breakdown of public institutions of government and justice. Its roots were both Roman and Frankish, but it took hold most strongly in the regions of greatest Frankish influence, roughly what became known as the Languedoil. Notwithstanding the lamentable cliché "feudal anarchy," feudalism actually prevented the worst excesses of lawlessness and political anarchy, which tended to be most severe in regions, mainly the south, where institutions based on the fief developed only belatedly and incompletely.

As traditional public institutions proved inadequate to maintain public order and achieve nonmilitary resolution of disputes, regional rulers like counts made increasing use of private contractual arrangements to enforce their authority. The rise of the fortified castle, however, often undercut this authority, producing a group of castellans who usurped some of the counts' powers and restricted the geographical area in which they could compel obedience. In this unsettled situation (early 11th century), those who were weak came under the protection of the strong, willingly or otherwise, and those who were strong sought to build up enough military might to protect themselves and their dependents. Both developments gave rise to feudal institutions. A lesser noble with a modest lordship who lacked a fortified house could best find protection by becoming the "man" of a powerful castellan, giving homage and fealty to this lord, and holding his lands henceforth as a fief. The castellan, in building up his own forces, gradually found it expedient to have his military retainers (vassals) supported by lands of their own, so he granted them fiefs subject to homage, fealty, and service. These fief holders generally were far inferior to their lords in wealth and power, but as landlords living off the labor of others they were nonetheless members of a small elite at the top of the social order, and the relationships of fief holding carried some presumption of *social* equality. This fact gave feudalism great flexibility, because it could be used as a device for making alliances and resolving conflicts between lords of roughly equal power. A potentially explosive property dispute could be settled by having one lord hold the land as a fief from the other.

Thus the fief-holding men of a particular castellan might have several different origins: lesser landlords who had chosen, or been forced, to hold their lands as fiefs; fighting men who had been granted fiefs to support them as knights; and neighboring castellans who held fiefs as a result of a transaction that resembled a treaty more than anything else. At the highest level of power were those "territorial princes" whose men included all these types but who also built castles and installed their own castellans, who held them as fiefs. A sufficiently powerful prince could sometimes compel existing castellans to render homage for their substantial possessions and hold them as fiefs.

Because the men who held fiefs from a lord varied greatly in their *de facto* power, it has been difficult to describe accurately the obligations attached to fief holding, and conditions also varied according to period and to local custom. The "classic" formulation of feudal obligations described them as consisting of aid *(auxilium)* and counsel *(consilium)*. The former included mounted military service, garrison duty, ceremonial gifts on certain occasions, and the obligation to assist financially if the lord were captured and forced to pay a ransom. "Counsel" referred to advice, sought and given according to custom, and service at the court that important lords maintained to deal with cases involving their men.

Against this view of feudal obligations, we have the different formulation of Fulbert of Chartres (1020), who wrote in purely negative terms, listing the things that a man should not do against his lord. Aside from the fact that Fulbert was writing at a time when feudal institutions were just coming into being as a response to public disorder, it is probable that obligations did vary enormously according to the *de facto* power of the parties involved. If a lord held a castle and his man did not, the feudal obligations of the latter were considerable and were enforceable. If, however, the holder of a fief was himself a castellan, the negative obligations described by Fulbert were as much as could be expected unless, in a particular situation, a castellan perceived that self-interest required him to attend his lord's court or respond with troops to his military summons.

The *de facto* power of a party to a feudal relationship, and with it the character of feudal obligations, could be altered dramatically if the holdings of one party were inherited by a minor or subject to a disputed succession. When succession to a fief was in dispute, the lord could make strenuous demands as his price for investing the successful claimant with the fief. If, however, the lord's position was disputed or fell to a minor heir, those who owed homage gained unusual leverage because their support was so sorely needed.

When it came into being in the 11th century as a revival and reformulation of much older practices, feudalism was an *ad hoc* attempt to cope with the disappearance of public courts and public order. As a device for regulating the relationships among the members of a violent military elite through a network of private contracts, it proved to be a flexible tool for reconstructing a system of public order. By the later 12th century, the French kings and territorial princes had found it a useful system for consolidating their power and providing a framework within which professional soldiers, paid officials, and public courts could be reintroduced. When, in the 13th century, feudal institutions were being elaborated in the legal sources, they were already becoming archaic, since military power, judicial authority, and the maintenance of public order no longer depended primarily on private relationships based on the fief. Nevertheless, the outlook of the nobility and the assumptions that gave rise to the representative and fiscal institutions of the 14th century remained strongly influenced by the feudalism of the 12th.

# FIEF/FEUDUM

. Revenue-producing property granted to a vassal in return for military service. The term *feudum* became common in the 11th century as it displaced "benefice." Although most fiefs consisted primarily of land, they could be entirely nonlanded (e.g., mills, tolls) or consist simply of a right to collect certain revenues (e.g., rents, taxes). The money fief (*fief-rente,* or *feudum de bursa*) was a cash pension paid from a prince's treasury; the counts of Champagne, for instance, assigned many such fiefs on the taxes they collected at the fairs of Champagne. Whatever the source of revenue, a fief was supposed to produce a regular, fixed income.

In most of France, the large-scale feudalization of land occurred from the late 11th century, as lords at all levels created fiefs from their domanial lands and imposed homage on allodial proprietors. At first, fiefs were considered personal grants, but they quickly became heritable and alienable and consequently evoked an increasingly complex set of customs to govern their circulation. Lords with many vassals often conducted inquests in order to determine the current standing of their vassals and fiefs; they also sought to check the abridgment of fiefs by vassals who subinfeudated (subdivided into rear-fiefs) and alienated their fiefs to nonnobles (churches and townsmen) who could not perform military service. In fact, by the 13th century military service was largely detached from feudal tenure, and fiefs became essentially aristocratic (rent-free and tax-exempt) tenures.

# FIEF HOLDING

. A new institution emerged in many parts of France during the first half of the 11th century, that of fief holding. This was a personal relationship between two men (or in rare cases a man and a woman) of knightly or noble status. One became the other's "man" *(homo),* promising allegiance in an act of homage, and received a fief in return. The fief was a piece of property, usually land, that the vassal, the man who performed homage, held for his lifetime. It could not be taken from him unless he failed to be faithful to his

lord, and it was presumed that his heir would normally take up the same fief, subject to doing homage to the lord's heir.

Although this practice of fief holding was new in the 11th century, it had long roots. The commendation of one man to another had similarities to the process by which Roman clients had commended themselves to powerful men during the Roman Empire, or even that by which serfs had commended themselves to landlords during the early Middle Ages. But what was different here was the presumed social equality between the lord of a fief and the vassal who received that fief, as there had never been between a Roman aristocrat and his clients, much less between a landlord and his serfs. The social equality was reflected in the kiss that was a normal part of the homage ceremony.

Again, there are roots of fief holding in the oath of fidelity that Charlemagne demanded of the freemen of his realm—essentially a "negative" oath, not to harm the king in any way—and in the benefices that Carolingian kings gave to their counts as long as they held their offices. But when fief holding became a fully developed institution in the 11th century, it was not part of any public or governmental function. Rather, it was a private relationship between lords involving personal land-holdings. It was in origin extremely *ad hoc,* used in many cases as a means to cement alliances or to settle disputes.

Princes and kings, however, soon saw the potential advantages of the fief-holding system. William the Conqueror divided all of England into fiefs for his great barons. They themselves had men who held fiefs from them, but the king was the ultimate lord of English territory and reserved the right to decide what to do with a fief when the fief holder died. The French and German kings, because they did not start with a clean slate, as had William in England, had more trouble imposing this concept of fief holding as something evolving from the king. But during the course of the 12th century they were able to persuade most dukes and counts that their duchies and counties were indeed fiefs.

Fief holding, which started as a private relationship between aristocrats in the 11th century and became an instrument of royal power in the 12th, reached its peak in the 13th century, when the obligations of holding a fief were institutionalized, the ceremony of homage became both stylized and elaborate, and long lists of fiefs and fief holders were compiled. By the 14th century, however, fief holding was in decline, as salaries and retainer fees, rather than fiefs, became standard for aristocrats in binding their knights to them, and as kings increasingly exercised royal power directly or through judges and bureaucrats, not through dukes and counts. Fief holding, which is what "feudalism" must be considered to mean if the term has any precise meaning at all—and what the term meant when it was coined in the 17th century—had become an insignificant part of social and governmental relationships by the end of the Middle Ages.

# FIEF-RENTE

. Fiefs-rente, or money fiefs (Lat. *feudum de bursa*), were created when a lord (usually the king) granted a lump sum of money or designated revenues instead of land in exchange for fealty, homage, and military service. It was a central institution in what has been called "bastard feudalism," existing in a period of transition between predominantly feudal (land-based) military systems and predominantly mercenary ones.

Although in theory identical to a landed fief, *fiefsrente* tended not to be heritable, were not subinfeudated, nor did they owe feudal *aides* and incidents. The essentially mercenary character of *fiefs-rente* is indicated by the fact that their recipients received not only the lump sum, but daily wages on campaign. Subtract fealty and homage from a *fief-rente* and the result is an indenture contract, widely used, especially by the English, to raise troops in the Hundred Years' War.

The use of *fiefs-rente* peaked in the 13th century. Philip II Augustus, having extended royal financial resources, began competing with Richard I and John of England for a limited pool of mercenaries. The use of *fiefs-rente* shot up on both sides as the kings attempted to secure the loyalty of mercenary troops with bonds of homage and fealty. Their use died out when money and its institutions became common enough that homage and fealty were no longer necessary to ensure a contract.

——. *From Fief to Indenture.* Cambridge: Harvard University Press, 1957.

# FIERABRAS

. An anonymous chanson de geste of the King Cycle relating the story of the winning of the Passion relics housed at Saint-Denis. Composed in 6,219 Alexandrines at the end of the 12th century, *Fierabras* shows the beginnings of the decomposition of epic narrative into romantic fantasy, in which locality, place, and action become blurred due to the author's propensity to make light of everything, even cruelty and religious earnestness.

Three years before the Battle of Roncevaux, the emir Balan retires with his army to Spain after ransacking Rome and carrying away the treasure of St. Peter. Charlemagne and his army follow. A series of battles culminates in a lonely duel between Oliver and Balan's giant son, Fierabras, who meets defeat and converts to Christianity, while Oliver

is taken prisoner. Most of Charlemagne's peers follow Oliver and are likewise captured by the emir, among others Gui de Bourgogne, with whom Fierabras's sister Floripas had already fallen in love after seeing him fight under the walls of Rome. Love scenes and battles between the Saracens and Christians follow until at last the emir himself is captured. Spain is then divided between Gui (and Floripas) and Fierabras, and Charlemagne has the relics brought to Saint-Denis, where they will be exhibited annually during the Lendit fair. The chest of relics, the true "hero" of the poem, serves to combine (at 1. 1,260) two older stories, which narrate the destruction of Rome and duel between Fierabras and Oliver, with a more recent second part inspired by a variety of chansons de geste.

In its Old French version, the poem is preserved in four manuscripts. More often than any other chanson de geste, *Fierabras* has been adapted to different environments and times. The earliest adaptation (5,084 Occitan Alexandrines) was composed between 1218 and 1230 in the Toulouse region. The Italian *Cantari di Fierabraccia e Ulivieri* date from the 15th and 16th centuries. A Middle Dutch version is attested for the 14th century, as is the Middle English *Sir Firumbras* (1357–77). The *Sowdon of Babylon,* narrating the Destruction of Rome episode as well as the romantic second part in Spain, is of the first half of the 15th century. *Fierabras,* the first chanson de geste to find its way into print in the 15th century, was, according to Cervantes, a favorite of Don Quixote.

The most important transformation of the Fierabras story appears in the three-part French prose adaptation, the *Histoire de Charlemagne* by Jehan Bagnyon (Geneva, ca. 1475). The first part deals with the legendary origins of France and traces its history through the reigns of the Merovingians to Charlemagne; Bagnyon dwells on the latter's legendary pilgrimage to Jerusalem and Constantinople by rendering the old poem of the *Voyage de Charlemagne* into prose. The second and longest part narrates the story line of *Fierabras,* and the third summarizes Vincent de Beauvais's version of the Pseudo-Turpin chronicle, with emphasis on the Battle of Roncevaux. An immediate success, the work was frequently reedited through the 19th century.

# *FILLE DU COMTE DE PONTHIEU*

. The first short story in Old French prose, composed in the early 13th century, the *Fille du comte de Ponthieu* relates the adventures of a noblewoman raped before her bound husband; she then tries to kill her witness. To punish the lady, her father, the count of Ponthieu, condemns her to abandonment at sea, where she is rescued, only to be married to a sultan. Later, she saves her first husband and father-in-law from death and escapes with them to France. The story is retold in the 13th-century chronicle by Ernoul, *Histoire d'outremer et du roi Saladin* and in the 15th-century romance *Jean d'Avesnes*.

# FISHING

. Fish were an important source of dietary protein and fishing a significant economic activity in France throughout the Middle Ages. Miraculous drafts of fishes met the prayers of Merovingian saints. Charlemagne ordered estate managers to improve fish stocks, while contemporary monasteries employed their own fishers. By then, most observing Christians were emulating the monks in abstaining from meat more than one day in three. Technological inability to fish offshore, to preserve, and to transport fish made the saltwater fishery less important than local freshwater stocks, which came under intense exploitation.

Depending on the size of the watercourse, rights over freshwater fisheries belonged to the king, territorial lord, or local landowner, who managed them as part of his domainal economy. Use of the fishery for substance by ordinary peasants was limited, tacit, and, in the later Middle Ages, ever more restricted. Lords allocated fishing zones *(piscaturae)* to specialized craftsmen in return for payments in kind. The varieties and seasons of local fishes called for various capture techniques: at bridges, mill dams, and sluices, permanent palisaded traps and wicker enclosures took migratory salmon and eels; bow nets, seines, hoop nets, and dip nets, as well as a number of angling methods are commonly recorded. By the 12th century, Norman coastal fishers were sending herring, cod, and various flat-fishes to Paris from the English Channel and the North Sea. Their inland counterparts caught trout, pike, bream, and, by the early 1200s, the exotic carp.

People carried eastern European carp westward, for this fish's ability to thrive in the artificial fishponds slowly developed from the impoundments made since the 9th century to power mills. By the mid-13th century, complexes of ponds were being constructed purposely for fish culture in, for instance, Burgundy, Sologne, and Forez. After the fish

put on two to four years of growth, the pond was drained to harvest them, seeded to grain for a year or so, then refilled and restocked with fry. Full-grown carp or pike could grace a lord's table or, as those from the many ponds of the last Capetian dukes of Burgundy, yield rich returns from sales to bourgeois merchants or the popes in Avignon. The same pressure of commercial demand caused overfishing of French fish stocks. In 1289, Philip IV initiated royal regulation of fishing gear, seasons, and the size of a legal catch. Probably as effective in changing the role of French fisheries, however, was the late-medieval expansion of the sea fishery, especially after the Dutch learned better ways to preserve herring for shipment inland.

# FLAGELLANTS

**.** *See* POPULAR DEVOTION

# *FLAMENCA*

**.** An Occitan romance dating from ca. 1240–50, *Flamenca* (also called *Las novas de Guilhem de Nivers*) survives in one manuscript (Carcassonne, Bibl. Mun. 34, formerly 2703) with several important lacunae, including first and last pages. Comprising 8,095 lines of octosyllabic rhymed couplets, this zestful narrative develops with wit and sympathy the stylized motifs of *fin'amors* into a full-length *roman*. It mischievously plays the church and marriage against an "underground" world where love rules.

Flamenca's father, Count Gui de Nemurs, consults his wife and advisers before marrying his daughter to the worthy Archimbaut de Bourbon. Archimbaut's love for his bride soon turns to jealousy. He locks her in a tower with two maids, allowing her out only for church and for medicinal baths. Guilhem de Nivers, the outlandishly perfect man in love with Flamenca by reputation alone, then takes rooms at the local bathhouse. His book-learning abets hypocrisy and his wealth facilitates bribery: he obtains the church office of circulating "the Peace." Each Sunday, the lovers exchange two syllables, finally agreeing to meet in the baths. After four months, Flamenca sends Guilhem and her husband away to prove themselves in tournaments, pledging fidelity to Archimbaut provided he end his jealousy. The men become friends. Archimbaut unwittingly delivers a love poem from Guilhem to his wife. At a final home tournament, Flamenca triumphs more than the men.

Stylistic elements suggest "realism" and hence value as a cultural and historical document. Abundant concrete details enliven lists of spices, musical instruments, songs, gifts; baths are sulfurous; a letter is illuminated. Feast days in the main action correspond

exactly to those in the calendar years 1197, 1223, and 1234. Easily drawing on the medieval repertoire of rhetorical figures, the *Flamenca* poet spryly crosses boundaries between the "real," the conventional, and the outrageous.

# FLANDERS

. The *pagus Flandrensis* was a district along the North Sea coast from Bruges to the Yser River, first mentioned in the 8th century. The "Flanders" with politi-cal and economic power by the 10th century, however, was bordered by the Scheldt (Escaut) on the north, the line of the Scheldt and Dender on the east, and the Canche on the south. While the counts held western and southern Flanders in fief of the French crown, lands in the east were held of the Holy Roman emperor.

The first known count, Baudouin I Iron Arm (d. 879), added the districts of Ghent, Waas, Thérouanne, Aardenburg, and perhaps the Yser and Leie valleys to his lands around Bruges. Baudouin II (d. 918) extended his power southward, and Arnulf I the Great (r. 918–65) took Montreuil, Douai, and Artois. After he died, his principality was divided and only reunited in the 11th century, and the counts' position was never as strong in the south, which had a predominantly Romance-speaking population, as in the north, the home of their dynasty. Baudouin IV (r. 988–1035) was the first Flemish count to control both banks of the Scheldt. Count Baudouin V (r. 1035–67) married his son and successor to the widow of the count of Hainaut, but the two houses were divided after the death of Baudouin VI (Baudouin I of Hainaut) in 1070. His young son Arnulf III's position was usurped by his uncle, Robert the Frisian (count of Flanders 1071–93). Flanders and Hainaut were reunited only in 1191.

The next counts tried to keep the peace with their French lords and Norman neighbors on the south. From the early 12th century, Lotharingia and imperial Flanders, which had dominated the diplomacy of the 11th-century counts, moved into the background, while Flemish policy was increasingly caught between the counts' two other feudal lords: the king of France, from whom they held most of their lands, and the king of England, from whom they held a *fief-rente* and on whom their cities were already dependent by the 12th century for high-grade wool. Foreign interests came to the foreground in 1127, when Count Charles the Good was assassinated by members of his entourage. After a civil war in which the king of France supported William Clito, the nephew and rival of King Henry

I of England, and the Flemish cities used the confusion to gain concessions from both sides, the cities and nobles chose as count Thierry d'Alsace, maternal grandson of Count Robert the Frisian.

Thierry d'Alsace (r. 1128–68) pursued a policy of neutrality and internal consolidation. He played the international diplomat, particularly as a crusader, making four trips to Palestine and marrying the daughter of King Foulques V of Jerusalem. In 1156, he married his son Philippe to Elizabeth of Vermandois and his daughter Marguerite to Elizabeth's brother Raoul V. After 1157, Thierry spent most of his time in Palestine, and power was exercised by Philippe, who became count in his own right in 1168. After Raoul V's death, Philippe arranged his widowed sister's marriage to Count Baudouin V of Hainaut. One of the great princes of Europe, Philippe consolidated his authority by promoting economic growth, notably in the foundation of new towns, instituting *baillis,* who took over most of the functions of the now feudalized *châtelains,* and giving new constitutions to the larger cities that strictly subordinated them to the count's administration.

Philippe d'Alsace's two marriages were childless, and he undertook closer relations with the French crown after the young Philip II Augustus, his ward, became king in 1180. He arranged the marriage of his niece Isabelle de Hainaut to the king. But to get this marriage he had to promise as her dowry one-third of his lands, including southern Flanders and Artois. After Elizabeth of Vermandois died in 1182, Philippe's refusal to return Vermandois to her sister led to a war with the French.

After Philippe d'Alsace died in Palestine, he was succeeded by Baudouin V of Hainaut, who ruled in Flanders as Baudouin VIII (r. 1191–95). Although Baudouin VIII had had to surrender Artois to the French crown as the price of the successsion, Baudouin IX (r. 1195–1205) managed to get most of it back by 1200. Baudouin IX became the first Latin emperor of Constantinople, but he died in captivity in the East after a military defeat in 1205, leaving Flanders to his two young daughters. Philip Augustus in 1212 forced the elder, Jeanne (countess 1205–44), to marry Ferrand of Portugal (d. 1233), who quickly took the Anglo-Guelf side in the dispute between King John I and the French. After the Battle of Bouvines (1214), Ferrand was kept in prison until Jeanne accepted the Treaty of Melun, which subordinated Flanders to the French crown. Her death without children in 1244 made her sister Marguerite countess of Flanders. Marguerite's first years were overshadowed by the power struggles of the children of her two marriages, to Burchard d'Avesnes and Guillaume de Dampierre. The countess also fell afoul of the cities, demanding that they contribute to paying her debts to the English king. When they refused, the English embargoed the export of their wool in 1270, and Flanders had to submit to a humiliating peace in 1275.

Long before this, Flanders had developed a precocious economic prosperity. There had been substantial population growth in the vicinity of Ghent as early as the 7th century. Colonization and reclamation were also significant in the 11th century east of Ghent and around Ypres and the coastal area, which led to the development of Bruges as the most important Flemish port. Most other inhabitable areas of Flanders were drained and colonized by the early 13th century, although the sandy and infertile northeast lagged behind. The classic manorial regime declined earlier in Flanders than in neighboring territories. The rural population of maritime Flanders had been free from the beginning, but the development of commercial relations and the advantages gained by the peasants

during the clearance movements led to the emancipation of most of the others from labor services by the 13th century except for a few areas in imperial Flanders. The chronology of clearances suggests a strong population growth in the central Middle Ages and relative overpopulation by 1250. Many rural tenements had been subdivided into units that were too small to sustain households, although this in turn promoted efficient agriculture and high seed yields. Flemish farming practice, emphasizing multiple sowings each year and intensive cultivation of the fallow and of industrial and fodder crops and animal husbandry, was the most technically advanced of Europe.

Flemish commerce in the 11th and 12th centuries was chiefly with England for wool and with the Rhineland for wine, in return for which Flanders exported finished cloth. The counts' economic policies included furthering a cycle of five fairs. Flanders became the most densely urbanized region of northern Europe in the 13th and 14th centuries. While Bruges was a largely commercial city, albeit with a substantial textile industry, the prosperity of Ghent, Ypres, and most of the smaller towns was based on the manufacture of cloth—heavy, luxury textiles for export in the case of Ghent and Ypres. The smaller communities, particularly in southern Flanders, used cheaper wools to make lighter textiles for export to Spain and Italy. The mixed cloths of many villages of western Flanders in the late Middle Ages found a considerable export market in the Baltic areas of Germany. Linen was also important in the villages and some of the larger towns, notably Ghent.

The mid-13th century also witnessed the first signs of social conflict in the Flemish cities, which were racked by strikes of textile artisans who resented the domination of the great entrepreneurs. Flanders was struck by the plagues of the late Middle Ages but suffered less than its neighbors. The most severe epidemics seem to have been those of 1368–69 and 1400, rather than that of 1348–49. By 1469, over one-third of the inhabitants of northern Flanders lived in cities. By this time, however, the great Flemish cities had passed their peak. Considerable industry was moving to the rural areas, and Brabant, Flanders's eastern neighbor, was nearly as densely urbanized.

Countess Marguerite was succeeded by her son, Gui de Dampierre (r. 1278–1305). He was greeted in 1280 with a series of uprisings in the major cities, in which the upper orders, the oligarchies of merchants and landowners who were generally pro-French, were opposed by the artisans and some newly wealthy drapers who were excluded from political participation and cherished Flemish national sentiment. King Philip IV the Fair of France intervened increasingly in the internal affairs of Flanders in the 1290s, hoping to annex Flanders to the crown domain. Gui de Dampierre was subjected to personal humiliations, although he tried until 1297 to remain a loyal vassal; but in early 1297 he renounced his allegiance to Philip and allied with King Edward I of England. The English military failure of that year left Gui isolated; in 1300, he was taken

captive to Paris, and Flanders came under direct French rule. The extreme measures of the French officials provoked a reaction, and in 1302 the French army was defeated in the famous "Battle of the Golden Spurs" near Courtrai. The French returned to the fight, however, and the treaties of Athis (1305) and Pontoise (1312) decreed a huge Flemish indemnity payable to the French, the surrender of the "Walloon" Flemish castellanies of Lille, Douai, and Orchies to the crown, and the restoration of the "Leliaert" (French-sympathizing) patricians who had been overthrown in 1302, but many of whom gradually worked their way back into the town magistracies.

Count Robert III de Béthune (r. 1305–22), Gui's son and successor, was able to restore much of the independence of Flanders, but only at the cost of frequent French military and diplomatic interventions. His grandson and successor, Count Louis de Nevers, came to power after a dispute within his family, was imprisoned by the French briefly at the beginning of his rule, and evidently thought that he owed his position to French help. Louis faced a rebellion in maritime Flanders, including Bruges, between 1323 and 1328, which he was able to crush only with the help of Ghent and the French in 1328. But during the 1330s Louis's entente with Ghent ended as the count tactlessly meddled in municipal affairs. The coming of the Hundred Years' War between England and France caught Flanders between the French sympathies of the count and many wealthy townsmen and the reliance of the great cities on English wool for their draperies. The great cities had taken a leading role in the political affairs of Flanders as early as the crisis of 1127–28, and by the 13th century the "good towns" were meeting in consultation with the counts on all matters of public policy. As an extension of this principle, the cities claimed the right to govern Flanders through the count after 1338, and without him after he fled Flanders in late 1339. Jacques van Artevelde, the captain of Ghent who became the virtual dictator of Flanders, carefully maneuvered Flanders into an English alliance but evidently hoped to convince the count to recognize Edward III of England as king of France. The English hoped to use Flanders as a base from which to invade France, but this hope failed at the siege of Tournai in 1340. The cities themselves, dominated but not controlled completely by weavers, maintained their rebellion until Ghent was stormed in January 1349.

The new count, Louis de Male (r. 1346–84), imposed loyal regimes in all the cities, generally giving considerable authority to the fullers, a less revolutionary element than the weavers. He gave privileges to foreign merchant colonies in Bruges and confirmed rights given earlier to numerous smaller communities to manufacture certain types of cloth. But there was a disastrous commercial war with the German Hanse between 1358 and 1360, and Flanders had to submit to the Germans' demands after a blockade. Louis's debasements of the coin also contributed to severe inflation and to the problems of Flemish drapers in maintaining their overseas markets. The control of the counterrevolutionary regimes began to fail in 1358, and weaverdominated regimes were back in control by 1361.

In contrast to what had happened in 1349–50, however, there was no mass proscription of political opponents, and the relations of the cities with the count generally remained correct, although the count did show some favoritism to the fullers, notably in giving them wage increases. Throughout the 14th century, Flanders had become increasingly dependent on imported grain from Germany and France. Louis de Male permitted Bruges, which by now was better disposed to him than was Ghent, to try to

evade the monopoly of Ghent on French grain coming down the Lys River by digging a canal into the Lys south of Ghent. The cities had well-defined spheres of influence, and when the workmen of Bruges began digging in the "quarter" of Ghent in the autumn of 1379, the militia of Ghent attacked. The resultant war lasted until the Peace of Tournai (December 18, 1385). Ghent was the only constant opponent of the counts, but at various times it was able to install rebel regimes in Bruges and Ypres and to control the smaller towns and rural jurisdictions, al-though less effectively than they had done in the time of Jacques van Artevelde.

After the war, Flanders came more completely than ever before into a French orbit. Louis de Male had married his heiress in 1369 to Philip, duke of Burgundy and brother of the French king Charles V.Philip succeeded his father-in-law as ruler of Flanders on January 30, 1384. The Flemish cities were more strictly subordinated to the Burgundian council and Chambre des Comptes. The power of the "four members" of Flanders— Ghent, Bruges, Ypres, and the Franc *(châtellenie)* of Bruges—continued strong during the Burgundian period. Although there were rebellions in the major cities between 1436– 38 and 1450–53, the only consequence was the further limitation of the cities' autonomy. With the death of Charles the Bold in 1477 and the succession of his daughter Marie and her husband, Maximilian of Habsburg, the cities again tried unsuccessfully to throw off the foreign ruler. At the end of the 15th century, Flanders was being ruled not by Frenchmen but by a German dynast whose heirs in the Low Countries would be Spaniards.

# FLAVIGNY

. Although no longer a major provincial center, Flavigny-sur-Ozerain (Côte-d'Or) retains fascinating medieval monuments and archaeological sites of artistic and historical interest, including the abbey of Saint-Pierre de Flavigny. Established in 719 by Wideradus, a nobleman of Burgundy, the Benedictine abbey was first dedicated to St. Prix, bishop of Clermont and martyr, although St. Peter soon became the dominant titular. Though no structures survive from this early period, as a prestigious monastery Flavigny maintained an important scriptorium by the end of the 8th century. Despite the turmoil of the 9th century, the community succeeded in translating the relics of St. Regina from nearby Alise in 866 under the dynamic abbacy of Ergilo. Subsequent abbots secured the continued prosperity and expansion of Flavigny, and as a town began to form around the abbey from the 10th century onward parish churches and fortifications were constructed. Following occupation by the English in the 14th century, the town was refortified in the late 14th and 15th centuries. In 1644, the Benedictines of Saint-Maur reformed the abbey and occupied it until its demise and sale in the 18th century.

The abbey church of Flavigny, largely ruined today, retains two 8th-century Carolingian crypts, unusual and valuable survivals of early-medieval architecture. The first occupies the lowest level and has been associated with the relics of St. Regina. Originally semicircular in plan with four bays to the west, it was later altered to create a hexagonal terminus. The second, often linked to the 878 dedication by Pope John VIII, is constructed one level up and to the east with two bays, small aisles, and a hexagonal apse. In addition to a Romanesque reworking of the church in the early 11th century, a Gothic campaign of construction is dated 1180–1230. Within the remains of the church and crypt, rare examples of pre-Romanesque and Romanesque sculpture of ornamental vegetal forms on pilasters and capitals are still to be found. A cloister was added ca. 1125, with sculpture in the tradition of Cluny III and Moutiers-Saint-Jean.

The parish church of Saint-Genest, with its narrow nave and refined floral capitals, offers a late example of Burgundian Gothic architecture. It also houses several Burgundian sculptures of the 15th century. A number of medieval houses survive from the 13th century through the 16th, with such architectural details as trilobed arches and mullioned stone windows. Buret-Vitello, an exemplar of Flamboyant Gothic domestic architecture from the late 15th century, includes ogive arches and a statuary niche. During the late-medieval centuries of prosperity, Flavigny was also given the right of fortification. Both the Porte du Val (13th c. and later) and the Porte du Bourg (mid-15th c.) are valuable survivals of defensive structures.

# FLODOARD DE REIMS

(893–966). Frankish chronicler. The history of west Francia in the first three-quarters of the 10th century is known principally through the *Annales* of Flodoard. This canon of Reims recorded the events from 919 to his own death in 966, focusing on the royal court and the great men of northern Francia. He continued the annals begun by Hincmar of Reims and was succeeded as a chronicler by Richer. Flodoard's other major work was a history of the bishopric of Reims, which also includes many details of 10th-century political history.

# *FLOIRE ET BLANCHEFLOR*

. This idyllic romance, based on the story of "Neema and Noam" in the *Thousand and One Nights,* exists in two versions, both anonymous. The earlier (ca. 1160; 3,342 octosyllabic lines in manuscript *A*) is courtly in inspiration and preserved in four manuscripts (*A:* B.N. fr. 375; *B:* B.N. fr. 1447; *C:* B.N. fr. 12562, and, as a fragment, in *V:* Vatican, Palatinus, lat. 1971). A 13th-century reworking, more popular in tone, is preserved in one manuscript and incomplete (3,448 octosyllables; B.N. fr. 19152). Both versions tell of two children born on the same day, one to a pagan queen, the other to a Christian captive, who are brought up together at court and fall in love. King Fénix (Galerïen in the popular version) opposes their union, sells Blancheflor into captivity and tells the hero she has died, building a magnificent tomb to support this fiction. Only when Floire becomes ill does he reveal his deceit. The young man searches through the East and discovers that Blancheflor is held captive by an emir. He bribes a porter with a

magnificent goblet, decorated with scenes from the story of Paris and Helen, and is smuggled into the tower in a basket of flowers. He is later discovered by the Emir, who, however, forgives the couple and joins them in marriage. On return to his homeland, Floire becomes king and converts to Christianity.

The popular version stresses the battle skills of the hero but curtails description of objects and settings. Floire wins over the Emir by defending Babylon against his enemy, the story ending with this victory. The courtly version contains references to the works of Ovid, Virgil, and the vernacular Alexander romance *Apollonius de Tyr*. As the owner of the magnificent goblet, Floire becomes part of a heroic line of descent, from Vulcan, its creator, to Aeneas, an earlier owner. The tale's popularity is attested by its translation into a variety of languages, including Dutch, German, Yiddish, Middle English, Italian, and Spanish.

# *FLOOVENT*

**.** Composed in Burgundy at the end of the 12th century in 2,534 assonanced Alexandrines, the chanson de geste *Floovant* combines the themes of the exiled hero and the Saracen princess who, having fallen in love with the hero, frees him from her father's prison and abandons her religion in order to marry him. It is found in Montpellier 441 and in two fragments in Freiburg (all three of the 14th c.). It was translated into Middle Dutch, Icelandic, and Italian.

King Clovis's son, Floovant, is banished by his father for having cut off his teacher's beard; with his squire, Richier, he enters the service of King Flore of Alsatia, who, upon learning that Floovant has saved his daughter from the Saracens, gives him the sword Joïeuse and the command of an army against the pagan King Galien. Floovant eventually weds the latter's daughter, while Richier, knighted, receives the hand of King Flore's daughter, Florete. When they learn that Clovis has been attacked by Galien at Soissons, Floovant, Richier, and the twelve peers hasten with an army to succor him; then, after a battle in which at one point—unknown to each other—Clovis fights his own son, Galien is killed, and Floovant is crowned Clovis's eventual successor. Attempts to link the story to Merovingian history, especially to Clotar II (584–629) and his son Dagobert I (608–638/39) have failed.

# FLORENCE DE ROME

. A chanson de geste of 6,410 Alexandrine lines from the first quarter of the 13th century, *Florence de Rome* is based on the legend of a virtuous married woman unjustly accused of adultery by her brother-in-law, disowned by her husband, pursued by several men, and falsely charged with murdering a child. She finally enters a convent, receives extraordinary healing powers, and is vindicated when her oppressors, stricken by horrible diseases, confess to their crimes. There are hundreds of versions of this story, both oriental and occidental (the earliest ca. 1150 in the German *Kaiserchronik*). Other names were given to Florence, notably Crescentia, Hildegarde, or Constantia. The poem was reworked in monorhyming quatrains in the 14th century and was also incorporated into the Pseudocycle of Dagobert in several 15th-century manuscripts, including B.N. fr. 24384.

# FLORENT ET OCTAVIEN

. One of several late-medieval epics inspired by the deeds of a pseudohistorical King Dagobert and his foundation of the abbey of Saint-Denis near Paris, this one centering on the adventures of the twin sons of a Roman emperor. The mid-14th-century poem of some 18,5000 Alexandrines, based on an octosyllabic 13th-century *Octavien* (5,000 lines), was rewritten in prose for a Burgundian courtier, Jean de Créquy, in 1454. An abbreviated version was printed several times during the 16th century, the last in 1592.

# FLORUS OF LYON

(d. ca. 860). Deacon and teacher at the cathedral school of Lyon, Florus studied under Leidradus and became a noted exegete, known especially for such *catenae* as his composite of Augustine on the Pauline epistles. Florus supported the rights of the deposed bishop Agobard in 835 and opposed Amalarius of Metz at the Synod of Quierzy in 838. He also played a part in disputes with Gottschalk and Johannes Scottus Eriugena, in both cases supporting Rabanus Maurus.

# FOIX

. The last of the great fiefs of the Midi to be restored to the crown, the county of Foix was also one of the last to be created during the Middle Ages. The town and castle of Foix, noted as early as the 7th century, formed part of the large county of Comminges-Couserans. A partition of the inheritance of Count Roger le Vieux in 1002 left the territory of Foix to a cadet, Bernard-Roger, whose sons Roger I (d. 1064) and Pierre-Bernard (r. 1064–70) ultimately assumed the title count of Foix. The domains of the counts included the cities of Foix and Pamiers, the towns of Lézat, Saverdun, and Mazères to the north and Tarascon, Lordat, and Aix-les-Termes to the south. During the Albigensian Crusade, Count Raymond-Roger, whose sister Esclarmonde sheltered and assisted heretics at Pamiers, was a determined enemy of Simon de Montfort. With the elimination of the viscounts Trencavel and the extinction of the house of Toulouse, Foix emerged in the mid-13th century as the most important independent fief in lower

Languedoc. In 1290, its territory increased with the marriage of Count Roger-Bernard III to Marguerite, heiress of the viscounty of Béarn.

The apogee of the counts' power came in the 14th century, when they profited from the weakness of royal authority during the Hundred Years' War and the strategic position of their own domains to play a critical role in the politics of the kingdom. Against the determinedly proFrench position of his rivals the counts of Armagnac, the brilliant and lettered Gaston III Phoebus (r. 1343–91) pursued a policy of official neutrality in favor of the English and engaged in frequent hostilities with both the house of Armagnac and the duke of Berry, royal lieutenant of Languedoc. His successor Jean I (r. 1412–36) continued the pro-English alliance until the accession of Charles VII, from whom he accepted the lieutenancy of Languedoc. At the death of François Phoebus (1483), the county of Foix passed to the house of d'Albret and was united to the monarchy with the accession of Henry IV.

# *FOLIES TRISTAN*

. The common subject matter of the Bern *Folie* (Bern MS 354; 584 octosyllables) and Oxford *Folie* (Bodleian Library, d6; 998 octosyllables) is Tristan's return to Iseut conjoined to the motif of feigned madness. The narrative of these two short tales is itself based on another "return": Tristan's evocation, first at Marc's court and then for Iseut and Brangain, of the main events of his past life. Because of the episodes cited, the Bern version is generally associated with the tradition represented by Eilhart and Béroul, while Oxford is related to Thomas d'Angleterre. Thus the two texts are important for reconstituting episodes that are missing in the Béroul and Thomas fragments.

Tristan's hiding behind a mask of madness permits the development, without constraints of decency, chronology, or verisimilitude, of a highly eroticized discourse, which moves without transition from burlesque fantasies and obscenities to lyric laments and the detailed depiction of dream worlds. Marked by the repetition of the verb "to recall, remember" (OFr. *membrer, remembrer*), the *Folies* return obsessively to the main Tristan themes of wounds, lovesickness, self-alienation (of which madness is the sign), unsatisfied desire, and death. They translate another Tristan obsession as well: the impossibility of establishing the veracity of language, especially the language of love. Tristan's words alone are not enough for Iseut to recognize him in either *Folie*. Only the

hound Husdent can pick out the hero, who, in the Oxford *Folie,* must revert to his own voice to convince the queen to receive him again.

# FOLKLORE

. Discipline that involves the study of daily life and material culture, symbolic systems, rituals, popular religion, folk medicine, judicial customs, performances, songs, tales, riddles, and many other aspects of life. The study of folklore—which draws on fields as diverse as literature, history, historical anthropology, ethnobotany, art and music history, and sociology—has shed considerable light on medieval French culture.

Historical anthropology, for example, has enabled us to undertake the excavation of a medieval folk culture no longer seen as a jumble of fragments but as an integrated worldview, acting on its environment through rituals and ceremonies and translating that experience through myth and legend. It has also stressed the specificity of the diverse ethnic components, regional cultures, and religious cultures that converged in the French Middle Ages. Archaeology has provided insights into the medieval rural world that have established foundations for understanding the relationship of material culture to beliefs. Examples are Bordenave and Vialle's study of funerary objects and burial practices in the rural areas around Albi (1983) and Chapelot and Fossier's 1980 study of villages that yielded information on patterns of settlement and human bonding. Linguistics is a kind of archaeology of words. Personal names and place-names, words for tools, plants, and trade techniques—all these help document material culture, as well as legends and the mental processes at work in word associations and word play. Facetious or derogatory surnames, for instance, are precious indicators of popular invective systems, exclusion patterns, and animal and plant symbolism.

Iconography is another important source. Its study was long dominated by Christian readings, but from the 1970s on scholarship illuminated the pagan or folk underpinnings of medieval sculptures in both ecclesiastical and secular buildings (e.g., Ross and Sheridan's work on grotesques and gargoyles and the Krauses' on misericords, both 1975). French cities, large and small, are richly adorned with symbolic and functional iconography. The densely coded language of street signs, known mostly through archival records, had been catalogued since the 19th century but not read with respect to folkloristics. Gaibenet's pioneering work (1984) identified images previously thought of as simply bizarre or amusing. Manuscripts, capitals and portals of churches, corner pillars of houses, beams, and lintels came alive with a folk world rife with facetious saints, mythological creatures, wild men, mermaids, the Jack-O'Green, the four outcast sons of

Aymon, but also with the symbols of folly and with obscene gestures to ward off evil, along with references to social customs, like the *ius primae noctis*.

Folk practices and customs are known through ample documentation. Letters of pardon refer to the organization of the calendar, feasts, and other aspects of religion. They bring us right into the worldview of the protagonists. A landmark in the study of medieval French folklore was Vaultier's work on letters of pardon during the Hundred Years' War (1965), which incorporated fragmentary information into the standard classification system of folklorists.

Another document of inestimable impact is the 15th-century *Évangiles des quenoilles,* a collection of aphorisms, medical recipes, charms, and beliefs attributed to a group of rural women who are presented as transmitting their knowledge through the sometimes bored or ironic cooperation of a scribe. Jeay's 1982 study raised crucial issues of how to read "folk" against "clerical," direct information against mediated, and how to exercise suspension of disbelief in handling such a source.

Literature provides a wealth of references to songs, legends, and proverbs. Though folk music, like all medieval music, is one of the hardest domains to document, song texts were embedded in medieval narratives and in separate collections, such as the *chansons de toile*. The function of orality in the formation, composition, and transmission of many medieval fictional narratives has been the subject of long debate. This is particularly true of the chanson de geste; the study of its formulaic composition, facilitated by Duggan's use of computers, has prompted serious rethinking of the relationship between oral and written composition and of blithe characterizations of a genre as uniquely "aristocratic" or "popular."

The extensive corpus of exempla, catalogued by Tubach (1969), is replete with material from oral tradition and has generated a renewed interest in the sources and variations of complex folktale cycles and of the relationships and tensions between folk culture and its clerical voicing. The study of hagiography allows us to differentiate saints' cults that can be deemed truly popular from those cults generated from above; an example is historical anthropologist Jean-Claude Schmitt's 1983 study of the local cult of a deceased dog "canonized" by the folk. Feminist studies, often coming from a social-science or art-history perspective, have played a major role in the development of this aspect of medieval folklore, broadening its definition beyond traditional distinctions of rural-urban or elite-folk to include the communities of women. Ashley and Sheingorn, for instance, begin their volume of essays on the place of St. Anne in late-medieval society by stating that their perspective is at the intersection of popular culture, popular piety, and women's studies, informed by cultural and gender studies, and attempts to bridge the gap between popular and elite cultures, between folklore and theology.

The foregoing represents just a sampling of French medieval-folklore scholarship, making reference to trends and issues that reflect to the greatest possible extent on the whole. Other areas that have been studied include public performance, carnival plays and other rituals, fraternities, the folklore of trades, folk medicine, fools and folly, witchcraft and the Devil, demons and ghosts, the legends of Melusine the serpent and Hellekin, leader of the unquiet dead, and tales of Roland leaving his mark on the landscape.

Though fully recognized as a discipline only in the past few decades, the study of medieval French folklore has a venerable history. One of the earliest explicit attempts at gathering folklore from primary sources in an organized way was the 16th-century doctor

Laurent Joubert's *Erreurs populaire au fait de la médecine et régime de santé,* whose 1576 edition included catalogues of sundry medical beliefs entitled *Propos vulgaires,* or sayings from the untutored, gleaned at his behest by friends and colleagues. Satirical depictions of Catholic folk practices by Protestant writers and polemicists, such as the erudite Henri Estienne *(Apologie pour Hérodote),* also provided useful insights into the folk religion of the time.

Medieval French folklore became a more densely charted sea with the 19th-century development of folklore studies throughout Europe, in the intellectual context of Romanticism. The upsurge of Germanic nationalism profoundly affected French folklore studies, since German scholars happily annexed France to Germanic culture. An important example of this approach is found in Liebrecht's notes to a partial edition of Gervase of Tilbury's *Otia imperialia,* entitled *Ein Beitrag zu deutsches Mythologie* (1856), a comparative study of medieval traditions with a medley of modern west European folk traditions, many of them French.

Throughout the 19th century, scholarly journals, national, regional, and local, published a plethora of articles on aspects of medieval French folklore, in which philology was dominant. Such medievalists as Joseph Bédier, Gaston Raynaud, and Paul Meyer focused on the role of medieval French fabliaux and other tales in the formation and transmission of the corpus of folktales and legends. Much attention was directed to the question of attributing Indian origins to European tales, and medieval tales generally; such was the argument in Bédier's *Fabliaux* and in Cosquin's 1911 study of the tale of "The Cat and the Candle" (*Romania* 40). Studies on Old French explained *façons de dire*—sayings, idiomatic expressions—and helped explicate the extended meaning of words and the beliefs underpinning them. Meyer and others also devoted attention to medieval medicine and its relationship to folk practices. In the early 19th century, extensive collections of miscellaneous texts were published: comic plays, debates, pamphlets, and broadsides, many of them connected to carnival and other popular feasts. The Romanian folklorist Sainéan studied the history of French slang; the polymath Francisque Michel's commentaries on the *races maudites*—pariah communities, such as the *cagots,* the presumed descendants of lepers—albeit now obsolete in scope and method, raised a question of folk culture and French history that is still discussed by medieval historians.

The early 20th century saw giant leaps in French folkloristics. Van Gennep's *Manuel de folklore français contemporain* (1937–58), still the standard work, provided the calendar and festive structure for the study of isolated folklore manifestations; his discussion included medieval examples. Saintyves, concerned with the survival of pagan practices, treated many themes of medieval hagiography in connection with folklore, such as the cult of St. Christopher, the symbolism of leprosy, virgin births, and protective processions around cities. Another landmark was Marc Bloch's *The Royal Touch* (1924; trans. 1973). A historian of the of the economic and social relations of feudalism, Bloch studied the healing powers of kings, exploring the connection among the political rituals of the monarchy, its religious content, and the practices of the folk.

Bloch's advances in bringing the discipline of history into the study of medieval folklore and Vaultier's reliance on letters of pardon did not have their full impact until much later, with the "New History." The historian Jacques Le Goff favored a multidisciplinary approach to history that included folklore and its methodologies as

valid tools. In his *Time, Work and Culture* (1980), Le Goff discussed the function of blood tabus in certain professions, the connection between official processions and folk religion, dragon lore, and the myth of Melusine, the serpent-tailed woman of dynastic foundation legends. Focused on a specific area and regional culture, Emmanuel Le Roy Ladurie's *Montaillou: The Promised Land of Error* (1978) also joined folklore and history. Based on a 14th-century inquisitor's records of a heresy-hunting expedition in a previously Cathar-Albigensian region, Ladurie combined ethnology, sociology, anthropology, and folklore as domains of the historian. He classified the behaviors of the people of Montaillou according to recognizable folklore categories and discussed beliefs within the broader context afforded by a comparative folkloristic view.

In the 1970s, the study of popular religion and popular religious sensitivity accelerated. The use of clerical writers, theologians, and even inquisitors was being recognized as an important means of retrieving fragments of folk culture. Essays on Languedoc in the 13th and 14th centuries, by Étienne Delaruelle, Bernard Plongeron, and Jean-Claude Schmitt (*Cahiers de Fanjeaux* 11 [1985]), examined the saints, feasts, legends, and amulets of popular piety. Ethnologist Claude Gaignebet's *Art profane et religion populaire* (1985) was a syncretic rereading of medieval culture and folklore in which iconography, myth, custom, and literature combined to underscore the pivotal importance of time, the folk calendar, and myth. He reopened the forbidden dossier of obscenity in art and culture, stressed the popular foundations of great texts of medieval literature, and incorporated isolated folk practices into systems of myth and religion, parallel but not always opposed to Christianity. Symbolic and mythical readings of the folk calendar were furthered in Philippe Walter's studies of time and hagiography in medieval narratives, and his dictionary of Christian mythology (1992) provides a useful summary of medieval folklore, myth, and ritual.

# FOLQUET DE MARSELHA

(fl. ca. 1178–95). Son of a rich Genoese merchant, the troubadour Folquet de Marselha was himself a wealthy merchant in Marseille by ca. 1178. Around 1200, he, his wife, and two sons entered the Cistercian abbey of Le Thoronet, of which he became abbot. As bishop of Toulouse from 1205 until his death in 1231, he helped found the Order of Preachers (Dominicans) and organize the Albigensian Crusade. According to the *Chanson de la croisade contre les Albigeois,* Folquet was responsible for the deaths at the stake of 10,000 Albigensians.

Of Folquet's nineteen certain songs, fourteen are love songs (thirteen have music preserved); the others are two crusade songs, two debate poems, and one *planh.* In song as in deed, he praised courtly love before rejecting it, in a learned and literary style that builds on his assimilation of Latin and Occitan *sententiae.* Yet his carefully refined and subtle artistry remains original and abstract, preoccupied with aesthetic and moral issues. His poetry and music were admired and imitated.

# FONTENAY

. Founded by St. Bernard himself in 1118, the abbey of Fontenay (Côte-d'Or) was one of the most

Fontenay, Cistercian abbey church, cloister. *Photograph courtesy of Whitney S.Stoddard.*

Fontenay (Côte d'Or), Cistercian abbey church. *Photograph courtesy of Whitney S.Stoddard.*

prosperous Cistercian foundations in the Middle Ages, with some 300 monks and postulants. The abbey church, begun ca. 1130 thanks to the generosity of Évrard, bishop of Norwich (d. 1150), and consecrated in 1147 by Pope Eugenius III, is one of the oldest Cistercian churches in France. It is marked by the simplicity typical of Cistercian architecture. Constructed on the plan of a Latin cross, the eight-bay nave is covered by pointed barrel vaulting and supported by transverse arches carrying barrel vaults in the side aisles. The flat chevet is lit by triple lancets, symbolizing the Trinity. The spare dormitory has a beautiful 15th-century timbered ceiling in the form of an upturned ship's keel. The elegant cloister and the rib-vaulted chapter house, supported by central piers, are pure Romanesque. Other conventual buildings include a prison, warming room and scriptorium, infirmary, and forge.

# FONTEVRAULT

. The 12th-century abbey of Fontevrault (Maine-et-Loire), located near the Loire's confluence with the Vienne, was founded, probably in 1101, by Robert d'Arbrissel as a monastic community for those, especially women, who had been attracted by his preaching. Fontevrault was a "double monastery," with communities of men and women living separate existences but sharing a single

church and under the single rule of an abbess. It attracted generous benefactions, notably from Henry II Plantagenêt and his son Richard the Lionhearted, who attributed his release from prison to the nuns' prayers. Both kings were buried at Fontevrault in the *cimetière des rois,* along with Henry's wife, Eleanor of Aquitaine, and his daughter-in-law Isabelle d'Angoulême, who ended her days here as a nun.

The abbey church, consecrated in 1119, is Romanesque in style and has a barrel-vaulted choir with ambulatory and three radiating chapels, a transept likewise barrel-vaulted, and an aisleless nave vaulted with a series of cupolas. This is the northernmost example of this latter stylistic feature, seen so often in southwestern France. The church was transformed into a prison after the Revolution, and its nave was divided into three stories. Restoration was undertaken at the beginning of the 20th century.

Also largely intact are the 16th-century cloister, chapter house, and refectory. Particularly remarkable at Fontevrault is the 12th-century octagonal kitchen, the Tour d'Évrault, each of whose original eight apsidioles had its own chimney. (Three have since disappeared.)

# FOOD TRADES

. Most medieval people spent well over half of their incomes on food and drink, making the trade in victuals the most important sector of the medieval economy. In the countryside, both lords and peasants concentrated on the agricultural production of foodstuffs, particularly grains, meat, and grapes for wine. Peasants, many of whom lived on the edge of subsistence, produced most of their own food and often paid their rents or received wage payments in the form of food. By the late Middle Ages, however, an increasingly large number of peasants produced a marketable agricultural surplus, which they either sold to middlemen (like traveling cornmongers) or brought to village and town markets themselves for sale directly to consumers.

Urban inhabitants were the most active traders and consumers in the medieval food trades. Between 25 and 40 percent of townspeople worked in some branch of the trade in victuals. Their occupations ranged from that of the wealthy vintner engaged in the wholesale purchase and sale of large quantities of wine, to the petty huckster who sold onions and garlic from door to door. Grains like wheat, rye, and barley represented the most crucial foodstuffs. A middling-sized town of 3,000 people consumed about 1,000 tons of grain each year, an amount of grain that required about 4,500 acres of arable land. Thus, a large city like Paris, inhabited by over 100,000 people in the early 14th century, had to go far outside its own hinterland to acquire adequate supplies of grain. During times of famine, municipal governments were forced to take spe-cial steps to prevent hoarding and to secure a regular and cheap supply of foodstuffs. Indeed, the fundamental anxiety over food supply, particularly grain, ensured that the food trades were among the most regulated aspects of medieval town life.

Many of the urban food trades were organized into guilds that shared in the regulation of foodstuffs. Most towns had guilds of bakers, butchers, and vintners; the largest cities possessed even more specialized guilds, like those of the pastry makers at Toulouse or poulterers of Paris. With the exception of those few merchants involved in the profitable long-distance trade in grain, wine, or salt, however, few of the medieval food-trade guilds attained the political power or prestige enjoyed by some of the other craft guilds, such as those in the textile trades. Butchers probably represented the most prosperous food-trade occupation aside from wine and grain wholesalers. Selling both salted and fresh meat, by the piece or on the hoof, butchers also profited from the sale of hides, skins, horns, and animal fat to other craftspeople. Mutton was the most common and cheapest meat they sold; pork was twice as expensive and beef four times as dear as mutton. As stock breeding expanded in the countryside and urban meat consumption increased in the late Middle Ages, the affluence of butchers appears to have grown even more.

Many urban residents produced a good deal of their own food by raising their own chickens, pigs, and even cows, and growing fruits and vegetables in their gardens. Some made their own bread dough (but usually had to take it to the baker for baking). For other essential foodstuffs, townspeople depended largely on the market. Fish, for example, was usually purchased in the marketplace, although inhabitants of coastal communities easily

secured their own supplies. The church's ban on meat during Lent, certain feast days, and every Friday and Saturday, made fish an important element in the medieval diet. Because of the risks of spoilage, fresh fish was generally retailed nearby its origins in the sea, rivers, or fishponds. But salted and dried fish were often shipped over long distances and represented a substantial proportion of the maritime trade of port cities and coastal fishing villages.

Spices, oils, and salt were also shipped over long distances. Salt was a particularly valuable and essential foodstuff, since it was used extensively as a seasoning and to preserve meat and fish. Towns and even the national government took advantage of the demand for salt by assessing a salt tax, or *gabelle,* on consumers, which was substantial enough to constitute an important element of urban tax revenues. Indeed, towns benefited from a wide variety of taxes on food and also realized revenues from the rents charged on shops and stalls, the butchers's shambles, and butter cross (where dairy products were commonly sold). Port customs and tolls on exports and imports of wine also represented a significant source of income for many towns and regional governments.
